# **The 16<sup>th</sup> International Conference on Innovation and Management (ICIM 2019)**

## **Organized and Hosted by**

University of Jaén, Spain

Wuhan University of Technology, China

## **Co-organized by**

Yamaguchi University, Japan

Eindhoven University of Technology, the Netherlands

Tilburg University, the Netherlands

NEF- Pontifical Catholic University of Sao Paulo, Brazil

University of Vaasa, Finland

Technological University of Malaysia, Malaysia

University of Wales Trinity Saint David, UK

## **Organizing Committee**

### Chairman:

Luis Martínez (University of Jaén, Spain)

Chen Xiaofang (Wuhan University of Technology)

### Co-Chairman:

Ken Kaminishi (Yamaguchi University, Japan)

Geert Duysters (Tilburg University, the Netherlands)

ArnoldodeHoyos (NEF- Pontifical Catholic University of Sao Paulo, Brazil)

JosuTakala (University of Vaasa, Finland)

Mohammad Ali Tareq (UniversitiTeknologi Malaysia, Malaysia)

Simon Haslett (University of Wales Trinity Saint David, UK)

### Members (In alphabetic order):

Alessandro Marco Rosini, André Furtado, AndyaraSantis, Angelo Palmisano, Antonio VicoMañas, Aquatias Christine, Ard-Pieter de Man, Beatriz Marcos Telles, Christine Syrgiannis, CláudioMarte, Deng Mingran, Diego Conti, Erika Zoeller Veras, Felipe Borini, Fernando Grisi, FláviaPereira de Carvalho, IrmtrautMecke, Ivanete Bellucci, John Rijpma, Kazuhiro Fukuyo, KoitiEgoshi, Kwai-Sang Chin, LadislauDowbor, Lennon Jardel de Araujo, Luiz Roberto Calado, Ma Ying, Maria Cristina Amorim, Milton Campanário, MônicaCairrãoRodrigues, Monique Greve, Motonobu Kubo, Nguyen HuuPhuc, Paul Henry Osborne, Roberto Bernardes, Rosa Alegria, Rosa Rizzi, Ruth Y. Lopez Trigo, Song Yinghua, SuXinning, Sun Zehou, TalesAndreassi, TelmaTeixeira, Tim de Leeuw, VinniciusVieira, Vitoria C. Dib, WangAimin, Walter Mcmanus, Wang Xianjia, Wei Jiang, Wim Vanhaverbeke, XieKefan, Naoki Ohshima, Yoshiyuki Matsuura

## **Executive Committee**

### Director:

Chen Xiaofang (Wuhan University of Technology, China)

Luis Martínez (University of Jaén, Spain)

### Members (In alphabetic order):

Ahmad Rahman Songip, Arnoldo de Hoyos, Geert Duysters, Huang Hongmei, Huang Xiaoyong, JosuTakala, Simon Haslett, Kazuya Inaba, Ma Ying, Mohammad Ali Tareq, Nguyen HuuPhuc, Paul Henry Osborne, Pang Yantao, Paulo Melo, Song Yinghua, Sergey Filippov, Tim de Leeuw, Wang Aimin, Yuko Hayashi, Zhu Wei

# CONTENTS

## Part 1

### The Application of AI Innovation in Business Innovation

Development of a System for Automatic Classification of Fake News in Portuguese Language Roger Oliveira Monteiro , Rodrigo Ramos Nogueira .....	1
The Sixth Wave of Innovation: Artificial Intelligence and The Impacts on Employment Marcelo Augusto Vieira Graglia, Patricia Giannoccaro Von Huelsen, José Arnaldo de Hoyos Guevara.....	6
Does Viral Marketing create Brand Awareness? An Exploratory Study with University Students Rafael Taino, Rafael Rodrigues Cardoso, Alexandre Luzzi Las Casas, ArnoldJose de Hoyos Guevara.....	17
Improved Genetic Algorithm for Solving TSP Li Yigao, Han Hua.....	24
How Does Leader’s Support for Eco-Innovation Promote Corporate Environmental Responsibility in Organization? Goli Yao Sidoine, Ye Jianmu, Ye Yongling.....	35
Research on the Impact of High-tech Enterprise Technology Diversification Development Strategy on Enterprise Performance Mou Jiongxu, Liu Ying.....	42
Research on the Development Trend of Global Face Recognition Industry Based on Patent Analysis Yang Fangjing.....	51
An Analysis Of The Transformation of Mega-pharma Business Model Toward the Indian Market Yaeko Mitsumori.....	61

Application of Artificial Intelligence Technology in Legal Practice	
Ma Nan.....	69
Monitoring Node Selection in Wireless Sensor Networks Based on Fuzzy Logic Scheme	
Hammad Mushtaq, Syed Nouman Ali Shah, Naveed Ahmad Faraz.....	78
Exploring the Ethics of Innovation Education in Artificial Intelligence	
Wang Xiumei.....	85
Prospect for the Development of Artificial Intelligence in the Core Business of Libraries	
Yuan Xueqing, Liu Lin.....	91
Construction and Management of MOOCs Platforms for Business English Translation Course	
Tang Lijun.....	98

## **Part 2**

### **Internet of Things, Big Data and Business Analysis**

Relationship between Big Data Analytics and Decision Making: A Cluster Analysis	
Gustavo Grander, Luciano Ferreira da Silva,Arnoldo José de Hoyos Guevara, Paulo Sérgio Gonçalves de Oliveira, Alan Tadeu de Moraes.....	106
The Influence of Digital Presentation on Consumers' Perceived Value Based on Evidence from Eye Movement Experiments	
Li Jiang, Liu Chun,Jiang Yushi.....	113
Study on Factors Affecting Continued Usage Intention of Mobile News Apps in India	
Saurabh Sharma, Cheng Yanxia, Prashant Sharma.....	133
Research on Bio-Information Risk Identification Management under Big Data Environment	
Chen Ruiying, Zhang Haili, Shen Jun.....	139
Research on Grid Management Mode Application in College Student Management in New Era	

Qu Shuaifeng.....	146
Research on the Governance of Government Network Public Opinion in the Age of Big Data	
Wang Chunjuan, Zhu Xiao.....	154
Research on the Influence of Consumer Perceived Product Innovation on Brand Evangelism	
Wang Pengtao, An Yamei.....	162
Research on Service Innovation of the Cloud Logistics Platform Based on Factor Analysis	
Wu Xia, Zhang Jianming.....	169
Performance Evaluation of Listed Commercial Banks Based on Factor Analysis	
Xiong Bin.....	177
Research on the Industrial Development Mode of “Internet plus Hunan Embroidery”: from the Perspective of Intangible Cultural Heritage Protection	
Wang Aimin, Liu Wenhua.....	186
Application of Big Data Analysis in the Innovation of Information Resources Management	
Luo Qifeng, Yang Jiaqi, Li Siqian.....	196
Separate Sections and Key Points: The Application of Big Data in Agricultural Science and Technology Information Service: Based on the Two Main Bodies of Supply Side and Demand Side	
Yang Yu, Liu Jun.....	202
Research on Agricultural Science and Technology Information Service Model and Its Problems Based on Big Data	
Li Yulin, Liu Jun, Wu Yongzhang.....	209
Research on University Library Self-built Resource Repositories in a Big Data Environment	
Sha Zhengyu.....	217
Universal Conceptual Intelligence Structure Based on Visual Intelligence for Automatic Recognition of All Objects without the Big Data	
Xu Xuetao.....	224

Study on Rural Logistics Mode Based on "Internet Plus": Taking Some Cities in Hubei Province as an Example	
Li Jue, Zeng Xueqin.....	234
Research on Operation Performance Evaluation System Construction for National Digital Publishing Bases	
Liu Yuhan, Liu Yongjian.....	245
Research on Enterprise Management System Innovation in the Era of “Internet +”	
Wang Jianguo.....	254
Research on Operation Management of Video Websites in China	
Lv Rui, Ping Yue.....	263
Foreign Experience and Reference in Operation Supervision of Sharing Bike	
Yang Jiaqing.....	270
Research on Optimal Path of Sports Variety Program Content Production Based on 4V Marketing Theory	
Sun Jinrong, Hu Xuehui.....	278
Research on the Driving Factors of Customer Loyalty: Regarding iPhone as An Example	
Deng Gang.....	285
Campus Skill Exchange APP in Smart Campus Environment	
Nie Zutian.....	292
A Study on the Corelation between the Technological Sophistication Index of imports in Producer Service Industry and Technological Innovation Ability of Manufacturing Industry	
Huang Huiping, Zhong Ruojun, ZhaoYulin.....	301
The Application of Big Data Technology in College Academic Achievement Management	
Xie Kai, Guo Fangming.....	314

### **Part 3**

#### **Safety Engineering and Risk Management**

Research on the Influence of Airport Staff Safety Risk Perception on Violation

Behavior	
Zhang Qian, Luo Fan.....	320
Media Reporting Strategies for Public Opinion Risk Management Based on Emergency---A Case of the Sinking Incident of Oriental Star Ship	
Zhang Wuqiao.....	327
A Stock Price Movement Prediction Model Based on Artificial Neural Networks	
Uzapi Hange, Siyanda Andrew Xaba.....	335
Study on Shutdown Time of Enterprises under Flood Disaster Scenario: A Case of Yuyao Companies after Typhoon Fitow	
Yang Lijiao, Ding Xiaonan, Jiang Xinyu.....	341
Study on the Credit Customer Default of Local Commercial Bank in Southern Jiangsu Province Based on Logistic Model	
Zhang Haoru, Fang Ming.....	351
Research on Innovation Performance of High-Tech Enterprises from the Perspective of Venture Capital	
Ye Xiaofen, Cheng Liang.....	357
Study on Employee Relationship Risk on the Effectiveness of Enterprise Structure Change in Cote d'Ivoire	
Monhéséa Obrey Patrick Bah, Akadje jean Roland Edjoukou.....	365
Research on Early-warning and Control Strategies for Risk Conduction of Enterprise Financial Management System	
Deng Xun, Deng Mingran.....	374
Risk Analysis and Control of Business Mode Transformation in HD Company	
Yin Limei.....	383
Theoretical Analysis and Practical Exploration of the Prevention and Control Management of Integrity Risk in Universities	
Yan Yan.....	390
Risk Analysis of Ships Navigation Safety in Wuhan Port	
Mao Senpeng, Jiang Feifei.....	399
Research on Risk Factors of Enterprise Product Innovation Design	
Deng Jun.....	406

Internet Financial Risk Early Warning Based on Fuzzy Analytic Hierarchy Process	
Yang Yuxin.....	415
Research on Network Security Evaluation of Big Data Center Based on Rough Set	
Liu Bin.....	432
Analysis of the Project Management of EPC Project General Contracting	
Pei Linyu, Xu Dongming.....	438
Evaluation of the Influencing Factors of PPP Contract Performance in Urban	
Underground Integrated Pipe Gallery Based on Grey Relation-TOPSIS Method	
Wu Yifan, Fang Jun.....	445
Risk Assessment for College Students' Sudden Death Based on AHP	
Huang Tingting, Xia Jiajia(455)	
Research on Network Culture Security Management in Universities from Network	
Public Opinion	
Li Huiyuan, Zhang Yan.....	461

## **Part 4**

### **Environmental Innovation and Sustainable Development**

Is the Importance of Sustainable Development Goals Universal Across Development	
Stage of Economies	
Yuko Hayashi, Frans Stel.....	469
Cash Crop Innovation System and Networks: Findings from Smallholder Cocoa	
Farmers in Ghana	
Patience Pokuaa Gambrah, Yu Qian.....	480
Application of Entropy Based TOPSIS in Analysis of Sustainability Performance of	
Sri Lankan Hotels	
P.R. Weerathunga, Cheng Xiaofang, WHMSS amarathunga,	
KMMCB Kulathunga.....	486
Historical Heritage and Sustainable Urban Development: Challenges imposed on	
owners and managers of listed historical buildings in the city of São Paulo	
Arnoldo Jose de Hoyos Guevara, Fernanda Cardoso Romão Freitas,	

Fabiane Domingues de Magalhães de Almeida, Alcides Garcia Junior.....	493
Research on Innovation Performance Analysis of Financial Policy: from the Perspective of Technology-based SMEs	
Wan Guochao, Zhang Lingzi, Tang Ling.....	504
Prediction Model of Energy Development Trend Based on SVM	
Lin Hui.....	515
A Ranking for the Sustainable Development Goals Focusing on the 5Ps	
Arnoldo de Hoyos Guevara, Agris L. Dumpe.....	522
A Ranking of Countries concerning Progress towards a Society 5.0	
Arnoldo José de Hoyos Guevara, Daniela Mary Terra, Jerônimo Henrique Ports, José Luiz Alves da Silva, Kallita Ester Magalhães.....	528
Effect of Environmental Regulation on Corporate Financial Performance: Mediating Role of Green Technological Innovation	
Chen Xiaofang, Tong Xiaohong, Xia Wenlei, Chen Xin.....	537
Awareness of the Worth of Life Within/Without for Systemic Resilience under Climate Change Disasters: The Amazon Bioma and the Gender-Differentiated Vulnerability	
Arnoldo José de Hoyos Guevera, Daniela Gasperin, Christine Syrgiannis, Anastasia Zabaniotou, Ivani Fazenda.....	546
Research on Evaluation of Industrial Sustainable Development Ability in China: Based on Dynamic Entropy Weight and DEA Mode	
Chen Mengxue, Zou Wei.....	555
Corporate Social Responsibility: A Multiple Case Study of the Civil Construction Industry in the State of Bahia, Brazil	
Paulo Melo, Manoel Joaquim F. de Barros, Arnoldo José de Hoyos Guevara, Edson Jorge M. De Sousa.....	563
Study on the Driving of Energy Saving and Emission Reduction to the Transformation of Resource-based Cities	
Chen Qiang, OuYang Xiao.....	574
Research on the Relationship between R&D Coupling Coordination and Upgrading of Equipment Manufacturing Industry: An Empirical Study of Shandong Province	

Li Xue, Hou Jie, Gao Pengbin.....	582
Employment Efficiency Evaluation of Innovation and Entrepreneurship Policy in China	
Zhu Hua.....	589
Study on the Evaluation of Industrial Innovation Capacity in Hubei Province	
Song Weiwei, Zou Wei.....	598
An Empirical Study on the Effect of Innovation on Employment from the Industry Level Perspective: A Case of China	
Allaberdiyev Guychmyrat, Wei Long.....	607
A Study on Environmental Uncertainty, Internal Control and Earnings Management	
Yang Yu.....	616
Research on the Effect of Inbound and Outbound Open Innovation on Firm Innovation Performance	
Hou Jie, Li Xue, Gao Pengbin(624)	
.A Study on the Relationship between Servitization of Manufacturing Industry and Enterprise Performance: Based on the Perspective of Life Cycle	
Zhu Zhangli, Fang Ming.....	631
The Innovation and Management of China’s Urban Brand Image under Experience Service Economy	
Li Huipeng, Zhang Yazhou.....	640

## Part 5

### Operation Management, Supply Chain Management and Transportation Management Innovation

House of Quality-Based Analysis of Green Supply Chain Management for the Sustainable Investment Decisions with Interval Type 2 Fuzzy Hybrid Model	
Luis Martínez, Hasan Dinçer, Serhat Yüksel.....	646
Tourist Forecasting Model of Short Holiday Based on Network Data: A Case Study of Mount Emei Scenic Area	
Ma Zhao Feng, Huang Ping, Guo Chuangle, Abdoulaye Boiro,	

Wen Zhili, Zhan Fei, Yin Zizhong.....	656
Influencing Mechanism of Business Mode Innovation Risk in Business Groups	
Mo Guoyong, Liang Benbu.....	664
Dual Pre-Strategy Analysis of Clothing E-Commerce Reverse Logistics for Small and Medium-Sized Enterprises	
Li Tianbiao, ShenJingye, Wei Qian, Zhang Yao, Dai Jinshan.....	671
Research on Optimization and Collaboration of Cross-border E-commerce Logistics Supply Chain	
Wang Aimin, Ji Tingting, Zhong Qianru.....	680
Regional Difference Analysis of Logistics Industry Service Innovation Capability in Hubei Province of China: Based on Porter's "Diamond Model"	
Lv Yuejiao,Liu Mingfei.....	687
Research on the Innovation Operation Mode of Science and Technology Business Incubator and its Influence on Innovation Economy	
Han Wensi, Xie Jialong.....	695
Management and Operation of Trace Evidence Laboratory under the CNAS Review System	
Lv Caihong, Liu Guomin ,Fang De.....	705
Study on Simulation and Optimization of Container Truck Path in Multi-quayside Crane Cooperation Mode	
Ye Yani, Ding Tao,Xiang Shengbin.....	712
Simulation Research of AGV Configuration Optimization in Automated Container Terminal	
Chen Ning, Tao Hui.....	722
Supplier Relationship Quality and Supply Chain Performance in Engineering Enterprises: The Regulating Role of Cooperation Vision	
Yin Long, Liu Mingfei.....	730
Business Mode Innovation Based on Iceberg Theory	
Yu Xiaoyu, Zheng Zhan.....	740
Research on B2C E-commerce Enterprise Logistics Mode Selection Based on Analytic Hierarchy Process: Taking Jingdong Mall as an Example	

Feng Lei.....	748
Synergetic Effect of Supply Chain in the Construction Industry	
Chen Huilin.....	756

## Part 6

### Human Resources and Organizational Behavior

Sick Organizational Culture: Leadership that Makes People Sick	
Alan Tadeu de Moraes, Luciano Ferreira da Silva,Arnoldo José de Hoyos Guevara, Gustavo Grander, Diego de Melo Conti.....	765
The Effect of Work-Family Enrichment on Employees’ Task Performance: The Mediate-Moderate Effect of Work Satisfaction and Social Support	
Li Guiqing, Wang Minxia, Du Wanyan, Ji Pei .....	769
Gamification Results in Training and Development Processes	
Siméia de Azevedo Santos, Leonardo Nelmi Trevisan1, Elza Fatima Rosa Veloso, Arnoldo de Hoyos Guevara.....	781
Research on the Influence Mechanism of Transformational Leadership on Enterprise Innovation Performance	
Na Risu, Cui Hainan, Zhang Di.....	797
Impact of Emotions on Conflict Management Styles	
Qamaruddin Maitlo, Farhan Aslam, Khaliq Ur Rehman.....	804
Review of Narcissistic Leadership Research	
Wan Wei, Li Mingze, Yang Mengxi.....	809
Creativity in the Design Process: SNA of Fit Perceptions and Satisfaction among Tertiary Students in Ghana	
Fortune Ama Amegah, Patience Pokuaa Gambrah,Isaac Kuma Yeboah.....	814
An Analysis and Solution Research of the Voluntary Unemployment of College Graduates from the Perspective of Employability	
Han Fang.....	819
Research on the Influence of Salesperson’s Characteristics on Customer Truse	
Sun Wei, Pan Jieyun, Zhang Jiajia.....	826
Research Prospect of Children's Education Network Platform from the Perspective of Organizational Behavior	

Chang Yuming.....	836
Research on the Influence of College Students' Entrepreneurial Team Heterogeneity on Innovation Performance: Taking Team Cohesion as Moderator Variable	
Zhou Yu, Hu Yan.....	843
An Analysis on the Management Mode of Universities' Target Responsibility System	
Ding Huifang.....	851
The Influence of Teacher Support on the Positive Behavior of College Students	
Duan Zhaolin.....	859
The Influence of Differential Leadership on the Innovation Behavior of Platform-based Enterprises Employees	
Yang Kun,Gui Ping, Xie Tong.....	866
Personality Traits of Risk-learning Serial Entrepreneur	
Cao Qian.....	875
Research on the Effect of Human Capital on the Producer Service Industry	
ZouWei, Liu Changjian.....	887
Research on Ecological Niche Optimization of College Students' Ideological and Political Education	
Wang Wenhui1, Sun Xu.....	895
Institutional Transformation of Public Institutions to Enterprises	
Xian Lei, Wu Xiaoyan.....	903
Influencing Mechanisms of Responsible Leadership towards Employees' Voluntary Green Behavior: A Multi-theory Perspective	
Ma Ying, Naveed Ahmad Faraz, Cheng Yanxia, Hammad Mushtaq, Ali Raza...910	
Research on the Relationship between Work Stress, Psychological Capital and Turnover Intention of Frontline Service Personnel	
Xiao Shuzhen, Qin Yuanjian.....	917
Research about Precision Incubation Model of Innovation and Entrepreneurship Based on the Incubation Network	
Wen Ge, Xia Yongmei, Huang Yangbo, Han Yu.....	926
Curve Impact of Knowledge Heterogeneity on Team Creativity: The Moderating	

Effect of Internal Social Capital	
Dai Wanliang, Lu Wenling, Su Lin.....	935
Impact of Employee’s Resilience on Organizational Resilience: Mediating Role of Compassion	
Khaliq Ur Rehman,Farhan Aslam,Qamar Uddin Maitlo.....	945
Study on Employee Reward System Satisfaction and the Impact on Their Sustainable Behavior: A Case of High Learning Institution Employees in Tanzania	
Jacob Julius Rombo, Luo Fan, Monhesea Obrey Patrick Bah.....	953
Homesickness and Proactive behavior: Collectivist Human Resource Management Practices as a Cross-Level Moderato	
Zheng Weili.....	962
Research on Relationship Marketing Framework and Implementation Path of Railway Freight Oriented by Customer Value	
Xu Fengwei, Zhang Zhenfang.....	971
A Study on Enterprise Life Cycle, Executive Compensation and Earnings Management	
Du .Wanxin.....	979
Organization and Human Resource Transformation Based on Three-Pillar Theory	
Du Ya.....	988
Research on the Cultivation Status and Measures of Innovative Talents of Marketing Major	
Ma Ying, Chen Long.....	996

## **Part 7**

### **Systems Engineering, Financial Engineering, Design Engineering and Industrial Engineering**

Evolutionary Game Analysis on Credit Behavior of Three Parties in Logistics Finance	
Xu Fengwei, Zhang Zhenfang, Yu Bowen.....	1006
An Integrated BWM and MOORA Method for Engineering Quality Evaluation in Project Managemen	
Gang Jun, Tu Yan, Wei Ying.....	1013

The Impact of China's Monetary Policy on Bank Risk-Taking Feng Rui, Xie Xiaoping, Chen Yuchun	1023
Research and Design of University Student Honor System Based on Information System Lv Zuheng, Wang Jinsong, Dou Zihan	1032
Assessing Land Use and Cover Change Effects on Vegetation in Ghana from 2002 to 2018: a Case Study of New Juaben Municipality Isaac Kuma Yeboah, Emmanuel Yeboah, Emmanuel Kojo Gyamfi, Henrritta Suapim	1039
Research on Governance Effect of Equity Structure: The Perspective of Mixed Ownership Reform in State-owned Enterprises Deng de Yu, Hong Hong, Xiang Shouren	1047
A Study on Earnings Management, Analyst Forecasts and Equity Liquidity Fu Keke	1059
Does Cost Stickiness Affect a Company's Financial Risk Li Yiwen	1067
The Feasibility Analysis of Popularizing Prefabricated Buildings in the Project of College Student Dormitory Zheng Feng	1075
Optimization Design of Wuhan Riverside Landscape Regulatory Plan Peng Yuha	1084
The Analysis of Effectiveness of Cost Control Strategy on the Profitability of Coca-Cola Company from 2015 to 2017 Xiao Zhiqi, Zhang Jingxian	1091

## **Part 8**

### **Intellectual Property, Knowledge Management, Industry-University-Research Cooperation and Strategic Alliance**

Competency Management, Knowledge Management and Corporative Education: A Study on Brazilian Companies Fernando José Lopes, Vivian Gava Malta de Abreu, Roberto Shizuo Kumasaka, Alessandro Marco Rosini, Arnaldo José de Hoyos Guevara	1099
---	------

Research on Development Tendency of Chinese Automobile Industry from the Perspective of International Industrial Chain	
Gu Zhiqiang,Wang Chaoyang.....	1108
A Research on The Innovation Performance of Agricultural Science and Technology Achievements Transformation in Sichuan	
Tang Ling, Wan Guochao.....	1126
Six-Element Mode of International Science and Technology Cooperation in China	
Mei Yanlan,Xie Kefan.....	1138
Research on the Development of Compound Fertilizer Industry Based on Patent Analysis	
Liu Li.....	1145
Research on the Improvement of Mental Health Education Ability of College Counselors Based on Knowledge Management Process	
Zhu Xi.....	1154
Survey on Research-University-Industry-Based MTI Education and Suggestions on Its Sustainable Development	
Yu Yanling, Ao Xinyue, Wang Danni, Zhao Jian.....	1166
Optimization of transformation path based on conversion rate analysis of scientific and technological achievements	
Ma Yinbo, Lu Jing.....	1173
Language Management on Language Choice of Chinese Singaporeans: Balance between Ethnic Identity and Utilitarian Value?	
Wang Jue, Chen Long.....	1186
A Case Study of Chinese Students' Attitudes towards Flipped Classrooms	
Tang Xiaofei.....	1195
The Impact of CBI on Non-English Majors' Critical Thinking Skills	
Wan Zi.....	1206
Research on the Influence of Five-chain Coordination on Regional Innovation Capability	
Teng Liangwen, Zhou Jiang, Chang Yuming.....	1214
Research on Evaluation System of Biological and New Medicine Technology	

Achievements from the Perspective of Technology Transfer	
Yan Jingdong, Li Fangting, Feng Cao.....	1224
Analysis on the Management Mode of University Library Makerspace	
Xu Fang, Su Hua, Liu Qin.....	1235
Characteristics of R&D Teams and Innovation Performance under Different Innovation Strategies: The Mediating Effects of Organizational Climate in Joint Ventures	
Li Shunjun, Peng Huatao.....	1243
Innovative Construction of Blended Teaching Patterns of College English Online Open Courses in the New Age	
Feng Yali, Han Yue.....	1258
The Practice and Innovation of Task-Base Language Teaching	
Lu Xiaoli , Ke Jianhua.....	1265

## **Part 9**

### **Investment, Corporate Finance and Corporate Governance**

Financial Literacy and SMEs Performances; Mediating Role of Risk Attitude	
Kulathunga KMMCB, Ye Jianmu, Weerathunga P.R.....	1273
Information Disclosure, Executive Compensation Incentive and Analysts' Earnings Forecast Errors	
Chen Yu, Zhang Youtang.....	1284
Media attention to the Impact of Earnings Management on Listed Companies	
Ji Yayuan.....	1301
Replacing China's Business Tax with Value-Added Tax Reform and Cost Stickiness: Evidence from the Service Industry Firms	
Hui Lili, Xie Huobao, Liu Xiaoning.....	1310
Evaluation and Analysis of Enterprise Investment Activities Based on Financial Quality Perspective: Taking Haier as an Example	
Xu Shiying, Li Xinjie, Luo Xuan.....	1328
Comprehensive Financial Evaluation of Listed Biomedical Companies Based on	

Factor Analysis and Cluster Analysis	
Huang Ziyu.....	1340
Empirical Research on Corporate Social Responsibility and TaxRadical: Independent Directors as Adjustment Variables	
Li Zhouliang, Yu Shuang, Zhou Guoqiang.....	1349
Research on Information Disclosure Behavior of Listed Companies: Taking *ST Olefin Carbon as An Example	
Zhu Hanlin, Wan Youqing.....	1357
A Study on Foreign Direct investment and Economic Growth in China: The Role of Human Capital Development	
Zhang Yuling, Wu Zihao, Brima Sesay.....	1372
Empirical Research on Financial Capability of Listed Companies in Northwest Five Provinces in China Under the Background of “One Belt and One Road” Strategy	
Song Tianqi, Liang Shanshan.....	1379
A Study on the Influencing Factors of Financial Leverage: Taking Real Estate Industry as a Sample	
Shen Jialu.....	1391
A Study on The Impact of Accounting Conservatism on Corporate Debt Financing Cost from the Perspective of Environmental Uncertainty	
Li Jiaying, Hong Hong.....	1400
A Study on Carbon Accounting Information Disclosure of Listed Companies in China's Steel Industry	
Ma Huizhi, Tang Miao.....	1411
A Study on the Influence of Interest Rate Liberalization on Enterprise Investment Efficiency: Based on the Nature of Property	
Dong Xueqin, Zhang Youtang.....	1422
A Research on the Contributing Factors of Cash Dividend Policy in Chinese Listed Companies	
Huang Ziying.....	1432
Media Coverage, Political Connections and Corporate Risk	
Zhou Yi, Zhang Youtang.....	1444
A Study on Public Demand and Optimization Strategies for University Libraries Based on Big Data from Search Index	
Liu Nan.....	1461

Moderating Effect of Ratio of Independent Director on the Relation between Managerial Overconfidence and Enterprise Value	
Dai Fei, Li Yan.....	1468
A Study on Strategic Change of Business Group Based on AHP: SWOT Method	
Kang Liwen, Xu Xusong.....	1477
A Novel Urban Traffic Tunnel Flooding Control Solution: Liquid Air Spray/Vaporization Based Icing and Natural De-Icing	
Tang Li, Zhang Cunquan.....	1487
Application of Scem-Ua Algorithm in Financial Modeling Analysis	
Chen Yubing.....	1500

## **Part 10**

### **Miscellaneous**

Study on the Public Service Satisfaction Perception Structure and Its Differentials: Based on the Research Data from Tourism City of Guilin ASC, China	
Zhang Rui, Wu Zhongjun, Yu Bo, Ning Yongli.....	1506
Evaluation Theory of the Core Competence of Art Design Industry Based on “Four-Three Structure” Model	
Wang Jun, Zhao Yiran, Yang Zhixuan.....	1520
Thematic Selection and Distribution in Management Academic English Writing	
Xiao Xianming.....	1527
Evaluation of Wushu Tourism Synergic Development Based on Fuzzy Hierarchy Analysis	
Yang Wei, Yi Peng.....	1536
A Research on Innovative Teaching Practice: A Net-based Case Study of Culture and Translation Course	
Yang Jing, Wang Aijun*, Li Lahua.....	1545
College Students’ Social Entrepreneurship: Status Quo, Determining Factors and Training Channels	
Xiang Yongkun.....	1553
Study on Ideal and Faith Education Effectiveness of University Student Backbone Team Based on	

Attitude Theory	
Wang Xiao.....	1563
James Joyce’s Araby in Interarts Perspective of Chinese Classical Art Theories	
Hu Min.....	1571
Original Family: An Analysis of the Key Factors Influencing the Ideological and Moral Education of Adolescents	
Cheng Gaojie.....	1578
China Standards "Going Out" Strategy to Improve the International Discourse Power of Chinese Enterprises: Take Infrastructure Construction as An Example	
Mao Shisi, Chen Shu.....	1586
Analysis on the Mode of Medical Care and Pension Support in Rural Areas Based on “Healthy China”	
Wu Qian, Qiu Yinggui.....	1594
Impulse Response Analysis of Collaborative Performance to Synergy Degree in Comprehensive Design	
Fang Jun, Wu Dingyuan, Zai Yue.....	1601
Learning English and Learning about English: Some Thinking on Non-English Major Graduate English Teaching	
Wu Lan.....	1618
Research on Service Level Improvement Strategy of Basic Nursing Management in College Hospitals based on PDCA Cycle	
Yu Wen.....	1627
Study on the College French Teachers’ TPACK Level and the Influence Factors under the Background of "Internet + Education": Taking Wuhan Universities as the Example	
Bai Yanyuan.....	1633
A Case Study on the Exhibit Ability of Popular Music in Museums	
Lv Qingtian.....	1642
Analysis on the Reports of French Media on People-to-People Exchanges between China and France	
Zhang Rui.....	1648
Research on User's Requirement of Game Handle Products Based on KANO Model	
Li Qiong, XuWei.....	1656
Research on the Advantages of University Online Courses Based on “Super Star Learning platform”	

Zhan Wei.....	1664
Investigation and Research on Community Property Management: Take a Certain District in Wuhan as an Example	
Wei Minghua.....	1671
Research on the Entrepreneurship Intentions for Undergraduates in the background of “Mass Entrepreneurship and Innovation”	
Liu Jia,Li Kai.....	1686

**Abstract:** With the rapid advancement of technology and easy access and dissemination of information, the term fake news has gained commanding attention, and research in several areas has been developed. This paper introduces the use of machine learning methods to discover, classify and store fake news texts for later ETL application of a Data Warehouse and a query environment that will contribute to future research. For this, a dataset was created and the Logistic Regression, Naive Bayes and SVM methods were evaluated. Finalizing the work with the selection of the best method that was inserted in an automatic classification system of fake news.

**Key words:** Machine learning; Text mining; Web mining; Fake detection; News mining

### 1 Introduction

In 1990, Tim Bernes-Lee created the well-known WWW (Tim, 2001), which allowed the manipulation of the graphical interface guaranteeing its expansion in the following years through the emergence and development of browsers, access providers and various portals of services.

According to a report by the International Telecommunication Union (ITU), a member of the UN, in 2018, the percentage of people connected to the Internet exceeded 3.9 billion people, representing 51.9% of the world population.

Brazil's 2018 data show that the percentage of people over 10 years old connected online in Brazil rose from 64.7% to 69.8% from the end of 2016 to the end of 2017. As a result, there was an increase of almost 10 million users within one year.

At the beginning of the twenty-first century there emerged an enormous tendency that follow until the present day: the use of social networks. More and more people are connected to each other through these platforms. Currently we have as examples of great cases of success of social networks: Facebook, Instagram, WhatsApp and Twitter. According to the Statistician Facebook had 608 thousand people connected at the end of 2010. At the beginning of 2019, the number of users reached 2,375 million, as shown in the chart below:

**Figure 1 Facebook Users**

Since the beginning of the Web, the volume of data that is in the repositories in the world network has grown exponentially, there are currently about 200 million active websites on the Internet, of which only the social network Twitter generates, on average, 500 million of posts per day. Such an explosion of data led to a study by the IDC (Institute Data Corporation) that estimates in the year 2020 we will

have 44 data zettabytes generated in worldwide (IDC. Gantz, J., & Reinsel, D. (2012), 2007).

In the different niches of social networks that have emerged, different ways of writing critiques, propitiated by the characteristics of the applications, have been observed. Specific sites, such as movie reviews, allow users to write relatively long texts. Microblogs, on the other hand, impose limits on the amount of message characters and are not exclusively intended for critical publishing. In the process of discovery and research that continued in social networks, the need to express opinions more directly arose (Von Lochter, J., 2015).

New sites are the third largest vehicle of information accessed by the Internet, second only to messaging applications and social networks. This information reflects the importance of using news sites and their impact on people's daily lives (Nogueira, R. R., 2017). Along with the importance of news stories and their sharing in social networks, comes the rise and spread of fake news. Since the middle of 2017, the number of events and debates about this phenomenon that has been called fake news has grown so. Fake news can be defined as news articles that are intentionally and verbatim fake and can fool readers. In this definition of fake news includes intentionally fabricated news articles, such as a widely shared article from the now defunct website denverguardian.com with the headline "FBI agent suspected in Hillary email leaks found dead in apparent murder-suicide" Hillary's e-mail leak found dead in apparent murder-suicide) (Delmazo, Caroline; VALENTE, Jonas CL., 2018).

Faced with the ease with which anyone can now access information, and with the ease of its use, we experience an era of great advances and solutions, followed by even greater problems, such as fake news. Because of its attractive nature, fake news spread rapidly, influencing people's behavior on a wide range of subjects, ranging from healthy issues (e.g. revealing miracle drugs) to politics and economics (as in the recent Cambridge Analytica scandal / Facebook and Brexit situation) (MONTEIRO, Rafael A.; SANTOS, Roney L. S.; PARDO, Thiago A. S.; ALMEIDA, Tiago A. de; RUIZ, Evandro E. S.; VALE, Oto A., 2018). Given its prominence, several multidisciplinary studies on the subject have been carried out. Aiming to contribute to such researches, this paper aims to couple to the ETL (Extract, Transform, Load) of a News Data Warehouse the semantic enrichment through classification of the type of news: real or false.

## 2 Related Works

About fake news and the application of Machine Learning, (GRUPPI, Maurício; HORNE, Benjamin D.; ADALI, Sibel., 2018.) constructed a dataset with news, in Portuguese and English, aiming to construct a classifier to predict whether the news source is reliable. Using an SVM algorithm with a linear kernel, it was possible to establish the most important characteristics as well as their classification. As a result, the classification algorithm obtained an accuracy of 85% for Brazilian datasets and 72% for American datasets. In a contribution to the news classification area, (MONTEIRO, Rafael A.; SANTOS, Roney L. S.; PARDO, Thiago A. S.; ALMEIDA, Tiago A. de; RUIZ, Evandro E. S.; VALE, Oto A., 2018) use the dataset Fake.br with the objective of evaluating the main methods of preprocessing texts to evaluate the performance of the SVM method. The best results were obtained with the combination of bag-of-words with feelings, as well as the use of all attributes, both with accuracy of 90%.

On your work, (MARUMO, Fabiano Shiiti, 2018) has collected news from truthful news sites and websites with fake news and / or satirical news, in order to find the best method for detecting fake news. As part of the pre-processing of the data, we used the Gensim framework to remove non-alphabetic characters, substitute spacing and line breaks for single spaces, remove words shorter than 3 characters, and convert capital letters to lowercase letters. The keras framework for data tokenization was also used. With the application of the classification algorithms LSTM and SVM, an accuracy was obtained above 90%.

Overfitting is a major problem in the case of a textual database. Therefore, FENG (Feng Xiaoyue; Liang Yanchun; Shi Xiaohu; Xu Dong; Wang Xu; Guan Renchu, 2017), used the algorithm AdaBoost, known to obtain great success for reduction of overfitting in face detection, character recognition (OCR) and vehicle classification. In his experiments, we used datasets from 20 newsgroups, Reuters dataset, which consists of 22 files with a total of 21,758 documents, and a BioMed dataset, which is divided into 10 topics, each containing between 1966 and 5022 news articles. The results were an average of 86% accuracy in the AdaBoost algorithm (Bonzaiboost).

## 3 System Architecture

After searching for a database with fake news, we found that there are few resources available in

the Portuguese language, in which the most used dataset is Fake.br (MONTEIRO, Rafael A.; SANTOS, Roney L. S.; PARDO, Thiago A. S.; ALMEIDA, Tiago A. de; RUIZ, Evandro E. S.; VALE, Oto A., 2018). This present proposal aims to provide an environment with consistent and clean data in the form of a multidimensional corpus for consumption by external applications and users. The multidimensional corpus is a set of texts stored according to a multidimensional model, which allows to explore the multidimensionality in different levels of abstraction: time, category of news, type (true or fake news).

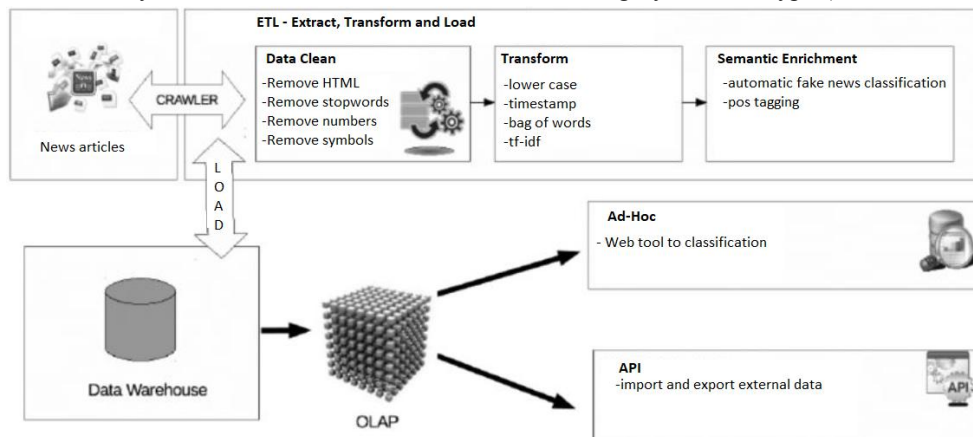

Figure 2 System Architecture

To perform the experiments, we developed a web crawler using a python language (MITCHELL, Ryan, 2018.). Including a library, beautiful soup for an initial data collection. A set of data was constructed by 1744 titles and fake corporations collected from the sites <boatos.org> and <g1.globo.com/fato-ou-fake>, and 3185 titles and body of real news collected from the site brasil.elpais.com. Initially will be tested the tests applied only to news, afternoon and body titles with the title and make a comparison between both. For this, the algorithms of machine learning, Logistic Regression, AdaBoost, Naive Bayes and SVM are used.

From the creation of a collection system, with an algorithm coupled to the ETL step, it will automatically classify the collected data, thus increasing the accuracy of the classifier, and generating a larger data base for future work to combat fake news. Also, a web interface was built, where the user will be able to submit a link and verify if this is true news, serving as a prototype before being submitted to ETL stage (this being the general purpose of this work).

#### 4 Results and Discussions

The data obtained received treatment of null values, noise (special characters such as commas, periods, parentheses, etc.) and transformation to lowercase letters. Each dataset received a new column, called label, where Boolean value 0 was given for true news, and 1 for fake news. With this, the data was combined into a single dataset. Initially, the dataset used only contained the news headlines, being then divided between training and test, in the proportion of 75% and 25% respectively.

The first portion serves to train the algorithm, while the second, to verify the accuracy of the algorithm. Afterwards, they received tokenization treatment, using the NLTK package, with the bag of words in Brazilian Portuguese. Tests performed using the algorithms Logistic Regression, AdaBoost, Naive Bayes and SVM (linear kernel), obtained the accuracy of 88.85%, 81.37%, 86.22% and 87.45%, respectively, in the model of tests. As a technique for evaluating the models used, cross-validation was used with the k-fold = 10 method.

Again, the dataset was divided between training and test, joining now the headings to the news body. They received the same treatment mentioned above, obtaining the accuracy of 90.88%, 84.23%, 91.19% and 91.16% in the Logistic Regression, AdaBoost, Naive Bayes and SVM algorithms, respectively. The application of the cross-validation method revealed an overfitting in some cases. Finally, the dataset was broken down to use only the news bodies.

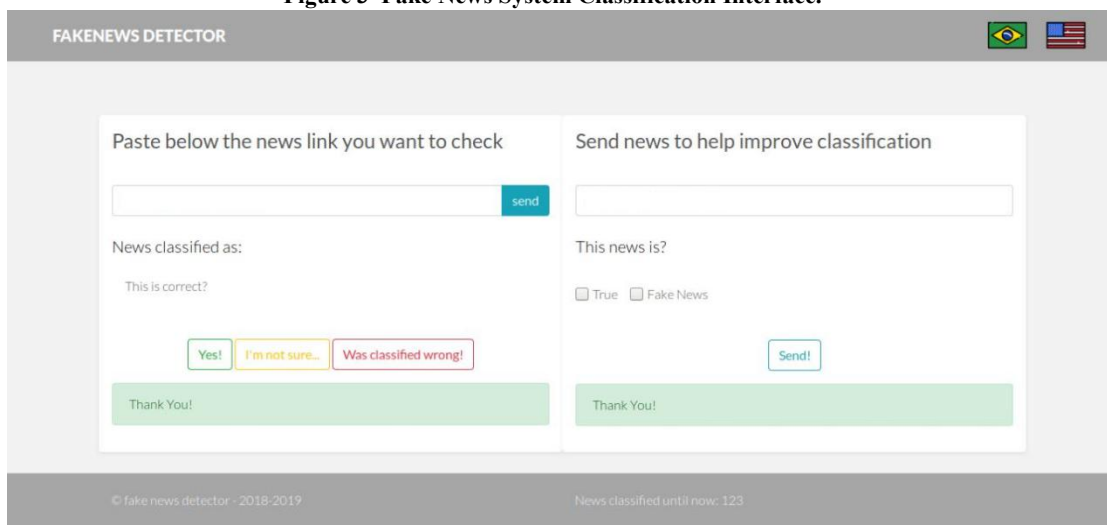

The same methods used previously were used in relation to the treatment and cleaning of the data. The application of the algorithms resulted in 90.88%, 94.23%, 91.19% and 91.16% accuracy in the algorithms Logistic Regression, AdaBoost, Naive Bayes and SVM respectively.

**Table 1 Experiments Results**

	Regressão Logística	AdaBoost	Naive Bayes	SVM(kernel Linear)
Titulo	88,85%	81,37%	86,22%	87,45%
K-fold	0,88	0,75	0,86	0,55
Corpo	97,40%	95,12%	97,80%	98,62%
K-fold	0,97	0,95	0,97	0,64
Titulo+Corpo	90,88%	84,23%	91,19%	91,16%
K-fold	0,90	0,84	0,91	0,54

From the results analysis, the Naive Bayes method was selected as the best method, due to its high accuracy, complemented by being an incremental learning method (online). After the coupling, the fake news classification interface was developed, the Figure 2 shows the system interface and is available on the server <https://detectorfakenews.herokuapp.com/>. The tool expects as a parameter the link of a news site, and returns whether or not it is a fake news (fake news).

**Figure 3 Fake News System Classification Interface.**

## 5 Conclusion

Fake news has existed since the beginning of human civilization and has always generated problems in our society. This fake news spread slower in the past, today we have the Internet that makes it easier to share this news to the world in less than a minute. This news causes a great evil to our society, generating deaths and traumas.

People are accused of crimes they never committed. There are innumerable cases of people being charged without having committed at least one crime, and in many cases these charges have been made without any basis, thus making the victims of such charges innocent. These false accusations can end up causing damage, aggression, trauma, death and even suicide. People also fail to take vaccines and make medical treatment, in addition to the policy.

In this paper we developed a system for automatic classification of fake news, which obtained a result of 97% efficiency. It still becomes necessary to test with larger databases, as well as to put the system to be validated in the real world.

Overfitting is a recurring problem on a textual basis. Some algorithms have achieved very relevant results, but when we applied cross-validation with  $k = 10$ , we noticed a large overfitting in some cases. Thus, it was observed that the Naive Bayes algorithm obtained besides the high accuracy, tolerance to overfitting.

## **The Sixth Wave of Innovation: Artificial Intelligence and The Impacts on Employment**

Marcelo Augusto Vieira Graglia, Patricia Giannoccaro Von Huelsen, José Arnaldo de Hoyos Guevara  
Pontifical Catholic University of Sao Paulo, Brazil  
(E-mail: mgraglia@pucsp.br, phuelsen@pucsp.br, arnoldodehoyos@yahoo.com.br)

**Abstract:** The beginning of the 21st century presents a scenario of profound transformations for human society. Technological innovations will enable significant advances in various areas and aspects of human society, such as health and longevity, energy efficiency and urban mobility. There will be economic prosperity within the logic of the process of creative destruction, with products and businesses being replaced by others. The sixth wave of technological innovation probably has severely impact the logic of interaction between technology, society and work. The new wave of innovation, based on digital and intelligence technologies that combine with information and communication technologies born in the second half of the 20th century, presents specific characteristics that differentiate it structurally from previous waves, such as high propagation velocity and maturation of technological innovations, convergence between several disruptive technologies and with high potential for the replacement of human labor.

**Key words:** Artificial intelligence; Industry 4.0; Technological innovation; Labor and employment

### **1 Introduction**

The development of technology throughout the history of mankind has generated significant advances and its benefits are absolutely tangible, relevant and intrinsically linked to the own civilizational development (Castells, 2006). Already in the field of human work, the fear of the potentially destructive effects of technology on jobs is symbolically represented by the Luddism movement in England in the early nineteenth century, where groups of workers used the destruction of machines as a means of pressing the employers against the precarious conditions to which they were subjected: exhaustive days, unhealthy working environments and low salaries. It was a historical period marked by economic turbulence, mass unemployment and hunger, in a scenario that was aggravated by the introduction of machines that caused layoffs and replaced more qualified and better remunerated functions by others with few technical demands and worse remunerated, generating conflicts between small producers (Robsbawm, 1952).

The emergence of a new technological revolution rekindles controversy with debates between opposing visions: those that envision a bright future, where technology releases humanity from the obligation of hard, repetitive and discouraging work, eliminates diseases, promotes longevity, comfort, allows new playful and sensory possibilities brought about by digital devices and environments and where older workers can work more and healthier - which would be a strategic possibility in the current demographic context, where several countries are facing a reduction of their workforce due to the aging and their deleterious effects on their economies (Vogler-Ludwig, Düll, & Kriechel, 2016). In an antagonistic position, those who fear the potentially harmful consequences of the intense proliferation of technology by sensitive fields of human society, such as work, genetic medicine, control over information and reckless application in the military field. There is also a risk of the dehumanization of relations and human consciousness in a cybernetic post-humanism scenario (Fukuyama, 2002). Although computerization has historically been confined to routine tasks involving activities based on explicit rules, artificial intelligence and big data algorithms are now rapidly entering into patterns-dependent domains and can readily replace work in a wide range of cognitive tasks not routine. Adding to this, advanced robots are gaining enhanced senses and dexterity, which allows them to perform a wide variety of manual tasks. This will likely change the nature of work in companies and professions (Brynjolfsson & McAfee, 2011). Some changes are already perceived: advances in user interfaces, for example, already allow computers to respond more efficiently to customer requests, reducing the need for human intervention in some service and service activities. With the expansion of computer capacity, tasks that were once considered too complex to be coded are being converted into well-defined problems treatable through digital solutions (Osborne & Frey, 2014). New high-performance applications in speech recognition and word processing allow simultaneous interpretation, automatic creation of complex standard texts, as well as analysis of large volumes of text for legal purposes. In medicine, intelligent image recognition software can significantly improve the diagnosis of many

diseases and generate increased productive capacity for physicians and affect the class of general practitioners. In the area of health care, interactive systems are being tested that can promote the psychological and emotional well-being of the elderly, partially replacing the work of assistants and caregivers. In sum, whether in relation to industrial, service or knowledge work, digitization is changing the entire sociotechnical system of people, organization and technology (Graglia & Lazzareschi, 2018). In its effects there are clearly positive aspects and others that inspire more reflection.

## 2 The Economic Cycles and Technological Innovation

The cyclical behavior of the world economy, alternating moments of growth and crisis has been studied by several authors (Hayek, 1933; Kondratieff, 1935; Mises, 1953 and Modis, 2017). Kondratieff (1935) affirms the existence of long waves that are not originated by random causes, but by inherent causes to the essence of the capitalist economy. The mechanisms that explain the existence and behavior of long waves are derived from the emergence of major technical changes, wars, revolutions and assimilation of new countries within the world economy. The technical changes in production play an influential role in the development of capitalism, and the development of techniques is itself part of the longwave rhythm (Kondratieff, 1935). Schumpeter (1939) argues that the disturbance motivating the beginning of a cycle is given by an innovation. According to his theory, there is a periodicity of long cycles, or long waves, of about fifty or sixty years. John Maynard Keynes (1883-1946) recognizes the existence of economic cycles, including the regularity of occurrence and duration, justifying it as the result of a cyclical variation in the marginal efficiency of capital. The marginal efficiency of capital (profit rate) is related to the expectation of an investor's return when acquiring a given capital asset, and the expected return will be the result of a flow of future incomes generated by the sale of the products. Keynes highlights the phenomenon of crisis as a typical feature of the economic cycle, where the inversion of an ascending to a descending phase usually occurs abruptly and violently - crisis - whereas the passage from a descending phase to an ascending one used to occur gradual and smooth. Therefore, both Keynes and Schumpeter believed that the understanding of the cyclical movements of the economy was in the fluctuation of the level of investment (Lima, 2011). In his work *Business Cycles*, Schumpeter emphasized the importance of innovations as a determining factor of economic development. He also coined the term "Kondratieff cycle" and thus linked the name of the Russian economist to the phenomenon of long waves. For Schumpeter, the periods of economic expansion are related to the fact that the innovative entrepreneur, when creating new products, breaks certain economic inertia by establishing a new technological paradigm, which is followed by other entrepreneurs, who apply resources to produce goods similar to the one created by the first. Thus, a wave of capital investment leverages the economy, generating prosperity and expansion of production and employment levels. As technological innovations are absorbed by the market, the rate of economic growth slows and a recessive process begins, resulting from the reduction of investments and even consumption, affecting the level of employment. A new cycle depends on the occurrence of another wave of technological innovation. This alternation between prosperity and recession is seen as part of the larger process of economic development (Schumpeter, 1997).

**Figure 1 Cycles of Kondratieff, according to Schumpeter.**

Source: Schumpeter (1939). Adapted by the authors.

From the work of Kondratieff, Schumpeter proposed in the 1930s that some important innovations were the root of the strong economic waves that began approximately in 1785. His hypothesis eventually led to an influential work in 1979 led by Gerhard Mensch. In the book *Stalemate in Technology: Innovations Overcome the Depression*, Mensch cataloged over one hundred innovations that made significant contributions to industrial society between 1750 and 1950. When he plotted the frequency of major innovations against the year in which they were invented, he discovered that a cluster of innovations arises once every fifty or sixty years, the same period observed in Kondratieff's work (Poire, 2011). The fundamental impulse that keeps the capitalist machine in operation comes from the new consumer goods, the new methods of production or transportation, the new markets, and the new forms of productive organization created by the capitalist enterprise. It is a process that incessantly revolutionizes the economic structure from within, incessantly destroying the old and creating new elements, from discrete explosions, separated by periods of relative calm. The process as a whole is continuous, since there is always a revolution or the absorption of the results of a revolution, forming a new economic cycle. It is from this process that capitalism is constituted and that every capitalist enterprise must adapt itself to survive. There is inherent tendency in the capitalist system for self-destruction and the idea of creative destruction highlights the disruptive character that characterizes the interference of major technological innovations over economies and their role as a fundamental agent in the process of economic development. The motivation of this phenomenon is explained by the entrepreneur's view on the possibility of earning profits from innovation. Over time, with every wave of investment in technology, a wave of innovation is generated (Schumpeter, 1961).

### **2.1 The first wave**

The first wave is marked by the first phase of the Industrial Revolution, which was boosted by new technologies such as the invention of the steam engine in 1712 by Thomas Newcomen (1664 to 1729) and his improvement by James Watt (1736 to 1819). Watt, in addition to adding a separate condensation chamber that allowed to reduce energy loss and thus generate significant gains in efficiency, later incorporated other modifications, such as a mechanism derived from the crank-crank system invented by Matthew Wasbrough (1753 to 1781) and patented in 1780 that allowed to transform the alternating rectilinear movement of the piston of the machine to steam in a rotating movement, which contributed to the expansion of its application (Tavares, 2008). The use of hydraulic energy expanded and the textile industry was one of the most representative economic sectors of this historical period.

### **2.2 The second wave**

The second wave has as motivating technologies and determining industries the modern facilities of transport and communication (emphasizing the railway system, the telegraph, the steamship), Portland cement. The discovery of new steel processes, such as the Siemens Martin (1865), Bessemer (1870) and Thomas (1888) processes, enabled steel to be obtained on an industrial scale and gave impetus to a new era of development. As productivity increased, production costs and prices dropped dramatically. Between 1882 and 1885 the average production cost of one liter of kerosene fell by 70%, the cost of steel rails was reduced by 88% and the cost of aluminum was reduced by 96% by the electrolytic refining process invented in the 1990s. 1880 (Jensen, 1993).

### **2.3 The third wave**

The third wave, characterized between the late nineteenth and the first half of the twentieth century, was a technological revolution that had among the main innovations the development of electricity, the internal combustion engine, chemical products and the first communication technologies, such as invention of the telephone and the radio and the diffusion of the telegraph. A set of macro inventions paved the way for the emergence of micro inventions in the fields of agriculture, industry and communications. A sudden and drastic increase in technological applications has transformed production and distribution processes, creating a flood of new products that has decisively changed the location of wealth and power, which has now been concentrated in the US and Germany (Castells, 2006).

### **2.4 The fourth wave**

The fourth wave, marked by the beginning of the second half of the twentieth century, is marked by the first computer, ENIAC, developed in 1946 by Mauchly and Eckert, the invention of the transistor by physicists Bardeen, Brattain and Shockley, Bell Laboratories, by the invention of the printed circuit in 1957 by Jack Kilby of Texas Instruments and the microprocessor in 1971 by Ted Hoff of the Intel Corporation. Significant changes in the speed of innovations can already be noticed. The so-called Moore's Law advocates that the number of transistors on a chip doubles every eighteen months, while

maintaining the same cost. The set of these inventions paved the way for the emergence of personal computers, such as the Altair 8800 developed in 1975 by Ed Roberts, Apple 1 (1976) and Apple 2 (1977), PC - Personal Computer by IBM (1981). In 1984 Apple released the Macintosh. The development of optoelectronics (fiber optic and laser transmission) and digital packet transmission technology have promoted the expansion of transmission line capacity. This technology, combined with advanced switching and routing architectures such as ATM (asynchronous mode of transmission) and TCP / IP (transmission control protocol and interconnection protocol) formed the basis for the emergence of the Internet. (Castells, 2006). Other innovations of this period include the control and development of nuclear power, the expansion of commercial aviation, the development of satellite production and the space race. Robotics is based on the development of microelectronics and is applied in industrial automation, initiating a new cycle of replacing human work in industries such as the automobile industry.

### **2.5 The fifth wave**

The fifth wave, beginning in the 1990s, is heavily based on information and communication technologies - generating the expansion of digital cellular telephony, the explosion of digital social networks, the growth of the software industry, the development of the UHF (Ultra High Frequency) RFID (Radio Frequency Identification) by IBM, the development of geolocation technologies such as GPS (Global Positioning System), AGPS (Assisted Global Positioning System), GSM (Global System for Mobile Communications) and the emergence of new digital social media. This period was called by Manuel Castells (2006) of the Information Age, characterized by an informational, global and networked economy.

### **2.6 The sixth wave**

Every wave of innovation lasts approximately until the profits generated by it fall back to the level of other older and more traditional sectors. It is a situation where technology, having reached its limits in terms of economic stimulus, needs to be replaced by another new technology in order to overcome those limits. Every wave converges, at its end, to a typical economic crisis and stagnation. The crisis in 2007-2010 is the end of the wave of the information technology and telecommunications revolution. The end of the fifth wave. Long cycles were originally described as having a frequency between 45 and 60 years. What some authors have pointed out is an apparent reduction in the interval between cycles due to the acceleration of scientific progress. In this new wave of innovation, the diffusion of digital technology has been driven mainly by two factors: the extraordinary pace of technical progress, expressed in Moore's Law (which deals with the exponential shrinkage of transistor sizes that can be applied to an integrated circuit and which can also be understood as a relation that deals with the continuous reduction of costs of these components and related equipment in relation to time) and the convergence of the marginal cost of information dissemination to zero. These factors have reduced hardware prices to an extraordinary degree. Intel co-founder Gordon Moore predicted in 1965 that the number of integrated circuits would double annually in relation to the cost of microprocessors over the next decade (Moore, 1998). This prediction, as a principle, proved to be correct. Supercomputer performance doubled every year between 1990 and 2012, disk efficiency increased 67% per year and the number of transistors in microchips increased 47% per year (Brynjolfsson & McAfee, 2011). While Moore's Law provides for the annual doubling of memory capacity in electronic chips in relation to their cost and thus cutting hardware cost fast, the zero marginal cost hypothesis points to the decreasing cost of inputs and related services the information (RIFKIN, 2016). Even though these are not laws in the strict sense, they describe one of the key features of digital versus analog technology: not only is it better, faster, and cheaper, but it will also continue to become better, faster, and cheaper in the future. This explains the high growth rates of the digital economy and its ubiquity. The fall in prices of hardware, software and especially the approach to the marginal costs of obtaining information close to zero, is making the demand for information goods grow at exorbitant rates, while digital technology more and more replaces the traditional mode of information production (Vogler-Ludwig, Düll, & Kriechel, 2016). The acceleration of the process of developing new technologies and the speed of expansion of their application in the market and adoption by a larger number of consumers may not only depend on an assumption of the continuation of Moore's Law but on models which show that the changes exponentially and not linearly (Kurzweil, 2001).

The comparison between the times spent to reach 50 million users, used as a reference to evaluate the speed of propagation of a new technology, serves as indicative manifestation for the issue of acceleration. Comparatively speaking, while the phone needed seventy-five years, the radio thirty-eight years and television fourteen years to reach fifty million users, the phone needed five years, the internet

four years, Skype two years, the mobile technology required only fifty days and it is estimated that new digital technologies need only thirty-five days to reach fifty million users. The report "Surfing the Sixth Wave: Exploring the Next 40 Years of Global Change" finds that the permanently high levels of commodity prices, as well as the worsening of environmental tensions, are indicative of the emergence of a new wave. The productivity of resources is the main driver of technological, economic and even social changes and part of the technologies that make up this new cluster that will impact the economy and society is already known. The sixth wave may have as artificial technologies artificial intelligence, biomedicine, hydrogen engine and robots (Shimula, 2009). Its effects will be leveraged by the digitalization and exponential increase of computational power, both legacies of the previous wave, which created favorable circumstances for the development of new products and services. The digitization will bring transformative possibilities in the field of virtual reality, which will be present in many common situations of common life. New business models will increase the flow of communication and interconnection between different groups and will provide the development of new forms of collaboration, business and social ecosystems. Robots will be able to do trivial things done by humans, from picking flowers to producing art. Information and communication technologies will continue to dramatically reduce transaction costs (Wilenius & Kurk, 2012). The set of transformations driven by the application of new technologies have also been called the "Fourth Industrial Revolution" (WEF, 2017) or "Industry 4.0". From the technological point of view, it is not possible to explain the complexity of the current phenomenon considering only those technologies directly involved with the industry and its effects. In fact, no segmentation from economic sectors can broadly represent the technological, economic, and social phenomenon that is unfolding. The technologies themselves are being applied indiscriminately in all sectors of the economy, combining, reaching and transforming factories, banks, farms, builders, schools and governments. The terminology "Industry 4.0" seems more appropriate to identify the transformation that is occurring in the factories and in the industrial sector specifically, symbolized by the application of cyberphysical systems (Kagerman, Wahlster & Helbrig, 2013; MGI, 2015), which have the function of connecting the world with the physical world because they are mechanisms that associate information and communication technology with sensors, controllers, robots, etc. There is no doubt that, from a technical point of view, they are a very important part of the constitution and viability of Industry 4.0, and from a sociological point of view their function is discrete, since it is only a technological device among so many innovations and disruptive models. In the Sixth Wave, the new technological arrangement opens the expected possibility of economic expansion, but it exacerbates one of the fundamental aspects of capitalism: productivity will certainly make a leap from the integration of technological potentialities. This productivity gain will be obtained from the simultaneous action on the two components that define it. Productivity, as a concept, is the relation between value produced and value consumed for a given production. Taking intelligent factories as example: on the one hand, they are able to produce in large volumes and at greater speed by using a higher level of integration between systems, intelligent machines and artificial intelligence. On the other hand, the same systems, machines and new technologies will generate a huge reduction in the need for human labor (Kagerman, Wahlster & Helbrig, 2013). High productivity gains will increase the financial profits of many companies and investors, to the detriment of others that for some reason do not have access to new technologies, affecting competition and the economic logic of price regulation. If there are no changes in the tax system and in the policies of income distribution, there will be a deepening of the historical phenomenon of concentration of wealth and social inequality, especially the impacts on employment and labor. The history of job recovery, in the growth and prosperity phases of economic cycles, still fuels the hope of new jobs, in the logic of creative destruction (Schumpeter, 1961); however, such phenomena should not function as in previous cycles. One of the reasons is demographic: previous technological revolutions occurred at times of strong population growth, that is, the demand curve had a positive growth both by the increase of populations and by the insertion of gigantic parcels of people in the consumer market. Other differences should also be considered, such as the expressive amount of new technologies emerging in the same time window, combining, converging and generating other innovations at an exponential speed that cannot be matched by traditional institutions such as governments and universities and the potential of the human labor that some of the new technologies bring.

### **3 Science, Employment and Work**

In the twentieth century, mechanization affected manual and repetitive labor, triggering a cycle of

substitution of human labor in factories around the world. On the other hand, it collaborated for economic development and opened space for the growth of the services sector, which expanded to the point where it currently represents the largest share of the gross domestic product of the main developed and developing nations (BLS, 2017, IBGE, 2018; DW, 2018). The service sector, in this way, has become the largest generator of jobs and income for the populations of these countries. However, even intellectual services, such as those performed by engineers, teachers and researchers, tend to be affected by new emerging technologies, especially with regard to replacing human work with systems and software (Osborne & Frey, 2013). According to World Trade Organization studies, 80% of job losses in advanced economies are linked to technological innovation. This phenomenon tends to be even stronger in developing countries, causing structural unemployment crises (WTO, 2017). Employment lost during short-term economic crises is partly reestablished in later periods of economic growth. It is clear that this reestablishment, even if partial, occurs in an uncontrolled and random manner: there is no guarantee that a resumption of growth will reverse a certain unemployment rate that was generated on a region, country or individuals. This job, because of the mobility of capital and labor, can migrate from country or continent, in search of greater efficiency and advantage. Structural unemployment, so called by its characteristic of irreversibility, is the result of productivity gains obtained by companies from the application of technology in their processes, whether those generating physical goods or services. The influence of technology on productivity and the consequent substitution of employment has been accelerating with the evolution of digital technologies. Digital innovation changes more radically the way the economic pie is distributed and accentuates the concentration of wealth, while destroying jobs for middle-class workers. New jobs generated in this context require more sophisticated skills that are not inaccessible to most workers (Brynjolfsson & McAfee, 2011; Osborne & Frey, 2013). Developing competencies through training strategies does not guarantee the insertion of the worker in the labor market, either because of the shortage of labor, or because the training programs often fail to sufficiently develop the necessary skills, generating an "apparent" training, by its superficial character. The advancement of digital technology over these functions can repeat the effect that automation, mechanization and robotization have generated on industrial jobs. Despite fears about these possibilities, what is certain is that artificial intelligence and other technologies such as synthetic biology, computer science, nanotechnology, quantum computing, additive manufacturing, autonomous vehicles and robotics will have fundamental impacts on the nature of work, on the economy and society in the coming decades. One of the critical points in the discussion about the expansion of the use of the new technologies in their diverse applications by individuals and organizations is the urgency of a deep restructuring of the policies, structures and mechanisms of social protection, of stimulating the generation of work and income and the systems educational, to support the transformations that are already taking place and that in a few years will reach new heights of complexity and power. Such restructuring also depends on an exceptional collaborative effort and enormous capacity for political articulation to involve countless actors, in many cases with distinct and contradictory interests. Even countries structurally well-prepared and organized to cope with this transformation depend on a combination of complex factors to succeed. If socioeconomic systems do not fit into a scenario of technological acceleration, integration and digitized globalization, then much of the global mass of workers may be unemployed by 2050 (Glenn & Florescu, 2016). The possibilities of generating new jobs from new functions and professions that emerge must be viewed with caution, since they can demand levels of impediment of competences for workers from functions of low complexity. What's more, they tend to be in absolute numbers to accommodate the mass of affected workers. Consultant McKinsey estimates that the career transition needs will be enormous - considering where it is feasible - and will involve at least 375 million workers who will need to develop new skills - in case of success in the rapid adoption of the digitization by the countries. If the transition is slow, unemployment will increase and still cause depreciation of wage values (MGI, 2017). The emergence of new businesses will also occur, but with higher levels of productivity and less need for human labor (Rander, 2016). The new business models will demand a lesser relation between the necessary labor and their productive capacity, whether of manufactured goods or services. The growth of companies that become automated will also occur in a lower standard of job creation. Personnel costs are usually significant for most companies; thus, the technology will be used to reduce personnel, with the objective of increasing operating margins and financial results.

According to Osborne and Frey (2013), 47% of jobs fall into the high risk category, ie jobs that can be automated in a relatively short period of time over the next decade or two decades, including jobs in numerous service sector activities, whether of an administrative or knowledge nature. In Germany, the

services sector accounts for about 70% of GDP and in Brazil for about 75%, where it also accounts for most jobs.

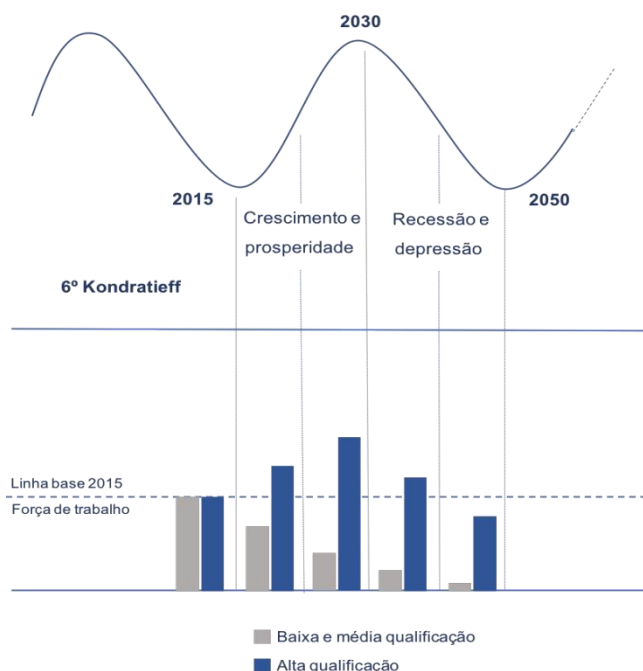

In Germany it comprises 72% of jobs and in the United States 80.1% (BLS, 2017, IBGE, 2018, DW, 2018). The adoption of process automation robots, electronic document recognition technologies and artificial intelligence opens up many optimization possibilities (Vogler-Ludwig, Düll, & Kriechel, 2016). Various occupations of the service sector will be impacted, involving transportation and logistics activities, office workers and administrative support, as analysts. Also factory workers will be affected (Osborne & Frey, 2014) and the digitization will significantly affect the public service. Reduction forecasts are already consolidated in some countries, such as Germany and the United States, where a reduction of 15% of occupations is expected in federal public services only until 2024 (BLS, 2017). The automation of knowledge work is being done from a new approach, which involves not only the question of information but also all the theory and modes of reasoning necessary to perform a task or task. Emerging solutions deal with large-scale knowledge bases, complex forms of situation assessment, sophisticated modes of reasoning based on values, and autonomous system behaviors. Some law firms, for example, are already using computers that can examine thousands of clarifications and legal precedents to aid in the preliminary research work that may involve hundreds or thousands of hours of work. Symantec's Clearwell system uses language analysis to identify general concepts in documents and present the results graphically and is able to analyze and classify more than 570,000 documents in two days. In financial services, artificial intelligence has played an important role in the analysis and financial transaction processes for some time. Banks are using machine learning to detect scams and identify situations like charges or claims outside the normal behavior of a person buying. Even services like Future Advisor use artificial intelligence to offer customized financial advice in a cost-effective and scalable way. It is estimated that by 2025, productivity gains of 45-55% can be achieved for 25 million knowledge workers in this sector, which would lead to the economic impact of \$ 600- \$ 800 billion per year (MGI, 2013) . Even in the field of programming services, the use of artificial intelligence applied to self-repair codes reduces the need for human programmers. Voice-enabled systems and ever-increasing personalization are expected to drastically reduce the demand for Call Centers to which India has become famous. About 69% of jobs in India are at risk of displacement due to artificial intelligence and automation. In India's top five IT service companies, job growth is down by as much as 40 percent, and the country faces huge challenges from the ongoing technology revolution: if nothing is done, about 69 percent of jobs will be lost for automation (Singh, 2017). The negative effects on employment also arise for medical health professionals, especially nursing and laboratory professions (Vogler-Ludwig, Düll, & Kriechel, 2016). The automation of knowledge work can have important effects on health care services. Oncologists at Memorial Sloan-Kettering Cancer Center in New York are using IBM's Watson Artificial Intelligence system to provide diagnoses of chronic treatment and cancer treatment by accessing the knowledge of 600,000 reports of medical evidence, two million pages of scientific literature from 42 medical journals and 1.5 million patient registries and clinical trials in the field of oncology, plus clinical and genetic data for each patient. With this, the AI system compares individual patient symptoms, vital signs, family history, medications used, genetic structure, diet and exercise routine to diagnose and recommend a treatment that is most likely to be successful. Wellpoint has adopted this technology to support decision-making and accelerate the process of approving medical applications, which took days before and are now completed in a matter of seconds. This was only possible because the system was trained with 25,000 historical cases, to which techniques of hypothesis generation and evidence-based learning are applied, to generate recommendations that aid in decision making. Cognitive computing in health can also help reduce costs and increase the efficiency of organizations by crossing data that allows for more efficient management (IBM, 2017). The benefits that such technologies can bring are undeniable, however, their side effect on jobs needs to be considered.

The retail sector is one of the great generators of employment, both because of its size in the world economy and because of its labor-intensive character. In the United States, it is the 4th largest generator of jobs, accounting for about 15 million eight hundred and twenty thousand jobs in 2016. Retail has a complex cost structure, based on two main factors: cost of goods sold and cost of the hand of work. The challenges and investments needed to improve the customer experience will entail automating tasks and processes that have remained unchanged for decades. By applying technologies such as AI and robotics, retailers want to use intelligent process automation to identify, optimize, and automate intensive, repetitive activities. Many retailers are already applying the automatic checkout process in their stores (Gartner, 2017a) and others are experimenting with robotic solutions with virtual assistants for customer service. The retail sector in the US has already presented a reduction of 3% in its annual jobs as a result

of the digitization. (Vogler-Ludwig, Düll, & Kriechel, 2016). It is estimated that by 2020 the top 10 retailers will apply advanced algorithms that will cut up to one-third of merchandising teams and digital chat and answering applications that will process 50% of customer service requests, impacting on the need for professionals for these activities (Gartner, 2017b). Another aspect that deserves attention when assessing the phenomenon of the threat of structural unemployment in the services sector is that this sector - historically - has absorbed a large part of the labor force that has been eliminated from the agricultural and industrial sectors, due to its own automation and increased efficiency. Because it encompasses a variety of activities that require low qualification, the services sector has generated job and income opportunities for industry and rural graduates (Osborne & Frey, 2013). The possibilities of migration of workers from the industrial and agricultural sectors to sectors of greater aggregate knowledge do not seem so possible with the new technological revolution.

#### **4 Essay on the Sixth Wave of Innovation and Work**

Schumpeter (1961) dealt with the concept of creative destruction, highlighting the disruptive and revolutionary character that characterizes the interference of technological revolutions in the economic structure: from within, intensely destroying the old and creating the conditions for the new. As technological innovations have emerged, from time to time, the investment of entrepreneurs in entrepreneurial actions have caused waves of economic growth. The sixth wave, or the sixth Kondratieff, is beginning, and like any great wave of technological innovation, it will last approximately until the profits of the new innovation fall to the level of other older and more traditional sectors, reaching its limits in terms of stimulus economic. In addition to entrepreneurial entrepreneurship, the new wave is also receiving stimulus from governments, which have been making huge investments to support initiatives that prepare the infrastructure of their industries and economies for the oncoming digital transformation, as has been happening in the US with the creation of advanced manufacturing institutes - Manufacturing USA - and in Germany, with the Industrie 4.0 program (Holdren & Lander, 2011; Vogler-Ludwig, Düll, & Kriechel, 2016; BMAS, 2017). Typically, waves of innovation are composed of four phases. The first phase is growth, when investments are boosted and innovations begin to impact on the economy and the labor market. The second phase is prosperity, when the degree of utilization of the innovations brings marked gains in productivity and causes wealth growth. The third and fourth phases are movements of economic decay: recession and depression (Schumpeter, 1961). The behavior of the labor market and employment used to follow this cycle, progressing in the phases of growth and prosperity and falling in the phases of recession and depression. However, the new wave suggests a behavior different from the previous ones. In the initial stages the employment will grow, but only the one based on higher qualification and for certain occupations. The employment of medium and low qualification, for the most part, may already decline in the first phase. Even high-skilled jobs tend to regress after the apex - which is characterized by the depletion of the effects of the high levels of investment that have driven the economy and the full adoption of innovations by companies. From the available studies and forecasts (Shimula, 2009; Holdren & Lander, 2011; BLS, 2017; BMAS, 2017) we can suggest a temporal configuration for the sixth wave of innovation and a trend in terms of the evolution of the workforce. Figure 26 represents this assay and suggests a setup for the sixth innovation wave.

**Figure 2 The 6th Wave of Innovation and the Evolution of the Workforce.**

## 5 Conclusion

New technologies will enable significant advances in various areas and aspects of human society, such as health and longevity, energy efficiency, reduction of environmental impacts and risks, food production, mobility in major cities, reduction of traffic accident rates and loss of life, new learning systems. There will be economic prosperity within the logic of the process of creative destruction, with products and businesses being replaced by others. The impacts that new technologies can generate on the 21st century workforce are of an order of magnitude similar to the great changes brought about by earlier waves of innovation. The changes that have taken place have not resulted in long-term mass unemployment because they have been accompanied by the creation of new types of work. However, we can not say with any certainty that this historical relationship between economic growth and employment and job creation will be maintained. The sixth wave of technological innovation has determinant characteristics that differentiate it structurally from previous ones. The speed with which transformation is occurring, the accelerated scalability of new technologies, the number of disruptive technologies emerging or maturing simultaneously, the massive potential for replacing human labor, the relevant impact that will occur in service sector jobs, and the different demand for qualification for workers - which favors some occupations as it excludes others - are some of the differences from the past that will dramatically affect the structure and the labor market. Imagining the future perspectives of work without considering these differences would be a misnomer. There will be an imbalance in the generation of jobs in terms of the functions of higher and lower qualification, being the second category impacted from the beginning of the process, in the phases of growth and prosperity of the new wave of technological innovation. After 2030, approximately, the decline of part of the most qualified workforce necessary for the operation of companies and organizations will also begin. The second phase of the sixth wave of innovation, with its typical stages of recession and depression, may be particularly critical for combining the degradation of economic conditions and the reduction of jobs in a society whose transformation to a new model of income generation and way of life has not yet is fully consolidated, given the speed with which all change must occur. The wealth that will be generated by economic growth in the prosperity stage of the sixth wave can be captured in a concentrated way by a few countries, corporations and individuals, accentuating inequality conditions.

## Does Viral Marketing create *Brand Awareness*? An Exploratory Study with University Students

Rafael Taino, Rafael Rodrigues Cardoso, Alexandre Luzzi Las Casas, Arnaldo Jose de Hoyos Guevara  
Pontifical Catholic University, São Paulo, Brazil  
(E.mail: rtaino@gmail.com, rrcardoso@pucsp.br, alascasas@terra.com.br,  
arnoldodehoyos@yahoo.com.br)

**Abstract:** Viral Marketing has attracted the attention of many schoolers and people from the field of marketing because of the broad reach the message it shares can get. Recent studies investigated what leads people to share viral content and which content is most likely to become viral. However, there is no proved correlation between *viralization* and brand awareness generating. Considering that the main purpose of any Marketing is make the target audience identify and remember a brand, the current study investigated through an exploratory survey whether the videos that went viral on 2016 were able to generate brand awareness in a group of students of the Pontifical Catholic University of São Paulo-PUC / SP. The results showed limited impact on the creation of brand awareness, because of previous experience of the public in recognition of the brand displayed on the video. In addition to the results the study also contributes by questioning the content displayed in viral videos and shows how the time of exposure of a brand on a video influences directly in the creation of brand awareness.

**Keywords:** Viral marketing; Brand awareness; *Viralization*

### 1 Introduction

The term "viral marketing" has existed for more than two decades, but it only became famous in digital media due its use on a previously established social media, that aims the contribution to the dissemination and sharing of information using word-of-mouth (WOM), or *boca a boca* in Portuguese (Almeida, Costa, Coelho and Scalco, 2016). The seek for viral content got a lot of attention from companies that, instead of spending money on media services, allocated efforts and resources to use free media in which customers are active as the main channel of communication (Corcoran, 2009<sup>1</sup>).

As far as *viralization* and content sharing are concerned, recent studies have investigated users behavior when sharing online content, the impact of different subjects shared influences how viral it will get, creating different values of those subjects to companies interested in Brand Awareness. (Berger, Akpınar, 2017; Dafonte-Gómez, 2014; Almeida et al., 2016; Berger, Milkman, 2012; Nikolinakou and King, 2018; Tellis et al., 2019).

Those studies brought meaningful contributions to the academic and managerial field by identifying that:

- (i) videos that generate a type of positive reaction are more likely to become viral compared to videos that induce negative reactions (Nikolinakou and King 2018, and Berger, Milkman, 2012);
- (ii) videos that have as their only goal to present a particular brand have more credibility among the audience (Berger and Akpınar, 2017) and
- (iii) the presence of a brand in videos with emotional content does not reduce the amount of share (Tellis et al., 2019).

However, despite the contributions mentioned, there are still dimensions that weren't explored that identify how viral videos are contributing to the generation of brand awareness in the audience reached by its message. Tellis et al. (2019) describes a literature review that shows that only 2 articles which analyzed video sharing have some kind of analysis regarding the presence of the brand on a video, but none evaluated how the presence of the brand on a video has created a memorable impact of the brand to the costumers.

Understanding the importance of brand awareness is primordial because viral videos are not only reaching a large number of people, but are also ensuring that the people who view it have a relation to what they saw and recognize the brand or the company who created it. Tariq et al. (Bloch, Sherrell and Ridgway, 1986), describes that a costumer, when having knowledge about a particular brand or

<sup>1</sup>Corcoran, Sean (2009), "Defining Earned, Owned and Paid Media". Sean Corcoran's Blog (December 16). Recuperado em 15 de abril de 2019, de [http://blogs.forrester.com/interactive\\_marketing/2009/12/defining-earned-owned-and-aidmedia.html](http://blogs.forrester.com/interactive_marketing/2009/12/defining-earned-owned-and-aidmedia.html).>

company increased, tends to speed up purchasing decision process.

In order to reduce this discrepancy, the study aims to improve viral marketing, by understanding how these viral videos contribute on the creation of brand awareness on an specific public. Our studie focus on exploratory research so that future studies can be done and get even deeper in the relationbetween viral videos and brand awareness.

In general, this study contributes to marketing research in two ways: (1) when evaluating whether branded videos create brand awareness; (2) by evaluating how the time spend on the brand or video content influences the generation of brand awareness.

## 2 Viral Marketing

Ogden e Crescitelli (2007)define viral marketing as a new style of marketing raised during Modern Communication of Marketing WOM, with the difference that it uses internet for propagation of message such as e-mail, video, audio, games, websites, social networks, photographs or documents, which, due to its quick transmission, can be compared to a contagious virus, using the means mentioned above.

The term Viral Marketing is a reinterpretation of the English expression “word of mouth”, created in 1997 (Knight, 1999). Sun et al. (2006) define viral marketing as a tool for establishing relations between communities, but online. The *Word of Mouth Marketing Association* (WOMMA) defines viral marketing as "the creation of entertainment or informational messages made to be passed on in a broader way, usually throw electronic means or email" (Freundt, 2012).

Regardless the definitions for viral marketing, Berger and Akpınar (2017), based on Berger (2014), describe that the success of any viral marketing action depends on two factors. The first factor is people's willingness to speak or share a particular marketing action, but to do so, one must investigate why people share some things over others. The second factor is that companies need to generate value for brands that are being used as advertising.

Berger and Milkman (2012) investigated what makes certain contents viral. Evaluating New York Times articles published over three months, the authors concluded that positive content is most likely to become viral than negative one. But this relation is more complex than it looks, since the authors have found that content that generates high positive excitement (eg, fascination or glamor) or negative (eg anger or nervousness) is more lkely to be shared than the ones that generate low excitement (for example, sadness).

Teixeira (2012) believes that, before attempting to make something go viral, a campaign must reach the goal of being seen. In addition, the author identifies factors that can positively impact on how viral a campaign can get, for example, the inclusion of emotional content already at the beginning of the subject and the creation of a roller coaster of emotions throughout the advertisement, in order to establish an emotional experience that goes up and down as a way to keep the public's attention.

Dafonte-Gómez (2014) evaluated a sample from 25 videos available on Unruly Mediadigital platform between 2006 and 2013 in order to identify the elements that stimulate the sharing of a particular video. The authors concluded that all those videos with emotional content, which contained elements such as surprise and joy, were more famous than the others.

Berger and Akpınar (2017) propose a categorization between the different types of advertisements, differentiating informational appeal from advertisements with emotional appeal. Advertisements with informative content are those where (i) there is greater emphasis on the product and the brand; (ii) the product and brand are the main focus; (iii) there is greater appeal in the characteristics and specificities of the product; (iv) the technical product information is provided. On the other hand, advertisements with emotional content are divided into Partially Emotional, where, in the course of advertising: (i) there is less emphasis on product and brand, (ii) the product and the brand are shown discreetly, as a complement to the message; (iii) there is musical, cinematographic, visual effects and / or famous artists appeal, and, (iv) there is no reference to the technical information of the advertisement. The other one is the Fully Emotional product, where: (i) there is medium / great emphasis on the product and the brand, (ii) the product and the brand are inserted with greater intonation as the central theme of the message; (iii) there are also musical, cinematographic, visual effects and / or famous artists appeals, but (iv) there is some references to technical information. The authors studied how these different types of content would impact *viralization* and two main conclusions were obtained. The first conclusion is that videos with emotional content are more shared than videos withto much information. The second conclusion is that the presence of the brand in the emotional videos does not negatively impactits fame. Thus, from

the managerial point of view, the authors suggested that companies should focus on creating videos with a meaningful presence of the brand.

Tellis et al. (2019) deepened the discussion on how the brand influences the amount of shares. The authors evaluated whether the presence of the brand at the beginning, middle, end or even absence of it would impact the results. In conclusion, it was identified that the presence of the brand at the end of the video is significantly better than the other options.

It is noticed that there is an evolution on the number of dimensions explored regarding viral videos. At the beginning the focus was what motivated the user to share a video, and currently there are articles analyzing how the moment of appearance of the brand will impact on the number of shares. However, as already mentioned above, there is no research that evaluates how viral videos have contributed to the creation and intensification of brand awareness.

### 3 An Exploratory Study on University Students

In this article, there was a research on students from PUC / SP. University students were chosen based on an article published by Berger and Akpınar (2017), in which a similar research was made on viral marketing with students from other universities in other countries. College students are the main users of many platforms from the Internet, therefore they are an essential audience to be evaluated. We based the exploration of labor in a very similar age profile, because we sought for the equalization of at least one of the variables among all the others present on the experiment, such as gender, race and socioeconomic level.

The foundations of the research involved a presentation of viral videos to the audience so that they could classify them as informational or emotional, identify the presence or absence of the brand and be able to tell which company is behind the video. The measurement of brand awareness took place through a numerical counting of how many could identify the brand involved in the advertisement. For each of the interviewees a file was delivered, containing a table identifying the advertisements in sequential order, plus two questions. The first question asked the student to classify the video as emotional or informative and the second one asked the interviewee to write the name of the brand or product related to each video.

Regarding the videos presented to the students, the similarities of the sources used were considered, just as Berger and Akpınar (2017) did, the initial proposal involved viral videos from the site *Unruly* (unruly.co), that is considered the most relevant platform in this field that evaluates and tracks video sharing. According to Berger (2016), since 2006 *Unruly* had mapped over 329 billion videos. However, the search for this content was not available, since *Unruly* no longer offers this service, making it impossible to obtain these advertisements.

As an alternative to overcome this obstacle, it was discovered, on the same website, an extensive list of other places where the main viral videos could be found, which were: *Campaign*, *the IAB*, *The Guardian*, *AdWeek*, *Werben&Verkaufen*, *Horizont*, *Contagious Magazine*, *Mumbrella Australia* and *Communicate*.

An individual research was made on each of those places, and on the *AdWeek*<sup>2</sup> website a 2016 report was found with the 20 most famous videos of that year. The choice of videos from a previous year had the purpose to minimize the impact of the seasonality of its content. In addition, the annual analysis brings a benefit that is the consideration of all stages of *viralization*, that is, the beginning, apex and decline, at local, regional and global level.

Ten videos were chosen from different countries spread around the world. The average time of the twenty videos is 2 minutes and 49 seconds. Regarding the number of shares, it varied between 544,585 and 1,949,387.

After defining the methodology and the data source used for the research, it was possible to collect results, on the morning of May 2<sup>nd</sup>, 2019, at Campus Monte Alegre, PUC / SP.

Before the experiment began, the students were given a brief explanation of the specialized literature, about how to define the informational and emotional contents, mentioning characteristics that distinguish each one of them and the importance of this study. Finally, the students were asked to answer the questions individually, avoiding the interference of a colleague.

<sup>2</sup> Adweek (2016). The 20 Most Viral Ads of 2016. Disponível em: <<https://www.adweek.com/creativity/20-most-viral-ads-2016-174885/>>

After that, the 10 videos were presented in sequence and, at the end of each one, the two questions in the questionnaire were answered.

#### 4 Preliminary Results

After the students took part of the research, each participant's answer was collected for evaluation and analysis. In total, 33 students participated in this activity. Considering that 10 advertisements were designed, a total of 330 responses were collected, which were analyzed from a quantitative and qualitative point of view. The first evaluation aimed to understand the distribution of the 330 responses between informational and emotional content.

The results showed that, out of the 330 evaluations carried out, 321 indicated that all 10 videos presented emotional content. This agrees with what other authors (Tucker, 2015 and Berger, 2014) have already found out about the fact that companies have prioritized the creation of videos with emotional rather than informative content, seeking for more and further reach.

Then, based on a series of emotional data a brand awareness assessment was made, questioning if the content that is fully emotional provides a more powerful generation of brand awareness than the partially emotional.

According to Keller (1993), a brand can be recognized by its name, term, sign, design or a combination of all these factors, creating Brand Knowledge, which is brand recognition through these symbols. The importance for brand recognition in the customer memory has been studied for many years to identify its effects on one's final decision (Alba, 1991).

The results are described in Table 1. It is observed that approximately 62% of the evaluations (n = 199) indicate the contents of the advertisements as fully emotional. In addition, approximately 38% (n = 122) of the evaluations classified them as partially emotional. Regarding the generation of brand awareness, it is observed that, for most videos (7 out of 10 videos), over 50% of all students recognized the brands behind it (RB), meaning that most videos are functional. The lack of other studies in literature has limited the comparison meaning that 50% index can be considered both good and bad index.

**Table 1 Time of Exposure of a Brand in Relation to the Total Time of the Advertising**

Ranking	Advertising	T.T.	T.E.B.	R.B.	E.R.P
10°	Mc'Donalds	01:01"	00:30"	91%	P. E.
9°	Cadbury's	00:46"	00:12"	24%	P. E.
8°	Ariel	02:18"	00:12"	79%	P. E.
7°	Doritos	00:30"	00:10"	94%	F. E.
6°	Nike	01:00"	00:05"	91%	F. E.
5°	S7 Airlines	03:22"	02:42"	64%	P. E.
4°	Vodafone	02:29"	00:13"	39%	P. E.
3°	Shell	03:03"	00:09"	76%	F. E.
2°	Channel 4	03:12"	03:12"	0%	F. E.
1°	John Lewis	01:30"	00:03"	67%	P. E.

T.T = Total Time of the advertising; T.E.B = Time of Exposure of the Brand; R.B = Recognition of the Brand

E.R.P = Evaluation of the Reserched Public (P.E. = Partially Emotional; F.E. = Fully Emotional).

Regarding the videos division between fully and partially emotional, the results obtained suggest that the generation of brand awareness does not depend on the type of content, since two videos had 91% of brand recognition, one being classified as fully emotional (video 6) and the other as partially emotional (video 10). Thus, it is suggested that brand awareness occurs regardless of the content.

As regards the time of exposure of the brand in the videos, we couldn't find similarities among them, which makes sense considering that the proposal and purpose of creating a video depends on the context and the results expected by the presented brand or product. Thus, the exposure time varied between 3 seconds and 2 minutes and 42 seconds.

These results suggest the absence of a proportion of brand exposure time in the total time of the video. For the most viral video (video 1), the brand exposure time was only 3 seconds of a 1 minute and 30 seconds total. In this case, the brand exposure time was approximately 3% of the total video time.

Regardless of the absolute or relative exposure time, the creation of brand awareness appears not to be impacted. In the video by *Nike*, used as an example above, the time of 5 seconds meant 3% of the total but indicated brand recognition from 91% of the responses.

In order to evaluate how exposure time of the brand or video content influences the generation of brand awareness, we analyzed these variables in all videos. The results obtained suggest the inexistence of a direct relation between each of the variables and the respective generation of brand awareness, as exemplified below.

The first example, referring to the video by *S7 Airlines*, obtained a brand recognition index of 64% although the logo is present in approximately 80% of the total time. This suggests that, because the company is not present in the students's daily lives, the generation of brand awareness is insignificant. On the other hand, there is the video by *Nike*, in which the company logo appears for only 3 seconds, but the brand recognition rating was 91%.

The second example, refers to the video by *McDonald's* company. The presence of the logo was approximately 50% of the total time, it is fully emotional, but the students classified it as partially emotional. The video, which takes part inside a company's franchise, has emotional appeal and the story created for the campaign appears to have impacted the public much more than the presence of the logo, suggesting that brand awareness is generated regardless of the emotional aspect. On the other hand, there is the video by *Channel 4*, in which the students got the content of the video right, however, the brand recognition index was 0%, even with the logo being present during the entire video.

## 5 Final Considerations

By the results obtained and the analyzes made, we identify and suggest that additional studies should be done with the intention of deepening the relationship between Viral Marketing and brand awareness. Although the results showed that *viralization* is generating brand awareness and that the type of content (fully or partially emotional) does not impact directly on brand awareness (measured by the correct index of responses), the analysis indicates the need of exploration in future researches. In this section we will discuss some of the observations made.

In this study, 40% of the videos were classified as fully emotional. In the study by Berger and Akpınar (2017), these authors indicate that only 20% of the emotional advertisements could be classified as fully emotional. They also mention that the companies responsible for creating these advertisements believe that the presence of the brand could negatively impact the amount of shares and views, thereby reducing brand exposure in the video. The present research, therefore, obtains different results from those published by Berger and Akpınar (2017) in which 40%, almost half of the students, classified the videos as fully emotional.

Additional studies are suggested because of our different results, as a way to understand and establish the most adequate classification of fully or partially emotional video, for example the already discussed *Channel 4* and *McDonald's*, since, regardless of the emotional aspects, the *viralization* could happen.

Regarding brand exposure time and the generation of brand awareness, we identified that the brand recognition most related to a previous knowledge, like it is seen in *Nike's* case, that presented low exposure time and a high index of correct answers. The reverse situation occurs with the companies *Channel 4* and *S7 Airlines*, where the exposure time was high, however, was not able to generate brand awareness. Thus, we suggest that future studies should be done to explore the relation between Viral Marketing and brand awareness, because the results show that if a company is already highly recognized in the market, *viralization* will only reinforce the existing brand awareness. While a company that has low brand awareness will not directly benefit from a viral video.

These observations have an important managerial impact, since, is not a good decision for a company with low brand awareness to allocate investments on the development of viral videos. In this case, companies should initially invest on brand awareness campaigns with tactical activities and initiatives that will ensure longer brand exposure.

These recommendations, however, are also related to one of the limitations of this study, which is the low number of respondents. The sample of 30 students is relatively low and, therefore, it is necessary to conduct new studies with a wider and more diverse sample. The choice of students in a single discipline does not consider the influence of other aspects, such as demographic and regional factors. Although all companies used were multinational, some have a greater presence in the Brazilian

market than others, which brings the need to carry out this study to other parts of the world.

## 6 Conclusion

Viral Marketing has always attracted the attention of companies and schoolers. Word-of-mouth marketing worked in a period when there was no internet and even today with the use of digital platforms it is used to reach a wider public and ensures brand exposure. This research explored Viral Marketing in order to understand whether making a video go viral generates brand awareness and whether the presence of a company logo and exposure time impact brand awareness.

We conclude that viral videos create brand awareness, but in a limited way, since the previous knowledge on a particular brand also influences on the identification of it in advertisements or future videos, as seen in *Nike's* case. Thus, companies that have *viralized* videos but are not recognized do not fully benefit from its fame.

We also conclude that there is no direct relation between the presence of a logo or its exposure time and the generation of brand awareness. As an example, there is the case of *Channel 4* in which the brand was exposed throughout the entire video, however the brand awareness was not obtained in a significant way.

Considering everything that was said, we understand that this practical research contributes to the academic field by showing that the *viralization* of videos involves several factors and that the correlations found need a deeper study. It also contributes to the management field by proposing that investments on viral video as a form of brand awareness require a greater strategy in the process of content creation and a prior assessment of the level of audience knowledge of the brand, considering the platform in which the advertising will be placed, the heterogeneity of the target audience and the adherence of this public to the techniques used in the advertisement, since the expected results may not be achieved due to limitations in the use of this field and the underutilization of the information obtained in the advertisement data collection stage.

(E-mail: 365186597@qq.com, hanhua@whut.edu.cn)

**Abstract:** In this paper, principles and solving process of basic genetic algorithm are firstly summarized. Considering that in view of TSP, basic genetic algorithm is likely to converge to the local optimal solution and often converges with low speed, we absorb advantages of other intelligent algorithms, with the purpose to enhance performances of genetic algorithm for solving TSP. The crossover operation in the genetic algorithm is improved by the colonial assimilation in the discrete imperialist competition algorithm, and to enhance the diversity of the population variation, we improve the mutation operation of the genetic algorithm by combine it with the Levy flight method. Finally, we test the performance of our proposed algorithm with some typical instances in the internationally commonly used library of TSP (TSPLIB), and the results are compared with performances of basic genetic algorithm and discrete flower pollination algorithm over the same instances set. The experiment results show that our improved genetic algorithm has high quality and fast convergence speed.

**Key words:** Traveling salesman problem; Genetic algorithm; Imperialist competitive algorithm; Levy flight

## 1 Introduction

The Traveling Salesman Problem (TSP) is one of the well-known combinatorial optimization problems in the field of operations research and has been proven to be a NP-hard problem, which means that no polynomial time algorithm that solve TSP with exact solution can be found unless NP=P. Our target in this problem is to find the shortest circular path that traverses all destinations once in a complete graph. TSP is rather close to real-life backgrounds and has a wide range of engineering applications. Instances that utilize thought of TSP include car-frame procedure scheduling, logistics distribution, aircraft routing arrangement, printed circuit board welding, etc. Many problems can be abstracted and transformed into TSP for simplification. Therefore, solving TSP effectively and quickly has high practical value.

There are mainly two types of methods for solving the TSP. One type is deterministic algorithm based on search, such as exhaustive method, branch definition method (Carpaneto G,1980), dynamic programming method (Bellman R,1962) and so on. All algorithms of this type have exponential complexity. The other type is intelligent algorithms that solve TSP approximately, such as genetic algorithm, ant colony algorithm, annealing algorithm, immune algorithm and so on. With the deepening of research, new algorithms with higher accuracy or/and lower complexity emerge. In *A fast Ant colony optimization algorithm for traveling salesman problems* (Ji J Z, Huang Z, Liu C N, 2009), an ant colony algorithm for solving traveling salesman problem was proposed; Marinakis et al. (Yannis Marinakis, Magdalene Marinaki, 2010) proposed a hybrid multi-particle swarm optimization algorithm; in Development a new mutation operator to solve the traveling salesman problem by aid of genetic algorithms (Murat Albayrak, Novruz Allahverdi, 2011), the greedy search algorithm was introduced into the genetic algorithm mutation operation to design a new greedy sub-path mutation operator; Yang Xinshe et al. (Li Qian, He Xingshi, Yang Xinshe, 2016) proposed a discrete flower pollination algorithm to solve the TSP problem.

This paper analyzes the genetic algorithm and the principle of solving the TSP, and then improves the genetic algorithm with absorption of other intelligent algorithms' advantages to strengthen its search ability. Experiments were carried out with TSPLIB data set, consequence of which verifies that our newly proposed genetic algorithm significantly improves the quality of the solution compared to basic genetic algorithm and pollination algorithm.

## 2 Basic Problem Description

### 2.1 Overview of TSP problem

The earliest description of the TSP was Cavalier travel problem researched by Euler in 1759, that is, for 64 squares in a chessboard, a knight is required to visit each square once and only once, and finally returns to the starting point (Baidu Baike, 2014). The general description of TSP is: there is a graph in which all cities are connected to each other with known distance between each city. Our target is to help a traveler wants to go over each city once and only once, and finally comes back to the starting city, to find the circular path with the shortest distance he can follow. Its mathematical model can be expressed as follows:

Let  $G = (V, E)$  be the weighting graph,  $V = \{1, 2, \dots, n\}$  be the vertex set,  $E$  be the edge set, the distance between the vertices is  $C_{ij}$ , and  $(C_{ij} > 0, i, j \in V)$  is known, and set:

$$x_{ij} = \begin{cases} 1 & \text{on the optimal path} \\ 0 & \text{other} \end{cases} \quad (1)$$

Then the mathematical model of the entire TSP problem is expressed as follows:

$$\min Z = \sum_{i \neq j} C_{ij} x_{ij} \quad (2)$$

$$s.t. \begin{cases} \sum_{i \neq j} x_{ij} = 1, j \in v \\ \sum_{j \neq i} x_{ji} = 1, j \in v \\ \sum_{i, j \in s} x_{ij} = |K| - 1, k \subset v \\ x_{ij} \in \{0, 1\}, i, j \in v \end{cases} \quad (3)$$

Where  $K$  is the total non-empty subset of  $V$ , and  $|K|$  is the number of vertices contained in  $K$ .

### 2.2 Introduction to genetic algorithm

Genetic algorithm is a stochastic parallel search algorithm based on the principles of natural selection and genetics, and is an efficient optimization method that seeks for global optimal solutions without any initialization information (Ren Z W, San Y, 2006). The genetic algorithm expresses the solution set of the problem in the form of the individual's genetic code in a population which is compromised by multiple individuals. In genetic algorithm, the quality of the solution is enhanced through continuous selection, crossover, mutation and other genetic operations. This intelligent algorithm has few restrictions on the properties of problems or the search space. It is also often easily combined with other algorithms, and has strong global search ability as well as strong robustness for solving nonlinear problems, which makes it to be widely applied into the fields of automatic control, function optimization, pattern recognition, image processing and other engineering fields. Genetic

algorithm is also one of the commonly used methods for solving NP-hard problems.

### 2.3 Genetic algorithm solves the principle of TSP problem

The genetic algorithm evolves from generation to generation based on fitness values to find the optimal solution of the problem. The main calculation process for a simple genetic algorithm to find a secondary TSP problem is as follows:

Step1: According to the coding mechanism, the route is encoded by the city serial number, and the composition codes are sorted according to the order of visiting the city to generate an initial population.

Step2: Calculate the fitness value of each individual in the initial population. In TSP, our purpose is to find solution circular path with the shortest distance (least cost), so the fitness function is designed as  $fit(i) = D / f(R_i)$ . The constant D can prevent the cost of path from being too large which will cause the fitness function value to be close to zero.

Step3: Selection operation. The selection in population is usually done using roulette or elite retention strategies, so that individuals with higher fitness values also have greater probability to be selected. The formulas for calculating the probability for an individual to be selected and the corresponding cumulative probability are as follows:

$$P_i = fit(i) / \sum_{i=1}^n fit(i), \quad Q_i = \sum_{j=1}^i P_j \quad (4)$$

Step4: Cross operation. Similar to mating and breeding process in reality, in the genetic algorithm, we select the parent individuals to perform the cross-operation to generate the offspring according to the crossover probability. The commonly used methods of cross-operation include single point intersection, partial mapping intersection, and cyclic intersection.

Step5: Mutation operation. In order to maintain the diversity of the population and avoid the local optimization in the early stage of evolution, in the genetic algorithm, genes of individuals are randomly determined to be mutated or not according to the mutation probability. Commonly used mutation operations include reverse order mutation and direction learning.

Step6: Evolutionary termination. When the preset maximum evolution algebra is reached, the iteration process is stopped and current solution will be returned as the best solution we achieve in this algorithm. Otherwise, we'll return to Step2 to calculate the fitness value of the new population, and the next round of evolution will be performed.

Simple genetic algorithms often have shortcomings such as slow convergence speed, trappings in local optimum, and low optimization accuracy. In order to improve the convergence rate of the algorithm while ensuring the diversity of the algorithm and making the algorithm result as close as possible to the optimal solution, we combined the advantages of other intelligent algorithms with the basic genetic algorithm and try to improve its performances.

### 3 Improvement on Basic Genetic Algorithm

Procedure of basic genetic algorithm includes crossover operation, mutation operation, and selection operation. And improvements on genetic algorithm mainly focus on three aspects:

1. Mixture of strategies. For instance, strategy of elite selection can be utilized in crossover operation, with the purpose to prevent negative crossover which will pollute genes of whole population.

2. Replacement of steps in genetic algorithm with methods coming from other intelligent algorithms. We can replace crossover, mutation or selection operation in genetic algorithm by optimization strategy of other algorithms, so that shortages of genetic algorithm can be made up.

3. Combination of multiple intelligent algorithms. For instance, we may employ algorithm that converges fast as our initial strategy, in order to obtain a good solution. Based on it, we utilize genetic algorithm to further enhance the accuracy of our final solution. This method decreases calculation time of genetic algorithm while ensuring quality of solution.

This paper modifies genetic algorithm at aspects of 1 and 2. We replace crossover operation by colonial assimilation in imperialist competition algorithm, and introduce strategy in Levy flight into mutation operation to increase diversity of mutation. In this paper, algorithms focus on solving discrete optimization problem, with possible linear or nonlinear restrictions, and variables range in all real numbers.

Compared to tradition intelligent algorithm, this algorithm employs advantages of other algorithms to make up for the shortcomings of basic genetic algorithm. Compared to greedy algorithms and annealing algorithms, our improved genetic algorithm has less dependency on original population. Compared to ant colony algorithm, it requires less calculation time, under the condition that solutions of equal quality are guaranteed.

## **4 Improved Crossover Operation based on Imperialist Competition Algorithm**

### **4.1 Overview of the imperialist competition algorithm**

Inspired by the imperialist colonial competition mechanism, Atashpaz Gargari and Lucas proposed a new intelligent optimization algorithm, the Imperialist Competition Algorithm (ICA), in 2007. The algorithm was mainly used to solve continuous optimization problems when it was initially proposed, and has been gradually applied into complex discrete combinatorial optimization problems later. Mohammadi et al. (Mohammadi-ivatloo B, Rabiee A, Soroudi A, 2012) applied ICA to the location problem of the hub station and achieved desirable results. Seyedmohsen et al. (Hosseini S, Khaled A, 2014) pointed out that ICA can be introduced to solve the TSP; Ardalan et al. (Ardalan Z, Karimi S, Poursabzi O, 2015) tried to solve the generalized traveling salesman problem by using ICA. (GTSP).

Different from other intelligent algorithms, ICA is created with inspiration from social behavior, and it is an optimization method formed by simulating colonization assimilation mechanism and imperial competition mechanism. The solution space is composed of a few countries. According to the size of power, these countries are divided into two types: the empire and the colony, and then the colonies are assigned according to the power of the empire. In the evolutionary stage, the empire conducts local search through colonial assimilation, revolution, and empire enhancement. The empire exchanges information through empire competition and conducts global search. When the maximum number of iterations is reached or there is only one existing country, the iteration stops. And the current best solution will be returned as the local optimal solution we search for.

### **4.2 Improvement based on colonial assimilation**

Colonial assimilation refers to the process that the inner colonies of the empire approach to the colonial state (a better solution). Here we use the alternative reconstruction method to replace the crossover operation in the genetic algorithm to generate new individuals. The specific steps are as follows:

Step1: Randomly generate a number between 0 to 1 at coding position of each city in a generation.

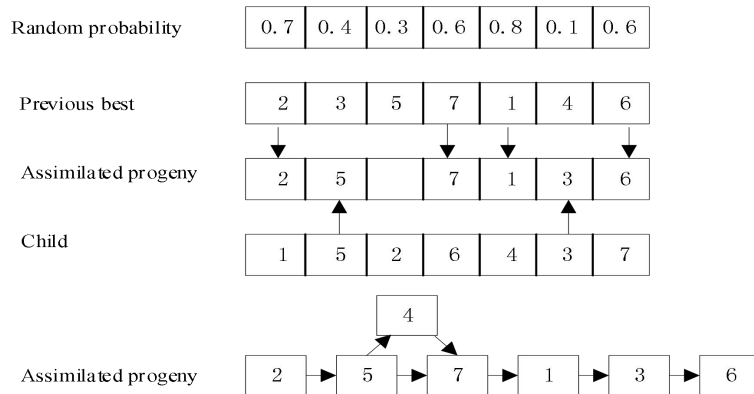

Step2: According to the assimilation probability  $P_a$ , if the random number of a city is greater than or equal to  $P_a$ , the city at the corresponding position of the best individual in previous generation is used as assimilated progeny.

Step3: For a position which has probability less than  $P_a$ , if the code of city the position does not appear at other positions of the assimilated progeny, the city code at this position is used as the code for assimilated progeny. Step 2 and Step 3 are collectively referred to as the replacement process.

Step4: The reconstruction process. For the city code that does not appear in the assimilated progeny, calculate the increasing distance of inserting all possible positions in the assimilated progeny, and insert the city code into the position that brings minimum increasing distance according to the greedy strategy. The formula for calculating the increasing distance is as follows:

$$Add = dis(a,i) + dis(i,b) - dis(a,b), \tag{5}$$

Where  $dis(a,i)$  represents the distance from city to city  $i$ , and  $Add$  represents the distance between cities coded as  $i$  and cities coded  $a$  and  $b$ .

**Figure 1 Assimilated Progeny Generation Process**

The specific generation process is shown in Figure 1. The progeny is assimilated according to the random probability sequence and the best individual of previous generation. Here  $P_a$  is set as 0.5. It can be seen from the figure that the code 2716 of the best sequence of the previous generation is directly used as the coding of the assimilated progeny. The positions which have probabilities less than 0.5 are coded as 523. Since the code 2 has appeared in the assimilated progeny, only 5 and 3 is placed in the assimilated progeny position. Since least increasing distance will be brought if the code 4 is inserted between 5 and 7, the assimilated progeny is 2547136.

Compared with the crossover operation of simple genetic algorithm, the colonization assimilation process changes genes of individuals at the overall level, which diversifies the whole population. And each generation is assimilated according to the best individual of the previous generation. Therefore, global search range is expanded while the convergence speed is ensured.

## 5 Improved Mutation Operation based on Levy Flight

### 5.1 Levy Flight Overview

Levy flight is essentially a random movement process with variable steps, which can move a

random step in different directions with a certain probability at the starting point to achieve the effect of local search. In recent years, there have been many studies on Levy flight. Michael (Michael F Shlesinger, 2006) combined Levy flight with the group intelligence algorithm, using large-step global search in the early stage of algorithm and local search with small step in the later stage. Shlesinger (Zhang Y, Wang L, Wu Q, 2012) employed Levy flight to increase population diversity and jump out of local optimum in intelligent algorithm. Therefore, we'll utilize Levy flight in the genetic algorithm to increase the search ability of the algorithm.

The Levy distribution function can be transformed into following probability density function:

$$Levy(\beta) \sim \mu = t^{-\beta} \quad 1 < \beta \leq 3 \quad (6)$$

We calculate the Levi random number using the following formula:

$$Levy(\beta) \sim \frac{\phi * \mu}{|v|^{\frac{1}{\beta}}} \quad (7)$$

Where  $\mu, v$  obey the standard normal distribution:  $\beta = 1.5$

At the same time, the formula for  $\phi$  is as follows ( $\Gamma$  is the gamma function):

$$\phi = \left( \frac{\Gamma(1 + \beta) * \sin(\pi * \beta / 2)}{\Gamma(\frac{1+\beta}{2}) * \beta * 2^{(\beta-1)/2}} \right)^{1/\beta} \quad (8)$$

The effect diagram of Levi's flight from 100 steps to 1 trajectory is shown in Figure 2:

**Figure 2 Levy Flight Path Map Figure 3 Levy Flight Wave Diagram**

Until now we discuss the application of Levy flight in continuous problems. Here we'll use Levy flight to perform discrete processing and apply it to the solution of TSP. According to the study of Aziz Ouaraab (Ouaraab A, Ahiod B, Yang Xin-she, 2014), the Levy flight is controlled in  $[0, 1]$ . According to the maximum value of the moving step  $n$ ,  $[0, 1]$  is equally divided into  $n$  intervals. The moving step size is defined by at which interval the value of Levy flight falls. However, search ability is limited in this algorithm and it is easy to fall into the local optimal solution. Therefore, we use the gradient transform step size to maintain the diversity of the population. It can be seen from Fig. 3 that the Levy flight is mainly distributed in the vicinity of 0 in the interval  $[0, 1]$ , and the frequency is decreasing as

the step size increases. Therefore, the transformation rule is determined as follows, where  $m$  is the number of cities traversed (rounded according to nearest integer):

Levy at  $[0, 0.1]$ , the individual performs  $m*10\%$  mutations;

Levy at  $(0.1, 0.3]$ , the individual performs  $m*20\%$  mutations;

Levy at  $(0.3, 0.5]$ , the individual performs  $m*30\%$  mutations;

Levy is greater than 0.5, the individual performs  $m*40\%$  mutations;

Through the above analysis, we can know that the random step size of Levy flight takes both global search and local search into account, so the mutation operations of other genetic algorithms are combined to ensure the population diversity in the iterative process.

## 6 Flow Chart and Pseudo Code of Improved Algorithm for Solving TSP Problem

In this paper, we use the pseudo-code and flow chart to describe the solution process of the test function by Colonial assimilation and Levy flight mutation operator based Genetic Algorithm (CLGA). The pseudo code of the main program of the CLGA algorithm is as

```

Procedures of the proposed CLGA algorithm
Begin
   $t = 0$ ;
  Initialize  $P$ ;
   $P(t) = \{X_1(t), X_2(t), \dots, X_n(t)\}$ 
  Evaluate  $P(t)$ ;
   $f(P(t)) = \{f(X_1(t)), f(X_2(t)), \dots, f(X_n(t))\}$ 
  While ( $t < t_{\max}$ ) do
     $P_s(t) = \text{Selection } \{ P(t) \}$ ;
     $P_a(t) = \text{Assimilation } \{ P_s(t) \}$ ;
     $P_L(t) = \text{Levy-Mutation } \{ P_a(t) \}$ ;
    Evaluate  $P_L(t)$ ;
    if  $t < 1$  then
      do  $X = \min \{ P_L(t) \}$ ;
    else
      if  $X < \min \{ P_L(t) \}$ 
      do  $X = \min \{ P_L(t) \}$ ;
    end
  end
   $t = t + 1$ ;
end
follows:
end
end

```

In the above pseudo code,  $t$  represents the number of iterations of the algorithm,  $t_{\max}$  represents the maximum number of iterations, *Initialize* represents the initial population,  $P(t)$  represents the  $t$ -th generation, *Evaluate* represents the fitness value, and *Selection*, *Assimilation* and *Levy-Mutation* are selection operation, colonization assimilation, and Levy flight variation operations respectively. The corresponding  $P_s(t)$ ,  $P_a(t)$  and  $P_L(t)$  are new populations produced by selection, assimilation, and Levy

mutation;  $X$  represents the optimal solution in the evolutionary process.

The specific flow chart of the CLGA algorithm is shown in Figure 4.

It can be seen from the flow chart that CLGA is the same as the basic genetic algorithm in the overall algorithm structure. Our improvement focuses on the crossover and mutation operations. The usage of colonial assimilation and Levi's flight to replace crossover and mutation operations increases the diversity of population evolution and avoids falling into local optimum.

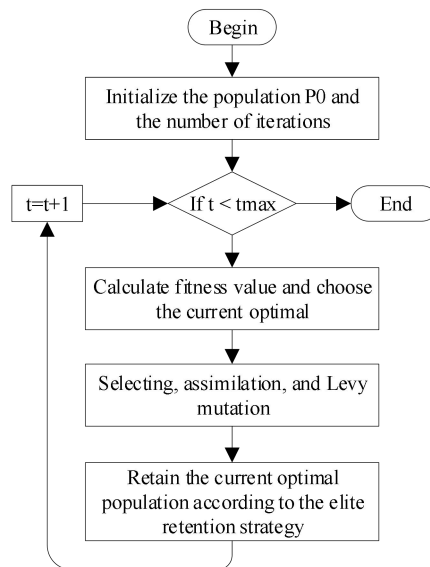

Figure 4 CLGA Solves the TSP Problem Flow Chart

## 7 Algorithm Experiment and Analysis

### 7.1 Experiment result analysis

To further verify the performance of the improved genetic algorithm, we choose the data set in the TSPLIB standard library for experimental testing. Experimental environment: The operating system is Windows 10, the CPU is i7-6498DU, the memory is 4G, and the programming software is MATLAB.

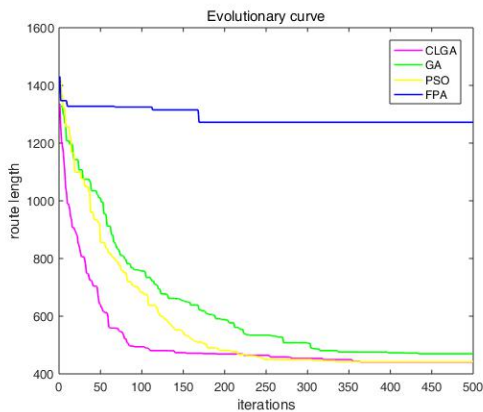

We compare the CLGA mentioned in this paper with genetic algorithm (GA), particle swarm optimization (PSO) and pollen algorithm (FPA), and analyze its computational accuracy, time consumption and convergence speed. The population size is 100, the evolution frequency is 500 generations; the assimilation probability of CLGA is 0.5; the crossover probability of genetic algorithm is 0.9, the mutation probability is 0.1; the conversion probability of pollen algorithm is 0.8;

We selected 5 sets of TSPLIB data (Ulysses16, Bayg29, Att48, Eil51, rat99) for experiments. The experimental data shown in the following table:

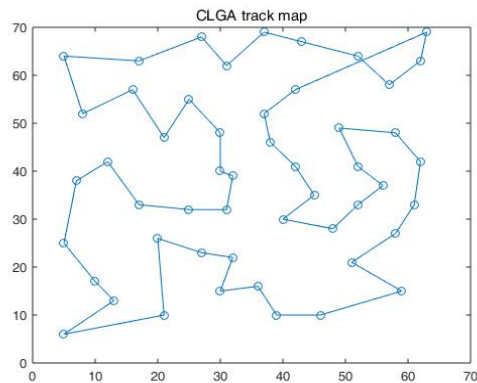

**Table 1 Comparative Analysis of Experimental Results**

Instance	TSPLIB	CLGA		GA		PSO		FPA	
	Value	Value	Time	Value	Time	Value	Time	Value	Time
Ulysses16	74.1087	74.1087	6.997	74.1087	5.348	74.1087	2.026	89.1189	1.42
Bayg29	9074.1	9074.1	9.633	9280.9	10.124	9309.3	2.223	18099	1.905
Att48	33523.7	34327.7	15.811	34781	11.767	35550.5	2.95	107100	3.209
Eil51	426	441.3	12.576	469.9	11.562	442.5	2.869	1272.2	2.879
rat99	1211	1308.0	25.614	1421.9	20.236	1391.5	5.417	6738.7	6.514

It can be seen from the above table that although the calculation time is increased compared with the GA, CLGA improves the calculation accuracy, especially when the number of cities is large. Compared with the other two intelligent algorithms, PSO has higher calculation accuracy and shorter calculation time. It can find solution of high quality quickly in small size data set. However, when the amount of data increases, its calculation accuracy is not as high as CLGA. Although the FPA has least calculation time, it has obvious calculation error and is required to be improved before it can be used in practical applications. Taking the calculation of Eil51 as an example, the convergence graph of each algorithm and the path diagram of the optimal result shown in Figures 5 and 6:

**Figure 5 Convergence Curve**

**Figure 6 Eil 51 Path**

The pink, green, yellow, and blue curves in Figure 5 represent the convergence trends of CLGA, GA, PSO, and FPA, respectively. It can be seen from the graph analysis that the convergence speed of CLGA is increased and the accuracy of the solution is also improved compare with GA. On the other hand, the quality of solution generated by FPA is not good. Both figure and table tell that the intelligent algorithm CLGA in this paper improves the convergence speed and calculation accuracy of the TSP problem compared with the basic genetic algorithm, and has advantages compared with other group intelligent algorithms.

**7.2 Advantages and disadvantages of algorithm**

The experiment consequence analysis indicates that improved genetic algorithm has favorable performances on solution accuracy over other algorithms while solving small-sized TSP. Nevertheless,

corresponding to the increasing number of cities in TSP, this favor decreases, though it still has advantages at aspect of calculation time. In analysis of convergence curve of algorithm, we can tell that its convergences fast at the early stage of calculation, due to the diversity brought by colonial assimilation operation, and randomness brought by Levy flight. On the other hand, this paper verifies the compatibility between genetic algorithm and other intelligent algorithms. Hence, on solving other problems in operational research field, we may also be able to absorb advantages of other algorithms into genetic algorithm to achieve some enhancement on its performances.

## 8 Conclusion

This paper designs an improved genetic algorithm for solving the TSP problem, introduces the colonial assimilation operation of the imperial competition algorithm to replace the crossover operation, and combines the Levy flight to enhance the mutation operation. The strong mutation ability of imperial competition algorithm and Levy flight is utilized to increase the diversity of the population and enhance its global search ability. The experiment results show that the improved algorithm can guarantee satisfactory calculation accuracy and improve the speed of the algorithm in solving the small-scale TSP. However, when the data size increases, the calculation time grows and the convergence capability is reduced. In the latter study, research concerning to improvements during local search can be conducted to increase the convergence speed in case of large data set.

(E-mail: golikid2@hotmail.com, jianmuye@126.com, 56083231@qq.com)

**Abstract:** This paper explicates the way a Leader’s support for eco-innovation promotes corporate environmental responsibility (CER) in the organization. As established in the paper, the leader’s support is seen to provide the resources and promoting innovative environments where employees can come up with an efficient means of production. Examples such as the leader’s direct statement of environmental commitment are also demonstrative of the support for eco-innovation hence promoting CER to avoid resource wastage. The secondary and primary methods using a quantitative design are used to collect the results. There is the demonstration that there is increasing leadership support for innovative approaches to the environment and this has also led employees to preserve resources available in the organization. It is recommended that smart processes should be encouraged by leaders to achieve even better CER in the organization.

**Key words:** Leader; Eco-innovation; Corporate environmental responsibility; Organization; Employee

### 1 Introduction

Companies have always been encouraged to uphold the highest standards of environmental protection in the course of their operations. Eco-innovation entails the incorporation of technology into the company to produce products and services are friendly to the environment (Aguado and Holl, 2017). More so, it focuses on aspects such as the reduction of emissions and resource consumption in the organization. A leader’s support of eco-innovation is always a big advantage because it directly promotes corporate environmental responsibility (hereinafter, CER) performance in these organizations. For developing economies, it is even more important than the leader plays an instrumental role in supporting eco-innovation hence leading to even more actions of CER in the organization (Weng, Chen and Chen, 2015). A leader’s support for eco-friendly innovation is always bound to have a positive impact on the CER of the organization because it influences employees toward the direction of seeking sustainable options for the organization.

### 2 Examples

The examples of the outcomes of a leader’s support for eco-innovation to promote CER are presented below. The involvement of leaders is a direct representation of the actions that employees and the company will take regarding the proper protection of the environment (Amitrano et al, 2018). Thus, the examples are as showed below;

**Table 1 Leader Support of Eco-innovation and Employee Support**

Variable(s) Entered	Dependent Variable: green product innovation practices			
	Hypothesis	Main effects	Interaction	Result
Innovation orientation		0.342 ***	0.371 ***	
Employee conduct		0.366 ***	0.412 ***	
Innovation orientation × Employee conduct	H8a		0.343 *	Supported
<b>R<sup>2</sup></b>	0.40	0.50		

Note: \* indicates  $\rho < 0.05$ , \*\* indicates  $\rho < 0.01$ , \*\*\* indicates  $\rho < 0.001$ .

PLS Results for moderation effects (green process innovation practices).

Variables (s) Entered	Dependent Variable: green product innovation practices			
	Hypothesis	Main effects	Interaction	Result
Innovation orientation		0.143	0.145	
Employee conduct		0.498 ***	0.513 ***	
Innovation orientation × Employee conduct	H8b		0.041	Not supported
<b>R<sup>2</sup></b>	0.35	0.35		

Note: \* indicates  $\rho < 0.05$ , \*\* indicates  $\rho < 0.01$ , \*\*\* indicates  $\rho < 0.001$ .

Source (Weng, Chen, and Chen, 2015)

In Table 1 above, there is a demonstration of innovation orientation regarding green production in the organization. When there is support from the leaders for eco-innovation, employees are also highly motivated to adopt innovative ideas to the production process (Tseng, Chang and Chen, 2019). However, if there is no such support, then there is a challenge with the realization of CER. There is the demonstration that the first action that is undertaken by managers is the recipe for CER in the organization especially if employees are influenced in the same direction (Buhl, Blazejewski, and Dittmer, 2016).

**Table 2 Leader’s Support for Eco-Innovation and Sustainability**

Vb	ERAD	%
c1	Openly states having implemented an EMS (ISO 14000 and/or EMAS)	62,82%
Environmental Information available		44,23%
c2	Openly states environmental commitment and/or policy	66,67%
c3	Openly shows details about the company’s environmentally related activities	39,10%
c4	Openly delivers a Sustainability/environmental/CSR report	26,92%
Environmental accounting available		4,17%
c5	Openly presents environmentally related economic data (expenses, provisions etc.)	8,33%
c6	Provides details information about environmental accounting in largest accessible financial database (SABI)	0,00%

Source: (Fondevila, Moneva, and Scarpellini, 2018)

In Table 2 above, there is also the presentation of the adoption of environmental management systems (EMS) that encourage eco-innovation within the organization (Calza, Parmentola and Tutore, 2017). The open declaration of the information related to the impact of the manager’s openness in supporting eco-innovation on the attainment of CER (Jo et al., 2015). The realization of CER is represented by the declaration of the sustainability goals of the organization through the corporate social responsibility (CSR) report as shown above (Tsai and Liao, 2017).

### 3 Data and Methodology

The identification of a specific method is vital for the collection of the data to be used in answering the questions in the study. A methodology needs to be clear enough to show the steps that will be followed in the collection and presentation of data in the study (Williamson and Johanson, 2017). For this research, it will be important to identify a specific method that will simplify the collection and the presentation of data.

The specific approach for this study will be the quantitative approach. The quantitative study approach entails the presentation of statistical information in the research. A quantitative approach is

chosen because it helps in the presentation of numerical data that is easier to comprehend through the subsequent discussions (Waring, Hedges and Arthur, 2017). More so, the quantitative approach is also preferred in this research because of its flexibility with data, in the sense that it could be used for a large population. However, the biggest downside is that the data collected through the quantitative approach cannot be easily generalized to the population.

The fundamental research question that is posed for this study is, How Does a Leader's Support for Eco-Innovation Promote Corporate Environmental Responsibility in Organization? Based on the research question, the independent variable is the leader's support for eco-innovation while the dependent variable is corporate environmental responsibility (CER). In tandem with the question, it should be noted that organizations are noticing the need to protect the environment and leaders are taking a leading initiative through the support of eco-innovation.

The first key gap in the literature is that there has been an insufficient explication of the approaches that show a leader's support of eco-innovation technologies in organizations. There are only general explanations about how organizations are transforming themselves to be environmentally friendly, but there is no clear discussion on the role that leaders are playing in this direction (Kumar and Kumar, 2017).

The second gap is that there has been insufficient utilization of quantitative methods to explore the link between the leader's support for eco-innovation and the promotion of CER (Sarkar, 2014). Most of the studies have explicated these variables differently, and this poses a challenge in understanding the link. More so, it is challenging to link the same to individuals such as employees.

The third gap is that there has been an only limited focus on countries when explicating the leader's role in adopting eco-innovation technologies. Most of the focus has been on developed economies in the analysis. There is no wider perspective on the aspect of developing countries (Gunaratne and Peiris, 2017). A wider focus on countries including companies in the stronger economy and the developing economy is key to understanding the benefit of leader impact on eco-innovation and the promotion of CER.

### **3.1 Method one**

The first method that will be followed will be a critical review of existing literature (Neumayer and Plümper, 2017). In this method, the previous studies that have been done on the impact of a leader's support for eco-innovation promote CER for the organization.

#### **3.1.1 Discussing Method One**

As noted above, the first method is a critical review of the literature. In this method, various journal articles and even CSR reports that talk about the leadership support of eco-innovative technology will be considered (Sekaran and Bougie, 2016). It will be important to get articles that directly discuss the topic and present findings that have been gathered. The method is helpful because it consumes less time especially because the article is readily available online (Hair, 2015). The researcher does not have to take much time to retrieve the article. More so, the method is helpful because it offers the opportunity to critically compare the results that have been found before across various studies hence setting the ground for the generation of conclusions and recommendations in the study. The key limitation of the method is that it lacks first-hand data that could help improve the reliability and credibility of the study's findings.

### **3.2 Method two**

The second method is quantitative research design. This is the approach that uses statistical approaches to present the data in the study. The method mainly entails the collection of data from human participants hence providing the opportunity for the presentation of first-hand data in the study.

#### **3.2.1 Discussing Method Two**

Method two is quantitative research design. The quantitative research design will be attained through the collection of findings using online questionnaires. The questionnaires as an approach to the collection of data are vital because they help the researcher gather a large amount of data from a large sample of the population (Fielding and Lee, 2016). The intention of the researcher is to make sure that there is independence in the study's course; thus, there will be a focus on the use of a positivist philosophy that separates the researcher from the sample population. The quantitative research design is also chosen because of the capacity to illustrate the real situation of the phenomenon through statistical numbers. This makes it easier to present data and explains hence reaching key conclusions and recommendations for the study. The researcher knows that there is a limitation of the quantitative

approach especially in terms of generalization. Thus, a larger sample will be included.

#### 4 Results

The results are key in illustrating the impact of a leader’s support of eco-innovation on CER. The two key variables include the leader’s support for eco-innovation technology (independent variable) and CER (dependent variable). These two variables are shown in the results that are presented below.

**Table 3 Result 1**

Variable Code	Definition of Question Items for the Analyzed Measure
<i>Technological eco-innovation (during last 3 years as compared to key competitors)</i>	
TEI-1	We usually were the first on the market to introduce new eco-innovative products
TEI-2	We have introduced more products that are eco-innovative
TEI-3	We have introduced products that are more eco-innovative
TEI-4	We usually were the first to introduce new, environment friendly methods of manufacturing, maintenance and logistics
TEI-5	We have introduces more or significantly improved processes bringing environmental benefits
TEI-6	We have been improving environmental parameters of our processes more effectively
<i>Operational performance (during last 3 years as compared to key competitors)</i>	
OP-1	Product quality
OP-2	Customer satisfaction
<i>Financial performance (during last 3 years as compared to key competitors)</i>	
FP-1	Increase in market share
FP-2	Profit growth
FP-3	Return on sale
FP-4	Return on investment

Source: (Ryszko, 2016)

In the diagram above, the key element that is illustrated concerns the leadership support for eco-innovation in companies. The key aspects that reflect leadership support are presented. One of the key aspects that are represented is that the management of organizations is always to support eco-innovative products (Dyllick and Muff, 2015). This is important because it gives employees the ability to be innovative and come up with products that have a less negative impact on the environment. The production of eco-innovative products is anchored on the resources that are provided by the members of the leadership within the organization (European Commission, 2014). The more resources there are, the more the focus of employees is on the production of environmentally friendly products.

More so, as showed in the table above, leadership support for eco-innovative technologies is seen through including processes that are highly innovative within the organization (Mocan et al., 2018). This entails the elimination of traditional means of production to introduce clean strategies that make sure

resources are well-used for the benefit of the organization. The proper use of resources from the environment and the subsequent replacement of those that have been taken for the completion of the production process show the support of the innovative strategy. It is through these improved processes that employees are also challenged to innovate and move the organization in the right direction.

Regarding the link between the leader's support for eco-innovation and CER, it is showed that there is better handling of the resources available in the environment (Ryszko, 2016). The product quality is of the highest standards and it does not harm the environment. More so, there is a focus on protecting the environment against harms such as dumping. All these processes are critical to ensuring that the environment is safe and hence long-term CSR.

**Table 4 Result 2**

Constructs	Scale items	Standardized Factor Loadings	Cronbach's $\alpha$	AVE	Composite Reliability

Source: (Tseng, 2019)

From the table above, when illustrating the link between approaches to innovation as supported by leaders, there is also the reflection of the view that the environment gains (Jang et al., 2014). For instance, environmental sustainability performance has been high with the emphasis on organizational processes that protect the dignity of the environment by protecting aspects such as the dumping of wastes into the water resources. The environment also gains to a great extent because there is the protection of resources that have been traditionally wasted by companies (McNally et al., 2015). When leaders in the organization take the initiative and support eco-innovation technologies, there is always the opportunity that employees will also get into the practice based on the influence of their leaders (Fondevila, Moneva, and Scarpellini, 2019). As part of CER, consumers always stand the chance to get the best quality of products that have been generated through innovatively sustainable means encouraged by their own leaders (Rizos, Behrens, and Taranic, 2015). Thus, innovative practices in the process of production and implementation of processes in the organization should always be a priority as it helps lead to a better environment.

## 5 Conclusion

Overall, there is a significant impact on CER when leaders support eco-innovative technologies in companies. The influence of leaders trickles down to employees who use innovation to protect the environment through the environment.

Thus, there are three key recommendations regarding the innovative points as per this research. There should be an encouragement of smart processes in the production processes that help to protect environmental resources. The excessive reliance on resources such as trees is undesirable because it only hurts the environment further. The second aspect of innovation concerns the mitigation of greenhouse gases that are released to the environment through improved means of production using new technology rather than old machines. The technology that could be encouraged is technology flue gas cleaning. This further protects the environment by making sure that there is no form of pollution that hurts the environment. The third aspect of innovation is to utilize wind turbines where possible to mitigate the pollution of the environment through undesirable gases from fuels. Thus, there are many points of innovation and organizations should pay attention to the points that favor them and their processes.

# Research on the Impact of High-tech Enterprise Technology Diversification Development Strategy on Enterprise Performance

Mou Jiongxu, Liu Ying

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 463730589@qq.com, 961980755@qq.com)

**Abstract:** This paper selected some high-tech enterprises in China from 2011 to 2017 as samples, and empirically analyzed the relationship between technology diversification strategy and enterprise performance of enterprises which are taking artificial intelligence projects as an example by a method of using data envelopment analysis (DEA). The research results of this paper show that the development of artificial intelligence projects on high-tech enterprises to carry out technology diversification strategy has a positive role; Technology diversification will have a negative impact on the financial performance of enterprises, but it will improve the market value of enterprises. The conclusion of this paper has a certain reference value for the high-tech enterprises in the development period to implement the diversified strategy.

**Key words:** Artificial intelligence; Diversified technology; DEA model; Enterprise performance

## 1 Introduction

High-tech enterprises are knowledge-intensive economic entities engaged in the scientific research, development, production and sales of high-tech products, the commercialization of scientific and technological achievements, and related technology development, service and consultation, with innovation as the development mission and the main means of survival. It plays an important role in our national economy.

Under the background of "Internet plus" and supply-side structural reform, economic growth has gradually entered into the stage of knowledge innovation driven by previous investment and production factors. Meanwhile, rapid economic growth has given birth to some high-tech "unicorn" enterprises. At the same time, the continuous development of Internet technology and the increase of market purchasing power also provide a good foundation for the development of high-tech enterprises, and enterprises have adopted the diversification strategy to open up new markets. Relying on the competitive advantages of their core technologies, they have expanded their technical activities or research scope to a variety of fields, such as artificial intelligence, autonomous driving and cloud computing and so on.

Technology has always been regarded as the power pillar of high-tech enterprises. Some scholars use resource utilization theory to view technology as a special resource for enterprises, which is conducive to improving the competitive advantage of enterprises. If enterprises only have a single technical capability, it is difficult to meet market demand and achieve sustainable development, so technology diversification becomes the important technological innovation strategy. However, with the continuous implementation of the technology diversification strategy, the cost of searching, screening, evaluating and integrating external knowledge, as well as the cost of integration and communication, will also increase, dispersing the technology accumulation and work energy of the company in its main field, thus limiting its long-term development in the main field. Moreover, when the cost involved in a new market exceeds the resource utilization and management capabilities of the enterprise, it will result in excessive diversification, weakening the synergy between businesses, and even negatively affecting corporate performance (Jansen J P, 2006; Nelson R R, 1959; Granstrand, 1998; Shin J, 2010).

Technological diversification and corporate performance have always been the focus of research in the field of corporate management. Williamson(Williamson,1994) have shown through empirical research that only the relevance of diversified enterprise technology strategic assets can be fully reflected in the market, and the performance of related diversified enterprises will be higher than non-Performance of related diversified companies<sup>6</sup>. Chinese scholars Lin Xiaohui (Lin Xiaohui,2008) and JinXiaobin (Jin Xiaobin,2002) believe that there is no obvious correlation between the degree of diversification and performance of enterprises, but because diversification can bring about the scope of economic effects, the high cost caused by diversification is offset to some extent. For non-diversified companies, technology diversified companies have better performance. In terms of research methods, the existing research mostly uses enterprise performance as the basis for evaluation and the index of asset input efficiency. Therefore, regression analysis, data envelopment analysis (Liu Yiquan, 2017), entropy index model (Zhao Qi,2016), factor analysis (Zhou Wenqi, 2007) and other research methods are often used to supply performance to conduct an evaluation.

As an emerging economic and technological catch-up country, China's high-tech enterprises are the main innovations of the country's development, but they have problems such as low degree of globalization, low ability to integrate technical resources, and high research and development costs. Is the diversification of high-tech enterprises' technology diversified for the healthy development of enterprises? Will this strategic choice bring about the improvement of technology and performance for high-tech enterprises? Based on this, this paper attempts to explore the practical effects of high-tech enterprises implementing technology diversification strategies from the perspective of input and output. Exploring the relationship between corporate technology diversification strategy and corporate performance, it is hoped that it will be an important reference and reference for enterprises to calmly respond to the new situation and take strategic decisions with caution.

## 2 Research Methods

### 2.1 Model establishment

The DEA method is an evaluation method that uses a mathematical programming model to calculate the relative effectiveness of several decision units (DMUs) with the same inputs and outputs. Using DEA for efficiency evaluation actually uses the linear programming method to find the envelope surface of the efficiency frontier input-output relationship, and finds the difference by comparing the evaluation object with the efficiency frontier, and then measures the efficiency. Determining whether a decision unit is effective depends on whether it is on the production frontier of the production possible set. Comparing different enterprises under certain technical conditions, how much the input can be effectively used in the production of output. If the decision-making unit is non-DEA, the original input-output vector can be adjusted by solving and calculating. The latter point is the "projection" of the decision-making unit on the production front (Li Qi,2016). This paper also makes use of this advantage of the CCR model to obtain the relative efficiency value of the input and output of the enterprise. Based on the evaluation results, the projection analysis is carried out to provide an improved solution for the invalid DEA unit. Differences and characteristics of corporate performance levels after smart projects. Then, the adjustment analysis of the invalid DEA unit is aimed at finding a reasonable path to solve the related problems existing in the implementation of the technology diversification strategy, and provide feasible measures for the healthy development of the enterprise.

The enterprise performance system is regarded as an input-output system with multiple inputs and outputs, and there are no similar evaluation units. For the evaluation unit DMU ( $i=1, 2, \dots, m$ ), the  $m$  input indicators are composed. input vector  $x_i=(x_1, x_2, \dots, x_m)^T$ ,  $t$  output vector  $y_i=(y_1, y_2, \dots, y_m)^T$ ,

then all input and output indicators evaluation unit consisting of input The matrix  $X = (x_1, x_2, \dots, x_m)$ , the output matrix  $Y = (y_1, y_2, \dots, y_m)$  The CCR model thus established

$$\begin{cases} \min \left[ \theta - \varepsilon \left( \sum_{i=1}^k Si^- + \sum_{r=1}^m Sr^+ \right) \right] \\ s.t \sum_{j=1}^n \lambda_j x_{ij} + Si^- = \theta x_{ip}, i = 1, 2, \dots, k \\ \sum_{j=1}^n \lambda_j y_{ij} - Sr^+ = y_{rp}, i = 1, 2, \dots, m \\ \lambda_j, \theta, Si^-, Sr^+ \geq 0, j = 1, 2, \dots, n \end{cases}$$

In equation,  $\theta$  ( $0 < \theta \leq 1$ ) is the comprehensive efficiency index, and  $\lambda_j$  is the weight variable.  $Sr^+$  is a relaxation variable, and  $\varepsilon$  is a non-Archimedean infinitesimal amount. The larger the value of  $\theta$ , the higher the operational efficiency of high-tech listed companies.  $\theta = 1$  indicates that the company's operating status is on the production frontier, and its output is optimally integrated with respect to the input. At this time, the evaluated DMU is valid for DEA, and  $\theta < 1$  indicates that the evaluated DMU is invalid for DEA.

**2.2 Data analysis**

This article selects new artificial intelligence to carry out projects of high-tech enterprises in 2015-2018 identified national listed companies as the initial sample. In order to make the conclusions true and reliable, this paper tries to exclude the influence of relevant factors on the data in the sample selection. So, consider the following points when choosing a sample:

- (1) Select the company issuing A shares only, to avoid the difference between the B shares or H shares.
- (2) Excluding each year ST, ST\* and PT companies and extremes company.
- (3) Excluding the listed companies before and after the three-year strategy for turning several times.
- (4) Excluding the listed company cannot obtain complete data.

Taking full account of the characteristics of listed companies' operation management and high technology, and based on the availability of data, in order to build a comprehensive performance evaluation index system, this paper selects three financial indicators as input indicators: fixed assets, main business costs, Total operating costs. The two main business incomes of total profit are selected as output indicators (Yu Wang, 2019).

**Table 1 Input and Output Indicators**

	symbol	name
	X1	Total assets
INPUT	X2	Main business cost
	X3	Period cost
OUTPUT	Y1	Total profit
	Y2	Main business income

002465	0.843	0.93	0.907	drs
600271	1	1	1	-
mean	0.902	0.934	0.962	

Note: The overall efficiency value is 1 , indicating that the infrastructure supply performance is optimal; the overall efficiency value is less than 1 , indicating no efficiency. CE stands for overall efficiency, VE stands for

technical efficiency, and SE stands for scale efficiency. Irs means increasing returns to scale; drs means declining scale returns; - means that scale returns are constant.

**2.2.1 Comprehensive efficiency analysis**

The comprehensive technical efficiency is a comprehensive measurement and evaluation of the multi-faceted capabilities of the decision-making unit's resource allocation ability and resource use efficiency.

**Figure 2 Three-year High-tech Enterprise CE Value**

In the year prior to carry out the project (2016), different high-tech enterprises overall efficiency, average efficiency value of 0.903, 42% above this value the efficiency of enterprises, description of each business year starting point is slightly different. In the mean while maintaining production based on constant change, China's high-tech industry listed companies still have an investment saving potential of 9.7%. In the year of the project, 28% of listed companies experienced a decline in overall efficiency, and most companies' overall efficiency increased slightly, so the overall on the up, it has improved the efficiency of listed companies. After one year of mergers and acquisitions, 50% of enterprises have reduced their overall efficiency, but 71% of them have slightly improved their overall efficiency level compared to 2016. However, the comprehensive efficiency level in 2018 is lower than the comprehensive efficiency level in 2016, so we can conclude that most enterprises will significantly improve the market value when they carry out the technology diversification strategy, but because of the individual management level and input-output ratio of the individual enterprises. When the operation level is different, most enterprises can improve their performance level through artificial intelligence projects, but a small number of enterprises will deteriorate. It needs to strengthen financial budget control, control costs and optimize internal organizational structure to reduce input waste.

**2.2.2 Technical efficiency analysis**

Technical efficiency reflects the influence of the equivalent factors of enterprise's production technology and management level on enterprise's operating efficiency. The closer the pure technical efficiency value is to 1, the more effective the enterprise's management level and technical level are.

**Figure 3 Three-year High-tech Enterprise VE Value**

It can be seen that there are 4 and 6 in three years. Four companies reached a technology effectively, accounting for 29% , 43%, 29%, three-year arithmetic of the total sample mean technical efficiency of the sample companies is 0.94, and 6% of advances in space technology, companies still need to Increase investment in research and development funds to promote the production of results, and enhance the company's own competitiveness in the industry. A three-year standard deviation are 0.08, 0.07, 0.08, indicating that the company's overall technical efficiency of these little difference. In the year before the launch of the project and in the year of the project, the efficiency was relatively stable. However, in the first year of the project, the technical efficiency changed greatly. In the second year after the war, the technical efficiency showed a downward trend, and the technical efficiency of listed companies increased overall.

**2.2.3 Scale efficiency analysis**

The scale efficiency is equal to the ratio of the overall efficiency value to the technical efficiency value.

**Figure 4 Three-year High-tech Enterprise SE Value**

It can be seen from the calculation results that the average value of the three-year scale efficiency is 0.96 , indicating that the scale of these listed companies has not yet reached the maximum. 14 listed companies, the artificial intelligence to carry out the project, in 2018 there are seven companies in the state of increasing returns to scale, indicating that after this stage eight companies continue to expand their production scale. This shows that if the company wants to achieve DEA effectiveness, on the one

hand, it will increase the production efficiency of its input factors, on the other hand, it will increase its scale of production to increase its scale efficiency. On the whole, the average scale efficiency of listed companies is more stable overall. In 2017, the scale efficiency of listed companies increased. After the occurrence, some enterprises showed a downward trend and overall stability.

### **3 Results Analysis**

There are two main reasons for affecting the performance of listed high-tech enterprises: First, the scale efficiency problem is prominent; second, the pure technical efficiency needs to be improved. Among them, the unsatisfactory scale efficiency is mainly related to the number of enterprise technicians and corporate assets. Some listed companies have fewer technicians and less obvious economies of scale. The greater the capital advantage of enterprises, the stronger the supply capacity, and the more advantageous the number of technicians employed. On the contrary, it will affect the investment. The overall technical efficiency is not high, which is mainly affected by factors such as the technical level of the enterprise, the quality of human capital, and the ability to learn. The stronger the learning ability, the higher the number of high-quality talents, the higher the technology, the stronger the technology research and development, the less the investment is redundant, the better the supply effect can be achieved with less investment, and the performance is more dominant. .

### **4 Conclusion**

The diversification of technology by enterprises can make full use of the core capabilities of enterprises, and reduce the internal transaction costs while improving the economies of scale of enterprises. However, when the technology diversification strategy is carried out, the production factors such as capital, talents and technology are excessively dispersed. It is easy for enterprises to lose the competitive advantage of their original main business. Enterprises should consider whether to adopt a technology diversification strategy based on their actual situation.

In the process of implementing the technology diversification strategy, it should be noted that the implementation of technology diversification can enable enterprises to search and learn knowledge in multiple fields, consolidate resources, generate strong innovation vitality, and also obtain synergies between technologies. In turn, achieve innovation results and improve corporate performance. However, excessive technical diversification will increase the company's research and development costs, and the company's ability to absorb and transform is limited, which will inevitably result in waste of resources, which is not conducive to high-tech enterprises to play the core technology's competitive advantage, while excessive technology. Diversification can also hurt a certain level of performance of the company, leading to the out-of-control ability of the company. Therefore, when implementing the technology diversification strategy, the company should consider the input-output ratio to maintain the technical diversification at an appropriate level.

Enterprises should rationally optimize the allocation of technical resources, ensure the rationalization of product structure, increase investment in innovation, focus on improving the ability of enterprises to absorb new knowledge, enhance the core technology competitiveness of enterprises, and thus promote the output of scientific and technological innovation. Enterprise managers should further deepen the reform of the enterprise science and technology research and development system, develop science and technology while paying attention to the assessment of corporate performance, enhance the company's innovative main position and maintain excellent operational standards.

# Research on the Development Trend of Global Face Recognition Industry Based on Patent Analysis

Yang Fangjing

Library of Wuhan University of Technology, Wuhan, P.R. China, 430063

(E-mail: 906816342@qq.com)

**Abstract:** The paper made trend analysis on global patent in the field of face recognition by taking advantage of retrieval and analysis tool of INNOGRAPHY, conducted specific comparison on high-intensive patents of three countries, China, America and Korea which were top three in number of global patent applications, and analyzed existent advantages and gap in patent application and layout in China. Although our country started later in the field of face recognition, it had been prosperous development trend on number of patent applications due to technology innovation and policy support. In terms of high-intensive patent, there was a certain gap with the United States. Accordingly, this paper proposed suggestions for face recognition technology in China: To improve quality of patent application; to strengthen cooperation among enterprises, universities and other scientific research institutions in order to realize a win-win situation; To fully cultivate the talents of face recognition and artificial intelligence.

**Key words:** Face recognition; Facial identification; Artificial intelligence; Patent analysis; High-intensive patent

## 1 Introduction

Face recognition technology, also known as facial identification technology and affiliated to the field of artificial intelligence, was a kind of identification technology which made use of inherent feature of human face for status identification, such as human face and iris recognition, etc. (Bankar P V, Pise A C, 2015). Face recognition technology captured face image by using computer, camera and other devices, automatically located and tracked face, and then processed image so as to achieve identity authentication (Bleumeur P N, Hespanha J P, Krieman D J, 1997). What was different from general recognition technology was that biological characteristic had its own unique property: uniqueness, irreproducibility, convenience and reliability (Li Yaodong, Cui Xia, Xiao Baihua, Dai Ruwei, 2002). Precisely due to aforementioned advantages, face recognition technology got more and more extensive application which predominantly was applied in finance, judicature, education, military and other fields (Xiao Jun, 2016; Hu Datao, 2010; Shen Chenyu, Yin Mei, 2018). Emerging field mainly included several types as follows: access control management, cell phone face recognition unlocking, face-scanning check-in in station, video monitoring and other fields (Li Xue, 2018). Although face recognition technology was applied extensively, patent trend analysis aimed at the technology was relatively deficient. Therefore, the paper made deep research for it, and provided background support for researchers in the relative field and its industry.

## 2 Trend Analysis on Global Patent

In order to study status quo of patent application for global face recognition technology, key words, "face recognition" or "facial identification" or "face identification" or "facial identification" in innography patent database were used to conduct retrieval. Retrieval scope was confirmed in abstract, right requirement and title of invention with retrieval deadline January 7, 2019. total of 37,457 patent applications involving face recognition technology were retrieved around the world (Including invention

patent, utility model and appearance design). In which there were 11,891 patent grants in quantity, accounting for 31.7% granted patents and 23,505 valid patents in quantity, accounting for about 62.8%, as shown in Table 1. On this basis, the technology was elaborated in the development trend, regional layout and other aspects around the world.

**Table 1 Patent Application Situation in the Field of Face Recognition around the World**

Country or Region	Total Number of Patent Applications	Number of Patent Grants	Proportion of Granted Patent	Number of Valid Patents	Proportion of Valid Patent
The World	37457	11891	31.7%	23505	62.8%

### 2.1 Trend of patent application

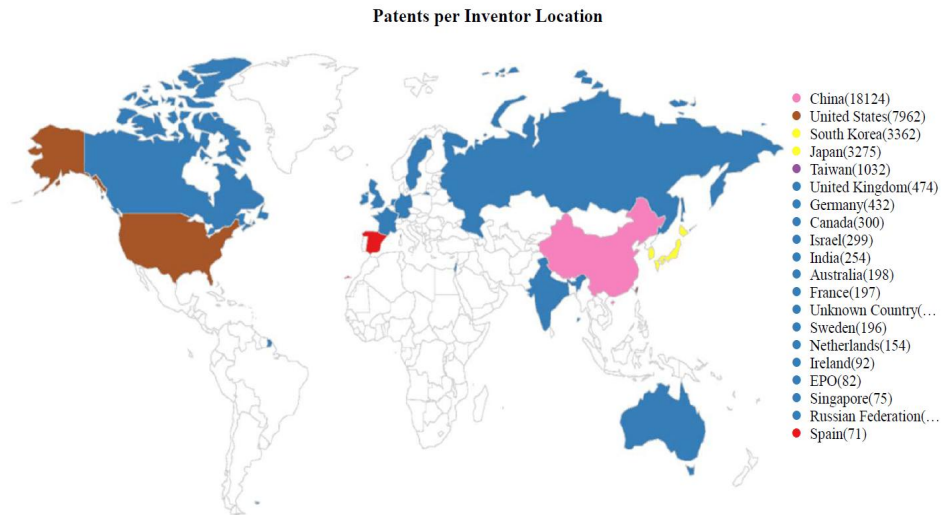

37,457 retrieval results were made statistics in accordance with Priority year of patent, and trend Figure 1 of global patent applications for face recognition technology was obtained. Since 1975, global patent application in face recognition technology had begun to emerge in succession. From 1991 to 1992, number of annual global patent application enhanced from single digit (8 pieces) to double digits (twelve pieces). From 1999 to 2000, number of annual global patent application enhanced from double digits (81 pieces) to triple digits (248 pieces). From 2006 to 2007, number of annual global patent application enhanced from triple digits (903 pieces) to four digits (1,114 pieces). In terms of application trend, number of patent application before 2000 was very few, rapidly rose after 2000, and later was roughly in a progressive increasing trend year by year. In 2017, number of patent application was up to top with 5,013 pieces. Due to examination on age limit, part of patent applications in 2018 had not made public in temporary, data in 2018 had decreased.

**Figure 1 Trend of Number of Global Patent Application on Face Recognition Technology**

## 2.2 Analysis on country/regional distribution

Application source for 37,457 patents was made statistics and country distribution Figure 2 was obtained.

**Figure 2 Country Distribution for Patent Application of Facial Identification Technology**

By Figure 2, analysis on patent application source of face recognition technology could understand strength of computer visual technology in countries and regions throughout the world. China was on the top with 18,124 patent applications. Besides China, there were 7,962, 3,362 and 3,275 patent applications respectively in the United States, Korea and Japan.

Number of patent grants and number of valid patents for the world and China, the United States, Korea and Japan four countries, were made induction and summary and then Table 2 was concluded.

**Table 2 Comparison between Number of Patents and Legal Status for Face Recognition in Top-ranking Countries**

Countries or Regions	Total Number of Patent Applications	Number of Granted Patent	Proportion of Granted Patent	Number of Valid Patents	Proportion of Valid Patent
The World	37457	11891	31.7%	23505	62.8%
China	18124	5974	33.0%	14292	78.9%
The United States	7962	2431	30.5%	3944	49.5%
Korea	3362	1223	36.4%	1476	43.9%
Japan	3275	1002	30.6%	1485	45.3%

After the proportion of granted patent was made analysis and comparison in the Table 2 , it could be concluded that the proportion of granted patent in China, the United States, Korea was all higher than average proportion of granted patent throughout the world, in which Korea took a leading place with 36.4%. Thus, Korea was superior to other three countries in emphasis on novelty, creativity and practicality of patent application and technical content in the field of face recognition.

After the proportion of valid patent was made analysis and comparison in the Table 2, just only China was higher than global average level in the proportion of valid patent, and other three countries all did not reach global average level. It could be seen that China attached importance to patent maintenance in the field of face recognition, on the other hand, number of valid patents included valid granted patent and valid pending review patent at the stage of review. However, in recent years a series of policy to encourage patent application issued by China, which led to great growth in number of applications, was a reason which gave rise to the proportion of valid patent in a leading position in the field of face recognition throughout the world, thus, it could be seen that enterprise and scientific institution had been in rapid upward stage for patent layout awareness in the field of face recognition.

### 3 Comparative Analysis on the Development of Chinese, American and Korean facial Identification Industry Based on Patent

Chose countries or regions with top three global ranking in number of applications in the field of face recognition, that was, China, the United States and Korea were made analysis.

#### 3.1 Comparative analysis on overall situation of patent application

Comparative situation for number of patents and legal status of face recognition in China, the United States and Korea three countries were shown as Table 3.

**Table 3 Comparison on Legal Status of Face Recognition in China, the United States and Korea Three Countries**

China			The United States			Korea		
Legal Status	Number of Patents	Proportion	Legal Status	Number of Patents	Proportion	Legal Status	Number of Patents	Proportion
Valid grant	4894	27%	Valid grant	2197	27.6%	Valid grant	1011	30.1%
Pending Review	9398	51.9%	Pending Review	1747	21.9%	Pending Review	465	13.8%
Expired	3832	21.1%	Expired	4018	50.5%	Expired	1885	56.1%
Total	18124		Total	7962		Total	3361	

As shown in Table 3, in terms of total number of patent applications, China's total number of patent applications in the field of face recognition was conspicuously more than that of the United States and Korea. But total number of patents included valid granted patent, pending review patent and invalid patent. According to three parts of valid grant, pending review and invalid patent, after analysis and

comparison were conducted for patent in China, the United States and Korea three countries, it could be seen that though China had advantages in total number of patent applications, it accounted for 27 percent in valid granted patent, slightly lower than that of the United States (27.6%) and Korea (30.1%). Therefore, China still needed to make improvement in quality of patent application so as to enhance rate of authorization.

Furthermore, invalid patent was made analysis in which most of them belong withdrawn patent, rejected patent and automatically invalid patent without paying annual fee. For rejected and withdrawn patent, either they did not conform to novelty, creativity, practicality and other review standards accredited by the patent bureau or they did not meet external conditions owned by patent grant. For the patent without paying annual fee which led patent right to automatically be invalid, most of them had not brighter market prospect. Therefore, number of invalid patents to some extent presented quality of patent application. The ratio of number between valid granted patent and invalid patent in China was 1.27, higher than that of 0.55 in the United States and that of 0.54 in Korea, which instructed that patent quality in the field of face recognition was relatively high and relevant enterprise or institution attached importance to late maintenance of patent in China. the other reason was that patent in China started late and a good deal of patents had all been in an initial stage.

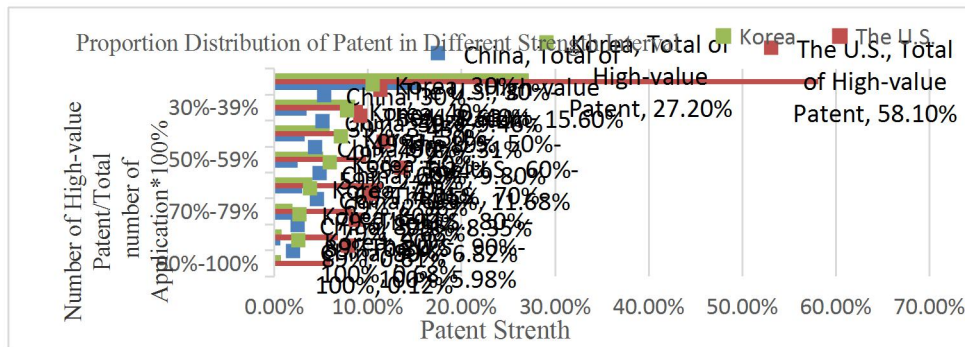

### 3.2 High strength patent analysis

"Patent Strength" was one of critical functions of Innography and comprehensive index for judgment of patent value (Luo Xuemei, 2019; Zheng Meiyu, 2018). Patent strength was influenced by number required by right, citation times or cited times, whether involving case, time span of patent, number of patent families and other factors. Patent strength could reflect literature value of the patent. We believe that patent strength between 30% and 100% are high strength patents. Interval of patent strength could be subdivided into 10% sub-intervals, and 30%-100% high-intensive patents in China, the United States and Korea could be screened and subdivided in order to acquire Table 4.

**Table 4 Patent Distribution in Different Strength Interval of Face Recognition Technology in China, the United States and Korea**

Patent Strength	China	The United States	Korea
90%-100%	22	476	23
80%-89%	111	543	27
70%-79%	485	665	65
60%-69%	537	930	136
50%-59%	449	780	176
40%-49%	592	582	198
30%-39%	625	753	290
Total Number of High-intensive Patents	2821	4629	915
Total Number of Patents	18124	7962	3361
The Proportion of High-intensive Patent	15.6%	58.1%	27.2%

As shown in Table 4, Analysis was made respectively for 18,124 patents in China, 7,962 patents in the United States, and 3,361 patents in Korea in which there were 2,821 patents in line with high strength patents in China, 4,629 patents in line with high strength patents in the United States and 915 patents in line with high strength patent in Korea. In order to analyze differentiation of application quantity in different intervals of patent strength in these three countries at greater length, number of patents with intervals of Patent Strength in China, the United States and Korea were normalized as 30%-39%, 40%-49%, 50%-59%, 60%-69%, 70%-79%, 80%-89%, 90%-100%, and final result was formed into histogram. Thus, Figure 3 was concluded.

**Figure 3 Proportion Distribution of Patent in Different Strength Interval of Face Recognition Technology in China, the United States and Korea**

Figure 3 respectively made use of gray, orange and blue dark-colored histogram to represent proportion distribution of patent in different strength interval in Korea, the United States and China, in which patent strength was two intervals of 80%-89% and 90%-100%. The United State had absolute advantages, especially in 90%-100% interval of patent strength, there were a few patents in Korea, and patents in China could basically be negligible. Table 4 could be analyzed that most of high strength patent in the United States focused on interval of 60%-69%, but it in China and Korea mainly focused on interval of 30%-39%.

In conclusion, among three countries, quality of patent application in the United State was the highest, then followed by Korea. The United State, as first-rate technology power in the world, had always led the world in computer, internet and even emerging AI and other aspects. While as a branch of AI technology, the development of face recognition technology was positively correlated with overall development of AI technology. However, China started late in the field of AI, continuous reinforcement of scientific strength and measures to encourage patent application had made China become an up-rising star in the field of AI, especially in the field of face recognition which was as a branch of artificial intelligence. China had controlled half of application quantity, but still had a long way to go for improvement on strength of patent application.

#### 4 Statistics and Analysis on Important Applicants

Through analysis on patent applicants, it could be found that enterprise or institution which had entered into or planned to enter into the industry reflected market share competition in the field from one side aspect.

##### 4.1 Global important applicants

Global important applicants represent enterprises or institutions which have the maximum number

of patents and leading technical strength in the field.

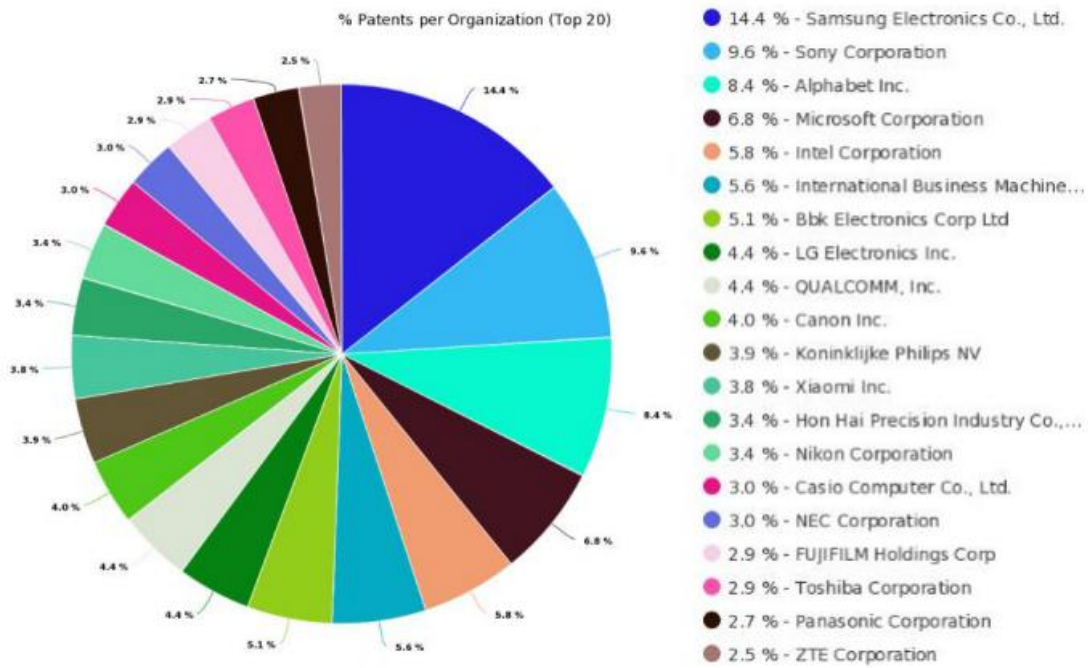

Figure 4 Top 20 Important Applicants in the World

From Figure 4, it could be seen retrieval deadline. Top 20 patent applicants in the field of face recognition around the world were all enterprises, among which there were no lack of applications of enterprises in China, for instance, Bbk, Xiaomi, Hon Hai, ZTE and other enterprises made patent layout in the global market in order to seek for a place in the international market in future.

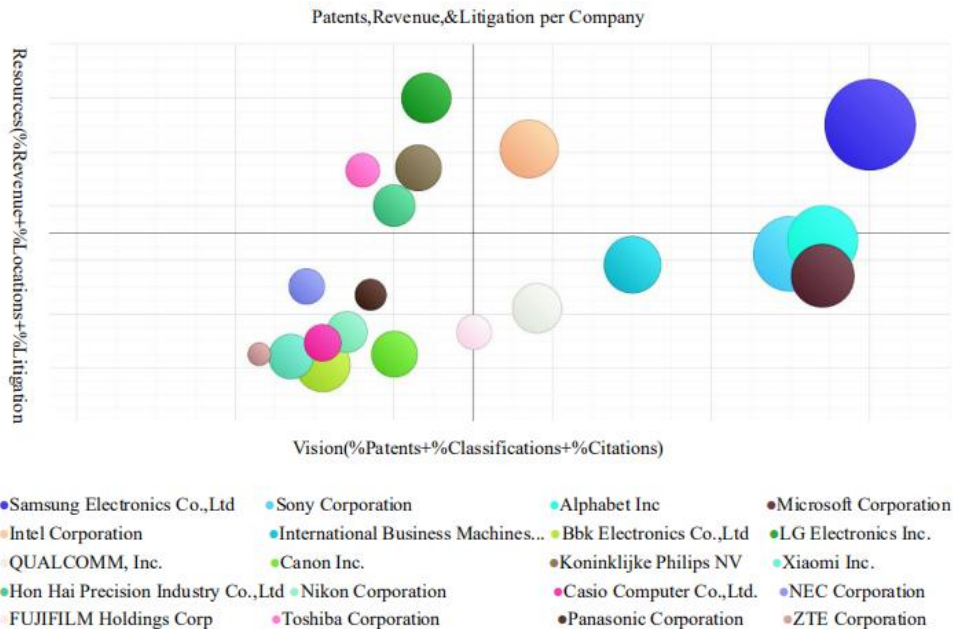

Figure 5 Bubble Diagram of Global Patentees

In combination of Figure 5, the color of the bubble could distinguish patentees with the size of the bubble on behalf of number of patents. horizontal axis represented technical strength in combination with three critical factors: number of patents, classified number of patents and cited number of patents, the further right-side the bubble was, the stronger technical strength of company was. Vertical axis represented comprehensive strength in combination with three important factors: income of patentee, resided geographical location, and litigation case and the more upwards the bubble moved, the stronger comprehensive strength of company was (Deng Xin, Mei Shiyong, CHEN Xiaojun, Xiao Qingming, Li Yu, 2018). Thus it could be seen that Samsung and Intel took absolute advantages in this field with strong economic and technical strength who were leaders in the field of face recognition. Technical strength was relatively strong in Microsoft, Sony, Google and Qualcomm Inc. who were potential technical sellers in the field of face recognition. Economic comprehensive strength was relatively strong in LG, Panasonic and Hon Hai who were potential purchasers in the field of face recognition.

#### 4.2 Important applicants in China

Important applicants in China represent enterprises or institutions in the field of recognition which have the maximum number of patents and leading technical strength in China.

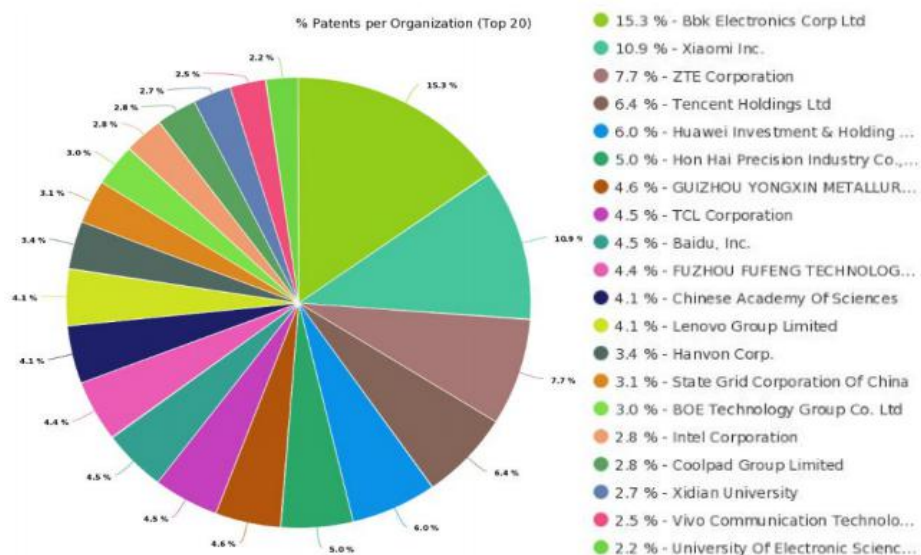

Figure 6 Top 20 Important Applicants in China

As shown in Figure 6. Top 20 patent applicants in the field of face recognition in China, besides most of enterprises, also admitted part of universities, such as Chinese Academy of Sciences, Xidian University, University of Electronic Science and Technology of China. All global important applicants were oriented by enterprise. Technical innovation was more closely to market demand so as to promote continuous development of AI industry. However, there were great differences between universities' own goals and positioning and enterprises oriented by economic interests, which led to its technical innovation in deficiency of effective combination with market. Therefore, it was still necessary for patent of the universities to improve on the AI industry.

Among top 20 applicants in China in the field of face recognition, application quantity in Bbk was

the highest, accounting for 15.3% of total number of patent applications, then followed by Xiaomi which accounted for 10.9%. It indicated that in the field of face recognition, these enterprises attached importance to patent application, and was actively making patent layout. However, number of patents could not absolutely represented comprehensive strength of intellectual property for company or institution, therefore, it was required to resort to bubble chart of patentee for specific analysis.

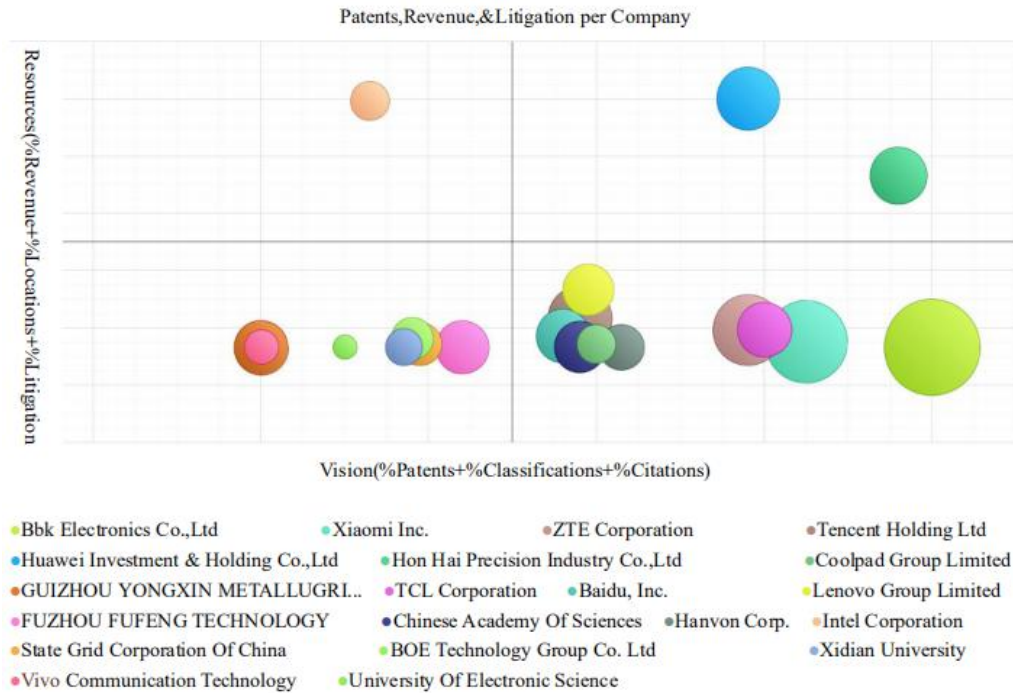

Figure 7 Bubble Diagram of Global Patentees in China

In combination of Figure 7, it could be seen that Huawei, Hon Hai. took absolute advantages in China with relatively strong economic and technical strength who was leaders in the field of face recognition. Technical strength in Bbk, Xiaomi, TCL and other companies was relatively strong who was potential technical sellers in the field of face recognition. Economic comprehensive strength in Intel who was potential purchaser was relatively strong in the field of face recognition.

### 5 Conclusion

The paper took data of global patent in the field of face recognition as an example and analyzed trends of global patent application as well as distribution in countries and regions. Analysis was concluded that countries or regions which were top three in total number of global patent applications were China, the United States and Korea. Also, patent application situation and high strength patent in these three countries were put emphasis on comparison. Global important applicants and important applicants in China was made analysis, thus, conclusion and suggestion were as follows: (1) Along with the rise of AI, more and more powerful enterprises had involved in the field of face recognition. And many enterprises had established AI laboratory, while universities had made deeper and more cutting-edge research and tended to basic theory. It was suggested that enterprises and universities jointly coordinate integrated resources, reinforce application research oriented by market demand, improve

pertinence and applicability of research, compensate for drawback which universities or enterprises brought into lack of market guidance quality or insufficiency of basic research for individual research. (2) According to analysis of important applicants, potential purchasers were mainly enterprises with strong comprehensive strength and they could cooperate with potential technical seller with strong technical strength and to achieve a win-win situation. (3) Universities should reasonably set up course scheme in the field of artificial intelligence. Enterprises should provide better practical platform for talents. Government should provide certain policy support for talents introduction and cultivation of enterprises.

# An Analysis Of The Transformation of Mega-pharma Business Model Toward the Indian Market

Yaeko Mitsumori  
Osaka University  
(E-mail: dt4y-mtmr@asahi-net.or.jp)

**Abstract:** The Trade-Related Aspects of Intellectual Property Rights (TRIPS) requires all member countries of the World Trade Organization (WTO), including advanced countries and developing countries, to introduce a TRIPS-compatible patent law into their countries. Due to the enforcement of TRIPS in 1995, India revised its patent law and enacted the Patents (Amendment) Act, 2005. The 2005 Act included product patents in the pharmaceutical field. Due to the new patent law with product patent protection, large foreign capital pharmaceutical companies re-entered the Indian market one after another and started engaging in both R&D and production, targeting the Indian market. However, recent data show that the number of patent applications has been declining over the past several years and the number of patented drugs launched in India has not increased so rapidly. This study analyzes the transitions of business models of foreign pharmaceutical companies in India based on the patent application data and the trend of patented drugs in the market.

**Key words:** Intellectual Property; WTO/TRIPS; Developing Countries/Newly Developing Countries; Pharmaceuticals; Evergreening

## 1 Introduction

As a result of the implementation of the World Trade Organization's (WTO's) Trade-Related Aspects of Intellectual Property Rights (TRIPS), which took effect in 1995, all members of the WTO, including advanced countries and developing countries, are required to introduce a TRIPS-compatible patent law, including product patents, in their countries. India, a member of the WTO, introduced product patent in 2005 in the pharmaceutical field. When India decided to re-introduce product patent, large foreign capital companies, so-called mega-pharma companies re-entered the Indian market one after another, targeting the country with the world's second-largest population. These mega-pharma companies applied patent to Indian Patent Office (IPO) and started engaging in research and development (R&D) and manufacturing their patented products. However, the number of patent applications in the field of pharmaceuticals has been declining over the past several years and the number of patented drugs in the Indian market has not significantly increased since 2005. This study analyzed the mega-pharma companies' strategies toward India – one of the phar-merging countries and the No. 3 pharmaceutical country in the world on volume – based on the Intellectual Property Rights (IPR) data and marketing data.

## 2 The Current Economic Status of India

### 2.1 Indian economic development

India has achieved rapid economic development, and according to the Japan External Trade Organization (JETRO), India achieved 7.0% GDP growth in 2018 (MUFG, 2019). The United Nations World Economic Situation and Prospect stated that the Indian economy expanded by 7.2% in 2018 and the report projected that the Indian economy would expand by 7.0% in 2019 and by 7.1% in 2020 (United Nations, 2019). In addition, the Organisation for Economic Co-operation and Development (OECD) Economic Outlook reported that India achieved economic growth of 7.0% in 2018 and is expected to grow by 7.2% in 2019 and by 7.4% in 2020 (OECD, 2019).

**Table 1 India's Economic Indicators**

Item	2015	2016	2017
Real GDP growth rate	8.2%	7.8%	7.1%
Nominal GDP	2,103(USD bn)	2,288(USD bn)	2,644(USD bn)
Per capita nominal GDP	1,639(USD)	1,762(USD)	2,009(USD)
Industrial production	3.3(%)	4.6(%)	4.4(%)
Wholesale price index	△3.6(%)	1.8(%)	2.9(%)

Source: MUFG

### 3 Pharmaceutical Industry in India

#### 3.1 History

When India won its independence from Great Britain in 1947, there was no pharmaceutical industry in India. This is one of the reasons the Indian pharmaceutical market was dominated by large foreign capital companies, so-called mega-pharma companies (Government of India, 2005). Having started in the 1970s, the Indian domestic pharmaceutical industry achieved rapid growth because the country's patent law then (The Patents Act, 1970) did not have any product patent protection for medicines (Government of India, 1970).

**Table 2 Indian Pharmaceutical Market**

	1950-51	1960-61	1970-71	1980-81	1990-91	2000-2001
Manufacturers	200		2300	6400	16000	20000
Investment(Rs.Mil)	50	560	2250	6000	9500	30000
R&D Expenditure(Rs.Mil)			100	290	800	4000
Production(Rs.Mil)	100	1130	4000	14400	45700	228870
Exports(Rs.Mil)		16	85	463	7848	87290
Imports(Rs.Mil)		176	243	968	4075	29800

Source: Bhojwani (2005:7)

In the 1970s, the entry barriers into the Indian pharmaceutical industry were very low, such that many companies rushed to enter the Indian pharmaceutical market. As a result, the prices of pharmaceutical products decreased significantly in India (Minato, 2007).

India has a long history in the study of chemistry and chemistry research has been one of India's strengths. This is one of the reasons India was able to produce qualified pharmaceutical products. With the very low prices and high quality, Indian pharmaceutical products were selling very well and the Indian pharmaceutical industry grew very rapidly (Mitsumori, 2010).

#### 3.2 Current market in India

According to the India Brand Equity Foundation (IBEF), the current Indian pharmaceutical sector was valued at US\$ 33 billion. The IBEF expected that the sector would reach US\$ 50 billion by 2025 (IBEF 2019). According to the IBEF, the Indian pharmaceutical industry has many strong points:

- Cost advantage;
- Skilled manpower;
- National Health Policy 2015 of India;
- Reduction of approval time for new facilities; and
- Increasing penetration of health insurance (IBEF 2019).

Today, the Indian pharmaceutical industry is ranked the world's No. 3 in volume and No. 11 in value. IQVIA, an information services company specializing in the medical industry, predicted that the Indian pharmaceutical industry would be No. 9 in the world by 2023 (IQVIA, 2019).

#### 3.3 Exports and imports

One of the features of the Indian pharmaceutical industry is that it is an export-oriented industry. Pharmaceutical exports from India, which include bulk drugs, intermediates, drug formulations, biologicals, Ayush and herbal products, and surgicals reached US\$ 17.28 billion in the 2018 fiscal year and US\$ 19.14 billion in the 2019 fiscal year (IBEF 2019).

**Figure 1 Pharmaceutical Exports from India**

Source: IBEF Pharmaceuticals May 2019:11

The biggest export destination for Indian pharmaceutical products is the U.S. In the 2018 fiscal year, 31% of India's pharmaceutical exports went to North America, followed by 19.4% to Africa and 15.9% to the EU (IBEF 2019).

### 3.4 Market by classification

In the Indian pharmaceutical sector, generic drugs occupy the largest share (70%), followed by over-the-counter (OTC) drugs (21%), and patented drugs (9%) (IBEF 2019).

Figure 2 Indian Pharmaceutical Market by Segment

Source: IBEF Pharmaceuticals, May 2019:10

### 3.5 Pharmaceutical market by indication

India is a developing country. When pharmaceutical products were classified by disease, the so-called acute disease drugs occupied large shares. However, recently, the so-called lifestyle diseases, such as diabetes, have been prevalent in India. As of 2018, anti-infective drugs, cardiac disease drugs, and gastrointestinal disease drugs are the top three segments in India.

Figure 3 Pharmaceutical Market by Indication

(Source: IBEF Pharmaceuticals, May 2019:10)

## 4 IPR in India

### 4.1 Patent system in India

India has a long history of patent protection. In 1911, when India was a colony of Great Britain, the Indian Patents and Designs Act, 1911 was enacted. The Act had both process and product patent protection in the pharmaceutical field (Mitsumori, 2010), (Government of India, 2005).

### 4.2 Transition of patent law

When India won its independence from Great Britain, there was no pharmaceutical industry in the country. This is why the Indian market was dominated by foreign capital companies; the so-called mega-pharma. Indira Priyadarshini Gandhi, the then prime minister of India, disliked seeing the Indian pharmaceutical market being occupied by foreign capital companies. Therefore, she scrapped the 1911 patent law and compiled a new patent act, the Indian Patents Act, 1970. However, the Patents Act, 1970

did not have any product patent protection in the field of medicine (Mitsumori & Nagahira, 2016), (Yamanaka, 2007).

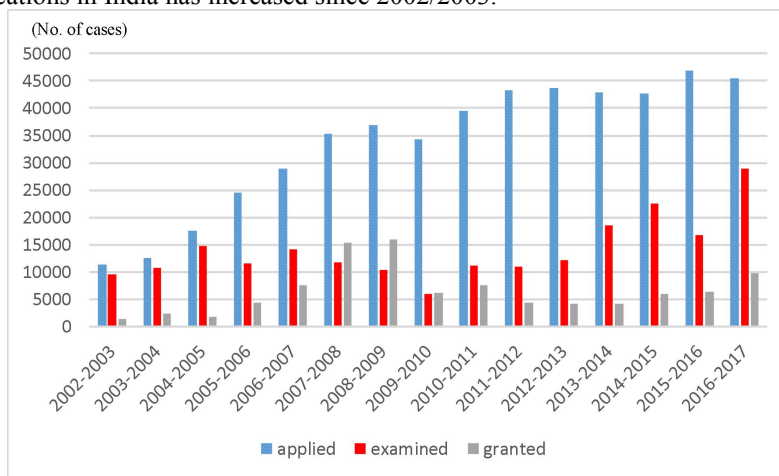

Under the Indian Patents Act, 1970, the Indian pharmaceutical industry has been flourishing (Minato, 2007).

However, due to TRIPS, India was required to introduce product patents by 2005 (Kubo 2007). In 2005, India introduced the Patents (Amendment) Act, 2005, which protects both process and product patents in the field of pharmaceuticals (Government of India, 2005).

#### 4.3 Patent application and granting

The Indian Patent Office (IPO) is administered by the Office of the Controller General of Patents, Designs and Trade Marks. India has four patent offices in Delhi, Mumbai, Chennai, and Kolkata. Each year, the IPO compiles and releases an annual report that contains all the data on IPRs (Anshul Saurastri & Uma Bhaskaran 2018),(Government of India 2016/2017).

Fig. 4 shows the number of patents applied for, examined, and granted between 2002/2003 and 2016/2017 (Government of India 2002/2003 - 2016/2017). Although there are fluctuations, the number of patent applications in India has increased since 2002/2003.

**Figure 4 Patents Applied for, Examined, and Granted in India (2002/03–2016/17)**  
 Source: IPO Annual Reports 2002/2003–2016/2017

### 5 Strategies of Mega-pharma Companies toward India

Table 3 shows the top ten pharmaceutical companies in the world (Nikkei Bio Tech, 2018).

**Table 3 Top Ten Pharmaceutical Companies in the World**

		Sales Revenue(US\$ bil.)
1	Pfizer	46.1
2	Novartis	43.0
3	Roche	41.9
4	Sanofi	39.6
5	Johnson&Johnson	36.3
6	Merck	35.4
7	GSK	28.9
8	AbbVie	28.2
9	Gilead Sciences	25.7
10	Amgen	21.8

Source: Nikkei Bio Yearbook, 2019

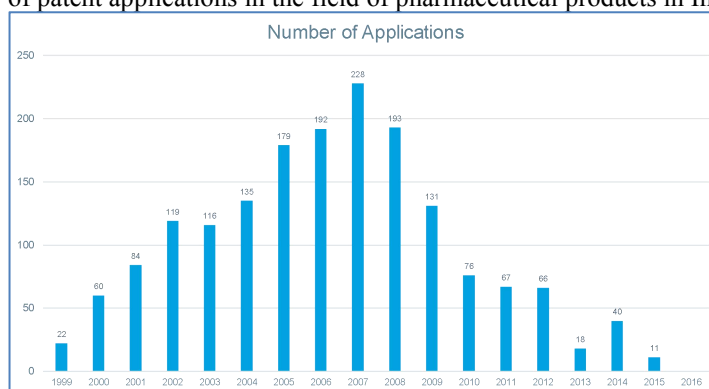

These mega-pharma companies re-entered the Indian pharmaceutical market one after another once India decided to re-introduce a product patent in the field of pharmaceuticals. Some companies set up their own R&D centers, while other companies set up their offices in major cities of India, such as New Delhi, Mumbai, and Hyderabad (Mitsumori, 2014).

Under the Patents (Amendment) Act, 1999, the Indian government set up a mailbox and started accepting product patent applications. Under the Patents (Amendment) Act, 2005, India re-introduced product patent and started examining these applications (Government of India, 2005).

Once a mailbox was set up, mega-pharma companies started applying their patents to IPO. Fig. 5

shows the number of patent applications in the field of pharmaceutical products in India (IQVIA, 2017).

**Figure 5 Number of Patent Applications (1999 - 2015)**

Source: IQVIA

According to IQVIA, almost all of the patent applications for these pharmaceutical products were submitted by foreign capital companies, including mega-pharma companies.

## 6 Two Landmark Incidents in India

### 6.1 Section 3(d)

In 2005, India revised its patent law and introduced product patent protection. However, the Indian Patents (Amendment) Act, 2005 includes a special safeguard article – Section 3(d), quoted below:

*(d) the mere discovery of a new form of a known substance which does not result in the enhancement of the known efficacy of that substance or the mere discovery of any new property or new use for a known substance or of the mere use of a known process, machine or apparatus unless such known process results in a new product or employs at least one new reactant.*

*Explanation—For the purposes of this clause, salts, esters, ethers, polymorphs, metabolites, pure form, particle size, isomers, mixtures of isomers, complexes, combinations and other derivatives of known substance shall be considered to be the same substance, unless they differ significantly in properties with regard to efficacy.*

Based on Section 3(d), the Indian patent office and courts have rejected “major” patents whose patentability had been approved in many other countries.

Two remarkable events regarding Section 3(d) occurred in India. The first one was the Swiss pharmaceutical company Novartis’ Gleevec lawsuit, and the other one was India’s first compulsory license issuance against the German pharmaceutical company Bayer’s Nexavar.

### 6.2 Novartis’ Gleevec lawsuit

Novartis submitted a patent application for Gleevec (general name: Imatinib), one of the most common anti-cancer drugs, through a mailbox set up by the Indian Patent Office. However, in 2006, the Indian Patent Office rejected Gleevec’s patent based on Section 3(d). Novartis, unsatisfied with the rejection, brought the case to court. Both the High Court of Madras and the Intellectual Property Appellate Board (IPAB) dismissed Novartis’ claims. The litigation was brought to the Supreme Court of India. In April 2013, the Indian Supreme Court dismissed Novartis’ patent application based on Section 3(d) (Yamana, 2007), (Fujii, 2013), (Miyagi, 2014).

### 6.3 India’s first compulsory license issuance

In March 2012, the Controller General of Patents Designs and Trademarks of India granted Natco Pharma Limited (an Indian generic drug manufacturer) a compulsory license for Bayer AG’s Nexavar (general name: sorafenib), which is an oncology drug. Due to the order, Natco was allowed to manufacture and sell a generic version of Nexavar (general name: sorafenib) but had to pay 6% royalty on the net sales to Bayer. In addition, Natco was able to charge Rs 8800 for a monthly dose (120 tablets) of the drug.

Since India’s very first compulsory license issuance, no other compulsory license has been issued in India (Kubo, 2012).

### 6.4 Impact of the two landmark incidents

The repercussions of these two incidents were widely divided. Regarding the Supreme Court ruling against Novartis, Médecins Sans Frontières (MSF), an international NGO working for access to

medicine in the Third World, released a press release on April 1, 2013 saying, “This is a huge relief for the millions of patients and doctors in developing countries who depend on affordable medicine from India” (MSF, 2013). On the other hand, Ranjit Shahani, the vice president of Novartis India stated, “Companies like Novartis would invest less money in research in India as a result of the ruling” (Harris, 2013).

Chip Davis, the executive vice president of advocacy at the Pharmaceutical Research and Manufacturers of America said, “It is another example of what I would characterize as a deteriorating innovation environment in India.” Meanwhile, Anand Grover, a lawyer working for the Cancer Patients Aid Association in India, said, “The ruling confirmed that India has a very high bar for approving patents on medicines” (Harris, 2013).

## 7 Discussion

Due to TRIPS, in 2005, India revised its patent law and introduced product patent protection. The new Indian Patents (Amendment) Act, 2005 was supposed to be an international TRIPS-compatible patent law. However, this Act contains a unique safeguard article – Section 3(d). Based on Section 3(d), the Indian government and Indian courts rejected internationally recognized patents such as the Gleevec patent.

Once India had decided to re-introduce product patent protection, mega-pharma companies re-entered the Indian market. These mega-pharma companies started applying product patents to IPO. This is one of the reasons the number of pharmaceutical patent applications in India increased rapidly since the late 1990s. The number reached 228 in 2007; however, since then, the number has rapidly declined. This trend suggests that these mega-pharma companies changed their strategies for the Indian pharmaceutical market.

As described above, two landmark incidents occurred in 2012 and 2013 in India. One of them was the Supreme Court’s decision on Novartis’ Gleevec in 2013 and the other one was compulsory license issuance in 2012. Both incidents were a huge blow to the mega-pharma companies. It is considered that through these incidents, these mega-pharma companies might have reviewed their strategies toward the Indian market.

When these mega-pharma companies re-entered the Indian market, they considered it one of the most prospective markets. However, through these two incidents, they found that IPR enforcement in India was weak and that IPR was not fully protected in the country; thus, they eventually decided not to apply patents to IPO.

Dr. Mitsuo Fujii, head of the IPR division of the Japan Pharmaceutical Manufacturing Association (JPMA), pointed out that foreign capital companies became cautious toward the Indian market. He said, “In around 2005 we looked for Indian market as a prospecting market.” He added, “However, several incidents occurred in India since then. Through these incidents we became to think we had better take a wait-to-see position at the moment toward Indian market”<sup>3</sup>.

These foreign capital firms may still seek several business opportunities in the Indian market and may find their contract manufacturing partners or contract research and development partners, out-licensing partners, or voluntary licensing partners.

## 8 Conclusion

The pharmaceutical industry of India is the world’s No. 3 in volume and No. 11 in value. With high quality and low prices, Indian pharmaceutical products are popular, not only in the Third World, but also in advanced countries.

India revised its patent law in 2005 and introduced product patent protection. Taking advantage of the revision of the patent law in India in 2005, almost all of the so-called mega-pharma companies re-entered the Indian market, targeting the huge consumption market. These mega-pharma companies launched R&D, manufacturing, and marketing in the Indian market. Thus, the number of patent applications by these mega-pharma companies shot up in India.

However, two land-mark incidents occurred in India – the Gleevec lawsuit and compulsory licenses. Due to these events, the mega-pharma companies seem to have changed their business model in the Indian market. The number of patent applications dropped significantly. Foreign capital

<sup>3</sup> An interview with Dr. Mitsuo Fujii, head of IPR division of Japan Pharmaceutical Manufacturing Association (JPMA) in December 2018

companies may find some opportunities in India as the bases for contract manufacturing sites or clinical studies sites.

# Application of Artificial Intelligence Technology in Legal Practice

Ma Nan

School of Law, Humanities and Sociology, Wuhan University of Technology, Wuhan, P.R. China,  
430070

(E-mail: mn1025960479@qq.com)

**Abstract:** The rapid development of artificial intelligence technology has changed the operating mechanism of the current legal system, which has a certain impact on the traditional legal system, but also brings opportunities. This paper analyzes and compares the current situation of the combination of artificial intelligence technology and law at home and abroad, and points out the advantages of the combination of artificial intelligence technology and law. This paper enumerates the application of artificial intelligence technology in legal practice, such as legal reasoning, information retrieval, intelligent trial, auxiliary legislation, and analyzes the problems and challenges of artificial intelligence technology in legal practice. It is hoped that readers can think more about this field and do more deep research.

**Key words:** Artificial intelligence; Legal services; Legal reasoning; Information retrieval; Legal documents; Auxiliary legislation

## 1 Introduction

Informatization is the historical process of making full use of information technology, developing and utilizing information resources, promoting information exchange and knowledge sharing, improving the quality of economic growth and promoting the transformation of economic and social development. In recent years, the state has been promoting judicial reform and legal information, "Internet + law" has become an important direction of innovation and entrepreneurship. And with the rise of artificial intelligence technology, some legal artificial intelligence products are gradually coming into everyone's field of vision and under the influence of super computing power, big data and continuously improving algorithms, make "Internet + Law" change to "Artificial Intelligence + Law". The deep integration of artificial intelligence and law can promote and perfect the development of the two subjects. With the help of artificial intelligence technology, the legal profession will undergo more profound and radical changes.

### 1.1 Domestic research status

The integration of disciplines is beneficial to the interpretation of the essence of the issue from multiple perspectives. Only by looking back on the law after jumping out of the law, can jurisprudence obtain a stronger vitality (Bai Jianjun, 2008). With the integration of disciplines, artificial intelligence and law will have more vitality. Many scholars have realized the unique advantages that the combination of the two brings to the research of law, artificial intelligence and logic, and more people have been or are engaged in the research of artificial intelligence and law.

Chinese professor Qian Xuesen put forward a general idea about the combination of artificial intelligence and law in 1981. However, it is a pity that there has been no further research on it in China for more than 20 years. In 2001, Zhang Baosheng analyzed the theoretical and practical value of the research and development of the legal system of artificial intelligence, as well as the jurisprudence basis of the application of artificial intelligence in jurisprudence (Zhang Baosheng, 2001); in 2007, Tang Haolai further discussed the connotation, research contents and possible impacts and challenges of the combination of artificial intelligence and law, and in 2012, we set up the judicial discretion model of artificial intelligence with the example of spiritual damage compensation.

China also has a small number of forward-looking institutions that specialize in quantitative research in law. For example, the Southwestern University of Finance and Economics has set up the key laboratory of rule of law quantification and information engineering in Sichuan Universities. Conduct relevant research on the rule of law indicators and legislative informatization. The Law School of China University of Political Science and Law has established a research center for big data and artificial intelligence law in 2017. Generally speaking, the research results of artificial intelligence and law in our country are not abundant, and it is still in the initial stage of research.

### **1.2 Overseas research status**

In the early 1950s, Lucien Mehl began to study the combination of artificial intelligence and law, because he was keenly aware that artificial intelligence would have a great influence on the study of law. In the 1970s, Anthony D. Amato argued that human judges should be replaced by robotic ones to remove legal uncertainty (Anthony D'Amato, 1977). But the question of whether it is right and feasible has been debated in American academia, sometimes philosophically. As J. C Smith points out, the idea that computers can or should replace judges is based on Descartes's "spiritual dualism" and "Leibnitz's fallacy." Both make the mistake that intelligence can exist independently of the human body and that all human thought can be expressed in a universal language (J. C Smith, 1998).

Legal Scholars in the United States and Europe have paid more attention to the study of rules and cases. The disciplines are relatively intensive, and artificial intelligence and law have received more attention. There are special departments and centers under the government or scientific research institutions for researchers of artificial intelligence and law, specializing in the theoretical and practical research of the combination of artificial intelligence and law. A joint effort of the United States government, academic institutions and companies has established modern technology and law related research centers, such as the Stanford Law Information Center, to study how modern information technology can be used to improve the quality and efficiency of Legal Systems At the same time, it reduces the operating cost, and its research not only includes the related theoretical research, it also includes practical research related to better understanding and compliance with relevant rules, enforcement agency monitoring of enforcement rules, and Regulatory Agency analysis of costs and conflicts of regulations. The Leibniz Centre for Legal Studies has been established in Amsterdam to integrate computer and legal personnel and to apply artificial intelligence for empirical research in legal theory, legal knowledge management and other legal fields.

### **1.3 Literature review**

As soon as the emergence of artificial intelligence technology, the world's hot discussion and research, and at present this technology has been skillfully applied in practical production and life, and artificial intelligence technology also has a huge potential of untapped, it can be combined with any other disciplines, will also promote great changes in other disciplines. In terms of the research results related to the combination of artificial intelligence technology and law, scholars have put forward the positive impact that artificial intelligence technology can bring to the field of law. For example, Dymitruk et al. believe that artificial intelligence will greatly reduce human and material resources and improve work efficiency. Kathrani and others believe that intelligence artificial will not only improve efficiency, but also be more fair and equitable. However, according to statistics, most of the relevant research results are produced by computer scholars, and the deep integration of computer science and law has not been realized yet. Many problems still need to be discovered, and these problems need to be solved by scholars in the two fields.

## 2 Artificial Intelligence and Law

### 2.1 Overview of artificial intelligence

Human activities often need intelligence, such as computer programming, mathematical problem-solving, car driving and so on need to use "intelligence". If the computer can simulate human thinking activities, like human thinking, then it can be considered that the computer has a certain sense of "artificial intelligence". Artificial intelligence system is a kind of system which can accomplish some intelligent tasks by using its software and hardware in various environments, such as judging, reasoning, proving, explaining, thinking and learning (Berman MD, 2016). In recent years, artificial intelligence has been highly valued all over the world. In 2014, 180 European companies and research institutions launched the world's largest civil robotics research and development program; in the same year, South Korea launched its second five year plan for the development of intelligent robots; in 2016, the White House reports and discusses the impact of smart and autonomous technologies on the economy and strategies to deal with it; in 2016, smart courts were included in China's national development strategy; in March 2017, the term artificial intelligence appeared for the first time in China's government work report, and the Central People's government issued a plan for the development of a new generation of artificial intelligence in July of that year China will strive to build an intelligent industrial chain in the field of image and speech recognition. In 2017, Alpha Go defeated the world's top Go player, Lee Sedol, and put artificial intelligence in the spotlight (Holcomb SD, Porter WK, Ault SV, et al, 2018), it also makes the application of artificial intelligence technology in the field of law become a new hotspot. In fact, artificial intelligence has been used to efficiently resolve online disputes, accurately retrieve and interpret legal information, accurately interpret and generate legal documents autonomously, comprehensively collect evidentiary information, and accurately conduct legal reasoning. Nowadays, more and more researchers study the application of artificial intelligence in law. Because combining artificial intelligence with law is a far-reaching task.

In the context of the country's vigorous promotion of intelligent legal services, from legal retrieval and preparation of legal documents, to contract review and legal consultation, to case outcome prediction and litigation strategy selection, legal Technology marked by intelligentization is stirring up the legal service market. Since 2013, under the leadership of the State Supreme Court on the application of artificial intelligence technology in intelligent legal services, the informatization and openness of legal documents has become a key direction of judicial reform (Fu Zitang, 2015). At present, China adjudicative document network has become the world's largest open judicial document library, open more than 60 million documents, a total of 20 billion visits. At the same time, the construction of smart courts continues to push forward and fall to the ground. The Zhejiang e-commerce Internet court began to operate on a pilot basis in 2015, and the "Internet + Smart Court" Information 3.0 era has been opened; in 2016, the Supreme Court and the China Power Science and Technology Corporation jointly established the Tianping big data company to explore applications such as big data and artificial intelligence (Luo Shuzhen, 2016); in 2017, President of the Supreme People's Court of China Zhou Qiang stressed at a meeting of the Supreme People's Court that the vigorous application of Strong AI technology in the field of justice will inject new impetus into Supreme People's Court Modernization.

On a global scale, the combination of artificial intelligence technology and law has attracted more and more computer scholars and law scholars to participate in research. In order to understand the research status and trends of the combination of artificial intelligence and law, the author chose to analyze the relevant research results data in the SCI database, using the "artificial intelligence and law" as the key words, select the SCI database to retrieve the relevant data. The horizontal axis is the time and the vertical axis is the number of research results. This paper analyzes the data in five years as a

time period.

**Figure 1 Data of Research Results in Artificial Intelligence and Law**

As we can see, since 2001, the number of research results combining artificial intelligence and law has steadily increased every year, especially in the less than four years from 2016-2019, the number of research results in this field has nearly doubled. It can be seen that more and more scholars are engaged in related research in the field of artificial intelligence and law.

## **2.2 The advantages of artificial intelligence in the legal field**

### **2.2.1 Increase efficiency**

It is inevitable for judicial personnel to engage in a great deal of repetitive work in their professional career. Statistics show that in the first half of 2017, the total number of cases handled by the courts in the whole of mainland China was ten thousand, ten thousand cases were finally concluded, the judgment rate was 60.9%, and the number of outstanding cases was ten thousand. Compared with the same period in 2016, the number of cases accepted by the courts nationwide increased by 11.2%, of which 14.8% were new cases, 9.88% were closed and 13.54% were not. There are about ten thousand judges in the country, 121.4 cases per person, 74.0 cases per person. As you can see, the workload of the judges is enormous. In fact, a judge is required to review a large number of relevant materials to conclude a case, and after careful consideration, to write a final judgment and so on. This is for the judge, whether professional ability, or physical quality, are under great challenge. If the application of artificial intelligence to deal with these cases, you can save most of the human and material resources, greatly improve their work efficiency and reduce the pressure that smart applications contribute to the reduction of more than 30% desk work (Kathrani P, et al.).

### 2.2.2 Improve quality

Artificial intelligence not only helps to improve efficiency, but also ensures that the fairness of the law is not affected by human factors and regional differences (Dymitruk M, et al., 2018). In reality, the quality of the judicial handling of cases is uneven, and sometimes there may have some cases that abuse of judicial power by the adjudicators, leading to many unjust and false cases, and even to such serious unreasonable situations as one case with two conclusions. Greatly shaken the majority of the People's confidence in the artificial adjudication. Moreover, judges in different regions may decide different cases of the same nature, which may not be fair to the sentenced parties and is not conducive to the construction of the legal system of the whole country. Therefore, it is necessary to use the scientific light of artificial intelligence to illuminate the black hole of handling cases at will, so as to make justice more just and careful, and truly achieve the goal of joint adjudication.

### 2.3 Feasibility analysis

Artificial intelligence is constructed by reverse engineering human brain function, so it can simulate human thinking well. Therefore, the logic operation of artificial intelligence justice and human justice has a high degree of commonness. However, artificial intelligence system can mine and integrate judicial data through machine language and digital code, thus breaking the limitation of human legal data processing Beyond Man's ability to recognize and integrate legal information and knowledge in natural language. Human rational thinking is not only limited, but also under the influence of psychological factors, the perception and judgment of empirical facts are often biased. As a result, legal persons may misjudge because of their own cognitive limitations, physical and emotional state. For example, a judge may be more or less personally involved in a case, and the outcome of the trial may differ from the strict provisions of the law. And artificial intelligence systems can use its powerful data storage, analysis and mining capabilities, not be disturbed by human emotions and external public opinion (Du Jin, Du Yanhui, Zhao Xin, 2013). Accurately identify the types of criminal behavior, quickly and accurately find the applicable legal provisions from hundreds of legal provisions, and realize the accurate connection between the types of behavior and legal consequences on the basis of constructing and optimizing the decision-making model, the accuracy of the legal trial has been greatly improved.

Artificial intelligence judicature can be built on judicial data, which can provide sufficient and effective evidence, precedent, standard and scale for most cases. As long as the continuity of the history of a particular social life is recognized and the abrupt nature of social evolution is not overemphasized, AI Justice is in line with social trends and legal beliefs. That is to say, the artificial intelligence judicature is the conformity, the continuation and the compliance to the numerous, the legal, the valid case logic. The artificial intelligence judicature also includes the case-based legal knowledge and the rule-based legal knowledge, which is a great contribution to the mixed system theory of legal knowledge. Therefore, whether from the perspective of the new natural law, or from the perspective of the application of law in reality and sociology, it is undoubtedly legitimate.

## 3 The Specific Application of Artificial Intelligence in Law

Early research on artificial intelligence and law is often scattered in computer and law journals. Since the publication of "Artificial Intelligence and Law" in the University of Pittsburgh Law School in 1992, it has been paying attention to the latest developments in artificial intelligence and law. Research topics include the application of artificial intelligence, cognitive psychology, jurisprudence, linguistics, philosophy and other knowledge for the establishment of legal knowledge, legal reasoning, court judgment models, as well as other ethical, social artificial intelligence and legal related research, publishing academic papers, book reviews, technical reports of technical systems or products, research notes, etc., has become the spiritual home of research scholars of artificial intelligence and law. The

following table is obtained through the statistics of related papers published in the journal in recent 15 years.

**Table 1 Research Content and Quantitative Analysis**

Sector	Legal reasoning	Legal information retrieval	Analysis of legal concept	Agent research	Norm revision	Policy making	Evidence	Review
Quantity	160	100	62	60	40	20	24	18
Proportion	33.06%	20.66%	12.81%	12.40%	8.26%	4.13%	4.96%	3.72%

According to the analysis of the research results published in the “Artificial Intelligence and Law” magazine in the past fifteen years. Firstly, the research theme of artificial intelligence and law is far more abundant than our imagination. Secondly, the research on artificial intelligence and law adopts the latest artificial intelligence. Related technologies and achievements; Thirdly, from the perspective of published articles, the use of artificial intelligence for legal reasoning, the establishment of judicial discretion models, and expert systems have always been the focus of artificial intelligence and legal research.

This paper enumerates four specific applications of the combination of artificial intelligence and law, which are elaborated and analyzed as follows.

### 3.1 Application one: Legal reasoning

Reasoning is a kind of rational thought activity, that is, the process of deducing the unknown proposition (conclusion) from many known proposition (precondition). In the field of law, reasoning plays a decisive role, because in the law-making, implementation, and even the daily People's knowledge of the law, law-abiding, need to reason. For example, when investigating a crime, the police will protect the original state of the scene, the purpose is to be able to deduce the case when the scene of the crime, the perpetrator's physical characteristics and psychological and so on. In court, legal reasoning is actually carried out in the form of dialogue. This dialogue is reflected in the fact that the parties and the accused are debating their conflicting claims, at which point the judge has to ascertain the truth of the facts from their reasoning in the dialogue, that is, in a criminal trial, a judge or jury needs to reason about a case that has already happened based on the evidence available to them.

The goal of the artificial intelligence system of legal reasoning is to provide human lawyers with a standard legal scale to measure the value of the arguments they make in their reasoning. The working principle of artificial intelligence system imitating legal reasoning is to create mathematical model and implement corresponding running program on computer that is to transplant the thinking process of human reasoning into intelligent system (including robot). For such a system to simulate a court system, the developer must not only have a basic knowledge of the law, but also a complete knowledge of legal reasoning. Such as the practical application of legal reasoning and theoretical development process, the norms and methods of legal reasoning, and so on.

### 3.2 Application two: Legal information retrieval

The value of legal information retrieval is obvious. Law Novices, experienced lawyers, judges, judiciary, and the general public all need to search for legal information from time to time (H Prakken, 2017). Nowadays, more and more judicial documents, such as legal texts, judicial documents and other legal materials appear on the Internet, which strongly supports the market of large-scale legal databases. However, most of the daily judicial databases search by the inherent keywords, which is time-consuming, laborious and expensive, so it cannot meet the demand of the legal information market well. An artificial intelligence retrieval system with powerful natural language processing capabilities can not only increase the work efficiency of lawyers by 500 times, further reduce the cost of litigation by 99%,

but also perform fast and accurate database searches Even better than humans. The working principle of legal artificial intelligence retrieval is that it can understand the fact of an event and identify the conflict with the law, and then accurately retrieve the best solution. The whole work does not need human intervention, and can even replace some lawyers' trivial work, thus freeing lawyers from the tedious retrieval work. Thus, the legal information retrieval system in the era of artificial intelligence is a very large and far-reaching research.

### **3.3 Application three: Handling of legal documents**

The artificial intelligence of legal document processing will give legal workers more and more powerful external brain aid. At present, researchers are keen on artificial intelligence processing of various contracts. This is because, on the one hand, routine exchanges of goods and services often require contracting (in contracts, the parties establish common rules to meet the expectations of the parties) and, on the other hand, because of the size and complexity of the contract, so it is a time-consuming and error-prone task to input and detect the contradictions and conflicts in the contract manually.

Drafting a contract is one of the main tasks of an enterprise legal consultant, which is time-consuming and laborious. However, artificial intelligence systems with deep learning capabilities can generate highly accurate, complex and context-specific contracts by learning a large number of actual contracts. The contract it drafted was far better than the result of copying the model contract, and better than the work of many experienced law firms. Silicon Valley firms have now adopted such a contract-generation system to help start-up companies create the legal documents they need, cutting hours from several days to a few hours. There are a number of similar companies in China, such as Baidu and iFLYTEK, that use their own patchwork methods to generate the required legal documents. A new era of intelligent systems to help draft legal documents is coming (perhaps in the next decade or so), with most trade contracts and the rest of the legal literature and even litigation and trial documents to be drawn up by Artificial Intelligence Systems. The role of judges and lawyers will shift from that of drafters to that of revisers and signatories. We still have a lot of work to do to prepare for this new era, because legal documents don't just include contracts.

### **3.4 Application four: Subsidiary legislation**

Law is a barrier to maintain social order, so when the existing law is incompatible with the new things, the law often needs to be re-customized or updated, that is, legislation is needed. Legislation usually refers to the process of making laws and regulations in strict accordance with specific procedures (H Luiten, 1999) (proposal of law, approval of law, agreement of law, promulgation of law). Legislation requires not only professional legal knowledge, but also keeping up with the changes of the times, paying close attention to the speech of the network society, based on data, and widely collecting people's opinions (Chen Yongmei, 2017). Relying solely on artificial frequency to innovate legislation or reform original legislation would not only add huge workloads to the departments concerned, but would also put great pressure on them. Therefore, it is necessary for the legal circle to use artificial intelligence to support legislation, because artificial intelligence not only has the powerful ability to deal with massive data, but also has the efficient learning ability. Legislation is in fact based on the reality of the problem, the development of a solution to the problem. This requires the legislature to find the crux of the problem, which is a great challenge for lawmakers, but for artificial intelligence system is very easy. In fact, artificial intelligence is the most appropriate tool for making legislative decisions based on the analysis of practical contradictions.

At present, all countries in the world have responded positively to the artificial intelligence assistance legislation. Wooldridge, a professor of computer science at the University of Oxford, says the

UK's work on artificial intelligence legislation is influenced by two factors: first, Britain's international standing in the field of artificial intelligence; and second, precautions against the possible dangers of artificial intelligence. Tianjin, China, has used an intelligent platform to review cases and is trying to use the platform's review work to advance the NPC's legislative work. This intelligent platform includes legislative project management, public legal documents, legal documents review, legal documents self-cleaning, legislative data analysis and so on. Although the rapid development of artificial intelligence symbolizes the coming of a new era, there are still some defects in the technology, such as the use of artificial intelligence for image recognition will reveal personal privacy.

#### **4 Problems and Challenges**

There are two major problems in the application of legal artificial intelligence: natural language understanding technology is far from mature, and case data are incomplete and lack of labels. Complex cases require lawyers to communicate with their clients over a long period of time to gain a comprehensive understanding of the case. With current technology, it is difficult for machines to perform similar functions. The deep application of artificial intelligence needs the unity of data, but the system docking needs strong coordination and high cost. In addition, legal AI applications face two major challenges: In terms of supervision, the legal services provided by AI systems are currently black boxes, and lawyers have no way of knowing the factors that influence their decisions and cannot supervise them; and in terms of confidentiality, artificial intelligence applications will be provided by third parties, and data storage and protection will not be controlled by lawyers, but by third party companies.

#### **5 Conclusion**

Discipline integration is beneficial to explain the nature of the problem from multiple perspectives, artificial intelligence and law as a new research discipline will have more vitality, many scholars have realized the combination to the law, artificial intelligence, logic and semantics, the unique advantages of more and more people have been or are in the research in artificial intelligence and law. In general, the cross-research results of artificial intelligence and law in China are not abundant. There are few research results combining theory and practice, and the research is not deep enough. The research on combining technology, case and jurisprudence is not enough, and it lacks practical investigation.

Because of the isolation and barriers of disciplines, there is a big difference between the research methods and the evaluation of academic achievements. The lack of mutual understanding between disciplines also restricts the growth of interdisciplinary subjects. Computer scholars mainly pay attention to the efficiency of computer computing methods, but lack of attention to legal theory and judicial practice. Legal scholars pay more attention to legal logic, legal concept itself, and pay attention to legal timeliness. Therefore, it is necessary for computer scientists and legal scholars to conduct related research.

Artificial intelligence technology has already begun to transform the entire legal profession, and the scale and speed of the transformation will depend not only on the pace of technological development and progress, but also on the degree of acceptance of new technologies and models by the entire legal community. This requires policy support and development orientation (Hao Tiechuan, 2018). Legal person needs to adjust the mentality, embrace the new technology and the new pattern positively, and persist in the idea and the belief to the law in this process, to prevent legal artificial intelligence from weakening and undermining the ideas and values upheld by the legal community and the legal system, and to allow legal artificial intelligence to promote justice rather than prejudice and discrimination, or go in the opposite direction, demeaning justice.

**Abstract:** Security is a vital issue for wireless sensor networks (WSN), lately significant research is focused towards resolving these issues. The nature of wireless sensor network applications requires confidentiality in intrusion detection system (IDS) that can provide ability to identify and control intrusions. The sensor nodes of wireless sensor networks are prone to be attacked by invaders. Several researchers have suggested light weight security modules which are either signature based or rules based for securing sensor nodes. However, the overhead of even the light weight modules on sensor nodes is challenged by limited battery life and compromising the life time and communication of the network. Similarly, assigning sensor node IDS on static nodes is vulnerable to be identified by invader. A dynamic node selection IDS is proposed that can counter the vulnerability. Fuzzy logic scheme as suggested for cluster head selection to be employed on DSIDS node selection.

**Keywords:** Dynamic sensor IDS; Leach; Monitor node selection; WSN

### 1 Introduction

Wireless Sensor Networks are implemented in real world solutions including highway traffic, military surveillance, data attainment about livestock activities on the planes, under the sea and in remote areas (Hosseini, 2011). In a typical WSN, there are many accumulation points (sensors) that collect information from their neighboring nodes, aggregate and broadcast the information toward base station where data is processed. WSN issues include safety of sensors, vulnerability of wireless channel for data distribution and shared broadcast communication, employment in unapproachable and open setting, involuntary and autonomous nature and restricted properties make WSNs vulnerable (Akyildiz, 2002).

This paper proposes dynamic monitoring node selection process & algorithm using fuzzy logic for WSN that will be executed by CIDS. The article is organized into 4 parts: part 2 focuses on exploring state of the art literature in node selection for WSNs as limited literature is available in dynamic WSN-IDS node selection this section is focused on cluster head selection mechanisms proposed as it closely relates to dynamic monitoring nodes selection. Section 3 explains proposed monitoring node selection that will hold WSN-IDS light weight version for WSN. Finally, section 4 concludes the article and provide impending path in WSN-IDS research.

### 2 Related Work

Security eruptions are categorized into two types in WSN: Active and Passive. In active attacks, attacker disturbs the operations in the targeted network. For example, the networking services may be terminated as a result of these attacks. There are many types of attacks for example flooding, Denial-of-Service (DoS), hole attacks and Sybil types attacks on WSN, further discussed by (Cayirci, 2009; Wang, 2006; Padmavathi, 2009). Resolutions to vulnerable securities in Computer Infrastructure (wireless and/or wired) involve three focal techniques (Fuchsberger, 2005) prevention, detection and mitigation.

In this issue (Zhang, 2003) describe intrusion as: “any set of actions that attempt to compromise the integrity, confidentiality, or availability of a resource”. The avoidance mechanisms are the frontline security against such intrusions that include identity confirmation for accessibility, encoding and secured routing. An Intrusion Detection System is to support the identification, assessment, and reporting the

intrusions. Intrusion detection is normally an element of holistic defense mechanism deployed on a system or device making it an integrated defense line (Ngadi, 2003).

IDS for WSN requires designing efficient software that suits the constraints of wireless sensor nodes, head nodes and central base station such as power consumption to extend the lifetime. Several possible arrangements of WSNs (Hosseini, 2011; Reis, 2002) may exist that comply to the specific application requirements, so it is difficult to define standard and predictable performance as IDS for a specific WSN needs to be rearranged in accordance to the unique application type of WSN.

Similarly, while designing a sensor node level IDS is challenged by limited battery life and probability of compromising the life time and communication of the network. Proposed a light weight rule based IDS which will reside on first level of WSN i.e. Sensor nodes. However, keeping in view the nature of WSN applications and its constraints, activating IDS on all of the sensor nodes is not practical. To solve this issue some selected sensor nodes that now onwards will be referred as monitoring node (MN) can be designated to have activated light weight rule based IDS. The primary issue is to deal with selection of these nodes.

This research proposed rules based multi-layer IDS architecture that is enabled on both misuse and anomaly detection. Different approaches of intrusion detection at all WSN layers i.e. sensor nodes, cluster heads and base station taking into consideration the constraints and vulnerabilities at these layers. On sensor nodes the threat of physical abduction and penetrating intrusions was proposed to be dealt by light weight rule based system and encryption. The architecture directs to perform detection and prevention mechanisms from physical threats for the WSN allowing cluster heads IDS (CIDS) to periodically perform dynamic selection of monitoring nodes (sensor nodes containing IDS). CIDS will further identify and perform active response such as detach compromised sensor nodes in their cluster whenever anomaly reported by the monitoring nodes. Initially (Wang, 2006) and later on (Noman, 2011) proposed specializing nodes (watchdogs) to contain intrusion detection module that decreases overhead on all nodes. Other than these nodes act as conventional sensor nodes to sense and transmit data. Furthermore the cluster head node IDS may take necessary action as it receives threat alerts from the watchdogs.

Following a static intrusion detection node all the time creates vulnerability in the sense that attacker can trap the monitoring nodes (MN). Extra energy may be consumed in electing the cluster heads thus (Saranya, 2015) suggested IDS without cluster but contain overhead for sensor nodes as they have to maintain data about neighboring nodes resulting in more power consumption.

Data gathering from MN proposed by (Silva, 2005) continuously pay attention to data series being communicated and filter data required for analysis and design of rules. After that the detection is performed using the "rules base" as elevated by MN. It is good scheme but not without demerits such as the process of determining the monitoring nodes is not well defined. The limitation in its algorithm makes it difficult for practically implementing it in WSN.

Several authors (Krontiris, 2008; Chi, 2006) highlighted the overhead present in most of the schemes. Being informed of that, the collaboration overhead is usually several orders of magnitude higher than the computation overhead (Akyildiz, 2002), this drawback is highly critical for WSN. Keeping in view emphasis can be found in the WSN research about selection of sensor nodes to be used as cluster heads (CH). The representation design is low energy adaptive clustering hierarchy (LEACH) protocol (Heinzelman, 2002; Heinzelman, 2000) a probabilistic model for CH selection and focus on rotating the CH for energy efficiency. This protocol has limitations of selecting an inefficient node as it depends solely on probabilistic model and do not consider other factors critical for selection of nodes such as distance between selected nodes and energy level. Clustering approach presented by (Lee, 2012) for fuzzy logic focus on energy prediction named as LEACH-ERE it is very influential in designing

our process for monitoring node selection. However, Lee et al. work is focused on selection of cluster heads whereas our work is towards selecting a collection of candidate nodes to act as monitoring node with active IDS enabled on them.

Solving the node selection issue (Qi, 2012) presented input linguistic parameters: Remaining Power of Sensor (RPS) Sensor Speed (SS) for cluster-head decision. They have considered the moving speed of the sensor thus to predict if the node will leave the cluster. Trust mechanism in WSN sensor node selection is important especially for hostile environments where malicious nodes are well disguised enabling them to attack the whole network using natural transmission over WSN (Mushtaq, 2017).<sup>4</sup>

### **3 Proposed MN Selection Approach**

Following sections describe the monitoring node selection approach proposed based on the data observation and its priority to become a MN.

#### **3.1 MN selection model**

Focus of this study is on network applications where sensor nodes are casually deployed and uninterruptedly observe the surroundings. The data collection is done on the sensor nodes and sent to the base station through cluster heads, base stations are usually situated outside of the ad hoc network.

Sensor node gather data from the atmosphere and send back to its related cluster head through monitor node, or as monitor node to gather data from sensor node and pass it through the rule base and take appropriate actions and after compressing transmit it towards the base location through CH. Assumptions adapted from Lee for this study:

1. Base station and sensor nodes are considered as stationary after deployment.
2. Every node has same energy initially, and the network is considered as homogeneous.
3. Through received signal strength distance can be calculated between two nodes.

Focus of this study is on handling probabilities and uncertainties, for the calculation of possibility of each node to act as Monitor node. As shown in fig 1.0, two inputs for fuzzy inference system (FIS) are the remaining energy (RE) and the projected remaining energy (PRE), and the only output variable is the possibility of a node to be selected as a Monitor Node, named Possibility. The higher possibility shows that the selected node has more probability to act as Monitor Node.

---

<sup>4</sup>[www.wikipedia.org/](http://www.wikipedia.org/) wireless sensor networks, intrusion detection system[W].

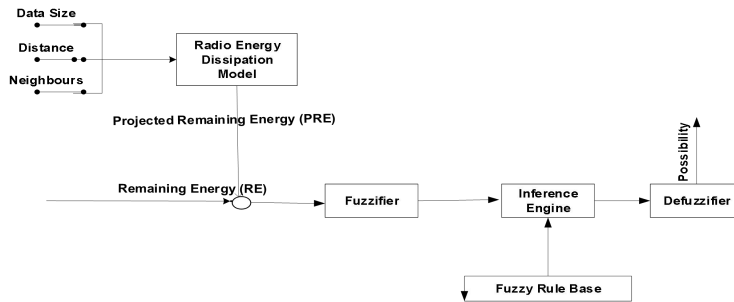

Figure 1 Proposed MN Selection Model Adapted from (Lee, 2012)

### 3.2 Fuzzy Inference System: Handling Uncertainties

In Fuzzy Inference System (FIS) the input variable is named remaining energy's (RE) fuzzy set, in this fuzzy set six different linguistic variables used are high, pretty high, moderate, precisely low, low, and v low. The "trilateral participation function" is assigned for language based parameters as pretty high, moderate, pretty low, low, while "trapezoidal function" is assigned for high and precisely low. Second fuzzy input is projected remaining energy (PRE) of the Monitor Node aspirant and the fuzzy set that elaborate projected remaining energy (PRE). The linguistic variables are high, medium and low for this fuzzy set. A membership function triangular is used for medium, whereas trapezoidal membership function used for high and low. The only fuzzy output is the possibility of a Monitor Node aspirant. To handle uncertainty fuzzy if-then rules mapping for the possibility calculation of node used to act as monitoring node. In all 18 rules for fuzzy mapping are defined based on two input variables as shown in table. The resultant variable possibility can be deduced from these two fuzzy input variables. This fuzzy variable is translated into a single crisp number which we can use generally. In this study, defuzzification is attained through center of area method for possibility. Normally, fuzzy rules can be created from experimental data or heuristic. This study determines "heuristic fuzzy rule generation method" as it has relatively high remaining energy (RE) and high expected remaining energy has higher possibility to become as Monitoring Node.

### 3.3 Dynamic Monitoring Node Selection Algorithm

The WSN have various routing protocols for node selection SPIN, HEED, SAR and LEAC Hare some of the popular routing protocols that vary in the services provided and techniques followed. Out of all these protocols LEACH and HEED are highly efficient protocols (Shio, 2010).

We determine the dynamic monitoring node selection algorithm to be based on LEACH protocol as it is the first cluster based routing protocol that distributes the energy load evenly over the network in a randomized manner. This approach is a first step is "Setup up phase" that returns the collection of MN within the cluster after single time execution at Cluster-IDS

(CIDS). The IDS MN selection has similarities in cluster head (CH) selection.

Accordance with LEACH algorithm standards first step is about calculating energy to direct transmission of node with formula

$$E_{ampk}(3d_1 + d_2)^2$$

Where “d1” is the first sensor node and d2 is the next transmission node

$$T(n) = \frac{P}{1 - P \times (r \bmod P^{-1})} \quad \forall n \in G$$

$$T(n) = 0 \quad \forall n \notin G$$

Here n is a random number between 0 and 1, P is the Monitor Node Possibility and MN that were not present in the completed rounds is denoted as G (set of nodes), If  $n < T(n)$  is true it leads to designate it as a MN. This way algorithm ensures that each node is made MN minimum once that makes it energy efficient. The second step is called “steady phase”, sensor nodes send their data to the monitoring node. The member sensors in each IDS cluster may transfer security data only with the MN via a single hop transmission. The figure 2.0 is not an optimum scenario however the second is better because the MN are spaced out and the network is more properly sectioned.

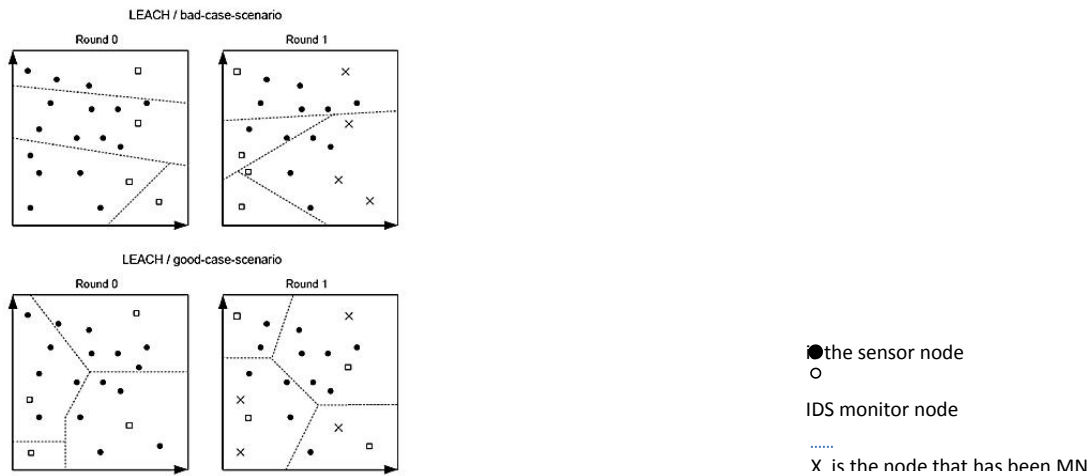

Figure 2 MN Selection Using LEACH Sample Scenario

#### 4 Conclusion

Considering the nature of wireless sensor network applications which are mostly deployed in critical environments such as military application require protection. In this paper monitoring node (node contain light weight IDS) selection problem in the WSN is focused. The paper proposes process of dynamically selecting to be handled by CIDS at different repeating cycles. Further, we suggest an algorithm build inspired from fuzzy logic cluster node selection that takes into account the resources (energy level) of the sensor nodes and

rank its possibility to be a monitoring node. This Approach targets to maintain the collections of all candidates node making it more efficient as the next round of MN selection can be done considering the possibility.

The proposed dynamic IDS monitoring node selection is expected to supplement the overall IDS architecture in WSN. In future research we propose to simulate the process and measure its performance.

# Exploring the Ethics of Innovation Education in Artificial Intelligence

Wang Xiumei

School of Computer Science and Technology, Wuhan University of Technology, Wuhan, P.R. China,  
430070

(E-mail: 14926500@qq.com)

**Abstract:** Innovation education in artificial intelligence combines the core technology of AI technology and practice of education, integrates innovation education, experience education, project-based learning and other concepts of education, and plays an important role in the New Era in enhancing students skills in research practice, combining science and humanities and developing students' innovative thought and international vision, thus further developing high-level personnel and building the atmosphere of "science & technology prospering education". However, with the technological progress and development of AI technology, human subjectivity has become vague during the implementation of innovation education, and the bias for AI technology in education practice may be intensified, which has raised concern for problems of orientation to education and developing innovative students. Based on the above, this paper summarizes the significance, advantages and existing problems of current innovation education under the background of artificial intelligence through literature research and investigation, and puts forward corresponding thinking. This paper holds that: from the technological perspective, the rapid development of AI technology, along with its advanced nature, instability and its gap from traditional education, has impacted the development of innovation education; from the perspective of subject, the fact that the concept of humans as subject has not been well developed and a lack of morality cultural literacy constitute the major factors; from the perspective of institution, the flawed legal system, regulations and policies, as well as the outdated ethics have resulted in the lack of ground for innovation education in artificial intelligence, and thus have caused various ethical problems. Therefore, supervision and protection of technology, strengthened international exchange & cooperation and scientific innovation are necessary in the sense of technology; ideas of humanities shall be integrated into AI technology; in terms of subjects, the participants shall enhance their sense of moral responsibility and moral & cultural literacy, and hold a clear sense of subject; from the institutional point of view, the sound legal system shall be established with relative ethic principles and regulations made, thus constructing the moral ethics that correspond the innovation education in artificial intelligence.

**Key words:** Artificial intelligence; Innovation education; Ethic exploration; Embedded values

## 1 Introduction

The cultivation of students is the common concern of the society. Using artificial intelligence technology to carry out innovative education is gradually moving towards colleges and society. On May 16, 2019, International Conference on Artificial Intelligence and Education was held in Beijing, and President Xi Jinping sent a congratulatory letter to the conference, noting that artificial intelligence (AI technology) is an important driving force to lead the new round of technological revolution and industrial transformation, which is now deeply changing people's way of production, life and study. Meanwhile, it pushes human society to embrace the smart era of humans - machine synergy, cross-industry integration, joint creation and sharing and it is an important mission for education to follow the

trend of global AI technology development, find and focus on the point of breakthrough, and foster ranks of high-level personnel in this regard who have both creative capabilities and teamwork spirit. An article on Guangming Online also notes that AI technology drives a new round of technological revolution, industrial revolution and social progress, and is changing people's way of study, production and life everyday subtly and directly, which imposes both opportunities and challenges on us. For us, promoting AI technology education is our responsibility and mission (Guangming Online, 2019). Nowadays AI technology + big data in education have been implemented in various pilot cities, and education institutes have already shared the dividend of education in AI technology. On one hand, it enables teachers to prepare for better-directed and more efficient classes, and releases them from heavy work on examination papers so that they could have more time and energy to improve their teaching. On the other hand, AI technology-empowered study could expand student's time and space for study, so that it could be anytime and anywhere. High-fidelity simulation could visualize the concepts difficult to understand and make abstract process figurative, improving students' understanding and application of knowledge. Various smart technologies can pave the way for students for links to vast information, thus making vast resources accessible and illuminating real problems and data for students. Visual technology could connect different human associations of shared-interests, such as teachers, students, parents and experts, promote mutual assistance and study, provides tools and frameworks of study, help students in representation, organization, construction, sharing, management, expression and reflection on knowledge, and thus enhance their learning capacities.

Introducing artificial intelligence tools to assist innovation education could strengthen the building of smart learning environment, help students adapt to such environment, and enhance their customized study with the smart technology, which follows the new requirement for educational method, educational concept and talents under the background of the current scientific and technological revolution. Meanwhile, it is of great significance to focus on ethics & morality education in the development of artificial intelligence, aware of both sides of technological development and discusses how to play the positive role to promote innovation education better serve students' whole process growing up in the context of artificial intelligence.

## **2 Difficulties in Innovation Education in Artificial Intelligence**

It is a long process to put forward the concept of artificial intelligence and then to enrich it. It was first invented by John McCarthy in 1956, and through the implementation. Nowadays, it commonly defined by the academics as an emerging science, the theory, method, technology and applied system of extension, simulation and expansion human intelligence.

### **2.1 The subjectivity researches of AI technology**

Researches on the ethics of AI technology are mainly conducted from subjectivity. ZHAO Yunfeng holds in Artificial Intelligence Shall not be the Subject of Criminal Liabilities that artificial intelligence is machine in essence that exerts the intention of humans, and thus as machine without emotion shall not be treated as subjects of liabilities (Zhao Yunfeng, 2019). Yet CHEN Quansi expresses different view in The Tortuous Liability and Fixation System of Artificial Intelligence that AI technology could make decisions and judgments on its own with the fact that the humanoid robot Sophia has obtained the Saudi Arabian citizenship, and thus as to any tortuous behaviors by AI technology, the liabilities shall come to the users, producers, managers and AI technology itself (Chen Quansi, Zhang Hao, Luan Qun, 2019). Meanwhile Nick BOSTROM points out in Superintelligence: Paths, Dangers, Strategies that orthogonality of goals are the cause of ethical problems of AI technology, namely the goals and methods

of AI technology are mutually independent and any algorithm (whether ethical or not) might be used to achieve the goals (Bostrom N, 2014).

## **2.2 The solution to ethical problems of AI technology**

On the solution to ethical problems of artificial intelligence, researchers are paying more attention to the guiding role of technological ethics and emphasizing the boundaries of artificial intelligence. CAO Jianfeng points out in *Urgent for In-Depth Research in Ethics of Artificial Intelligence* that development of artificial intelligence shall be guided by ethics of science, or researches for evil purposes would be inevitable, such as the genome-edited babies, so while promoting the cross-discipline cooperation, we should strengthen the research in ethics to guide technological development for good purposes (Cao Jianfeng, 2019). DANG Jiayu believes in *Research on the Ethical and Legal Risk of Artificial Intelligence* that while AI technology has promoted the network of information technology, it has also blurred the line between physical reality, numbers and individuals, and also spawned many complex legal and ethical problems, and therefore AI technology development must follow three principles: 1 to guarantee the security of human beings and pursuit public interests; 2 to be transparent and traceable; 3 to respect the individual privacy (Dang Jiayu, 2017). Wendell WALLACH asserts in his work *Moral Machines: Teaching Robots Right from Wrong* that in the near future, the ethical aspect of algorithm will be determined by the values embedded by engineers to the system, yet they have not decided how to embed them into their products, so the group of moral agents could be enlarged to include not only humans but also AI technology systems, namely the autonomous moral agents (Wendell Wallach, 2017). Once the design of AMAs is completed, it will be more convenient to morally guide smart robots. He also mentions that though AMAs can help manage the ethical behaviors of algorithm machine, the vital problems of embedded value have not yet been solved. Frodo PODSCHWADEK analyzes AMAs in *Do Androids Dream of Normative Endorsement? On the Fallibility of Artificial Moral Agents* and he believes that the faults of ethics of AMAs are different from those of humans, as they result from the flawed moral system (Podschwadek F. Do androids dream of normative endorsement? On the fallibility of artificial moral agents [J]. *Artificial Intelligence & Law*, 2017). He asserts that such faults could be avoided by real-time embedding ethic principles and accepting that AMAs could sometimes ignore the ethical guide, yet such measures might also turn good behaviors into bad ones.

From previous research, we can find that under the background of advancing the artificial intelligence, innovation education at the same time has its concern. Scholars have not come to a clear conclusion on whether artificial intelligence could be agents of liabilities and are still discussing and exploring the final methods of ethical problems of artificial intelligence. Targeting these two points, this paper also puts forward the ethical discussion of innovative education in the context of artificial intelligence.

## **3 Strengthening the Construction of Morality to Avoid the Risks of Lack of subjectivity**

### **3.1 The matter of human subjectivity in AI**

As to the matter of human subjectivity in artificial intelligence, this paper believes that from the perspective of human-technology relation, humans as subject can research on and reform technology, while technology as object has been improved and works as the effective tool to achieve the goals of humans. By pushing the progress of science and technology, humans have improved their livelihood and achieved happiness. However, the industrialization resulting from technological development has

restricted our performance of human agency in social production, and the coming smart age makes human labour being replaced by robots to a large extent. With the application of AI technology replacing humans for certain AI technology tasks, such automation and smart age have emancipated production capacity but also raised concerns for human unemployment. Meanwhile we found that new jobs are also coming out which are more demanding (Guangming Online, 2019). Just as Herbert MARCUSE put it, humans exist under the control of technology and society, and individuals are gradually assimilated in the social environment, resulting in the impacted subjectivity (Herbert Marcuse, 2008). With the technological progress, AI technology has been improving mentally and physically, and humans are being controlled by machines. Some smart robots can even make moral choices on its own, which indicates the enhanced subjectivity of AI technology. However, the existing ethical problems of AI technology are inevitable. The fundamental task of education is to cultivate people, human beings should always play the dominant role in its relation with AI technology in education industry, and make use of human agency, individual choice and interpersonal differences, thus properly controlling AI technology rather than being controlled.

### **3.2 The solution to avoid the ethical risks of AI**

To avoid the ethical risks of AI technology, measures shall be taken from the rational perspectives of function designers, subjects and objects of education, so that AI technology could be properly applied and thus benefits human beings who should never become totally dependent on the technology. The research & development of AI technology must always serve humans and be considered from human desires, so the ideas of humanism should be integrated into artificial intelligence. Albert EINSTEIN once remarked on science and technology that it completely depends on human beings rather than tools how it is being used and whether it brings happiness or disaster to humans (Albert Einstein, 1978). The ethical problems of AI technology are largely related to the moral pursuit of developers and users. AI products in the daily life are figurative outcome of technology and reflect human wisdom. Human-machine relation is still the relation between human beings and objects, yet it could reflect interpersonal relations. Education practitioners and education audiences should also clarify the primary and secondary relationship between education content and education methods, reasonably locate the role of artificial intelligence in long-term education activities, organically combine various methods, give full play to the assisted role of artificial intelligence tools, and use artificial intelligence technology to help the educated better understand the world and change the world. Human potential of value creation could be tapped by artificial intelligence technology, which frees humans from physical labour so that we could further perfect and promote ourselves, which is the meaning of human-technology relation in the real life.

## **4 Embedding Values to Block the Direction towards Intensified Bias**

### **4.1 The value orientation of algorithm**

In the beginning of AI product design and education, the objects of education might be directed towards intensified bias and thus be limited to the previous stereotype. Some scholars simply compare algorithm to tools and hold that the influence of it on people actually derives from themselves, while algorithm as tools does not imply any value, so when seeking for the solution to ethical problems of algorithm, we only need to discuss from the moral agents rather than embedded value. To them, algorithm does not involve value, and technology could not be categorized as good or evil. In this sense, all that needs for discussion is whether it could achieve the goals of users, and whatever the goals are, technology itself shall not be labeled good or evil. These scholars further believe that algorithm is in essence certain technology, and thus remains neutral while being applied in big data or AI technology. Therefore, people only need to be concerned with whether it has fulfilled its function of dealing with

and using data, or whether the design of driverless cars is flawless. Algorithm frees people from natural limits and enables them to accomplish what they were not able to do. After the big data technology was invented, people began to use it, and therefore algorithm further expanded the scope of human activities and provided people of more choices. Consequently, behaviours guided by different values emerge, which shows that algorithm also has its value orientation.

#### **4.2 The way to block the direction towards intensified bias**

Blocking the direction of intensified bias from the source of developers is of great significance to the formation of the starting point of innovation education under the background of artificial intelligence. In order to block the direction towards intensified bias, embedded value based on consequentialism, namely value sensitive design, which emphasizes more the control of algorithm result, i.e. it will adjust the embedded value according to the result of the algorithm whatever good or evil. The first step is to collect the behavioral data of all the algorithms, rate them and classify them by values; then the algorithm will be improved based on the values of behaviors, and praise and promote the algorithm that results in good behaviors while ban those resulting in evil ones; finally all the algorithms resulting in good behaviors will be concluded for the ethic standard which will be included in the algorithm as the code of conduction. To regulate algorithm by embedding values, we should focus on the ethics themselves, but still we cannot guarantee the standards could cover all the ethic problems. Therefore, problems of algorithm discrimination and unfairness remain to be explored for solution by embedding algorithm.

### **5 Conclusion**

Artificial intelligence is a very important aspect in today's information society, and AI education is indispensable nowadays when "morality education" is emphasized in advanced education, information technology is being popularized among students and the sense of IT application being enhanced. The sound AI education relates to the equal, proper, and lifelong education for individuals, as well as their competitiveness in the future and national talent strategy. As an emerging industry, artificial intelligence is more and more closely connected with human life. By now AI technology has achieved highly self-adaptive nature, self-learning and self-analysis. The development of AI technology has brought more bonuses of development of human and human society. But while enjoying those bonuses from technological progress, we should be careful not to be dependent on it, and always check the flaws so that the problems could be found and solved. The development of AI technology has been generally progressive, but each coin has two sides. If properly applied, it will be infinitely beneficial, otherwise the unprecedented crisis might be caused. In any case, AI technology is meant to serve human beings, and if humans cannot take charge of its development, the results might be unpredictable. Therefore, reasonable regulations and restrictions must be carried out.

Undoubtedly the history of AI technology, from its emergence to education, and then to our daily life, is a process of gradual progress, during which we should base on human ethics and reflect on it so that we will not be dissimilated by the technology but properly development and apply it. This is essentially the matter between humans.

Widespread entrepreneurship and innovation are the trend of the time, and thus colleges and universities have already get prepared ahead of time by introducing innovation and entrepreneurship education. Artificial intelligence - assisted innovation education could actively enhance college students' information literacy and innovation capability, so as to meet the needs and promote the development of The Times. The constant maturity of artificial intelligence needs the injection of

humanistic spirit. This is the point of the article. Based on ethics, this paper holds the “people oriented” idea and explains the possible ethic problems involved in the popularization and application of AI technology to innovation education, analyzes the reasons and raises the countermeasures and solutions, thus providing suggestions how AI technology better fits innovation education and further develop personnel in this regard.

# Prospect for the Development of Artificial Intelligence in the Core Business of Libraries

Yuan Xueqing, Liu Lin

Library, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: vvfl@qq.com, 19582560@qq.com)

**Abstract:** The era of Artificial Intelligence is coming. The relationship between Artificial Intelligence and each of us is becoming more and more intimate, and it constantly challenges our perception and cognitive limits. It will also bring new changes to all aspects of the library field. This paper combines development of Artificial Intelligence and the status quo of Artificial Intelligence in the field of libraries to analysis the prospect of Artificial Intelligence in the future development of the core business of libraries. It may provide academic discussion to promote the library to become a more important education center and cultural center.

**Keywords:** Artificial intelligence; Library; Core business; Prospect

## 1 Introduction

### 1.1 Background Information

Artificial Intelligence (AI), from the concept of "Artificial Intelligence" at the 1956 Dartmouth conference, to the "deep blue" draw chess champion Kasparov in 1997, and the AlphaGo victory over Go World champion- KeJie in 2017, Artificial Intelligence technology has entered a new stage after 60 years of development, which has aroused widespread concern of Artificial Intelligence in the whole society, making it an important driving force for global technological innovation and social transformation. Various fields are experiencing the baptism of Artificial Intelligence technology.

The "Guidelines on Actively Promoting Internet + Actions" issued by the State Council in July 2015 and the "13th Five-Year Plan Outline" issued in March 2016 all proposed to vigorously develop Artificial Intelligence. In 2017, it was written in The Government Work Report, and in July of that year, promulgated the "New Generation Artificial Intelligence Development Plan of the State Council", whereby Artificial Intelligence entered a stage of substantive development in China.

### 1.2 Literature Review

I reviewed the literature on the application of Artificial Intelligence in library in recent years. In the full text database of CNKI, I have retrieved 680 articles on the topics of "Artificial Intelligence" and "library". After the advanced retrieval, 130 papers with high correlation were obtained after eliminating duplicate and irrelevant papers. As early as 1985, scholar Xie Yuantai mentioned the application of Artificial Intelligence in libraries (Xie Yuantai, 1985). In terms of the distribution of authors, except Zhang Xingwang, Jiang Kang, Yin Hanxiong and Ren Shuoshi, who have published 2-3 papers, other authors have published 1 paper. They have not yet become the core author in the field.

Combined with the publication trend and specific research content, the application research of

Artificial Intelligence in library can be roughly divided into four stages. The first stage: from 1985 to 2000, the annual publication volume was less than 4 articles. The research in this stage mainly discusses the subject characteristics of Artificial Intelligence and the application of new technology in library, which is the enlightenment stage of the application of Artificial Intelligence in library. The second stage: from 2001 to 2010, the annual publication volume generally shows a steady growth trend, mainly discusses the application of Artificial Intelligence technology in digital library, which belongs to the preliminary development stage. The third stage: from 2011 to 2016, the annual number of published papers is stable, which is a stable development stage. It mainly studies more deeply some specific technologies such as intelligent retrieval technology and data mining technology, and continues to introduce the newly developed application of Artificial Intelligence technology in the library. The fourth stage: the publication volume increased sharply in 2017, which is a rapid development stage. The main research contents in this period are information resource construction, intelligent retrieval, personalized service, barrier-free reading, application of Artificial Intelligence in intelligent library, etc.

The research of Artificial Intelligence technology in library has the following characteristics: the research subject changes from traditional library to digital library, and then develops into Smart Library and even Intelligent Library. Research contents have been focused on intelligent retrieval, ontology, data mining, model construction, text classification, resource construction, personalized service, etc. The research features are obvious stages, strong technicality, wide research scope and strong continuity. The research direction shows the characteristics of emphasizing technology and neglecting humanities (Wang Shengang et al., 2018), most articles are about Artificial Intelligence, few articles mentioned how libraries view the development of Artificial Intelligence and how librarians should deal with the development of Artificial Intelligence.

## 2 Cognition of AI

### 2.1 Development stage of AI

The development of AI is divided into three phases (Warwick, 2011):

- 1) Machine learning phase - intelligent system uses a series of algorithms to learn from experience;
- 2) Machine intelligence phase - the machine uses a series of advanced algorithms to learn from experience (such as deep nerve Network), some areas of AI have now progressed to this second stage;
- 3) Machine awareness stage - it can learn from experience without external data.

Accordingly, AI research is divided into three types:

- 1) Narrow AI or Weak AI - which can perform and complete basic, role-based tasks, such as tasks performed by chat bots and personal assistants, e.g. Apple's Siri;
- 2) General AI or Strong AI - it can perform and complete human level tasks. It involves continuous learning of the machine, e.g. Tesla's self-driving car, and then Google's Alpha dog is the first to defeat the human profession Go players, the first AI program to defeat the world champion of Go, its main working principle is "deep learning";
- 3) Super AI - Super AI machine is much smarter than the most intelligent human brain in almost all fields, including science Innovation, general knowledge and social skills.

## 2.2 Concepts and characteristics of AI

AI technology is a kind of science and technology that computer system can reason, learn and solve problems according to people's thinking and behavior.

AI technology presents new features such as deep learning, cross-border integration, human-machine collaboration, group openness, and autonomous control<sup>5</sup>.

## 2.3 Importance of AI in the development of library

In the literature review of the IFLA Trend Report, AI is listed as one of the four major technology trends, and it is proposed that there are three main aspects of the impact of AI on the future of the library<sup>6</sup>:

- 1) The whole new beyond search Browser and the semantic analysis of web content;
- 2) Integrated speech recognition, machine translation, and speech synthesis to support real-time multi-language translation;
- 3) Cloud service crowdsourcing translation and recognition of diverse and complex web content.

In addition, the American Library Association's Top 10 news in 2016 also ranked the development of AI as the fifth place<sup>7</sup>. This shows that AI has entered the agenda of library development.

## 3 Application of AI in the Field of library

### 3.1 Application technology

With the formation and promotion of the information technology ecosystem represented by mobile Internet, big data, cloud computing, and the Internet of Things, especially the widespread application of big data and the rapid improvement of computer computing capabilities, AI technology is developing rapidly, it also contributed to the development and innovation of technologies such as big data, cloud computing, and the Internet of Things. At present, from the perspective of application and research, AI mainly focuses on the following areas: machine learning, problem solving, logical inference, neural network, natural language processing recognition, robot, and intelligent retrieval and so on.

In general, the form of AI applied to libraries is mainly reflected in the two aspects of Subjectivity and Assistive. Subjectivity refers to intelligent tools built and developed based on AI technology, for example, intelligent retrieval systems for library applications, intelligent consulting systems, user evaluation systems, etc.. Assistive means that AI is embedded into other systems, tools or programs as a assistive technology to realize some functions of the system, tools or programs, such as the user's adaptive learning system, the information literacy training system, the system supporting the library decision-making, and the library performance evaluation system.

### 3.2 Application status

In fact, AI technology has long entered the field of library and information. From the early bibliographic retrieval system to the full-text retrieval of electronic documents, the essence of information retrieval embodies AI. Without intelligent retrieval, it is not thorough retrieval. Nowadays, information retrieval has become more and more intelligent, and it is getting closer to the needs of searchers. At the same time, more and more relevant information is associated with it. It is AI technology that gives this kind of learning ability.

Research and application of AI in the field of libraries have long focused on several branch technologies of AI, such as expert systems, pattern recognition, natural language processing, robotics, machine learning, and some or several related fields in the library including information retrieval and cataloging, classification, book selection, procurement, subscription, circulation, reference consulting and library automation applications. Basically, the concept of AI and these branch technologies was combined with the latest computer technology at the time to design and develop some new systems or experimental models for libraries. Some models and systems have been continuously researched, improved, developed and commercialized. In recent years, with the development of AI technology and computer technology, AI research and application in the field of libraries has begun to get involved in strong AI technologies such as biometrics, intelligent chat robots, artificial neural networks, and deep learning.

There are already many successful cases in which libraries use AI. For example, two students from Aberystwyth University in the UK have developed a directory query and location-guided robot to provide readers with enquiries and guidance services for the library's 800,000 collections<sup>8</sup>. The Westport Library in Connecticut, USA introduced robots to provide information service to readers from September 2014<sup>9</sup>.

### 3.3 Problems

Although library academics and industry have given high expectations to AI's library applications, AI technology itself is constantly evolving and changing, and AI's library application is still in its infancy. From the current situation, the main problem faced by the AI library application is the lack of integrity, showing obvious fragmentation and dispersion.

First of all, AI research and application mainly focus on a specific field of library management and service (such as personalized consulting solution system and smart inventory robot), but neglected the improvement of users' technological literacy (the ability to recognize and use AI)

Secondly, The AI library application scenario is mainly limited to a certain activity of the library, such as intelligent retrieval system, intelligent library decision support system. In fact, such research is still in the scope and field of previous research.

In the end, the existing AI focuses more on a single application of the library, but does not pay enough attention to the training of readers and special group services, and does not play its due role and effect. In general, the scope of current library application AI is not wide enough, and a set of extensive, efficient, and systematic application systems has not yet been established and formed.

## **4 Development Prospects of AI for the Core Business of the Library**

For libraries, basic business needs revolve around resource construction and reader service. No matter how modern technology develops and to what extent, these two aspects are always at the core of the library business (Yuan Xueqing,2016).

### **4.1 Information resource construction**

#### 4.1.1 Intelligent book purchase

Libraries and users, publishers, booksellers, resources, electric power business, logistics, etc. based on the Internet for the connection of business, data sharing. AI can accurately analyze user needs based on big data, assist librarians to accurately purchase paper and online Electronic literature resources, and then automatically complete ordering business management, acceptance registration, fund management, resource gift exchange and statistical analysis related to resource construction.

#### 4.1.2 Intelligent document organization

AI can automatically perform document cataloging and checking, cataloging, cataloging query, exporting catalog products and cataloging statistics according to machine-readable catalogue standards and related specifications. Based on the metadata center, standardized database and other automatic identification acquisition, update MARC, DC and other metadata, the library can automatically import OPAC, to provide uniform metadata management and resource discovery services for paper documents and electronic resources. Intelligent technologies such as image recognition, speech recognition, machine translation and natural language processing can be used to organize the knowledge content in the literature, such as intelligent semantic indexing, intelligent abstracting, subject navigation and knowledge base construction. Knowledge computing engine technology can realize the automatic acquisition of knowledge, capable of concept recognition, entity discovery, attribute prediction, knowledge evolution modeling and relationship mining, and form multi-source, multi-discipline and multi-data type cross-media knowledge mapping.

Libraries can learn from the experience of Google and Baidu, use the technology of knowledge computing engine to extract knowledge from the collection resources and Internet information, and build a knowledge network with its own characteristics through semantic organization and mining.

#### 4.1.3 Intelligent document management

In the management of the library, it is possible to realize the whole process unmanned book library, from the paper documents into the library, put on shelves, sort and locate, take books, and the whole frame and inventory, all of which are identified and automatically operated by the robot. It can realize the whole process and the whole system intelligent and unmanned. The intelligent analysis which based on big data can realize the intelligent sub-library and reasonable layout of collections. It can also realize real-time monitoring and intelligent early warning.

### **4.2 Reader service**

#### 4.2.1 Intelligent service inside the library

AI can be based on image recognition, speech recognition technology to assist the library intelligent user identity authentication and management. It also includes navigation, seat-selection,

retrieval, and borrowing/returning. The intelligent consulting robot system is used to carry out reference and knowledge consultation based on natural language understanding in the library to enhance the level of interaction with users. It can carry out intelligent express literature service outside the library and extend the scope of services.

#### 4.2.2 Intelligent service outside the library

It can integrate scattered and heterogeneous digital resources, realize semantic retrieval based on intelligent technologies such as voice, picture and natural language understanding, and provide personalized search in combination with user based on big data analysis.

It can be integrated with paper collection resource retrieval system and external library resource retrieval system to provide unified retrieval service. Based on dynamic big data analysis, users' demands and behavioral characteristics of the library can be mined, and digital resources can be reorganized and aggregated by means of intelligent knowledge organization technology. Carry out multi-dimensional personalized customization (subscription) services and personalized push services for different user groups to improve the accuracy of digital library services and user satisfaction. Mobile Internet, Internet of things and other technologies can be used to develop intelligent perceptive reading services outside the library, providing knowledge services based on the real-time situation of users.

According to the literacy level of different users, we can provide personalized intelligent education programs, and carry out multi-literacy online education for all kinds of users. It can gather library resource data, service data, user behavior data, system log data and other data to set up library big data center, extract user portrait and resource characteristics through data intelligent analysis, and provide accurate information retrieval and recommendation, comprehensive analysis and evaluation and other services.

Data interface can be developed to facilitate the application development of other institutions and individuals; Based on existing resources and intelligent organization and analysis technology to make knowledge mining and production, thematic analysis, intelligence analysis, etc..

## 5 Conclusion

By combining the development of AI and the analysis of the current situation of AI in the field of library, this paper looks forward to the development of AI in the future of library core business, the prospect of resource construction and reader service namely. In the intelligent construction of information resources, including intelligent interview, intelligent document organization, intelligent document management, etc., and in the intelligent service of readers, including intelligent inside and outside library services, etc., to promote the library becomes more important academic centers and cultural centers provide academic research.

From the perspective of library function, like other technologies used in library applications, the purpose of AI library application is still to focus on libraries and users, both to improve library performance, to promote user development, and to realize the value of libraries. The value goal of the library determines the direction and method of application of the AI, and the core of the successful use of the AI is still the wisdom of the librarian. By analyzing the historical process of library technology, it can be seen that technology will never replace real person. Even if the library uses a large number of

intelligent robots in the future, it will not shake the librarian's dominant position. Otherwise, the library will deviate from its essence.

The development of Artificial Intelligence will also change the employment pattern of librarians and the redivision of their operational modules. The importance of librarians gaining competence through experience will gradually decline, and the urgency of developing new core skills is growing, especially in the human-machine symbiosis environment, the accomplishment demand of complementary ability with Artificial Intelligence machine is prominently. Librarians should pay more attention to the emotional communication with readers, strengthen the connection with readers through various ways, optimize their own work and business model, enhance the innovation ability, make the library move forward in the new business model.

# Construction and Management of MOOCs Platforms for Business English Translation Course

Tang Lijun

School of Foreign Languages, Guizhou University of Finance and Economics,

Guiyang, P.R. China, 550025

(E-mail: 183849791@qq.com)

**Abstract:** The reform of College English teaching in China, especially business English translation teaching, should grasp the historical opportunity of the current MOOCs education trend sweeping the whole world. We can take MOOCs online learning as a platform to vigorously deepen the reform of business English translation teaching with the core of improving business English translation skills. We should take an effective series of measures to promote the combination of business English translation theory and practice, such as strengthening the construction of MOOCs platforms for business English translation course, changing learners' concepts, improving the quality of educators and actively responding to the impact of MOOCs on business English translation classroom. Moreover, we can further upgrade the overall improvement of Chinese higher education, promote "going out" strategy of Chinese culture and enhance the soft power of Chinese culture.

**Key words:** MOOCs platform; Business English; Translation course; The curriculum reform

## 1 Introduction

In the past some years, MOOCs have entered the mainstream of educational sources via the establishment of several high-profile MOOCs platforms, such as primarily Coursera, EdX, and Udacity etc., offering free courses from a range of elite universities and receiving a great deal of media attention (Daniel, 2012). 2012 has been referred to as 'the year of the MOOC' (Siemens, 2012). Later, many elite universities all over the world are joining this "smoke-free" education revolution, and MOOCs have showed blowout growth. China's first MOOCs platform, *TopU.com*, founded by Educational Science and Technology Group, was created in October 2012. Tsinghua University and Peking University joined EdX platform, and Shanghai Jiao tong University and Fudan University joined Coursera platform in 2013. And the MOOCs self-study room of Guokr.com was changed to *MOOC College*, and *Coursera Zone* operated by NetEase Corporation was officially established, Xuetangx.com, developed by Tsinghua University and based on EdX source code, was successfully launched online in 2013. Later CNMOOC independently developed by Shanghai Jiao tong University was officially launched, and *MOOCs of Chinese Universities* developed by Love Course Network and NetEase Cloud Classroom, was launched in 2014, marking the MOOCs time in China's higher education circle.

There are various studies on MOOCs and related teaching modes and reforms both at home and abroad. Some scholars explored different dimensions of MOOCs, such as the changing roles of the professor (instructor) and learners on MOOCs (Cormier & Siemens 2010; Masters 2011); the benefits and requirements of MOOCs in practice (Koller, Ng, Do & Chen 2013; Emanuel 2013); the discussion specific problems and proposed effective methods, such as student retention, feedback (Singh, Gulwani, Solar-Lezama 2013; Clow 2013; Lewin 2013); the evaluation of learning effects on MOOCs platform

(Li, Link, Ma, et al. 2014). From the above studies, the achievement on MOOCs are plentiful with few studies on constructing and managing MOOCs platform. So this paper tries to explore the construction and management of MOOCs platform in China.

## **2 Analysis of MOOC Platform Construction Model for College English Translation Course in China**

### **2.1 Major current teaching model of college English translation course**

Every reform in the history of educational development has always brought about the reorganization and reconstruction of various educational elements. MOOCs, which are deeply shaking the foundation of China's education development, bring positive development opportunities to Chinese education. On the other hand, they also bring severe challenges to Chinese universities, especially ordinary colleges and universities. It has become an important issue for Chinese universities on how to effectively build MOOCs platform and accelerate integration into this MOOCs wave. Just as some researchers have said, the development and application of MOOCs platform will actively promote domestic universities to improve their curriculum quality and explore innovations in university teaching modes (Lu Fang, 2013). Even some researchers believe that online courses will promote universities to speed up educational reform and improve their teaching quality, otherwise our universities will easily degenerate into the teaching laboratory and guidance classroom of the first-class university (Du Yang, 2013). However, no matter how MOOCs develop in the future, it's their fundamental aims are to develop and share high-quality curriculum resources. Only by adhering to the aim of high-quality curriculum development, responding positively and participating in the construction of MOOCs platform, can we master the discourse initiative and effectively integrate into the development process of MOOCs in this educational revolution.

For a long time, the teaching mode of College English translation course in our country has based on the behaviorism theory---- the teaching process of demonstration (stimulation) - imitation (reaction) - repetition (reinforcement). Although this teaching mode is beneficial to learners' reinforcement of words, sentence patterns and phrases, it neglects learners' emotional cognition and transformation between the two languages. And it separates the relationship between teaching, learning and translation, so it is impossible for learners to apply translation theories and skills flexibly to specific translation practices and discourse situations, which can not achieve unexpected translation effects with too profound theoretical studies. Later, the translation teaching mode are based on the theory of constructivism to break through the teaching dilemma of overemphasizing theory or skills. The constructivist theory holds that students are required to construct mathematical knowledge actively in their minds by exploring, discussing and other different methods in the whole learning process to give full play to the subjective initiative of students. In the process of meaningful construction of knowledge, students' abilities of analyzing, solving and creative thinking have also been trained.

In our view, the translation teaching mode based on the constructivist theory breaks through the shortcomings of the teaching mode based on behaviorist theory, emphasizing the learner's practice, it aims at requiring learners to transcend the stage of imitation and reinforcement so as to construct the practical stage of translation on the basis of mastering translation theory, rules and techniques. In this way can learners truly appreciate the integrity of the whole translation process, and the real purpose of translation teaching can be achieved. In a sense, constructivism perfects the limitations of behaviorism, that is, it constructs the integrity of translation teaching from the theoretical stage to the practical stage, and achieves the ultimate goal of education. However, from the process of educational activities, the

process of education is a two-way interaction processes between learners and educators with particular emphasis on the interaction and feedback between the two sides. Therefore, there are still drawbacks in the translation teaching modes based on these two theories. In today's mobile Internet era, it is imperative to give full play to the advantages of Internet plus to constantly improve the translation ability of learners through online and offline learning. So, it is important to make full use of Internet and MOOC platform in the translation course to facilitate the learner's translation competence and efficiency.

## 2.2 Overview of the construction of MOOCs platform for English translation in China

Currently, there are two main types of English translation courses on MOOCs platform in China, namely general education courses and professional courses. General education courses mainly include *Listening and Speaking of Daily English* (Tsinghua University), *General Course of College English Self-study* (Beijing University of Science and Technology), and *College (Oral) English* (National University of Defense Technology), and so on. These courses are mainly for all English learners in the world with the characteristics of large-scale opening and low assessment requirements. On the other hand, *Principles and Practice of Computer-Aided Translation* by Yu Jingsong in Peking University, a type of professional course, is suitable for MTI students, advanced undergraduates majoring in foreign languages, translators and learners of foreign language. Course contents include various aspects of translation, such as information and translation technology, Internet search engine or information service and translation practice, corpus and translation research, e-book dictionary, reference book and translation practice, translation memory research, practice on translation memory software, terminology management in translation practice, practice on computer-aided translation software project, translation service, localization service and quality control, introduction to machine translation and localization engineering, the systematical explanation of the principles and practices of computer-aided translation, etc.

With the high attention and rapid development of MOOCs in China, more and more MOOC network platforms are constantly emerging. At present, the main MOOC platforms in China are as follows:

**Table 1 The Main MOOCs Platforms in China**

Platforms	Theme	Founders
MOOCs of Chinese Universities	let every user who has the desire to improve learn the courses of the best schools in China	NetEase, Higher Education Press
CLMM-TVET	policy consultation, information exchange, etc. for micro-courses in vocational education	Tongji University
NetEase Open Course	disseminate the knowledge and wisdom of all mankind	NetEase
Hujiang Community	make education fairer through Internet and build the ecosystem of Internet education	Hujiang Network
MOOCs College	Discover excellent online lessons in the world	Guoke Network
Xuetang Online	make MOOC study serve the practical purpose.	Tsinghua University
GLR	Promote fairness in education, explore educational innovation and help young people to find	Guo Laren Education and technology Group

	employment	
Chinese MOOCs	collect excellent courses to benefit Chinese all over the world	Peking University and Alibaba Group
CNMOOC	let everyone go to the best university	MOOC Research Institute of Shanghai Jiaotong University
Ewant Network Platform	let all Chinese enjoy free access to high-quality educational resources and free lifelong education	Five Jiaotong Universities on both sides
Wisdom Tree	realize student-centered discussion of online autonomous learning, cross-university classroom live interaction, credit certification and degree support	Shanghai Excellent Ruixin Digital Technology Co., Ltd.
UOOC Alliance	Constructing large-scale open online courses to provide course learning choices and services for League college students and social learners	local universities under the advocacy of Shenzhen University

Source: Collecting Internet data

At present, online education platforms in China are growing throughout the current construction of major MOOCs platforms, but there exists the following problems. Firstly, each platform has its own system and interface, so the functions are different. And the platform is mainly composed of micro-lesson video, document, in-class test, discussion, final examination and other modules with few activities designed for students to participate in (Ji Fujun, Li Licong 2014). Secondly, there are some shortcomings in various platforms, such as single curriculum, few online courses and low utilization, which cannot provide effective services and public sharing for learners (Hu Quintai, Lin Xiaofan 2015). Last, these platforms generally lack feedback mechanism of learning effect and intervention function after learning. Furthermore, interaction function of some MOOCs platforms are weak, their curriculum content and interaction system are separated with few test questions of many courses (Wang Yingjie, Feng Ze, Nie Yunming, 2015).

### 3 Implementation Way of College English Translation Course Reform in MOOC Era

#### 3.1 Applying MOOCs teaching model in college English translation

##### 3.1.1 Course construction

A complete making process of an online MOOCs courses involves nine links, such as course topic selection, course planning, course design, course shooting, recording and editing, course online, problems solving in course-based forum, homework correction and certificate issuance, etc. The first three links are very important because they are the key factors to the success of the curriculum development, the degree of social attention and the reactions of the learners after the release of the curriculum. Therefore, the current designers of MOOCs courses are basically the masters of the world's key universities, monopolizing the MOOCs curriculum, and the general universities are still in a weak position. The course of college English translation can make use of the MOOCs of the world's key

universities, such as interpreting course in Guangdong University of foreign studies, Wang Xiaodong's the introduction of translation of Central South of China Yao Yuan's the translation in practice course in Nanjing University in the platform of Chinese University MOOCs.

These MOOCs can transform the traditional teaching mode of translation course by the way of introducing advanced translation theories and foster comprehensive translation skills. They can enable students to understand translation comprehensively, the basic theoretical and practical issues involved in translation, as well as understand the nature of translation, the process of translation, the object of translation, the subject of translation, various factors affecting translation, contradictions in translation, the function of translation. It also has a systematic understanding of the spirit and mission of translation in the context of multi-social and cultural background, forms a correct view of translation, constructs the necessary background knowledge for translation practice, and lays the foundation for a more in-depth translation course offered in the later stage. Alternate Interpretation is a core course in the interpretation teaching. It focuses on the training of cognitive skills of interpretation. It helps learners to master various sub-skills by explaining principles and practicing exercises, aiming at comprehensively applying it to interpreting practice and accomplishing the task of consecutive interpretation.

### 3.1.2 Course features

We can introduce the characteristics of MOOC courses into our translation teaching. First, MOOCs courses can provide whole-course assistance, such as systematic learning, answering questions within 24 hours, homework correction, interactive live lesson, matching vocabulary field, etc. Second, they can supply learners with all kinds of excellent class service. Third, they can help learners learn with half the effort through original systematic method of B2A translation and training system. Fourth, they can provide high-quality teaching materials and training materials. Fifth, they can teach learner translation theories and skills by famous translators with professional knowledge and practical experience. Sixth, learners can get the certificates without leaving their home. Seventh, learners can use Apple and Android mobile terminals to learn more freely.

Translation consists of two parts: translation and interpretation. The translation teaching should take "translation" as the center, integrating various factors, such as internal and external factors, macro and micro factors. So students can think and discuss all important aspects of translation so as to enable them to grasp the key points and difficulties in a short time and guide them to think and explore translation problems purposefully so as to prepare for later study. The courses of interpreting can cover five core skills: listening, memory, note taking, expression and evaluation, and pay more attention to after-class exercises and interactive discussions. The Chinese English competence scale that is Interpretation Competence Scale is introduced to provide learners with a scientific measurement tool to effectively monitor the learning effect and progress.

### 3.2 Increasing the construction of MOOC Platform for English translation course

With the in-depth development of mobile Internet and the further understanding and widespread use of MOOCs by universities all over the world, more and more universities will develop and build their own MOOCs platforms. Overlooking the current situation of MOOCs platform curriculum construction, the English courses of general education are more than that of professional knowledge. Therefore, we should actively seize the opportunity and join the university alliance organizations to give full play to the advantages of the groups and seek common development. It is inevitable for the era development to actively develop and construct suitable English translation courses for learners at different levels. For example, we can actively introduce various technical MOOCs platforms such as TopU.com, and develop MOOCs platforms for our translation course team to provide live video service. Moreover, we can participate in the global MOOCs process to build an exclusive MOOCs platform with

our own curriculum characteristics and styles. Therefore, we can provide the most convenient learning service for our students, as well as learners from other brothers colleges or even all over the world, and better expand strong radiation and influence of our curriculum construction.

The aim of MOOCs platform construction MOOCs platforms is mainly to solve the problems that the teachers and students don't know how to use the platform, or are not willing to use the platform. Therefore, the MOOCs platform of translation course will take the simple and easy to use as the principle and user's computer operations at primary level as the orientation. And we can introduce the mature operation mode of Internet. On one hand, we should take the market need as the orientation, especially the combination of the teachers' teaching and scientific research in order to stimulate their interest in MOOCs platform construction and application and improve their translation teaching quality. On the other hand, we can enable students to perform their individual talents and achieve excellent scores and improve their translation competence and skills to promote the application of MOOC platforms.

Many universities and college can combine the integration of resources to construct a MOOC platform of translation curriculum according to the demands of MOOCs application as well as introducing excellent translation courses into this platform. Moreover, we can provide some compulsory and optional courses that allow students to make their credit certification and tailor the translation programs to suit their different interest. After the construction of MOOCs platforms, different universities can introduce their own corresponding translation courses into the platform according their own teachers' qualification and teaching resources. The function of the platform mainly includes five aspects of basic translation service. First, online study system includes many various functions, such as videos of translation teaching, homework and self-test, online course discussion, translation Wiki, course syllabus, course announcement, course progress tracking, expanding translation learning materials, network share, etc. Second, the system of course management includes is to provide all-round services for translation teachers and adaptation of translation course, such as creating translation course, translation custom settings, the management of translation course, the establishment of evaluation and assessment methods and some common teaching tools. Third, theme or service setting is to customize and build user's own theme interface or domain name service according to the different need of translation course. Five, translation mutual evaluation system can provide function module to evaluate translation competence in order to facilitate the evaluation of translation courses and the mutual learning and communication between learners and translation platform.

### **3.3 Transforming learners' concepts and improving the quality of educators**

Under the background of the rapid updating of current knowledge, it is necessary for English learners to constantly improve students' basic English ability, especially in English listening, speaking, reading and writing by the means of actively studying general education courses in College English through MOOCs platforms, so as to lay a solid foundation for learning English translation theory and skills. At present, most of the current domestic learners who can complete MOOCs courses come from key colleges and universities. On the one hand, most of the current courses on MOOCs platforms come from countries all over the world, especially the US-led developed countries, whose MOOCs courses are mainly in English, so it is difficult for learners to complete the course without good basic English. On the other hand, some key universities in China first introduced and expanded MOOCs courses, such as Peking University, Tsinghua University, Shanghai Jiao tong University and Tongji University. Under this learning background, the students of these universities were the first to understand and participate in learning on MOOCs platforms. In order to follow MOOCs development trend and enable Chinese students to enjoy high-quality MOOCs resources, Chinese universities should not only take efficient actions to construct MOOCs platform and strengthen cooperation and exchanges among universities, but

also constantly improve<sup>10</sup> the quality of educators and make innovations in course selection, development and design.

### **3.4 Actively dealing with MOOC impacts on English translation classroom**

The wide spread of MOOCs is highly related to the leading participation of famous universities in the construction of MOOCs courses. These MOOCs courses introduced by famous universities worldwide has won wide popularity for these universities, and also enabled the students of ordinary universities and the general public to enjoy high-quality learning resources. However, it also has brought about unprecedented changes and impacts on the history of Chinese educational development. All educators have joined in the education battle in an all-round way from Government Department of National Education to university teachers. MOOCs have broken through the barriers of University campuses, making the boundaries between the educational and service functions of universities blurred gradually. Huang Gang, a professor in Shanghai Jiao tong University, once said MOOCs made all learning resources, whether at home or abroad, immediately appear in front of us (Fan Liping, Jiang Peng, 2014). Such advantages of MOOCs mean that current higher education has gone into the process of internationalization, and some countries and regions, especially western developed countries, regard MOOCs as an important way to export and enhance cultural soft power. Therefore, Chinese universities should strengthen the development of local MOOCs courses to integrate into the world online education platform, finally further promote Chinese culture to the world and enhance the national cultural soft power in order to actively respond to Western cultural hegemony.

## **4 Conclusion**

There are many inevitable reasons for MOOCs to becoming the main force of course construction, such as the curriculum team, massive teaching resources and timely online interactive learning methods of world-class universities. As MOOCs were first taken place in western developed countries, such as USA and Europe, and these English-speaking countries have a strong position of in the world, many MOOCs courses are mainly in English, which brings about both a rare historical opportunity and a severe challenge for China. Therefore, we should seize this historical opportunity to vigorously deepen the English translation teaching mode, taking MOOCs online learning as the platform and the promotion of English translation skills as the core. And we should take a series of effective measures to promote the combination of English translation theory and practice and constantly improve the English translation level of Chinese students, such as constructing MOOCs platforms, changing the concept of learners, improving the quality of educators, and actively responding to MOOC's influence on English translation classes. Only by this way can we keep up with the pace in the process of educational reform, give full play to the online educational function of MOOCs platforms and promote the overall improvement of Chinese higher education.

**Abstract:** This article aimed to understand the relationships that Big data analytics have with decision making. So, to achieve this goal a search in the Scopus database was performed. As a result, we identified the relevance of the topic according to the frequency of publications, the most profitable Journals of the period analyzed and through VOSviewer software we performed a co-citation analysis of keywords and identified 5 network groupings, some more topics recent research results and a density map indicating the strongest relationships among the keywords used in the 93 papers analyzed. We also suggest at the end of the paper a systematic literature review as a way to seek a deeper understanding of the research area and to validate the results found in this study.

**Keywords:** Machine learning; VOSviewer; Artificial intelligence; Bibliometry

### 1 Introduction

Big data can be defined as a generic term for any collection of large, complex datasets that are difficult to store, process, analyze, and understand using traditional database processing tools (Huang & Chaovaitwongse, 2015). Big data has emerged as a paradigmatic shift on how organizations make decisions (Mortenson, Doherty, & Robinson, 2015). There is a common acceptance that Big data can be adopted at strategic, tactical, and operational levels, thus improving existing decision-making practices (Wamba, Ngai, Riggings, & Akter, 2017).

The term “Big Data” has become hugely popular in the business world in recent years (Gupta, Chen, Hazen, Kaurd, & Gonzalez, 2018). Its use is either to support decision making or to make automated decisions (Davenport & Kirby, 2016). Through decision support systems (DSS), it is possible to process large volumes of data using output models and outputs with interfaces that increasingly permeate the professions with a high level of knowledge (Constantiou & Kallinikos, 2014).

From this context, we try to understand what relations Big data analytics have with decision making. Our goal was to understand how the use of Big data analytics contributes to decision making processes in different aspects of use, given its great applicability. To do this a literature mapping was performed, this being a variation of systematic literature review, used in this study to understand the interaction between keywords and to answer the question of research that guided this study: what Big data analytics relationships have with decision making?

We performed a search in the Scopus database and analyzed the data of 93 articles through the VOSviewer software. We identified 5 clusters through network analysis, recent studies with 'machine learning' and 'sustainable development' terms related to Big data analytics and decision making, and a strong relationship of the term 'artificial intelligence' to the search terms used in this research.

Our study is organized as follows: We present a brief theoretical basis in item 2, then we describe the methodological procedure and data collection in item 3, then we present the results in item 4, and finally the conclusion in item 5 along with suggestions of future research opportunities in depth to confirm our findings as well as to increase the understanding about the topic that has been presented as very relevant for society.

### 2 Theoretical Background

As highlighted by Laney (2001), Big data has three primary characteristics: volume, velocity and variety, and later complemented by SAS<sup>11</sup> with the characteristics of variability and complexity. These dimensions required more powerful computers, an ubiquitous network, and algorithms capable of

---

<sup>11</sup> SAS disponível em [https://www.sas.com/en\\_us/insights/big-data/what-is-big-data.html](https://www.sas.com/en_us/insights/big-data/what-is-big-data.html)

connecting datasets in order to make possible analyzes that would not be possible until then, and this convergence made possible the commercial application of data Science (Provost & Fawcett, 2013).

According to Manyika et al. (2011), Big data can play a significant economic role for the benefit not only of private trade, but also of national economies and their citizens. The authors also highlight the value generated by the use of Big data in five domains: health, public sector administration, retail, manufacturing and global personal location data.

For Fayyad, Piatetsky-Shapiro, and Smyth (1996), computational theories and tools help humans extract useful information from the ever-increasing volumes of digital data. And efficient information management is critical to value creation because the amount of data is quickly generated, hampering decision-making processes (Fredriksson, 2018).

### 3 Data and Methodology

For this study, we used the Scopus database because it is one of the main databases in the area of Social Sciences. We performed the research on 05/30/2019 with the Boolean term: "Big data" AND ("Decision Theory" or "decision support system\*" or "decision-support system\*"). The use of the '\*' symbol was so that plurals, gerunds or nouns were also identified in the search. As an initial restriction, we limited the search so that the words were contained in title, abstract, or keywords.

As a result, we obtained 1,031 results that were reduced to 243 results after the filtering of areas (limiting to Business, Management and Accounting, Decision Sciences; Social Sciences) and after a new filter was limited to articles only, we obtained 93 results. These papers underwent an individual exploratory analysis with title reading, summary and when necessary, reading directed to the article to identify the possible contributory character to answer our research question.

To help us with the research question, we use the grouping technique using the VOSviewer software. Grouping techniques play a prominent role in bibliometric research by providing clusters of authors, publications and related keywords (Van Eck & Waltman, 2017). This analysis conditioned us to understand the most relevant connections between the articles identified in the research through the relationship between the keywords of the works.

This method is described by Župič and Čater (2015) as useful in a phase prior to a literature review, for example, as it guides the researcher to the fields of research by reducing subjective bias. Thus, we perform co-occurrence analyzes of keywords through three ways of visualization via VOSviewer: network, overlap and density. The methodological procedures followed in this study can be visualized in Figure 1.

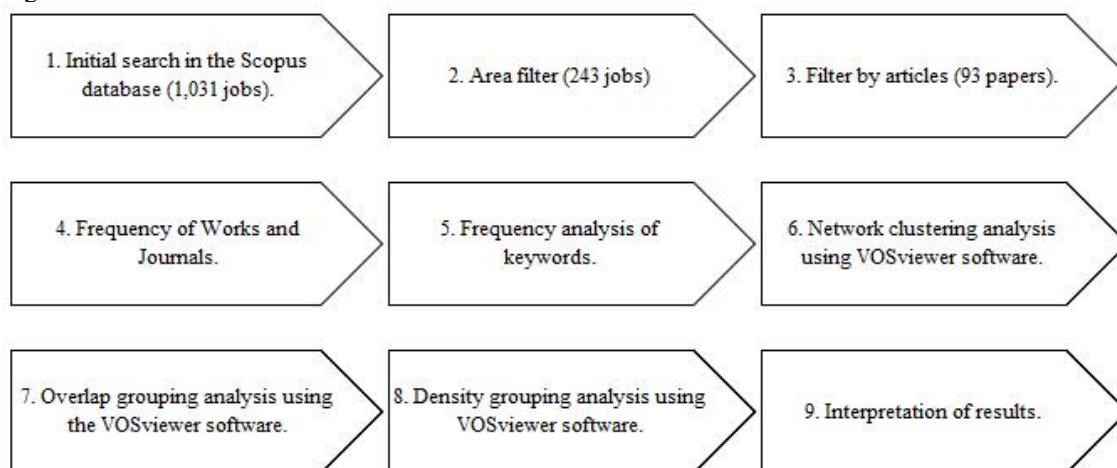

Figure 1 Methodological Procedure of this Work

## 4 Results

### 4.1 Descriptive analysis

Initially, we analyzed the frequency of publications of the 93 selected papers, as can be seen in Figure 2. Note that in the first two years (2012 and 2013) only one publication per year occurred and from 2014 there was an exponential growth of publications, including with the year 2019 already with 8 publications, a year that is still partially counted due to the period of research. Due to our research question, we decided to keep the year 2019 even if we did not have the total of publications for the year.

**Figure 2 Publications by Year**

We also analyzed which Journals were most profitable in this period, as presented in Table 1 and we can verify that they were "Journal Of Decision Systems" and "Decision Support Systems" with 9 and 7 papers, respectively. Of the total number of Journals with publications registered in the research, 13 represented 48.39% of the sample (these with more than one registered work), the other Journals had only one work registered, thus representing 51.61%, and were not mentioned in the table.

**Table 1 Most Profitable Journals**

Journal	Frequency (n)	Frequency (%)	Cumulative frequency (%)
Journal Of Decision Systems	9	9,68%	9,68%
Decision Support Systems	7	7,53%	17,20%
Lecture Notes In Business Inf. Processing	4	4,30%	21,51%
Sustainability Switzerland	4	4,30%	25,81%
European Journal Of Operational Research	3	3,23%	29,03%
Information Sciences	3	3,23%	32,26%
Knowledge Based Systems	3	3,23%	35,48%
Computers And Operations Research	2	2,15%	37,63%
Computers Envir. And Urban Systems	2	2,15%	39,78%
Dili Xuebao Acta Geographica Sinica	2	2,15%	41,94%
Information And Management	2	2,15%	44,09%
Technol. Forecasting And Social Change	2	2,15%	46,24%
Transportation Research P. Emerg. Technol.	2	2,15%	48,39%

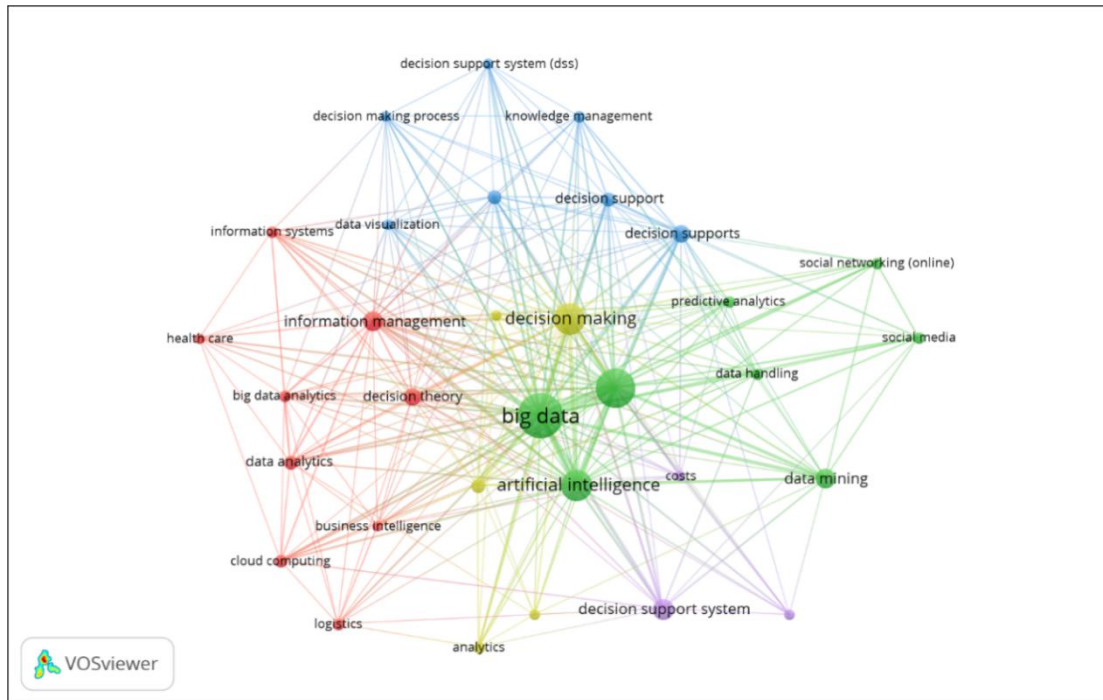

Table 2 shows the frequency that the keywords were cited in the analyzed works. As an exclusion criterion, we chose to filter out keywords that had been quoted at least four times, and as a result 32 keywords from a total of 931 were recorded, which were cited 389 times out of a total of 1,400, representing 27.79% of total citations.

**Table 2 Most Cited Keywords in the Analyzed Database**

ID	Keywords	Frequency (n)	Frequency (%)	Cumulative frequency (%)
1	big data	74	5,29	5,29
2	decision support systems	58	4,14	9,43
3	decision making	36	2,57	12,00
4	artificial intelligence	35	2,50	14,50
5	decision support system	17	1,21	15,71
6	information management	15	1,07	16,79
7	data mining	14	1,00	17,79
8	decision supports	12	0,86	18,64
9	decision theory	11	0,79	19,43
10	decision support	8	0,57	20,00
11	digital storage	8	0,57	20,57
12	data analytics	7	0,50	21,07
13	information analysis	7	0,50	21,57
14	cloud computing	6	0,43	22,00
15	analytics	5	0,36	22,36
16	big data analytics	5	0,36	22,71
17	data handling	5	0,36	23,07
18	information systems	5	0,36	23,43
19	knowledge management	5	0,36	23,79
20	logistics	5	0,36	24,14
21	predictive analytics	5	0,36	24,50
22	social media	5	0,36	24,86

24	business intelligence	4	0,29	25,50
25	costs	4	0,29	25,79
26	data visualization	4	0,29	26,07
27	decision making process	4	0,29	26,36
28	decision support system (dss)	4	0,29	26,64
29	health care	4	0,29	26,93
30	machine learning	4	0,29	27,21
31	strategic decision making	4	0,29	27,50
32	sustainable development	4	0,29	27,79

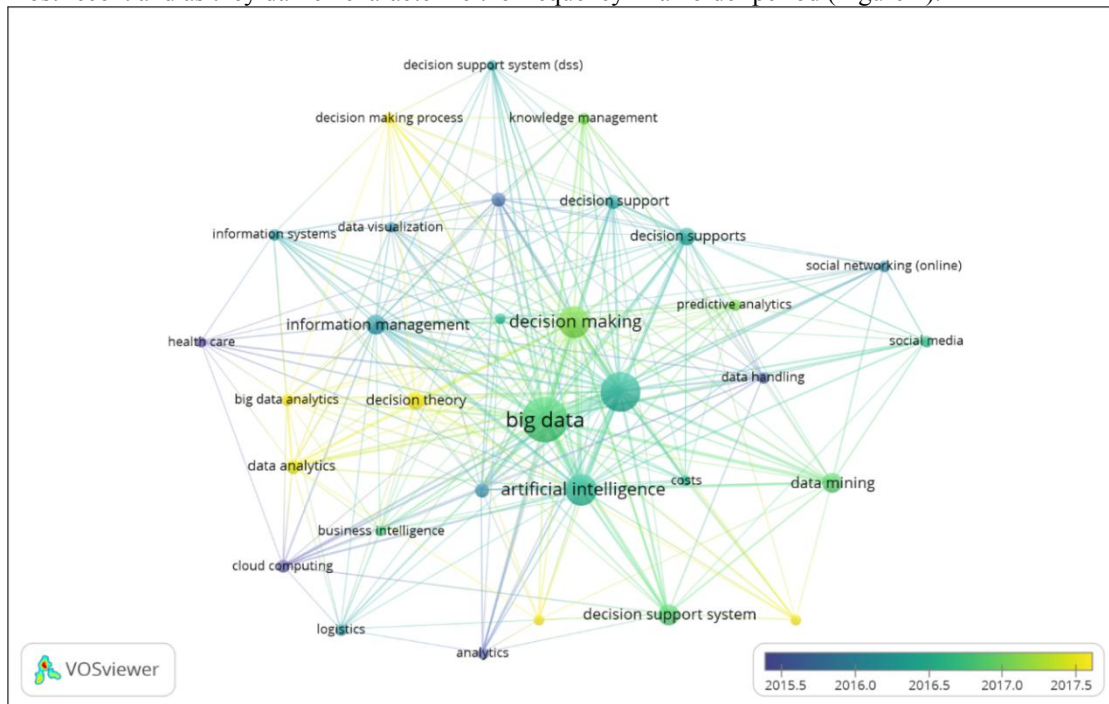

It should be considered that the keywords identified with IDs 2 and 5 are separated only by the fact that the first one is in the plural and the second in the singular, but could be considered as the same keyword and in this case it would be the most frequent word (n = 75), the same occurred with the keywords in ID 8 and 10, but we opted to maintain the originality of the data extracted from the software. The 32 most frequently used keywords in the papers therefore represent 27.79% of the total frequency of keywords.

From the analysis of frequency of keywords, we analyze the grouping of these by means of the network visualization as shown in Figure3. From this verification, we can notice the formation of 5 groupings discriminated, these identified with the colors red, blue, green, purple and yellow.

**Figure 3 Networking of Keywords**

After the network visualization, we perform the keyword overlapping visualization, which organizes them according to the frequency identified in a time horizon so that the yellow words are the most recent and as they darken characterize the frequency in an older period (Figure 4).

**Figure 4 Keyword Overlay View**

Finally, we perform density analysis, which intensifies color (with warm colors) according to frequency and relation to other words (Figure 5).

Figure 5 Keyword Density View

#### 4.2 Interpretation of the analysis

From the descriptive analysis, we can verify that for the search term used 5 groups were identified that can characterize study areas: the cluster identified with red color suggests studies directed to environments such as health, logistics and IT with decision support by means of business intelligence mechanisms. The cluster identified with the blue color suggests studies directed to the systems/processes of decision making and knowledge management. The grouping identified with the green color suggests studies directed to the mining of data through artificial intelligence to guide decision making processes. The cluster identified with the color purple suggests studies directed to decision support systems oriented towards sustainable development. Finally, the cluster identified with the yellow color suggests studies directed to the strategic decision making via machine learning.

We can also highlight that recent studies can be directed to sustainable development, machine learning, Big data analytics and decision making, as well as highlighting the strong relationship through density analysis that the keywords artificial intelligence, Big data, decision making and decision support systems have, and may indicate a strong relation in the studies, just as we can assume some opportunities of studies with peripheral relations in the density map.

#### 5 Conclusion

This article aimed to understand what Big data analytics relations have with decision making and to achieve this goal a search in the Scopus database was performed and interpreted through VOSviewer software. We initially analyzed the frequency of publications of the search conducted as well as the most profitable Journals as a way of understanding the relevance of the research area and where more works are published. As a result, we see exponential growth starting in 2014 from publications such as "Journal Of Decision Systems" and "Decision Support Systems" as the most profitable Journals.

Then, we identified 5 clusters of keywords that suggest different areas of study (Figure 3), as well as a more recent incidence of studies targeting sustainable development, machine learning, Big data analytics, and decision making (Figure 4). An important contribution that should also be highlighted was the strong relationship of the keywords Big data, artificial intelligence and decision making (Figure 5), thus suggesting studies involving the three terms.

As a limitation to the study we can highlight that the combination of the term Boolean directs the frequency of keywords extracted from the database, so a different combination can result in different relationships between the keywords, so we cannot gauge that the results found in this research truly reflect the relationships between surveys. To mitigate this uncertainty, as a suggestion of future studies,

we propose an extension to this preliminary bibliometric analysis by means of citation and co-citation analyzes of the works.

Citations, according to Župič and Čater (2015) are used as a measure of influence, so that if an article is very quoted it is considered important based on the assumption that the authors cite documents that they consider important for their work. Co-citations, defined as the frequency with which two units are cited together (Small, 1993) indicate that the more items are quoted together, the more likely the content is related to them (Župič & Čater, 2015). Thus, it would be possible to support the findings of this work, to relate relevant authors to the identified areas and also to condition a systematic review of the literature for a deepening of the identified factors, as suggested by (Župič & Čater, 2015).

# The Influence of Digital Presentation on Consumers' Perceived Value Based on Evidence from Eye Movement Experiments

Li Jiang, Liu Chun, Jiang Yushi

School of Economics and Management, Southwest Jiaotong University, Cheng Du, P.R. China, 610031

(E-mail: LIJ929@foxmail.com, 906375866@qq.com)

**Abstract:** In this study, eye movement experiments were conducted to observe consumers' gaze time on creative materials, and to study consumer information processing fluency and consumer perceived value. The research results show that the digital presentation form in the slogan positively affects the perceived value of consumers, and also has a significant impact on the fluency of information processing of consumers; the fluency of information processing of consumers in the slogan digital presentation form and consumer perceived value There is a clear intermediary role; product involvement has a regulatory effect between the digital presentation form and the consumer perceived value in the slogan, the higher the product involvement, the perceived value of the consumer in the proportional and descriptive digital presentation. The lower the perceived value of emotions and the higher the perceived value and emotional value of the percentile consumer.

**Key words:** Advertising slogan; Digital presentation form; Consumer perceived value; Product involvement

## 1 Introduction

Figures are intuitive, easy to read and easy to understand, so they are favored by advertising copywriting. In the advertising works, the number of appearances has been very high (Ma Yaqiong, 2015). In social life, whether it be a bow stick to the road or volley hung giant advertising signs, as the newspapers and propaganda in the streets and widespread transmission of radio, film and television, advertising, at any time can be filled with the number in the eyes and ears, digital is an integral part of life, advertising plays an important role in the information society (Wang, 2006). Digital can shorten the distance with consumers, help consumers understand advertising information, and enhance the persuasive power of advertising. The advertisement USES digital to convey the practical meaning of the product, artistically reflects the symbolic meaning of the product, and highlights the target object of the product (Ning Limei, 2010).

Figures can make the objects described precise, clear, real and sensible. These characteristics can enhance the credibility and recognition of advertisements to improve the efficiency of information transmission, and make the information transmission more readable and sensible (Wang Xiya, 2014). Number is usually used to record and describe information of things, the best is the fact that the abstract in the form of specific figures show before the eyes of consumers, has appeared and hidden two kinds, fixed usage, by the score, the multiple forms, from the written form, such as Arabic numerals and Chinese capital, Chinese characters, to help consumers establish a range of easy to measure (Wu Yuyao, 1993), accurate convey of referred to objects of the objective conditions, to guide consumers to have more specific cognitive mentioned things.

At present, digital presentation is A critical consideration in both advertising creativity and

communication in theoretical research and practice (Baroody A J, 1985). Advertising more than the number in the present form for the number and unit used in combination, there is also a research from the aspects of font, size, number present form, also have the digital form, from a digital source to enhance digital effects, consumer awareness and consumer decision-making, to explore the Numbers after the research of digital rendering, advertising effectiveness, etc. However, in the reality of advertising communication, there is another form of digital presentation -- digital proportion, which can more directly reflect the advertising appeal and brand attitude. In marketing and consumer behavior literature, although the researchers have recently begun to research the accomplishment and ability of digital consumer problems in market (Adkins N R, Ozanne J L, 2005), mostly with individual cognition, digital effects, information processing and the consumer behavior research, but few slogan form Numbers appear in studies of the impact on consumers' perceived value, such as the percentage information (Chatterjee S, et al, 2000), it is a very notable research direction.

In the real advertising communication, there are many classic digital proportion of the form of advertising, to the majority of the audience left a deep impression. Golden arowana advocates balanced dietary fatty acids and puts forward the concept of 1:1:1 blended oil. Although consumers do not know what is fatty acid, they will perceive its scientific rationality when they see such a ratio. Maotai-flavor liquor is one of the two major Maotai-flavor liquors. Every 10 range hoods sold in China have 6 are the Boss brand, tell the consumer the boss range hoods are very popular, you are worth buying; Feihe milk powder's high-end sales grew 200 percent in 2017, giving consumers a sense of its quality and popularity in the market. These forms of presentation enhance the persuasiveness and perception of its advertising, so that consumers can have trust, accuracy and stability, forming a purchase decision. Although the form of digital presentation in the above advertising slogans can have an impact on consumers' attitudes, it will be the focus of this study to find out what effects it can have and the mechanisms of these effects.

The figures are presented in different forms in advertising creativity. Previous studies have shown that the digital effects produced by different forms of numbers can affect consumers' brand perception. These studies are mostly based on the size, positive and negative, digital sources of digital, etc. The proportional form has a more intuitive advantage and a perceived experience than other types of digital forms.

## 2 Literature Review

### 2.1 Digital presentation form

The numerical value information of Numbers will be processed automatically. As another carrier of digital information, Chinese digital words will also affect the processing of Numbers, resulting in typical digital effects (McCrink K, Wynn K, 2007). There are differences between Arabic and Chinese characters in the encoding and representation stage (ZhaoHui et al., 2008), while Chinese lowercase Numbers (such as "five"), Chinese uppercase Numbers (such as "five") and Arabic Numbers (such as "five") all have symbolic effects (Cao Bihua et al., 2010). The processing performance of Chinese uppercase Numbers, Chinese lowercase Numbers and Arabic Numbers is improved step by step. Digital SNARC effect is separated in size information and order information, and the order information of Numbers has a greater impact on SNARC effect than the size information of Numbers (Jin Guichun et al., 2016). The processing of pure decimal adopts the method of parallel access, which causes the SNARC effect of attention, and the attention transfer of the pure decimal space is affected by the pure decimal itself and the corresponding natural number (Sun Yueliang et al., 2017). The subjects in the task

repetition group showed a classic SNARC effect in numerical cognitive processing (Wang Qiangqiang et al., 2018). Digital size can significantly influence consumers' attitudes towards products and brands (Feng Wenting, WangTao, 2017). Fraction is an important mathematical concept mastered by individuals after integer. Integer can only represent Numbers discretely, and the representation of fraction is orderly and continuous. Therefore, fraction is more accurate than integer (SunYu et al., 2016).

Perceptual processing level when different digital context number the number of symbol and the symbol processing and space represent significant differences (Matthews P G, Chesney D L, 2015), the size of the abstract information and quantitative information can also be characterized space, and the information in the space structure of occupied space information resources, with digital symbols in occupied space representation of spatial information resources are the same (Yang Jinqiao, 2011). Negative Numbers are composed of symbols and Numbers, and there are two possible representations of negative Numbers. There is a stable correspondence between time and digital information (Zhang Jie, 2016). In the digital parity context, the spatial representation of Ordinal Numbers in the vertical dimension is affected by the context, and the spatial representation of Numbers in the vertical dimension is dynamic and regulated by specific and abstract situations (Qiao Fuqiang et al., 2016). In the odd-even judgment of Arabic numerals 1-9(except 5), brightness activates or inhibits the spatial representation of numerals, which may be related to the ratio of brightness to power and the amount of cognitive resources consumed (CaoBihua et al., 2017). When individual interpretation of the stimulus of numerical attributes, with different Numbers and the unit will not only represent the same number of deviation, also affected by the digital launch (Pinel P, Dehaene S, 2001), with different Numbers of the same goods have different requirements, or even make decisions to violate the economic utility maximization (Wu Yinghao, Jiang Jing, 2018).

The above literatures mostly studied the influence of Numbers from the perspective of digital effect and representation. Both visual channel presentation and auditory channel presentation (Nuerk H C, et al, 2005) have found consistent SNARC effect, but there are few studies on digital proportion. Numbers are often presented in proportion, such as proportion, percentage and description. Proportion refers to the proportion between Numbers to express an advertising appeal, such as golden arowana 1:1:1. Percentile refers to the comparison between a number and a certain parameter, and the difference between the number and the parameter is directly reflected by the percentile type, such as 100% of HuiYuan juice. Descriptive type refers to the creative appeal of using the proportion of Numbers in the form of text description, such as the advertisement slogan of the boss's range hood. Starting from the inhibitory control model, there are significant differences in the negative start measures under different numerical ratios (JiangRonghuan, LiXiaodong, 2017). The digital presentation forms in advertising language are mostly used for the expression of advertising appeals, which can accurately reflect the advertising appeals, form distinct differentiation characteristics and improve the advertising effect. This study will take three digital presentation forms and conduct experimental research through eye movement experiment.

## 2.2 Perceived Value of Consumers

Perceived value is the preference or evaluation of certain attributes of a product or service after weighing the advantages and disadvantages between consumers' perceived performance and consumers' perceived cost (Sersland D R, 1987; Woodruff R B, 1997), and make an overall evaluation of the benefits obtained and costs paid (WuYonghong, FanXiucheng, 2004). Perceived value has a seven-dimensional structure of cognition and emotion, among which self-satisfaction, price, quality, transaction and characteristic dimensions have a significant direct positive impact on consumer satisfaction (Mohammed Ismail el-adly, 2018). Value will be perceived value is divided into five dimensions model function, social, emotional, cognitive and situational value five value dimensions,

these dimensions respectively in terms of brand, products and purchase affect consumers' buying behavior (Sheth J N, Newman B I, Gross B L, 1997), found in the study of durable goods, cognitive value and situational value no significant influence on consumer purchase intention, so it is concluded that the three dimensions of durable goods are functional value, emotional value and social value respectively (Sweeney J C, Soutar G N, 2001). Through the formative evaluation of perceived value on a multi-dimensional scale including functional, emotional and social value dimensions, the study shows that perceived value has a great positive impact on consumer satisfaction (Rasoolimanesh S M, 2016). With the increase of perceived differences, consumers are more likely to turn to better quality choices (Adaval R, 2013). The commodity attribute number will initiate consumers' perception of quantity, metaphorical association of related concepts, and different information processing methods, and affect subsequent consumption behavior through spillover effect, so that consumers' decision-making is no longer based on the tradeoff of commodity attributes, but more dependent on the consumption situation (Wu Yinghao, Jiang Jing, 2018).

### 3 Theoretical Basis and Research Hypothesis

#### 3.1 Digital presentation form and smoothness of digital processing in advertising language

Digital processing is a process in which consumers process digital stimuli to form corresponding mental representations of Numbers and use them for corresponding cognitive processing, such as quantitative comparison and mathematical operation (Zhang Hongchuan et al., 2005). Based on theories such as limited memory capacity, easy access to information extraction and smooth information processing, this paper studies the psychological mechanism of the influence of Numbers on consumer behavior. In addition to the size of Numbers, the presentation of Numbers may also influence consumer behavior (Wu Yinghao, Jiang Jing, 2018). When dealing with digital-related information, consumers will make a trade-off between seeking the optimal result and spending the least cognitive effort. The digital presentation form can make consumers' digital processing more smooth (Bettman J R, Luce M F, Payne J w., 1998). Digital presentation forms also influence consumers' perception of the degree of target achievement and the power of target pursuit (Bagchi R, Li x., 2011). Accurate digital presentation will initiate different information processing methods of consumers and make them process accurate Numbers more smoothly (Dan K, Janiszewski C, 2011). Integer makes consumers more inclined to rely on sensory processing information, while precise number makes consumers more inclined to use cognitive analysis to process information (Wadhwa M, Zhang K, 2015). When consumers are in the situation of relying on sensory processing information, expressing commodity attributes as integer can improve consumers' positive attitude towards this commodity. Arabic Numbers, Chinese Numbers and English Numbers are spatial representations of Numbers and numerical properties, and have an impact on the smoothness of digital processing (Wang Jin, 2011). The three forms of digital presentation have different degrees of influence on the information processing fluency of consumers. Compared with the equivalent oral information, the proportional digital presentation is faster in identifying and comparing the digital processing speed of consumers (Childers T L, Viswanathan M., 1996). It is better to use percentage discount than to describe the effect of discount (Chen H, Rao A R, 2007). Consumers can intuitively see the discount ratio and make further decisions more easily. When evaluating the impact of a series of percentage changes, the sequential percentage discount generates more sales, revenue and profit for buyers than the economically equivalent single percentage discount (Zolmajd-haghighi Z, Hanley Q, 2014). Accordingly, the following hypotheses are proposed in this study:

**H1: Digital presentation has a positive impact on digital processing fluency. Descriptive digital presentation has better information processing fluency than percentile and proportional**

**digital presentation.**

### **3.2 Digital presentation form, information processing fluency and consumer perceived value in advertising language**

Figures presented in the AD copy, strengthened the AD copy of the appeal of the use of force to make advertising information to convey a clear, clear, digital proportion in daily consumer goods ads, frequent is actually a rational consumption for modern consumers complex relieve and release (Ning Limei, 2010), a clear and objective impression to consumers, prompt consumers to cognitive and emotional transformation towards the direction of the favorable advertising information. Digital cognitive studies have shown that proportion compared with the single number with greater fluency (Dan K, Janiszewski C, 2011), whether the generation of perception (Bornstein R F, D 'Agostino P R, 2011), or the distribution of the meaning of the event, when cognitive activities more fluid than expected, people make attribution is the cause of the fluency, including the increase of perceived credibility, accuracy, ability (Schindler R M, Yalch R F, 2006). Helps research product perception, number recognition, and persuasiveness (PenaMarin J, Bhargave R, 2016). Digital processing fluency plays a mediating and guiding role in consumption context, and can stimulate consumers to respond to functional value and emotional value. Therefore, the following hypothesis is proposed:

**H2a: Digital presentation positively affects consumers' perceived functional value;**

**H2b: Digital presentation forms positively affect consumers' perceived emotional value;**

**H3a: Digital processing fixation duration positively affects consumers' perceived functional value;**

**H3b: The duration of digital processing gaze positively affects consumers' perceived emotional value;**

**H4: Information processing has an intermediary effect between digital presentation form and consumer perception.**

### **3.3 Involvement regulation effect**

Is involved in the consumer in the process of consumer information search, product evaluation, brand choice when the effort put into the amount of time and degree (Liu F, Cheng H, Li J, 2009), also reflects A stimulus or task that is associated with consumer needs and current life ideal degree (Palanisamy R, Wang S. A, 2003), and per unit time, the audience in their own life and to stimulate the building can be realized between experience, contact, or the number of associated (Krugman H E, 1965). Product involvement refers to the degree to which the audience pays attention to the information the advertisement is trying to convey based on their inherent needs, values and interests, and the importance of such advertising information to consumers (Wu Shuilong et al., 2017). No matter what kind of involvement it is, involvement is the relevance and importance of something perceived by individuals based on their inherent needs, values and interests (Zaichkowsky J L, 1985).

Products involved in high degree of audience information processing motivation, they pay close attention to AD the core content, fine processing of advertising information, to explore the different rhetorical forms of advertising information contains the advertising message, in the in-depth and systematic understanding established on the basis of advertising in an attempt to convey the real meaning of attitude (Wu Shuilong, 2017). When consumers receive advertising information, they have different paths to information processing due to their different ability to process information and motivation (Cacioppo J T, et al., 1986). When the information processing ability and motivation are high,

consumers will process the information in the central path, while low, they will process the information according to the peripheral path (Hu Xiaoyun, XuFang,2006). When browsing advertisements with high product involvement, consumers can obtain more advertising information (Jiang Yushi, 2013), and high involvement will further refine the advertising information.

Products involved in the audience's attention in the product information (Wright, P L, 1973), from a personal situation in perspective, the product is involved in an individual's core issues to advertising, product information content showed a certain strength and sustainability of internal awakened state (Reimann M, et al., 2010), the audience of the products involved in that contains both the importance of product information to the audience and other cognitive relevance and interesting emotion correlation (XuYi, 2011). Involvement is an internal state of motivation, evoking or interest, so the degree of audience involvement will affect the motivation of consumers to process product information (Rayner K, et al, 2001). Compared with low involvement in degrees of goods, advertising can get consumers of high involvement in products longer browsing time, more to look at times, the average pupil is bigger, eye movement data shows that the consumers because of high degree of goods in the more elaborate processing of advertisement information, relatively also get more advertising information, the purchase intention is also more strongly (Garcia C, 2000). Consumers with high product involvement usually have higher perceived dimensions in information processing than those with low product involvement, and when the involvement is high, consumers will search for relevant information more actively, thus influencing consumers' functional value, emotional value and purchase decision, etc. (Richins M L, Bloch P H, Richins M L,1986).

H5: The product involvement has a significant moderating effect on the digital presentation form and the perceived value of consumers in the slogan. When the product involvement is high, the digital presentation form in the slogan has a stronger influence on the perceived value of consumers, and this positive adjustment affects the perceived value of consumers through the intermediary effect of information processing.

H5a: For consumers with high product involvement, the percentile presentation is superior to the proportional and descriptive class in terms of perceived functional value to consumers;

H5b: For consumers with high product involvement, the percentile form of presentation has higher perceived emotional value to consumers than the proportions and descriptors.

To sum up, the research model is shown in figure 1:

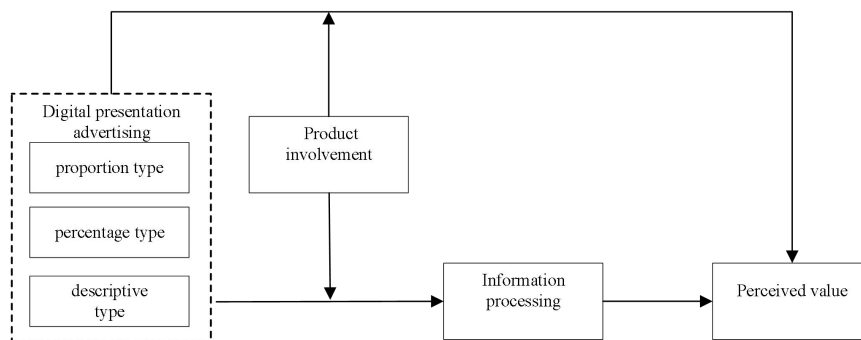

Figure 1 Conceptual Model of This Study

## 4 Research Methods

### 4.1 Variable measurement

#### 4.1.1 Eye movement index

Information processing is largely dependent on vision, and about 80% ~ 90% of external information is obtained through the eyes (Jacob R J K, Karn K S, 2003). Eye movement is the subjects of stimulus information processing and a reflection of the change of the inner (Song Zhijie, et al., 2017), in the eye movement index, looking time effectively reflects the participants of the stimulus information processing fluency (Li Baozhu, Wei Shaomu, 2018), this study selected looking time as the main eye movement examination index, information processing fluency (Landwehr J R, Labroo A A, Herrmann, 2011). Total fixation time, total fixation duration) refers to the fall in the interest of all combined fixation point of time, the index can reflect the cognition of stimuli and degree of processing difficulty or interested in, look at the longer (Guo Suling et al., 2017), the information processing depth is deeper (Lai M L, et al, 2013), the visual perception quality evaluation is higher (Guo Suling et al., 2017), therefore, to let the number of participants interested in their present form advertising effective subjective choices, It is necessary to analyze the process of consumers' perception of digital presentation form advertising together with multi-dimensional eye movement indicators.

#### 4.1.2 Perceived value

This study mainly investigated the influence of digital presentation form in advertising on consumer perception, and explored its influence mechanism according to the (s-o-r) model (Xu Xiaojuan et al., 2017). Stimulation (S) is the external motive force that affects the cognitive and emotional processes of consumers. Organism (O) refers to the internal process and structure of an individual between stimulation and ultimate behavior and reaction; Reaction I is the output or final behavior of consumers after reaction. The stimulus (S) in this study is a digital advertisement composed of digital, text, shape and color elements. Organism (O) refers to the smoothness of the processing of the digital information presented in the advertisement by consumers; Response I refers to consumers' perception score of advertisements in different digital presentation forms. Perceived value table adopts (Sweeney J C, Soutar scale, 2001), function (FV) value and emotional value (SV) two dimensions, a total of eight items, combined with the fine-tuning of this research: the product quality stable/the product well-made/the product craft is advanced, the product formula science/the product let me use the rest assured, the product benefit is/it is/let me get the product I like self-gratification, questionnaire in the form of likert scale, 1 (completely disagree with, 7 for complete agreement. Subjects for related item scores, Cronbach's  $\alpha = 0.929$ .

#### 4.1.3 Product involvement

Based on the personal involvement scale proposed (Vaughn R, Zaichkowsky, 1994), the degree of involvement of subjects in the product was examined from the perspective of individual characteristics, product nature and situational factors. The scale adopts the seven-point likert scale, in which emotional involvement refers to the individual's feelings and emotional state of the product, including five items such as attractive, exciting, interesting, engaging and charming. Cognitive involvement measures the activation degree of an individual to product information processing, including the degree of value, importance, need intensity, relevance and significance. Participants according to the above 10 dimensions determine their relations with the product and scoring, Cronbach's  $\alpha = 0.824$ .

## 4.2 Preliminary experiment

In order to avoid the interference of brands and products in advertisements on experimental results, brand familiarity in experimental materials needs to be pretested. Of this study is to present the number in the form of advertising involved cooking oil (golden dragon fish), milk powder (flying crane), lampblack machine (the boss), cosmetics, estee lauder, shopping platform (a lot of spelling), advertising and brand familiarity influence into consideration, this research subjects in the school for freshmen, the participants were recruited 30 undergraduate students ( $N_{boys} = 15$ ,  $N_{girls} = 15$ ) as participants, the participants need to "are you familiar with the brand in the advertising", "are you familiar with the product in the AD" two multi-item scale, 1 are not familiar with, 7 means very familiar (Dahl D W, Hoeffler S, 2010).  $M_{golden\ arowana} = 4.70$ ,  $M_{flying\ crane} = 4.30$ ,  $M_{boss} = 3.67$ ,  $M_{estee\ lauder} = 4.43$ ,  $M_{spelling\ more} = 5.70$ . In order to make this research experiment controllable, it is necessary to remove the spelling more ads with high brand familiarity. Eliminate high brand familiarity advertising,  $M_{type\ ratio} = 3.68$ ,  $M_{percentage\ type} = 3.08$ ,  $M_{description\ type} = 3.14$ ,  $t(29) = 15.53$ ,  $p > 0.05$  data analysis results show that all the participants of the brand advertising and the advertising, products are not familiar with, and various types of digital data results no significant differences between present advertising, this research of the brand advertising and the advertising, the factors influencing product control success.

## 4.3 Formal Experiment

### 4.3.1 Selection of subjects

This experiment for recruiting subjects of teachers and students in a university in Chengdu, with 95 subjects participated in this study, subjects standards for normal vision or corrected visual acuity, no color blindness, are right-handed (Yang Qiang, et al., 2019), there are five subjects do not accord with standard of the participants, 90 eligible subjects to participate in this experiment, finally the boy 38 (42.22%), girl 52 (57.78%), get a gift and after the experiment.

### 4.3.2 Experimental design

This experiment adopts 3 (digital presentation forms: ratio vs type percentage vs description) x 2 (product involved in degrees: high vs. low) experiment, proportion type as the control group, percentage and description as the experimental group, digital form as independent variables, the digital processing fluency as intermediary variables, products involved in degrees for regulating variable, customer perceived value of the dependent variable.

### 4.3.3 Experimental instruments and irritants

Experimental instrument: this experiment was carried out in the cognitive engineering laboratory of Southwest Jiaotong University. The eye-link2000 Eye tracker developed and produced by SR Research company of Canada was used in the experiment, and EB (experiment-builder) was used to compile the experimental program.

Experimental stimuli: in this experiment, golden arowana blended oil, flying crane milk powder and boss range hoods were selected as the stimuli of digital presentation form advertising, respectively representing proportional, percentage and descriptive digital presentation forms. In order to reflect the authenticity of the experiment, all the pictures used in the experiment were from the pictures on the official websites of the relevant companies. In order to effectively control the experiment, all the pictures were processed by the CDR drawing software to make all the stimulants consistent in terms of pixel (720X640), font, background, layout and other aspects, At the same time, no interference was ensured in the experimental environment.

4.3.4 Experimental process

In order to ensure the smooth success of this experiment and achieve the expected objectives of the experiment, the research team gave experimental guidance to the subjects before the formal experiment. The subjects' eyes should be kept at a distance of about 60cm from the screen, the eye tracker should be started, the experimental items should be selected, and the experimental instructions should be informed to the subjects. Afterwards, the appropriate test distance should be calibrated and confirmed. This experiment in the first group of proportion type, the second type for the percentage, the third group is descriptive, corresponding to the type of stimulus, each type of seven pictures, in turn, is presented to the subjects, play time setting for each stimulus 30 s, all the participants to participate in the corresponding type experiment, after the experiment, the subjects related to filling out a questionnaire.

4.3.5 Data processing and analysis

Eye-link2000 Eye tracker program automatically records the subjects' Eye movement data when browsing advertisements. With the built-in data processing program of Eye tracker, the original data can be preliminarily integrated and reduced, and the fixation duration, fixation point data files and fixation sequence files can be counted. The data can be output in the form of Excel and converted to SPSS24.0. The data were analyzed by single factor analysis, repeated measurement variance analysis and simple effect test.

(1) Digital presentation form and information processing fluency

In this study, eye-link 2000 eye-link Data Viewer was used for Data analysis, and statistical software SPSS21.0 was used for Data analysis. The results of Eye movement Data analysis were shown in the table. The results showed that (as shown in table 1), the *M proportional type* =20.637, the *M percentage type* =4.197, the *M descriptive type* =0.623, and the proportional fixation duration was the longest. There was a significant difference between the digital presentation form and the fixation duration in the advertising language,  $F=1006.290(P<0.001)$ , as shown in table 2.

**Table 1 Statistical Analysis of Digital Presentation Form and Description of Fixation Duration**

	Average (m)	Standard deviation	Standard error	95% Confidence interval for the mean		Minimum	Maximum
				Lower limit	Ceiling		
Proportion type	20.637	6.025	0.550	19.548	21.726	11.413	37.823
Percentage type	4.197	2.104	0.192	3.817	4.577	1.132	8.813
Descriptivetype	0.623	0.201	0.018	0.586	0.659	0.136	0.993
Total	8.486	9.470	0.499	7.504	9.467	0.136	37.823

*Comment: \*express  $p<0.05$*

**Table 2 Numerical Representation and Anova Analysis of Gaze Duration**

	Sum squares	Degrees freedom	mean squares	F	Sig
Between group	27345.170	2	13672.585	1006.290	0.000
Within group	4850.601	357	13.587		
Total	32195.772	359			

Comment: \*express  $p < 0.05$

Further analysis showed that the independent sample T test of proportional type and percentage type showed that the fixation duration of proportional type was significantly longer than that of the percentile group, and the  $M_{percentile\ type} = 20.637 >$ , and the  $M_{percentile\ type} = 4.197$  ( $t = 28.222$ ,  $p < 0.001$ ). The length of proportional fixation was significantly longer than that of the descriptive group, with  $M_{proportional\ type} = 20.637 >$  and  $M_{descriptive\ type} = 0.623$  ( $t = 36.372$ ,  $p < 0.001$ ). Compared with the descriptive advertising, the cognitive processing of proportional advertising was more difficult and the fixation duration was longer, as shown in table 3 and 4. In general, descriptive digital presentation of advertising information processing fluency, the shortest fixation time, followed by the percentile, proportional digital presentation of advertising information processing to understand the most time, the longest fixation time, hypothesis H1 is supported.

**Table 3 Independent Sample T Test of Viewing Time of Proportional and Percentage Ads**

	Don't assume equal variance			36.372	119.265	0.000	20.014	0.550

*Comment: \*express p<0.05*

(2) Digital presentation form and consumer perceived value in advertising language

ANOVA analysis of single factor (digital presentation forms: proportional, percentage and descriptive) showed that there were significant differences in the perceptual function of digital presentation forms  $F=120.624(P=0.045)$ . Further analysis shows that the independent sample T test for proportional type and percentile type shows that the perceived functional value of proportional type is significantly greater than that of the percentile type group.  $M_{proportional\ type}=5.275 > M_{percentile}=4.158$  ( $T=6.976, p=0.036$ ). Independent sample T test was conducted for proportional and descriptive ads. The perceived functional value of proportional ads was greater than that of descriptive ads, and  $M_{proportional\ ads}=4.158 > M_{descriptive\ ads}=2.580$  ( $T=8.861, p<0.001$ ). That is, compared with descriptive ads, proportional ads had higher perceived functional value. In general, the value of the perceived function of advertising consumers in the form of proportional digital presentation is the highest, followed by the percentage, and the value of the perceived function of advertising consumers in the form of descriptive digital presentation is the lowest, hypothesis H2a has been verified.

Univariate analysis was continued, and the results showed that there was a significant difference in the perception and emotion of digital presentation form  $F=60.618(P<0.001)$ . Further analysis showed that the independent sample T test for proportional type and percentile type showed that the perceived functional value of proportional type was significantly lower than that of the percentile group, and that the  $M_{proportional\ type}=2.983$  Independent sample T test was carried out for proportional and descriptive ads. The perceived functional value of proportional ads was significantly lower than that of descriptive ads.  $M_{proportional\ ads}=3.717 > M_{descriptive\ ads}=4.517$  ( $T=-5.392, p<0.001$ ). Advertising consumers with descriptive digital presentation have the highest perceived emotional value, followed by percentile, and proportional digital presentation has the lowest perceived emotional value. Hypothesis H2b is supported.

(3) Information processing fluency and consumer perceived value

Through univariate analysis of digital processing and consumer perceived value, the results show that there is a significant difference between consumer gaze duration and perceived value  $M_{FV}=4.219$  ( $F=1.338, P<0.05$ ),  $M_{EV}=4.616$  ( $F=1.582, P <0.05$ ), the consumer's emotional perceived value is greater than the functional perceived value, as shown in Table 5, therefore, H3a, H3b are supported.

**Table 5 Univariate Analysis of Digital Processing Fluency and Consumer Perceived Value**

Dependent variable	Independent variables	Class III	Degrees freedom	Mean square	F	Sig
		Sum of squares				
FV	Fixation duration	417.624	564	0.740	1.338	0.032
EV	Fixation duration	790.613	564	1.402	1.582	0.011

*Comment: \*express  $p < 0.05$*

(4) The mediating effect of information processing fluency

Using the process plug-in of SPSS software, refer to the Bootstrap method proposed for the mediation effect test (Preacher, Hayes, 2004; Hayes, 2013). The sample size is 5000. Under the 95% confidence interval, the total effect of  $X$  on  $Y$  is 0.3108, 95%  $CI$ : 0.2162 -0.4054,  $P = 0.0000 < 0.05$ , so the total  $XY$  effect was statistically significant. The direct effect of the independent variable  $X$  (the digital representation in the slogan) on the dependent variable  $Y$  (consumer perceived value) is 0.1775, 95%  $CI$ : 0.0817 -0.2733, excluding 0,  $P = 0.0003 < 0.05$ , so the  $X$  pair exists directly Effect; the indirect effect of  $X$  on  $Y$  is 0.1333, 95%  $CI$ : 0.0925-0.1813, excluding 0, indicating that the influence of information processing fluency (gaze duration) on the digital presentation form and consumer perceived value in the slogan is an indirect intermediary. Models, therefore, the fluency of information processing plays a mediating role in the impact of digital representations on consumer perceived value in slogans, so  $H4$  is supported.

**Table 6 Media Processing Fluency Mediation Effect Test**

(5) The adjustment effect of product involvement

Through repeated measures analysis of variance for 2 (engagement: high, low)  $\times$  3 (digital representation: percentage, proportional, descriptive), the results (shown in Table 7) indicate: (1) product involvement The main effect is significant ( $F(2,628)=2884.599, p < 0.001$ ); (2) the main effect of the digital representation is significant ( $F(2,628)=2881.888, P < 0.001$ ); (3) product involvement The interaction between degrees and digital representations was significant ( $F(2,628)=2944.881, P < 0.001$ ).

**Table 7 Multivariate Test a**

a. Design: intercept interior design: digital presentation + product involvement + digital presentation \* product involvement b. accurate statistics

Comment: \*express  $p < 0.05$

In the repeated measurement process, the main effect of the pairwise comparison in the main body adopts the LSD method, and all  $P < 0.001$  (shown in Table 8) indicate that the digital presentation forms are different in comparison, due to the digital presentation form and the product involvement degree. There is an interaction effect between them, and it is of little significance to study the main effect, so it is necessary to study the simple effect.

**Table 8 Pairwise Comparison of the Main Body of Digital Presentation in Slogan**

c.1=proportion type; 2=percentage type; 3=descriptive type

Comment: \*express  $p < 0.05$

Further analysis of the simple effect of the degree of involvement in the digital representation (shown in Table 9), for the proportional digital representation, the perceived value (FV) of high involvement and low involvement is significantly different ( $P < 0.05$ ), the proportional digital presentation form of high-impactness is lower than the perceived value of low-involvement in the score of perceived function value ( $M_{high} = 4.186$ ,  $M_{low} = 4.354$ ); Form, high-impact degree of perceived functional value score is higher than low-involvement ( $M_{high} = 4.295$ ,  $M_{low} = 4.140$ ); descriptive digital presentation form, high-impact degree of perceived functional value score is lower than low The degree of involvement ( $M_{high} = 4.211$ ,  $M_{low} = 4.235$ ).

For the proportional digital representation, the perceived emotional value (EV) of high involvement and low involvement is significantly different ( $P < 0.05$ ), which is expressed as a high-impact ratio of proportional digital presentations in the perception of emotional value. The perceived functional value of the score below the low involvement ( $M_{high} = 4.606$ ,  $M_{low} = 4.774$ ); the percentile digital presentation, the score of perceived emotional value of high involvement is higher than the low involvement ( $M_{high} = 4.832$ ,  $M_{low} = 4.420$ ); Descriptive digital presentation, the score of perceived emotional value of high involvement is lower than that of low involvement ( $M_{high} = 4.661$ ,  $M_{low} = 4.635$ ), therefore, product involvement Degree has a significant adjustment effect on the digital presentation form and consumer perceived value in the slogan. The contours of perceived functional value and emotional value are shown in Figures 4 and 5. Therefore, H5, H5a and H5b are supported.

**Table 9 Analysis of the Simple Effect of Digital Presentation, Involvement and Perceived Value in Slogans**

Dependent variable	Group	Involved in degrees	Average	Standard error	95% Confidence interval	
					Lower limit	Ceiling

		high	4.661	0.132	4.401	4.921

*Comment: \*express  $p < 0.05$*

## 5 Conclusion and Discussion

### 5.1 Research conclusions

This study combined with involved in degrees and slogan in digital form design and implementation of eye movement experiment, specific conclusions as follows: 1) the slogan of the digital representation of consumer information processing fluency (at time) have a significant impact, descriptive digital presents the best forms of advertising information processing fluency, looking at the shortest time and the second is the percentage type, proportion type digital advertising information processing to understand most time, looked at the longest; 2) the digital presentation has a significant impact on the perceived value of consumers in advertising language. The proportional digital presentation has the highest perceived value of consumers and the lowest descriptive value. In terms of emotional perceptive value, descriptive digital presentation is the highest, while proportional digital presentation is the lowest. 3) consumers' information processing fluency (duration of fixation) has a significant impact on consumers' perceived value. Consumers' emotional perceived value is greater than their functional perceived value; The information processing fluency of consumers plays an intermediary role in the influence of the digital presentation form on the perceived value of consumers. 4) products are involved in degree of AD appear in digital form and the consumer perceived value has significant regulation, consumer products are involved in degree is higher, the proportion and describes the digital presentation of advertising function, the lower the perceived value and emotional value perception, full digital presentation of advertising function value and emotional value, the higher the

perception.

## 5.2 Theoretical contribution

The theoretical contributions of this paper are mainly reflected in three aspects: 1) this study introduces the computational neuroscience model of information processing fluency, and introduces the new variable of information processing fluency into the creative research field of advertising language. Through interdisciplinary research, the research variables and content of advertising language creativity are further enriched. 2) the results of this study show that the interaction between the digital presentation mode of advertising language and the smoothness of consumers' information processing significantly affects consumers' perceived value of advertising language and advertising effect, which has an important enlightening effect on the creative research of advertising language, consumers' advertising attitude and advertising effect. 3) this study enriches the research foundation of digital presentation mode and digital effect of advertising, and provides the research foundation for further research on digital presentation mode and advertising creativity.

## 5.3 Management enlightenment

The practical significance of this study provides a reference for the advertising creativity of enterprises. As digital cognition is accepted by more and more consumers, digital elements are widely used in advertising creativity. Brand owners should fully combine product features to select appropriate digital presentation methods for advertising creativity. Type slogan in the percentage of Numbers of consumer perception, the best advertising effect is the most ideal, full digital presentation form both proportion and descriptive representations, the advantages of clear semantic contrast, can be described, with the universality of the obvious, such as "HuiYuan juice 100%", "FeiHe crane high-end sales growth of 200% milk powder", not only can accurately and clearly express product demands, more can promote brand essence and influence.

## 5.4 Research limitations and future research prospects

Although this study to further study of the AD in the digital presentation styles influence on consumer perceived value, the value and the research conclusion, but there are still some shortcomings, mainly has the following several aspects: 1) the subjects of this study are college students, they are willing to accept new things, but also to have certain limitations, their cognition of the product or demand will affect the popularized in other audience, this study will discuss other types of subjects in the AD digital presentation of sensory evaluation; 2) the experimental materials in this study were selected according to the product involvement, without taking into account the factors of product type. For example, the digital presentation of functional and entertainment products in advertising slogans will definitely have a significant difference in the perception of consumers. 3) the limited subjects and experimental materials in this study affect the accuracy of eye movement experimental data to a certain extent. In the future, the experimental materials will be enriched and the number of eye movement subjects will be increased, so as to further optimize and improve the conclusions of this study.

**Abstract:** Mobile news apps are the latest technological innovation to keep users' abreast with latest news and trends. However, there has been sudden spurt of news apps in the market with every media organization bringing out their own mobile apps. Making users' to stick to one and keep them hooked for longer period has become a major challenge for each organization. Therefore, considering the attributes of news apps in the Indian context, based on UTUAT 2 model, this study suggests that effort expectancy, facilitating conditions and habit have a significant effect on users' continuous usage intention of news apps. Furthermore, these attributes have been empirically tested, proved and further discussed in the study. The study provides a theoretical contribution and practical implications that are relevant for the stakeholders working in the area of mobile news apps in India.

**Key words:** Mobile news apps; Continued usage intention; UTUAT2; India

### 1 Introduction

Rapidly increasing smartphone users have spurt the growth and rising use of mobile applications (apps). Mobile apps are now integral part of daily life, meeting our various needs for any plausible purpose (Kim et al., 2013). The use of mobile apps will continue to grow with the expansion of smartphone device users, estimated to reach up to 5.5 billion by 2022. India is no exception where apps are rapidly proliferating and have embedded into the daily lives of most Indians. The mobile app usage in India has outpaced the global growth. According to App Annie, an analyst and business intelligence firm, India has the second-largest number of mobile app downloads in the world, overtaking the US and trailing only China. The report further states that, the app downloads grew by 215% in 2017 and, on an average, Indians use more than 40 apps in a month, while having a total base of close to 80 apps.

Among all, mobile news apps remain one of the most popular applications. News apps deliver news and media firms, newspapers and news aggregators have created apps that facilitate access to information on mobile device. With the enhancement of mobile devices, users are more likely to receive information in fragments through these instruments (Wu et al., 2013). News, intrinsically, is a special form of information that is random, diverse, processed in real time and is relatively different from specific themes like learning material. Because of this nature, users do not have access to a common channel for searching their preferred news. The effective solution is to provide personalized recommendation systems based on their unique characteristics, preferences, interests and trading records (Ye et al., 2019). Daily Hunt, In shorts, News Dog, Flipboard are news recommendation apps based on data mining that provide personalized information to users.

However, this clutter of apps leads to the complexity in consumers' minds and reduces their loyalty towards mobile apps (Malik et al., 2017). For a user there are varied options available to switch or shift between different mobile apps. Downloading of an app is just a first step towards success of a service, attracting and retaining new users is the most critical (Chang et al., 2014). There are various ways to encourage user adoption of an innovation, the long-term sustainability of a new information system relies on users' continuance behavior than on their initial adoption decisions (Venkatesh et al., 2011). Therefore, it becomes important to study users' continuance intention and explore determinants of users' intention to continue using mobile news app. This study explores the factors that influence the continuous usage intention of the mobile news apps, proposes a conceptual model

and tested those dimensions empirically. In general, this study is exploring the critical antecedents in users' continuous intention in the context of mobile news apps in the Indian context.

The rest of the paper is organized as follows: Section 2 reviews existing literature relating to this study and based on that hypotheses are developed. Section 3 discusses the methods used in data collection analysis. Section 4 enumerates all the findings and it contains the discussion. Finally, section 5 concludes the study and lists some recommendations.

## 2 Literature Review and Hypotheses

Researchers have paid much attention in identifying and measuring mobile app users' behavior. Information System (IS) adoption theories such as Technology Acceptance Model (TAM), Theory of Reasoned Action (TRA) and Theory of Planned Behavior (TPB) have been used as theoretical basis. TAM was proposed by (Davis, 1989) in which he introduced two determinants, perceived usefulness (PU) and perceived ease of use (PEOU) that influences individuals' behavior to use a system. Due to its parsimony TAM has been widely used to explain apps adoption (Kang, 2014 , Kouser et al., 2014). TRA proposed attitude and subjective norms as the determinant that influences users' behavior (Fishbein and Ajzen, 1975) while in TPB, Ajzen (Ajzen , 1991) added perceived behavioral control as another determinant. However, both TRA and TPB being offline-based theories have limitation in their application to online context (Howard Chen and Corkindale, 2008).

By integrating eight most popular theories, including TRA, TPB and TAM, Venkatesh et al. (Venkatesh et al. , 2003) postulated Unified Theory of Acceptance and Use of Technology (UTAUT). It proposed four antecedents, performance expectancy, effort expectancy, social influence and facilitating conditions as the main factors determining user adoption. Several researchers, to explain the acceptance of mobile apps (Lee et al., 2012) empirically tested UTUAT including shopping apps (Chopdar et al., 2018). Later UTAUT model extended to UTAUT2 (Venkatesh et al., 2012), adding hedonic motivation, price value and habit as additional antecedents to study technology adoption from consumer perspective and is preferred due to high predictive power. Since UTUAT2 covers the constructs that are intrinsic to both utilitarian and hedonic apps along with applicability of it was shown in relation with shopping apps in India (Tak and Panwar, 2017), this theoretical model has been considered for our study. However, this study has, excluded price value construct as news apps are available free to download and has no price consideration involved.

Fig. 1 shows the six factors (performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation and habit), as suggested in UTAUT2 are proposed in our model.

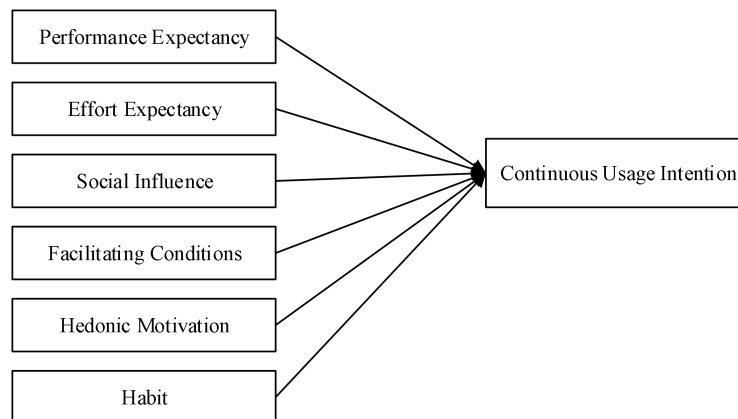

Figure 1 Conceptual Model

Performance Expectancy (PE) refers to ability of the news apps to help users' in achieving what they want in a more convenient and productive manner. Customers will have an intention to use a system, which they perceive will save time and effort than the traditional one. If news apps provides information more conveniently, users' will have a positive reaction to continue using it. Effort Expectancy (EE) defined as the degree of ease associated with the use of the technology under consideration. If users' find the news apps easy to handle without any help or assistance, they will be more inclined to use that app. Thus, customers' intention to continue using a news app will be shaped by an extent to which they find it easy and uncomplicated. Social Influence (SI) reflects the effect of important people's opinion on individual user behavior. Users' tend to comply with the other peoples outlook whom they consider are important. In using mobile news apps, people will follow voice of others that will shape their intention to use it. Facilitating Conditions (FC) means that users' have the necessary knowledge and resources to use the given technology. Since, mobile news apps are a software that run on smartphones and not very useful without proper internet connection. Moreover, FC also refers that users' can use the technology without any technical glitches combined with high quality of service care. All these factors effect user's intention to use news apps. Hedonic Motivation is a new construct introduced in UTAUT2 and is defined as the fun or pleasure derived from using technology. Feelings of pleasure and playfulness is also linked to the extent of innovativeness, creativeness and novelty in using mobile news apps. Hence, it argued that if news apps are creative, novel and bring joy, users' will be inclined in using it. Habit is the extent to which people tend to perform behaviors automatically because of learning. It is users' spontaneous response based on their previous experience. In the context of mobile news apps it refers, role of habit is crucial as consumers will use apps in future based on their on their experience which comes from regular using of apps. Thus, we hypothesize that

**H1: PE will have positive impact on users' continuous usage intention of mobile news apps.**

**H2: EE will have positive impact on users' continuous usage intention of mobile news apps.**

**H3: SI will positively influence user's continuous usage intention of mobile news apps.**

**H4: FC will positively influence users' continuous usage intention of mobile news apps.**

**H5: HM will positively influence the continuous usage of mobile news apps.**

**H6: Habit will positively influence the continuous usage of mobile news apps.**

### 3 Methodology

Data for this study collected from two major Indian cities, New Delhi and Jaipur through a standardized questionnaire distributed among 100 people. To find the continuous usage intention of mobile news apps, it was required that users' must have adopted news apps before, hence, survey included only those who have been using these apps. The statistical package for social science (SPSS) to carry out to achieve the objective of research. The reliability test, factor analysis and linear regression was used to find the relations between variables. Research model includes seven factors and each factor was measured with multiple items adopted from Venkatesh et al. (Venkatesh et al., 2012) This includes three for PE, SI, HM, HT and CUI and four for EE and FC.

### 4 Analysis and Discussion

#### 4.1 Factor analysis

The first stage involved explanatory factor analysis (EFA) of six independent variables to have an initial overview of the latent variables and delete or modify the redundant items. We used principal components analysis with Varimax rotation. The 20 items resulted in 6-factor solution with 14 items loading above 0.55 (Table 1). Based on poor loadings, we removed six items belonging to two constructs i.e. PE and HM. The internal consistency reliability (measured through Cronbach's Alpha) of remaining four factors were above 0.6 for the 20 items solution, confirming high correlation and reliability among each items under reaming four constructs.

**Table 1 Factor Loading and Cronbach's Alpha of the Variables**

Constructs/Items	Factor Loading	Cronbach's Alpha
SI1	.913	.943
SI2	.906	
SI3	.917	
EE1	.642	.862
EE2	.816	
EE3	.672	
EE4	.668	
FC1	.801	.848
FC2	.843	
FC3	.709	
FC4	.747	
HT1	.727	.749
HT2	.766	
HT3	.759	

#### 4.2 Correlation results

Bivariate correlations of four of the predictor variables with continuous usage intention (CUI) were statistically significant and in the hypothesized direction. As illustrated in table 2, Effort Expectancy was positively related to the continuous usage intention of mobile news app and highly significant ( $r = .506, p < .01$ ). Thus, the second hypothesis (H2) was supported by the research. Social influence, however, was found statistically insignificant as ( $r = .139, p > .05$ ). Hence, H3 was not supported in the research. Facilitating Conditions (FC) in the mobile news apps was also positively correlated with CUI having a significant value of ( $r = .427, p < .05$ ). Similarly, habit (HT) was also positively correlated with CUI with, although with significantly values at 90% ( $r = .252, p < .10$ ). It can be assumed that HT is a predictor even if not a very strong one and hence our H6 was supported in the research.

**Table 2 Correlation Results of the Variables**

Variable	SI	EE	FC	Habit	CUI
Social Influence (SI)	1				
Effort Expectancy (EE)	.000	1			
Facilitating Conditions (FC)	.000	.000	1		
Habit (HT)	.000	.000	.000	1	
Continuance Intention (CI)	.139	.506***	.427**	.252*	1

\*\*\*1%, \*\*5%, \*10%

#### 4.3 Regression Results

Regression analysis helps us to find the relationship among the variables. The process reveals us how dependent variables change when any one of the independent variables varied. In a bid to reaffirm the test on the behavioral factors on continuance usage intention, regression model was assessed using variance explained ( $R^2$  measures) and the level of significance of the beta coefficients. Equation used for the regression analysis between depended and independent variables is:  $CUI = a + \beta_1 \times w + \beta_2 \times x + \beta_3 \times y + \beta_4 \times z + error$ , (where 'w' represents SI, 'x' represents EE, 'y' signifies FC and 'z' is HT). Table 3 shows the results. The results indicate that effect of CUI on SI is insignificant ( $\beta = .11, p > .05$ ). While, effort expectancy ( $\beta = .41, p < .01$ ) and facilitating conditions ( $\beta = .35, p < .01$ ) were highly significant and have substantial effect on the CUI of mobile news apps. Factor HT ( $\beta = .20, p < .05$ ) also observed to be effecting CUI. The  $R^2$  of the variables indicates that the model explains 52.1% of the variance.

**Table 3 Result of Regression**

	<i>Coefficient</i>	<i>t-Value</i>	<i>P-Value</i>
(Constant)	3.660***	43.380	.000
SI	.115	1.349	.184
EE	.418***	4.901	.000
FC	.353***	4.142	.000
HT	0.208**	2.443	.019
Adjusted R <sup>2</sup>	0.478		
F-Statistics	12.24***		0.000

\*\*\*1%, \*\*5%, \*10%

## 5 Conclusion

This study was an attempt to explore and develop understanding the aspects that could shape Indian users' continued usage intention of mobile news apps. Based on the extant literature review, UTAUT2 model was found to be suitable theoretical foundation for the proposed conceptual model and carry out the research work. In this model PE, EE, SI, FC, HM and HT were predicted to have positive effect on continued usage intention of mobile news apps. The data was collected from actual adopters of news apps in India. The data was analyzed using SPSS and results confirmed that EE, FC and HT factors have influence on CUI of mobile news apps while SI was observed to be insignificant in our study. The two other factors PE and HM dropped from the analysis because of their poor factor loading in factor analysis. Thus, if news apps developers focuses on EE, FC and HT aspects of apps, it will enhance users' continuous usages of those apps. This study provides a theoretical and practical contribution to key stakeholders and practitioners working in the area of mobile news apps.

# Research on Bio-Information Risk Identification Management under Big Data Environment

Chen Ruiying<sup>1</sup>, Zhang Haili<sup>2</sup>, Shen Jun<sup>2</sup>

1 College of Informatics, Huazhong Agricultural University, Wuhan, P.R. China,430070

2 School of Management, Wuhan University of Technology, Wuhan, P.R. China,430070

(E-mail: RuiyingChen@webmail.hzau.edu.cn, 1050251455@qq.com, sjarr@whut.edu.cn)

**Abstract:** Under the big data environment, standardized mass bio-information can provide useful resources for medical development, scientific research, and clinical treatment. However, there are various risks in the collection, classification, storage and application of standardized biological information. Therefore, it is necessary to identify the possible risks of bio-information in the big data environment, and then to propose targeted bio-information risk management strategies, including controlling the risk of collecting biological information, controlling the risk of biological information processing, controlling the risk of biometric information storage, and controlling the application of risk to biological information.

**Key words:** Big data; Bio- information; Risk identification; Risk management

## 1 Introduction

The White Paper on Standardization of Big Data (The White Paper on Standardization of Big Data,2018) jointly prepared by the China Electronics Technology Standardization Institute and other units pointed out that China is in the transition period of digital economic development, and the disclosure, sharing and service of information have become the theme of the development of the times. Establish a multi-level precision medical knowledge base system and a national biomedical big data sharing platform, and carry out research on key technologies of precision medical core such as next-generation gene sequencing technology, omics research and big data fusion analysis technology, and promote the transformation of medical diagnosis and treatment mode. The combination of biological information and databases will greatly promote the development of research in all areas of life sciences and therefore plays an important role (Stein, 2013). At the same time, the results of the bio-informatics database not only have important theoretical value, but can also be directly applied to industrial and agricultural production and medical practice (Chiappelli et al., 2018). The standardization of bio-informatics big data has become one of the main contents in the “scientific research” section of important application areas. Because with the opening of the era of precision medicine, more and more researchers use biological information for scientific research or medical clinical, they design and manipulate the collection, processing, storage, application of biological information for future research or clinical use (Nagai et al., 2018).

However, biological information is highly correlated with the privacy of the information provider, and it is susceptible to the objective environment and is likely to be subjective or objectively manipulated by information operators (Balenton et al., 2017). If it is managed improperly in any part of the bio-informatization process, there will be considerable risks. Although some problems caused by

unclear identification and mismanagement of bio-information risks have rarely been reported, the fears caused by them have already existed. Experts and scholars have also conducted some research. Some scholars believe that biological sample database information from the perspective of security management Safety management is a multi-faceted, multi-factor dynamic process (Lang Tao et al., 2014). Therefore, the author believes that adopting the ISO27001 standard and conducting information security evaluation is one of the important basic tasks for establishing a reliable biological sample library. Other scholars believe that the biological sample library safety management system plays an important role in the management of security incidents. Personnel safety, sample security and information security issues cannot be ignored (Ge Meiling et al., 2018). With the advent of the post-genome era, many aspects of the industrialization and sustainable development of biological sample banks should be re-explored clearly defined, content and scope of application (Man Qihong, 2018).

Therefore, from the perspective of personal information protection in biological databases, it is practical to study the dilemma and outlet of the principle of informed consent in the era of big data (Shanfang et al., 2019). Based on the concept of balance between protection and utilization, the new type of informed consent model that adapts to the needs of big data should be skillfully designed and transformed from a uniform agreement to a hierarchical consent based on information classification and scenario risk assessment (Peng et al., 2019). Based on the current research status of bio-informatics risk management, scholars have studied bio-safety issues, informed rights issues, and bio-informatics database construction from their respective research fields and perspectives (Végyári et al., 2011) (Vaught, 2016). The current research results are based on the systematic research of bio-informatics risk, especially bio-informatics risk identification in the big data environment. Bio-informatics risk management needs to start from the risk identification and propose the research plan in order to solve the bio-informatics risk systematically. Management and control issues, so the research in this paper is urgent and necessary.

## **2 The Status of Biological Information and Its Risk Management under the Background of Big Data**

### **2.1 Status of biological information management under the background of big data**

Biological information mainly refers to health and disease organs, tissues, whole blood, plasma, serum, body fluids or treated derivatives such as DNA, RNA, proteins, etc., as well as clinical, pathological, therapeutic, follow-up, and related to these biological samples. Informed consent, ethical approval and other information. Big data has the characteristics of large amount of data, various types, low value density, fast speed, and high timeliness. Since the concept was proposed, it has gradually applied in the fields of physics, biology, and environmental ecology. In the process of standardized collection, processing, storage and application of massive amounts of biological information in the context of big data, the development and management characteristics of biological information and its sample database are summarized as:

(1) The standardization of the biological information sample library has a long way to go. The standardization of the biological information sample library is essentially a rule for sharing and reusing the activities of the biological sample library, biological samples and their data information. The realization of the standardization construction of the biological information sample library must be carried out from the application before the sample collection, ethical review, informed consent, processing, annotation, storage during collection, to packaging, transportation, use, destruction, etc. after collection. Standard formulation and implementation.

(2) The operation and sharing of the biological information sample library has taken shape. In China, the operation and use of biological sample banks are closely linked. At present, there are three main methods for the operation of biological sample banks. The first is the establishment of a biological sample library led by specific project operation. The second one is the establishment of a biological sample library led by related institutions. The third is establishment of a biological sample bank. Regarding the sharing of bio-information sample libraries, an effective paradigm has not yet been formed, so there will be a certain extent that the bio-information sample library resources can be repeatedly constructed, the usage rate and the sharing rate can be improved.

(3) Sustainable development requires continuous investment. The construction and maintenance of the biological sample bank requires cost input, rationally formulate the paid use service value system of the biological sample, and reasonably collect the paid use fee of the biological sample resource for the operation and maintenance of the biological sample bank, which is the resource for realizing the biological sample. Value attributes and effective ways to ensure the sustainable development of biological sample banks.

## 2.2 Overall framework of bio-information risk management

In the context of big data, in the process of standardized collection, processing, storage and application of biological information, all aspects may encounter uncertainty and pose certain risks to users of biological information. According to the risk management theory, these risks are controllable to a certain extent and scope, and have the significance and necessity of risk management. Therefore, according to the classic risk management framework and path, the overall framework of bio-information risk management in the context of big data is designed (see Figure 1).

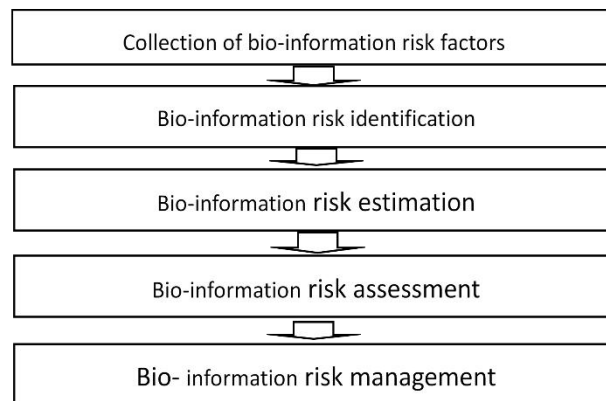

Figure 1 Overall Framework of Bio-Information Risk Management

## 3 Bio- Information Risk Identification Objects and Types

Under the big data environment, the main functions of the bio-information database include: informational biological sample resources, virtualized retrieval and remote monitoring, etc. Some scholars have classified the information of the biological information base as shown in Table 1.

**Table 1 Classification of Information in the Biological Sample Library**

classification	Contents
Sample data	Electronic data: biological sample information Paper data: medical history file
Data application	Stand-alone program: desktop system, office software Cloud data program: cloud data application, remote control program Program: executable program, biological sample library solution provider software
Equipment and facilities	Network facilities: wired or wireless router, LAN Office equipment: servers, desktops, laptops Mobile devices: mobile storage devices (U disk), digital cameras, voice recorders Security facilities: computer firewall, fingerprint authority system
Support and guarantee	Support staff: Biological sample library system support staff Network service: provided network connection service (telecommunications) Third-party services: services enjoyed by purchased products

Source of the table: Lang, T., Zhou, C. Z., & Xu, X. W. (2014). Information Risk Assessment of Biological Samples Database Based on ISO27001 System. *Chinese Medicine Biotechnology*, 6, 228-230 (In Chinese)

However, more scholars have been combined the research results of bio-information database, considering the research scope and research focus of the paper, this paper focuses on the information risks that may be generated in the process of obtaining “sample data” in Table 1, bio-information. Standardize the risks that occur during collection, processing, storage, and application.

(1) Risk of bio-information collection. After the bio-information big data standardization, the bio-information collection work bears the brunt, but in the process of bio-information collection, the biometric information collected may be unreal or polluted due to improper operation, instrument error and some people providing error information. This possibility is the source of a series of subsequent risks. If not handled properly, it will generate risk transmission along the use of biological information.

(2) Risk of bio-information processing. According to the ultimate goal of the use of biological information, the biological information processing process includes specific steps such as calculation, classification, and packaging. Each link may have uncertainty, and ultimately it is the risk of biological information processing.

(3) Risk of bio-information storage. Under objective conditions, biological information storage requires special temperature, humidity, and other environmental conditions. Under appropriate storage conditions, biological information is not easily destroyed. However, the occurrence of any microscopic factor in the storage process will change the nature or characteristics of biological information. In addition, the risk of biometric information storage also comes from human factors, such as the risk caused by the internal control system of the company or hospital.

(4) Risk of bio-information application. After obtaining the biological information, the information needs to be analyzed according to the final use. The precision of the analytical instruments involved in the analysis process and the professionalism of the analysts will have an impact on the final analysis results. Professional analysts use sophisticated analytical instruments, and the probability of bio-information analysis risk is not small or small; on the contrary, not very professional analysts use less sophisticated analytical instruments, the probability of bio-information risk occurrence will greatly increase.

## **4 Bio-Information Risk Management and Control Recommendations in a Big Data Environment**

### **4.1 Controlling the risk of collecting biological information**

Information on biological information samples and sample donor disease diagnosis and outcomes plays a very important role in research and clinical treatment. In the process of collecting sample information, firstly confirm the authenticity of the source of the biological information sample, including the basic information of the clinic. Second, to ensure the security, integrity, and legitimacy of the equipment, information systems, and operational processes used in the information gathering process.

### **4.2 Controlling the risk of biological information processing**

In the big data environment, the processing of biological information should establish a corresponding information processing system to improve processing efficiency and reduce the probability of occurrence of risks. Automatic acquisition of clinical information through the interface improves the collection efficiency, avoids errors caused by human factors, and makes the collected information more complete, accurate and effective. However, when the BIMS system is relatively independent or lacks a larger supporting platform, it will produce defects in which the biological information samples are incomplete. In order to avoid the risk of human information processing as much as possible, it is possible to control the occurrence of corresponding risks by formulating corresponding systems.

### **4.3 Controlling the risk of biometric information storage**

In view of the reasons for the risk of bio-information storage analyzed in the previous section, the risk source from objective physical aspects in the big data environment is gradually reduced, and the risk management should mainly focus on risk control from human factors, the most important of which is internal control. The company first established an internal control mechanism for bio-information control, optimized the internal control management system, and increased publicity to create an internal control culture and atmosphere.

### **4.4 Controlling the application of risk to biological information**

The sample library manager should first review the identity of the biometric information user for verification. After confirming the error, the sample transfer condition is notified in advance according to the storage conditions of the outbound biological information sample. When the biological information sample is released from the warehouse, an employee confidentiality agreement must be signed with the relevant staff to protect the privacy of the bio-information owner and user.

## 5 Conclusion

Biological information is not only an important resource for individual economic activities, but also a strategic resource of the country, which contains great application value. The standardization of biological information in the big data environment, as well as the collection, processing, storage and use of biological information, give it new features. While making full use of its massive data, convenient use, fast and cheap, it must be fully realized. It is of practical significance to propose various measures for the risk of bio-information. In the future, more quantitative research methods can be used to evaluate and classify various risks, and the research perspective of bio-information risk management will be expanded to form more systematic research results. There are various risks associated with the collection, classification, storage and application of standardized biological information. Therefore, it is necessary to identify the possible risks of biological information in the big data environment, and then propose a targeted bio-information risk management strategy. And this paper proposes to establish a biological information base and a corresponding information processing system to improve processing efficiency and reduce the probability of occurrence of risks. In future research, it is necessary to further strengthen the influence factors of different risk of bio-information. The reform of the governance system will improve the efficiency of risk prevention and control, and provide a necessary reference for the decision-making of relevant government departments.

## Acknowledgement

We thank for the project that supports the paper. We thank for all authors and writers who provided the quality and high-level literature and papers.

# Research on Grid Management Mode Application in College Student Management in New Era

Qu Shuaifeng

Automotive Engineering College, Wuhan University of Technology, Wuhan, P.R. China, 430070  
(E-mail: 104582674@qq.com)

**Abstract:** With rapid development of Chinese economy and society and deepening education system reform, new challenges and requirements college are emerging in college student management. This paper introduces grid management mode into college student management and proposes a relative concept in new era. It analyzes necessity and feasibility of college student grid management by taking Wuhan University of Technology (WHUT) as an example, and conducts research on grid management mode application in college student management in new era.

**Keywords:** Grid management; Student management; Information technology; Informationization

## 1 Introduction

General secretary Xi Jinping emphasized at National Education Conference that "we must deepen higher education system reform to establish a higher-level talent cultivation system, and to cultivate socialist builders and successors who are well developed in morality, intelligence, physique and aesthetics." College student management plays a key role in college talent cultivation system. With rapid development of Chinese economy and society and the deepening education system reform, traditional college student management mode cannot fully meet the requirements of the new era, and college's ideological, political, security and stability constructions are under great pressure. As an emerging concept in management practice in recent years, grid management is an effective mode for disposing complicated management affairs. It is of great significance both in theory and practice to be introduced into college student management exploration. Yu and Robertazzi (Yu and Robertazzi,2003) pointed out that grids own spatial characteristics, which can be divided and managed virtually. Friedrich et al. (Friedrich et al.,2007) held that the application of grid theory can improve government's serving ability and people's happiness. After comparing and analyzing community grid management practices in Beijing, Shanxi and Shandong, Chen and Xiao (Chen and Xiao,2015) explored to establish urban community grid management with service and democracy that based on science and technology. Qiao (Qiao,2018) conducted research on application of grid theory to student security management in independent colleges and analyzed its necessity and feasibility, and established a grid organization model of college student security management. Liu (Liu,2019) analyzed current situation of grid management in Qinhuangdao in Hebei province with suggestions on existing advantages and disadvantages.

At present, grid management has been deeply studied at home and abroad. Although the research fields are different, it is agreed that grid management is an efficient and advanced management tool and means. At present, grid management is mainly applied in urban governance. The study (Hong and Zhang, 2017) show that grid management can improve the ability of urban governance, while urban governance is similar to efficient student management. It is scientific enough to apply grid management to university student management. At present, there are few studies on the application of grid thinking in

university student management. It is of great theoretical value and practical significance to introduce the concept of grid management into the management of college students and explore the model of grid management of College students.

## **2 Challenges Faced by College Student Management in New Era**

### **2.1 Challenge from education system reform**

In September 2017, the instruction issued by General Office of the CPC Central Committee and General Office of the State Council pointed out that “the institutional mechanism for promoting development of higher education connotation shall be strengthened” . Compared with traditional extensional development mode, the connotative development mode focuses on talent cultivation quality, scientific research achievements and contribution to the society (Li et al. 2018). It highlights the dominant role of college teachers and students with more autonomy. With the deepening higher education system reform, traditional assessment system will be gradually replaced by new credit system and major-minor system, which will enable students to develop in a comprehensive way. They can select courses, teachers and dormitory independently. However, students cannot figure out direction if they are not guided by appropriate education, which put forward new requirements on college student management. Meanwhile, new management mode shall adapt to new education system, which will bring severe challenges to the traditional college student management.

### **2.2 Challenges brought by changing student characteristics**

Characteristics of college students in new era have undergone significant changes (Bao and Sun, 2018). In 2018, the “Post-2000s generation” students have entered college campus. At present, both “Post-1995 generation” and “Post-2000s generation” are dominant groups in college with common characteristics: strong sense of autonomy but weak independent living ability. With improved material life, they pay more attention to spiritual pursuit and autonomy to make their own decisions. However, affected by exam-oriented education system, some students are lack of independent living ability. They own strong self-confidence, curiosity, but poor psychological enduring capacity. The popularity of the Internet encourages them to express bravely, and get used to being praised. But they have weak determination and confidence to overcome difficulties. They become more utilitarian with strong capacity and intelligence. Influenced by the overall environment, college students in the new era are smarter and more capable. However, they are also more utilitarian due to the influence of the market economy. When they participate in some activities, they will consider what they can get first. As the object of the management, the changing characteristics of college students will also pose challenges to traditional college student management.

### **2.3 Challenges brought by "Internet Plus" era**

With rapid development of mobile Internet and information technology. On one hand, educational informatization, especially higher education informatization, lags behind other social public services. College student management Informatization is not fully realized in most colleges and universities (Feng et al. 2018). Some colleges have installed a closed student management system that only can record and check simple information. It cannot achieve real-time access and utilization analysis of all kinds of comprehensive information of students. On the other hand, as Internet aborigines, "Post-2000s generation" has realized deep Internet integration, especially the popularity of smart phones has completely changed their way of living, working and learning (Zhang et al. 2019). Therefore, "Internet Plus" era will certainly bring new challenges to college student management.

### **3 Related Concepts of College Student Grid Management in New Era**

#### **3.1 Grid and grid management**

Grid is an emerging technology that built on the Internet. It integrates high-speed Internet, high-performance computers, large databases, sensors, and remote devices together to provide more resources, functions, and interactivity for scientists and ordinary people (Wang et al. 2017). Grid enables people to use other resources such as computing and storage transparently to realize comprehensive sharing of computing resources, storage resources, data resources, information resources, software resources, communication resources, knowledge resources, and expert resources, etc.

Inspired by computer grid management, grid management divides objects into several grid units according to certain criteria. Modern information technology and coordination mechanism are used to realize effective information communication, resources organization to finally integrate organizational resources and improve management efficiency. The core idea of grid management is to reflect user submission simplicity and accuracy and grid responding speed.

#### **3.2 Community grid management**

Community grid management is the innovation of grassroots management mode. It divides community into several grid units according to geographical environment, population density and other conditions on the principle of convenient management. Advanced information technology is used as an auxiliary means to introduce new management concepts to community. The person in charge of the grid is responsible for providing services to the residents in the grid. Each grid will form a large network and realize community information sharing, high-class community management and public services.

#### **3.3 Student community grid and behavior grid**

Student community grid is a vertical physical grid formed by student parks, buildings, and dormitories that inspired by academy management system. It is an important carrier of self-management or administrative activities carried out for specific needs such as maintain order, satisfy material and spiritual demands inside student community (Zhang and Yan, 2017).

Student behavior grid is a horizontal information grid that based on student behavior characteristics, which inspired by grid management. It is an organic connection of students' information generated by learning, living, and working on campus as well as an important guarantee for realizing information sharing, analysis and utilization.

#### **3.4 College student grid management in new era**

The college student grid management in new era is based on rapid development of mobile internet and information technology. It utilizes basic principles and management methods of grid management to build student community and behavior grid. It achieves efficient student management and adapts to their growth and development by integrated information resources, improved organizational structure and optimized business process. Student grid management will facilitate efficient integration of college resources, smooth communication among student groups, and the implementation of “student-oriented, service-oriented, combination of education and management” philosophy. Management will be realized in service, while it will also reflect service and education accordingly. The Informa ionization, standardization, refinement and systemization of student management will provide students with personalized service and educational guidance.

## **4 Necessity and Feasibility Analysis of College Student Grid Management in New Era**

### **4.1 Practical demand of highlighting “Student-oriented” philosophy**

To form a higher level talent cultivation system, the "student-oriented" philosophy should be insisted firmly (Wu, 2016). Adhering to this philosophy in college student management can effectively cope with new challenges and promote comprehensive, sustainable, individualized development of students as well as the construction of a harmonious teacher-student relationship. It also meets the same requirements of humanized management advocated by grid management. The grid management mode can turn traditional student management into personalized management, which fully consider characteristics and personality of students and better serve them to grow and reach their prime.

### **4.2 The objective requirement to improve college managing ability**

At present, Chinese colleges adopt bureaucratization management mode, which based on rigid system that constraint by a single method. During this process, the constraint is emphasized from top to bottom while student personality and feedbacks are ignored. The existing management mode adopts "parental" thought to manage students, which will reduce students' satisfaction on college management, and neglect the cultivation of students' self-management ability and finally result in weakened college management. Nowadays, with stricter criteria in students' mental health education, safety and stability management, and risk prevention, a new management method is urgently needed to improve college management ability. While the grid management mode can divide college management affairs into grids. All information can be efficiently circulated, resources can be shared, and efficient management services for students can be realized. It is an important way to improve college comprehensive management ability.

### **4.3 Information technology development provides technical support for college student grid management**

Grid management collects necessary information by collection device, and transmit them to data center through network for storage and processing. Multiple information technologies are being utilized in the management. With rapid development of information technology and maturing big data analysis, "Internet Plus", cloud computing, 5G communication technology, face recognition technologies, instant messaging tools like WeChat, Weibo, QQ are gradually popularized. Colleges have established their own official website and a communication mechanism with society. The various departments in colleges have basically realized office automation and established their own management systems. They are also strengthening digital campus construction. The hardware infrastructure and software resources are constantly being improved in colleges. The continuous improvement of information technology and construction provide hardware foundation and platform guarantee for the implementation of grid management in college.

### **4.4 Successful application of community grid management provides experience for college student grid management**

The concept of grid management was put forward in 2003, it was first applied to community management in cities. It was the methodological innovation of urban management theory. It achieved desired result after being implemented in cities. For example, the “Grid Management, Group-type Service” information management platform in Zhoushan has been operated for 3 years, which have

disposed nearly 60,000 issues and integrated resources from 30 departments with 99% settlement rate. The people's safety index in Zhoushan has also been effectively improved with 8.9% year-on-year decreased mass petition rate (Pan, 2017). The grid management has enhanced public's sense of acquisition and happiness, and promoted social harmony and stability. There is a great similarity between urban management and college management because of the similar background and lifestyle of the people in cities and colleges (Huang, 2018). The summarized and optimized grid management cases in cities can provide useful experiences for college student grid management.

## **5 College Student Grid Management Platform Construction in New Era**

College student grid management can absorb successful experience from urban community grid management to a certain extent, but their significant difference must be taken into consideration. It shall stand at college talent cultivation height and to be systematically planned and promoted as a whole that combined with college Informationization basis and group characteristics of student. Wuhan University of Technology (WHUT) owns some outstanding characteristics such as scattered campus and large student scale, which brought difficulties in student management. This paper takes WHUT as an example to put forward an overall idea of college student grid management in new era.

### **5.1 Establishing a student grid management center**

The student grid management center is jointly established by party and government administration office, informatization office, network information center, student affairs department, youth league committee, academic affairs office, graduate school, security department, logistics support department, library and other departments. Five sub-centers such as student community grid management center, student behavior grid management center, student big data analysis center, student online one-stop service center and student grid management monitoring center are also established. With more than 50,000 students, 7 student parks, 71 student buildings, and 12,659 dormitories, WHUT established a 4-tier student community grid according to the "dormitory-building-park-college" principle. Student community grid management center is responsible for grid information reporting, the basic affairs processing and feedback. Student behavior grid management center is mainly responsible for acquisition, transmission and sharing of various information. Student big data analysis center carries out in-depth mining, analysis and prediction in massive student information with feedback. Student online one-stop service center processes students' various affairs online to save their time by information flowing. Student grid management monitoring center supervises operation process with assessment and incentives of college's student grid management.

### **5.2 Forming a dedicated grid management team**

After completing grid division, it is necessary to form a grid management team to facilitate the management of all grids. The entire college grid is divided into four tiers. The tier-1 grid managers are the vice president or deputy secretary who is in charge of student work, and heads of student grid management center. The tier-2 grids are 7 student parks. Corresponding schools will form a student park management center to coordinate various student affairs including academic guidance, life guidance, career planning, postgraduate examination guidance, scientific research counseling, second and third class teaching, etc. The tier-3 grids are 71 students buildings which led by full and part-time residential counselors and assisted by residence advisors and building party branches. The tier-4 grids are 12,659 dormitories which are specifically managed by the dormitory head. The tier-1 and tier-2 grid managers shall timely share and release all important student information and dispose their problems. The tier-3 and tier-4 grid managers shall upload and report student information with feedbacks in a timely manner

by a time-limited processing system.

### **5.3 Establishing a comprehensive student information platform**

The timely information with comprehensiveness and accuracy is the foundation of student management. It is necessary to fully integrate existing information and data platforms and realize free flow and real-time sharing of various information in college-level data center. The comprehensive student information platform is deeply connected to college data center. Assisted by grid technology, it solves problems of information acquisition, sharing and circulation to ensuring the accuracy of information acquisition, timeliness of transmission, and thoroughness of sharing. Grid managers can get all comprehensive student information timely according to their authority. For example, the platform can obtain students' curriculum selection, classroom performance and credit information from educational administration system, obtain logging and position information on students' campus network connection from network information center, obtain consumer information such as canteens and supermarkets, obtain students' book borrowing and entry-exit information from library, obtain dormitory and campus entry-exit information from security department, obtain student payment information from financial system.

### **5.4 Building an online one-stop student service platform**

The online one-stop student service center will integrate existing student-related service functions such as academic affairs, student affairs, finance, security, library, logistics together. Then put service items including curriculum selection, grade checking, award review, fund application, employment guidance, household administration, payment reimbursement, book borrowing, property maintenance, utility payment into online one-stop service platform. Meanwhile, a mobile phone client will be developed to facilitate students to handle various affairs online, and to coordinate with the existed one-stop service center to simplify process with improved efficiency. The traditional recursive mode has been turned into a flat management mode, which shortened the distance and achieved seamless communication between teacher and student.

### **5.5 Establishing a student big data analysis center**

After collecting a large amount of student information, it is necessary to establish a student big data analysis center (Xue and Meng, 2016). The center can create visual data mode and behavioral analysis prediction mode on students' learning levels, hobbies and personality characteristics from different dimensions and perspectives by means of data mining, data visualization, crawler algorithm. to analyze and utilize student information. It will draw a "student portrait" to depict his five aspects including knowledge level, learning ability, personality characteristics, psychological characteristics, and living status to achieve behavioral analysis, targeted funding, academic forewarning, crisis forewarning and growth leading and to better serve the individualized growth and development needs of students. During information analyzing and utilizing process, student privacy must be protected and classified into different categories. Grid managers who own permissions must sign confidentiality agreement.

### **5.6 Safeguards for grid management platform**

Safeguards are necessary to realize smooth operation of grid management platform. First of all, the overall management level of grid teams shall be improved. Because as a relatively new management method, grid management is developing constantly. While some managers may have unclear understanding and insufficient methods on their works. Secondly, college student grid management center shall dynamically utilize the resources from various departments to collect student data and information timely in order to achieve deep resource integration and improve management service

efficiency effectively. Thirdly, a thorough supervision and evaluation mechanism shall be established. Responsibilities and tasks of the entire grid shall be subdivided to each grid manager clearly. Thus all managers will fulfill their responsibilities and effectively solve the students' practical issues under supervision and regular assessment.

## 6 Conclusion

It is pragmatic and innovative to introduce grid management mode into college student management to solve prominent problems in new era. The paper takes Wuhan University of Technology (WHUT) as an example and puts forward overall design ideas for the application of grid management in college student management in new era. It conducts preliminary researches on college student grid management platform in following aspects: community grid division, grid team, student information platform, online one-stop student service platform, student big data analysis center, security system, etc. In the next step, in-depth study will be conducted on college student grid management information system, operation mechanism and resource sharing mode, management service process reengineering so as to realize the Informationization, standardization, refinement and systematization to better serve students to grow up to reach their prime.

## Research on the Governance of Government Network Public Opinion in the Age of Big Data

Wang Chunjuan, Zhu Xiao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

((E-mail: chunjuanwang882@hotmail.com, 541278340@qq.com))

**Abstract:** With the popularization of mobile terminals, information is becoming more and more unimpeded, along with the advent of the era of big data. It brings both opportunities and challenges to the governance of government network public opinion. Using the literature research methodology and the case analysis, combing the research results of domestic and foreign scholars, this paper analyzes the current situation of the network public opinion governance, concludes that having initially built a big data platform for network public opinion and realized the transformation from managing to governing network public opinion, the government strengthens the awareness of the rule of law of network public opinion gradually. Also, it is believed that the government has not fully grasped the opportunity brought about by the big data, with idea, technology as well as ethical dilemma remaining. Finally, from the three aspects it provides development strategies for the government to create a healthy and green network public opinion ecology.

**Key words:** Big data era; Network public opinion; Government governance; Public opinion management

### 1 Introduction

Compared with previous Internet, Internet of things and cloud computing, today's big data, as another emerging technology of the era, imposes a significant impact on the development of human society, daily life and work. According to the 43rd report on the status of Internet development in China, released by the China Internet Network Information Center (CNNIC), as of December 2018, the size of Internet users reached 829 million, with new Internet users as 56.53 million over the whole year, and the penetration rate as 59.6%, thus forming the world's largest public opinion filed.(as shown in the following picture). China's complicated network public opinion environment has been followed by a series of public opinion disturbances, which has imposed various adverse effects on the daily life of the public and the political stability of the country. Therefore, how to construct the optimal path of network public opinion governance in the era of big data is very important.

Figure 1 The Number of Internet Users and Internet Popularization Rate

Western public opinion is relatively open and stable, and the negative effect of public opinion is relatively low, thereby making the government adopt more liberal means. As far as network public opinion is concerned, Porten-Che P and Eilders C. (Porten-Che P and Eilders C.,2015) believed that network public opinion has the nature of "silent spiral". McQuailD (McQuail D,1997) believed that the communication revolution triggered by the Internet is essentially manifested in the transformation of audiences from passive information receivers as well as consumers to active information searchers, distributors as well as exchangers. In terms of the governance of network public opinion, James Allan(Allan,2003) found that Topic Detection and Tracking (TDT) technology has been applied in network public opinion data analysis as early as the 1990s. Kumaran(Kumaran,2004) suggested to promote the use of natural language processing techniques to aid statistical strategies for new event monitoring. Goncalves P And Benevenuto F (Goncalves P And Benevenuto F,2013) believed that we can use the Positive and Negative Affect Schedule-t (Positive And Negative Affect Schedule-t) to measure emotions in online media, to calculate standardized scores of various emotions, thus analyzing users' responses to specific events.

Chinese scholars and foreign scholars show a great difference in the research direction and emphasis. At present, network public opinion researches from the perspective of the government have been favored and pursued by abundant scholars who have put forward plenty of views worth discussing, which are reflected mainly in the following three aspects: network public opinion monitoring, guidance and response at big data age.

Big Data and network public opinion monitoring refers to the automatic detection of big data, functional separation, statistical analysis and so on. Ren Dejing (Ren Dejing,2016) proposed that the government should conduct correlation analysis of massive as well as disorderly network public opinion data before specific network public opinion crisis occurs by combining with big data in-depth analysis technology, to explore its value, and to contribute to early warning of public opinion crisis. Believing that the government's detection of network public opinion remains at the level of public security, Zhang Shuoyang (Zhang Shuoyang,2016) contended that it should collect, process and analyze information and manage public opinion through such devices as e-government private network and terminal storage based on cloud platform storage and calculation.

Big data and network public opinion guidance, that is, the government uses various network carriers to communicate with netizens, so as to develop in a healthy direction through guiding network

public opinion. Xu Jinghong and Jiang Qiulan (Xu Jinghong and Jiang Qiulan,2012),from the perspective of communication, analyzed the problems existing in the microblog of party and government institutions under the guidance of network public opinion, along with the proposal of suggestions for improvement: optimizing interaction, treating each other honestly, changing from indoctrination to participation; Zhang Dong and Liu Jianhui (Zhang Dong and Liu Jianhui,2008) analyzed the basic principles of agenda setting by taking the Hangzhou nanny arson case as an example to propose strategies such as strengthening the sense of responsibility, improving interactive mechanism and improving media literacy.

Big data and network public opinion response indicates that the government takes a series of measures to solve network public opinion crisis and establish a good image of government departments. Gao Hang(Gao Hang,2016), from the perspective of the system dynamics method, proposed that we can reduce the investigation on external factors such as supervision institutions and personnel quality, and increase the research on internal factors such as the degree of attention, hardware and software supporting conditions, which are closely correlated with government public opinion. Li Xueyan (Li Xueyan,2018) proposed to build a timely response system in the outbreak period of network public opinion, along with the promotion of the response as well as disposal in the diffusion period of network public opinion.

The research views of domestic and foreign scholars mentioned above are of considerable reference value, but there is still room for further improvement. First of all, the existing researches demonstrate that "big data" and "network public opinion governance" are not very closely linked. Even more, abundant researches are trapped in a circle of "old wine in new bottle", failing to apply big data fully, thereby making it difficult to seize the opportunity provided by big data to construct an effective and realistic path. Secondly, a large part of research is carried out based on certain socially hot events, followed by the analysis of the network public opinion. In other words, it still focuses on a certain "network public opinion crisis", without paying attention to "network public opinion governance", thus failing to dig out the characteristics of the current government's governance of network public opinion, and neglecting the governance effect achieved by the government.

## **2 The Current Situation of Government Governance under China's Network Public Opinion**

### **2.1 Initially build a big data platform for network public opinion**

China's e-government construction has laid a solid foundation for the establishment of China's big data platform for network public opinion. For example, the notion of "two nets, one station, four databases and twelve operation systems" was established in 2003. Subsequently, the e-government system developed rapidly. By December 2018, China have 394 million users of online government services, accounting for 47.5 percent of the total Internet population, along with 2,817,962 government websites. Moreover, it's not difficult to find that "Internet + e-government service" in our country has been further deepened, due to information technologies such as the Internet, big data and AI, have been applied by governments at all levels to further improve the efficiency of government services. Even more, it serves as the main source of information collection and the premise of data analysis.

### **2.2 Initially realize the transformation from managing to governing network public opinion**

The main task of management is to design and maintain an environment which is capable of achieving the maximum objectives with existing resources. The original intention of governance is to

serve, which is fundamentally different from that of the traditional government management. With the development of big data and the change of network public opinion, government departments at all levels have begun to actively seek more effective ways to govern network public opinion, and to strengthen the interaction between officials and people by establishing government affairs micro-blogs and releasing various government affairs information in real time. At the same time, the government has also strengthened the cooperation with the network media, requiring the microblog real-name authentication, and attaching importance to the improvement of the quality of Internet users. This is conducive to smooth public opinion expression channels, and can contribute to improving the credibility of the government and reducing online rumors.

### **2.3 Gradually strengthen the awareness of the rule of law of network public opinion**

At present, China attaches great importance to protecting the legitimate rights as well as the interests of citizens, legal persons and other organizations. *Regulations on the Administration of Microblog Information Services* was issued in February 2018, which aims to clarify the main responsibilities of microblog service providers, and achieve the authentication of real identity information as well as administrative management. Followingly, *Has the Attribute of Public Opinion and Social Mobilization Ability of Internet Information Services Security Assessment Rules* released in November aims to urge and guide information service providers with public opinion attribute or social mobilization ability to fulfill the security management obligations stipulated by law and guard against the harm caused by the spread of illegal information such as rumors and false information. In short, these laws and regulations have established a basic institutional framework, thus providing legal basis and legal protection for citizens in terms of safeguarding their legitimate rights and interests.

## **3 Government Governance Dilemma under China's Network Public Opinion**

### **3.1 Ideological Dilemma**

Ideas guide people to understand and transform the world through guiding their ability and activities. Mistakes and deviations will occur in the government's network public opinion management if the concept cognition of "big data" fails to keep up. China embraces a large number of Internet users, with the source of big data at the forefront. However, at present, China lacks the awareness of integrating, analyzing and utilizing big data, thus resulting in the final total data falling behind developed countries. For example, the heavy rain event in Xingtai of Hebei province on July 19, 2016, was very urgent, which, however, didn't attract the attention of the government until the spread of netizens and we—media on the 22nd. The state media, on the other hand, at the end of the chain, has been slow to respond natural and man-made disasters which constantly test the government's prediction ability. Thus, analyzing and mining big data over the years is of great positive significance to prevent malignant public opinion events.

### **3.2 Technical Difficulties**

"Science and technology are the first productive force", which also serves as an important guarantee and technical premise for the government to improve the ability of network public opinion governance in the era of big data. Big data is of rich connotation. To be more specific, only at the technical level, the fields intersecting with big data involve mining and analysis of association rules, pattern recognition, integrated learning, prediction model, regression statistics, time series analysis, cluster analysis and so on. After the big data era, the Chinese government's information processing level has achieved preliminary results, but there is still a lot of room for growth in terms of technology

application. More specifically, local governments at all levels, especially the local governments at the grass-roots level, lack strong consciousness of network public opinion forecasting technology, with a shortage of professional talents as well as technical processing system, which leads to screening of vast amounts of data network public opinion and timely judgement and warning, thus restricting the combing, guiding and handling of subsequent network public opinion.

### 3.3 Ethical Dilemma

At present, government departments, increasingly more superstitious, rely on science and technology to detect and manage network public opinions. Specifically, they pay one-sided attention to the intervention of public opinions, but ignore netizens, the main body of network public opinions. Even more, they lack the awareness of solving social problems reflected in network public opinion which, in essence, serves as a part of public opinion. Therefore, the most fundamental purpose of the government which carries out network public opinion governance should be to establish effective communication with the public and society by taking the network as a medium, so as to contribute to understanding public opinion, and releasing information more effectively. Otherwise, a new round of problems may be triggered if the fundamental problems and the underlying causes can't be identified, which is not conducive to strengthening the two-way and symmetrical communication between the government and the public, and to alleviating as well as eliminating the crisis of network public opinion.

## 4 Optimization and Improvement of China's Government Network Public Opinion Governance

### 4.1 Establish and spread the concept of "big data" for network public opinion governance

Traditional network public opinion governance concept means to conduct qualitative analysis, find the source, and finally take countermeasures after the occurrence of public opinion events. Obviously, this idea is not applicable to the big data era. Only by setting up the concept of "big data", starting from monitoring and prediction, carrying out quantitative analysis and finding out all relevant factors, can we prevent problems from happening and truly realize the open sharing of data. See figure 2 for details.

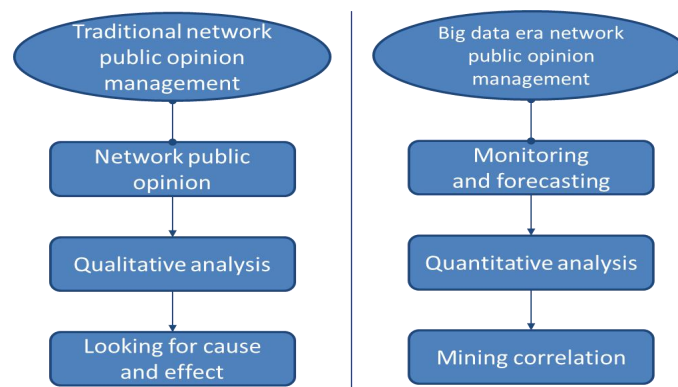

Figure 2 Comparison between the Concept of "big data" and Traditional Network Public Opinion Governance Concept

First of all, whether the concept of "big data" can really be implemented depends on the government and its managers in the final analysis. Therefore, it is necessary to implement the policy intentionally, to organize the learning and sharing of "big data" concept, and to render the atmosphere of "big data" concept.

Secondly, it is not feasible that data collection of network public opinion governance relies solely on the government to sing a "one-man show", which requires the participation of multiple social subjects.

#### **4.2 Develop and strengthen "big data" technology for network public opinion governance**

On the one hand, we should step up the application awareness of big data. Due to in the face of massive network public opinion information, Internet computer technology and big data analysis technology play an indispensable role in information identification and screening, it is essential for us to focus more on promoting research and development of disciplines and key technologies related to big data, such as artificial intelligence, mass data storage and management, real-time big data processing etc.

On the other hand, efforts should be made to cultivate professionals in relevant fields. At present, some Internet companies have been cooperating with universities to carry out related activities. However, the talent training mechanism for the subdivision of government network public opinion governance under big data has not yet emerged, thus making it a feasible way to build a long-term training mechanism of big data talents by introducing overseas talents in the field of big data and expanding the major of big data through universities.

#### **4.3 Establish mechanisms to promote "public interaction" for network public opinion governance**

"Emotional resonance" with netizens refers to giving the public an outlet to channel their emotions. Through this way, governments at all levels can set up interactive communication platforms for officials and citizens by setting up government micro-blogs, portal websites and official accounts, so as to promote electronic government office, to open and transparent government affairs, and to step up the communication between the government and the public.

Facts have proved effectiveness of establishing information release mechanism, releasing information timely, initiatively, openly and transparently, letting Internet users know what they want to know, winning the favor of public opinion, timely eliminating the negative impact exerted by incorrect information in society, and achieving "emotional resonance" with Internet users.

## **5 Conclusion**

Research review: Based on existing literature on Internet public opinion governance in the era of big data, this paper further analyzes the current situation of Internet public opinion governance, as well as the achievements and shortcomings of the government in the governance of Internet public opinion. Followingly, combined with the historical background of big data, the paper puts forward suggestions on establishing and disseminating the concept of "big data", developing and strengthening the technology of "big data", and establishing and promoting the mechanism of "public interaction".

Research deficiencies and prospects: due to the author's lack of relevant practical experience, the suggestions on the governance path of network public opinion are inevitably inadequate and idealistic. At the same time, the author's analysis and demonstration on the governance of government network public opinion combined with big data is not profound enough. Thus, the author will understand and

analyze this topic in the future practical researches deeply, and try to make his argument more scientific and powerful, so as to contribute to the government to creating a healthy network public opinion ecology.

## Research on the Influence of Consumer Perceived Product Innovation on Brand Evangelism

Wang Pengtao, An Yamei

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 805743824@qq.com, 784200936@qq.com)

**Abstract:** Product innovation is a hot topic in management studies, but previous studies have ignored consumers' subjective views on product innovation. In fact, the consumer perceived product innovation is not only closely related to product characteristics, but also influenced by the consumer characteristics and buying situations. And the consumer perceived product innovation will significantly affect consumers' brand attitude. Perceived product innovation is stronger, and the brand identity is higher. It is more likely to cultivate brand evangelists. Therefore, starting from the consumer perceived product innovation and based on the S-O-R model, this paper takes the brand identity as the intermediary variable, constructs the conceptual model of the perceived product innovation on brand evangelism, and explores the cultivation path of the brand evangelists. The model was supported by analyzing the data collected from 144 consumers. The results are as follows: Perceived product innovation has a positive effect on brand identity, brand identity has a significant positive effect on brand evangelism, and brand identity plays a mediating role between perceived product innovation and brand evangelism.

**Key words:** Perceived product innovation; Brand identity; Brand evangelism; S-O-R model

### 1 Introduction

Innovation has always been an important topic in management research at home and abroad. However, past innovation research mainly focused on the impact of product innovation on performance from the company perspective, while ignoring consumer perception and judgment of the product innovation. In fact, there is a significant difference between an enterprise's understanding of product innovation and consumers' actual subjective perception of product innovation. Consumers' perception of product innovation is not only closely related to product characteristics, but also influenced by many factors, such as individual characteristics and buying situations. In addition, consumer perception of product innovation will significantly influence consumers' brand attitude. When the consumer perceived product innovation is stronger, it is more likely to become brand evangelist.

In recent years, the brand has received more and more attention from companies. A good brand can not only increase the intangible assets of the company, enhance the competitiveness of the company, but also establish a good relationship between the consumer and the brand, resulting in evangelist behavior. Perceived product innovation is beneficial for consumers to have positive association with the brand and stimulate their sense of identity, which is conducive to the generation of brand evangelism. Therefore, this paper constructs "Perceived Product Innovation - Brand Identity - Brand Evangelism", selects the mobile phone brand as the reference brand, discusses the mechanism of consumer perceived product innovation affecting the brand, and provides the theory for the enterprise to innovative products and

cultivate brand evangelist

### 1.1 Literature review and research hypotheses

The S-O-R theory is stimulus-organism-response theory which was proposed by Mehranian and Russell. Based on the S-O-R theory, this paper constructs a model of “perceived product innovation-brand identity-brand evangelism”. Perceived product innovation is the source of stimuli. Consumers are inspired by the brand to bring their own innovation and stimulate their own pleasing experience with the brand.

#### 1.1.1 Perceived product innovation and brand identity

The concept of perceived product innovation was first proposed by Rogers. It is the subjective judgment of consumers on a product that is different from other similar products, and is mainly judged from the two dimensions of novelty and practicality. It mainly includes two aspects: First, it refers to the subjective evaluation of consumers' differences, novelty and uniqueness of the product; second, consumers perceive the novelty degree of a product by comparing it with other similar products (Goode, 2013). Therefore, this paper defines perceived product innovation as the subjective judgment of consumers on the novelty and practicality of mobile phones compared to other similar products in reality or ideal.

Perceived product innovation and brand identity. Product innovation perception can stimulate consumers' innovative associations with brands, thereby producing a sense of identity (Chen Shu, 2015). An empirical study shows that perceived product innovation has a positive impact on brand identity (Xue Zhe, 2018). Based on the above analysis, the following hypotheses are put forward:

**H1: consumer perceived product innovation has a positive impact on brand identity.**

**H1a: consumer perceived product innovation has a positive impact on personal brand identity.**

**H1b: consumer perceived product innovation has a positive impact on social brand identity.**

#### 1.1.2 Brand identity and brand evangelism

Lam defines brand identity as the psychological state of consumers' cognition, emotion and evaluation of a brand, emphasizing the unity between psychological level and a brand (Lam, 2010). It should be divided into two dimensions based on the differences in self-motivation defined by consumers, mainly personal brand identity and social brand identity (Rio, 2001). Therefore, this article uses the research of scholars Rio on brand identity, and measures from the two dimensions of personal brand identity and social brand identity. Brand evangelism refers to the fact that consumers freely convey the positive experience and feelings of specific brands, and frequently show strong desire to influence others' buying behavior (Doss, 2014). Brand evangelism is used to describe a group of consumers. Their enthusiasm for brand recognition and loyalty reached preaching enthusiasm. There was a higher-level consumer behavior than the brand's positive word-of-mouth communication. Not only did it continue to purchase the brand, but it also positively recommended people nearby to purchase the brand. It may even ruin other brands with competing relationships (Yuan Denghua, 2016). According to the study of the above scholars, this article adopts Yuan Denghua's viewpoint on the definition of brand evangelism.

Brand identity and brand evangelism. An empirical study shows that brand identity can significantly influence "positive brand recommendation" and "anti-competitive brand", that is, influence

the brand evangelism (Becerra, 2013). The scholar takes the industry of high definition video game as an example to find that brand loyalty, brand community identity and self-connection are the predominant factors of brand evangelism, and the brand evangelists will take "badmouth" and other injurious behavior to the competitive brand (Marticotte et al, 2016). Consumers with a higher level of brand identity is more likely to form a brand evangelism (Yuan Denghua, 2016). Based on the above analysis, the following hypotheses are put forward:

**H2: brand identity has a positive effect on brand evangelism.**

**H2a: personal brand identity has a positive effect on brand evangelism.**

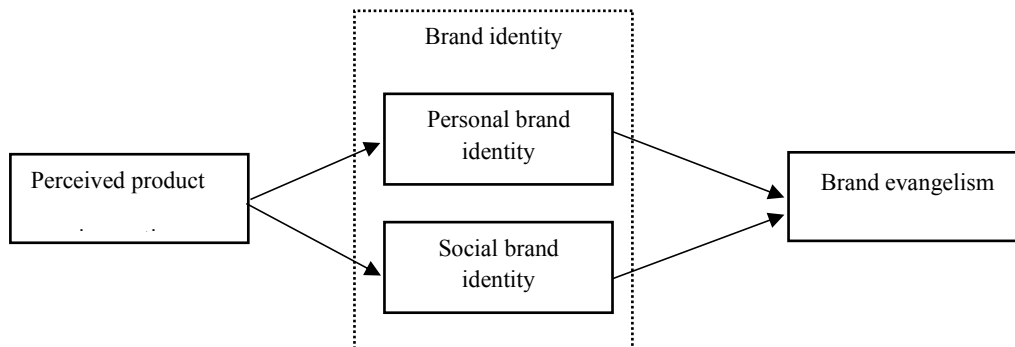

**H2b: social brand identity has a positive effect on brand evangelism.**

### 1.1.3 The intermediary role of brand identity.

Brand satisfaction indirectly affects brand evangelism through brand identity of consumers, and brand identity plays an intermediary role in this process (Doss, 2014). The scholar points out that the psychological mechanism of brand evangelism is that "brand experience" develops into "brand evangelism" through "the ultimate brand trust and identity" (Yuan Denghua, 2016). Yang Xiaoyan (2008) found that trust in brands is the main driver of consumer intentions and behavioral implementation. If consumers have concerns or distrust of the brand's attributes and values, then he will avoid the consumption behavior of the brand. Xia Xiaoping (2011) used green food as the research object to verify the positive influence of consumer brand identity on brand esteem and purchase behavior. Based on the above analysis, the following hypotheses is put forward:

**H3: brand identity plays an intermediary role between perceived product innovation and brand evangelism.**

As a result, the brand identity is finally generated and the brand's evangelism behavior is finally

driven by this state. The specific model diagram is as follows:

## 2 Questionnaire Design

### 2.1 Variable measurement

All the scales in the study were revised on the basis of the maturity scale and the purpose of the study, thus ensuring the reliability and validity of the measurement. The paper reference the maturity scale of Goode and so on to measure the product innovation perception, including 5 items. The measurement scale for brand identity draws on the scale used by Rio (Rio, 2001), individual brand identity contains 3 questions, social brand identity contains 3 questions. Matzler is used for the survey of brand promotion, and there are 6 items in this scale (Matzler, 2007).

## 2.2 Data collection and sample characteristics

The questionnaire survey was conducted in Wuhan, Hubei from April 2018 to May 2018. The survey channels were mainly combined through online surveys and offline surveys. Online surveys were conducted by WJX, QQ, WeChat, etc. to ensure the randomness of the samples and ensure the authenticity of the data sources. The next survey was mainly conducted by interview method, through the in-depth interview to obtain consumer personal experience and behavior information in order to discover the key factors affecting consumer brand promotion behavior. A total of 150 questionnaires were issued, of which 144 were valid questionnaires, with an effective rate of 96%.

## 3 Empirical Analysis

### 3.1 Reliability and validity test

After the questionnaires were issued, the questionnaires were collected, and the invalid questionnaires were rejected, 144 valid questionnaires were collected. In order to ensure the validity of data, SPSS 22 software was used to conduct quality inspection and preliminary data processing, including reliability and validity test. The results of the test are shown in Table 1.

**Table 1 Reliability Statistics Table for Observable Variables**

Observed Variable		Cronbach's Alpha Coefficient	KMO	Result
Perceived Product Innovation		0.786	0.866	Good
Brand Identity	Personal Brand Identity	0.858	0.743	Good
	Social Brand Identity	0.814	0.784	Good
Brand Evangelism		0.759	0.761	Good

The scale test results show that the Cronbach's Alpha coefficients are between 0.7-0.9, indicating that the reliability of the questionnaire is good and can be further analyzed. The KMO values used in this paper are located between 0.7-0.9, respectively, indicating that the item has good convergence validity and the scale has good construct validity.

### 3.2 Analysis of structural equation model

In this paper, we use AMOS 21 software to establish structural equation model, test the model and verify the hypothesis. The results of the structural equation test are shown in Table 2.

**Table 2 Analysis Results of Structural Equation Model**

Path	Path coefficient	Estimate	C.R.	P	Result
Perceived Product Innovation→Personal Brand Identity	0.624	0.110	0.914	***	Adopted
Perceived Product Innovation→Social Brand Identity	0.595	0.226	0.875	***	Adopted
Social Brand Identity→Brand Evangelism	0.002	0.055	0.803	0.002	Adopted
Personal Brand Identity→Brand Evangelism	0.618	0.107	0.786	***	Adopted

From table 5-2, we can see that the structural equation model is well fitted and can effectively test and explain the relevant hypotheses. That is to say, hypothesis 1-a, 1-b, 2-a, 2-b are adopted.

### 3.3 Test of the mediating effect

With the help of SPSS20.0 PROCESS plug-in, we use Bootstrap method to test the mediating effect of brand identity. The results show that the confidence interval is (0.005, 0.341) 、 (0.006,0.256) , and does not contain 0, indicating that the mediating effect of brand identity is significant. That is to say, hypothesis 3 is adopted.

**Table 3 Analysis Results of Mediation Effect Model**

	P.E.	Bias-Corrected Percentile 95%CI		
		Lower	Upper	Results
Perceived Product Innovation→Brand Evangelism	0.505	0.269	0.341	*** (P=0.001)
Perceived Product Innovation→Personal Brand Identity→Brand Evangelism	0.058	0.005	0.111	*** (P=0.009)
Perceived Product Innovation→Brand Evangelism	0.186	0.116	0.256	*** (P=0.001)
Perceived Product Innovation→Social Brand Identity→Brand Evangelism	0.059	0.006	0.112	*** (P=0.001)

## 4 Conclusion

Through literature research and data analysis, the following conclusions are obtained. (1) Perceived product innovation has a positive impact on brand identity. In particular, it has a significant impact on personal brand identity. (2) Brand identity has a positive impact on brand evangelism. The two

dimensions of brand identity (personal brand identity and social brand identity) have a positive impact on brand evangelism. Among them, personal brand identity has a significant positive impact on brand evangelism. (3) Brand identity plays an intermediary role between perceived product innovation and brand evangelism.

This conclusion has certain guiding significance for the marketing practice of enterprises. (1) Enterprises should examine product innovation from the perspective of consumers and attach importance to customer's perception of product innovation. In the process of product innovation, enterprises should focus on how to increase the consumer's perception of innovation. (2) This study is conducive for the enterprises to the formation of marketing promotion strategy based on the specific content of perceived product innovation and brand identity. It can also put forward reasonable and feasible suggestions for the brand strategy and brand management of the enterprises. (3) In this paper, the research on the formation mechanism of brand evangelism provides a feasible suggestion for the enterprise to cultivate its own brand evangelists, which is beneficial to the enterprise to advocate the maintenance and cultivation of the customers.

Due to the limitations of time and energy, there are still some deficiencies in this study. For example, the scale used in this paper is based on the mature scale abroad without considering the Chinese context and modifying some of the items. However, the cultural background of foreign countries is quite different from that of our country. The future research can be focused on the following aspects: first, by observing the actual performance of the brand evangelists under different cultural backgrounds, the measurement dimension and index of the brand evangelism are tested to improve the adaptability of the scale. Second, we can explore the actual needs of brand evangelists' consumption, and take this as the starting point of enterprise innovation, and change the way of product innovation. Third, we further study how to drive the online behavior of brand evangelists, and examine how brand evangelists affect the perception and preference of other consumers to specific brands through social media for the O2O marketing.

# Research on Service Innovation of the Cloud Logistics Platform Based on Factor Analysis

Wu Xia, Zhang Jianming

Wuhan Huaxia University of Technology, Wuhan, P.R. China, 430223

(E-mail: sunnywu529@163.com,huozhetree@163.com)

**Abstract:** With the foundation of “cloud computing and big data”, the cloud logistics platform is a modernized network information technology platform that provides the comprehensive logistics services for customers. Service innovation of the cloud logistics platform will effectively improve logistics efficiency of the whole society. By reviewing the research status of the cloud logistics platform, user service satisfaction of the cloud logistics platform was investigated through questionnaires. SPSS software was used to do factor analysis for data to explore primary influence factors for user satisfaction of the cloud logistics platform. Based on it, the author proposed the countermeasures and advice on service innovation of the cloud logistics platform.

**Key words:** Big data; The cloud logistics platform; Factor analysis; Collaboration

## 1 Introduction

With the foundation of “cloud computing and big data”, the cloud logistics platform integrates with the internet, Internet of Things and advanced logistics management philosophy to provide the comprehensive logistics services for customers. As the interactive medium of logistics service participants, the cloud logistics platform attracts and integrates with the professional logistics service resources that re complementary with core services, offers the systematic logistics services to customers, and shows the service resource configuration and service operation management functions. With the development of information technology, the cloud logistics platform (i.e. highway logistics platform, port logistics platform and logistics information service platform) is constantly coming out like mushrooms after rain, resulting in intensifying competition in the logistics market. If the cloud logistics platform wants to maintain a dominant position in the competition of logistics market, it is necessary to continuously make a service innovation to strive for development. Studies of domestic and overseas scholars on the cloud logistics platform are mainly concentrated on the concepts and features of the logistics platform, framework of the logistics platform, and functional structure of the platform (H Ramirez, B Maschke, D Sbarbaro,2013).Cloud uses lots of mutually associated virtual machine techniques to do resource allocation with the market orientation and completes customer-driven service management based on the service level agreement(SLA), while the cloud platform is the foundation to uniformly and dynamically provide and exhibit the computer resources(Buyyar, Yeocs, Venugopal,2009).The cloud logistics platform is an important tool to do intelligent matching between resources and information and to facilitate production activity control. It is a multi-functional platform that serves for each object in the logistics process (Athanasios A. Pallis,2013). The platform services are featured with network externality, resource integrality, functionality, cooperativity and derivative (Hua Zhongsheng,2014). The goal of the logistics information platform service mode based on cloud ecology

is to build the platform ecosystem of common value, which requires the interaction, sharing and collaboration of all parties on the platform to achieve common value creation(Xing Daning,2016).The cloud logistics mode has better management effect and broad development prospects, which is manifested in integrating resources and sharing resources to improve logistics operation efficiency and service quality(Wang Zhihong,2019).Multiple scholars conducted the theoretical elaboration on the business service mode of the cloud logistics platform, but there are fewer studies on the service innovation countermeasures proposed for the influence factors of user satisfaction based on the cloud logistics platform. In this paper, customer satisfaction of cloud logistics platform is investigated through questionnaire, and factor analysis of data is carried out by SPSS software to dig out the main influencing factors of customer satisfaction of cloud logistics platform. Based on this, countermeasures and Suggestions for cloud logistics platform service innovation are proposed.

## **2 Influence Factors for User Satisfaction of the Cloud Logistics Platform**

### **2.1 Data acquisition**

Using a random sample survey,325 questionnaires were granted and 310 effective questionnaires were recycled with the effective rate as 95%. SPSS20 was used to do statistical analysis for the questionnaire data.

### **2.2 Reliability and validity**

SPSS20 was utilized to analyze the Cronbach's coefficient as  $\alpha=0.826$ . The reliability was more than 0.7, showing that the questionnaires had consistency and good questionnaire reliability.

The variable validity analysis was conducted by making a comparison between correlation coefficient KMO and Bartlett inspection. SPSS20 was used for KMO and Bartlett inspection. KMO was 0.802, which was very close to 1, showing the good convergence validity. The usefulness degree of questionnaires was higher. Sig was close to 0, showing that the questionnaires were suitable for factor analysis.

### **2.3 Composition of influencing factors**

By looking up relevant literatures and information, the indexes of affecting user satisfaction of the cloud logistics platform are analyzed: with regards to the services, technologies and functions of the cloud logistics platform, it can be observed that 18 basic indexes will affect user satisfaction, including new information push of the platform, personalized customization, convenient resource matching, real-time monitoring, reliable operation application, effective demand analysis, successful browse, intuitive and convenient operation, fast data processing, the latest laws and regulations, reliable information of freight sources, specific vehicle information, enterprise recommendation, timely satisfaction of needs, timely response of feedback, reasonable charge, convenient process and information safety protection(Wang Jie, Zhang Hongchao, Wang Yu,2019). Based on these indexes, the user questionnaires of the cloud logistics platform were designed. Also, Likert Scale was adopted to design the five-level measurement and problems. "Very dissatisfied", "dissatisfied", "general", "satisfied" and "very satisfied" should be represented from 1 to 5 scores.

SPSS was utilized to do factor analysis for the questionnaire results. Variables with high degree of overlapping and strong correlation in information were screened out. The factors that dominated the leading influence degree were selected as influence factors for analysis to obtain Table 1 and Table 2:

**Table 1 Extraction of Influence Factors**

No.	Initial eigenvalue			Extraction of quadratic sum			Rotation of quadratic sum		
	Total	Variance %	Accumulation %	Total	Variance %	Accumulation %	Total	Variance %	Accumulation %
1	7.912	43.956	43.956	7.912	43.956	43.956	7.265	40.361	40.361
2	3.227	17.926	61.882	3.227	17.926	61.882	3.166	17.590	57.951
3	1.867	10.372	72.254	1.867	10.372	72.254	2.092	11.624	69.575
4	1.377	7.650	79.903	1.377	7.650	79.903	1.859	10.328	79.903
5	.941	5.230	85.133						
6	.791	4.395	89.529						
7	.604	3.357	92.885						
8	.401	2.228	95.113						
9	.340	1.891	97.004						
10	.239	1.328	98.332						
11	.145	.803	99.135						
12	.089	.495	99.630						
13	.038	.212	99.842						
14	.016	.087	99.929						
15	.010	.057	99.987						
16	.002	.013	100.000						
17	4.684E-016	2.602E-015	100.000						
18	-3.47E-016	-1.932E-015	100.000						

Four factors were extracted from the factor analysis. The initial eigenvalue, variance and accumulated contribution rate of each factor are shown in the above-mentioned Table. The accumulated contribution rate was 79.903%, showing the good overall effect.

**Table 2 Rotary Component Matrix**

	Components			
	1	2	3	4
The latest laws and Regulations	0.932			
Specific vehicle information	0.879			
Reasonable charge	0.783			
Enterprise recommendation	0.689			
Information safety protection	0.683			
Reliable information of freight sources	0.678			
Successful browse		0.921		
Intuitive and Convenient operation		0.557		
Convenient process		0.950		
Fast data processing		0.926		
Convenient resource matching		0.637		
Effective demand analysis			0.831	
Personalized customization			0.739	
Real-time monitoring			0.938	
Reliable operation application			0.931	
Timely satisfaction of needs				0.930
Timely response of feedback				0.795
New information				0.626

push of the platform

### 3 Results Analysis

As shown in the above-mentioned table2, the first components include the latest laws and regulations, specific vehicle information, reasonable charge, enterprise recommendation, information safety protection and reliable information of freight sources, showing that the cloud logistics platform users pay attention to the service quality of comprehensive information resources, reflecting in information timeliness, reliability and safety. The second components get involved in successful browse, intuitive and convenient operation, convenient process, fast data processing and convenient resource matching, showing that the cloud logistics platform users pay attention to the convenience in the platform function design. The third components contain effective demand analysis, personalized customization, real-time monitoring and reliable operation application, indicating that the cloud logistics platform users lay emphasis on business service diversity and intelligence. The fourth components get involved in timely satisfaction of needs, timely response of feedback and new information push of the platform, implying that the cloud logistics platform users value the interactive experience service efficiency in the platform. Therefore, it can be observed that user satisfaction is mainly affected by the service quality of comprehensive information, convenient platform functions, intelligent diversity of business services, and interactive efficiency of the cloud logistics platform.

In order to analyze the influence degree of specific influence factors, the score of each factor was used to calculate the comprehensive score and rank in order. The component weight was firstly calculated and the comprehensive coefficient of each factor was calculated and shown in Table 3:

**Table 3 The Comprehensive Coefficient Table of Each Factor**

	1	2	3	4	Score	Rank
Convenient resource matching	0.079	0.137	-0.04	0.066	0.075	1
Fast data processing	0.128	0.03	0.035	-0.096	0.072	2
Effective demand analysis	0.064	0.106	-0.031	0.17	0.071	3
Reliable information of freight sources	0.052	0.087	0.033	0.183	0.07	4
Specific vehicle information	0.092	-0.006	-0.028	0.178	0.063	5
Reasonable charge	0.149	-0.027	-0.044	-0.084	0.062	6
personalized customization	0.118	0.129	-0.125	-0.207	0.058	7
Information safety protection	-0.009	0.311	-0.003	-0.077	0.057	8
Timely response of feedback	-0.013	0.301	0.025	-0.089	0.055	9

Convenient process	0.132	-0.038	-0.012	-0.12	0.051	10
New information push of the platform	0.01	0.042	-0.038	0.334	0.042	11
Reliable operation application	-0.03	-0.003	0.505	-0.15	0.034	12
Timely satisfaction of needs	0.085	0.07	0.083	-0.519	0.024	13
Successful browse	-0.054	-0.221	-0.097	0.071	0.014	14
Real-time monitoring	-0.07	-0.083	0.519	-0.029	0.007	15
Intuitive and Convenient operation	-0.081	0.125	-0.063	-0.133	-0.037	16
The latest laws and Regulations	-0.158	0.096	0.032	0.104	-0.051	17
Enterprise recommendation	-0.148	0.067	0.023	0.067	-0.057	18
Component weight	0.550	0.224	0.130	0.096		

It can be found from the above-mentioned table that top 10 ones respectively include convenient resource matching, fast data processing, effective demand analysis, reliable information of freight sources, specific vehicle information, reasonable charge, personalized customization, information safety protection, timely response of feedback, and convenient process. Therefore, it can be observed that in the big data era, the intelligent service of the cloud logistics platform is considered as the most important influence factor that affects the customer satisfaction, fully showing the features of the big data era, intelligent resource matching and demand analysis. If the service intelligence provided by the platform can greatly meet needs of users, the satisfaction will be higher. Also, the functional technical design of the platform should be concise and high-efficient. This aspect also conforms to the situation in today's society—efficiency first. The enterprise that can acquire information at the soonest can first seize the market and gain the maximum benefits to realize the self-development. Also, reasonable charge shows the attention on the cost control. The development of the platform and enterprises can't be separated from control of various costs. In order to gain the better development, it is necessary to do reasonable management on costs, set up a fair price and improve user viscosity.

## 4 Service Innovation of the Cloud Logistics Platform based on Influencing Factors

### 4.1 Perfect the service function design of the platform and improve customer satisfaction

Firstly, it is necessary to learn from the service functions of the mature cloud logistics platform to perfect and enrich the service functions of the platform. To perfect the service functions and satisfy more service needs of enterprise users (i.e. provide park planning service, information planning service and supply chain optimization service) not only can improve profits of user enterprises and the platform, but also can enhance logistics service quality and increase customer satisfaction for logistics services. Besides, big data should be fully utilized. Relevant information can be collected by analyzing

transaction data of the platform, issuing investigation on the platform, and giving a telephone interview to know about enterprise demands. Corresponding services will be provided in line with user enterprise demands. According to the service conditions of user enterprises, different attentions of users will be found out. Then, according to attentions of enterprises, it is essential to perfect and facilitate the platform construction, perfect service functions, and improve customer satisfaction(Zhang Jiping, Luo Wenping,2019).

#### **4.2 Recommend accurate business of big data and meet the personalized needs of users**

It is necessary to integrate with resources, realize resource information sharing, as well as improve logistics operation efficiency and service quality. The cloud logistics platform has multiple advanced logistics technologies, Internet of Things, big data and other emerging technologies, and develops an integration and sharing role on data resources. In terms of logistics enterprises, data information gained on the cloud logistics platform can be used to gain the logistics market information. The accurate business layout can be carried out by combining with advantages of logistics business, so as to realize the accurate business recommendation and improve logistics service quality and efficiency. Based on the personalized service recommendation for enterprises, enterprises will be able to rapidly gain information, reduce time waste on each process, reduce information costs, and bring more earnings to user enterprises. Personalized services enhance communication in both parties, so that the platform will know well with user enterprises, promote the platform construction, and greatly improve enterprise loyalty to the cloud logistics platform.

#### **4.3 Fully realize resource sharing and reduce user costs**

On the one hand, resource sharing of the cloud logistics platform will reduce an asymmetric problem of market information and decrease operation costs of logistics enterprises. On the other hand, the technical advantages of the cloud logistics platform will provide a logistics technical solution for logistics enterprises (TaoHuiping,2018). For example, on the basis of big data, cloud computing and Internet of Things, the distribution route of logistics enterprises are optimized or platform resources are redistributed through the calculation and management ability of the cloud logistics platform, thus multiple logistics enterprises collaborate with each other to complete the same logistics business. According to layout of different logistics enterprises, the logistics transfer process and empty-loading ratio of logistics transportation will be reduced, so as to reduce costs.

#### **4.4 Perfect the software and hardware facilities on the platform and improve logistics safety**

On the one hand, the cloud logistics platform embodies the strength of itself and determines the information processing capability of the platform. On the other hand, convenient process, fast data processing and convenient resource matching are important factors of customer satisfaction, thus improvement on the hardware facilities of the cloud logistics platform not only enables the platform to have the better development, but also intensifies the response speed, so as to strengthen the handling efficiency of enterprises. It is necessary to reinforce cloud computing, big data and Internet of Things, facilitate the online and offline intelligent integration of the cloud logistics platform and collaborative development, constantly enrich the cloud logistics participants, perfect and improve the cloud logistics products and service quality(especially for the logistics distribution process, service traceability process, and allocation of cargos), reinforce the supervision on each process of the cloud logistics platform, strictly control transaction on the platform, let user enterprises track each step in real time, improve enterprise reliability, let enterprises attract more customers, and expand the market. Reinforcing the logistics process supervision can promote the cloud logistics platform to manage all kinds of information and participants, own the strict control, guarantee logistics safety, and promote the normal operation and sustainable development of the platform (Wang Xiran,2017).

## 5 Conclusion

Through the analysis, it could be observed that the user satisfaction of the cloud logistics platform might be mainly affected by service quality of comprehensive information, convenient and fast platform functions, intelligent diversity of business services, and interactive platform efficiency. Based on it, by combining with the important degree ranking of specific influence factors and utilizing big data, the author came up with the service innovation countermeasures for the cloud logistics platform from service function optimization, demand analysis, cost control and safety supervision, so as to provide the reference for developing the cloud logistics platform. In the later stage, the investigation samples can be improved to conduct an in-depth study on the security risk control of cloud logistics platform.

# Performance Evaluation of Listed Commercial Banks Based on Factor Analysis

Xiong Bin

Graduate School, Wuhan University of Technology, Wuhan, P.R.China, 430070

(Email: 173099175@qq.com)

**Abstract:** Commercial banks are an important driving force of national economic development and financial system construction, and play an important role in credit creation, financial services, economic regulation and other aspects. Due to the special asset and liability structure and business scope of commercial banks, the traditional business performance rating system is no longer applicable. This paper takes 16 commercial banks listed in a-share market as research objects, including state-owned and joint-stock commercial banks. Through the construction of business performance evaluation system and the adoption of factor analysis method, this paper puts forward countermeasures and Suggestions to improve the business performance of listed commercial banks.

**Key words:**Listed commercial banks; Business performance; Performance evaluation; Factor analysis

## 1 Introduction

Commercial banks take profit as the target and a variety of financial assets as the business objects. Their business scope involves asset business, liability business and off-balance sheet business, and they have the function of credit intermediary and value creation. Commercial banks can make full use of their capital, technology and information advantages to provide a wide range of financial services and intermediary services to meet the needs of different subjects. At the same time, commercial industry can effectively adjust the structure of social and economic development and industrial structure, and is an important driving force for national economic development, as well as an important part of the financial system. With the development of social economy and financial system reform, the banking industry has been expanding its development in our country, and presents the industry trend, the banking industry gradually reduce the barriers to entry, commercial banks increasingly fierce competitive environment, the market share of a shrinking, industry increased risk factors, main show is the non-performing loans of commercial banks to increase, the deterioration of asset quality, lack of financial innovation, etc. Meanwhile, the development of internet finance has also posed new challenges to commercial banks and brought significant negative impact on their performance (Shen Chuang and Liu Xiaotian, 2017). Therefore, commercial banks should improve their service level while paying attention to operating efficiency. By evaluating the business performance evaluation of commercial banks and putting forward corresponding countermeasures and suggestions, it is helpful to find out the problems existing in the development of commercial banks at the present stage, improve the operation efficiency and benefit of banks, and realize the value maximization.

Scholars at home and abroad have done extensive research on the business performance of commercial banks. Main influencing factors include capital adequacy ratio, business expense ratio and non-interest income (Lu Li et al., 2016). Under the new market environment, commercial banks should accelerate the transformation and upgrading in combination with their own development characteristics and improve their own development ability. Cost to income ratio was one of the main factors affecting operating performance. By improving the management level of leaders, employee performance will be affected, thereby affecting the operating performance of banks (Hawaldar et al., 2016)). There was an inverted “U” relationship between intermediary business and operating performance of commercial

banks (Chen Yuxiao and Zhou Zhaoxiong, 2017). The liquidity ratio of commercial banks, rate of return, capital adequacy ratio and management level would directly affect the operating performance of banks, while the industry growth rate has no significant impact on the operating performance (Rani D. M. and Zergaw L. N., 2017; Parka and Jangb S. C., 2013). The balanced scorecard method was adopted to evaluate the performance of commercial banks' management from finance, customer, internal operation, learn and grow four levels design corresponding evaluation index system, and thought that commercial banks should formulate strategic performance evaluation mechanism, improve internal management level, through the cooperation with the third party payment platform to provide value-added services, and then into a modern commercial bank (Yuan Yongjing, 2018).

Existing scholars' researches on commercial banks' operating efficiency mainly focus on their profitability, management level and risk management level. This paper uses factor analysis method to analyze the operation efficiency of commercial banks objectively, and puts forward effective improvement measures according to the existing problems in the development of commercial banks, so as to promote the sustainable development of commercial banks in the fierce market competition environment.

## 2 Research Design

### 2.1 Mathematical model of factor analysis

Factor analysis is a statistical analysis method proposed by k. Pearson, Charles Spearman and other scholars (Christopher H. and Scott R., 2018). It is a process of selecting several influential factors that can represent the majority of indicator factors, namely principal component factors. By using linear function, the analysis process is simplified, and the final score of each indicator is calculated for performance evaluation. Assuming that the sample size is n, each sample has p evaluation indicators, and the original data of each indicator is x, an evaluation matrix is formed, as shown in 1-1:

$$X = \begin{pmatrix} x_{11} & x_{12} & \dots & x_{1p} \\ x_{21} & x_{22} & \dots & x_{2p} \\ \dots & \dots & \dots & \dots \\ x_{n1} & x_{n2} & \dots & x_{np} \end{pmatrix}$$

Each row of vectors constitutes a random vector that can be observed, and if its mean is u, then the mathematical model of factor analysis is

$$\begin{cases} x_1 = u_1 + a_{11}f_1 + a_{12}f_2 + \dots + a_{1m}f_m + \varepsilon_1 \\ x_2 = u_2 + a_{21}f_1 + a_{22}f_2 + \dots + a_{2m}f_m + \varepsilon_2 \\ \dots \\ x_p = u_p + a_{p1}f_1 + a_{p2}f_2 + \dots + a_{pm}f_m + \varepsilon_p \end{cases}$$

Where,  $f_i$  is the common factor that cannot be observed,  $\varepsilon_i$  is the special factor (which is the unique factor of component  $x_i$ ), and each factor, common factor and special factor are mutually independent.

The matrix of the factor analysis mathematical model is

$$\vec{x} = \vec{a}\vec{f} + \varepsilon, \quad A = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1m} \\ a_{21} & a_{22} & \dots & a_{2m} \\ \dots & \dots & \dots & \dots \\ a_{p1} & a_{p2} & \dots & a_{pm} \end{pmatrix}$$

Where,  $a_{ij}$  is the factor load, and the greater its absolute value is, the stronger the correlation between  $x_i$  and  $f_i$  is, which is also the ultimate goal of the factor molecule to obtain the value of  $a_{ij}$ .

### 2.2 Design of evaluation index system

Commercial banks are an important part of the financial system. Due to their special asset and liability structure and business scope, it is required that the evaluation index system must be scientific and complete to reflect their operating efficiency from multiple perspectives. In order to ensure the reliability of the evaluation results, this paper, on the basis of the principles of comparability, quantifiability, relevance and comprehensiveness, and by referring to the research results of existing scholars, analyzes from the four levels of profitability, loan management ability, asset safety and development ability, and preliminarily selects 11 financial indicators. Among them, profit maximization is the internal driving force of the development of commercial banks, which reflects the operating ability of commercial banks to off-balance sheet business. The safety of assets can provide reasonable guarantee for the normal operation of commercial banks, which is the ability of commercial banks to cope with risks and the prerequisite for them to obtain high profits. Development ability is the future development trend of commercial banks, which reflects whether they can achieve sustainable development in market competition. Its evaluation index system is shown in table 1.

**Table 1 Business Performance Evaluation Index System f Commercial Banks**

Level indicators	The secondary indicators	Calculation method
Profitability	Rate Of Return on Total AssetsX <sub>1</sub>	(Net profit/total assets at the end of the year)*100%
	Rate Of Return on Common Stockholders' EquityX <sub>2</sub>	(Net profit/year-end net assets) *100%
	Total Asset TurnoverX <sub>3</sub>	(Total sales/average total assets) *100%
Loan management ability	Loan of Asset RatioX <sub>4</sub>	(Total liabilities/total assets) *100%
	Debt-equity RatioX <sub>5</sub>	(Total liabilities/total owner's equity) *100%
	Loan-to-deposit RatioX <sub>6</sub>	(Total loan/total deposit) *100%
Asset security	Non-performing Loan RatioX <sub>7</sub>	(Non-performing loan balance/total loan balance) *100%
	Provision CoverageX <sub>8</sub>	(Non-performing loan loss provision/non-performing loan balance) *100%
Development capacity	Increase Rate of Main Business RevenueX <sub>9</sub>	(Operating income growth at the end of this year/operating income at the end of last year) *100%
	Net Profit Growth RateX <sub>10</sub>	(Net profit growth of this year/net profit of last year) *100%
	Capital Accumulation RateX <sub>11</sub>	(Growth of owner's equity this year/at the end of last year) *100%

### 3 Empirical Analysis

#### 3.1 Data collection and processing

In this paper, 16 commercial banks with more than five years of establishment and listed in A shares are selected as research samples. These banks are large and medium-sized commercial banks in China, which are representative to a certain extent. The evaluation of its operating performance can represent the current situation and existing problems of commercial banks in China. On this basis, this paper selects the financial data of each bank on December 31, 2016 for empirical analysis, all of which are derived from Guotai'an CSMAR database. Because of the different dimensions of financial indicators, it is necessary to deal with the original data dimensionless. The formula used is as follows:

$$y_{ij} = 0.1 + \frac{x_{ij} - m_j}{M_j - m_j} \times 0.9$$

Among,  $m_j = \min(x_{ij})$ ,  $M_j = \max(x_{ij})$

#### 3.2 Factor analysis process

KMO and Bartlett tests were carried out on 11 preliminarily selected indexes by SPSS 19.0 software to test the partial correlation of each evaluation index, that is, whether it was in accordance with the normal distribution, and if the value of KMO was less than 0.5, it was not suitable for factor analysis. The actual test results are shown in Table 2, from which we can see that the KMO value is 0.509, indicating that there is a certain correlation between the selected financial indicators, which is suitable for factor analysis. In addition, Sig. The value was 0.000, which was significantly lower than the significant level of 0.05, which further showed that the data were in accordance with the normal distribution.

**Table 2 KMO and Bartlett Tests**

Kaiser-Meyer-Olkin measure of sampling adequacy		0.509
Approximate chi-square		220.207
Sphericity Test of Bartlett	df	55
	Sig.	0.000

Through the analysis of the common factor variance of each index, it is found that the extracted variance is more than 0.6, which indicates that the extracted components can effectively describe the basic information of 11 items of financial data. Then the eigenvalues and contribution rates of the coefficients are analyzed, and the results are shown in Table 3. It can be seen that there are four eigenvalues that meet the conditions, and the contribution rate of cumulative variance is 90.342%, which indicates that the four principal components cover the basic information of the original 11 financial indicators. These four comprehensive indicators can be used to reveal the operating performance of listed commercial banks. Among them, the contribution rate of the first principal component factor was the largest, which was 43.906%.

**Table 3 Total Variance Explained**

Component	Initial eigenvalue			Extract square sum load			Rotation squared load		
	Total	Variance %	Accumulate %	Total	Variance %	Accumulate %	Total	Variance %	Accumulate %

1	4.830	43.906	43.906	4.830	43.906	43.906	3.594	32.673	32.673
2	2.392	21.743	65.649	2.392	21.743	65.649	2.770	25.181	57.853
3	1.490	13.544	79.193	1.490	13.544	79.193	2.277	20.702	78.555
4	1.226	11.150	90.342	1.226	11.150	90.342	1.297	11.787	90.342
5	.586	5.325	95.667						
6	.254	2.308	97.975						
7	.114	1.040	99.015						
8	0.090	0.817	99.832						
9	0.016	0.145	99.977						
10	0.002	0.015	99.991						
11	0.001	0.009	100.00						

Extraction method: principal component analysis

The rotation component matrix is obtained by orthogonal rotation method, as shown in Table 4. The financial index with large load in principal component 1 is the profit rate of total assets, the rate of return on net assets and the turnover rate of total assets, which is defined as profitability factor F1; The ratio of asset to liability is the largest in principal component 2, followed by the ratio of debt to equity and the ratio of deposit to loan, and the correlation coefficient of the first two indexes is more than 95%, which is defined as loan management ability factor F2. The load in principal component 3 is the non-performing loan ratio, and the provision coverage is defined as the asset security factor F3. The largest load in principal component 4 is the capital accumulation ratio, followed by the net profit growth rate and the operating income growth rate, which is defined as the development ability factor F1.

**Table 4 Rotating Component Matrix**

	Component			
	1	2	3	4
X1	0.718	-0.559	0.176	0.232
X2	0.844	0.295	0.029	0.268
X3	0.636	-0.060	0.052	0.335
X4	0.213	0.972	-0.068	0.005
X5	0.272	0.957	-0.020	-0.025
X6	-0.765	0.663	-0.254	0.131
X7	-0.882	0.015	0.758	0.162

X8	0.309	0.334	0.856	-0.083
X9	-0.044	0.392	-0.306	0.684
X10	0.180	0.461	0.146	0.721
X11	0.059	0.153	-0.866	0.935

According to the variance contribution rate of each factor, it is regarded as the weight, and the comprehensive evaluation model of business performance is constructed,  
 $F = 0.32673 \times F_1 + 0.25181 \times F_2 + 0.20702 \times F_3 + 0.11787 \times F_4$ , According to the coefficient matrix of the score of each factor, the score of the factor is calculated, and the mathematical model is as follows:

$$F = \sum_{i=1}^{11} a_i X_i \quad (a_i \text{ is the Score coefficient for financial indicators, } X_i \text{ is the Value for financial indicators})$$

Through calculation and analysis, the comprehensive score and ranking of the operating performance of 16 listed commercial banks in A shares in 2016 are obtained, as shown in Table 5:

**Table 5 Comprehensive Score and Ranking of Commercial Banks**

	F1 (ranking)	F2 (ranking)	F3 (ranking)	F4 (ranking)	Comprehensive score	Comprehensive ranking
Bank of China	-0.143 (4)	0.173 (15)	0.284 (9)	0.584 (14)	0.124	14
China Construction Bank	-0.232 (6)	0.364 (14)	0.528 (4)	0.863 (6)	0.227	7
ICBC	-0.218 (5)	0.166 (16)	0.517 (5)	0.815 (7)	0.174	12
ABC	-0.446 (16)	0.742 (9)	0.545 (2)	0.598 (13)	0.224	8
Industrial Bank	-0.334 (10)	1.064 (1)	0.529 (3)	0.645 (10)	0.344	3
Bank of Communications	-0.330 (8)	0.405 (13)	-0.071 (13)	0.440 (16)	0.031	16
Shanghai Pudong Development Bank	-0.396 (14)	0.886 (4)	0.286 (8)	0.902 (4)	0.259	5
Ping'an Bank	-0.257 (7)	0.597 (12)	-0.213 (16)	1.311 (1)	0.177	11
Minsheng Bank	-0.427 (15)	0.990 (3)	0.328 (7)	0.649 (9)	0.254	6
China Merchants Bank	-0.331	0.710	0.564 (1)	1.221 (2)	0.331	4

	(9)	(10)				
China Citic Bank	-0.368 (12)	0.752 (8)	-0.145 (15)	0.620 (12)	0.112	15
Everbright Bank	-0.422 (13)	0.875 (5)	0.151 (11)	0.454 (15)	0.167	13
Huaxia Bank	-0.334 (11)	0.773 (7)	-0.099 (14)	0.996 (3)	0.182	10
Beijing Bank	-0.083 (3)	0.603 (11)	-0.018 (12)	0.625 (11)	0.195	9
Nanjing Bank	0.375 (1)	0.867 (6)	0.159 (10)	0.671 (8)	0.453	2
Ningbo Bank	0.256 (2)	0.997 (2)	0.475 (6)	0.870 (5)	0.536	1

### 3.3 Results analysis

From the perspective of profitability, urban commercial banks rank the top three, namely Nanjing Bank, Ningbo Bank and Beijing Bank. In addition to Agricultural Bank of China, the other four state-owned commercial banks also have outstanding profitability. Among joint-stock banks, Ping'an Bank, China Merchants Bank and Industrial Bank have good profitability, while Shanghai Pudong Development Bank and Minsheng Bank rank lower. The reason may be that their non-performing loan ratio is relatively high in 2016 (1.89 and 1.68 respectively), while the non-performing loan ratio of commercial banks is the lowest (0.87), which further affects the provision for bad debt, resulting in poor profitability.

In terms of loan management ability, Industrial Bank, Ningbo Bank and Minsheng Bank rank the top three respectively. Commercial banks and investment banks as its strategic development direction, by the end of 2017 and 346 commercial banks established close relations of cooperation, information management system is relatively perfect, and is not bound by loan-to-deposit ratios, resulting in the development of bank customer group, improve the quality of the loans and loans. In addition, industrial bank combines financial products with scientific and technological development, and through financial innovation provides the market with a variety of innovative products and services, such as golden eye and digital cloud, etc., to meet customer needs, while constantly improving the bank's governance structure and improving its risk management ability (Larry L. and Silvia Z., 2018). The non-performing loan balance of state-owned commercial banks is relatively large. The loan-to-deposit ratio of Bank of China, China Construction Bank, Industrial and Commercial Bank of China and Bank of Communications is above 0.7, and that of Agricultural Bank of China is 0.65.

In terms of asset safety, except for bank of communications, the other four state-owned commercial banks ranked relatively high, indicating that after the share reform and capital injection, the capital accumulation of state-owned commercial banks has been growing, the non-performing loan ratio has been greatly reduced, and the provision coverage has been improved, guaranteeing the safety of assets to some extent (Chadha S. and Sharma A. K., 2016). Among joint-stock banks, China Merchants Bank ranks first in asset safety, while Ping'an Bank, Citic Bank and Huaxia Bank rank lower, indicating that banks should also pay attention to asset liquidity and safety while pursuing profit maximization, so as to improve the comprehensive performance level.

In terms of future development capacity, Ping'an Bank, China Merchants Bank and Huaxia Bank rank the first three and are all joint-stock banks. Compared with state-owned commercial banks, although joint-stock banks are relatively small in scale, their operating income and net profit grow rapidly and their information disclosure mechanism is more perfect. Their operation and development bring certain capital accumulation to banks. Urban commercial banks rank 5th, 8th and 11th

respectively in terms of development ability, indicating that although urban commercial banks do not have a high market share, their profitability is outstanding and they rank high in terms of loan management ability and other aspects, and they are potential stocks for the development of commercial banks. China Construction Bank, Agricultural Bank of China, Bank of Communications and other state-owned commercial banks, due to their large scale of operation, weaker business expansion capacity and financial product innovation capacity than joint-stock banks, have slow growth rate of operating income, net profit and capital accumulation rate.

It can be seen from the comprehensive ranking in table 4 that the comprehensive operation performance of Ningbo Bank, Nanjing Bank and Industrial Bank is the highest. The reason may be that these commercial banks continue to expand the scale of business outlets, provide innovative products and services based on customer demand, and effectively meet the market demand. However, Bank of Communications, Citic Bank and Bank of China are relatively backward in comprehensive operation strength, mainly in terms of asset safety and loan management ability, which will affect the sustainable development of commercial banks in the future.

#### 4 Conclusion

The research shows that, compared with state-owned commercial banks, urban commercial banks have outstanding operating performance, especially Bank of Ningbo and Bank of Nanjing. The operating performance of joint-stock banks is uneven, but most of them rank above the medium level. State-owned commercial banks have certain advantages in asset security. According to the actual situation of commercial banks, it puts forward the following suggestions. (1) Commercial banks should maintain profitability persistence and loan management efficiency. This is the basic dynamic of commercial bank's survival and the foundation, such as establishing information management system, optimizing the organizational structure and credit management system, improving the work efficiency, and reducing operating costs and operating risk. Meanwhile, commercial banks should expand their business scope, find new profit growth points through financial innovation, fuse of finance and science and technology, and improve their profitability and loan management ability. (2) Commercial banks should pay attention to their non-performing loan ratio and allocation coverage, improve loan quality by optimizing loan structure and business structure, strengthen customer credit assessment, and establish risk warning mechanism. The key way for commercial banks to improve their business performance is to expand loan business on the basis of ensuring the safety of funds, provide diversified financing channels and provide guarantee for the sustainable development of banks.

# Research on the Industrial Development Mode of “Internet plus Hunan Embroidery” : from the Perspective of Intangible Cultural Heritage Protection

Wang Aimin, Liu Wenhua

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wangam@vip.163.com,1786584887@qq.com)

**Abstract:** At present, "Internet plus", as a new economic form, has become an inevitable field in the development of various industries. intangible cultural heritage represents the unique culture, spiritual characteristics and values of all ethnic groups, and plays a vital role in shaping China's cultural self-confidence and activating cultural soft power. In this paper, Hunan Embroidery, one of the intangible cultural heritage items of traditional technology, is taken as the main research object. On the basis of summarizing the cases of the excellent industrial development mode of "Internet plus Embroidery" from the perspective of intangible cultural heritage protection, this paper reconstructs the new industrial development mode of "Internet plus Hunan Embroidery", and expounds in detail the operation mechanism and benefit of the new mode. The purpose of this paper is to provide reference for the development of Hunan Embroidery enterprises under the background of "Internet plus".

**Key words:** Intangible cultural heritage protection; Internet plus; Hunan Embroidery; Industrial development mode

## 1 Introduction

In 2006, Hunan Embroidery was included in the first batch of national-level intangible cultural heritage projects (Zhang Zhaolin,2016). It is a Hunan folk craft with a strong Hunan culture. Since the emergence of the first embroidered village of Hunan Embroidery in 1898, the Hunan Embroidery industry has undergone more than one hundred years of change and development, forming an industrial chain integrating R&D, production and sales (Zuo Xiao,2017). However, with the advent of the Internet era, the development of science and technology and modern industry has made the traditional handicraft production methods of Hunan Embroidery outdated, the products lack innovation, the marketing mode is backward, the financing channels are reduced, and the loss of Hunan Embroidery skills, lack of talents, and inadequate implementation of protection policies are not in place(Mou Xingang and An Li,2015). This makes Hunan Embroidery into a development dilemma. At present, how to protect and inherit the skills of Hunan Embroidery in the "Internet plus" era and promote the successful transformation and upgrading of Hunan Embroidery industry is an important issue. Therefore, it is of practical significance to analyze the development mode of Internet plus Hunan Embroidery industry from the perspective of intangible cultural heritage protection.

"Internet plus" is the result of the use of Internet Thinking in practice. It is a new format formed by the Internet evolution under the environment of Innovation 2.0. It refers to the combination of traditional industries and the Internet, and the transformation of production methods and business through the use of Internet information technology and Internet platforms (Sun Shun Yao,2016). Mode reconstruction and business system renewal to promote industrial transformation and upgrading, improve the level of development, and ultimately increase the wealth of the whole society. At present, China mainly implements three methods of intangible cultural heritage protection, namely, rescue protection, productive protection and legal protection. Hunan Embroidery belongs to the intangible cultural heritage

project of traditional crafts. It has its own production attributes and commodity attributes. It should be based on productive protection, and legal protection and rescue protection will develop in harmony (Wu Xu,2017).

## 2 The Typical Cases of the "Internet plus Embroidery" Industry Development mode from the Perspective of Intangible Cultural Heritage Protection

### 2.1 Cases analysis of typical modes from the perspective of rescue protection

Rescue protection refers to a kind of protection for intangible cultural heritage projects and their inheritors, including digital protection and inheritor protection (Xin Wang and Rong Zheng,2018). The former is to record specific intangible cultural heritage projects by means of science and technology, with the help of photography, pictures, writing and so on, to integrate these information into a database for retention protection, while the latter is to train talents for specific intangible cultural heritage projects. Let the intangible cultural heritage inheritors develop in the process of inheritance and innovation.

#### 2.1.1 Digital protection perspective - Hunan Embroidery digital museum

In the current technology-oriented era, the digitalization and informatization of traditional physical museums is the collision and blending of traditional culture and Internet technology (Huanjun Cao,2014). It not only makes the management of the museum systematic, informative, and convenient, but also expands the entities in the library. The preservation and communication channels of the collection broke through the time and space restrictions of the physical museum service. The Shaping Hunan Embroidery Museum in Hunan Province has created an online digital museum that integrates the information resources of Hunan Embroidery and has the functions of storing, displaying and sharing resources related to Hunan Embroidery. It is an open and all-round network platform. The public can understand and learn the cultural resources of Hunan Embroidery and appreciate the collection of Hunan Embroidery without leaving the household. Shaping Hunan Embroidery Digital Museum is built based on the browser/server system structure. It consists of three major business modules: virtual museum, database and background management system. The virtual museum is created by FLASH technology, the 360-degree three-dimensional display of the physical museum information, including the museum guide and collection display, viewers can freely move to choose the viewing angle, The database includes the collection database, the needle library and the Hunan Embroidery character library, the background management system is mainly to digitally organize, process and release the physical museum resources and industry dynamics, providing display and retrieval services for tourists. Figure 1 is a diagram of the overall architecture of the museum.

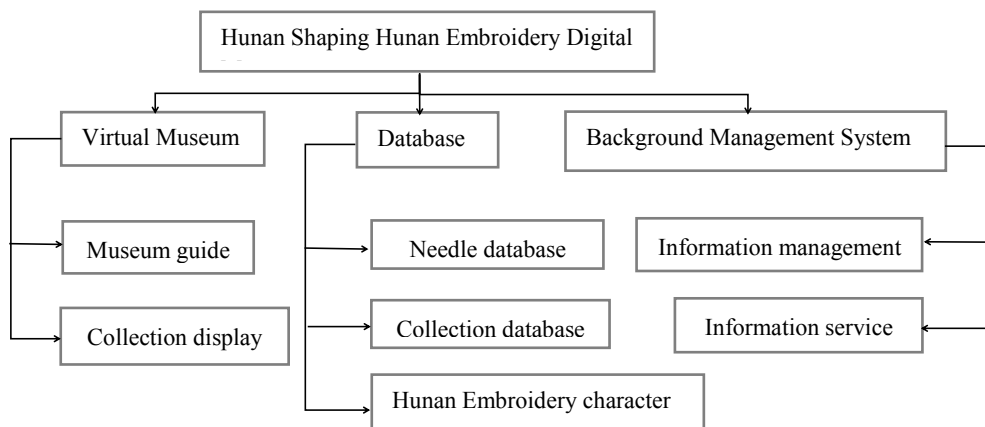

Figure 1 Shaping Hunan Embroidery Museum Overall Structure

### 2.1.2 Talent cultivation perspective - online embroidery education

According to data released by CNNIC, as of 2018, the number of online education users in China reached 144 million, of which the number of mobile online users accounted for 120 million. With the development of online education, many embroidery industries disseminate embroidery knowledge through online video, online open classes or the establishment of online schools, to meet the needs of students, and to cultivate heirs of different embroidery projects. On March 6th, 2018, Suzhou University released a large-scale online open class "Silk Culture and Products" for 9 weeks and 3-4 hours per week on the MOOC online platform. Students only need to register to login. The curriculum, the autonomy and convenience of students' learning is greatly improved. The online embroidery education reduces the learning threshold for embroidery knowledge, making students no longer limited to time and venue (Zeng Ximei et al,2013).

## 2.2 Cases analysis of typical mode from the perspective of productive protection

Productive protection refers to intangible cultural heritage projects that have production attributes and commodity attributes for traditional crafts, fine arts, etc., so that they can convert intangible cultural heritage resources into cultural products by means of production, circulation, and sales in the process of production practice (Yuan,2018). Intangible cultural heritage projects are protected and passed on in production practice. Productive protection is mainly reflected in the innovation of production technology, product design, marketing mode and financing channels.

### 2.2.1 Production process perspective - computer embroidery machine

Because embroidery has the characteristics of handicrafts, the production cycle is long, the creation cost is high, and the lack of embroidery workers often leads to a situation in which the supply in the embroidery industry is in short supply. In order to cope with this situation, computer embroidery machines came into being. At present, 80% of the domestic computer embroidery machine market is occupied by Dahao Technology, and it has a market share of more than 60% in foreign markets. The computerized embroidery machine developed by Dahao Technology has become an Internet intelligent terminal integrating process embroidery operation, order tracking management and machine diagnosis and maintenance. Dahao Technology has also developed a control software APP, and the staff can carry out the computer embroidery machine on the mobile terminal. Remote control, network management, order management, etc. After installing a chip, a computer embroidery machine can store 800 patterns and 100 million needles. Dahao Technology's operating income in 2018 reached 1.06 billion yuan, an increase of 27.99% over 2017. The development and operation of the computerized embroidery machine has greatly improved the production efficiency of the embroidery industry, reduced the pressure of traditional embroidery workers, and alleviated the shortage of embroidery products.

### 2.2.2 Product design perspective - Suzhou Embroidery plus cultural and creative industries

The cultural and creative industry is a smart-led industry with creativity as the core, the main culture as the soul, the support of science and technology, the creative development and utilization of cultural resources by individuals or teams, and the marketing of intellectual products or intellectual property (Dele Cui et al,2017). At present, most of China's embroidery industry is mainly based on the production of arts and crafts, and the price is expensive. Suzhou Embroidery is the first embroidery industry involved in the field of cultural creativity, and has developed a variety of Suzhou Embroidery products that are novel in design, practical and affordable. For example, Suzhou Embroidery wallets, card holders, bookmarks, business card holders and other products that integrate the elements of Suzhou

embroidery, and the prices of these products are around 100 yuan. The development mode of “Suzhou Embroidery plus cultural creation industry” innovates the products from product design, integrates Suzhou Embroidery elements into various practical products in life. This mode plays a big role in adding product value and expanding corporate visibility and market share.

### 2.2.3 Marketing mode perspective

#### (1) E-commerce plus Hunan Embroidery industry

The embroidered e-commerce road began in 2011 with the Hunan Jin Embroidery Research Institute to open the “Golden Caixia” store on Taobao platform. At present, there are three main development modes of e-commerce in Hunan Embroidery industry. One is to open online stores for Taobao, Tmall, Jingdong and other third-party e-commerce platforms for B2C mode sales, the second is to build online malls for sales, the third is to use WeChat From the media platform, they open a store on the mobile side and sell Hunan Embroidery products based on the user's social network. The e-commerce road of Hunan Embroidery Industry has opened up online sales and communication channels for the traditional Hunan Embroidery industry, which has reduced product transaction costs, promoted product sales and information transmission more quickly and efficiently. It provides a bright road for the transformation and upgrading of the traditional Hunan Embroidery industry.

#### (2) Self-media content shopping guide

self-media is a way to share the news, knowledge, interesting things, and mental journeys around us, after the public is integrated into the Internet knowledge and information era. At present, many Hunan Embroidery enterprises have opened Weibo and subscribed articles, and through the production of high-quality content about Hunan Embroidery, packaging Hunan Embroidery history and culture, Hunan Embroidery craft, and Hunan Embroidery products to attract fans to purchase. There are 86 public numbers about Hunan Embroidery that can be found on WeChat homepage. Dozens of companies such as “Yifei Hunan Embroidery”, “Red Hunan” and “Jin Caixia Hunan Embroidery” have been well done. Hunan Embroidery enterprises use the community effect of self-media to introduce the high-quality content, let the public understand the history and culture of Hunan Embroidery, grasp the consumer psychology, and guide consumers to place orders for shopping.

#### (3) Opinion leader

Under the guidance of government policies, the wave of traditional culture in 2017 swept through various industries such as film and television, variety, education, and the Internet. For example, the documentary "Looking for Craftsmanship", "Hundred Hearts and Craftsman" and other intangible cultural heritage and inheritors are broadcast on the video website. In December 2017, "National Treasures" is a cultural program that tells the cultural heritage of past and present. Concerned, once the program was broadcasted, the domestic search for tourism and cultural products increased by 50%. In 2017, under the efforts of the government and various industries, the cross-border integration of the Internet and the traditional cultural industry was greatly promoted, and the traditional culture became a new “network red man”. The Hunan Embroidery industry has been among them. With the help of video, variety, live broadcast, and film and television channels, the popularity of Hunan Embroidery was attracted to attract the attention of the public. which not only spread the culture of Hunan Embroidery, but also directly or indirectly drove the sales volume of Hunan Embroidery products and improved Hunan Embroidery. The overall level of development of the industry.

### 2.2.4 Perspective of financing channels - Patchwork Embroidery plus Internet crowd funding

The Patchwork Embroidery originated from the Dabujiang area of Cangzhou City, Hunan Province.

It originated in the Han Dynasty and was popular in the Ming and Qing Dynasties. It is a national-level intangible cultural heritage project. Internet crowd funding refers to the act of the fundraiser through the Internet crowd funding platform to initiate fundraising from the mass sponsors. At present, Internet companies such as Jingdong, Taobao and Tencent have launched crowd funding platforms, and some self-built special crowd funding platforms are also emerging to serve social, poverty alleviation and entrepreneurship.

Combining Patchwork Embroidery with Internet crowd funding is He Juan, a non-genetic inheritor of patchwork embroidery skills. In 2013, He Juan established a company to engage in the business of patchwork embroidery products. He Juan submitted his design products to the Taobao crowdfunding platform for review. After the approval, on November 8, 2015, Taobao crowd funding platform launched a patchwork project, including five products, namely mobile phone case, key case, and Fu. Word, Zhong Ni image and head band, raising the target of 50,000 yuan, and promoting it on the crowd funding homepage. As of December 3, 2015, the total amount of crowd funding was 37,094 yuan, and 74% of the target task was completed. The pattern of Patchwork Embroidery plus Internet crowd funding has improved the popularity of patchwork embroidery, increased the sales volume of Patchwork Embroidery products, expanded new financing and sales channels with Taobao crowd funding platform.

### **3 The Development Mode of "Internet Hunan Embroidery Industry" from the Perspective of Intangible Cultural Heritage Protection**

#### **3.1 Construction of the development mode of Hunan Embroidery industry**

##### 3.1.1 The main elements of the pattern

###### (1) Government

The government is the subject of legal protection and rescue protection. Legal protection refers to the legislative bodies to formulate laws and regulations on intangible cultural heritage protection and development, to support and restrict the healthy and orderly development of intangible cultural heritage industries, and to carry out protection work mainly from human rights law, environmental law and intellectual property law. Hunan Embroidery is one of the first batch of national-level intangible cultural heritage projects, and the government has the responsibility to protect and develop it. Therefore, in the process of constructing the development mode of the Internet plus Hunan Embroidery industry, the government is an important main element for legal protection and rescue protection of Hunan Embroidery.

###### (2) Hunan Embroidery enterprise

Hunan Embroidery enterprise refers to a legal person or other social economic organization engaged in the R&D, production and sales of Hunan Embroidery products for the purpose of profit. Whether it is in the traditional market of Hunan Embroidery or the Hunan Embroidery market under the background of the "Internet plus" era, Hunan Embroidery enterprise has been the main force to promote the development of Hunan Embroidery industry. Building the Internet plus Hunan Embroidery industry development mode, Hunan Embroidery enterprises have become an indispensable one.

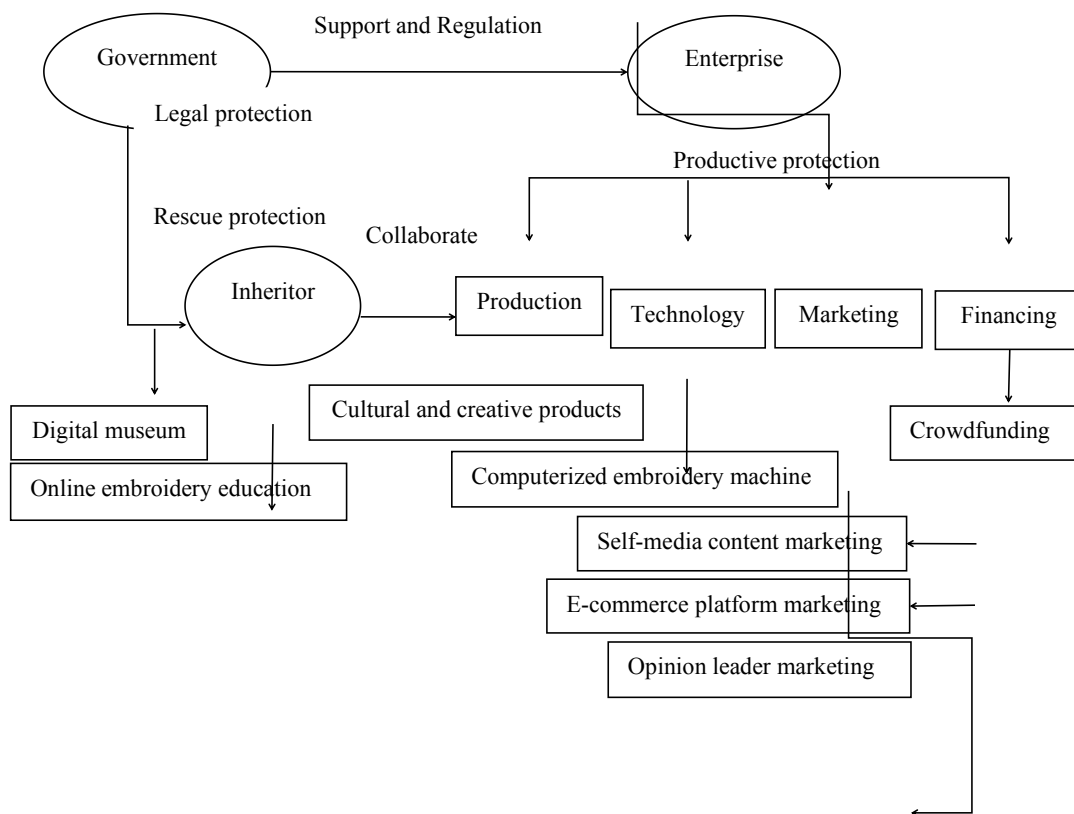

###### (3) Hunan Embroidery inheritor

The inheritor of Hunan Embroidery is a complete master of the traditional cultural knowledge of Hunan Embroidery, the skill of Hunan Embroidery, and actively carry out the inheritance activities

related to Hunan Embroidery. It is representative and authoritative in the Hunan Embroidery industry, and is approved by the state, province, city and county. The level of the accreditation authority represents the level of the inheritor of the Hunan Embroidery project. The protection of the inheritors is one of the ways in which the government carries out the rescue protection of Hunan Embroidery techniques, and it is an effective guarantee for the inheritance of the knowledge and skills of Hunan Embroidery. In the development process of the Internet plus Hunan Embroidery industry, Hunan Embroidery inheritor is an important main factor.

### 3.1.2 Constructing the development mode of "Internet plus Hunan Embroidery industry"

Based on the perspective of intangible cultural heritage protection, comprehensively develop the current "Internet plus Embroidery Industry" excellent development mode, build a government, Hunan Embroidery enterprise, and inheritors as the main elements, with productive protection as the main protection method, legal protection method and rescue protection method. A comprehensive development mode of "Internet plus Hunan Embroidery Industry" with coordinated development. The development mode is shown in Figure 2.

**Figure 2 "Internet plus Hunan Embroidery" Industry Development Mode from the Perspective of Intangible Cultural Heritage Protection**

### **3.2 The operation mechanism of the new mode**

#### 3.2.1 Hunan Embroidery enterprise business process

##### (1) R&D procession

Hunan Embroidery enterprises can follow the development mode of Suzhou Embroidery plus cultural and creative industries, and hire excellent design teams and Hunan Embroidery inheritors to develop Hunan Embroidery products. Hunan Embroidery Enterprises provide R&D funding support. Hunan Embroidery inheritor and design team are responsible for the R&D of cultural and creative products. The combination of Hunan Embroidery pattern, method, materials and design team design concept creates a practical life that belongs to Hunan Embroidery industry. Cultural and creative products are affordable, such as stationery, cups, clothing, card holders and other products.

##### (2) Producing procession

The production of traditional Hunan Embroidery products is mainly based on manual workshop-style hand-embroidering. The production cycle is long and the process is complicated, which is not suitable for mass production. The essential feature of Hunan Embroidery enterprises is profitability, and the traditional production style are already backward. The computerized embroidery machine integrates the process of embroidering operation, order tracking management, machine diagnosis and maintenance as one of the Internet intelligent terminals, as well as a special control software APP. The staff can remotely control and manage the computerized embroidery machine on the mobile terminal. Hunan Embroidery enterprises can purchase computer embroidery machines for product production, improve the production efficiency of products, and reduce production costs.

##### (3) Marketing procession

In the "Internet plus" era, the marketing methods of Hunan Embroidery enterprises mainly include e-commerce platform marketing, self-media content marketing and opinion leader effect to drive marketing. The marketing mode of e-commerce platform can be realized in three ways: one is to open an online store on the third-party e-commerce platform for B2C mode sales, the second is to build the online shopping mall to sell products. The third is to use the self-media platform to sell products based on the social network. The self-media content marketing is an indirect marketing method. It refers to the production of high-quality content about Hunan Embroidery through the self-media platform such as subscribed articles, attracting fans' attention and praise, ultimately get profit. The opinion leader marketing mode refers to the popularity through video, variety, live broadcast, film and television channels, attracting the attention of the public, making Hunan Embroidery become opinion leader, spreading the knowledge of culture and driving the sales of products.

##### (4) Financing procession

In addition to the traditional methods of bank loans, venture capital, bond issuance, and stock issuance, the "Internet plus" era of Hunan Embroidery enterprises can also learn from the example of "Patchwork Embroidery plus Crowd funding" and set up the target amount of fundraising, use social platforms to raise funds from the public.

#### 3.2.2 The government cooperates with the development of Hunan Embroidery enterprise

The government can formulate reasonable policies, increase investment promotion, and gather foreign embroidery enterprises in one region to stimulate innovation and orderly competition, resulting in the cluster effect of Hunan Embroidery industry. In the region, the government supports the

cultivation of a certain embroidery enterprise and encourages it to acquire other small and medium-sized enterprises to expand itself, making it a leading enterprise and driving the development of other Hunan Embroidery enterprises. In the industrial chain, in the vicinity of the Hunan Embroidery industrial cluster, cultivate sericulture and forestry parks, integrate the production of embroidery threads, embroidery production and sales, ultimately reduce industry costs and improve operational efficiency.

### 3.2.3 Inheritors cooperate with Hunan Embroidery enterprise to R&D production

The Hunan Embroidery inheritor has mastered the complete knowledge of culture and skill and technique. It is a living resource database of Hunan Embroidery intangible cultural heritage project. Hunan Embroidery enterprise can hire Hunan Embroidery inheritor to assist in the R&D of products. Hunan Embroidery Enterprise provides financial support. The inheritor cooperates with the design team to combine the embroidery pattern, the embroidery method, the different embroidery materials and the concept of the design team to jointly develop different kinds of cultural creative derivatives with Hunan Embroidery elements.

## 3.3 Benefits analysis of the new mode

### 3.3.1 Industrial ecological benefits

In the newly constructed "Internet plus Hunan Embroidery" industry development mode, the government, Hunan Embroidery enterprises and inheritors are three main elements. The government supports and regulates the orderly development of Hunan Embroidery enterprises through the formulation of policies and systems. At the same time, the good development of Hunan Embroidery industry is conducive to the protection and inheritance of Hunan Embroidery culture and skills. There is a duty to regularly organize the inheritance activities of Hunan Embroidery culture and cultivate follow-up talents. Hunan Embroidery inheritors cooperate with enterprises to carry out R&D of Hunan Embroidery products, and enterprises provide financial rewards to inheritors. In the new mode, it not only realized the win-win situation of the government, Hunan Embroidery enterprise, and inheritor, but also promoted the development of the entire Hunan Embroidery industry. Figure 3 shows the ecological system of the Hunan Embroidery industry under the new mode.

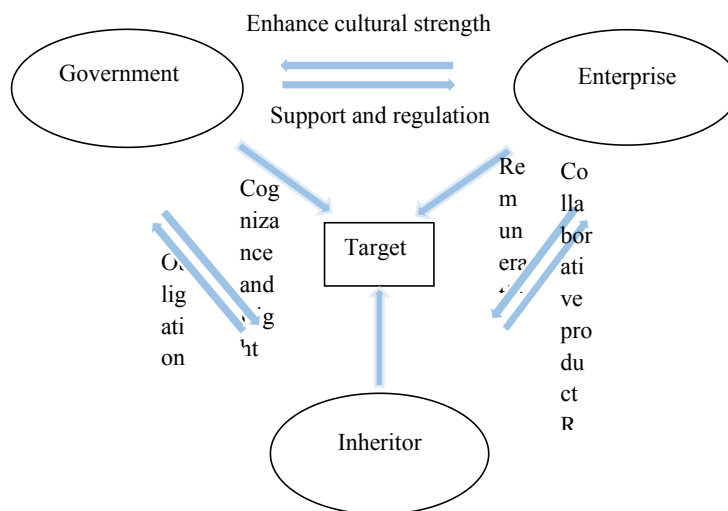

Figure 3 Ecology System of Hunan Embroidery Industry under the New mode

### 3.3.2 Economic benefits

The income under the new mode is mainly reflected in the two main bodies of enterprise and inheritor. In the "Internet plus" era. The direct purpose of Hunan Embroidery enterprises is to increase the economic profits. Hunan Embroidery enterprises have direct economic benefits under the mode of productive protection. The Hunan Embroidery inheritor, as one of the targets of the government's rescue protection, received the government's financial support. They also cooperated with Hunan Embroidery enterprise to assist them in product R&D and obtain wages.

### 3.3.3 Cultural benefits

As a national intangible cultural heritage project, Hunan Embroidery has a distinct regional and national character, and contains the spiritual connotation of Hunan culture. It is a cultural card for foreign exchanges in Hunan province. Under the new mode of "Internet plus Hunan Embroidery", the government has strengthened legislation and established a "national plus province plus city plus county" four-level intangible cultural heritage project and inheritance list protection system, giving Hunan Embroidery and inheritors legal status and society. The government builds the Hunan Embroidery digital museum, expands the channels for disseminating cultural knowledge of Hunan Embroidery. Inheritors teach students through online video, online open classes, online schools, it spreads the knowledge of Hunan Embroidery culture. Through the production and sales of Hunan Embroidery products, Hunan Embroidery enterprises have promoted the spread of cultural knowledge while gaining economic value. Under the new mode, the common goal of the government, the inheritors and enterprises are to make the Hunan Embroidery intangible cultural heritage project better protected and develop.

## 4 Conclusion

Taking the Hunan Embroidery industry under the intangible cultural heritage traditional technology as the main research object, this paper explores how to make use of the Internet Thinking and technology to innovate and "make blood" development under the background of "Internet plus". The first part of this paper describes the relevant theories of "Internet plus" and intangible cultural heritage protection. Secondly, On the basis of theory, this paper sums up the cases of excellent development mode of "Internet plus Hunan Embroidery industry" and "Internet plus other embroidery industry" from the perspective of intangible cultural heritage protection. To provide the basis for the innovation of the development mode of Hunan Embroidery industry under the background of "Internet plus", Finally, on the basis of the second part, from the perspective of intangible cultural heritage protection, this paper constructs a new development mode of "Internet plus Hunan Embroidery industry", and expounds the operation mechanism and benefits of the new mode in detail. The mode of this paper provides a reference for the development of Hunan Embroidery industry under the background of "Internet plus".

# Application of Big Data Analysis in the Innovation of Information Resources Management

Luo Qifeng, Yang Jiaqi, Li Siqian

School of Transportation, Wuhan University of Technology, Wuhan, P.R. China, 430063

(E-mail: 443293143@qq.com, styjq@whut.edu.cn, siqian\_lee@whut.edu.cn)

**Abstract:** In the literature management, the approach of using big data theory to carry out data mining, mass data analysis and high dimension data reading embodies the advantages of big data technology. Through scientific statistics and analysis of network reading and other complex big data, it can greatly improve the scientific research and teaching work in university. Meanwhile, big data technology enables university libraries to cooperate successfully with other academic research institutions in the internet age. The application of big data technology in university libraries has become a landmark achievement of the innovative development strategy on information resources management.

**Key words:** Big data analysis; University library; Information resources; Data management

## 1 Introduction

The first explicit analysis of big data analysis on university library management is the massive reading data. From the representation of data analysis, the analysis of massive data can be understood as the classification and management of the records of the reading objects such as the literature and information of interest to the readers. The big data technology is suitable for the data management of the university library, and it also has the time and space attributes. An important function of the analysis and management of mass data is to analyze and organize the determined data targets in order to provide the value and basis of the existence of the digital book resources (Cohen et al., 2009). The reading data in massive data can not only reflect the importance of the document, but also reflect the utilization ratio of the document. Literature knowledge is the interpretation and expression of concepts, and reading data is an important material to reveal the mode and relationship of knowledge existence. A single data record cannot explain the value, reliability and cognition of knowledge (Tu, 2012). It is only to organize and relate the data of different records in order. The reading information of readers is analyzed through big data analysis, and the key clues of the common and different reading information related to the knowledge literature are compared. Through an orderly interpretation of the effective information to induce the knowledge structure and clues hidden in data, we can approve the reliability and value of the knowledge.

## 2 The Application of Big Data Analysis on Data Management, Literature and Knowledge Module in University Library

The process of using big data technology to analyze library literature knowledge is complicated. Knowledge acquisition can be divided into explicit knowledge acquisition and tacit knowledge acquisition. Data obtained by explicit knowledge acquisition is called dominant data. The mass data analysis of the dominant data is obtained by measurement and classification according to a certain rule or theory. The analysis is used to describe the total amount of reading and the acquisition of the concept of knowledge, such as the classification reading of the science department, the literature collecting,

news events reading, internet and public knowledge media platform participating, and so on. The purpose of data analysis is to objectively evaluate the degree and intensity of utilization of information resources in university libraries (Cuzzocrea, 2011). However, a lot of knowledge and information cannot be obtained directly by quantifying. This part of knowledge and information needs to be inferred through model assistance. And the data used in the unknown conceptual modeling are called recessive data. The important role of the recessive data analysis is to reveal the reliable basis of the explicit knowledge and information.

Taking the PBL (Problem-Based-Learning) teaching mode data analysis and research as an example, PBL is a learning method and a related knowledge system based on problem solving and the ability of autonomous learning for college students (Jones, 2012). The PBL teaching model can arouse the enthusiasm and initiative of college students and form the skills of solving problems and the ability of autonomous learning. By analyzing the clicks of college students accessing relevant knowledge as the dominant statistics, it is showed that colleague students can solve problems independently without teachers' guidance. This data analysis conclusion is also benefited from a group of high dimensional recessive data: taking the sum of the dominant data taken by the university students in the library and the clicking data of the knowledge related knowledge as the sum of recessive data. It's a complex experiment, and the key to the success is how to design and analyze the data of double blind. By trying the effective recessive knowledge structure of data management, the comprehensive observation data supporting the research can be obtained. The information of purchasing book, the total reading of the electronic information resources and the related recessive consumption data can provide follow-up support for the study. For example, the students with weak awareness of the PBL can pay attention to the research results of this subject, and the students with a strong sense of PBL are concerned about the information acquisition of interdisciplinary knowledge related to the field of the subject. Therefore, the PBL teaching model cannot be separated from the mass data collection and analysis of the information technology in university library. On the basis of the full acquisition of dominant data, we should also use the big data technology to analyze the recessive data to provide an objective scientific data reference for the research project.

### **3 Cloud Computing in Big Data Perspective and Data Mining of University Library**

The cloud computing academic cooperation program, jointly launched by Google, University of Washington and Tsinghua University, is actively exploring the new model of data management in university libraries in the era of big data. Cloud computing is a super computing method in virtual computing environment (Yao, Tian, 2012). It is dynamic and extensible. The cloud computing technology based on the university library includes four layers of data architecture: Infrastructure-as-a-Service (IaaS), Platform-as-a-Service (PaaS), Software-as-a-Service (SaaS) and Data-as-a-Service (DasS), which is the network computer technology and the cluster computing technology that serves the readers (Feng, 2012). The internet has brought new opportunities for the development of university library services, such as fast feedback, online reading, intelligently borrowing, reading software online upgrading, and so on.

Cloud computing has changed the research of university library information platforms from the previous study of single computer software development and evolution systems to the integration of social knowledge networks and public knowledge platforms. The information resources of university library use the computer cloud computing technology to link the social dispersed large-scale electronic literature publishing system closely with the individual terminal readers, research institutions and academic groups, and raise the demand of the university library information resources and service to a closely related model. It also expands the total amount of literature knowledge and diversity the ways of acquiring knowledge in university libraries. Such as the resources sharing in different university

libraries, the utilization and development of the software engineering of university books, the adaptive of the upgrading of the book reading software, the storage pool of precious literature, the desktop pool of reading terminal, and the security pool of the cloud computing disaster recovery system. The cloud computing and the data mining of university library are relative but different: the dynamic and scalable computing power of the cloud computing brings the possibility for the high efficiency and mass reading data management of the university library (Liu, Huang, 2011). In the cloud computing environment, the number of click times of E-books has provided the academic dynamic data and related dissemination of knowledge to the publishers, the book companies and other knowledge publishing corporations and the writers. It can guide the library collection, the knowledge consumption, the information resources and the library literature update and development. The service-oriented characteristics of cloud computing makes it possible for university libraries to provide data mining of collection literature services for university scientific research. Meanwhile, the development of cloud computing technology cannot live without the support of the data mining of university library. Taking the literature search as an example, the search based on cloud computing includes three parts: web storage, search processing and front-end interaction. With the development of broadband technology, the literature of university library also includes the literature of multimedia data (Newman, 2011). The search engine that can query images, sounds, pictures and films has been developed. And the images and videos are the supplement of the text information of the contemporary university library. The data mining of university libraries has been widely used in these parts, such as the web page removal in web storage, web sorting in search processing and query classification in library front-end interaction. Therefore, the cloud computing technology provides a technical basis for the library's massive reading and the complex electronic literature data mining. It has brought a breakthrough innovation to the public library resources service under the network environment (Devenport, 2007).

#### 4 Big Data Case Analysis on Research Cooperation of Academic Institutions

The case data in this paper is derived from the literature records of CNKI, including the author and author institutions of the literature. Network nodes are used to represent the research institutions. The edges in the network represent the jointly published literature of the corresponding two nodes (research institutions), and the weight of edges is decided by the number of co-published literature of the corresponding research institutions. An undirected graph of different scientific research institutions in cooperation network is presented with 179 nodes and 779 directed edges. Assuming that  $G = (V, E)$  is used to represent the cooperation network of research institutions. The  $V$  is the small node set and  $E$  is the set of edges.  $W_{vw}$  is the number of edges between the vertex  $V$  and  $W$ . The weight of the network edge is defined as follows:

$$W_{vw} = \sum_k \left( \delta_v^k \delta_w^k / \binom{2}{n_k} \right) \quad (1)$$

Where  $W_{vw}$  is the institution, the weight of the edge is between  $v$  and  $w$ ,  $n_k$  is the research institution and author affiliation of literature  $k$ . If the institution  $v$  appears in paper  $k$ ,  $\delta_v^k = 1$ , otherwise,  $\delta_v^k = 0$ . With the formula in case, one paper contributes only one edge weight to the whole cooperative network of scientific research institutions, which avoids the high evaluation of one paper on the whole organization cooperation network due to the joint publication of multiple research institutions. The network data analysis is shown in Table 1.

**Table 1 The Scientific Research Cooperation Weighting Statistics of Different Research Institutions**

No.	Node	Node	Weight
1	Capital University of Economic and Business	China University of Finance and Economics	3.33333

2	Capital University of Economic and Business	Renmin University of China	3
3	Beihang University	Jilin University	3
4	Beihang University	Harbin Institute of Technology	2.33333
5	Wuhan Institute of Technology	China University of Geosciences	4
6	Wuhan Institute of Technology	Tsinghua University	2
7	Huazhong Science and Technology University	Peking University	3.33333
8	Huazhong Science and Technology University	Wuhan University	5.33333

In this case the data is stored in the hard disk data “affiliations, txt” of university library. The original data of the case is named dt.TXT. As shown in Table. 1, each row represents an edge, the first and second column represents the nodes in the network, and the third column is the edge of the weights in the network. Based on the dt data, the undirected graph is constructed with the software packages “igraph”, and the basic information about the cooperation between research institutions on the internet is presented. R package in igraph software is loaded to call the data with require (igraph). FN algorithm is expressed as: (plotcg, layout=L, vertex, color=color vertex, label=NA). The results of data mining about the cooperation between research institutions on the internet in FN algorithm is shown in Table 2.

**Table 2 Results of Network Data Mining in Cooperative Universities**

Cooperation region	Name of cooperative universities and research institutes	Number of institutions
1. Beijing	Tsinghua University, Peking University, Renmin University of China, Beijing Normal University, Chinese Academy of Social Sciences...	20
2. Northeast region	Chinese Academy of Sciences, Harbin Institute of Technology, Jilin University, Dalian University of Technology, Jilin University of Finance and Economics...	26
3. Eastern China	Fudan University, Nanjing Normal University, Nanjing University of Finance and Economics, Nanjing Agricultural University, Zhejiang University...	18
4. Southern China	Sun Yat-sen University, Jinan University, South China University of Technology, South China Normal University, South China Agricultural University...	10
5. Central China	Wuhan University, Huazhong Science and Technology University, Central China Normal University, Zhongnan University of Economics and Law, Central South University...	28
6. Northwest Region	Northwest University, Xi'an Jiaotong University, Shaanxi Normal University, Xi'an University of Technology, Chongqing University...	17

According to the results of the network information data mining, the data analysis is continued. The method of nonnegative matrix decomposition, with the advantages of high operation speed and high Interpretability, is the optimization and most popular method at present, which attracts the attention of more and more university libraries. Moreover, the nonnegative matrix analysis technique is applicable to the collection of electronic image storage, the text data and literature document classification in university libraries. The function NMF that can be decomposed into nonnegative matrices is created firstly, and the data mining of cooperative universities and research institutes is carried out with the function (Badea, 2005). Then the R package Rcolor Brewer is installed and the palette under the requirement of Institution category for each node is also installed. As shown in Table 2, the first cooperation region is Beijing, which mainly included the Tsinghua University, Peking University, Renmin University of China, Beijing Normal University, Chinese Academy of Social Sciences and other 15 cooperative universities and research institutes. The remaining cooperation regions are distributed in the Northeast region, Eastern China, Southern China, Central China and Northwest Region. After the data mining and data analysis of cooperative universities and research institutes, the corresponding R package “entropy” programming is explained.

Big data technology overcomes the physical distance of scholars in different regions and various institutions. The data of academic achievements in different universities and research institutions is deeply summarized, sorted, counted and calculated with the big data technology on the internet, and the general situation on the resource sharing and in-depth academic cooperation between the universities with major research institutions is analyzed. The information resource platform of university library becomes the data hub between cooperative universities and research institutions, which provides the sufficient information technology support for the cross-regional cooperation of academic resources in China.

## 5 Conclusion

The big data technology is used to establish a comprehensive platform for literature resources and information in university library, which provides a variety of big data analysis services in data collection, creation, detection, synthesis, coding, storage, publication, retrieval, judgment, problem solving and academic researching in colleges and universities. It is not only greatly expanded the function of university library in the digital age and also greatly promote the utilization of the books intelligence and literature. Moreover, it has promoted the knowledge innovation module of the discovery of new knowledge and interdisciplinary learning from big data, and the development and innovation of the information resource management model in university library.

# **Separate Sections and Key Points: The Application of Big Data in Agricultural Science and Technology Information Service: Based on the Two Main Bodies of Supply Side and Demand Side**

Yang Yu, Liu Jun

School of Marxism, Wuhan University of Technology, Wuhan, Hubei, China, 430000

(E-mail: 1445233678@qq.com, 76737306@qq.com)

**Abstract:** At present, the development of agricultural informatization in China is at a critical stage. The construction of agricultural science and technology information service platform with big data is of great significance to the development of agricultural modernization. Theoretically, the agricultural science and technology information service platform based on big data can effectively promote the interactive communication between agricultural researchers and producers and achieve a win-win situation. This study uses the method of empirical analysis, through visits and questionnaires, to explore the actual situation of demand docking between the two main bodies under the background of big data, and then find out the deviation between the actual situation and the theoretical conception. Based on the analysis results, it concludes that there are still some problems in the current development, such as low participation enthusiasm and poor participation. The conclusion is that the construction of agricultural science and technology database should be divided into sections and key parts.

**Key words:** Big data; Agricultural technology; Demand docking; Information service

## **1 Introduction**

Big data plays an important role in the process of agriculture becoming more and more modernized and informatized in China. The big data characterized by Volume, Velocity, Variety, Value and Veracity "5V" provide new path and new choice for agricultural science and technology information service (Wang Wensheng, 2015). Under the guidance of the Ministry of agriculture's guidance on promoting the development of big data in agriculture and rural areas (Nongshifa, 2015) and other important documents, the construction of agricultural science and technology big data has been rapidly carried out everywhere. However, for the two main subjects of agricultural science and technology service, agricultural researchers and agricultural producers, will the platform meet the needs of both of them and achieve the mutual benefit?

## **2 Mutual Benefit: The Ideal Form of Agricultural Science and Technology Information Service Mode under Big Data**

Many scholars at home and abroad attach great importance to the application of big data in agricultural science and technology information service. For its two main bodies, agricultural researchers and agricultural producers, it is the academic expectation of scholars to achieve a win-win

situation. Agricultural science and technology information resources, as the primordial and basic data generated from agricultural research activities and the source of information for analysis and research, are important supports for scientific and technological innovation, and have great scientific value, economic value and social value (Gui Shuting, 2018). Digital agricultural science and technology information platform can save time and energy for researchers to find and analyze information, and grasp the latest frontier trends, so as to improve the efficiency of agricultural research output and promote the development of scientific research. The same is true for agricultural producers. Scholar Sripad K. Devalkar points out that the Indian government pays attention to integrating agricultural data and completing agricultural science and technology information database by using big data technology, which provides convenient, detailed and professional agricultural science and technology information for farmers and greatly improves agricultural production efficiency (Sripad K. Devalkar, 2018). In the era of big data based on the Internet and the media, the relationship between simple and active information transmission in the agricultural science and technology information service is broken. Not only the supply side of scientific research achievements can get the reflection of agricultural operators on agricultural science and technology in time, understand the adjustment of planting structure of agricultural operators, grasp the transformation effect of agricultural scientific and technological achievements. The main body of agricultural management can also retrieve relevant agricultural science and technology through various channels according to their own needs, greatly expanding the information acquisition space, and effectively avoiding the "bullwhip effect" of information transmission (Liu Min, 2019). To some extent, they have affirmed the powerful data analysis and processing technology under the background of big data, providing strong protection and path selection for the communication between the two main bodies of agricultural science and technology information service.

On the whole, from the perspective of agricultural researchers, with the help of comprehensive data and information platform, it is possible to share scientific research results and practical technology with agricultural producers in a timely manner, and understand the technological needs of agricultural producers and the feedback of technology use, and promote the innovation of new technologies once again. At the same time, the transformation of scientific research paradigm brought by big data enables agricultural science and technology personnel to discover new knowledge from massive data and improve practicability and pertinence of scientific research (Wu Bingfang, 2016). From the perspective of agricultural producers, we can quickly retrieve the required scientific and technological information, and timely feedback the problems and doubts in the application of new technologies, which can better meet the production needs, make agricultural inputs and outputs in direct proportion, which is a virtuous cycle of win-win cooperation (Li Lingping, 2016). This study uses an empirical analysis method to explore whether the role of agricultural science and technology information service based on big data on the supply side and demand side of agricultural science and technology information is consistent with the above theoretical ideas.

### **3 Empirical Analysis Process**

On the basis of collecting feedback on the supply and use of agricultural scientific and technological information in the major network information service platforms, this study explores the real prospect of the docking communication between the supplier and the demander of agricultural scientific and technological information under the background of current large data by means of questionnaire and field interviews and data processing and analysis.

#### **3.1 Index system and questionnaire issuance**

Combined with previous studies on this issue, we constructed an index system in connection with the actual situation (see Table 1), and designed questionnaires for two main subjects, agricultural researchers and agricultural producers. In view of the subjects of agricultural producers, a random sample survey was conducted at Yin Zu town and Li Bu Town in Huangshi city of Hubei Province, the town of Bu river, Cen he town of Jingzhou, Tuanshan town of Xiangyang City, Wolong Town, Tunpu township of Enshi City, etc. 120 questionnaires were distributed, and 112 valid questionnaires were collected, with an effective recovery rate of 93.3%. In view of the main body of agricultural researchers, a total of 46 questionnaires were distributed in Huazhong Agricultural University, Hubei biological science and technology Career Academy and other agricultural research institutes, and a total of 45 valid questionnaires were collected, with an effective recovery rate of 97.83%.

**Table 1 Index System**

Classification	Specific Indicators	
Agricultural Scientists	(X1) Research field	(X2) Browse feedback information
	(X3) Performance appraisal	(X4) Using feedback information
	(X5) Supply information frequency	(X6) Cognition of supply importance
	(X7) Required feedback content	(X8) Satisfaction with feedback information
	(X9) Cognition of feedback importance	
Agricultural Producers	(X1) Agricultural type	(X2) Browse supply information
	(X3) Agricultural scale	(X4) Adoption of information on Supply
	(X5) Educational level	(X6) Effect of new science and technology
	(X7) Income level	(X8) Cognition of supply importance
	(X9) Feedback frequency	(X10) Cognition of feedback importance
	(X11) Required supply content	(X12) Satisfaction with supply information
	(X13) Is there Internet access?	

### 3.2 Principal component analysis

There are many indicators showing the current situation of agricultural science and technology information supply and demand docking, which may have interactive effects. Therefore, this study adopts the principal component analysis method. After data standardization, the applicability of factor analysis was tested for the two sets of data, and the results showed that the method was suitable for use (see tables 2 and 3).

**Table 2 KMO and Bartlett Test Tables for Agricultural Researchers**

Kaiser-Meyer-Olkin Metric for Sampling Sufficiency		0.816
Approximate chi square		296.995
Bartlett Sphericity Test	df	43
	Sig.	0.000

**Table 3 KMO and Bartlett Test Tables for Agricultural Workers Producers**

Kaiser-Meyer-Olkin Metric for Sampling Sufficiency		0.887
Approximate chi square		296.995
Bartlett Sphericity Test	df	43
	Sig.	0.000

Secondly, the two sets of data are extracted by principal component analysis respectively, and the variance maximization method is used to factor rotations, and the variance contribution rate and factor load and factor load value of each factor are obtained. The cumulative variance contribution rate reaches 83.685% and 86.236% respectively, indicating that the overall situation can be explained better (see Table 4, table 5).

**Table 4 Conclusion of Factors Extracted from Agricultural Researchers**

Common Factor Naming	Variance Contribution Rate after Rotation	Factor Load and Factor Load Value
Group Characteristics	20.121%	(X1) 0.668, (X7) 0.723
Participation Enthusiasm	33.273%	(X3) 0.962, (X5) 0.969, (X2) 0.973, (X6) 0.957, (X9) 0.815
Participation Effect	30.291%	(X4) 0.976, (X9) 0.981

**Table 5 Conclusion of Factors Extracted from Agricultural Producers**

Common Factor Naming	Variance Contribution Rate after Rotation	Factor Load and Factor Load Value
Group Characteristics	21.692%	(X1) 0.912, (X3) 0.925, (X5) 0.931, (X7) 0.911, (X11) 0.721
Participation Enthusiasm	33.654%	(X9) 0.985, (X2) 0.972, (X10) 0.953, (X8) 0.897, (X13) 0.887

Participation Effect	30.890%	(X4) 0.982, (X6) 0.899, (12) 0.916
----------------------	---------	------------------------------------

## 4 Results

According to the questionnaire data and principal component analysis, it is known that under the background of big data, agricultural science and technology information service has not achieved the desired result. As agricultural science and technology information providers and agricultural producers of information demand side, there is no good interaction and demand satisfaction. We have summarized the current problems into two main points:

(1) The enthusiasm of the two sides is low: If we want to make the two main bodies achieve mutual benefit in agricultural science and technology information exchange, we must first have the support of data information (Wu Bingbing, 2015). In reality, most agricultural producers lack initiative in expressing their aspirations and providing feedback due to their low quality of science and technology, lack of information awareness and high cost of network infrastructure (Wang Zuzhu, 2015). At the same time, the research work of agricultural researchers is influenced by many factors such as policy orientation, market changes, interest distribution and so on. In addition, the limitations of farmers and the regional characteristics of information feedback will not completely determine the direction of scientific research and information supply according to the needs of farmers.

(2) The effect of communication is not good: Although the big data platform provides a carrier for information exchange, the operation mechanism of the platform is still not perfect. The gap between the two sides of information supply and demand in space and discourse system makes information communication gap, not only cannot fully tap the value of information provided by agricultural researchers, but also the farmers' demand for science and technology and feedback information cannot be targeted to reply and solve (Zhu Fangchang, 2017). For example, a farmer feedback strawberry malformation through the platform. The advice given by experts is to control temperature and humidity, soil moisture content. However, the lack of specific methods for measuring soil water content and controlling temperature and humidity has not solved the technical difficulties faced by farmers in actual operation.

On the basis of analyzing the realistic problems and focusing on how to build a large database and promote the mutual win-win situation between the providers and the demand side of the agricultural science and technology information providers, this study gives the following two suggestions:

(1) Agricultural science and technology database should be established according to the actual needs of different links in different agricultural fields. In all fields of agriculture, it can be divided into planting, forestry, animal husbandry and fishery. From the management of production process, it can be divided into facility planting, facility farming and precision agriculture. Agricultural technology may run through every aspect of agriculture (Meng Xiangbao, 2014). In order to make mass agricultural science and technology information play a substantial role, we need to build different databases based on categories. For example, the planting industry can be specifically divided into food crops, fruit, tea, cotton and so on, each of which can be specifically divided into crop seeds, irrigation, fertilization, pest control and other contents. Based on the characteristics of crops, a specific agricultural science and technology information database is established to ensure that agricultural researchers' information supply is classified and orderly, and the feedback information of agricultural producers can be followed.

(2) The construction of agricultural science and technology database should be focused and targeted. At present, it is still difficult to build a large database containing all agricultural science and technology

content, So for the emerging agricultural technology, we need to provide detailed data information and a convenient feedback platform for agricultural production personnel to understand and select, and timely feedback doubts and problems, in order to promote the improvement of new technology once again. For example, the popularization and application of new technologies such as planting Chinese herbal medicines and fruits will require more interaction and interaction between the providers of agricultural science and technology information and the needs. For rice and corn, the more regular crops will depend on the experience gained by farmers in actual production. This type requires less agricultural technology, so the construction of related databases can also reduce the pressure.

## 5 Conclusion

Based on literature review, this paper describes the ideal form of agricultural science and technology information service to promote effective docking between agricultural researchers and agricultural producers in the context of big data. Through empirical analysis, the gap between reality and idealized state is verified. The conclusion is that agricultural science and technology database should be divided into blocks and focused on targeted construction. This study still has some shortcomings, such as how to define the classification standard of agricultural technology categories and establish a more effective agricultural science and technology information service platform, which is the direction for further research.

**Abstract:** With the continuous development of big data technology, its application in agricultural science and technology information service has gradually attracted attention from all walks of life. This paper analyses the theoretical model of agricultural science and technology information service based on big data and the optimization and improvement of the traditional agricultural science and technology information service mode. It also analyses the feasibility of applying big data technology in contemporary agricultural science and technology information service and the problems that easily arise in the application process, and puts forward some countermeasures and suggestions.

**Key words:** Big data; Agriculture; Scientific and technological information service; Theory construction

### **1 Introduction**

In 2015, the State Council issued the Circular of the State Council on the Issue of the Platform for Action to Promote the Development of Big Data (Guofa, 2015). Under its guidance, the Ministry of Agriculture issued the Implementation Opinion of the Ministry of Agriculture on Promoting the Development of Big Data in Agriculture and Rural Areas (Nongshifa, 2015) on 31 December of the same year, which defined the overall requirements for the development and Application. But it can also be seen that, big data is still in the stage of development, and its application in agriculture and rural areas is not mature at present. The role of big data in agricultural science and technology information service is not fully reflected. Although the agricultural science and technology information service model based on big data has been widely praised by all walks of life in recent years, can this model really be widely promoted? What problems will it face in the actual operation process?

### **2 Research Status of Agricultural Science and Technology Information Service Based on Big Data**

#### **2.1 Limitations of traditional agricultural science and technology information service**

Traditional agricultural science and technology information service mode is easy to form "information island" in the process of information transmission (Liu Min et al., 2019). Under the new situation, farmers have the need to quickly obtain information on various kinds of breeding technology,

processing technology, market dynamics, policies and regulations, life science popularization and so on. However, the traditional rural science and technology information service still stays at the level of holding training courses, technical consultation and issuing technical materials, scientific and technological discs. It is difficult to meet the increasing demand of farmers for science and technology information (He Yijun, 2016). Traditional service mode is mainly one-way service, which can not realize the interaction and exchange of information. In addition, the traditional agricultural science and technology information service institutions are unevenly distributed, and farmers have a higher cost of obtaining information. For farmers, the access to information is single, the way is backward, and the basic conditions of rural science and technology information service are still weak. (Wang Haiyan, Shao Xiwu, 2010). After the tax and fee reform, the original agricultural technology extension station was cancelled, and the agricultural science and technology information service system also appeared incompatible phenomenon.

## **2.2 Advantages of big data agricultural science and technology information service**

Through the in-depth application of the Internet and big data, we can accurately understand the needs of farmers and make scientific and technological research and development more precise to connect with farmers. Using data management supply chain, data perception marketing, data guidance services, the use of data not only affects marketing but also can guide their "production" (Zhang Xingwang etc., 2019). Big data can enhance the ability of scientific research providers and industrial demanders to acquire agricultural science and technology information, expand the space for agricultural operators to participate in the transmission of agricultural science and technology information, thus realizing the sharing of agricultural science and technology information and eliminating "information islands" (Liu Min et al., 2019). Overall, big data can help to develop modern agriculture with high efficiency, safety, economy and environmental protection (Liu Fanglin, 2018).

## **2.3 Application of big data agricultural science and technology information service**

The French government has taken effective actions in integrating agricultural data and completing agricultural science and technology information database by using big data technology. With the help of the Internet, it provides farmers with convenient, detailed and professional agricultural science and technology information, which greatly improves the efficiency of agricultural production. (Song, P, Y Chen, 2015). Promote agricultural science and technology information service through Internet search data analysis, utilization of agricultural professional database and analysis and utilization of data from self-Media platform (Chen Shengwen etc., 2014). The application of large data of agricultural science and technology information in agricultural enterprises is also studied. Taking the Climate Corporation as an example, the model of integrating weather simulation, massive plant root structure and soil quality with large data is analyzed. It is pointed out that it is helpful for them to make more accurate comprehensive judgment on the prediction of agricultural accident weather risk (Hamish Barwick, 2016).

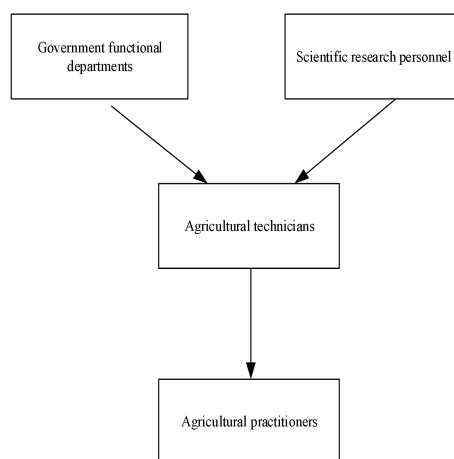

Generally speaking, scholars have made a thorough study on the advantages of big data technology compared with traditional agricultural science and technology information service mode. They have also made a comprehensive study on the application of big data and the existing problems, but they lack the theoretical construction of the application of big data technology in agricultural science and technology information service. In other words, academic circles focus more on applied research, while theoretical research is slightly inadequate.

### 3 Theoretical Construction of Agricultural Science and Technology Information Service Based on Big Data

With the continuous development of big data technology, its application field is gradually expanding. Before discussing the theoretical model of agricultural science and technology information service based on big data, we should first make clear what is big data. In *The Age of Big Data*, written by Victor Mayer-Schoenberg and Kenneth Cookie, big data refers to the analysis and processing of all data without the shortcut of random analysis (sample survey). Some scholars believe that large data is generally a large number of complex structures and different types of data aggregates, data processing based on cloud computing, relying on data sharing to form a resource body (Xu Meng, 2019). IBM proposes that big data has “5V” characteristics of volume, velocity, variety, value and veracity.

#### 3.1 Theoretical construction of traditional agricultural science and technology information service model

Traditional agricultural science and technology information service mode mainly adopts the way of "upload and download": government organs release policy information, laws and regulations related to agricultural science and technology, and scientific research institutes and agricultural colleges provide agricultural science and technology information. Through the study and dissemination of agricultural technicians, it is transferred to agricultural practitioners and radiated through "herd effect" (Fig. 1).

**Figure 1 Information Service Process of Traditional Agricultural Science and Technology**

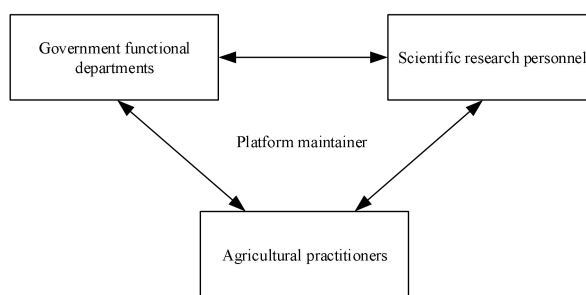

In this process, the information service of agricultural science and technology that agricultural practitioners can obtain depends on the degree of imparting by agricultural technicians. The whole process is transmitted from the first level to the lower level, that is, the agricultural science and technology information service obtained by agricultural practitioners is indirect and one-way, they can only passively accept, but can not convey their needs and wishes upward. Due to the limitation of administrative system, there are many disadvantages in the process of information transmission, such as long channels, many links and slow speed, which will lead to incomplete, asymmetric and untimely information acquisition by farmers.

In addition, the traditional agricultural science and technology information services will also use radio, television, newspapers, publicity materials and other media for information services. However, its drawbacks are also obvious. Radio and television are non-repeatable, which is not conducive to farmers

to learn a certain scientific and technological information many times; newspapers and publicity materials and other paper media can carry a limited amount of information, which is not intuitive enough only through text description and image display.

### 3.2 Optimization and improvement of traditional agricultural science and technology information service model by big data technology

Agricultural science and technology information service based on big data relies on Internet and cloud computing, and realizes information communication and sharing through unified data information collection and service platform. According to the principles of practicability, systematicness, ease of use, extensibility, comprehensive service and security, the agricultural science and technology information service platform is constructed. The network platform can replace the agricultural technicians as the link between the supplier and the demander of agricultural sci-tech information service, avoiding the inadequate information transmission and information distortion and error caused by the uneven technical and cultural levels of agricultural technicians (fig. 2).

**Figure 2 Agricultural Science and Technology Information Service Flow Based on Big Data**

There are two main sources of data. One is to carry out field measurements by manual means, that is, farmers themselves or other agricultural professionals, and input the collected data into a unified data collection platform. Second, through the modern Internet of Things technology, the environment can be monitored 24 hours in real time, and the data can be automatically transferred to the platform. These data include the application of an agricultural technology in different environments. Every farmer will transfer the data from his own production process to the platform, which can be aggregated into a huge database. After the original data is transferred to the platform, the data are classified and analyzed by technicians. Some simple data processing can be automatically completed by computer. Through the technologies of de-duplication and noise reduction, data storage, fusion and big data mining analysis tools, the classification subjects of agricultural planting and breeding are analyzed. Information processing intention, remove useless or false information, classify surplus information data, form different types of databases, and automatically generate background information such as source data, access to data and environment. The results of the analysis can guide the information suppliers to provide more targeted agricultural science and technology information services. The main body of information supply can directly provide information to the platform. For example, the staff of government departments can update the relevant policies, measures, laws and regulations of agricultural science and technology on the platform, and the researchers can send relevant scientific research information and achievements.

According to the source channel and type of information, the platform can be divided into different modules, such as integrated information service module, agricultural technology service module, online education and training module, expert online consultation module, agricultural scientific research

information module, etc. A set of systematic and structured agricultural science and technology information service database is formed through the combination of audio and video. Agricultural practitioners, such as farmers, agricultural enterprises and cooperative organizations, can directly obtain the required information from the platform. If the demand can not be met, they can also feed back the demand to the information supplier through the platform, thus realizing the effective connection between the supply and demand of information. This platform can be presented by many terminals, such as website, mobile phone APP, etc. Compared with the traditional agricultural science and technology information service mode, it is more convenient, fast, accurate and efficient.

## **4 Practical Problems and Countermeasure Suggestions on the Application of Big Data in Agricultural Science and Technology Information Service**

### **4.1 Practical problems of big data application in agricultural science and technology information service**

#### **4.1.1 Problems in data acquisition**

Big data needs to be supported by a sound and perfect network system, but the survey shows that in 2018, the scale of rural netizens in China is only 222 million, and the Internet penetration rate is only 38.4%. At present, the digital and networked environment in rural areas has not yet formed, and there is a lack of hardware facilities to provide data. In areas where the Internet has become popular, there are also problems that farmers can not provide accurate data. Taking the implementation of an improved variety as an example, it requires farmers to have a comprehensive understanding of the relevant situation of planting, but in practice, farmers often have difficulty in grasping comprehensive land parameters, such as temperature, humidity, soil acidity and alkalinity, seed development and so on. Due to the limited scientific and technological quality and cultural level of most peasants, it is difficult to guarantee the comprehensiveness, authenticity and reliability of the data.

The cost of organizing measurements for agricultural professionals is high. Moreover, the location of agricultural industry in China is mostly in undeveloped areas. It is impossible for professionals to survey all areas, to observe and monitor these areas for a long time, and to ensure real-time data. Although the accuracy and timeliness of data can be guaranteed by using Internet of Things technology, China's agriculture is dominated by small-scale production, the cost of Internet of Things will be high, and the level of agricultural automation in China is low, so the data of fine operations can not be obtained.

#### **4.1.2 Problems in data arrangement and analysis**

How to classify and organize massive data is also a big challenge. At present, there is no uniform criterion for the division of agricultural fields in academic circles. Before 1990s, agricultural information was customarily divided into four categories: agriculture, forestry, animal husbandry and fishery. However, with the development of science and technology, such as "shrimp-rice co-cultivation" technology and other types of symbiotic agricultural models have emerged, the traditional way of division has been unable to meet the needs of reality.

Big data is a huge amount of data with complex structure and diverse content. Its requirements in data analysis, processing and storage are much higher than other traditional databases (Chahaixia, 2019), which can not be separated from the support of human resources, and must be a professional with agricultural and computer technology background. However, due to the emergence of big data as a new

technology in recent years, there is still a lack of relevant professionals. The difference between the agricultural science and technology information service based on big data and the traditional agricultural science and technology information service lies in the diversification of its service objects, from a single farmer as the object to a variety of agricultural industry practitioners and scientific researchers. Obviously, there is a huge gap between farmers and scientific researchers in cultural level and scientific quality. Whether farmers can understand some professional terms, and whether the popularization of professional terms will lead to distortion of original intentions, all these need a large number of professionals to solve.

#### 4.1.3 Problems in data export and platform construction

The greatest advantage of applying big data to agricultural science and technology information service lies in the realization of information communication and sharing, which can not be separated from the perfect legal mechanism, operation mechanism, management mechanism and supervision mechanism. From the point of view of the legal system, the relevant laws and regulations for the application of big data in agricultural science and technology information service are not perfect. There is a lack of policies and regulations to promote agricultural rural informatization and data construction in line with the actual situation in rural areas, and a lack of unified standard system and operational norms. The division of powers and responsibilities of the functional departments of agricultural science and technology information service is not clear, and there is a phenomenon of multi-department management. The main body of scientific research information supply is more diverse, who will supervise them and how to supervise them, who will supervise them after the establishment of a unified data information platform, whether a special department should be set up for this, and so on. These problems still need to be solved. In other words, the agricultural science and technology information service model based on big data lacks a perfect institutional environment.

### 4.2 Countermeasure and suggestion

#### 4.2.1 Perfecting agricultural infrastructure and improving scientific and cultural quality of farmers

The state should increase financial support for agricultural science and technology information service based on big data, promote infrastructure construction in rural areas, and provide material basis for it. Promote the popularization of the Internet and broadband, and provide appropriate financial subsidies to some poor areas, so as to reduce the cost of using the network, realize that every household has access to the network, and build a perfect information network system. Publicize the advantages of big data agricultural science and technology information service to farmers, cultivate network awareness and information awareness, take villages as units, improve the ability of farmers to apply network through collective training or one-to-one counseling. At the same time, it is necessary to train farmers and related personnel in data acquisition ability so as to collect real and effective data resources.

#### 4.2.2 Attracting and training professional talents

The government can vigorously publicize the good prospects of agricultural science and technology information service model based on big data, and improve the talent introduction system through policy guidance. In the educational system, courses related to this can be offered, and talent transfer agreements signed between relevant departments and educational institutions can solve the problem of talent scarcity from the source. For those who have already taken office and have mastered Internet technology, targeted training related to agriculture can be carried out, so as to train more professionals with both agricultural and computer technology background. At the same time, by improving the salary and treatment of such talents, and improving the incentive and incentive system, talents will be absorbed into the construction of large data agricultural science and technology

information service.

#### 4.2.3 Establishment and improvement of management and supervision mechanism

In view of the agricultural science and technology information service based on big data, the government should take into account all aspects of the specific situation and issue a set of perfect rules and regulations to clarify the distribution of powers and responsibilities of various departments. Coordinating government departments, agricultural enterprises, scientific research institutes and agricultural colleges to build a standard system of large data agricultural science and technology information service, and to establish industry norms. Establish error correction system and emergency system to remedy problems in the operation of the platform in time.

## 5 Conclusion

Big data is a new technology in the Internet era. It has a wide range of applications, and it will continue to improve and innovate in the process of social development. Compared with the traditional agricultural science and technology information service model, the agricultural science and technology information service model based on big data has significant advantages. However, due to the high technical content of agricultural science and technology information service based on big data, the uneven scientific and cultural quality of the service objects, and the imperfection of related facilities, many problems will arise in the operation process. These problems can not be solved in a short time. To improve with the continuous development of big data technology, we need not only the support of the state and government, but also the practice of social enterprises and agricultural personnel. Only in this way can we seek new vitality for the development of agricultural modernization in China. Keeping up with the trend of social development, China's agricultural economy will not lag behind, and China's agricultural economy will be able to achieve substantial and sustainable development.

# Research on University Library Self-built Resource Repositories in a Big Data Environment

Sha Zhengyu

Library, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: 4261731@qq.com)

**Abstract:** Through the literature statistics analysis, the paper describes research on self-built resource construction of university library repositories in recent years, trying to furnish theoretical basis of the transformation of university library self-built resource construction. Starting from the existing situation of the library, it discusses the influence of big data onto university library data, resource construction, service for readers, teaching, scientific research and librarians, finally, proposes innovative self-built resource repositories for university library in the era of big data. A new self-built big data management system should be established, to provide highest quality services for teachers and students.

**Key words:** Information resources construction; Self-built resource repositories; University library; Big data

## 1 Introduction

By the end of the last century, internet technology had developed rapidly and internet information had shown explosive growth. From the beginning of this century, development of the open-access movement provided free, quick and up-to-date research sources to others. On such an international scale, while purchasing digital databases, many university libraries began to build their own repositories, such as subject information portals, special repositories, etc., which collect freely available resources or open access to provide a strong supplement for academic services.

To date, according to statistics in progress, the number of self-built repositories for 985-Project sponsored university library in China was more than 190, library self-built repositories forming a certain portion (Chen Si et al., 2016). However, the existing repositories have gradually fallen behind the progress of science and technology. Library service has gone through the process of resource services, information services and knowledge services during this period. Those repositories information and services could no longer meet the rapidly changing needs of users. Now they need information immediately (Su Xinning, 2015). Taking the subject information portal as an example: many university libraries have used the subject knowledge service platform to replace those old repositories, using them to take advantage of the latest technologies. Digital resources of new platforms became more frequent and the organization of resources is more standardized, it could also adapt to new demands of users. The old subject information portal became increasingly difficult to develop, and other types of self-built repositories also faced similar dilemmas as subject information portals.

In a big data environment, great changes have taken place in data sources, database technology and database application. So, the old library self-built repositories need to find new ways to develop. The purpose of this paper is to analyze and review research of university library self-built repositories and find better ways to facilitate their improvement.

## 2 Database Analysis

### 2.1 Literature statistics analysis

We used the China Academic Journal Network Publishing Database (CAJD) as literature sources to research the statistics of self-built university library repositories based on publications between 2006 and 2018. A total of 1264 journal articles were retrieved. In core journals, with the same search conditions, the scope of Journals with the search limited to SCI source journals, EI source journals, core journals, and CSSCI, 312 papers were retrieved. The calendar year data is shown in Table 1.

**Table1 Statistics on the Publication of Library Self-built Repositories in China**

Sector	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	Totals
Papers	64	74	94	120	125	123	124	115	125	97	62	71	70	1264
Core papers	15	14	23	36	43	38	42	35	24	14	8	11	9	312

In Table 1, from 2006 to 2008, the number of research literature in self-built repositories is on the rise, and the number of core papers is also increasing. From 2009 to 2014, the number of research literature is large. At the same time, the number of core journal papers has also increased significantly. From 2015 to 2018, the number of research papers began to decrease. The trend of the number of publications in core journals is the same.

Through analysis of changing trend in number of literature, it can be concluded that the research on library self-built repositories has been on the decline. From the actual situation, the amount of papers published in the self-built repositories for university library is basically consistent with the actual situation of self-built repositories for universities. Under the new technological environment, the development of such is in on decline, but in the case of development, it continues to be sustained.

From CAJD, through statistics of research literature about library self-built repositories in big data environment for universities, 205 pieces of literature were retrieved, of which 39 papers are in the core journals (Table 2).

**Table 2 Statistics on the Publication of Resource Construction in the Context of Big Data in China**

	2013	2014	2015	2016	2017	2018	Totals
Papers	3	18	38	48	39	59	205
Core papers	1	5	9	9	6	9	39

The research literature about library self-built repositories in big data environment has been on the rise in recent years, so have been the core papers. It can be seen that the related research about library self-built resources gets involved in the context of big data, the research is still in its budding stage.

### 2.2 Research field

When we analyze the content of 303 core papers from 2006 to 2017, it reveals that nearly 200 papers are discussed around resource construction. The relevant papers mainly focus on quantity statistics, resource types, database technique, digital resources sharing, existing problems of resources

construction, network platform, library service, as well as intellectual property rights and evaluation systems of the self-built repositories. The theoretical research can be classified into three stages: the first stage: discussion of the theory about the necessity of self-built repositories; the second stage: affirmation and study self-built repositories; the third stage: theoretical regression, summary and inductive analysis (Lin Zengxing, 2018; Chen Shanmin, 2017).

In general, the content of existing self-built resources research is mainly based on experiences and review, while the number of research papers on their construction in the background of big data is limited. The research is in the initial stage of theoretical discussion and case analysis. Xiao Ximing pointed out in the "Hot Issues of Information Resources Construction in China from 2013 to 2015" through literature and data analysis that big data and information resources construction is a heated issue in the field of information resources construction in the past three years (Xiao Ximing et al., 2016).

### **3 The Impact of Big Data on Libraries**

#### **3.1 New data environment**

Most of the existing self-built library repositories are mainly concentrated on scholars' databases, academic paper databases, dissertations & amp. thesis databases, special databases, etc. These repositories use different management platforms to access and manage data. Users end up searching every repository to find the information they want, or retrieve the same data from different repositories, which is obviously unreasonable.

In a big data environment, the characteristic of the library has been generalized quantification, relevance and diversification (VANESSA J, 2017). Great changes have taken place in the content and types of library data. At present, most of these library's affairs already have quantitative data, such as library equipment and sensor information. Besides, library user behavior data, library digital resources analysis data, data of library data usage analysis, institutional repository data, and the existing library self-built repositories data compose big data collection of library.

In view of the goals of providing services for university discipline construction, teaching, and scientific research, the university's data onto teaching and research should not be ignored too. Various valuable information on the internet is also necessary for the library's self-built repositories, such as research project application information, conference information, scientific research data, social data on mobile platforms, event report data, etc.

By collecting the scattered data using acquisition technology and obtaining these structured, semi-structured and unstructured heterogeneous bits of data, self-built repositories can use this greatly to their benefit (Zhang Hong, 2016).

#### **3.2 New technology**

Big data technology development makes it possible to provide alternative solutions to replace those old self-built repositories. At present, the development of artificial intelligence has made a qualitative leap. The rapid development of computer hardware and software supports the improvement of computing power and the breakthrough of core algorithms. In such an environment, libraries should combine resources with new technologies, innovate and deepen services, and provide a good platform for personalized learning (Liu Wei et al., 2013).

Based on non-relational database technology, the new library self-built repositories could be

constructed to realize a unified data storage and management. Through cloud computing, we can create indexes and identifiers for data, which help to realize search, association, visualization, analysis and application of data. Data mining should become an effective tool to find hidden valuable information on the repositories too. Rapid development of acquisition technology can help us obtain various kinds of data, such as using a web crawler to help us get whatever sort of information we need from the web. For new library self-built repositories, the semantic web is used as the knowledge representation. We could expect effective application of other technologies to improving library service, such as artificial intelligence or machine learning techniques.

We believe that more and more new technologies could help us attain our objectives in work, as the application of new technologies in the library has become an irresistible trend.

### **3.3 Changes in user's demand**

In the face of massive data, users' needs have changed a lot user requirements for resource acquisition are time-sensitive, diverse, comprehensive, accurate, easy to obtain, personalized, etc.

The different individuals or background difference between the users leads to the diversification of the user needs. The personalized needs of users require the library to fundamentally change from the concept of resource construction and service.

Data in a big data environment is changing rapidly. If the information lacks effectiveness, it will lose its value. Users are eager to get real-time information quickly with simple and efficient means.

In the traditional mode, the library only provides readers with book lending services, electronic resources services or network resource information services. However, the user demand has changed dramatically from the big data thinking mode. They need more than just information resources, but also expertise, research hot spots, research frontiers, and research data (Sun Yongsheng et al., 2016; Gao Lin, 2015). What they need is not a piece of information, but the reorganization and analysis of the processed information. More and more users are looking for forward-looking, comprehensive and systematic knowledge services.

Under the support of mature technical conditions, users have higher requirements for the comprehensiveness and accuracy of accessing resources.

## **4 Transformation of Library Self-built Repositories in a BigData Environment**

### **4.1 New platform**

The new data environment and data technologies make it possible to build new library self-built resource platforms.

Through the new platform, we can collect library big data through data extraction technology. Library big data usually comes from sensor of library, library automation system, social network data on mobile devices, library service platform, Network data, database, System log, etc. We extract the required data from these data sources and clean inaccurate data. After filtering and rejecting incorrect data, the data is finally converted into a predefined data model according to requirements, and loaded into the data warehouse. Various types of structured, semi-structured and unstructured massive data support high-quality data services of library (Huang Chuanhui, 2018).

Through the new platform and data warehouse, we can achieve a more flexible resource clustering method. Based on data clustering, the library can analyze various data clustering and find rules to formulate strategies. Based on data clustering of thematic, libraries can provide a variety of content-riches thematic information services. Based on data clustering of user characteristics, personalized data collections can be pushed to users in time too (Du Hui et al., 2015).

Through the new platform, we can analyze user behavior by analytic visualizations, data mining algorithms or predictive analytic capabilities, researching user needs and personalized characteristics, pushing more reasonable personalized service content. Through analysis tools, library can analyze resource utilization and find potential causes that affect resource utilization, seeking a more reasonable resource allocation method and improving the quality of resource services. Through statistical analysis of data, combined with work experience, it will help us improve the efficiency of library work.

#### **4.2 New service**

Big data has not only brought changes in our lives and businesses, but also brought changes in our thinking models, which affected the development of all walks of life. In a big data thinking model, the data we need is on a full scale. Correlation between data is not necessarily a causally maintained relationship, but even the wrong data can be related data. Following this, libraries can gather the user's characteristics and requirements. Accordingly, library can provide users with new services catered for their needs (Guan Sifa, 2015).

First, the library can provide personalized services, such as online open classes, books, or documents that users are interested in. Personalize library services such as academic news services, research hot spot services, latest conference information services and personalized learning program customization services are also available.

Second, it can improve subject services of the library. Using big data technology, flexible resource clustering can be used to reveal a discipline theme. Data mining technology can help us find the potential relationship data onto some theme, which enrich the content of library subject service.

Third, it can deepen library disciplines service (Huang Weiling, 2016). By mining the self-built resource data onto the library, the library can obtain a large amount of data, such as scientific research activities, library literature coverage, utilization, scientific research output, and development trends. These kinds of data can provide more comprehensive and flexible information support for discipline building.

Lastly, we can make library's unified retrieval platform base of library self-built repositories, which can coordinate the accuracy and completeness of results better. Through the new library self-built repositories, users can gain knowledge service directly, not only information or data service.

All in all, more new models of library services based on big data technology are expanded to deepen the library service level. It provides supporting for teaching work and scientific research in universities, such as timely tracking services and scientific research data services.

#### **4.3 New ways of working**

The important point of this way of thinking is that all things can be quantified by data. Based on the collection and analysis of the library affair data onto new self-built repositories, we can have insight into the user's behavior preferences. As according to such, we can evaluate or forecast library affairs. For example, by analyzing the use of library resources, we can understand the success or failure of its construction strategy. Accordingly, the optimization scheme could be formulated for more rational

allocation of resources. By analyzing usage habits of library users, more suitable opening hours and space arrangement of libraries can be discussed. A library development trend can be predicted through big data, which can help library managers make a decision.

The research and practice of library self-built repositories can inspire the librarians to improve the professional skills and data analysis capability through learning. In our era of big data, data-driven decision has revolutionized all walks of life. If we can be good at analyzing data, we can improve personalized services through user behavior data analysis, analysis discipline research on hot spots, and predict discipline development trends through literature analysis, or make new library construction strategies by library affair data analysis. It is important that librarians should have the capacity to work with data collection, data sensitive and logical analysis. Combining work experience, human creativity, lifelong learning, communication, and innovation can make the library self-built repositories develop maximize their efficiency.

## 5 Conclusion

Driven by the “Double-first-class” construction goals, higher requirements are placed on library digital resource construction and services (Zhao Limei et al., 2019). In the big data environment, we should get rid of traditional thinking and subjective speculation. As an indispensable part of library resources construction and self-built repository construction, we need to establish a new repository management system. Based on mass of data onto new repositories, new application technology should be used towards scientific prediction, rapid decision-making and responses, such as big data analysis or big data visualization. It can help us to maximize the value of big data library resources, and new repository management systems will provide ever-changing service through application technology too. The transformation of self-built repositories will help us deepen the service libraries can provide and improve the efficiency of their utilization. Therefore, the proposition should be looked into further because it is essential to maintain any library’s longstanding healthy and sustainable development.

# Universal Conceptual Intelligence Structure Based on Visual Intelligence for Automatic Recognition of All Objects Without the Big Data

Xu Xuetao,

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R.China, 430070

(Email: xuxuetao@whut.edu.cn)

**Abstract:** Sheer fiddling with data regardless of concept, the three elements of big data, computing power promotion and good AI algorithm of traditional AI can't bring real, understandable AI. To achieve semantic intelligence with the aid of semantics is logically ridiculous, from concept to intelligence is a prospective way. Concept is not only the basis of brain intelligence, but intelligence itself because the formation process of concept is visual intelligence driving and thus make concept an intelligent structure, which further makes the conceptual neuron network emerge conceptual intelligence as logical reasoning and semantic thinking. Conceptual intelligence of system 2 is based on visual intelligence of system 1. Visual intelligence is that our brain making classification is not based on absolute difference but on the visual proportionality of relative difference. Concept intelligence is that concept and neuron are structurally isomorphic. Classification is not based on similarity, which in nature is relative difference, nor the classify-as, which in nature is classify-into. Single concept has several transverse dendrites and a longitudinal nerve axon, transversely, each connecting path in each single cognitive domain with the relative big difference relations, which found the semantic intelligence of conceptual association and logical reasoning, fuzzy operation and simultaneously result accuracy. Concept can be precisely positioned by an aggregation of several big differences relations in multi-cognitive domains. Longitudinally, axons are the information channels where the remaining information of small differences from the upper conceptual classification transmitting to the next concept of the network to continue the fine classification. Classification is based on the proportion of differences in the same cognitive domain, each time according to the principle of big differences, from big to small differences as peeling an onion.

**Keywords:** AI; Relative Difference; Visual Intelligence; Proportion; Conceptual Intelligence

## 1 Introduction

At the 2018 CCF-GAIR conference, academicians from many top colleges or universities around the world discussed the defects of the deep learning algorithm as well as the neural network structure and the limitations of "big data". Professor Ma Yi<sup>1</sup> talked of the limitations of 'big data': "taking image processing as the example, billions of data are still 'small samples,' the amount of data that can really train a good model tends to be infinite, but even with big data to train the model, there is still an essential difference from the ideal intelligent model". As to the limitations of DNN structure, he stated

---

<sup>1</sup> Ma Yi, professor of the Department of Electronic Engineering and Computer at the University of California, Berkley.

that “with a small change in the imported data, there will be a great change in classification, the problem of the algorithm lacking of robust has not been solved until now. They say that Neural Network is the bigger, the better, the deeper, the more accurate, that is nonsense.” Many companies reported that even under a training of a large number of samples and that the accuracy of the trained system model is as high as 99%, the system would still make a lot of retarded mistakes and easy to be interfered with in the practical application.

Realizing the size of the data "big or small" is not decisive, Academician Zhang Ba, dean of the School of AI at Tsinghua University, pointed out that “the three elements ‘big data, computing power promotion and good AI algorithm’ of traditional AI can’t bring real intelligence. “The current AI can only follow the rules, it has no flexibility and the intelligence people want. The current basic approach to AI is flawed, so we have to work towards an real, understandable AI”.

Academician Zhang is insightful, he realized that the three elements of traditional AI can’t bring real intelligence, and most likely, he realized the problems of traditional data, so he comes to semantics, but the semantic vector space he presented as a solution is theoretically imperfect, it has insurmountable problems and technically impossible. Zhang says that lacking common sense is the reason the machine lacking reasoning. This is surely a brilliant idea! But how? He says that “The first step towards real, understandable AI is to build a common sense base for machines”. “Through embedding to turn symbols into vectors as far as possible to keep the semantics not lost.” “the second step is to raise the feature space to semantic space by unifying the perceptual and knowledge world”. “The key is to convert the obtained scalar data into vectors to use them on the machine”, but so far, he says “to combine behavior (eigenvector) with data (symbolic vector) into the semantic vector space or to project perception and cognition into the same space to establish a unified neural network to realize semantic understanding seems difficult”.

Academician Zhang’s deep insight coincides with our long-term conviction that the pure data-driven system, or sheer fiddling with data regardless of concept, no matter how brilliant the algorithms is, can never produce real intelligence. We are not surprised at the failure of the three elements. Wrapping imbecile with elegant words of “training results unstable, algorithm not robust” can’t cover the fact of results computing wrong. The current algorithms are based on probability and statistics. Complexity and clumsiness are twins. Taking the face recognition and the auto-driving as examples, to display one time of a printed striped paper in front of the camera, the whole AI system will immediately collapse. Can we call that intelligence? Therefore, analyzing the current technology problems to put forward a new scheme to realize real understandable AI become this paper’s focus.

## **2.Rational: From Semantics to Intelligence is no Better than From Concept to Intelligence**

### **2.1 Semantic vector space as the solution is impractical**

To achieve semantic intelligence with the aid of semantics is logically ridiculous, that’s to put the carriage before the horse. No intelligence, no classification, which as a higher intelligence produces concept, concept with conceptual intelligence produces language. Higher intelligence is based on lower intelligence, both classification and conceptualization have intelligence and all is the products of neuron network. That is, intelligence produces language, not on the opposite. Analyzing language to make an intelligent machine is like analyzing thunder to make a lightning machine. The method Academician Zhang offered is an amelioration to or born from the traditional methods of knowledge map or language processing. Their common ground is from semantics to intelligence. In my opinion, it is hard to reach the right meaning of words by cutting words out of sentence. Sometimes, a sentence can be a big

concept and is inseparable in semantics. For example, Chinese have a like to say “zuo dian ti”, which in English is “sit elevator”. English speakers may wonder why Chinese use “sit” instead of “stand”? Chinese explained to them that “sit” here just means “stand”! “sit” means “stand”? See what I mean? Sentence is beyond analysis. “zuo dian ti” is more like a concept than two words. Concept is the smallest complete meaning, it can as small as a word, as big as a sentence. Both words and sentence are representations, representation of meaning and both can associate with real scenes. People know that the specific meaning of a word is determined by the sentence, and the sentence as a whole by bigger context, but few knows it’s the sentence instead of the word that firstly mappings the scene. Saussure said that language segments the world. He was saying language, not words. It indicates that it’s sentence firstly mapping the scene. Lexical meaning comes from sentence decoding or scene decoding. My daughter Snow white, before learning to speak, at the 7<sup>th</sup> day of her birth, flushed her face, furiously spited out one sentence “wo da shi ni men”, in English “I beat you to death” while her mouth was forced open by a spoon and fingers that four people pressed her on bed to feed medicine. I tell this story with the risk of being treated as a liar, but even though, I decide to be brave to let the truth spread. Of course, after that, she was incapable of talk until one years old, actually she knew the lexical meaning of “ I, you and death” about two years old. How can a person use the right sentence in the right situation while fully unknowing most of the words in the sentence? But this is beyond dispute especially when we spot some trendy adults learning to speak only one whole sentence of “I love you” in French, Russia, or other unknown language while fully unknowing how many words in the sentence utterance, but this doesn’t hinder them from using the sentence rightly and being welcomed. I brave this story out not to prove how my daughter is, but to explain how great Saussure and the real language acquisition process is. I never mean to treat my daughter’s story as an experiment or a proof, but it reveals two basic facts: firstly, it is sentence that firstly mapping the scene, that sentence decoding is much later. Secondly, before sentence mapping the scene, situations or reality had been roughly classified and learned by brain, this means concept or concept system is developed before and independent of language system, that’s why animal can carry out simple think with no language. Universe starts from one sound of “Bang”, the first sound of baby’s talk “ah” or “cry” contains all the words throughout his life. As one fertilized egg splitting into a complex body, the simplest "ah" can split into human language. Undecoded sentence as a whole mapping different scenes which concept system classified, then the meaning of the classified scene is transferred to the associating sentence, then sentence gains its meaning. Different pronunciations between two sentences mapping the different scene features between two scenes, “difference mapping difference”, words with different pronunciations are decoded.

Our brain receives speech sound more like that of the tape recording: voice is continuous and there is no clear boundary between the pronunciations of words, the whole sentence including dialect features in the pronunciation in whole are copied down truthfully, the accent, tone and even para-language of a family can pass on to the next generation, everything indicates that sentence in the form of physical wave is wholly copied down by brain, and then as a whole to associate the real scene. This can explain why a word or a sentence has so many pragmatic or contextual meanings, it turns out that the polysemy is determined by the fact that it’s the sentence which firstly associates different scenes. Contextual meaning determines the meaning of a sentence, and the meaning of a sentence is decomposed into vocabulary, so the meaning of a sentence can be expressed by wrong words or even words with the opposite lexical meaning.

All in all, the way to dig words out of the sentence to extract meaning is fundamentally wrong. Chinese have an old saying “cutting paragraph to extract meaning is ridiculous”. The semantic vector or common sense base is of little value even if it was established in such a way for semantics extracted in this way with a large number of polysemy and no way to mapping specific scene. We don’t need to analyze the pragmatic meaning of vocabulary, because the pragmatic meaning of words originates from the conceptual meaning produced by conceptual classification, which is independent of language, the

pragmatic meaning can be acquired from the real scene cognition which includes visual recognition(see figure 1:one of the equation I developed), object classification and the classified backgroundlization.

$$\text{spacing between object and its background} = \frac{\text{Binocular visual aberration of the object}}{\text{Eyes spacing}} \times \text{spacing between object and the midpoint of two eyes}$$

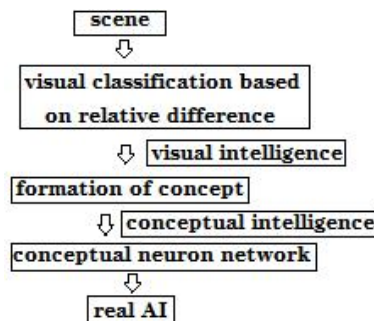

**Figure 1 Visual Intelligence: Visual Recognition and Backgroundlization**

By the way, we need to note that classification is to facilitate thinking efficiency by fading the classified things into background to meet the fuzzy dealing. In another word, background is also the category for fuzzilization or edgeinglization, or more simply, classification is backgroundlization to release brain’s calculation burden.

**2.2 From concept to intelligence is a realistic and prospective way**

Sheer fiddling with data regardless of concept can never produce real intelligence, that’s why both Probability Statistics and Pure Mathematical Fuzzy Logic Calculation can’t achieve real intelligence. Probability Statistics uses pure data calculation technology to drive the system, which makes machine can only execute instructions, lack of flexibility. Though the fuzzy logic is not considered using of Probability Statistics, but as long as it remains to be the past like of mathematical reasoning and logical programming, the conceptual logical reasoning and semantic thinking will never be realized. The current computer, it is either 0 or 1, but there are a lot of uncertainties between 0 and 1. Is there a contradiction between achieving the result accuracy of either 0 or 1 and achieving that accuracy by simultaneously using a fuzzy calculation process? The answer is “no”, provided we abandon the outdated mathematical scheme of current fuzzy logic operation and replace it by a new model we called the neural network of conceptual intelligence structure(NNCIS)( see chapter 3).

Intelligence requires accuracy, accuracy requires fuzzy, so intelligence requires an intelligent conceptual structure. Simplicity and fuzzy calculation should be the features of physical structure of neuron network instead of the features of algorithms. If we can use physical structure to replace algorithms to directly produce intelligence, we don’t need algorithms at all. We’d better believe that real intelligence is produced by the structural connecting details of neural network and the data inter-connecting relationship, and both are owing to nature’s harmoniously physical neural network design than by advanced algorithms or the data abundance. Creator’s hand to create intelligence is intelligent that in our brain there is no algorithms, so both the neural network structure and the data produced by the neural network structure are inevitably with spiritualism.

**Figure 2 the Process to AI**

So, the solution is we have to descend to the formation of concepts to study the visual principle of contrastive classification. Since concept is based on the scene, so the semantic intelligence is related to visual automatic classification intelligence. Conceptual meaning and the establish of conceptual neuron network must be based on real scenes, that is, concept intelligence is based on visual intelligence. Lexical meaning is mainly pragmatic meaning, which derives from the conceptual meaning, and conceptual meaning originates from the visual classification of things. The process to realize AI (see figure 2). The value to study the visual classification process of the conceptual meaning formation is far greater than only to study the superficial meaning of vocabulary from the level of context.

As long as the NNCIS can automatically learn from the automatically visual classification and the algorithms will immediately lose its significance. As to the distributed storage and extraction technology of information in NNCIS, iteration, recurrence manners are important, because the process to store and extract information must be accurately reversible. To the latter area, we don't pretend we know everything at the present time, but we know that the data of relative difference classification can be represented by 0, 1 which coincides with the machine code (see chapter 3), that is, to use visual intelligence to automatically establish conceptual intelligence to achieve real, understandable AI is methodologically feasible.

### **3 Conceptual Intelligence Based on Visual Intelligence as the New Direction**

According to Daniel Kahneman, there are two systems—the system 1 and system 2 in our brain. System 1 operates automatically and quickly, with little or no effort and no sense of voluntary control. System 2 allocates attention to the effortful mental activities that demand it, including complex computation. Kahneman's division is simple and useful, but we should understand that system 1 is the basis of System 2 and that his division is just functional. Structurally, regarding system 1 as the upper layer or peripheral part of system 2 is not accurate, taking visual intelligence and conceptual intelligence as the example, based on my research, they are respectively of system 1 and system 2, but both are the products of the same neuron network, so their relationship is actually “one same neural network, two reversible processes”.

Visual intelligence, which is of System 1, refers to the automatic process of visual classification by producing inner-connected visual data to form and position concept, it is a datum forward polymerization process, while conceptual intelligence, which is of System 2, refers to the process to use the inner-connected data produced by the visual classification of system 1 to activate conceptual connecting to carry out conceptual reasoning, which is a datum reverse divergence process.

To find out what happened to system 1 or what visual intelligence is the foundation to understand and achieve the function of system 2 or conceptual intelligence. Apparently, difference to classification is the foundation to make judgment and choice. The reverse is more illuminating: being able to make a judgment or choice in itself is the sign of intelligence and the ability to conceptualize based on classification. That is, classification is the basis of conceptualization and intelligence. But the question is why conceptualization or a conceptualized neural network can produce intelligence only when conceptualization is based on visual classification? The answer is that the process of visual classification and conceptual classification themselves have the intelligence: the visual proportional classification intelligence based on relative difference and the multi-cognitive domain positioning intelligence (see 3.1).

### 3.1 Principle of visual intelligence: law of visual proportional classification in single cognitive domain based on relative difference comparison

Since human operates visual classification and conceptualization automatically and quickly, so the process of visual classification to achieve intelligence, of itself and of the conceptual formation process are of intelligence. Because comparison is mainly carried out within a single cognitive domain each time, and considering visual automatic classification is the major content of system 1, so we just choose one single visual cognitive domain from all the cognitive domains as the example to illustrate the visual automatic classification principle of brain.

The comparison of two images or concepts is considered difficult to identify the differences. We know they are different, but can't tell what exactly the differences are, this is actually we don't know why they are different, or what makes these differences?

I find that vision has intelligence in its classification and further the concept formation has intelligence. Let's use three numbers of "10, 5, 2" as the example to illustrate the visual intelligence. To be more intuitive or direct, I drew three straight lines in the left Picture with respectively the accurate height of "10, 5, 2", and the transverse distance between them is equal(see figure 3). Before comparing their heights, we should understand that there are absolute differences between each them two and relative differences among them. According to the absolute difference, since  $10-5=5 < 5-2=3$ , so, straight lines of 5 and 2 should be classified into the same category, because the absolute difference 3 that between 5 and 2 is smaller than the absolute difference 5 that between 5 and 10. But visual classification experiments(see figure 3 carefully and try to make classification according to their heights based on your brain's judgments) have shown that all the people intuitively divide 10 and 5 into the same category.

Figure 3 Visual Intelligence Based on Visual Proportional Classification

Why? This is because  $10/5=2$ ,  $5/2=2.5$ , because  $2 < 2.5$ , so 10 and 5 are divided into the same category. It proved to be that people makes classification not on the basis of absolute difference but according to relative difference on the basis of visual Proportionality. I call this phenomena of relative difference principle of visual classification the Proportionality Principle of Visual Intelligence(PPVI). Though I called it visual intelligence, the principle of visual intelligence classification is applicable to all the cognitive domains, such as height, thickness, straightness, curvature, speed, acceleration, size, amount, color, time, degree, density, consistency, even gravitation, etc, all classification in each cognitive domain is automatically, so it's actually the universal classification intelligence that brain evolved. As a lower intelligence of system 1, it's the foundation of higher intelligence, such as conceptual intelligence of system 2.

### 3.2 Conceptual Intelligence

#### 3.2.1 Absolute difference and relative difference in classification

Things are relatively existed. The relativity of image existence and conceptual existence originates from the difference comparison between or among things. There are two kinds of differences between or among things—absolute difference and relative difference. Without the absolute difference between things, there will be no differentiation, no individual discrepancies, no psychological significance of things, and above all, no relative difference and classification as well as conceptualization.

Difference is the essential reason for the recognition of things and the formation of Concepts. It's wrong to say that the recognition of things and the formation of concepts come from the similarity of things. According to the similarity theory, the similarity of dogs is "dog", of rabbits is "rabbit", of animals is "animal", of biology is "biology", of substance is substance, of the three states of solid, liquid, gas are respectively them own. That's senseless and ridiculous. If we understood that the three states are existed relatively, we would not go to similarity to take it as the reason of similarity, but shift to relative difference, anyway what making solid is solid is that it's not liquid and gas.

Absolute difference is the difference between any two things in a single cognitive domain comparison, it is the foundation of relative difference and classification but itself has little for classification. For example, two straight lines are different in length, but you have no reason to make classification based on absolute difference. After all, classifying them into one or two type(s) equals to zero or no classification. Relative difference is the difference among any three things in a single cognitive domain comparison, it's more valuable than absolute difference. Any three things can be classified into two categories, I take it as a doctrine, because there is always relative difference among any three matters. Therefore, relative difference makes classifications and concepts as well as the recognition of things. It is important to note that similarity is a pseudo-concept, it is not the basis of concept. Similarity is in nature of difference, more specifically, the relatively difference.(see figure 4)

**Figure 4 Similarity is in Nature of Relative Difference**

Brain recognizes things by establishing conceptual classification based on relative differences not on absolute differences. For instance, a person taking off his jacket, the absolute difference before and after the motion is the jacket, jacket is just one part of that person, apparently the part can not be a base to recognize the whole.

The last but not the least, people says that classification is according to the similarity of the same category. This sounds contradictory, because there is question between the similarity and the same category very like the relationship between chicken and egg, which goes first and who decides who? If similarity and the same category can't determine each other, then, we can't help but ask what on earth determines the similarity and same category? To avoid similarity itself as the answer, the answer can only be the opposite: Difference. Yes, Similarity is difference. So called similarity is in nature the

relative difference. People do not classify things according to similarity but according to relative difference. We must note, similarity is relative difference, but relative difference is not similarity. Why not? Because difference is absolute. There are only absolute difference and relative difference in the world, other than that, there's nothing else. Absolute difference is caused by absolute movement, both are the origin of the world, they are synonyms. Taking straight lines as an example, people say that the similarity within the system of straight lines is straight line, but in fact, this is said relative to an external reference, such as a curve. Therefore, so-called similarity within the straight lines system is essentially the big difference between the straight line system and the outside curve system. This is similar to the space theory. There is actually no similarity within the straight lines system except for absolute differences between them, such as the small discrepancies in other cognitive domains of length, thickness, color, smoothness, and even the degree of straightness, so, straight lines can be further classified according to newly emerged relative differences.

### 3.2.2 Neuron Network of Conceptual Intelligence Structure

Based on relative difference, visual contrast, visual recognition and visual classification, the process of concept formation is actually establishing connections between concepts in every cognitive domain, these connections can return to produce logical reasoning and brain intelligence.

As to image recognition, the current technology and all expert system are characterized by calculating small differences and comparing for similarities, but the similarity and the classifying-as are unreal, they are respectively relative difference and classifying-into. Image recognition based on the relative differences is more practical. In face recognition, the same face of the same person produces different images in our two eyes and the image is inconstant and always varying from time to time(that's of great value and significance, but we don't discuss here), hence, the same person's faces with small discrepancies consist a system, so-called similarity is the big difference with respect to another system of other people's faces. The face recognition process from Macro to micro like peeling onion, the so-called similarity of one person's faces is the big difference between human faces and animal faces, man and woman, old and young, my faces and your faces. This is our brain's real processes of image recognition.

When machine identifies a face, it needs not only to recognize a face according to the "big difference" (relative to animal face), but also to identify whose face it is based on the "small difference" between faces. To this moment, the big difference ( between man and woman, between old and young) is deepening to be smaller and smaller difference to the degree that the "small difference" between individual faces nearly fall in the same person, for example the human+man+young + facial organs category, so the difference is small. But big and small are relative, within the small difference of faces, we still can find relatively big difference in the small difference comparison. It is, among small, there are relative big. The process to identify whose face is, is according to the "relative difference" between my faces and other's faces, which people usually treat it as a process of classify-as, but because my faces are not exactly the same in all the time or situations, for example, your face has the "small difference" before and after wearing glasses, makeup, a little white and fat in winter, a little black and thin in summer, etc. Since difference is absolute and similarity is fake, and the latter is unable to work and not robust but relative difference in nature, the recognition process is forever classify-into, not classify-as, so the recognition process is always relatively like peeling an onion, getting ride of the big difference(the classified), left the small discrepancies(the unclassified), among the small ones, there are still bigger ones, therefore, classify-as is fake as well, face recognition is always a classify-into process from big difference to small difference following the principle of the relative difference and visual intelligence.

Classification based on the relativity of difference leads to an effect that each time of classification

can find only one biggest difference among all cognitive domains. For example, what's the biggest difference between human and animal? The answer is intelligence, other features like having language or different shape are relatively unimportant. When classification deepens to category of mammal, hair may be the biggest difference between human and gorilla, other features like breast-feed or straight walking are relatively unimportant. When classification deepens to category of human, as for the white and the black, color may be the biggest difference while intelligence and language may be unimportant. The peeling onion and dichotomy process cause the concept to have a hierarchical structure and every time of classification is a fuzzy calculation, so the result on the contrary is accurate. Because the secret of brain classification is to save energy, to get ride of the already classified to focus on the unclassified, so the classified is always treated by brain as the background of further classification, this can explain why we have attention and what is noticed is always in the center of eyeballs. That's so called visual attention.

All in all, difference is absolute, similarity is relative difference, there is no classify-as but classify-into in our brain. The so-called classification is to classify-into things like peeling onion according to the order of relative differences among things from big to small. Just as all elephants' "big" is relative to all other animals' "small". If there was no other animal's "small", there would be no elephant's so-called similarity of "big". Brain recognize things according to the big difference, which doesn't require accuracy, fuzziness is the advantage of the big differences to achieve result accuracy. A veiled face, a scared face, a face without eyes, all can be classified into faces by brain, but machine will be knocked down. Why? Because brain adopts "classified into" but machine adopts "classified as". Twins are the easiest to be classified into the same category, because they are more distinct from others. They are firstly classified into human, then into twins, both are based on the relatively difference. Recognition is achieved in such a way.

#### **4 Conclusion**

The formation of concept is not directly related to language but based on visual intelligence, which and conceptual intelligence produce image recognition intelligence and semantic intelligence, not on the opposite. Visual intelligence of proportional classification based on relative difference with the characteristics of high simplicity and universality, itself is intelligence. Visual intelligence is an universal automatic classification principle, it can be applied to all cognitive domains. The conceptual intelligent network has conceptual intelligence because the network is based on the proportional classification principle of visual intelligence and is isomorphic to neuron network structure. A concept can be positioned by an aggregation of several transversely relative difference connections in several main cognitive domains. There are many transversely relative difference connections among concepts in different cognitive domains. The shape of the concept has several transverse dendrites and a longitudinal nerve axon, each transverse connection path is a large difference relation which can be represented by 0 and 1, that is the basis of realizing fuzzy operation and simultaneously result accuracy. Axons are the information channels where the remaining small difference information from the upper classification is transmitted to the next concept of the network to continue the fine classification. Classification is based on the proportion of differences in the same cognitive domain, each time according to the principle of big differences, from large to small differences as peeling an onion. Big difference in Classification, which is in nature of proportionality and relativity, can also be looked as based on the relative distance among things, according to the distance from big to small, layer by layer classification.

## Study on Rural Logistics Mode Based on "Internet Plus": Taking Some Cities in Hubei Province as an Example

Li Jue<sup>1</sup>, Zeng Xueqin<sup>2</sup>

1 School of Computer Science and Technology, Wuhan University of Technology, Wuhan, P. R. China, 430070

2 Faculty of Physics and Electronic Science, Hubei University, Wuhan, P. R. China, 430062

(E-mail: kingofjade@qq.com, 1305360873@qq.com)

**Abstract:** Nineteen major reports put forward "the strategy of revitalization of the countryside". And the key to the Rural Revitalization is to strike a good fight against poverty. Poverty alleviation by e-commerce is the landing of the "Internet Plus" in the field of poverty alleviation. It is also an important way to deepen the poverty alleviation, to implement the precise poverty alleviation strategy and to boost the Rural Revitalization Strategy. However, the complex geographical conditions, poor traffic conditions, difficulties in logistics transportation, high logistics costs and long circulation cycle are major factors which constrained rural e-commerce development (Yang Huijuan, 2019).

**Keywords:** Rural E-commerce; Rural Logistics; Internet Development; Rural Revitalization

### 1 Introduction

Kalin Hristov (2017) thinks that the Internet Plus initiative has been recently introduced as a way to reinvigorate China's slowing economy. As is known to us all, many companies are using logistics software and the Internet to run their business more efficiently and meet the needs of customers (Aldin & Stahre, 2003), now the countryside also welcome the Internet. In recent years, rural work has always been the most important target of the Party and the state. At the beginning of 2018, the Central Conference on Rural Work pointed out that the road of rural development with Chinese characteristics is not isolated rural development, but rural development linked with urban and rural development, not relying on the traditional "trinity" development of land, capital and labor, but making full use of modern science and technology, especially modern information technology, to promote the realization of the strategy of rural revitalization, that is, making full use of computing, Machine, Internet, Mobile Network, Internet of Things, Big Data, Cloud Computing, Block Chain, AI Artificial Intelligence and other technologies promote the development of modern rural areas. On February 4, 2018, the No. 1 Document of the Central Committee of 2018 was published, namely, the "Opinions of the Central Committee of the Communist Party of China and the State Council on Implementing the Rural Revitalization Strategy". The opinion pointed out that it is necessary to persist in solving the "three rural issues" as the top priority of the party's work, which will continue to increase the policy of strengthening agriculture, benefiting farmers and enriching farmers, and solidly promote agricultural modernization and new rural construction, and comprehensively deepen rural reform. As Maier (2017) points that electronic commerce is the collection information flow, business flow, cash flow, logistics is a process of trade

transactions, since have received extensive attention of society from all walks of life, certainly including the countryside life

By the end of 2017, Chinese agricultural population has reached 41.48%, which means that nearly half of Chinese people live in rural areas. By the end of 2017, the number of broadband access in rural areas has reached 93.77 million, which shows that the rural e-commerce market is huge (Wu Lixia & Zhang Yuejin, 2019). Under the trend of "Internet Plus" and rural revitalization, "rural electric business" will become one of the main force of rural industry. The advantages of price and more alternative categories have brought about the impact on the typical characteristics of rural traditional shopping. In addition, we find that those migrant workers, who have gained more insights in big cities and experience in online shopping, are also driving the consumption of online shopping in rural areas when they return to the countryside. More than 10% of the income of the new generation of migrant workers comes from the purchase of clothing, and mainly from the purchase of online shopping. These young migrant workers are the main participants of rural e-commerce at this stage.

However, due to geographical location, infrastructure and many other factors, rural logistics has begun to restrict the development of rural e-commerce, and become the bottleneck of rural economic development. Looking at the national conditions, China is a big agricultural country, and the output of agricultural products ranks the top in the world. However, there are always problems in the supply and demand of domestic agricultural products, and a large number of unsalable agricultural products are serious. In this context, in order to promote the development of rural e-commerce industry, China must build a unique e-commerce distribution logistics network system covering prefecture-level cities, especially some agricultural products can enjoy the green channel policy in the transport process. According to this regulation, the relevant departments must reasonably plan the transportation route from the rural production base to the wholesale market, and form the distribution network and distribution line covering prefecture-level city, county-level city, Township and rural areas (Zhang Yan, 2019).

Guidelines issued by the Central Committee of the CPC and the State Council on the three-year campaign to win the battle against poverty put forward: speeding up the "express delivery to the countryside" project, improving the rural logistics distribution system in poverty-stricken areas, and strengthening the construction of cold-chain facilities in agricultural production bases with distinctive advantages. Generally speaking, the definition of logistics refers to the use of various modes of transportation, such as transportation, storage, distribution, loading and unloading, to achieve the transfer of goods from one place to another in space. Therefore, effective logistics channels play an important role in realizing the circulation of urban and rural commerce and trade, and further promoting the integration of urban and rural commerce and trade. From the perspective of industrial composition, logistics as an important part of economic development, its development level will affect the overall quality of economic development. At present, the rural logistics industry is still in the stage of development, even in some economically underdeveloped areas, which is still in its infancy. The logistics network is few, the coverage rate is generally low, the warehousing facilities are simple and the technical equipment is not perfect, the unified logistics information platform has not been established, the large logistics data has not been formed, and the information can not be exchanged and transmitted in time, which leads to the inability to collect, analyze and share logistics information resources. And industry development lacks scientific and rational mechanisms and models and related policies (Yuan Shujuan, 2018). The author visits and investigates the development of logistics economy in villages and towns under the jurisdiction of Xiangyang, Yichang and other cities in Hubei Province. Through the construction of models, data comparison and literature analysis, to a certain extent, the author draws the experience of rural logistics economic development that can be popularized, and finds the problems that need to be solved urgently in the process of development.

In the early stage, the author sent out 225 questionnaires to residents in Zaoyang City, Hubei Province, and 220 valid questionnaires were recovered. The Respondents involved in all age levels, including urban areas, townships, community villages and other places, including e-commerce, growers, courier company leaders, students, ordinary residents and other professionals.

## 2 Reflections on the Current Situation of Rural Logistics in Zaoyang, Hubei Province

### 2.1 Investigation on the current situation of rural logistics in Zaoyang city

**Figure 1 Age Distribution of Respondents**

The survey involves all age groups. According to the staff who cooperated with the survey, most of the residents who stayed in the towns of Zaoyang City were middle-aged and above, and most of them took advantage of the geographical advantages of Zaoyang City to engage in planting industry. In recent years, the rapid development of rural e-commerce in Zaoyang City has attracted many young people from abroad to return home and start businesses.

**Figure 2 The Distribution Chart of Common Express**

**Delivery Companies in the Villages and Towns Where the Respondents are Located**

The survey results show that Chinese Post (EMS) is basically universal in all villages and towns of Zaoyang City, and the "four links and one access" express delivery network is quite popular, second only to postal express delivery, while the more expensive Shunfeng express in urban areas, the fewer village and town-level network outlets. In addition, there are a few Xiangyang city-level logistics companies also exist in some townships.

**Figure 3 The Distribution Map of the Number of Express Outlets Near the Villages and Tomns Where the Respondents are Located**

The above survey results show that there are only 3 or less express network points near a few villages and towns serving the residents' lives. In villages and towns with slightly developed traffic, the number of express network points reaches 3 to 5, while in a few villages and towns with important traffic positions, the number of express network points can reach 5 or more.

**Figure 4 Distribution of Delivery Time**

Surveys show that most residents need 3 to 5 days to receive or deliver express delivery, and the time to receive or deliver express delivery is usually less than 3 days from the village and town residents of the city-level express sorting center, while in southern mountain area of Zaoyang, the time to receive or send express delivery may be 5 days or longer.

**Figure 5 The Distribution Map of the Distance Between the Villages and Towns Where the Respondents are**

**Located and the Express Outlets**

The above distribution map shows that most of the residents live in 3-5 kilometers of the local distribution of express delivery network, living in villages and towns, urban residents, only 1-2 kilometers away from the express delivery network, in villages and towns with inconvenient traffic, still need to be 5 kilometers away from the express delivery network.

**Figure 6 Distribution Map of Service Problems Encountered by Respondents**

The survey shows that the main problem that residents encounter is that the delivery time is too long. In addition, in the process of delivery, the damage of express delivery also occurs. A few residents said that they had experienced the return of express delivery.

**2.2 Survey on online sales of residents of Zaoyang city**

As the survey shows, over half of the people have the experience of selling agricultural products online,. And according to the interview with team members, the other part of people, who have no such experience, are not able to conduct online sales.

**Figure 7 Online Sales of Agricultural Products Income Distribution Map**

Most of the residents regard online sales of agricultural products as a sideline industry. Among them, 60.91% of the residents earn more than 2000 yuan from online sales of agricultural products, 23.64% of the residents earn 2000-5000 yuan from online sales. In addition, a small number of large farmers and e-commerce have long-term online sales channels with income of more than 5000 yuan.

### **2.3 A survey of suggestions on logistics development**

Among the 220 people who participated in the questionnaire. 134 of them thought that improving the current situation of rural logistics should improve the traffic conditions, strive for village-to-village communication and household-to-household communication; 20 of them said that improving the current situation of rural logistics should relax policies, encourage everyone to develop rural e-commerce industry and stimulate the development of rural logistics industry with demand; in addition; 66 of them thought that training should be organized to train relevant industries' Talents.

## **3 Analysis of the Field Survey Result in Zaoyang**

### **3.1 Visiting Sanjie group of Zaoyang city -- storage and logistics system for rural e-commerce services**

The head of Zaoyang Sanjie Group and chairman of Zaoyang Electronic Commerce Association introduced to the team members the standardized warehousing of electronic commerce and the logistics system responsible for distribution of Sanjie Group.

#### **3.1.1 Standardized warehousing that integrates storage, testing and sub-packaging.**

In order to promote the rapid development of electronic commerce in Zaoyang City scientifically and effectively, Sanjie Group, the industry leader, first built a standardized warehouse. Sanjie Group's standardized warehouse is equipped with automated sorting equipment and improved on the basis of ordinary sorting equipment, which adapts to the characteristics of peaches that can not withstand bumps. At the same time, there is a relatively complete evaluation system in the warehouse. For each batch of

products sold online, besides the necessary safety assessment of pesticide residues, a series of scientific analysis has been made on the sugar content of fruits and the shelf life of fruits.

### 3.1.2 Logistics system for delivering agricultural products

Agricultural products sales have a great impact on harvest weather. In a few days of maturity, it is necessary to race against the clock to pick, sort, pack and ship them out. For this reason, Sanjie Group cooperates with many logistics companies to deliver goods to customers in the shortest possible time. According to statistics, Zaoyang peaches are usually sold to Guangzhou. In peak season, peaches picked in the morning are transported to the sorting center by express train in the afternoon for direct distribution. In addition, the precise poverty alleviation channel developed by Jingdong Logistics Company is not only cheaper than other logistics companies, but also meets the requirements of distribution speed.

## **3.2 Visiting the head of "four connections and one access" in Xinglong town -- about the development of several frequent express companies**

### 3.2.1 Express business model of "four connections and one access"

In Xinglong Town, Zaoyang City, members of the practice team visited the head of "four links and one access" express company. After the introduction of five leaders, team members learned that "four links and one access" generally adopts the franchise system. After application and headquarters evaluation, express outlets can be set up in areas of scale, requiring separate facades and regular business and service assessment. Unlike direct operation, franchise system requires the person in charge to bear all risks, transportation costs and transit costs are also borne by the person in charge.

### 3.2.2 Efficiency of "four links and one access"

Because of the scale requirement of setting up express delivery network, the network often only exists in the areas with Township level. For the demand of picking up and sending mail in administrative villages, it often needs to go to the towns where it can meet. In the administrative villages with relatively developed traffic, the head of the town-level network often invests in setting up a temporary express delivery receiving and discharging point to provide convenience for villagers. Therefore, breaking the "last kilometer" of distribution, logistics development path is blocked and long.

## **3.3 Visit the business transportation of Xiangyang Branch of Chinese Post -- the leader of cracking the "last kilometer" of rural distribution.**

The postal company combines with the village e-commerce network to realize the delivery of express delivery by the village. 102 new postal routes have been developed. The total mileage of the postal routes is 4309 kilometers. And specially equipped with 12 minivans, 3 pickup trucks, 1 medium-sized van, 62 delivery personnel, according to the city to town once a day, the town to the administrative village five times a week of distribution frequencies for express logistics distribution. At the same time, the postal company has signed cooperation agreements with 11 express delivery companies, such as Yousu, Xinyu, Zeda, Xiangyang Guoda and Zhisheng, to establish an open platform to realize the sharing of logistics distribution resources. Postal companies issue courier bills in village-level online stores, and all 11 courier companies cooperating with them send courier bills, which are brought back by postal couriers and distributed to city-level warehouses. The last and first kilometers of express delivery are made by postal companies.

## **4 Problems Existing in current Rural E-commerce and Logistics**

### **4.1 Express company "sweep the snow in front of each door".**

Except for Xiangyang Branch of Chinese Post, to a certain extent, to realize the sharing of logistics distribution resources, in other aspects, express companies "sweep the snow before the door". In transportation, express companies generally take ordinary express delivery items as the main part, only when the network express is not loaded with cars, can they store and transport agricultural products to major e-commerce warehouses. Therefore, in the peak season when agricultural products are concentrated, there is still a phenomenon of "cannot be transported out", which often leads to the phenomenon of unsalable products. This is also the reason at the beginning of this summer, which is similar to "Peach Township Peach can't sell, throwing pond to feed fish".

### **4.2 Express association exists in name only**

The express association which manages the major express companies has not played a great role. In the peak season of logistics and transportation demand, several express companies have jointly raised their prices, which has not provided the necessary convenience for the suppliers.

### **4.3 Logistics infrastructure still needs to be strengthened.**

Agricultural products are natural products, with strong seasonality, affected by weather and other factors. In the survey, members of the practical team found that, in addition to large-scale e-commerce companies own warehouses, logistics companies do not have basic safeguard facilities for storage, transportation, packaging, loading and unloading, low standardization of equipment, poor mechanization and automation level, imperfect infrastructure of rural logistics, logistics equipment is relatively backward.

### **4.4 Traffic conditions can not keep up with the needs of the logistics industry.**

One of the important reasons why express companies "mainly focus on big cities and take small places" is that the transportation development in rural areas is backward and the transportation cost is high. In the process of investigation, members of the practice team also learned that the common network of several major express companies often stopped with towns. For administrative villages, one is inconvenient traffic, the other is not up to the scale of opening network. Compared with the development of logistics express industry in southern and northern areas of Zaoyang City, we can see that the number of network outlets in northern plain area is obviously more than that in southern mountain area.

### **4.5 Lack of technical support.**

When interviewing villagers in Xinglong Town, when members of the practice team asked why their peaches were not sold online, the aunt said that she would not do a series of online operations. It is understood that Zaoyang City has joined several vocational schools to carry out training, but the scale still can not meet the needs of the public, so that many farmers who want to develop e-commerce stop at the technical link.

## **5 Conclusion**

Gimnez and Ventura (2003) pointed out that information and communication technology

are very important on the development of supply chain. Combined with the data of field research and literature analysis, the current development of rural logistics in China can be said to usher in a new opportunity. In particular, the intake of "Internet Plus" and other elements adds vitality to the development of rural logistics, so as to glimpse the future trend of new rural construction, that is, refinement, technicalization and datamation. Of course, in this process, it is inevitable to face many problems and solve the corresponding constraints, such as the concept of farmers, technical assistance, policy implementation, etc. Therefore, the author also has the following suggestions and prospects.

### **5.1 Cultivate the main body of rural logistics market.**

Actively promote the integration of rural logistics resources and realize the diversification of market subjects. Accelerate the pace of assets reorganization and transformation of the original agricultural products circulation enterprises; Change the current situation of small scale, monotonous and closed operation; And in accordance with the development direction of agricultural products circulation industrialization; Focus on increasing support for the wholesale market of agricultural products, agricultural products transport enterprises, import and export enterprises, logistics distribution enterprises and large food chain supermarkets; Relying on the market, organize the Agricultural Product Transportation Association and encourage the development and cultivation of modes such as "production land + farmers", "processing enterprises + farmers", "production and marketing enterprises + farmers, distribution centers + farmers"; so as to improve the degree of market organization.

### **5.2 Improving the technical level of rural logistics**

With the development of modern science and technology, logistics equipment and technology are constantly improving, which can maximize the loss of agricultural products in the process of transportation and storage, reduce logistics costs and improve product added value. The government should encourage rural logistics enterprises or individuals to purchase advanced logistics transportation equipment and refrigeration and fresh-keeping equipment by means of financial discounts and financial support; they also should constantly strengthen the standardization of rural logistics, actively adopt international or domestic logistics standards in the logistics links of transportation, packaging, processing and warehousing, and actively develop the transportation of containers and large refrigerated vehicles in accordance with market requirements. Continuous improvement of rural logistics technology.

### **5.3 Logistics pattern of "Freight Line + Passenger Transport Alliance".**

At present, the experience of "Freight Line + Passenger Transport Alliance" in Zigui County of Yichang City has been popularized throughout the province. Drawing lessons from this experience, the logistics pattern of "freight liner + passenger transport alliance" was formed by the trunk line of large logistics companies in Zaoyang City, truck delivery in city and town, and passenger cars in villages. The seamless docking of "station-to-station, station-to-point and point-to-door" was realized to solve the embarrassing situation that the administrative villages could not reach the construction of express delivery network, express delivery could not go out and could not be delivered. Break the "last kilometer" of logistics distribution (Zhang Xiliu, 2019).

### **5.4 Accelerate the implementation of "land allocation".**

The e-commerce of Zaoyang city has a certain scale. In the peak season of fruit market, there is a great demand for logistics. Logistics companies sign up to implement "land allocation". After sorting and packaging from the origin, they are directly transported to the sorting center of the destination city for distribution. The next day goods ordered online can be delivered to the hands of customers, which not only greatly improves the effectiveness, but also increases the satisfaction process of customers. The

greatest advantage is to solve the problem that the logistics demand can not be satisfied, and successfully solve the problem of slow sales.

### **5.5 Improve the level of commonality in logistics and distribution.**

The realization of joint distribution is the best mode of resource integration among distribution modes. In particular, multiple enterprises jointly implement the distribution mode of distribution. According to the actual situation of local development, each logistics company can cooperate, divide the region, and realize that a specific company is responsible for a certain region. As Tan Xinming & Tong Guangzhan (2018) point that it can improve the utilization of resources and greatly reduce the cost of distribution.

(E-mail: ilovemcgrady001@126.com, liuyj626@163.com)

**Abstract:** National Publishing Bases are high-tech industrial clusters which possess characteristics of cultural and creative industry dominated by the government. They have already become power producers and incubators of Chinese digital publishing industry. However, the existing research rarely involves the operation performance evaluation construction, thus hardly measures the practical operation situation. This thesis combines the practical operation situation of National Publishing Bases, adopts Delphi method and analytic hierarchy process to construct the operation performance evaluation system and get the corresponding weight of each index based on relevant industrial clusters theories. Initially build a 4-dimensional operation performance evaluation system including technological innovative ability, media convergence ability, market profitability and base scale. This system provides important decision-making reference and practical guidance for measuring the operation performances of National Publishing Bases.

**Keywords:** Digital Publishing Bases; Operation Performance; Evaluation System; Industrial Clusters

## 1 Introduction

The operation performance of National Publishing Bases refers to level and consequence operated by all bases bodies together under the certain resources, circumstances and conditions. Operation performance can estimate the working progress and effect through different dimensions. It is a relatively comprehensive and scientific evaluation method. The operation performance evaluation of National Publishing Bases needs to combine relative methods of industrial clusters and development characteristics of bases to conduct comprehensive judgement of possession, using, management and economic resources allocation. Therefore it can get relative objective and scientific judgement of development of every single base (Wang Can, 2013).

It needs to refer to operation performance evaluation system of cultural and high-tech industrial clusters. Wang Xin (2012) utilizes Fuzzy Comprehensive Evaluation (FCE) to construct operation evaluation system of electronic information industry. The system divides into aggregation ability, competitive ability, innovation ability, intensity of cooperation, economic capability and input-output capacity. Guo Wei (2013), Wang Huan (2012), Tian Xuefeng (2016), Li Wen (2009) and other scholars evaluate such industrial clusters for Sichuan, Hubei, Hebei, Jiangsu and other provinces. The result show that innovation is the crucial element to promote the operation performance for such industrial

clusters.

## **2 The Significance and Functions of Operation Performance Evaluation System Construction of National Publishing Bases**

### **2.1 The significance operation performance evaluation system construction**

Constructing the operation performance evaluation system of National Publishing Bases can simplify and quantify the complex relationships of all fields in the comprehensive performance system of bases. The construction of operation performance system has positive effects for reducing bases running cost, enhancing productivity, optimizing the industrial structure, expanding competitive advantage, removing obstacles to development and other aspects. Therefore the bases and the government can estimate the operation situation through the evaluation system.

### **2.2 The functions of operation performance evaluation system construction**

The functions of constructing operation performance evaluation system mainly reflect three aspects: measurement, comparison and prediction. The function of measurement means the system can estimate the operation effect specifically so that every base will know their advantages and disadvantages distinctly. The function of comparison can help bases to confirm the status in the same industry. Therefore the bases and the government can know operation status from different aspects, periods, variations and trends. The function of prediction focuses on future development trend of bases.

## **3 Construction of Operation Performance Evaluation System**

### **3.1 Preliminary election of evaluation index**

According to the researches based on performance evaluation of industry clusters by numerous scholars, the indexes primarily includes economic benefit, social benefit, Effects of competition, technological innovative ability, production capacity, input-output capacity, cluster concentration, government forces and other aspects (Yang Xin, 2008; Jiang Yuxia, 2009; Du Lei, 2016). Different types of industry clusters have different deviations to choose indexes. Combined the theories of industry clusters and practical characteristics of National Digital Publishing Bases, the research adopts the Delphi method to collect the suggestions of industry experts from State Administration of Press and Publications, Chinese Academy of Press and Publication, Hubei Changjiang Publishing and Media Group, Time Publishing and Media Group, Huazhong National Digital Publishing Base and Hangzhou National Digital Publishing Base. Through making a synthetic judgment on the availability and importance of indexes, the evaluation system can be preliminarily divided into three hierarchies: target level, module level and index level. The target level refers to the evaluation object: the operation performance of National Digital Publishing Bases. Module level includes four dimensions: technological innovative ability, media convergence ability, market profitability and base scale.

#### **3.1.1 Technological innovative ability**

As an industry cluster combined with cultural and high-tech industry, the technological innovative ability National Digital Publishing Bases reflects in technology R&D capability, cultural expression, digital content creativity and many other aspects(Sun Ling, 2015). High-quality digital publishing

productions not only rely on superior digital content, but also need advance high-technology to support. Therefore, the technological innovative ability will be reflected through following key indicators: numbers of technology enterprises, numbers of digital publishing enterprises, speed of producing new products and technology diffusion rate.

### 3.1.2 Media convergence ability

Even though the technology level in the bases largely decides the usage experiences and convenience like terminals, softwares and platforms of digital content, circulation channels and other aspects, but it is only the bridge which connect with users and digital content products. The development essence of digital publishing bases is offering services for dissemination of knowledge content. The quality of digital content is the core in the publishing industry. Therefore cultural industry strength will be reflected through following three indicators: the number of traditional publishing enterprises, cultural brand awareness and media convergence ability.

### 3.1.3 Market profitability

The market profitability directly reflects the market share of every base in the digital publishing industry, it is composed by four indicators: operation revenue, net profit, revenue growth rate and revenue as a percentage of the digital publishing market.

### 3.1.4 Base scale

Base scale embodies the current overall scale and horizontal volume of every base. It is composed of following four indicators: total number of employees, total number of enterprises, growth rate of the number of enterprises settled in and general assets.

## 3.2 Confirmation of the index system weight

To confirm the weight of the index system needs following specific steps based on Analytic Hierarchy Process: construct judgement matrix, calculate maximum eigenroots and eigenvectors of judgement matrix, consistency check, calculate combination weight vector and consistency check and determinate the weight of indexes.

### 3.2.1 Judgement matrix construction

According to the Analytic Hierarchy Process proposed by Professor Tomas L.Saaty in 1970s. This method can divide elements which are relevant to decisions into different levels. It includes both the rating and comparison methods. Rationality requires developing a reliable hierarchic structure or feedback network that includes criteria of various types of influence, stakeholders, and decision alternatives to determine the best choice (Thomas L.Saaty, 1990).

This investigation altogether provides 30 questionnaires and 24 were recovered. 23 questionnaires were valid. The effective questionnaire returns-ratio is 77%.

The experts are from State Administration of Press and Publications, Chinese Academy of Press and Publication, Hubei Changjiang Publishing and Media Group, Time Publishing and Media Group, SinoMaps Press, Phoenix Publishing and Media Group, Publishing House of Electronics Industry and other well-known publishing houses. The judgement matrix of target level is shown in the Table 1.

**Table 1 The Judgement Matrix of Target Level**

	A <sub>1</sub>	A <sub>2</sub>	A <sub>3</sub>	A <sub>4</sub>
A <sub>1</sub>	1	1	2	3
A <sub>2</sub>	1	1	1	2
A <sub>3</sub>	1/2	1	1	2
A <sub>4</sub>	1/3	1/2	1/2	1

Similarly, four judgement matrixes of module level can also be constructed as A<sub>1</sub>, A<sub>2</sub>, A<sub>3</sub> and A<sub>4</sub>. The judgement matrix A<sub>1</sub> of technological innovative ability is shown in the Table 2.

**Table 2 The Judgement Matrix A<sub>1</sub> of Technological Innovative Ability**

	B <sub>1</sub>	B <sub>2</sub>	B <sub>3</sub>	B <sub>4</sub>
B <sub>1</sub>	1	1/2	1/4	1/5
B <sub>2</sub>	2	1	1/3	1/4
B <sub>3</sub>	4	3	1	1/2
B <sub>4</sub>	5	4	2	1

The judgement matrix A<sub>2</sub> of media convergence ability is shown in the Table 3

**Table 3 The Judgement Matrix A<sub>2</sub> of Media Convergence Ability**

	B <sub>5</sub>	B <sub>6</sub>	B <sub>7</sub>
B <sub>5</sub>	1	1/2	1/3
B <sub>6</sub>	2	1	1
B <sub>7</sub>	3	1	1

The judgement matrix A<sub>3</sub> of market profitability is shown in the Table 4

**Table 4 The Judgement Matrix A<sub>3</sub> of Market Profitability**

	B <sub>8</sub>	B <sub>9</sub>	B <sub>10</sub>	B <sub>11</sub>
B <sub>8</sub>	1	2	1/4	1/3
B <sub>9</sub>	1/2	1	1/2	1/2
B <sub>10</sub>	4	2	1	1
B <sub>11</sub>	3	2	1	1

The judgement matrix  $A_4$  of base scale is shown in the Table 5

**Table 5 The Judgement Matrix  $A_4$  of Base Scale**

	B <sub>12</sub>	B <sub>13</sub>	B <sub>14</sub>	B <sub>15</sub>
B <sub>12</sub>	1	1/2	1/3	1/5
B <sub>13</sub>	2	1	1/4	1/2
B <sub>14</sub>	3	4	1	1/2
B <sub>15</sub>	5	2	2	1

### 3.2.2 Calculate maximum eigenroots and eigenvectors of judgement matrix

In general, it can adopt summation or root-finding method to calculate approximately the approximate value of eigenvalue when we calculate maximum eigenroots and eigenvectors of judgement matrix based on AHP. In this article, we adopt summation method to solve.

(1) To normalize each line of vectors of A, the results shows that

$$\tilde{w}_{ij} = a_{ij} / \sum_{i=1}^n a_{ij} \quad (\text{Formula 1})$$

(2) To sum  $\tilde{w}_{ij}$  on the basis of rows, the results shows that

$$\tilde{w}_i = \sum_{j=1}^n \tilde{w}_{ij} \quad (\text{Formula 2})$$

(3) To normalize

$$\tilde{w}_{ij}, w_i = \tilde{w}_i / \sum_{i=1}^n \tilde{w}_i, w = (w_1, w_2, \dots, w_n)^T \quad (\text{Formula 3})$$

### 3.2.3 Final determination of index weight

(1) The index weight of module level

First, it is necessary to normalize the judgement matrix A to get:

$$\tilde{w}_0 = \begin{pmatrix} 0.3529 & 0.2857 & 0.4445 & 0.3750 \\ 0.3529 & 0.2857 & 0.2222 & 0.2500 \\ 0.1765 & 0.2857 & 0.2222 & 0.2500 \\ 0.1177 & 0.1429 & 0.1111 & 0.1250 \end{pmatrix}$$

To sum  $\tilde{w}_0$  on the basis of rows, the results shows that:

$$\tilde{w}'_0 = (1.4581 \quad 1.1108 \quad 0.9344 \quad 0.4967)^T$$

To normalize  $\tilde{w}'_0$ , the results shows that:

$$\tilde{w}_0'' = (0.3645 \quad 0.2777 \quad 0.2336 \quad 0.1242)^T$$

$\tilde{w}_0$  refers to the eigenvector which corresponds to the weight of every index.

Then calculate the maximum eigenvalue of judgement matrix A:

$$\lambda = \frac{1}{n} \sum_{i=1}^n \frac{(A\tilde{w}_0'')_i}{\tilde{w}_0''_i} = \frac{1}{4} \times (4.0658 + 4.0483 + 4.0323 + 4.0366) = 4.0458$$

According to the consistency check formula proposed by Saaty,

$$CI = \frac{\lambda - n}{n - 1} \quad \text{(Formula 4)}$$

If the calculated result is smaller than 1, it means the result has passed the consistency check.

To conduct consistency check:

$$CI = \frac{\lambda - n}{n - 1} = \frac{4.0458 - 4}{4 - 1} = 0.0153$$

Saaty also proposed the table of random consistency index by 100~500 random samples. The numerical comparison table is shown in Table 6.

**Table 6 The Random Consistency Index of RI**

<i>n</i>	1	2	3	4	5	6	7	8	9	10	11
<i>RI</i>	0	0	0.58	0.90	1.12	1.24	1.32	1.41	1.45	1.49	1.51

According to the random consistency index, the results shows that:  $RI = 0.9$

Therefore:

$$CR = \frac{CI}{RI} = \frac{0.0153}{0.9} = 0.017 < 0.1$$

The results shows that judgement matrix A has passed the consistency check.

(2) The index weight of index level

Similarly, the weight of every index in index level can also be calculated. The judgement matrix  $A_1$  of technological innovative ability can be normalized as:

$$\tilde{w}_1 = \begin{pmatrix} 0.0833 & 0.0588 & 0.0698 & 0.1026 \\ 0.1667 & 0.1177 & 0.093 & 0.1282 \\ 0.3333 & 0.3529 & 0.2791 & 0.2564 \\ 0.4167 & 0.4706 & 0.5581 & 0.5128 \end{pmatrix}$$

To sum  $\tilde{w}_1$  on the basis of rows, the results shows that:

$$\tilde{w}'_1 = (0.3145 \quad 0.5056 \quad 1.2217 \quad 1.9582)^T$$

To normalize  $\tilde{w}'_1$ , the results shows that:

$$\tilde{w}''_1 = (0.0786 \quad 0.1264 \quad 0.3054 \quad 0.4896)^T$$

$\tilde{w}''_1$  refers to the eigenvector which corresponds to the weight of every index of technological innovative ability.

Then calculate the maximum eigenvalue of judgement matrix  $A_1$ :

$$\lambda = \frac{1}{n} \sum_{i=1}^n \frac{(A_1 \tilde{w}''_1)_i}{\tilde{w}''_1_i} = \frac{1}{4} \times (4.0212 + 4.0174 + 4.0727 + 4.0829) = 4.0486$$

To conduct consistency check:

$$CI = \frac{\lambda - n}{n - 1} = \frac{4.0486 - 4}{4 - 1} = 0.0162$$

According to the random consistency index, the results shows that:  $RI = 0.9$

Therefore:

$$CR = \frac{CI}{RI} = \frac{0.0162}{0.9} = 0.018 < 0.1$$

The results shows that judgement matrix  $A_1$  has passed the consistency check.

The weight of judgement matrix  $A_2$ ,  $A_3$ , and  $A_4$  can be calculated and checked through the same way. The calculated results of judgement matrix  $A_2$  is:  $\tilde{w}''_2 = (0.1699 \quad 0.3873 \quad 0.4428)^T$ . The calculated results of judgement matrix  $A_3$  is:  $\tilde{w}''_3 = (0.1530 \quad 0.1400 \quad 0.3682 \quad 0.3388)^T$ . The calculated results of judgement matrix  $A_4$  is:  $\tilde{w}''_4 = (0.0854 \quad 0.1531 \quad 0.3281 \quad 0.4334)^T$ . All the calculated results have passed the consistency check.

### 3.2.6 Consistency check of combination

The overall index level also should be conducted to consistency check based on AHP. Saaty proposed the formula of consistency check of combination so that we can calculate the result:

$$CR^* = \frac{CI^*}{RI^*} = \frac{\sum_{i=1}^n w_i CI_i}{\sum_{i=1}^n w_i RI_i} = \frac{0.3645 \times 0.0162 + 0.2777 \times 0.00915 + 0.2336 \times 0.071 + 0.1242 \times 0.06437}{0.3645 \times 0.9 + 0.2777 \times 0.58 + 0.2336 \times 0.9 + 0.1242 \times 0.9} = 0.0407 < 0.1$$

The results calculated above shows that the overall judgement matrix has passed consistency check. It means the combination weight vector can be the final weight value.

### 3.3 Confirmation of index weight of the operation performance system

Trough the research steps above based on Delphi method and AHP, the overall operation performance evaluation system can be confirmed, the weight of every level can be calculated as shown in Table 7.

**Table 7 The Index Weight of Operation Performance Evaluation System of National Publishing Bases**

Target level	Module level	weight	Index level	weight
Operation Performance Evaluation System of National Digital Bases	Technological innovative ability	0.3645	The number of technology enterprises	0.0786
			The number of digital publishing enterprises	0.1264
			Speed of producing new products	0.3054
			Technology diffusion rate	0.4896
	Media convergence ability	0.2777	The number of traditional publishing enterprises	0.1699
			Cultural brand awareness	0.3873
			Concurrence ability	0.4428
	Market profitability	0.2336	Operation revenue	0.1530
			Net profit	0.1400
			Revenue growth rate	0.3682
			Revenue as a percentage of the digital publishing market	0.3388
	Base scale	0.1242	Total number of employees	0.0854
			Total number of enterprises	0.1531
			Growth rate of the number of enterprises settled in	0.3281
			General assets	0.4334

#### 4 Conclusion

The article constructs the operation performance evaluation system of National Digital Publishing Bases based on Delphi and AHP method. The system is composed by 4 module dimensions and 16 specific indexes. The calculated results shows that the weight of technological innovative ability is the highest among these 4 modules. It reacts the core effects in operation performance of National Digital Publishing Bases. The index weight of technology diffusion rate has reached 0.4896. It means the application and diffusion speed of high-technology largely decides the level of technology in the bases as industrial clusters. Media convergence ability takes the secondary position compares to market profitability. The weight shows that the quality of digital content production still relies on digital content

enterprises but not high-tech enterprises. The weight of base scale is 0.1242. It means digital publishing industry is obviously different from traditional heavy industries. The size of base scale can not influence the development crucially.

This system provides important decision-making reference and practical guidance for measuring the operation performances of National Publishing Bases. Therefore we can directly analyze the practical operation situation of every aspect.

# Research on Enterprise Management System Innovation in the Era of “Internet +”

Wang Jianguo

School of Law, Humanities and Sociology, Wuhan University of Technology, Wuhan, P.R.China,  
430063

(E-mail: 27073636@qq.com)

**Abstract:** The rapid popularization of the Internet has gradually broken the traditional management thinking of enterprises, especially in the “Internet +” era. More and more Chinese enterprises widely participate in the global international major business transaction, such as economic globalization, regional economic integration. Can Chinese enterprises figure out an effective internal governance mechanism in the management system? This paper will analyze the concept of "Internet +", compare the internal management system of Chinese and foreign enterprises, find out the problems existing in the management system of Chinese enterprises, and try to find targeted solutions.

**Key words:** Internet; Management; Institutional innovation; Change

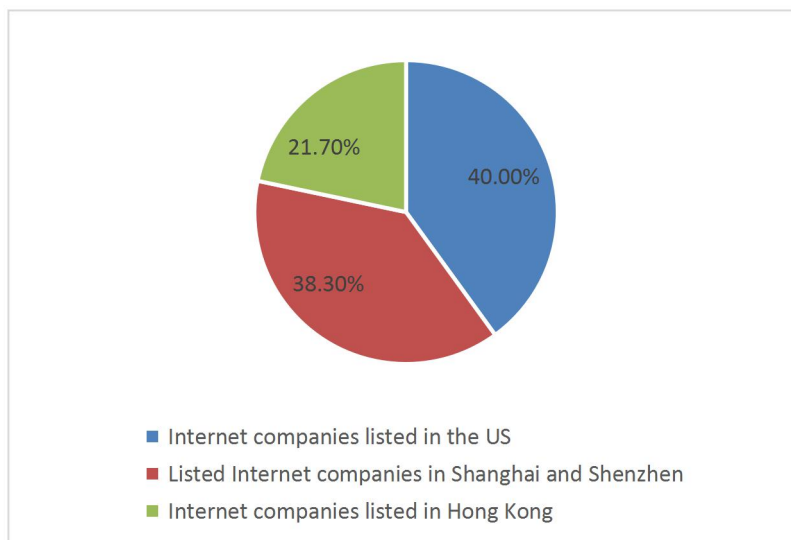

## 1 Introduction

In 1972, the United Nations put forward the concept of "Internet+" at the seminar on human environment. At the third session of the 12th National People's Congress, Premier Li Keqiang put forward the concept of "Internet +" in his government work report. In 1994, the Chinese government formulated the white paper on China's population environment and development in the 21<sup>st</sup> century, which for the first time incorporated the strategy of sustainable development into the long-term plan of China's economic and social development. The outline of the 13th five-year plan sets out the direction and goals for the implementation of "Internet +"(Chen Xiaoping,2002). The plan is clear: we need to implement the "Internet +" action plan, develop Internet of things technologies and applications, develop the sharing economy, and promote the integration of the Internet with economic and social development. We will implement the national big data strategy and promote open sharing of data resources. We will improve the mechanism for universal telecommunications services by speeding up the network and cutting costs, to advance the development of next-generation Internet. We will promote innovation in industrial organizations, business models, supply chains and logistics chains, and support innovations based on internet +.

At present, the academic community pays more attention to the issue of enterprise management innovation in the Internet era. Some scholars believe that since China introduced the "Internet +" strategy in 2012, "Internet +" has been integrated into all walks of life and various fields, making China step into The Internet age. Due to the strong openness and integration of the Internet, this also provides a once-in-a-lifetime historic opportunity for corporate management. Under the "Internet +" strategy, higher requirements are put forward for enterprise management work, and the optimization and improvement of enterprise management mode should be vigorously promoted. In particular, enterprises

must deeply understand the important value of enterprise management innovation in the Internet era, and analyze and restrict in depth. All aspects of enterprise management innovation in the Internet era, using system thinking and innovative ideas, vigorously promote enterprise management reform, innovation and development (Li Xiaocheng, 2019). Some scholars pointed out that enterprises in the Internet era should continue to innovate their management concepts, management models, organizational structures, and human resources management methods, strengthen their links with the market, and establish a good information feedback mechanism to improve the management efficiency of enterprises and promote The further development of the company provides technical support for the sustainable operation of the company (Lin Minjun, 2019). Some scholars believe that under the background of the Internet, enterprise management should adopt an innovative model and explore new development paths. On the basis of mastering the development requirements of the times, we should appropriately innovate management models, seize development opportunities, guide enterprises to develop in the direction of modernization, and fully demonstrate the application advantages of Internet technologies (Tan Ying, 2018). In addition, some scholars believe that in the context of the "Internet +" era, the survival and development lines of enterprises have undergone qualitative changes. The buyer's market has become the lever for enterprises to obtain survival points. "Smart service" has become the market characteristic of the economy and society. This is the "marginal effect" brought by the "Internet +" era. Therefore, enterprise management must embed information technology such as big data and cloud computing in time, and exert its value and functions in production management, business process reengineering, and collaborative supply chain management. Through technological innovation, user demand tapping potential and cost management are reduced. The development needs of enterprises such as production management and business process reengineering, and the deep integration of "Internet +" enterprise management innovation (Guo Ya, 2018). Other scholars believe that in the innovation of enterprise management, it should reflect the characteristics of the era of "Internet +" era of convenience and high speed. In management and management, enterprises must not only arrange production, management, and management according to their own scale, capital, and system. They also need to reflect the needs of users in business management and put user needs first. At the same time, users can absorb user experience and user feedback on products through the Internet, deepen the communication between enterprises and users, and let users get a good experience (Cui Yijia, Wu Zhiwei, 2018).

With the continuous popularization of the Internet, China's Internet industry has ushered in an opportunity for rapid development. As of December 2018, the total number of Internet listed companies in China and abroad was 120, an increase of 17.6% compared with the end of 2017; the overall market value of domestic and overseas Internet listed companies was 7.89 trillion yuan. Among them, the number of Internet companies listed in Shanghai and Shenzhen is 46, which is the same as that at the end of 2017; the number of Internet companies listed in the US is 48, an increase of 7 from the end of 2017; the number of Internet companies listed in Hong Kong is 26, compared with 2017. At the end of the year, 11 were added, as shown in Figure 1.

**Figure 1 Distribution of Internet listed Companies in China**

After 30 years of reform and opening up, Chinese enterprises have been absorbing the essence of developed countries (regions) such as Europe, America and Japan in terms of enterprise management system, forming a set of enterprise management system suitable for China's national conditions. The rapid popularization of the Internet has gradually broken the traditional management thinking of enterprises, especially in the "Internet +" era. More and more Chinese enterprises widely participate in the global international major business transaction, such as economic globalization, regional economic integration(Demsetz.H,2006). Can Chinese enterprises figure out an effective internal governance mechanism in the management system? This will be the focus of this article. This paper will analyze the concept of "Internet +", compare the internal management system of Chinese and foreign enterprises, find out the problems existing in the management system of Chinese enterprises, and try to find targeted solutions.

## 2 Overview of Enterprise Management System

Enterprise management system refers to the internal and external system that the enterprises will involve when they are engaged in commercial activities(Fan Jingli, Zheng Boxun,2013).The external system environment of enterprise includes: *Constitution, Securities Law, Contract Law, Enterprise Law, Corporation Law*, rights awareness, professional ethics and so on. And the government issued the related laws and regulations, such as *Food Safety Law, Labor Law, Environmental Protection Law* and so on for all walks of life, which provides an external organization system environment for the enterprise. Inner-enterprise also has a set of system supporting its operation. Taking the company's articles of association as the core, the enterprise generally sets up performance management, attendance management, marketing management, human resources management, incentive mechanism, responsibility according to their own actual conditions(Fan Jingli, Zhong Chenbo,2015).These rules guide enterprises to be engaged in business activities. In business activities, enterprises constantly improve and formulate new rules and regulations according to external market, internal structure and other factors. Its purpose is to better carry out management work and promote the sustainable development of enterprises.

### **3 Comparisons of Chinese and Foreign Enterprise Management Systems**

#### **3.1 Traditional Chinese enterprise management system**

Under the influence of Chinese social development, dynasty change, foreign trade, war and other factors, Chinese traditional enterprise management system has gradually formed a unique "mainland culture" type enterprise management system (Hart.O, Moore.J, 2008). For instance, *Sun Tzu's Art of War* is the existing comparatively completed system of military operations and internal organization and management. *The Patriarch System* was mainly based on the regional control, and this system was formed due to the needs of war, business and trade. *Leading by teachers* is an effective way for enterprises to retain their important skills (Ju Fanghui, Xie Ziyuan, Bao Gongmin, 2008). *The Craft Inheritance System* is a kind of mysterious inheritance system in which some skills are passed down only to female or male. *The Patriarchal Management System* is the "one person alone has the say" management pursued by most enterprises, in which the "Leader" is the spiritual leader of the enterprise.

#### **3.2 Modern Chinese enterprise management system**

China's modern enterprise management system not only inherits the traditional Chinese enterprise management system, but also absorbs the management systems of developed countries such as Hong Kong, Macao, Taiwan, Europe, America and Japan since the reform and opening up. Such management systems as *the Patriarchal Management System* and *Leading by teachers* are still the management methods chosen by most enterprises (Stephen F. King, Thomas F, 2005). With China's reform and opening up, enterprises from Hong Kong, Macao and Taiwan have flooded into the mainland, and more foreign investment has taken part in China's commercial activities. In order to develop the enterprise, it also introduces such systems as manager system, quality management, 5S management, 7S+1 management, performance appraisal management, corporate culture construction, setting more awards and so on.

#### **3.3 Japanese enterprise management system**

It was once touted as the four magic weapons of Japanese economic management: lifetime employment system, seniority-wage system, enterprise union and decision-making mechanism (Zhang Weiyong, 2005). It has become an important experience of domestic and foreign enterprises in Japan's rapid economic development in 1980s. However, with the great recession in Japan in 1990s, the Japanese government took various measures to stimulate the economy, including reforming the management system and rigid national regulation, but still failed to reverse the trend of Japanese economic recession.

From the above comparison of enterprise management system, there are several characteristics: First, some good applicable management systems are retained and gradually optimized; second, enterprises must actively or passively absorb advanced management system concepts to develop; third, a good management system must be open, inclusive and keep pace with the times (Ning Xiangdong, 2006). On the contrary, today's Chinese enterprise management system can be said to be an effective system accumulated by enterprises in the collision of commercial and trade circulation. Fourth, only in the suitable external environment, can the enterprise management system play its role. If just applied mechanically, the result is often the opposite to what one wishes.

## 4 Problems Existing in Chinese Enterprise Management System in the Internet + Era

The era of Internet + has completely changed people's life, study and work habits. As of December 2018, the number of netizens in China reached 829 million, and a total of 56.53 million new netizens were added throughout the year. The Internet penetration rate was 59.6%, an increase of 2.9 percentage points from the end of 2015, as shown in Figure 4-1. Rise of the individual, disruptive innovation, and fan economy have demonstrated the value of the individual, and infinitely amplified it. The world is also becoming a flat world because of the Internet (Barbara van Mierlo, Cees Leeuwis, Ruud Smits, Rosalinde Klein Woolthuis, 2009). As a single point, each individual can suddenly arise anytime and anywhere. The era of Internet + is an era of publicizing individuality and exerting the role of the individual. In the future, human beings and the Internet will also become more symbiotic and integrated. Technology and human beings will gradually become one and realize the ultimate human intelligence. The development of the Internet and technology connects the individual with the world, making individual autonomy stronger and human beings more social. Meanwhile, traditional jobs are disappearing and new ones are popping up. In the face of the fast pace of the Internet, Chinese enterprise obviously cannot adapt to or keep up with the pace. There are mainly the following problems.

Figure 2 China's Internet Penetration Rate from 2012 to 2018

### 4.1 Lagging internal management system

First of all, some enterprises' internal management system has confused related information and serious overlapping phenomenon. For example, Chinese enterprises have the problem of authenticity and accuracy of financial information in financial management. Secondly, although the enterprise has established relevant internal management system, it lacks rationality and scientificity, and cannot be integrated with the enterprise's development goal and business environment, thus leading the enterprise cannot maximize its own value in the business process.

#### **4.2 Governance structure to be improved**

On the one hand, some enterprises have not set up internal governance mechanism in line with the development of the era of Internet +, leading that the advantages of internal management system cannot reflect the value of enterprise operation and development(Peter Joore,2007). On the other hand, due to the lack of internal supervision departments in enterprises, the management system isn't implemented, and thus the internal management cannot achieve the desired effect.

#### **4.3 Lack of containment in institutional setting**

Firstly, there is no effective containment between posts, which leads to confusion or overlapping of rights in some posts. Secondly, some employees of relevant positions have low professional skills and lack of solid theoretical knowledge, which leads to the failure of effective development of management system in enterprise operation(Yao Yao, Zeng Xianfeng,2015).Third, some personnel have professional knowledge and skills, but after the change of the management system, they cannot conduct in-depth research on the new system. So there are frequent operational errors and misjudgments of information in the process of work.

#### **4.4 Lack of public relations emergency response measures**

In the Internet age, all kinds of information transmission channels and ways are diversified and real-time. In the process of operation, some enterprises will inevitably deal with some topics which are interesting to the competitor and the news media because of personnel changes, labor disputes, reasonable tax avoidance, etc. Once exposed, the enterprise has to struggle to deal with it. This not only has an impact on the marketing of enterprises, but also sets up obstacles in strategic development and other aspects. At the same time, due to these unplanned events, the established plans such as department collaboration and internal management will be disrupted.

### **5 Solutions**

The development of the Internet is beyond people's imagination and prediction, and it is an uncontrollable development state. Just as the "Effect of Sand" shows, enterprises cannot predict when they will run their own business and when the events that are not conducive to the enterprise will occur. As an enterprise, what it can do is to practice its skills, instead of replacing traditional management with the best management. The enterprise should transform the organizational structure, update the management system and optimize department functions with the ideas and methods of the Internet. In view of the above problems existing in the current enterprise management system, this paper proposes the following solutions.

#### **5.1 Improving the efficiency of system implementation**

When formulating the relevant enterprise management system, the rationality and operability of the system should be fully verified, so as to improve the cognition of the whole staff to the system, strengthen the staff's understanding and publicity of the system, and improve the staff's recognition of the system. The implementation of the system cannot focus on the form, but constantly improve the system in the development of enterprises, and make the system more in line with the development of enterprises and the needs of the times.

### **5.2 Improving the quality of management personnel**

The low quality of enterprise management personnel is an important factor which leading to the enterprise management system that cannot be effectively implemented. It's necessary to strengthen professional ethics education and job responsibility education for the management, and improve the awareness of dedication of the management staff. It can teach staff to highly understand the corporate culture and implement the system. In this way, the effect of the low quality of the management on the overall atmosphere of the enterprise can be avoided.

### **5.3 Establishing and improving incentive mechanism**

In the process of enterprise system setting, first of all, it is necessary to establish an incentive mechanism and set up a publicity group to publicize the incentive mechanism to every department, group and individual, so as to stimulate the enthusiasm of employees, improve their recognition of the mechanism and promote the effective implementation of the system. For the first time, enterprises should establish a corresponding incentive feedback mechanism according to the specific situation of the implementation of the incentive mechanism, so as to ensure that the system can be put into practice and achieve real results. Secondly, in the setting of incentive mechanism, multiple awards, such as safety award, full attendance award, performance award, innovation award, communication award, stability award and loyalty award, should be set according to the situation of each position and work, so that most employees can participate in the competition and activities.

### **5.4 Establishing and improving the supervision mechanism**

The supervision mechanism includes several functions: the first is to supervise the implementation of the system; the second is to collect market information; the third is to provide information data support for enterprise decision-making; the fourth is to control enterprise operating costs; the fifth is to supervise enterprise management violation (self-correction and repair function). In short, corporate supervisory departments should have even more comprehensive functions than the national development and reform commission, and should act as the "brain" of business operations.

### **5.5 Grasping the core of enterprise operation**

In the era of Internet +, to obtain opportunities for sustainable development, enterprises should not only integrate multiple development relationships, but also focus on refinement. At the same time, the enterprise should establish a unique corporate culture, so that employees can understand the long-term direction of the enterprise, understand its own tasks and goals, work hard on the stability and adaptability of the enterprise, and cultivate the self-innovation of the enterprise.

### **5.6 Improving internet operation capacity**

The Internet is personalized and subversive. Enterprises cannot participate in business activities without the Internet. In the era of Internet +, the Internet is no longer a platform, but an important tool for enterprise operation. The enterprise must have a professional maintenance and management of the Internet team, the team should coordinate the relations of various departments within the enterprise, play a good linkage role, and integrate the resources of the enterprise.

### **5.7 Improving the ability of public relations response**

Internet information transmission has the characteristics of fast speed and high participation. It seems that there is no place to hide for the enterprise internal information in the era of Internet +. Enterprises should not only establish and improve a set of internal information strategic confidentiality

and supervision and management system, but also set up an independent public relations department to deal with the negative information of enterprises, and strengthen the social publicity of enterprises. In an emergency, they can quickly and effectively make timely and effective response.

### **5.8 Respecting and recognizing the value of the individual**

Enterprise development must follow the "people-oriented" concept, respect and attach importance to personal value. For example, Steven Jobs is the spiritual leader of Apple, and whether Cook can become the next Jobs is yet to be proven. Especially in the era of Internet +, we must fully stimulate individual potential, respect and recognize individual value, and break the traditional management thinking mode. If an enterprise has a core, a department has a core, and a group has a core, the enterprise's core competitiveness of talents can be formed by the multi-point linkage.

## **6 Conclusion**

The era of Internet + is strange to every business operator, and there is not much successful experience to be copied for reference. In this era of rich imagination, enterprises are faced with more opportunities and challenges than ever before. What they can do is to practice basic skills and adapt to changes with times. The system is the support of the normal operation of an enterprise. A good system can boost the development of the enterprise, while an unreasonable system may lead the enterprise into failures. Business owners must break the traditional mode of thinking, using the Internet to integrate internal and external resources from a new view. Based on the principle of respect for personal value, business owners must use a strategic holistic view to grasp the opportunities derived from the Internet. We need to have the determination to make self-revolution, and interpret the enterprise value through innovation, creativity, integration, inclusiveness, symbiosis, co-prosperity and sharing.

**Abstract:** This paper takes operation management of Chinese video websites as the research object, using the literature review method, case analysis method and other research methods to analyze the operation and management mode and the dilemma of China's video website. It is believed that with the rapid development of the Internet, challenges and opportunities coexist in the video website development in China. From the aspects of diversified development strategy, strengthening media integration, and laying emphasis on re-investing in user market segmentation, the future development direction of Chinese video websites has been constructed, and the conclusion has been drawn that the development prospects of Chinese video websites are bound to be promising.

**Key words:** China; Video website; Operation; Management

### 1 Introduction

According to the "China Internet Network Development Status Report" released by China Internet Network Information Center (CNNIC) in August 2018, as of June 30, 2018, the number of Chinese netizens reached 802 million, with a penetration rate of 57.7%. With the popularity of the Internet, the Chinese Internet industry has developed rapidly and maintained a good momentum. Video websites have emerged with the rapid development of the Internet. Based on the learning, entertainment and sharing needs of people on the Internet, video content is produced, distributed, shared and disseminated, and profitable through advertising, user payment and branding strategies (Shi Shuli, Meng Zhe, 2016). Different from the increasingly mature video websites of Europe and the United States represented by the US video website YouTube, Chinese video website encounters both great opportunities for development and the impact of social networking platforms, new media convergence technologies, and copyright protection after the five stages of germination, exploration, stability, growth and transformation which the Chinese video website has undergone since the establishment of LeTV, the first video website in China in 2004. This paper starts with analyzing the current operation and management mode of Chinese video websites, and points out that China's video websites have the dilemma of single profit model, serious content homogenization and high operating cost. The focus of this paper is to make some explorations on how Chinese video websites face future development trends and how to develop emerging strategies. On literature review, research in China, retrieval of "video website" in China How Net, the search results show that there are more than 6500 relevant Chinese literatures, among them, more than 80 articles were analyzed from the perspective of video website operation. From the perspective of video website operation, the article mainly includes four aspects: research on content of video website, research on operating mode of video website, research on operational dilemma and countermeasure of video website, research on the development strategy of

video website from the perspective of new media integration. For example, in "the content characteristics and ways to survival of self-made programs on video website", Li Xiang summarized the reasons for the rise of self-made programs on video website and their performance, propose differentiated strategies for homemade programs on video website. In "the struggle and puzzlement of iQiyi: an analysis of the operating mode of Chinese video website", Wei Liu divides the operating mode of video websites into two kinds: UGC mode represented by You Tube and official mode represented by Hulu. In "The future development trend of video website in China", Lu Jianfeng forward that the future development of video websites is mainly driven by two aspects, one is to constantly innovate the profit model, the other is to continuously enhance brand influence. On research abroad in China, video websites abroad have been established earlier and developed faster, relevant literature mainly focuses on the origin, development process and development status of You Tube and HuLu two benchmarking websites, most of them focus on case studies, few studies have been done on the overall operation management of video websites.

## **2 Mode of Chinese Video Website Operation Management**

The video website operation management mode is mainly analyzed from the aspects of the source of the video content as the key carrier and the profit mode of the video website. The video content source determines the overall operation direction and development mode of the video website, and the profit model determines the influence and long-term strategy of the video website.

### **2.1 Main source of video content**

#### **2.1.1 User generated content (UGC)**

UGC, that is, user sharing content, means that the video content created by the user can be published and shared at any time in the video website, and other users can view, share, comment and collect on the platform. User sharing content is based on the needs of people's social interaction. It is also the most important source of content at the beginning of the video website. It is characterized by personalization, so that users can become the masters of the Internet. For example, the US video website You Tube is a typical representative of users sharing content (Qin Zongcai, Liu Li, 2016). The website slogan is "Broadcast Yourself", which fully demonstrates that the website provides people with an open self-display space, which can fully exert their self-creation. The Chinese video websites Youku and Tudou are also typical representatives of sharing content. Their slogan is "Everyone is the director of life". The website emphasizes the important position of original video content sharing, highlighting its originality and grassroots characteristics.

#### **2.1.2 Copyright purchase**

In the early days of the creation of Chinese video websites, a large amount of unauthorized video contents were uploaded to the video website, causing many disputes and lawsuits. With China's deepening of the rule of law, copyright protection has been raised to an important position. The State Administration of Press, Publication, Radio, Film and Television have issued a series of rules and regulations on copyright protection. Chinese video websites have begun to pay attention to copyright purchases, through the purchase of high-definition genuine TV dramas and movies and TV shows, a complete viewing experience was provided to users, and sticky audiences were gained by the video website. For example, the Hulu video website jointly invested by the three major broadcasters in the United States, namely, National Broadcasting Global, Fox, and ABC, has won the favor of users by purchasing a large number of high-quality genuine professional video content (Inc L.P, 2018). The

Chinese video website iQiyi takes "Yue enjoy quality" as its concept, and through the continuous capital investment, it will purchase high-definition genuine video content as an operation strategy, so that users could get a good viewing experience.

### 2.1.3 Homemade content

As the competition of video websites continues to intensify, users sharing content and copyright purchases have become the main way of video content sources of major video websites. In order to highlight the differences between video websites, professional technical teams have been hired to combine the characteristics of the websites with the needs of the audience to make homemade micro-video, TV series, movies, TV programs and other content. In recent years, the self-made content of Chinese video websites has presented the characteristics of continuous improvement of content quality even close to or exceeding professional standards. For example, Sohu Video has always used self-made boutique video content as a development strategy, and has invested a lot of money and resources for self-made content and Sohu produced channels are also set on the website. In recent years, self-made dramas such as "Dear, Princess Disease" and "swordsman Ritian" have been popular among users, and even the phenomenon of self-made dramas being sold back to traditional TV media has appeared.

**Table 1 User Size of China's Homemade Variety Show in 2017**

number	Variety Name	platform	Maximum monthly equipment coverage (ten thousand)
1	China has hip hop	iQiyi	10768.7
2	My sister is hungry	iQiyi	6110.7
3	Son of Tomorrow	Tencent Video	5578.4
4	Let's Talk	iQiyi	5533.1
5	Where is Dad going	Mango TV	5099

## 2.2 Profit model of video website

### 2.2.1 Advertisement income

Advertising revenue is the initial and most important source of profit for all video websites. As the application of video websites on the PC side and mobile clients continues to grow, the demand of users continues to increase, and advertisers' focus on advertising is transferred from traditional media to emerging media such as video websites. Video advertisements can be roughly divided into three types: patch ads, overlay ads, and implant ads. A patch advertisement is also called an in-video advertisement, which means that the advertisement content is mandatorily played in the front, middle or back when the user uses the video content, and the advertisement effect is directly related to the click rate of the video content. Coverage ads are the most basic form of advertising for video sites. They appear statically or dynamically at any location on the video site page. Coverage ads are not mandatory ads and usually do not affect the playback of the video and the clicks of the site content. Some ads can be manually closed. Implanted advertising is a new form of advertising, which has also been widely used in video websites. Advertisers indirectly incorporate the representative symbols and features of advertising products into

video content through title and implantation in video to make users to subtly accept advertisements for achieving marketing purposes.

### 2.2.2 User payment

In order to obtain a large number of audience and a high user click-through rate, Chinese video websites generally provide users with free video content, but with the development of market economy and fierce competition, Chinese video websites have gradually begun to charge users for providing high quality video content. In China, the shopping website has formed a relatively complete payment mode for member users. Member users can enjoy discounts and high-quality services after the payment. In the process of paying for video website, with the increasing awareness of copyright protection, users have changed the concept of free access to video resources, and gradually accept the form of watching video content by paying members fees (Bi Qiumin, Zeng Zhiyong, 2012). In 2010, Chinese video websites LeTV and Youku took the lead in providing member-paid services. Later, mainstream websites such as iQiyi and Sohu also launched membership payment services of which the initial results were not satisfactory, but with the change of users' concept, income from members' paying continues to grow.

Figure 1 Scale of Video Payers in China from 2014 to 2017(ten thousand)

### 2.2.3 Branding strategy

The branding strategy is the highest value-added profit model for video websites, and it is also a sign that video websites are gradually maturing. Branding strategy means that video websites rely on the influence of their own brands to achieve profitability by building network platforms, copyright operations and operations, and capital operations for enterprise users. Strategies of conformity and alliance have been applied by China's video websites in succession for a better implement of the branding. Youku video and potato video have been merged into Youku Tudou in a way of 100% share swap. The three mainstream websites Iqiyi video, Tencent Video and Sohu Video have formed a strategic alliance and established "video content cooperation organization" to achieve resource interoperability and platform cooperation.

## 3 Operation Management Dilemma of Video Website in China

### 3.1 Single profit model

Although the video website has multiple profit models, the user payment and branding strategy is still in the exploratory stage. At this stage, the profit model of Chinese video websites is mainly based

on advertising revenue. Due to the single profit model, video websites rely too much on advertising revenue, which requires video content to win more users' click-through rate, attract users' attention and sell their attention to advertisers (Gou Shixiang, Wang Ling, 2010). In order to maximize profits, video websites take risks to use a lot of erotic videos that spoof click-through rates, and post video links for the purpose of spreading viruses, and low-key whispers, which is not conducive to the normal competition of video sites and social civilization.

### **3.2 High content homogenization**

Although each video website has different development strategies and focuses, under the China's video website environment and limited innovation, content homogenization is still very high, almost every video content resource can be found in multiple other videos. This also reduces the brand loyalty of the users'. Although video websites are constantly seeking differentiated competition under the strategy of self-made content and proprietary rights and the content homogenization has been improved, but working capital and investment are limited. All the video websites have adopted multiple forms of comprehensive development strategies so that the phenomenon of quality is inevitable.

### **3.3 High operating costs**

During the process of development of China's video websites, unremitting exploration of development strategies and approaches to be in line with the development of the industry and the development of its own needs has reversed the condition of being unable to make ends meet and start to achieve profitability, however, the more and more fierce market competition makes various video websites to seek differentiated development, and to put an constantly increasing investment in self-made content and copyright purchases, and to spend a lot of money to purchase a popular online drama which have made a rapid price expansion of the copyright. So that the increase proportion of copyright costs has led to an increase in operating costs. In addition, in order to ensure users to have high-definition, smooth and high-quality experience, video sites will continue to invest in technology updates.

### **3.4 The dysfunctional copyright protection system**

The Chinese video website has been facing the dilemma of copyright protection since its inception. A lot of manpower and material resources are required to deal with copyright disputes because of the problem of disputes and litigation cases which are caused by the copyright problem, so that the pace of development is stunted. The deep-seated reason for the copyright problem of video websites is the temptation of profit. Video website mainly relies on users to share content. In order to gain greater benefits, some video websites which are not disciplined enough have relaxed the review and check of the video content, which ultimately caused infringing behavior. With the continuous strengthening of China's efforts to crack down on piracy and the increasing legal awareness of the majority of Internet users, the copyright protection system of Chinese video websites has been gradually established, but the road is still very long, and it requires the participation of multiple subjects including legislation, justice, administration, and rights holders to gradually complete the copyright protection system.

## **4 Operation Management Development Direction of China's Video Website**

### **4.1 Expand the industrial chain and implement a diversified development strategy**

With the rapid development of the Internet, video websites solely rely on the video content resources of the website itself to make profits that are not in line with the needs of the times (Wang Ling, 2009). It is necessary to improve the market competitiveness by improving the industry chain. Through

cooperation with mobile terminal manufacturers, the hardware market is occupied to facilitate penetration into the home. By arranging the TV client and hardware facilities to occupy the user's living room, which is helpful to improvement of the user's viewing service and improvement of the advertising bargaining power and profitability. China's video websites must adhere to the road of sustainable development, implement a diversified development strategy. Through the wide-ranging use of applications such as 4G and even 5G networks and the popularization of APP software or many other various forms to expand market in various domain such as mobile phones, tablets, mobile internet technologies, mobile social platforms, etc. The special advantages of three-dimensional integrated marketing shall be given to full play, and the influence and potential advantages of high-quality content resources shall be constantly magnified, so that unexpected surprises would be created.

#### **4.2 Enhance media convergence and promote user experience**

Media convergence is the general trend of the development of new media, and the era of the continuous development of Internet technology. In the macro background of media convergence in the information age, Chinese video websites should make full use of digital technology to share big data technology among different media to realize video content resource sharing, optimize service content and improve product quality (Hao Weida, 2013). Through media integration, we could gradually explore the unique competitive advantage of our own brand. By relying on this high-quality user experience, we may finally get the promotion of brand's goodwill and user stickiness.

#### **4.3 Precise content delivery, focusing on user segmentation**

As Internet users are increasingly demanding service quality, Chinese video websites must take a differentiated path in order to differentiate themselves in the future market competition. Through the analyses of the market distribution pattern, customer needs and their own positioning, Chinese video website could make a precise localization, and highlight user's personalized needs. Each video website needs to focus on the user market segmentation. With the help of big data technology, video websites could collect and share user-related data in various ways, grasp the individual needs of different users, and tailor the video content according to the user's needs to improve user dependence.

### **5 Conclusion**

The last 15 years have witness Chinese video website's appearance in 2004, and it's transformation from weak to strong, from exploration to maturity. The future development of the Internet is changing and the future development of Chinese video websites would absolute not be a smooth sailing, especially under the impact of current social networking platform represented by the short video of the vibrato, and the live broadcast of Betta. But the video website is going to base on the unique video content resources, and take strong capital operations and social operations as shields to hold huge development opportunities against all the challenges. This paper starts with the operation management mode of Chinese video website, analyzes the video content source and profit model, and puts forward the dilemma of monopoly, homogenization and high operating cost which China's video website operation management has encountered. After the analysis of the dilemma, this paper focuses on pointing the future development direction of China's video website operation management, namely, expanding the industrial chain and implementing diversified development strategies; strengthening media integration and enhancing user experience; accurate content delivery, focusing on user market segmentation. The proposal of these viewpoints has certain reference significance for the future

## Foreign Experience and Reference in Operation Supervision of Sharing Bike

Yang Jiaqing

School of Law, Humanities and Sociology, Wuhan University of Technology, Wuhan, P.R. China,  
430063(E-mail: 258601839@qq.com)

**Abstract:** The earliest bicycle in history appeared in France. The origin of bike-sharing is still in Europe. The "white bike project" in the Netherlands was the earliest form of bike-sharing. Nowadays, some foreign countries also attach great importance to the development of sharing bike, and regard sharing bike as an important way to optimize the public transport structure. This paper will make an analysis of the foreign experience of the operation and supervision of sharing bike, in order to provide some experience reference for improving the operation and supervision of sharing bike in China.

**Key words:** Sharing bike; Operation supervision; Experience; Reference

### 1 Introduction

The earliest bicycle in history appeared in France. In 1790, the French invented the wooden bicycle, which was the first bicycle in history (Wafic El-Assil, Mohamed Salah Mahmud, Khandker Nurul Habibi, 2017). After continuous improvement, a bicycle with modern transportation significance was gradually formed. The origin of bike-sharing is still in Europe. In 1960s, there was a "white bike project" in the Netherlands, where a group of young people put white-painted bicycles in public places for free use, which was the earliest form of bike-sharing. Up to now, some foreign countries also attach great importance to the development of sharing bike, and regard sharing bike as an important way to optimize the public transport structure (Philipp Aeschbach, Xiaojing Zhang, 2015). We can make an analysis of the foreign experience of the operation and supervision of sharing bike for providing some experience reference for improving the operation and supervision of sharing bike in China.

At present, the social problems caused by sharing bicycles have aroused the attention of the academic circles. Some scholars have proposed countermeasures and suggestions for standardizing the sharing of bicycle operations. Li Yanqing (Li Yanqing, 2018) believes that the standard shared bicycle operation needs to start from the following aspects: First, formulate clear administrative regulations to guide the scientific development of the shared bicycle economy; Second, enhance the legal operation awareness of shared bicycle operating enterprises; Third, enhance the public The legal literacy, the standard use of shared bicycles. Deng Daming and Li Zijian (Deng Daming and Li Zijian, 2017) put forward their own views on the supervision strategy of sharing bicycle deposits. They believe that to strengthen the supervision of shared bicycle deposits, first of all, it is necessary to clearly understand the legal nature of sharing bicycle deposits, and prevent the sharing of bicycle deposits from illegal fundraising or malicious circle. Second, to further clarify the supervision of the shared bicycle deposit, the clear department is responsible for the supervision of sharing the bicycle deposit; again, the introduction of third-party credit supervision agencies to prevent the risk of capital run; Finally, build a unified supervision platform to achieve shared bicycles The immediacy of financial data regulation. Wang

Guangrong (Wang Guangrong, 2017) believes that the key to solving the problem of shared bicycle operation lies in constructing a legal mechanism for cooperation between government and enterprises, strengthening the legal responsibilities of the government and enterprises in the process of sharing bicycle operations, and avoiding the mismanagement of shared bicycle operation supervision. Huang Yibo and Nie Ning (Huang Yibo and Nie Ning, 2017) believe that the biggest risk facing shared bicycle operation is capital risk, and the effective strategy for mitigating the risk of funds is to deposit the deposit of shared bicycles to a third party, and this third party should be a bank. Hong Ping, Zhang Xiaya, and Yu Shuaidong (Hong Ping, Zhang Xiaya, and Yu Shuaidong, 2018) believe that the strategy of strengthening the supervision of shared bicycle deposits can be started from the following aspects: first, the regulators and departments that clearly share the deposit of bicycles; second, the introduction of the deposit custody system; Determine the deposit of the interest rate; Fourth, the risk reserve is prorated. Fu Rui (Fu Rui, 2017) believes that the operation of standard shared bicycles needs to focus on solving the following two problems: first, to clearly share the responsibility of the bicycle during the cycling process; second, to clarify the legal responsibility of private possession of shared bicycles.

It can be seen from the previous literature review that the current academic circles have already carried out a richer discussion on the issues related to shared bicycles. The legal issues of sharing bicycle operations and the legal regulation measures have formed certain research results. These research results provide ideas, methods and theoretical guidance for the research of this paper. However, in these research results, there is a lack of comparative horizons, and there is no comparative analysis of the experience of developing bicycles abroad. Based on this, this paper intends to study the supervision experience of foreign shared bicycle operation, in order to seek breakthroughs and innovations in theoretical research.

## **2 Experience in Operation Supervision of Sharing Bike in Foreign Countries**

### **2.1 Experience in operation supervision of sharing bike in the Netherlands**

As early as 1890, the Netherlands began to build the world's first bicycle lane, which to some extent promoted the development of Dutch bike-sharing. Specifically, the experience of operating and supervising bike-sharing in the Netherlands mainly focuses on the following aspects.

The first is to set up special bicycle roads and penalize users who do not ride on special roads. The right of way of sharing bike is a major issue related to the operation of sharing bike. Without the right of way, the operation of Shared bikes can hardly be guaranteed. In order to ensure the operation of bike-sharing in the Netherlands, bicycle lanes are specially planned. Currently, the total length of bicycle roads has exceeded 35,000 kilometers, accounting for about 30% of the total length of roads in the Netherlands. Not only that, in the bicycle special road, the bicycle signpost is also specially painted and set up for each place between the interval distance, direction and other information. Thanks to this, users of sharing bike can enjoy certain convenient conditions during their riding (Pucher J, Buehler R E, 2012). At the same time, some warnings or fines will be given to cyclists who cross the bike lane, which actually regulate the cycling behavior of cyclists.

The second is to stipulate in the law that sharing bike has the relative preferential right to use the special roads for bicycles. In order to encourage residents to travel in a green way, the Netherlands clearly stipulates that sharing bike has the relative priority of the right to use special bicycle roads. When motor vehicles want to use or occupy bicycle roads for special reasons, they must try to avoid sharing bike and give priority to the travel of sharing bike.

The third is to give some tax breaks to users of sharing bike. Cyclists who often use sharing bike can get certain tax breaks or exemptions in the process of tax payment, as well as deposit reduction.

The fourth is to improve the construction of parking lots for sharing bike and set up a reward system for reporting illegal parking. Currently the number of sharing bike in the Netherlands is more than 17 million while the population of the Netherlands is only about 17 million. The number of sharing bike puts forward certain requirements on the parking lots, otherwise it will affect the public order. Therefore, the government actively supports the construction of bicycle parking lots. Dozens of large bicycle parking lots have been built all over the country. On this basis, a reward mechanism for illegal parking has been set up. Anyone who finds disorderly parking behavior can report it, and the informant can get corresponding rewards, which objectively avoids the problem of disorderly parking of sharing bike.

## **2.2 Experience in operation supervision of sharing bike in Japan**

Japan's land area is small and land resources are very scarce, so the development of public transport has become a key breakthrough to solve the problem of resource shortage. Therefore, sharing bike is also developing rapidly in Japan. In 2012, there were only 20,000 people using sharing bike in Japan, while in 2016, the number was nearly 2 million people. In order to regulate the operation of sharing bike, the Japanese government has also taken a series of measures.

The first is to introduce special bicycle management laws. As early as 1980, Japan promulgated the law on promoting the safe use of bicycles and the construction of bicycle parking lots, aiming at the social problems caused by improper bicycle parking (Greg Rybarczyk, Changshan Wu, 2010). In 1994, on the basis of revising this law, Japan promulgated the law on measures to promote the safe use of bicycles and comprehensively promote bicycle parking, focusing on solving the parking problems caused by bicycles. In 2012, Tokyo's Seitama City issued the first local bicycle management act in Japan -- "bicycle use charter", which mainly refines the regulations on traffic management of bicycle use, so as to minimize traffic accidents in the process of bicycle use. In 2017, Japan introduced a law to promote the use of bicycles, which clearly stipulates that bicycles are environmentally friendly means of transport. This has improved the legal status of bicycle traffic in Japan's traffic law, in which explicit provisions have been made on the parking, leasing, sharing and management of bicycles, which is the most important legal basis for the operation supervision and management of sharing bike.

The second is to define the regulatory bodies of sharing bike. In the law on promoting the use of bicycles in Japan, it is clearly stipulated that a bicycle promotion headquarters shall be set up under the Ministry of Land Infrastructure and Transport, which shall be responsible for the formulation and implementation of bicycle promotion plans to promote the development of bicycle sharing business. In addition, the bicycle promotion headquarters is also responsible for supervising the implementation of bicycle plans in various places, especially supervising the number of sharing bike and the development scale of sharing bike enterprises in various places, so as to avoid excessive growth of sharing bike. It can be seen from this that there are clear regulatory bodies for Japanese bike-sharing operations.

The third is to strengthen the supervision of parking behavior. Japan clearly stipulates that pedestrians have the absolute priority of the road, bicycles have the relative priority of the right to travel, and motor vehicles must avoid pedestrians and bicycles. However, while emphasizing the relative priority of bicycles, Japan's road traffic law strictly limits the abuse of the priority of bicycles, requiring bicycle users to abide by traffic rules and park their bicycles in designated parking lots. This actually creates good conditions for the operation of sharing bike, which not only encourages residents to use sharing bike, but also strictly requires residents to abide by traffic rules. Moreover, Japan also encourages bicycle companies to offer deposit reduction or break to users who comply with their parking obligations, which helps to cultivate good parking habits.

The fourth is to specify the obligation in the allocation of bicycle parking lot. Japan has made clear provisions on the obligations of local governments in the allocation and construction of bicycle parking lots (Elliot Fishman, Simon Washington, Narelle Haworth, 2014). Therefore, the Ministry of Land Infrastructure and Transport of Japan has issued the regulations on the obligation of allocation and construction of standard bicycle parking lots. It clearly stipulates the obligation of each building to provide bicycle parking lots and requires local governments to cooperate. Table 1 shows the regulations for the allocation of bicycle parking lots in Osaka. It can be seen from this that Japan clearly stipulated the main body of bicycle parking, which to some extent helped to solve the problem of disorderly parking of bicycles.

**Table 1 Standards for Construction of Bicycle Parking Lots in Osaka, Japan**

Facility	Facility size	Scale of bicycle parking lots
Amusement facilities, retail stores, convenience stores, catering stores, karaoke shops, etc.	over 300 square meters	One bike per 15 square meters
Sports facilities, government departments, etc.	over 400 square meters	One bike per 20 square meters
Banks, post offices, etc.	over 500 square meters	One bike per 25 square meters
Learning facilities, cinemas, theaters, hospitals, etc.	over 600 square meters	One bike per 30 square meters

### 2.3 Experience in operation supervision of sharing bike in France

Bicycle operation also started early in France. In 1974, the French city --- La Rochelle launched the "Yellow Bike" project, in which the government provided yellow bikes to citizens for free, so that citizens could use bicycles to travel. In 2007, Paris established the public bicycle rental system Velib, which has become a relatively successful operation case of bike-sharing project since its operation. Among the cyclists in Paris, one out of three rides a bicycle in the Velib system. The experience of bike-sharing operation in France mainly focuses on the following aspects:

The first is to strengthen the regulation of sharing bike. France attaches great importance to the planning and construction of exclusive bicycle roads. In Paris, bicycle lanes of more than 370 kilometers have been built, which cover most streets in downtown Paris. Like the Netherlands, France also attaches great importance to the regulation of bicycle traffic. For users who do not follow the transportation rules, France requires bicycle enterprises to cancel their bike rental qualification.

The second is to reasonably plan bike rental sites. France attaches great importance to the planning of bike rental sites as a breakthrough to promote the orderly operation of bike-sharing. Take Paris as an example, at present, there are more than 1400 bike rental sites in Paris. These bike rental sites are equipped with the Internet query system, so that Parisians can check the usage of bicycles at any rental site, which greatly improves the efficiency of bicycle operation.

The third is to strengthen the investigation of bicycle safety risks. French sharing bike also faces the problem of damage when operating, in order to solve this problem, the government cooperates with bicycle enterprise, paying funding dedicated to repair the damaged bike and irregularly checking on the security situation of traffic. Once finding that bike is not in conformity with the operating conditions,

enterprises will be punished, which can supervise bicycle enterprises to actively fulfill obligations to protect the safety of the bicycle.

#### **2.4 Experience in operation supervision of sharing bike in the UK**

With bike-sharing enterprises all over the country, the bike-sharing business in Britain is also relatively developed. The experience of UK bike-sharing operation mainly includes the following aspects:

The first is to play the role of tax in promoting the development of sharing bike. In order to promote the development of sharing bike, UK allows local finance to support the development of sharing bike. For example, after the Barclays bicycle plan was launched in London, London provided certain financial relief policies to the enterprises developing the public bicycle business, which to some extent stimulated the development of Britain's sharing bike. Relying on government tax breaks, some bike companies offer users a deposit reduction, which reduces the risk of deposit to some extent.

The second is to establish a perfect sharing bike rental system. In order to ensure the sustainable operation of sharing bike, Britain also attaches great importance to the construction of sharing bike rental system. For example, London established 24 hours car rental network system, and user can search the number of sharing bike and parking lot by touching the screen of the sharing bike rental points. Generally there will be the next rental point far from no more than 300 meters, and users can click the option on the touch screen for 15 minutes to find parking lot, which is convenient for users to find sharing bike and return the bike in time.

The third is to strictly limit the qualification of users. In the UK, bike-sharing fees are mainly charged by credit cards and debit cards, so users have to be at least 18 years old to be eligible to buy and rent the bikes, which avoids teenagers from using them at a younger age and reduces safety risks.

The fourth is to strengthen the safety supervision of sharing bike. Britain has a very strict management on the safety configuration of sharing bike, requiring bicycle enterprises to configure safety equipment as much as possible. For example, the London government requires sharing bike to be equipped with blaze lamp to ensure the safety of sharing bike at night.

#### **2.5 Experience in operation supervision of sharing bike in Australia**

In 2010, the first sharing bike operating system MBS appeared in Melbourne, Australia, which started the operation of sharing bike. The experience in the operation and supervision of sharing bike in Australia mainly focuses on the following aspects:

The first is the mandatory wearing of helmets for cyclists. Australia introduced mandatory helmet laws in the 1990s. Cyclists who do not wear helmets will be penalized. In November, 2010, the Victorian government began offering helmet rental services at some sites in an attempt to increase helmet usage. In 2013, the Victorian government further experimented with free helmet sharing, putting helmets on the handlebars of some sharing bikes. The mandatory wearing of helmets strengthens the safety awareness of cyclists on sharing bike, which is conducive to the personal safety of cyclists.

The second is to strengthen the management of sharing bike. The Australian government attaches great importance to the regulation of the operation of sharing bike. For example, the Australian government will issue a notice to the bicycle enterprises and require them to pay a certain amount of fines to get back the sharing bike if they park sharing bikes in the streets, parks and beaches at will. Sharing bikes that are not collected by operators in time will be destroyed or recycled. Through this measure, it urges bicycle enterprises to strengthen the management of sharing bike, so as to avoid the

adverse impact of sharing bike on social and public order.

The third is to strengthen the supervision of sharing bicycle deposit. The Victorian government requires bicycle companies to keep deposits in the exclusive accounts of financial institutions when collecting deposits from users. For users with good credit, bicycle enterprises are encouraged to exempt from deposit.

### **3 Reference of Operation and Supervision of Sharing Bike in Foreign Countries**

From the experience of the development of sharing bike in foreign countries, it can be seen that in order to promote the orderly supervision of sharing bike, some foreign countries have put forward corresponding laws and regulations, which provide a guarantee for the development and operation of sharing bike. From the experience of operation and supervision of sharing bike abroad, we can learn from it according to its national conditions to strengthen the supervision of sharing bike in China.

#### **3.1 Coordinating the interests of all parties and paying attention to the protection of users' security rights and interests**

From the above experience of bike-sharing operation, it can be seen that all countries pay more attention to the protection of the right of way for bicycles, which should be realized mainly in three ways: one is to pay attention to the construction of bicycle lanes in road planning. The Netherlands, France and the UK have all built their own roads for bicycles to ensure their passage. Not only that, but there are special signs on these exclusive roads to guide cyclists. The second one is to clarify the right of way for bicycles in the law. The Netherlands, Japan and other countries have clearly put forward the relative priority of bicycle traffic, which has been written into traffic laws and regulations. The priority of bicycle traffic is second only to pedestrians, which provides legal protection for the operation of sharing bike. The third one is to strengthen supervision over the safety of sharing bike. In Australia, bike-sharing riders must wear helmets, while in the UK, there is a strict age limit on users and a blaze light must be installed on bike-sharing services to ensure personal safety. The direct consequence of the above measures is to protect the safety rights and interests of users, which is a good coordination of the interests of users of sharing bike, bicycle enterprises and motor vehicle drivers.

#### **3.2 Defining regulatory bodies and implementing regulatory functions**

Government supervision is an important condition to ensure the orderly operation of sharing bike. Some foreign countries have introduced corresponding laws to strengthen the supervision of sharing bike, which also brings useful enlightenment to China's sharing bike. Australia and Japan attach great importance to the supervision of sharing bike. In particular, Japan has issued laws to make clear provisions on the supervision of sharing bike and set up bicycle promotion headquarters to endow them with the supervision function of sharing bike. At present, China's regulations on the regulatory bodies of sharing bike are not clear. For example, the description of "transportation and finance authorities" seems that both financial and transportation authorities have regulatory powers, but in fact, there is no regulatory authority that is actually implemented, let alone the sub-work and cooperation between regulatory bodies. Especially for the deposit supervision of sharing bike, the principle of "law without authorization is prohibited" is followed. The current sharing bike legal attribute is not clear, so the financial departments will not put the deposit into its regulation scope before obtaining legal authority. It leads sharing bike deposit in the current situation without supervision. The operation of sharing bike in foreign countries shows that it is necessary to further clarify the supervision department and implement its specific responsibilities, so as to construct an effective supervision system of sharing bike.

### 3.3 Paying attention to deposit risk prevention

Deposit risk is an inevitable problem in the operation process of sharing bike. Britain and Australia pay more attention to the prevention of deposit risk of sharing bike. For example, the British government encourages bike companies to reduce or break user's deposit through tax exemption policies to avoid disputes between users and bike companies due to deposit. Australia requires bicycle companies to bring the deposit of users into the supervision of financial institutions, and for users with good credit, the deposit can be exempted. These measures show that some foreign countries are aware of the risks brought by the security deposit of sharing bike, and must take effective measures to prevent the security deposit risk. Foreign experience shows us that as a product of the development of sharing economy, sharing bike must be attached importance for guarding against the risk of deposit in the operation process. On the one hand, we must strengthen the supervision of deposits, such as the supervision of user deposits by specialized financial institutions. On the other hand, by means of incentive, deposit reduction for users with good credit and replacement mechanism for deposit can also effectively prevent deposit risk.

## 4 Conclusion

As a new way of travel, sharing bike plays an important role in optimizing traffic structure, easing urban congestion, reducing travel costs and protecting urban environment. However, while bike-sharing is growing, it is also faced with a series of problems. One of the important reasons for these problems is the weak supervision on the operation of bike-sharing in China. Therefore, to solve the problems existing in the operation and supervision of sharing bike, we must start from multiple levels. While learning from the effective experience of foreign countries, according to China's national conditions, we can formulate corresponding regulatory measures to provide strong support for the benign development of this new business model.

# Research on Optimal Path of Sports Variety Program Content Production Based on 4V Marketing Theory

Sun Jinrong, Hu Xuehui

Physical Education Department, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: jinrongsun40@126.com, 741792443@qq.com)

**Abstract:** The sports variety program is an emerging products combination of sports industry and cultural entertainment industry. It can stand out from the competition of similar products and attract the attention of the public only by optimizing of content production in the context of content competition. Combined with the advantages and disadvantages of the current sports variety program in the production of content, this paper adopts the qualitative research method to construct the 4V marketing mix model of sports variety program based on the 4V marketing theory. In the meantime, the paper explores the optimal path of sports variety program in content production which is divided into four dimensions: the production of variation, the production of versatility, additional value production and the production of vibration.

**Keywords:** 4V Marketing theory; Sports variety program; Content production; Optimal path

## 1 Introduction

The appearance of sports variety program is not only a bold extension of sports competition performance industry's definition, but also a response to the audience's increasingly personalized and diversified viewing needs. In response to this development status, Li Qiumeng (2016) believes that the entry of sports elements into variety shows is an inevitable development trend from the perspective of mutual benefit and symbiosis between variety shows and sports industry. According to the development of sports variety in China, Yao Jing (2017) concluded that the imbalance of various elements is the main problem that causes discomfort to the audience. Research on content production has been launched, and Zhang Luyuan (2017) has made the following recommendations: 1. The establishment of the target theme should achieve the balance between mass groups and minority projects. 2. The design of concept should realize the balance of entertainment and sports elements. 3. Participants should achieve a balance between professionals and amateurs. Under the background of "content is king" market competition, the research of the specific path of content production optimization has a self-evident significance for the development of future sports variety program and even to the development of sports competition performance industry.

## 2 Sports Variety Program 4V Marketing Combination Mode

4V marketing theory is a new marketing mix proposed by professor Wu Jinming in 2001. It makes a comprehensive and thorough analysis of the advantages and disadvantages of the early 4P, 4C, 4R marketing mix and the historical limitations of its economic background. The 4P marketing mix is

obsessed with supply-side issues such as products, prices and channels, but lacks judgment and analysis of the demand side. The marketing mix of 4C and 4R focuses on the needs of customers starts from the demand side, but ignores the creation of product characteristics and core competitiveness. The 4V theory takes the maximization of the value of both supply and demand as the marketing concept and proposes a new marketing mix of variation, versatility, value, and vibration combined with the current era of economic form. It improves the deficiencies of the early marketing theory in the marketing combination mode from both sides of the demand side and the supply side, and provides a feasible new direction for the future development of sports variety.

In order to improve the effect of sports variety information dissemination, combined with 4V marketing theory, this study constructs a sports variety 4V marketing combination model, as shown in Figure 1.

Figure 1 Sports Variety Program 4V Marketing Combination Mode

On the one hand, this model should improve the value of sports variety program content products through the production of variation, the production of versatility, additional value production from the supply side point of view. On the other hand, the audience can accept the value information of the product without error through the production of vibration.

### 3 Optimal Path of Sports Variety Program Content Production

According to the constructed 4V marketing mix model of sports variety program, the specific optimal path will be discussed from four dimensions taking content production as the starting point: variation, versatility, value, and vibration respectively.

#### 3.1 Enhance the product identification and build the core competitiveness of sports variety program

Variation production aims to cultivate the core competitiveness of sports variety in content and endues the audience with preference intention to watch sports variety through the way of "no one has the same as me, while others have the same as me". It is mainly completed from three aspects: market segmentation variation, content production variation and image production variation.

##### 3.1.1 Market segmentation variation

With the rapid development of information technology and the arrival of the all-media era, information dissemination has become a decentralized development trend. Previous content production which focuses on "big and complete" is hard to get reverberation. The seed of sports variety program is more suitable for burying the "market land" of "small and specialized" content production. The audiences of sports variety program are different from NBA, super league and other traditional head

sports IP, they are usually consisted of college students and young users who are used to using the network new media platform. From this point of view, targeting this niche market should use online media as the main channel, to establish the market positioning of sports variety program with the student and middle-income group as the main user groups.

### 3.1.2 Content production variation

There will be no shortage of product supply but only high-quality product supply will be lacked in the overcapacity market. The high-quality sports variety program products will have the following two points in the content production variation.

First of all, it is necessary to differentiate content production from non-sports variety shows. Conflict and suspense are two effective indicators to enhance storytelling and attract audiences. Through ingenious setting, it can effectively enhance the cohesiveness between programs and audiences and optimize communication effects. Therefore, the sports variety program must take advantage of its conflicting design and suspense setting to achieve the effect of the combination of real and variety through natural ways relying on its own conflicts to confront (conflict) and the unpredictability of the results (suspense). In general, the control of the setting of the big suspense is divided into a numbers of suspense composed of natural conflicts, which constitutes a chain structure of suspense-conflict-suspense.

Secondly, comparing with sports variety program of the same type, homogeneity should be avoided. Ahead of the Beijing Olympic Games, the provincial satellite TV launched a series of sports variety program which almost the same that shows no sincerity to the audiences. In contrast, "This Is Slam Dunk!" subverts the production modes of previous sports variety shows in content and form. It not only records a game with a long lens in complanation, but also shapes an emotional three-dimensional individual athlete and creates a three-dimensional passionate basketball culture scene, thus achieving differentiated production of content.

### 3.1.3 Image production variation

Eunjoo Cho et al. believe that image building for a product is an anthropomorphizing process. To achieve the goal of personalization, the products should be endowed with human emotions. Meanwhile, consumption behaviors of consumers also reflect their own images. That is, audiences prefer to watch programs that are conformed to their own images, or build their expected images in order to obtain social currency by watching programs with specific images. As mentioned above, the user portraits of sports variety program audiences is accustomed to used the network of new media. To build the image of sports variety program, we can make it by labeling the content production through analysis their diversified needs and the psychological characteristics of the pursuit of fashion culture combine with the characteristics of the sports program.

## **3.2 Provide flexible function supply to meet the needs of multi-user groups**

According to the use and gratification approach, different audiences can meet their different needs through the same media information. The essence of functional production is to provide different series production for users with different requirements.

### 3.2.1 Strengthen the core functions of sports variety program

With audience-based thinking, the audiences who watch sports variety program are roughly divided into two categories: sports enthusiasts and the potential sports fans on the Internet. To meet the needs of such a huge user groups, we should pay more attention on the core functions of sports variety program

by making sure every frame revealing sports symbols and presenting the expected sports programs to audiences with the most professional language and pictures. The core function of sports variety program lies in its professional content. It is worth emphasizing that the professionalism of sports should be put in the first place while sports and entertainment can not be separated. And only by strengthening the professional sports content production can we avoid the situation of putting the cart before the horse.

### 3.2.2 Expand the extension function of sports variety program

The core function of sports variety program is supported by the production of professional content, and the extended function will be made by the entertaining production. The partition wall will be set up between the programs and the audiences if we pursue professionalism and sportiness blindly. To put it strong, the sports variety program should expand the extended function through two channels based on not losing the features of sports competition, such as the opening of rules and the liberalization of competition system.

### 3.2.3 Explore the additional functions of sports variety program

The aesthetic paradigm of the masses has been distorted by the most traditional variety program which pursues to produce excessive entertainment content. The entertainment gradually becomes "fool" under the environment of the pursuit of entertainment production. And the additional functions of sports variety program are a correction of social aesthetics. As Terry Agleton said, "aesthetics is born as the language of the body". The audience will abandon their cognition of ugliness and flatter, reconstruct the healthy aesthetic paradigm by the production of sports variety program which shows the beauty of physical, sports and posture. It will also construct the aesthetic value of the organic combination of art and entertainment when audiences savour this ancient beauty comes from within the body.

## **3.3 Develop the additional value of products and create the best experience atmosphere for audiences**

The additional value production is to enhance the total value of sports variety program through technology addition, service addition and cultural brand addition.

### 3.3.1 Additional technology

The additional value of sports variety program can be enhanced by technical addition. It means to integrate high and new technologies organically into the content production through technical innovation. In the program, the high-speed movement and dynamic movements, the photographic capture of the bodies, the upload speed of information data, the clarity and synchronicity of the presented pictures will directly affect the experience value of audiences. The upcoming 5G era will provide a new network framework. The peak transmission speed will reach 10 Gbps. And the delay of milliseconds will mostly solve the pain points that VR, AR and other current technologies cannot be popularized in production. This will bring more development space for sports variety production in the future.

### 3.3.2 Additional services

According to the relational experience value model, service addition refers to the passive feelings of consumers on the external value of products. And the passive feelings of consumers cannot be known without external interference of products. Therefore, sports variety program needs to improve the content production in the following two aspects.

First of all, audiences can directly feel the external value of the program through exquisite program production, just like immersive scene setting. For example, the scene production of "Street Dance" chose a complete different approach from traditional recording scenes, such as a down-to-earth Shikumen Street in Shanghai, a metal arcade street in Guangzhou, a cyberpunk future street, and a Chinese-style Beijing street with red bricks, rubble and lanterns. With four streets of different styles, the exquisite scenes not only make the dancers show themselves more naturally and harmoniously, but also capture the audiences' vision instantly and immerses them in the cultural world of hip-hop.

Secondly, it is necessary to build a sensory feedback mechanism. Schramm believes that, it is necessary to bring in a "feedback mechanism" to change the "one-way uniqueness" into "two-way interaction" of the propagation path-in mass communication. The application of real-time comment technology satisfies the audiences' demand for deep interaction. It completes the transformation from the viewer to the experiencer and even to the participant. With getting this important feedback mechanism appropriately, the two-way interaction mechanism can be effectively established and the services will be more humanized by adjusting the next content production timely according to the real feeling from the feedback of audiences.

### 3.3.3 Additional culture and branding

The addition of culture and brand is to build recessive superstructure on the basis of a good economic product. It means to enhance the symbolic value of products by the symbolization of content production. The symbolic meaning of symbols will continuously convey certain information to the public, which will persist in consumers' mind and influence their consumption preferences. For example, in "Street Dance", the towel has transformed to be a promotion symbol in both personal and team dance competitions. It constructs the symbolic connection between street dance and the towel. Follow this rule, producers have to find out innovation and memory points, then repeat them through camera language. And it is necessary to strengthen the audiences' memory points, by taking the initiative to set discussion topics in mass communication and giving play to the important role of network opinion leaders like famous bloggers, so that it can successfully add cultural brand value to the program.

## 3.4 Establish deep emotional identity and cultivate audiences loyalty

From the perspective of the correlation between consumers and the consumption environment, resonance refers to the intrinsic value actively generated by audiences when they watch sports variety program. The audiences' intrinsic value can be maximized while the loyalty to the program can be cultivated through benefit resonance, demand resonance and emotional resonance.

### 3.4.1 Resonance of benefits

From the perspective of benefits, it is generally divided into two aspects: economic benefits and social benefits. Economic benefit can be seen as the return on investment ratio of audiences, that is, the ratio between the time consumed by watching sports variety program and the value obtained. In the early stage of program broadcast, the acquisition of experience value can be enhanced from variation, versatility, and value production. But, in the middle and later stages of program broadcast, the audiences' experience value will be continuously influenced by the program's reputation due to the existence of the long tail effect. And the excessive consumption of a single symbol will greatly affect the resonance of economic benefits. For example, the literary IP of "Tomb Notes" has been repeatedly used by different teams in a short period of time, and the audiences' experience value is neglected in pursuit of short-term benefits. Therefore, to achieve an organic unity of economic benefits, producers have to find a balance between short-term benefits and long-term word-of-mouth. This is called resonance of benefits.

In the terms of social benefits, sports variety program is a new way to export culture to the new generation of Internet users. It has to assume the responsibility of strengthening the culture power of motherland and send positive messages to the masses by the superior content production of sports variety program. As a sports culture brand of the new generation, although it cannot achieve the massive cultural output of NBA. But in some way, it can also shoulder the responsibility of sports culture output and build up the cultural self-confidence of the new era with its flexible content production.

#### 3.4.2 Resonance of demand

Consumers are utility maximizers, and demand resonance is actually a kind of expected value and satisfaction of consumers in pursuit of "demand satisfaction". To satisfy the resonance of demand, it is necessary to consider the content production of sports variety based on audiences. In order to achieve the popularization of sports culture from the content production, producers have to consider the audience's understanding of sports culture. From the perspective of narratology, the sports variety program should make a omnipotent narrative of the event from the perspective of God by adopting a method named zero-focus. For example, in order to make sure audiences can watch the program smoothly without barriers, "Street Dance" shows audiences the technical names of every dance movement by posting production with subtitles. This not only propagandises the sports culture, but also achieves the resonance of demands between the sports variety program and audiences.

#### 3.4.3 Resonance of emotion

Although the sports variety program takes the route of "small and specialized" content production, but it should strive to start from "wide and complete" in terms of emotional resonance. Arnold Van Gennep, a famous German anthropologist, believes that television media should construct a collective memory ceremony by the advantages of centralized communication. Because ritual sense can reflect people's inner needs and reflect the image of cultural precipitation. As an indispensable component of human civilization since its birth, sports are common memories of hundreds of millions of people. In terms of the potential volume of emotional resonance, sports are even bigger than Chinese literature. Therefore, sports variety program should transform from elitism to grass-roots and become secularization in terms of content production in order to effectively achieve the public emotional resonance.

## 4 Conclusion

This paper puts forward suggestions for the content production of sports variety program guided by 4V marketing theory. In the terms of variation production, firstly, to meet the personalized needs of the sports variety program audiences through the small and specialized market segmentation differentiation production. Secondly, to build the core competitiveness of sports variety program through the advantages of natural conflicts and suspense setting. At last, to establish a positive energy image of sports culture with higher recognition through the production of image differentiation. In terms of versatility production, the first is to provide elastic function supply for different user groups through professional core and entertainment extension function production. And the second is to correct the distorted aesthetic paradigm of the public to some extent through excavation and cultivation of additional functions. In the terms of value-added production, it is necessary to enhance the invisible added value of the sports variety program through the addition of high-tech such as AR and VR, the addition of hardware services like the refinement of the scene and the addition of software services like two-way interactive mechanism. And to provide sports variety products with higher value of symbols by producing symbolized content for establishing brand effect. In the production of vibration, the first thing is to achieve the resonance of the benefits through getting the balance between short-term benefits and

long-term word-of-mouth. Secondly, to achieve the demand resonance by spreading minority sports culture in a popular way. At last, to arouse the public's "wide and complete" emotional resonance by setting the memory of the ceremony, so that it can achieve the maximization of the utility of sports variety program and audiences.

# Research on the Driving Factors of Customer Loyalty: Regarding iPhone as An Example

Deng Gang

School of E-Commerce, Wuhan Technology and Business University, Wuhan, P. R. China, 430065

(E-mail: 363070212@qq.com)

**Abstract:** Research indicates that loyal customers not only reject the marketing information of competitors, but also develop new customers for the enterprises. Many enterprises have realized the important role of customer loyalty, but most of them have a partial understanding about it, and fail to know how to maintain and improve customer loyalty. Through the research of relevant literature, the driving factors of customer loyalty are sorted out in this paper. Then, it regards the marketing practice of iPhone as an example to make analysis, so as to put forward the effective ways to cultivate customer loyalty in the marketing process of enterprises, and helps the enterprises to establish competitive advantages.

**Key words:** Customer loyalty; Driving factors; Cultivating method; iPhone

## 1 Introduction

In the current internet economy environment, it is increasingly difficult to retain customers for it is more convenient for them to make a wide choice. Enterprises should not only to strive for new customers, explore new market, but also retain existing customers, ensure their loyalty and stabilize market share. As to the concept of customer loyalty, it has been spotted widely since it has been proposed. A large number of studies have proved that the customer loyalty is closely related with enterprise performance, and it is undoubtedly an intangible asset of an enterprise. However, people still do not make an agreement on the its driving factors and mechanism.

Apple is a high-tech enterprise whose core business is making electronic products. CEO Steve Jobs announced the launch of iPhone at Macworld on January 9, 2007. Despite its high price, the iPhone has been embraced by millions of apple fans since its launch. According to the latest data released by authoritative research institution Counterpoint, in 2018, the top 3 share of high-end phones in the world are iPhone, which accounts for 51%; Samsung, which accounts for 22% and Huawei, which accounts for 10%. According to the results of the survey of smart phone customer loyalty commissioned by the Wall Street Journal, iPhone's customer loyalty is as high as 78%, and Samsung's customer loyalty is 58%, which ranks in the second place. There is no doubt that Apple has been successful in fostering customer loyalty.

Currently, it is widely recognized that customer loyalty refers to a repeated purchase behavior accompanied by a higher attitude tendency (Dick & Basu, 1994). As one of the earliest recognized drivers, customer satisfaction has not achieved good results with extensive practice in the industry. An integrated study shows that satisfaction mainly affect attitude loyalty while its influence on behavior loyalty is not stable (Fan Xiucheng et al., 2009). Some people propose that compared with customer satisfaction, it is easier for customer happiness to drive customer loyalty. There are three points of view created in the follow-up researches: customer happiness has a significant impact on customer satisfaction; customer happiness does not have a significant impact on customer loyalty; the relationship

between customer loyalty and happiness is influenced by moderating variables (Zhang Yuexian et al., 2013). Perceived value is considered crucial for customer repurchase intention (Blackwell, 1999). Research proves that customer engagement in value creation could considerably promote perceived value (Wang Jiuhe & Liu Lin, 2017). The influence of experience, based on customer perception, on customer loyalty is also verified (Li Huaming & Li Rong, 2013). A higher switching cost can lock customers. However, it can also bring a negative effect (Thomas O Jones, 1995). Trust is considered as an influential factor, which can lead to positive relationships, including forming the customer loyalty (Morgan & Hunt, 1994). Enterprise image determines consumer behavior, especially customer loyalty (Andreassen & Lindestad, 1998). In addition, researchers also proposed that customer loyalty is affected by contextual factors such as oriental culture (Hennig Thureau et al., 2000), similarity of value (Morgan & Hunt, 1994), competition degree (Ma Baolong et al., 2007). To sum up, there are many drivers of customer loyalty and some of them are overlapped. Based on the factors we have discussed above, scholars have made a combination and put forward many models, but still there is no agreement has been made on the mechanism of customer loyalty.

Based on the literature reviews and case studies at home and abroad, this paper tries to make a further discussion on the driving factors and its function so that it can provide available references to enterprise that they can take effective measurement to cultivate customer loyalty.

## **2 Construction of Driving Factors**

The behavioral reflection of customer loyalty is repeated purchases. Studying previous researches, the driving factors of customer loyalty should consist of customer satisfaction, customer value and conversion cost, etc. Therefore, it is important to clarify the driving factors of customer loyalty for it is the premise to explore an effective way to retain customers and maintain their repeated purchase.

### **2.1 Customer satisfaction**

Customer satisfaction is the first to be considered as the driving factor of customer loyalty. It refers to a state of pleasure or disappointment that occurs when compared the perceived value of a product or service with its expectation. Researches indicate that customer satisfaction is a demanding factor of customer purchase, word-of-mouth effect and customer loyalty (Reichheld & Sasser, 1990). With customer satisfaction, renewed purchasing behaviors will occur. Repeated purchases and satisfaction, then, generate loyalty. Therefore, it is the premise to ensure that its products and services can satisfy or even exceed customers' expectation.

### **2.2 Customer value**

Most scholars agree that customer value is customer perceived value, whose core is the weigh between perceived gain and loss. Perceived value plays a decisive role in customers' repurchase intention. And the situational factors can affect customer loyalty directly and indirectly. It could act on the composition of perceived value (Blackwell, 1999).

Customer satisfaction is to enable customers to enter the selection of products, but it cannot guarantee that the customers will continue to purchase. The relationship between customers and enterprises is the exchange of benefits and values on earth, and what the customers are loyal to be the excellent value provided by the enterprise not a particular enterprise. And what customers want is also the product value that can meet their own needs, so excellent value is the key to customer loyalty. It is the most important driver of customer loyalty. However, this does not mean that customer value can

affect customer loyalty alone.

### **2.3 Customer trust**

Customer trust refers to the identification and trust of consumers on the products or services of a certain enterprise or brand, which is the result of continuous strengthening of customer satisfaction.

Studies indicate that trust is the basis of loyalty, and there exists a certain correlation between customer trust and customer loyalty. It is believed that trust should work in a mutual way (customers and enterprises). Loyalty originates from trust, which in turn strengthens customer loyalty. It is manifested in a more positive word-of-mouth publicity, a more consumption behavior, and a stronger dependence, etc. (Dick & Basu, 1994). The empirical study conducted by Han Xiaoyun and Wang Chunxiao on the service industry has found that customer trust plays a significant impact on customer loyalty in all dimensions directly or indirectly (Han Xiaoyun & Wang Chunxiao, 2003). Only through continuously providing stable quality products and services can enterprises develop a sense of trust.

It can be seen that customer trust is the result of the continuous strengthening of customer satisfaction, and the sublimation of customer trust produces customer loyalty, trust is the foundation of customer loyalty.

### **2.4 Conversion cost**

When consumers are faced with the purchase decision, the cost of switching from one product or service provider to another is called conversion cost. Such cost includes currency cost, psychological cost and time cost incurred by switching providers. Generally speaking, the conversion cost of service is higher than that of product in general. It is believed that conversion cost is conducive to maintain the relationship between enterprises and customers for it could prevent customers from leaving the enterprise service (Anderson & Ponnarolu, 2002).

In order to avoid the psychological and emotional pressure caused by transferring new service providers and the risks and uncertainties brought by this foundation, consumers try to maintain the existing relationship, even if they are not very satisfied with the existing relationship. It can be concluded from the above that there exists a negative correlation between conversion cost and customer value and customer satisfaction; while conversion cost and customer loyalty exist positive correlation.

### **2.5 Other factors**

In addition to the above factors, social norms also influence customer loyalty. Social norms limit people's value orientation and impose an opinion on the judgments of the products, which directly influence people's choices. Researches show that enterprise image has a great influence on customer behaviors, customer loyalty in particular (Andreassen & Lindestad, 1998). And advertisements make a great contribution to build, keep and strengthen brand loyalty. In addition, customer loyalty is also influenced by lifestyle and situational factors.

## **3 Case Study of iPhone**

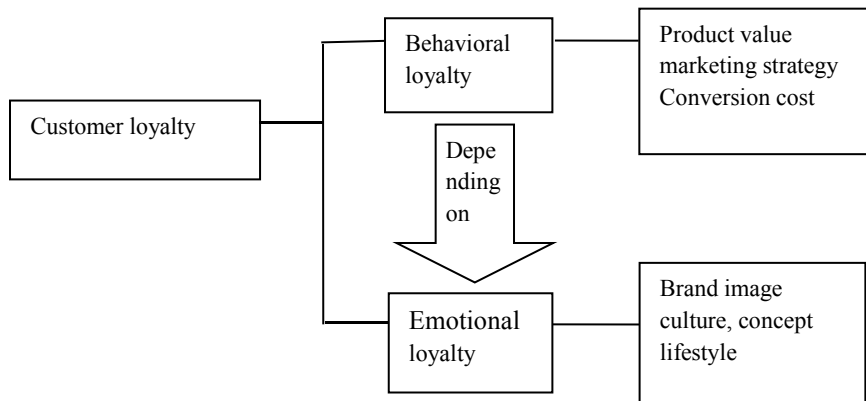

### **3.1 Customer loyalty model of iPhone**

A true customer loyalty is an internal unity of behavioral loyalty and emotional loyalty. The emotional loyalty is the fundamental factor, while the behavioral loyalty is the result of customer loyalty.

From the analysis of driving factors, behavioral loyalty comes from customer value, namely product strategy, marketing strategy and product conversion cost, etc. emotional loyalty comes from the image of an enterprise or brand, culture, values and lifestyle, etc.

From the way of cultivating customer loyalty, customer value is the premise and basis to promote the purchase and retention when the value provided by products or services meets or exceeds the expectation of customers, customer satisfaction will be generated. Repeated customer satisfaction will develop customer trust to the enterprise or brand, and then the customer trust will produce customer loyalty. Conversion cost does not bring true loyalty, it can drive behavioral loyalty. Social culture, norms, ads and lifestyle could have a moderating effect on customer value, satisfaction and trust.

iPhone creates the maximum customer value for consumers through continuous innovation, and effectively delivers customer value through advertising, experience store and other marketing means, so as to generate high satisfaction and trust and stimulate customer loyalty. While applications based on closed iOS and various technology patents may cost a lot, its unique apple culture can help customers form their value, lead a new lifestyle, and shape their attitude loyalty. Therefore, through the inductive analysis, we build the customer loyalty model of iPhone (Figure 1).

**Figure 1 Customer Loyalty Model of iPhone**

Based on this, this paper elaborates on the driving factors and cultivating methods of iPhone customer loyalty.

### 3.2 An analysis on the way of cultivating customer loyalty

#### 3.2.1 Creating excellent value to win customer trust

Customer value is the basis and premise of customer loyalty, and the functions and benefits of products are the core elements of customer value. It possesses three characteristics, the first is that software runs fast and web browsing is very easy. The second is the closed iOS operating system, which is stable. Because of the closed environment, all apps have to be strictly reviewed by apple before they can be downloaded into apple store, which ensures the unified user experiences and the product quality of apple mobile phones. The third is that it could enables apple's entertainment function to be quite powerful. All these allow the iPhone to meet customers' needs while far exceeding their expectations. Meanwhile, apple together with downstream channel operators, has set up apple experience stores to greatly deliver customer value. The experience store helps customers to fully understand the product functions and benefits before purchase, so as to reduce the risk. In the process of experience, customers

can also put forward suggestions and opinions to the staff. It cannot only win the customers' trust, but also can collect valuable ideas for product innovation in this way.

iPhone is unique in product function, appearance design and packaging, aiming to create value for customers in all aspects. Many consumers are impressed by the powerful functions and pleasant use experience of iPhone after using it, so they build a high level of trust in it and continue to make repeated purchases.

### 3.2.2 Establishing brand culture, shaping attitude loyalty

Based on its spirit of "bold innovation and dare to take risks", iPhone has created a unique brand image of apple, which makes the consumers produce a strong sense of attachment to it. Firstly, iPhone creates the skeleton of apple brand by virtue of its powerful function, outstanding performance, fashionable appearance and packaging, which is fashionable, high-end and superior. Secondly, the legendary life experience and unique personal charm of Jobs has given the apple brand spiritual connotation. Finally, the marketing skills and user experience of Apple Inc have left a deep impression on customers and cultivated more and more "apple fans". In the 2018 Brand Z 100 global brand value ranking released in London, UK, apple ranked the second with a brand value of more than 300 billion dollars.

### 3.2.3 Improving conversion costs, capturing behavioral loyalty

Apple has developed a closed iOS operating system and various innovative applications for the iPhone, which makes it powerful, stable and smooth. When the consumers become proficient in applications and get accustomed to them after experiencing learning and exploration, it will produce conversion cost compared with the using of android phones. Consumers need to spend time and energy to overcome their old habits to adapt to new systems and functions, but they cannot get better user experiences at the same time. Many customers have returned to iPhone after trying to switch to android phones.

In addition, iPhone attaches great importance to customer privacy protection, it provides customers with security protection that is far beyond android phones, which significantly reduces the risk of customers from being attacked by hackers and subjected to fraud. A classic example happened in 2016, Apple refused to help the Federal Bureau of Investigation (FBI) open the iPhone of a terror suspect to obtain the information it needs in order to protect customer privacy. The closed mobile phone system and strict privacy and security protection system increase the conversion cost of customers, and capture their behavioral loyalty.

## **4 Research Inspiration**

High customer loyalty is a magic weapon for enterprises to win the competition. Based on the summary of previous studies and the analysis of customer loyalty of apple mobile phone, the following ways of cultivating customer loyalty can be obtained in this paper:

### **4.1 Constantly creating customer value to win customer loyalty**

Customer value is the basis and premise for consumers to purchase products or services. In the information age, through powerful e-commerce system, enterprises can build customer database, implement scientific customer relationship management, timely update customer related information, discover customer demand changes, and constantly increase product added value. The composition of

customer value is diversified. Enterprises can enhance customer value through improving product value, service value, personnel value and image value. Only through understanding and striving to exceed customer expectations, improving customer satisfaction and consolidating customer trust can ultimately win the customer loyalty.

#### **4.2 Increasing conversion cost, retaining customer loyalty**

As the research and practice results have indicated, increasing the conversion cost is an effective way to retain customers and improve customer loyalty. The enterprises should try to increase the difficulties and costs of customer conversion through some ways and means so as to retain customers. Firstly, the enterprises can create irreplaceable products through patent threshold, non-standardized products and services or closed setting and so on. Secondly, the enterprises can increase the customers' dependence on enterprises through cultivating their consumption habits of products, so as to improve customer loyalty. Finally, the enterprises can implement customized marketing strategies to bind consumers with emotional bonds through one-to-one service, so as to increase conversion costs and improve customer loyalty.

#### **4.3 Establishing brand image, enhancing customer loyalty**

Simply speaking, store impression and brand image refers to the customers' overall perception and evaluation of the brand and enterprise. Only when customers have a good impression of the brand will they continue to buy repeatedly. Enterprises can leave positive attitudes and preferences to customers through store layout, advertising, a series of marketing strategies, user experience and participation in public utility activities, and enhance customer loyalty through direct or indirect methods.

#### **4.4 Improving customer engagement to improve customer loyalty**

User experience is the most direct way for customers to understand product attributes, and also the fastest way to gain favorable impression on enterprise products or services. Therefore, in order to obtain customer satisfaction, it is necessary to strengthen user experiences, enable customers to participate in the process of experience, collect customers' suggestions in the process of experience, and gradually improve the quality of enterprise products and services. In addition, through customer participation, integrating the emotion of enterprise and customer, enhancing emotional investment, strengthening customer dependence on the enterprise, so that, the customer loyalty can be improved.

## **5 Conclusion**

From the perspective of the driving factors of customer loyalty, customer value is the premise and basis to promote the purchase and retention of consumers. When the value provided by products or services meets or exceeds the expectation of customers, customer satisfaction will be generated. Continuously Repeated customer satisfaction will establish customer trust to the enterprise or brand, and customer trust drives the generation of customer loyalty. Conversion cost cannot bring true loyalty, but it can drive behavioral loyalty of customers. Social culture and norms, advertising and demographic characteristics possess moderating effects on customer value, customer satisfaction and customer trust.

## Campus Skill Exchange APP in Smart Campus Environment

Nie Zutian

School of Computer Science, University of Melbourne, Melbourne, Australia, VIC 3000

(E-mail: 360283838@qq.com)

**Abstract:** Social APPs is now the most popular trend in APP market. In 2017, two social APPs, WeChat and QQ, have ranked the top 2 APPs in China. However, developing new types of social APPs is imperative, as the social APP market has become saturated. The literature used in this paper mainly focus on the key functions of this social APP, the typical steps to realize the key technologies of this social APP and the user analysis of their requirements. The method to build a complete mobile APP with efficiency and extensibility by constructing back-end platform and front-end application. This APP creates a brand-new way for college students of making friends and learning skills. The final goal is to use method above to propose an "online learning, offline learning" companion learning platform, which is used to teach a certain skill to others or help oneself learn a new skill. This paper will describe the system structure and structure of the campus skill exchange APP, the steps of system design are described and the key design technology of the system in detail.

**key words:** Smart campus; University; Hobby; Skill exchange APP

### 1 Introduction

According to a report conducted by Quest Mobile, in 2017, the user scale of mobile social industry was close to that of mobile netizens, with a penetration rate of 92.9% in China. Mobile netizens mainly focus on building mobile social network, among which the 'stranger social pattern' has been playing a very important role over the world since 5 years ago, especially in U.S. The fierce competition of social apps in the United States has never stopped. No matter Facebook, Instagram or Twitter, they are always in a competitive state. Now there are numerous niche and vertical social apps emerging. Compared with China, American social platforms are more decentralized and tend to be more decentralized. As Facebook's relationship chain ages, American users are turning to a new platform. In the past two years, DAU of Instagram and WhatsApp has been growing rapidly and penetrating deeper into the market. These differentiated social products are gradually spreading the social traffic of the market. With focusing on the stranger social pattern that are similar to Instagram, this campus skill exchange APP develops an "online understanding, offline learning" buddy learning platform. Smart campus environment facilitates students to improve one skill or learn a new skill. This software takes Android phone as the carrier, takes Python as the development language, uses MySQL database and Retrofit network development framework, and the integration development tool is currently very popular Android Studio (Zhang Zhihua, 2016). The target audience is mainly college students with a large number of potential users. Simple interface, clear function. The user through the phone software online know their own needs to learn the skills of the students, and exchange skills: you can install handheld have android application of this system software includes mobile phones, through login into their own user interface, can undertake the corresponding with other users access to information to send, such as register their own interests and hobbies, browse other user operations such as the rise of the hobby. This

paper discusses the user demand, the system design and key technologies of the campus skill exchange system.

## **2 User Demand and UI Design of Campus Skill Exchange System V1.0**

In terms of the design of APP user requirements, it is mainly divided into two parts: skill exchange and traveling together:

First, skill exchange: exchange skills and get what you need. It's good for trading your skills for someone else's.

Second, go hand in hand with the same goal. Suitable for learning new skills (Wu Minrui, 2019).

APP function modules are mainly divided into three modules: home page, personal information card and list.

### **2.1 Homepage design of campus skill exchange system V1.0**

According to users' search skills to find matching person to push, push the user required skills related BBS and posts (Huo Liya, 2018), the client use the layout of the card clearly intuitive display of information, at the same time call GestureDector API to implement the left slide switch, right slide like the function of the collection, right like collections are added to the same favorites eventually convenient access. At the same time, you can modify your personal information and store it in the database. When the user swipes a finger to the left on the phone screen, GectureDector's API is executed in the background, and the card creates an animation that is skipped by a left swipe. At this point the background does not execute any instructions and jumps to the next card. The user swipes his or her finger to the left on the screen of the phone. GectureDector's API is executed in the background, and the card is animated to his or her liking. At this point, the background stores the data of this card into the "list" associated with the user and jumps to the next card (Pan Chengfeng ,2017).

### **2.2 Campus skill exchange system V1.0 -- personal information card**

According to the investigation, the core information needed is: name, school, skill exchange time and specialty. Later, real name authentication will be carried out when filling in "name" and "school", so as to connect with the educational administration system of the school and ensure the authenticity of the user group. The "ideal time for skill exchange" was set up to fully consider the possibility of coordination among college students in their spare time. In addition, it also provides multiple "specialties" for filling in, so that more talented people can show themselves, enriching user experience. Then, the form is determined and the database is built to ensure the interaction between the data.

### **2.3 List of campus skill exchange system V1.0**

Including their own collection of lists as well as their matching list

**Figure 1 List**

The list is presented in a form similar to "long picture", showing all other users that the user right-slides through. The user swipes up and down to view the list (Zhu Chunhua, Zhang Yizhi, 2017).

We set up our background on the server to provide client data and facilitate real-time monitoring of client data and timely update of data to ensure the availability of users. For example, the client is interested in a message, and likes to collect, the client will send like to request to the server, the server after the receipt of a request will be like in the database to find whether also sent like requests, if the two love each other, each other displayed a pair, both the client or know each other like collection.

### **3 System Design Steps of Campus Skill Exchange System V1.0**

#### **3.1 Data collection of campus skill exchange system V1.0**

Mainly through questionnaire survey, the information required by the App is preliminarily determined as name, age, school, grade, skill calling ideal time, specialty and intention skill. Finally, based on the situation and development of the whole project, the core information of the App is determined as follows: 1. Name; 2. School; 3.

#### **3.2 Database building of campus skill exchange system V1.0**

After the core information is determined, the corresponding form is established, and the SQL syntax is deeply studied. I am proficient in using DML instructions such as select, insert, delete, update, as well as important DDL statements such as create, alter, drop and so on to perform relevant operations on database data. Meanwhile, transplant the built environment to the client platform and background, and learn to use SQLite (Lu ping, Hu Yang, 2019).

SQLite: is an in-process library that implements a self-contained, serverless, zero-configuration, transactional SQL database engine. It is a zero-configuration database, which means that, like any other database, you do not need to configure it in the system. Like other databases, the SQLite engine is not a standalone process and can be connected either statically or dynamically as required by the application. SQLite accesses its storage file directly. Advantages: learning Java and python systematically in the background setup process. Because it supports both process-oriented functional programming and object-oriented abstract programming, and has extensibility and embeddability, it finally chooses python to set up the background service. Also learn about network transport protocols, Http and Https, and RESTful architectures, and write apis that are more usable.

### **3.3 Client development of campus skill exchange system V1.0**

Learn how to use Android Studio to develop applications and SQLite to interact with data. Use XML to write UI interface, and use Java to achieve interface visualization. After the background was successfully built and the main interface UX was confirmed, we learned to use Retrofit network framework and background to complete network communication, and GestureDetector API to complete left sliding switch and right sliding core functions of favorite favorites. When you're almost done, use gradle to sign the entire application.

### **3.4 Post-optimization of campus skill exchange system V1.0**

#### **3.4.1 background optimization**

Improve data, improve data security at the same time, change the protocol from HTTP to HTTPS. Monitor client data and timely improve the frozen update data to ensure user experience.

#### **3.4.2 client optimization**

Enrich and beautify the UI interface, so that the application has better aesthetics and interaction. Solve a few bugs to further reduce the application crash rate. Performance optimization, through the refactoring of the code, so that the application response faster, less memory footprint. Network optimization, using thread pool to manage multithreading, improve the efficiency of multi-task execution and experience. Power optimization, through the assistance of Google related tools, and cannot use the permanent background, to achieve the effect of minimum power consumption.

## **4 Key Technologies of Campus Skill Exchange System V1.0**

### **4.1 Background building of campus skill exchange system V1.0**

Language: Python. Methods: Get and POST methods are combined. Get requests: when using the get method, request data is placed directly in the URL. Post request: when using the post method, the data is placed in the data or body, not in the URL, which will be ignored. Jsonify: convert dict types directly to json strings through the jsonify method. You can also convert a dict to a json string using json.dumps (jsonStr). jsonify is a json processing class that comes with flask, and the returned one is the flask result.

### **4.2 Client development of campus skill exchange system V1.0**

Modify personal information: Insert operation. Detect the API of the GestureDetector method.

```

1 public void insertCourse(Info info){
2 db.execSQL("INSERT INTO " + DataBase.TABLE_Info + " VALUES (null,?,?,?,?) ",
3         new String[]{
4             info.name,
5             info.school,
6             info.time,
7             info.resume
8         });
9 }

```

Network request: Retrofit open source network framework (Yan Yuhua, 2019).

**Figure 2 Client Development -- Personal Information Part of the Code**

NAME, SCHOOL TIME, ideal TIME, RESUME

INFOLIST: personal information. DIRECTION: change DIRECTION. Mivlike: like list (associated with a list item).

When SWIPE operation is carried out, the corresponding code of SWIPE direction is judged, and the interface shows the corresponding effects of left and right strokes respectively. After SWIPE is completed, if the SWIPE is to the right, the four items of the card are put into the "list".

GestureDetector:

GestureDetector. OnGestureListener: when a particular sports event occurs, the callback will notify the user. This class can only be used with Motion Events that are reported via touch actions (not trackball events). Use this class:

First, create a gesture detector instance for your view.

Second, onTouchEvent (MotionEvent). The methods defined in the callback execute when the event occurs.

Third, if you listen for onContextClick(MotionEvent), you must call onGenericMotionEvent(MotionEvent) in the onGenericMotionEvent(MotionEvent).

```

87
88     Observable.concat(getCache, RetrofitWork.getApi().getInfo())
89         .subscribeOn(Schedulers.io())
90         .observeOn(AndroidSchedulers.mainThread())
91         .subscribe((Consumer) (product) -> {
92             if (isLoading) {
93                 mProduct = product;
94                 Gson gson = new Gson();
95                 mProductJson = gson.toJson(mProduct);
96                 sp.saveString(PreferenceUtil.PRODUCT_INFO, mProductJson);
97                 Log.d(TAG, "accept : success : load data");
98             } else {
99                 tv.setText(mProduct._product.get(0).getName());
100                Log.d(TAG, "accept : success : get cache");
101            }
102        }, new Consumer<Throwable>() {
103            @Override
104            public void accept(Throwable throwable) throws Exception {
105                Log.d(TAG, "onError : " + throwable.getMessage());
106            }
107        });
108    }
109 }
110 }
111 }
112 }

```

Figure 3 Client Development -- Part of the Network Request Code

Retrofit:

There's A line in the retrofit documentation: A type-safe HTTP client for Android and Java. A type-safe HTTP client library. Type-safe code for accessing memory locations that are authorized to access. For example, type-safe code cannot read values from private fields on other objects. It can only be read from a well-defined permissible access type. Type-safe code has well-defined data types.

### 4.3 Database building of campus skill exchange system V1.0

MySQL is used here for related operations. MySQL is written in C and C ++, its SQL parser is written in yacc, but MySQL's lexical analyzer is homemade. MySQL is suitable for many system platforms, including AIX, BSDi, FreeBSD, hp-ux, eComStation, i5 / OS, IRIX, Linux, macOS, Microsoft Windows, NetBSD, Novell NetWare, OpenBSD, OpenSolaris, OS / 2Warp, QNX, Oracle Solaris, Symbian, SunOS, SCO OpenServer, SCO UnixWare, Sanos and Tru64. There is also a MySQL port to OpenVMS.

#### 4.3.1 Users fill in their personal information

After filling, the APP will save the data in the local database and upload the data to the server when the network is available. INSERT INTO tb\_stu1(name, school, time, resume) VALUES (' nie zutian,' 'central China normal university ',' after 3pm on May 21, 2018 ', 'basketball '); Add data

#### 4.3.2 Users like other users

Send instructions to the server, the server will other users' personal information into the "list" of this user. The MySQL database optimization based on Autopilot will be implemented later. Autopilot USES Snapshot, the Snapshot technology. In fact, a snapshot is a reference mark or pointer to the data stored in the storage device. That is to say, it is the status of the data at a certain moment. The core of its working principle is to establish a list of Pointers to indicate the address to read the data, provide an image of the instantaneous data, and then copy it when the data changes (Dang Xiangying, 2019).

At the later stage, it tries to borrow Snapshot technology in this system, which can be used to quickly obtain the user's personal information and make data copy after the diversification of user data becomes more complex.

## **5 System Deployment**

### **5.1 Through the following steps, we finally completed the campus skill exchange APP in the smart campus environment**

#### 5.1.1 Data and information collection

Mainly through questionnaire survey, the information required by the App is preliminarily determined as name, age, school, grade, skill calling ideal time, specialty and intention skill. Finally, based on the situation and development of the whole project, the core information of the App is determined as follows: 1. Name; 2. School; 3. Ideal time of meeting 4. Specialty

#### 5.1.2 Database construction

After the core information is determined, the corresponding form is established, and the SQL syntax is deeply studied. I am proficient in using DML instructions such as select, insert, delete, update, as well as important DDL statements such as create, alter, drop and so on to perform relevant operations on database data. Meanwhile, transplant the built environment to the client platform and background, and learn to use SQLite (Sun Yueling, 2018).

#### 5.1.3 Background construction

In the background setup process, I systematically learned Java and python. Because it supports both process-oriented functional programming and object-oriented abstract programming, and has extensibility and embeddability, it finally chooses python to set up the background service. Also learn about network transport protocols, Http and Https, and RESTful architectures, and write apis that are more usable.

#### 5.1.4 Client development

Learn how to use Android Studio to develop applications and SQLite to interact with data. Use XML to write UI interface, and use Java to achieve interface visualization. After the background was successfully built and the main interface UX was confirmed, we learned to use Retrofit network framework and background to complete network communication, and GestureDetector API to complete left sliding switch and right sliding core functions of favorite favorites. When basically done, use gradle signature to package the entire application (Zhang Chengyu, 2018).

### **5.2 Stage results have been achieved**

#### 5.2.1 Data collection and database construction

#### 5.2.2 Set up the background to complete core functions like collecting

Client interested in a message like collection, the client will enjoy it to the server sends the request, the background after get the request will be like in the database to find whether also sent like requests, if two showed a collection of each other, then the client show match, otherwise until both sides each other like to collect.

#### 5.2.3 Completion of core functions of the client

Realize the information in the way of card display left slide switch right slide like collection, and in the collection plate in the way of waterfall flow display like collection, at the same time can edit and maintain the function of personal data.

### **5.3 Late update**

#### **5.3.1 Background optimization**

Improve data, improve data security at the same time, change the protocol from HTTP to HTTPS. Monitor client data and timely improve the frozen update data to ensure user experience.

#### **5.3.2 Client optimization**

Rich and beautify the UI interface, so that the application has better aesthetics and interaction. Solved a few bugs, further reducing the application crash rate. Performance optimization, through the refactoring of the code, so that the application response faster, less memory footprint. Network optimization, using thread pool to manage multithreading, improve the efficiency of multi-task execution and experience. Power optimization, through the assistance of Google related tools, and cannot use the permanent background, to achieve the effect of minimum power consumption.

### **5.4 Expected research results**

Through further optimization in the later stage, the App will achieve a high-quality campus skill exchange application that integrates aesthetics, ease of use and simplicity.

## **6 Conclusion**

This paper discusses the availability of a campus skill exchange APP that allows users to discover their possible hobbies and determine the ideal time to meet with another user to learn this skill, or share a mastered skill with others. Mainly, it introduces the user demand, design steps, key technologies and system deployment of this APP. With this APP, the spare time of college students can be fully enriched.

Furthermore, this APP can be improved into a multi-function system that contains users more than just students (e.g.: kids, employees, olds).

# **A Study on the Corelation between the Technological Sophistication Index of imports in Producer Service Industry and Technological Innovation Ability of Manufacturing Industry**

Huang Huiping, Zhong Ruojun, ZhaoYulin

School of Economics, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 997118372@qq.com, 727580274@qq.com, ylzhaow@whut.edu.cn)

**Abstract:** Faced with the current situation that China's manufacturing industry is on large scale but with a poor competitiveness, the imports of producer services can provide the solutions to the dilemma by improving the technological innovation capacity through its technology spillover effects. This paper mainly focuses on the quality of the imports in producer service industry--Technological Sophistication Index (TSI), and empirically analyzes the impacts of the overall TSI of import in productive services industry and the TSI in different industries on manufacturing innovation capacity of different countries through fixed effect model and quantile regression. The results show that the overall TSI of producer services imports have significant effects on manufacturing innovation capacity, and the impacts of different industrial TSI on developed and developing countries are not on the same level. What is more, the research conclusion has important policy enlightenment for China to develop producer service trade and improve the innovation ability in manufacturing industry.

**Key words:** Imports in producer service industry; Technological sophistication index; Manufacturing industry; Technological innovation ability

## **1 Introduction**

Manufacturing is the foundation of a country which determines a country's comprehensive strength and international competitiveness. The manufacturing industry has made great contributions to China's economic development since the reform. However, the manufacturing industry has been locked in the low-end in technology and low-value-added production links characterized by processing trade, OEM, etc., getting in the dilemma of trade. There is a big gap between China's manufacturing industry and developed countries in terms of technical quality and efficiency, the added value rate of China's manufacturing industry is about 20%, far lower than that of 35% in industrial developed countries in recent years.

This situation is mainly caused by the imbalance of industrial structure, low-leveled investment in R&D, inadequate infrastructure and so on, among which the less support from producer services industry, is one of the main factors. In 2016, the added value of producer services accounted for 25.57% of China's GDP, while that of the US accounted for 46.8% of GDP in the same period.

As supporting sector, producer service is directly related to manufacturing of forming a complete set of services, which can introduce the increasingly specialized human capital and technology capital of manufacturing, with a strong technological spillover effect (Luo and Zeng, 2017). Importing producer service plays an important role to promote the technology ability of manufacturing. Scholars define the

quality of producer services imports or the technology factors that can be used in the import as the technological sophistication index(TSI) of producer services imports (Dong,2016).In recent years, the level of TSI of producer services imports and innovation ability in China have been steadily rising, which shows a certain connection. So, what is the relationship between the quality level of different producer services imports and manufacturing innovation ability?

The technology spillover effects brought by the imports of producer services can significantly improve the level of manufacturing technology innovation, domestic and foreign scholars have conducted a series of studies on this topic. Amiti finds that the imports of producer services have a significant positive effect on the productivity and innovation capacity of the American manufacturing industry (Amiti and Wei,2006). Maouses dynamic panel GMM method then finds that imports a significant to the promotion of China's capacity for independent innovation (Mao,2010).Some researchers find that the imports in producer service industry role for the efficiency of manufacturing industry independent innovation in developed countries than in developing countries (Cai and Li, 2017), However these literatures only study the one-way effects of the quantity of producer service imports on manufacturing innovation ability.

With the concept of TSI of producer services arising, some scholars gradually pay attention to the impact of quality of imports in producer service industry on manufacturing industry. Mo finds that the imports complexity of different types of producer service trade has different influences on the manufacturing competitiveness of countries (Mo,2015). Xuan focuses on the high-tech manufacturing industry and confirms that the increasing TSI of the imports of financial services, computers and information services plays a strong role in promoting the innovation ability of the manufacturing industry (Xuan and Chen, 2017).

These studies have provided us with valuable ideas and fundamental work. Based on these researches, the paper tries to explore the correlation between the TSI of imports in producer service industry and manufacturing technology innovation ability. It attempts to improve the existing research from the aspects of data volume, industry classification and measurement methods, and finally presents conclusions and recommendations for improving the structure of imports trade and promoting the national manufacturing technology innovation capacity.

## **2 Theoretical Analysis and Hypothesis of the Study**

Producer service industry is a supporting service industry directly related to manufacturing industry. It is an emerging industry independently developed from the internal production and service industry of manufacturing industry and does not provide direct and independent service utility to consumers, which attached to manufacturing enterprises and exists in the links of enterprise production. Therefore, the imports of producer services have an impact on the level of technological innovation ability of the manufacturing industry through a certain mechanism (Dong,2016).Because the transforming capacities of imported technology spillovers of producer service ability are not the same, for different types have different role in the country's manufacturing technology innovation ability. In the following part, the relationship between the imports in producer services industry and the innovation ability of manufacturing industry from the perspective of theoretical mechanism are expounded.

### **2.1 Mechanism of imports in producer service industry promoting innovation**

Generally speaking, the imports of producer services can promote manufacturing technological innovation through the following mechanisms:

(1) Technology spillover effects

Technology spillover effects can be summarized as "learning" in the imports (Amiti and Konings, 2007), with imports of service which contains the technological secrets, technical know-how and knowledge innovation. Local companies can learn and absorb these by spillover effects (Mo, 2015), especially the service with higher TSI which contains a large number of additional values be materialized. The importing countries can absorb and digest the technical knowledge in service imports through imitation or even independent innovation, so the spillover effects of imports in producer services industry will promote the improvement of innovation ability.

(2) Innovation agglomeration effects

The producer service condenses a large collection of capital and human resources, for some manufacturing industries which are only with a comparative advantage in the specific production process. These enterprises can make up for the corresponding shortcomings and improve the production decision by importing relatively lack of producer services of core technology or process. (Luo and Zeng, 2017). They can reduce the innovation input to improve their own deficiencies, save the corresponding innovation cost, and increase the R&D projects with their own comparative advantages, so as to enhance the core competitiveness of enterprises.

(3) Competition effects

Increased imports in producer services industry will inevitably squeeze domestic producer services industry. To get from being eliminated by the market in the competition, they should not only strive to improve their R & D level, increase R & D investment and strengthen the construction of R & D talent team. It is also necessary to learn to effectively absorb the advanced technological level contained in import services, and on this basis to carry out secondary innovation and improve their own innovation ability. (Liu, 2014). Otherwise, the squeeze and competition caused by imports of services with high TSI will rapidly replace domestic services and hinder technological development. So we give:

Hypothesis 1: The TSI of producer services has a positive incentive effect on manufacturing innovation ability.

## **2.2 The restriction of the basic development of manufacturing industry**

There is a prerequisite for the positive incentive of producer service imports on manufacturing innovation, that is, the TSI of imports in producer service can adapt to the local manufacturing basis and coordinate with other production factors. This is because the improvement of innovation ability depends not only on the "amount" of input, but also on its allocation, integration and adaptation to other factors. There is not necessarily a positive relationship between factor quality and a country's realization of technology catch-up, however the correlation between them is restricted by factors such as the quality of innovation elements and the matching of innovation environment and other innovation elements. If the elements with higher quality cannot match with other elements effectively, there would be side effects on technology development (Yang and Xu, 2015). That's to say, when a country's manufacturing industry development basis is poor, and the country's imports in producer service industry with high TSI cannot fit well with the country's manufacturing industry mutual confluence, or with other elements to form the optimal allocation in the process of manufacturing production, thereby reducing the country's manufacturing industry innovation ability. So we furtherly give:

Hypothesis 2: Restricted by the development level of manufacturing industry, the TSI of disparate types of producer services has different or even negative influences on the level of manufacturing

technology innovation.

Basing on the assumptions above, this paper mainly studies the impact of the TSI of imports in producer service industry on the technological innovation ability of the manufacturing industry. The samples will be divided into developing countries parts and developed countries parts in order to test the hypothesis.

### 3 Index Selection and Model Setting

#### 3.1 Imports classification of producer service trade and calculation of corresponding TSI

The producer service data in this paper mainly comes from the United Nations Trade Development Database (UNCTAD), the paper combines UNCTAD classification standards and the national bureau of statistics classification criteria, to divide producer service units into 6 categories: financial services, intellectual property services, insurance services, transportation services, communication services and other business services. Specific categories can be seen in table1.

**Table 1 Imports Classification of Producer Services**

category	imports of producer services
Financial service (FIN)	Financial mesomeric and ancillary services
Intellectual property service (IP)	Intellectual property rights, proprietary rights and other patents and royalties
Insurance service (INS)	Insurance and pension services
Transportation service (TRS)	Transportation and its supporting and supporting services
Communication service (COM)	Communications, computer and information services
Other business services (OTH)	Professional and management consulting, technology, trade related and other business services

After classifying the imports in producer service industry, the calculation of the TSI of the imports which is as the core variables is involved. Hausmann et al. proposed a method to measure the technical content of export of finished products and applied it to producer services (Hausmann and Rodrik, 2007). This method will be used as calculating the TSI index of each producer service trade, and the specific formula is as follows:

$$TSI_k = \sum_j \frac{(x_{jk} / X_j)}{\sum_j (x_{jk} / X_j)} Y_j \quad (1)$$

Where,  $TSI_k$  is the technological sophistication index of sub-item  $k$  of producer services industry trade,  $x_{jk}$  is the export value of sub-item  $k$  of producer services industry trade of country  $j$ ,  $X_j$  is the total

export value of producer services trade of country  $j$ , and  $Y_j$  is the per capital GDP level of country  $j$ .

After calculating the TSI of each producer services industry trade, we further measure the imports TSI of each country. The specific formula is as follows:

$$IS = \sum_k \frac{m_k}{M} TSI_k \quad (2)$$

Where,  $IS$  is the imports TSI of a country's service trade,  $m_k$  is the imports amount of sub-item  $k$  of a country's service trade imports, and  $M$  is the total amount of imports in producer service industry that year. Therefore, the TSI of different producer service industries can be calculated by the formula.

According to the classification and formula (1) and (2), the sample data of 30 countries from 2000 to 2016 are calculated and drawn in figure1, which can effectively compare the changes of TSI between different years and different departments.

Figure 1 TSI of Different Categories of Producer Service Industry from 2000 to 2016

It can be seen that TSI of the six categories of producer service industry fluctuated and increased from 2000 to 2008, among which TSI of the financial service industry increased the most. In 2008 and 2011, due to the outbreak of the financial crisis, the TSI of the six industries decreased at the same time. According to Yang, TSI fluctuation during the crisis was mainly caused by its impact on the volume of export trade and the price of exported goods, while the actual technical connotation of each sub-industry was still relatively stable (Yang,2015). The six types of producer services trade are basically stable, forming high TSI services represented by financial services and intellectual property services, medium TSI services represented by communication services and insurance services, and low TSI services represented by other business services and logistics services.

### 3.2 Index selection

This paper mainly studies the TSI of imports in producer service industry and the quantitative correlation between manufacturing industry innovation ability. We introduce the calculation method of TSI as the core of the variables, the next step is to select a reasonable measure of manufacturing technology innovation ability, and add some controlled variables to enhance the accuracy of the measurement results.

(1) Dependent variable

There are some scholars used the method of new product output ratio (NP) to measure the innovation capacity of manufacturing industry, and the specific calculation method was the ratio of new product output value of manufacturing industry of each country to total industrial output value of that year. We will draw on this approach in the article. This index emphasizes the quality exploration of whether innovation can be translated into achievements, and has obvious improvement compared with the number of commonly used patent applications.

(2) Controlled variables

In order to more accurately and comprehensively study the relationship between TSI of imports in producer service industry and the innovation ability of manufacturing industry, this paper selects several other factors that may significantly improve the innovation ability of manufacturing industry as the controlled variables of the model, as follows:

① Trade openness(trade). It's expressed by the ratio of a country's total imports and exports to GDP. Melitz found that export trade helps enterprises to gain technological progress and increase productivity through "export learning" effects and competition effects (Grossman and Helpman,1991a).

② R&D expenditure (R&D). The ratio of R&D expenditure to GDP of a country is used in this paper.

③ Human capital level (hc). Generally speaking, a country's human capital level represents the skill level of the labor force

④ Foreign direct investment (fdi). A large number of studies have shown that FDI can promote the improvement of manufacturing technology innovation ability through technology transfer and spillover effects.

⑤ Infrastructure construction (inft). This paper uses the number of secure Internet per million people to calculate this index.

### 3.3 Data source and description

In order to enhance the accuracy of the conclusion as much as possible and obtain the most continuous data of the span as much as possible, this paper selects the transnational panel data of 30 countries from 2000 to 2016, including 20 developed countries and 10 developing countries. In this paper, the imports and export volume of producer services and trade volume of various countries involved in the calculation of TSI are derived from UN comtrade database, and the data of other controlled variables are derived from world development indicators (WDI) database. The data of the amount involved are all denominated in current us dollars. Due to the different statistical annual cycles in different countries, there are some data gaps, then the exponential smoothing method is impressed to solve it.

**Table 2 Variable Overview**

Variable Type	Variable Name	Calculation Method	Data Source
<b>Dependent variable</b>	New product output ratio (NP)	The output value of new products/the total output value	
<b>Core independent variable</b>	TSI of imports in producer Service industry (IS)	$IS = \sum_k \frac{m_k}{M} TSI_k$	
	Trade openness (trade)	Total value of imports and exports / GDP	WDI database
	R&D expenditure (rd)	R&D expenditure /GDP	UN comtrade database
<b>Controlled variables</b>	Human capital level (hc)	Number of R&D personnel per million people	
	Foreign direct investment (fdi)	Net inflow of foreign direct investment	
	Infrastructure construction (inf t)	Number of secure Internet servers per million people	

### 3.4 Model design

In order to verify the hypothesis 1, the metering design idea of the article is to use GLS method to measure the correlation between overall TSI of producer services and the manufacturing technology innovation ability of the overall sample countries and developed countries and developing countries firstly, then do a quantile regression on this basis to improve measurement results. In order to overcome heteroscedasticity, the logarithmic processing of data is performed. Based on this, the following equation is designed:

$$Ln(NP)_{i,t} = \alpha_0 + \alpha_1 \ln(IS)_{i,t} + \alpha_2 \ln(fdi)_{i,t} + \alpha_3 \ln(hc)_{i,t} + \alpha_4 \ln(rd)_{i,t} + \alpha_5 \ln(trade)_{i,t} + \alpha_6 \ln(\inf t)_{i,t} + \varepsilon_{i,t} \quad (3)$$

Where, IS represents the overall TSI of imports of producer services, i represents different sample countries, t represents time,  $\alpha_0$  to  $\alpha_6$  represents the estimated coefficient, and  $\varepsilon$  represents the error term varying with time and individual changes. Other variables are described in detail in table2 and will not be repeated here.

After completing the integrity test, in order to verify the point of view of hypothesis 2, it is necessary to incorporate the imports of producer services from different industry into the measurement system, and to distinguish between the samples from developed countries and developing countries, for analyzing the correlation between TSI of the imports of technical services for different industry and industry's ability to innovate, from which equations (4) to (9) are designed.

$$Ln(NP)_{i,t} = \alpha_0 + \alpha_1 \ln(FIN)_{i,t} + \alpha_7 \ln(fdi)_{i,t} + \alpha_8 \ln(hc)_{i,t} + \alpha_9 \ln(rd)_{i,t} + \alpha_{10} \ln(trade)_{i,t} + \alpha_{11} \ln(\inf t)_{i,t} + \varepsilon_{i,t} \quad (4)$$

$$Ln(NP)_{i,t} = \alpha_0 + \alpha_2 \ln(INS)_{i,t} + \alpha_7 \ln(fdi)_{i,t} + \alpha_8 \ln(hc)_{i,t} + \alpha_9 \ln(rd)_{i,t} + \alpha_{10} \ln(trade)_{i,t} + \alpha_{11} \ln(\inf t)_{i,t} + \varepsilon_{i,t} \quad (5)$$

$$Ln(NP)_{i,t} = \alpha_0 + \alpha_3 \ln(TRS)_{i,t} + \alpha_7 \ln(fdi)_{i,t} + \alpha_8 \ln(hc)_{i,t} + \alpha_9 \ln(rd)_{i,t} + \alpha_{10} \ln(trade)_{i,t} + \alpha_{11} \ln(\inf t)_{i,t} + \varepsilon_{i,t} \quad (6)$$

$$\ln(NP)_{i,t} = \alpha_0 + \alpha_4 \ln(OTH)_{i,t} + \alpha_7 \ln(fdi)_{i,t} + \alpha_8 \ln(hc)_{i,t} + \alpha_9 \ln(rd)_{i,t} + \alpha_{10} \ln(trade)_{i,t} + \alpha_{11} \ln(\inf t)_{i,t} + \varepsilon_{i,t} \quad (7)$$

$$\ln(NP)_{i,t} = \alpha_0 + \alpha_5 \ln(IP)_{i,t} + \alpha_7 \ln(fdi)_{i,t} + \alpha_8 \ln(hc)_{i,t} + \alpha_9 \ln(rd)_{i,t} + \alpha_{10} \ln(trade)_{i,t} + \alpha_{11} \ln(\inf t)_{i,t} + \varepsilon_{i,t} \quad (8)$$

$$\ln(NP)_{i,t} = \alpha_0 + \alpha_6 \ln(COM)_{i,t} + \alpha_7 \ln(fdi)_{i,t} + \alpha_8 \ln(hc)_{i,t} + \alpha_9 \ln(rd)_{i,t} + \alpha_{10} \ln(trade)_{i,t} + \alpha_{11} \ln(\inf t)_{i,t} + \varepsilon_{i,t} \quad (9)$$

The core variables of the above formula are the TSI of imported financial, insurance, transportation, other business, intellectual property and communication services. The specific classification details and abbreviations can be seen in table 3.1. The remaining controlled variables are the same as equation (3).

## 4 Empirical Test and Analysis

Based on the design of the above theories and models, the following part will start with the TSI of producer services from the perspective of the whole and the sub-industry, and discuss their impact on the manufacturing innovation capacity of different types of countries. To test hypothesis 1, we will explore whether the TSI of producer services has a positive incentive effects on innovation, and what different influences it has on developed and developing countries. In the model construction, the Hausmann test was firstly carried out to select fixed effect or random effect matching, followed by general regression analysis and quantile regression to enrich the conclusion. After the holistic inspection, the production service will be subdivided into industries, and the whole country and different types of countries will be compared and tested, trying to select the industries that can promote the improvement of innovation ability most and provide targeted advice for developing countries to find an import structure suitable for their own development path.

### 4.1 Inspection of overall TSI of imports in producer service industry

Firstly, the influence of the TSI of the total imports of producer services on innovation will be analyzed. According to the results from the Hausmann test, we select the fixed effect model to analyze the variables. The results are shown in Table 3

**Table 3 Impact of the Overall TSI of Producer Service Trade on Manufacturing Innovation Capability**

VARIABLES	(1)all countries	(2)developed countries	(3)developing countries
	Fixed effect	Fixed effect	Fixed effect
lnIS	0.473*** (0.0675)	0.398*** (0.0608)	0.344** (0.170)
Intrade	0.470*** (0.120)	0.0281 (0.108)	1.214*** (0.244)
lninf t	0.132*** (0.0255)	0.00809 (0.0249)	0.259*** (0.0464)
lnrd	0.860***	0.0274	1.073***

	(0.117)	(0.142)	(0.196)
lnfdi	0.0603***	0.0290**	0.0950*
	(0.0165)	(0.0123)	(0.0489)
lnhc	-0.295***	0.297**	-0.422***
	(0.0919)	(0.131)	(0.135)
Constant	16.54***	16.51***	14.27***
	(0.805)	(0.898)	(1.380)
Observations	483	314	169
R-squared	0.517	0.418	0.662
Number of country	30	20	10

Standard errors in parentheses \*\*\* p<0.01, \*\* p<0.05, \* p<0.1

The regression results show that:

(1) The overall TSI ln(IS) of producer services trade has a significant positive effects on the technical innovation capacity of all the samples, as well as the samples of developed and developing countries. This indicates that the higher the TSI of imports in producer service industry, the greater the effects on technological innovation. This is mainly due to the technology spillover brought by producer services, and this significant positive relationship proves the point of hypothesis 1.

(2) The TSI of producer services imports has a slightly greater impact on the innovation capacity of developed countries than that of developing countries. The TSI of a country or region's imports in producer service industry must adapt to the local manufacturing level and be coordinated with other production factors to give full play to the positive incentive effects brought by its imports (Mo,2015) . Developed countries owe absolute advantage to make full use of high TSI of the producer service imports. AS for developing countries which obviously lack the advantages, they cannot get as much as them from the exports to promote technology innovation ability.

(3) In the controlled variables, except the negative effects of human capital level, all the others can promote innovation ability. This is because the human capital level represents the capital in the form of a country's advanced elements, R&D spending more on innovation of incentive effects are stronger doesn't make sense. Only if good environment basis and human capital investment fit properly, can TSI of imports produce positive effects. However most of the sample countries does not meet the conditions, in that case increasing R&D staff blindly will increase the research and development costs, inhibit innovation.

(4) Because the trade and technical level of each country are at different stages of development, which makes the correlation between imports in producer service industry and innovation in manufacturing different. GLS cannot effectively reflect the characteristics, however the quantile regression defects of each error term given the same weight, can more fully reflect the relationship between the variables, the results are shown in table 4.

**Table 4 Quantile Regression Results**

	(1)	(2)	(3)	(4)	(5)
Quantile point	0.05	0.25	0.5	0.75	0.95
lnIS	0.400**	0.429***	0.465***	0.517***	0.573***
	(0.130)	(0.0941)	(0.0775)	(0.125)	(0.210)
Observations	483	483	483	483	483

Standard errors in parentheses\*\*\* p<0.01, \*\* p<0.05, \* p<0.1

The quantile regression results show that:

(1) TSI promotes the improvement of manufacturing innovation capability at all sub-points.

(2) Along with the transition from the low point to the high point, the TSI of the imports in producer service industry has a trend of increasing marginal utility in promoting the utility of innovation activities. That is to say, the TSI of producer services imports will play a stronger role in promoting manufacturing innovation capacity in countries or regions with strong manufacturing innovation capacity. It can be explained that imports utilization efficiency of producer services with different TSI depends on its matching degree and integration degree with the manufacturing production module of the importing country, which is largely determined by the technical level and innovation ability of the importing country.

#### 4.2 Inspection of TSI of imports in subdivided producer service industry

Due to the large differences in the nature of the producer service industry, distinguishing the impact of the TSI of the in producer service imports in different industries on the innovation capability of the manufacturing industry makes means. Table 5 gives results:

**Table 5 Impact of TSI of Imports in Subdivided Producer Service Industry  
on Manufacturing Innovation Capacity**

VARIABLES	(1)all countries	(2)developed countries	(3)developing countries
lnFIN	0.0332	0.0718**	0.0784
	(0.0303)	(0.0293)	(0.0647)
lnINS	0.0576*	0.0436	-0.0445
	(0.0336)	(0.0271)	(0.0792)
lnTRS	0.462***	0.331***	0.344**
	(0.0600)	(0.0564)	(0.138)
lnOTH	0.169***	0.296***	-0.131*

	(0.0410)	(0.0391)	(0.0755)
lnIP	0.243***	0.127***	0.335***
	(0.0465)	(0.0464)	(0.0868)
lnCOM	0.163***	0.198***	0.129
	(0.0430)	(0.0374)	(0.0852)
Observations	483	314	169
Number of countries	30	20	10
Country FE	YES	YES	YES

Standard errors in parentheses\*\*\* p<0.01, \*\* p<0.05, \* p<0.1

Table 5 shows that:

(1) Excluding the financial services with the highest TSI, the TSI of other producer services imports have a significant effects on the manufacturing innovation capacity of all the sample countries, among which the TSI of transportation service industry is the most powerful.

(2) Developed countries benefit more from the TSI of imports in producer service industry. All services except insurance services have a significant impact on their manufacturing innovation capacity.

(3) Only the TSI of transportation services and intellectual property services bring significant positive incentives to the manufacturing innovation capacity of developing countries, while insurance services and other business services hinder their manufacturing innovation level.

(4) The TSI of imports in financial services have a significant positive effects only on samples of developed countries.

(5) The TSI of other services industry hinders the improvement of manufacturing technological innovation capacity in developing countries, while it has the opposite effects in developed countries.

Restricted by the economic development and manufacturing level of some countries, the overall country sample can better integrate and absorb imported medium and low TSI services, such as transportation services. But the financial services with high TSI are different from them. We can easily find that the financial operation system of developed countries is highly efficient, and the imports of financial services is an important supplement to the domestic financial system, which can introduce external competition and stimulate a country's financial system to operate more efficiently due to the inadequacy of its own system (Grossman and Helpman, 1991b). Other services with low TSI need to invest more labor and material resources. Developed countries can make up for their disadvantages by importing such producer services with medium and low TSI and provide conditions for their own manufacturing technological innovation. By contrast, developing countries' imports such commercial producer services may crowd out their well-developed peers, creating bad competition and hampering their ability to innovate in manufacturing.

## 5 Conclusions

This paper uses the multinational panel data of 30 countries, from 2000 to 2016 for empirically-analyzing the impact of the overall TSI of the imports in producer service industry trade and the TSI of different industries on the manufacturing innovation capacity of different countries through the GLS method and quantile regression under fixed effect. It can be concluded that:

(1) The overall TSI of the imports in producer service industry significantly promotes the manufacturing innovation capacity of all countries, but it promotes the manufacturing innovation of developed countries slightly more than that of developing countries.

(2) The higher the sub-points are, in other words the higher the innovation level is, the greater the incentive effects of the TSI of the imports in producer service industry on innovation.

(3) Imports of producer service industry with low TSI, such as the transportation service industry, have the strongest ability to promote the manufacturing industry innovation ability of the overall national sample, followed by the intellectual property service industry which is easier to transform and absorb. The financial services industry with the highest technical complexity has only a weaker promotion effects for developed countries.

(4) Distinguishing between developed and developing country samples, the TSI of different industries has different impacts on developed countries and developing countries' manufacturing industry innovation ability. The former mainly benefits from transportation services, communication services and other industries, while the latter is affected by transportation and the impact of intellectual property services is relatively large.

Through the research conclusions of this paper, some policy recommendations can also be put forward to improve China's manufacturing innovation ability and revise the dilemma of "large scale but poor competence" in manufacturing:

Firstly, it is necessary to reduce the trade barriers for the imports of producer services and increase the degree of openness of the service market. Make full use of the comparative advantages of the world, especially developed countries, and improve the innovation capability of domestic manufacturing industries by importing medium-technical and complex production services;

The second is to promote the advantages of the country in transportation services and other industries, strengthen technical exchanges and cooperation. Matching and continuously optimizing the imports structure of producer services trade by rationally introducing according to the development level and demand of the domestic manufacturing industry to ensure the optimal quality of production factors;

Last but not least, only when the domestic human capital and knowledge capital accumulate to a certain extent can the embedded knowledge and technology spillover of intermediate products be obtained. We must pay attention to the construction of innovation infrastructure and the cultivation of local high-quality labor force for advanced R&D abilities.

# The Application of Big Data Technology in College Academic Achievement Management

Xie Kai, Guo Fangming<sup>12</sup>

Deans Office, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: shakekai@whut.edu.cn, songfm@whut.edu.cn)

**Abstract:** Students in the process of learning in colleges and universities will accumulate a lot of data, and the scale and speed of growth faster. How to make effective use of these abundant data resources to make decisions is an urgent problem to be solved, and big data technology provides new solutions for academic achievement management. This paper first analyzes the source and characteristics of current academic achievement data, then introduces the working idea of using big data technology to discover and predict academic achievement problems, proposes a new process of academic achievement management, constructs the main structure of the big data academic warning system, and draws the conclusion that big data technology can effectively help academic achievement management.

**Keywords:** Big data technology; Cloud computing; School management; Academic early warning system

## 1 Introduction

With the continuous development of higher education, the academic achievement management of colleges and universities is relatively complex, and the number of students and academic operations are numerous. Big data technology is needed to meet the growing management needs. As a product of the deep development of modern computer information technology, big data technology is not only the value of the ideological level, but also the methodology of the practical level. In the process of learning, college students will produce a large amount of data such as student status data, academic degree data, course data, examination data, academic achievements, award honors, disciplinary action, various assessments, teaching evaluations, etc. These are university education big data, the composition of these contents is subordinate to the research field of higher education big data. Some scholars (Liu Dan, 2015) believe that big data technology has become an extension of the body of teachers and students, gradually changing the way of existence and cognitive habits of teachers and students in teaching activities, reorganizing the activities of teachers and students and understanding the way of learning. Under this background, the traditional empirical study will be reshuffle of teaching data, the past can't collect and analysis of students' classroom performance, learning behavior data information is endowed with new capabilities and value, is the great opportunities of teaching to scientific evidence.

At present, the existing researches mainly focus on the strategy or application of big data

---

<sup>12</sup> Corresponding author: Guo Fangming

technology to promote teaching management and student management in colleges and universities. Most of these researchers come from the administrative management departments of colleges and universities. They all see the importance of big data technology to the management of colleges and universities. They believe that big data technology helps the country understand the running state of colleges and universities, the changes of teachers' teaching methods, the ability of teachers to process data, the promotion of digital education resources and services, the updating of the theory and methods of administrative staff management in colleges and universities, and the individualized training of students from a macro level, but relatively little research on related technologies. How to effectively using big data technology university academic achievement management currently is an urgent need to solve the problem. In this paper, the technology of data management in school has explored the application of the article expounds how to boost academic management of big data technology and analyses the related technology, this paper puts forward the ideas of the construction of academic achievement management cloud platform.

## **2 Big Data Technology Helps College Academic Achievement Management**

University academic achievement big data is in the education teaching activities of colleges and universities, that can be collected, through the data integration can create new value(Xie Jian, 2018), from the content, concrete can be divided into student status data, education degree, course class data, test data, the academic achievement record, awards honor data, disciplinary data, all kinds of assessment data, teaching evaluation data, etc.

The academic achievement management of colleges and universities runs through the links of student status maintenance, curriculum setting, classroom teaching, taking examinations, obtaining grades, obtaining academic degrees and so on. In the actual academic achievement inspection, there are some problems:

First, the way of thinking and working methods of managers are relatively conservative, and they pay more attention to routine work and less attention to big data technology, resulting in that managers need to spend a lot of time to integrate and process data.

Second, the previous teaching management platform cannot meet the current dynamic, detailed evaluation data requirements.

Thirdly, due to the limitation of the objective conditions of running a university and the increasingly individualized and diversified learning needs of students, the degree of student satisfaction is not high.

The use of big data technology to assist academic achievement management can improve the work efficiency of managers, optimize personnel allocation, upgrade the teaching management platform, increase the data source channels, realize the requirements of evaluation data, and build a network platform to alleviate the diversified learning needs of students(Ye Huanhuan, 2018, Meng Na, 2018, Diao Zhigang, 2018, Li Zhen, DiaoGang, Zhao Huifeng, 2008).

## **3 Study Inspection System Based on Big Data Technology**

Academic achievement management has gradually become the main work of university student status management, and its importance is self-evident(Huang Rengang, 2008). Accurate prediction and

timely discovery of academic achievement problems are of great importance to the growth of students. Traditional academic warning is usually a post-analysis, which leads to a lagging work model. At present, big data technology has been mature, so it is of great significance to use big data technology for data analysis and prediction research.

Academic achievement management integrates all kinds of data, and the abundant information resources are enough to make reasonable discovery and prediction of academic achievement problems. Based on the learning rules of learners and referring to the existing big data technology system, this study proposes the following structure chart of student academic warning system based on educational big data (as shown in figure 1).The system consists of five sub-modules: data acquisition, information processing, data analysis, visual feedback and early warning.

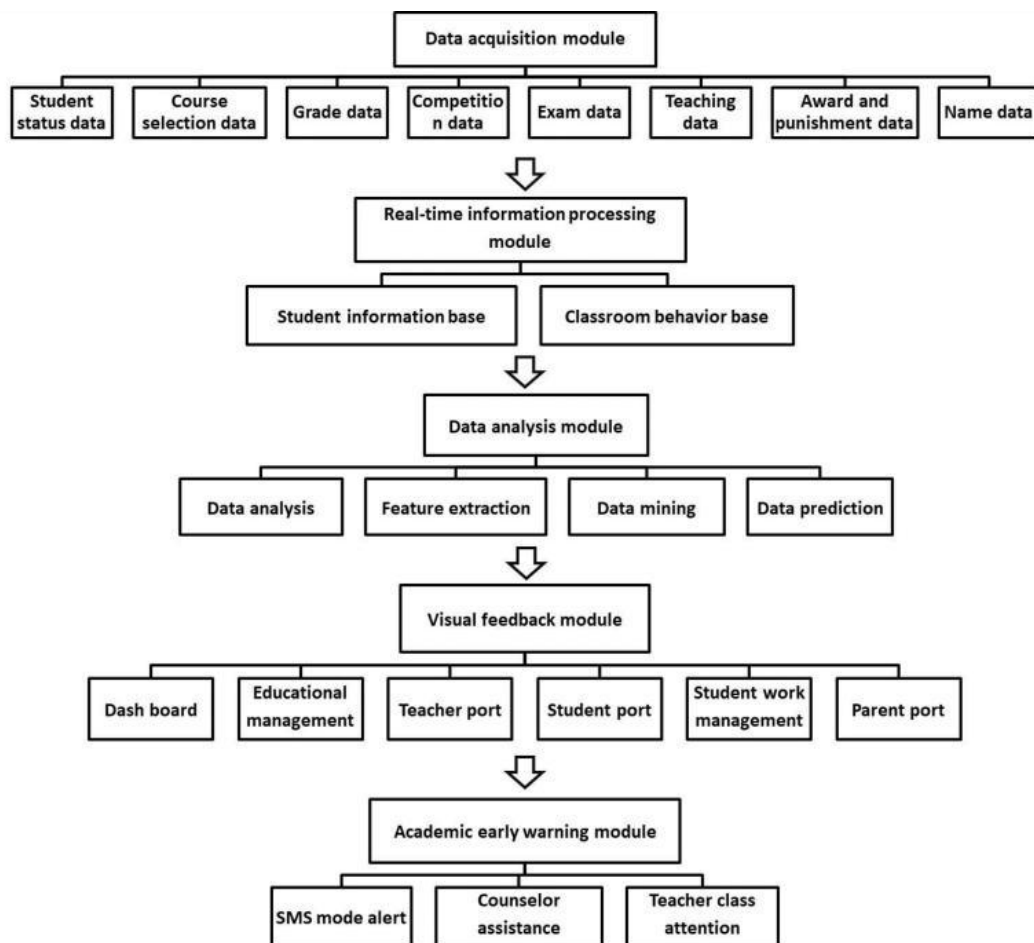

Figure 1 Structure Chart of Academic Early Warning System

### 3.1 Data acquisition module

The data acquisition module collects students' learning data through the educational administration management system. The data of students are mainly collected from the aspects of student status information, learning process (classroom behavior), academic achievement information, evaluation and teaching information, reward and punishment information, etc. For example, student status information is mainly collected from the four dimensions of students' personal basic information, personal hobbies,

graduation and middle school, and family economic status.

### **3.2 Real-time information processing module**

The real-time information-processing module USES the unified data standard to preliminarily clean, classify and count the data, and at the same time ensures the data interflow with the subsequent modules. For some real-time incremental data, such as classroom behavior data updated every day, in addition to the need to adopt this kind of data real-time storage of large capacity storage devices, also need to make real-time comparison and analysis of the results of the analysis will be stored in the student information database, to explore different personality differentiation of academic achievement problem possible.

The real-time information-processing module requires the recording of each student's academic achievement data and panoramic state detection data. The storage and transmission of these massive data bring great challenges to servers and networks. Based on the current development of technology, the appropriate storage and computing cloud platform can be selected according to the actual situation.

### **3.3 Data analysis submodule**

Data analysis submodule can be divided into classification, association rule discovery, dependency discovery, and anomaly and trend discovery. It is necessary to comprehensively use machine learning, statistical learning, neural network and other methods to extract potentially valuable information from massive teaching data and provide data support for the intervention or assistance of learners, teachers, management departments and other relevant parties.

In addition to determining whether students are at academic achievement risk, the learning analysis module is more important to use the analysis results to provide decision data for human intervention in the next step. In order to provide students with personalized teaching guidance to facilitate students to complete their studies.

### **3.4 Visual feedback subsystem**

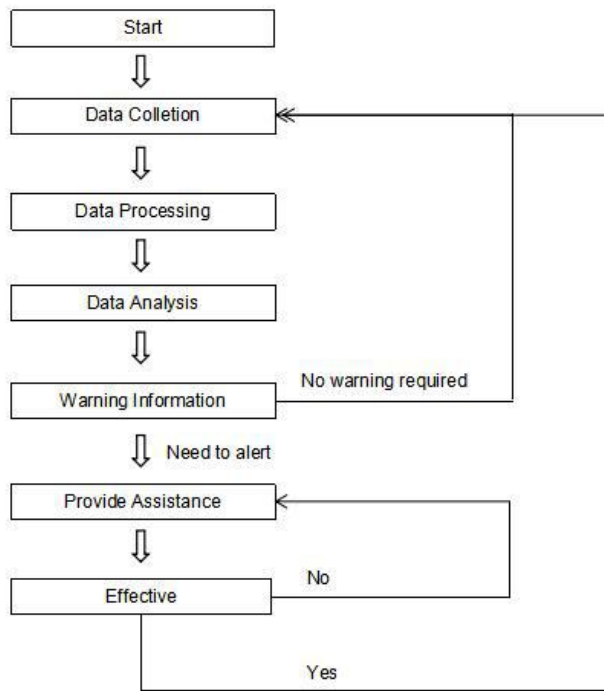

The visual feedback submodule is divided into five different user terminals: student terminal, teacher terminal, teaching management terminal, student management terminal and parent terminal. The main function of the visual instrument panel is to present the system analysis information to system participants in a timely manner. According to the needs of different participants, different terminals provide differentiated functional interfaces in terms of the received information content and information presentation mode. For example, for teaching management personnel, the dashboard displays the overall performance changes of all grades in the school in the form of charts, etc., which is data-oriented and provides decision-making data reference for credit clearing, teaching resource allocation, course selection and setting, etc.

### **3.5 Warning submodule**

With the massive accumulation of students' learning data, the warning engine will become increasingly intelligent, and more warning prompts will be completed automatically by the academic achievement management system. At the same time, considering the complexity of the academic achievement situation, the system also provides artificial warning function. The educational administration and student management personnel can help the problem students face to face and provide learning advice, psychological counseling or learning partner recommendation and other support measures. Teachers can give more attention and help to problem students by adjusting teaching methods. Parents can give their children early encouragement and psychological counseling. Thus from many aspects to promote students successfully complete their studies.

#### 4 New Process of Academic Achievement Management

Based on the structural design of the academic achievement inspection system and the existing business logic of the school's academic achievement warning, the following new process of academic achievement management is constituted (as shown in figure 2).

**Figure 2 New Process of Academic Achievement Management**

Academic achievement management students' various learning data collected through academic achievement management system, data processing module for data cleaning and proofreading after preprocessing operations, set up different real-time database, data analysis module through data mining and analysis techniques for personalized analysis and comprehensive evaluation, the results of the analysis through the visual feedback module presents different participants.

When there is an academic achievement warning, the academic achievement management system will choose different ways to deal with the warning information of different levels and push it to the students and the administrators who want to close the system. According to the warning information received, management personnel will take appropriate intervention and assistance measures in combination with their own work scope, so as to effectively improve the rate of students completing their studies.

Artificial participation makes academic achievement management more scientific and reasonable, so that students can not only feel the efficiency and convenience brought by technology, but also feel the humanistic care of schoolteachers(Zhao Xuemei, Zhao Keyun, 2018).

## 5 Conclusion

Big data technology brings new solutions to the academic achievement management of colleges and universities(Wang Chunfeng, 2018).The application of relevant technologies can facilitate the detection and prediction of academic work and fully optimize the allocation of management personnel. With the help of big data technology, daily academic achievement data report and risk, assessment can also be generated, and intelligent push can be realized(Yin Maozhu, 2018).

Big data technology will become the basis of decisions related to teaching management, and promote the transformation of undergraduate teaching management towards intensive and professional management. The established academic achievement cloud platform will become the inevitable choice to solve many academic achievement problems in the near future.

# Research on the Influence of Airport Staff Safety Risk Perception on Violation Behavior

Zhang Qian, Luo Fan\*

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 1010329592@qq.com, sailluof@126.com)

**Abstract:** Based on literature review and questionnaire survey, the study verifies and put forward the hypothesis model of airport staff safety risk perception, safety attitude and violation behavior. The results show that airport staff safety risk perception, safety attitude all have significant negative impact on the violation behavior, the safety attitude plays an intermediary role in the effect of safety risk perception on the violation behavior. According to the analysis results, the study provides interventions to airport staff violation behavior. Managers can proceed from the organization's security management and the staff management, and intervene in violation behavior by improving airport staff risk perception and safety strengthening safety attitude. The authors explore the impact of safety risk perception of airport staff on violation behavior, so as to provide decision support for reducing the violation behavior of staff and improve the efficiency of airport safety management.

**Keywords:** Airport staff; Safety risk perception; Violation behavior; Risk management

## 1 Introduction

The existing research shows that human error is an important factor affecting airport security accidents, and the complexity of the human determines that individual emotions, cognition and other aspects may have an impact on safety behavior. The deviation in the risk perception of airport staff is likely to lead to violations of regulations, which will lead to security accidents.

At present, domestic and foreign scholars' research on safety risk perception mainly focuses on the fields of driving, coal mine and hotel. Scholars generally believe that the level of individual safety risk perception and safety attitude will affect the violation behavior. However, scholars have no unified conclusions about whether the individual safety risk perception level has a positive or negative impact on the violation behavior, and the mediator variables selected are different. On the one hand, some studies have discussed the positive impact of security perception on security behavior (Shen Y., Tuuli M M., et al, 2015). Some scholars believe that individual safety risk perception has a significant negative effect on safety behavior, and they propose that reducing staff safety risk perception is an important way to reduce injury rate(Dong Xiaogang, Wang Shunhong, 2014). On the other hand, many behavioral studies have shown that drivers with high-risk perception levels have lower probability of traffic accidents (Rolison M. R., Scherman A., 2002). In addition, the research shows that staff safety attitude is related to safety incidents and has a significant impact on safety behavior (Wetmore M, Lu CT, 2006).

At present, most researches on the safety risk perception of airport staff mainly focus on the influencing factors and status quo of the risk perception, and lack of empirical research on the impact of the safety risk perception of airport staff on violation behaviors. So is the violation behavior of airport staff also affected by safety risk perception? If so, is the effect positive or negative?

Based on the above discussion, this study explores the impact mechanism of airport staff safety risk perception on violation behavior from the perspective of safety risk perception, and extends the research perspective of airport staff violation behavior. In addition, this study provides decision support for reducing staff violation behaviors, and promotes airport safety management.

## 2 Theoretical Analysis and Research Hypotheses

### 2.1 Research framework

Safety risk perception refers to the intuitive judgment and subjective attitude towards the possibility and severity of the consequences of risk events in production work (Xia N, Wang X, et al, 2017). In this study, the violation behavior of airport staff is defined as the production behavior that leads to safety accidents due to staff violation of safety regulations, including risk violation behavior consciously controlled by individuals and habitual violation behavior unconsciously controlled (Wang Xia, 2017; Slovic P., 1987). This study explores the impact mechanism of airport staff safety risk perception on violation behavior from the perspective of cognitive psychology and organizational behavior, and recognizes the mediating role of safety attitude by the relevant literature analysis. Therefore, this paper attempts to construct a mechanism model for airport staff safety risk perception to influence violation behavior through safety attitude. The research framework is shown as Figure 1.

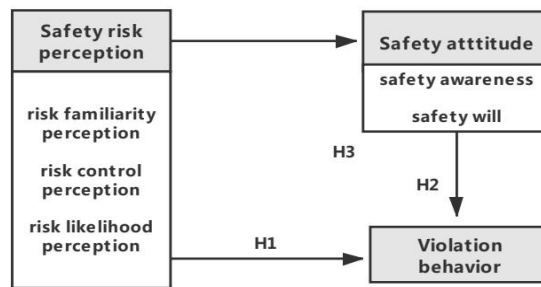

Figure 1 Research Framework

### 2.2 The effect of safety risk perception on violation behavior

Airport staff is faced with serious risk consequences when violations occur, which will affect their perception of violations. Many studies have shown that safety perception is an important antecedent variable of safe behavior (Smith T. D., Eldridge F., et al, 2016). The level of staff risk perception is affected by the following aspects: the low level of security atmosphere in the airport will reduce staff safety awareness; the stable and monotonous staff work content will cause staff to experience emotional exhaustion and job burnout; the safe working environment may cause staff to misunderstand safety behavior. Currently, the measurement method for risk perception is usually psychological measurement paradigm. Scholars gradually realize that risk perception is composed of different dimensions. Slovic divides the content of risk perception into different dimensions, such as risk control, possibility, and familiarity (Slovic P., 1987). The internal factors that interfere with violations mainly include individual mental health and safety values (Paul P. S., Maiti J, 2007; Morrow S. L., Mcgonagle A. K., et al, 2010). Based on this, the following assumptions are made:

H1: Airport staff safety risk perception has a negative impact on violations.

H1 can be divided into the following three sub-hypotheses:

H1a: Airport staff risk familiarity perception has a significant negative impact on violations;

H1b: Airport staff risk control perception has a significant negative impact on violations;

H1c: Airport staff risk likelihood perception has a significant negative impact on violations.

### **2.3 The mediating role of safety attitude**

Safety attitude is the value judgment and psychological tendency of employees when they are in safe production (Alistair Cheyne, Sue Cox, et al, 1998). This study concludes that the safety attitude of airport staff has a significant effect on violations. In general, safety attitude mainly include safety cognition and safety will dimension (Lu Bo, Chen Pei, et al, 2010; Xu Menghong, 2012). Safety cognition refers to the individual's cognition of safety characteristics and safety, mainly through individual feelings, perceptions, memories and thoughts. Safe will refers to a psychological process in which individuals strive to regulate their own behaviors in order to achieve safety goals. In recent years, many scholars have combined safety risk perception with safety attitudes and dangerous attitudes to explain risk behaviors in the fields of aviation, driving, and coal mining. Based on this, this paper proposes the following two assumptions:

H2: The safety attitude of airport staff has a negative impact on violation behavior.

H3: The safety attitude of airport staff plays a mediating role in the impact of security risk perception on violation behavior.

Among them, H2 consists of two sub-hypotheses:

H2a: Airport staff safety awareness has a negative impact on violation behavior;

H2b: The safety will of airport staff has a negative impact on violation behavior.

## **3 Study Design**

### **3.1 Research sample and data collection**

In this study, 151 staffs of T airport and S airport were surveyed online by questionnaire method, 129 valid questionnaires were received, and the recovery rate was 85.43%.

### **3.2 Measurement scale**

This study draws on the maturity scales in related fields. It includes three scales of airport staff safety risk perception, safety attitude and violation behavior, and requires the participants to answer according to the actual feelings in the work. All scales use the Likert5 graded score method, which is based on very non-conformity, non-conformity, general compliance, comparative compliance, and very consistent, representing 1 to 5 points respectively.

The security risk awareness scale refers to the relevant results of Simon's risk perception (Simon M, Houghton S M, et al, 2000), there are 12 items( $\alpha=0.852$ ). The safety attitude scale mainly have 8 items( $\alpha=0.716$ ), including 'safety regulations cognition', 'production process cognition', 'safety concept cognition', 'safe production mood', 'safe production will' and other topics (Xu Menghong,

2012). The violation behavior scale draws on the research results of Fogarty and Shaw on unsafe behavior, there are 5 items ( $\alpha=0.907$ ), including ‘safety regulations violations’, ‘labor discipline violations’, ‘operational requirements violations’ (Fogarty G J, Shaw A, 2010).

## 4 Data Analysis and Results

### 4.1 Factor analysis

Factor analysis was performed on the safety risk perception scale data. Factor 1 reflects the familiarity of airport staff with risk events (i.e. violation behavior), so it was named as ‘risk familiarity perception’. Factor 2 is about the perception of the possibility of airport staff risk arising from violations, so it is named as ‘risk possibility perception’. Factor 3 refers to the control ability of airport staff in violation of regulations and the controllable perception of consequences caused by violation decisions, so it is named as ‘risk control perception’.

Similarly, the safety attitude scale is divided into two factors. Factor 1 describes the cognition of airport staff on safety regulations and safety systems, so it is named as ‘safety cognition’. Factor 2 reflects the subjective understanding of airport staff to overcome difficulties and implement safety regulations when faced with special circumstances, which is named as ‘safety will’. The data of the violation behavior scale have passed the one-dimensional test, so there is no dimensional distinction.

### 4.2 Correlation analysis

Firstly, the overall relationship between the three scales of airport staff safety risk perception, safety attitude and violation behavior is analyzed. As shown in Table 1, overall, airport staff safety risk perception was significantly negatively correlated with violation behavior ( $r=-0.499, p<0.01$ ), and safety attitude was significantly negatively correlated with violation behavior ( $r=-0.730, p<0.01$ ).

**Table 1 Safety Risk Perception, Safety Attitude and Violation Behavior Correlation Coefficient Matrix**

Variable	Safety risk perception	Safety attitude	Violation behavior
Safety risk perception	1		
Safety attitude	.703**	1	
Violation behavior	-.499**	-.730**	1

Note: \* means significant at 0.05 level, \*\* means significant at 0.01 level (two-sided test)

Then, the correlation between the factors of safety risk perception, safety attitude and violation behavior is analyzed, the results are shown in Table 2. Risk familiarity perception is negatively correlated with violation behavior ( $r=-0.356, p < 0.01$ ), risk possibility perception is negatively correlated with violation behavior ( $r=-0.506, p < 0.01$ ), and risk control perception is not significantly correlated with violation behavior. The reason why risk control perception is not related to violation behavior may be that in a risk environment, when staff perceive that they can control violation behavior, they will think that they are less likely to take risks and thus more likely to carry out violation behavior. Safety cognition has significant negative correlation with violation behavior ( $r=-0.215, p < 0.05$ ), and safety will has significant negative correlation with violation behavior ( $r=-0.820, p < 0.01$ ). The above

analysis results preliminarily support the theoretical model and hypothesis.

**Table 2 Safety Risk Perception, Safety Attitude Factors and Violation Behavior Coefficient Matrix**

Variable	Risk familiarity perception	Risk possibility perception	Risk control perception	Safety cognition	Safety will	Violation behavior
Risk familiarity perception	1					
Risk possibility perception	/	1				
Risk control perception	/	/	1			
Safety cognition	.562**	.242**	.131	1		
Safety will	.176*	.271**	.103	/	1	
Violation Behavior	-.356**	-.506**	.085	-.215*	-.820**	1

Note: \* means significant at 0.05 level, \*\* means significant at 0.01 level (two-sided test)

### 4.3Hypothesis test results

In this study, SPSS20.0 was used for stepwise regression analysis, and the results are shown in table 3. After testing, VIF in this paper is close to 1, indicating that collinearity is not obvious.

Firstly, the regression analysis of the safety risk perception scale and the violation behavior shows that the safety risk perception has a significant negative impact on the violation behavior ( $\beta=-0.347, p<0.01$ ), hypothesis H1 is verified. The regression analysis of various factors of safety risk perception and violation behavior shows that risk familiarity knowledge ( $\beta=-0.506, p<0.01$ ) and risk possibility perception ( $\beta=-0.354, p<0.01$ ) have significant negative influence on violation behavior, which verifies hypothesis H1a and H1b. However, risk control perception factors didn't enter the regression model, indicating that hypothesis H1c couldn't be verified.

Then, the regression analysis of safety attitude and violation behavior shows that safety attitude has a significant negative impact on violation behavior ( $\beta=-0.749, p<0.01$ ), and the hypothesis H2 is verified. Similarly, we can calculate that safety cognition ( $\beta=-0.821, p<0.01$ ) and safety will ( $\beta=-0.2131, p<0.01$ ) all had significant negative effects on violation behaviors, and hypothesis H2a and H2b were verified.

**Table 3 Regression Analysis and Hypothesis Testing**

Control variable	Non-standardized coefficient		Standardization coefficient	t	Sig	ADJ.R <sup>2</sup>	F
	B	standard error	Beta				
(1)safety risk perception	-.347	.053	-.499	-6.492	.000	.243	42.152**
(2)risk familiarity perception	-2.577	.357	-.506	-7.225	.000	.372	38.834**

(3) risk possibility perception	-1.800	.357	-.354	-5.047	.000		
(4) safety attitude	-.803	.092	-.749	-8.749	.000	.490	128.803**
(5) safety attitude	-4.181	.240	-.821	-17.419	.000		
(6) safety will	-1.086	.240	-.213	-4.524	.000	.715	161.946**

Note: \* means significant at 0.05 level, \*\* means significant at 0.01 level (two-sided test)

The mediating utility test results of safety attitude are shown in Table 4. In model 2, the regression coefficient of safety attitude is significant, indicating that "safety attitude" produces mediating utility. The regression coefficient of "safety risk perception" in model 1 is significant, while it is not significant in model 2, indicating that "safety attitude" plays a full mediating role between "safety risk perception" and "violation behavior", and hypothesis H3 is verified.

**Table 4 Safety Attitude Intermediary Utility Analysis**

Independent variable	Model 1			Model 2		
	Standardized Beta	t	Sig	Standardized Beta	t	Sig
safety risk perception	-.499	-6.492	.000	.027	.312	.755
ADJ.R <sup>2</sup>	.243			.526		
F	42.152**			71.882**		

Note: \* means significant at 0.05 level, \*\* means significant at 0.01 level (two-sided test)

## 5 Conclusion

This study takes airport staff as the research object, discusses the influence of airport staff safety risk perception and safety attitude on the violation behavior from the perspective of safety risk perception, and proposes the intervention countermeasures of airport staff violation behavior. It is found that airport staff safety risk perception has a significant negative impact on violation behaviors. It means that staff with higher safety risk perception ability are more inclined to abide by safety rules and regulations and are less likely to have violation behaviors. The safety attitude of airport staff has a significant negative impact on the violation behavior. Safety attitude plays a completely mediating role in the influence of airport staff safety risk perception on violation behavior.

Managers can improve staff risk perception from the perspective of organizational safety and staff management, such as establishing risk management culture, strengthening staff safety attitudes, and conducting behavioral education.

Future studies should expand the sample size to increase the representativeness of the sample data and use objective data to avoid subjective effects of the self-measurement table.

# Media Reporting Strategies for Public Opinion Risk Management Based on Emergency

## ---A Case of the Sinking Incident of Oriental Star Ship

Zhang Wuqiao

School of Humanities and Law, Guizhou University of Finance and Economics, Guiyang, P.R.China,  
550025

(E-mail: 892260268@qq.com)

**Abstract:** Due to the particularity of serious emergencies, China attaches great importance to the construction of emergency management system in the face of serious emergencies, especially to improve the ability of the network to public opinion and the responsibility of the news media in the process of emergent events. Taking the sinking incident of "Oriental Star" as an example, the study finds that under the background of media convergence, this sinking incident brings together the communication characteristics of various media, due to the features of content orientation, expression and narrative strategy of traditional media and emerging media. Furthermore, it realizes channel integration and cross-border communication and achieve the maximum, widest and most effective communication effect to ensure the healthy formation, development and dissemination of social public opinion by making full use of the advantages of integrated media communication. Therefore, it is a successful case of integrating media to guide the development of public opinion in a serious emergency.

**Key words:** Emergency events; Public opinion risk; Media reporting; The sinking incident

### 1 Introduction

At present, we are stepping into the era of all media. Emergencies are accompanied by high-intensity public opinion confrontation, which not only adds new variables to the emergencies, but also has an important impact on their process. The game of various media forces has become the norm (Liu Ting & Chen He, 2015). Due to the particularity of major emergencies and the severity of the results, every serious emergency in history inevitably had produced some negative comments to affect the image of the Chinese government, and even brought about adverse social consequences. However, great changes have taken place in the social environment of crisis communication in China today, such as the rapid development of communication technology, fierce competition among media, and the general enhancement of the audience's awareness of rights and psychological endurance (Sun Yuanming, 2008). Therefore, after the occurrence of major emergencies, China attaches great importance to the construction of emergency management system in the face of major emergencies, while news media plays an important role and is the key factor in the process of public opinion response. Therefore, we take the sinking incident of "Oriental Star" as an example to analyze the

media's reporting characteristics and public opinion response strategies in the face of major emergencies, so as to provide decision-making reference for formulating public opinion response policies in the face of emergencies in the future.

Many scholars at home and abroad investigate the study of media coverage from various aspect, such as the effect of trade credit on stock price (Liu Huan & Hou 2019); the content and framing of opioid-related media coverage (Russell, Spence & Thames 2019); the role of media in supervising relevant agencies and meeting the public need for related information (Chen Xueli & Valdmanis 2019); the media coverage from the major online newspapers in Mexico (Curiel, Arnau & Pinedo, et al. 2019); the application of media report strategy to study the workplace violence (Jonathan, Lu Fang, Zhang Xinqing 2019). These studies explore the feature and strategies of media coverage, with few illustrations of the media reporting strategies for public opinion risk management. So this paper takes the sinking incident of "Oriental Star" as an example to explore the strategies of media reporting for public opinion risk management.

## **2 Sample Selection**

At about 21:00 pm on June 1, 2015, the "Oriental Star" passenger liner capsized in Jianli Section of Yangtze River in Hubei Province. There were 454 people on board, including 403 tourists, 46 crew members and 5 travel agency staff, and 12 people were rescued. After this sudden major emergency, General Secretary Xi Jinping gave important instructions and Premier Li Keqiang even personally went to the scene to conduct the search and rescue work. More importantly, from the perspective of the public opinion dissemination, the investigation and study of the domestic mainstream network media, such as paper media, television, websites and WeChat and microblog, etc, showed that there has been no large-scale network rumors and negative information impact so far after this event, showing a healthy and upward social atmosphere. So, it reflects a sound emergency management system and the full role of the media in public opinion response of major emergencies in China.

### **2.1 Selection of research period**

In terms of time selection, we started at 21:00 pm on June 1, 2015, when the "Oriental Star" began to sink. Then various media carried out a full range of follow-up reports under the background of media convergence. By 11 a.m. on August 8, 432 bodies had been found. Later, after two hours of thorough and careful inspection, the Joint Acceptance Group confirmed that the body clearance had been completed, and the representatives of all parties signed the checklist, marking the completion of the site investigation and clearance of the "Oriental Star" sinking incident. Therefore, we selected a 10-day period from June 1 to June 10, 2015 to investigate the number and content of media reports by considering the particularity, continuity and lag of media reports, especially paper media and television stations.

### **2.2 Selection of target media**

Major emergencies report is a special type of report in a special period with wide public attention, high quality requirement for journalists and great instantaneous influence (Yan Liang 2015). The "Oriental Star" incident attracted wide attention and spread of reports from domestic and foreign media, which fully embodied the important characteristics of the whole media era. In the choice of target media, we focus on the domestic mainstream media: Xinhua Daily Telegraph; CCTV, Phoenix

Network, Sina Weibo, WeChat. Meanwhile, we also selected Hubei Daily and Hubei Network Radio and Television Station to better understand the coverage of the incident, because the location is within the territory of Hubei Province.

### 3 Reporting Performance of Different Media

#### 3.1 Television communication

As an important part of the daily life in today's society, television is accompanied by us every day in such crowded public areas as stations, airports, restaurants, or in private families. So watching TV especially in the public sphere is no longer the privatization of the past due to TV's publicity and recommendation characteristics. When you pass through some public spheres, the live picture of TV will inadvertently come into our eyes, or even let us stop to watch from time to time. Thus, with the wide spread of television, TV has become a kind of the most popular propaganda media as well as the main source of information for middle-aged and elderly people and network blind areas. And it has permeated all aspects of people's daily life, such as clothing, food, housing, transportation, entertainment, education, etc., and affects people's behavior.

##### 3.1.1 CCTV performance

After the "Oriental Star" incident, CCTV took a series of powerful measures immediately according to the basic rules and principles of response to public opinion, and achieved remarkable results, as shown in the table below.

**Table 1 Response Schedule of CCTV at First Time**

Time	Corresponding Measures
after the sinking incident	CCTV immediately started Level II Emergency Response Plan overnight
2: 52 a.m. on June 2	The exclusive news of "Overthrow of more than 400 Yangtze River passenger liners in the Hubei Section of Yangtze River and" was launched around the world through the "CCTV microblog".
3: 00 a.m. on June 2	CCTV News Channel is ahead of all traditional media and news agencies to send authoritative news through TV.
6: 02 a.m. on June 2	The first live phone call with the foreword reporter was broadcast.
7: 00 a.m. on June 2	CCTV broadcast important instructions from General Secretary Xi Jinping and Premier Li Keqiang
8: 00 a.m. on June 2	A reporter from CCTV's Hubei station send out the first global live broadcast on the rescue site.

CCTV has effectively curbed all kinds of rumors that once circulated in society, effectively guided the orientation of media and sound development of social public opinion by means of high-density, professional live broadcasts, bold and innovative TV expressions and authoritative information.

According to the relevant statistics, CCTV sent more than 70 reporters to the scene and the relevant provinces along the Yangtze River to carry out all-round follow-up reports during the 10-day-rescue process. And more than 110 live connections were made and more than 1100 related news items were broadcast with a total duration of more than 46 hours. CCTV News Channel ranked first in the ratings for three consecutive days from 3 to 5, June, garnering over 790 million views on the related news reported by the new media of CCTV News. During this period, 129 pieces of relevant news were released by "International Television" of CCTV to overseas media, 94 of which were used 243666 times by 833 overseas TV channels such as CNN, BBC, Al Jazeera, Brazil's Universal TV, etc. and the total talk time was about 89 hours. Therefore, CCTV distributed the largest number of publications to the single incident in the past two years no matter from the number of foreign media or the number of broadcasts. (Shen Yong & Zhang Yujun, 2015).

### 3.2.2 Performance of Hubei network radio and television station

After the sinking incident, Hubei Radio and Television Station started the emergency response mechanism quickly. According to the principle of timeliness, accuracy, openness and transparency, it actively released authoritative information, did a good job in news reporting and public opinion response to social concerns. The logo of Hubei Satellite Television Station turned black and white from 2 to 7, June to mourn the sinking incident of the Oriental Star. Moreover, live coverage of the incident was carried out during three important periods of morning, afternoon and evening. In addition to the fixed 130-minute news section in the evening, there were more than 70-100 minutes of live coverage in the daytime. The total time of live coverage on June 4 was 391 minutes, which led to the full-day broadcasting of the channel. According to statistics, after the "Oriental Star" sinking incident, Hubei Satellite TV and Hubei Public News Channel have achieved nearly 200 live broadcasting, with more than 400 minutes of live press conference and 2800 minutes of live television broadcasting. The special program of "Oriental Star" sinking incident broadcast by Hubei Satellite TV at 21:25 p.m. has received good ratings, with an average viewing rate of 0.42% and a viewing share of 1.71%, which was 27% higher than last week's program at the same time, and ranked second in the country in the evening of 2 to 4, June (Hu Sha & Shi Yongjun, 2015). It has effectively improved the viewing rate of Hubei Satellite TV and the benign dissemination effect of social public opinion.

According to the database statistics of Xinhua News Agency multimedia, Hubei Satellite TV alone broadcast 113 special news programs since the rescue of the sinking incident. Television with the characteristics of the integration of audio and video, greatly facilitates the reception effect of the audience group, makes the audience group get rid of the restriction of cultural level to fully understand the occurrence and development of events, and produces strong visual impact and emotional resonance. And the TV media, which can also demonstrate with the three-dimensional dynamic model, improves the audience's experience perception, so that the rescue work has received strong support from all walks of life.

### 3.3 Website dissemination

In today's Internet era, the two-way interactive communication and cross-communication of network media have greatly enhanced the group awareness and diffusion effect of events. User groups can effectively extend and distribute through hypertext and hyperlink on the network to make multiple users obtain information in the first time. After the incident, many websites at home and abroad have held this hot information tightly and carried out all-round online broadcast. Many websites have set up special web pages on this event. Therefore, the participation enthusiasm of the public has been greatly

improved through network media communication. For example, in the article “Expert Interpretation: Six Questions about the Sinking Incident of ‘Oriental Star’”, 6580 netizens participated in and 249 commented on this incident. Therefore, the effective participation and comments of social netizen also broadens the group awareness of events to a certain extent, and plays a positive role in eliminating bad guesses and rumors.

### 3.4 “Two Micro” dissemination

As the “two micros” represented by social networking media Weibo and WeChat have come in succession, multidimensional network channels have changed the single linear communication mode. Moreover, they have great expansion effect and provide a wide space and convenient conditions for the rapid release of information with the characteristics of one-to-one, one-to-many, or multi-to-many or multi-to-one communication.

Figure 1 Message Volume Released by Microblog and WeChat

#### 3.4.1 Performance of Sina Weibo

Sina Weibo is one of the most influential social network media in China. According to statistics, Sina Weibo timely released the development of the incident with a total of 187 related Weibo messages from June 2 to June 10, 2015, after the shipwreck incident. But compared with other network media, there are still some lags. For example, the first micro-blog content released by Sina Weibo was forwarded at 7:04 a.m. on June 2 after other media reports were disseminated.

The hot topic “the Sinking Incident of ‘Oriental Star’” was launched by Sina Weibo. As of June 10, 876 million people had read the topic and 907,000 people had actively participated in the discussion, reflecting the netizen’ great concern about the progress of the incident. A total of 33 Weibo news were released on the second day of the incident, June 2, when intensive publication of information was launched on Sina Weibo. In the process of rescue for all officers and soldiers, especially on June 5, Sina Weibo also kept pace with the development of the incident, timely release of rescue progress with 10 Weibo news to the public. With the announcement of the rescue work, the number of Sina Weibo reports on the incident continued to decrease from June 8.

#### 3.4.2 Performance of WeChat Released by Xinhua News Agency

As WeChat relies on the network of acquaintances and the mass communication, it greatly improves the effectiveness of communication. Especially as people can brush micro-messages anytime and anywhere, and receive the information pushed by WeChat public number at any time in the

popularization and application of smart phones, WeChat achieve one-to-many dissemination effect and improve the rate of information attainment. According to statistics, from June 2 to June 10, 27 pieces of news related to the incident were pushed by Xinhua News Agency, of which 9 articles read more than 80,000. At 6:59 a.m. on June 2, the first news of "Oriental Star" sinking incident was pushed. The three days from June 2 to 4 were the intensive period of news announcement with 8, 5 and 6 items respectively. Then the number was gradually decreased from June 5 to 8, with 4, 2, 1 and 1 items respectively, and was not be sent after June 9. But from the concern of the circle of friends, the title "Full Understanding of the Sinking of Oriental Star within 24 Hours from a Picture", which was pushed on June 2, has attracted a great deal of forwarding and attention from netizens.

## **4. Analysis of Reporting Characteristics of Different Media**

### **4.1 Different content orientation**

New media, such as websites, TV stations, Sina Weibo and Xinhua News Agency, focus on dynamic updates of the occurrence and development of events, and timely release of real-time dynamic information of events to the public. Furthermore, they adopt two-way interaction with the audience to meet their information needs. In content, they mainly focus on the progress of events, especially the real-time updating of rescued personnel information and the number of victims. The TV stations also provides live online broadcasting to restore the event process in 3D pictures so that the audience can more intuitively understand the information of the event and the media make effective respond to the concerns and questioning of the public, such as the articles "Twelve People Were Rescued, Not 14 in the Sinking Incident of Oriental Star---- Official Explanation of the Reasons for Change in the Number of Rescued Persons" by Xinhua , and "Media: Why the Shipwreck Was Corrected after 72 Hours" by Phoenix Net.

### **4.2 Different expressions**

With the rapid development of social media, as an important social phenomenon in today's society, social language has become popular worldwide as well as profoundly affect our daily life. According to statistics, a series of popular social network phrases, such as "now my heart is almost collapsed", "the world is so big, I want to see", etc., have a very high dissemination influence and has changed the language ecological environment of the whole social media. Therefore, compared with traditional paper media, new media such as Weibo, WeChat and website are more lively, emotional and colloquial in their discourse expression to make people feel the close relationship between the audience and the media.

### **4.3 Different narrative strategies**

The honeycomb news narrative mode is the main mode of communication of the new media at present, especially the live online communication carries out bit by bit broadcasting according to the sequence of events' development. For example, in the process of hull righting and salvage, all new media have adopted real-time live broadcasting, enhancing the timeliness by means of interpolation and explanation the background of the incident and the rescue process in detail. Therefore the audience can feel the atmosphere of the scene, and better understand the occurrence and development of events, dispelling many misunderstandings and ignorance of the incident facts.

## 5 Conclusion

Under the background of all-media convergence, the “Oriental Star” sinking event has brought together the characteristics of various media, made full use of the advantages of all-media communication. And it has made full use of the communication functions of “up-to down” and “down-to-up” transmission of media to realize media integration and achieve maximum and most effective communication effect. So it is a successful case of integrating and disseminating major emergencies to ensure and guide the healthy formation, development and dissemination of public opinion. Of course, many important aspects make great contribution to the healthy influence of public opinion dissemination in this incident, such as fully cooperation among the Party and the state, the functional departments and the mainstream media, timely, high-intensity and high-frequency exposure of all kinds of information, and the continuous improvement of the media, and quality and literacy of Internet users, etc.

It is a complex systematic project to correctly guide the dissemination and development of social public opinion in a healthy and healthy direction. Especially in the era of “Internet plus” that social media is advancing rapidly, it is particularly important to establish and improve the key system, which requires such institutional arrangements, as the optimization and perfection of the system, network news release, and the strengthening of network media supervision and self-discipline. It is a serious issue for public administrators and the mainstream value how to adapt to the changes of the times, construct a new pattern of guiding work, constantly enhance the response of social public opinion, and promote the modernization of national governance system and governance capacity.

(E-mail: u.hange@yahoo.com, master.xaba@gmail.com)

**Abstract:** The stock market is influenced by a number of factors and therefore it is challenging to predict. Prior researchers have proposed predicting the stock price movement using historical price data and company related factors. This paper builds a MultiLayer Perceptron neural network model that predicts whether the stock price will rise or fall based on historical stock price data. It also uses open innovation announcement data to examine whether an open innovation model that permits companies to utilize both the internal and external resources can affect the fluctuation of the stock price. The results demonstrate that the MultiLayer Perceptron ANN is able to correctly predict stock price as either rise or fall, with an accuracy of 76.2%. Furthermore, the feature selection experimentation reveals that the opening price, closing price, open innovation announcements, and highest price are the most determinant factors of stock price.

**Key words:** Stock price movement; Artificial neural networks; Multilayer perceptron; Open innovation

### 1 Introduction

The stock market is regarded highly risky with high yield; hence investors are concerned with the analysis of the stock market. Investors and researchers have been attempting to predict stock price movement using various techniques such as fundamental analysis (Hedayati, Hedayati and Esfandyari, 2016). This technique assumes that the stock price is determined by its intrinsic value. The analysis is achieved through assessing a company's operations and the market it operates in. Prior research posits that fundamental analysis is well suited for long-term prediction. (Al-radaideh and Alnagi, 2015). Technical analysis has also been employed for stock price prediction based on historical stock prices and volume data. It is rooted on the notion that history repeats itself and that future stock price trajectory can be predicted through scrutinizing past price data. Technical analysis is well suited for short term prediction (Rosati et al., 2019; Angulo-ruiz et al., 2018).

With the advent of online trading platforms, an explosive growth of data has been observed; motivating the application of artificial intelligence (AI). AI reveals hidden but useful trends from large datasets using sophisticated algorithms such as decision trees, deep learning and Artificial Neural Networks (ANNs) (Setty, Rangaswamy and Subramanya, 2010). For instance a study developed a decision tree model using past stock prices to generate decision rules that recommend whether to buy or sell stock (Al-radaideh and Alnagi, 2015). Another research proposed a deep convolutional neural network for event-based stock market forecast (Pinheiro and Dras, 2017). These studies neglect other factors such as open innovation which might impact stock price movement.

Open innovation encourages companies to tap on both the internal and external knowledge and resources to accomplish their innovation tasks (Chesbrough, 2003). A noteworthy benefit of open innovation is reduction of risk of failure due resource pooling and risk sharing amongst collaborating companies (Napiera, 2019). This can increase investor confidence in the future earnings of a firm. Even though the financial implications of open innovation are substantial, little research exists as to how it can create value for companies and consequently affect the stock price movement.

Therefore this paper contributes an artificial neural network (ANN) model that predicts whether the stock price will rise or fall, based on open innovation data and historical stock price data. The model makes use of a Multilayer perceptron (MLP) ANN. The rationale for applying ANNs in this paper is due to their capability to detect nonlinear relationships in the input data set. This makes them suitable for stock price prediction which is complex and nonlinear in nature (Victor Devadoss and Antony Alphonse Ligor, 2016). The model is tested on a company from a developing country (Alibaba). Most studies are based on companies from developed countries, however the results from

developed countries cannot be directly applied to companies in developing countries.

## **2 Stock Market and Open Innovation**

Today, a considerable number of markets are characterized by high competition. Firms are subsequently striving to differentiate their products and services to stay ahead of competition (Bergschöld and Källgren, 2014). Innovation is increasingly becoming the greatest source of gaining competitive edge and enhancing firm value. Innovation investment is inherently risky, thus it can heighten investor uncertainty, which could result in significant stock price drops (Napiera, 2019). This has heightened the demand for less risky approaches of innovation (Brunswick and Chesbrough, 2018).

Conventionally, companies relied solely on internal research and development (R&D) capabilities, facilities, knowledge and resources, to turn inventions into innovation. This is designated as, a closed innovation model (Chesbrough, 2003). Closed innovation is fraught with staggering costs and increased risks across industries (Brunswick and Chesbrough, 2018). Thus, companies are shifting from closed innovation to open innovation.

The paradigm was coined by Chesbrough to encourage companies to search for innovation opportunities beyond their confines (Chesbrough, 2003). Open innovation allows companies to leverage its partners' resources. Partners may include research centers, universities, suppliers, customers and governmental research institutes. As a result, this may reduce the innovation time by dividing labor among partners (Chesbrough, 2003). Furthermore, when external partners are involved in the innovation, the process becomes open to external scrutiny, thus timely and quality feedback can be attained. Thus, more investors would have a positive sentiment toward the company about their future profit and invest, hence affecting the stock price. Therefore this study posits that open innovation is an important factor to consider when predicting stock price movement.

## **3 Proposed Method**

The aim of the proposed model is to predict whether the stock price is falling or rising, using open innovation data and historical stock price data. The open innovation announcements deduced from company press release headlines are used as an open innovation indicator and they are nominal (Yes or No). If there is a particular announcement regarding open innovation activities such as sourcing external knowledge or partnerships or collaboration, then the value for that record is "Yes." If there is no open innovation activity then the value is "No."

The historical stock price data which are opening, high, low and closing prices for the current day, are downloaded from Yahoo finance. The model architecture is exhibited in figure 1 below;

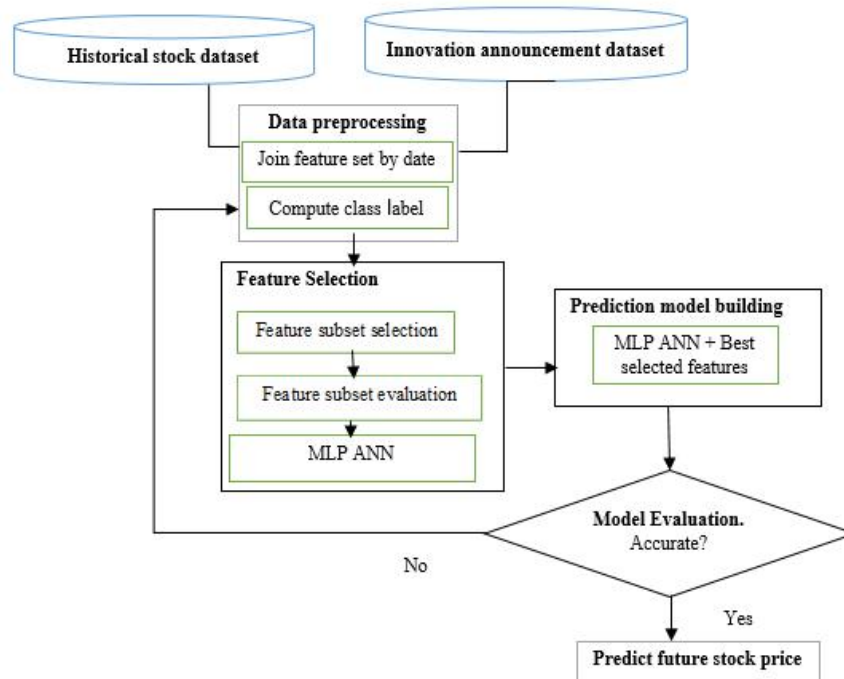

Figure 1 Proposed Model Architecture

### 3.1 Data preparation

All the data preparation is performed in Microsoft excel. The first step, is to join historical stock price and innovation announcement datasets by date. If there is a press release announcing any open innovation activity on a particular day, then the label for that day is “Yes” or otherwise “No.” The next section is to label each data instance as either rise or fall. This is computed based on the variance between the closing price of the current day and the previous day. If the closing price for the current day is higher than the closing price for the previous day, then the price label is rise, otherwise it is labeled as fall. The resulting output is used as input to the feature selection phase.

### 3.2 Feature selection

By eliminating variables that do not add any value to the accuracy of the model, the efficiency of the algorithm is enhanced (Kumar and Minz, 2014). Also feature selection chooses the most determinant variables for a particular class. This section will test whether open innovation is important for predicting stock price risk. The study applies a wrapper approach and best fit search method that use MLP ANN for subset evaluation. The advantage of the wrapper approach is that it selects an optimal subset that is most appropriate to the learning algorithm, therefore, the accuracy of the wrapper methods are normally better (Kumar and Minz, 2014). The accuracy of the wrapper method in this paper is evaluated using cross-validation.

### 3.3 Prediction model building

This section builds a model that predicts the stock price risk class based on the collected feature set. The combined dataset is split into training and testing sets, and MLP ANN is used to learn patterns from the dataset. An MLP is a feed forward ANN model that maps a set of input data in to suitable output. It comprises several layers of nodes in a directed graph, with each layer fully connected to the next one (Thota and Chandalasetty, 2013). Apart from the input nodes, every node is a processing component (neuron) with a nonlinear activation function. This ANN applies a supervised learning technique known as back propagation for building the model. Its strength lies in the ability to solve complex problems like fitness approximation. The MLP architecture is depicted in figure 2 below;

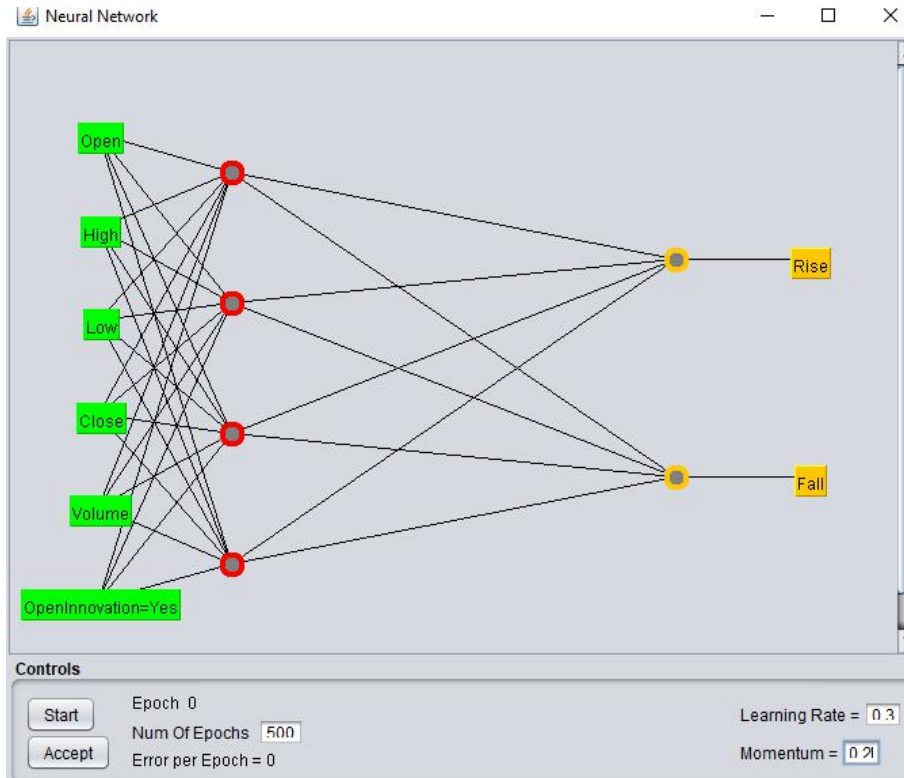

Figure 2 MLP ANN Architecture in WEKA

### 3.4 Model evaluation

An experiment is carried out for MLP ANN and percentage split validation is used to estimate performance. Out of all the instances, 80% are utilized for training and the remaining 20% make up the test set. Overall classification accuracy, is employed as an evaluation metric. It measures the overall effectiveness of the model by computing the percentage of correctly classified instances out of all the instances as shown below;

$$Accuracy = \frac{TP + TN}{TP + TN + FP + FN} * 100$$

Where TP (true positive) is the number of positive instances that were indeed correctly predicted as positive.

TN (true negative) is the number of negative instances that were correctly predicted as negative instances. FP (false positive) is the number of negative instances that were incorrectly predicted as positive and FN (false negative) is the number of positive instances that were incorrectly predicted as negative.

### 4 Experimental Results

This section describes the experimental results performed to predict the stock price movement using AI and open innovation data. The Alibaba group's stock price data from 19 September 2014 to 22 May 2019 obtained from Yahoo finance is used. The historical stock price dataset contains 1175 instances and the open innovation announcements are 86 in total. After joining the datasets, the final dataset contains 1175 instances and 7 features. A total of 940 instances are used for training the MLP ANN. Performance evaluation is done on the remaining 235 instances. The experiments is performed in the Waikato Environment for Knowledge Analysis (WEKA). The WEKA data mining workbench is an open source and free software that offers researchers a platform to conduct experiments by applying various to datasets of their choice (Hall et al., 2009). Prior to experimentation, attribute selection is performed. The rankings of the most predictive features are summarized in figure 3.

Figure 3 Feature Selection Ranking

As indicated by figure 3, the volume is least correlated to the stock price risk with a ranking of 0% and thus it is manually eliminated. After the deletion of volume feature, the accuracy of the MLP ANN remains the constant, meaning that the volume does not add any value to the effectiveness of stock price risk prediction. Similarly, the lowest price is less correlated to stock price risk prediction with a ranking of 10% and it is also deleted. However, the accuracy of the MLP ANN increases to 76.2%. This means lowest price degrades the accuracy of the stock price risk prediction. The highest price had a ranking of 20% and when it is eliminated, the model performance declines to 75.7%. Therefore highest price feature is retained. Open innovation is correlated to stock price risk with a ranking of 30%. The accuracy is the lowest (75.3%) when this feature is removed. Thus, open innovation announcements are a stock price risk factor and the feature is retained.

To this end, the final selected features for predicting stock price movement are opening price, closing price, open innovation announcements, and highest price. The results of the MLP ANN built with the selected features are shown below;

Table 1 MLP and Best Selected Features Results

Correctly classified instances	Incorrectly classified instances	Total	Accuracy (%)
179	56	235	76.1702

As illustrated in Table 1 the MLP ANN model, correctly classifies 179 out of 235 instances as either rise or fall. Thus, the overall classification accuracy of MLP ANN is 76.2%. The results demonstrate the model has a potential for practical usage in predicting stock price risk as either rise or fall. However, further improvements to the accuracy are necessary.

## 5 Conclusion

This paper presented a model based on MLP ANN, historical stock price data and open innovation announcements for predicting stock price movement. The model is developed to assist investors in their decision making process. The results indicated that the MLP ANN was able to correctly stock price as either rise or fall, with an accuracy of 76.2%. Furthermore, the feature selection experimentation also revealed that opening price, closing price, open innovation announcements, and highest price are the most determinant factors of stock price. Essentially, the results indicate the proposed approach as a promising avenue of research. However, the study is subject to some limitations. It considers Alibaba group dataset only, additional datasets need to be considered to assess the applicability of open innovation in stock price movement prediction and enhance its accuracy. The work can also be extended by examining the utility of deep learning, sentiment analysis techniques coupled with other stock price predictor variables such as corporate social responsibility.

## **Study on Shutdown Time of Enterprises under Flood Disaster Scenario: A Case of Yuyao Companies after Typhoon Fitow**

Yang Lijiao, Ding Xiaonan, Jiang Xinyu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: yanglj976@163.com, dxn0929@foxmail.com, jxy119@whut.edu.cn)

**Abstract:** With the acceleration of climate change and urbanization, flood disasters are becoming more and more frequent. The assessment of flood disaster loss has become the core content of disaster risk management research. However, the research methods of regional loss assessment, at present, mainly focus on using I-O and CGE models basing on macro input-output table. There are few methods to evaluate economic losses from bottom to top on the basis of micro-enterprises' loss data. In this paper, based on the data of production stagnation and reduction time of enterprises suffering Typhoon Fitow in 2013, using survival analysis model and considering the relationship between disaster risk and vulnerability of disaster-bearing bodies, we proposed a method for evaluating the shutdown time of effected enterprises. The results shows that: For all types of enterprises, inundation is an important risk factor leading to shutdown. Furthermore, when the inundation exceeds 0.5 meters, the average shutdown time of enterprises is extended by one week compared with those of enterprises whose inundation is less than 0.5 meters. If the inundation exceeds 1 meters, the average shutdown time of enterprises is 2 weeks longer than that of enterprises whose inundation is less than 0.5 meters. Meanwhile, we found that for different types of enterprises, there are significant differences in other factors leading to the extension of shutdown time except for the inundation. Therefore, combined with different influencing factors, this paper accurately estimates the average shutdown time of traditional manufacturing enterprises under 9 inundation scenarios and those of commercial enterprises under 3 inundation scenarios. The results of this study can provide input parameters for further establishing micro-enterprise loss model and connecting macro-regional loss model, and provide scientific basis for regional disaster prevention and mitigation management.

**Key words:** Flood disasters; Survival analysis model; Shutdown time of enterprises; Yuyao

### **1 Introduction**

Flood disasters are one of the most serious natural disasters causing economic losses worldwide. Hurricane Florence hit the East Coast of the United States in 2018, and the heavy rainfall caused severe flooding and property losses about 20 billion US dollars. According to China Eco-environment Bulletin 2017 published by Ministry of Ecological Environment of China, the direct loss of flood disasters in China amounted to 214.3 billion yuan. With the increase of extreme rainfall frequency caused by global climate change and the agglomeration of population and enterprises to cities, the risk of flood disaster increases(IPCC, 2014). As the core content of disaster risk management, disaster loss assessment is becoming more and more important.

At present, the researches of flood disaster loss assessment is mostly based on macro-perspective, which regards the loss of industrial sectors in the whole region. Among them, I-O and CGE loss

assessment models are taken as examples, scholars have carried out a lot of related researches (Hallegatte S, 2008; Xie wei, 2012; Zhang Peng, 2012; Wang G., 2015; Jiang Ling, 2016). These two models can be used to assess the loss for the impact of multi-region and multi-stakeholders (including government, enterprises and residents). However, they also have some shortcomings: The classical I-O model is considered to be over-estimated or pessimistic because of the linear substitution of capital and labor and the instantaneity of industrial loss rate setting (Hallegatte S, 2014; Okuyama Y, 2013). CGE model compensates for the weakness of linear substitution through non-linear function, but recent empirical studies have found that CGE model also has some weaknesses. CGE is also considered as underestimation or optimism model, because, in the short term after the disaster, the fluctuation of product price is difficult to grasp and the price of long-term products is relatively stable (Mackenzie C A, 2012). Therefore, the accuracy of the current macro-perspective model for assessing the economic losses needs to be further studied.

Aiming at the lack of loss estimation model at micro level and the problem that the accuracy of loss ripple effect evaluation model at macro level needs to be improved, this paper evaluates the actual shutdown time of micro-enterprises by investigating different types of enterprises. Meanwhile, this paper sorts out the current literature of disaster-stricken enterprises' loss. In earlier studies, Yu Qingdong (Yu Qingdong, 1998) simplifies assessment model of enterprise shutdown losses, and Mao Chunmei (Mao Chunmei, 1998) estimates the loss of shutdown through various expenses and additional expenditures incurred after the disaster. In latest research, Huang Min (Huang Min, 2015), to establish a production cut-off loss model for industrial enterprises, combines with the earthquake damage situation and production cycle theory, considering the disaster loss coefficient and production cut-off time synthetically. However, these previous studies do not examine the relationship between disaster risk and vulnerability, and were difficult to use for rapid assessment of post-disaster losses. Although the latest research involves the issue of shutdown time, the localization process of the model has not been completed due to the lack of local enterprise loss data in flood disaster scenarios.

Therefore, taking Yuyao disaster-stricken enterprises in Zhejiang Province as an example, which was attacked by typhoon "Fitow" in 2013, using survival analysis model and considering the relationship between disaster risk and vulnerability, this paper explores the key factors leading to the extension of enterprise shutdown, and estimates the shutdown time, which can provide input parameters for further establishing micro-enterprise loss model and connecting macro-regional loss model. Meanwhile, this paper can provide policy recommendations to guide the rapid recovery of enterprises after disasters, and comprehensively enhance the ability of disaster prevention and mitigation in the region, which has strong practical significance.

## 2 Methodology

Survival analysis, also known as risk model, is a statistical analysis method to study the relationship between survival phenomena and response time data. This method has been applied in biology, medicine, insurance, sociology and economics (Guan Chentao, 2017; Wu Bing, 2007; Chen Jinghao, 2016).

In this paper, the shutdown process of disaster-stricken enterprises can be understood as a survival event in essence. Stoppage time can be regarded as survival time, and the end event is the end of "stop state". In previous studies, Yang L J (Yang L J, 2016) and others initially used this method to estimate the stagnation of various disaster-stricken enterprises during the 2000 Nagoya rainstorm disaster in Japan. However, there is still a lack of research on disaster recovery factors and disaster time estimation of small and medium-sized enterprises in China under flood disaster scenarios.

## 2.1 Basic principles of survival analysis

Survival analysis includes the following four key functions: cumulative probability density function, probability density function, survival function and risk function.  $T$  represents the stochastic variables of shutdown time of disaster-stricken enterprises, the functions are defined as formula (David G. Kleinbaum, 2011):

$$F(t) = P(T \leq t) = \int_0^t f(x) dx \quad (1)$$

$$f(t) = \frac{dF(t)}{dt} = F'(t) \quad (2)$$

$$S(t) = P(T > t) = 1 - F(t) = \int_t^{\infty} f(x) dx \quad (3)$$

## 2.2 Construction of survival analysis model

Based on the above four key functions, the survival time model can be established by descriptive method, non-parametric method (K-M), semi-parametric method (Cox) and parametric method. At present, Cox model is the main method to study the influencing factors of survival duration. However, the basic assumption of this model is that different individuals have a constant proportion of mortality risk at any time. This hypothesis has some limitations for the study of different types of enterprises' shutdown time. Therefore, in order to accurately reflect the actual situation of shutdown time of various disaster-stricken enterprises, and make the research results more practical, this paper chooses the parameter method.

In order to facilitate readers to understand the whole process of building the model, this paper takes Weibull model as an example:

Weibull probability density function is as follows:

$$f(t) = k\lambda^{-k} t^{k-1} \exp(-\lambda^{-k} t^k) \quad (4)$$

The scale parameters  $\lambda$  and shape parameters  $k$  are all constants greater than 0. The survival function  $S(t)$  is as follows:

$$S(t) = P(T > t) = 1 - F(t) = \exp(-\lambda^{-k} t^k) \quad (5)$$

Introducing statistically important influencing factors,  $\ln(\lambda^{-k}) = x^T \beta$ , a Weibull model with multi-factors is constructed as follows:

$$S(t, x) = \exp[-t^k \exp(x^T \beta)] \quad (6)$$

The parameters  $k, \beta$  can be estimated by maximum likelihood estimation.

$$L = \prod_{i=1}^n [S(t_i)]^{1-\delta_i} [f(t_i)]^{\delta_i} \quad (7)$$

Where  $i$  and  $n$  respectively represent the number of the first sample and the total number of individual samples,  $\delta_i = 0$  indicates the sample lifetime is censored data, otherwise,  $\delta_i = 1$  indicates the

sample lifetime is non-censored data. The formula is further transformed into logarithmic likelihood function:

$$\begin{aligned} \text{Log}(L) &= \sum_{i=1}^n [\delta_i \log h(t_i, x_i) + \log S(t_i, x_i)] \\ &= \sum_{i=1}^n [\delta_i \{x^T \beta + \log k + (1-k) \log(t_i)\} - t_i^k \exp(x^T \beta)] \end{aligned} \quad (8)$$

### 3 Data

#### 3.1 Survey of research areas

On 7 October 2013, typhoon Fitow (201323) landed at Shacheng Town at the junction of Zhejiang and Fujian at 1:15 a.m. Affected by the heavy rainstorm caused by Typhoon Fitow, Yuyao suffered a once-in-a-century flood, with a maximum rainfall of 499.9 mm. More than 70% of the urban area was flooded, with water depth of more than 1.5 meters in many places. Water generally accumulated for more than 3 days, and in some areas for more than 10 days. According to the statistics of Government Work Report 2014 of Yuyao City, there are more than 20,000 enterprises that have been affected or shut down, and the direct economic loss of Yuyao City is 22.77 billion yuan.

#### 3.2 Research data

According to the national economic industry classification standards, the study divides the sample data of 211 disaster-stricken enterprises into 13 categories of manufacturing and 3 categories of commercial industries. Considering the analyzability of the sample, the sample of Yuyao research enterprises is further divided into two categories: 159 traditional manufacturing enterprises and 62 commercial enterprises. The traditional manufacturing industries include textile and apparel industry, culture and education industry, rubber and plastic products industry, non-metallic mineral manufacturing industry, metal products industry, general equipment manufacturing industry, special equipment manufacturing industry, automobile manufacturing industry, electrical machinery and equipment manufacturing industry, instrument manufacturing industry, paper and paper products industry, other manufacturing industries, printing and recording media reproduction industry; Commercial enterprises include resident services, accommodation and catering, and wholesale and retail businesses ( Figure 1).

Figure 1 The Industry Distribution of Questionnaire Samples

## 4 Results and Analysis

### 4.1 Model selection

The lifetime distribution functions involved in the parametric method include Weibull distribution, exponential distribution, lognormal distribution, normal distribution. Based on the data distribution characteristics of shutdown time of different types of disaster-stricken enterprises in Yuyao City, this paper calculates the goodness-of-fit value (Table 1).

Table 1 Goodness of Fit for Each Distribution

Distribution	AIC		BIC		D	
	TE	CE	TE	CE	TE	CE
Weibull	1037.02	384.70	1043.04	388.86	0.1189	0.1508
exponential	1056.66	393.79	1059.67	395.86	0.1229	0.1264
lognormal	1195.42	376.97	1195.42	381.12	0.2109	0.1012
normal	1097.17	425.89	1103.19	430.05	0.1935	0.2303

Compared with other distribution functions, Weibull function fits well the distribution of shutdown

time for traditional manufacturing enterprises. Specifically, the AIC and BIC values of the data fitted by Weibull function are the smallest, that is, the complexity of the function model is the smallest, and the D value is the smallest, that is, the maximum vertical difference between the observed values and the fitted values of all sample points is the smallest. For commercial enterprises, lognormal function can better fit the shutdown time of enterprises.

#### 4.2 Explanatory variable selection

In this paper, shutdown time are taken as dependent variables. By screening explanatory variables, an estimation model is built to predict the shutdown time of disaster-stricken enterprises. Different from the traditional non-probabilistic regression model, this paper adopts survival analysis regression model, which can not only explore the main factors affecting the shutdown and recovery of enterprises, but also show the characteristics of shutdown time of different types of enterprises. Based on the existing researches at home and abroad, this paper finds that many scholars regard submergence depth, number of workers, loss rate of fixed assets, loss rate of inventory and decline rate of production capacity as important factors affecting the shutdown time of enterprises (Shi Yong, 2015; Zhang Y, 2009; Koks E E, 2015; Kajitani Y, 2014).

#### 4.3 Parameter estimation of the model

Based on the selection of model and explanatory variables, Weibull parameter model of traditional manufacturing enterprises affected by disasters and lognormal parameter model of commercial enterprises affected by disasters are used for shutdown time model, and the estimated parameters are as follows (Table 2):

**Table 2 Estimation Results of Parameters of Enterprise Shutdown Time Model**

(a) Traditional Manufacturing (Weibull)				
Variables	Parameters	Standard error	Z	p
(Intercept)	2.06527	0.08975	23.01	<2e-16
inundation	0.00431	0.00163	2.64	0.0083
equipment	0.00932	0.00310	3.01	0.0026
inventory	0.00461	0.00261	1.76	0.0777
Log(1/k)	-0.57725	0.06840	-8.44	<2e-16
Chisq	47.36 ( DF=3, P=2.9e-10 )			
(b) Commercial Enterprises (lognormal)				
Variables	Parameters	Standard error	Z	p
(Intercept)	1.83743	0.11372	16.16	<2e-16
inundation	0.00687	0.00214	3.21	0.0013
Log(scale)	-0.41476	0.09206	-4.51	6.6e-06
Chisq	9.49 ( DF=1, P=0.0021 )			

According to the estimated parameters, the probability distribution maps of shutdown time of disaster-stricken enterprises under different disaster levels are drawn, and the shutdown time is predicted. Take the shutdown time of traditional manufacturing industry as an example: Fig.2 shows the probability distribution of shutdown time of traditional manufacturing enterprises in Yuyao City under three different disaster levels. The black curve shows the probability distribution of shutdown time when inundation depth is 0-0.5 meters and fixed assets and inventory are slightly lost; the blue curve shows the distribution of shutdown time when inundation depth is 0.51-1 meters and fixed assets and inventory are slightly lost; the red curve shows the shutdown time when inundation depth is 1.1-2 meters and fixed assets and inventory are slightly lost. It also can be concluded that the average shutdown time of manufacturing enterprises under three disaster levels is 11, 17 and 23 days respectively. Similarly, it can be predicted that the shutdown time of Yuyao commercial enterprises under different flooding depths is 7, 13 and 16 days respectively. Therefore, when the enterprise is aware of its disaster situation (such as inundation depth), it can estimate the possible shutdown time of the enterprise, so as to rationally arrange the business strategy during the shutdown period.

**Figure 2 Distribution of Shutdown Time for Traditional Manufacturing**

Finally, a multi-variable shutdown time model are established to predict the possible shutdown time of traditional manufacturing enterprises and commercial enterprises under various submergence scenarios (as shown in Tables 3 and 4). The average shutdown time of traditional manufacturing enterprises under 9 different scenarios are predicted with different submergence depths and different composite scenarios of fixed assets and inventory losses. The average recovery time under the compound scenarios of shutdown time, different productivity decline rate and inventory loss; the average shutdown time under three different submergence scenarios and the recovery time under three different inventory loss scenarios for commercial enterprises.

**Table 3 Prediction Results of Traditional Manufacturing under Various Submergence Scenarios**

equipment & inventory	Shutdown Time(days)								
	L&L	L&M	M&L	M&M	L&S	S&L	M&S	S&M	S&S
inundation									
0-50cm	11	12	14	15	14	16	17	21	24
51-100cm	17	15	17	21	16	20	22	26	29
101-200cm	23	24	21	28	25	26	29	31	36

**Table 4 Prediction Results of Commercial Enterprises under Various Submergence Scenarios**

inundation	Shutdown Time(days)
0-50cm	7
51-100cm	13
101-200cm	16

## 5 Conclusion

Based on the survival analysis parameter model and the historical disaster data of local enterprises, this paper studies the shutdown time of disaster-stricken enterprises under flood disaster scenarios. The paper provides the basis for enterprises to formulate emergency response for flood disasters. At the same time, using this model to estimate the shutdown time of different types of enterprises under different submergence scenarios will help to accurately assess the indirect economic losses of affected enterprises. Meanwhile, the research methods and results can provide reference for studying the losses of disaster-stricken enterprises in other flood-affected areas. This study finds that:

For all enterprises in Yuyao City, the inundation depth is an important risk factor leading to the shutdown of the disaster-stricken enterprises. As far as traditional manufacturing industry is concerned, when the inundation exceeds 0.5 meters, the average shutdown time of enterprises is prolonged by one week compared with that of enterprises with inundation less than 0.5 meters; when the inundation exceeds 1 meter, the average shutdown time of enterprises is prolonged by two weeks compared with enterprises with inundation less than 0.5 meters, the same is true for commercial enterprises. Therefore, enterprises should choose higher location. Meanwhile, enterprises and governments need to strengthen the infrastructure construction of surrounding drainage systems, and formulate detailed flood control engineering measures plan.

For different types of enterprises, there are great differences in other influencing factors except inundation, which lead to prolonged shutdown time. Compared with commercial enterprises, the shutdown time of traditional manufacturing enterprises is mainly affected by the loss of fixed assets and inventory. For example, when the inundation depth of enterprises is not more than 0.5 meters, the

shutdown time of enterprises with moderate loss of fixed assets and inventory is prolonged by 1 week, while that of enterprises with severe loss is prolonged by 2-3 weeks on average.

The shutdown time of different types of enterprises can be accurately exported under various inundation scenarios, including the average shutdown time of traditional manufacturing enterprises in Yuyao City in 9 inundation scenarios and commercial enterprises in 3 inundation scenarios. The final shutdown time calculation results can provide input parameters for further establishing micro-enterprise loss model and connecting macro-regional loss model, and improve the accuracy of loss assessment.

## Study on the Credit Customer Default of Local Commercial Bank in Southern Jiangsu Province Based on Logistic Model

Zhang Haoru, Fang Ming

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: vk110e5.7@gmail.com, fxlasting@aliyun.com)

**Abstract:** With the deepening of financial innovation and sharp changes in the external market environment, the increasing international banking risk shows a complex and diversified characteristics. In this study, a Logistic Model is used to calculate the current probability of non-retail credit customer default of local commercial banks in southern Jiangsu Province. In addition, an analysis and a suggestion of a more timely, dynamic, accurate credit rating system are given according to the default probability results. This study also has significant reference for other local commercial banks to build strategic alliance for building their internal credit rating system.

**Key words:** Commercial bank; Credit customer; Probability of default; Logistic model

### 1 Introduction

With the deepening of financial innovation and the rapid changes in the external market environment, the risks faced by the international banking industry are complicated and diversified. However, the World Bank has studied the global banking crisis and found that one of the important reasons for the liquidity crisis caused by the decline of asset quality of banks is credit risk. Credit risk has become an important cause of bank failures and even regional and global financial crises.

After the financial crisis came up in 2008, the Basel III was introduced in 2010. With several twists and turns, it finally released its latest regulations on January 2013. The new agreement calls for commercial Banks to use the internal rating method to evaluate customers' credit status (Arun C. et al., 2017). In order to distinguish different types of credit risk, the Basel committee classified the risk into sovereign risk, bank risk, corporate risk, retail risk, project financing risk and equity risk according to different risk exposures. The internal rating method (IRB) includes the primary method and the advanced method. It refers to the method to determine the risk-weighted assets of an asset business based on risk parameters such as default probability (PD), default loss rate (LGD), default risk exposure (EAD) and maturity (M). The new capital agreements also points out that commercial banks must carry out comprehensive reform in order to meet the basic conditions of internal rating system.

In terms of research on credit rating, a scholar summarized that credit rating and loan to small customer appear to be inefficiency, thus more attention should be paid to small and medium-sized financial industry (Leonard et al., 2018). However, the credit rating process could even be related to irrational decision (Gibson et al., 2014).

However, as far as the domestic situation is concerned, large state-owned commercial banks like ICBC and joint-stock commercial banks like CMB have successively carried out the construction of internal rating system and achieved a certain degree, but the implementation of new capital agreement

of local commercial bank is just at the initial stage. Without the huge resource owed by the large state-owned commercial bank and the joint-stock commercial bank, local commercial banks tend to build a smaller and easier internal rating system, or outsource that to an agency. And it is not rarely to find that local commercial bank share their ratings information with their peer. While a more rating industry competition leads to stronger corporate misreporting incentives, it is important to strengthen the internal rating system (Lee K. et al., 2019). In addition, some empirical evidences show regional bias in credit rating agencies (Talha A.Y. et al., 2018).

In terms of research on credit rating index system, the main point of credit rating index system is to clarify the credit elements, which methods are mainly 3C, 5C, 3F, 5P in the world (Xiang Lishuang et al., 2019).

Afterwards, Logistic Regression, Neural Network and Factor Analysis Models were introduced into the credit rating, which made up for the shortcomings of traditional methods like lack of objectivity and comprehensive analysis. Traditional Logistic Model and Probit Model are widely used due to their strong ability of identification, prediction, promotion and good comprehensibility (He Guanghui et al., 2017). For the first time, dynamic information was integrated into the rating model to make up for the deficiency of existing studies that pay less attention to the change trend of evaluation value, which is more consistent with the variability characteristics of enterprises (Zhang F. et al., 2016). Thus, the comprehensiveness and reliability of evaluation conclusions are improved.

## 2 Sample

The internal credit rating method of bank credit customers is a process of gradual evolution and continuous improvement, especially since the 1950s. With the development of credit risk analysis technology, more and more quantitative techniques have been gradually applied to the internal credit rating of commercial bank. After several the financial crises outbreak, with the modern computer technology development, the banking industry pays more and more attention to the quantitative analysis of risk.

The credit rating system is an important role for commercial banks to evaluate credit and reflect the solvency and willingness of bank loan customers. The relative measurement of these factors in credit management system is mainly the market competitiveness of customers, the solvency of assets and the organizational management level of customers. China's commercial banks are divided their own credit customers into different credit grades with their evaluation system, which includes Five Grades System, Nine Grades System and Seven Grade System.

Although there are some differences in the setting of credit rating index system of China's commercial banks, the content of their evaluation indexes is almost the same. The customer sample used in this study is generally composed of four categories of indicators, including the organization's financial performance, capital operation, solvency and development prospect. Basic, revision and evaluation are the three levels of rating indicators. These three levels of rating indicators are mutually calibrated to form credit rating results. The final customer score is divided into the following credit ratings: 80 or higher to AAA; 80-70 to AA; 70-60 to A; 50-60 to BBB; 40-50 to BB; 30-40 to B; all scores below 30 are in level C.

The data source of this study is the data of credit customers of several commercial banks in southern Jiangsu Province. All these commercial banks have explored ways to implement new capital agreements for their developments. It is also the precedent that China's local commercial banks start to

implement the Basel III. In order to scientifically and reasonably construct the credit customer default probability model of commercial financial banks, the data selection scope is the total number of corporate loan customers occurred and recorded in these commercial banks in southern Jiangsu Province, namely the sample population selected by the model. The sample is divided into 9 categories according to the main industry which the customer operates, which includes steel trade, construction, Class C production, Class B non-textile production, Class B textile industry, Class A non-textile production, Class A textile industry, non-steel wholesale and retail and service industry. This paper analyzes the rating distribution of 69632 automatic ratings and effective ratings of non-retail credit customers as of June 30, 2015, as shown in the following figure.

Figure 1 Customer Credit Rating Sample Distribution

### 3 Model

The core of the modeling method is to establish a model to measure risk factors. The most critical indicators of risk factors are default probability (PD) and default loss rate (LGD). The default probability refers to the possibility that the borrower cannot repay the loan principal and interest or fulfill the obligation in a certain period in the future. The default loss rate refers to the percentage of the amount of losses caused to the creditor by the borrower in the risk exposure (creditor's rights) once the borrower defaults, namely the severity of the losses. The current calculation model for PD mainly is Logistic Model, which suits to the cases where the dependent variable is a classification variable (Yue Linlin, 2015).

The default probability model used in this paper is Logistic model. This is because the Logistic function is simpler and clearer than the cumulative normal distribution and has abundant economic implications, as the formula shown below:

$$P(y_i = 1 | x_i) = P[\varepsilon_i \leq (\alpha + \beta x_i)] = \frac{1}{1 + \exp(-\varepsilon_i)}$$

The advantage of Logistic Model is that it can give us a probability between 0 and 1 and there is an inflection point in the curve, which means the value of the function increases slowly at first, then accelerates, and then decelerates and increases. This phenomenon is very consistent with the economic

meaning and business intuition, such as the impact of income on purchasing behavior. The Logistic Model is also logarithmically linear in nature, with many linear properties and it can introduce multiple factors in regression form.

After referring to reference and analyzed the complicated index rating system, nine indicators with high coefficients are selected to cover the three aspects of debt paying ability, profitability and operation ability, which include leverage, ROA, operating profit, ratio of total liabilities to deposit-income, EBITDA, sales revenue, capital accumulation, total asset turnover, long-term asset suitability(Gibson H.D. et al., 2014)(Antonella M., 2019). Due to the space and confidentiality factor, it is not possible to elaborate.

The final Logistic Model form is shown below:

$$P(y = 1|\chi) = \rho = \frac{\exp(\alpha + \beta_1\chi_1 + \beta_2\chi_2 + \beta_3\chi_3 + \dots)}{1 + \exp(\alpha + \beta_1\chi_1 + \beta_2\chi_2 + \beta_3\chi_3 + \dots)}$$

#### 4 Empirical Results

In this paper, the Logistic default probability model was used to analyze the default probability of all sample as of June 30, 2015, and the descriptive figure of PD of effective rating are presented in the form of graph as shown below.

Figure 2 Effective Ratings PD Descriptive Figure

It is not difficult to figure out from the figure above that the average default rate of non-retail credit customers of several commercial banks in southern Jiangsu Province is about 1.7%. At the same time, with the gradual decrease of credit rating of non-retail credit customers, the default rate also shows a trend of gradual increase in turn, and the standard deviation of default rate is also increasingly large. That means a greater fluctuation range of default probability, which basically conforms to the basic law of default of non-retail credit customers in China.

From the above nine sectors, it is also not hard to find that the average default rate of non-retail

credit customers of several commercial banks in southern Jiangsu Province is different, which is determined by the development prospect of different industries and the quality of customer base. In general, the lower the average default rate, the higher the quality of non-retail credit customers in the industry. The detailed empirical results are shown below:

**Table 1 Nine Industry Average PD(%) Calculated Based on Logistic Model**

Class	Class A Textile Industry	Class B Textile Industry	Class A			Steel Trade	Non-steel Wholesale & Retail	Service	Constru ction
			Non- textile Product ion	Class B Non-textile Production	Class C Product ion				
AAA	0.454	0.421	0.366	0.332	0.432	0.891	0.966	0.199	0.991
AA	0.779	0.679	0.568	0.634	0.424	1.482	0.873	0.700	1.472

## 5 Conclusion

Credit rating is the basis of risk measurement. Without credit rating, there is no real risk management. Therefore, the research on the theory and method of credit risk rating is of great practical significance to the development of China's commercial banks, especially the development of risk management system. Based on the new requirements of the new capital agreement on the internal credit rating system, this study conducts an empirical study on the internal credit rating of the credit customers of several commercial banks in southern Jiangsu Province.

In line with the requirements of the new capital agreement, this paper analyzes and redesigns the internal credit customers rating system, and puts forward the idea of constructing default probability model by using Logistic Model. The Logistic Model involved in this paper is mainly aimed at calculating non-retail credit customers' default probability, and analyze the calculation results. The results show that the number of customers in 9 industries is close to the normal distribution, and the average default rate of steel trade industry is the highest, 2.164%. The service sector had the lowest average default rate, 1.537%.

A more timely, dynamic and accurate credit rating system is necessary for the current mechanism, therefore some suggestions are given according to the study. First of all, commercial bank should pay attention to the training, discovery and reserve of rating personnel, constantly optimize the structure of professional personnel, improve the business skills of relevant staff, and use a variety of measures to ensure its stability. Secondly, strengthening the professional training of credit staff, especially credit and

credit approval personnel, and improving their professional ability are conducive to improving the overall risk control ability of commercial banks and effectively identifying and resolving risks in core businesses. Finally, appropriate incentives and collaboration with professional institutions are also necessary to local commercial banks' rating system.

With the improvement of China's financial market, local commercial banks need to further design LGD models in the future, so as to better enter the stage of advanced internal rating law. In addition, only general corporate exposures are selected for the division of risk exposure in this paper, but other corporate exposures such as public institutions, professional loans and other financial institution exposure models are not analyzed, which needs to be further improved in future studies.

## Research on Innovation Performance of High-Tech Enterprises from the Perspective of Venture Capital

Ye Xiaofen, Cheng Liang

School of Economics and Management, Wuchang Shouyi University, Wuhan, China, 430064

(E-mail: yexf1983@163.com, 1932773177@qq.com)

**Abstract:** High-tech enterprises are the main force of technological innovation. Introducing venture capital is the key measure to improve its innovation ability. Starting from the relationship between venture capital and high-tech enterprises, this paper analyses the influence of venture capital participation, venture capital share ratio, venture capital with state background on innovation performance of high-tech enterprises, then selects the high-tech enterprise data listed on GEM, and uses the regression analysis method for empirical research. The research results show that improving the innovation performance of high-tech enterprises is related to the participation of venture capital. Then, through further testing of the data, it is concluded that the characteristics of venture capital are also the key factors to improve the innovation performance of high-tech enterprises. Finally, according to the results of empirical analysis, this paper puts forward corresponding suggestions from three perspectives: government, venture capital institutions and enterprises.

**Key words:** Venture capital; High-Tech enterprises; Innovation performance; Regression analysis

### 1 Introduction

China has always advocated that science and technology is the first productive force. On October 18, 2017, the 19th National Congress of the Communist Party put forward that innovation is the first driving force to lead the development of science and technology. As an important force of technological innovation, high-tech enterprises have created 65% of invention patents and 80% of new products in China. However, high-tech enterprises have always been facing difficulties in financing because of their uncertain market prospects, high risks and large demand for financing. Because of their natural conservatism, the traditional financing channels and methods can't meet the demand for finance of high-tech enterprises. The emergence of venture capital has become a catalyst for promoting technological innovation in high-tech enterprises. In recent years, theorists have also paid much attention to the research of high-tech enterprises and venture capital. Some research results show that venture capital can help the growth of high-tech enterprises (Hassan, 2007; Pender, 2010; Gou Yannan, 2014), especially the increase of R&D investment (Zhang Pengkai, 2015; Hou Sihui, 2016; Ning Yuxin, 2017). Although the practice and the theory agree that venture capital has a positive effect on the technological innovation of high-tech enterprises, the effect is still lacking demonstration. This paper will select profitability index and technological innovation ability index to conduct exploratory research on venture capital and high-tech enterprises from the perspective of innovation performance.

## **2 Research Model Construction**

### **2.1 Research hypothesis**

Firstly, this paper studies the impact of venture capital participation on innovation performance of high-tech enterprises, and then on the basis of venture capital, further studies the impact of the Share-holding ratio and the state-owned background of venture capital on innovation performance of high-tech enterprises.

In the early stage of high-tech enterprises, it is difficult to obtain capital investment from traditional channels. The participation of venture capital exactly solves the financing difficulties of high-tech enterprises, and makes a significant positive impact on enterprise innovation performance (Hua Yong, 2018; Zou Shuang, 2017). At the same time, venture capital also brings advanced management experience to high-tech enterprises and helps them transform innovative achievements into market products. Thus, the first hypothesis of this paper is put forward.

H1: Venture capital participation has a positive and significant impact on the innovation performance of high-tech enterprises.

The control right of venture capital to high-tech enterprises is mainly determined by the proportion of equity held by venture capital, which is positively correlated. That is to say, the technological innovation ability of enterprises changes with the change of Share-holding ratio of venture capital. Another research shows that venture capital with large share-holding ratio is more conducive to technological innovation input and output of enterprises (Li Jiujin, 2018). Thus, the second hypothesis of this paper is put forward.

H2: The shareholding ratio of venture capital has a positive and significant impact on the innovation performance of high-tech enterprises.

Venture capital institutions with state-owned background have rich experience in investment management. They have a mature service system, which can not only provide more perfect services, but also help enterprises improve their innovation level (Wu Tao, 2017). Thus, the third hypothesis of this paper is put forward.

H3: State-owned venture capital has a positive and significant impact on the innovation performance of high-tech enterprises.

### **2.2 Sample selection and data source**

As part of the capital market, the GEM market is dedicated to promoting technological innovation in small and medium-sized high-tech enterprises. The accuracy, transparency and asset structure of its data are relatively good. Therefore, this paper selected 210 high-tech enterprises listed on GEM from 2015 to 2017 as research samples, of which 86 listed companies have venture capital background, accounting for 42.38%. The venture capital data comes from the company's prospectus, and the patent data is obtained from the website of the national patent search and analysis. The other data are from the Guotai'an database and the Shenzhen Stock Exchange.

## 2.3 Variables designing

### 2.3.1 Dependent variables

This paper measures the innovation performance of high-tech enterprises through profitability and technological innovation ability. The profitability is measured by the return on net assets; the technological innovation capability is measured by the investment in R&D and the number of patents. So, the return on net assets, R&D investment and the number of patents are taken as the dependent variables of this empirical study.

### 2.3.2 Independent variables

In order to measure the impact of venture capital on innovation performance of high-tech enterprises, this paper chooses venture capital, shareholding ratio of venture capital, state-owned venture capital as independent variables to investigate.

### 2.3.3 Control variables

Innovation performance of high-tech enterprises will be affected and constrained by other factors, such as enterprise size, establishment years, industries, regions, government subsidies and so on. These factors constitute the control variables of this study.

The design of dependent variables, independent variables and control variables is shown in Table 1.

**Table 1 Variables Description Table**

Variable Type	Variable Name	Variable Symbol	Variable Description
Dependent Variables	profitability	ROE	return on net assets
	technological innovation output	P	number of patents
	technological innovation investment	R&D	R&D investment amount, logarithmic
Independent Variables	venture capital	VC	venture capital, remember 1, not 0
	shareholding ratio of VC	VC share	the proportion of venture capital
	state-owned venture capital	VC background	state-owned, remember 1, not 0
Control Variables	years of establishment	Age	between the date of establishment and listing
	enterprise size	Size	total assets, logarithmic
	area	Area	eastern, central and western regions
	government grants	Gov	total amount, logarithmic
	industry	Industry	industry 1, information technology 2, others 0.

## 2.4 Modeling

In order to test the impact of venture capital participation on innovation performance of high-tech enterprises, this paper constructs the following models:

$$H1-1: ROE = \beta_0 + \beta_1 \times VC + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (1)$$

$$H1-2: R\&D = \beta_0 + \beta_1 \times VC + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (2)$$

$$H1-3: P = \beta_0 + \beta_1 \times VC + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (3)$$

In order to test the impact of different shareholding ratios of venture capital on the innovation performance of high-tech enterprises, the following regression models are constructed:

$$H2-1: ROE = \beta_0 + \beta_1 \times VCshare + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (4)$$

$$H2-2: R\&D = \beta_0 + \beta_1 \times VCshare + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (5)$$

H2-3:

$$P = \beta_0 + \beta_1 \times VCshare + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (6)$$

In order to test the impact of different backgrounds of venture capital on innovation performance of high-tech enterprises, this paper constructs the following regression models:

$$H3-1: ROE = \beta_0 + \beta_1 \times VCbackground + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (7)$$

$$H3-2: R\&D = \beta_0 + \beta_1 \times VCbackground + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (8)$$

$$H3-3: P = \beta_0 + \beta_1 \times VCbackground + \beta_2 \times Industry + \beta_3 \times Area + \beta_4 \times Age + \beta_5 \times Size + \beta_6 \times Gov \quad (9)$$

## 3 Empirical Analysis

### 3.1 The impact of venture capital on the profitability of high-tech enterprises

The regression analysis results of the impact of venture capital on the profitability of high-tech enterprises are shown in Table 2. From Table 2, we knew that the significance of venture capital participation for corporate profitability is 0.445, and there is a high degree of independence among the variables, because the VIF value is 1.571. Therefore, the participation of venture capital has a positive and significant impact on the profitability of enterprises. The significant difference of venture capital with different shareholding ratios is 0.896, while the VIF value of variance expansion factor is 1.38, which shows that the shareholding ratio of venture capital has a significant impact on the profitability of enterprises. The significance of venture capital in different backgrounds to the profitability of enterprises is 0.218, and the VIF value is 1.153. Therefore, it shows that the improvement of

profitability of enterprises is also positively related to venture capital with state-owned background.

**Table 2 Analysis of the Impact of Venture Capital on Profitability**

Model	Un-standardized	Standardized	T	Sig.	Collinear Statistics	
	Coefficients	Coefficients			Tolerance	VIF
	Std. Error	Beta				
(constant)	.173		-2.031	.044		
VC	.012	-.065	-.765	.445	.637	1.571
VC share	.001	-.013	-.165	.869	.725	1.380
VC background	.019	-.090	-1.235	.218	.867	1.153
Industry	.010	-.012	-.169	.866	.927	1.079
Area	.011	.082	1.178	.240	.953	1.049
Age	.001	-.082	-1.169	.244	.925	1.081
Size	.021	.159	2.075	.039	.781	1.280
Gov	.012	.131	1.687	.093	.762	1.313

a. Dependent variable: ROE

### 3.2 The impact of venture capital on R&D investment of high-tech enterprises

The regression analysis results of the impact of venture capital on R&D Investment of high-tech enterprises are shown in Table 3. The significance of venture capital participation in R&D investment for technological innovation is 0.905, which shows that the participation of venture capital has a positive and significant impact on R&D investment of technological innovation. The significant effect of venture capital with different share-holding ratio on R&D investment of technological innovation is 0.822. This shows that the higher the proportion of equity held by venture capital, the more financial support it will get in R&D. Enterprises will be more focused on technological innovation, and they will invest more in R&D. The significant effect of state-owned venture capital on R&D investment of technological innovation is 0.473, which shows that improving the level of technological innovation investment of enterprises is related to state-owned venture capital.

**Table 3 Analysis of the Impact of Venture Capital on R&D Investment**

Model	Un-standardized Coefficients		Standardized Coefficients	T	Sig.	Collinear Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(constant)	-.977	.595		-1.641	.102		
VC	-.005	.041	-.007	-.120	.905	.637	1.571
VC share	-.001	.004	-.012	-.225	.822	.725	1.380
VC background	-.048	.067	-.036	-.719	.473	.867	1.153
Industry	.293	.034	.416	8.523	.000	.927	1.079
Area	.054	.038	.068	1.412	.159	.953	1.049
Age	-.002	.004	-.031	-.637	.525	.925	1.081
Size	.784	.072	.577	10.848	.000	.781	1.280
Gov	.151	.042	.196	3.643	.000	.762	1.313

a. Dependent variable: R&D

### 3.3 The impact of venture capital on patents of high-tech enterprises

The regression analysis results of the impact of venture capital on patents of high-tech enterprises are shown in Table 4. According to Table 4, the significance of venture capital participation to the patents is 0.042. The participation of venture capital has a positive impact on the technological innovation output, that is, venture capital is conducive to the improvement of the output level of technological innovation. The significance of venture capital with different shareholding ratios to the patents is 0.337. The venture capital with large shareholding ratio will increase the enterprise innovation achievements output. The significance of venture capital in different backgrounds to the patents is 0.408. State-owned venture capital is more conducive to improving the technological innovation output of enterprises.

**Table 4 Analysis of the Impact of Venture Capital on Patents**

Model	Un-standardized Coefficients		Standardized Coefficients	T	Sig.	Collinear Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(constant)	-455.753	88.231		-5.165	.000		
VC	12.411	6.075	.163	2.043	.042	.637	1.571
VC share	-.618	.642	-.072	-.963	.337	.725	1.380

VC background	-8.245	9.938	-.057	-.830	.408	.867	1.153
Industry	.263	5.088	.003	.052	.959	.927	1.079
Area	-3.014	5.693	-.035	-.529	.597	.953	1.049
Age	.155	.536	.019	.290	.772	.925	1.081
Size	41.181	10.712	.277	3.844	.000	.781	1.280
Gov	15.874	6.158	.188	2.578	.011	.762	1.313

a. Dependent variable: P

## 4 Conclusion

Starting from the relationship between venture capital and high-tech enterprises, this paper analyses the influence of venture capital participation, venture capital share ratio, venture capital with state background on innovation performance of high-tech enterprises, then selects the high-tech enterprise data listed on GEM, and uses the regression analysis method for empirical research. The results show that venture capital has a significant role in promoting the profitability and R&D investment of high-tech enterprises, and a general role in promoting the number of patents of high-tech enterprises.

Therefore, in order to make better use of venture capital to improve the patent production of high-tech enterprises, we should make more efforts. First, in the face of technological innovation achievements of enterprises, the government should establish an effective intellectual property system, protect achievements and guide enterprises to carry out technological innovation. Second, after venture capital enters the enterprise, venture capital institutions take advantage of their rich management experience or technical advantages to strengthen the operation and management of venture capital, and ensure that venture capital is used for its original purpose. Third, high-tech enterprises can divide enterprise research and development projects into four stages: establishment, implementation, conclusion, transformation, and implement comprehensive management by designing monitoring measures of key points in each stage.

## **Study on Employee Relationship Risk on the Effectiveness of Enterprise Structure Change in Cote d'Ivoire**

Monhéséa Obrey Patrick Bah<sup>1</sup>, Akadje Jean Roland Edjoukou<sup>2</sup>

1 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 School of Accounting, Dongbei University of Finance and Economics, Dalian, P.R.China, 116025

(E-mail: monheseabah@yahoo.com, edjoukou2015@yahoo.fr)

**Abstract:** Change is crucial for organizations in growing, highly competitive business environments. Among the employee's relationship, Communication has an important role because without clear information; it's impossible to understand each other. Shared Goals and Values, the core issue of companies, employees can't achieve organizational objectives if they didn't share them. Leadership style has a significant value. Choose the most suitable style to lead your employees is hot preoccupation nowadays. Change's theories describe the effectiveness with which organizations can modify their strategies, processes, and structures. Thus, the paper presents different variables apt to influence positively or negatively the change. To address this research, data has been collected from telecommunications, refinery, and services sectors through questionnaire and Smart PLS is the main tools and structural equation modeling, the techniques to analyze the data. Conclusions, limits and future research have been drawn in this paper.

**Key words:** Employee relationship; Enterprise structure change; Risk management; Human resources

### **1 Introduction**

In recent decades, performance has become the focused point of enterprises in the business sector. The business owner set up their strategies and design their structures to achieve the organizational goals. But, even if the performance has been reached, the leaders of the company should pay attention to several factors able to reduce their profit or disturb the ambiance in the workplace. With globalization and rapid transformation of business units, the change process became inevitable for the business survivor. Thus, we must consider many variables among them, the nature of Employee Relationship (ER). ER has been defined as the formal or informal relationship between two peoples or a group of individuals with converging characteristics, common goals, and the same vision. Kurt Lewin has introduced the concept of Organizational Structure Change; his work was based on social psychology and human behaviors when a company tries to improve his work manners or bring new ways, culture, and ideas. For him, the change is a process wished by the leader for the business needs (Kurt Lewin, 1947). In the change process provided by Kotter built on Lewin's work, the success of change is based on the involvement of employee because if one leader ignores the needs of his employee, this change will fail. Change is also a fact of organizational life, just as it is in human life (Kotter, 1996). An organization that doesn't change cannot survive long much less thrive in an unpredictable world. Several factors may make the organizational change necessary, including new

competition in the marketplace or new demands by customers (Kotler, 1999). When change is well planned and implemented, it brings many tangible benefits, including improved competitiveness, employee satisfaction. Mullins said that the change is not personal gain but make the organization stronger and better equipped for the future (Mullins, 2007). Therefore, the main question is, which are the factors that can predict enterprise structure change. To understand this question and address the right answer, this study aim will achieve the following objectives:

- To investigate the importance of enterprise structure change.
- To examine the effect of employee relationship on enterprise structure change in these sectors.
- To identify the obstacles that impact negatively on enterprise structure change's implementation.
- To provide recommendations on how to apply enterprise structure with limited risk.

Find out variables can impact organizational change; we need to move on the theoretical and empirical research.

## 2 Literature Review

The organizational change explains the movement of an organization from the known (current state) state to the unknown (desired future state) state. It is because the future of this change is uncertain and may concern the people's worth, coping abilities, and competency, so the people of the organization do not support change unless they are convinced against the status quo (Cummings, Worley, & Calhoun, 2009). According to Kotter, effective change efforts must begin with individuals and groups evaluating an organization (Kotter, 1995). In many studies, the effectiveness of organizational change has been associated with different variables. The critical review of change theories offers a constructive framework for managing organizational change throughout different stages of the process. Based mainly on Kurt Lewin change stages and others scholars, they pointed out the leadership's role, knowledge management and employee involvement as the main factor of organizational change success within the company (Hussain et al., 2016). Their study focused on change management for the state-owned enterprise, found that employee engagement is not correlated with the process. However, leadership style and individual readiness can predict the organizational change significantly (Mangundjaya, Utoyo, & Wulandari, 2015). Many authors have defined leadership style. It is considered a factor that has a major influence on the performance of organizations, managers, and employees (Wang et al., 2005). Leadership style, often called 'management style, describes the approach managers use to deal with people in their teams. There are many styles of leadership. Leaders can be classified in extremes as follows (Armstrong, 2009).

Charismatic/non-charismatic. Charismatic leaders rely on their personality, their inspirational qualities, and their 'aura'. They are visionary leaders who are achievement-oriented, calculated risk takers, and good communicators. Non-charismatic leaders rely mainly on their know-how, their quiet confidence, and their analytical approach to dealing with problems. Autocratic/democratic. Autocratic leaders impose their decisions, using their position to force people to do as they are told. Democratic leaders encourage people to participate and involve themselves in decision making. Enabler/controller. Enablers inspire people with their vision of the future and empower them to accomplish team goals. Controllers manipulate people to obtain their compliance. Transactional/transformational.

Transactional leaders trade money, jobs, and security for compliance. Transformational leaders motivate people to strive for higher-level goals.

Nisren Osama Al-Khozondar investigates the effect of employee relationship management (ERM) on the employees' performance in Telecommunication and Banking Sectors in Gaza. ERM main components are Human Resources Practices, Communication, Trust, Shared Goals and Values, and Leadership Styles (Nisren Osama Al-Khozondar, 2015). Shared goals and values are defined as the extent to which partners have beliefs in common about what behaviors, goals, and policies are important or unimportant, appropriate or inappropriate, and right or wrong (Herington et al., 2009). He is concluded that ERM components have a positive effect on the employee's performance and sharing goals and values with the employees are considered prerequisite and foundation to improve employee's performance. Communication in the institution refers to the extent to which the institution informs employees about important issues in the organization. Such important issues include values, strategies and changes that affect the institution and employees. Institutional communication can be done either formally through formal structures or informally using unstructured procedures. Communication with employees strengthens their identification with the institution and creates institutional solidarity due to trust among employees or between different departments (Chinomona & Sandada, 2013).

Thus, based on these researches, we can find a link between employee relationship and organizational performance. Since several years ago, change has been associated with organizational performance, because the change success can also predict the employee's performance. The study of Fadeyi & Oke, 2016 support this affirmation. In their findings, there is a positive correlation between aspects of change composed by the quality of change communication, participation, attitude of top management & readiness toward change, leadership style, and organizational performance. However, if many papers address the change and performance, it will be quite interesting to analyze the factors that can influence organizational change (Cummings, Worley, & Calhoun, 2009). Regarding these facts, achieve the enterprise structure change is becoming a daily problem for managers. For sure, many researches have been done in different countries, but in Cote d'Ivoire, we face a lack of research, investigate it and share some recommendations is therefore our little contributions to reduce this missing data. Employee relationship has replaced industrial relations as the term for defining the relationship between employers and employees. Nowadays, employee relationship is seen as focusing on both individual and collective relationships in the workplace, with an increasing emphasis on helping line managers establish trust-based relationships with employees. A positive climate of employee relations with high levels of employee involvement, commitment, and engagement can improve business outcomes as well as contribute to employee's well-being. Employee relationship in a change process can be seen as all actions from them apt to fail any change implementation. In this paper, Communication (COM), shared goals and values (SGV) and leadership style (LS) are the main independent variables. According to these variables, this research has five hypotheses define as:

H1: Shared goals and values directly impact enterprise structure change

H2: Shared goals and values have a positive relationship with leadership style

H3: Leadership style positively influence enterprise structure change

H4: Leadership style has a positive relationship with communication

H5: Communication significantly predict enterprise structure change

Figure 1 Conceptual Model

### 3 Data and Methodology

Mouton (Mouton, 2001) views research methodology as concentrating on the research process and the kind of tools and techniques to be applied. Firms operating in Côte d'Ivoire were considered as the population for the study.

#### 3.1 Data collection

This research used both qualitative and quantitative approach in the form of survey design to carry out this study. Data has been collected from employees of telecommunications, refinery, and services sectors through both google forms which is an online questionnaire and physical questionnaire address to people. 137 questionnaires were collected.

#### 3.2 Data analysis

After preliminary analysis to check if all the items have been filled, only 120 has been useful. The qualitative data collected is codified into quantitative following the Likert five scale from Strongly disagree to strongly agree where the higher value is, the more positive the respondent's attitude towards the subject's response to the question is. With the help of SPSS, we codified the data obtained. The codified data is imported into Smart PLS. Then, we drawn the theoretical model, which is the translation of the hypothesis in the scheme and calculated the path coefficient and model fit of this study. After running the PLS Algorithm, we found the Average Variance extracted (AVE), Composite Reliability (CR), and Alpha. These variables are the relevant indicators for the measurement model in structural equation modeling (SEM). We run also outer loadings to measure the item's quality. Using one-tailed test, the hypothesis has been checked through bootstrapping. The result appeared with P value, T-test, and the significance level, which determine if our hypotheses are supported or not.

### 4 Results

Smart PLS 3 (Boenningstedt, Germany) and IBM SPSS Statistics 24 (Armonk, NY, USA) were used in this study. Data analysis was conducted using smart PLS primarily because PLS-SEM is a preferred option due to its better predictive power over factor-based SEM and its ability to simultaneously estimate relationships between several independent as well as dependent variables in a structural model and multiple latent observed or unobserved variables.

Furthermore, PLS is believed to be a preferable approach for decision-making and management-oriented problems; it is also preferred when the study focuses on prediction.

The internal consistency reliability was established using composite reliability (CR) which has been recommended by scholars as being a better representative measure for reliability as compared to earlier practices that use Cronbach's alpha.

The outer loading analysis shows that all items selected for this study are equal or above 0.70. Keeping in mind that the minimum level of 0.40 is an acceptable value for item loading. Table 1 shows that the values ranged between 0.70 and 0.841, thus confirming sufficient reliability.

**Table 1 Item Loadings**

Constructs	ITEM	LOADINGS			
		COM	ESC	LS	SGV
Communication (COM)	COM1	0,772			
	COM2	0,825			
	COM3	0,807			
Enterprise Structure Change (ESC)	ESC1		0,775		
	ESC2		0,738		
	ESC3		0,802		
	ESC4		0,758		
	ESC5		0,729		
	ESC6		0,746		
	ESC7		0,782		
	ESC8		0,769		
Leadership Style (LS)	LS1			0,769	
	LS2			0,79	
	LS3			0,764	
	LS4			0,781	
Shared Goals and Values (SGV)	SGV1				0,742
	SGV2				0,841
	SGV3				0,7

To assess the construct validity by examining both the convergent and discriminant validity, 0.5 or higher was set as the acceptable value of average variance extracted (AVE). Table 2 shows that all the constructs had AVE values greater than 0.5 and ranged between 0.582 and 0.918, thus confirming convergent validity. We assessed the discriminant validity using Heterotrait-Monotrait (HTMT) criteria.

**Table 2 Reliability and Convergent Validity**

	Cronbach's Alpha	Rho_A	C.R	AVE
COM	0.723	0.728	0.844	0.643
ESC	0.897	0.902	0.918	0.582
LS	0.781	0.787	0.858	0.603
SGV	0.643	0.638	0.806	0.583

As shown in Table 3, all of the variables displayed acceptable discriminant validity using the HTMT test as well as bearing values below thresholds of 0.90.

**Table 3 Discriminant Validity Heterotrait-Monotrait Ratio (HTMT)**

	COM	ESC	LS	SGV
COM	0.802			
ESC	0.471	0.763		
LS	0.577	0.514	0.776	
SGV	0.331	0.635	0.535	0.763

To assess the structural model, a three-stage approach was carried out by the author. Firstly, the R<sup>2</sup> value was obtained for each latent variable. Secondly, a redundancy check of Q<sup>2</sup> was calculated by using a blindfolding function to ascertain the quality of predictive relevance. Thirdly, the bootstrap function was used to assess whether the path coefficients of the structural model are significant or not.

**Figure 2 Results of the Model**

As recommended by scholars,  $f^2$  values of 0.02, 0.15 and 0.35 indicate that the interaction term is low, medium, or large on the criterion variable respectively. A  $Q^2$  value of greater than zero implies that the model has good predictive relevance. Table 4 shows the results of the model obtained through PLS Algorithm function under smart PLS software.

Table 5 displays the values for  $f^2$  were obtained from the measurement model results and the  $Q^2$  values obtained through the blindfolding function. It is evident from the figure that the relationship paths from LS to ESC ( $f^2 = 0.012$ ), bear a low interaction because  $f^2 < 0.02$ . COM to ESC and SGV to ESC paths ( $f^2 = 0.078$ ;  $f^2 = 0.343$ ) have a medium interaction. Also, the SGV to LS path was strong enough with an  $f^2$  value of 0.401. The strongest interaction term was between LS and COM with a huge  $f^2$  value of 0.499.

**Table 4 Result of the Model – Mean, STDEV, T-values, P-values**

Hypotheses	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics ( O/STDEV )	P Values	Results
COM -> ESC	0.245	0.252	0.110	2.226	0.013	Supported
LS -> COM	0.577	0.578	0.087	6.647	<0.001	Supported
LS -> ESC	0.106	0.112	0.123	0.864	0.194	Not Supported
SGV -> ESC	0.497	0.488	0.117	4.246	<0.001	Supported
SGV -> LS	0.535	0.564	0.063	8.544	<0.001	Supported

**Table 5 Model Strength and Quality**

	F Square				R Square		Q Square	
	COM	ESC	LS	SGV	SSO	SSE	$Q^2 (=1-SSE/SSO)$	
COM		0,078			0,333	360.000	289.918	0.195
ESC					0,486	960.000	733.093	0.236
LS	0,499	0,012			0,286	480.000	406.384	0.153
SGV		0,343	0,401		360.000	360.000		

## 5 Conclusion

The study aim was to analyze the employee relationship on the effectiveness of enterprise structure change. Based on the literature review, we have pointed out three variables. After data

collection and analysis through Smart PLS, the five hypotheses of this research were supported excepted the relationship between leadership style and enterprise structure change. If in the literature, there is a strong relationship between these two variables, the lack of relationship in this case can be explain by the suitable leadership role adopted in these organizations. Thus, employee don't see the leadership style as an obstacle of change's failure. From this research, it will be evident that employee relationship (ER) can bring benefits to organizations. Succeed a change process means to facilitate communication with all stakeholders, train the employee directly involved, explain the change goals and share the same vision about it to reduce the employee resilience and adopted a suitable leadership style. ER can work by strengthening and increasing the relationship between organizations and their employees. To reap the required objectives from ER there is a need to implement them according to the enterprise structure change strategies. Change success in mainly focus on employee because they are the first affected by these actions. Manage the implementation of change effectively means to meet the employee needs and the desired state wished by the organization.

Discuss about this topic required to have a huge population which needs a long period of work. Therefore, the limited population of the research is our first limitation. Secondly, this study has been done in English but due to the population's location, it has been translated in French for the respondents. The communication bias can affect the quality of question and answer. Thirdly, the study was only based on three sectors. Some scholars introduce the concept of corporate culture and its role on organizational performance. Future research can be focus on the key role corporate culture in the change implementation and also determine the suitable corporate culture for change needs. And it will also help in developing effective communication channels and systems so that the information needs of employees are met.

**Abstract:** This paper expounds the basic definition of early-warning, prevention and control strategies for risk conduction of enterprise financial management system, puts forward the three components of risk source, risk conduction carrier and risk conduction path for risk conduction of enterprise financial management system, and sets corresponding early-warning indicators and qualitative risk early-warning values. Then the single-factor early-warning mode, multi-factor early-warning mode and comprehensive early-warning mode are used to timely and accurately issue corresponding levels of alarms to effectively prevent and control the risk conduction of the enterprise financial management system. The research on the early-warning, prevention and control strategies for risk conduction of enterprise financial management system has important theoretical research value and practical application value.

**Key words:** Risk conduction early-warning; Risk early-warning indicator; Qualitative risk early-warning value; Early-warning; Prevention and control strategy

### 1 Introduction

"Early-warning" means to taking the lead and taking precautions. Fritzpatrick (Fritzpatrick, 1932) was the first to study financial risk early-warning, and he put forward the univariate model of financial risk early-warning; Smith and Winakor (Smith and Winakor, 1935) also used an univariate model for analysis, and found the "labor capital/total assets" indicator had the highest discriminating ability. Beaver (Beaver, 1966) analyzed 30 financial ratio indicators for 79 failed companies and corresponding 79 successful companies between 1954 and 1964, found the three indicators, "cash flow/total debt", "net income/assets", "total debt/total assets", had good effect on financial risk early-warning, and the "cash flow/debt total" indicator had the best effect on financial risk early-warning. After the 1960s, many scholars conducted a lot of in-depth research on the early-warning model of enterprise financial risk. Altman (Altman, 1968) proposed the "I-score" model, and selected five financial ratio indicators to warn the enterprise financial risks separately based on theoretical research and empirical investigation; after that, the scholars adjust Altman's model by replacing indicator or correcting coefficient as needed, and applied the model to the per-existing control of financial risks in different industries. Domestic research on financial risk early-warning started late. Wu Shinong and Huang Shizhong (Wu Shinong and Huang Shizhong, 1987) introduced the analysis indicators and early-warning model of enterprise bankruptcy in China for the first time. Since then, the research on financial risk early-warning had gradually formed a certain system by Qi Lian (Qi Lian, 1990); Chen Jing (Chen Jing, 1999), Wu Shinong et al (Wu Shinong et al, 2001), Wan Xining et al (Wan Xining et al, 2005), Deng Xiaolan et al (Deng Xiaolan et al, 2006) and other scholars studied from the application of multivariate models.

There are few scholars at home and abroad who study the risk conduction of enterprise financial management system. Benston (Benston, 1986) considered that systemic risk occurred when a certain number of enterprises in the system fail simultaneously on the research of enterprise financial risk conduction; Davis et al. (Davis et al., 1999) and Jarrow et al. (Jarrow et al., 2001) studied the financial risk conduction of enterprises from the perspective of vulnerability, and considered that the failure of

one enterprise will lead to the failure of other companies, so ordinary financial fragility will occur; Jean Helwege (Helwege, 2010) had a more comprehensive research of enterprise bankruptcy and systemic risk after the subprime crisis, believed that the causes of the financial crisis included the conduction of relevant people and information conduction, and proposed relevant policy recommendations. Li Bingxiang and Tian Zhanjun (Li Bingxiang and Tian Zhanjun, 2006) specialized in enterprise financial risk conduction earlier in China, and constructed an analytical framework for the formation and conduction of enterprise financial risk on the basis of research. Shen Jun and Deng Mingran (Shen Jun and Deng Mingran, 2006) studied the financial risk conduction and its carrier; Yin Li (Yin Li, 2009) studied the financial risk conduction effect of enterprise groups under the framework of organizational failure; Chen Aizao (Chen Aizao, 2009) studied financial risk conduction of enterprises from the perspective of supply chain.

There are fewer scholars at home and abroad research on the risk conduction early-warning of enterprise financial management system. At present, Deng Mingran et al. (Deng Mingran et al., 2013) had studied in their works and discussed mechanism, functions, activity patterns, missed warning and false warning of the risk conduction in enterprise financial management systems. The research on early-warning prevention and control strategy for the risk conduction of enterprise financial management system was to warn, prevent and control the risks of risk source, risk conduction carrier and risk conduction path in the enterprise financial management system, and effectively prevents and controls the risk conduction of enterprise financial management system. The research has important theoretical research value and practical application value.

## 2 The Framework of Early-Warning, Prevention and Control Strategies for Risk Conduction of Enterprise Financial Management System

The early-warning, prevention and control strategy for risk conduction of enterprise financial management system refers that aimed at the risk conduction components of enterprise financial management system, establish risk early-warning indicators and their qualitative risk values, set up risk early-warning and alarm mode to issue a level alarm accurately, and prevent and control the risk conduction of enterprise financial management system effectively under the information asymmetry and uncertainty environment. The specific architecture is shown in Figure 1.

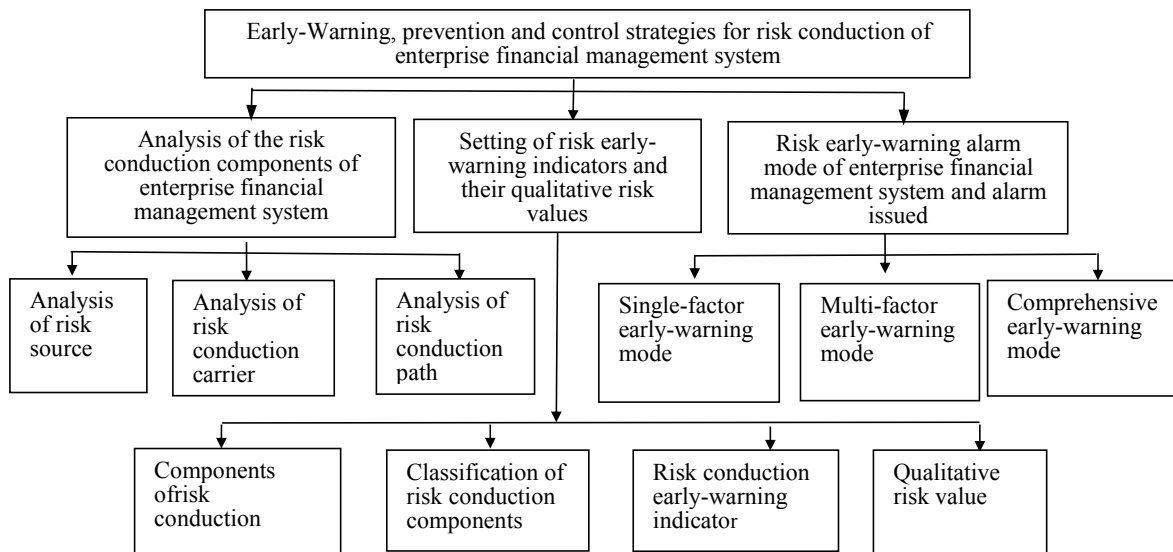

Figure 1 The Framework of Early-Warning, Prevention and Control Strategies for Risk Conduction of Enterprise Financial Management System

### 3 Analysis of the Components of Risk Conduction in Enterprise Financial Management System

The risk conduction of enterprise financial management system is a process that in the enterprise financial management system, the risk of enterprise financial management system is accumulated in the risk source, relies on a certain risk conduction carrier to spread, and spreads to all aspects of the enterprise financial management system through a certain risk conduction path, so that the possibility of the enterprise financial management goal is higher than the expected target and suffers losses. This process consists three main elements: risk source, risk conduction carrier and risk conduction path.

(1) Risk source is the source of the risk in enterprise financial management system, and it is the root of risk accident of the enterprise financial management system. According to the content cycle of enterprise financial management, it is divided into the funding risk source, the long-term investment risk source, the liquidity risk source and the profit distribution risk source.

(2) Risk conduction carrier is the carrier that carries or transmits the risk of the enterprise financial management system. According to the state of existence of the carrier, it is often divided into a capital carrier, a technical carrier, an information carrier and an accounting staff carrier.

(3) Risk conduction path refers to the route and way through which the enterprise financial management system conducts risk in the enterprise financial management activities. It is divided into the internal risk conduction path and the external risk conduction path of the enterprise according to the enterprise scope. The specific components are shown in Figure 2.

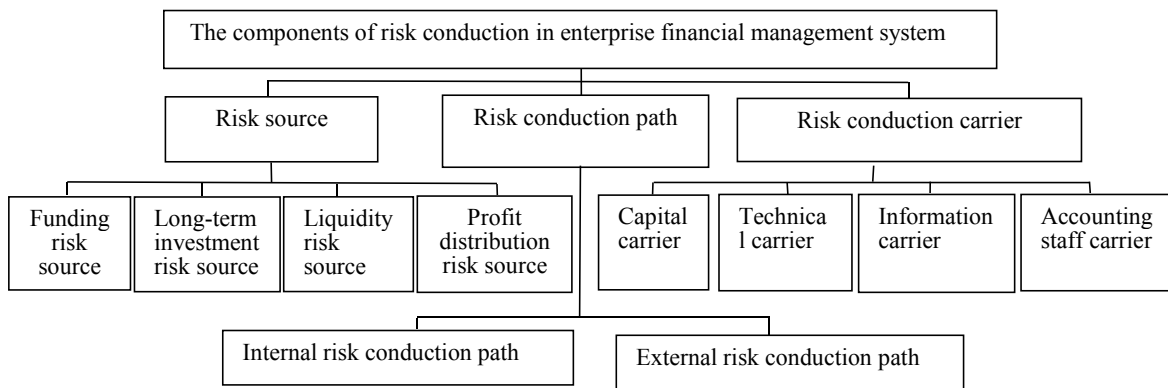

Figure 2 The Components of Risk Conduction in Enterprise Financial Management System

### 4 Setting the Risk Conduction Early-Warning Indicator and Qualitative Risk Value of Enterprise Financial Management System

According to Figure 2, under the premise of having known the components of risk communication in the enterprise financial management system, this research uses expert opinion method to set early-warning indicators and determine qualitative risk value for risk source, risk conduction carrier and risk conduction path, that is shown in Table 1.

**Table 1 Enterprise Financial Management System Risk Conduction Early-Warning Indicators and Qualitative Risk Value Table**

Risk conducti on compon ent	Classificati on of risk conduction component	Early-warning indicator					Qualitative risk value				
		A <sub>ij</sub> (t=1,2,3,4,5)					A <sub>ijt</sub> B				
A <sub>i</sub> (i=1,2,3)	A <sub>ij</sub> (j=1,2,3,4)

A <sub>32</sub>	Legitimacy of operation	Environment sensing	Degree of harmony	High level	Strong ability	Wide range

## 5 Risk Conduction, Early-Warning and Alarm of Enterprise Financial Management System

The relative research literatures always use fuzzy comprehensive evaluation method to determine the qualitative risk value of risk conduction and early-warning indicator of enterprise financial management system.

By fuzzy comprehensive evaluation method, the factors that affect the risk transmission of enterprise financial management system could be converted into clear numbers, we will get a comprehensive evaluation conclusion value to determine the risk level. Then alarm, if necessary.

An important part of the alarm transmission of enterprise financial system risk transmission is to set the alarm mode. Only by setting up a scientific and reasonable alarm mode can the risk communication of the enterprise financial system be effectively managed. The alarm mode has single factor warning, multi-factor warning, and comprehensive warning.

### 5.1 Single-factor early-warning mode

The single-factor early warning mode is a method that combines the characteristics of the industry in which the enterprise is located, collects empirical data that affects the value of the risk factors of the enterprise financial management system, and establishes a set of early-warning indicator systems to judge the risk of enterprise financing system. For example, A<sub>111B</sub> is the risk value (A<sub>111B</sub>) of the early-warning indicator to the financing source (A<sub>11</sub>) of the financing source (A<sub>11</sub>) in the risk source (A<sub>1</sub>), and then uses the expert opinion method to set its security area, as shown in the table. 2 is shown.

**Table 2 Single Factor Warning Safety Zone**

High risk area	Elementary risk area	Safe area	Elementary risk area	High risk area
(Ye,Yc)	(Yc,Ya)	(Ya,Yb)	(Yb,Yd)	(Yd,Yf)

The basic alarm criteria are:

When  $Y_a < A_{111}B < Y_b$ , no alarm is issued;

When  $Y_c \leq A_{111}B \leq Y_a$ , or  $Y_b \leq A_{111}B \leq Y_d$ , the first-level alarm is issued;

When  $Y_e \leq A_{111}B \leq Y_c$  or  $Y_d \leq A_{111}B \leq Y_f$ , the second-level alarm is issued;

When  $A_{111}B < Y_e$  or  $A_{111}B > Y_f$ , the three-level alarm is issued.

And so on, each situation can establish a corresponding security area for the alarm indicator's qualitative risk value and issue a corresponding level alarm.

**5.2 Multi-factor early-warning mode**

We can use model  $A_m = b_1 \cdot A_1 + b_2 \cdot A_2 + \dots + b_n \cdot A_n$ , to weighted algorithm to get value at risk of  $A_m$ . And then the security area is set by the expert opinion method, as shown in Table 3.

**Table 3 Multi-Factor Early Warning Security Zone**

High risk area	Elementary risk area	Safe area	Elementary risk area	High risk area
(Ze,Zc)	(Zc,Za)	(Za,Zb)	(Zb,Zd)	(Zd,Zf)

The basic alarm criteria are:

When  $Z_a < A_{111}B < Z_b$ , no alarm is issued;

When  $Z_c \leq A_{111}B \leq Z_a$ , or  $Z_b \leq A_{111}B \leq Z_d$ , the first-level alarm is issued;

When  $Z_e \leq A_{111}B \leq Z_c$  or  $Z_d \leq A_{111}B \leq Z_f$ , the second-level alarm is issued;

When  $A_{111}B < Z_e$  or  $A_{111}B > Z_f$ , the three-level alarm is issued.

And so on, each situation can use this method to establish a qualitative risk value security area of the corresponding alarm indicator and issue a corresponding level alarm.

**5.3 Comprehensive early warning mode**

The comprehensive early warning model consists of three elements: probability of risk factor risk occurrence in enterprise financial management system, called 'P'; possible risk loss of enterprise financial management system, called 'h'; uncontrollable degree of each risk factor, called 'x'. The risk comprehensive risk value is defined as:  $A = \sum_{i=1}^n p_i \cdot h_i \cdot x_i$

After that, we could set up setting up safety zone by using the expert opinion method, as shown in Table 4.

**Table 4 Comprehensive Warning Safety Zone**

High risk area	Elementary risk area	Safe area	Elementary risk area	High risk area
(Ce,Cc)	(Cc,Ca)	(Ca,Cb)	(Cb,Cd)	(Cd,Cf)

The basic alert criteria are:

When  $C_a < A < C_b$ , no alarm is issued;

When  $C_c \leq A \leq C_a$ , or  $C_b \leq A \leq C_d$ , the first-level alarm is issued;

When  $C_e \leq A \leq C_c$  or  $C_d \leq A \leq C_f$ , the second-level alarm is issued;

When  $A \leq C_e$  or  $A \geq C_f$ , the three-level alarm is issued.

## 6 Conclusions

The research on early-warning, prevention and control strategies for risk conduction of enterprise financial management system consists of three parts: analyzing the components of the risk conduction in enterprise financial management system, setting the risk conduction early-warning indicator and qualitative risk value of enterprise financial system, providing alarm mode and alarm issuance.

(1) The risk conduction of enterprise financial system consists of three elements: risk source, risk conduction carrier and risk conduction path. Risk source can be divided into funding risk source, long-term investment risk source, liquidity risk source and profit distribution risk source according to the content cycle of enterprise financial management system. Risk conduction carrier can be divided into capital carrier, technical carrier, information carrier and accounting staff carrier according to the state of existence of the carrier in enterprise financing system. Risk conduction path can be divided into internal risk conduction path and external risk conduction path of the enterprise according to the range of risk conduction path in enterprise financial management system.

(2) The enterprise financial system risk conduction early-warning indicators can be further subdivided according to the risk source, risk conduction carrier and risk conduction path of risk conduction in enterprise financial managements system. The early-warning indicator  $A_{ijt}$  and its corresponding qualitative risk value  $A_{ijt}B$  are set.

(3) The early-warning mode of risk conduction in enterprise financial management system includes single-factor early-warning mode, multi-factor early-warning mode and comprehensive early-warning mode. The programs of implementing early-warning for each early-warning mode are following: Firstly, we can get the qualitative risk value using the risk early-warning mode. Then, find out dangerous areas in safety zone table according to the qualitative risk values. Thirdly, issue the appropriate level of alarm according to the situation in dangerous areas to control the risk source, intercept the risk conduction carrier, break the risk conduction path, so that prevent and control the risk conduction of the enterprise financial management system effectively.

# Risk Analysis and Control of Business Mode Transformation in HD Company

Yin Limei

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail:1207412455@qq.com)

**Abstract:** Under the state's construction requirements for for-profit institutions to be transformed into enterprises and the environment of rapid development of information technology and continuous integration of economy, it is imperative for Guangxi Geology & Mineral Huadi Industry and Trade group Co., Ltd.(HD) to transform its business mode (BM). This paper mainly establishes a risk assessment system based on the possible risks in the process of HD's business mode transformation (BMT), and uses fuzzy analytic hierarchy process (FAHP) to conduct risk assessment. The results show that HD's business mode transformation risk (BMTR) is in medium risk state. Then, give some suggestions to improve the theoretical basis and technical support for business mode transformation risk analysis and control.

**Key words:** Business mode; Transformation risk; Risk analysis and control; Fuzzy analytic hierarchy process

## 1 Introduction

With the development of information technology such as cloud computing and big data, information technology and economy are constantly merging, and the competition among enterprises is also growing. At present, the competition among enterprises has changed from the original product competition to the competition of BM. BM is a comprehensive perspective describing how enterprises do business in the market (Zott, C, Amit, R and Massa, L, 2011). It is a structural template describing how enterprises deal with customers, suppliers and partners (Zott, C and Amit, R, 2008). Academics believe that BMs are not static, but dynamic (Demil, B and Lecocq, X, 2011). With market changes, the sustainability of BMs is uncertain, and the existing BMs will soon become obsolete. Therefore, enterprises must have sustained business mode innovation and transformation capabilities (Sosna, M, Trevinyo-Rodríguez, R N and Velamuri, S R, 2010). Clauß, T adopted strict methodological procedures to develop a set of comprehensive measurement standards for BMT(Clauß, T, 2017); Clauss, T et al. pointed out should rely on customer satisfaction, customer perception of BMT, to link BMT to customer value creation, to ensure the success of BMT activities (Clauss T, Kesting T, and Naskrent J, 2019). A good MD can create competitive advantages, obtain independent products, differentiated channels and information advantages, create guiding logic, link economic value to the realization of technological potential (Chesbrough, H and Rosenbloom, R S, 2002), and provide economic leverage for enterprises to achieve large-scale profits (Euchner, J and Ganguly, A, 2014). Therefore, it is very important to find a successful BM.

However, BMT a high-risk behavior. The more complex an enterprise is, the more risks it will bring. Even a slight change in its operation will bring risks and uncertainties to the enterprise. For

example, enterprises often face such risk as separating the definition of the value proposition from the development of BM, resulting in unrealistic value proposition in the economy. Meanwhile, the transformation of BM will also bring consistency and inertia risk to enterprises, organizations, business departments, teams and individuals (Makins, Q, Nagao, D and Bennett, N, 2012). In view of these risks, many scholars have carried out relevant research. Wu Jiazhen and Li Huabiao found that market risk, investment risk and human resource risk are the main risks affecting enterprise transformation through a large number of case studies (Wu Jiazhen, and Li Huabiao, 2012). Wu Lihua divided BMTR into general risk brought by macro-environment such as society and economy and industrial risk brought by industrial environmental change by analyzing the formation process of enterprise transformation risk (Wu Lihua, 2005). Some scholars used case analysis method to divide BMTR into industrial choice risk, business choice risk, process control risk and post-management risk according to the process of transformation. Therefore, it has great theoretical and practical significance to identify and analyze the BMTR.

It can be seen that in order to help enterprises to avoid risks and achieve success of BMT, scholars have made targeted research on the classification and research methods of BMTRs, but there are few reports on the comprehensive principle of risk identification. Based on the transformation of industrial and trade BM in HD, this paper uses FAHP to evaluate and analyze it from six categories: human resources risk, financial risk, technical risk, operational risk, market risk and environmental risk, aiming at providing theoretical basis and technical support for the risk assessment of BMT.

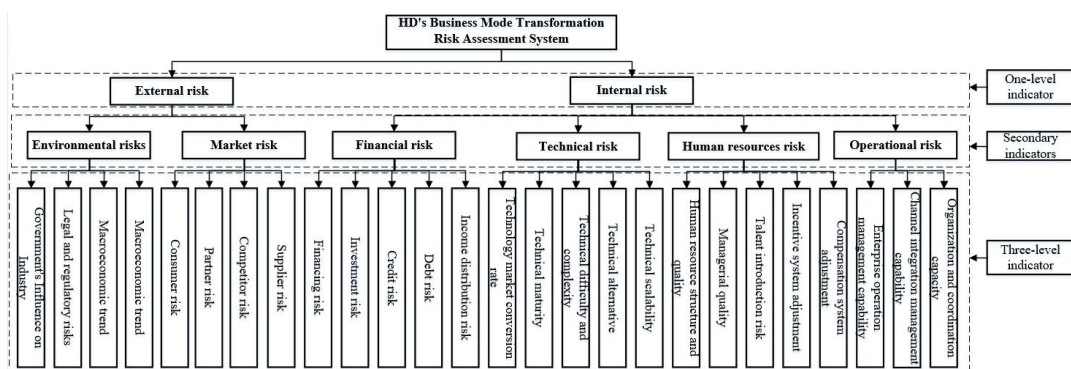

## 2 Method

This paper mainly uses FAHP. FAHP combines Fuzzy Mathematics (FM) with the traditional Analytic Hierarchy Process (AHP) skillfully. The steps of FAHP are as follows: (1) Establish a ladder hierarchy; (2) Perform expert scoring, construct an  $n * n$  judgment matrix, according to Satty's 1-9 scale table(1 means  $i$  and  $j$  have the same importance; 3 means  $i$  is slightly more important than  $j$ ; 5 means  $i$  is obviously important than  $j$ ; 7 means  $i$  is strongly important than  $j$ ; 9 means  $i$  is extremely important than  $j$ ; 2, 4, 6, 8 indicates the intermediate value of the above two adjacent levels; Reciprocal indicates the importance of comparing the order of exchange of two elements). (3) Find the maximum eigenvalue  $\lambda_{max}$  and the corresponding eigenvector  $V_i$  of each matrix, carry on normalization; (4) Conduct consistency testing, if the Consistency Ratio (CR) < 0.1, explain that the vector passes the consistency test, and the eigenvector  $V_i$  can be used as the weight of each risk index in the corresponding index layer (Consistency Index  $CI = \frac{\lambda_{max} - n}{n - 1}$ ,  $CR = \frac{CI}{RI}$ ); (5) Establish an evaluation set according to the risk level, score the risk level of each index, obtain the fuzzy matrix  $R_i$  of each index, and use the fuzzy comprehensive discriminant  $F_i = V_i R_i$ , calculates the results of each index evaluation; (6) Perform a hierarchical total ranking, and obtains importance-rankings.

## 3 Risk Assessment System

### 3.1 HD's BMTR composition

What factors and degree of influence on BMT of enterprise are issues that practitioners and risk

management scholars are concerned about, and also an important factor affecting the success of BMT. Scholars believe that both the external and the internal environment of the enterprise will have an effect on the BMT. According to previous research results and the actual situation of HD, BMTR of HD is divided into external risk and internal risk. External risks include two secondary indicators: environmental risks and market risks. Internal risks include financial risks, technical risks, human resource risk and operational risk. Under each secondary index, it can be divided into several third-level indicators. To sum up, the BMTR evaluation system of HD is constructed as shown in Figure 1.

Figure 1 HD's BMTR Assessment System

### 3.2 Comprehensive evaluation of HD's BMTR

#### 3.2.1 BMTR index weight determination

This article invites six experts who are familiar with the BMTR to score. Using the 1-9 scale table, the degree of importance of the indicators is compared in pairs. The judgment matrices of total risk, external risk, internal risk, environmental risk, market risk, financial risk, technical risk, human resource risk and operational risk are expressed as follows:  $A, C_{external}, C_{internal}, C_1, C_2, C_3, C_4, C_5$  and  $C_6$ .

$$C_1 = \begin{bmatrix} 1 & 0.33 & 2.37 & 1.78 \\ 0.32 & 1 & 2.58 & 1.47 \\ 0.42 & 0.39 & 1 & 1.44 \\ 0.56 & 0.68 & 0.69 & 1 \end{bmatrix} \quad C_3 = \begin{bmatrix} 1 & 1.91 & 0.25 & 1.88 & 4.03 \\ 0.52 & 1 & 0.37 & 1.88 & 2.61 \\ 4.00 & 2.70 & 1 & 0.93 & 2.93 \\ 0.53 & 1.06 & 1.08 & 1 & 2.83 \\ 0.24 & 0.38 & 0.34 & 0.35 & 1 \end{bmatrix} \quad C_6 = \begin{bmatrix} 1 & 3.33 & 3.33 \\ 0.30 & 1 & 1.65 \\ 0.30 & 0.87 & 1 \end{bmatrix}$$

$$C_2 = \begin{bmatrix} 1 & 3.50 & 3.25 & 2.20 \\ 0.29 & 1 & 1.04 & 1.24 \\ 0.31 & 0.96 & 1 & 3.17 \\ 0.45 & 0.81 & 0.32 & 1 \end{bmatrix} \quad C_4 = \begin{bmatrix} 1 & 3.14 & 3.42 & 2.42 & 3.00 \\ 0.32 & 1 & 2.50 & 4.86 & 2.21 \\ 0.29 & 0.40 & 1 & 1.28 & 2.00 \\ 0.41 & 0.21 & 0.78 & 1 & 2.50 \\ 0.33 & 0.45 & 0.50 & 0.40 & 1 \end{bmatrix} \quad C_{external} = \begin{bmatrix} 1 & 0.47 \\ 2.13 & 1 \end{bmatrix}$$

$$C_{internal} = \begin{bmatrix} 1 & 1.86 & 1.62 & 2.24 \\ 0.54 & 1 & 2.62 & 2.20 \\ 0.61 & 0.38 & 1 & 1.83 \\ 0.96 & 0.45 & 0.55 & 1 \end{bmatrix} \quad C_5 = \begin{bmatrix} 1 & 1.78 & 2.83 & 2.17 & 2.41 \\ 0.56 & 1 & 3.83 & 2.64 & 2.26 \\ 0.35 & 0.35 & 1 & 1.71 & 2.29 \\ 0.46 & 0.38 & 0.58 & 1 & 1.90 \\ 0.41 & 0.44 & 0.44 & 0.53 & 1 \end{bmatrix} \quad A = \begin{bmatrix} 1 & 0.38 \\ 2.60 & 1 \end{bmatrix}$$

Calculate the maximum eigenvalue ( $\lambda_{max}$ ) and eigenvector ( $W_i$ ) of each matrix, and perform consistency check and normalization. The results are summarized as shown in Table 1. the judgment matrices all have good consistency. Therefore, each component of the normalized processed feature vector can be used as the weight of each risk indicator in the corresponding index layer.

Table 1 Judgment Matrix Calculation Results and Consistency Test Results

Risk Factor	$\lambda_{max}$	CI	RI	CR	Consistency (CR<0.1)	Weighting of factors
External Risk	2	0	0	—	passing	$W_{external} = (0.3198, 0.6802)^T$
Internal Risk	4.1439	0.0480	0.90	0.0533	passing	$W_{internal} = (0.3726, 0.3104, 0.1867, 0.1303)^T$
Environmental Risk	4.2576	0.0859	0.90	0.0954	passing	$W_1 = (0.2480, 0.4295, 0.1566,$

Market Risk	4.2443	0.0814	0.90	0.0904	passing	$W_2 = (0.4862, 0.1632, 0.2211, 0.1296)^T$
Financial Risk	5.4447	0.1112	1.12	0.0993	passing	$W_3 = (0.2251, 0.1390, 0.3730, 0.1942, 0.0687)^T$
Technical Risk	5.4323	0.1081	1.12	0.0965	passing	$W_4 = (0.4064, 0.2696, 0.1227, 0.1186, 0.0826)^T$
Human Resource Risk	5.2848	0.0712	1.12	0.0636	passing	$W_5 = (0.3364, 0.3002, 0.1456, 0.1241, 0.0937)^T$
Operational Risk	3.0022	0.0011	0.58	0.0020	passing	$W_6 = (0.6245, 0.1965, 0.1790)^T$

Note:  $n = 2, RI = 0.58; n = 3, RI = 0.58; n = 4, RI = 0.9; n = 5, RI = 1.12.$

### 3.2.2 Fuzzy consistency judgment matrix construction

According to the HD's BMTR situation, select five evaluation levels to form a risk level evaluation set, namely:  $H = \{H_1, H_2, H_3, H_4, H_5\} = \{\text{Very High Risk, High Risk, Medium Risk, Low Risk, Very Low Risk}\}$ . Then, according to the evaluation set, distribute questionnaires to HD's employees at different levels for risk rating evaluation, and 78 questionnaires were recovered. The overall evaluation results are organized into the following fuzzy matrix.

$$\begin{aligned}
 R_1 &= \begin{bmatrix} 0.23 & 0.23 & 0.37 & 0.10 & 0.06 \\ 0.19 & 0.21 & 0.37 & 0.14 & 0.09 \\ 0.19 & 0.19 & 0.41 & 0.12 & 0.09 \\ 0.23 & 0.19 & 0.42 & 0.08 & 0.08 \end{bmatrix} & R_2 &= \begin{bmatrix} 0.12 & 0.22 & 0.47 & 0.09 & 0.10 \\ 0.18 & 0.19 & 0.44 & 0.10 & 0.09 \\ 0.21 & 0.26 & 0.44 & 0.04 & 0.06 \\ 0.15 & 0.18 & 0.47 & 0.13 & 0.06 \end{bmatrix} & R_3 &= \begin{bmatrix} 0.27 & 0.32 & 0.32 & 0.04 & 0.06 \\ 0.24 & 0.38 & 0.27 & 0.03 & 0.08 \\ 0.29 & 0.24 & 0.32 & 0.06 & 0.08 \\ 0.29 & 0.28 & 0.29 & 0.05 & 0.08 \\ 0.17 & 0.15 & 0.49 & 0.09 & 0.10 \end{bmatrix} \\
 R_4 &= \begin{bmatrix} 0.17 & 0.21 & 0.46 & 0.08 & 0.09 \\ 0.17 & 0.19 & 0.45 & 0.08 & 0.12 \\ 0.18 & 0.22 & 0.41 & 0.08 & 0.10 \\ 0.17 & 0.29 & 0.37 & 0.05 & 0.12 \\ 0.12 & 0.29 & 0.41 & 0.08 & 0.10 \end{bmatrix} & R_5 &= \begin{bmatrix} 0.13 & 0.38 & 0.32 & 0.08 & 0.09 \\ 0.15 & 0.27 & 0.38 & 0.12 & 0.08 \\ 0.09 & 0.26 & 0.45 & 0.12 & 0.09 \\ 0.12 & 0.17 & 0.47 & 0.15 & 0.09 \\ 0.12 & 0.13 & 0.47 & 0.17 & 0.12 \end{bmatrix} & R_6 &= \begin{bmatrix} 0.14 & 0.24 & 0.45 & 0.08 & 0.09 \\ 0.13 & 0.19 & 0.50 & 0.09 & 0.09 \\ 0.13 & 0.23 & 0.41 & 0.13 & 0.10 \end{bmatrix}
 \end{aligned}$$

### 3.2.3 Fuzzy comprehensive evaluation

According to the fuzzy synthetic discriminant  $F_i = W_i^T R_i$ , calculate the evaluation at all levels. Firstly, the evaluation results of environmental risk, market risk, financial risk, technical risk, human resource risk and operational risk of secondary indicators  $F_1, F_2, F_3, F_4, F_5$  and  $F_6$  are calculated.

$$\begin{aligned}
 F_1 &= W_1^T R_1 = (0.2066, 0.2085, 0.3846, 0.1170, 0.0809); F_2 = W_2^T R_2 = (0.1536, 0.2188, 0.4585, 0.0858, 0.0844) \\
 F_3 &= W_3^T R_3 = (0.2703, 0.2791, 0.3189, 0.0514, 0.0769); F_4 = W_4^T R_4 = (0.1671, 0.2219, 0.4363, 0.0777, 0.1037) \\
 F_5 &= W_5^T R_5 = (0.1280, 0.2800, 0.3896, 0.1150, 0.0898); F_6 = W_6^T R_6 = (0.1362, 0.2284, 0.4527, 0.0909, 0.0918)
 \end{aligned}$$

Secondly, according to  $F_1$  and  $F_2$ , the evaluation matrix of the external risk is established as  $F_{external}$ ; according to  $F_3, F_4, F_5$  and  $F_6$ , the evaluation matrix of the internal risk is established as  $F_{internal}$  and normalized.

$$F_{external} = \begin{bmatrix} 0.2066 & 0.2085 & 0.3846 & 0.1170 & 0.0809 \\ 0.1536 & 0.2188 & 0.4585 & 0.0858 & 0.0844 \end{bmatrix}$$

$$F_{internal} = \begin{bmatrix} 0.2703 & 0.2791 & 0.3189 & 0.0514 & 0.0769 \\ 0.1671 & 0.2219 & 0.4363 & 0.0077 & 0.1037 \\ 0.1280 & 0.2800 & 0.3896 & 0.1150 & 0.0898 \\ 0.1362 & 0.2284 & 0.4527 & 0.0909 & 0.0918 \end{bmatrix}$$

Thirdly, the  $W_{internal}$  and  $W_{external}$  are respectively multiplied by the internal and external risk assessment matrices  $F_{internal}$  and  $F_{external}$  to obtain the internal and external risk assessment results, that is,  $T_i = W_i^T F_i$ .

$$T_{external} = W_{external}^T F_{external} = (0.1705, 0.2155, 0.4349, 0.0958, 0.0833)$$

$$T_{internal} = W_{internal}^T F_{internal} = (0.1942, 0.2549, 0.3860, 0.0766, 0.0896)$$

Finally, calculate the evaluation results of the overall risk of HD's BMT.

$$T = W^T (T_{external}, T_{internal})^T = (0.1876, 0.2440, 0.3996, 0.0819, 0.0878)$$

According to the principle of maximum attribute, the maximum value corresponding level is the HD's BMTR level. In the system calculation results, the maximum value is 0.3996, so, the risk level of HD's BMTR is "medium-risk".

### 3.2.4 Total hierarchical sorting

The total ranking weight is the product of the third-level indicator risk weight and the second-level indicator risk weight. First, establish the X-axis as the three-level index single sorting weight, and the Y-axis is the Cartesian coordinate system of the three-level index total sorting weight; Then, construct a linear function of  $Y = bX$ , where b represents the secondary index single sorting weight. Therefore, the total ranking of external risks and internal risks is shown in Figure 2 and Figure 3.

Figure 2 HD's BMT External Risk Total Ranking Figure 3 HD's BMT Internal Risk Total Ranking

At the total risk ranking map, the higher the point position on the ray, the greater the proportion of the corresponding risk, that is, the greater the impact on the BMT.

### 3.3 Analysis of system operation results

Judging from the final score of the above evaluation, HD's BMTR is in a medium-risk state. Internal risks have the greatest impact on HD's BMT; therefore, the first task is to prevent and control the internal risks of the enterprise, and financial risks and technical risks are the main reasons for

forming internal risks. In the internal risk, it should focus more on the financial risks by financing and creditor's ability, and technical risk by technology market conversion rate and technology maturity. In the external risk, the proportion of market risk is greater than the proportion of environmental risk. Therefore, when conducting external risk prevention and control, pay more attention to the market risks by consumers and competitors and the environmental risks by national laws and regulations.

#### **4 Suggestion**

To prevent and control the risk of HD's BMT, HD should identify the main causes of BMTRs, integrate limited resources, and manage key risk types in a targeted manner, thereby effectively reducing the risk of BMT and achieving a successful transformation of business Modes. Therefore, this paper gives the following suggestions for the risk assessment of HD's BMT:

For the external risks, first, focus on understanding the changes in consumer demand and willingness to consume, establish a market-oriented research department for consumers, track and investigate consumers, and then reposition and upgrade products and services. Second, fully grasp the similarities and differences between competitors and themselves, dig up potential competitors, strengthen core competitiveness building; Third, rationally analysis of the target partner's strength and risk control capability, scientifically select partners, strictly control alliances with enterprises, optimize resource allocation, achieve complementary advantages, and reduce the risk of partners. Finally, pay close attention to changes in the international policy environment and macroeconomic situation, fully understand the changes in national industry attitudes and related laws and regulations, set up a special forecasting department, scientifically predict economic trends and changes in laws and regulations.

For the internal risks, first, scientifically evaluate the risk control ability and solvency of investment lending transferee, carefully select investment and lending objects, fully integrate various financing methods, and improve corporate financing capabilities. Second, improve the commercial value and the maturity of technology, timely grasp the best time to enter the market, and maximize the industrialization of technology. Third, scientifically set up human resources structure and positions, strictly implement regular training, improve the ability and quality of employees. Fourth, strictly control the recruitment of talents to ensure a high-quality workforce. Finally, fully understand the advantages and disadvantages of different operating channels, improve the channel integration management capabilities, and ensure the healthy and orderly development of the multi-channel combined operation mode.

#### **5 Conclusion**

At present, many companies are focusing on business Mode innovation and transformation, with the aim of acquiring new market resources and discovering new economic growth points, thereby enhancing their competitive advantage. Based on this, this paper summarized the academic research results about business Mode, business Mode innovation and transformation and its risks. According to the actual situation of HD, the risk factors affecting the transformation of its business Mode were studied. It built a three-level Mode of HD's BMTR assessment. Combined with the fuzzy analytic hierarchy process, the evaluation results of HD's BMTR were in "medium-risk". Finally, several prevention and control suggestions were given for the internal and external risks of the enterprise to improve the success of HD's BMT. However, the empirical research in this paper still has some shortcomings. For example, when conducting fuzzy evaluation, only the severity of the impact of each

risk is considered, and the possibility of each risk is neglected. In response to this issue, further modifications will be made later in the study.

(E-mail: 312243103@qq.com)

**Abstract:** In China, universities assume the functions of personnel training, scientific research, social service and cultural inheritance and innovation. From this point of view, level of university interior management and administrative ability affect the direct play of function. In recent years, with the rapid development of higher education in China, the integrity risk of internal management in universities has also increased, and it is particularly important to comprehensively strengthen the prevention and control of integrity risks in universities. This article studies and elaborates the concrete steps and implement of the prevention and control management of integrity risk in universities from the perspective of risk management, using the theory of process management, defines that strengthen overall integrity risk prevention and control management in universities generally go through risk screening, diagnosis and assessment, risk identification, risk response and disposal procedures on the basis of summary analysis of Process Reengineering, at the same time makes a deep interpretation of thoughts and methods of each process in order to provide enlightenment and reflection on further optimizing the integrity risk management and control in universities.

**Key words:** Universities; Integrity risk; Risk management; Process reengineering

### 1 Introduction

As an important means of modern management and measure of corruption control, the management level of integrity risk prevention and control directly determines the modernization process of university mechanism system and capacity, and even affects the realization of personnel training, scientific research, social service and cultural inheritance and innovation. We must have a deep understanding of the importance and urgency of strengthening the integrity risk prevention and control in universities, focus on effective integrity risk prevention and control, optimize the school-running environment, comprehensively improve the scientific level of school management, and strive to provide strong guarantee for accelerating the sustainable and healthy development of higher education.

From the point of current literature, domestic research focuses more on integrity risk prevention and control mechanism construction and mainly studies from the necessity and significance, the existence question and the reason, the optimization strategy and the way to carry out the comprehensive research of integrity risk prevention and control mechanism construction. While there is only a small amount of data available for reference lacking related studies on the integrity risk prevention and control management especially in higher education field from the perspective of risk management. Chen Shilin et al. proposed the basic principles and countermeasures for the prevention and control of integrity risks in universities combined with the current situation of anti-corruption and applied the risk management theory to the prevention and control integrity risks in universities (Chen Shilin, Li Zhihong, MA Guohong, 2014). From the perspective of risk management theory, He Xigeng discussed the

construction of anti-corruption risk prevention and control mechanism in universities from three aspects: the investigation of anti-corruption risk by power operation, the reduction of risk space by improving management system, and the prevention and control of anti-corruption risk by improving operation mechanism(He Xigeng, 2013). From the theoretical basis and connotation of risk management, Xu Maijin et al. studied the risk prevention and control mechanism and work system design of internal risk in universities(Xu Maijin, Zhang Huwei, 2014). Based on the risk prevention and control theory and taking some universities in Beijing as examples, Ma Weina et al. proposed the design ideas and countermeasures of the integrity risk prevention and control management information platform(MA Wei-na, HAO Ping, ZHOU Liang, 2012). The overseas research on the prevention and control of integrity risks is similar to that in China, mostly focused on the causes of integrity risks (corruption), the prevention and control measures of integrity risks and the system. For example, American scholars Rajeev k. Goel and Michael a.elson believe that "the risk of integrity is closely related to geographical factors, historical factors and the influence of the government. They also analyze the influence of historical and geographical factors on the breeding of corruption and the role of legal supervision and other policies adopted by the government in the prevention and control of the integrity risk "(Rajeev K. Goel, Michael A. Nelson, 2010). Daniel Treisman proposed in his research on the causes of corruption problems in different countries that "different forms of national integrity risk prevention and control can be caused by historical reasons, cultural reasons, economic level, influence of political system, interference of national policies and other factors"(Daniel Treisman, 2000). Seongcheol Kim et al. proposed in their related research on corruption prevention that "the introduction of electronic information science and technology to establish the e-government system, namely the network information platform, can improve the transparency of the integrity work of relevant government departments and better inhibit the breeding of corruption"(Seongcheol Kim, Hyun Jeong Kim, Heejin Lee, 2009). Dutch scholars Cyrille FiJnaut and Leo Huberts put forward the idea of "using legal means to curb the breeding of corruption" and explained the specific application and corresponding measures of "legal system" in the prevention and control of corruption risks. However, in general, due to the differences in region, environment, culture and other aspects, foreign universities have different models and practices in the prevention and management of integrity risks, which are also quite different from domestic universities.

Based on the above point and on the basis of theoretical analysis and practice summary combined with the actual situation of domestic universities, this paper will put forward the realization path and optimization measures for further strengthening and improving the prevention and control of integrity risk in universities from the perspective of risk management.

## **2 Theoretical Basis for the Prevention and Management of Integrity Risks in Universities**

From the perspective of management science, the essence of risk management is " to apply general management principles to manage an organization's resources and activities, and effectively control and deal with various risks faced by risk management subjects through the application of various risk management technologies, so as to achieve the goal of obtaining the maximum security guarantee at the minimum cost"(Shao Hui, Zhao Qingxian, Lin Na, 2010). From the understand of this definition, the integrity risk prevention and control management is using the principle of the related theories of management in accordance with the procedures and methods of risk management and the internal public power exercise in universities as well as the factors associated with the risk (including risk itself) to protect against, control and disposal, in order to reduce risk and improve the management efficiency of the daily management activities.

On the basis of Process Reengineering theory, integrity risk management of universities can be identified and assessed namely through exercise the power by probability subject, exercise process, leading system, management system and the external environment which may produce risk related factors and offer the ideas and measures of improving management and optimizing the integrity risk." The core of process reengineering is the reengineering of the management mode which goes through scientific management and ensure the efficient and accurate process execution, optimize the process through continuous improvement of the way of activities, so as to make the enterprise remain competitive" (Wu Jinsheng, 2012). Integrity risk control and management in universities should sort out, diagnose and evaluate all kinds of integrity risk and within the universities and the various factors may affect the integrity risk on the basis of the above theory and formulate verification methods of risk management so as to realize with the minimum cost to achieve maximum security risk prevention and control management goals.

### 3 Practical Approaches for Universities to Comprehensively Strengthen Integrity Risk Prevention and Control

Risk management is a continuous, cyclic and dynamic process. In order to achieve the goal of integrity risk management, it is necessary to solve a series of problems, such as what risks exist in universities, where the risks occur, the probability of the risks, the degree of impact caused by the risks, and what measures are taken to prevent and manage the risks. Therefore, universities should comprehensively strengthen the prevention and control management of integrity risks, generally through risk screening and identification, risk diagnosis and evaluation, risk response and disposal and other procedures according to the definition of process management theory.

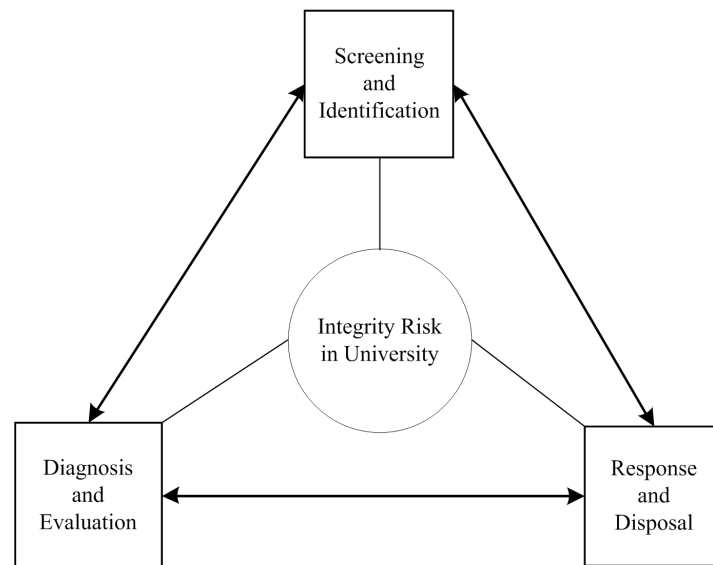

Figure 1 Schematic Diagram of Integrity Risk Prevention and Control Management in Universities

#### 3.1 Investigation and identification of integrity risk

The investigation and identification of integrity risks refers to the process of comprehensive and careful screening and screening of various work fields, units, departments, posts and personnel that may have the integrity risk in universities through certain methods and means, so as to obtain relevant risk

factors. It is easy to say that risk screening and identification is to find and determine the activities of risk information. "Risk identification is one of the key tasks of integrity risk prevention and control management and accurate and effective risk identification is the foundation of building an integrity risk prevention and management mechanism" (Zhang Lan, 2012). Risk screening and identification mainly solve two aspects of the problem, one is what the university internal integrity risk is? The second is where these integrity risks occur. As for the problem of finding out the risks, we should compare the classification of the four types of risks, focus on the investigation from the aspects of ideology, job responsibilities, rules and regulations, and external environment, and comprehensively identify them from both internal and external perspectives. As for the problem of finding out where the risk occurs, it should be carried out from the three levels of school, department (secondary unit) and specific post, focusing on the important matters, key areas and key links of the risk occurrence. See the table below for details.

**Table 1 Objects and Contents of the Investigation of Integrity Risks**

Object	Content
School	The integrity risks of the school leadership and its members in the top-level design of major matters decision-making, important personnel appointment and removal, major project arrangement and large amount of funds, as well as the decision-making procedure and decision-making system of daily management work
Departmental (secondary unit)	The department (second-level unit) shall exercise the independent right and discretion of running a school in the work of teaching management, scientific research management, student management, personnel management, fund management, graduate student enrollment and foreign cooperation in running a school
Specific position	The staff who exercise public power have the integrity risk in performing their duties, carrying out specific tasks and implementing rules and regulations

The simplest and most common methods to investigate and identify the risk of integrity are the comparison self-examination method and the random sampling method. Comparison self-examination method is to analyze and compare individual thought performance, job responsibility division, rules and regulations requirements and other elements related to the occurrence of risks one by one, and find out all integrity risks that have occurred or may exist. The random inspection method randomly checks and verifies the risk items, risk fields and risk links to ensure full coverage and no omission in the risk screening. It should be said that different units, different positions and different stages of integrity risk are not identical, therefore, screening and identification of the risk should be combined with practice, seeking truth from facts to find out the risks accurately and it can't literally expand boundaries, in particular to identify integrity rather than other types of risks, nor any risk of narrow scope and could not find out those hidden trouble in obvious problems.

### 3.2 Diagnosis and assessment of integrity risks

Risk diagnosis and assessment refers to the process of estimating, measuring and evaluating the probability of risk occurrence and the impact and loss degree caused by risk occurrence found in the early stage, which serves as the reference and basis for taking corresponding prevention and control

management measures. Its main purpose is to reduce the risk as much as possible, especially to prevent the occurrence of major risk accidents and at the same time to implement the risk prevention and control management measures and the management cost invested in a reasonable control.

The probability of risk is the possibility amount of risk. From the qualitative perspective, the identification of risk occurrence probability can be divided into five types: extremely low, low, medium, high and extremely high in the order of occurrence probability from low to high. The so-called risk impact degree is the loss caused by the occurrence of risk, including direct loss of economy and assets, as well as indirect loss of reputation and rights. For the determination of the degree of risk impact, it can also refer to the above ideas to divide the degree of risk impact into five types: extremely low, low, medium, high and extremely high. Correspondingly, we can also use a probability distribution, mathematical statistics and other empirical research methods to define the degree of risk probability and risk impact to a certain value and carries on the quantitative analysis of related numerical and make it reflected in the form of data. The greater the numerical value is reflects that the risk probability and impact degree is higher, while the lower the conversely it is. For example, we can use probabilistic risk assessment (also known as probabilistic risk analysis) to assess the probability and impact of risk occurrence. According to the definition of probabilistic risk assessment method:

$$R = p * s$$

Where, R represents the risk rate (the standard or scale to measure the risk size), p represents the probability of the risk occurring within a certain period of time, and s represents the degree of impact or loss caused by the risk.

**Table 2 Qualitative Evaluation Criteria of Integrity Risk Grade**

Risk level	Probability of occurrence of risk	Degree of risk impact	Value at risk
Very low	Risks don't happen in general, they haven't happened in the past, and they're unlikely to happen in the future	Little or no loss, and no significant impact on the normal operation and management of the work	1
Low	Risks occasionally occur	Has had some impact, but to a lesser extent	2
Medium	Risks may occur if they are not paid attention to and can be avoided by taking appropriate measures	Will cause adverse effects, but the extent of the impact is manageable	3
High	Risks happen all the time	The loss is large, affecting the normal operation and management of the work	4
Very high	Risk can happen at any time, the occurrence of risk is almost inevitable	Cause irreparable loss to the unit and individual	5

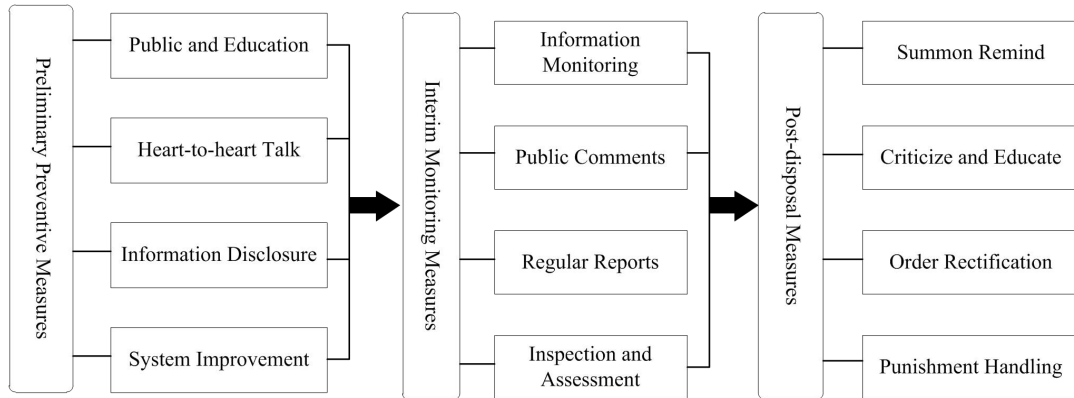

According to the degree of risk probability and impact on the target of comprehensive evaluation, in combination with the important degree of public power, the frequency of the power, the discretion of the factors such as size, our universities of the risk can be divided into three levels, namely, Category A, Category B and Category C, quantitatively calculated by applying the method of probabilistic risk assessment at the same time, we can conclude: Category A as the highest levels of integrity risk (risk value of 4 or less), the probability of occurrence of A risk is great which can cause serious consequences, and possibly break the law or the case constitutes crime. It is very necessary to draw high attention. Category B is the general level of integrity risk (4 risk value 12), such risk may or may not occur, the impact degree and loss brought by the controllable scope, need to take measures to strengthen prevention and management, try to avoid the occurrence of such risks. Category C is low-grade integrity risk (12 risk value 25), which is less likely to occur and will not cause serious consequences even if it does occur. It needs to be emphasized that no matter what kind of risks we are faced with, we cannot let down our vigilance and must do a good job in prevention and control and management, because the risks themselves are universal, potential, loss-making and changeable.

**Figure 2 Risk Evaluation Plot**

### 3.3 Risk response to integrity

Integrity risk response and disposal refers to the activities of taking appropriate prevention, monitoring and disposal measures to intervene and control risks according to different risk types on the basis of risk screening, identification, diagnosis and evaluation. According to the time stage of risk occurrence, we can effectively manage the risk of integrity from the three aspects of early prevention, middle monitoring and late disposal.

Fig

**ure 3 Integrity Risk in Universities Response and Disposal Basic Flow Diagram**

(1) Preliminary preventive measures. In view of the above classification of integrity risks in universities, preventive measures such as publicity and education, heart-to-heart talk, information disclosure and system improvement can be taken in the early stage to minimize the possibility of risk occurrence. First, make full use of the campus media to strengthen the publicity of integrity, carry out warning education in a planned way, and constantly enhance personal risk awareness, integrity awareness and self-discipline awareness. Second, regular development of heart-to-heart conversation activities, face-to-face communication, exchange of views, timely grasp the ideological dynamics. Third, vigorously promote the construction of integrity culture, let integrity culture into all aspects of work and life, and actively create a clean atmosphere of campus culture. Fourth, we will make more information disclosure, make management more transparent, and let the people oversee and exercise power in a transparent way. Fifth, we will improve rules and regulations, establish a long-term working mechanism for risk prevention and management, and plug loopholes in the occurrence of risks.

(2) Interim monitoring measures. In the middle stage of risk prevention and control, process management should be strengthened. Through information monitoring, public comments, regular reports, inspection and assessment, the integrity risks that have been screened out in the early stage, especially high-level integrity risks, should be supervised and managed. Information monitoring is mainly to use modern information means to timely collect and grasp risk information and carry out summary analysis. The public evaluation is mainly taken through the establishment of opinion boxes, supervision of the release of telephone and email, meetings, questionnaires, etc. so as to understand the public's opinions and suggestions on the prevention and control of integrity risk management. The regular report mainly refers to that the relevant responsible units and responsible personnel regularly report the work status of risk prevention and control management to the management department and leaders. The inspection and assessment are mainly taken to assess and evaluate the implementation of the system and the performance of duties so as to urge the continuous improvement and improvement of risk prevention and control management.

(3) Post-disposal measures. The post-disposal is mainly aimed at the situation that the risk of integrity has occurred. Timely measures should be taken to minimize the degree of risk impact and prevent the integrity risk from evolving into corruption or even crime. For this reason, we must take corresponding measures to control. For example, for those problems with small risk impact, we can interview relevant units and personnel, remind them and put forward work requirements. For problems with a high degree of risk impact, we may order rectification within a time limit and criticize and educate relevant units and personnel. For the problems with particularly significant risk impact degree, they shall be dealt with in strict accordance with relevant regulations, and certain economic

compensation or punishment shall be given when necessary.

#### 4 Conclusion

According to the above research, the author believes that the integrity risk prevention and control management in universities should comply with the ideas and methods of risk management theory and be concerned with the university internal integrity risk which may be produced or impacted by the risk of related elements, from risk screening and diagnosis and assessment, risk identification, risk response and disposal of three aspects of optimizing the risk prevention and control management process, taking concrete measures to integrity, risk for effective prevention and control and management. In future research, the author will continue to comply with the research ideas, taking the integrity risk prevention and control of management combined with the internal control management work and punishing and preventing corruption work. On the basis of systematic and in-depth analysis of the relevant theories of risk management, this paper will further propose more scientific and effective integrity risk prevention and control measures against corruption and provide beneficial inspiration and reference for accelerating the modernization of university management system and capability.

## Risk Analysis of Ships Navigation Safety in Wuhan Port

Mao Senpeng, Jiang Feifei

School of Navigation, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 568773627@qq.com, 970386280@qq.com)

**Abstract:** Wuhan port is an important port for inland river navigation in China, we must pay more attention to the safety of vessels sailing within the port. Aiming at the present situation of navigation safety in Wuhan port, this paper employs the formal safety assessment method to analyze the risk of navigation safety of ships in Wuhan port. Based on the risk identification of human, ship and environment factors in Wuhan port, an evaluation index is constructed to obtain the risk level of ship navigation in Wuhan port according to the risk matrix, and a risk control option is proposed. The present paper would provide some references for the safety management department to ensure the safe navigation of ships in Wuhan port.

**Keywords:** Formal safety assessment; Risk identification; Risk assessment; Risk analysis

### 1 Introduction

According to statistics from the Ministry of Transport, Wuhan port has handled 13.33 million tons of cargoes loaded and unloaded in 2019 as of March 2019, 14.6 percent higher than that of the same period in 2018. In the face of the increasing navigable density, the safety risks of water traffic accidents are also increasing. Therefore, the risk analysis of navigation safety of ships in Wuhan port can effectively reduce the occurrence of traffic accidents in the port.

#### 1.1 Research status of ship navigation safety risk analysis

Risk analysis is one of the important parts of the research on ship navigation safety in port waters. So far, the commonly used safety assessment methods include fuzzy mathematical analysis, analytic hierarchy process (AHP), analysis network process (ANP), probability analysis and formal safety assessment method (FSA) (Fan Hong, 2004). Formal safety assessment (FSA) is one of the commonly used for safety assessment. As a technical tool of safety management, FSA method can be used for risk analysis in navigation safety management to comprehensively, reasonably and effectively improving ship navigation safety.

##### 1.1.1 Study on the risk analysis of ship navigation safety abroad

In the field of water traffic safety assessment, experts such as M.J. BARLATT from the UK and Kwik from Germany summarized the safety assessment index system and index factors, and achieved certain research results.

Britain is the first country to study the safety assessment of crew and passengers on high-speed catamarans (Wang Yunlong, 2011). Japanese scholar Hiroaki Kobayashi put forward the method of environmental safety assessment of navigation difficulty, which can quantitatively evaluate the operation difficulty of ships (Hiroaki Kobayashi, 1992). In recent years, IMO is researching and popularizing a new method for maritime Safety standards –FSA (Formal Safety Assessment), which takes risk analysis and Assessment as one of the most important steps for the FSA (Z Karaszewsky,

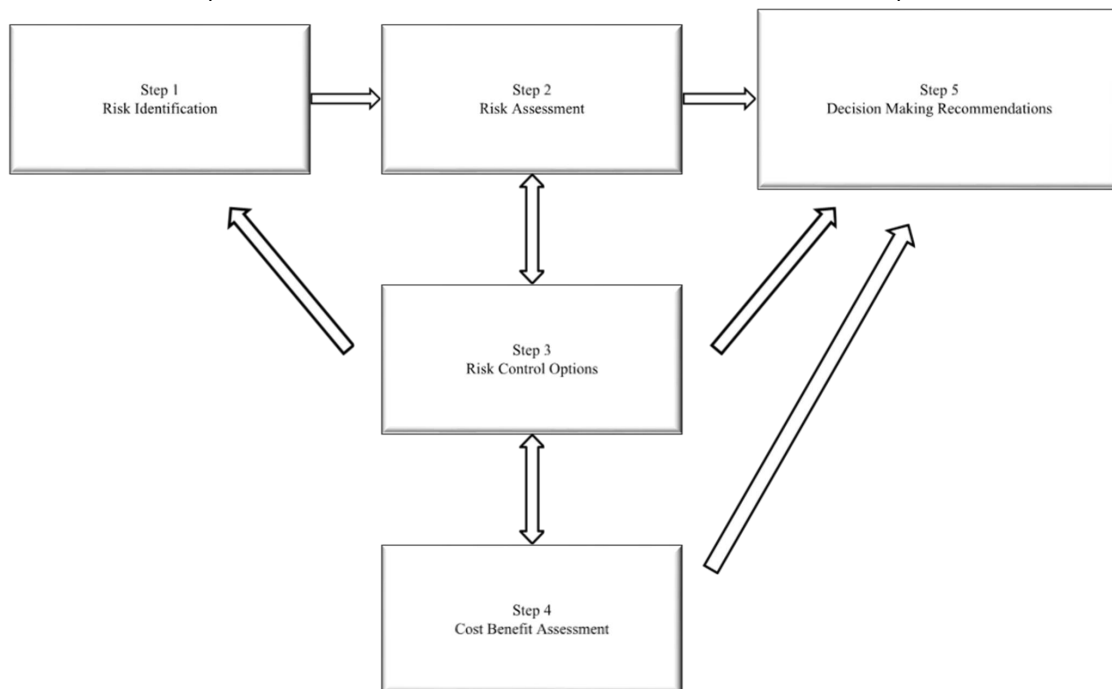

1995).

1.1.2 Study on the risk analysis of ship navigation safety in China

In November 1999, China Classification Society published the Guidelines for the application of comprehensive safety assessment, and cooperated with Shanghai Institute of Standards to apply FSA method to the risk assessment of high-speed ships in the Yangtze river (Chen Weijiong, 1998). The research on sea traffic in China started late, but many experts have done a lot of research on the evaluation of traffic safety of ships in port waters from different angles. Sun Ruishan, etc. put forward the system engineering theory based on "human, aircraft and environment" in the Airline safety assessment system (Fang Quangen, 2004). In the Formal assessment of the environmental risk of ship handling in harbor waterways, engineer Ma Hui made a quantitative analysis and evaluation with the method of grey statistical assessment. Wuhan University of Technology Fan Hong introduced the general situation of formal safety assessment, analyzed the sources of uncertain factors and various difficulties in the implementation in the Research on the Method of Ship Formal Safety Assessment (FSA) (Xu leping, 2000).

**2 Risk Analysis Based on FSA**

In the process of navigation, the safety status of ships has impacted on many aspects. By connecting inland and sea transport through Wuhan, the logistics boom on a larger scale will give a boost to the economy of the hinterland of central China. The formal safety assessment (FSA) is adopted for the navigation risk analysis of Wuhan port. FSA is a systematic and standardized analysis method, which is usually composed of five steps, including risk identification, risk assessment, risk control options, cost benefit assessment and decision making recommendations, as shown in Figure 1 (Jing Shi, 2019). Under the framework of FSA method, the present paper analyzed the risk of navigation safety of ships in Wuhan port, in combination with the specific situation of Wuhan port, following the steps of risk factor identification, risk assessment and risk control optionl

**Figure1 FSA Flow Chart**

## **2.1 Wuhan port risk identification**

### **2.1.1 Wuhan port people for the factors of risk identification**

In the research of ship navigation safety, human factor is a very important subsystem, nearly 80% of navigation accidents are caused by human factor. Human factors can be specifically divided into four aspects: safety awareness, experience and skills, strain capacity and physical quality of personnel involved in ship navigation. Combined with the actual situation of Wuhan port, the risk of navigation in the port is reflected as follows: on the one hand, some ship operators in Wuhan port have obvious weak safety awareness and insufficient responsibility awareness. On the other hand, the lack of highly educated seafarers and the low comprehensive quality of seafarers in the port leads to the lack of strain capacity and experience in dealing with emergencies when the ship encounters emergencies.

### **2.1.2 Risk identification of influential factors in Wuhan port**

The ship factor is one of the objective factors of water traffic accidents. Ship structure, ship size, ship equipment, ship age, sailing speed and other factors have an important impact on navigation safety. The increasing size of ships results in the turbine factory quality requirements, as well as the late turbine equipment maintenance requirements more stringent. Through the inspection of nearly 240 ships of Wuhan port authority, it can be found that the overall safety of the ships sailing in the port is in good condition. However, as time goes by, the stress structure of each part of the ship and the hull will gradually age, and its function and life will gradually fade, which makes surface traffic accidents more frequent. In order to save the operation cost, some port companies neglect the safety management of ships and cut corners on the daily maintenance of ships.

### **2.1.3 Wuhan port risk identification of environmental factors**

The environmental factors that affect the navigation of ships in port waters include hydrological and meteorological conditions at the time of navigation and navigation conditions within the port area. In terms of precipitation, temperature, water level, flow rate and fog condition, etc., the hydrological and meteorological conditions of Wuhan are good, and there is no history of freezing all year round in the port area. The ship is not easily affected by wind, waves, low visibility and other factors when sailing in Wuhan port, which has little impact on the risk generated in the process of sailing. The figure shows the distribution of part of the port area of Wuhan port. From the Figure 2, it can be seen that the Yangtze river is crossed by several bridges, with narrow water width and multiple bends in the channel, among which the channel width of the Yangtze river section is 80 meters at the narrowest point. With the increase of port throughput, the navigation density increases and the probability of collision increases. Due to the influence of the swirling current near the pier, it is difficult for passing ships to control their speed, which leads to frequent bridge collisions in Wuhan port.

Figure2 Distribution Map of Wuhan Port (Part)

## 2.2 Wuhan port of risk assessment

In the existing water traffic accidents, it is not difficult to find that the risk factors of personnel loss and property loss caused by ship stranding, hitting rocks and collision are diversified, and it is difficult to use the same standard in risk analysis. This paper adopts FSA method to systematize and quantify risk factors in risk assessment, and then measures the navigation risk of the ship (Peter Vidmar, 2018). There is a relationship of a double function between risk  $R$  and event occurrence frequency  $F$  and event severity  $N$ , namely Formula (1):

$$\text{Risk} = f(F, N) \quad (1)$$

The attributes of frequency and consequence degree are not single, so the risks are superposed.

$$\begin{aligned} \text{Risk}_{\text{status1}} &= f(F_{\text{status1}}, N_{\text{status1}}) \\ \text{Risk}_{\text{status2}} &= f(F_{\text{status2}}, N_{\text{status2}}) \\ \text{Risk}_{\text{total}} &= \text{Risk}_{\text{status1}} + \text{Risk}_{\text{status2}} \\ &= f(F_{\text{status1}} + F_{\text{status2}}, N_{\text{status1}} + N_{\text{status2}}) \end{aligned} \quad (2)$$

According to the general situation in the maritime industry and the practice of experts. And the application of Professor Fang Quangen of Shanghai Maritime University in the study of pilotage Safety in Shanghai Port. The frequency  $F$  is the ratio of the sum of the number  $C$  of the events in unit time to the sum of the ship activity  $Q$ , namely Formula (3):

$$F = \frac{\sum C_i}{\sum Q_i} \quad (3)$$

The frequency of events is divided into four levels: Frequent ( $F_4$ ), Probable ( $F_3$ ), Occasional ( $F_2$ )

and Rare ( $F_1$ ), which are used as the evaluation indexes in this paper (Li Faming,2013).

The severity  $N$  of the event is the ratio of the sum of the consequence  $S$  of the event in unit time to the sum of the number  $C$  of the event, namely Formula (4):

$$N = \frac{\sum S_i}{\sum C_i} \quad (4)$$

There are seven levels of consequence occurrence during the voyage of a ship. In this paper, four levels of Very Serious ( $S_7$ ), Severe ( $S_5$ ), General ( $S_3$ ) and Slight ( $S_1$ ) are selected as evaluation indicators.

The risk in the navigation of the ship is classified into levels, and the Figure 3 is obtained. In the lower left corner of the figure, the risk level of the light-colored area is  $R_2$ - $R_4$ , which represents the risk area that is allowed to be ignored. The risk level of the middle white area is  $R_5$ - $R_8$ , indicating the low risk area. The dark area in the upper right corner has a risk rating of  $R_9$ - $R_{11}$ , indicating a high-risk area (Jakub Montewka,2014). The above evaluation indexes can be used in the risk analysis of navigation safety of ships in Wuhan port. If the risk level is within  $R_2$ - $R_4$ , it is considered acceptable when the risk occurs; In the range of  $R_5$ - $R_8$ , it is considered that reasonable loss can be reduced when the risk occurs; In the range of  $R_9$ - $R_{11}$ , the risk is considered to be firmly forbidden. After the quantitative assessment of the risk factors of Wuhan port, it is concluded that the risk level of the ship navigation safety of this port belongs to the risk area which can be reasonably reduced.

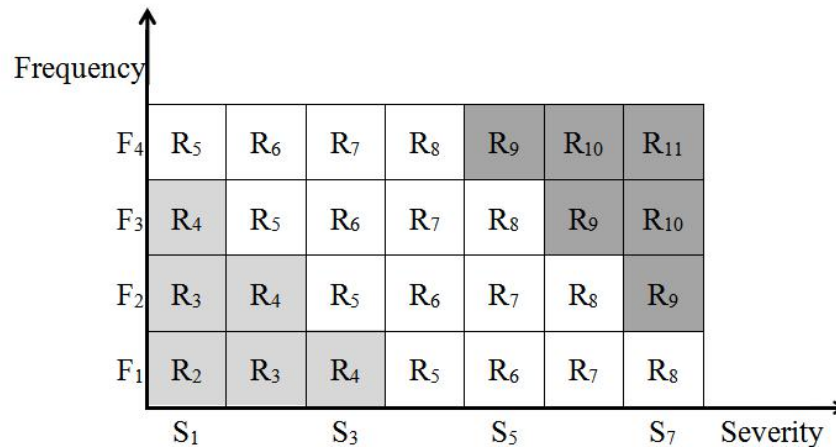

Figure3 RiskRating Diagram

### 2.3 Risk control options of Wuhan port

Through the risk identification and assessment of Wuhan port, it can be found that there is a lot of room for improvement in the navigation safety management of the port. The following control options are proposed for the prominent aspects of the problem:

(1) The comprehensive quality of the crew needs to be improved. To strengthen the awareness of the safety responsibility of the crew and establish a scientific and reasonable safety management system (SMS); Crew members are required to master various emergency rescue measures to reduce

man-made security risks in finitely from the root.

(2) Improving the navigation safety of ships and the VTS system of Wuhan port. On the one hand, we should pay more attention to the daily maintenance of ship equipment, and regular inspection of radar, fog clocks, firefighting equipment, and keep VHF communication unobstructed. On the other hand, we should increase investment in Marine equipment, accelerate the upgrading and introduction of more advanced equipment, and improve the anti-risk capability of ships in terms of technology and equipment.

(3) Improving the navigation environment of the port. Although there is less severe weather in Wuhan all year round, in order to improve the safety of navigation, the supervision department should strengthen the reminder of navigation ships. In addition, we can visit the ship and crew members to optimize the port route and stabilize the traffic order in the port waters to reduce, as far as possible, the ship collision caused by wind, fog, cyclone.

### 3 Conclusion

Through the analysis of risk identification, risk assessment and risk control scheme, this paper carried out risk analysis on the navigation safety of ships in the waters of Wuhan port, and came to the conclusion that the navigation safety risk existing in this port can be reasonably reduced, and put forward suggestions to reduce the navigation risk, so as to ensure the navigation safety of ships in Wuhan port. Based on the FSA, this paper made a quantitative analysis of the navigation risk of Wuhan port and classifies the risk level. In the follow-up study, more detailed decision-making suggestions can be obtained by combining with the cost-benefit evaluation.

# Research on Risk Factors of Enterprise Product Innovation Design

Deng Jun

School of Urban Design, Wuhan University, Wuhan, Hubei, 430072

(E-mail: whuteach@126.com)

**Abstract:** This paper expounds that the risk of enterprise product innovation design exists objectively. It reveals that the risk concept of enterprise product innovation design consists of the risk of design strategy, the risk of design target, the risk of design process, the risk of design quality, the risk of design intellectual property and their sub-risks. This paper discusses the research on the risk concept of enterprise product innovation design, which lays the theoretical foundation and preconditions for the research of risk identification, risk management and risk transmission. This paper has important theoretical value and practical significance.

**Key words:** Enterprise product innovation design; Design risk; Design strategy risk; Design target risk

## 1 Introduction

Compared with the theoretical research on product innovation and risk management, the research on design risk theory is a term appearing in recent years, and mostly focuses on the fields of architectural design, engineering construction and so on. Ke Dong, from Tsinghua University, discuss the reasons for the existence of design risks, sources of risks, and forms of expression, identification methods and other issues, in his dissertation: "Market Risk Identification Design in SME Product Design Plan"(Ke Dong, 2006); Wan Zhang in Zhejiang University built a product development project risk identification system, identified the five main risk factors and 16 key risk factors of risk management of the mobile phone design company product development project, and calculated the weight between risk factors and risk consequence indicators his dissertation "mobile phone design company product development project risk identification and control research" (Wan Zhang, 2007); Zhisheng Li of Central South University proposed in "Managing Your Design Risks" (Zhisheng Li, 2007) The concept of design risk reveals the way to pay attention to the control of design risk and enhance the success rates of product innovation.

Enterprise product innovation is an exploratory activity that starts from the conception of new products and ends with the sales and delivery of new products. (Chen Hanqing, 2005) Design risks are ubiquitous in this exploratory activity. The design risk directly affects the success or failure of enterprise product innovation design activities. However, it is far enough from to study the risk of enterprise product innovation design in academia and business circles at home and abroad. Therefore, the research on enterprise product innovation design risk has very important theoretical research value and practical application value.

## 2 The Formation of Enterprise Product Innovation Design Risk Concept

There are many different opinions about the definition of product innovation. Academician Xu Qingrui of Zhejiang University believes that all technological innovation activities and the introduction

of new product development can be called product innovation; Professor Fu Jiayu of Tsinghua University believes that the purpose of product innovation is to obtain new or some improved, improved products, including the renewal of industrial equipment; Professor Shumei Ma, from the institute of modern manufacturing technology of Tongji university, believes that the so-called product innovation refers to the process of creating products with competitive advantages in the market in order to achieve business goals. Product innovation is mainly reflected in product design.

Product innovation design is a systematic and high-procedural enterprise production and management activity. The successful development of a new product will go through market research, development decision, design and implementation, manufacturing, sales, recycling and so on. (Xie Kefan, 1993) In this process, enterprises need to make strategies and set goals according to the information of market research. New products need to be designed based on the design process and design system; Design and product departments need to develop corresponding product quality standards to meet consumers demand; new products also need to be protected by intellectual property rights to ensure the continuous benefits of enterprise product innovation. (Feng Xiaoqing, 2001) To sum up, a successful development of a new product must go through making design strategy, design business objectives, design process flow, design production and management system, design product quality standards, design intellectual property rights protection and other links. In the design process of these links, due to the influence of subjective and objective factors, there are a lot of uncertainties, which make the actual achievement of the design and the design goal are too high, so that the design value suffers the possibility of loss, that is, the design risk.

The existence of enterprise product innovation design risk is not based on human will, and it exists objectively. Systematic analysis and identification are carried out from the perspective of system theory, which forms the risk concept of enterprise product innovation design. According to the experience of enterprise product innovation, the design risk concept consists of design strategy risk, design target risk, design process risk, design system risk, design quality risk, and design intellectual property risk. The specific content is shown in Figure 1.

**Figure 1 The Concept of Enterprise Product Innovation Risk Architecture Diagram**

### **3 The Essence of Enterprise Product Innovation Design Risk Concept**

As for the definition of risk, scholars at home and abroad discuss a lot, which can be summarized as follows: the lost chances and possibilities; the higher actual and expected results; the lost uncertainty; the probability of actual result is higher than expected target; things that have negative effects and are unexpected to happen. (Song Mingzhe, 2003)

The design risk involved in enterprise product innovation design is the possibility of loss of design value due to the influence of subjective and objective reasons, which leads to many uncertainties in the design process of enterprise product innovation design. Its essence makes the following analysis.

### **3.1 Risk of enterprise product innovation design strategic**

Enterprise product innovation design strategy is one of the components of enterprise production and management strategy, which is the development plan of enterprise design department and the long-term plan and strategy formulated by enterprises according to their own design work and the design criteria and directional requirements.

The production and operation strategies of enterprises are divided into enterprise levels, which are divided into company level strategy, business level strategy and functional level strategy. The realization of the enterprise product design strategy is affected by the strategy of each layer.

The company-level strategy is the core strategy of the company's highest level. It is directly related to the positioning and development of the enterprise, as well as the allocation of various resources and department setting of the enterprise, it has the most fundamental effect on the design strategy and thus forms the design strategy risk leadership decision-making risk.

Business strategy is the strategy of each business unit of an enterprise, which determines the performance, quality, delivery time, after-sales service and price of products. It has the most direct impact on design strategy, and forms the direct factor risk of design strategy risk.

The functional level strategy is the specific path and means to ensure that the various strategic objectives of the enterprise can be realized. The implementation of various tasks is guaranteed by formulating specific, precise and clear rules. It indirectly influences on design strategy, developing the indirect factor risk of design strategy risk.

The scientific, advanced, maneuverability and effectiveness of enterprise product innovation design strategy also directly affect the effect of design strategy, forming the design strategy risk internal factor risk.

The strategic risk of enterprise product innovation design consists of external factor risk (leadership decision-making risk, direct factor risk, indirect factor risk) and internal factor risk.

### **3.2 Risk of enterprise product innovation design target**

The enterprise product innovation design goal is based on its content composition, including the technical goals, artistic goals, functional goals, economic goals and market objectives of the design. Whether the design goal can be achieved is influenced by the production technology and management technology of its own technical goal, the art form and artistic function of the artistic goal, the coordination of the basic function, supporting function and additional function of the functional goal, the rationality of the cost and profit index of the economic goal, and the accuracy of the market segmentation and market positioning of the market goal. However, the establishment of these goals is influenced by the changes of design clients, design contractors, consumers, competitors, national policy and other factors, and there are many uncertainties. Thus, the technical goal risk, artistic goal risk, functional goal risk, economic goal risk and market goal risk of enterprise product innovation design goal risk appear.

According to the theory of the logical relationship of means and purpose, strategy is the means and methods taken in order to achieve the target; goals are the achievements and results expected by

individuals, departments or the whole organization, in the implementation of organizational planning, goals are both the starting point and the destination. The relationship between strategy and goals is so close that many organizations do not separate them in their actual planning and project operations.

XELIBRI, for example, which is the mobile phone brand that Siemens launched from February to December 2003. With a life span of just one year, the XELIBRI sold only 780,000 handsets in the first 10 months of its popularity, less than 2% of the global sales of the Siemens brand. In 2004, Siemens announced that it was suspending production lines of the XELIBRI series and cutting prices. The reason why the XELIBRI phones failed may be because, as Amy said, an American mobile phone user, "if the XELIBRI phones are targeted at high-level users, the price is a little lower and the functions cannot meet the needs of high-level users. But the XELIBRI phones are considered too expensive and unacceptable for the public. Obviously, Siemens made a wrong judgment when it established the market positioning of XELIBRI mobile phone. Even though the appearance design was excellent and the quality was excellent, it could not save the product from failure, because it did not really grasp the key to success in the design strategy and goal stage, so other design links were just in vain.

Figure 2 XELIBRI 1-8

### 3.3 Risk of enterprise product innovation design process

From the point of view of industrial production, the process refers to the steps from raw materials to finished products. From the perspective of design process content, it includes product demand and investigation, product development and design, product display and identification, product production and sales, product recycling and reproduction. Whether the design process can be achieved and smooth is affected by the uncertainty of the internal factors of each link and the uncertainty of the connection factors between the links.

The authenticity and accuracy of the data in product demand and market research links, the accuracy of the concept and detail design of product development and design process, the prototype test and evaluation of comprehensive, accuracy and objective fairness of product display and identification link, the scientificity and competitive strength of the products production and sales link production process, and the requirements for energy conservation and environmental protection in product recycling and reproduction process, the uncertainty of the internal factors in these links, lead to the inherent risk of each link of the design process.

The scientificity, integrity, timeliness and adaptability of the feedback mechanism in the upstream and downstream links of the process of the enterprise product innovation design, as well as the degree of cooperation among functional departments, result in the risk that each link of the design process connects with the other.

The risk within each link of the design process and the risk of each link connecting each other constitute the risk of the enterprise product innovation design process.

### **3.4 Enterprise product innovation design system risk**

In general definition, the system is a combination of several components that are interconnected and mutually constrained, with an organic whole with specific functions. (Wang Yingluo, 2005) Enterprise product innovation design system is a comprehensive system of cross-domain, cross-level and cross-department. This integrated system is divided into internal elements of the system and external elements of the system. External elements of the system include market environment elements, policy and regulation elements, and emergency elements and so on.

The personnel element specifically refers to the professional quality of the designer, which is directly related to the quality of the design scheme; the technical element means that the technical strength of the enterprise itself will lead to the realization of the level of design standards; the capital element refers to the funds required by the enterprise to provide the design project. Adequacy will lead to the quality of the design project and the speed of the progress; the fluctuation of these factors and their uncertainty lead to the formation of internal factor risks.

Market environment factors specifically refer to the changes and uncertainties of time, spatial factors, information factors, price factors, etc., which are the key to the result of enterprise product innovation; the elements of policies and regulations refer to the stability and persistence of policies and regulations, which are related to the survival and development of enterprise design system organization. Emergency elements refer to natural disasters, political turbulence, explosive news, etc. Related projects will lead to the breakdown of the enterprise design system, while non-related projects will lead to the instability of the design system. The changes and uncertainties of the above factors lead to the formation of risks of external factors of the system. (Cachon, G. P., Randall, T., Schmidt, G. M, 2007)

The risk of internal factors and external factors of design system constitute the risk of enterprise product innovation design system. (Gero Js, 2004)

### **3.5 Risk of enterprise product innovation design quality**

Design quality refers to determining the quality or quality level of the required design based on the user's purpose of use, economic status, and internal conditions of the enterprise. (Chen Xiaotan, Zhao Jianghong, 2006) This usually includes the quality of market research, design ideas/concepts, and design specifications.

Market research quality refers to the precision degree of clearly meeting the requirements of users' "adaptability" and formulating corresponding design quality standards in the research stage. (Nigel Cross, 2007) Design conception/concept quality refers to the level of achieving "adaptive" design quality standards based on the input of design information and the output of stage results; Design specification and quality refers to the conformity of the specific product scheme to the design quality standard of "adaptability". These involve the uncertainty of the realization degree of design quality requirements, which leads to the quality risk of enterprise product innovation design.

Product quality is an important guarantee to realize the value of products. The quality is directly related to the sales volume of products, and then affects the survival and development of enterprises. Design quality is the core element of product quality, design quality risk will greatly affect design quality, and design quality defects will bring incalculable huge losses to enterprises.

On February 12, 2010, a Nebraska consumer filed a lawsuit against Toyota motorcorporation in Los Angeles, demanding that Toyota should take responsibility and pay economic compensation for the death of her husband and the injury of her caused by the vehicle it manufactured. Toyota has recalled 9.1 million vehicles around the world (figure 3), dealing a heavy blow to Toyota and the Japanese

automobile industry as a whole.

**Figure 3 The Cause of Toyota Brake Door Accident**

### **3.6 Risk of intellectual property rights of enterprise product innovation design**

Intellectual property rights refer to the lawful rights to possess, use, dispose of and profit from intellectual work. The exclusive rights include copyright, invention patent, utility patent, design patent, trademark, service mark, manufacturer name, source name or country of origin.

From a broad perspective, design intellectual property rights refer to the rights to possess, use, dispose and profit obtained by means of trademark registration, application of invention patent, utility model patent and appearance design patent, which are formed by means of design, such as pattern, logo, modeling, structure, new concept/principle and application of new material. In a narrow sense, it refers to product design patent.

In the process of enterprise product innovation design, the design results without patent protection are easy to be imitated and cannot bring reliable value to enterprises, forming the risk of intellectual property rights of enterprise product innovation design.

Since domestic automobile enterprises and design companies are not strong in vehicle research and development and lack of experience, especially for small and medium-sized domestic automobile enterprises, imitation of successful models in the market has become the main way for them to start their business, mainly reflected in the appearance design of successful models. (I M Verstijen. J M Hennessey, 2010) In September 2007, on the first day of the Frankfurt auto show, auto weekly, Germany's most influential auto professional newspaper, published an article revealing that BMW group had sued Chinese SHUANGHUAN automobile and German dealers in Munich local court, while SHUANGHUAN SCEO models were on display at the Frankfurt auto show. (Deng Jun, 2011) BMW group argues that the SCEO model launched by SHUANGHUAN is similar in appearance to the X5 model of BMW's urban off-road vehicle, and that its low price has a market impact on the X5 model and infringes BMW's intellectual property rights, so it asks the Munich court to make the relevant ruling. In June 2008, the court in Munich ruled that SHUANGHUAN was infringing and banned German car dealers from importing the SHUANGHUAN SCEO models, which look like BMW X5 (figure 4). (Deng Jun,2011)

Figure 4 BMW X5 Model (left) Double-Ring SCEO Model (right)

#### 4 The Research Value of Enterprise Product Innovation Design Risk Concept

Research value 1, identify enterprise product innovation design risk and its connotation, and reveal enterprise product innovation design risk concept framework system (figure 5).

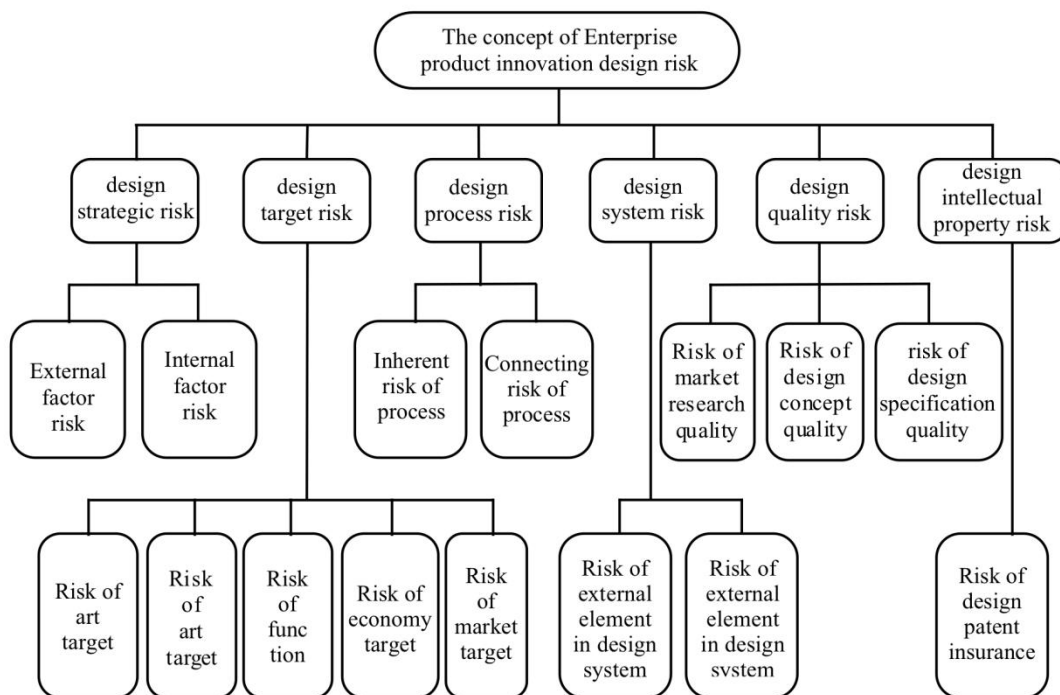

Figure 5 Composition Chart of Enterprise Product Innovation Design Risk View

The existence of enterprise product innovation design risk is not transferred by human will, but is an objective fact. Careful analysis of its causes and accurate identification of its risks is the premise of strengthening risk management, and on this basis to reveal the enterprise product innovation design risk concept and its framework system, which is a powerful measure to prevent risks and control risks.

Research value 2, provides the foundation and conditions for strengthening enterprise product innovation design risk management.

Domestic and foreign scholars have made a lot of achievements in risk management. It is generally believed that risk management should be carried out through risk identification, risk measurement, risk control and other links, and common methods and strategies for enterprise risk management such as risk identification, risk avoidance, risk sharing and risk transfer are put forward. The research on the risk concept of enterprise product innovation design identifies the risk of enterprise product innovation design and its framework system, which provides the foundation and conditions for strengthening the design risk management.

Research value 3, laid a foundation for the prevention and control of enterprise product innovation design risk transmission.

Enterprise product innovation design risk is dynamic, it will be in risk source, and under the influence of internal and external environment, relying on certain risk carriers, through a certain path or channels, diffusion and spread to every link of enterprise product innovation design and its business process, the realization of the product innovation design of the enterprise has reached the established goal. The research on the risk concept of enterprise product innovation design identifies the risk of enterprise product innovation design and its framework system, which lays a foundation for controlling the risk source, intercepting the risk transmission carrier, breaking risk conduction paths, and effectively preventing and controlling the risk transmission of enterprise product innovation design.

## **5 Conclusion**

The formation of enterprise product innovation design risk concept is expounded. Enterprise product innovation design risk concept consists of design strategy risk, design target risk, design process risk, design system risk, design quality risk and design intellectual property risk. The above risk events have certain order and primary and secondary relations, so the establishment of the risk concept is helpful for entrepreneurs and managers to judge the timing of risk control intervention.

The essence of enterprise product innovation design risk concept is discussed, and the framework system of enterprise product innovation design risk concept is constructed. The framework is helpful to clarify the influencing factors and specific meanings of various risk events, to locate the specific objects of risk control, and to clarify the impact scope of the control measures.

It reveals the three-point research value of enterprise product innovation design risk concept, and lays a theoretical foundation and prerequisite for the research of enterprise product innovation design risk identification, risk management and risk transmission. At present, relevant researches have been completed including: industrial product design risk assessment system, risk control strategy based on industrial product design risk assessment system, and design risk conduction control strategy based on dynamic coupling.

# Internet Financial Risk Early Warning Based on Fuzzy Analytic Hierarchy Process

Yang Yuxin

School of International Education, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: yangyuxin\_wut@163.com)

**Abstract:** Based on the analysis of the impact of big data on Internet Finance under the background of internet, this paper combs the current development of Internet Finance in China, finds out the similarities and differences between internet Finance and traditional finance, and through comparative analysis, clears up the unique risks of Internet finance. On the basis of these analyses, this paper takes full account of the characteristics of Internet finance. Starting from the concept of big data, with the help of fuzzy analytic hierarchy process and data as the core, it tries to construct an early warning system for Internet financial risk assessment. Then, empirical research based on this system shows that China's current Internet financial risk level is relatively high, mainly due to the uncertainty of Internet security. Finally, based on the research findings, this paper puts forward some suggestions on the measures to be taken at the level of Internet security, operation, business and law.

**Key words:** Internet finance; Big data; Risk warning; Risk assessment

## 1 Introduction

### 1.1 Research background and purpose

Internet has changed the world, and Internet finance is changing the world. The development of science and technology has led to the development of the Internet, and also provided opportunities for the emergence and development of Internet finance. With the continuous attention to the financial industry and Internet technology in China, the support for Internet finance from the policy perspective has become stronger and stronger, which has promoted the development of Internet finance in China at a very fast speed. But in addition to optimistic judgment, we still need to think about the risks of Internet finance rationally. After all, for the financial industry, controlling and avoiding risks is the most important thing.

There are endless Internet financial products, crowdsourcing, P2P, online finance, micro-lending and so on. These new financial situations help people who are unable to enter the financial industry to get what they want, so that people no longer need to look to finance but participate in it.

It has to be admitted that Internet finance has the same risks as traditional finance, but also because of the high-tech dependence, high dissemination and diffusion of the Internet itself, these risks have increased to a certain extent.<sup>[3]</sup> At the same time, due to the imperfect supervision system of Internet Finance and the imperfect laws and regulations, the risks of Internet finance have increased to some extent. But this cannot be a reason to curb the development of Internet finance, but rather to urge us to find out where these shortcomings and risks are, and find ways to promote their healthy development, rather than blindly suppress them. This is also the original intention of the current study of Internet

financial risk.

Based on this, it is necessary to establish an Internet financial risk assessment and early warning system. Effective evaluation and early warning system can enable the whole industry and industry institutions to identify risks as early as possible, avoid them as early as possible, and control them in advance. It can ensure the healthy development of Internet finance and avoid adverse consequences. On the other hand, with the development of Internet technology, people can forecast the trend more conveniently and accurately. In this technological background, with the help of the advanced Internet technology and concept of big data, it is most suitable to effectively prevent the risk of Internet finance. Therefore, based on this background, this paper tries to study how to use big data to prevent the risk of Internet finance, and to find an effective way to promote Internet finance to avoid risks and develop healthily.

## **1.2 Summary of domestic and overseas research**

With the rapid development of Internet finance, more and more people participate in the research of Internet finance. Among many factors, the risk of Internet finance and its management are still a hot issue of concern.

Sun Zhihan (Sun Zhihan, 2010) made a comparative analysis of nine micro-P2P credit websites in China, and put forward suggestions on risk and avoidance of website operation.

Yang Fengfei (Yang Fengfei, 2012) took the mortgage as the research object, and combined with SWOT analysis tools, concluded that the development of mortgage depends on its platform advantages, and that its risk prevention and control should also focus on online methods.

Xie Ping (Xie Ping, 2012) combed the concept of Internet finance in his research, and regarded Internet finance as a new financing mode.

Li Wenbo (Li Wenbo, 2013) analyzed the cost advantages of Internet finance in the process of operation, especially in the process of financing, and positively evaluated the potential of Internet finance development. However, he also reminded us that due to the lack of supervision, the risk of Internet finance must be paid attention to.

At the same time of the continuous development and economic growth of the network financial services industry, foreign scholars Garrer and Eve think that the further improvement of the network financial services is a necessary condition for economic growth. The quantity of the financial services quality can explain the economic growth rate to a certain extent, through which they can discuss the role of financial structure in economic growth.

Marcono (Marcono, 1973) and Eve (Eve, 1973) respectively published Goods Market and Capital in Economic Development and Financial Deepening in Economic Development, in which they put forward two representative theories of "Financial Suppression" and "Financial Deepening" which still have great influence.

Levin (Levin, 1997) pointed out that due to the development of information technology, people's ability to collect and process data has been greatly improved, which also created favorable conditions for empirical analysis, enabling it to play the role of statistical analysis technology. Relevant phenomena, in which the developed countries have basically developed a relatively perfect financial service system, can effectively promote economic growth. On the contrary, the rapid economic growth can also reflect the mature financial service system of the developed countries.

Of course, from the research abroad, we can see that the impact of Network Finance on foreign banking industry is limited, and it does not make small and medium-sized banks restless as the domestic "wolf" has come. This is closely related to the marketization of foreign interest rates. Most banks have long been rid of the development stage of relying on deposit-loan spreads to make profits. Therefore, foreign research on network finance mainly reflects the development of network finance.

## **2 Definition and Characteristics of Internet Financial Risk**

### **2.1 Definition of internet financial risk**

Internet finance refers to a new financial business model in which traditional financial institutions and Internet enterprises use Internet technology and information and communication technology to achieve financing, payment, investment and information intermediary services.

Internet finance is not a simple combination of Internet and financial industry, but a new mode and new business to adapt to the new demand naturally after being familiar with and accepted by users (especially for e-commerce) at the level of network technology such as security and mobile. It is a new field which combines traditional financial industry with Internet technology.

At present, the main Internet financial products and services are Alipay's payment services, Ali loans and other financing business, Yu Ebao and other financial services, bitcoin and other virtual currency business. These businesses are progressively advancing and gradually approaching the core of traditional financial services.

Therefore, internet financial risk is defined as the possibility of loss affected by the uncertainties of the above-mentioned Internet financial products and services.

### **2.2 Classification and main risk analysis of internet financial risk**

Network financial risks come from different aspects, mainly from the Internet and financial perspective, specifically, can be subdivided into the following categories:

#### **2.2.1 Technological Risks of Internet Finance**

Internet finance relies on the Internet. Further, at present, it mainly relies on computer software and hardware. Therefore, the security of computer hardware and software surpasses other factors and becomes the first factor to be considered in Internet financial security. The reasons of computer hardware mainly include man-made damage, service life and so on. The software may come from compatibility, virus and hacker attack. According to incomplete statistics, the energy of hacker attack activities is increasing by about 10 times every year. The risk brought by these factors is mainly due to the diffusion of the network, leading to the infection of the whole network. For traditional finance, viruses can infect only one or two computers, or a small LAN, with more consequences of data loss and damage. The impact of modern hacker attacks and viruses may be large-scale, and the consequences may be the system stops running, or even the tampering and diffusion of data, or even the leakage of commercial secrets. In network finance, such risks may be systemic.

#### **2.2.2 Business risk**

##### **(1) Payment and Settlement Risks**

The virtual nature of Internet finance makes the transaction and service of Internet finance break through the limitation of time and space, and people can complete financial transactions in any way at anytime and anywhere. This enlarges the regionality of the Internet financial business and opens the payment and settlement functions to a wider scope, which greatly increases the number of payment and settlement and consequently brings risks. On the other hand, the wider use of transnational and regional payment systems based on electronic technology has increased the possibility of financial institutions being "involved" by external risks, which has also led to an increase in risk to a certain extent. Information risk comes from information asymmetry. The openness of the Internet improves the transparency of financial institutions' business, but for financial institutions, it will be more difficult for them to choose and judge customers under the influence of Internet privacy protection policy, and their dominant position in information transmission will gradually disappear, which is facing greater moral hazard for financial institutions. On the other hand, network information transmission is faster, and is not limited by time and space. To a certain extent, traditional financial industry is facing greater risks, and the risk of sudden and volatility is stronger. For speculators, this is a good opportunity to make a fortune, but it may cause large fluctuations in financial markets, and even affect the economic operation of a country or a region. Similarly, there are market risks brought by irrational operation of international hot money.

## (2) Liquidity risk

Liquidity risk is the main risk in financial industry, which refers to the electronic currency that Internet financial institutions are unable to accept customers. The extent of such risks is affected by the size and balance of e-money issuance. Generally speaking, the larger the issuance scale, the greater the liquidity risk. This is mainly due to the lack of independence of electronic money, but also need to experience the link between issuance and settlement from electronic money to real money. This leads to liquidity crisis once the issuer's real currency reserve is insufficient.

## (3) Credit risk

This risk mainly refers to the risk that one side of the Internet financial transaction cannot fulfill the contract on time. Because of the virtuality of Internet finance, the physical characteristics of Internet financial institutions have been reduced, and the credit evaluation of both sides of the transaction depends entirely on the network, which makes it more difficult for both sides to verify each other's identity and the authenticity of the transaction, and leads to an increase in the level of credit risk. As far as China is concerned, the credit risk may also arise from the imperfection of the credit investigation system, which reduces the cost of breach of contract and increases the possibility of breach of contract. At the same time, for Internet financial institutions, it is also necessary to consider that once huge losses or security issues related to payment systems occur, they will often have a greater impact and impact on the public than traditional finance, and it will be more difficult to restore credibility. For the entire Internet financial system, once there is a security problem, regardless of the cause, it will seriously undermine public confidence in Internet finance.

### 2.2.3 Legal Risk

This risk is mainly due to the lack of legal system for Internet Finance in China. At present, China's legal system in the field of Internet finance is still based on the traditional financial industry. Various laws and regulations do not fully take into account the characteristics of Internet financial business and risk. At this time, the legal system of Internet finance has loopholes to drill, which also increases the number of illegal acts. Taking the network electronic contract as an example, how to judge its validity, how to judge its fairness like the traditional finance, how to investigate the responsibility of one party after breach of contract, how to claim compensation, these problems occurring on the Internet platform

cannot be explained and avoided by the traditional financial legal system. In addition, for transnational transactions, the standard of traditional financial law to determine rights, responsibilities and obligations is often the time and place of signing, but in the context of the Internet, how to determine the time, how to determine the position of both parties in the transaction, need to be fully considered.

#### 2.2.4 Other risks

Other risks, such as the conventional risks of traditional financial industry, such as market risks, financial derivatives trading risks, also exist in the field of Internet finance.

### 2.3 Characteristics of internet financial risks

Internet technology makes the risk of Internet finance more complex and changeable. Besides the characteristics of traditional financial risk, it also has its own characteristics:

**Strong dissemination:** The primary characteristics of Internet technology are openness and information sharing. The network structure, coupled with the development of mobile internet, makes the dissemination of Internet information broader, breaking through the time and space constraints of financial transactions.

**Instantaneity:** As mentioned earlier, one of the characteristics of the Internet is fast, which enables Internet finance to process information remotely and instantaneously. For some financial transactions that pursue speed, speed may lead to an increase in returns, but it also leads to irreparable errors when they occur.

**High Vitality:** Internet financial transactions take the Internet as the "trading market". The transaction is no longer a real currency but a "virtual number". Similarly, for the protection of privacy, the transaction objects, processes and objectives are more opaque, which makes the virtual nature of Internet finance higher.

**Complexity:** The Internet makes the strangers more intimate, and the degree of information sharing stronger. This increases the convenience of financial transactions, on the other hand, it also increases the possibility of information leakage. At the same time, the Internet has more nodes than traditional finance, and the explanation is more vague, so the financial risk is more complex.

Generally speaking, although the risk of Internet Finance seems to be a large part higher than that of traditional finance, it is still in a controllable range considering the proportion of Internet Finance in China's financial industry. China's Internet finance is still in the early stage of development, the proportion of new financial formats is smaller, but the momentum of development cannot be underestimated. Therefore, the risk prevention and management of Internet finance should start from a small place and be dealt with as soon as possible. We must not hold the idea of "development before governance". Once Internet Finance develops, it will be too late to deal with it. Once problems arise, the chain reaction will most likely impact the entire financial system.

## 3 Analysis and Establishment of Internet Financial Risk Warning Index System

### 3.1 Internet financial risk identification

In the process of analyzing Internet finance, relevant scholars also analyzed the risk types of Internet finance. [In fact, from the perspective of financial stability, Internet finance is ultimately a

virtualized financial trading platform, so there is still the need to analyze its risks.] Foreign research on the identification of Internet financial risk is mainly divided into two kinds of risks: liquidity. Risk and Credit Risk Online Transaction of E-Commerce includes services of many third-party credit institutions, including banks, credit card authorization agencies, consumer online privacy protection agencies and consumer confidence organizations, and introduces eBay's third-party payment service Richard Walton discusses insurance issues in B2C e-Commerce.

For liquidity risk management, it mainly focuses on the third-party payment of Internet Finance and network lending. [For third-party payment, Guo Shibang believes that because of the concealment of online payment and the absence of online transaction records, third-party payment constitutes an impact on the anti-money laundering system.] Wang Zhen and others analyzed the potential risks of third-party payment, and proposed to prevent money laundering. Policy Suggestions on Risk Xie Kai et al. pointed out the hidden danger of the flow of customer payment funds and put forward measures to prevent the risk of customer funds for online lending, Yang Kaisheng believed that in the investment and financial management business of Internet finance, there was a lack of provisions on prohibiting disguised deposit absorption of related products, strict requirements on the source and application of funds and supervision methods. Ronin pointed out that Internet enterprises began to develop online lending business while carrying out payment business. Lack of post-loan supervision and risk control led to the increase of non-performing loans, which made enterprises unable to operate normally.

In view of credit risk management, Weng Zhoujie and others think that the future development of P2P network lending in China is facing some obstacles, such as imperfect personal credit system, lack of relevant laws and regulations and poor self-discipline of the industry. Zhang Yuxi thinks that because most of the Internet financial services adopt new technologies, they are more likely to fail. Any system problems caused by any reason will bring to the Internet financial service providers. Li Wenbo and others pointed out that the domestic credit environment and credit information system are not conducive to the development of Internet finance. Some scholars also believe that network financial services and service institutions have very obvious virtual characteristics.

For technology risk management, Zhang Yusong and others believe that there are no matching standards or standards in the technical aspects of Internet finance, especially in the use of security technology. In the process of designing and using the financial system platform, there are not enough experimental tests. Li Wenbo and other studies show that there are potential risks in Internet financial technology, and the security of the platform is facing a test. Zhang Yuxi believes that the technical risks of Internet finance are mainly manifested in three aspects: first, systematic security risks. Second, the risk of technology choice. Thirdly, technical support risk.

In view of legal risk management, Xinping pointed out that many Internet finances are actually between "legal" and "illegal", and a slight carelessness may touch the "illegal absorption of public deposits" or "illegal fund-raising" high-pressure line. There are also some scholars who identify legal risks from many aspects. First, they violate the relevant laws and regulations of the state and the aspects not covered by the laws and regulations that appear in the network. Second, there is a lack of legal provisions on network finance. The representatives are Weng Zhoujie, Li Wenbo and so on.

In summary, scholars believe that the liquidity risk of Internet finance mainly comes from the third-party payment risk and the network lending risk. Credit risk mainly comes from personal credit and the credit risk brought by the technology risk of Internet finance. Technical risk mainly comes from hackers and viruses attacked by the imperfect supporting measures of Internet system, while legal risk mainly comes from the attack against interconnection. The laws and regulations of online finance are not perfect. Because Internet finance is still in its infancy, the research on risk identification and risk prevention of Internet Finance by relevant scholars is not perfect, and further research is still needed.

### 3.2 Internet financial risk management

In the aspect of risk management of Internet finance, foreign academics have conducted in-depth discussions on the development of Internet finance, Internet financial risks and risk control and supervision of Internet finance. Karne Furst conducted a survey of all commercial banks in the US financial market and concluded that banks carrying out electronic financial services have a wider range of sources of liabilities, and their income is also transferred from interest income to intermediary business income.

Profit level and asset quality are relatively high. Anait K. Pamlhatur believes that banks will face operational risk, security risk, legal risk and reputation risk in carrying out online banking business. As banks enter the field of online banking, an innovative and forward-looking risk management method is indispensable. With the emergence of online banking, early self-regulation measures will evolve into an increasingly detailed review.

Compared with foreign scholars' risk management methods, domestic research on Internet financial management methods mainly focuses on liquidity risk, credit risk, technical risk and legal risk risk management.

For liquidity risk management, most of the literature on third-party payment will focus on the management of deposit funds. Xiong Jianyu suggests that China should establish and improve the access and exit mechanism of third-party payment companies, standardize the operation activities of third-party payment companies, and ensure the safety of trading funds. Ba Shusong put forward suggestions on the impact of cross-border business of third-party payment institutions on the existing regulatory system: first, to implement access system and strict credit management; second, to actively respond to the macro-currency of third-party payment institutions to create pro-cyclical risks; third, to strengthen the active supervision of third-party payment business; fourth, to strengthen the protection of financial consumers' rights and interests, and to strengthen precipitation. Safety management of funds. Wang Yifei believes that in terms of fund management, risk control of Internet financial products needs to be considered from two perspectives: one is the risk control of the products issued by the institutions themselves, and the other is the help of the institutions to manage the risks of financial products consumers. He Hong analyzed the risk management of Internet financial network lending from two perspectives of capital management and consumers.

In view of legal risk management, Wang Yuanyue's research shows that in the absence of relevant laws and regulations and supervision, networked private lending has brought many negative impacts on the stable development of economy and society, which urgently needs to be included in the scope of supervision and standardized management. It is pointed out that the legislation of network finance should be strengthened, and "Information and Communication Service Standard Law", "Data Protection Law", "Electronic Funds Transfer Law" should be enacted as soon as possible, so as to clearly define the rights and obligations of the relevant subjects of network lending finance. Wang Zhanjun advocated drawing lessons from foreign developed countries' policies in risk management, introducing a series of special rules, such as "International and Domestic Electronic Commerce Signature Law", "Network Information Security Steady Operating Guide", "Electronic Banking Business Security and Steady Procedure", to actively guard against the risks of Internet financial transactions, in order to protect the rights and interests of Internet financial consumers. In the actual operation of supervision, we should comprehensively improve the ability of supervisors to grasp the operation status of network financial business and predict the risks of network financial business, enhance the systematicness and foresight of macro-control, and strengthen the standardization of network financial supervision, so as to improve the modernization, scientificization and legalization level of network financial supervision.

Aiming at technology risk management, Yin Zhiyong pointed out that we should improve the level of technology prevention of computer network system in Internet financial enterprises, improve the computer security management system of bank financial system, and formulate the overall plan and unified technical standards for the development of network finance. In view of credit risk management, He Hong points out that it is necessary for us to build an effective horizontal cooperative monitoring system, which is the basic way to promote the steady development of Internet finance and prevent the credit risk of Internet finance.

In summary, in order to achieve effective risk management of Internet finance, we need to speed up the construction of relevant laws and regulations of Internet finance, including the revision and improvement of the financial legal system, the basic legal legislation related to the development of Internet finance, and the formulation of relevant department rules and national standards of Internet finance. Secondly, we should build a scientific and orderly Internet financial supervision system, strengthen the cooperation of international Internet financial supervision, strengthen the comprehensive supervision of international criminal activities such as money laundering by means of Internet banking through international cooperation of Internet financial supervision, and form a supervision system that can effectively guarantee the healthy operation of Internet Finance and be responsible for global Internet finance. Finally, we should encourage traditional industries to boldly try Internet finance, so that traditional industries will usher in new opportunities.

## **4 Establishment of Internet Financial Risk Warning System**

### **4.1 Construction method of early warning index system**

Qualitative method means that researchers choose early warning indicators to construct early warning indicators system according to their subjective understanding of the connotation of indicators information and previous experience.

Quantitative method refers to the preliminary selection of indicators in a wider range, the collection of data according to the preliminary indicators, and then the use of statistical analysis and other data analysis methods to analyze the data, select indicators of high relevance or importance to build early warning index system.

In summary, the warning index system constructed by qualitative method often has strong explanatory ability, but the effectiveness of this kind of method depends on personal knowledge and experience, which is greatly influenced by subjective factors and lacks scientific basis and persuasion. The index system constructed by quantitative method usually has a wide range of information content and good objectivity, but data analysis methods such as t-test often result in information loss of part of the data, which leads to the reduction of the effectiveness of the index system, and the index system constructed by quantitative method often has weak explanatory ability.

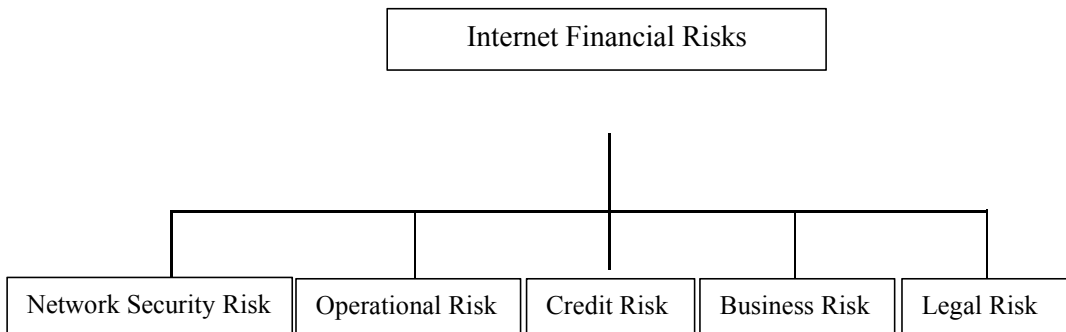

### **4.2 Selection of internet financial risk early warning index system**

Internet financial risk assessment is a multi-criteria decision-making problem. In multi-criteria decision-making problems, attribute values and related weights are expressed by fuzzy numbers. A fuzzy number is a convex fuzzy set, which is represented by a given sequence of real numbers and is graded from 0 to 1. The most commonly used fuzzy numbers are triangular and trapezoidal ones. The membership degree of fuzzy sets is smooth and progressive. The membership degree of fuzzy set is expressed by membership function. In a given model, the variables expressed by fuzzy language are

used in the fuzzy set, such as "Internet financial risk is high" or "project cost is high". The membership function of a fuzzy set expresses the fuzziness of each element and range. In most cases, it is a set of unit intervals. In real life, fuzzy linguistic values can be expressed in terms as well as in terms of fuzzy numbers. This expression is more appropriate in qualitative judgment than in definite value. Terminological risk is a qualitative and vague concept, which can be defined by vague language rather than numerical value.

The model established in this paper adopts the form of grading table of Internet financial risk indicators, and assigns the scores determined by each indicator according to the weight of risk indicators. In building the model, it is not enough to determine only the first-level indicators and scores. Under each indicator, more detailed options should be determined as the second-level indicators. According to the second-level indicators, the impact of the indicators is scored. The total score of each second-level indicators is the score of Internet financial risk indicators. The determination of secondary indicators is a tedious and complex work, which mainly depends on the relationship between past research data and real risk situation and the experience judgement of Internet finance related practitioners. The secondary indicators and values of the model are determined on the basis of referring to the relevant research results at home and abroad and consulting the opinions of many risk assessment professionals in Internet finance. Finally, five first-level risk index systems (network security risk, operational risk, credit risk, financial business risk, legal and reputation risk) and 17 second-level indicators are selected to construct the evaluation index system of Internet financial risk.

Firstly, the weights of Internet financial risk indicators are determined by using the fuzzy AHP method. Firstly, the hierarchical structure is established. Establishing hierarchical structure generally includes target layer, criterion layer, index layer, and even sub-index layer. The target layer of this model is Internet financial risk assessment. The standard layer includes five first-level indicators: network security risk, operational risk, credit risk, financial business risk and legal risk. Under the five first-level indicators of the criterion level, several second-level indicators are set up, totaling 17 second-level indicators, which constitute the index level. The details are shown in the following figure:

**Figure 1 Hierarchical Chart of Risk Assessment of Internet Finance**

The second step is to construct a fuzzy judgment matrix. Fuzzy judgment matrix refers to the matrix formed after the establishment of hierarchical structure, which needs to determine the importance of each factor at the next level affecting a factor, and determine an important score by comparing two or two of these factors. This model is assigned according to 1-9 scale method, as follows:

**Table 1 1-9 Scaling Method**

Scale	Meaning
1	I is as important as J
3	I is slightly more important than j
5	I is obviously more important than j
7	I is more important than j
9	I is more important than j
2、4、6、8	The median value of the adjacent judgment above indicates the ratio of J to I. Their reciprocal

The third step is to test the consistency of the fuzzy judgment matrix. The fuzzy judgment matrix that does not satisfy the consistency is adjusted accordingly. According to the properties of the fuzzy consistent matrix, the concrete steps of checking and adjusting the consistency of the judgement matrix are as follows:

(1) Determine an element with high accuracy of judgment and high accuracy of importance score, such as factor I, and get the importance score of  $b_{i1}, b_{i2}, b_{i3}, \dots, b_{in}$

$$\omega_i = \frac{\sum_{j=1}^n i, j}{n\alpha_i} + \frac{1}{n} - \frac{1}{2\alpha_i}, i = 1, 2 \dots n$$

The fourth step is hierarchical total ordering. On the basis of hierarchical single ranking, the relative importance weights of each factor in the index layer relative to the target layer are calculated. The weight value is the product of the weight of each index relative to the criterion layer and the weight of the criterion layer relative to the target layer.

#### **4.3 Empirical study on internet financial risk assessment based on fuzzy analytic hierarchy process**

With the rapid development of modern society and economy, all walks of life are in a state of fierce competition. Although Internet finance is only a new industry, it is also facing potential challenges from all sides. [9] At this time, the prevention of its risks is particularly important. In order to clearly identify the key factors affecting the Internet financial risk, modern comprehensive assessment and decision-making are becoming more and more quantitative. With the increasing complexity and uncertainty of objective things and the fuzziness of people's risk perception, the realistic risk prevention has not only stayed at the static, accurate and balanced level of problem decision-making. When people take corresponding preventive measures against certain risks, it is very likely that the uncertainty of estimation will lead to the waste of manpower and material resources.

The key risk factors were not even contained. Therefore, it is of great significance to analyze and determine the risk factors affecting the Internet by using AHP and fuzzy mathematics.

4.3.1 Determine the main factors and the secondary indicators of each main factor

According to the analysis in the previous chapter, the author summarizes the sub-risk factors of Internet financial risk as follows:

**Table 2 Interlinked Risk Assessment Index Set of Our Finance**

Objects of evaluation	first-level indicators	second-level indicators
Internet Financial Risk	Network Security Risk U1	Risk of network tampering
		Web page hanging risk
		Phishing risk
		Site Backdoor Risk
		Risks from Innovation of Payment Method
	Operational risk U2	Inter-industry Linkage Risk
		Consumer Operational Risk
	Credit risk U3	Internal fraud risk
		External fraud risk
		Liquidity risk
	Business Risk U4	market risk
		Interest rate risk
		Legal Liability Risk
		Risk of Subject Qualification
	Legal and Reputation Risk U5	Virtual currency risk
On-line money laundering risk		
Reputation risk		

4.3.2 Establishment of Assessment Set

In this paper, the author classifies the risk evaluation criteria of Internet finance as "high", "high", "medium", "low" and "very low". The evaluation set is:  $V=\{V1, V2, V3, V4, V5\}=\{\text{high risk, high risk, medium risk, low risk, very low risk}$ . Among them, the basis for the division of these standards is as follows:

**Table 3 The Basis for The Division Of Standards**

Classification	Identification	Description
5	Very high.	Once it happens, it will seriously affect social and economic development, affect the operation of the organization, cause great losses, and affect badly.
4	High	Once it happens, it will have a greater economic and social impact once it occurs, which will have a negative impact on the organization and operation within a certain range.
3	Middle	Once it happens, it will cause certain economic and social impacts, but the impact is not wide and deep.
2	Low	Once it happens, will have an impact within the organization, and can be quickly dealt with and resolved.
1	Very low	Once it happens, it will not have a significant impact. Simple measures can make up for it.

Those experts who are invited to grade the risk level should take into account both the probability of risk occurrence and the loss once the risk occurs.

#### 4.3.3 Determining the Weight of Risk Assessment Elements

In this paper, the 1-9 annotation method is used to construct the judgment matrices based on the comprehensive consideration of the opinions of 30 experts, as follows:

**Table 4 The Judgment Matrices**

U	U <sub>1</sub>	U <sub>2</sub>	U <sub>3</sub>	U <sub>4</sub>	U <sub>5</sub>
U <sub>1</sub>	1	5	3	3	5
U <sub>2</sub>	1/5	1	3	3	1/3
U <sub>3</sub>	1/3	1/3	1	1/5	1/3
U <sub>4</sub>	1/3	1/5	1/3	1	1/3
U <sub>5</sub>	1/5	3	3	3	1

That is to say, for the risk of Internet finance, the judgment matrix A of the first-level index is as follows:

$$A = \begin{bmatrix} 1 & 5 & 3 & 3 & 5 \\ 1/5 & 1 & 3 & 3 & 1/3 \\ 1/3 & 1/3 & 1 & 1/5 & 1/3 \\ 1/3 & 1/5 & 1/3 & 1 & 1/3 \\ 1/5 & 3 & 3 & 3 & 1 \end{bmatrix}$$

Similarly, each secondary index matrix A I is as follows:

$$A_1 = \begin{bmatrix} 1 & 1/3 & 1/5 & 3 \\ 3 & 1 & 1/3 & 3 \\ 5 & 3 & 1 & 7 \\ 1/3 & 1/3 & 1/7 & 1 \end{bmatrix} \quad A_2 = \begin{bmatrix} 1 & 1/3 & 5 \\ 3 & 1 & 7 \\ 1/5 & 1/7 & 1 \end{bmatrix} \quad A_3 = \begin{bmatrix} 1 & 3 \\ 1/3 & 1 \end{bmatrix};$$

$$A_4 = \begin{bmatrix} 1 & 3 & 7 \\ 1/3 & 1 & 5 \\ 1/7 & 1/5 & 1 \end{bmatrix}; \quad A_5 = \begin{bmatrix} 1 & 1/9 & 3 & 1/3 & 1/5 \\ 9 & 1 & 7 & 5 & 3 \\ 1/3 & 1/7 & 1 & 1/5 & 1/7 \\ 3 & 1/5 & 5 & 1 & 1/3 \\ 5 & 1/3 & 7 & 3 & 1 \end{bmatrix}$$

For matrix A, the maximum eigenvalue  $\lambda_{max} = 5.291$ ,  $CI = 0.0728$ ,  $RI = 1.120$ ,  $CR = 0.065 < 0.10$  can be calculated, which indicates that the matrix has passed the consistency test. According to the corresponding calculation formula, the eigenvectors corresponding to the maximum eigenvalues are  $A = (0.443, 0.083, 0.149, 0.267, 0.058)$ . That is to say, the weights of the first-level risk indicators {u1, u2, u3, u4, u5} are 0.443, 0.083, 0.149, 0.267 and 0.058, respectively. From the same calculation process, the weight of each factor of matrix A 1 can be calculated as  $A1 = (0.124, 0.241, 0.571, 0.065)$ ; the weight of each factor of matrix A2 is  $A2 = (0.637, 0.105, 0.258)$ ;

The weight of each factor in matrix A3 is  $A3 = (0.333, 0.667)$ .

The weight of each factor in matrix A4 is  $A4 = (0.649, 0.279, 0.072)$ .

The weight of each factor in matrix A5 is  $A5 = (0.061, 0.516, 0.036, 0.128, 0.259)$ .

#### 4.3.4 Multilevel Fuzzy Evaluation

Thirty professionals with similar work nature and long experience in Internet finance were invited to rate the single-factor risk level, as shown in Table 4.2.

**Table 5 Single-Factor Evaluation Results**

First level index (Weight)	Secondary Indicators (Weight)	Evaluation Results				
		Relatively high	High	middle	Low	Very Low
Network	Risk of network tampering	0.6	0.25	0.10	0.05	0

Security Risk (0.443)	(0.124)					
	Web page hanging risk (0.241)	0.4	0.3	0.15	0.1	0.05
	Phishing risk (0.571)	0.75	0.1	0.1	0.05	0
	Site Backdoor Risk (0.065)	0.4	0.3	0.15	0.1	0.05
	Risks from Innovation of Payment Method (0.637)	0.3	0.2	0.2	0.15	0.15
Operational risk (0.083)	Inter-industry Linkage Risk (0.105)	0.2	0.3	0.3	0.1	0.1
	Consumer Operational Risk (0.258)	0.15	0.2	0.4	0.15	0.1
Credit risk (0.149)	Internal fraud risk (0.542)	0.6	0.15	0.15	0.1	0
	External fraud risk (0.089)	0.3	0.4	0.2	0.05	0.05
	Liquidity risk (0.649)	0.4	0.25	0.15	0.15	0.05
Business Risk (0.267)	market risk (0.279)	0.15	0.5	0.2	0.15	0
	Interest rate risk (0.072)	0.05	0.4	0.4	0.4	0.05
	Legal Liability Risk (0.061)	0.05	0.4	0.3	0.2	0.05
Legal and Reputation Risk (0.058)	Risk of Subject Qualification (0.516)	0.05	0.15	0.25	0.30	0.25
	Virtual currency risk (0.036)	0	0.2	0.2	0.4	0.2
	On-line money laundering risk (0.128)	0.1	0.5	0.3	0.1	0
	Reputation risk (0.259)	0	0.05	0.15	0.5	0.3

The main factor fuzzy matrix of the secondary index can be obtained from the single factor evaluation result table

$$R_1 = \begin{bmatrix} 0.60 & 0.25 & 0.10 & 0.05 & 0 \\ 0.40 & 0.30 & 0.15 & 0.10 & 0.05 \\ 0.75 & 0.10 & 0.10 & 0.05 & 0 \\ 0.40 & 0.30 & 0.15 & 0.10 & 0.05 \end{bmatrix}$$

$$R_2 = \begin{bmatrix} 0.30 & 0.20 & 0.20 & 0.15 & 0.15 \\ 0.20 & 0.30 & 0.30 & 0.10 & 0.10 \\ 0.15 & 0.20 & 0.40 & 0.15 & 0.10 \end{bmatrix}$$

$$R_3 = \begin{bmatrix} 0.6 & 0.15 & 0.15 & 0.1 & 0 \\ 0.3 & 0.4 & 0.2 & 0.05 & 0.05 \end{bmatrix}$$

$$R_4 = \begin{bmatrix} 0.4 & 0.25 & 0.15 & 0.15 & 0.05 \\ 0.15 & 0.5 & 0.2 & 0.15 & 0 \\ 0.05 & 0.4 & 0.4 & 0.1 & 0.05 \end{bmatrix}$$

$$R_5 = \begin{bmatrix} 0.4 & 0.15 & 0.25 & 0.30 & 0.25 \\ 0.3 & 0.25 & 0.20 & 0.10 & 0.15 \\ 0.1 & 0.5 & 0.30 & 0.10 & 0 \\ 0 & 0.05 & 0.15 & 0.5 & 0.30 \end{bmatrix}$$

According to the fuzzy comprehensive evaluation formula  $B_i = A_i * R_i$ , the evaluation results of each secondary index can be calculated.

As follows:

$$B_1 = (0.625, 0.1799, 0.1154, 0.0654, 0.0153)$$

$$B_2 = (0.2508, 0.2105, 0.2621, 0.1447)$$

$$B_3 = (0.3999, 0.3168, 0.1834, 0.0667, 0.0334)$$

$$B_4 = (0.3050, 0.3306, 0.1820, 0.1464, 0.0360)$$

$$B_5 = (0.0738, 0.1816, 0.2196, 0.3068, 0.2182)$$

Thus, the main factor evaluation matrix of secondary indicators can be obtained as follows:

$$B = \begin{bmatrix} 0.6250 & 0.1799 & 0.1154 & 0.0654 & 0.0153 \\ 0.2508 & 0.2105 & 0.2621 & 0.1447 & 0.1318 \\ 0.3999 & 0.3168 & 0.1834 & 0.667 & 0.0334 \\ 0.3050 & 0.3306 & 0.1820 & 0.1464 & 0.0360 \\ 0.0738 & 0.1816 & 0.2196 & 0.3068 & 0.2182 \end{bmatrix}$$

According to formula  $B = A * R$ ,

$$B = (0.4430, 0.2432, 0.1615, 0.1078, 0.0450)$$

According to the principle of maximum membership, the level corresponding to the maximum value is the level of networked financial risk. From the above results, we can see that the maximum value is 0.443, and the corresponding risk level is "very high". In addition, the main risk of Internet

finance is network security risk. This conclusion also confirms the subjective judgment of experts. In addition, credit risk and technical operation risk also account for a large proportion, indicating that these risks are more obvious.

#### **4.4 Model running results analysis**

After collecting and analyzing a lot of data, we can see that the risk of Internet finance is still very high. In the five first-level indicators set in this paper, we can know that network security risk occupies the largest weight. If we want to better develop Internet finance, we must do a good job in preventing network security risks. The second is business risk, which is more consistent with the facts. Because Internet finance itself is the product of the integration and innovation of network technology and financial business. For these financial business risk prevention, we can learn from the traditional financial business in risk prevention measures. Secondly, credit risk, all financial activities are the evaluation of credit in the final analysis. As Internet finance, it also faces huge credit risk. Then there are operational risks and legal risks. These risks are important, but they are relatively small in this model.

Specifically implemented to the secondary indicators, the calculation results can be obtained, for network security risks, phishing risk is the most important factor. In fact, according to the data released by the National Internet Emergency Response Center, phishing is also the most important factor that causes the loss of consumer property every year. Secondly, the risk of website hanging horse, the trend of network tampering, and finally the risk of website backdoor. The overall risk state is also at a high risk, which needs to be paid close attention to.

For operational risk, the most critical factor is the risk brought by the innovation of payment mode. The innovation of various kinds of Internet terminal equipment leads to the change of people's payment mode, which is easy to cause risks when the external situation changes. Secondly, the operational risk of consumers, in view of consumers' lack of awareness of the potential risks hidden by the rapid development of Internet technology, is likely to be exploited by malicious programs. Finally, the industry-related risk will also have a greater impact on operational risk. However, the overall operational risk is in a medium state. Among credit risks, external fraud risk is more prominent. Overall, it is in a high-risk state. Among the financial business risks, the most important factor is liquidity risk. Secondly, market risk and interest rate risk. If the funds cannot be well circulated, it will bury a deep hidden danger to Internet finance. Overall, it is in a state of high risk.

Finally, in the legal and reputation risk, the subject qualification risk occupies a relatively important position. Secondly, reputation risk, followed by money laundering risk and virtual currency risk, and finally the risk of legal lag. Overall, they are in a state of high risk.

In summary, the first-level and second-level indicators involved in Internet finance are analyzed sequentially, and an overview result is obtained. According to the results of the risk assessment, when taking risk prevention measures, we can focus on a more comprehensive macro-control.

## **5 Conclusion**

The construction of Internet financial risk management system needs to consider many angles. According to the risk evaluation index system of this paper, combined with the above evaluation results, the related measures of Internet financial risk prevention can be divided into the following directions: network security, operation, credit risk, market risk and legal and reputation risk. To construct a three-dimensional framework of Internet financial risk management system, to analyze and discuss the key

factors affecting Internet financial risk management, to implement targeted guidance and control measures, and to achieve effective control of Internet financial risk through non-rigid ways such as technology, legal (reputation) means and management functions

# Research on Network Security Evaluation of Big Data Center Based on Rough Set

Liu Bin

School of Electrical and Electronic Engineering, Wuhan Polytechnic University, Wuhan, P.R.China,  
430023

(E-mail: 443748171@qq.com)

**Abstract:** In the 21st century, information technology has entered a big data era. Under this environment, new technical requirements and challenges have been put forward for the network security of big data Center, especially how to effectively evaluate the network security. It has always been the focus of industry research. In this paper, by studying the traditional network security evaluation method, combining with the related characteristics of big data Center, and using the theoretical knowledge of rough set, the paper puts forward a network security evaluation method based on rough set. The method can be reduced from a large number of dynamic data at high latitudes, and the core values that can represent the network security attributes can be screened out, so that the security of network security can be carried out.

**Key words:** Rough set; Big data; Network security; Evaluation

## 1 Introduction

The current information technology has entered a new era - the era of big data. Its data types are diverse, its structure is complex and it also has the characteristics of dynamic change. According to the particularity of the network environment established by big data center (Sun Zepeng, 2017), Sun Zepeng puts forward some thoughts on the current construction of big data center, especially how to ensure data security when enterprises are faced with the massive data of multi-source and heterogeneous, which has been studied at home and abroad. Big data center network security requirements and traditional ways are different, how to evaluate network security has always been the focus of research (Liu Wenyan, 2018), there is no evaluation standard in the world. Liu Wenyan has done some research on the mainstream network security evaluation models, especially on the main models: attack tree, attack graph, attack chain, attack surface, network infectious disease model, Petri net, automaton and so on. These analyses are based on complex evaluation parameters, index data, and the establishment of model is time-consuming. Because of the intensive coupling degree, it is difficult to modify. In view of the above problems, the paper starts with the network security requirements of big data centers, and studies the elements of network security evaluation. By introducing the relevant theoretical knowledge and methods of rough set (Pawlak Z, 1982), we can quickly and concisely establish a big data center network security evaluation model on the basis of meeting the requirements, so as to quickly keep up with the changing pace of network security.

## 2 Analysis of Network Security Model Requirements

Overall, big data generally refers to large-scale, massive unstructured data and semi-structured data, which have Volume, Velocity, Variety, Value, Veracity and other characteristics. The goal of big data center network security is to achieve three security attributes, confidentiality, integrity and availability (Jeff Kaliverisky, 2008).

### 2.1 Network security analysis of big data center

Firstly, data integrity is one of the three characteristics of data security. The function of data integrity is to ensure that the data is correct and effective. It is considered by all information systems. Although the cloud storage service provider of data as a service is much more advanced than the general integrator in technology, database server and other aspects, it still cannot guarantee that 100% of the data system does not fail. Therefore, data integrity failures occurring in traditional system storage may also occur in big data centers. These faults can be roughly divided into the following two categories:

- (1) Faults caused by equipment problems. Such as BIT Decay, tape failure, etc.
- (2) Faults caused by software defects.

Secondly, for big data centers based on cloud computing environment, data access control issues need to become more complex, and it is difficult to ensure that cloud service providers can adhere to 100% of its service treaties. At the same time, important sensitive data of users should also be kept secret for cloud service providers.

Finally, the virtualization of big data centers also brings some problems, VMM (Virtual Machine Manager) is attacked(Hai Jin, 2013). VMM is attacked mainly from the following two aspects:

- (1) From outside of VMM. Attackers use Rootkit and other means to gain root privileges, leaving behind backdoor assemblies to collect data. The intruded host is intercepted by Rootkit and gets all the hardware requests from users.
- (2) From the client virtual machine. Domain 0 is the control domain of virtual machine in virtual machine system. The controlled client virtual machine utilizes the application program to avoid the detection and control of VMM and access Domain 0 directly, thus controlling all other virtual machines.

In addition, attacks on big data networks include attacks on covert channels (that is, attacks on covert channels generated by various error messages) and malicious code attacks.

Similarly, traditional network attacks also threaten big data centers. These threats are manifested in: Attacks against network application vulnerabilities; Attacks against SaaS mode, DDOS (Distributed Denial of Service) attack(Maqsood, 2014), Man-in-the-middle attack, etc. As there are so many dangers in the network security of big data centers, it is necessary to establish an effective evaluation model for network security.

## 2.2 Analysis of current network security evaluation model

The current main network security situation evaluation system model is shown in figure 1.

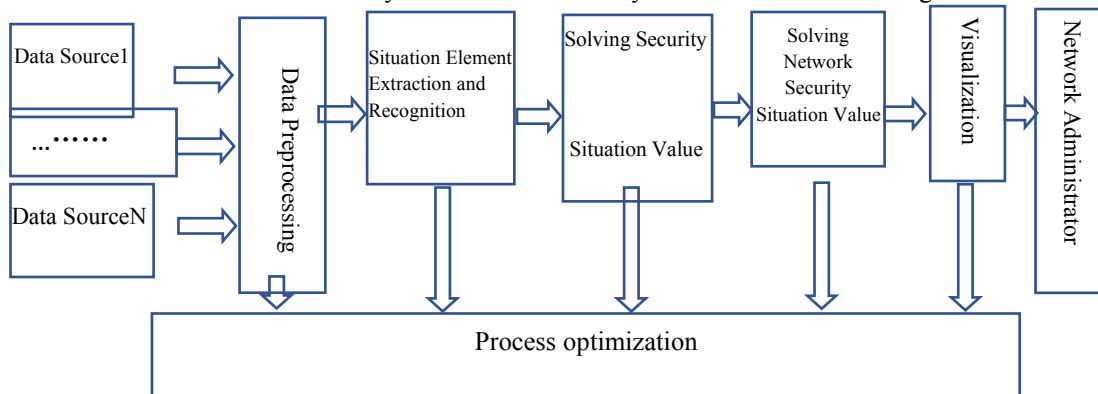

Figure 1 Network Security Situation Evaluation System Model

We analyze it from the abstract level, extract and identify the situation elements through the preprocessed multi-source data, so as to determine the type of network attacks. According to the attack type, the security situation value can be obtained by calculating, and the security situation value can reflect the degree of network destruction, so it can be submitted to the network administrator visually.

The roles of each module are as follows:

- (1) Data source module: mainly collects attack information and environmental information generated in cloud computing system.
- (2) Data preprocessing module: preprocesses the collected information and keeps them in a uniform format when stored.
- (3) Security situation element extraction module: determine the type of attack.
- (4) The calculation module of the security state value: determines the damage degree of the attack type to the network.
- (5) The security situation value is calculated by the level analysis: the operation status of the network is displayed.
- (6) Visualization module: dynamic display of the security situation of cloud computing network.

The most important is the extraction of security situation elements, which is related to the efficiency of network security evaluation model. However, network security data has a series of characteristics, such as high-dimensional, dynamic and stochastic, which reflect its uncertainty. How to obtain valuable information from large-scale dynamic data with strong uncertainty is one of the most important research contents in this field. Although some methods mentioned above can obtain certain security situation elements in some aspects, there is no good solution to the uncertainty of large-scale data network. The case results in the failure of the security evaluation model to assess the network security risk in a timely and comprehensive manner. The evaluation model based on rough set theory(Pawlak Z, 1998) studied in the paper is just a useful attempt in this field.

### **3 Proposal of Rough Set Model**

Rough set theory is proposed by Polish scholar Pawlak. It mainly describes inaccurate knowledge by upper and lower approximate operators. It is an intelligent mathematical tool to deal with inconsistent and uncertain information. This theory can not only model the nonlinear and discontinuity function relations, but also have high objectivity and can effectively deal with big data. Its basic theory is as follows.

If a set is exactly equal to any union set of the basic set, it is called a clear set, otherwise it is called a rough set. It can find hidden knowledge and show the laws that exist within things. rough set theory has the following basic concepts:

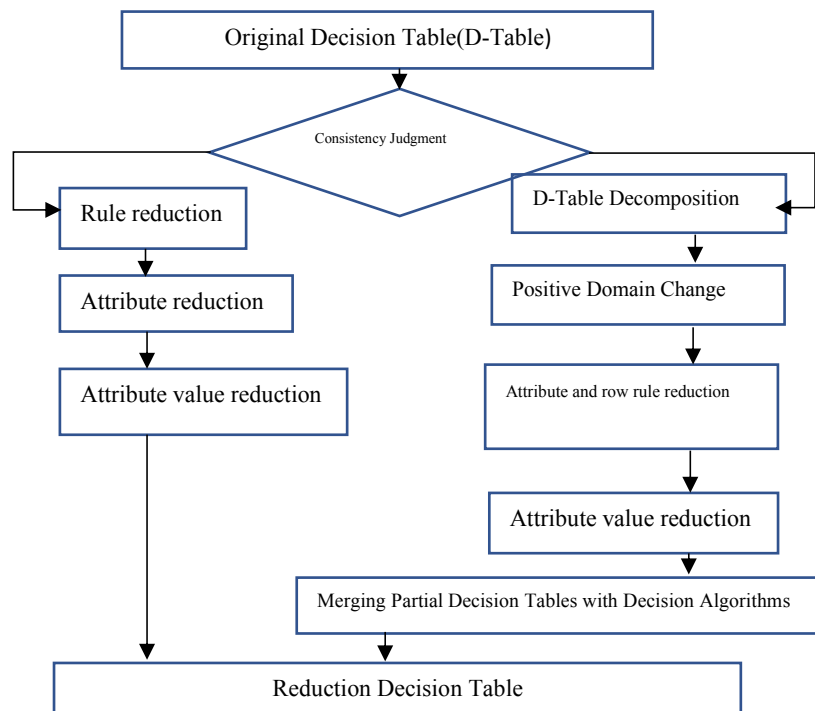

- (1) Information system. The information system is quaternion  $K = (U, A, V, P)$ . Where  $U$  is the set of objects,  $A$  is the set of attributes,  $V$  is the range, and  $P$  is a mapping.
- (2) Knowledge. Knowledge is a classification ability. The ability to classify certain things

according to their different characteristics can be regarded as some kind of "knowledge". It is composed of objects that are indistinguishable from each other in the domain. "something" here means anything we can talk about, such as time, process, object, etc.

(3) The upper and lower approximations of the set. Let  $U$  be a domain,  $I$  be a set of equivalence relations in  $U$ , then  $X \subseteq U$ , then: The maximum set that can be judged by existing knowledge of all objects that must belong to  $X$  is called the lower approximation of set  $X$  with regard to  $I$ , which is recorded as:  $I_*(X) = \{x \in U, I(x) \subseteq X\}$ . The smallest set of objects that may belong to the  $X$  according to the existing knowledge is the upper approximation of the set  $X$  with respect to the  $I$ , which is recorded as:  $I^*(X) = \{x \in U, I(x) \cap X \neq \emptyset\}$ . For an exact set, its upper approximation is equal to the lower approximation; then, when the upper approximation is not equal to the lower approximation, it is a rough set.

In rough set theory, the establishment of network security evaluation universe  $U$  is to collect samples of evaluation data sets. According to the existing experience and network security standards (Ma Li, 2019), we have selected more than 30 indicators from network security data, including security information such as host monitoring system, to provide the original data to participate in the evaluation. There is a certain relationship between these data.

Rough set theory is a discrete system, it is necessary to discretize the evaluation data, and then reduce the attributes of the above discretized data. As a result, we retain the attributes of host class, topological location and other attributes, and remove the attributes of operating system class. The whole process of Rough Set Reduction (Chen Xinying, 2016) of Network Security evaluation Model is shown in Figure 2.

**Figure 2 Rough Set Reduction Process of Evaluation Model**

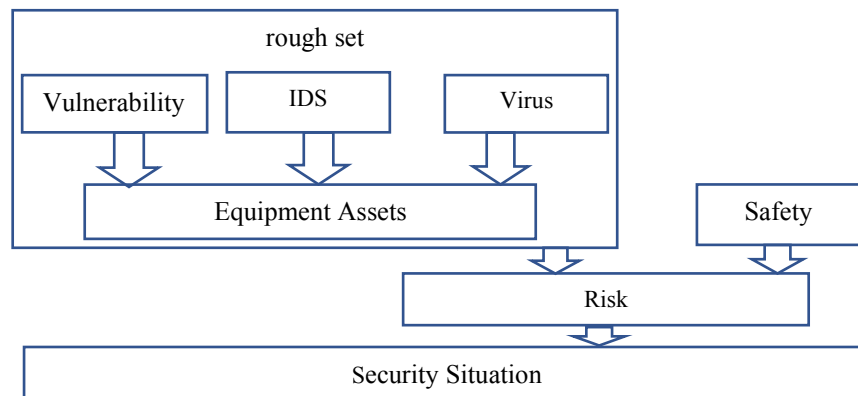

We use the same method to reduce the attributes of vulnerability-threat discrete sample table. As a result, we retain the attributes of vulnerability level and attack type, and remove the attributes of vulnerability risk level.

In the decision table, if we choose to delete a record, we will get the following three results:

- (1) Conflict in decision-making. Then the attribute value can not be deleted and its original attribute value needs to be restored.
- (2) Duplicate records and no conflict occurred. Then the attribute can be deleted and marked as "!".
- (3) There were no duplicate records or conflicts. Then we need to confirm whether it can be deleted by the next judgment, and mark it as "?".

In summary, the reduction algorithm of attribute values in decision table is as follows:

- (1) According to the three cases mentioned above, the attribute values in the information table are marked correspondingly.
- (2) Delete duplicate records that appear, and then validate tags one by one. Records. If there is a record that all its attribute values are marked as "?" If the decision is made by an unmarked judgment, change "?" to "!" Otherwise, the original value will be restored.
- (3) Delete marked as "!" And duplicate records of occurrences.
- (4) When two records are identical, delete "!" Less records. After reduction, a new information table is obtained. Because of the one-to-many relationship, it is necessary to merge in a one-to-many manner. Finally, the decision table of network security evaluation is obtained. According to the decision rules, our network security evaluation model is shown in figure 3.

**Figure 3 Network Security Evaluation Model**

The model is explained as follows:

- (1) Equipment Assets: the hardware part of the network.
- (2) Vulnerability/Vulnerability: Risks due to vulnerability or vulnerability.
- (3) IDS: risk caused by potential intrusion events.
- (4) Virus: risks caused by potential viral events.
- (5) Safety measures: various safety measures adopted to protect assets from damage.
- (6) Risk: According to the state of risk, get the security situation.

The selection of network security situation elements will directly affect the reliability of evaluation. According to the theory of Rough set, the paper proposes an evaluation model, which is divided into three layers from top to bottom: the feature layer of situation elements, the semantic understanding layer of situation elements and the decision layer of situation elements. The main function of the first layer is to obtain a certain amount of information, and then preprocess the collected information through data fusion technology. The second layer is to analyze the types of attacks, mainly through the correlation analysis of the upper data. The last layer is to determine the degree of risk hazards caused by various types of attacks and their impact on network services.

#### 4 Conclusion

With the continuous development of network technology, network security in big data centers will become a hot spot of continuous research, and network security evaluation will become one of the key technologies with good development prospects. The paper studies the network security evaluation model based on rough set, and puts forward some solutions. In the future work, there are still many places to consider, such as: how to build an evaluation test environment(Zhu Yeqing, 2016), whether to form a general evaluation model, and so on, are the direction of our efforts.

# Analysis of the Project Management of EPC Project General Contracting

Pei Linyu, Xu Dongming

School of Civil Engineering, Henan University of Science and Technology, Luoyang, P.R. China, 471000

(E-mail: 630379838@qq.com, 676823546@qq.com)

**Abstract:** In recent years, the rapid development of China's economy has promoted the expansion of construction projects. The increasing complexity of architectural functions has led to increasing difficulty of project management. In order to solve these challenges, the project management model of EPC (Engineering Procurement Construction) has been gradually popularized and has been widely applied in China. In this work, a comparison between the characteristics of the traditional mode and the EPC general contracting mode has been processed, based on the systematic elaboration of the project management theory. The project management of EPC general contracting can be summarized into three main points, which are design management, procurement management, construction management. The detailed analysis has been demonstrated based on these main points of management. Moreover, the existing problems in EPC management, experienced by the owner and the contractor, has been analyzed and put forward corresponding conclusions on relevant problems.

**Key words:** EPC engineering; General contracting mode; Project management; Traditional mode

## 1 Introduction

### 1.1 Research ideas and contents

In EPC project, the scope of the general contractor contracts covers design, procurement, construction and commissioning phase. For example, the overall planning, organizing and implementing specific work of the entire construction project, can effectively solve the low-efficiency information exchange issues between design, procurement, construction and cross-matching. Simultaneously, it can achieve the goals of the comprehensively managing the project progress, quality, cost, safety (Zhao Jinxiang, 2019). Since EPC projects commonly are large-scale, complex and with varied management contents, continuous innovation is needed to control all aspects of the project in the implementation process (Yang Junjie, 2014). The international common contracting modes include EPC (Design-Procurement-General construction contract), Design-General construction contract, BOT (Build-Operation-Transfer), PPP (Public-Private-Partnership), PM (Project Management), PMC (Project Management construction), etc.

This work aims at the international and domestic construction market environment. The purpose of this paper is to summarize the operational EPC project management method, according to the project progress, quality, safety, cost and other management theories, by utilizing reasonable analysis methods. This will not only contribute to the management of the company's construction projects, but also put forward management methods for other EPC projects for reference and promotion.

### 1.2 Research status of EPC

The general contracting mode of projects started early, with a sound legal system, mature market

environment and a large number of experienced general contracting enterprises (Lu Fengli, 2015). At present, the mode has been used by the relevant UN organizations, World Bank, Asian development bank and so on. The construction project management norms and contract texts formulated by the international federation of consulting engineers (FIDIC) are generally recognized and widely adopted by international financial organizations and many countries (She Jianming, 2012). The research on the general contract management of EPC project is also relatively early. There are also mature management methods. In recent years, James P. Lewis has summarized the theories of engineering management, elaborated the theories of engineering management abroad in detail, and summarized the development of engineering management methods (Zhou Yuliang, 2010).

At the end of the 1990s, the general contracting of engineering gradually became popular in China. The relevant management theories also began to prevail. The risk management of EPC project is very important. The procurement of EPC projects directly affects the quality, progress, investment and even safety of the projects (Qin Hongbo, 2017). Based on the engineering practice, Li Xiaofei summarized the procurement methods and details of the general contracting project, which provided the direction for the project procurement (Li Xiaofei, 2014). The construction management of EPC is the last opportunity to realize the final product. He Chengqi summarized the methods of project planning and control by compiling, tracking, analyzing and controlling the progress (He Chengqi, 2013). EPC cost management is the core of EPC management. Most of the current researches focused on analyzing the management of EPC general contracting project from a single perspective in EPC management, but were lack of overall study on the integration of each module. Therefore, this paper attempts to discuss EPC general contracting project management from the perspectives of design, construction and procurement.

## **2 Overview of EPC Project General Contracting Mode**

### **2.1 Definition of EPC project general contracting mode**

EPC is the abbreviation for Engineering, Procurement, and Construction. In EPC mode, the engineering includes site selection, overall plan, organization, implementation, coordination and specific drawing design of the whole project. The procurement includes procurement of general building materials, procurement of various specialized equipment that can meet the project's usage function, and Procurement of materials needed during the commissioning and trial operation after the project is completed. The contents of the construction include construction, installation, equipment debugging, commissioning and trial operation.

### **2.2 Features of EPC general contracting mode**

EPC general contract has the following main characteristics:

(1) The owner entrusts the EPC general contractor with the overall package of specific work such as project design, procurement, construction and trial operation to organize and implement, while the owner is only responsible for the overall, principle and target management and control. In the EPC general contracting mode, the contractor (Owner) is not too involved in the specific management of the project, but gives the general contractor great authority and freedom to the work within the scope of the contract, and the general contractor will lead the completion of most of the specific implementation work.

(2) The owner shall only sign the general contracting contract with the EPC general contractor. The design, procurement, construction or trial operation of the project shall be fully undertaken by the general contractor or partially entrusted to a qualified subcontractor at the discretion of the general contractor. The subcontractor shall enter into subcontracts with the general contractor without having a direct contractual relationship with the owner. The general contractor shall be liable to the owner for the quality, safety and time limit of the subcontracted work, and the subcontractors shall be jointly and severally liable.

(3) The owner may send a management team to the project or hire a professional project management company as an agent of the owner to manage the project. This kind of management is principled and phased management by objectives without involving too many specific affairs.

(4) The owner transfers the management risk of EPC to the general contractor, reducing its management responsibility and risk. The general contractor of the EPC general contracting project shall be responsible for the whole process of "design, purchase and construction" of the construction project, and for the quality of the construction project and the performance of all professional subcontractors of the construction project. The general contractor is the first person responsible for the EPC general contracting project.

### **2.3 Comparison between traditional mode and EPC general contracting mode**

#### 2.3.1 Traditional mode

Traditional Delivery Method mainly refers to DBB (Design. Bid. Build) mode. This mode is based on the construction unit as the core, contracting out various work contents to the participating units, which only has a contractual relationship with the construction unit and are directly responsible to the construction unit. If all the construction, decoration and installation projects are entrusted to a contractor, it is called the general contractor for construction. If the construction project, decoration project and installation project are directly entrusted to different contractors by the construction unit, it is called the construction parallel contracting mode (Cai Junling, 2015).

#### 2.3.2 Differences between traditional mode and EPC general contracting mode

The differences between general contracting mode and traditional mode are as follows:

##### (1) Different application scope

The traditional model is suitable for general housing construction projects with relatively simple and clear project content, no great technical difficulty and sufficient construction funds.

The EPC mode is not only applicable to general housing construction projects, but also to large industrial projects, such as large transportation hub, electric power, mining, metallurgy, petrochemical and other projects. Most of the projects applicable to EPC mode are characterized by large project volume, high professional and technical requirements, large capital demand, heavy coordination and cooperation tasks of relevant majors, and a high proportion of professional equipment and materials in the total investment.

##### (2) Different capital requirements

The traditional model requires the owners to raise sufficient construction funds in advance to

facilitate the smooth progress of the project. The requirement of cash flow to owner is higher.

In EPC mode, there are BT, BOT and other financing construction modes. BT mode is adopted, that is, the construction is financed by the contractor in the survey, design and construction stage, and the owner repurchases after the completion. Using BOT mode, after completion, the contractor shall obtain a certain period of management rights, and then hand them over to the owner after the expiration of the operating period. In this way, the capital pressure of the owners in the construction phase of the project can be effectively reduced and the capital flow tension of the owners can be alleviated.

### (3) Different management structures

In the traditional mode, the owner is at the core of project management, and the survey, design, construction, equipment and material suppliers form contract relations with the owner respectively, but there is no direct economic contact between them, so the owner needs to undertake a lot of coordination and decision-making work. In the EPC mode, the owner signs a contract with an EPC general contractor (or EPC consortium contractor) with a clear and single contractual relationship. Compared with the traditional model, the project management task of the owner is greatly reduced. The owner only needs a few managers to manage the whole project.

### (4) Different bidding methods

In the conventional model, survey, design, construction and procurement should be divided into public bidding, and the whole project can only be completed by multiple bidding. Moreover, since the next stage of bidding mostly requires the work results of the previous process, the time delay is relatively long, which will consume a lot of energy, time and costs of the owner. In EPC mode, the owner only needs to conduct one bidding to determine the general contractor for survey, design, construction and procurement, which greatly saves time, energy and costs.

## **3 Key Points of Project Management of EPC General Contract**

### **3.1 Design management**

Design as the initial project planning, and throughout the whole process of engineering construction in EPC project, design documents as the basis of engineering procurement, construction, design, procurement and construction of a reasonable crossover and mutual cooperation have a basic role. The procurement needs to conduct bidding or inquiry based on the equipment and materials requisition and inquiry technical documents provided by the design, while the design is responsible for technical review and review of the manufacturer's technical documents and drawings. Therefore, in the whole construction process, design management needs to be reviewed and controlled, and the role of reasonable cross-coordination of design in construction and procurement in terms of schedule, cost, quality and safety is an important work content.

### **3.2 Purchasing management**

In the product construction cycle of the general contracting project, the procurement stage is the beginning of the actual manufacturing and engineering entity formation process, including

professional subcontracting, material and equipment, service and labor procurement (Li Guozhi, 2015). On the one hand, based on design documents, the procurement process needs to firstly compile procurement list (equipment and materials) and technical requirements (professional subcontracting, services and labor), then analyze relevant requirements and prices, and finally conduct bidding or inquiry through a market survey. On the other hand, it is necessary to ensure that the subcontracting has a reasonable overlap with the project construction after the purchase and the supplier. Therefore, the monitoring and management of the quality of acquisition work and acquisition results are related to the construction, completion and acceptance of the project, which ultimately reflect the quality of the whole project. For example, the coordination between the time of purchasing qualified equipment and materials (including delivering to construction site) and the construction schedule is the guarantee of the construction schedule. The levels of procurement cost also directly affect the construction cost.

### **3.3 Construction management**

Construction management is an important part of EPC construction stage. It is divided into construction preparation management, construction operation management, construction finalization management-three stages. In the stages construction management ready to join the design phase, within the established time limit for a project, construction progress plan, quality management planning and cost management schemes, safety management, human resource planning, communication and coordination, etc., to complete the construction scheme, construction organization design, etc., in order to guide the construction management implementation. In this stage, the selection of construction subcontractors is also completed. Subcontractors with corresponding strength and similar construction experience are selected through bidding.

Construction management is according to the stage of planning implementation. It includes subcontracting for management, coordinating the relationship between the design, package and the owner. Construction management includes checking the construction actual situation regularly. People find out the reason of the deviation by comparing actual situation and planning, and its influence to the construction process. And then find out the adjusting measures to correct deviation, try our best to ensure accomplish quality, progress, cost and safety goals. The implementation of construction management is mainly to control the progress, quality, cost and safety by taking corresponding control measures and methods (Cao Jiming, 2011).

The end of construction management is after the completion of construction. It includes organizing the project department's management personnel to carry out the handover procedures, and checking and accepting the achievements of project quality, cost, progress and safety, and evaluating the construction management effect of the project. In the process of construction management, real-time monitoring of the impact of changes in external factors on the internal and external aspects of the project, adjusting and correcting the deviation in time.

## **4 Status Analysis of EPC General Contracting Project Management**

### **4.1 Problems existing in EPC general contract project management**

EPC contracting mode can take into account the interests of both the owner and the contractor. In China, some EPC general contracting projects have been put into practice, but this mode is not mature, exposing certain problems.

#### 4.1.1 Problems of the owner

From the perspective of the owners, most owners have not realized the real connotation of EPC. On the one hand, the decision-making layer of the owner does not know about EPC mode, and is conservative in whether the project adopts EPC mode or not. On the other hand, in terms of the specific management level of the owner, even in EPC projects, many managers are unwilling to give up their management power and have a strong desire for control, which to some extent restricts the effectiveness of the internal coordinate system of the general contractor.

#### 4.1.2 Contractor's problems

The contractor side includes design, survey, construction, material and equipment suppliers and so on.

From the perspective of design units and survey units, in the traditional mode, if the subsequent process loss is caused by its own problems, the loss shall be borne by the owner, which will lead to the weak responsibility of some survey and design personnel. In EPC projects, the output value of intellectual labor of investigation and design only accounts for a very small part of the whole project, but it will have a great impact on the subsequent construction of engineering entities and equipment procurement.

Construction units, in the traditional mode, can wait for the completion of the design drawings and drawings after review before starting construction, once there are any problems in the design can be pushed to the owner responsibility and consequences.

### **4.2 Suggestions on EPC general contract project management**

#### 4.2.1 Recommendations to the owner

The owner shall strengthen the understanding of various construction modes, deeply analyze the advantages and disadvantages of EPC mode, and boldly adopt EPC mode for construction of qualified projects, so as to obtain the best technical and economic benefits.

#### 4.2.2 Recommendations to contractors

With EPC contractor for construction enterprises to take the lead in the process of project implementation, the most important thing is to adopt the method of contract, economic means to arouse the enthusiasm of survey and design personnel. The construction enterprise, as the lead party, shall have the right to speak in the contract payment of the design and investigation party, and can decide on the corresponding reward and punishment measures. At the same time, in EPC projects, construction units must take the initiative to strengthen contact with design units. From the construction period, cost, construction scheme and other aspects to improve efficiency, reduce risks, and finally earn profits for themselves.

## **5 Conclusion**

As a contracting mode is vigorously promoted in China recently, EPC project general contracting mode has been well applied in many projects. Helping the owner to realize the requirements of

investment, progress and use, it also brings the general contractor benefits from integrated management of large-scale projects. Utilizing this mode can save the investment, reduce the length of the working period, and have a better realization of various indexes expected by the owners. However, the research on EPC general contracting mode in China is still at the initial stage and not profound enough.

On the basis of consulting a large amount of literature, this paper makes a deep analysis of project management under EPC general contracting mode, and mainly obtains the following results: the characteristics of EPC general contracting mode are studied and analyzed, and the differences between this mode and other general contracting modes are compared and analyzed. The project management characteristics and existing problems of EPC engineering are studied and analyzed comprehensively. The specific optimization measures of EPC general contracting project management are put forward.

# **Evaluation of the Influencing Factors of PPP Contract Performance in Urban Underground Integrated Pipe Gallery Based on Grey Relation-TOPSIS Method**

Wu Yifan, Fang Jun

School of Civil Engineering and Architecture, Wuhan University of Technology,

Wuhan, P.R. China, 430070

(E-mail: wyfsheung@qq.com, 172050328@qq.com)

**Abstract:** Although the introduction of the PPP model has effectively promoted the construction of urban underground integrated pipe gallery, it also faces obstacles to contract fulfillment. From the perspective of contract management, this article takes the PPP project contract of urban underground integrated pipe gallery as the research object. First of all, the influencing factors that hinder the performance of the contract are classified according to the contract formation stage and contract performance stage. Then, based on the grey correlation-TOPSIS method, the contract performance evaluation model of PPP project in urban underground integrated pipe gallery is constructed. Finally, the domestic real case is selected to verify the validity of the model. The results show that the model can identify the factors hindering the performance of the contract and the corresponding influence degree.

**Key words:** PPP project in urban underground integrated pipe gallery; Contract management; Contract performance; Grey correlation-TOPSIS method

## **1 Introduction**

The urban underground integrated pipe gallery is a tunnel space where centralized drainage, heat, electricity, gas, communications and other municipal pipelines are laid under the urban roads for unified monitoring and management. The organic combination of the PPP model and the urban underground integrated gallery project must take into account their respective particularities and adaptability, and overcome a series of problems arising from this to ensure the smooth development of the project.

For the risk management research of PPP projects, HHM method, RFRM method and AHP method were used to construct a risk sharing model for PPP project in urban underground integrated pipe gallery (Zhao Jia, 2016). The interaction between risk factors of PPP project in urban underground integrated pipe gallery based on ISM-MICMAC model were analyzed, and the result showed that there was a progressive relationship between risk factors (Zhou Xianhua et al, 2017). The risk management capabilities of public organizations' PPP projects were identified based on the IRM method (Bianca B.M. Keers, Paul C. van Fenema, 2018). The strategic behavior of Chinese investors' overseas investment by portraying the ownership structure of enterprises, investment motives and the quality of host institutions were reflected from the perspective of risk management methods (Subhan Ullah, Zheng Wang, 2019).

For the research on Contract Management of PPP projects, Due to the long duration of PPP

contracts, it was necessary to consider the changes in the scope of social expectations (Jose M. Viegas, 2010). As for the contract flexibility, the government subsidy mechanism which would be separated from construction and operation was benefit from it (Wang Xiao, Gao Shenyuan, 2016). Besides, the grey correlation analysis method was used to screen out the key factors affecting the contract management of PPP projects (Ma Haifeng, 2017).

For the research on the relationship governance of Contractual subjects in PPP projects, it was believed that there had been a positive interaction between contract governance and relationship governance of the construction project (Luo Yazhuo, 2011). In order to verify the relationship between relationship management and management performance, the performance evaluation system was constructed to explore the dimension of then in PPP project management (Tian Binfan, 2017). As for the project cooperation, incorporating the sustainability of public-private partnerships into the performance appraisal of PPP projects was proposed (Marlies Hueskes et al,2017). And some quantitative analysis method like structural equation model were also used to empirically analyze the relationship between relationship governance, PPP project control and project performance (Li Xiaoguang et al, 2018).

## **2 Construction of Contract Performance Evaluation Index System**

The PPP project contract system of urban underground integrated pipe gallery is quite large. In addition to the most core and representative franchise agreement, it also includes a series of contracts signed or performed in different stages of project implementation. This article uses the questionnaire survey method to identify the influencing factors hindering the contract performance of PPP project in urban underground integrated pipe gallery, and classifies them according to the contract formation stage and contract performance stage. The final evaluation index system of PPP project in urban underground integrated pipe corridor contract performance is shown in figure 1.

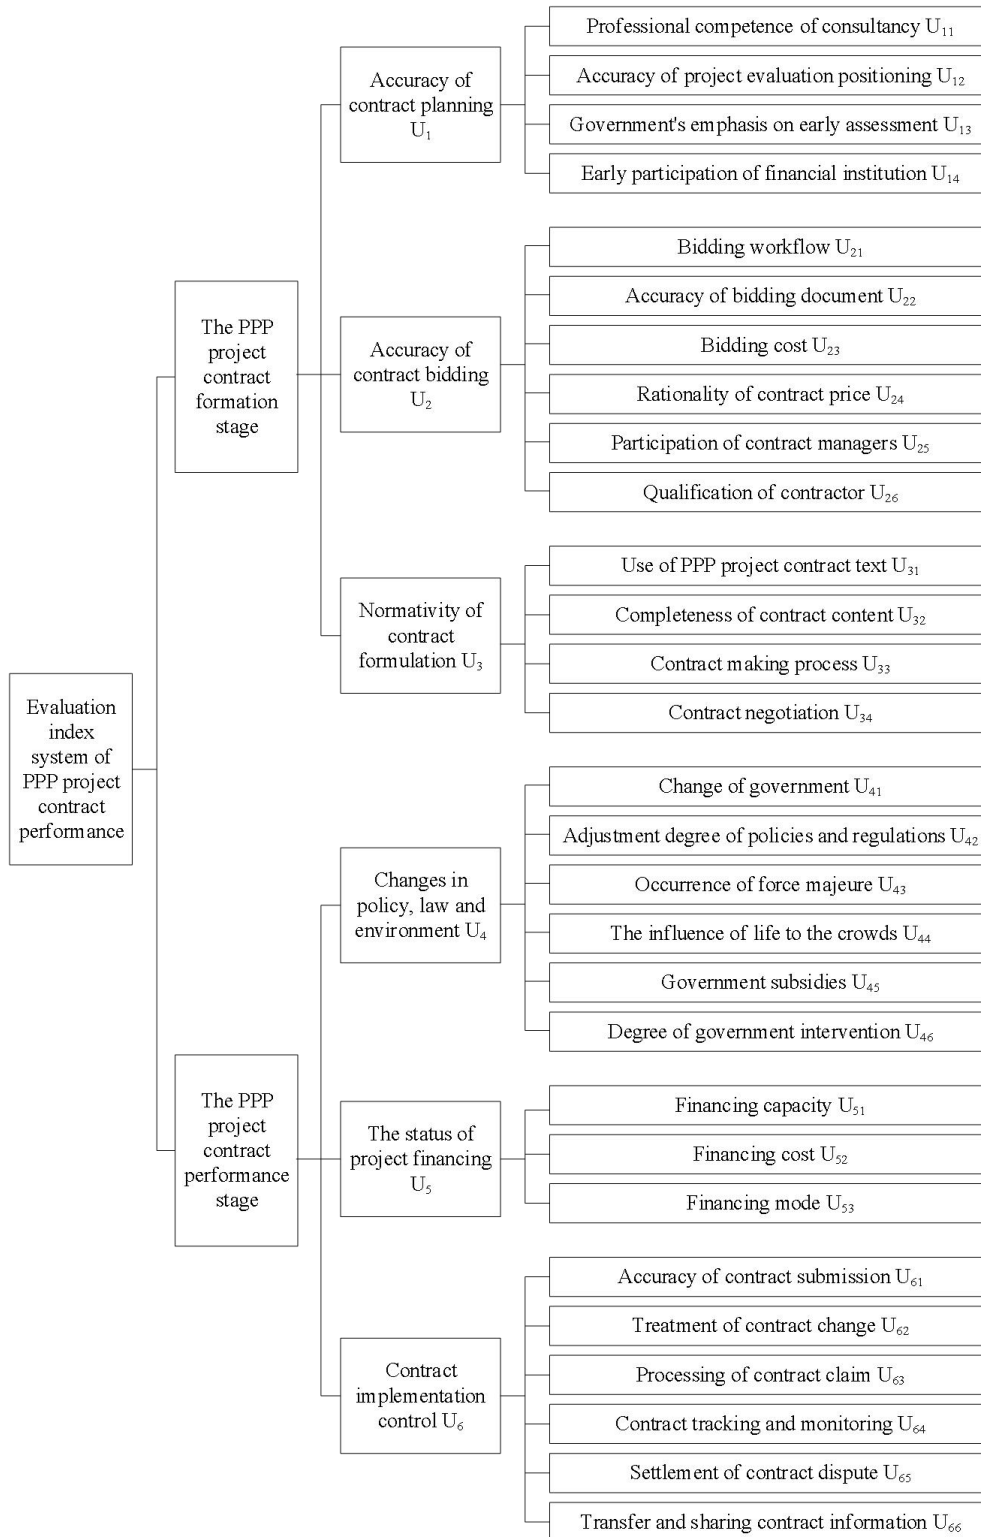

Figure 1 Evaluation Index System of Contract Performance

### 3 Construction of Contract Performance Evaluation Model

#### 3.1 Overview of grey relation-TOPSIS model

Grey relational analysis is a tool to judge whether the connection is close or not according to the similarity of geometric shape of sequence curve. The closer the curve is, the greater the correlation between the corresponding sequences will be. The TOPSIS method is often used in multi-objective decision-making. Its core idea is to calculate the distance between the selected decision-making scheme and the positive and the negative ideal solution, and rank the schemes according to the relative sticking schedule, so that the selected scheme is closer to the optimal solution. Through the combination of the two, we can overcome the limitation of small sample size and evaluate objectively from the two dimensions of optimum and worst, so as to improve the accuracy of the final results.

#### 3.2 Grey relevance-specific steps of TOPSIS model application

##### 3.2.1 Determining the index weight

In this article, the weight of index is determined by the method of entropy weight, and the data are processed by the range method. Due to the limitation of the length of the article, I will not elaborate on it here.

##### 3.2.2 Computing weighted standardized decision matrix

Weighted standardized decision matrix:

$$Z = (z_{ij})_{m \times n} (i = 1, 2, 3, \dots, m; j = 1, 2, 3, \dots, n)$$

$$Z_{ij} = w_j \times y_{ij} \quad (1)$$

$$Z = (Z_{ij})_{m \times n} = \begin{bmatrix} Z_{11} & Z_{12} & \dots & Z_{1m} \\ Z_{21} & Z_{22} & \dots & Z_{2m} \\ \vdots & \vdots & \vdots & \vdots \\ Z_{n1} & Z_{n2} & \dots & Z_{nm} \end{bmatrix} \quad (2)$$

##### 3.2.3 Determining the positive and negative ideal solutions

The positive and negative ideal solutions of weighted standardized decision matrix  $Z$  are determined  $Z_j^+$  and  $Z_j^-$ .

$$Z_j^+ = \left\{ \max_{1 \leq i \leq m} z_{ij} \right\} \quad (3)$$

$$Z_j^- = \left\{ \min_{1 \leq i \leq m} z_{ij} \right\} \quad (4)$$

##### 3.2.4 Computing Euclid distance

The Euclid distances  $d_j^+$  and  $d_j^-$  from each index to positive ideal solution  $Z_j^+$  and negative ideal solution  $Z_j^-$  are calculated respectively.

$$d_j^+ = \sqrt{\sum_{i=1}^m (z_{ij} - z_j^+)^2} \quad (5)$$

$$d_j^- = \sqrt{\sum_{i=1}^m (z_{ij} - z_j^-)^2} \quad (6)$$

### 3.2.5 Calculating grey relational coefficient

The grey relational coefficient matrices  $\xi^+$  and  $\xi^-$  of each index with positive ideal solution  $Z_j^+$  and negative ideal solution  $Z_j^-$  are calculated respectively.

$$\xi^+ = \frac{\min_i \min_j |z_{ij} - z_j^+| + \rho \max_i \max_j |z_{ij} - z_j^+|}{|z_{ij} - z_j^+| + \rho \max_i \max_j |z_{ij} - z_j^+|} = \frac{\rho w_j}{w_j - z_{ij} + \rho w_j} \quad (7)$$

$$\xi^- = \frac{\min_i \min_j |z_{ij} - z_j^-| + \rho \max_i \max_j |z_{ij} - z_j^-|}{|z_{ij} - z_j^-| + \rho \max_i \max_j |z_{ij} - z_j^-|} = \frac{\rho w_j}{z_{ij} + \rho w_j} \quad (8)$$

Where  $\rho \in [0, 1]$  is the relational coefficient, and the smaller the coefficient, the greater the resolution. Therefore, grey relational coefficient matrix:

$$\xi^+ = (\xi^+)_{m \times n} = \begin{bmatrix} \xi_{11}^+ & \xi_{12}^+ & \cdots & \xi_{1m}^+ \\ \xi_{21}^+ & \xi_{22}^+ & \cdots & \xi_{2m}^+ \\ \vdots & \vdots & \vdots & \vdots \\ \xi_{n1}^+ & \xi_{n2}^+ & \cdots & \xi_{nm}^+ \end{bmatrix} \quad (9)$$

$$\xi^- = (\xi^-)_{m \times n} = \begin{bmatrix} \xi_{11}^- & \xi_{12}^- & \cdots & \xi_{1m}^- \\ \xi_{21}^- & \xi_{22}^- & \cdots & \xi_{2m}^- \\ \vdots & \vdots & \vdots & \vdots \\ \xi_{n1}^- & \xi_{n2}^- & \cdots & \xi_{nm}^- \end{bmatrix} \quad (10)$$

### 3.2.6 Calculating the grey relational degree

The grey relational degrees  $r_j^+$  and  $r_j^-$  of each index with positive ideal solution  $Z_j^+$  and negative ideal solution  $Z_j^-$  are calculated respectively.

$$r_j^+ = \frac{1}{m} \sum_{i=1}^m \xi_{ij}^+ \quad (11)$$

$$r_j^- = \frac{1}{m} \sum_{i=1}^m \xi_{ij}^- \quad (12)$$

### 3.2.7 Dimensionless data processing

The dimensionless Euclid distance  $D_j^+$  and  $D_j^-$ , grey relational degree  $R_j^+$  and  $R_j^-$  are obtained by dimensionless processing of Euclid distance  $d_j^+$  and  $d_j^-$ , grey relational degree  $r_j^+$  and  $r_j^-$ .

$$D_j^+ = \frac{d_j^+}{\max_j d_j^+} \quad (13)$$

$$D_j^- = \frac{d_j^-}{\max_j d_j^-} \quad (14)$$

$$R_j^+ = \frac{r_j^+}{\max_j r_j^+} \quad (15)$$

$$R_j^- = \frac{r_j^-}{\max_j r_j^-} \quad (16)$$

### 3.2.8 Computing relative closeness

The dimensionless Euclid distance  $D_j^-$  and grey relational degree  $R_j^+$ , Euclid distance  $D_j^+$  and grey relational degree  $R_j^-$  are merged to get  $S_j^+$  and  $S_j^-$  respectively.

$$S_j^+ = \alpha D_j^- + \beta R_j^+ \quad (17)$$

$$S_j^- = \alpha D_j^+ + \beta R_j^- \quad (18)$$

In the formula,  $\alpha$  and  $\beta$  represent the preference level of decision makers for different types of data, usually  $\alpha + \beta = 1$ , and  $\alpha \in [0, 1], \beta \in [0, 1]$ . Subsequently, the final evaluation value of  $C_j^+$  is determined.

$$C_j^+ = \frac{S_j^+}{S_j^+ + S_j^-} \quad (19)$$

Ranking the actual completion rate of each index in the project, the greater the  $C_j^+$ , the smaller the performance of the contract will be hindered. On the contrary, the smaller the  $C_j^+$ , the greater the obstacles to contract performance.

## 4 Empirical Analysis

The total construction investment of an underground integrated management PPP project in Nanjing core area of Jiangsu Province is about 4.319 billion yuan. BOT mode is adopted for operation, and the duration of cooperation is 25 years. The total length of the integrated pipe gallery is about 53 kilometers, including 31.29 kilometers for the main line and 22.12 kilometers for the branch line.

This article invites 10 contract managers and project managers with rich experience to participate in the scoring. "0" means "unimportant", and the corresponding score is 1. "1" stands for "general important", and the corresponding score is 2 to 4. "2" stands for "very important", and the corresponding score is 5. According to the actual situation of project implementation, the original matrix  $R$  is obtained by scoring the indexes listed in figure 2.1.

$$R = \begin{bmatrix} 4 & 4 & 4 & 3 & 4 & 3 & 4 & 4 & 3 & 5 \\ 4 & 5 & 2 & 4 & 2 & 4 & 3 & 4 & 5 & 4 \\ 5 & 4 & 5 & 5 & 5 & 5 & 5 & 5 & 5 & 3 \\ 4 & 4 & 3 & 4 & 3 & 4 & 5 & 5 & 4 & 5 \\ 1 & 2 & 1 & 3 & 2 & 1 & 1 & 3 & 1 & 3 \\ 4 & 4 & 4 & 5 & 4 & 3 & 5 & 4 & 5 & 4 \\ 3 & 3 & 4 & 4 & 4 & 3 & 3 & 3 & 5 & 3 \\ 3 & 2 & 4 & 3 & 2 & 3 & 2 & 4 & 3 & 3 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 4 & 4 & 4 & 4 & 3 & 4 & 4 & 4 & 4 & 2 \end{bmatrix}$$

Standardized matrix  $Y = (y_{ij})_{m \times n}$  is obtained by processing the data in the original matrix  $R$  with range method.

$$Y = \begin{bmatrix} 0.5 & 0.5 & 0.5 & 0 & 0.5 & 0 & 0.5 & 0.5 & 0 & 1 \\ 0.333 & 1 & 0 & 0.333 & 0 & 0.333 & 0.667 & 0.333 & 1 & 0.333 \\ 0 & 0.5 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0.5 & 0.5 & 1 & 0.5 & 1 & 0.5 & 0 & 0 & 0.5 & 0 \\ 1 & 0.5 & 1 & 0 & 0.5 & 1 & 1 & 0 & 1 & 0 \\ 0.5 & 0.5 & 0.5 & 0 & 0.5 & 1 & 0 & 0.5 & 1 & 0.5 \\ 1 & 1 & 0.5 & 0.5 & 0.5 & 1 & 1 & 1 & 0 & 1 \\ 0.5 & 1 & 0 & 0.5 & 1 & 0.5 & 1 & 0 & 0.5 & 0.5 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & 0.5 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

Determining index weight by entropy weight method as follows.

$$\omega = (0.031, 0.024, 0.020, 0.026, 0.026, 0.026, 0.026, 0.040, 0.026, 0.028, 0.033, 0.028, 0.026, 0.053, 0.029, 0.028, 0.040, 0.022, 0.034, 0.028, 0.021, 0.028, 0.035, 0.040, 0.028, 0.037, 0.024, 0.028, 0.163)$$

The weighted standardized decision matrix  $Z = (Z_{ij})_{m \times n}$  is obtained by formula (1) and formula (2).

$$Z = \begin{bmatrix} 0.016 & 0.016 & 0.016 & 0 & 0.016 & 0 & 0.016 & 0.016 & 0 & 0.031 \\ 0.008 & 0.024 & 0 & 0.008 & 0 & 0.008 & 0.016 & 0.008 & 0.024 & 0.008 \\ 0 & 0.010 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0.020 \\ 0.013 & 0.013 & 0.026 & 0.013 & 0.026 & 0.013 & 0 & 0 & 0.013 & 0 \\ 0.026 & 0.013 & 0.026 & 0 & 0.013 & 0.026 & 0.026 & 0 & 0.026 & 0 \\ 0.013 & 0.013 & 0.013 & 0 & 0.013 & 0.025 & 0 & 0.013 & 0.025 & 0.013 \\ 0.026 & 0.026 & 0.013 & 0.013 & 0.013 & 0.026 & 0.026 & 0.026 & 0 & 0.026 \\ 0.020 & 0.040 & 0 & 0.020 & 0.040 & 0.020 & 0.040 & 0 & 0.020 & 0.020 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & 0.082 & 0 & 0 & 0 & 0 & 0.163 \end{bmatrix}$$

The positive idea solution  $Z_j^+$  and negative ideal solution  $Z_j^-$  of the index are determined by formula (3) and formula (4) respectively.

$$Z_j^+ = (0.030, 0.024, 0.020, 0.026, 0.026, 0.026, 0.025, 0.026, 0.040, \dots, 0.163)$$

$$Z_j^- = (0, 0, 0, 0, \dots, 0)$$

The Euclid distances  $d_j^+$  and  $d_j^-$  of positive ideal solution  $Z_j^+$  and negative ideal solution  $Z_j^-$  of the index are determined by formula (3-5) and formula (3-6) respectively.

$$d_j^+ = (0.062, 0.050, 0.057, 0.054, 0.048, 0.048, 0.034, 0.050, \dots, 0.231)$$

$$d_j^- = (0.048, 0.052, 0.060, 0.049, 0.051, 0.050, 0.050, 0.049, \dots, 0.182)$$

The grey relational coefficient matrices  $\xi^+$  and  $\xi^-$  are calculated by formula (7), formula (8), formula (9) and formula (10) respectively. Where,  $\rho$  take 0.5.

$$\xi^+ = \begin{bmatrix} 0.508 & 0.508 & 0.508 & 0.333 & 0.508 & 0.333 & 0.508 & 0.508 & 0.333 & 1.000 \\ 0.429 & 1.000 & 0.333 & 0.429 & 0.333 & 0.429 & 0.600 & 0.429 & 1.000 & 0.429 \\ 0.333 & 0.500 & 0.333 & 0.333 & 0.333 & 0.333 & 0.333 & 0.333 & 0.333 & 1.000 \\ 0.500 & 0.500 & 1.000 & 0.500 & 1.000 & 0.500 & 0.333 & 0.333 & 0.500 & 0.333 \\ 1.000 & 0.500 & 1.000 & 0.333 & 0.500 & 1.000 & 0.333 & 0.500 & 1.000 & 0.500 \\ 0.500 & 0.500 & 0.500 & 0.333 & 0.500 & 1.000 & 0.333 & 0.500 & 1.000 & 0.500 \\ 1.000 & 1.000 & 0.500 & 0.500 & 0.500 & 1.000 & 1.000 & 1.000 & 0.333 & 1.000 \\ 0.500 & 1.000 & 0.333 & 0.500 & 1.000 & 0.500 & 1.000 & 0.333 & 0.500 & 0.500 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0.333 & 0.333 & 0.333 & 0.333 & 0.502 & 0.333 & 0.333 & 0.333 & 0.333 & 1.000 \end{bmatrix}$$

$$\xi^- = \begin{bmatrix} 0.492 & 0.492 & 0.492 & 1.000 & 0.492 & 1.000 & 0.492 & 0.492 & 1.000 & 0.333 \\ 0.600 & 0.333 & 1.000 & 0.600 & 1.000 & 0.600 & 0.429 & 0.600 & 0.333 & 0.600 \\ 1.000 & 0.500 & 1.000 & 1.000 & 1.000 & 1.000 & 1.000 & 1.000 & 1.000 & 0.333 \\ 0.500 & 0.500 & 0.333 & 0.500 & 0.333 & 0.500 & 1.000 & 1.000 & 0.500 & 1.000 \\ 0.333 & 0.500 & 0.333 & 1.000 & 0.500 & 0.333 & 0.333 & 1.000 & 0.333 & 1.000 \\ 0.500 & 0.500 & 0.500 & 1.000 & 0.500 & 0.342 & 1.000 & 0.500 & 0.342 & 0.500 \\ 0.333 & 0.333 & 0.500 & 0.500 & 0.500 & 0.333 & 0.333 & 0.333 & 1.000 & 0.333 \\ 0.500 & 0.333 & 1.000 & 0.500 & 0.333 & 0.500 & 0.333 & 1.000 & 0.500 & 0.500 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 1.000 & 1.000 & 1.000 & 1.000 & 0.498 & 1.000 & 1.000 & 1.000 & 1.000 & 0.333 \end{bmatrix}$$

The grey relational degree  $r_j^+$  and  $r_j^-$  are calculated by formula (3-11) and formula (12) respectively.

$$r_j^+ = (0.505, 0.541, 0.417, 0.550, 0.700, 0.552, 0.783, 0.617, 0.567, 0.533, 0.472, 0.533, 0.583, 0.400, 0.517, 0.533, 0.433, 0.767, 0.467, 0.533, 0.800, 0.533, 0.453, 0.433, 0.533, 0.450, 0.613, 0.533, 0.417)$$

$$r_j^- = (0.629, 0.610, 0.883, 0.617, 0.5667, 0.568, 0.450, 0.550, 0.567, 0.800, 0.739, 0.533, 0.517, 0.933, 0.583, 0.800, 0.833, 0.500, 0.867, 0.800, 0.533, 0.533, 0.819, 0.833, 0.533, 0.783, 0.476, 0.800, 0.883)$$

$D_j^+$  and  $D_j^-$  are obtained by formula (13) and formula (14) respectively.

$$D_j^+ = (0.139, 0.053, 0.061, 0.089, 0.131, 0.091, 0.237, 0.106, 0.120, 0.148, 0.181, 0.104, 0.107, 0.319, 0.121, 0.148, 0.237, 0.057, 0.194, 0.170, 0.091, 0.104, 0.208, 0.220, 0.104, 0.189, 0.077, 0.148, 1.000)$$

$$D_j^- = (0.266, 0.284, 0.330, 0.272, 0.278, 0.274, 0.272, 0.272, 0.272, 0.268, 0.266, 0.268, 0.274, 0.289, 0.267, 0.268, 0.272, 0.302, 0.267, 0.268, 0.308, 0.268, 0.267, 0.272, 0.268, 0.268, 0.281, 0.268, 1.000)$$

Then,  $R_j^+$  and  $R_j^-$  are obtained by formula (15) and formula (16) respectively.

$$R_j^+ = (0.589, 0.631, 0.487, 0.642, 0.817, 0.914, 0.720, 0.662, 0.622, 0.551, 0.622, 0.680, 0.625, 0.429, 0.554, 0.571, 0.464, 0.821, 0.500, 0.571, 0.857, 0.571, 0.486, 0.464, 0.571, 0.482, 0.657, 0.571, 0.446)$$

$$R_j^- = (0.665, 0.645, 0.933, 0.652, 0.599, 0.600, 0.476, 0.581, 0.599, 0.846, 0.762, 0.571, 0.554, 1.000, 0.625, 0.857, 0.893, 0.536, 0.929, 0.857, 0.571, 0.571, 0.878, 0.893, 0.571, 0.839, 0.510, 0.857, 0.946)$$

$S_j^+$  and  $S_j^-$  are calculated by formula (17) and formula (18) respectively, Where,  $\alpha$  and  $\beta$  are 0.5.

$$S_j^+ = (0.428, 0.458, 0.409, 0.457, 0.548, 0.594, 0.496, 0.467, 0.447, 0.410, 0.444, 0.474, 0.450, 0.359, 0.410, 0.420, 0.368, 0.562, 0.383, 0.420, 0.583, 0.420, 0.376, 0.368, 0.420, 0.375, 0.469, 0.420, 0.723)$$

$$S_j^- = (0.402, 0.349, 0.497, 0.371, 0.365, 0.346, 0.357, 0.344, 0.360, 0.497, 0.472, 0.338, 0.330, 0.659, 0.373, 0.502, 0.565, 0.296, 0.561, 0.514, 0.331, 0.338, 0.543, 0.557, 0.338, 0.514, 0.293, 0.502, 0.973)$$

Then, the final value of relative closeness  $C_j^+$  is calculated by formula (19).

$$C_j^+ = (0.515, 0.567, 0.451, 0.5552, 0.600, 0.632, 0.582, 0.576, 0.554, 0.452, 0.485, 0.584, 0.576, 0.352, 0.524, 0.455, 0.395, 0.655, 0.406, 0.450, 0.638, 0.554, 0.410, 0.398, 0.554, 0.422, 0.615, 0.455, 0.426)$$

Finally, the relative closeness  $C_j^+$  of each index can be ranked,  $U_{44} > U_{51} > U_{22} > U_{64} > U_{21} > U_{32} > U_{23} > U_{24} = U_{33} > U_{12} > U_{25} = U_{52} = U_{62} > U_{14} > U_{41} > U_{11} > U_{31} > U_{42} = U_{65} > U_{26} > U_{13} > U_{46} > U_{66} > U_{63} > U_{53} > U_{45} > U_{61} > U_{43} > U_{34}$ .

From the ranking results of the relative closeness of the indexes, we can see that the leading indexes such as "the degree of impact on people's life", "financing ability" and "the accuracy of bidding document" have less obstacles to contract performance, while "the accuracy of contract submission", "occurrence of force majeure" and "contract negotiation" have greater obstacles to contract performance.

## 5 Conclusion

Based on the idea of contract management, this article identifies and categorizes the influence factors that hinder the normal performance of the contract according to different stages. Through the construction of the evaluation index system of PPP project contract performance of urban underground integrated pipe gallery, the further screening of the evaluation indexes is completed. Then, the contract performance of PPP project of urban underground integrated pipe gallery is constructed by grey relation-TOPSIS method. The situation evaluation model evaluates the performance of a specific project contract, and verifies the validity of the evaluation model. The deficiency of this article lies in the small number of samples obtained in the later stage, which may lead to errors in the results, and then affect the accuracy of the final evaluation.

**Abstract:** As for the current situation and reasons of college students' sudden death (CSSD), a risk assessment exploration is necessary. First, index system for the sudden death of college students is established referring to literature learning. Then, the priority factors affecting the sudden death risk of college students are obtained by Analytic Hierarchy Process (AHP). Finally, aiming at the prevention of CSSD risk, combined with quantitative analysis and risk management theory, evaluation methods and risk control strategy are proposed.

**Key words:** Risk assessment; AHP; Sudden death; College students

### 1 Introduction

Sudden death is one of most serious disease of human beings. The World Health Organization (WHO) defines sudden death as that people who are generally healthy or seemingly healthy, in a short period of time, sudden death due to natural diseases is sudden death. In recent years, college students' sudden deaths (CSSD) have occurred frequently. The types of the cases were mostly sudden death from sports, sleep or drinking. On April 26, 2018, a college student in Tianjin suddenly fell to the ground when he participated in the physical fitness test. On the morning of May 7, 2018, a senior student in Changsha died after three convulsions in an Internet cafe. On January 10, 2019, a sophomore boy in a university in Zhejiang died suddenly during the final review. The doctor initially identified the death because of sudden cardiac death. The frequent deaths of college students bring great losses to school and families. It is of great social and practical significance to strengthen the prevention of sudden death risk of college students.

Analytic Hierarchy Process (AHP), proposed by Professor Saaty in the United States in the 1970s, is a hierarchical weighted decision analysis method combining qualitative analysis and quantitative analysis. At present, the academic community has carried out some research on the CSSD. FENG Dazhi investigated and obtained cause of sudden deaths among college students, and proposed related prevention and monitoring measures (Feng Dazhi, 2012). Xie Qingzhi conducted data collection and analysis of CSSD, using modern risk management methods (Xie Qingzhi, 2013). Harmon K G concluded that sudden cardiac death is the main medical reason for student athletes to die during exercise through cases study of CSSD through the National Collegiate Athletic Association (NCAA) database (Harmon K G, 2011). By analyzing the reasons and response plans of the cases, the conclusions lack universality. To assess the risk of CSSD and early warning mechanism are not systematically analyzed. Based on the current situation and causes of CSSD, factors affecting the risk of CSSD from four aspects including Family History, Illness History, Psychological Quality and Physical Quality, are discovered. These could help construct index system. Then the priority factors of the factors influencing the risk of CSSD can be extracted by AHP. After all, some risk control strategies for CSSD are proposed.

## 2 Risk Assessment Model

The semi-quantitative method was used to quantitatively evaluate the risk of CSSD (Li Songchen, 2014). The product of risk index indicates the risk of CSSD, which is related to systemic risk and expressed by equation (1).

$$R(i, j) = E \cdot S \cdot C \quad (1)$$

In equation (1),  $E$ ,  $S$ , and  $C$  are three risk indexes;  $R(i, j)$  is risk value.  $E$  indicates the probability of risk.  $E$  ranges from 0.1 to 1.  $S$  indicates the severity, which ranges from 1 to 10.  $C$  indicates the consequences, which ranges from 1 to 100.  $C = 1$  means no injury. If sudden death happens,  $C = 100$ . The specific values of severity  $S$ , consequence  $C$  and risk value  $R(i, j)$  can be determined according to Table 1.

**Table 1 Risk Source**

$S$		$C$		$R(i, j)$		
$S$	Severity	$C$	Severity	$R(i, j)$	Risk level	Degree of risk
1	Slight	1	No injury	(0, 20]	Level 1	Slight risk
2	Serious	15	Mild injury	(20, 60]	Level 2	Common risk
4	More serious	30	Serious injury	(60, 170]	Level 3	Significant risk
7	Very serious	50	Huge injury	(170, 350]	Level 4	High risk
10	Extremely serious	100	sudden death	(350, +∞)	Level 5	Great risk

## 3 The Risk Index System for CSSD Based on AHP

### 3.1 Analysis of the factors influencing the CSSD risk

Chen Chujie concluded that the sudden death of sports death among college students was mainly caused by sudden cardiac death, which accounts for 70%, followed by brain-related deaths of about 15% (Chen Chujie, 2016). Main causes include heat stroke, asthma, post-exercise cardiac abnormalities, myocarditis, poor lifestyle and organ failure (Wang Yunfeng, 2014; Xia Jiaoyang, 2018; Liu Huiying, 2013). Maron B J evaluated a database from both the U.S. National Registry of Sudden Death in Athletes and the National Collegiate Athletic Association (2002-2011) (Maron B J, 2014). From the above analysis, the factors influencing the CSSD mainly include individuals and families. Personal factors are dominant. Personal factors are mainly in disease, psychology, and lifestyle. Family factors are mainly genetic diseases and major injuries.

### 3.2 Construction of index system

The evaluation index in the risk of CSSD are divided into three layers, namely the target layer, the criterion layer and the program layer. With deep summary of relative literatures, the factors affecting CSSD risk into four index: Family, Illness, Psychological quality and Physical quality. Family medical history is an invisible 'killer' that affects CSSD. Some CSSD are caused by diseases or defects derived

from parents. Therefore, family  $Q1$  is an important factor affecting CSSD, including hereditary disease, non-genetic disease, physical disorder, and non-accident early death. Illness  $Q2$  refers to individual cases, including hereditary disease, congenital non-genetic disease, cardiovascular non-genetic disease, and non-accidental syncope. Psychological quality  $Q3$  reflects the college students' ability to resist stress, including mood swings, depression, suicidal, and frustration. Physical fitness  $Q4$  is one of direct cause of sudden death, including health status, exercise load, physical disorders, and bad hobby. The index system of factors affecting the risk of CSSD is constructed as figure 1.

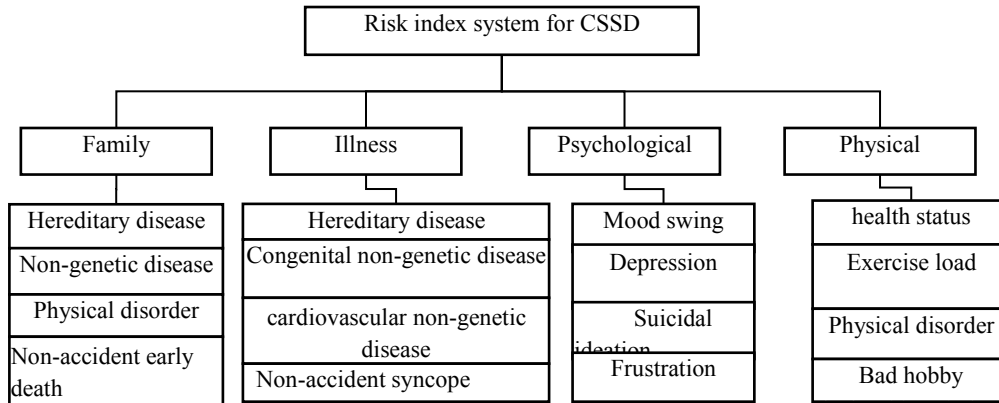

Figure 1 Risk Index System for CSSD

## 4 CSSD Risk Assessment

### 4.1 Weight setting

According to the hierarchical structure, elements of the program layer are compared with each other. And make a judgment based on the relative importance of the index to the target layer, and the judgment value  $A$  is given to form a judgment matrix. Generally, the index  $B_i$  ( $i = 1, 2, \dots, m$ ) belonging to the index  $A_k$  ( $k = 1, 2, \dots, n$ ) has a judgment matrix of  $m$ -dimensional square matrix.

$$B = \begin{bmatrix} b_{11} & b_{12} & \cdots & b_{1m} \\ b_{21} & b_{22} & \cdots & b_{2m} \\ \vdots & \vdots & \vdots & \vdots \\ b_{m1} & b_{m2} & \cdots & b_{mm} \end{bmatrix}$$

Where:  $b_{ij}$  ( $j=1,2,\dots,m$ ) is the index discriminant scale of  $B_i$ , and the index  $i$  is compared with the index  $j$ , and the relative importance degree to the index  $B_i$  is usually determined by the 1 ~ 9 scale method.

Following the principles of objectivity and authenticity(Qu Zhengeng, 2019),6 experts were invited to evaluate the index. A geometric average is used to sort out the comparison matrix at each

level. Each index weight is determined according to formulas  $\bar{\omega}_i = \sqrt[m]{\prod_{j=1}^m b_{ij}}$  and  $\omega_i = \frac{\bar{\omega}_i}{\sum_{i=1}^m \bar{\omega}_i}$ .

The maximum eigenvalue of the judgment matrix is determined by equation (2). Compare the size of the weight product of the criteria layer and the program layer to obtain the comprehensive ranking of

the program layer indexes. In the analytic hierarchy process, the consistency problem is tested. The object of the test is the consistency of the maximum eigenvalues  $\lambda_{\max}$  and  $m$  of the judgment matrix, which is  $CI = \frac{\lambda_{\max} - m}{m - 1}$ ,  $CR = \frac{CI}{RI}$ .  $RI$  is an average random consistency test index and is a fixed constant,  $m = 4$ , here  $RI = 0.9$ . It is generally believed that when  $CI < 0.1$ ,  $CR < 0.1$  the data in the constructed judgment matrix is legal and acceptable, otherwise the judgment matrix needs to be reconstructed. The values of  $\omega_i, \lambda_{\max}, CI, CR$  are listed in Table 2.

$$\lambda_{\max} = \frac{1}{m} \sum_i^m \left( \frac{(AW)_i}{\omega_i} \right) \quad W = (\omega_1, \omega_2, \dots, \omega_m)^T \quad (2)$$

**Table 2 Index Weights and Consistency Test**

	$\omega_i$ (comprehensive sort)				$\lambda_{\max}$	$CI$	$CR$
$Q_i$	0.0539	0.1425	0.4018	0.4018	4.0079	0.0026	0.0029
$Q(1, j)$	0.4367(10)	0.0724(16)	0.1716(14)	0.3193(13)	4.0899	0.0300	0.0333
$Q(2, j)$	0.0478(15)	0.1415(12)	0.2785(7)	0.5322(2)	4.0716	0.0239	0.0265
$Q(3, j)$	0.0905(9)	0.5443(1)	0.3146(5)	0.0506(11)	4.1468	0.0489	0.0544
$Q(4, j)$	0.0927(8)	0.3856(3)	0.1823(6)	0.3394(4)	4.0247	0.0028	0.0091

It can be seen from the table that the factors influencing the risk of CSSD are mainly manifested in depression in psychological quality, non-accident syncope in the illness history, exercise load in physical fitness and bad hobby. Finding the main influencing factors affecting the CSSD, it also grasps the main contradiction of the risk of CSSD, and can effectively promote the prevention and control of sudden death in colleges and universities.

#### 4.2 Evaluation method

If matrix  $B$  is judged as consistent, comprehensive weights can be set as the weights of each index. And the expert scores are used to evaluate the overall risk of sudden death. The evaluation can be expressed as equation (3).

$$SDR = \sum_{i=1}^n \left( \omega_i \sum_{j=1}^m R(i, j) u(i, j) \right) \quad (3)$$

Where  $SDR$  is the comprehensive evaluation value of CSSD risk. And  $n$  is the amount of index in the criterion level.  $\omega_i$  is the weight of the index of the criterion level,  $m$  is the amount of index in program layer,  $R(i, j)$  is the risk value of the index in program level,  $0 < R(i, j) \leq 100$ ;  $u(i, j)$  is the weight value in program level. The overall risk assessment criteria are shown in Table 3.

**Table 3 SDR Value Evaluation Criteria for the Comprehensive Evaluation Value for CSSD Risk**

SDR	Level	Severity	Measure
$(100, +\infty]$	A	Extremely high	Multiple Response
$(60,100]$	B	High	Focus observation
$(20,60]$	C	Significant	Observation object
$(0,20]$	D	Low	keep it as it is

### 4.3 Case application

Through the stochastic sampling test of 30 college students, some effective  $R(i,j)$  are formed. Two typical sample are shown in matrix  $R^1(i,j)$  and  $R^2(i,j)$ .

$$R^1(i,j) = \begin{bmatrix} 0.1 & 1 & 0.1 & 0.1 \\ 0.1 & 0.1 & 0.1 & 0.1 \\ 4 & 0.1 & 0.1 & 30 \\ 1 & 30 & 0.1 & 2 \end{bmatrix} \quad R^2(i,j) = \begin{bmatrix} 0.1 & 60 & 0.1 & 0.1 \\ 0.1 & 0.1 & 0.1 & 0.1 \\ 30 & 60 & 30 & 60 \\ 30 & 30 & 0.1 & 105 \end{bmatrix}$$

It can be seen from the  $R^1(i,j)$  that the most damage suffered comes from the ‘frustration’ and ‘load’ of life. The second is ‘Mood swing’, which is in line with the living conditions of most college students. According to equation (3), the SDR value is 5.7783, the risk level is D. That is, measures should be taken to maintain original state. It can be seen from  $R^2(i,j)$  that the damages are a lot of physical and psychological injury in life, especially bad lifestyle. Through the overall risk evaluation, SDR value is 38.9600, which means the risk level is C. Correction of individual bad habits is urgent. Some special supervision may be necessary.

### 5 Conclusion

Based on the comprehensive data collection and analysis of CSSD, risk and factors of CSSD are identified. A risk index system of sudden death composed of three-level indexes is constructed. Using this index system, to assess and early-warning the risk of sudden death for college students is feasible. The priority of the program level indexes is obtained to guide the colleges to prevent the sudden death of students based on AHP. This can minimize the occurrence of the CSSD.

In summary, the prevention of sudden death risk among college students is an important work. Colleges and universities should examine the risk of sudden death among college students continuously. Combining scientific risk control strategies with novel risk assessment methods could help safety supervision for college students.

**Abstract:** With the development of network technology and the popularization of we-media, network public opinion has an important impact on the security of network culture in universities. The network culture security in universities is an epitome of that in society. Based on the investigation of the current situation of network culture security in universities in Wuhan which are operated directly under the Ministry of Education, this paper analyses the problems and their causes of network culture security in universities from the network public opinion. On this basis, it explores the guiding ideologies, working principles, management concepts, guarantee mechanisms and implementation path of network culture security management in universities.

**Key words:** Network public opinion; Universities; Network culture; Security management

### 1 Introduction

With the development of network technology and the popularization of we-media, the network has become an information source and a broad platform for the public to express their feeling and opinions. Network public opinion has an important impact on the safety of network culture, which has aroused the great attention of the Chinese government. In the first meeting of the central leading group on network security and informatization, Xi pointed out that doing a good job in online public opinion is a long-term task, and it is necessary to innovate and improve online publicity, apply the law of the Internet communication, carry forward the main theme, stimulate positive energy, vigorously cultivate and practice the core socialist values, grasp the timing, degree and efficiency of online public opinion guidance, and make cyberspace clear. The National Informatization Development Strategy 2006-2020 calls for advocating network civilization and building a positive and healthy network culture in an all-round way.

As an important social group using Internet, university students have a wide range of knowledge, strong curiosity and acceptance ability, and they generally use we-media, which leads to rich channels, fast speed and wide coverage of network public opinion in universities. Universities are national personnel training bases, and their network culture security is an epitome of that of society. Therefore, it is important to study the network culture security management in universities from the network public opinion.

The network public opinion is getting increasingly academic attention. The research focuses on six major themes: network public opinion handling mechanism, characteristics, impact, related groups, media in universities, as well as network public opinion and ideological and political education in universities, (Li Wenqing, et al., 2019).

There have been a lot of studies about the network culture security in recent years, however studies on that in universities are still few. The network culture security management in universities is generally studied combining the undergraduate ideological and political education, such as Xie Kemin et al. studied the impact of network culture security on ideological and political education of university students (Xie Kemin, et al., 2012), and Liu Ning explored the countermeasures of promoting ideological and political education with the construction of network culture in universities (Liu Ning, 2014). There are also some studies on the use of firewall (Ma Tao, et al., 2012), big data (Zhao Jian, 2016) and other technologies to improve the network culture of universities.

However, there are few studies based on the connection of the network culture security in universities and the network public opinion. Li Aimin proposed the management mechanism of network public opinion based on campus network culture security (Li Aimin, 2012). Deng Yongfa put forward strategies to improve network culture security from the aspects of mechanism, legal system, integration of resources and technology from the network public opinion (Deng Yongfa, 2010). However, without considering the particularity of universities, the strategies he gave could not be fully applicable to universities.

## **2 Network Public Opinion and Network Culture Security in Universities**

In 2007, Liu Yi put forward the concept of network public opinion in his monograph-*An Introduction to Internet Public Opinion Research*, which is the first monograph on the theory of network public opinion in China. That is, "the sum of different emotions, attitudes and opinions expressed and disseminated through the Internet" (Liu Yi, 2007).

Hu Ting holds that "network public opinion in universities refers to the attitudes, opinions, emotions or behavioral tendencies expressed by university students on the Internet through certain channels on issues, events or phenomena concerned with or related to their own interests within a certain period of time on campus." (Hu Ting, 2014) The content of network public opinion in universities covers social stability, school reputation, campus security, management decision-making, rights and interests of teachers and students, etc.

Network cultural security is a state in which the content of network cultural information cannot damage the national cultural interests in the process of production, dissemination and consumption, and can provide a positive and sustained impetus for the national cultural value system, as well as the security of material technology, system and regulations, network spiritual accomplishment and other aspects in order to ensure this security state (Yao Weijun, et al., 2010). Network culture security includes network security, such as network information dissemination security and storage security; Network system security, such as network security regulations and regulations; Network subject security, mainly refers to the security of people's ideology. Network culture security in universities is the refinement of the concept of network culture security.

The influence of network public opinion on network culture security in universities has two sides. The positive influence includes the spread and development of campus network culture, the construction of a harmonious campus, and university students' understanding and thinking of the world. The negative

effects are mainly reflected in three aspects. Firstly, university students are generally open-minded and credulous, and they may overreact under the guidance of bad public opinions. Secondly, the negative online public opinion, including pornography culture, violence culture and cult culture, has brought huge obstacles to establish a correct worldview, outlook on life and values. Thirdly, some university students spend most of their time on network communication, which is likely to lead to personality deviation and loneliness and depression.

### 3 A Case Study on the Current Situation of Network Culture Security in Universities from the Network Public Opinion

Through questionnaire survey, interview and other means, this paper conducted a survey-The Current Situation of Network Culture Security in Universities for students in 7 universities in Wuhan which are operated directly under the Ministry of Education. The questionnaire mainly focuses on the network behavior of university students, the participation and identification of online public opinions, and the management of network culture security in universities. In the survey, 482 questionnaires were sent out and 453 valid questionnaires were collected, with the effective rate of 94.0%.

#### 3.1 Network behavior of university students

Research shows that more than 90% of the students spend more than 2 hours online every day, with 4-6 hours accounting for the largest proportion (35.23%), and 8.94% of the students spend more than 8 hours on the Internet. 79.69% of the students surf the Internet for Browsing WeChat, weibo, etc., with 68.42% for chatting, 65.21% for study and 59.76% for reading news, as shown in Figure 1. 12.28% of the students think that the online information is highly credible, and 55.72% will judge the credibility according to the situation. It can be seen that university students spend a long time online, and trust network information. The Internet has become an important channel for them to obtain information.

Figure 1 The Things University Students Do Online

#### 3.2 Participation and identification of online public opinions

According to the survey, students pay the most attention to social hot issues online, accounting for 76.21%, followed by entertainment events and campus news, accounting for 66.23% and 49.82% respectively, as shown in Figure 2.

**Figure 2 The Internet News University Students Most Concerned About**

As for whether they will reprint or comment on news after reading it, 21.03% of the students say they never do it, 71.96% of them do so occasionally, and 10.01% of them do it often. Regarding the attitude towards social hot issues on the Internet, 17.76% of the students will follow and comment, 78.5% of them occasionally follow but do not comment, and only 3.74% of them neither follow nor comment. 68.22% of the students say they will consider the impact of their own comments when making online comments, but there are still 11.21% say they will never do so, and 20.56% of them say they will not when making anonymous comments. It can be seen that most university students pay attention to public opinions and have their own opinions. Most students generally choose to be onlookers, but some students make comments regardless of the impact.

Facing hot issues, 65.38% of the students choose to believe the information and opinions from official microblogs, followed by that from official websites and public numbers on WeChat, as shown in Figure 3. 79.25% of them think that online public opinions have an impact on their thoughts and behaviors.

**Figure 3 University Students' Trust in Various Sources of Information and Opinions on the Internet**

### 3.3 Management of network culture security in universities

83.28% of the students know their university's new media platforms such as WeChat and weibo, but only 46.94% of the students read them regularly or occasionally. It can be seen that new media public platforms have been set up in universities, but still need to be strengthened.

## **4 Problems and Their Causes of Network Culture Security in Universities from the Network Public Opinion**

On the whole, university students can deal with online public opinions reasonably, and the overall safety of network culture in universities is good, but there are some problems worthy of attention. First, useful information on the Internet coexists with false and harmful information, and university students trust network information and are easily affected. Second, Students express and forward opinions through we-media, which promotes the generation and dissemination of online public opinions. Third, the effective network culture security management still needs to be strengthened. Combined with the survey results, the causes of the problems are analyzed.

Firstly, western countries use the Internet for Cultural infiltration, and university students are the main objects. All along, western forces have been trying to divide and westernize China through cultural infiltration, such as publishing remarks advocating western capitalism and denigrating socialism on BBS, carrying out subtle publicity and edification through QQ group, weibo, WeChat and other new media platforms, or spreading the ideology and culture of capitalism through films, animation, online games. They try to destroy the core value system of socialism in China, so as to eliminate the political identity of university students to the socialist country and the ruling communist party.

The second is the mental immaturity of university students. University students have a strong sense of subjectivity and are willing to express their unique opinions. In addition, they lack social experience, and are easy to make irrational or incorrect judgment, and some even act excessively.

The third is the backwardness of network ideological and political education in universities. Some universities do not take ideological and political education as a job through the whole process of education and teaching. Some universities have conservative ideas, fail to innovate educational methods, and propaganda workers are lack of confidence and ability to control the cyberspace, which makes the network ideological and political education lag behind.

The fourth is the lack of network public opinion management in universities. Some universities do not pay enough attention to the supervision of online public opinion, and lack the awareness and measures of public opinion warning. There is no management system of network public opinion in some universities. The management of network public opinion in most universities is in charge of student affairs office, network center, youth league committee, etc., with unclear division of labor. Some universities fail to introduce advanced network monitoring and information filtering technology, and lack effective network supervision technology.

## **5 Countermeasures of Network Culture Security Management in Universities from Network Public Opinion**

### **5.1 The guiding ideologies of network culture security management in universities**

First, we should take the national policies and social ethics as the guidance to grasp the correct direction of network public opinion guidance. In 2015, Notice of the Department of Ideological and Political Work of the Ministry of Education on Carrying Out the Second Batch of Special Pilot Work of Network Culture Construction in Colleges and Universities pointed out: “in order to further explore the mechanism and path of network culture construction in colleges and universities, promote the network dissemination and promotion of core socialist values, and enhance the targeted effectiveness of network ideological and political education, we should give full play to the educational function of network

culture, and strive to build a number of demonstration bases of network culture construction in colleges and universities.”

Second, we should take the law of network development as the guide and give scientific guidance to network public opinions. The network has its own inherent norms and self-discipline mechanism, which is not enough to maintain the normal operation and development of the network as the network environment has become more and more severe and complex. Therefore, in the process of network culture security management in universities, on the one hand, it is necessary to follow the inherent norms and self-discipline mechanism of the network, guide students to establish the awareness of network self-discipline, and regulate their network behavior consciously; On the other hand, mandatory intervention and legal means should also be used appropriately.

Third, we should take the growth rules of university students as the guide and exert the positive effect of network public opinion. In the network culture security management, students' needs to learn knowledge, broaden their horizons, improve their abilities and abilities in cyberspace should be met. Their opinions can be expressed, their grievances vented and their rights exercised.

### **5.2 The working principles of network culture security management in universities**

The first principle is people-oriented. We should take students as the real subject of education, respect students, understand students, and trust students, but do not blindly listen to students.

The second principle is timeliness. In the face of public opinion events, universities should release effective information in a timely manner, and continuously release the latest situation. It can prevent other malicious information from distorting the facts of the event.

The third principle is openness. We should insist on the initiative, timely and authoritative information disclosure. Especially in the face of public opinion events, information disclosure can enable students to understand the origin of the event, so as to relieve students' extreme emotions.

The fourth principle is objectivity. Universities should ensure the objectivity and authenticity of the information released and establish good credibility of the management department.

The fifth principle is effective guidance. It is necessary to pay close attention to the ideological trends of students, and provide timely information disclosure and ideological guidance.

### **5.3 The management concepts of network culture security management in universities**

Firstly, it should be made clear that the management of network culture security in universities is not to maintain stability, but to promote campus harmony.

Second, it is people, but not information, that play a dominant role in the formation and evolution of network public opinions.

Third, in the face of complex network public opinion, the management of network culture security in universities no doubt lies in the guidance not in the obstruction.

### **5.4 The guarantee mechanisms of network culture security management in universities**

Firstly, rules and regulations need to be improved. The responsibilities of each department need to be clarified. It is necessary to form an accountability mechanism to hold departments and individuals responsible for negative effect.

Secondly, the construction of organization and team needs to be strengthened. In the organizational construction, a vertical system of "university-major-class" and a horizontal system of student organizations and associations are needed. In the construction of team, it is necessary to set up special network culture security management personnel, and form a network culture security management team, including technical experts, leaders, teachers, counselors and students, and constantly train them to improve their working ability.

Thirdly, effective technical guarantees are necessary. Network information technology plays an important role in the security of network culture. Universities should strengthen the investment and construction of software and hardware to advance the science of network culture security management.

### **5.5 The implementation path of network culture security management in universities**

The implementation path of network culture security management in universities includes five aspects: information publishing, transmission, coordination, guidance and supervision.

In the process of information publishing, it is necessary to adhere to the principle of open, transparent, fast and smooth, set up information release agency, and make full use of campus network platform.

In the process of information transmission, it is necessary to quickly collect and analyze the universal, important and influential information among students, and make effective feedback on the basis of comprehensive analysis of the information.

In the process of information coordination, in accordance with the requirements of adhering to responsibilities, integrating resources and reducing costs, the linkage mechanism between departments should be established to ensure close cooperation and coordination among departments.

In the process of information guidance, it is necessary to cultivate "opinion leaders", and establish a long-term mechanism of network public opinion guidance, so as to create a positive network culture atmosphere in universities.

In the process of information supervision, information technology should be used to collect, sort out, evaluate, warn and deal with the network public opinions of universities, so as to realize the supervision of network public opinions of universities and improve the level of network culture security of universities.

## **6 Conclusion**

Based on the investigation of the current situation of network culture security in universities, this paper pointed out the core problems and reasons, and put forward the countermeasures of network culture security management in universities.

The validity and reliability of the countermeasures will continue to be studied, and pilot projects will be done to get broader conclusions and establish a network security management system in universities.

## Is the Importance of Sustainable Development Goals Universal Across Development Stage of Economies?

Yuko Hayashi<sup>1</sup>, Frans Stel<sup>2</sup>

2 Faculty of Behavioural, Management and Social Sciences, University of Twente, the Netherlands.

(E-mail: hayashiy@yamaguchi-u.ac.jp, f.g.stel@utwente.nl)

**Abstract:** In recent years, the importance of sustainable development has increased since the world community endorsed the 2030 Agenda for Sustainable Development and its 17 Sustainable Development Goals (SDGs) designated by the United Nation in 2015. For higher education students who study deeply in specialized fields, it is necessary to consider how their knowledge and academic research can contribute to the sustainable development of society. However, not many such studies have been conducted yet. In this study, we explore an international comparative survey on students' awareness of the SDGs using questionnaires from more than 20 countries from developed countries and emerging economy countries. The study also suggests evidence that some sustainable priorities are universal and there are some inter-country variability. For example, in both developed and emerging countries, items such as climate change, water, and food that are closely related to basic life were given high priority. Our analysis highlights similar patterns of importance of SDGs in emerging and advanced economies. However, the SDGs will be defined and operationalized differently in different countries due to divergent situations of emerging and advanced economies. Therefore, customized approaches are needed to implement the sustainable development goals. In addition, more attention should be given to lowly ranked sustainable items as waste and pollution, availability of resources and inequality of wealth and income. These items are undervalued, but have huge consequences.

**Key words:** SDG; Sustainability; Questionnaire survey; Environment; Student

### 1 Introduction

Since 17 Sustainable Development Goals and 169 targets has been designated in "Transforming Our World: The 2030 Agenda for Sustainable Development"(The United Nations, 2015) , people's sensitivity for sustainability has grown stronger. What has been regarded as a problem in developing countries, such as hunger and poverty, is found out to be closely related to various problems in developed and emerging countries such as excessive production, consumption and environmental destruction(Zhou and Moinuddin, 2017). Therefore, the SDGs cannot be achieved without comprehensive consideration including among whole world. The attitudes of companies, investors and customers are also changing. After the 2008 stock market crash, investors began to focus not only on short-term investments but also on ESG investing that contributes to the global environment in the long term (European Commission, 2012)

. There has been a tendency to increase investment in companies aiming for sustainable development goals. Customers began to realize that their purchasing behavior had an impact on the environment. If Companies sell non-sustainable products and do not care for the environment, customers refrain from purchasing. Therefore, the SDGs can be an incentive for companies to develop sustainable product, process, and service. The United Nations put a priority on the policy "STI (Science, Technology, and Innovation) for SDGs" in order to accelerate to achieve SDGs as a future blue print of the world(IATT, 2018). Without STI, the earth cannot support 9 billion people in the world in 2050. In addition to these industry and government movements, activities for the SDGs are also expanding in the academic and educational fields. In Japan, many schools adopt the concept of SDGs in primary and secondary education.

It is also important for the students in higher education institutions, where the students' specialty would be more narrowed and profound, to consider how the knowledge and skills that students are learning will contribute to the sustainable development goals of society. However, there are few studies on the students' awareness of SDGs. Therefore in this study, we conducted an international comparative survey of awareness of SDGs through websites in more than 20 countries from developed countries and emerging economy countries.

## **2 Analytical Method**

This study is based on the "Agenda for the Future" questionnaire survey asking how cultural, personal, and social values are associated with environmental concerns and we excerpt answers to the priority of sustainable development goals. This paper explores the question: are the priorities of sustainable development goals different from emerging countries to developed countries? How are they different? Sustainable priorities are examined by developed countries and emerging economies.

### **2.1 Survey period**

"Agenda for the Future" questionnaire survey was conducted from 2015 to 2018. The survey is still ongoing to increase the number of countries and students.

### **2.2 Survey method**

We asked the respondents to prioritize these items on their mobile phones or laptops through a short questionnaire using Qualtrics software. By not using paper format, it is considered that there are advantages such as collecting data in one database and analyzing it quickly, or performing it remotely. Questions were conducted in Japan, Brazil, and Indonesia in their native language, and in other countries in English. The reason for the translation is to make the understanding of the question clearer than in English.

### **2.3 Survey targets**

Students from around the world who are enrolled in doctoral, master's, and bachelor courses were targeted. Each survey should include approximately 100 students attending university to secure the same quality of students. We use researchers' networks to find universities to accept the questionnaire survey in their classes so that there is a possibility to have bias to choose targeted universities.

## 2.4 Survey content

The response time was about 15 minutes. All respondents gave explicit consent to involve their opinion in our analysis. In the first section, questions were asked about priorities for sustainable development goals. We asked pre-graduate and graduate university students to assist the World Economic Forum to formulate an Agenda for the Future. We grouped the 17 Sustainable Development Goals of the United Nations into 10 sustainable priorities so that students can recognize to answer easily. The correspondence is shown below (Table 1). For example, as Goal 11: "Sustainable cities and communities" in SDGs is difficult to understand for students, we extracted concise and important idea from Goal 11 and set, "Population: growth & ageing" as an example of priority ranking. However, as each item's concept of "Priority Ranking" and "Sustainable Development Goals" are similar but exactly same, we cannot treat them as completely equal items. Consequently, we should be careful to translate the result of the questionnaire survey to sustainable development goals.

We asked the respondents to prioritize these items sorting descending way by dragging items on through a short questionnaire using Qualtrics software. Incomplete, double, or inconsistent answers have been removed from the analysis.

**Table 1 Sustainable Priorities Derived from UN Sustainable Development Goals**

10 sustainable priorities	...derived from SDG goals
Food: availability & safety	Goal 2: no hunger Goal 3: good health and well-being
Human rights & labor conditions	Goal 4: quality education Goal 5: gender equality
Poverty & income inequality	Goal 1: no poverty Goal 10: reduced inequalities
Population: growth & ageing	Goal 11: sustainable cities and communities
Religiously driven activism	Goal 16: peace and justice
Water: availability & purification	Goal 6: clean water & sanitation Goal 14: life below water
Waste & pollution reduction	Goal 12: responsible consumption & production Goal 15: life on land
Climate change, global warming, Co2 emissions, ozone layer	Goal 13: climate action
Energy: availability & use	Goal 7: affordable and clean energy
Resources usage, availability of raw materials, re-use, recycling	Goal 8: decent work and economic growth Goal 9: industry, innovation and infrastructure

### 3 Results and Discussion

#### 3.1 Simple aggregation

The research took place in the period 2015-2018 in the context of sustainability awareness courses that were then part of their study programs. During this period, a total of 1194 students in 12 datasets participated in questionnaire surveys. Each dataset has approximately 100 bachelor, master, or doctoral courses students from Netherlands, Brazil, Japan, and other countries. In some countries, not all questions are included in all datasets due to time constraints of their programs. After screening of the data, 996 responses could be included in the analysis. Of the respondents, 25.1% was born in the Netherlands, 13.5% in Brazil, 12.0% in India and 10.9% in Japan. These four countries account for 61.5% of the total respondents. The other respondents had 37 nationalities. Developed countries accounted for 52.0% including- Netherlands, Japan, Singapore, Finland, and Germany. Emerging economy countries accounted for 48.0% including Brazil, India, Turkey , Mexico, Nepal, China, and East Europe Countries. Considering that the total number of valid responses was 996, and the Netherlands accounts for a quarter, we conclude that there is a bias, if we take population into consideration. However, we keep on expanding participants from all over the world in order to increase accuracy. In total, 54.2% males and 45.8% females participated in the research. Participants were, on average, 26 years old (average birth year 1993).

#### 3.2 Comparison of between advanced countries and emerging countries

We compared developed countries with emerging countries in ranking priorities for sustainable development goals across the globe as the figures below. Standard Errors, which were used as an indicator of universality of sustainable issues on the horizontal axis , were culcurated from Standard Dviations. On the vertical axis, we used the importance of sustainable priorities. The error bars of a chart shows the 95% Confidence Intervals. A priority border was 5.5 which was middle of the 10 ranking and boader of universality was set on 0.23 which was the average of Standard Errors.

Figure 1 Sustainable Priorities in Advanced Countries

Figure 2 Sustainable Priorities in Emerging Countries

We categorized the rankings in a 2x2 table in which we juxtapose importance (high/low) and universality (high/low), as is summarized in Figure 3.

<p>I. Universal high priorities:</p> <ul style="list-style-type: none"> <li>• food</li> <li>• energy</li> <li>• human rights (in developed economies)</li> </ul>	<p>II. Less-universal high priorities:</p> <ul style="list-style-type: none"> <li>• water</li> <li>• climate change</li> </ul>
<p>III. Universal low priorities:</p> <ul style="list-style-type: none"> <li>• waste</li> <li>• population</li> </ul>	<p>IV. Less-universal low priorities:</p> <ul style="list-style-type: none"> <li>• human rights (in emerging economies)</li> <li>• poverty/ inequality</li> <li>• religion</li> <li>• resources</li> </ul>

Figure 3 Sustainable Priorities Across Advanced and Emerging Countries

In our survey, universal high priorities are food and energy (and partly human rights). In developed countries, water ranked first, food ranked second, and climate change ranked third (Figure 1). The top three in emerging countries, is climate change, food and water (Figure 2). Although the

rankings are different, it can be seen that issues that are directly related to survival are given high priority.

**Food** gets a high priority with low standard errors in both developed countries and emerging countries(Figure 3), which indicates that food is regarded as an important universal goal. The food item involves food availability and food safety. In the whole food chain - from farm, to processing and supermarket- ca. 30 percent of food is wasted(WWF, 2014). A large part of food waste is due to consumer behavior. In addition, in many production chains, food is wasted: by producers, retailers, restaurants, supermarkets and end-users. This is a waste of food money, and energy. Furthermore, it causes additional CO<sup>2</sup> emissions from transport and disposal. According to KPMG research (2014), the food industry would have no profits if they had to pay the full cost of their negative environmental side-effects or externalities, such as pollution, CO<sup>2</sup> emissions. Food prices are a significant issue in developing countries like India and perceptions that growing food prices for people are likely to result in community unrest(KPMG, 2014). In India, not enough food is available, resulting a relatively high prevalence of stunting (low height-for-age) in children under 5 years of age(Sachs et al., 2017). It indicates that there are excessive food in some places and shortage of food in other places. India might have problems not only in food production, but also food supply chains. We conclude that food is an important issue. Consequently, solving food-related problems - e.g. lack of availability, food waste, food security, and improper food distribution – is essential to sustainable development..

**Energy** ranked is ranked high in both developed countries and emerging countries(Figure 1, Figure2). It is recognized as an important issue after three issues that are directly related to survival. Energy consumption is increasing rapidly due to simultaneously increasing population and development levels. World energy-related carbon dioxide emissions are expected to grow dramatically, especially in non-OECD countries, according to the World Energy Outlook of the International Energy Agency. Because of higher global energy demand, energy prices may rise. The necessity to become more energy-efficient and use more alternative and renewable sources of energy will grow.

**Human rights** are moral principles or norms that describe certain standards of human behavior and are regularly protected as natural and legal rights. In 2019, geopolitical tensions and competition have intensified resulting in increasingly politicized discussion about human rights(World Economic Forum, 2019). In advanced economies human rights are prioritized slightly above average, in emerging economies slightly below the average of all ten sustainable priorities.

Less-universal high priorities are water and climate change(Figure 3).

In our survey, water is highly prioritized, although opinions vary. We argue that this variation is caused by differences in access to water in emerging economies in contrast to developed countries, where water availability and sewage is nationwide available. Water is highly related to other goals since water lies at the heart of everything that is important for human life: food, sanitation, energy, production of goods, transport and the biosphere. Water supports human's basic life. Without drinking water, humans cannot live. Safe drinking water, is an essential ingredient to human health. Water is imperative to agricultural food production. Water control is important to protect people's lives and property from floods and typhoons which are related to climate. Lack of water leads to poverty. Water scarcity for many businesses can be a major risk to growth and development(KPMG, 2012). The 2030 Water Resources Group (2010) estimates that the global demand for freshwater will exceed supply by 40 percent by 2030 assuming average economic. In terms of waste, sewage problems in toilets and household wastewater becoming more important, and water pollution problems that are also affected

by industrial waste lead to increased human health problems as well.

Climate change is important, although the priority is varying in our survey. Climate change is the source of many high impact/high likelihood risks, as defined in the World Risk reports of 2018 and 2019: due to climate change, several high impact / high probability events may occur: extreme weather, natural disasters, water and food crises, and ultimately interstate conflicts or weapons of mass destruction (Figure 6)(World Economic Forum, 2018a). Therefore, further education of consequences of climate change is relevant. Climate ranks first priority in emerging countries and ranks third priority and second lowest standard error in developed countries. Emerging countries may have more direct and serious damage than developed countries because they lack the resilience, strength, and flexibility to protect from natural disasters.

In the universal low priorities quadrant, issues of waste and population are considered (Figure 3).

**Waste** gets a universally low priority (Figure 1,2). In emerging countries, it can be fully expected that waste will increase along with economic growth, therefore, it is desirable to take measures in advance. Waste problems can cause biodiversity loss and ecosystem collapse, a high impact / high probability risk (Figure 5). For instance, micro-plastics has become a major social problem which has been detected in the human body and the EU has issued a ban on them. Plastic garbage in ocean leads to micro plastics in food chains and yet unanticipated health risks.

Although **Population** ranks 9th in emerging countries, population explosion affects immensely the levels of consumption: a growing population leads to growing consumption and larger ecological footprint and excessive non-sustainable use of natural resources. Especially in Africa and parts of Asia (India), population growth is estimated. India has 1.39 billion population representing 18 per cent of the world's population and is the second most populous country after China (1.44 billion). United Nation report said that around 2027, India is projected to overtake China as the world's most populous country, while China's population is projected to decrease by 31.4 million, or around 2.2 per cent, between 2019 and 2050(United Nations, 2019). A growing population in an area suffering from climate change, more extreme weather conditions and resource scarcity, will lead to large-scale involuntary migration and subsequent interstate conflicts.

At the same time, a shrinking population may cause economic problems. Population ranks the last priority in developed countries, but aging society becomes serious problem in near future. As is illustrated in Figure 4, in developed countries in 2035 one fourth of the population are aged above 65 years. Japan, as a front runner, has problems with the declining birth rate and aging population which mainly causes a shrinking of total labor force, increase in social welfare expenses and shortages in welfare-related care jobs. The huge population of China is more rapidly aging than other countries. The working proportion of the population is known as the 'dependency ratio'. This ratio is one of the indicators of sustainable development as defined by the World Economic Forum(World Economic Forum, 2019). A lower dependency ratio jeopardizes future economic growth. Some economic structural reform should be needed to keep the aging society.

Figure 4 World Aging Rate (population >65 years of age)

Source: UN World Population Prospects, 2015

In the less-universal low priorities quadrant, the items of poverty/ inequality, human rights (emerging economies), resources and religiously driven terrorism are mentioned (Figure3).

**Poverty/ inequality** gets low priority (Figure1,2). Income inequality and poverty is becoming a growing problem in many advanced economies, while in most emerging economies these issues have improved although their absolute levels of inequality and poverty remain much higher in emerging economies(World Economic Forum, 2018a). In both, advanced and emerging economies, wealth is significantly more unequally distributed than income. Wealth inequality is rising in many economies. Poverty and inequality are sources of sustainable risks because they lead to social instability and consequently the risk large-scale involuntary migration, terrorist attacks and man-made environmental disasters (e.g. burning tropical forests). In addition, large-scale involuntary migration may lead to interstate conflicts. In Figure 5, we visualize these trends, based on the assessment of the World Risk Report 2019 of the World Economic Forum.(World Economic Forum, 2019)

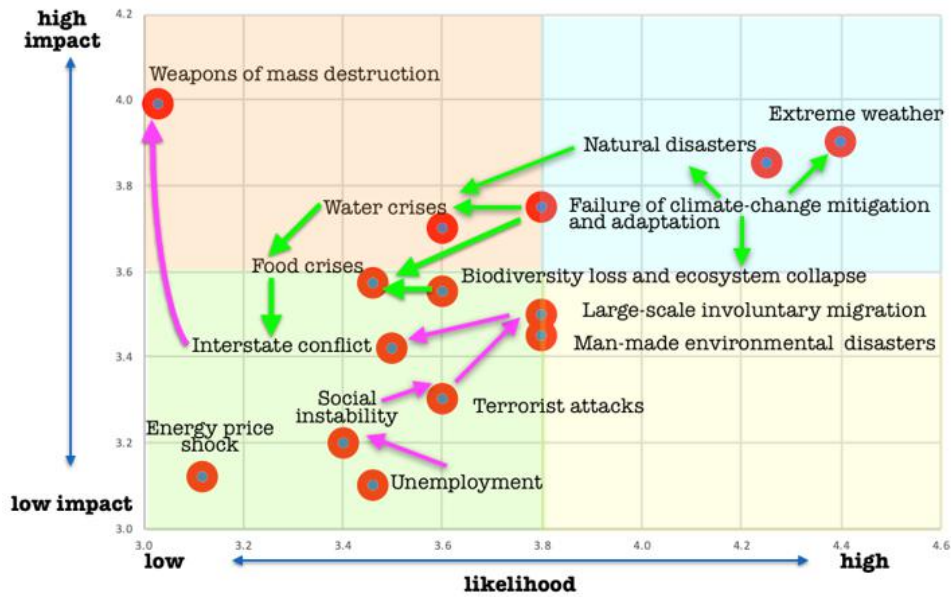

Figure 5 Global Risk Trends and Their Likelihood Related to One Another

The availability of resources get a low priority: still much more resources are used than is available in the long term. According to KPMG (2012), resource shortages can be expected (KPMG, 2012). Because the resources on which businesses rely will become more difficult to access, they will tend to become costlier (World Economic Forum, 2018b). Resource use has grown faster than the population. Shortages of a number of key resources are becoming more and more apparent, from arable land, fresh water and metals to fossil fuels. Companies, consumers and governments, need to prepare themselves for a world where raw materials may be in short supply and subject to price volatility, higher prices and potential disruption to supplies. For example, marine fish stocks face the risk to become over-exploited, especially in Asia. Growing soil erosion might lead to reduced agricultural or biofuel productivity. There are also concerns about supplies of fertilizing minerals such as potassium and phosphorous and rare-earth minerals such as neodymium, yttrium and cerium (KPMG, 2012).

**Religiously driven terrorism** or activism is lowly prioritized (Figure 1, 2). This is in accordance with the global risk report 2019 (World Economic Forum, 2019): terrorist attacks are rated with a below average likelihood and impact. Terrorist attacks are related to social instability and state collapse. In turn, social instability is related to unemployment or underemployment, poverty and income inequality.

#### 4 Conclusion

In this study, we made a comparative study of sustainable priorities in various emerging and advanced countries. In both type of societies climate change, water, food and energy are highly prioritized while items of waste and pollution reduction, population, income inequality and availability of resources get less emphasis. Although relative priorities are comparable in different countries, the

interpretation differentiate between countries, e.g. in some countries availability of water might prevail, while in other countries the purification, avoiding excessive levels of water, or water treatment and sewage issues might be more relevant.

Due to the fact that in developed countries and emerging countries similar items are prioritized, we conclude that a sense of urgency of a climate change, water, food and energy issues is shared around the globe. A common awareness is important in order to have sufficient inclination to collaborate globally in order to solve sustainable problems related to these issues.

Both in emerging and advanced societies, issues related to waste and pollution reduction, population, income inequality and availability of resources are relatively lowly rated. Still, these issues have huge consequences and related to global risks. Waste is related to resource availability, biodiversity, food-security, clean water and air. Population is related to consumption, ecological footprint, carbon dioxide emissions, but also to sustainable growth. Income inequality and poverty are related to social instability and consequently the risk large-scale involuntary migration, terrorist attacks and man-made environmental disasters (e.g. burning tropical forests). The availability of resources is associated with biodiversity, interstate conflicts, large-scale involuntary migration. Because of these consequences, more attention should be given to education of the widespread effects of these low prioritized items.

This study is not without limitations. First, our study used self-assessment methods. These self-reports might differ from actual behaviors in real negotiations (Ajzen, 1991). Subsequent research using actual behavior would provide for a more realistic understanding of prioritizing sustainable behavior compared to self-report. Second, we only asked students to respond. Increasing our database to a wider sample of population would provide a better understanding of sustainable priorities. Third, an increase of sample size to more cultures will increase the statistical power of our conclusions.

We suggest three avenues for further research: to include demographic variables, personality characteristics, and social attitudes in the analysis of sustainable priorities. First, age and gender might be of impact to the selection of sustainable priorities. Second, personality characteristics as honesty and agreeability might influence the priorities. Third, social attitudes as the Social Dominance Orientation might be of importance to assessment of sustainable items.

## Cash Crop Innovation System and Networks: Findings from Smallholder Cocoa Farmers in Ghana

Patience Pokuaa Gambrah, Yu Qian

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: [patiencegambrah@yahoo.com](mailto:patiencegambrah@yahoo.com), [yuqian@whut.edu.cn](mailto:yuqian@whut.edu.cn))

**Abstract:** This paper uses household and informant survey data from Ghana to: understand the managerial structures that influence change in cocoa production systems. We examined how innovation system networks are operating in the smallholder cocoa production and also identify interventions for strengthening innovation capacity. Results obtained from the study shows that, public sector actors are the major players in the cocoa production system and they also play a major role in marketing linkages. We also find out that the private sector actors also play certain key functions in the network. Again it was observed that, there exist differences in the innovative (IG) and non-innovative (NG) networks, with IG showing larger access to inputs, production, information, credits and markets. We also found out that, vital institutions which could build up the stakeholders' capability to identify, implement and acclimatise sustainable practices were not involved in the processes. We therefore, recommend for a policy reform of the current cash crop system to find solutions to the institutional and policy matters that restrain current cash crop innovation system.

**Key words:** Innovation capacity; Social network analysis; Cocoa production system; Institutional settings

### 1 Introduction

Agriculture is considered as the most central part to African economic development (John W. McArthur and Jeffrey David Sachs, 2019), but its sustainable development faces a lot of setbacks. Inadequate innovation capacity (CalestousJuma, 2011), low productivity (United Nations Development Program, 2012), dwindling natural resources and climate change (Thomas S. Jayne, et al 2010) have all made agricultural development not realise its full potential (United Nations Development Program, 2012).

Similarly, in Ghana the agriculture sector is characterised as experiencing sluggish rate of technological change (World Bank, 2017) and the slow emergence of alternative official and structural arrangements to boost growth and development. This means that diffusion of new knowledge in agricultural technologies only is not sufficient to deal with the above-mentioned challenges. Instead, it is imperative to understand the range of actors and ways of improving their capacity and thus follow fresh agricultural innovation systems of importance. We begin by rethinking cocoa production as part of a bigger dynamic system of cash crop innovation. The background we are using for our analysis is innovation systems method which permits us to explore the capability to innovate. The idea of innovation systems by (Andy Hall et al, 2001) and (Norman Clark, 2002) offers an alternative structure to the linear technology diffusion model. We concentration on innovation capacity (Andy Hall, 2009) other than on the diffusion of innovation (Everett M. Rogers, 1983). Innovation capacity emphasises on policy and development mediations that put together knowledge and information so as to support an unceasing process of innovation. Innovation is defined as the technique for creating, retrieving and using knowledge and information to generate new products, processes, services, and many others, which fulfils social and economic goals (Andy Hall et al, 2001). The problem is partly concerned with developing new knowledge, but it is also about the capability to activate available knowledge, and how to use this knowledge. This moves the importance from technology and agricultural techniques to networks, linkages and institutional settings that allows the assimilation of different knowledge bases, and enable the alteration of recommended technologies to meet the necessities of the local context.

The innovation system idea is offered as a basis for examining the idea of innovation capacity. World Bank (2006a) offers the four-theme analytical framework to examine agricultural innovation capacity. Which includes: Actors; Attitudes and Practices of the main actors; Pattern of interaction; and Enabling environment. In the smallholder farmers' network, actors are private firms or government institutions which help in the whole production process. The various institutions, which shape how these actors interact and learn cannot be ignored, as they set the rules of engagement (Douglass C. North, 1990).

SNA is a very useful tool for investigating social structures. As a tool which can be applied in

many fields, we examine, in particular, its effect in the innovation system. It is important in understanding innovation systems because of its analytical emphasis on relationships and interactions within social structures, and its ability to use knowledge flows and other traits contained within such interactions (David J. Spielman et al, 2009). This paper examines how cocoa smallholders innovate; how their social networks contribute to innovation processes; and how those decisions, networks, and processes are influenced by policy and market-driven factors in Ghana as a case study.

The paper is structured as follows: the next section describes the methodology used, emphasizing on the study area, the data collection process and the social network analysis (SNA) methods used. Then we present the results and discussion in the following section and conclude the paper in the last section.

## 2 Data and Methodology

The SNA of smallholder cocoa farmers involved both quantitative and qualitative data and a combination of different approaches.

### 2.1 Study area

This study was conducted in two Locations, one in the SefwiWiawso Municipality in the Western North Region and the other in the Asutifi North District in the Ahafo Region all in Ghana. The study focused on innovations that were introduced by the Ghana government/COCOBOD over 10 years (2007-2017). During this period the government was involved in implementing an integrated cocoa development program via packages of mass spraying, improved seedlings, fertilizer distribution, marketing and capacity building at the local level which has produced hopeful livelihood improvement results. The data collection was conducted in eight villages, four from each of the two Locations. Households were selected through a stepwise process. A systematic random sampling was employed to select households from each village. Accordingly, a total of 144 households were selected from the two Locations in the eight enumeration sites for household survey. Households for additional study in the focus group discussions (FGD) was selected from each location based on a rough table created from the household survey data. The four homes with the maximum scores and the four homes with the minimum scores was selected for distinct focus group interviews and were denoted as innovative group(IG) or non-innovative group(NG), respectively. As shown in Table 1, these groups statistically differed, with IG exhibiting higher mean values. This allowed us to recognize groups that, according to the survey data, were generally supporting the various innovations.

**Table 1 Descriptive Statistics for Focus Group Participants**

Attributes	Mean(IG)	SD(IG)	Mean(NG)	SD(NG)	Standard error	p-value
Mean family size (no.)	9.95	2.31	8.23	1.13	0.4560	0.0004
Mean age (years)	49.32	8.70	48.7	9.60	2.2900	0.7875
Mean education(years)	4.38	2.35	3.45	1.50	0.4930	0.0638
Mean land ownership size(ha)	10.85	1.71	10.48	1.40	0.3910	0.3473
Mean cocoa trees(no.)	100	2.20	99.4	1.88	0.5120	0.5170
Mean land size allocated for production	9.20	1.25	9.12	1.22	0.309	0.7964
Mean land size allocated private production	5.33	2.31	5.21	1.21	0.462	0.7958

Subsequent from the FGD interviews at each site, another semi-structured dialogs was done with key actors found within the FGD partakers and an institutional ranking exercise was also done. The data obtained was then used to conduct our social network analysis of each site.

## 3 Data Analysis

Based on the available data obtained from farmers and other players, we built network matrices for the data. These matrices were the basis for our social network analysis. After importing the network matrices as a table into UCINET (Stephen P Borgatti et al, 2002), we then analyzed our data.

## 4 Results and Discussion

We performed a network analysis of innovation actors in the smallholder cocoa production system, and examined the central players, the underlying collaborative relationships and its implication.

**4.1 The actors in cocoa production innovation system**

We identified various actors in the system and they were made up people including a range of public, private and civil society organizations. There were a total of 25 actors with a web of 369 ties taking part in the innovation systems network (Figure1). The density, which is an indicator for the level of connectedness of a network for the innovators network, was 0.615, i.e. about 61.5% of all possible direct linkages are present. Furthermore, the degree of centralization of the whole network is low (0.418), showing that only 41.8% of the links were reciprocated. Thus, this indicates that actors are not well connected. Which means that, there is a possibility to increase the interconnections between actors in this network, which could help in improving the productivity of the cocoa sector.

**4.2 Role of public service providers in linkage facilities**

It was found that the public sectors play a central role in the cocoa production innovation system. The measures of centrality that was used to examine the centrality of the actors in the network from Figure 1 and Table 2 reveals four main institutions which play a key role in the smallholder innovation process. By their order of degree centrality, we have: CBC, NGO, FCA and LFA. They are all private service providers which are closely connected with smallholder households and they operate around an intertwined network of agencies.

**Table 2 Measures of Centrality of Actors in the Network**

Actors	N Degree	NOut-degree	NIn-degree	N Closeness	Normalized Betweenness
Smallholders(SMH)	1	0.583	1.000	1.000	0.049
Inspection activity(IA)	0.375	0.292	0.250	0.615	0.002
Disinfestation Activities (DA)	0.292	0.208	0.208	0.585	0.000
Cocoa Beans (CB)	0.583	0.458	0.542	0.703	0.012
Cocoa Products (CP)	0.500	0.500	0.167	0.667	0.006
Hybrid Seed Pods (HS)	0.708	0.583	0.667	0.774	0.000

CODAPEC & Hi-Tech					
Cocoa Disease and Pest Control(CODAPEC) (COD)	0.75	0.708	0.500	0.800	0.004
Field Operations (FO)	0.792	0.708	0.792	0.828	0.005
Cocoa Agronomy (CA)	0.708	0.667	0.500	0.774	0.001
Cocoa Development/ Improvement (CI)	0.750	0.667	0.542	0.800	0.001
Capsid, Black Pod and CSSVD Control (DCD)	0.792	0.708	0.625	0.828	0.005
New Products Development (NPD)	0.750	0.625	0.708	0.800	0.001
Farmers' cooperative union(FCA)	0.917	0.833	0.917	0.923	0.021
Farmers credit union (FCU)	0.833	0.833	0.250	0.857	0.010
Cocoa Buying Companies (CBC)	1.000	1.000	1.000	1.000	0.049
NGO	0.958	0.875	0.833	0.960	0.032
Religious social organization (RSO)	0.708	0.458	0.708	0.774	0.001
Brokers (BRO)	0.500	0.417	0.375	0.667	0.004
Traders (TRA)	0.750	0.542	0.625	0.800	0.013
Local Farmers' Association(LFA)	0.875	0.583	0.875	0.889	0.017
Village Administration(VA)	0.833	0.708	0.750	0.857	0.013
Zonal/district agriculture office (ADO)	0.833	0.667	0.792	0.857	0.032
Agriculture extension officers(AEO)	0.750	0.708	0.750	0.800	0.001
Cocoa processing companies (CPC)	0.583	0.458	0.417	0.706	0.012

Nevertheless, a high level of accessibility does not automatically show good-quality service. This suggests that there are still chances of improving the services of these actors.

**Table 3 Role of Public Sector Actor**

Attributes	N Degree	N Out-degree	N In-degree	N Closeness	Normalized Betweenness
Smallholders (SMH)	1.000	0.846	1.000	1.000	0.012

Cocoa processing companies (CPC)	0.769	0.538	0.615	0.813	0.000

**Figure 1 SMH Cocoa Farmers Network**

**Figure 2 Role of Main Public Sector Actor**

(Note: The size of each node is determined by the node's degree centrality. Please refer Table 2 for the abbreviations)

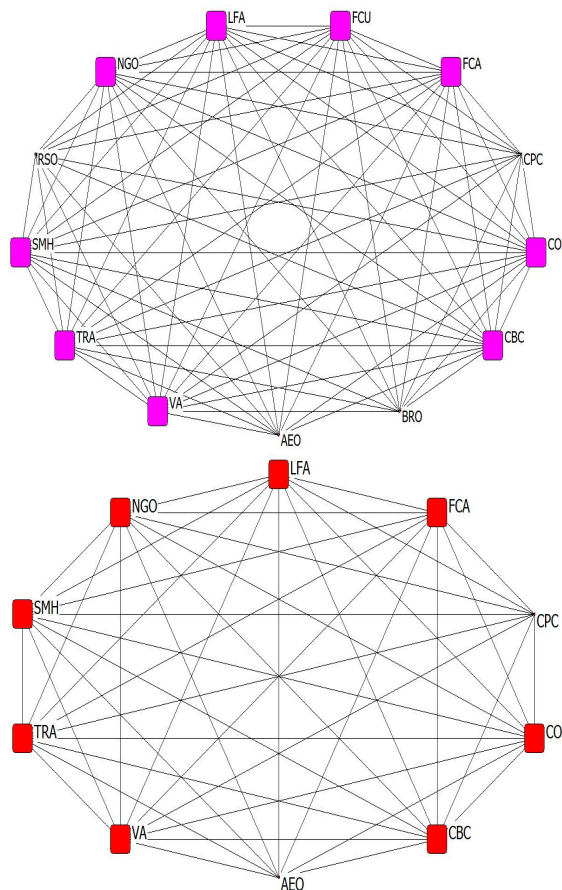

From Table 3 and Figure 2, it is evident that, COCOBOD is a key actor when it comes to the innovation system of smallholder cocoa farmers. They serve as a link between government, the private sector, and the farmers to bring the best out of Ghana's cocoa. They deal less when it comes to buying the beans directly from the smallholder farmers. The marketing actors which are dominantly private sector actors like CBC, FCA and traders, have some sort of high connection (Figure 2). In spite of the lack of isolated actors (Figure 1 and 2), some of the actors are not widely involved in relationships with all the other actors but have an outlying position within the network, who are typically private sector actors. This has revealed a strong case that, the interventions and innovations employed by the government is yielding positive results, but there is still opportunity to allow the entry and input of private sector actors. This means that, in addition to the formation of enabling rules, laws and regulatory environment for private service delivery and public support for private sector growth is important.

#### 4.3 Differences between innovators and non-innovators

Figure 3 and 4 provide a generalized overview of the typical networks for IG and NG based on aggregated data from eight case study sites.

**Table 4 Descriptive Measures for IG and NG**

Measure	Innovative Group	Non innovative group
Ego network size (no. of nodes)	13	10
Ego network density	0.846	0.922
Asymmetric	0.205	0.111
Standard deviation	0.361	0.268
Average degree	10.154	8.300
Degree centralization	0.182	0.097

**Figure 3 Innovators Network Node Degree**

**Figure 4 Generalised Networks for Non-Innovators**

(Note: The size of each node is determined by the node's degree centrality. Please refer Table 2 for the abbreviations)

The innovators network has 13 actors and the NG network has 10. Innovators have more members in their network than non-innovators: this means innovators have comparatively bigger access to formal and informal information, inputs, credit and markets than NG who depend more on public service and public institutions (Figures 3 and 4 and Table 3).

The study showed that the smallholder cocoa production innovation network does not include Universities, seedlings associations, R&D private and NGO cocoa advisory service providers and agro industries. The connections between the Private sector actors which includes traders, brokers, input suppliers, and companies are weak (Figure 1).

A study done by (Tilman Altenburg et al, 2008) revealed that, innovative capacity in a sector depends on the quality and density of collaborative connections between actors. These include public and private outfits which carry out research, train, advice, finance, coordinate and regulate. It is, therefore, vital for an innovative network to encompass all direct and indirect actors from the point of production to the point of consumption of the cocoa products either as recipients of support or as lending support and service to ensure program success.

## 5 Conclusion

Our findings propose that, the possibility of innovation system is not yet fully realised. Innovations follow a linear path of supply-driven technology dissemination through the public sector. Hence, additional deliberations are required. Effort to boost farmers to produce the secondary part of the cocoa instead of selling the primary beans should also be encouraged in order for farmers to earn more from their produce. Again to encourage innovation, the public sector can support interactions, joint actions, and wider public private partnership programs. This study also opens a wide door for further study on the role of different networks in the cocoa sector and the impacts of different networks on productivity and adoption of innovations of the cash crop sector both at local and national level.

**Abstract:** Sustainability is the limelight of many industries, especially in developing countries. In the hospitality industry, in particular, sustainability plays a pivotal role since it contributes immensely to the economy of a country. However, the hospitality industry is increasingly facing various challenges due to the uncertainty and instability in the business environment. Thus, the central focus of this study is to evaluate the sustainability performance of Sri Lankan hotels industry. For this purpose, 25 hotels were selected from the hotels listed in the Colombo Stock Exchange (CSE). In order to determine the sustainability performance of the selected hotel, we identified 18 indicators that represent the economic, environmental, and social and governance sustainability. Then, we developed a multidimensional sustainability performance index system and using entropy-based TOPSIS, the values of the individual indicators were aggregated. Eventually, we rank the hotels based on the TOPSIS scores, which represent the sustainability performance of hotels. The resulted TOPSIS scores reveal that the Sri Lanka hotels' sustainable performance is moderately high. This indicates that there is a growing tendency to adopt more sustainable practices among hotels companies in Sri Lanka. Recently, stakeholders in the state and private sector have paid much attention to the tourism industry because it has tremendous potential and many prospects, and the same is reflected in our results. While we are providing important implications for managers and policymakers, our findings urge the hotels with a low-level sustainability performance to go for more sustainable practices.

**Keywords:** Sustainability performance; Hotel industry; Entropy-based TOPSIS; Sri Lanka

### 1 Introduction

Despite the recent downturn, the tourism industry is the most vibrant and robust sector in the Sri Lankan economy, with the exponential growth in the number of visitors arriving and the burgeoning foreign exchange earnings. A satisfactory political and economic stability maintained in the nation after the end of the tragic war of 30 years in 2009, combined with the increasing reputation of the Island as a popular tourist destination, has caused the growth of the tourism industry at a pace never achieved in history (Jayawardhana, Silva, & Athauda, 2015; Kularatne, Wilson, Månsson, Hoang, & Lee, 2019). Over the past decade, the hotel sector has also shown significant growth as an integral of the tourism industry in terms of infrastructure development and level of sophistication. SLTDA report (2017) shows that the number of Tourist Hotels has increased from 245 in 2008 to 401 in 2017. Similarly, No. of rooms has also been tripled during the last decade. Apart from the tourist hotels, the other supplementary establishments which provide the accommodation facility have also increased from 513 units in 2008 to 1693 units in 2017. However, because of high capital investments and increased competition, corporate hotels are more inclined to make profits than to be more socially responsible. Nevertheless, corporate hotels' obligation goes beyond merely creating profit to take care of their employees, the environment, and the society at large.

At the global level, with the realization of the increasing importance of corporate social responsibility, a growing number of hotels companies have moved towards a value-based stakeholder management approach. Such approach enables the managers to maximize the economic value for all stakeholders- shareholders, employees, creditors, suppliers, customers, and society as a whole- by building a strong coalition of all interest groups surrounding the company (Wagner & Svensson, 2014). Moreover, the natural and socio-cultural environment being an important aspect of the tourist destination, hotels can gain a competitive advantage by displaying their accountability towards the

social and environmental impact of their operations. (Assaf, Josiassen, & Cvelbar, 2012; Cvelbar & Dwyer, 2013; Wagner & Svensson, 2014). Therefore, sustainability performance for the hotel industry is increasingly important.

Given the great emphasis on sustainability performance, the main purpose of our study is to empirically analyse the sustainability performance of Sri Lankan corporate hotel sector. For this purpose, listed hotel companies were selected, and the required data was obtained from annual reports and websites. Sustainability performance of each hotel was determined using the author developed a multidimensional evaluation index. Finally, Hotels are ranked based on the sustainable performance score obtained using one of the popular Multi- Criteria Decision-Making approaches (MCDM): Technique for Order Preference by Similarity Ideal Solution (TOPSIS).

## 2 Evaluation of Sustainability Performance

### 2.1 Development of sustainability performance evaluation Index

The crucial stage in developing the Sustainable Performance Evaluation Index is to identify appropriate indicators. Since the company's sustainability performance consists of three dimensions, namely Economic, social and governance, and environmental, the indicators should be drawn to cover all the aspects. Following a comprehensive analysis of sustainability literature and experts' opinion, we recognized eighteen indicators, as shown in Table 1. Moreover, these indicators were divided into two groups as positive contributors and negative contributors. Furthermore, the values for the indicators were determined based on the information disclosed in the annual reports and the official web sites of hotel companies.

**Table 1 Sustainability performance Evaluation Indicators**

Dimension	Indicator	Description	Measurement	Contribution
Economic Sustainability	C1	Five years' Revenue Growth	$(\text{Revenue}_t - \text{Revenue}_{t-5}) / \text{Revenue}_{t-5}$	Positive
	C2	Market Share	Hotel's Revenue / Industry Revenue	Positive
	C3	Operational cost to total assets	Cost / Total Assets	Negative
	C4	Amount of donations and charitable contribution to the total revenue	Donation / Total Assets	Positive
	C5	Benefits provided to employees out of Income earned	Staff Cost / Total Assets	Positive
	C6	Number of social initiatives to uplift the living condition of local community		Positive
	C7	Number of Initiatives to promote education, health, culture etc.		Positive
	C8	Number of initiatives to ensure guests' privacy, health & safety, and foods safety		Positive
	C9	Analysis of employees based on gender, age, and region and number of initiatives to increase employee welfare (i.e., occupational health, training & education, evaluation, promotion, and recognition & rewards)	Seven Assessment Levels on a 1 to 7 Scale, where 1 is the lowest and 7 is the highest	Positive
Social and Governance Sustainability	C10	Number of initiatives taken and discussion of supply chain management		Positive
	C11	Awards and certification in recognition of the social contribution of the hotel	1 score for each award and certification	Positive
	C12	Number of committees related to governance	1 score for each committee	Positive
	C13	Number of board of directors'	1 score for each board	Positive

Environmental Sustainability	C14	meetings held during the year Gender diversity in the director board	meeting Ratio of female to male directors	
	C15	Method adopted to reduce energy and water consumption, greenhouse gas emission and initiative to preserve natural resources	Seven Assessment Levels on a 1 to 7 Scale, where 1 is the lowest and 7 is the highest	Positive
	C16	Methods and processes adopted to reuse, recycle effluents and waste.		Positive
	C17	Awards and certification in recognition of environmentally friendly operations.	1 score for each award and certification	
Other	C18	Level of non-compliance to Law and regulation related social, economic and environmental areas	Five Assessment Levels on a 1 to 5 Scale, where 1 is the lowest and 5 is the highest	Negative

## 2.2 Sustainability performance Score

Use of Multiple Criteria Decision Making (MCDM) methods-for instance, Analytical Hierarchy Process (AHP) Data Envelopment Analysis (DEA) Technique for Order Performance Similarity to Ideal Solution (TOPSIS) is common in the literature on performance assessment. Hsu (2013) used the TOPSIS technique to suggest an investment analysis model based on different financial ratios. Initially, he selected 21 indicators as economic measurement factors and lowered them using dimension reduction methodology to ten most representative factors. Similarly, Deng, Yeh, & Willis (2000), Wang (2009), Seçme et al. (2009) used the TOPSIS technique to assess financial and non-financial performance. Number of other researches also used TOPSIS as an MCDM strategy to evaluate and rank financial and non-financial performance of various industries (Bulgurcu, 2013; Chang, Lin, Lin, & Chiang, 2010; Ertuğrul & Karakaşoğlu, 2009; Kaynak, Altuntas, & Dereli, 2017; Kumar, 2016; Weerathunga, Xiaofan, & Samarathunga, 2019). In light of the previous studies, the sustainability performance of hotels was evaluated using the TOPSIS method developed by (Hwang & Yoon, 1981). This method is used for four reasons. First, the logic behind TOPSIS is rational and easily understandable, second the calculation process is straightforward, third TOPSIS allows us to determine the best alternative based on a number of criteria using a simple mathematical process and fourth each criterion can be weighted based on different rationales.

The application of the TOPSIS method need to determine appropriate weights for each criterion considered in sustainable performance evolution process. For this purpose, Entropy method as proposed by Shannon (1948) was used. Entropy method is one of the most popular methods for determining weights for indicators (Hsu, 2013). Employing entropy method needs to follow certain steps as mention below.

**Step 1:** Normalization of  $m \times n$  evaluating matrix

$$A = [x_{ij}]_{m \times n} \quad (1)$$

Where,

$m$  = Number of alternatives,  $i=1, 2, \dots, m$

$n$  = Number of criteria,  $j = 1, 2, \dots, n$

$x_{ij}$  = the performance indicator of  $i^{\text{th}}$  alternative with respect to  $j^{\text{th}}$  criteria.

The original matrix  $A = (x_{ij})$  should be normalized to the evaluation matrix  $R = (r_{ij})$ , where  $r_{ij}$  is the normalized valued of  $i^{\text{th}}$  alternative with respect to  $j^{\text{th}}$  criteria, and  $r_{ij} \in [0,1]$ . The initial values can be normalized using one of two methods (Chang et al., 2010) below depending on the nature of the data.

For the positive value:

$$r_{ij} = \frac{\max_i x_{ij} - x_{ij}}{\max_i x_{ij} - \min_i x_{ij}}, \quad (2)$$

For the negative value:

$$r_{ij} = \frac{x_{ij} - \min_i x_{ij}}{\max_i x_{ij} - \min_i x_{ij}}, \quad (3)$$

Consequently, we have following normalized evaluation matrix

$$R = [r_{ij}]_{m \times n} \quad (4)$$

**Step 2:** Calculation of weights for each criterion based on entropy.

Weights can be calculated as follows according to (Chang et al., 2010);

- Compute the  $p_{ij}$  values using formula (6)

$$p_{ij} = -k \frac{X_{ij}}{\sum_{n=1}^m} p_{ij}, \ln p_{ij}, \forall j \quad (5)$$

- computed the  $d_i$  value using formula (7)

$$d_i = 1 - E_j, \forall j \quad (6)$$

- Calculated weights ( $w_j$ ) for each criterion using formula (8). One condition must be satisfied,  $\sum_{j=1}^n w_j = 1$ .

$$w_j = \frac{d_{ij}}{\sum_{j=1}^n d_{ij}}, \forall j \quad (7)$$

Third, we calculated the TOPSIS score for each alternative (hotels) using entropy weights obtained in the in the previous section. TOPSIS score is representative of the best alternative from a set of finite alternatives. The best alternative is decided based on the closeness to the positive ideal solution and farthest to the negative ideal solution.

Following is the procedure for TOPSIS score calculation:

**Step 1:** Obtain the original matrix as shown in equation (1).

**Step 2:** Construct the normalized matrix  $[r_{ij}]_{m \times n}$ .

Since data for each evaluation criteria contain in the original matrix does not have uniform dimension, we normalized the data using following procedures in line with Y.-J.Wang (2009) and Y.-J.Wang & Lee (2007).

Positive contributors are normalized as:

$$r_{ij} = \frac{x_{ij}}{\sqrt{\sum_{n=1}^m x_{ij}^2}}, \quad (8)$$

Negative contributors are normalized as:

$$r_{ij} = \frac{\frac{1}{x_{ij}}}{\sqrt{\sum_{n=1}^m \left(\frac{1}{x_{ij}}\right)^2}}, \quad (9)$$

**Step 3:** The normalized decision matrix  $[r_{ij}]_{m \times n}$  is converted to weighted normalized decision matrix as follows.

$$V = (v_{ij})_{m \times n} = \begin{bmatrix} w_1 r_{11} & w_2 r_{12} & \dots & w_n r_{1n} \\ w_1 r_{21} & w_2 r_{22} & \dots & w_n r_{2n} \\ w_1 r_{31} & w_2 r_{32} & \dots & w_n r_{3n} \\ \vdots & \vdots & \dots & \vdots \\ w_1 r_{m1} & w_2 r_{m3} & \dots & w_n r_{mn} \end{bmatrix} \quad (10)$$

Where,  $w_j, j = 1, 2, \dots, n$ . is entropy weights for each criteria calculated from equation (8), and  $\sum_{j=1}^n w_j = 1$ .

**Step 4:** Determined the positive ideal solution and negative ideal solution by using equation (12) and (13) respectively.

$$A^+ = \{v_1^+, v_2^+, \dots, v_n^+\} = \{(max_i v_{ij} | j \in J), (min_i v_{ij} | j \in J)\} \quad (11)$$

$$A^- = \{v_1^-, v_2^-, \dots, v_n^-\} = \{(max_i v_{ij} | j \in J), (min_i v_{ij} | j \in J)\} \quad (12)$$

**Step 5:** Calculated distance (separate measures) for each company for each period from positive ideal solution,  $d_a^+$  and negative ideal solution,  $d_a^-$  as follows:

$$d_a^+ = \sqrt{\sum_{n=1}^n (v_{ai} - v_i^+)^2}, a = 1, \dots, m, \quad (13)$$

$$d_a^- = \sqrt{\sum_{n=1}^n (v_{ai} - v_i^-)^2}, a = 1, \dots, m, \quad (14)$$

**Step 6:** Calculated closeness coefficients for each company for each period separately by using following formula.

$$C_i = \frac{d_a^-}{d_a^+ + d_a^-}, a = 1, \dots, m \quad (15)$$

The calculated value of  $c_i$  is indicative of multidimensional sustainability performance score for each hotel company in our sample. The higher value of  $c_i$  indicative of higher sustainability performance whereas lower value of  $c_i$  indicates lower sustainability performance.

### 2.3 Sample and data

In order to select an appropriate sample of hotels companies for our performance evaluation, the annual reports and the web sites of the all 39 hotels listed under Hotels and Travel sector in the Colombo Stock Exchange at the year-end 31<sup>st</sup> December 2018 were analysed. This process allows us to identify 25 hotels that match with evaluation criteria in the study. The rest of the hotels were excluded from the analysis since they have not disclosed sufficient information related to their sustainable performance. The information required for performance analysis were extracted from both web sites and the annual reports published at the end of 2017/2018 financial year.

## 3 Results

Table 3 presents the sustainability performance scores and the respective ranks for each hotel in our analysis. The performance scores are calculated using TOPSIS method. Two different methods – entropy weights, equal weights- were used to determine the weights for the selected criteria in each dimension of sustainability performance. The process of determining entropy weights are presented equations (1) to (7). By equations (8) to (15), the TOPSIS scores were obtained.

**Table 3 Sustainability Performance Score and Respective Ranks of the Hotels**

Hotel	Entropy Weights		Hotel	Equal Weights	
	Score	Rank		Score	Rank
Hotel A	0.710	1	Hotel A	0.758	1
Hotel B	0.657	4	Hotel B	0.674	5
Hotel C	0.651	5	Hotel C	0.680	4
Hotel D	0.391	21	Hotel D	0.474	22
Hotel E	0.462	15	Hotel E	0.546	13
Hotel F	0.434	17	Hotel F	0.551	12
Hotel G	0.585	7	Hotel G	0.499	19
Hotel H	0.409	19	Hotel H	0.514	17
Hotel I	0.528	10	Hotel I	0.540	15
Hotel J	0.691	2	Hotel J	0.743	2
Hotel K	0.169	25	Hotel K	0.195	25
Hotel L	0.434	16	Hotel L	0.542	14
Hotel M	0.539	9	Hotel M	0.523	16
Hotel N	0.411	18	Hotel N	0.509	18
Hotel O	0.367	23	Hotel O	0.421	23
Hotel P	0.515	11	Hotel P	0.622	7
Hotel Q	0.563	8	Hotel Q	0.591	9
Hotel R	0.327	24	Hotel R	0.401	24
Hotel S	0.491	12	Hotel S	0.611	8
Hotel T	0.468	13	Hotel T	0.567	11
Hotel U	0.408	20	Hotel U	0.481	21
Hotel V	0.386	22	Hotel V	0.483	20
Hotel W	0.464	14	Hotel W	0.572	10
Hotel X	0.664	3	Hotel X	0.716	3
Hotel Y	0.621	6	Hotel Y	0.641	6

According to the results presented in Table 3, 11 hotels have TOPSIS score above 0.5 under the entropy weights. When equal weights are used in the weighting process, 18 hotels' scores go beyond 0.5. Both of these results indicate the sustainability performance in the selected hotel are moderately high. The top three hotels under entropy weights are Hotel A, J, and X having sustainability scores of 0.710, 0.691, and 0.664. The ranking of these top three hotels is same under the equal weights but with different scores. Practically, these three hotels are the largest hotels in term of size and its operations. They have established the best practices within their companies in order to achieve sustainable development. The analysis of their official websites and annual reports revealed that they have fully adopted the Global Reporting Initiative (GRI) guidelines in disclosing their information to the stakeholders. Moreover, these hotels have been recognized with different awards and certification for their achievements in an effort of sustainable development.

#### 4 Conclusion

The hotel sector as an integral part of the tourism industry is paramount to the economic growth of Sri Lanka. Therefore, the main aim of this study was to analyze the sustainability performance of the hotel sector in Sri Lanka. Our analysis was carried out using the information disclosed by hotel companies in their annual reports and official websites. In order to identify the commitment of hotels towards sustainable development, first, we developed a sustainable performance evaluation index following previous studies and experts' opinion. We identified 18 indicators that could represent the different dimension of sustainable performance such as economic, environmental, and social and governance. Then, each hotels' annual reports of the financial year 2017/18 and websites were analyzed against the developed sustainability index. Following this process, the initial decision matrix was constructed. We use entropy based TOPSIS in determining the sustainability scores for each hotel. The results of the study indicate that the sustainability performance in selected hotels is moderately high. This may be because of the increased attention of different stakeholders of the tourism industry. Moreover, fierce competition in the hotel industry following the recent tourism boom in the country

urge the hotel companies to be more vigilant about their operation. As a result, hotels managers have paid more attention to stakeholder-oriented business practices.

The main contribution of this study is the proposed novel approach to determining the sustainability performance of the hotel industry. Moreover, for the best of our knowledge, this is the first attempt to analyze the sustainability of Sri Lankan hotel industry using such a quantitative approach. This research offers significant perspectives for hotel executives, owners, and other hotel sector stakeholders. According to results, certain hotels have a low level of sustainability performance. These hotels should concentrate more on sustainability practices to level up with their peers. Policymakers should encourage hotels through the development of appropriate strategies to adopt sustainable practices.

**Abstract:** The worldwide concern regarding sustainable urban development has been increasing as the populations of countries increase and demand more consumption of the already scarce natural resources. According to the United Nations, it is estimated that 55% of the world population lives in urban centers, with the perspective of surpassing 68% in 2050. In Brazil, 84% of the population today live in the cities. One of the goals of sustainable development is to make cities more sustainable and inclusive and, to accomplish such goal, many variables need to be accomplished, among which is the strengthening of efforts to protect and safeguard cities' cultural heritage, for the present and future generations. Seeing as São Paulo is the 10<sup>th</sup> urban city in the world and its historical heritage preservation policies are recent and in the process of being outlined, this research strives to answer: What are the main challenges identified by owners/managers of listed historical buildings in São Paulo, which stand in the way of conserving/preserving their properties? Results revealed that the main challenges are a lack of knowledge about what interventions can be done to the property, lack of knowledge on incentive laws and more feasible ways for the conservation of historical sites and dealing with excessive bureaucracy. Such results contribute to the implementation of urban development policies focused on the sustainable goal of safeguarding the city's cultural heritage, in order to propitiate advancements in preserving the memory and identity of the city through the conservation of properties listed as historical heritage.

**Keyword:** Historical heritage; Historic building; Sustainable development

### 1 Introduction

Today, most of Brazil's population lives in urban areas, according to the last census, 84% of Brazilians live in the cities. The rapid urbanization process in Brazil generated the metropolization phenomenon, that is, the urban occupation that goes beyond the cities' limits <sup>13</sup>(IBGE – Brazilian Institute of Geography and Statistics, 2010).

In this scenario of urban transformation, the cities' sustainable management if one of the great 21<sup>st</sup> century challenges, thus, significantly and innovatively transforming urban space management is essential in order to reach sustainable development.

Among the SDG's – Sustainable Development Goals – there is the “Sustainable Cities and Communities” SDG <sup>14</sup>(UNITED NATIONS, 2015) which aims to make cities sustainable and inclusive. Among the targets established in this SDG, target 11.4 stands out since it contemplates the strengthening of efforts to protect and safeguard cities' cultural heritage. That is, in order to ensure sustainable urban development, the preservation of historical heritage is highly relevant and indispensable. (LEMOS,1981; LEITE, 2012; FIGUEIREDO, 2014).

In the scope of preservation, it is necessary to consider that there is also a preservation of meanings, identities and traditions of a location and the individuals who live there; consequently, there is preservation of citizenship and the right to memory for future generations. The efforts are in a sense of

<sup>13</sup>IBGE - Instituto Brasileiro de Geografia e Estatística. (2010) Censo 2010. [R] Retrieved June, 19, 2019, from <https://agenciadenoticias.ibge.gov.br/agencia-sala-de-imprensa/2013-agencia-de-noticias/releases/13937-asi-censo-2010-populacao-do-brasil-e-de-190732694-pessoas>.

<sup>14</sup> NAÇÕES UNIDAS (2015) ODS - Objetivos de Desenvolvimento Sustentável. [R] Retrieved June 15, 2019, from <https://nacoesunidas.org/pos2015/>.

preserving not only what is tangible, but the intangible as well, and safeguarding the cultural and immaterial heritage of a society. (FONSECA, 2005; FIGUEIREDO, 2014; UNITED NATIONS, 2015; <sup>15</sup>IPHAN – Institute of National Historical and Artistic Heritage, 2015).

In this scenario, the search for ways of making feasible the heritage conservation has been a challenge. Today, the city of São Paulo has around 3,600 sites listed as historical heritage, which are mainly located in the central area. The preservation policies have been consolidated since the creation of the Department of Historical Heritage of São Paulo in 1975, which has since strived to take the first steps towards the path of identifying and listing all historical buildings. <sup>16</sup>(DPH-SP – Department of Historical Heritage of São Paulo, 2019; SOMEKH, 2017).

Listing a site as historical heritage is understood to be the administrative act set forth by the public power, which can be the federal, state or municipal administrations, with the goal to preserve, through law enforcement, assets with historical, cultural, architectonic and environmental value to the population, preventing that they are ever destroyed or demeaned <sup>17</sup>(IPHAN– Institute of National Historical and Artistic Heritage, 2019).

Seeing as any movement towards solving a problem starts with a diagnosis, this research allows property owners to have a voice. Therefore, this study's general goal is to learn the main challenges identified by owners/managers of listed historical buildings in São Paulo and find out which factors affect their ability to conserve/preserve their properties.

With the intention of achieving such goal, the following specific goals were outlined: identifying if it is an onus to manage or to own a listed historical property; identifying the positives and negatives of managing or owning a listed historical asset; identifying if they are aware of legislation regarding their properties; identifying if they know of or make use of incentive laws for preservation; identifying if, in the owners' or managers' perception, their properties are economically or culturally valued for being listed as historical heritage.

This exploratory research is justified by its contribution to diagnosing the challenges of preserving historical heritage in the city of São Paulo, subsidizing possible actions from public and private powers towards preserving the city's memory for future generations, reaching SDG target 11.4.

The second article on the Venice Charter, which deepened and diversified the worldwide guidelines for maintaining historical and architectural heritage through the resolutions on the II<sup>nd</sup> International Congress of Architects and Technicians of Historic Monuments in 1964, states that preserving this group of assets requires the collaboration of all sciences, therefore it is not simply a multidisciplinary subject, but it is also interdisciplinary (IPHAN– Institute of National Historical and Artistic Heritage, 2019).

This research was structured as follows: Firstly, there will be a conceptualization on historical heritage and the importance of preserving material assets in order to preserve the immaterial, thereafter, we will discuss how and why this historical heritage must be inserted in the sustainable development theme. After that, there will be a discussion on the methods chosen for this research and, finally, a demonstration of the study's main results.

## 2 Historical Heritage – Preserving the City's Memory

The actions and studies focused on preserving historical heritage materialized in buildings and public-private monuments have a double-sided role to society. When we preserve a building for its historical or architectural meaning we act for the preservation of culture, life stories, past relived in memories and the many meanings this material/immaterial intersection represents and revives in the collective imaginary. Added to that is the fact that civilizations' future evolution lies on preserving our traditions. The monuments and historical assets are witnesses to our story and past traditions and, hence, are an essential element to the development of people, as well as economic and social development

(FONSECA, 2005; UNITED NATIONS, 2015).

<sup>18</sup>Le Goff (1984) states that the documents and monuments are the repositories of collective memory. The life stories and collective memory remain anchored in houses' walls and historical buildings' facades. In this sense we can talk about an urban ecology that is actively working to maintain and settle the cities' dynamics. "The conversion of the material city as an object of historical knowledge was motivated by the transformation of the urban space that followed the Industrial Revolution" (CHOAI, 2001 p.179).

In Brazil, however, the matters referring to material heritage are much more recent and frequently restricted to specific fields of knowledge, such as architecture. If we consider that the SPHAN (National Historical and Artistic Heritage Service), a federal organ which was pioneer in dealing with matters related to heritage, was only created and started functioning in 1937, it can be assumed that studies about this Brazilian cultural dimension have many gaps, precisely since it is so new. Concerning the fields of knowledge, the gaps are also present. Studies involving the conservation of material heritage, whether it's historical or architectural, are common within those specific fields, however, they are rare in the fields of sociology, anthropology and other areas of applied social sciences.

This first step in creating an institution for the protection of national historical heritage was taken by the administration of the then president Getúlio Vargas, through the promulgation of Law number 378, which has the following information on its article number 46: <sup>19</sup>"Art. 46. The National Historical and Artistic Heritage Service is now created, with the function of promoting, all over the country and permanently, the listing, conserving, enrichment and knowledge of historical and artistic national heritage." (LAW NUMBER 378, 1937).

Significant changes only occurred in 1979 with the creation of the National Pro-Memory Foundation, establishing a new way of working, based on a wider and more updated conception of cultural assets. After that, SPHAN (National Historical and Artistic Heritage Service) becomes IPHAN (Institute of National Historical and Artistic Heritage), linked to the Ministry of Culture (MUTTER, 2012, p. 75).

All the changes in this historical cycle had contributions from Brazilians. The landmark of Brazilian involvement in the internationalization of preservationist policies was the approval of the document "Recommendation Concerning the Protection, at National Level, of the Cultural and Natural Heritage" on National Congress, also known as "Paris Recommendations", promoted by the Unesco in November 16<sup>th</sup>, 1972.

Years after the beginning of discussions in the international scope and after over 80 years in Brazil, historical heritage was finally understood in its importance for the cities, it started to be studied and widespread and it started to be taken into consideration in the planning process for cities' growth dynamics. (FONSECA, 2005; CARDOSO, 2007)

In sight of how important the preservation of assets listed as historical heritage is to the cities and to the future of a society, we can say that the agenda for preserving such heritage must be linked to sustainable urban development, not only so that civil society fully comprehends and becomes aware of the importance of this action, but also so that innovative preservation management mechanisms are established through partnerships and public-private investments.

### 3 Urban Sustainable Development and the Preservation of Historical Heritage

The worldwide concern regarding sustainable urban development has been increasing as the populations of countries increase and demand more consumption of the already scarce natural resources. It is estimated that 55% of the world population lives in urban centers, with the perspective of surpassing 68% in 2050 <sup>20</sup>(UNITED NATIONS, 2018).

Therefore, sustainable and inclusive development is in the contemporary agenda for world leaders

<sup>20</sup> NAÇÕES UNIDAS (2018) World Urbanization Prospects. [R] Retrieved June 20, 2019, from <https://population.un.org/wup/Country-Profiles/>.

through the UN and the SDGs (Sustainable Development Goals), which have the objective of supplying mankind's current needs, without compromising the planet's capability to tend to future generations <sup>21</sup>(UNITED NATIONS, 2015).

For Leite (2005), sustainable urban development is one of the greatest challenges for current and future megacities in the 21<sup>st</sup> century, but that can also bring countless opportunities. The redevelopment of these cities in an intelligent way can make them more sustainable, optimize their infrastructure and improve their spaces. In this context, technological advancements may contribute to a more participatory management, with e-governance systems providing clear and efficient information to optimize populations' urban lives.

In Brazil, urban territory development was marked by accelerated population growth in industrialized centers, who were in search of better socioeconomical conditions for their families and were mostly composed of people coming from rural areas and foreign immigrants. Currently, 84% of the population is urban (figure 01), estimated to reach 92% in 2050 <sup>22</sup>(IBGE - Brazilian Institute of Geography and Statistics, 2010; UNITED NATIONS, 2018) and the city of São Paulo, the focus of this research, is the 10<sup>th</sup> biggest urban city in the world, where approximately 11 million people live <sup>23</sup>(IBGE, 2010).

**Figure 1 Urban Population**  
Source: United Nations (2018)

The established infrastructures and services were not able to keep up with the demanded Brazilian development growth, so the territorial occupation was unorganized, evolving with no efficient and sustainable urban planning. According to Villaça (1999), the urbanization process in Brazil went through a number of phases since the end of the 19<sup>th</sup> century, when it had its first phase, which featured embellishment plans based on European tradition. Since then, several interventions created by different administrations were implemented to deal with sanitation, mobility, housing and space occupation (Villaça, 1999; <sup>24</sup>WRI Brazil – World Resources Institute Brazil, 2019). However, it was only during the country's democratization period, with the promulgation of the Constitution (1988) and the City Statute <sup>25</sup>(Law number 10,257, 2001) that more blunt guidelines were established so that urban planning would start being recognized as a political process with social participation.

These guidelines legitimized the Master Plan as an instrument for city planning and its review every 10 years has been leading cities with over 20 thousand inhabitants to reevaluate their urban development model, creating policies for more sustainable expansion and utilization of already existing spaces (LAW

number 10,257, 2001); and in 2015, the country takes another step in the urbanization process with the creation of the Metropolis Statute <sup>26</sup>(Law number 13,089, 2015), which constitutes guidelines so that metropolitan regions and urban agglomerations can promote the creation of Integrated Urban Development Plans for “the organization, planning and execution of public functions of common interest”. (LAW number 13,089, 2015)

In the city of São Paulo, the ruling <sup>27</sup>PDE – Strategic Master Plan, in English - (2014) is a municipal law that guides sustainable development and growth for the city until 2030 and one of its strategies is focused on the “preservation of heritage and cultural stimulation” and it names 4 types of Special Culture Preserving Zones, focusing on the preservation of assets that hold historical, landscape, environmental, social or cultural interest in the city.

This strategy converges to the fulfillment of what was set out on the “Declaration of Amsterdam” in 1975, which instituted a model of preserving, conserving and revitalizing the European historical heritage, giving direction to an integrated urban planning, with society’s participation, and which already clarified its importance to our resource economy and the combat against waste <sup>28</sup>(IPHAN - Institute of National Historical and Artistic Heritage, 2015).

In Somekh’s view (2016), the PDE – Strategic Master Plan - (2014) can restructure the city in order to make it more compact, with efficient mobility mechanisms, reducing the consumption of natural resources and, with that, thrusting the preservation of historical heritage “within a perspective that is contemporary and values the identity of the city of São Paulo with the creation of new instruments, such as the APC ZEPECs - Special Culture Preserving Zones – and the Cultural and Creative Territories” (SOMEKH, 2016, p.214).

The city of São Paulo currently has 3,600 buildings listed as historical heritage (SOMEKH, 2017) and it has some municipal laws that promote the feasibility of restoring historic properties. <sup>29</sup>Law number 10,598/1988 (Urban Territorial Tax - IPTU - Exemption Law), <sup>30</sup>Law number 12,350/1997 (Facade Law), <sup>31</sup>Law number 15,598/2013 (Program to Support Cultural Projects) and <sup>32</sup>Decree number 57,667/2017 (Adopt an Artistic Work Project), that allow the owner or manager of these properties to have discounts or exemptions on their IPTU tax (Urban Territorial tax) for an undetermined period of time, discount on municipal taxes and enveloping of the building during construction in order to obtain a sponsorship for the restoration. Even though these laws have been in force for a while, very few buildings have benefited from these legislations and most of them are in varied levels of degradation.

The goal of this research is to try to understand the reasons why the owner or manager of these historic São Paulo buildings cannot preserve them, once it is possible to find examples in European countries, which have been working with the preservation theme for many decades now, that show how the preservation of heritage can be tied to contemporary modernity. We can observe, in different parts of the globe, movements in the most different formats that seek to make the preservation of historical heritage feasible and to requalify urban landscape.

Barcelona was a city that pioneered innovative management for preserving their cultural historical heritage. In 1986, mayor Pasqual Maragall started the program: “*Barcelona, posa’t guapa*” (Barcelona, make yourself beautiful). In order to engage the people from Barcelona, the solution was a practical action: every citizen who requested a technical report, which is a document detailing the specific conservation of a property, would have it free of charge, containing the studies on the deficiencies found in the building facade’s conservation, and just in the first 02 years of the campaign, city hall issued 6

<sup>32</sup> Decreto nº 57.667 (2017). Programa Adote uma Obra Artística. [R]Retrieved June 15, 2019, from <http://savim.org.br/decreto-no-57-6672017-programa-adote-uma-obra-artistica/>.

thousand technical restoration reports. For the accomplishment of such task, city hall partnered with universities that made professionals available for this work.

A second step in the program was to find financial resources to execute the restorations. Between 1988 and 1992, only 4.9% of all sponsored cultural activities in Spain were patrimonial restorations of buildings or monuments, that is, the numbers were not favorable. However, the huge campaign developed by city hall through the media and the support of public figures and artists made millions of citizens engaged with the cause, which is why the sponsor had guaranteed positive repercussion in terms of corporate identity. Whoever sponsored the restoration of the facades of historic buildings would be able to use the construction protection screen to announce the deed, keeping in mind that Barcelona was already implementing the clean city law, but, whoever sponsored the restoration work would be within the exception of the law. Back then, 600 historic properties were restored under this model, which was then replicated throughout other European countries. (VIANA, 2012).

In 2014, the city of Paris also created a public-private partnership program, the Reinventing Paris program offered 23 large municipal properties to the private initiative, the concurrent teams needed to gather incorporators, investors to make the restorations feasible. 76 projects were selected in the beginning of 2016 and city hall collected 600 million euros<sup>33</sup>(MISSIKA, 2019).

Other initiatives can become effective tools in the local reality, today there are many movements that must be studied such as the<sup>34</sup>Heritage Fund (2019), which is the biggest financier dedicated to heritage in the United Kingdom, many forms of Impact Investments, which are “investments made in companies, organizations and funds that intend to have measurable social and environmental impact along with financial return”<sup>35</sup>(GIIN, 2018, p.02), which can add to their scope the cause of preserving historical assets bringing efficiency into resource management.

Initiatives such as these are more present every time on the agenda of private companies, which have, in the last few years, shown interest in ideas such as creating a shared value (PORTER; KRAMER, 2011), conscious capitalism, social responsibility in companies<sup>36</sup>(WBCSD, 2000; MARREWIJK, 2003; HENDERSON, 2001) and sustainable development (WCED, 1987; SACHS, 1994).

## 4 Methods

This research is exploratory, because it studies a problem which still has very incipient studies in Brazil and because this nature of research seeks to determine tendencies and to identify new environments and fields to be studied more in depth (GIL, 2007; SAMPIERI et al., 2013).

We opted for the *in loco* field research as the technical procedure applied in this paper, because according to Gil (2007), field studies look for a in-depth analysis of the proposed questions. We chose the quali-quantitative approach and not purely quantitative, because according to Sauerbronn and Avrosa (2010) the qualitative research is used in an interpretative constructivist approach, a view which seeks comprehension and the meanings of a phenomenon.

It is important to highlight that this research originates from a Data Driven perspective, that is, data oriented, because the field research, as well as primary data collection, was carried out by the Escola Paulista de Restauro (São Paulo Restoration School), through a partnership with a private company that acts in the cause for conservation and restoration of assets listed as historical heritage in São Paulo and that ventured to understand the hindrances for conserving historical assets, thus, the data collection preceded a theoretical substantiation.

On the data driven perspective, primary data collected through interviews are analyzed with the goal of generating categories of analysis (CHARMAZ, 2006).

The first step on this research was identifying and defining the research problem and creating an interview protocol, the second step was a random selection of assets listed as historic heritage in São

Paulo and identifying the respondent subject for the research and, then, they were interviewed, on the fourth step is when the data analysis took place in order to obtain the categories of analysis and the fifth and last step is the discussion of the research's findings.

The first questions for the elaboration of a questionnaire used on step 01 started from the empirical formulation from day to day treatment with questions regarding the maintenance of listed historical buildings. The goal was to inquire people to settle several assumptions such as: Is it an onus to live in, manage or own a listed historical building? Do people value the fact that they are contributing to the maintenance of the memory and history of a location? What do they actually know about the legislation that protects their property? How were their restoration experiences? These concerns led us to create the thematic axes which guided the questionnaire.

We chose one with a random base of 100 historical assets from the city of São Paulo. The sample was obtained through the Geo Sampa tool, which is a georeferencing tool that maps the city's listed historical buildings.

We sought to establish several selection criteria in order to guarantee diversity on the sample, thus, it was defined that the sample should contemplate a relative geographical diversity, by neighborhood or city zone, and we also considered the type of property, residential, commercial, industrial and Social Organizations. The last criteria established was regarding who manages the property: individual management or professional management.

Up until the elaboration of this article, there had already been 78 interviews and we established a limit of 50 interviews for the elaboration of this partial analysis.

The data analysis, as well as the conclusions, will be shown on the next section.

## 5 Main Results

In this section we will present the data analysis obtained after the manual codification process carried out on the fourth step of this research. This analysis was made through the observation of incidents mentioned by the participants, from where we were able to extract the categories of analysis as a way of answering what the biggest challenges are when conserving buildings listed as historical heritage in São Paulo from the perspective of the owners/managers of these properties.

We identified that the majority of the listed historical buildings included in this research are located in the central area of the city. As to the type of property, for the most part, 44% are residential properties, 28% are commercial properties and 18% are properties that belong to social organizations. The second item we observed shows the type of management, that is, what type of structure manages the property and, therefore, is directly handling matters regarding the listed property when any type of intervention to the property may happen. In this sample's case, the majority of the properties are managed by the owners themselves or by the co-owners, that is, individual management.

In order to check if the implicit common sense assumption that preserving and conserving a historic asset is a burden to its owners who, unaware of the legislation, consider the maintenance of their property an action that involves many duties, we tried to identify through the participants' speech if managing or owning these assets is positive or negative. So, 46% see it as something negative, 44% see it as something positive and 10% are indifferent.

We asked the participants if they were aware of the incentive laws that conduct the listed property cases in São Paulo. Then, it was found that 84% of the considered sample did even not know one of the existing laws. As to those who were aware of the legislation, about the use of such instruments in the city of São Paulo, most of the opinions were positive: *"It is fair because we are conserving a good of the city and the financial incentive helps in the maintenance."*

It is important to notice that the participants' lack of knowledge on incentive laws and feasibility indicate a need for an initial action that favors awareness and dissemination.

Starting from the idea that when we preserve a listed historic asset, we are not only preserving the material aspect, but also the memory and culture of a location (FONSECA, 2005; FIGUEIREDO, 2014; UNITED NATIONS, 2015; IPHAN - Institute of National Historical and Artistic Heritage, 2015), we tried to understand whether owners and managers were aware of the reason why their property was listed by the preservation organs.

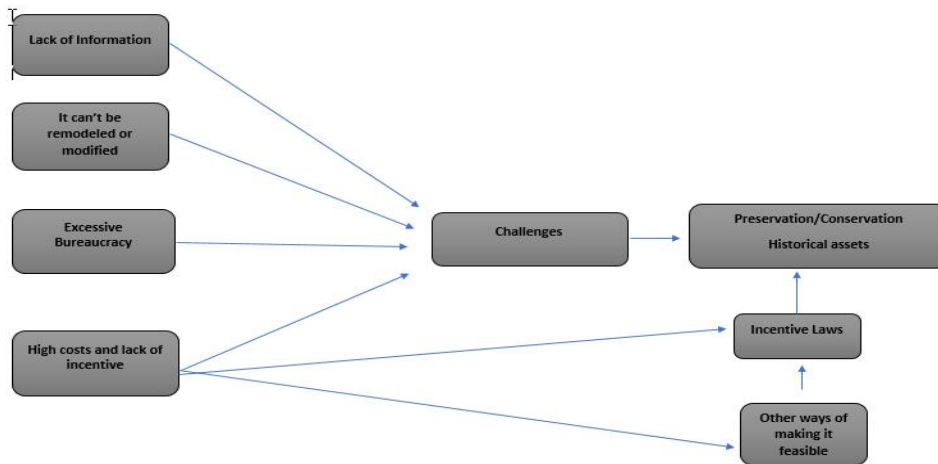

**Figure 2 Reason for Listing**  
Source: Created by the authors, 2019

The participants demonstrated through evidences a great frequency in mentions of the “historic value” and “architectural value” categories; however, there are also expressive mentions of the “I don’t know” category.

The entire data analysis process, from codification until the frequency analysis on the established categories followed the established flow to comply with the goals of this research, which are to identify the main challenges, from the perspective of owners/managers’ of listed historical buildings in São Paulo, that prevent them from conserving/preserving their properties.

On that sense, figure 03 shows the dynamics between the main identified challenges to be deal so that the final goal of the issue established here, which is precisely conserving and preserving historical assets in the city of São Paulo, is reached.

**Figure 3 Map of the Dynamics for the Preservation of São Paulo’s Historical Heritage.**  
Source: Created by the authors, 2019.

The most frequent negative aspect mentioned by the participants was the affirmation that the property cannot be remodeled or modified. The participants stated that: “Cannot be modernized, so commercially no one gives value”.

The second most frequent negative aspect mentioned is the challenge imposed by the excess of bureaucracy, as it is demonstrated by the participants: “In order to do a restoration, it is necessary to consult CONPRESP (DPH), and there is a lot of bureaucracy. It has no benefits, only standards to comply with”.

We can deduce by the evidence that the experiences owners and managers had with the city

management organs were not positive in terms of the necessary help in obtaining approvals for interventions on their properties. Keeping in mind that in our sample, the asset management is mostly carried out by its owners.

The third most frequent aspect mentioned, even though in a smaller scale when compared to the other two bigger challenges mentioned above, was about the high costs and lack of financial incentive. The participants stated that: *“In addition to the cost of restoration that uses expensive and very specific materials, it still has the cost of the projects, you are hampered by the high costs involved in the work and, on the other hand, there is no counterpart of the State”*.

The economic and financial challenge for the participants is significant and the incident responses show that the participants know very little about the laws and ways of incentive that exist for conserving historical assets. Once again, we highlight the importance of developing actions for the awareness and information of property owners and managers.

Today, in São Paulo, we have some ways of incentive and feasibility of conservation and restoration of listed historical buildings. In one of the questions we sought to understand the participants' vision regarding two of these laws through the thematic axes “Incentive Laws.

Economic assistance is mentioned by most participants who consider the laws to be positive, followed by the importance of taking care of and keeping the properties well conserved. Out of our 50 analyzed cases here, 26 viewed these aspects as positive. In cases where the mention is negative or neutral, most mentions occur from a lack of both knowledge and dissemination of the laws for the people who need them the most: the owners. Others question if the contributed values would be enough to cover the maintenance and restoration costs.

The studied sample of 50 historical buildings totals an area of around 374 thousand m<sup>2</sup> that needs to be conserved and restored in the city.

## 6 Conclusion

The results of this study allowed us to identify the main challenges faced by managers and owners of properties in the city of São Paulo for the conservation of historical assets.

The fact that several owners/managers do not even know the reason why their property is considered historical heritage is an indicator that it is still necessary to make efforts to spread information and awareness to signal the importance of the city's historical assets to the owners and managers of these properties and to society in general. What we can deduce through the initial results of this field research is that a second step, which is just as important as the beginning of the listing process, would be the start of a movement spreading awareness and information to the owner/manager about the meaning of listing, awareness on the importance of that building for the city's memory and guidance regarding what can be modified or not in that property.

Recently, the DPH - Department of Historical Heritage - tried to focus their objectives on the so-called “valorization pillar” for understanding that creating social and economic value for cultural assets is essential and these are important actions towards overcoming challenges in favor of conserving and preserving assets (SOMEKH, 2017; DPH 2019).

Other initiatives surfaced regarding the valorization of historical heritage, such as “the creation and regularization of the Heritage Journey, the São Paulo Cultural Value Stamp and the Restoration Factory initiative, which suggested the promotion of social cohesion in areas with great incidence of listed historical buildings in the city” (SOMEKH, 2016, p.239).

Once owners and the civil society have full understanding of how important this preservation action is, the question that must be asked is how to make urban development projects that contemplate the revitalization of neighborhoods and historical buildings economically feasible and how to do that in a city like São Paulo, without unleashing other urban phenomena such as the gentrification that happened in large cities? (CARDOSO, 2007).

The results from this research show that not even the participants know the incentive laws and, that way, they cannot discuss the effectiveness of their applicability.

Many existing ways and models of network feasibility (VIANA, 2012; MISSIKA, 2019; GIIN, 2018; HERITAGE, 2019) must be studied and adapted to the reality of the city of São Paulo.

The so-called Impact Investments (GIIN, 2018) can be a strong mechanism to be used in favor of the creation of a sustainable economic feasibility network, after all, the more democratic and modern the conservation policies are, the closer we will be to the accomplishment of new economic ways that make

them sustainable.

Finally, it is understood that the challenges towards preserving the city's historical heritage must be surpassed through the creation of this network that may include professionals from many fields of knowledge, because a complex problem requires multidisciplinary solutions and innovative sustainable management.

This research reaches here its general goal by identifying the main challenges owners/managers of listed historical buildings in São Paulo go through when preserving their properties. The conservation of historical heritage meets the goals for sustainable development towards more inclusive cities (UNITED NATIONS, 2015). However, since we are talking about initial exploratory studies with partial results, it does have limitations and identifiable gaps.

As a suggestion for future researches in order to fill the gaps identified in this research, we suggest: studies with the previous managers for the Municipal Department of Historical Heritage aiming to identify the main challenges and limitations within this preservation organ; researches alongside property owners who used or are using some of the incentive laws in force in the city in order to understand the applicability potential of these incentives; researches on the applicability effectiveness of international experiences for a possible nationwide replication and, finally, it would be ideal to widen the sample having one specific central neighborhood in São Paulo as pilot to understand in more detail the existing dimensions and variables that impede the preservation of these assets.

Our initiative while researchers must function so that we start new discussions and promote more researches on urban development management for restoration and preservation of São Paulo's heritage through articulations between civil society and the public and private sectors.

## Research on Innovation Performance Analysis of Financial Policy : from the Perspective of Technology-based SMEs

Wan Guochao<sup>1</sup>, Zhang Lingzi<sup>2\*</sup>, Tang Ling<sup>1</sup>

1 School of Management, Chengdu University of Information Technology, Chengdu, P.R.China, 610100

2 School of Accounting, Chongqing University of Technology, Chongqing, P.R.China, 401320

(Email: [wgc@cuit.edu.cn](mailto:wgc@cuit.edu.cn), [tangling@cuit.edu.cn](mailto:tangling@cuit.edu.cn), [429664217@qq.com](mailto:429664217@qq.com))

**Abstract:** This paper empirically tests the allocation efficiency of financial policies by using DEA super-efficiency model. Based on the time series data of science and technology SMEs in Sichuan Province from 2011 to 2017, this paper estimates and analyzes the impact of financial policies on innovation performance of science and technology SMEs from a meso-level perspective. The results show that the overall innovation performance level of small and medium-sized science and technology enterprises in Sichuan Province in 2012-2013 and 2016-2017 is relatively ideal. The allocation of financial policies is relatively effective in 2013 and 2017. In 2011, 2014 and 2015, due to scale factors, the resource allocation capacity is relatively poor, the problems of redundant input and insufficient output is quite obvious, the overall innovation efficiency is low, and there was still much room for improvement in the role of policies.

**Key words:** Technology-based SMEs; Financial policies; Data envelopment analysis; Innovation performance

### 1 Introduction

Innovation-driven development of small and medium-sized science and technology enterprises is an important force to adapting to the new economy, new formats and new changes. It is the leader of innovation activities, the key focus to cultivating "unicorn" enterprises, and plays an important role in adjusting industrial upgrading and promoting economic development. Small and medium-sized science and technology enterprises in Sichuan Province have occupied the first place in the western provinces in terms of scale. Their rapid development, high technological content and strong competitiveness have long become the backbone of Sichuan's technological innovation and the new force of economic

growth. Therefore, precise support for small and medium-sized science and technology enterprises in Sichuan Province and improvement of the innovation quality of small and medium-sized science and technology enterprises are not only the need to implement inclusive science and technology innovation policies, but also the national strategic need to cultivate new dynamic and new formats. Under this background, it is even more urgent to use policies to support the fission growth of technological SMEs' innovation.

Compared with scientific and technological innovation activities of enterprises above designated size, scientific and technological small and medium-sized enterprises have many shortcomings in financing channels, resource allocation and other aspects due to their own development restrictions, which requires the government to give special preferential treatment to scientific and technological small and medium-sized enterprises in terms of financial support policies. Relevant studies also show that fiscal policy is not only an important tool for the government to regulate macro-economy, but also the most effective way for governments to support small and medium-sized enterprises to carry out innovation activities. Financial investment in science and technology plays an important incentive role in improving the national innovation ability and promoting the construction of an innovative country. Financial support policies are closely related to the healthy and stable development of small and medium-sized science and technology enterprises. However, whether the financial support policy can effectively promote the innovation activities of small and medium-sized science and technology enterprises; Whether the innovative funds for the development of small and medium-sized enterprises can give full play to market traction; How to scientifically evaluate the supporting effect of fiscal policy on innovation activities. In order to solve the above problems, this paper takes the medium-sized data of small and medium-sized scientific and technological enterprises in Sichuan Province as the research subject, and explores the performance impact of financial support policies for small and medium-sized scientific and technological enterprises, which has certain reference significance for improving the effectiveness of financial policies, strengthening the effective use of financial funds, and promoting the rational allocation of scientific and technological resources.

## **2 Literature Review**

Through combing the existing literatures, it is found that in many research results at home and abroad, there are two ways to explain the relationship between financial R&D support and enterprise innovation. One is that government financial support has crowding-out effect on the scientific and technological innovation activities of small and medium-sized enterprises(Goolsbee, 1998; David et al., 2000). Second, government R&D funding has an incentive effect on technological innovation of enterprises. Highly market-oriented competition can stimulate the production of more new technologies, thus realizing the scale effect of social technological innovation(Arrow K, 1962). Panel data and random model are used to study the impact of science and technology incentive policies on R&D input-output(Zhu Pingfang et al., 2003). Government subsidies have a u-shaped effect on enterprises' scientific and technological innovation activities (Zhou Ming et al., 2017). Through

empirical analysis, this paper analyzes and calculates the performance of fiscal and tax policies supporting independent innovation in China, and puts forward policy Suggestions to optimize fiscal and tax support(Jia jia, 2017). In the different development stages of the enterprise life cycle, the government subsidy effect in the seed stage is the most significant(Gao Song et al., 2011). A performance evaluation system based on four aspects of economic benefits has been established(Jiang Hui et al., 2017). This paper studies the innovation driving factors of small and medium-sized science and technology enterprises by multi-case method(Su Jin et al., 2104). The -DSPE model is refined, which is the mechanism model of government support behavior affecting innovation performance of SMEs (Zheng ye et al., 2017). However, among the numerous studies, there is still room for research on the evaluation of the innovation efficiency of small and medium-sized science and technology enterprises by financial support policies, and the corresponding performance evaluation methods and mechanisms need to be improved. Therefore, this paper collects authoritative network data sources released by Sichuan provincial government departments by hand, and discusses the impact of financial support policies on the innovation performance of small and medium-sized science and technology enterprises in combination with Sichuan statistical yearbook, and puts forward the optimization path of financial support policies on the basis of empirical analysis.

### 3 Research Design

#### 3.1 Research methods and models

The performance level of financial support policies is a proportional relationship with the goal of improving the scientific and technological innovation capability, the investment index of fund projects, procurement policies, tax incentives and other policies of all levels of government, and the output index of innovation results. Under the existing financial support policy, the more innovative output results, the higher the performance of the financial support policy; At the same level of innovation output, the lower the investment in support policies, the higher the performance of financial support policies. Data envelopment analysis, DEA) is an effective method to evaluate the relative effectiveness of multi-index input and multi-index output. For the effectiveness evaluation of most similar decision-making units with input and output, it is superior to avoid the main factors and simplify the algorithm. This

$$\left\{ \begin{array}{l} \min \quad \theta e - \varepsilon \left( e^{\wedge T} s^- + e^T s^+ \right) = V_{D_\varepsilon} \\ s.t. \quad \sum_{j=1}^n x_j \lambda_j + s^- = \theta x_{j_0}, \\ \quad \quad \sum_{j=1}^n y_j \lambda_j - s^+ = y_{j_0}, \\ \quad \quad \lambda_{j_0} \geq 0, \quad j = 1, 2, \dots, n, \\ \quad \quad s^- \geq 0, \quad s^+ \geq 0, \end{array} \right.$$

empirical study adopts the super-efficiency model of DEA method. Compared with the traditional CCR or BCC model, the super-efficiency DEA model can further analyze the efficient decision-making units. Suppose that the input and output data are  $(x_j, y_j)(j = 1, 2, \dots, n)$  The mathematical form of the super-efficient DEA model is as follows:

Among them,  $s^-$  is the relaxation variable,  $s^+$  is the residual variable.  $\varepsilon$  is a non-Archimedes infinitesimal and the optimal solution of linear programming is  $\lambda^0, s^{-0}, s^{+0}, \theta^0$ .

### 3.2 Variable analysis

The evaluation of innovation efficiency is a complicated and comprehensive process. The index evaluation system includes two aspects: innovation input and innovation output.

#### 3.2.1 Financial support policy input indicators

The following three indicators are selected as indicators of financial support policy input. (1) Financial allocations for science and technology. Financial science and technology appropriation is the most important way for financial revenue to support enterprises to carry out independent innovation activities, accounting for about 2% of public financial expenditure in Sichuan Province. Therefore, financial science and technology appropriation is selected to represent the level of policy input. (2) research and development expenditure. Research and development expenditure is the use of government funds to fund research and development activities of enterprises, to provide financial guarantee for research and development activities of enterprises, and to play a role in stimulating and guiding research and development expenditure of the whole society. Referencing the practice of existing documents, R&D funds are used to express innovation input. (3) the scale of government procurement for small and medium-sized technological enterprises. As an administrative act, the scale of government procurement is manifested in supporting the independent innovation activities of small and medium-sized enterprises, improving the independent innovation level of enterprises, and promoting enterprises to embark on an innovation-driven development path (Bai Yanfeng et al., 2012). The government directly supports and encourages the development of some key industries, not only plays a guiding role in industrial structure adjustment and scientific and technological innovation, but also is an important means to make up for market demand risk defects. Therefore, the government procurement scale of small and medium-sized scientific and technological enterprises is selected as the input index.

#### 3.2.2 Financial support policy output indicators

The following three indicators are selected as output indicators of fiscal support policies. (1) Number of patent applications. Patents are generally regarded as the direct result of technological innovation and an important manifestation of enterprises' ability to break through core technologies. In this empirical study, the application volume of invention patents of small and medium-sized science and technology enterprises is selected as the output index, which reflects the ability of enterprises to use external resources to carry out independent innovation activities and eliminates the interference of government approval behavior. (2) Number of small and medium-sized technological enterprises. The growth of the number of small and medium-sized science and technology enterprises is an important indicator that directly reflects the effect of government financial support and can make up for

the shortage of patents in measuring innovation output. (3) High-tech output value. Considering the important role of scientific and technological innovation in small and medium-sized scientific and technological enterprises and the actual effect of input factors, high-tech output value is selected to represent the economic effect of policy input and the market value of innovation results. The problems described in this paper have 6 decision-making units, 3 input indicators and 3 output indicators. The specific meanings of the indicators are shown in Table 1.

**Table 1 Table on Selection of Input-Output Variables for Innovation Performance**

Indicators	Indicator meaning	Indicator code	Indicator unit
Input index	Financial allocations for science and technology	$x_1$	Calculate/ hundred million=100M
	Government R&D funds	$x_2$	100M
	Small and Medium-sized Enterprises Government Purchasing Scale	$x_3$	100M
Output indicator	Patent application	$y_1$	number
	Number of small and medium-sized technological enterprises	$y_2$	Ten thousand
	High-tech output value	$y_3$	100M

### 3.2.3 Research objects and data

The empirical research is mainly based on the contents involved in the evaluation indicators of Sichuan Province from 2011 to 2017, evaluates the impact of Sichuan Province's financial support policies on the innovation performance of small and medium-sized science and technology enterprises, and proposes policy optimization paths. The data comes from the Sichuan Statistical Yearbook, an authoritative data source published on the official websites of the Sichuan Provincial Science and Technology Department, the Finance Department, the Industry and Commerce Bureau, the Intellectual Property Office and other competent departments.

## 4 Results

Using super-efficiency DEA model and Max DEA software to solve the linear programming, the evaluation results of Sichuan province's financial support policies on the innovation performance of small and medium-sized science and technology enterprises are obtained. The evaluation results after sorting are shown in Table 2. The evaluation results show that, from 2011 to 2017, Sichuan financial support technology-based SMEs have performed well in innovation performance, with an average comprehensive efficiency of 1.1063. The average value of pure technical efficiency and scale efficiency are 1.2608 and 0.8775 respectively. The performance of scale efficiency is obviously lower than pure technical efficiency. This also shows that while further improving the innovation ability and management level of financial support for small and medium-sized science and technology enterprises, we should focus on breaking through the short board of scale management and allocate reasonable support funds according to the characteristics of small and medium-sized science and technology enterprises at different stages of development. We should not only avoid the shortage of funds, but also prevent the problem of excessive investment of funds.

**Table 2 Results of Innovation Performance Evaluation from 2011 to 2017**

	Overall Efficiency (CRS)	Pure Technical Efficiency (VRS)	Scale Efficiency Score	RTS
2011	0.9734	1.2712	0.7657	Increasing
2012	1.0388	1.0729	0.9683	Increasing
2013	1.4153	2.4259	0.5834	Decreasing
2014	0.9832	0.9839	0.9993	Decreasing
2015	0.9958	1.2769	0.7798	Decreasing
2016	1.0084	1.011	0.9975	Decreasing
2017	1.4356	1.2049	1.1914	Decreasing
Mean value	1.1063	1.2608	0.8775	

### 4.1 Comprehensive efficiency analysis

As can be seen from fig. 1, the overall efficiency of financial support for innovation of small and medium-sized science and technology enterprises is fluctuating upward. In 2011, the score was the lowest, but it also reached 0.9734, which was close to the DEA effective level. After reaching the first peak of 1.4153 in 2013, there was a certain decline, but then it stabilized and rebounded. The efficiency climbed year by year, reaching a score of 1.4356 in 2017, which was the maximum value during the study period. This shows that the financial

support for small and medium-sized science and technology enterprises in Sichuan Province has made steady progress and achieved relatively ideal results.

**Figure 1 Comprehensive Efficiency of Sichuan Province's Financial Support for Innovation of Small and Medium-sized Science and Technology Enterprises from 2011 to 2017**

#### 4.2 Pure technical efficiency analysis

As can be seen from fig. 2, in terms of pure technical efficiency of financial support for innovation of small and medium-sized science and technology enterprises, the performance in other years is basically the same except for 2013, which fluctuates within a narrow range among communities, and only scored slightly less than 1 in 2014, while the other years are all greater than 1. This shows that Sichuan Province has performed well in creating a good environment for entrepreneurship development, scientific management and use of supporting funds.

**Figure 2 Pure Technical Efficiency of Sichuan Province's Financial Support for Technological SMEs' Innovation from 2011 to 2017**

### 4.3 Scale efficiency analysis

Scale efficiency measures whether the current scale is in an optimal state. The smaller the scale efficiency, the greater the deviation from the optimal scale. As can be seen from fig. 3, although the scale efficiency of Sichuan province's financial support for technological SMEs' innovation is not high, the overall trend is fluctuating and rising. During the research period, it has been greatly improved, indicating that the scale of financial expenditure is gradually rationalized.

**Figure 3 Scale Efficiency of Sichuan Province's Financial Support for Technological SMEs' Innovation from 2011 to 2017**

### 4.4 Projection analysis

In order to further find the causes of poor efficiency performance in low-efficiency years, explore the situation of input redundancy and output insufficiency in that year, and provide specific suggestions and improvement schemes for decision makers to improve efficiency, projection analysis is further carried out on the three years of efficiency loss in 2011, 2014 and 2015, and Table 3 is compiled according to the calculation results of Max DEA software. As can be seen from Table 3, the situation in these three years is relatively similar. Among the input factors, government research and development funds have the greatest room for improvement and the most serious losses, reaching 26.68% in 2011. It means that at the level of innovation scale in that year, the relative redundancy of government R&D investment is the biggest reason for low innovation efficiency. Among the output factors, the number of patents authorized and the number of small and medium-sized scientific and technological enterprises have the greatest room for improvement, with the number of patent applications improving by 34.54% in 2011. This shows that the number of small and medium-sized scientific and technological enterprises in Sichuan Province in 2011 is relatively small and the

scientific research achievements are relatively scarce, resulting in an unreasonable output ratio. Therefore, we should focus on improving performance by effectively using government research and development funds, encouraging innovation and entrepreneurship, and encouraging invention and creation.

**Table 3 Input-output Projection Analysis in Low Efficiency Years**

	Input redundancy rate			Output insufficiency rate		
	Financial allocations for science and technology	Government R&D funds	Small and Medium-sized Enterprises Government Purchasing Scale	Number of patent applications	Number of small and medium-sized technological enterprises	High-tech output value
In 2011	2.66%	26.68%	2.66%	34.54%	14.70%	2.66%
In 2014	1.68%	6.72%	1.68%	31.28%	16.01%	1.68%
In 2015	0.42%	2.90%	0.42%	22.69%	9.13%	0.42%

Note: according to the calculation results of Max DEA software.

## 5 Conclusion

Through this empirical study, the following conclusions can be drawn: the overall innovation performance level of Sichuan science and technology SMEs in 2012-2013 and 2016-2017 is relatively ideal, and the allocation of financial policies is relatively effective in 2013 and 2017. However, in 2011, 2014 and 2015, the allocation of resources is relatively poor due to scale factors, and the problems of input redundancy and insufficient output are obvious, resulting in low overall innovation efficiency. Through further analysis of non-DEA effective annual projections, it is found that the reason for relative redundancy at the current scale level is that the allocation ratio among financial science and technology allocation, government R&D investment and government procurement scale of small and medium-sized enterprises is unreasonable. On the basis of reducing government R&D funds, financial investment should appropriately increase financial science and technology allocation and government procurement scale of small and medium-sized enterprises to obtain more output. Based on the above evaluation results, the targeted optimization path is put forward from four aspects: strengthening precision cultivation, establishing fault tolerance and error correction mechanism, improving innovation and entrepreneurship ecology, and developing together with points and areas.

# Prediction Model of Energy Development Trend Based on SVM

Lin Hui

School of Science, Wuhan University of Technology, Wuhan 430070, P. R. China

(E-mail: 463600152@qq.com)

**Abstract:** Increasingly serious energy problems require people to improve the utilization efficiency of renewable energy. In this paper, we study the problem of predicting the energy development trend in China. Concretely, we establish a prediction model of energy development trend based on support vector machine (SVM), and use the genetic algorithm (GM) to solve this model. Moreover, according to the data of energy utilization in the year from 2007 to 2017, we make an empirical analysis by using this prediction model and obtain the prediction result of energy development trend, that is, the share of coal in energy use is declining, and the proportion of oil and natural gas and other new energy sources are rising.

**Key words:** Energy development; Trend prediction; SVM; GM

## 1 Introduction

In order to achieve the social goals of economic development, China has adopted a series of measures including vigorous development of renewable energy to improve the supply of resources. Strengthening the development and utilization of renewable energy is the main method to cope with the increasingly serious energy and environmental problems, and is also an important way for human society to achieve sustainable development (Wang, 2008; He, 2013). As an important part of renewable energy, biomass energy comes from all organic substances formed by photosynthesis directly or indirectly using green plants, including animals, plants, microorganisms, and excreta and metabolites produced by these organisms (Dunjic et al., 2016; Zhong et al., 2019). The biomass suitable for energy use is generally divided into four types: agricultural biomass, forestry biomass, livestock manure, municipal waste and wastewater (Tsai et al., 2017). By analyzing China's energy structure in recent years, we introduced the current energy use situation and determined the development trend of energy utilization by predicting the utilization of major energy sources in the next few years.

There are many methods for predicting time series on energy sources. For example, the AR(p) model is proposed to predicting the energy consumption structure (Sohrabi and Zarepour, 2019), and the AR(q) Nonlinear Regression Models (Liu and Wei, 2004) and the ARMA(p, q) model (Kocak, 2017) are established to predict the energy development trend. These models are more suitable for linear prediction, and not suitable for nonlinear time series prediction. For solve this problem, neural network technology provides a powerful tool for nonlinear time series prediction. The EU energy system is analyzed by means of artificial neural networks (Damir et al., 2019). The recurrent neural network model is presented to forecast the electric energy consumption based on the traditional neural network model (Zagrebina et al., 2019). However, the conventional neural network has some defects such as local minimum and lack of theoretical guidance for the number of nodes in the hidden layer network, which weakens their prediction ability. Therefore, in this paper, we establish a prediction model energy

development trend based on SVM (Xu et al., 2019), and the method of GA (Shojaedini et al., 2019) is used to automatically search and determine the parameters through genetic optimization for the prediction of energy use in China.

## 2 Data Collection and Preprocessing

The energy classification mainly includes renewable energy and non-renewable energy. The biomass energy we studied is contained in renewable energy. China is a country with a large energy consumption. The main energy sources are coal, oil and gas, and some new energy sources are gradually expanding, including nuclear energy, wind energy, hydropower and biomass.

We extracted China's energy consumption in the China Statistical Yearbook <sup>37</sup> from 2007 to 2017 and unified the dimensions as shown in Table 1.

We will show China's energy utilization from 2013 to 2017 in Table 2.

From Table 2, we can see that among the energy used in China, coal accounts for about 60% of the total, oil accounts for about 20%, natural gas accounts for about 5%, and the rest of the energy accounts for about 15%. In the process of continuous development, the proportion of coal energy continues to decrease, and the proportion of oil, natural gas and other new energy sources continue to increase.

**Table 1 The Use of Energy (Unit: Ten Thousand Tons of Standard Coal)**

Year	Total amount	Coal	Petroleum	Gas	Other
2007	311442.0	225795.5	52945.1	9343.3	23358.2
2008	320611.0	229236.9	53542.0	10900.8	26931.3
2009	336126.0	240666.2	55124.7	11764.4	28570.7
2010	360648.0	249568.4	62752.8	14425.9	33900.9
2011	387043.0	271704.2	65023.2	17804.0	32511.6
2012	402138.0	275464.5	68363.5	19302.6	39007.4
2013	416913.0	280999.4	71292.1	22096.4	42525.1
2014	425806.0	279328.7	74090.2	24270.9	48116.1
2015	429905.0	273849.5	78672.6	25364.4	52018.5
2016	435819.0	270207.8	80626.5	27020.8	57963.9
2017	449000.0	271196.0	84412.0	31430.0	61962.0

<sup>37</sup><http://www.stats.gov.cn/tjsj/ndsj/2018/indexch.htm>

**Table 2 Energy Use Ratio**

Year	Coal (%)	Oil (%)	Natural gas (%)	Other (%)
2017	60.4	18.8	7.0	13.8
2016	62.0	18.5	6.2	13.3
2015	63.7	18.3	5.9	12.1
2014	65.6	17.4	5.7	11.3
2013	67.4	17.1	5.3	10.2

### 3 Energy Development Trend Prediction

#### 3.1 The prediction model based on SVM

The impact of different parameters of support vector machine (SVM) model (Xu et al., 2019) on the power load forecasting was studied, and a short-term power load forecasting system was studied with SVM model whose parameters were optimized by genetic algorithms. The parameters for SVM model were determined through genetic algorithms to get the optimum parameter values, and these parameter values were used in the SVM model and genetic algorithm-support vector machine (GA-SVM) model was obtained, which was used to make short power load forecasting.

For the training sample set  $(x_i, y_i)$  (where  $i=1, 2, \dots, n$ ;  $x_i \in R_n$ , is the input variable;  $y_i \in R$ , which is the corresponding output value). The basic idea of support vector machine regression theory is to find a nonlinear mapping  $\varphi$  from the input space to the output space. Through this nonlinear mapping, the data  $x$  is mapped to a high-dimensional feature space  $F$ . And linear regression is performed in the feature space with the following estimation function:

$$f(x) = [\omega \times \varphi(x)] + b \quad (1)$$

$$\varphi: R^m, \omega \in F \quad (2)$$

where  $b$  is the threshold. The function approximation problem is equivalent to the following function:

$$R_{reg}(f) = R_{emp}[f] + \lambda \|\omega\|^2 = \sum_{i=1}^s C(e_i) + \lambda \|\omega\|^2 \quad (3)$$

where  $R_{reg}[f]$  is the objective function;  $s$  is the number of samples;  $\lambda$  is the adjustment constant;  $C$  is the error penalty factor;  $\|\omega\|^2$  reflects the complexity of  $f$  flatness in high-dimensional space. Considering that the linear  $\varepsilon$  insensitive loss function has good sparsity, the following loss function can be obtained.

$$|y - f(x)| = \max \{ 0, |y - f(x) - \varepsilon| \} \quad (4)$$

The empirical risk function is:

$$R_{emp}^\varepsilon[f] = \frac{1}{n} \sum_{i=1}^n |y - f(x)| \quad (5)$$

According to statistical theory, the support vector machine determines the regression function by minimizing the following objective functions:

$$\min \left\{ \frac{1}{2} \|\omega\|^2 + C \sum_{i=1}^n (\xi_i^* + \xi_i) \right\} \quad (6)$$

$$y_i - \omega \cdot \varphi(x) - b \leq \varepsilon + \xi_i^*$$

$$\omega \cdot \varphi(x) + b - y_i \leq \varepsilon + \xi_i$$

$$\xi_i, \xi_i^* \geq 0$$

where  $C$  is the weight parameter used to balance the model complex term and the training error term;  $\xi_i^*$  and  $\xi_i$  are relaxation factors;  $\varepsilon$  is the insensitive loss function. This problem can be translated into the following dual problem:

$$\max \left[ -\frac{1}{2} \sum_{i,j=1}^n (a_i^* - a_i)(a_j^* - a_j) K(X_i, X_j) + \sum_i a_i^* (y_i - \varepsilon) - \sum_{i=1}^n a_i (y_i - \varepsilon) \right] \quad (7)$$

$$\sum_{i=1}^n a_i = \sum_{i=1}^n a_i^*$$

$$0 \leq a_i^* \leq C$$

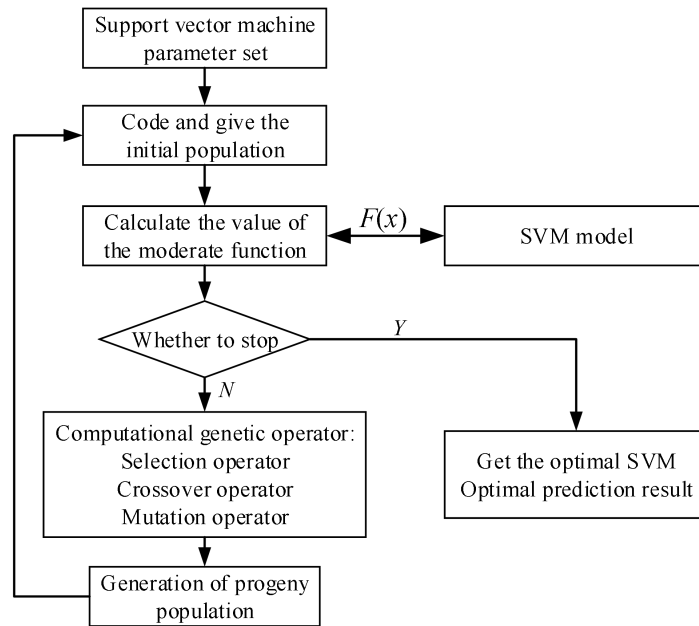

$$0 \leq a_i \leq C$$

By solving the above problem, we can get the support vector machine regression function:

$$f(x) = \sum_{i=1}^n (a_i - a_i^*) K(X_i, X) + b \quad (8)$$

### 3.2 Solving model by GA

We combine genetic algorithm (Shojaedini et al., 2019) and support vector machine (GA-SVM) to propose a method for automatic selection of support vector machine parameters. The relationship between different choices and prediction accuracy is obtained by various parameters, so as to find out the relationship between prediction accuracy and parameters, and reduce the complexity of calculation. The steps of model establishment are shown in Figure 1 as follows.

**Figure 1 Operating Flow Diagram of GA-SVM**

Through the above methods, we forecast China's main energy use, and derive the consumption of coal, oil, natural gas and other energy sources from 2018 to 2023 and the proportion of total energy. The forecast result is shown in Table 3.

By the empirical analysis of the prediction model above, we obtain the prediction result of energy development trend, that is, the share of coal in energy use is declining, and the proportion of oil and natural gas and other new energy sources is rising.

**Table 3 The Forecast Result**

Year	Coal (%)	Oil (%)	Natural gas (%)	Other (%)
2023	48.77	20.90	9.84	20.30
2022	50.56	20.60	9.18	19.60
2021	52.56	20.30	8.68	18.40
2020	54.53	20.00	8.20	17.20
2019	56.48	19.70	7.72	16.10
2018	58.39	19.30	7.27	15.00

## 4 Conclusion

In this paper, we established an optimization model for predicting the energy development trend based on SVM and GA, and make an empirical analysis of this prediction model according to the the data of energy utilization in the year from from 2007 to 2017. From the prediction results, we provide the following principles, directions and policy suggestions for the future development and utilization of

biomass energy in China on the basis of comprehensive consideration of China's national conditions, agricultural conditions and resource characteristics.

(1) Principles of development and utilization. We should adapt measures to local conditions and take the road of diversified development. Biomass energy is a structural system composed of biogas, crop straw, solidified, gasified and carbonized forest product and liquid biomass fuel, among which liquid biomass fuel can be divided into corn, rapeseed and potato. In short, the biomass raw materials and the products are diverse. China's natural conditions are complex. To achieve integration with rural economic development, China's biomass energy industry must follow the path of diversification of raw materials and products and adapting to local conditions.

(2) Development and utilization direction. Biogas engineering, biomass carbonization technology etc. are the main directions for the development and utilization of biomass energy in China in the future. Biogas refers to organic matter that undergoes microbial fermentation under anaerobic conditions to produce a methane-based combustible gas. The operation mechanism of the biogas industry is to use waste from rural production and living processes to produce biogas, biogas slurry and biogas residue through anaerobic reaction of biogas digesters, and then use them in all aspects of production and life to form a benign Industrialization cycle chain. China's biogas production resources are very rich. In addition to livestock and poultry manure, straw and rural organic waste, the relative concentration of organic waste produced by agricultural product processing and bioenergy processing, as well as urban organic waste, will increase. Modern biogas production, processing and application are an emerging direction of biogas projects compared to traditional rural biogas digesters, and their prospects cannot be estimated. Modern biogas production and processing technologies and facilities, power stations, gas stations and vehicles using biogas, as well as commercial operating systems have matured. While consolidating, developing and improving the production and application of traditional biogas, China will focus on introducing and developing industrialized and large-scale modern biogas production and application technologies to increase commodity rates.

(3) Biomass carbonization technology. Biomass carbonization refers to the process of producing biomass and by-products through a certain process and chemical reaction. Biomass carbonization not only saves energy, but also effectively utilizes resources, turns biomass into treasure from waste, and effectively solves the three problems in rural areas, improves the living conditions of farmers, improves the quality of life, and narrows the gap between urban and rural areas. It has accelerated the pace of building a new socialist countryside in China, and it has opened up new avenues for the use of energy in China.

## A Ranking for the Sustainable Development Goals Focusing on the 5Ps

Arnoldo de Hoyos Guevara, Agris L. Dumpe  
Pontifical Catholic University of Sao Paulo, Brazil  
(E-mails: dehayos@pucsp.br, agris.dumpe@grupofolha.com.br)

**Abstract:** Moving strategically toward the 2030 Agenda for Sustainable Development, the UN organized a Sustainable Development Solutions Network (UNSDSN) and a Platform (HLPF) in order to harness the so-called Data Revolution that could help to achieve systemically the 17 Goals, by attaining local and globally the corresponding targets. For this purpose, there is a need to keep joining efforts and know-how to develop an appropriate framework and roadmap. This paper represents a contribution for monitoring the SDG based on the 5Ps People, Planet, Prosperity, Peace and Partnership; by using data from the Iberoamerican Foresight Network Observatory (ORIBER).

**Key words:** RIBER; SDGs; 5Ps; Ranking of countries

### 1 Introduction

There is a great need to consider ways to foster strategic foresight that may help, not only governments, but also the private sector and civil society to get involved collaboratively taking care of the present and future conditions regarding the five key development drivers related to the SDG : People, Planet, Prosperity, Peace and Partnership. On this paper we'll be presenting some of the alternatives going on that may contribute to the High-Level Political Forum (HLPF, 2019) that is the central platform for follow-up and review of the 2030 Agenda for Sustainable Development, based on connecting studies regarding 15 Sustainable Development Challenges developed for the Iberoamerican region and the 5Ps. Our work, being interdisciplinary, may also contribute on harnessing insights regarding Social-Ecological Systems Research for Monitoring Sustainable Development as being developed at the Stockholm Resilience Center by Selomane et al (SELOMANE, 2019), particularly nowadays where think-thanks networks like the Millennium Project and Plataforms may become involved with E-Governance as recommended by the UN(UN, 2018); and already being implemented in places like Estonia (HEATH, 2019).

The SDGs could more easily reached if regionally institutional radars were developed so that farther future-oriented decision-making processes may be more effective. The futures-oriented information research has nothing to do with predictions or incremental trends. Forecasting and trends do not guarantee innovative ideas and disruptive innovation because they analyses the past to predict the future and relies on continuity. The landscape of analysis is now more volatile, uncertain, complex and ambiguous (VUCA) and needs disruptive answers that require anticipatory and collective intelligence systems. Actually the UN Inter-Agency and Expert Group on the SDG Indicators (IAEG-SDGs<sup>38</sup>) may be moving in that direction using new dashboards, frameworks and cross matrixes approaches, particularly now with the UNSDN fostering a Data Revolution (UNSDN, 2019), and the strong support of Jeffrey Sachs and the Sustainable Development Solutions Network (SACHS,2018).

Actually and as mentioned by Weitz (WEITZ, 2017), the Stockholm Environmental Institute (SEI) has being working in developing a practical approach for gaining a systemic and contextual perspective on the SDGs, that may help to understand interactions, synergies and trade-offs among them and hence strategically become more systemically efficient; and as indicated at SEI <sup>39</sup>: *How the Sustainable Development Goals (SDGs) interact with each other is a key question in the implementation of the 2030 Agenda. Understanding these interactions is vital for prioritizing action and anticipating knock-on effects.* This kind of approach has already being tried focusing implementing the 2030 Agenda in Latin America by the independent Research Forum IRF (BARKET, 2017).

### 2 The Iberoamerican Foresight Network - RIBER

A few years ago ( 2014 ) an Iberoamerican Foresight Network – RIBER<sup>40</sup> was started, as regional subgroup of the Millennium Project Think-Thank, with the purpose of joining forces helping the

<sup>38</sup> <https://unstats.un.org/sdgs/iaeg-sdgs/>

<sup>39</sup> <https://www.sei.org/projects-and-tools/projects/disentangling-interactions-sustainable-development-goals/>

<sup>40</sup> <https://www.pucsp.br/catedrainacysachs/riber.html>

Iberoamerican Region to overcome development hardships seeking new ways to foster Sustainable Development, something that Jorge Máttar from CEPAL was also starting doing together with Daniel Perroti from ILPES at that time; and more recently (2016) these two organizations organized an International Course on Strategic Foresight for dealing with the UN SDGs consisting basically in: Defining the Problem and identifying the relevant variables concerning the structural system; develop alternative scenarios; and design and build up a strategic foresight sustainable development model. Moreover actually already a year before UN SDGs were defined, the RIBER had build up an Observatory (ORIBER<sup>41</sup>) and was working on this kind of model based on 15 SDGs (GPS), somehow related to the 17 UN SDGs as we are going to show next and applying to 132 countries divided into 3 Regions: Iberoamerican (AIBER, 21 countries) Advanced Economies (AVECO, 27 countries) and Others (OTHERS, 84 countries)

SDGs Ranking of Countries based on the GPS through the 5 P's of Sustainable Development Goals (SDGs).

The first step was to relate the RIBER 15 SDGs to the 17 UN SDGs as shown in the following Table 1.

**Table 1 Relating the RIBER 15 SDGs with the UN 17 SDGs**

RIBER 15 SDGs	UM 17 SDGs
1 Basic Resources: Water, Food, Energy	SDG 1, SDG 2, SDG 6, SDG 7, SDG 12, SDG 14
2 Shelter	SDG 11
3 Security and Peace	SDG 16
4 Health and Environment	SDG 3
5 Inequalities and Gender Social Inclusion	SDG 5, SDG 10
6 The Future of Work and Education	SDG 4, SDG 8
7 Productive Transformation and Sustainable Innovation	SDG 9
8 Integration and Strategic Alliances	SDG 17
9 Longevity Trends	SDG 3
10 Climate Change and Renewable Energies	SDG 13
11 Biodiversity: Natural and Social Capital	SDG 15
12 Resilience	SDG 11
13 Democracy and Social Networks	SDG 8, SDG 16
14 Decocracy and Social Networks	SDG 16
15 Well-Being and Quality of Life	SDG 2, SDG 3, SDG 4, SDG 16

And also to relate the RIBER 15 SDGs with the synthetic UN 5Ps

- P1. PEOPLE - End poverty and hunger in all forms and ensure dignity and equality.
- P2. PLANET - Protect our planet's natural resources and climate for future generations.
- P3. PROSPERITY - Ensure prosperous and fulfilling lives in harmony with nature.
- P4. PEACE – Foster peaceful, just and inclusive societies
- P5. PARTNERSHIP - Implement the agenda through a solid global partnership

As shown in the following Table 2

**Table 2 Relating the RIBER 15 SDGs to the UN 5 Ps**

RIBER 15 SDGs	UM 17 SDGs
1 Basic Resources: Water, Food, Energy	P1, P2
2 Shelter	P1, P2
3 Security and Peace	P1, P3, P4
4 Health and Environment	P1, P2, P5
5 Inequalities and Gender Social Inclusion	P1, P3, P4, P5
6 The Future of Work and Education	P1, P3
7 Productive Transformation and Sustainable Innovation	P2, P5
8 Integration and Strategic Alliances	P1, P5
9 Longevity Trends	P1
10 Climate Change and Renewable Energies	P1, P2
11 Biodiversity: Natural and Social Capital	P1, P2, P3
12 Resilience	P1
13 Democracy and Social Networks	P1, P3

<sup>41</sup> <https://www.pucsp.br/catedraignacysachs/oriber.html>

14 Decocracy and Social Networks	P1, P3, P4,P5
15 Well-Being and Quality of Life	P1, P2, P3

Using these ideas it was possible, using multivariate analysis based on information( hundreds of variables for 132 countries ) regarding the **RIBER 15SDGs** to build up a **Global SD Ranking** that allows in particular, to see how is The Iberoamerican Region – AIBER ( 21 Countries) doing when compared to a group of Advanced Economy Countries – AVECO ( 27 Countries) and Other Countries – OTHER ( 84 Countries ). The greatest difference among AVECO and the other two groups as may be seen in Fig. 3 clearly being regarding Partnership and in particular, Peace as it was to be expected and would need a special care.

A linear Model was built for each of the SDG 5Ps, by using Principal Component Analysis ( PCs ) and Stepwise Regression, to select a give weights to the variables involved ( Vars ) that give raise to New Indicators( Nis ), find levels of simliarity ( Fig. 1 ) and build up rankings as shown in thenext tables.

$$NI = \sum_{PC1}^{PCn} PCn * ((R-Sq * Var 1) + (R-Sq * Var 2) + \dots + (R-Sq * Var n))$$

NI = New Indicator

PC = Eigenvalue of principal component

R-SQ = Corresponding R<sup>2</sup> on the Variable on the Stepwise Regression

UK	100	AVECO	Uzbekistan	13	OTHERS
Switzerland	100	AVECO	Burundi	13	OTHERS
Sweden	99	AVECO	Mali	13	OTHERS
Canada	98	AVECO	Togo	12	OTHERS
U.S.	97	AVECO	Angola	11	OTHERS
Denmark	96	AVECO	Pakistan	9	OTHERS
Australia	94	AVECO	Yemen	7	OTHERS
Finland	93	AVECO	Venezuela	4	OTHERS
Norway	93	AVECO	Guinea	4	OTHERS
New Zealand	93	AVECO	Sudan	0	OTHERS

**Figure 2 Comparing the 5Ps Using ANOVAs for the 3 Regions**

As may be seen in Figure 2 the greatest differences among AVECO and the other two groups are

clearly Partnership and in particular Peace, as it was to be expected and would need a special care.

### 3 Conclusion

No doubt all 5Ps are basic but it may depend on the region as well as how critical is the timing regarding climate, that the UN Climate Action Summit 2019 that will be working in New York next September 23; as a matter of fact UN Secretary Antonio Guterres is pressing the countries representatives for realistic plans to reduce greenhouse gas emissions by 45% over the next decade, *by means of full transformation of economies in line with sustainable development goal since. uneven growth, rising debt levels, possible upticks in financial volatility, and heightened global trade tensions are hampering progress on reaching the Sustainable Development Goals* (UN,2019). This is reinforced by the Energy Transition Commission (ETC, 2018) very recent report **Mission Possible** declaring that full decarbonization is technically feasible with technologies that already exist and could cost less than 0.5% of Global GDP, but it could take longer due to uneven growth. So there is still some questions like to what extent will the poor countries benefits form the COP24 (BARAKAT, 2019).

The question is if the present geopolitical deglobalizing crisis that is going on, as well as the impacts on local unstable governments, will allow to actually develop and implement Strategic Foresight Planning focusing Sustainable Development, before is too late. This means changing Mind Sets of present day Governance, and perhaps moving into what it is now called Society 5.0, an idea that came from Japan that helps to develop human strengths and values as mentioned by Seiichi Matsuo (MATSUO, 2019), President of Nagoya University, and represents an Advanced Educational approach<sup>42</sup>. For this purpose, some projects like Teach the Future develop by the Futurist Peter Bishop<sup>43</sup> and Transforming the Future by Riel Miller (MILLER, 2018) as well as groups like the Resilience Alliance<sup>44</sup>, the Stockholm Environmental Institute (SEI), and the World Economic Forum (WEF)<sup>8</sup> may be of some help.

## A Ranking of Countries concerning Progress towards a Society 5.0

Arnoldo José de Hoyos Guevara, Daniela Mary Terra, Jerônimo Henrique Portes,  
José Luiz Alves da Silva, Kallita Ester Magalhães

Pontifical University Catholic of São Paulo, São Paulo, Brazil  
(E-mail:dehoyos@pucsp.br; daniela.terra@hotmail.com; jeronimo.portes@bol.com.br;  
jl.alves@uol.com.br; kallitaester@gmail.com)

**Abstract:** The Fourth Industrial Revolution has arrived, and we are trying to adapt to the innovations. It is changing the way we interact in society, how we consume, live and work. But this agile process already presents a new stage that takes place in conjunction with the new digital age, involving people, technology, sustainability, risks and opportunities: it is the 5.0 Society. This article seeks to understand the impact of ongoing changes and the needs around sustainability, analyzing key indicators that include both movements. With this, we hope to obtain data on the possibility of building the new Sustainable Technology Society, besides investigating the next steps to make this happen in Latin America. In this study, 35 variables were analyzed a sample of 57 countries, including management, business, sustainability, technology, education and Society 5.0 dimensions, among others. We present an analysis of the relationship between the variables and the creation of a synthetic indicator, called SSI (Society 5.0 Index), which allows us to show the position of each country in this ranking. This is the discussion we present here.

**Key words:** Society 5.0; Smart society; Fourth industrial revolution; Industry 4.0; Imagination society.

### 1 Introduction

Society 5.0 is a term used in the Fifth Science and Technology Basic Plan, reviewed by the Japanese Government's Council for Science, Technology and Innovation, and can be defined as a "Society of Intelligence", in which physical space and cyberspace are strongly integrated. Although focused on humanity, 5.0 refers to a new type of society where innovation in science and technology occupies a prominent place, with the aim of balancing social and societal issues that need to be solved, while ensuring economic development (Salgues, 2018).

Recently, Keidanren (Japan Business Federation) has defined Society 5.0 as the "Imagination Society", where digital transformation will be combined with creativity and values to develop a sustainable society. In the Fourth Industrial Revolution, as called by WEF - World Economic Forum (WEF, 2019), we are observing the fusion between distinct scientific worlds, where the discoveries are mixing and building new frontiers. The main subject is that "what makes the Fourth Industrial Revolution fundamentally different from the previous ones is the fusion of these technologies and the interaction between physical, digital and biological domains" (Schwab, 2016).

In this new brave world, we have to learn how to use correctly and fully the capacity of the new developments. It's necessary a correct direction, for example in the IoT, BigData and AI application, where "like other general-purpose technologies, their full effects won't be realized until waves of complementary innovations are developed and implemented" (Brynjolfsson, E.; Rock, D.; Syverson, C., 2017).

In Germany, there were discussions about Industry 4.0. This term was created in 2011 at the Hannover fair to describe how smart factories will be and how to revolutionize the organization of value chains. At MIT, we can observe this information and concerns about its application when it was mentioned that the effect of these digital technologies will manifest itself with full force through automation and unprecedented things (Brynjolfsson, McAfee, 2014).

We can see in the table 1 the main disruptive technologies regarding the Industry 4.0.

**Table 1 Main Disruptive Technologies of 4.0 Industrial Revolution**

	Features	Reference
Artificial Intelligence	Machine Learning, Advanced Algorithmics, Avatars, Chatbots and Automatic Decisions	Kaplan, 2016 Brynjolfsson et. al, 2017
Advanced Mobility Wide World	SmartPhones, 4G/5G, QRC, NFC, Autonomous Car	Deloitte, 2017 <sup>1</sup>
Internet of Things - IoT <sup>2</sup>	Monitoring of Digital and Physical information, Wireless Sensors, RFID, Beacons and BLE- Bluetooth Low Energy	Greengard, 2015 Kevin Ashton, 2009 <sup>2</sup>
Big Data	Data Science, Analytics, Structured and No Structured Data	Thomas Davenport, 2014
Blockchain	Cryptocurrency, Digital Ledger	Swan, 2015
Smart Environment (SmartCities and Houses)	Controlling and Decision, by machines or by human commands	Glasmeier et. Al., 2015
Ubiquitous Computing	Global Access and Storage	Schwab, 2016
Wearable Clouths and Devices	Human action measurement, Remote health monitoring, diagnostics and decisions, emergency notification systems	Greengard, 2015

Source: prepared by authors - adapted from references.

As a result, all industries have the potential to create new value through disruptive innovation and Advanced Mobility<sup>45</sup>, both in terms of creating innovative products and services and improving supply efficiency. The key features of core technologies such as IoT<sup>46</sup>, Big Data, and Artificial Intelligence are the common technology foundations in all industries, not only in the manufacturing process problem, but also in a wide range of industries across industry boundaries where most likely it will have an impact. As a result, there may be unforeseen rapid changes in the industrial structure and work structure itself, and new opportunities may be spread globally, but concerns about labor migration will be a concern. For this reason, in advance of this change, redesign of the entire economy and society including various legal systems has become essential to become more humane (Fukuyama, 2018).

Society 5.0 will be an Imagination Society, where digital transformation combines with the creativity of diverse people to bring about "problem solving" and "value creation" that lead us to sustainable development. It is a concept that can contribute to the achievement of the Sustainable Development Goals (SDGs, 2018) adopted by the United Nations (Nakanishi, 2019)<sup>47</sup>.

More broadly, it is defined that a Smart Society as one where digital technology, thoughtfully deployed by governments, can improve three broad outcomes: the well-being of citizens, the strength of the economy and the effectiveness of institutions (Chakravorti, 2017)<sup>48</sup>.

A bibliographic survey was carried out on the topic using the Web of Science database, and only 14 articles mention the theme of Society 5.0. Only a few of them actually work the core theme. This demonstrates the importance of addressing the issue, facing the challenge of achieving sustainable development around the world.

We have important issues that are appearing during this process, such as: what are the major components of society 5.0? Can we consider some countries as models for such societies? What kind of variables can we suggest monitoring and analyze this new model of society?

<sup>48</sup><https://hbr.org/2017/10/the-smart-society-of-the-future-doesnt-look-like-science-fiction>

## 2 Theoretical Reference

The studies on society 5.0 involves the search for new models and solutions to the main global challenges of today's society on the context of the 4<sup>th</sup> Industrial Revolution - World Economic Forum, (WEF, 2019). Within these models we can highlight the Japanese model, presented at the last WEF, where he presents the transition from society 4.0 to society 5.0, through the following dimensions:

**Table 2 Transitions Dimensions from Society 4.0 to Society 5.0**

Dimension	Description
1 - Economies of scale	Problem solving & value creation: a society where value is created
2 - Uniformity	Diversity: a society where anyone can exercise diverse abilities
3 - Concentration	Decentralization: a society where anyone can get opportunities anytime, anywhere
4 - Vulnerability	Resilience: a society where people can live and pursue challenges
5 - High environmental impact Mass consumption of resources	Sustainability & environmental harmony: a society where humankind lives in harmony with nature

Source: prepared by authors - adapted from Nakanishi, 2019<sup>49</sup>.

Inside this model, we can find some indicators suggested by the authors, such as:

- **Problem Solving & Value Creation:** Wealth to growing populations, diversity, digital technologies, satisfying individual needs, solving problems, and creating value.
- **Diversity:** Diversity, discrimination by gender, race, nationality, etc.
- **Decentralization:** Concentration of wealth and information (or distribution), opportunities to study and work, population distribution, etc.;
- **Resilience:** Damage caused by earthquakes and floods, vulnerabilities, public security, growing social anxiety about terrorism and other crises, damage caused by cyber-attacks, resilience, unemployment and poverty, level of medical care, etc.
- **Sustainability & environmental harmony:** Energy efficiency, water supply and waste management, food wastage, etc.

In the study of smart society presented by Chakravorti and Chaturvedi (2017), other dimensions were also considered with other group of variables, such as: (1) Citizens/People: inclusivity, environment and quality of life, state of talent and the human condition, talent development. (2) Economy Components: global connectedness, economic robustness, entrepreneurial ecosystem, innovation capacity. (3) Institutions Components: freedoms offline and online, trust, safety and security, public services.

This article aims to compile, compare and suggest some important variables within the discussion of society 5.0, as a way to understand and make contribution in the development of the theme. Thus, we search for possible relations between variables related to the skills of the future (Coursera, 2019) and a set of variables linked to other dimensions of development of society that are aligned with the model proposed by the Japanese Keidanren. Below we can check the **34 Indicators** selected for this work:

- **Skills for the future:** Data Science, Data Management, Data Visualization, Machine Learning, Mathematics, Statistical Programming, Statistics, Business Global Ranking (BGR), Accounting, Communications, Finance, Management, Marketing, Sales, Technology, Computer Network, Databases, Human Capital Index (HCI), Operating Systems, Security Engineering, Software Engineering.
- **Society:** Global Innovation Index (GII), Global Innovation INPUT, Global Innovation OUTPUT, Control of Corruption, Environmental Performance Index (EPI), Well Being, Democracy, Vulnerability, Susceptibility, Peace, Governance, GINI Index.
- **Development Index:** Human Development Index (HDI), Social Progress Index (SPI).

## 3 Methodology

This is an exploratory study that seeks to contribute to the discussion of variables important to

<sup>49</sup><https://www.weforum.org/agenda/2019/01/modern-society-has-reached-its-limits-society-5-0-will-liberate-us/>

society. For this proposal, 57 countries were selected and divided into 3 regions: AIBER (Iberian American Region), AVECO (Advanced Economy Countries) and OTHERS (Other sample countries), as follows:

- **AIBER (12):** Argentine, Brazil, Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, Guatemala, Mexico, Peru, Portugal, Spain;
- **AVECO (22):** Australia, Austria, Belgium, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Ireland, Israel, Italy, Japan, Netherlands, New Zealand, Norway, Rep. of Korea, Sweden, Switzerland, United Kingdom, United States;
- **OTHERS (23):** Bangladesh, Belarus, China, Egypt, Hungary, India, Indonesia, Kenya, Malaysia, Nigeria, Pakistan, Philippines, Poland, Romania, Russian Federation, Saudi Arabia, Singapore, South Africa, Thailand, Turkey, Ukraine, United Arab Emirates, Vietnam.

Using Minitab as statistical analysis software and data collected by the ORIBER and Global Skills Index Report (Coursera, 2019), we examined the possible dimensions of Society 5.0. The selection considered 35 synthetic indicators that were normalized (0-100) and positivized (the higher the better), out of which 10 were selected for being more representative; moreover for Saudi Arabia, Singapore, Vietnam and the United Arab Emirates, regression was used to estimate some missing values in the Welfare and SPI variables.

In our final analysis, using PCA (Principal Component Analysis) and Stepwise Regression, a **Society 5.0 Index -S5I** was developed, to represent our final model integrating the variables, and defining a ranking of the countries (see table 4).

It is important to emphasize the limitations of our study. The countries were selected according to their similarities in each group and the availability of data on these countries, in the many variables selected by us. As an exploratory study, it is an initial step that will require further analysis and further research in the future. It is, therefore, a proposal for a new approach in our academic environment.

#### 4 Results and Discussion

Figure 1 Dendrogram of the Level of Similarity of the 9 Indicators More Relevant

In the dendrogram it is possible to visualize some interesting relations. One may consider three main sectors of variables are present in the dendrogram: Skills for the future –Sector A (4 variables), Society – Sector B (4) and Development – Sector C (2).

On the left side, Sector A it is possible to notice that the Management and the BGH (Business Global Ranking) run closely together (99.14) as well as Software Engineering and Machine Learning do (92.03) being technical tools. Actually, both groups seem to be closely connected (88.60). This scenario indicates the importance of human actions in the decisions of how to use technological evolution.

Then we have also high similarity between HDI and SPI (97.89), that correspond to Sector B related to main indicators for human development, the final goal to the sustainable society.

It is very interesting to observe three other variables in sequence. Control of Corruption, with 92.90 of similarity with Sector B as well as 92.51 with GII (Global Innovation Index); all of these with 84.97 similarity with Susceptibility. This scenario may indicate the strong systemic dependence between human development, the use of technological solutions and the government actions. It is worth remembering that the GII means how to deliver Innovative Solutions and how to build Cooperation between countries around the world and the control of Susceptibility means resilience, the ability to react quickly to crises and unforeseen events. It is sector C.

It is possible to observe a similarity of 77.80 between subgroups A and B/C. We could verify the real needs of working for management and business using technology to achieve social and developmental outcomes in society. It is important to highlight that Management and HDI are the main variables in this study representing 70.2% of the results in our model.

There is an approximation between Democracy and subgroups A/B/C (69,03), what seems to indicate that it is necessary to have conditions of preservation of freedom, right of expression and security in the strengthening of an environment capable of sustaining a development of other variables.

It was observed that it is possible to relate the groups of variables that stood out most in the study with the Keidanren model, as described below:

- **Problem solving & value creation:** with the variables of *Management, Business, Machine Learning* and *Software Engineering*, which indicates the importance of a conscious management of business and technology in the generation of value to society, as is the case of HDI and SPI. Here, we show the dynamics of governance and transparency in organizations so that there is an alignment in the search for solutions to global challenges.

- **Resilience and Decentralization:** with the variables of *SPI, HDI, Control of Corruption, Global Innovation and Susceptibility*, that indicates that human development is important in the generation of skills and environments capable of generating a better response to crises, disasters and situations of risk. In this sense, *innovations* enter as a tool of collaboration in the process creating paths of greater connectivity and access to information. The idea is to create environments with greater opportunities for the people.

- **Diversity:** with the variables of *democracy, SPI and HDI*, that connects to environments of political stability, respect for diversity and freedom, economic stability and security, defending the freedom of individuals, strengthening the "being who they are" and being responsible for their choices.

The table 3, bellow, shows the comparison of the 3 regions for each one of the variables by using ANOVAs.

**Table 3 Summary of Data (ANOVAs)**

Region	Management	Business	Machine Learning	Software Engineer.	SPI	HDI	Control of Corruption	Global Innovation	Susceptibility	Democracy
AIBER	42,08	47,9 2 75,5	29,67	47,33	60,61	59,07	39,06	26,45	67,52	64,73
AVECO	77,09	5 28,1	76,32	68,14	93,90	91,62	86,27	71,42	88,00	83,15
OTHERS	29,83	3 27,6	36,91	36,52	42,00	50,04	39,35	30,33	63,53	38,67
F - value	28,86	5	24,19	7,93	48,18	33,95	28,87	40,04	10,80	46,66

Source: prepared by authors

The value of "F" represents the degree of approximation between the regions was added (the larger the F value the greater the difference). The most important difference between regions is SPI (48,18) and the one that makes less difference is Software Engineering (7,93).

We have the following outliers by indicators: Republic of Korea (Management and Business, may be because the country has had a quick development in the last decades), Israel (Susceptibility by the geographic region) and Singapore (Global Innovation, with superior indicator in OTHERS).

These approximations and deviations are best seen in the figure 2.

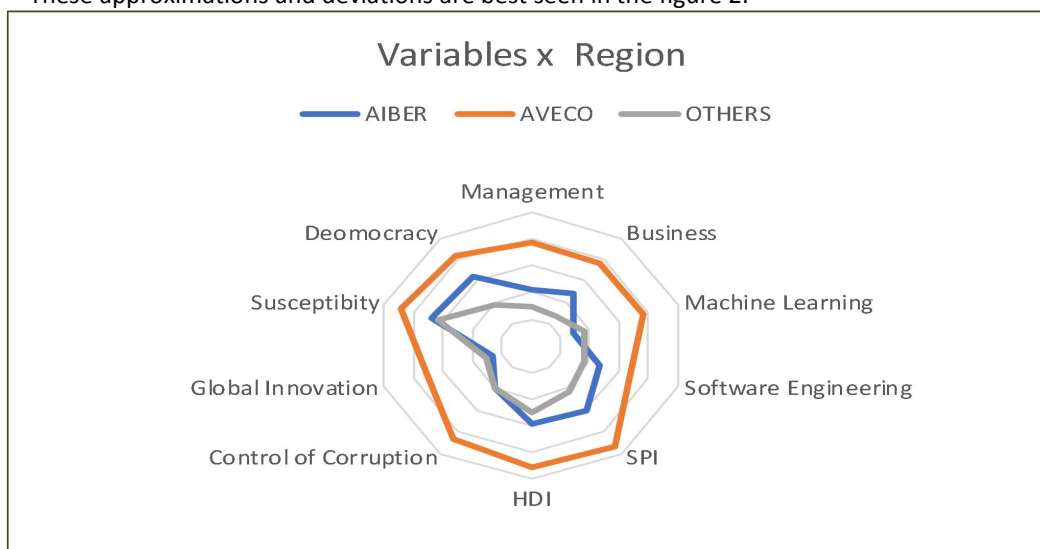

Figure 2 Variables by Regions

**Comments:**

✓ In the chart it is possible to notice that the **AVECO region** presents all the best Indicators of the studied set, distancing itself from the other groups of countries mainly in *innovation and human development (SPI and HDI)*, maybe in consequence of their management process.

✓ The second group with the best performance is the **AIBER region**: it emerges in the dimension of *democracy, medium indicator for SPI and HDI, software engineering and business* but presents the lowest score in the *Global innovation index and Machine Learning*. It is necessary pay attention because it is possible find out opportunities in this situation.

✓ In addition, AIBER approaches the **OTHERS region** in the issue of *susceptibility* which may indicate a greater need for investment under conditions of less exposure to risks and crises. The **OTHERS region** is the one with the lowest performance in the sample studied.

**Main differences observed:**

**Susceptibility:** This is the indicators where the **AIBER** and **OTHER** regions are very close, presenting as Outlier Israel (1) that is in the region AVECO. The highest indicator of the **AIBER** and **OTHER** regions was the susceptibility. This can be explained by the greater vulnerability of these countries to external influences. We need to reinforce that the low "F" factor (10,80) indicates that this susceptibility variable is the one of greater proximity and similarity between the three groups.

**Global Innovation:** Within the 10 variables, innovation was the dimension that presented one of the lowest performances and the greatest impact for the three regions, being the only dimension where the AIBER region was inferior to the OTHERS region. However, it is one of the indicators of lower adhesion in all regions surveyed with factor "F" 44.04. It may be that developing countries do not need more collaboration than they already have with other countries, and AIBER and OTHERS need more than they can get at this moment.

**Democracy and business:** For these indicators, it is clear that the AIBER region moves radically away from the OTHERS region in these two points.

**SPI and HDI:** These are the best indicators presented in the AVECO region. They present with the largest individual indicators of the study (93,90 and 91,62), where we can associate issues of health, education and income development.

**Software Engineering:** The lowest indicator of the AVECO region is related to technology (68,14). In the other hand, they are the countries where the advances are in the state of art with disruptive technologies. Is a point to research on future studies.

**Business:** This is the lowest indicator in the OTHERS region (28,13).

Finally using Principal Component Analysis and then selecting weights for the variables using Stepwise Regression it was possible to define what we are calling a Society 5.0 Index – SSI that lead us to define a Ranking as shown in Table 5, where one could observe that regarding the Society 5.0 Index. Spain is doing a little better than the United States as well as Brazil a little better than China... the two greatest powers today

**Table 4 Ranking of Countries for SSI – Society 5.0 Index**

Countries	Region	SSI - Index	Ranking	Countries	Region	SSI - Index	Ranking
Switzerland	AVECO	100	1	Romania	OTHERS	51,38	29
Austria	AVECO	94,71	2	Japan	AVECO	50,48	30
Finland	AVECO	94,46	3	Costa Rica	AIBER	47,76	31
Belgium	AVECO	92,3	4	Greece	AVECO	43,49	32
Sweden	AVECO	62,2	5	<b>Brazil</b>	<b>AIBER</b>	<b>43,27</b>	<b>33</b>
Germany	AVECO	91,13	6	China	OTHERS	40,22	34
Netherlands	AVECO	90,21	7	South Africa	OTHERS	39,36	35
Australia	AVECO	85,7	8	Ukraine	OTHERS	38,36	36
New Zealand	AVECO	84,1	9	Peru	AIBER	38,02	37
Czech Republic	AVECO	83,89	10	Malaysia	OTHERS	34,22	38
United Kingdom	AVECO	83,28	11	United Arab Emirates	OTHERS	33,47	39
Norway	AVECO	82,79	12	Colombia	AIBER	33,15	40
Canada	AVECO	81,35	13	Thailand	OTHERS	32,78	41
France	AVECO	80,93	14	Viet Nam	OTHERS	29,72	42
Israel	AVECO	80,71	15	México	AIBER	28,97	43
Denmark	AVECO	78,55	16	Rep. of Korea	AVECO	27,59	44
Singapore	OTHERS	76,03	17	Philippines	OTHERS	26,86	45
Poland	OTHERS	75,77	18	Ecuador	AIBER	24,14	46
<b>Spain</b>	<b>AIBER</b>	<b>75,04</b>	<b>19</b>	Guatemala	AIBER	22,65	47
United States	AVECO	74,92	20	India	OTHERS	22,58	48
Hungary	OTHERS	71,67	21	Dominican Republic	AIBER	22,14	49
Portugal	AIBER	66,42	22	Saudi Arabia	OTHERS	17,93	50
Ireland	AVECO	66,37	23	Turkey	OTHERS	17,58	51
Italy	AVECO	66,26	24	Indonesia	OTHERS	16,96	52
Argentina	AIBER	65,48	25	Kenya	OTHERS	15,73	53
Russian Federation	OTHERS	60,53	26	Egypt	OTHERS	8,28	54
Belarus	OTHERS	58,13	27	Nigeria	OTHERS	2,25	55
Chile	AIBER	57,18	28	Bangladesh	OTHERS	0,93	56
				Pakistan	OTHERS	0	57

Source: prepared by authors

The final average per region, for synthetic indicator SSI (Society 5.0 Index), is showing in the table number 5.

**Table 5 Average by Region**

SSI	Average
AIBER	43,68

AVECO	78,43
OTHERS	33,51

Source: prepared by authors

It is important to note that AVECO is almost twice the AIBER average (1,8) and 2.5 times the OTHERS average (2,3). This distance means a huge effort to develop new approaches and be close to the developed countries. This situation highlights the urgency of developing public and private policies for this purpose.

In the chart below (Figure 3) it is possible to visualize the pairs, within the sample surveyed, that stood out the most for these variables. The darker regions represent the places with the best performance. In general, the countries of the AVECO region (developed countries) presented the best results.

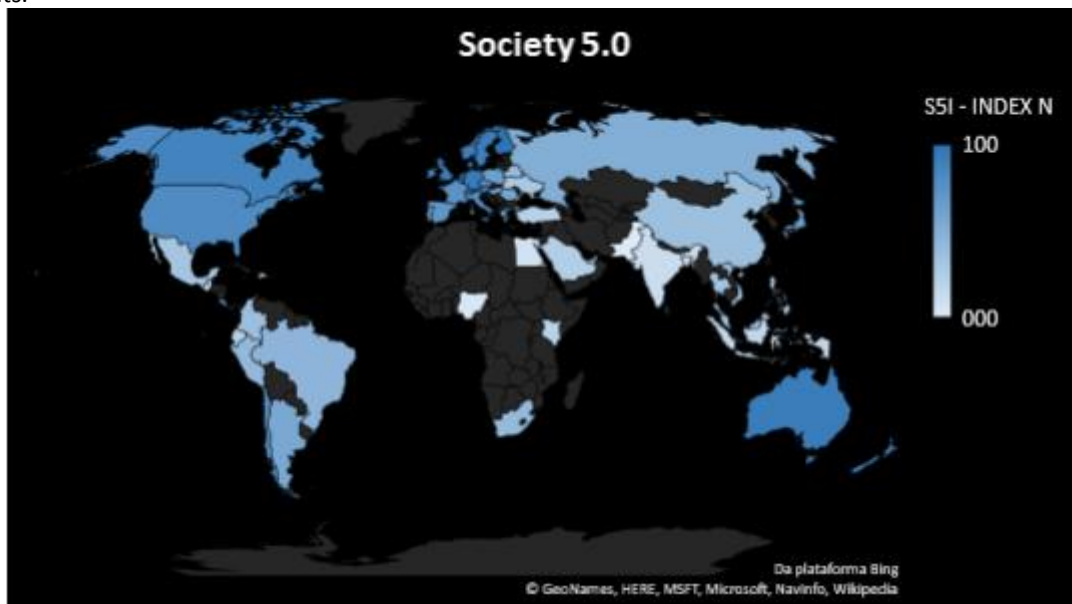

Figure 3 Dimensions that Favour the Development of Society 5.0 for the Countries of this Study

## 5 Conclusion

There are many directions in which society will advance through technological development. While technology can bring about improvements such as higher living standards and greater convenience, it can also have negative effects, such as employment impact, increasing disparity, and uneven distribution of wealth and information. It's up to all of us to choose which direction we should go. We should consider what kind of society we want to create rather than try to predict what kind of society it will be (Nakanishi, 2019).

The use of technology is directly responsible for the success of the business and management, as everyone knows, but we can highlight the connection between Management, BGH (Business Global Ranking), GII (Global Innovation Index) and Control of Corruption with HDI e SPI, Human Development indicators, as a signal to get our total attention, because it means results that have a direct impact on the whole society. The appropriation of disruptive technology and government actions are the way to achieve the necessary inclusion and prepare the new generation for the Digital Age, using the direction of the United Nations Development Goals (SDGs, 2018) for a sustainable society. What stands out is that the economic, social and environmental dimensions are revolving around the technological axis and that "the revolution now is to change our way of thinking and a way of living in greater harmony with nature" (Sange, 2008).

This theme is only at the beginning of its academic discussion and depends on concrete actions to be integrated to the society and to be part of the political agenda for sustainable growth, which is so much sought.

In other words, government rules and policies need to include specific studies to prepare each

state, culture, and society to figure out how to apply technology, where to apply the digital solution, and how to spend money. These indicators, studied here, show that there is a connection between management, technology and social outcomes.

On the other hand, the distance between the countries of AVECO and those of AIBER / OTHERS in Global Innovation in the figure 2 and the average in the table 5, is very worrying, given that the time to address and manage modern technologies is far from the latter countries. And, in our opinion, these are the last opportunities to approach the leaders of the technologically advanced world. Because, in some cases, we are talking about software application and Artificial Intelligence, solutions that do not require an industrial park to be developed, such as 4.0 Industry. But surely, it requires a better educational system and a strong leadership of nations and business leaders to watch out for these issues. A good example of this process is the Nagoya University in Japan, as mentioned recently by its President Seiichi Matsuo, regarding a new Educational Philosophy to help moving into a Society 5.0 Culture (Matsuo, 2019).

It will be almost impossible to deploy Society 5.0 in AIBER, at the same time with the rest of the developed world, if the ecosystem and the necessary positive conditions have not been prepared before.

We understand that society 5.0 is clearly linked to the SDGs (2018) in the most of dimensions. We suggest that new variables studies should be development with these directions also.

Our contribution is to use technology and data as a tool to identify the indicators that help define and build the new society. We can see, from this study that these variables have a strong relation among them, so that these indicators may be considered in future studies to monitor and create models for the Society 5.0.

# Effect of Environmental Regulation on Corporate Financial Performance: Mediating Role of Green Technological Innovation

Chen Xiaofang, Tong Xiaohong, Xia Wenlei, Chen Xin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: cxf2010611@163.com, tongxh518@163.com, 290149@whut.edu.cn, cx910316@163.com)

**Abstract:** This paper adds new insights to the increasingly prominent contradiction between economic development and environmental protection in China by examining the effect of environmental regulations on corporate financial performance. As a novel attempt, based on the Porter Hypothesis and Schumpeter's Innovation theory, it argues that a company's efforts to bring green technological innovation plays a mediating role on the relationship between the environmental regulations and corporate financial performance. The sample of the study consists of 561 heavily polluted listed companies over the period from 2010 to 2017. The results reveal that government regulation pressure can effectively improve financial performance, of which the green technological innovation plays a mediating role.

**Key words:** Environmental regulation; Green technological innovation; Corporate financial performance; Intermediary effect method

## 1 Introduction

Environmental regulations put pressure on enterprises to conduct their operations in an environmentally friendly manner. As a result, the operations of the enterprises may be constrained, affecting their financial performance. The extant literature reveals two types of thoughts relating to the effect of environmental regulations on green technological innovation and corporate financial performance.

The early studies report that environmental regulations increase the burden of enterprises, which impairs not only their green technological innovation, but also financial performance. For example, environmental regulation led to increased costs and capital transfers, ultimately restraining the technological innovation (Walley and Whitehead, 1994). The invention of environmental protection technology patents lacks funds because of the pollution emission control (Chintrakarn, 2008). People find that the relationship between environmental regulation and green technology is not simply monotonous (Bréchet and Meunier, 2014), but U-shaped (Zhang Qian and Qu Shiyong, 2013). It is also uncovered that too strict environmental regulations are not conducive to green technological innovation of enterprises.

On the other hand, in line with the "Porter hypothesis", it can be argued that well-designed environmental regulations can stimulate technological innovations for improving productivity and resource utilization, and, thereby, increase the financial performance. Through an empirical test using statistics from more than 4200 factories in the European Union, it was found that under certain

conditions, environmental regulation would encourage technological innovation to reduce production costs of enterprises (Lanoie et al., 2008), and enterprises can reduce unnecessary costs through green technological innovation, and thereby, improve corporate profits (Marin, 2014). Studies also showed that green innovation has a positive effect on enterprise economic performance (Li Yina and Ye Fei, 2011), green innovation can improve economic efficiency and ecological efficiency when compared to the traditional technological innovation (Xiao Xianjing and Zhao Wei, 2006).

Accordingly, the current literature reveals contradictory evidence on the effect of environmental regulations on green technological innovation and financial performance of enterprises. Therefore, the objective of this study is to examine how the environmental regulations affect the enterprises' green innovation and financial performance. The results of the study can contribute the industry in the following manner. The findings promote the enterprises to continuously engage in green technological innovation to enhance their sustainable development. The environment regulatory authorities can also use the results to determine the effectiveness of the environmental regulations in promoting enterprises to engage in green technological innovation. Further, the findings are of great significance to policy makers when introducing new environmental regulations.

The remainder of the paper is organized as follows. Section 2 shows the formulation of research hypotheses. Section 3 explains the conceptual model, measurement of variables and hypothesis testing. The results are discussed in Section 4. Section 5 concludes the paper.

## **2 Research Hypothesis**

### **2.1 Environmental regulation and green technological innovation**

According to the system theory, when enterprises encounter pressure from government system, they tend to be obeyed the system to avoid punishments so that their survival legitimacy will be improved. The environmental regulations reflect the government's pressure to protect the environment. As a part of mandatory regulatory measures, the government compels enterprises to adopt environmental protection strategies to enhance their survival. Further, it brings external prestige pressure to enterprises through environmental information collection and disclosure. Therefore, it can be expected that enterprises attempt to take measures to comply with the environmental regulations in order to avoid pollution penalties and protect the corporate image, which eventually promote green technological innovation, as given by the hypothesis 1.

Hypothesis1 (H1): Environmental regulation is positively related to enterprise green technological innovation.

### **2.2 Green technological innovation and enterprise performance**

As discussed in Section1, the extant literature lacks a strong consensus on the impact of green innovation on corporate financial performance. The green technological innovation increases the development cost of enterprises. However, this increased cost could, to a certain extent, be offset or even outweigh by financial benefits arising from the efficient utilization of resources from the improved production processes. In addition, green innovation is beneficial for enterprises to produce low energy consumption and low pollution products, which can distinguish enterprises from competitors and help enterprises to expand new market segments. Based on these arguments, it can be expected that the Green technological innovation improves the financial performance of enterprises, as given by the hypothesis 2.

Hypothesis2 (H2): Green technological innovation is positively related to the financial performance.

### 2.3 Green technological innovation and enterprise performance

The policies and measures for environmental protection and regulation force enterprises to internalize the environmental concern into their business activities, which can lead to innovation and, thereby, improve their financial performance. Porter's Hypothesis emphasizes that the influence of the environmental regulations on the financial performance is indirect. Studies argued that external environmental policies can promote enterprise innovation activities, and the "technology compensation" brought by innovation activities can improve the financial performance (Wang Jianming et al., 2010). Hence, there exists a mediating role of green innovation activities on the relationship between environmental regulation and the financial performance of enterprises. The following two hypotheses are formulated to examine this mediating effect.

Hypothesis3 (H3): Environmental regulation has a positive effect on corporate financial performance.

Hypothesis4 (H4): Green technological innovation has a mediating effect on the relationship between environmental regulation and financial performance.

## 3 Data and Methodology

### 3.1 Conceptual model and hypothesis testing

Figure 1 depicts the conceptual model with the related hypotheses. This study employs asset-liability ratio, firm size, cash holdings and shareholding of the largest shareholder as the control variables of financial performance. Hence, the H2, H3 and H4 hypotheses are examined after controlling for the effects of these variables.

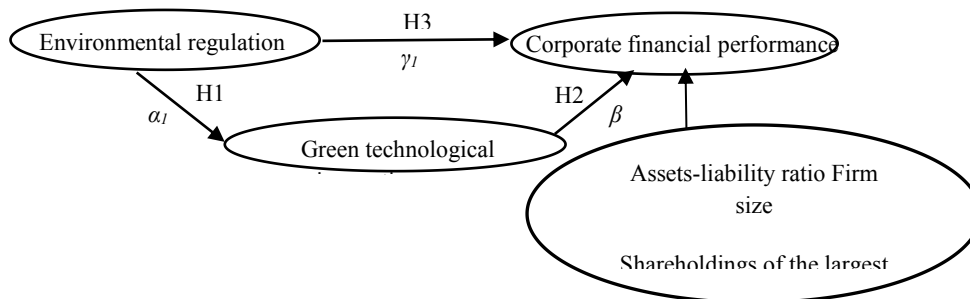

Figure 1 Conceptual Model of the Study

The examination of the direction and significance of coefficient  $\alpha_1$  in equation (1),  $\beta_1$  in equation (2) and  $\gamma_1$  in equation (3) provides evidence relating to the hypotheses H1, H2 and H3 respectively.  $\alpha_1 * \beta_1$  represents the mediating effect of green technological innovation on the relationship between environmental regulation and financial performance, as indicated by H4. The total effect of the environmental regulation on the financial performance is the sum of the direct effect ( $\gamma_1$ ) and the mediating effect ( $\alpha_1 * \beta_1$ ).

$$PA\_GR = \alpha_0 + \alpha_1 RE\_COGD + Controls + \varepsilon_1 \quad (1)$$

$$ROA = \beta_0 + \beta_1 PA\_GR + Controls + \varepsilon_2 \quad (2)$$

$$ROA = \gamma_0 + \gamma_1 RE\_COGD + Controls + \varepsilon_3 \quad (3)$$

$$ROA = \theta_0 + \theta_1 PA\_GR + \theta_2 RE\_COGD + Controls + \varepsilon_4 \quad (4)$$

### 3.2 Sample selection and measurement of variables

This study concerns on the heavy polluting companies listed in the A-share market from 2010 to 2017 as the research sample. The validity of the sample is improved by excluding the companies \* ST and ST that were specially processed and the companies that had major asset restructuring during the sample period. Further, the data with abnormal values are eliminated from the sample. Accordingly, the final data set includes the equilibrium panel data of 561 listed companies.

Table 1 shows the measurement of variables depicted in the conceptual model. The intensity of the environmental regulations is measured based on the cost of pollution control, which can be obtained from the Yearbook of Environmental Statistics. The number green environmental protection patents, as published in the 5ipatent.com website, is used to measure the green technological innovation. Studies argues that it is reasonable to measure the innovation level of enterprises by patents, because patents have certain potential market value (Shane, 2005). The CSMAR database of Guotaian is used to obtain the financial data of the selected companies to measure the financial performance and the control variables.

**Table 1 Variables and Their Measurement Units**

Variable type	Variable name	Symbol	Measurement
Response	Corporate Financial performance	<i>ROA</i>	Return on assets
Mediator	Green innovation patent	<i>PA_GR</i>	Ln(Applied green environmental protection patents +1)
Predictor	Environmental regulation	<i>RE_COGD</i>	(Cost of pollution control in provinces /GDP of provinces)×1000
Controls	Asset-liability ratio	<i>DEBT</i>	Total liabilities/total assets
	Firm size	<i>SIZE</i>	Natural logarithm of total assets
	Cash holding	<i>CASH</i>	Balance of cash and cash equivalents /Average total assets
	Largest shareholder	<i>FISH</i>	Shareholding ratio of the largest shareholder

## 4 Results and Discussion

### 4.1 Descriptive analysis

The descriptive statistics relating to the variables employed in this study are shown in Table 2. The average of ROA is 0.044, which indicates a lower performance level of the selected sample of

companies. The average of PA\_GR is 0.239, which is quite different from its median. It indicates that the companies' green technological innovation is at a very lower level.

**Table 2 Descriptive Statistics of the Study Variables**

Variable	Average	Median	Standard deviation	Minimum	Maximum
<i>ROA</i>	0.044	0.038	0.055	-0.506	0.482
<i>PA_GR</i>	0.239	0.000	0.498	0.000	3.136
<i>RE_COGD</i>	3.871	3.043	3.855	0.000	58.530
<i>DEBT</i>	0.422	0.427	0.212	0.007	1.345
<i>SIZE</i>	22.128	21.892	1.299	18.760	27.040
<i>CASH</i>	0.158	0.111	0.142	-0.165	0.931
<i>FISH</i>	37.317	36.200	15.329	3.620	95.950

#### 4.2 Correlation analysis

Table 3 reports the correlations between study variables. It shows that the correlation coefficients are no more than 0.4, indicating the fact that there is no serious collinearity between environmental regulation, green technological innovation and the control variables. The correlation coefficient between RE\_COGD and PA\_GR is 0.047, which preliminarily proves that environmental regulation can promote enterprise green technological innovation.

The correlation coefficient between PA\_GR and ROA is 0.021, which indicates a positive correlation between green technological innovation and financial performance of companies. The positive correlation between RE\_COGD and ROA (0.042) also provides preliminary support for the expected positive relationship between environmental regulation and financial performance of companies.

**Table 3 Correlation of Study Variables**

	<i>ROA</i>	<i>PA_GR</i>	<i>RE_COGD</i>	<i>DEBT</i>	<i>SIZE</i>	<i>CASH</i>	<i>FISH</i>
<i>ROA</i>	1						
<i>PA_GR</i>	0.021	1					
<i>RE_COGD</i>	0.042	0.047**	1				
<i>DEBT</i>	-0.447**	0.077**	-0.089	1			
<i>SIZE</i>	0.113**	0.161**	0.080**	0.552**	1		
<i>CASH</i>	0.315**	-0.052**	0.023	-0.057**	-0.362**	1	

*FISH*            -0.006            0.019\*\*            0.068\*\*            0.106\*\*            0.303\*\*            -0.001            1

\*\* indicates that the correlation is significant at the level of 0.01;

\* indicates that the correlation is significant at the level of 0.05

### 4.3 Regression analysis

In order to reveal the impact of environmental regulation on enterprise green technological innovation, this paper carries out panel regression analysis based on equation (1). The results show that the regression coefficient of RE\_COGD to PA\_GR is 0.001, which is significant at the level of 5%. This shows that government environmental regulation has a certain promoting effect on enterprise green technology output, which supports the view of Hypothesis 1 in this paper.

**Table 4 Regression Result among Variables and Mediating Effect**

	<i>PA_GR</i>		<i>ROA</i>	<i>ROA</i>	<i>ROA</i>
	(1)		(2)	(3)	(4)
<i>C</i>	0.483*** (109.543)	<i>C</i>	0.485*** (115.361)	-0.108*** (-6.850)	-0.111*** (-6.938)
—	—	<i>PA_GR</i>	0.001** (2.312)	—	0.002** (2.4335)
<i>RE_COGD</i>	0.001** (1.984)	<i>RE_COGD</i>	—	0.002** (2.031)	0.002** (2.318)
<i>DEBT</i>	0.138* (1.743)	<i>DEBT</i>	-0.054*** (-7.915)	-0.057*** (-8.301)	-0.057*** (-8.347)
<i>SIZE</i>	0.006*** (20674)	<i>SIZE</i>	0.002*** (8.257)	0.006*** (8.762)	0.006*** (9.044)
<i>CASH</i>	-0.172* (-1.874)	<i>CASH</i>	-0.027*** (-3.389)	-0.025*** (-3.126)	-0.027*** (-3.354)
<i>FISH</i>	-0.000** (-2.352)	<i>FISH</i>	0.000 (0.710)	-0.000 (-0.647)	-0.000 (-0.695)
<i>Adj-R<sup>2</sup></i>	0.398	<i>Adj-R<sup>2</sup></i>	0.572	0.668	0.781
<i>F</i>	4.838***	<i>F</i>	8.767***	254.685***	227.631***
<i>OBS</i>	3303	<i>OBS</i>	3304	3303	3304

\*\*\*、\*\* and \* respectively indicated that T-test was significant at 1%, 5% and 10% levels

In equation (2), the correlation coefficients of PA\_GR and ROA are 0.001, which is significant at the level of 5%, this proves that green technological innovation indeed improves enterprise performance significantly. That is, the more green technological innovation, the better financial performance. This conclusion confirms Hypothesis 2 of this paper.

As shown of equation (3) in the Table 4, it is the regression result of environmental regulation and enterprise performance, the coefficient of RE\_COGD and ROA is 0.002, which is significant at 5% level. This shows that environmental regulation has a positive impact on enterprise performance, and verifies Hypothesis 3 in this paper.

In order to test the mediation effect of green technological innovation, the test method to verify the mediation effect model was used to test the mediation effect model (Wen Zhonglin et al., 2004). As shown of the equation (4) in the Table 4, the total effect of environmental regulation on enterprise performance is 0.002, and has passed the significance test of 5% level respectively. In the mediation effect model, Table 4 shows that the direct effect of environmental regulation on green technological innovation is 0.01 and was significant at 5%. In table 4, the direct effect of green technological innovation on enterprise performance is 0.002 and was significant at 5%. The direct effect of environmental regulation on performance was 0.002, and passed the significance test. Therefore, green technological innovation plays a part of intermediary role between environmental regulation and enterprise performance. Hypothesis 4 holds.

## 5 Conclusion

### 5.1 The summary

Based on the data of 561 heavy polluting enterprises from 2010 to 2017, this paper draws the following main conclusions:

Environmental regulation promotes green technological innovation in enterprises. The policy of environmental regulation regulates the pricing mechanism of pollution discharge and reasonably estimates the cost of pollution discharge. It not only forms a compulsory pressure on the polluting enterprises, but also has a certain incentive effect on the resource and environmental protection enterprises.

Green technological innovation can improve enterprise performance. Green innovation activities can not only minimize production pollution, avoid environmental penalties, but also improve productivity, develop new market for environmental protection products, and win a good social reputation, thereby establishing environmental protection first-mover advantage and enhancing the market performance of enterprises.

Green technological innovation plays a part of intermediary role between environmental regulation and enterprise performance. Enterprises will take more green technological innovations to reduce environmental pollution and improve the legitimacy of the system, thereby enhancing the competitive advantage of enterprises and promoting the performance of enterprises.

## 5.2 The proposal

Strengthening green technological innovation and promoting enterprise performance. From the empirical analysis, we can see that green technological innovation and enterprise performance are significantly positively correlated, indicating that the implementation of green technological innovation is conducive to improving enterprise performance. As people pay more and more attention to the green environment, the global supply chain has begun to pay more attention to the green environment, so it is particularly important to strengthen the green technological innovation of enterprises.

Perfecting corporate governance and improve the efficiency of resource allocation. From the research results, we can see that the proportion of the largest shareholders is negatively correlated with the green technological innovation and performance of enterprises, which indicates that highly concentrated equity is not conducive to the development of enterprises. Studies pointed out that board governance plays a positive role in enterprise green technological innovation (Wang Fengzheng and Chen Fangyuan, 2018). Good corporate governance objectively helps enterprises to establish a long-term mechanism of independent innovation, which can improve the allocation of green technological innovation funds.

## 5.3 The expectation

Although this paper analyses the impact of government environmental regulation on enterprise green technological innovation, and also analyses the economic consequences of green technological innovation, due to the limitations of time, capacity and resources, there are still some shortcomings in this paper, such as single sample and incomplete selection of indicators, so future research can be carried out from the following points:

Expand the research samples. This paper chooses heavy pollution industry companies as samples. Although green technological innovation in heavy pollution industry is the most urgent, the current development of green economy requires green production in all industries, so the research object can be extended to other industries in the future.

In addition to considering the government's environmental regulation, we should consider the impact of stakeholders such as consumers, media, investors, community public on enterprise green technological innovation, especially the community public. As one of the most effective stakeholders around the enterprise, the environmental pressure of the community public can have the most direct impact on the enterprise. However, it is difficult to quantify and obtain data on the environmental attitude of the community public, which can be used as one of the directions for further in-depth research in the future.

**Abstract:** Resilience is acknowledged both explicitly and implicitly in a range of the proposed SDGs targets. It is a core feature of target 13.1 in its aim to ‘strengthen resilience and adaptive capacity to climate-related hazards and natural disasters in all countries’. The scope of this paper is to discuss the extent of Resilience considering the expectation of adaptation of Human Beings to unfavorable and risky situations, concerning the Reference used. Taking Life as a reference, adaptation brings us out of suffering. That may be called Resilience in the Systemic View of Life, which understands that everything and everyone is interconnected. In order to better feel the Worth of Life, a Vision/Approach of Inner Processes of Creation is discussed, helping each one, who experiences it, to become conscious of Worth in him/herself, and therefore in others and Nature as a whole. The lack of such understanding has led to decisions of the use of human, material and financial resources exclusively for utilitarian purposes, bringing exhaustion to all of them. This is the case of the huge bioma of Amazon, which is under threat and needs urgent care and respect to stop disaster in chain. Women’s vulnerability is also connected with the concept of global resilience and discussed. The above can help decisions taken under the discussed perceptions to lead to constructive Creation.

**Key words:** Resilience; Worth of life; Systems view of life; Interdisciplinarity; Gender differentiated vulnerability; Amazon bio ma.

### 1 Introduction

The term resilience emerged in physics and engineering, being one of its forerunners the English scientist Thomas Young who according to Timoshenko (Timoshenko, 1953) already in 1807 introduced the concept of elasticity and resilience, describing his experiments on tension and compression related to the relationship between the applied force in a body and deformation that this force produces.

Yet, it is in Psychology that the term resilience is explored as a cognitive and behavioral effort. So much that the area takes ownership of the concept and considers it a landmark, from the book *Vulnerable but invincible: a longitudinal study of resilient children and youth* by Werner and Smith (Werner and Smith, 1989); and more recently a contribution to the concept of resilience on this area may be found in the work of Gasperin and Marca (Gasperin and Marca, 2019).

Reflecting on this concept, that leads us to an individual that needs to be tough without failing, an individual who is expected to overcome any adversity, we ask: “To what extent? Under which references?” Neurolinguistics considers there is no failure, just feedback; and the Systemic View of Life by Capra (Capra, 1995; 1997, and 2002) can show the extent of adaptation. Besides, there is the possibility to use what Capra (Capra, 1987) calls the Uncommon Wisdom, the knowledge from within, and experience the Inner Processes of Creation devised by Syrgiannis (Syrgiannis, 2019) that lead to the awareness of the own Worth<sup>50</sup>.

<sup>50</sup><https://www4.pucsp.br/icim/ingles/downloads/PROCEEDINGS-ICIM-2013-Brazil.pdf>

Today, the various challenges of climate change demand societies to become more flexible to crises, to become resilient in integrated, sustainable, multidimensional and inclusive ways. The United Nations Agenda 2030 for Sustainable Development<sup>51</sup> recognizes the importance of transforming societies through sustainable, resilient and inclusive paths, encompassed by the interlinked and universal Sustainable Development Goals (SDGs)<sup>52</sup>. Target 1.5 represents the core resilience target, as mentioned on the HLPF report: 'By 2030 build the resilience of the poor and those in vulnerable situations, and reduce their exposure and vulnerability to climate-related extreme events and other economic, social and environmental shocks and disasters'. In fact, there is already a Global Solutions Initiative that organizes a Global Policy Forum yearly and publishes a Global Solutions Journal<sup>53</sup>, and there is a Resilience Alliance that has been acting for 40 years now<sup>54</sup>.

The objective of the present study is to discuss how essential it is to recognize the Worth of others and Nature in decisions making. Life involves Power, Love and Wisdom, which may be felt Within to be recognized Without, with the perception of Rhythms. Decisions by professionals, authorities and by each single Human Being should be taken considering the Web of Life. Particularly, when these decisions relate to biomass and bio resources like the Amazon Forest, now living critical times which affects climate change. The study takes a theoretical, philosophical approach to resilience and discusses the vulnerabilities produced, particularly the gendered vulnerability during risks and disasters of climate change<sup>55</sup>.

## 2 Development of the Study

In order to approach the subject holistically, an interdisciplinary approach was used by the collaboration of authors who are professors in Management and Engineering Schools, members of a group of Studies and Research on Futures, and Leaders of the Group of Studies and Research on Interdisciplinarity, and Spirituality, from two regions of the planet: Brazil/Latin America and Greece/Mediterranean.

Firstly, a discourse contribution to the concept of resilience was developed, followed by reflections on the denial of the fragilities of the subject in the concept of Resilience, and on the mercy of being the ideal subject of the dominant ideology. This part of the study is based on discourse analysis (DA) which works with language in the world. It works with ways to give significance and considers the production of sense, as part of life.

Then, there was the presentation and discussion on how awareness of our Worth through the Inner Processes of Creation leads to decisions making for Life. This was followed by the Amazon Forest example of Climate Change and the gender differentiated vulnerability in Natural Disasters.

### 2.1 A discourse contribution to the concept of resilience

The main pillars of resilience proposed by Werner and Smith (Werner and Smith, 1989) are vulnerability and the ability to deal with situations of extreme adversity. Vulnerability refers to individual predisposition to the development of psychopathology or ineffective behavior in crises. However, the ability to deal with adversity needs to be described as the set of strategies used by individuals to adapt to adverse or stressful circumstances.

With this milestone, the concept of resilience is divided from the perspective of two generations, the first generation of studies defines resilience as "the adaptability of the individual, that is, the person who is able to handle and overcome an adversity". In parallel to the first generation of studies, positive Psychology emerges. One of the forerunners of the study in this field was Rutter (Rutter, 1993). The author mentions that invulnerability and the ability to adapt sustain the concept of resilience. The second generation adds the term "positive adjustment", as it favors the development of the potential of individuals and makes them stronger and more active.

We would like to consider the unconscious aspect of an individual who suffers in the process of adaptation. An individual who is not always capable of handling and overcoming adversity. The

individual who, according to Freud (Freud, 1923), had the sovereignty of the self of consciousness and reason affected with a new conception; and that from Lacan book 5 (Lacan, 1999) is structured in the field of language and was constituted as a subject willing for ideology.

Freud (Freud, 1990) went beyond the notion of the individual, as he describes the unconscious, and modified, successively, its records. At this point, the self emerges. It would be the part of the unconscious mind that changed by the proximity and influence of the external world and could serve as a mediator.

Lacan re-elaborated the constitution of the self by Freud, and emphasized that the self is the subject of language. The self as the subject of language is determined by the representations, the traces of memory and the signs of perception that are organized as a structure. In this perspective, the language reveals the contents of the unconscious.

So, the unconscious mind is represented by a signifier, i.e. an acoustic image. This signifier shows in speech through metaphor or metonym. The metaphor is when a word replaces another, and metonym is the substitution of one term for another, but it has some relation with the first.

## **2.2. Methodology used in the research of Resilience**

This study is based on discourse analysis (DA) which works with language in the world. It works with ways to give significance and considers the production of sense, as part of life.

Starting from the idea that the materiality of ideology is speech, and that the materiality of the speech is language, the relationship speech-language-ideology is worked. Thus, behind speech there is an ideology, that is, a set of ideas, thoughts, doctrines or world views of an individual or group, for their social and political actions.

According to Pêcheux (Pêcheux, 1988), there is no speech without a subject and there is no subject without ideology. That is the way the language makes sense. So the speech of an individual or group reveals their ideologies. The speech has regularity, functioning and cannot be analyzed as a closed structure in itself. It is understood that speech is determined by a social – historical process

As for Lacan (Lacan, 1999), he understands that the speech is from the Other; and that the subject is considered a subject, because he is subjected to the discourse of the Other. Therefore, the individual becomes a subject when he is subjected to the discourse of the Other.

We perceive in the discourse of resilience, that it proposes an individual immersed in the discourse of resistance, to overcome any limits, and supply any lack. Since the current social-economic paradigm has integrated resilience with capitalist production, it advocates the development of increasingly strong and productive individuals.

## **2.3 The denial of the fragilities of the subject in the concept of Resilience**

The conceptual definition of resilience involves the language and the significance that could be understood through the empty spaces, the effects of meaning that are inserted in it. Therefore, the subject depends on the functioning of a linguistic structure, that is, on the one hand he or she is found in a language arrangement, and on the other, he or she is constituted in historicity and memory.

Speaking about the self, we submit it to the structural functioning of language, which enables to use language and emptiness. To become a subject, it is necessary to inhabit a language system, that is, the discourse which reveals the unconscious.

For the existence of a subject, it is necessary to go through the signifiers that occupy the place of the Other and transmit the laws of the symbolic meaning. The process of Subjectivity crosses the meaning of the Other; in other words, when analyzing the materiality of resilience, we can reflect that the definition attests to the presence of an ideology, and stands before the question: what does that mean?

With regard to the subject assumed by this discursive construction, we can think that the materiality of resilience reveals the subject of Lacan's alienation and the ideological subjection of Althusser (Althusser, 1971).

The individual who is immersed in a discourse of adaptation without suffering, reveals a subject who is lost in the process of being subjected, when he is submitted to the discourse of overcoming and strengthening.

For Althusser (Althusser, 1971), the interpellation of the individual in the subject occurs by ideology. We can say that ideology is part, or rather, is the condition for the Constitution of the subject. The interpellation produces the subjection and this occurs at any historical time and in whatever

conditions of production. Therefore, the discourse of adaptation, coping, overcoming and strengthening presents representatives of an ideology.

It could be said that in the discourse of the concept of resilience, there is a denial of human fragilities, by proposing the development of qualities that help individuals to resist; forgetting that by resisting there is suffering. Therefore, it is shown not only an individual who adapts, but also an individual who adapts positively. An individual who moves by the desire of completeness. However, by denying his or her incompleteness, he or she becomes subjected to discourse, which is not by him; it is the discourse of the Other (Gasperin & Marca, 2019).

"The individual is expected to be capable of boundless freedom and unfailing submission. He or she is allowed to say everything, as long as he or she submits to the speech". This free subject, without limits, submissive and without flaws, is observed in the resilience that achieved social expectations or performance without signs of misfit.

This definition that the individual does not present signs of misfit, sacraments the process of fragmentation of the subject, through the subjection of the discourse of the Other. The discourse regulates the relationship between what was said and the unspoken. The non-said relates to the non-saying, that is, in the sense of being implicit. What is not verbalized, but is still there. The untold keeps secrets between the lines. For this reason, by dipping in the text to interpret it we must keep in mind the principle that each subject has his or her ideologies with a discursive memory.

It is what the materiality of adversity reveals, which is described as the set of strategies used by individuals to adapt to adverse or stressful circumstances, with cognitive and behavioral efforts to cope with demands of adverse situations. Such discourse makes us reflect and make some questions: If adversity is evaluated as an overload, how can this individual overcome this adversity? Why nothing is said about adversity? What is silenced expecting individuals to adapt to adversity? Does the untold of adversity reveal the ideal subject for the dominant ideology?

#### **2.4 Are we at the mercy of being the ideal subject of the dominant ideology?**

The ideal subject proposed by the concept of resilience reveals an individual who is able to cope, overcome and strengthen in a positive way against adversity. This proposition presents a resistant individual and subjected by the dominant ideology that aims to make it increasingly stronger and more productive. Thus, nothing is said about adversity, because the ideal subject is the one responsible for adapting, indiscriminately, to anything that is placed in the category of adversities. No matter what he or she has to adapt to, as long as he or she adapts (Gasperin & Marca, 2019).

The capitalist production transformed work into an activity linked to strength and productivity. Moreover, defines the object to be explained as the human history that includes the wills and consciousness of the historical agents, and does not mention the will and consciousness of the subject. Thus, we can consider that capitalist production does not consider the suffering of the individual. In fact, it is responsible for individuals to adapt to adversities (Dardot & Laval, 2016).

The productive subject constructed the industrial society. It was not just about increasing material production, it was necessary that the power would be redefined as productive and stimulating production, whose limits would be determined by the effects of his or her action on production.

This productive power is correlated to the productive subject, not only the worker, but the individual who produces well-being, pleasure and happiness. In this way, one can think that in the society in which we live the capital and the goods are at the center of economic activity, not life. Therefore it is a *si ne qua non* condition, to understand the subject who suffers in face of a discourse of overcoming.

It is essential to understand the anxieties of the subject who lives an adaptation process and who often suffers, because he cannot adapt, and does not even strengthen him or herself. The new imposition to the subjects assumes that the company is not a community or a place of Self Realization, but an instrument and a space of competition. It is presented ideally, above all, as the place of all innovations, permanent change, continuous adaptation to variations in market demand, pursuit of excellence, and zero failure.

Althusser (Althusser, 1971) suggests that ideology acts or works in such a way that it recruits subjects among individuals, if not all, or transforms individuals into subjects, if not all through the interpellation. For the author, the human subject transcends his true state of diffusion, and finds an image of himself.

In this sense, it can be stated that language enables and enhances the expression and

communication of the distance of the real that is originated in the relations of work. So it is evident that the ideal subject is determined by the productive powers. The understanding of this aspect reveals that the subject becomes an epiphenomenon of social relations, without any interference from his subjectivity, that is, adversities are taken as invariable.

It can be considered that the ideal subject of the dominant ideology is to manufacture useful men, docile to work and disposed to consumption. Since the law of effectiveness is to intensify efforts, it maximizes results and minimizes waste. Such ideology reaches the insane height of alienation by wishing to suppress any feeling of alienation: obeying our own desire or the Other who speaks in a low voice within us. In this sense, it is a Lacanian control: the desire of the subject is the desire of the Other.

### 3 Reflections for Discussion

#### 3.1 Becoming aware of our worth through the inner processes of creation leads to decisions for life.

Knowledge can be accessed both, from outside and inside. It is usually offered by outside. However, we have a very important Source which comes from inside, called by Capra (Capra, 1987), Uncommon Wisdom. The word Uncommon was used to show that it is often not used, but it is an extraordinary reservoir of power, Love and Wisdom. It makes conscious what we did not know we knew. It is related to the Inner Processes of Creation, which have been devised along many years of the use of language that emerges for proposals, to help professionals, scholars and citizens in general to take decisions on a variety of issues, particularly the ones related to Life and sustainability.

This Vision/Approach considers the individual from the perspective of Interdisciplinarity, Complexity and Transdisciplinarity, with the capacity of self organization as an Autopoietic Being. Interdisciplinarity is understood not only as a connection of fields of knowledge, but also the way to regard the individual as full of possibilities, according to Fazenda (Fazenda, 2002). The dialogics by Morin (Morin, 2008, 2012, 2014) considers what emerges even if it appears to be in opposition to something else. Transdisciplinarity by Nicolescu (2002, 2008, 2010<sup>56</sup>, 2014) considers Science as focussed on the Subject, not the object. The object emanates from the subject and both are immersed in a third hidden element of a ratio of infinite reach. Oneness is felt, then.

This process is described in detail on the article “Inner Processes of Creation towards awareness of own worth for sustainable proposals”, by Syrgiannis et al (Syrgiannis et al., 2019) at the Journal of Cleaner Production Volume 230, from Sept 1st, 2019 based on a workshop conducted at the Global Conference on *Cleaner Production and Sustainable Consumption*, in Barcelona, Spain, in November 2015<sup>57</sup>, with further perceptions on a presentation of the topic at ARTEM Conference on *Creativity and Sustainability*, in Nancy, France, in September 2017<sup>58</sup>.

The process is conducted regarding the Autopoietic ability of the individual, that is, the ability to get organized, in constant movement of autonomy and interdependence, which cannot be controlled by outside. Besides, the interdisciplinary view of the individual as full of possibilities, takes him/her out of conditioning, allowing the condition of author of the own speech, which emerges rhythmically from inside, the key words being the beat.

The inner Processes of Creation are composed of 4 movements: Creation, Unity, Way and Realization. The first movement, is the one which allows for words to emerge on a topic in an attitude of Will Power, in which one opens him/herself to register words in an atmosphere of trust and respect to the unique rhythm of each one. Once some words are registered, they can be correlated in an attitude of love and meaning is revealed. Therefore, wisdom is verbalized. What was unconscious coming to light.

This process could be shared in groups working on the same topic for further meaning. During this time, some apparent contradictions are seen as dialogics by Morin allowing for thoughts, feelings, words and actions to be aligned. In the second movement, Unity, the group selects some of the ideas to compose a proposal, reflecting the light of the Process, to be developed. The third movement allows for the group to make any adjustments to proceed with clarity and harmony in respect to life. Then, the proposal can be presented with keywords in the style chosen, when there is Self Realization.

Methodology of Transdisciplinarity – Levels of Reality, Logic of the Included Middle and Complexity, International Center of Transdisciplinary Research and Studies CIRET, France. Online at: <[http://basarab-nicolescu.fr/Docs\\_Notice/TJESNo\\_1\\_12\\_2010.pdf](http://basarab-nicolescu.fr/Docs_Notice/TJESNo_1_12_2010.pdf)>

<sup>57</sup><https://www.iiiee.lu.se/event/global-cleaner-production-sustainable-consumption-conference>

<sup>58</sup><https://www.icn-artem.com/en/article/2nd-artem-organizational-creativity-and-sustainability-international-conference>

It is to this Power, Love and Light that all of us can seek for resilience out of suffering to creative solutions for life. Decisions, then, will be according to the Systems View of Life, for they have emerged by the beings who are part of the System of Life, having become aware of their Worth.

### 3.2 Nature claims for a systemic view of life – The Amazon Forest as an example

The Amazon Forest is the biggest and most important in the world, corresponding to 53% of all tropical vegetation. It is located in the North of Brazil, a continental country, corresponding to 40% of all Brazilian territory, extending along the states of Pará, Amazon, Amapá, Acre, Rondônia, Roraima and some parts of the states of Maranhão, Tocantins and Mato Grosso. It also includes some land from countries near Brazil, like the Guianas, Suriname, Venezuela, Ecuador, Peru and Bolívia, being a very important bioma to be preserved.

Despite its biodiversity, the ground found in the area is poor on nutrients, meaning that, when the original vegetation is removed, there is no more chance for re-planting, because the ground cannot handle deforestation.

Preservation of the Amazon Forest depends on the Systemic View of Life and the economic reference cannot be the only one to guide decisions on how to use the region. Just as Sustainable Development took decades to introduce the triple bottom line, that is, adding the social and environmental aspects to the single bottom line which was economical, so the environment and people have to be taken into consideration for any economical improvements in the region.

An organization called SUDAM- *Supertendência de Desenvolvimento da Amazônia*<sup>59</sup> was created to attract financial incentives from national and international investors, one of the main activities being the vegetable exploitation, allowing big companies to remove invaluable raw materials to produce their products, at no controlled rate.

In 1995, the deforestation of the Amazon Forest had reached its peak, leading to a significant increase of heating of the weather worldwide. This effect is called global warming and, because of its size, the Amazon Forest has a direct impact on the weather and the humidity around the world.

Even with the problems presented, there is no improvement in any law to keep the integrity of the forest. Actually, based on a study by Kroner (Kroner, 2019), since 1961, Brazil has altered 66 times, for the worst, the laws supposed to protect the Amazon forest, affecting 11 million hectares of it.

All these mistreat is caused because companies lack the Systems View of Life, not being able to understand and respect the production of disaster in chain. When our Worth could be made aware within, we may finally recognize Worth in everyone and everything else, especially in Nature.

Sustainability has been regarded as an adversity to Industrial rise, so companies are not able to make a choice for sustainable development. Industries would have to consider the Worth of Nature, not only productivity. In the case of Amazon Forest, if Nature's Worth<sup>60</sup> was taken into consideration, not only the weather heating would be solved, but there would be a way of producing without harming and still having the economical profits.

### 3.3 Challenges to comprehensive humanized care

The recently released documentary *Amazon, The Awakening of Florestania and the Pan-Amazonian Synode* represent signs of a new civilizing moment, which allied with the call of the Pope's *Laudato Si*<sup>61</sup> on our commitment to take Care of our Own Home, are helping initiatives to strengthen our Planetary Consciousness and Responsibility, which can now benefit strategically with accelerated and converging advances of the 4<sup>th</sup> Industrial Revolution to implement Global Impact projects within the New Paradigm; already in the context of a Platform such as the SDSN-Amazon<sup>62</sup> can be leveraged by the Global Solutions Forum (ICSD)<sup>63</sup>. Avoiding disaster and climate change is our responsibility.

Even the Sweden teenager Greta Thunberg is engaged in going around the world to make people conscious of the threat of life in the planet. However, it is clear that we have to also develop the Inner Wisdom to implement the necessary measures, reflecting the correct perspective of Life care.

### 3.4 Gender differentiated vulnerability in Natural Disasters

Resilience to disasters and climate change of individuals, communities, organizations and countries refers to adaptation and recovering from hazards, and it starts with disaster risk reduction. It is gaining much attention in discussions on the theory and practice of adaptation to climate change. The concept is widely coupled with the social-ecological systems and their resistance to climate-change adversities (Mikulewicz, 2019). Approaches to resilience to climate change can be socially exclusionary if they do not acknowledge diverse risks or social-economic barriers to resilience (Forsyth, 2018).

Risk is defined as the probability of loss in terms of human lives, economic assets, environmental, cultural values and critical infrastructure due to an unexpected destructive event that can occur in a certain area in a certain period of time. Risk is a function of Exposure and Vulnerability:

$$Risk = Hazard * Exposure * Vulnerability.$$

Vulnerability to environmental degradation and natural hazards is connected with social, poverty, and gender lines. Vulnerability and exposure are dynamic and varies with time and spatial scales. It is economic, social, geographic, demographic, cultural, institutional, governance, and environmental dependent. Individuals and communities are differently exposed and vulnerable due to differences in wealth, education, race/ethnicity/religion, gender, age, class/caste, disability, and health status; as was already mentioned in 2012 at a Special Report on *Determinants of risk: Exposure and vulnerability of the Working Groups I and II of the Intergovernmental Panel on Climate Change (IPCC)*<sup>64</sup>.

Disaster risk is the possibility of adverse effects in the future. The adversities of climate change, such as natural hazards (wildfires, floods and hurricanes, and others) and more gradual degradation of the environment are already felt in many areas. These adversities are in relation with the ecosystems, water resources, human health, human settlements and migration patterns, energy, transport and women. Many regions in the world, have been undergoing profound transformations through forest degradation, land use changes and effects of global climate change. These transformations increase vulnerability of the region and also of the population because associated environmental risks are high.

Women are more affected, primarily, as they constitute the majority of the world population, the majority of the world's people in poverty. They are also more dependent on their livelihood on natural resources that are threatened by climate change and they face social, cultural, economic and political barriers that limit their coping capacity (UN Women, 2019)<sup>65</sup>.

Perception of the risks that come from climate change are important for local communities, for men and women for risk analysis and for subsequent societal decision making. Although women perceive a higher probability of a catastrophic event, men and female subjects do not make different investment decisions when faced with uncertainty and risk (Young et al., 2017).

Critical factors to climate change are mitigation, adaptation, technology transfer and financing. Mitigation involves a process of curbing greenhouse gas emissions from human activities, while adaptation involves a range of activities to reduce vulnerability and build resilience in key sectors, such as water, agriculture and human settlements (UN Women, 2019).

Building disaster resilient communities is the main objective for crisis management institutions across the globe, for suffering less and recovering more quickly when a community is faced with adversity. In order to assess a community's resilience, Norwegian researches propose to use vulnerability metrics that can be used to identify potential low-risk (high resilience, low vulnerability) and high-risk (low resilience, high vulnerability) (Scherzera et al., 2019).

Other researchers (Balaei et al., 2019) have used and tested indicators related to water supply at post-disaster period in Chile and New Zealand, countries that have experienced earthquakes in 2010 and 2011, respectively, concerning the issue of water supply. The proposed indicators were homicide rate, assault rate, inverse trust in army, inverse trust in police, mean years of school, and perception of crime to identify and explain the difference in water supply resilience between the two countries, while the vulnerability assessment of a community at the risk of a volcano in Indonesia, was performed by emphasizing the combination of physical, social, and economic characteristics (Hizbaron et al., 2018).

In many adversities, women are more vulnerable than the men. There is broad understanding that gender equality is a fundamental part of increased resilience to disasters (FAO, 2014).<sup>66</sup> However, most of the studies published in the international literature consider resilience as a function of social,

<sup>64</sup><https://www.sei.org/publications/determinants-of-risk-exposure-and-vulnerability/>

<sup>65</sup>UN Women Watch. Online at: <<https://www.un.org/womenwatch>>

<sup>66</sup><https://www.fao.org/3/a-i6618e.pdf>

economic, physical and hazard aspects, that surrounded the at-risk communities while the gendered-vulnerability is not considered.

Questions like how might men and women be differentially affected by long-run climate change and short-term climate risks, what are the characteristics and causes of gender differentials in vulnerability/resilience, what are the adaptation options, strategies, and approaches that are available to and preferred by men and women should be used by researchers, policy-makers and development practitioners to better understand the vulnerabilities of men and women to climate change, towards taking actions to reduce that vulnerability.

Gender-sensitive metrics are important in measuring the vulnerability and assessing the resilience or improving the resilience of a community, when coupled with unequal access to resources and to decision-making processes, and limited mobility that places women in rural areas in a position where they are disproportionately affected by climate change. It is commonly known that climate change has serious ramifications in food availability, food accessibility, food utilization and food systems stability (UN Women, 2019). Gender-sensitive indicators are necessary to track how different interventions affects the lives of different social-economic groups and assess whether progress is made towards gender equality and if corrective measures are taken (De la O Campos, A. P., Garner, E., FAO 2014).

It is also important to identify gender-sensitive strategies to respond to the environmental and humanitarian crises caused by climate change (UN Women, 2019). Work is required to identify and streamline the approaches and practices of gender-differentiated vulnerability in Natural Disasters differentiation approaches and practices, and to incorporate into guidelines for collaboration, women empowerment and resilience training, capacity building, planning, regulations and procedures and leadership in strategic development. Women and men can be proactive in adapting to the adverse consequences of climate change or mitigating climate change.

#### **4 Conclusion**

The study indicates that regarding resilience, the exclusion of the subject is observed in the discourse of the dominant ideology, with the predominance of an attitude, where his or her life is determined and treated as a mere object. Hence one should avoid to follow this predominant attitude but we must defend and protect our subjectivity, that is, our identity that is shaken and marked by its uniqueness, that lies in the untold of adversity and shaken by the discourse of adaptation out of suffering; particularly nowadays with the impacts of the Social Networks.

This may be fostered by increasing the awareness of our own Worth to share the Systemic View of Life, helping to take sustainable decisions in preventing chain disasters and avoiding additional suffering to everyone, particularly women, who are more affected. In the case of Amazon Forest, if Nature's Worth was taken into consideration, not only may help the weather heating problem and preserve biodiversity, but there would be a way of producing without harming the environment and still having social-economical profits.

In addition, women, need to be resilient in hazards and during the post-hazards periods because in disasters and extreme climate events linked with climate change is likely to affect women more than men. The gendered vulnerabilities may, however, be reduced by capacity building and social changes, by identifying gender-sensitive strategies to respond to the environmental and humanitarian crises caused by climate change.

Measures taken in the decision making with the Systems View of Life on the part of authorities can play a crucial role in preventing a huge number of risks to life in all its forms. That can be developed through the Inner Processes of Creation that brings awareness of own Worth, and therefore the Other and Nature.

**Abstract:** This paper used dynamic entropy weight and data envelopment analysis method to study the industrial composition of industrial sustainable development in China's 29 provinces and cities, and constructed an industrial sustainable development capability evaluation index system for China. The sustainable development capabilities of 29 provinces and municipalities had been evaluated and proposed a series of recommended countermeasures to promote the sustainable development of China's industrial economy, comprehensive social progress, sustainable use of resources, continuous improvement of the environment and continuous innovation of technology.

**Key words:** Industrial sustainable development capability; Evaluation index system; Dynamic entropy weight method; DEA model

### 1 Introduction

In recent years, with the increasingly prominent problems of resources, environment and ecology, sustainable development has received more and more attention from people. Research on sustainable development at home and abroad has developed rapidly like springing up.

Sustainable development capability is "the probability that a particular system successfully limits its development, coordination, and sustainability to a sustainable development threshold", that is, "the ability of a particular system to successfully extend to sustainable development goals" (Wenyuan Niu, 1994). The ability to sustain industrial development is the ability of industries in specific regions to promote economic growth and development in accordance with the goals and requirements of sustainable development (Hongwei Li, 2010).

Foreign scholars' research on development evaluation indicators can be divided into four categories: (1) a more micro-level pressure-state-response indicator based on the ecological-environmental perspective (Costanza R, 1991) (China 21st Century Agenda Management Center, 2004); (2) Sustainability Index based on comprehensive value accounting (Daly HE, 1990); (3) Selecting population, resources, environment, economy, society and other indicators for systematic analysis; (4) Measuring sustainability by establishing unsustainable indicators (Jodha, N. S, 1993). The domestic

evaluation index system covers five aspects of economy, society, resources, environment and science and technology (HL Xie, 1999), (Li Zhao, 2009), (Cunzhi Guo et al., 2016). Some scholars first summarized it as “development degree”. Three dimensions of continuity, coordination (SG Chen, 2004). The Sustainable Development Research Group of the Chinese Academy of Sciences presented the China Sustainable Development Indicators System in the 1999 China Sustainable Development Strategy Report. The indicator system is divided into five levels, with a total of 45 indices covering 208 indicators (China) Institute of Sustainable Development of the Academy of Sciences.

The sustainable development ability evaluation methods mainly include analytic hierarchy process (Zhang JS, 2012), BP neural network evaluation method, entropy weight TOPSIS method (Guodong Xu, 2012), factor analysis method (SL Zhao, 2013), data envelopment analysis, ecology Footprint analysis, etc. Data Envelopment Analysis (DEA) is a common method for measuring sustainability. Compared with other methods, the DEA method has comparative advantages and strong objectivity in dealing with multi-input and multi-output problems, so it is widely used by scholars at home and abroad. The DEA model was used to evaluate the sustainable development ability of a large city in China from 1986 to 1996, and the evaluation results were briefly analyzed (ZX Zeng , 2000). Based on the DPSIR-DEA model, the sustainable development capacity of 31 provinces and cities in China from 2003 to 2015 was evaluated (JQ Zhang, 2017). The DE-Malmquist index method was used to calculate the green total factor productivity of the Yangtze River Economic Belt from 2004 to 2015 (Ming Yi, 2018).

## 2 Construction of Industrial Sustainable Development Ability Evaluation Index System and Selection of Evaluation Methods

### 2.1 Construction of industrial sustainable development capability evaluation index system

Based on the availability of data, the industrial sustainable development capability evaluation index system including five first-level indicators, 14 second-level indicators and 21 third-level indicators was designed from the input and output aspects (see Table 1).

**Table 1 Regional Evaluation Index System for Industrial Sustainable Development Capacity**

Type	Indicator			Unit	Attribute
	First level	Second level	Third level		
Input	Energy consumption $X_1$	Energy consumption $X_{11}$	Industrial enterprises above designated size Increased value of energy consumption $X_{111}$	tons of standard coal / 10,000 yuan	Reverse
		Electricity consumption $X_{12}$	Industrial enterprises above designated size added value of electricity consumption $X_{121}$	kWh / million yuan	Reverse

		Environmental Protection Investment $X_{21}$	Industrial pollution control investment accounts for the proportion of industrial added value $X_{211}$	%	Positive
				%	Positive
	Environment Pollution $X_2$		Comprehensive utilization rate of industrial solid waste $X_{221}$	10,000 tons	Reverse
		Industrial "three wastes" $X_{22}$	Industrial wastewater discharge $X_{222}$	10,000 tons	Reverse
			Industrial sulfur dioxide emissions $X_{223}$	10,000 tons	Reverse
			Industrial smoke dust emissions $X_{224}$	10,000 tons	Reverse
		technology staff input $X_{31}$	R&D personnel of industrial enterprises above designated size account for the proportion of industrial employees $X_{311}$	%	Positive
	Technology Innovation $X_3$	Science and technology funding $X_{32}$	R&D expenditure of industrial enterprises above designated size accounts for the proportion of main business income $X_{321}$	%	Positive
			New product development expenditures accounted for the proportion of main business income $X_{322}$	%	Positive
		R&D Emphasis $X_{33}$	The number of industrial enterprises with R&D activities accounts for the proportion of all industrial enterprises $X_{331}$	%	Positive
		Economic growth $Y_{11}$	Industrial added value growth rate $Y_{111}$	%	Positive
		Economic structure $Y_{12}$	High-tech industry (manufacturing) main business income accounting for the proportion of industrial main business income $Y_{122}$	%	Positive
			Total asset contribution rate $Y_{131}$	%	Positive
Output	Economic Development $Y_1$	Economic benefit $Y_{13}$	Labor productivity $Y_{132}$	%	Positive
			Cost and expense profit $Y_{133}$	%	Positive
		Industrial extroversion $Y_{14}$	Industrial export delivery value of industrial sales output value $Y_{141}$	%	Positive
		New product market competitiveness	New product sales revenue accounted for the proportion of main business income $Y_{151}$	%	Positive
			New product export sales revenue accounted for new product sales revenue $Y_{152}$	%	Positive

	$Y_{15}$			
society	Employment contribution $Y_{21}$	Employment contribution rate $Y_{211}$	%	Positive
development $Y_2$	Per capita labor remuneration $Y_{22}$	Per capita labor remuneration of manufacturing urban employees $Y_{221}$	%	Positive

## 2.2 Data source

The data was compiled from the China Statistical Yearbook, the China Industrial Statistical Yearbook, the China Science and Technology Statistical Yearbook, and the statistical yearbooks of the provinces (municipalities and autonomous regions). Among them, some data are directly taken from the statistical yearbook, and some data are calculated by the data on the statistical yearbook. Due to the lack of relevant data in Hainan and Tibet, only the industrial sustainable development capacity of 29 provinces and cities in China from 2011 to 2016 was evaluated.

## 2.3 Selection of evaluation methods for industrial sustainable development capability

Industrial sustainability assessment is a multi-input-multi-output evaluation study, so it is suitable to use data envelopment analysis; at the same time, in order to follow the Banker rule (the number of decision-making units must be more than twice the sum of input and output variables) In this paper, before using the data envelopment analysis method, the entropy weight method is used to determine the weight and calculate the comprehensive index, which not only reduces the number of indicators, but also ensures the completeness of the information of the indicators, thus conforming to the application conditions of the data envelopment analysis method. In addition, the dynamic entropy weighting method is adopted because the weights determined by the data are different each year.

## 3 Evaluation of China's Industrial Sustainable Development Capability

Applying the dynamic entropy weight method to determine the weight, and calculating the input and output comprehensive index values of industrial enterprises above designated size in China's 29 provinces and cities from 2011 to 2016, using DEAP 2.1 software to sustain industrial sustainability in 29 provinces and cities in China. Development capacity was measured (Table 2). The study found:

**Table 2 Evaluation Index of Industrial Sustainable Development Capacity of 29 Provinces and Cities in China from 2011 to 2016**

Area	2011	2012	2013	2014	2015	2016	Mean	Ranking

### **3.1 Industrial sustainable development capacity has important support for regional economy**

Areas with strong industrial sustainability are basically strong in overall economic strength, such as Beijing, Tianjin, Shanghai, and Guangdong. Reaffirming that industry is an important support for a region's economic strength.

### **3.2 The ability of sustainable development in different regions varies from year to year**

Except for the two municipalities directly under the central government of Beijing and Tianjin, the sustainable development capabilities of various provinces and cities in different years have fluctuated greatly. Moreover, it can be seen that the industrial sustainable development capability of most provinces and cities in China is weak and needs to be improved.

### **3.3 Industrial sustainability capacity is related to positive input and output**

Comparing Beijing with strong sustainable development ability and Qinghai Province with weak sustainable development ability, it can be seen from the comprehensive index value that provinces and cities with stronger sustainable development capacity generally have relatively less investment and relatively higher output. Large; the provinces and cities with weaker sustainable development capabilities are the opposite. From the perspective of the original indicators, provinces and cities with strong sustainable development capabilities generally have more positive inputs and positive outputs, and relatively less negative inputs and negative outputs; provinces and cities with weaker sustainable development capabilities in contrast.

## **4 Suggestions on Improving the Sustainable Development Capability of China's Industry**

In summary, this paper puts forward relevant suggestions from five aspects of resources, technology, economy, society and environment to enhance the sustainable development capability of China's industry.

### **4.1 Optimize resource allocation and improve resource allocation efficiency**

In general, the resources invested by industry mainly include manpower, material resources and financial resources. For human resources, through the establishment of a sound talent introduction mechanism, configuration and guarantee mechanism. For natural resources and energy, optimize energy structure and improve energy efficiency. For the capital element, shorten the payment period and increase the capital turnover rate.

### **4.2 Increase investment in innovation and promote the transformation of scientific and technological achievements**

For the government, it is especially important to formulate relevant policies and regulations to encourage innovation and optimize the innovation environment. For enterprises, according to production needs, increase R&D personnel and funding, and promote the transformation of scientific and technological achievements, and so on. For individuals, divergent thinking, stimulating imagination, and thinking about problems at the intersection of disciplines.

#### **4.3 Optimize industrial structure and transform economic development mode**

Accelerate the transformation and upgrading of traditional industries, increase the proportion of high-tech industries in the industry; vigorously develop new industries such as new energy automobile manufacturing, information technology industry, and green industries such as biomedicine, energy conservation and environmental protection equipment, and digital technology; The opportunity of structural reform will promote the deep integration and development of manufacturing, finance and service industries.

#### **4.4 Responding to local residents and improving people's quality of life**

First, establish a sound interest feedback system, increase investment in infrastructure such as schools, hospitals, parks, and road maintenance. Second, develop an ecological compensation system, and actively carry out ecological protection activities such as afforestation and land reclamation; once again, actively organize or participate. Public welfare donations, product sales and other activities give back to the community.

#### **4.5 Reduce pollution emissions and increase environmental management investment**

On the one hand, heavy chemical enterprises improve the comprehensive utilization rate of resources, reduce the generation and discharge of pollutants, ensure that pollutants meet the standards, and reduce pollution from the source. On the other hand, invest heavily in environmental protection projects, assist relevant departments in pollution control and ecological restoration.

### **5 Conclusion**

The research results showed that industrial development has a strong supporting role for the regional economy. The level of industrial sustainable development is related to the positive input and output of industries in various provinces and cities. In view of the research results, we have put forward targeted countermeasures from the five aspects of resources, science and technology, economy, society and environment to enhance the sustainable development capability of China's industry.

The future evaluation and research on industrial sustainable development capacity will also be an ongoing process. Industrial sustainability assessment needs to consider the resource endowments, geographic location, national policies, and other specific characteristics of each province, etc., but these qualitative factors are difficult to quantify in the research process and need to be broken in future research. The selection of relevant indicators will be a process of continuous development and improvement.

(E-mail: pmmelo@yahoo.com, manoeljfb@gmail.com,

arnoldodehoyos@yahoo.com.br, edsonjorgedemoraes@icloud.com)

**Abstract:** The main aim of this research is to verify the importance of corporate social responsibility (CSR) in the context of the civil construction industry in the State of Bahia. The CSR became relevant as business environment is increasingly more complex and competitive, and society has demanded from organizations concrete actions about issues such as sustainability and social development. Those actions are aligned with the ten principles suggested by the United Nations Global Compact. To carry out this research, a multiple case study strategy was used through interviews with key respondents from six construction companies based in the State of Bahia. The findings showed that CSR is a relevant issue as far as business strategies are concerned for 67% of companies surveyed. Despite the theme is not a consensus, this study showed that several actions have been developed informally related to CSR, especially those linked to the welfare of communities surrounding construction sites and the use of modern technologies that help reducing environmental impact, the management of construction waste (debris).

**Key words:** Corporate social responsibility; Sustainability; Strategy; Environment

### 1 Introduction

The increase of complexity in the business sector, together with the advances of latest information and communication technologies and consequent improvements of firm's productivity, have resulted in significant growth of competitiveness among organizations. This growth of competitiveness has caused significant changes inside companies, those focused on new differentiation strategies that include economic, social, organizational, and environmental dimensions. As far as different dimensions are concerned, social and environmental ones are becoming more relevant. Organizations which are social and environmentally responsible are in constant searching for answers for new challenges presented by contemporary management strategies. These strategies aim sustainable competitive advantages for companies in different markets and countries.

In response to these challenges, a new concept is appearing: the so called Corporate Social

Responsibility (CSR). According to the Commission of the European Communities (Commission of the European Communities, 2001), CSR is a concept whereby organizations decide voluntarily to contribute to a better society and a cleaner environment. Then, CSR aims to drive businesses to make companies an important partner of society and co-responsible for its development, not only economically but also social and environmentally.

To highlight the importance of CSR, the United Nation (UN) Secretary-General Kofi Annan in 1999, during his speech at the World Economic Forum launched the UN Global Compact focused to promote among companies worldwide, corporate policies based on sustainable social and environmental practices.

According to Voegtlin & Pless (Voegtlin & Pless, 2014), despite some limitations and challenges, this UN initiative has generated considerable attention and discussions among companies around the world and a new organizational infrastructure has emerged and changed the scope of social responsibility of those companies with benefits for the businesses and society as a whole.

Based on this concept, companies and governments are changing, affecting contemporary management strategies. One of the main changes is related to the understanding that organizational strategic decisions should not be driven by the accomplishment of shareholder's interests only, but also driven by other stakeholders' interests, such as employees, suppliers, public agents, competitors, local communities, environment, and society. This kind of debate is making a turn in another direction: while designing corporate strategies, firms should take into consideration not only the view that shareholders are the only and the main stakeholder. Firms should also consider the search for minimizing environmental and social potential negative impacts. It is a naive and a superficial feeling to believe that these actions would threaten the competitiveness of companies.

Companies have been accelerating and widely accepting this new organizational philosophy since the end of the 20th century with the growing concern for social and environmental impacts caused by some economic agents, such as firms in the oil, energy, and civil construction industries. In the construction industry, companies have caused impacts in the environment by changes in the local geography and treatment of residue, where construction works (building sites) are found at.

As a result, firms in this sector are adapting and adopting new strategies able to attend this new reality. Society pressure causes this new move to much more respect with the environment, which is more conscious, pushing companies to intensify actions to attend this new organizational profile of the social and environmental responsibility of firms.

In this context, the present study aims to understand how firms in the civil construction industry perceive the trend of the growing of CSR as an organizational strategy. The application of such strategy may help to improve firm's competitiveness and public image before society. Then, to carry out this research, the study surveyed firms in the State of Bahia's construction industry in 2017. The choice of the state of Bahia was due to the ease access to companies and the 2015 Brazilian Chamber of Construction Industry (CBIC) Report, which showed that Bahia held 1/4 of companies in the Northeastern region, with 8,833 registered firms (See Table 1).

In the civil construction industry, the importance of CSR is growing fast and has influenced how firms are dealing with new demands of society, including environmental and social aspects and the economic development of communities,

cities, and countries. In physically built environments, the construction of roads, bridges, sewer systems, tunnels and other infrastructure projects have significant impacts in the environment and the surrounding communities.

**Table 1 Civil Construction Firms in the Northeastern Region of Brazil by State in 2015**

<u>STATES</u>	<u>NR. OF FIRMS</u>	<u>%</u>
BAHIA	8.833	22,40
CEAR	7.291	18,49
PERNAMBUCO	5.470	13,87
RIO GRANDE DO NORTE	5.005	12,69
PARA BA	4.450	11,28
MARANH O	2.525	6,40
PIAU	2.390	6,06
ALAGOAS	1.884	4,77
SERGIPE	1.583	4,01
TOTAL.	39.431	100,0 0

Source: CBIC Report (2016)<sup>67</sup>

Then, the approach of CSR focused in the civil construction industry is justified by the clear impact this industry has caused in the environment, local communities and surrounding area of the construction sites as well as the relevant importance of this sector for the Brazilian economy, particularly, concerning new job generation. According to the 2017 report of Brazilian Institute of Geography and Statistics, this sector represented 6.2% of Brazilian GDP in 2016, employing around 3.5 million people in Brazil.

## **2 Corporate Social Responsibility, a Contemporary Theme in Organizations**

According to Bowen (Bowen, 1953), the field of study of CSR is very wide and has impact in all economic activities, thus with important repercussion in businesses, local communities, environment, and society. Even though it has been studied since the end of the Second World War, it was only in the beginning of the 21<sup>st</sup> Century that CSR appears as a new paradigm in the elaboration and designing of organizational strategies. This is due to the role of society in charging organizations with more responsible attitudes about the environment and society itself. According to O'Connor (O'Connor, 1999), these attitudes are related to the maintenance of the quality of the environment, the well-being of society and its long-term sustainability.

In this context, markets are becoming increasingly more competitive, with lower profit margins, combined with ever-increasing demands on quality and ethical posture. These factors are putting intense pressure on the way organizations are being managed and, particularly, on environmental management and social responsibility. Therefore,

<sup>67</sup>Câmara Brasileira da Indústria da Construção. Retrieved at: <<http://www.cbic.org.br>>. Access: 10/09/2016

CSR is a global phenomenon and not only a specific wave in developing countries. Traditional and mature markets have also been affected by this movement and pushing organizations to change dramatically.

New strategies focused on CSR have led companies to a distinctive look, searching for new attitudes towards the different stakeholders involved. According to Aaker (Aaker, 2007), CSR is not only a matter of organizational strategy, but is causally linked to the company's reputation and values, directly affecting the organization's image and brand *vis-à-vis* its target customers. Corporate social responsibility is an important part in the field of management study, influencing organization's goals, values, general strategies, and the concept of firms itself.

Recent studies (Capra, 1998; Reiser, 2010) in management field have emphasized significant changes in the business environment, relating them to the political, economic, and technological fluctuations that are occurring in the global arena. These changes concern business' nature and demand an original approach, fundamentally innovative, to understand and to deal with new realities, which directly involves social and environmental issues, creating a new benchmark for business management.

The 1987 Brundtland Report (a commission created by the United Nations to deal with environment and development) defined sustainability as a way of meeting the needs of the present without compromising future generation's needs (Wayne, 2012). Corporate interests must manage business as well as the interests of their stakeholders and the environment. This argument reflects the social and political role played by companies and their business purposes, because they go beyond profit maximization and compliance. According to Drucker (Drucker, 1993), any disregard for sustainability and CSR by organizations is not consonant with economic freedom and the liberalization of the economy.

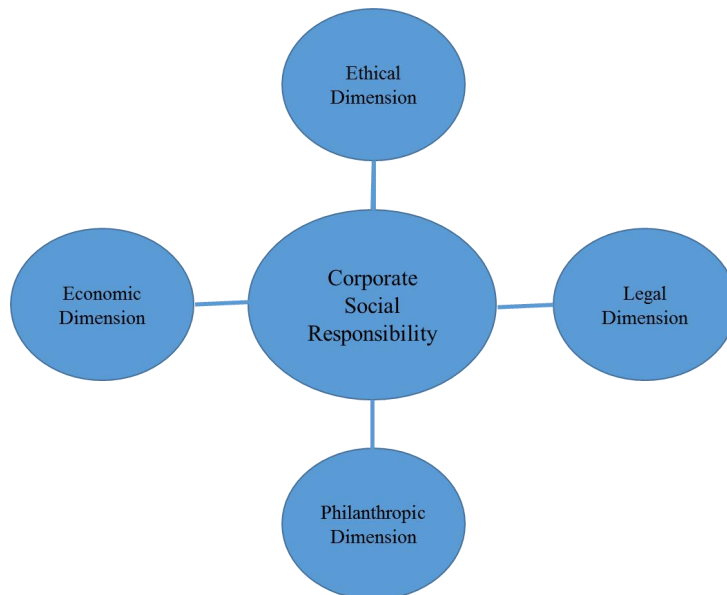

This new organizational paradigm brings the need for a socially responsible company that works in conditions that cause the least possible impact to the environment, through the production of ecologically cleaner products preserving environment, ensuring healthy ecosystems, social equality, and good organizational governance. For Hart e Milstein (Hart e Milstein, 2004), companies should be concerned with the balance between economy, society, and the environment, in an increasingly interdependent world.

In this new arena, issues such as social and environmental responsibilities are part of the agenda of large organizations, in recognition that their obligations go beyond profitability and compliance. It is increasingly strong the trend of a more responsible corporate social behavior in which companies seek the balance between the economically practical, the socially just and the environmentally sustainable. This paradigm is translated into the model proposed by Carroll (Carroll, 1979; 1991), when he considered that CSR should cover four (4) dimensions: economic, legal, ethical and philanthropic (See Figure 1).

Carroll (Carroll, 1979; 1991) suggests a model that attributes to business a series of responsibilities with society, far beyond the simple economic issue of generating profit for shareholders and obeying laws. According to this author, the company's role goes beyond economic and legal purposes *vis-à-vis* society. The traditional view is related to the economic performance, which involves a set of tools and methods that make it possible to diagnose the firm's financial situation to verify the stability and profitability of the business or project. According to Schuler and Cording (Schuler and Cording, 2006), these methods of measuring financial performance may be by profit, market value and growth, and in all cases, the results should be related to the contribution of companies to the development of society and the preservation of the environment.

Although the economic dimension, that involves the obligation of companies to be productive and profitable, is considered the most important of the activities; nowadays, Ursini & Bruno (Ursini & Bruno 2005), Campbell (Campbell 2007), Pelozo (Pelozo, 2009) and Pelozo, &Shang (Pelozo, &Shang, 2011) consider other dimensions also important and investigate the direct relationship between economic performance and CSR. This approach refers to the concept of the Triple Bottom Line for sustainability (Elkington, 1997), that suggests that companies must be measured by its responsibility with people, the planet and with profit as well. What determines the success of an enterprise is not the result of its profits alone, but also how companies act in relation to environmental and social issues.

From this point on, organizations should consider, in the elaboration of their institutional business planning, not only economic goals, but other issues, such as protection and conservation of the environment and the inclusion of communities. Both are part of the basic concept of CSR and sustainability.

**Figure1 Dimensions of the CSR Model (Carroll, 1979; 1991)**

The ability of companies to attend not only their interests, as well as the interests of society, must be in association with the organizational strategies. These strategies must be able to keep the level of

competitiveness, create value, supply financial results and a return to investors and to society. It is necessary to measure the financial and economic results to keep track of the evolution of production, costs, and profit, but also one must quantify sustainability measures to verify the firm's contribution to the society and the environment.

In Brazil, this relationship between economic performance and CSR is in maturation. Studies and researches developed by Moretti & Campanário (Moretti & Campanário, 2009) are showing that companies are getting satisfactory economic and financial results when applying the concepts of CSR and sustainability. Notably, those that started to integrate the New Market in the stock exchange are committed to the adoption of corporate governance standards, with CSR as one of its pillars (Prociány&Verdi, 2009).

### **3 Methodological Approach**

This research has the aim to understand how firms in the construction industry in the State of Bahia perceive the importance of CSR as an organizational strategy. The study selected six (6) companies preferentially based on the ease access to those with headquarters in the city of Salvador and availability of personal contact within their management staff.

Regarding the research approach, the present study is eminently qualitative, due to its subjective and less numerical nature in understanding the role of corporate social responsibility (CSR) in Bahia construction industry sector. As a research strategy, it used multiple case studies, because, according to Yin (Yin, 2005), the results are more exact and credible, and the researcher has greater security for the defense and presentation of the data.

As data collection strategy, this research used interviews with convenience access to key informants. For the choice of those key informants, the criterion adopted was according to the relevance of the position held within the companies and their ability to meet the goals of the research. The study conducted interviews between March and May 2017. For collecting data, a structured and semi-structured questionnaire was used, which allowed greater flexibility and freedom to address relevant issues that may appear during the interview. Other sources, such as websites of companies surveyed, were used to obtain relevant information that allowed the understanding about the companies, such as its history, mission, vision, organizational structure, and values.

The script construction of the questionnaire was based on the Ethos Institute method<sup>68</sup>. The Ethos Institute is a civil society organization of public interest, created in 1998, which ended up becoming a reference for the dissemination of the culture of sustainability and CSR in Brazil. The Ethos Institute developed a method with 47 thematic indicators, organized in four dimensions: social, governance and management, vision and strategy, and Environment. From the 47 indicators, this research named 23 that apply to the interests and aims of this study.

#### 4 Findings

Findings showed that four of the surveyed companies (67%) totally agree or agree that CSR is a relevant issue for their organizations (See Table 1); however, only two companies (33%) clearly showed that CSR is part of its business strategy. Those companies have even formally structured a specific department in the organization to deal with this issue inside the organization.

Other companies' issues, related to CSR, were translated informally into organizational actions, such as:

(i) Contacts with local community leaders, from surrounding construction sites, to carry out educational campaigns;

(ii) Agreements with organizations, such as Social Service of Industry (SESI), which used to carry out educational campaigns on occupational safety, health, and environment;

(iii) Company's construction projects, which, somehow, affected surveys of local community's needs. Some examples of such needs are paving streets and improvement of properties' general appearance by region around the construction site.

**Table 2 Is CSR considered a Relevant Issue in your Organization?**

Companies	Totally Agree	Agree	Indifferent	Disagree	Totally Disagree
01			X		
02					X
03	X				
04	X				
05	X				
06		X			

Source: Primary data

Moreover, even though companies state that they care about CSR mostly through non-institutionalized strategies; in fact, they have been working in a way that promotes social responsibility. Table 2 confirms this find, as it presents evidence that:

(i) although the questionnaire addressed twenty-three (23) items, based on the method of the Ethos Institute, twenty-two (22) were contemplated in the six (6) companies surveyed and;

(ii) fifteen (15), of the 23 items listed in the questionnaire, equivalent to 65%, are present in at least three (3) of the companies surveyed.

**Table 3 List of CSR Indicators Applied to Firms Surveyed Source: Primary Data**

ITEMS		Firm	Firm	Firm	Firm	Firm	Firm
		01	02	03	04	05	06
01	Publicly exposes its ethical commitments through institutional documents in the internet or other means to its stakeholders.				X		
02	The company is open to criticism from groups or stakeholders about the nature of its products, processes, or services.	X			X		X
03	Third parties audited piece of information on the economic and financial situation of the company's activities.				X	X	X
04	Supplies information that affects employees and unions in a prompt approach, facilitating them to position themselves	X		X	X	X	X
05	The company has incentive and recognition program concerning the employees' suggestions for improving internal processes.	X		X	X		
06	Has specific program for hiring apprentices	X	X	X	X	X	
07	The company's code of conduct and / or statement of values included the policy on promoting diversity and non-discrimination.				X		X
08	The policy on promoting equity and non-racial discrimination is formal and contained in the company's code of conduct and / or statement of values		X		X		X
09	The policy on promoting gender equity is formal and contained in the company's code of conduct and / or statement of values.		X		X		X
10	The company's job and salary plan are transparent and addressed in its code of conduct and / or its statement of values.	X			X		X
11	Supplies prevention and a treatment program for drug and alcohol addiction and HIV / AIDS	X		X			
12	Periodically analyzes the socioeconomic profile of employees to define strategies, benefits, education, and professional development programs						

ITEMS		Firm	Firm	Firm	Firm	Firm	Firm
		01	02	03	04	05	06
1 3	Offers supplementary pension plan to all employees.				X		
1 4	The environmental policy is formal, known to all employees and is included in company's code of conduct and / or statement of values.			X	X		X
1 5	Has environmental emergency plan, which lists all products, processes or services that involve risks. In addition, it supplies a training program to employees regularly facing danger situations.			X			
1 6	Promotes, in its strategic decisions, programs to reduce solid waste generation, as well as control and monitoring of production chain of inputs origin.			X	X		X
1 7	Customer and consumer policy and standards are set out in the company's code of conduct and / or statement of values.				X		X
1 8	Maintains a special program, focusing on consumer / customer health and products and services safety.	X	X		X		X
1 9	Recognizes the community, in which it is present, as an important stakeholder in its decision-making processes.	X	X	X	X	X	
2 0	Carries out surveys of local needs before designing projects in the community.	X		X	X		
2 1	Carries out, in the community, together with local organizations, educational campaigns of public interest.	X	X		X		
2 2	Take social actions and other stakeholders in account for the overall strategic planning process.				X		
2 3	Adopts or develops partnerships with public agencies, aiming at social goals, health, eradication of child labor, promotion of food security etc.	X	X	X	X		X

## 5 Conclusion

One of the main outcomes of this study is to verify that, in general, companies surveyed are concerned with CSR; however, this concern, in some of them, does not seem to be translated institutionally nor are formally adopted as business strategy. The belief of relevance of CSR issue, as part of business strategy agrees with Ashley et al. (Ashley et al., 2002), Soares (Soares, 2004), and

Bertoncello & Chang (Bertoncello & Chang, 2007), who emphasize the importance of this theme to organizations.

According to the findings, the CSR has been a critical issue, discussed among construction companies in the state of Bahia. Several strategies have been developed, especially those related to the welfare of communities surrounding construction sites and the use of innovative technologies that help reducing environmental impact, in particular management of construction waste (debris), which brings direct gains to the environment, the workers and society. Those strategies guarantee healthier ecosystems with less impact on environment and society.

Thus, to answer the research question, which deals with the importance of CSR within the context of the construction companies in the state of Bahia, this study showed that CSR, for most of the companies surveyed, is relevant, although, in some of them, are treated informally. In fact, most companies prove that, in some way, this theme is relevant, but not often translated into formal business strategies yet.

# Study on the Driving of Energy Saving and Emission Reduction to the Transformation of Resource-based Cities

Chen Qiang, OuYang Xiao

School of Science, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:52169530@qq.com, 1931114893@qq.com)

**Abstract:**From economic form, social form and natural form, this paper explores the driving effect of energy-saving and emission reduction on energy-consuming industries, high-tech industries and development of tourism industries of resource-based cities, based on the investigation of the current situation of resource-based urban development in China. By using statistical analysis methods such as correlation analysis and regression analysis, and multivariate regression model constructed, we find that there is a high degree of positive correlation between the transformation of resource-based cities and energy saving and emission reduction. Finally, we use the Markov prediction model is used to predict and analyze the industrial structure of a typical resource-based city, Pingdingshan City, in the next 10 years, in order to explain the driving effect of energy saving and emission reduction on the transformation of resource-based cities. The method presents good application value in the analysis of economic development, the prediction of industrial structure changing and urban development planning.

**Key words:** Energy saving and emission reduction; Resource-based city; Multivariate regression analysis; Markov prediction

## 1 Introduction

At present, environmental problems, population problems and resource problems have become one of the three major problems in the sustainable development of economic society (Zhu Xun, 2005). As the largest energy consumer and carbon emitter, China, while ensuring stable and sustainable economic development, must take the road of "energy saving and emission reduction" in line with the national conditions. The vigorous implementation of energy conservation and emission reduction policies has led to the gradual adjustment of the urban industrial structure and has had a driving effect on the transformation of resource-based cities (Liu Hongbin, 2010). Pingdingshan city in Henan Province is a mature and typical resource-based city with abundant mineral resources, but it needs to keep moving forward on the road of transformation.

## 2 Research Design

### 2.1 Purpose

Nowadays, facing the rapid development of society and economy, resource and environmental constraints, through energy conservation and emission reduction to promote the transformation and development of resource-based cities is imminent(Dou Bingci, Qin Yuanchun, 2016).In order to

understand the driving effect of energy saving and emission reduction on resource-based cities, this study takes Pingdingshan city of Henan province as an example to analyze. To ensure the validity and accuracy of the results, this survey first through pre-survey to determine the best sample volume, and then based on the best sample volume to determine the final survey volume, by using artificial auxiliary questionnaires and referring to government statistics. Because of the large sample size in the large-scale sample survey, the large sample theory is used to determine the interval estimation by using the limit distribution, while the theoretical basis of the finite total non-release sample is the Wald-Wolfowitz theorem (Sun Shanze, 2017), which can determine the optimum sample quantity according to the pre-survey data and then use the absolute precision.

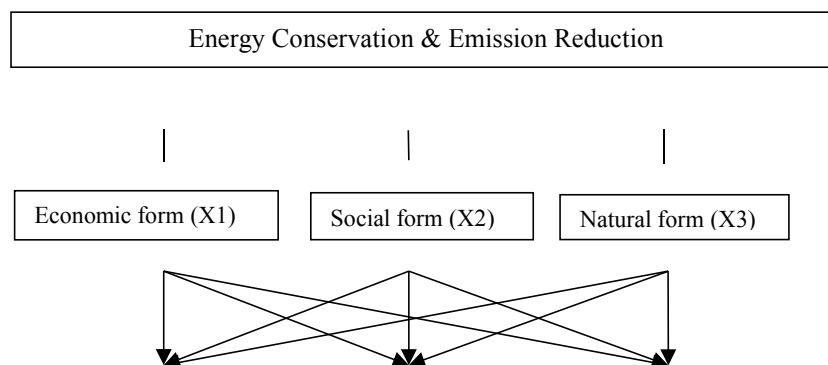

After screening and pretreatment, 774 effective questionnaires were obtained, the effective rate was 91.1%. This paper mainly analyzes the basic information of the interviewees, the basic situation of the Pingdingshan and the basic situation of energy saving and emission reduction, after that we carries on the correlation analysis and the regression analysis for the specific data, and then gets the driving effect of the energy saving and emission reduction on the resource-based city transformation. Finally predicts the future economic development trend of the Pingdingshan, thus validating the "Energy saving and emission reduction "driving effect on the development of resource-based cities.

## 2.2 Research method

One of the key points of this paper is the setting of two variables-energy saving and emission reduction and resource-based urban transformation. Whether we can accurately grasp the setting of these two variable indexes is related to whether we can accurately reflect the driving effect of energy saving and emission reduction on the transformation of resource-based cities.

The core content of resource-based urban transformation is the transformation of its industrial structure (Yang Jianlin, Zhang Sifeng, Wang Jiajia, 2018).A large number of scholars at home and abroad do many academic researches from different disciplines. And there is a considerable amount of research in its evaluation. In this study, energy saving and emission reduction was set as an independent variable, and the transformation of resource-based cities was set as a variable. In the construction of the model, energy saving and emission reduction are mainly composed of its economic form, social form and natural form, while the transformation of resource-based cities is the adjustment of resource-based urban industrial structure, mainly for energy-consuming industries, high-tech industries and tourism.

Considering the need of research and the feasibility of operation, this paper simplifies the model to a certain extent. From the simplified model, we can see that the relationship between the two magnitude variable of energy saving and emission reduction and the two-magnitude variable of resource-based urban transformation is not a simple one-to-one correspondence effect, but a more complex correlation, which also shows that the driving effect of energy saving and emission reduction on the transformation of resource-based cities is not simply linear relationship, but has complexity and The specific model relationships are detailed in Figure 1:

**Figure 1 Driving Effect Model of Energy Saving and Emission Reduction on Resource-based City Transformation**

In the process of index setting, this paper fully investigates and references the literature published by other scholars, which mainly includes the reference to the evaluation system of industrial transformation ability (Wu Yayun, Gao shikui, 2015). The measurement indexes of energy saving and emission reduction economic form set in this paper include: Urban Development, Enterprise development, economic development and resource utilization, and the measurement indexes of social form include: Government attitude, policy cognition and residents ' attitude, while natural form includes residents ' living environment and urban environment construction.

### 3 Data Analysis

This paper mainly uses Excel software to input and organize the investigation data, and uses Spss19.5 software to carry out statistical analysis. In the process of discussing the driving effect of energy saving and emission reduction policy on the transformation of resource-based cities, this paper first uses Pearson correlation analysis (CD Jayaweera, N. Aziz, 2018) to discuss the correlation between variables, and then uses multivariate regression analysis to explore the specific influence degree of energy saving and emission reduction variables on dependent variables on the basis of greater correlation.

#### 3.1 Correlation analysis

In order to explore whether there is relevance and the extent of relevance, this paper analyzes and discusses the economic form, social form and natural form of energy saving and emission reduction.

Correlation analysis between the economic pattern index of energy saving and emission reduction and the industrial structure of Pingdingshan City is shown in Table 1 below:

**Table 1 Correlation Analysis of the Influence of Economic Form and Industrial Structure**

		Y1	Y2	Y3
X1	Pearson Correlation	.635**	.663**	.452**
	Sig.(2-tailed)	0.000	0.000	0.000

Note: \*\* is significantly correlated on 0.01 levels (bilateral)

From the data in the table, we can think that the economic form of energy saving and emission reduction is related to the high energy consumption industry, high-tech industry and tourism, and has a high positive correlation with the energy-consuming industry and high-tech industry, which shows that the economic form of energy saving and emission reduction has a great influence on these two industries. It can be argued that the deeper the policy of energy conservation and emission reduction, the greater its impact on energy-intensive industries and high-paying technology industries.

It is worth noting that there is a weaker correlation between the economic form of energy conservation and emission reduction and the tourism industry, which also shows that energy conservation and emission reduction have limited influence on tourism development in economy. The main reason is that tourism itself should on the basis of scenic natural environment and a long history and culture, which is why the correlation with the tourism industry is relatively low.

Correlation analysis of the influence of energy saving and emission reduction social form on Pingdingshan industrial structure the results shown in table 2 below can be obtained:

**Table 2 Correlation Analysis of the Influence of Social Form and Industrial Structure**

		Y1	Y2	Y3
X2	Pearson Correlation	.528**	.657**	.338**
	Sig.(2-tailed)	0.000	0.000	0.000

From the social form of energy saving and emission reduction and the correlation and significance of measuring the transformation of resource-based cities, the social form mainly has a strong correlation with high-tech industry. And high-tech industry is moderately correlated with the energy-consuming industry, and the correlation with tourism industry is relatively weak.

Correlation analysis of the influence of natural form of energy saving and emission reduction on Pingdingshan industrial structure the results shown in table 3 below can be obtained:

**Table 3 Correlation Analysis of the Influence of Natural Form and Industrial Structure**

		Y1	Y2	Y3
X3	Pearson Correlation	.678**	.568**	.535**
	Sig.(2-tailed)	0.000	0.000	0.000

Similarly, it can be seen from the table that the natural form of energy saving and emission reduction has a strong correlation with the energy-consuming industry, while the correlation with high-tech industry and tourism industry is in the medium range, and the correlation with the tourism industry is relatively weak.

By comparison, we can know that energy-saving emission reduction has a strong correlation with high energy consumption industry and high-tech industry, which means with the deepening of energy conservation and emission reduction work, the impact and fluctuation of these two industries will also be the largest. And the tourism industry is only more related to the natural form of energy saving and emission reduction, the main reason is that the natural environment focus on the development and maintenance of tourism has an important role in promoting, which naturally has a certain correlation.

2.3.2 Multiple Regression Analysis.

To explore whether the economic form further, social form and natural form of energy saving and emission reduction have an interdependent relationship with the transformation of resource-based cities. This study further adopts multivariate regression analysis on the basis of exploring correlation analysis (Zhou Rubiao, Lin Xiaoxia, Wang Yuhua, 2019). The results indicate that the three variables contained in energy conservation and emission reduction have a high degree of interpretation of resource-based urban transformation, which means the transformation of resource-based cities largely depends to energy conservation and emission reduction. The specific parameters of regression analysis are table 4 and table 5 below.

**Table 4 Model Summary Table**

Model	R	R <sup>2</sup>	Adjusted R Square	Std. Error of the Estimate
1	.652 <sup>a</sup>	.395	.472	.595

a. Predictors: (Constant), economic form, social formation, Natural form

**Table 5 Regression Coefficient Table**

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	St. Error	Beta		
(Constant)	.087	.276		.216	.009
Economic form (x1)	.315	.073	.388	6.146	.000
Social formation(x2)	.470	.081	.206	3.154	.002
Natural form (x3)	.215	.072	.210	3.123	.002

The linear equations for the impact of energy conservation and emission reduction on Pingdingshan urban transformation, which are fitted by research data, are as follows:

$$Y = 0.087 + 0.315X_1 + 0.470X_2 + 0.215X_3$$

From the above results, we know that 65.2% of resource-based urban transformation can be determined by the three forms of energy conservation and emission reduction. Among the various elements, the social form of energy saving and emission reduction has the greatest contribution coefficient to the industrial structure of Pingdingshan, which shows that the government's policies, systems and residents' attitudes are very important to the transformation of resource-based cities. And the contribution rate of natural form is relatively small, which indicates that energy saving and emission reduction in environmental construction pressure is relatively small. From this, we can basically think that social form is the most driving effect on the transformation of resource-based cities.

In addition, on the basis of regression analysis, the variance analysis (Fu Yingying, Tian Zhenkun, Liyumei, 2019), the observation value of F test statistics is 67.573, the corresponding P value is approximately 0, so it is considered that the regression coefficients have obvious influence on the due variables in regression analysis, and a multivariate linear regression model can be established. Therefore, it can be concluded from the above analysis that the economic form, social form and natural form of energy saving and emission reduction have a direct positive effect on the transformation of Pingdingshan.

### 3.2 Prediction of industrial structure

#### 3.2.1 Build model

In order to verify the promotion of energy saving and emission reduction to the transformation of resource-based cities, this paper predicts with the help of Markov model (Shaanxi Statistical Bureau, 2018)<sup>69</sup>, the hypothesis includes: (1) The added value of three industries remains unchanged within one year, and its calculated by year; (2) Assuming that three industrial value added per year is only related to the proportion of industries in the previous year; (3) The acceptable range of errors is [-1.5%, 1.5%].

The basic model of Markov prediction is:  $X(k + 1) = X(k)P$ , where  $X(k)$  represents the state vector of the predicted object at  $t = k$  time;  $P$  represents a one-step transfer probability matrix;  $X(k + 1)$  represents the state vector of the Predictor object at  $t = k + 1$  time. The value added of the  $n$  industry in the  $T$  period as a share of GDP is  $Z_n(t)$  ( $n=1, 2, 3$ ). The Markov prediction model is:

$$\begin{pmatrix} z_1(1) & z_2(1) & z_3(1) \\ z_1(2) & z_2(2) & z_3(2) \\ \dots & \dots & \dots \\ z_1(t) & z_2(t) & z_3(t) \end{pmatrix} = \begin{pmatrix} z_1(0) & z_2(0) & z_3(0) \\ z_1(1) & z_2(1) & z_3(1) \\ \dots & \dots & \dots \\ z_1(t) & z_2(t) & z_3(t) \end{pmatrix} \begin{pmatrix} P_{11} & P_{12} & P_{13} \\ P_{21} & P_{22} & P_{23} \\ \dots & \dots & \dots \\ P_{31} & P_{32} & P_{33} \end{pmatrix}$$

The upper formula is  $Z_2 = Z_1P$ ,  $P = \begin{pmatrix} P_{11} & P_{12} & P_{13} \\ P_{21} & P_{22} & P_{23} \\ \dots & \dots & \dots \\ P_{31} & P_{32} & P_{33} \end{pmatrix}$  is the transfer probability matrix.

Then the optimal solution of the state transfer matrix in the above model can be obtained by using the least squares method. that is  $\hat{P} = (Z_1^T Z_1)^{-1} Z_1^T Z_2$ . The state transfer matrix can be obtained by bringing in the relevant data of Pingdingshan three industries.

#### 3.2.2 Prediction results

In order to ensure the accuracy of the forecast, this study only predicts the changes of three industries after 10 years. According to the Statistical Yearbook data (Henan Statistical Bureau, 2019)<sup>70</sup>

<sup>69</sup><http://tjj.shaanxi.gov.cn/site/1/html/126/131/138/17204.htm>

<sup>70</sup> [http://www.ha.stats.gov.cn/sitesources/hntj/page\\_pc/index.html](http://www.ha.stats.gov.cn/sitesources/hntj/page_pc/index.html)

of Henan province, the proportion of three industries in 2018 was set as the initial state matrix, and the data of the next decade can be predicted by using the probability of State transfer. In order to make the comparison of the data results more obvious, this paper compares the predicted industrial structure diagram with the current industrial chart, and the results are shown in Figure 2 below.

**Figure 2 Comparison of Industrial Structure Chart of Pingdingshan**

By contrast, you can see intuitively: In the next 10 years, the proportion of the second industry will decline in Pingdingshan city, the tertiary sector will surpass secondary industry as the most important component of the industrial structure, which is also the inevitable result of the transformation of resource-based cities(Fu Xiaodong, 2015).

#### 4 Conclusion

This paper discusses and analyzes the driving effect of energy saving and emission reduction on the development of high energy consumption industry, high-tech industry and tourism in resource-based cities respectively, and the findings indicate the following: first, energy conservation and emission reduction have a significant positive impact on industrial optimization and economic development of resource-based cities; Second, the economic form, social form and natural form of energy saving and emission reduction have a high positive correlation with high energy consumption industry and hi-tech industry, and the transformation driving effect of resource-based city is obvious. Third, Pingdingshan can develop the tertiary industry and break through the limitation of resources and environment, insist on sustainable development and then realize the transformation of resource-based cities.

# Research on the Relationship between R&D Coupling Coordination and Upgrading of Equipment Manufacturing Industry:

## An Empirical Study of Shandong Province

Li Xue, Hou Jie, Gao Pengbin

School of Economics and Management, Harbin Institute of Technology, Weihai, P.R. China, 264209

(E-mail: lixuehit@163.com, 2387764361@qq.com, gaopengbinhit@163.com)

**Abstract:** Based on the statistical data of Shandong equipment manufacturing industry from 2009 to 2016, this paper analyzed the mechanism between internal and external R&D coupling coordination and industrial upgrading. The coupling coordination model of physics was used to calculate the coupling degree of internal and external R&D, and the Malmquist index was used to measure industrial upgrading. The results showed that the R&D coupling coordination was at moderate level, which plays an important role in driving industrial upgrading. According to the results, some suggestions for R&D management were also proposed.

**Key words:** Internal R&D; External R&D; Industrial upgrading; Coupling coordination; Malmquist index

### 1 Introduction

The equipment manufacturing industry is the cornerstone of industrial development and the core component of the manufacturing industry, which provides production technology and equipment for the national economy and national defense construction. However, the deep-seated problems affecting the development of the equipment manufacturing industry have not yet been fully resolved, including unreasonable industrial structure and weak independent innovation capability, etc.

For the relationship between internal and external R&D and industrial upgrading, many scholars pay more attention to the following aspects. First, some scholars study the impact of internal R&D on industrial upgrading. Internal R&D capabilities contributed to the rise of the industrial value chain based on panel data of the Chinese manufacturing industry (Yu and Fan, 2014). Using the impulse response function method to study the internal R&D on high-tech industries, it is found medium-sized high-tech industries fluctuated greatly after the impact (Chu and Zhang, 2013). Second, some scholars focus on the impact of collaborative innovation on industrial upgrading. Combined collaborative innovation and industrial cluster theory, scholars show China's coal industry and found that synergistic innovation plays a positive role in regulating (Guo, 2014). Previous studies analyze the industry data of China's manufacturing industry from 2005 to 2014, the results showed that internal R&D, industry-university-research cooperation R&D are the best strategic choices in the transformation and upgrading of the manufacturing industry (Yuan and Sun, 2017). Third, some scholars analyze the impact of internal and external R&D collaboration on industrial upgrading. Based on electronic communication equipment manufacturing industrial transformation and upgrading of the Yangtze

River Delta, it is found that R&D innovation will promote its movement to the upstream of the value chain (Zhang, 2010). When scholars research the coupling between technological innovation and traditional industries, proposed the path of industrial upgrading, and promoted the transformation and upgrading of traditional industries through technological innovation, internal R&D and external R&D (Cheng and Wu, 2015).

Whether it can adhere to internal R&D as the leading factor and rely on external R&D has become the key of industrial upgrading. The synergistic relationship between internal and external R&D indicates that can have a more positive impact on industrial upgrading (John and Wang, 2012). In order to distinguish from previous research, this study uses the coupling coordination degree model and Malmquist index method to study the relationship between internal and external R&D coupling and industrial upgrading from the perspective of system. Finally, it provides corresponding countermeasures based on the research results. This paper will enrich and improve the theory of internal and external R&D and industrial upgrading and provide reference for future research. The suggestions are significant to solve the practical problems existing in the industrial development and to promote the industrial upgrading of the manufacturing industry and the development of the overall economy.

## **2 Method**

### **2.1 R&D coupling coordination model**

Coupling theory was initially mainly applied in the field of physics, and in recent years it has been gradually applied in the field of social science. Coupling refers to the interaction between two or more internal elements or modes of motion, which results in a coordinated and symbiotic dynamic association (Pile, David, 2012). The coupling of internal and external R&D refers to the interaction between internal R&D system and external R&D system, resulting in complementary advantages and further promoting the positive overall relationship. Coupling coordination can be carried out four levels: the low level ( $0 < H \leq 0.4$ ), the moderate level ( $0.4 < H \leq 0.6$ ), the high level ( $0.6 < H \leq 0.8$ ) and the extreme level ( $0.8 < H \leq 1$ ).

### **2.2 Malmquist index model**

The Malmquist index model describes the production changes of output and input through the distance function, which can measure total factor productivity, technological progress, etc. (Zhang and Jiang, 2014). Through the Malmquist index model, this paper studies the technological progress index to analyze equipment manufacturing industry, and explores the relevant content of industrial upgrading. The Malmquist index can be used to represent the input-based technological progress growth from  $t$  to  $t+1$  (Walheer, 2018). The Malmquist index value is greater than 1, indicating that the technological progress of the  $t+1$  is increased compared with the  $t$ ; the Malmquist index value is less than 1, indicating that the TFP has decreased; the Malmquist index value is equal to 1, indicating that the technological progress has not changed.

### **2.3 Data**

This study uses equipment manufacturing data from 2009 to 2016 collected by Shandong Statistical Yearbook. Seven sub-sectors are selected, including Metal Products Industry (M1), General

Equipment Manufacturing Industry (M2), Special equipment manufacturing Industry (M3), Transportation equipment manufacturing Industry (M4), Electrical machinery and equipment manufacturing Industry (M5), Computer, communications and other electronic equipment manufacturing Industry (M6) and instrumentation manufacturing Industry (M7).

## 2.4 Variable

R&D coupling. We use the coupling model to measure the coupling coordination degree of internal and external R&D. The internal R&D systems use internal R&D expenditure indicators, including government funds (I1), corporate funds (I2), offshore funds (I3) and others (I4). External R&D systems use external R&D expenditure indicators, including expenditures for domestic research institutions (E1), expenditures for domestic higher education (E2), and expenditures for overseas (E3) (Yu and Fang,2015).

Industrial upgrading. It is appropriate to use the technological progress index to evaluate. The total industrial output value, total assets and number of employees are selected to measure technology progress index in the seven sub-sectors. The above indicators are used to calculate the technological progress in the Malmquist index through Stata15., then analyze the industrial upgrading.

## 3 Result

### 3.1 R&D coupling coordination

Considering that only relying on the internal R&D and external R&D coupling degree will lead to misleading judgment and draw a pseudo conclusion that the degree of coordinated development is higher, this paper carries out the analysis of the coupling coordination degree of internal and external R&D in Table 1. Overall, internal and external R&D is in a moderate degree of coupling, there are relatively large industry differences from Figure 1.

**Table 1 Internal R&D and External R&D Coupling Coordination in Manufacturing Industry**

	2009	2010	2011	2012	2013	2014	2015	2016	M
I1	0.10	0.09	0.15	0.41	0.35	0.35	0.39	0.29	0.26

Figure 1 Internal R&D and External R&D Coupling Coordination in Manufacturing Industry

### 3.2 Industrial upgrading

The industrial upgrading of the equipment manufacturing industry in Shandong Province is quite ideal (Table 2), and the technological progress has performed well from Figure 2.

Table 2 Shandong Province Equipment Manufacturing Industry Technology Progress Index

Techch	I1	I2	I3	I4	I5	I6	I7	Mean
2009	0.96	0.96	0.96	1.11	1.08	0.99	0.96	1.00
2010	1.02	1.00	1.02	1.14	1.02	1.02	1.00	1.03
2011	1.11	1.11	1.13	1.06	1.12	1.12	1.10	1.11
2012	1.02	1.02	1.04	1.08	1.07	0.96	0.97	1.02
2013	1.04	1.04	1.05	1.09	1.06	1.03	1.03	1.05

Figure 2 Shandong Province Equipment Manufacturing Technology Progress Index

### 3.3 R&D coupling coordination and industrial upgrading

In order to have a deeper understanding of the relationship between R&D coupling and industrial upgrading, we make unit root, panel data co-integration, granger causality analysis, and impulse response test using stata15. The relationship between internal and external R&D and industrial upgrading of equipment manufacturing industry is showed.

#### 3.3.1 Unit root test

The unit root test is performed on the internal and external R&D coupling coordination degree and the technology progress index to judge the stability of the corresponding panel data. The unit root test of the internal and external R&D coupling coordination degree and industrial upgrading are in compliance with the requirements at a significant level of 1%. Both of them have a long-term stable relationship, and can be co-integrated. analysis.

#### 3.3.2 Co-integration test

In order to test the relationship between internal and external R&D coupling coordination degree and industrial upgrading, co-integration test is performed. The result shows the R&D coupling has a co-integration relationship with industrial upgrading in the 5% Pedroni co-integration test( $P=0.003$ ), and also meets the conditions for long-term stable interaction. The further conformity of the co-integration relationship lays the foundation for the next Granger causality test.

#### 3.3.3 Granger causality test

The R&D coupling coordination degree is the Granger cause of the industrial upgrading( $P=0.00$ ), while the industrial upgrading is not the Granger reason for the R&D coupling coordination degree( $P=0.424$ ). On the whole, the test results confirm that the R&D coupling coordination degree is the Granger cause of the industrial upgrading.

### 3.3.4 Impulse response test

It can be seen from Figure 3 that when the coordination degree of R&D is accumulated to a certain extent, the growth rate and growth rate of the technological progress index are very rapid. The technological progress index has accumulated to a certain extent, and it also has a certain feedback effect on the coordination degree of research and development. This shows that the accumulation of internal and external R&D is to a certain extent, and when it reaches the point of explosion, it will greatly promote the technological progress and cause industrial upgrading.

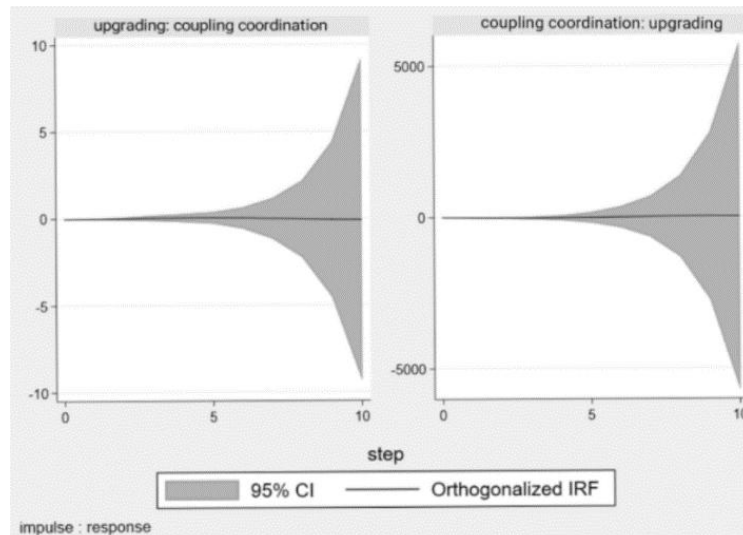

Figure 3 Impulse Response Function between R&D Coupling Coordination and Industrial Upgrade

## 4 Conclusion

The paper uses the physics coupling model to measure the internal and external R&D coupling. The research finds that the overall R&D coupling coordination degree is in the state of moderate coupling, and the industry distribution is uneven. The overall efficiency of the equipment manufacturing industry is good by using Malmquist analysis, but it also exists insufficient. The development of various sub-sectors in the equipment manufacturing industry is unbalanced, the coupling gap between R&D and the upgrade efficiency is also different, which indicates that there is still no optimal balance between R&D coupling and industrial upgrading. This paper verifies the role of internal and external R&D coupling in promoting industrial upgrading, thereby deepen the understanding of the relationship between internal and external R&D interactions and industrial upgrading, and fill the gaps in previous research.

The suggestions for the R&D of equipment manufacturing industry in combination with the development of Shandong Province are as follows. we must pay attention to balance the relationship between internal R&D and external R&D, and find a balance. In addition, we must pay attention to internal and external communication, maintain knowledge flow, information flow, capital flow, so that internal and external R&D coupling outputs can flow and drive upstream and downstream enterprises. Then, it can promote the upgrading of the overall industry.

However, there are some limitations in the research. Only the data of Shandong Province are used for verification. The best situation of the internal and external R&D coupling coordination degree is not further analyzed. In the future, we will continue to pay attention to the development of equipment manufacturing industry and make further research.

# Employment Efficiency Evaluation of Innovation and Entrepreneurship Policy in China

Zhu Hua

School of Economic, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: zmwhlg@163.com)

**Abstract:** The purpose of this article is to evaluate the regional employment efficiency of innovation and entrepreneurship policy (IEP) in China. We developed a set of indicators in relation to policy evaluation and employed super-efficiency dynamic slack-based model (DSBM) to calculate regional employment efficiency values. The article concludes that over 50% of the Chinese provinces have ineffective overall employment efficiency, and western region's performance is obviously superior to the central and eastern regions. Term efficiency scores of the three regions all show fluctuant trends over time, but there is regional inequality between eastern and other regions, implying that, in eastern provinces, policy resources bring about the least effect on creating employment opportunities.

**Key words:** *Innovation and entrepreneurship policy; Employment efficiency; Dynamic SBM model (DSBM); Factor efficiency index (FEI)*

## 1 Introduction

*In recent years, innovation and entrepreneurship have attracted governments' great attention due to its impact on economic growth and job creation (Audretsch, et al, 2014). Scholars proffer that innovation and entrepreneurship policy (IEP) contribute to risk reduction and market regulation for innovation and entrepreneurship (Edquist, 2011). However, in China, constantly increasing policy inputs has been employed with poor consideration of the performance of IEP. Meanwhile, annual growth in the number of college graduates and migrant worker forces China to confront unprecedented employment pressures in recent years. Therefore, employment creation has been regarded as one of the most crucial objectives of IEP. Although IEP deals with multiple issues such as economic growth, society development and environment protection, etc., a specialized investigation of employment performance of IEP not only leads to better investment and more even distribution of public resources, but also encourages greater responsibility for how those public resources are utilized.*

The following section presents relevant literature regarding performance assessment of IEP. Section 2 give a short review of the literature on the evaluation of innovation and entrepreneurship policy. In Section 3, we explore the framework logic of the relationship between IEP and job creation. Section 4 spells out super-efficiency DSBM to calculate the employment efficiency values of IEP. Section 5 is devoted to compute and analyze the regional employment efficiency values in China from 2007-2015. Also, a FEI analysis for calculated efficiency scores is presented in this section. The conclusion and recommendation are presented in section 6.

## 2 Literature Review

To examine the performance of IEP, past researchers normally evaluated the effect of public resource investment (inputs) on the outcome of IEP (outputs) (Wei, 2016). These researchers mainly concerned about economic objectives of IEP, resulting in output variables merely involving economic benefit indicators, such as production value of high technology industry and the number of patent applications, etc. (Zhou, 2017). Nonetheless, as an essential realistic goal, scholars have not yet attached

great importance to employment growth in policy evaluation, and few study selects employment growth as the output variable. Undoubtedly, different objectives of IEP should be balanced in evaluation. Otherwise, a biased assessment will lead to inconsistent attainment of different objectives.

Regarding the evaluation models of IEP, multivariate statistical methods are broadly used by many scholars. As a non-parametric method, DEA model attracts more scholars' attentions as it processes the inputs and outputs simultaneously (Apergis and Polemis, 2016). Performing efficiency values over a course of time is a new development in DEA model. Tone and Tsutsui (Tone and Tsutsui, 2010) developed dynamic slacks based measure (DSBM) in which the overall efficiency and term efficiency over a period of time is measured. However, at present, there is little literature adopts this method to assess the performance of IEP. Moreover, few studies combine the super-efficiency DEA and DSBM to rank effective units. Therefore, this paper applies super-efficiency DSBM model to evaluate the overall and term employment efficiency of IEP in China. Furthermore, some scholars argue that policy-makers depending heavily on increasing investment of policy resources rather than taking sufficient consideration of policy mix will lead to inefficiency of IEP (Atkeson and Brustein, 2011), yet few researchers conduct a quantitative analysis of the input excess or shortfall, which gives the specific references to policy-makers. Since factor efficiency index (FEI) is helpful in adequately measuring and analyzing the input excess or shortfall, it could be useful in understanding the direct reasons that cause the inefficiency (Bai et al., 2014).

On this basis, the objective of this paper is three-fold: firstly, this paper builds a more comprehensive measurement system that assesses employment efficiency of IEP. Second, super-efficiency DSBM is proposed to calculate and analyze provincial overall and term employment efficiency values in China. Finally, based on the term efficiency scores, FEI is employed to find main reasons that why employment efficiency fails to reach the optimal level.

### 3 Theoretical Framework

Since Schumpeter proffered that entrepreneurs were 'agents of creative destruction', entrepreneurship and innovation has been regarded as a single concept. Generally, on the one hand, by introducing creative products and processes into the market place, start-ups translate the investment of new knowledge into the competitiveness of economic growth (Audretsch and Keilbach, 2008). On the other hand, the entrants engage more in innovation than incumbents because producing new methods or new products is an approach to keep their core competence (Laguir et al., 2016). Therefore, the small but growing research emphasizes the association between innovation and entrepreneurship. Some scholars use the term 'facilitate one in the hope of getting more of the other' to represent the connection of innovation and entrepreneurship (Autio et al. 2014). We argue that innovation and entrepreneurship should be integrated into one system to provide a more realistic portrayal. Accordingly, public policy of innovation and entrepreneurship activities display complex interactions rather than two parallel processes, stemming from the complexity of innovation and entrepreneurship. Generally, according to the previous literature, innovation and entrepreneurship process includes three essential links, namely knowledge production, incubation activities and market promotion. Among them, knowledge production is the origin in the process; incubation activities transform the new knowledge into practical application; and market promotion commercializes new products.

Usually, innovation and entrepreneurship policy consist of three categories: supply-side policy, demand-side policy and environment policy. The supply-side policy is applied purposely to provide resources (funds, human resources, infrastructures, etc.). Supply-side policy can be subdivided into

provision for knowledge production and support for incubation activities. Demand-side policy focuses on creating demands for new products in commercialization and dissemination. Environment policy promotes optimal allocation by minimizing the uncertainties that might arise from the breakdown of converting public policy resources investment into the driving force to economic and social changes. Employment growth driven by innovation and entrepreneurship intrinsically links with the marketing in innovation and entrepreneurship process (Dachs and Peters, 2013). On the micro level, only when the large-scale production and application of innovations bringing about the expansion of emerging market and the reduction of production cost as well as motivating the enterprises to expand capacity and drive profits, firms are able to create substantially new positions. On the macro level, by demonstration effect and knowledge spill over, commercialized new products further add industrial values that may generate tremendous employment opportunities (Luan and Yang, 2016). Therefore, the higher market-based degree of innovation and entrepreneurship is, the more employment opportunities will be provided (Lawless, 2014). The relationship between IEP and employ mentis shown in Figure 1.

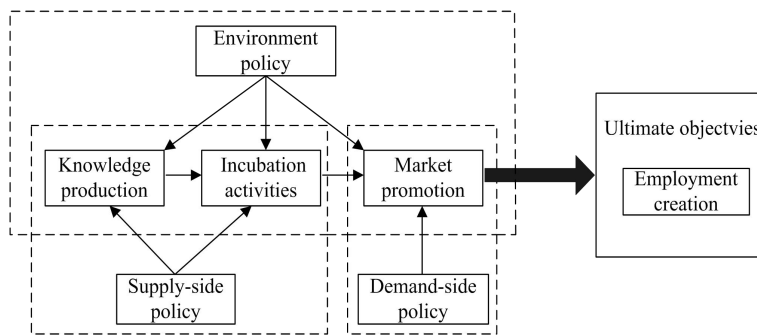

Figure 1 The Relationship between Innovation and Entrepreneurship Policy and Employment

#### 4 Efficiency Evaluation with Super-efficiency DSBM Model

Dynamic SBM model (DSBM) deriving from SBM proposed by Tone and Tsutsui is used to evaluate the DUMs in a consecutive period. Assume that there are  $t = 1, \dots, T$  periods and  $j = 1, \dots, n$  DUMs. Each DMU contains X input and Y output, and Z denotes the free link. To measure the accurate effective DUMs of the above DSBM, this paper combines the study of Tone on the base of super-SBM to rank the effective DMUs. The objective function the non-orientations DSBM model with free link under the constant returns-to-scale (CRS) is expressed as below:

$$\rho_0^* = \min \frac{\frac{1}{T} \sum_{t=1}^T w^t \left[ 1 - \frac{1}{m+1} \left( \sum_{i=1}^m \frac{W_i^- S_{iot}^-}{x_{iot}} + \sum_{i=1}^{nfree} \frac{S_{iot}^{free*-}}{z_{iot}^{free*-}} \right) \right]}{\frac{1}{T} \sum_{t=1}^T w^t \left[ 1 + \frac{1}{s+1} \left( \sum_{i=1}^s \frac{W_i^+ S_{iot}^+}{y_{iot}} + \sum_{i=1}^{nfree} \frac{S_{iot}^{free*+}}{z_{iot}^{free*+}} \right) \right]}$$

s.t.

$$x_{iot} = \sum_{j=1, \neq j_0}^n x_{ijt} \lambda_j^t + s_{it}^- (i=1, 2, \dots, m; t=1, 2, \dots, T); y_{iot} = \sum_{j=1, \neq j_0}^n y_{ijt} \lambda_j^t - s_{it}^+ (i=1, 2, \dots, s; t=1, 2, \dots, T);$$

$$z_{iot}^{free} = \sum_{j=1, \neq j_0}^n z_{ijt} \lambda_j^t + s_{it}^{free} (i=1, \dots, nfree; t=1, 2, \dots, T); \sum_{j=1, \neq j_0}^n z_{jt}^{free} \lambda_j^t = \sum_{j=1, \neq j_0}^n z_{jt}^{free} \lambda_j^{t+1} (\forall i; t=1, 2, \dots, T-1)$$

$$\lambda_t \geq 0, s_{it}^- \geq 0, s_{it}^+ \geq 0 \text{ and } s_{it}^{free} \geq 0, \sum_{t=1}^T w^t = T \sum_{i=1}^s w_i^+ = s \sum_{i=1}^m w_i^- = m \quad (1)$$

where  $x_{ijt}$  and  $y_{ijt}$  denote the input and output at term  $t$ , and  $z_{ijt}^{free}$  is free link;  $s_{it}^-$  and  $s_{it}^+$  are slack variables denoting input excess and output shortfall, separately;  $s_{iot}^{free*-}$  and  $s_{iot}^{free*+}$  indicate respectively excess and shortfall to  $z_{iot}^{free}$ ; and  $\lambda_t \in R^n (t = 1, \dots, T)$  is intensity vector in period  $t$ . This paper defines the  $\rho^*$  as efficiency value. Obviously, the smaller the value of  $\rho$  is, the less efficiency will be.

## 5 Employment Efficiency of Innovation and Entrepreneurship Policy in China

### 5.1 Indicator selection

As for supply-side policy, two types for knowledge generation and incubation activities are considered. For knowledge generation, R&D subsidy is employed as a common policy. Government funds in intramural expenditure on R&D are regarded as to be a good proxy indicator. For incubation activities, because regional governments encourage the application of new knowledge by building incubators for new firms or innovation agencies, the number of incubators is a similar indicator on behalf of government investment in financing incubation activities. As to demand-side policy, since public procurement as influences on expected profits of innovation agencies and new firms, the amount of provincial government procurement can be taken as the input of demand-side policy. In addition, we take it as the indicator of environment policy input because the government financial support broadly plays a part in optimizing the environment of innovation and entrepreneurship. Due to the hysteresis and continuity, government financial support is proper to be chosen as the free link variable in innovation and entrepreneurship process. For output indicator, since China's innovation and entrepreneurship activities are mainly concentrated in urban cities, the consequences generated by the activities tend to be found in urban cities. Then, employment in urban units at each year's end is considered to be a good proxy indicator.

### 5.2 Data sources

As a large country, unbalanced regional development remains a serious problem for China. Thus, regional employment efficiency scores tend to be significantly different. Therefore, we divided China into three regions, eastern, central and western. We take the panel data of mainland China's 28 provinces from 2007 to 2015 as a sample. Due to the significant missing data in Hainan, Tibet and Qinghai, these three provinces were not included in our research. The data comes from the China Statistical Yearbook, China Science and Technology Statistical Yearbook, China government procurement Statistical Yearbook and China Torch Statistical Yearbook. The basic statistical characteristics are shown in Table 1.

**Table 1 Descriptive statistical characteristics of input and output variables**

Type	Indicators	Variable	Mean	Median	Min	Max
Inputs	Input of supply-side policy(x1) (Knowledge production)	The amount of government expenditure in R&D	74.76	110.51	2.44	791.64

	Input of supply-side policy(x2) (Incubation activities)	The number of regional national incubators	30.19	59.99	1	505
	Input of demand-side policy(x3)	The amount of regional government procurement	377.31	357.16	29.2	2113.2
Free-link	government financial support(x4)	The amount of government financial support	70.41	78.95	4.33	569.55
Outputs	Employment figures(Y)	The number of employed people in urban	525.45	324.65	57.13	1973.3

### 5.3 The Result of empirical analysis and discussion

The overall efficiency and term employment efficiency are presented in Table 2.

**Table 2 Overall Efficiency and Term Efficiency**

Province	Overall efficiency	Term efficiency									
		2007	2008	2009	2010	2011	2012	2013	2014	2015	
Beijing	0.3325	0.4417	0.4934	0.5053	0.5879	0.4659	0.5627	0.4426	0.5219	0.3274

	Ningxia	0.4551	0.4963	0.5536	0.5375	0.6600	0.6030	0.6278	0.5752	0.6915	0.5005
	Xinjiang	1.1938	1.2503	1.1948	1.2110	1.1127	1.1269	1.2694	1.1393	1.2636	1.1936
	average value	0.8323	0.8014	0.9211	0.8653	0.8860	0.8411	0.8647	0.7968	0.8892	0.8866
	National average	0.6974	0.6904	0.7959	0.7649	0.7649	0.7246	0.7624	0.7104	0.7834	0.7682

(1) The overall efficiency of national average from 2007-2015 has reached 69.74% of optimal level, indicating the overall employment efficiency of China is at an upper moderate level on the whole. Average over all efficiency values over the eastern, central and western regions are respectively 0.4531, 0.8068 and 0.8323, which imply that all regions are faced with tasks to improve efficiency. As shown in Table2, 12 provinces have attained the optimal efficiency, which are mainly from western region. Specially, Shanxi, Xinjiang, Guizhou, Gansu and Fujian are the 5 top provinces, while overall efficiency of Beijing, Tianjin, Shanghai, Jiangsu and Anhui show greater room for improvement. The results suggest that employment growth in some provinces, especially in most eastern provinces with greater development in terms of economies, has not yet been consistent with high public resources investment.

(2) The term efficiency scores are showed in Figure 2. At national level, term efficiency scores have fluctuated over time, and have a gradual increase with an 11.27% cumulative growth. Both central and western regions' term efficiency scores show a better performance than national average. Despite reaching the peak in 2008, term efficiency values of central and western regions decline gently to the lowest level in 2013 and bounce back from 2014. However, central region exhibits a relatively lower performance except in 2015. At the same time, the values of term efficiency in the east are consistently below national average significantly, which reach the peak in 2008, 2012 and 2014. It should be noted that differences in dynamic changes between eastern and other regions are getting larger in recent years,

indicating that, in eastern region, urgent and effective measures need to be taken to improve the employment performance.

Figure 2 Dynamic Changes of Employment Efficiency

(3) The trends of provincial term efficiency values show that ending values in 16 provinces are higher than beginning values, but only Shanxi and Xinjiang invariably have effective performance. Eight provinces, with Hebei, Jilin, Jiangxi, Henan, Hubei, Chongqing, Sichuan and Shanxi, have cumulative growth rates over 20%, which suggests that employment efficiency scores are developing. The cumulative decline rates are more than 10% in five provinces, including Beijing, Tianjin, Shanghai, Anhui and Guizhou, implying that the driving effect from IEP to job creation are weakening. In the remaining provinces, efficiency values changeless in cumulative rates, which may be due to ineffective policy of innovation and entrepreneurship on employment.

5.4 Factor efficiency index analysis

Factor efficiency index (FEI) is used to measure the excess or shortfall of inputs and free-link. If FEI is zero, implying the input factor is regarded as efficient, while a positive or negative FEI indicates excess and shortfall, respectively. The same holds for free links. The calculation formula is  $FEI = \text{Actual data} / \text{projection} - 1$ . The average FEIs of different policy have been showed in Figure 3.

Figure 3 Average Factor Efficiency Index (FEI)

As for the FEIs of supply-side policy in knowledge production, three regions all have excess investment. Specially, the greatest potential for improvement are in eastern region. Meanwhile, from the FEIs of supply-side policy in incubation activities, we find that three regions have excess input, indicating that the employment growth are not accompanied with huge investments in incubation, at least to the same extent. The FEIs of demand-side policy hold the same situation. However, in eastern region, demand-side policy exhibits more effective impact on employment. As the free link, financial support can exert sustained long-term impact upon innovation and entrepreneurship process. In other words, the amount of financial support should be combined with other investment quantity of IEP. As

shown in Figure 3, all the provincial investment of financial support is unsatisfying. For improving the employment efficiency, financial support needs to be reduced in eastern region and increased in central and western regions overall.

## 6 Conclusion

With super-efficiency DSBM model, this paper measures the employment efficiency of IEP of China's 28 provinces during 2007 to 2015. The excess and shortfall of government investment on innovation and entrepreneurship are analyzed by FEI. The empirical results show that overall efficiency and term efficiency in most provinces are unsatisfying in the sample period, suggesting a rapid job growth are not accompanied with the swift growth of inputs on IEP. The employment efficiency of three regions undergo fluctuation over the period, and the provinces with high performance tend to be in western region, whereas the provinces with low performance are concentrated in eastern region.

1. Obviously, in eastern region, though the amounts of investment on innovation and entrepreneurship are larger, the public resources have not yet produced effective impact on employment. On the account of the public expenditure of innovation and entrepreneurship policy failing to promote employment growth effectively, the planning and management of IEP should be improved and undergo regular appraisal. A supervisory system for the IEP targeting at employment growth should be established.

2. According to FEI analysis, eastern region has the most excess input in three types of public policy, implying that all types of public resources fail to boost employment growth effectively. In the central and western regions, inputs of supply-side policy and demand-side policy are excess, while the environment policy should be added to guarantee its role of coordination. Based on the results, regional governments ought to adjust the investment structure of IEP. Specifically, the eastern provinces are supposed to appropriately reduce the investment of IEP, especially the investment of supply-side policy, and increasing the investment of environmental policy should be taken as priority by central and western provinces.

## Study on the Evaluation of Industrial Innovation Capacity in Hubei Province

Song Weiwei, Zou Wei

Jiangnan University, Wuhan, P.R. China, 430056

(E-mail: 498695899@qq.com, 36937694@qq.com)

**Abstract:** In order to speed up the construction of innovation-oriented national construction, we must strive to improve our innovation capacity. As an important part of the national economy, the industry has long accounted for about 40% of China's gross domestic product, which plays an important role in the national economy. Industry as the principal part of innovation in the economic construction and social development of Hubei Province have played an important role. Hubei Province, as the key innovation base in China, is facing the dilemma of low efficiency in the integration of scientific and technological innovation resources. In view of this situation, this paper analyzes the current situation of industrial innovation ability in Hubei Province from the perspectives of input and output from 2009 to 2017. On this basis, using the method of data envelopment analysis, six indexes are designed from four aspects: human input, financial input, new product output and scientific and technological achievement output. This paper evaluates and analyzes the industrial innovation capacity of 31 regions in China from 2009 to 2016, finds out the position of Hubei, and explores the reasons for the low industrial innovation capacity of Hubei.

**Key words:** Innovation capacity; Industry of Hubei Province; Input-output; DEA

### 1 Introduction

In the report to the 19th CPC National Congress, General Secretary Xi Jinping stressed: "Innovation is the first driving force leading development and the strategic support for building a modern economic system." To speed up the construction of an innovative country, we must focus on improving the capacity of scientific and technological innovation. In recent years, various regions of our country have continuously increased their investment in scientific and technological resources, and remarkable achievements have been made in the development and reform of science and technology.

As for what is innovation, the scholar Fu Jiaji (Fu Jiaji,1998) holds that innovation refers to the technological revolution generated by enterprises in the continuous development process, breaking technological barriers, completing the entire production process, transforming technology into commodities, and finally achieving production goals. Katharine Wakelin (Katharine Wakelin,2001) used the Cobb-Douglas production function to analyze the data related to research intensity of 170 enterprises in the UK. The research shows that the longer the innovation activity lasts, the higher the research return rate.

At present, there are many researches on the evaluation of industrial innovation ability at home and abroad, mainly through the establishment of evaluation index system, the selection of mathematical modeling method to analyze the input-output efficiency of innovation ability in a region for a year or several years. Cao Hongjun (Cao Hongjun,2009) constructed five first-level indexes including innovation consciousness, innovation input capacity, innovation output capacity, innovation activity management mode and innovation mode, and expanded them into 27 second-level indicators to evaluate the independent innovation ability of enterprises by using Analytic Hierarchy Process. Jiang Xinghua (Jiang Xinghua,2012) constructed the evaluation system of regional scientific and technological innovation ability by using Analytic Hierarchy Process, and comprehensively evaluated the scientific and technological innovation ability of Foshan city by using the grey correlation degree evaluation theory.

Based on the data of listed industrial enterprises in Hubei Province during the three years from 2008 to 2010, Tu Hongxing (Tu Hongxing,2012) took R&D input capacity, R&D output capacity and transformation capacity of R&D input and output as first-level indicators to construct a comprehensive evaluation model of enterprise R&D capacity. Analyzed and evaluated the R&D ability of listed industrial enterprises by factor analysis. Su Yang (Su Yang,2017) selected factor analysis method to evaluate the independent innovation ability of industrial enterprises. Dong Dengzhen (Dong Dengzhen,2017) used the combination of dynamic factor analysis method and cluster analysis method to evaluate and compare the industrial innovation ability of 28 provinces and cities from 2009 to 2013. Based on this, it evaluates and analyzes the innovation ability of industrial subdivision in the region. Xu Ru (Xu Ru,2019) selected industrial enterprises in 30 provinces of China in 2014 as samples for evaluation by means of factor analysis and cluster analysis. The results showed that the independent innovation ability of China industrial enterprises is obviously different in region.

Hubei Province is abundant in scientific and technological innovation resources and scientific research talents, and many well-known institutions of higher learning, scientific research institutes, national and provincial scientific research bases gather here. However, the integration level of scientific and technological resources in Hubei Province is not in the leading position in our country. There is still a huge room for improvement in Hubei Province in making full use of the abundant scientific and technological resources and effectively transforming it into a strong industrial advantage in order to better serve the local economic and social development. If make better use of scientific and technological resources and improve the efficiency of the utilization of scientific and technological resources in Hubei Province, we can help the transformation and upgrading of Hubei's industrial industry and promote Hubei's economy and society. It is of great significance to promote the economic and social development of Hubei Province.

Based on the economic development of industrial enterprises in Hubei Province, this paper studies the current situation of innovation ability of industrial enterprises above designated size in Hubei Province from 2009 to 2017 from two aspects of input and output. On this basis, data envelopment analysis (DEA) method was used to conduct an empirical study on the innovation capability efficiency of industrial enterprises in various regions of China from 2009 to 2016, to find out the position of Hubei Province and compare it with other regions of China. Time span from 2009 to 2016, to avoid the choice one year of accident data, make the evaluation results more comprehensive and accurate.

## 2 Research on the Present Situation of Hubei's Industrial Innovation Ability

### 2.1 Research on the input status of industrial innovation ability in Hubei Province

#### 2.1.1 Number of R&D personnel in industrial enterprises above designated size in Hubei Province.

Figure 1 shows the number of R&D personnel in industrial enterprises above designated size in Hubei Province from 2009 to 2017. The number of personnel increased from 55,893 in 2009 to 154,580 in 2017, with an average annual growth rate of 13.56%. In terms of growth, the number of R&D personnel increased the most in 2011, 52.01 percent. Although the absolute number of R&D personnel continued to increase after 2012, its growth rate showed a downward trend.

**Figure 1 R&D Personnel in Industrial Enterprises above Designated Size in Hubei Province (2009-2017)**  
 Data source: Come up with China Statistical Yearbook on Science and Technology 2010-2018.

### 2.1.2 Internal expenditure on R&D funds of industrial enterprises above designated size in Hubei Province.

As shown in figure 2, the internal expenditure on R&D expenditure of industrial enterprises above designated size in Hubei Province increased from 10.577 billion yuan in 2009 to 46.894 billion yuan in 2017, with an average annual growth rate of 20.46 percent. In 2011, the increase peaked at 47.51 percent.

**Figure 2 Intramural Expenditure on R&D in Industrial Enterprises above Designated Size in Hubei Province(2009-2017)**

Data source: Come up with China Statistical Yearbook on Science and Technology 2010~2018.

### 2.1.3 Funds for the development of new products of industrial enterprises above designated size in Hubei Province.

Expenditure on new product development increased from 13.559 billion yuan in 2009 to 46.406 billion yuan in 2017, with an average annual growth rate of 16.63 percent. As can be seen from the figure 3, with the exception of a decline in 2015 (down 15.93 percent), inputs grew faster in the rest of the year than in the previous year, among which the increase in 2010, 2011 and 2016, both close to or more than 30 percent.

**Figure 3 New Products Development of Industrial Enterprise above Designated Size in Hubei Province (2009-2017)**

Data source: Come up with China Statistical Yearbook on Science and Technology 2010~2018.

## 2.2 Research on the output status of industrial innovation ability in Hubei Province

### 2.2.1 New product sales revenue of industrial enterprises above Designated Size in Hubei Province.

As shown in figure 4, the new product sales revenue of industrial enterprises above designated size of Hubei Province has increased from 165.054 billion yuan in 2009 to 752.349 billion yuan in 2017, with an average annual growth rate of 20.88%. Among them, the highest growth rate is 41.18% in 2010, and the annual growth rate of new product sales revenue basically exceeded double digits, indicating

that the benefit of the new product is relatively satisfactory.

**Figure 4 New Products Sales of Industrial Enterprise above Designated Size in Hubei Province (2009-2017)**

Data source: Come up with China Statistical Yearbook on Science and Technology 2010~2018.

### 2.2.2 Number of R&D projects of industrial enterprises above designated size in Hubei Province.

The number of R&D projects of industrial enterprises above designated size in Hubei Province is shown in figure 5, increasing from 4,256 in 2009 to 12,968 in 2017, with an average annual growth rate of 14.94 percent. Among them, the largest increase in 2011, the growth rate of 53.78%, fell in 2015, a 13.14% drop.

**Figure 5 R&D Projects of Industrial Enterprises above Designated Size in Hubei Province (2009-2017)**

Data source: Come up with China Statistical Yearbook on Science and Technology 2010~2018.

### 2.2.3 Number of patent applications by industrial enterprises above designated size in Hubei Province.

The number of patent applications for industrial enterprises above designated size in Hubei Province (figure 6) increased from 4,693 in 2009 to 22,244 in 2017, with an average annual growth rate of 21.47 percent. Among them, the largest increase in 2011, at 71.52%.

**Figure 6 Patent Application by Industrial Enterprises above Designated Size in Hubei Province (2009-2017)**

Data source: Come up with China Statistical Yearbook on Science and Technology 2010~2018.

### 3 Evaluation method selection and Index system Design of Innovation capacity of Industrial Enterprises

The evaluation of innovation capacity of industrial enterprises in Hubei Province is essentially an evaluation of input-output efficiency. In the evaluation, multiple input and output indicators should be taken into account, and most of them are difficult to set production functions and weights in advance. Therefore, DEA method is selected to evaluate the innovation capacity of industrial enterprises in Hubei Province.

According to the principles of scientific selection, consistency and comparability of index, and combining the development status of Hubei industry, this paper constructs the index of evaluation system of innovation capacity of Hubei industry from two aspects of input and output. The input of innovation capacity includes financial input, human resource input, material resource input, information resource input and other elements, among which financial input is an essential basic condition for enterprises to carry out innovation activities, while human resource is the core element of enterprises to carry out innovation. Based on the above principles, three innovative input indicators are selected from two aspects of human and financial input, namely total R&D personnel, internal expenditure of R&D expenditure, and new product development expenditure. New product development funds. The output of scientific and technological achievements, the transformation and industrialization of scientific and technological achievements are the key elements of enterprise innovation capacity, which have an important impact on the sustainable development of enterprises. Therefore, three output indicators of innovation capacity are selected from two aspects of new product output and scientific and technological achievements output: sales revenue of new products, number of R&D projects and number of patent applications (shown in Table 1).

**Table 1 Evaluation System of Hubei Industrial Enterprises Innovation Capacity**

	Category	Index
<b>Input of Innovation Capacity</b>	Input of Human	Total R&D Personnel
	Input of Financial	Internal Expenditure of R&D Expenditure
		New Product Development Expenditure
<b>Output of Innovation Capacity</b>	Output of New product	Sales Revenue of New Products
	Output of Scientific and Technological Achievements	Number of R&D Projects
		Number of Patent Applications

### 4 Evaluation and Analysis of Industrial Innovation ability

According to the evaluation index system of Hubei industrial innovation capacity in Table 1, 31 regions in China from 2009 to 2016 were selected as the research objects, and the analysis results as shown in Table 2 were obtained. The main results are as follows:

**4.1 The technical efficiency index of industrial innovation capacity is in a relatively backward position.**

Technical efficiency value (Comprehensive efficiency value) is reflected in the given input (or output), the extent to which DMU can obtain output (or reduce input), which can be used to reflect the effectiveness of the evaluated object as a whole. As shown in Table 2, the average industrial innovation technology efficiency index in 31 regions of the country is 0.746.

**Table 2 Evaluation Results of Industrial Innovation Ability in Hubei Province**

Region	crste	vrste	scale	Return to scale changes
Beijing	0.833	0.971	0.857	drs
Tianjin	1	1	1	—
Hebei	0.575	0.837	0.687	drs
Shanxi	0.401	0.506	0.791	drs
Inner Mongolia	0.522	0.556	0.94	drs
Liaoning	0.593	0.675	0.878	drs
Jilin	1	1	1	—

<b>Mean</b>	<b>0.746</b>	<b>0.875</b>	<b>0.852</b>	

Data source: Come up with Statistical yearbook of Chinese science and technology 1909-2017, Hubei statistical yearbook 2009~2016.

The technical efficiency index of industrial innovation capacity in Tianjin, Jilin, Guangdong, Hainan, Chongqing and Tibet is 1, which is in the state of technical efficiency and best scale. The technical efficiency of other regions is not effective. Among them, the technical efficiency index of industrial innovation capacity in Guangxi, Shanghai, Guizhou, Xinjiang, Zhejiang, Beijing and Hunan is between 0.8-1, indicating high technical efficiency. The technical efficiency index of industrial innovation capacity was lower than 0.6 in Liaoning, Gansu, Jiangsu, Jiangxi, Hebei, Hubei, Shanxi, Qinghai, Heilongjiang, Inner Mongolia and Shaanxi, indicating that the industrial innovation ability of these regions was relatively low. Only 6 of the 31 regional industrial innovation technology efficiency indexes are in the technically effective state, indicating that most regional industries need to make input and output adjustment.

#### **4.2 The pure technical efficiency index of industrial innovation ability is in a relatively backward position**

Pure technical efficiency refers to whether the output has reached the maximum under the given input quantity, and whether the output can be increased by optimizing the structure of input factor or strengthening management. According to Table 2, the average pure technical efficiency of industrial innovation capacity in 31 regions is 0.875.

The pure technical efficiency index of industrial innovation capacity in 14 regions of Guangdong, Guangxi, Hainan, Jilin, Jiangsu, Ningxia, Shandong, Shanghai, Sichuan, Tianjin, Tibet, Xinjiang, Zhejiang and Chongqing is 1, which is in a state of pure technical efficiency. It shows that these areas are effective for the use of input resources. The pure technical efficiency index of Beijing, Guizhou, Jiangxi, Shaanxi, Heilongjiang, Hebei, Hunan and Henan is between 0.8 and 1, which is relatively high. The pure technical efficiency index of Hubei, Liaoning, Inner Mongolia, Qinghai and Shanxi is less than 0.7, which shows a certain gap with other regions.

#### **4.3 The scale of input and output of industrial innovation capacity is decreasing, and the input resources have not been fully utilized**

Scale efficiency reflects the relationship between the change of input quantity and output quantity. The closer the scale efficiency is to 1, the more appropriate the production scale and the higher the productivity. According to Table 2, there are three states of input and output of

innovation ability of industrial enterprises in 31 regions: Return of scale increases, return of scale remains unchanged and return of scale decreases.

Among them, Tianjin, Jilin, Guangdong, Hainan, Chongqing and Tibet six regions have no change in the scale of input and output of industrial innovation capacity. The increase of input-output scale income of Guizhou industrial innovation capacity shows that the input scale of industrial innovation resources is not enough. In other words, increasing investment in research and development will increase output more than input, thus improving industrial innovation capacity. Therefore, industrial enterprises in Guizhou should increase investment in this aspect.

There are 23 regions in Anhui, Beijing, Fujian, Gansu, Guangxi, Hebei, Henan, Heilongjiang, Hubei, Hunan, Jiangsu, Jiangxi, Liaoning, Inner Mongolia, Ningxia, Qinghai, Shandong, Shaanxi, Shanghai, Sichuan, Xinjiang, Yunnan, Zhejiang and Shanxi with decreasing returns on the scale of industrial innovation capacity. This shows that the reasons for the unsatisfactory industrial innovation capacity of the above regions are that the input resources are wasted to some extent.

## 5 Conclusion

The analysis of the innovation capacity of industrial enterprises in 31 regions from 2009-2016 shows that the technical efficiency index of Hubei (0.570) is lower than the average value of the national technical efficiency index (0.746). The pure technical efficiency of Hubei (0.679) was lower than the national average (0.875). There are increasing returns on scale (1 region), constant returns on scale (6 regions) and decreasing returns on scale (23 regions) in the input and output of innovation ability of industrial enterprises in China, Hubei Province is in a state of decreasing returns of scale. In view of the above phenomena, it is necessary to improve Hubei's industrial innovation ability from the following aspects: strengthening the input of independent innovation and diversified investment; optimizing the personnel allocation, perfecting the mechanism of introducing talents; promoting the transformation of scientific and technological achievements and speeding up the development of industrialization; Improve the ability of independent innovation and realize the sharing of resources among industries.

# **An Empirical Study on the Effect of Innovation on Employment from the Industry Level Perspective: A Case of China**

Allaberdiyev Guychmyrat, Wei Long

School of Economics, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: 562502516@qq.com, longwei@whut.edu.cn)

**Abstract:** The paper studies theoretical and empirical scientific literature about the impact of innovation on employment. By using panel data from 30 China's industries from 2012 to 2016, examines the employment effect of innovation. New product sales revenue used as a proxy for product innovation, and R&D expenditures used as a proxy for product and process innovation. OLS with the fixed effect estimator method applied as an empirical model. Findings suggest a positive and significant relationship of new product sales revenue and R&D expenditures with employment throughout the corresponding industries, where the latter found to be better explaining the variations of employment.

**Key words:** Innovation; Employment; Product innovation; Process innovation

## **1 Introduction**

The impact of innovation on employment has long been a debated issue. While innovation is known to have a strong positive relationship with long term economic growth in general, the relationship between innovation and employment has not been clearly identified. This is because innovation has two distinctive effects on employment (Vivarelli, 2014; Harrison et al., 2008;). On the one hand, innovation has a displacement effect, which displaces workers by capital, and has a negative influence on jobs. On the other hand, innovation has a compensation effect, which increases the demand for workers in the production process. Thus, the overall employment effect of innovation cannot be

predetermined. Given that the economic theory does not ascribe an exact net effect of innovation, it has become a matter of empirical analyses. Empirical analysis has mostly been conducted at the firm-level, and typically categorizes innovations as process innovations and product innovations. Some studies (Harrison et al., 2014, 2008) argue that distinguishing the innovation type facilitates understanding the employment effect of innovations and that each type of innovation has a different purpose and can have different employment effects. Firms introduce process innovation for cost-saving but introduce product innovation for demand expansion. Thus, the former is expected to have a negative influence on jobs and the latter, a positive influence. While a large volume of literature verifies the above reasoning, they are mainly at the firm level, and ignore the fact that innovative firms increase in demand for labor may be due to the stealing business from their industry peers, thus, on the industry level, the effect of innovation on employment may end up differently comparing with firm-level data.

The research purpose is to attempt to fill the gap by using aggregate industrial data to test the innovation-employment relationship. Employment always was and will be in the center of policy discussion, and China's government is making great effort to change the Chinese economy to innovation-driven economy. Therefore, it is essential to understand the effect of innovation on employment in order to avoid the adverse effects of employment policies on innovation (Gavin et al., 2017).

In what follows, Section 2 discusses the literature, and Section 3 describes the data, and applied estimation method, Section 4 explains the empirical results, and Section 5 draws conclusion.

## **2 Employment Effect of Innovation**

### **2.1 Firm level**

Most studies contend that the ambiguous employment effect of innovation is closely related to the type of innovation, namely product and process innovation.

At the firm level, product innovation creates more employment by increasing product demand and labor input for its production. However, the effect depends on the substitution rate and productivity differences between old and new products (Lim and Lee, 2018). In other words, increased labor demand to produce new products might be offset by the layoff of workers in the old product production facilities. Moreover, the labor displacement effect might intensify if the new product requires less labor input.

By contrast, process innovation has a direct labor displacement effect, which is reasoned by the productivity increase through improving the production process. Productivity increase means less labor and/or capital for the given amount of product. On the other hand, productivity might be accompanied by a price reduction, thus, leading to higher demand for the product and labor for its production.

Several empirical studies conducted on this topic consistently found that the product

innovation positively associated with employment growth, while the process innovation appears to have a less clear-cut impact. (Luigi et al., 2019; Calvino, 2019; Hou et al., 2019; Mitra, 2016; Harrison et al., 2014).

## **2.1 Industry level**

At the industry level, when the new product is complementary to the existing one within the industry, it increases the demand for employment. However, when the new product is a substitute for the old one, the employment effect of product innovation becomes unclear. The product innovation in one firm would encourage employment, only if the demand increase for the new product does not happen at the expense of other firms demand reduction within the industry. If the demand increases at the expense of the other firms, then the employment level in the industry not only stays the same but might reduce as the business stealing can hinder the performance of other firms (Daniel et al., 2018). Harrison's study on France, Germany, Spain and UK firms documents the fact that one-third of the net employment created by product innovators is due to reallocation effect of the business stealing (Harrison et al., 2014).

The unclear impact of process innovation on employment might become significantly negative once the analysis takes industry context into account. For instance, in a monopolistic market structure, process innovation leads to more significant employment decline and product innovation does not create larger employment (Lim and Lee, 2018).

Buerger's study on the relation between innovativeness and employment argues that the co-evolution of innovation and employment growth rates tends to be sector-specific. In the transport equipment industry, patent growth does not show any significant relation to employment growth. However, in the chemical industry, a (weak) negative relationship is found (which suggests the presence of business stealing effects). Instead, in the electrics and medical instrument industries, their results point out a positive and significant correlation between the growth of patenting and employment growth. Finally, the study highlights that in chemicals and transport equipment industries, employment growth is associated with subsequent R&D growth (Buerger et al., 2012).

In summary, firm level empirical studies consistently draw similar conclusions, the results differ when industry context is introduced. Moreover, it is challenging to develop a hypothesis and predict possible results. A recent study on China's manufacturing industries over the period 2000–2006 finds a positive effect of innovation on employment (Mairesse and Wu, 2019). We contribute to the literature by conducting an empirical study on China's manufacturing industries over the period 2012-2016 by using industry level aggregated variables as a confirmation to the previous study results.

## **3 Data and Methodology**

### **3.1 Data source and description**

This research encompasses 30 manufacturing industries in China. Data covers the period

of 2012-2016 on a yearly basis, collected from Wind database. Observations are the aggregate value of every industry (data is not the firm level), which enables to capture the short-term effect of innovation on employment. Industries with missing values removed from the dataset in order to avoid any unwanted effects throughout the calculation. And the selected variables for empirical analysis are as follows (Table 1):

**Table 1 Variables, Measurement and Expected Effect on the Dependent Variable**

Variables	Measurement	Expected correlation with the dependent variable
Dependent variable: Employment	10000 persons	---
Independent variable: New product sales revenue	CNY 100 million	Positive correlation
R&D expenditure	CNY 100 million	Positive correlation

The dependent variable is employed personal of the corresponding industry, and the independent variable is the frequently used proxy for product innovation in the literature, new product sales revenue and R&D expenditure (for example, Lim and Lee, 2018). New product sales revenue used as a proxy for product innovation. R&D is a broader measure of innovation activity, as it includes both product and process innovation.

[29] Manufacture of Textile	[30] Manufacture of Electrical Machinery and Equipment

---

### 3.2 Empirical model

In panel data analyses, simple OLS estimation may lead to biased results in the presence of unobserved heterogeneity. As the empirical analysis is based on a panel data regression model, the fixed effect estimator method applied to solve the time-fixed unobserved cross-sectional heterogeneity problem, which is a common problem for panel data analysis. Thus, the fixed effect estimator applied to remove any time-fixed unobserved cross-sectional heterogeneity and calculated by removing the average value of the whole period from each corresponding year. In order to deal with time related trend effects of the corresponding data, dummy variables for three years included in the equation. The panel data regression model takes the form:

$$Empl_{i,t} = \alpha + \beta_i X_{i,t} + \mu_i + \varphi_t + \varepsilon_{i,t} \quad (1)$$

where:  $Empl_{i,t}$  is dependent (number of employees) variable;  $i$  and  $t$  stand for cross-sectional unite (industry) and time (year), respectively;  $\alpha$  is constant;  $X_{i,t}$  is the independent variable (two variables are tested, sales revenue of new products as a proxy for product innovation and R&D expenditure as a proxy for product and process innovation);  $\mu_i$  is time-fixed unobserved cross-sectional heterogeneity;  $\varphi_t$  time effects that are constant for all cross-sectional observations (for instance, trend);  $\beta$  is a parameter that shows the impact of right-hand side variable on the dependent variable and need to be estimated;  $\varepsilon_{i,t}$  is error that is normally distributed with constant variation and zero serial correlation.

## 4 Results and Discussion

### 4.1 Results

Product innovation of corresponding Chinese industries has positive and significant effect on employment. When sales revenue from new products increases by 100 million yuan,

employed personal increases by 80 new employees. R-squared of the estimation is 0.33, which means there is still a significant part of employment variation that cannot be explained by the independent variables in the equation. The Durbin-Watson stat is 2.2, close to two, indicates that there is no serial correlation in the error term. Even though R squared is not ideal, the equation is stable enough not to ignore it.

The empirical calculation also conducted by using R&D expenditures as a proxy for innovation. Compared with new product sales revenue, R&D expenditures not only proxies product innovation but also encompasses process innovation as well. Although many researchers agree on the positive effect of product innovation on employment, several studies suggest the negative effect of process innovation on employment. In order to test these effects of innovation on employment in China's industry, R&D expenditures included in the calculation.

**Table 2 OLS Results. Dependent Variable: Employment (unit: 10000; t-statistics in parentheses)**

Independent variables	(1)	(2)
New product sales revenue (100mln)	0.008 (6.59)	–
R&D expenditure (100mln)	–	0.14 (7.38)
Year 2013 (dummy variable)	21.6 (5.21)	21 (5.2)
Year 2014 (dummy variable)	17.4 (4.18)	15.9 (3.95)
Year 2015 (dummy variable)	9.8 (2.37)	7.5 (1.83)
C (intercept)	-0.54 (0.23)	-1.23 (0.54)
Observations	163	163
R-squared	0.32	0.36
Durbin-Watson stat	2.2	2.1

As table 2 illustrates, product and process innovation of corresponding Chinese industries has overall positive and significant effect on employment (data limitation does not allow to distinguish the product innovation effects and process innovation effects separately). When R&D expenditures increases by 100 million yuan, employed personal increases by 1412 new

employees. Not surprisingly, R&D expenditures contain more information that explains the variations in employment compared with new product sales revenue. R-squared of the estimation is 0.36, which means there is still a significant part of employment variation that cannot be explained by the independent variables in the equation.

The calculation results support the positive employment effect of innovation on employment. R&D have more explanatory power compared with new product sales revenue.

#### **4.2 Discussion**

Several studies related to the topic that has been conducted where the subject was China's industries found a positive relationship between innovation and employment (Mairesse and Wu, 2019; Hou et al., 2019; Wei and Huifang, 2017). Our results are consistent with these related studies. The magnitudes of the parameters may differ because the different time periods and estimation method applied, but the signs are consistent. It shows the dominance of the compensation mechanism of the innovation over its labor displacement effect. It can be argued that the pace of China's economic growth creates a favorable environment for market and demand expansion.

Product innovation increases employment as the creation of jobs in the manufacturing of the new products seems to be bigger than the displaced jobs because of the substitution of new products' sales for sales of old products. Moreover, the business stealing cannot fully mitigate the positive employment effect of innovation.

Also, the process innovation positively effects to wage increase through productivity increase, which further boosts domestic demand. Process innovations, such as in logistics, also facilitated access to international markets and increases demand for products. Thus, the R&D variable as a proxy found to be more robust in explaining the employment effect of innovation than the new product sales revenue.

Altogether, the results point to the fact that innovation does not reduce employment. The idea that innovation stimulates employment seems then well established at the industry level.

#### **5 Conclusion**

The paper investigated the relationship between innovation and employment, firstly, from a theoretical perspective, then from an empirical perspective by thoroughly reviewing related literature. According to theory, even though innovation has labor displacing effect, those effects are fully or partially neutralized through different channels of the compensation mechanism. On the other hand, several empirical studies have been conducted to test the effect of innovation on employment. However, they have mainly focused at the firm level, and a limited number of studies analyzed at industrial level.

The paper investigated innovation-employment relationship at the industry level by using panel data for 30 China's industries. OLS regression with fixed effect estimator method was used to test the relationship of the corresponding variables.

Findings show a positive and significant correlation between innovation and employment in both cases, where the independent variable is new product sales revenue as a proxy for product innovation as well as where the independent variable is R&D expenditure. The latter found to be the better estimator of the variations in employment compared with the former one.

Limitations of this study must be mentioned to shed lights to future research avenues. New product sales revenue and R&D expenditures are good proxies for innovation, but they cannot fully capture the overall effect of innovation on employment. Also, it is hard to distinguish the effect of process innovation and product innovation by using these variables. Comprehensively constructed innovation index would be better to capture innovation-related information from a different perspective. Moreover, it is important to isolate industries' growth that is not related to innovation, but due to other reasons, such as the coverage expansion, which raises demand for products and leads to the higher demand for the labor force.

## **A Study on Environmental Uncertainty, Internal Control and Earnings Management**

Yang Yu

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070  
(E-mail: 1104023241@qq.com)

**Abstract:** In this paper, all the listed companies of non-financial industries in Shanghai and Shenzhen stock exchanges from 2011 to 2015 were taken as samples to test the effect of environmental uncertainty on earnings management behavior of companies, and to analyze the impact of internal control on the relationship between environmental uncertainty and earnings management. It is found that higher environmental uncertainty induces accrual earnings management behavior of listed companies, and good internal control has significant inhibitory effect on earnings management induced by environmental uncertainty. The research conclusion of this paper supports that enterprises should strengthen internal control to deal with the risk that may be brought by the change of external environment when facing the uncertain environment.

**Key words:** Environmental uncertainty; Accrued earnings management; Real earnings management; Internal control.

### **1 Introduction**

Since the 21st century, there have been a large number of incidents of accounting fraud, financial data falsification and earnings management of listed companies at home and abroad, resulting in different degrees of impact on the global capital market. The earnings management behavior of the management of listed companies is the opportunistic motivation choice of the management, which will reduce the accounting quality of listed companies and damage the long-term interests of the company. Therefore, the study of earnings management incentives and governance means is of great significance. For China in the transition period, modern enterprises are faced with many problems such as the transformation of government functions, economic transformation and upgrading, and the uncertainty of the capital market, which makes enterprises face the volatility and unpredictability of the external environment, that is, environmental uncertainty. Companies with higher environmental uncertainty are more likely to have more frequent earnings fluctuations, greater management pressure on operations and performance, and more likely to take opportunistic actions. So, can environmental uncertainty be an important external factor that induces earnings management? However, as an important internal governance mechanism to alleviate information asymmetry and improve the quality of accounting information, it is still worth exploring whether internal control can play its due governance role when environmental uncertainty triggers earnings management.

Previous studies have mainly discussed the influencing factors and economic consequences of earnings management. Most scholars believe that the establishment and improvement of internal control system and corporate governance mechanism can effectively reduce the degree of management's manipulation of corporate earnings (Doyle,2007; Ye, 2014). Hemmen (Hemmen,2010) took Spanish enterprises as an example, and the research results showed that debt financing could reduce the positive accrual earnings management behavior of enterprises. Ahn and Choi (Ahn and Choi,2014) found that

Banks play an important role in restraining the earnings management of loan enterprises, and the earnings management level of enterprises declines with the enhancement of bank supervision. The research of Lu Taiping and Zhang Dongxu (Lu Taiping and Zhang Dongxu,2014) shows that enterprises with higher degree of financing constraint will have smaller scope of earnings management, which may be due to higher risk.

As for the economic consequences of environmental uncertainty, existing researches mainly focus on three aspects. (1) the impact of environmental uncertainty on investment efficiency. The study of Veronesi (2012) shows that when the external uncertainty increases, enterprises will respond to it by reducing investment in external projects, and their investment will become more cautious. Xu Qian (Xu Qian,2014) believes that environmental uncertainty will bring negative effects on the investment efficiency of enterprises. (2) on the impact of environmental uncertainty on audit opinions. Li Wei (2015) 's study shows that under the circumstance of uncertain environment, the decision-making process of audit opinions has obvious anchoring effect. Bu Jishuan (Bu Jishuan,2015) pointed out that various risks faced by auditors would increase with the increase of the uncertainty degree of enterprise environment. (3) on the impact of environmental uncertainty on the cost of capital, Sharma (Sharma,2002) show that environmental uncertainty will bring high financing costs to enterprises. Most existing literature on the study of earnings management environmental uncertainty and other external factors and internal factors such as internal control to separate research, few will related theory at the same analysis framework that comprehensive consideration, and in this paper, the dynamic relations between the tentative efforts, study environment is uncertain the management of internal control of accounting information quality.

## 2 Hypothesis Development

Because the environment uncertainty provides, the motivation and opportunity for the management to carry on the earnings management. First of all, there is uncertainty about the environment management have a strong incentive for earnings management: on the one hand, environmental uncertainty can lead to a surplus fluctuation of listed companies, the external stakeholders will judge company instability, investors may be out of the stock market, the creditors to remove investment, finally resulting in a decline in the value of the enterprise, unable to continue as a going concern, such as bad, these will stimulate management for earnings management. On the other hand, earnings information is directly related to the reputation and salary of the management. The management will pursue its own interests first, so earnings management will go against the interests of shareholders (Mantecon, t. and Beard, D, 2005). Secondly, environmental uncertainty leads to an increase in the degree of information asymmetry (Osma, 2008), which makes it more difficult to identify the behaviors of the management, and makes external supervision and review more complex and difficult. The management is more likely to hide its opportunistic behaviors, thus increasing the possibility of earnings management. Based on the above analysis, this paper proposes the following hypotheses:

H1: The degree of earnings management is positively correlated with the environmental uncertainty, that is, the higher the environmental uncertainty is, the higher the degree of earnings management of the company will be.

Internal control, as a corporate governance mechanism, can effectively find fraud and fluke behaviors in various links of listed companies and improve the quality of accounting information (Wang Xuejun, 2017). High environmental uncertainty will induce enterprise management to conduct earnings management activities (Osma, 2008). Good internal control can effectively inhibit the earnings management induced by environment uncertainty. specific inhibition of path is as follows: first of all,

the environment is uncertain, there is a strong information asymmetry, more of the external supervision of listed companies, while internal control activities can be objectively comprehensively from the program to monitor the activities of the internal personnel (Zhang Guoqing, 2008). Secondly, through risk assessment in internal control, listed companies can identify the risks brought to enterprises by the uncertain environment, and then formulate strategies to actively deal with the risks, so as to prevent the management from manipulating earnings because of these risks (Lin Zhonggao, Zheng Jun, Bu Jishuan, 2015). Based on the above analysis, this paper proposes the following hypotheses:

H2: internal control significantly weakens the positive correlation between environmental uncertainty and earnings management degree.

### **3 Data and Methodology**

#### **3.1 Sample selection and data sources**

This paper takes A-share listed companies in Shanghai and Shenzhen from 2011 to 2015 as the research object. In order to ensure the reliability of the regression results, the following data were screened: (1) all listed financial and insurance companies were excluded; (2) elimination ST company, \*ST and PT enterprise, the reason is the continuous loss of these three types of companies, the reason has a lot of particularity, will have a great impact on the results; (3) AH cross stocks and AB cross stocks are excluded, because cross stocks have different regulatory environments, which will affect the results; (4) companies with missing variable data during the study were excluded. Finally, 4711 observations were obtained. In addition, in order to avoid the influence of extreme values on regression results, winsorize 1% processing was performed on all continuous variables. The relevant financial data in this paper are all from the CSMAR database, and the internal control data are from the DIB internal control and risk management database.

#### **3.2 Variable measurement**

(1) explained variables. In this paper, discretionary accrual (DA) is used to express the degree of earnings management. Referring to the measurement of corresponding accrual earnings management (DA) by Dechow, the modified Jones model is adopted.

(2) explanatory variables. The explanatory variables in this paper are environmental uncertainty and internal control. Based on the practice of Shen huihui, Yu peng and Wu liansheng (2012) in considering environmental uncertainty from a dynamic perspective, this paper adopts the variation coefficient of abnormal sales revenue of an enterprise in the past five years to measure the environmental uncertainty (EU) faced by the company after industry adjustment.

At present, the internal control measurement method widely used in China is the DIB internal control index published by DIB enterprise risk management technology co., LTD. It is based on the five objectives defined in the basic norms of enterprise internal control, adopts the method of objective and subjective scientific judgment, selects the representative detailed indicators and revised indicators, and uses the subjective judgment to give weight, finally weighted to obtain the DIB internal control index. Therefore, this article uses the DIB internal control index to measure the internal control.

(3) control variables. In this paper, the company size, asset-liability ratio, return on total assets, equity concentration, audit opinions, accounting firms are selected as control variables, and the introduction of industry and annual two dummy variables.

Specific variables are explained in table 1.

**Table 1 Variable Definitions**

Variable	definition
DA	Accrual earnings management
EU	Environmental uncertainty
IC	Internal control
Size	Enterprise size =ln (total assets)
Lev	Asset-liability ratio = total liabilities/total assets
ROA	Rate of return on total assets = total ebbtide/total assets
H5	the sum of squares of shares held by the top 5 shareholders
Audit	Whether the accounting firm is one of the top four international accounting firms
Audittyp	Audit opinion dummy variable
Year	Annual dummy variable: if it is the current year, it takes 1; otherwise, it takes 0
Indcd	Industry dummy variable

### 3.3 Regression model

According to the hypothesis of the paper, the corresponding control variables are selected and the following model is designed:

In order to test the impact of enterprise environmental uncertainty on real earnings management and accrued earnings management (that is, to verify H1), the following model is designed:

$$Abs\_DA = \beta_0 + \beta_1 EU + \beta_2 size + \beta_3 lev + \beta_4 ROA + \beta_5 H5 + \beta_6 Audit + Year + Indcd + Audittyp + \varepsilon \quad (1)$$

In order to verify H2, the cross term of internal control and environmental uncertainty was added into the model to obtain the following model:

$$Abs_{DA} = \beta_0 + \beta_1 EU + \beta_2 IC + \beta_3 EU * IC + \beta_4 size + \beta_5 lev + \beta_6 ROA + \beta_7 H5 + \beta_8 Audit + Year + Indcd + Audittyp + \varepsilon \quad (2)$$

## 4 Results

### 4.1 Descriptive statistics

The descriptive statistical results of the main variables in this paper are shown in table 2. Can be seen from the table, be explained variable accrued earnings management absolute value (Abs\_DA) the maximum value of 4.5105, the minimum value is 0, that is accrued earnings management behavior of listed companies, and the difference is bigger, positive accrued earnings management of listed companies in 2993, accounted for 63.53%, show more inclined to use accrued earnings management of listed companies to increase profits. The maximum value of environmental uncertainty (EU) is 20.2039, and the minimum value is 0.0783, respectively. It can be seen that different enterprises are faced with great differences in environmental uncertainty. The maximum value of internal control (IC) is 9.7772,

and the minimum value is 0, indicating that there is a big gap between different enterprises' internal control construction, and the median and average values are 6.8429 and 6.6886, respectively, indicating that the internal control of listed companies in China is generally low. Among the control variables, the mean value of company Size (Size) is 22.2854, and the standard deviation is 1.1916, indicating a large difference in the Size of Chinese companies. The asset-liability ratio (Lev), equity concentration ratio (H5) and return on assets (ROA) are all significantly different among listed companies. The average Audit value of the Audit firm is 0.0401, which indicates that not many listed companies use the international big four for auditing, only 4.01%.

**Table 2 Descriptive Statistics**

Variable	N	Mean	Sd	P50	Min	Max
Abs_DA	4711	0.0769	0.1167	0.0525	0.0000	4.5105
DA	4711	0.0279	0.1370	0.0241	-4.5105	2.6292
+DA	2993	0.0825	0.1023	0.0600	0.0000	2.6292
-DA	1718	-0.0672	-0.1377	-0.0425	-4.5105	-0.0001
EU	4711	1.2948	1.8729	0.7510	0.0783	20.2039
IC	4711	6.6886	1.0557	6.8429	0.0000	9.7772
Size	4711	22.3963	1.1916	22.2854	19.3223	25.2678
Lev	4711	0.4841	0.2049	0.4917	0.0470	0.9478
H5	4711	0.1692	0.1227	0.1362	0.0128	0.5664
ROA	4711	0.0516	0.0459	0.0454	-0.1601	0.2011
Audit	4711	0.0401	0.1963	0.0000	0.0000	1.0000

#### 4.2 Regression analysis

(1) environmental uncertainty and earnings management. OLS multivariate regression was used to test the model (1), with the absolute value of the manipulable accruals (Abs\_DA) as the explained variable and the environmental uncertainty (EU) as the explained variable. Regression results shown in table 3, model (1) the test results show that the environmental uncertainty (EU) and accrued earnings management (Abs\_DA) significant positive correlation, shows that the listed company environmental uncertainty is higher, the reason of earnings management will strengthen management, to adopt various means of earnings management, to verify the H1. Among the control variables, the higher the asset-liability ratio (Lev), the higher the degree of accrued earnings management, indicating that the greater the financial risk, the listed company will choose various ways and means to conduct earnings management in order to obtain financing. The Size of a company is positively correlated with earnings management, indicating that the larger the company is, the more opportunities and means the management has to manipulate earnings without being discovered. Equity concentration ratio (H5) is positively correlated with accrued earnings management, indicating that higher equity concentration makes major shareholders pay more attention to the long-term development of the company and prefer accrued earnings management with less operational risk.

(2) environmental uncertainty, internal control and earnings management. OLS multivariate regression method was used to test model (2), and the absolute value of manipulable accruals (Abs\_DA) was taken as the explained variable to test the relationship between environmental uncertainty (EU), internal control (IC) and earnings management. The regression results are shown in table 3. The test results of model (2) show that environmental uncertainty (EU) has a significant positive correlation with accrual earnings management, and internal control (IC) has a negative correlation with accrual earnings management, which is consistent with the research conclusion of hypothesis 1, and the cross term (EU\*IC) has a significant negative correlation with accrual earnings management (Abs\_DA). The results of model (2) fully demonstrate that in the impact path of environmental uncertainty on earnings management, internal control can play a good regulatory role and effectively inhibit the opportunism motivated behavior of management caused by environmental uncertainty. H2 is verified. Among the control variables, Size is positively correlated with accrued earnings management, indicating that the larger the company is, the more ways and means listed companies choose earnings management. Debt to asset ratio (Lev) is positively correlated with accrued earnings management, indicating that when the debt to asset ratio is high, listed companies will obtain financing through earnings management. Audit by the big four accounting firms is negatively correlated with accrued earnings management, but it is not significant, indicating that when accounting firms are highly competent, listed companies will be more cautious and reduce their earnings management behaviors.

**Table 3 Environmental Uncertainty, Internal Control and Earnings Management**

Variable	Model (1)		Model (2)	
	coefficient	T	coefficient	T
EU	0.00797***	7.80	0.00789***	7.70

\*, \*\*, \*\*\* Indicate significance at 0.10, 0.05, and 0.01, respectively (two-tailed).

## 5 Conclusion

This paper analyzes the environmental uncertainty influence on earnings management, and internal control on the environment uncertainty induced by earnings management governance effect, the following conclusion: the higher environmental uncertainty will induce the earnings management behavior of listed companies, internal control and good for the environment uncertainty induced surplus management has significant inhibitory effect. Further research shows that the internal environment, risk assessment, information and communication among the five elements of internal control have significant governance effects on earnings management.

Based on the research conclusions of this paper, the following Suggestions are put forward :(1) listed companies should adopt various means to perfect and implement internal control, so as to facilitate the board of supervisors to timely supervise the behavior of managers and reduce the possibility of earnings management. (2) the management needs to enhance its strategic flexibility to help enterprises reduce the impact of environmental uncertainty on earnings, so as to optimize the quality of enterprise information and maximize enterprise value. (3) when the environment is uncertain, regulators should strengthen the inspection of internal control construction, regularly inspect the construction and implementation of internal control of listed companies, and strengthen supervision.(4) in the face of the uncertainty of the external environment, investors should enhance their own risk awareness, to prevent the listed company management defects caused by the company's financial operation risk, resulting in investment mistakes.

The research prospects of this paper :(1) in addition to internal control, whether there are other contract mechanisms with governance effect that will affect the relationship between environmental uncertainty and earnings management is a question worth exploring in the future. (2) internal control is composed of five elements, so whether the five elements have an obvious role in earnings management under uncertain circumstances, and what the mechanism is, are worth discussing, in-depth research can better understand the mechanism of internal control.

# Research on the Effect of Inbound and Outbound Open Innovation on Firm Innovation Performance

Hou Jie, Li Xue, Gao Pengbin

School of Economics and Management, Harbin Institute of Technology, Weihai, P.R. China, 264209

(E-mail: 2387764361@qq.com, lixuehit@163.com, gaopengbinhit@163.com)

**Abstract:** In recent years, open innovation has received extensive attention from scholars and practitioners. This paper integrates inbound open innovation, outbound open innovation and their interaction into a theoretical model. Based on the survey data of 209 Chinese manufacturing firms, correlation analysis and hierarchical regression analysis are used to verify the hypothesis. The results show that both inbound and outbound open innovations have a positive impact on the firm innovation performance, and the two-way open innovation interaction also has a positive impact on firm innovation performance. According to the results, some suggestions are also proposed.

**Key words:** Inbound open innovation; Outbound open innovation; Innovation performance; Interaction effect

## 1 Introduction

In an era of knowledge explosion, firms have been unable to maintain competitiveness in the fierce market competition by generating new ideas and developing new products through internal technology research and development. This makes the open innovation model quickly attract attention around the world. More and more firms are beginning to break the organizational boundaries of traditional closed innovation, and cooperate extensively with external organizations to purposely integrate internal and external resources, so as to obtain competitive advantage and provide sustainable development for the firm.

The impact of open innovation on corporate innovation performance has been extensively studied by scholars, most of whom view open innovation as a whole. In general, scholars can still reach a certain consensus that open innovation can improve the innovation performance of firms. However, researchers face an important question: how can firms open up in order to get a return (Laursen, Salter, 2014)? The focus of this research is on the choice of the direction of knowledge flow: choose inbound open innovation or choose outbound open innovation (Chesbrough, Crowther, 2006). Compared with outbound open innovation, inbound open innovation has long been the focus of researchers. Therefore, outbound open innovation has not been fully studied and understood. In recent years, some scholars have incorporated two-way open innovation into a theoretical model. Rubera et al. Showed that the two open innovations have significant positive effects on product portfolio innovation and firm performance (Rubera, 2016). But it is rare to study the interaction between the two modes, especially the impact on innovation performance.

Based on the above discussion, this study focuses on the analysis of the impact of inbound open innovation, outbound open innovation and their interaction on the innovation performance of firm, so as

to study the impact of the two-way knowledge flow management mode at the organizational boundary on the innovation performance.

## **2 Theoretical Analysis and Research Hypotheses**

### **2.1 Inbound open innovation and innovation performance**

Inbound open innovation is a process in which enterprises use external knowledge or technology internally by scanning the external environment. This process allows enterprises to obtain technical knowledge from external knowledge resources such as universities, scientific research institutions, users, even competitive enterprises or non-competitive enterprises to enrich the enterprise knowledge base. Enterprises can choose profitable or non-profitable open practice to get external knowledge and technology. In the first case, enterprises develop more formal transactions by obtaining patents and increasing investment in innovation, such as joint research and development, strategic alliances, etc. In the second case, enterprises get free ideas and knowledge from customers, suppliers, competitors and consultants in an informal way (Scuotto, 2017).

Resource-based view holds that resources are an important factor affecting firm innovation, but the scarcity and finiteness of resources determine that firms must interact with external controllers to obtain the required critical resources. At present, firms rich knowledge mainly through interaction with stakeholders such as customers and suppliers, which can improve the innovation of firms. In the process of interaction with customers, firms can identify valuable and exploitable business opportunities in relevant information such as market demand and the existence of new markets, thereby reducing the risk and cost of innovation (Baldassarre, 2017). Unlike customer collaboration, working with suppliers is often associated with cost reduction and organizational process innovation. The cooperation with suppliers, companies can achieve high-level input of knowledge resources through strategic alliances, joint ventures, and outsourcing agreements. High-quality knowledge resources can not only directly improve organizational processes, but also reduce the cost of new product development and design. It is worth mentioning that the exchanges between enterprises and scientific research institutions, competitors and other external stakeholders are also deepening, and the scope of introducing resources has continued to expand. These resources further enrich the innovation resources of enterprises and lay a solid foundation for the subsequent innovation of enterprises. Based on the above discussion, the following hypotheses are proposed:

**H1: Inbound open innovation has significant positive impact on firm innovation performance.**

### **2.2 Outbound open innovation and innovation performance**

Outbound open innovation is the process by which firms transfer knowledge or technology to the external environment to obtain monetary or non-monetary benefits. This idea begins with free disclosure of technical details in open source software, and later in the information and its related industries has been widely applied, which leads to free disclosure as an important feature of outbound open innovation. For paid opening to the outside world, firms usually adopt joint ventures, sell products that meet market needs, participate in standardization, business incubation, and technology licensing (Chesbrough, 2014).

In the process of development, firms may generate a large number of resources that do not match the current development or are temporarily idle, and under-utilized intellectual property rights. At this time, they can be commercialized to improve the utilization rate of internal innovation resources and reduce the cost of internal maintenance and update. Firms can also improve performance when they sell

intellectual property or introduce ideas into the external environment. On the one hand, the external commercialization of resources such as knowledge no longer limits a firm to its own market, but also enables it to discover and develop new markets by relying on external partners. On the other hand, in the external commercialization process of innovation achievements, firms can not only gain a lot of economic benefits, but also gain a high reputation and a strong influence in the technology market. These non-economic interests are conducive to the establishment of industry standards based on firm technology and the improvement of firm brand influence. Relying on the power of technological discourse and brand advantage, firms can reduce the cost of new technology development and increase the sales of new products (Noh, 2015). Based on the above discussion, the following hypotheses are proposed:

**H2: Outbound open innovation has significant positive impact on firm innovation performance.**

**2.3 Two-way open innovation interaction effect and innovation performance**

Inbound open innovation and outbound open innovation are not independent and closely related. Firms adopting inbound open innovation can obtain a large amount of external resources, including technology, knowledge, information, and manpower. By introducing these resources, firms can enrich existing resource systems, and externally rich resources are a true reflection of the market. Through the introduction of external resource, firm can also discover the current market demand, thereby promoting the firm to enhance its strength to carry out outbound open innovation. In other words, adopting inbound open innovation can promote enterprises to improve relevant knowledge and skills, stimulate enterprises to continuously innovate, and encourage enterprises to transform technological achievements, thus ensures the effective implementation of outbound open innovation. Outbound open innovation pays more attention to the ability of firms to commercialize. It is a means to externally transfer idle resources of firms. On the one hand, it solves the cost of maintenance and renewal of idle resources inside firms, so that firms have more funds to carry out internal innovation or purchase external resources. On the other hand, in the process of outbound open innovation, firms can have some understanding and control of the market environment, clarify the resources in the market, and formulate the firm's next development strategy, so as to carry out internal research and development or search for external resources and technology with more purpose. Based on the above discussion, the following hypotheses are proposed:

**H3: Two-way open innovation interaction effect has significant positive impact on firm innovation performance.**

In sum, based on the above hypotheses, we establish the conceptual model (Figure1).

**Figure 1 The Conceptual Model**

### 3 Date and Methods

#### 3.1 Sampling and data collection

This paper selects manufacturing firms as a research sample, because manufacturing firms have frequent exchanges and extensive cooperation, and obvious characteristics of open innovation compared with other industry firms. The questionnaire survey time of this study is from August to December 2018, and some firms are randomly selected from the manufacturing firms in key provinces and cities in China to issue a questionnaire on the spot. For the questionnaire, the respondent is required to be the middle and senior leaders of the firm or the relevant responsible persons of each department. A total of 300 questionnaires are distributed, and 240 are recovered. The recovery rate was 80%. Excluding the invalid questionnaire, 209 were obtained, and the recovery efficiency was 87.08%.

#### 3.2 Variable measurement

The measurement of the variables in this paper uses the Likert 5-point scoring method. The innovation performance measurement refers to Jugend's research and gets 5 items (Jugend, 2018). The measurement of open innovation refers to the research of Naqshbandi et al., in which the inbound open innovation gets 6 items and the outbound open innovation gets 4 items (Naqshbandi, 2016). The measurement of control variables refers to Randhawa's research, including firm year, firm capital, number of employees and industry (Randhawa, 2016).

### 4 Analysis and Results

#### 4.1 Validity and reliability

In this study, Cronbach's Alpha value of statistical software SPSS23.0 is used to test the reliability of the scale, and exploratory factor analysis is used to test the validity of the scale. According to table 1, the Cronbach's Alpha and CR coefficients of each variable are greater than 0.7, so the scale passes the reliability test. The KMO of each variable is greater than 0.8, indicating that it is suitable for exploratory factor analysis. The factor load factor of each variable exceeds 0.5, and all variables AVE are significantly greater than 0.5, so the scale has good convergence validity. According to Table 2, the square root (diagonal coefficient) of AVE of each variable is greater than the correlation coefficient of the row and column, indicating that the discriminant validity of the scale is good.

**Table 1 Reliability and Validity**

Variables	KMO	Item	Factor loading	CR	AVE	$\alpha$
Inbound open innovation	0.933	I1	0.890	0.958	0.792	0.947
		I2	0.876			
		I3	0.861			
		I4	0.919			
		I5	0.928			
		I6	0.863			

Outbound open innovation	0.818	O1	0.838	0.926	0.716	0.862
		O2	0.874			
		O3	0.814			
		O4	0.840			
Innovation performance	0.871	IP1	0.821	0.904	0.652	0.866
		IP2	0.806			
		IP3	0.802			
		IP4	0.793			
		IP5	0.816			

#### 4.2 Hypothesis tests

Table 2 shows the descriptive statistics for all the variables and their correlations. We adopt the regression equations via software SPSS 23.0 to test the effect of inbound open innovation, outbound open innovation and their interaction to firm innovation performance.

**Table 2 Means, Standard Deviations, AVEs, and Correlations for the Variables**

Variables	1	2	3	4	5	6	7
1 Year	1						
2 Capital	0.063	1					
3.Employee	-0.113	-0.087	1				
4 Industry	-0.133	-0.047	-0.107	1			
5 Inbound	0.081	0.002	-0.104	-0.004	0.889		
6 Outbound	0.074	0.047	0.045	-0.047	0.740**	0.846

Mean	2.620	2.500	2.390	2.470	3.028	2.990	3.180
SD	0.078	0.075	0.075	0.077	0.078	0.067	0.482

Notes: n =209. \*p<0.01; \*\*p<0.00. Figures on the diagonal are the square root of the AVE.

Before constructing the interaction term, this paper centralizes the two-way open innovation to avoid severe multicollinearity problems in the model. Table 3 shows that the explanatory power of M2(relative to M1)is significantly improved ( $\Delta R^2=0.633$ ,  $p<0.001$ ). Inbound open innovation has a significant positive impact on innovation performance ( $\beta=0.644$ ,  $p<0.001$ ), supporting hypothesis H1. Outbound open innovation has a significant positive impact on innovation performance ( $\beta=0.185$ ,  $p<0.05$ ), supporting hypothesis H2. The interaction of two-way open innovation has a significant positive impact on innovation performance ( $\beta=0.097$ ,  $p<0.05$ ), supporting hypothesis H3.

**Table 3 Regression Result of Open Innovation and Innovation Performance**

Variable	M1	M2
Year	0.085	0.033
Capital	0.000	-0.003

Notes: \*p<0.05; \*\*p<0.01; \*\*\*p<0.001. Explained variable: innovation performance.

## 5 Conclusion

Based on the survey data of 209 manufacturing firms in China, this study aims to provide information on how open innovation affects innovation performance. The research conclusion shows that inbound and outbound open innovation can promote innovation performance, which is consistent with the conclusions of most studies. Most importantly, this study confirms that the interaction of two-way open innovation has a significant impact on innovation performance, which not only enriches the research on the relationship between open innovation and innovation performance, but also provides a new theoretical contribution to the research on the relationship between two-way open innovation interaction effect and firm innovation performance.

This paper also has some important practical implications. In increasingly competitive market, firms should actively seek for external innovation elements, and then combine them with internal resources to strengthen their independent innovation capabilities. In addition, firms also need to actively "go global". In the process of "going global", they should pay attention to market information, predict market trend and create frontier products and services in line with market demand.

Besides, our research has some limitation. This study conducts empirical research on manufacturing firms in several representative regions of China in the form of questionnaires, but several regions are relatively independent, so the industries and firms surveyed have certain specialities and limitations, and it is possible to conduct targeted research on firms in a certain cluster area and propose more constructive proposals in the future.

# A Study on the Relationship between Servitization of Manufacturing Industry and Enterprise Performance: Based on the Perspective of Life Cycle

Zhu Zhangli, Fang Ming

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 2404955401@qq.com; fxlasting@whut.edu.cn)

**Abstract:** Taking non-financial listed companies in China's A-share manufacturing industry from 2011 to 2016 as samples, this paper empirically examines the impact of servitization of manufacturing industry on enterprise performance from the perspective of enterprise life cycle. Research found that: (1) In the long run, servitization will bring about the improvement of enterprise performance. (2) There are also differences in the degree of "performance effect" of servitization in different life cycle stages. It reveals U-shape effect for enterprise at growth stage and mature stage, and it is more significant at maturity period, while in the recession stage, it is not obvious. (3) When there are differences in industry competition, the more competitive enterprises are, the more significant u-shaped relationship will be.

**Key words:** Servitization; Enterprise performance; Enterprise life cycle; Industry competition; Paradox of servitization

## 1 Introduction

With the rapid development of information technology and modern management technology, the global industrial structure is gradually shifting from industrial economy to service economy. Under the economic development status of our country, our government timely put forward national strategic planning: the "Made in China 2025", in order to speed up the coordinated development of manufacturing and services, and to promote production for the manufacture industry to transform to a service-oriented one. Service-oriented value-added has become a new engine and new power for the manufacturing industry to carry out profound reform and high-end transformation and upgrading (Kowalkowskiet al., 2017).

At present, scholars at domestic and abroad have carried out many researches around servitization. The provision of services in any organization is taking on greater strategic importance (Eloisaet al., 2018). The studies and disciplines that have the greatest impact on servitization among manufacturing firms have been identified to illustrate the intellectual structure of this discipline (Martín-Peña et al., 2017). The service-oriented transformation is an important source of the competitiveness of China's manufacturing industry, which can effectively expand the value-added space in the value chain (Wang Xiaoping et al., 2019). In order to realize servitization, the resources in the enterprise can be integrated by taking the elements of the business model as attributes. The original key resources and capabilities of manufacturing enterprises are the necessary basis for the transformation of enterprises (Li Jinghua et al, 2019). There are three different views on the relationship between servitization and enterprise performance. Firstly, servitization has a positive effect on enterprise performance. Servitized firms can havemore profits, more employees, and higher total sales than non-servitized firms (Crozet and Milet, 2017). Secondly, servitization has an inhibitory effect on enterprise performance. Advanced services positively affect firms' sales and profitability while basic services negatively affect firms' profitability (Sousa and Silveira, 2017). Furthermore, with the further development of the "service-performance"

empirical research, some experts suggest that service and enterprise performance may not be limited to linear relationships, including “U-shaped” (Szász et al., 2017), “saddle type” (Kastalli and Looy., 2013).

The above research on servitization and enterprise performance has remained at a static level, and has not yet penetrated the enterprise. So, in the different life cycle stages of manufacturing enterprises, how to have the enterprise performance effect brought by the implementation of servitization strategy is still an unsolved problem. In addition, considering the competition intensity of different industries, it is remained unknown that the differences in the performance of enterprises in implementing servitization.

## 2 Theoretical Analysis and Research Hypothesis

The manufacturing industry in China is generally based on processing and assembly, which is in the middle of the “smile curve” of the value chain. While processing and manufacturing are severely and easily manipulated and imitated due to low technical content and product homogeneity problems, resulting in an extremely low product added value. Due to the problem of China's manufacturing background, many manufacturing companies only focus on the expansion of production scale, neglecting intangible assets and human capital. At this point, the adoption of a service strategy will lead to a sharp rise in operating costs and management complexity, thereby curbing enterprise performance. However, with the continuous investment of intermediate elements and the deepening of service awareness, enterprises directly reduce production costs by outsourcing specialized production services. Enterprises outsource non-core links to service corporate and indirectly reduce manufacturing costs. In the organization of activities, not every link can produce value. Some activities create a higher proportion of the value of total value, which needs to focus on. By focusing resources on high-tech products, it is possible to achieve internal economies of scale and external economies of scale (Liu Bin et al., 2016), which can reduce the overall cost of the company, resulting in an increase in enterprise performance. Based on the above analysis, this paper proposes the following assumptions:

**H1: Servitization leads to long-term performance improvement and a certain degree of short-term performance sacrifice.**

Enterprise life cycle theory believes that enterprises with different life cycles reflect different characteristics in corporate governance, management, and finance. Therefore, enterprises need to choose the method and strategy to solve problems. There are big differences in the ability and conditions for companies to implement service strategies in different life cycles. For this reason, the economic consequences of servitization in manufacturing enterprises will be different.

Company at growth stage often do not form stable profitable methods. Their financial strength, technical support and other overall strengths are weak. The ability to develop new businesses is relatively limited, and they do not have competitive advantages. Enterprises have greater resistance to improve their performance through the implementation of service-oriented strategies. Adopting a service strategy in the growth period will reduce enterprise performance.

During the maturity period, the company has a sound organizational structure and rich management experience. The products produced have a large share in the market, it has strong competitive strength. As mentioned above, manufacturing enterprises are initially involved in the service sector, lacking awareness of the market, and there are problems such as information asymmetry and internal organizational changes. However, with the gradual deepening of the service strategy, adopting the “product and service” promotion model will win greater economic benefits for the enterprise.

In the recession period, the sales of enterprises declined, the market share and profit rate began to fall. The poor management within the enterprise hindered the implementation of the service strategy,

and it was easier to face the problem of service dilemma. Therefore, the relationship in the recession period is not obvious. Based on the above analysis, the hypothesis of this paper is proposed.

**H2: There are differences in the “performance effect” of manufacturing enterprises in different life cycle stages.**

There is a significant negative correlation between servitization and performance when enterprise in growth stage; the relationship is “U-type” when company at mature stage; while it is not obvious in recession period.

**3 Research Design**

**3.1 Sample selection and data sources**

In this paper, listed manufacturing companies in China from 2011 to 2016 were selected as the research samples. According to the information disclosed by the CSMAR database for the industry classification of listed companies, the following data were removed from the selected samples: (1) Enterprises established after 2014. (2) ST listed enterprises. (3) Enterprises with missing or incomplete data. In order to make the data more effective, this paper processed the extreme values of the sample data based on the degree of servitization, and finally obtained 1480 valid enterprise data. The financial data involved in this paper are mainly from the CSMAR database, and the missing data are supplemented and verified by combining the sample enterprise website and the annual report disclosed by the enterprise.

**3.2 Measurement of variables**

**3.2.1 Servitization**

According to the above analysis, this paper uses the proportion of service income to the total operating income as the representation of the degree of servitization. The larger the ratio is, the higher the degree of servitization. Since Chinese enterprises are not obliged to disclose service income, because service income is often regarded as a trade secret, which is difficult to obtain specific data. Therefore, this paper uses other operating income of enterprises to approximately replace service business income and calculate the degree of servitization. In addition, considering the possible of non-linear relationship between the degree of servitization and enterprise performance, the quadratic term of service income proportion is set.

**3.2.2 Enterprise life cycle**

Based on the cash flow grouping method proposed by Dickinson, this paper divides the life cycle of an enterprise into three stages: growth stage, maturity stage and decline stage.

**Table1 The Combination of Cash Flow Characteristics at Different Life Cycle Stages**

Cash flow	Growth period		Mature period	Decline period				
Operational cash flow	-	+	+	-	+	+	-	-
Investing cash flow	-	-	-	-	+	+	+	+
Financing cash flow	+	+	-	-	+	-	+	-

### 3.2.3 Industry competition

In this paper, the HHI index, which is the sum of squares of the sales revenue of enterprises in each industry, is used to measure the intensity of competition in the industry. HHI index can well reflect the distribution of the overall sales in the industry. When the number of enterprises in the industry is certain, the higher the HHI index is, the smaller the industry competition will be. In conclusion, if the value of the industry in which the sample is located is greater than the median, therefore the industry is highly competitive; otherwise, this industry is low competition industry.

### 3.2.4 Control variable

In this paper, asset-liability ratio, management ownership ratio, cash degree, enterprise size and enterprise age are selected as control variables.

**Table 2 Study Variable Definition Table**

Variable Type	Symbol	Variable Name	Calculation Formula
Dependent variable	<i>ROA</i>	Rate of return on total assets	$EBIT * 2 / (\text{total assets at the beginning of the year} + \text{total assets at the end of the year})$
Independent Variable	<i>SER</i>	Servitization	Extraordinary gains/ operating income
	<i>LIFE</i>	Enterprise life cycle	Cash flow composition
	<i>HHI</i>	Industry competition	The sum of the squares of the sales revenue of each industry
	<i>DEBT</i>	Asset-liability ratio	Total liabilities / total assets
	<i>SIZE</i>	Scale of the enterprise	$\ln (\text{The book value of the company's total assets})$
	<i>AGE</i>	Age of the enterprise	2016 minus the year the company was founded
	<i>GMS</i>	Managerial ownership ratio	Number of management shares/total shares
Control Variable	<i>FAR</i>	Assets specificity	Net fixed assets/total assets
	<i>CHR</i>	Cash degree	Net cash flow from operating activities/total ending assets

### 3.3 Model design

Referring to previous studies on the relationship between servitization and enterprise performance, this paper combines the above theoretical assumptions and selected variables to build the following specific model:

$$ROA_{i,t} = \beta_0 + \beta_1 Ser_{i,t} + \beta_2 Ser_{i,t}^2 + \sum_{i=1}^n \beta_i Controls_i + \varepsilon$$

## 4 Empirical Analysis

### 4.1 Descriptive statistical analysis and correlation analysis

The new statistical results based on the description of all the variables in the sample data are shown in table 3. According to the sample data, some enterprises have not yet implemented servitization, while some enterprise have as high as 45.42% of servitization degree. However, the average degree of servitization of the sample companies is only 4.85%, far lower than the average level of some developed countries such as the United States and Germany. Therefore, the servitization process of China's manufacturing industry is advancing. Compared with other sub-industries, equipment manufacturing industry has a higher degree of servitization. However, in general, the servitization level of China's manufacturing industry is still low, and its breadth and depth still need to be improved.

**Table 3 Descriptive Statistics**

	N	Min	Max	Mean	Standard Deviation
ROA	5220	-0.6683	1.3936	0.0441	0.0677
SER	5220	0	0.3152	0.042	0.0575
HHI	5220	0.0087	0.4192	0.025	0.0309
DEBT	5220	0	3.3055	0.3452	0.2113
SIZE	5220	3.6889	12.175	7.6788	1.0793
AGE	5220	1	36	14.51	3.729
GMS	5220	0	0.8973	0.178	0.2247
FAR	5220	0	0.8091	0.1589	0.1283
CHR	5220	-0.4726	0.5817	0.0368	0.0735

Besides, the correlation analysis shows that the correlation coefficient between most variables is less than 0.5, indicating that the correlation between explanatory variables and control variables is weak.

### 4.2 Regression analysis

The regression results of model (1) shows that, in the overall sample, the coefficient of the first term of servitization is significantly negative, while the coefficient of the second term of servitization is significantly positive, indicating that there is a u-shaped curve relationship between the degree of servitization (SER) and the net interest rate of total assets (ROA). The test results are consistent with H1.

**Table 4 The Impact of Different Life Cycle Servitization on Enterprise Performance**

	Total	Growth	Mature	Decline
SER	-0.311***	-0.246***	-0.277***	-0.135
	(-7.837)	(-4.793)	(-4.373)	(-0.855)

SER2	1.037*** (6.030)	0.677*** (3.042)	0.800*** (2.789)	0.557 (0.866)
HHI	0.046*** (5.471)	0.037*** (5.233)	0.042*** (4.381)	0.031** (2.492)
DEBT	-0.109*** (-24.105)	-0.104*** (-17.597)	-0.127*** (-17.705)	-0.139*** (-7.845)
SIZE	0.009*** (10.824)	0.006*** (5.080)	0.012*** (9.360)	0.018*** (5.464)
AGE	0.001*** (2.590)	0.000 (0.500)	0.001*** (3.003)	0.003** (2.149)
GMS	0.031*** (7.783)	0.036 (6.951)	0.036*** (5.915)	0.035 (0.866)
FAR	-0.043*** (-6.420)	-0.031*** (-3.359)	-0.027*** (-2.788)	-0.091*** (-3.453)
CASH	0.192*** (16.904)	0.199*** (12.516)	0.308*** (14.604)	0.222*** (4.619)
N	5220	2643	1850	727
R2	0.240	0.255	0.317	0.337

The results of different life cycle of regression are shown in table 4, growth period and mature period are significant negative coefficient of service, while quadratic coefficient is positive. Regardless of enterprise in the growth and maturation, the level of service and enterprise performance is a u-shaped curve relationship, but under 1% significance level, the relationship of mature enterprise is more significant. The first term coefficient and the second term is negative and positive respectively, but they are not significant at the level of 10%, indicating that the effect of the servitization strategy is not efficient. This test result is not completely consistent with H2 above. Although the comprehensive strength of enterprises in the growth stage is weak, its effect on enterprise performance is not always negative with the advancement of servitization. After reaching a certain critical point, servitization can also promote the improvement of enterprise performance in the growth stage.

## 5 Further Discussion and Robustness Analysis

### 5.1 The service effect of manufacturing enterprises under the different industry competition

In addition to enterprise life cycle, industry competition intensity is also an important factor

affecting enterprise performance. The HHI index is used to divide the entire sample into low-competitive industries and high-competitive industries for regression of model (1), and the results are shown in table 5.

**Table 5 The Regression Results under the Difference of Industry Competition**

	Total	Low-competitive industry	High-competitive industry
SER	-0.311*** (-7.837)	-0.264*** (-4.547)	-0.329*** (-6.068)
SER <sup>2</sup>	1.037*** (6.030)	0.899*** (3.606)	1.110*** (4.691)
HHI	0.046*** (5.471)	/	/
DEBT	-0.109*** (-24.105)	-0.130*** (-19.885)	-0.086*** (-13.760)
SIZE	0.009*** (10.824)	0.010*** (8.171)	0.008*** (6.538)
AGE	0.001*** (2.590)	0.001** (2.076)	0.001* (1.704)
GMS	0.031*** (7.783)	0.039*** (6.481)	0.026*** (4.775)
FAR	-0.043*** (-6.420)	-0.033*** (-3.563)	-0.061*** (-5.531)
CASH	0.192*** (16.904)	0.159*** (9.964)	0.233*** (14.425)
N	5220	2548	2672
R <sup>2</sup>	0.240	0.261	0.281

According to the results, the low and high competition industry competition is a significant negative coefficient of service industry, the secondary coefficient is positive. It shows that the strength of the companies in any industry competition, the relationship both show a u-shaped curve. Under 1% significance level, the quadratic term coefficient of highly competitive enterprise is significantly greater than that of low-competitive industries, which indicates that the more competitive the company, the more obvious the u-shaped curve.

## 5.2 Robustness analysis

Reappraisal of enterprise performance. It is too simple to use the net interest rate on total assets as the indicator of enterprise performance. This paper further uses ROE to represent enterprise performance, and then conducts regression on the overall sample data and sample data of different life cycles. The results show that the magnitude and direction of the key coefficient are basically the same, while the other control variables remain relatively stable. This result proves the reliability of the corresponding empirical results to a large extent. Due to the limitation of space, the regression results of control variables are not listed in this paper.

**Table 6 The Impact of Different Life Cycle Servitization on Enterprise Performance**

	Total	Growth	Mature	Decline
SER	-0.293*** (-3.089)	-0.207*** (-3.831)	-0.282*** (-4.465)	-0.148 (-0.927)
SER2	0.983*** (5.581)	0.552*** (2.866)	0.838*** (2.928)	0.625 (0.960)
N	5220	2643	1850	727
R2	0.236	0.220	0.301	0.318

## 6 Conclusion

Based on the theory of enterprise life cycle, through the regression of sample data, the research findings of this paper are as follows: (1) There is a u-shaped curve relationship between servitization and enterprise performance. The information asymmetry or the limitation of their own resources leads to the decline of short-term performance of enterprises. (2) The influence of manufacturing servitization on enterprise performance varies in different life cycle stages. (3) Further research finds that the more competitive the industry is, the more significant the impact of servitization on enterprise performance will be. The results show that enterprises need to be identified according to their life cycle stages when implementing the servitization strategy. It should be noted that it takes time for the "performance effect" of servitization to play its role. Therefore, a reasonable choice of servitization strategy in different life cycles can be an important means for enterprises to improve performance.

Many of the literature related to the derivative services of manufacturing companies emphasize that services play a significant role in the ability of manufacturing companies to enhance their competitiveness, but it is still unknown that how services play a role in this process. The ability status of different enterprises to transform into service-oriented manufacturing has certain differences. What kind of aspects (product technology, service capability, etc.) should be derived from services in order to achieve competitiveness improvement and transfer of enterprise capability status is worth studying.

# The Innovation and Management of China's Urban Brand Image under Experience Service Economy

Li Huipeng<sup>1</sup>, Zhang Yazhou<sup>2</sup>

<sup>1</sup> Wuhan University of Technology, Wuhan, P.R. China, 430070

<sup>2</sup> Maoming Vocational and Technical College, Maoming, P.R. China, 525000

(E-mail: 411276362@qq.com, 360954128@qq.com)

**Abstract:** China's economic development has changed from high-speed growth to high-quality development. However, the domestic traditional economic development model is difficult to support the development of urban industrial clusters and the construction of urban brand image. The evolution of global economic development has brought innovation and management inspiration to the shaping of urban brand image. The construction and perception of city brand image mainly includes the shaping of five sense experience and the innovative thinking of urban brand image, which allows customer to pay attention to the point of the city brand friendly experience image, accurately and quickly spread the city brand image innovation value and disseminate management space. In this paper, an image innovation and management strategy is proposed by using field research and literature research methods for the experiential economic service in China. The construction strategy and innovative management mode are achieved through the combination of urban brand image innovation management and experience economic service under the experience economy service.

**Key words:** Experience service; Urban brand; Image building; Innovation and management

## 1 Introduction

### 1.1 Experience service economy

Experience service economy is a kind of service economy in which experience is emphasized when products or services are purchased. The younger generation consumers pay increasing attention to the "experience" during the procedure of purchasing products, especially in the area of urban. This kind of "Experience" is able to make customers fully feel the charm of the city brand to create the interaction and intimacy and a sense of belonging to the city brand. Experience service economy is the development of the consumer economy, emphasizing the material needs and feelings of customers, and paying attention to the psychological experience of the service economic behavior audience. It is a new type of economic development from passive consumption to active service to experience interaction. Different from the enterprise product economy and the service consumption economy, experience service economy pays more attention to the audience participation and self-experience. Through the experience-aware service, the audience identity and good expression can be enhanced so that the need and spiritual enjoyment of customers can be fully satisfied.

## 1.2 Urban brand image

The city brand image stands out in the era of experience service economy, providing a feasible idea for the formation of urban brand value competitiveness, and plays significant role in the competition between cities. The interpretation for “Brand” in the Oxford dictionary is “to prove ownership, as a sign of quality or other purposes”, mainly used to distinguish and display quality<sup>71</sup> (Li Cheng, 2010). With the long-term development and the emergence of new commodities, the brand’s connotation is also becoming mature and rich, mainly referring to the combination of elements such as words, symbols, patterns, etc., which have been known widely today.

The city brand is developed and studied combining brand and the image of city after the maturity of the corporate brand, and with the accumulation of design practice experience. As professor Keith Dinnie in the University of Duke said: “The power of urban branding is to let People understand and know a certain area and naturally associate a certain image and association with the existence of the city, let its spirit blend into every building in the city, and let competition and life coexist with the city.”(Keith Dinnie, 2014)

The urban brand image is the external image and visual modeling symbol of the city brand. It establishes its own image position and the core value through a long-term accumulation of the development of the city, and then integrates the development context of the city into the brand's visual image.

## 1.3 The relationship between experience economy and urban brand image

Experience economy meets the need of high-quality service of customers. The city brand image is the direct feeling of people during the experience procedure of city service and the human landscape of the city. The urban brand image carries out economic activities and the feelings through the urban experience service carrier, and at the same time affects the cognitive establishment of the city brand image in the audience psychology. It can be said that experience economy and urban brand image are interrelated and mutually compatible.

The intangible assets accumulated by the city brand image have a demonstration effect on improving the development of the service economy, and at the same time enhance the reputation and popularity of the city brand image. The city brand image is influenced by the economic development of the experience service, and it is counterproductive to the experience service economy. The goodness of the urban experience service economy plays a crucial role in brand image formation and management (Ping Yang, 2007).

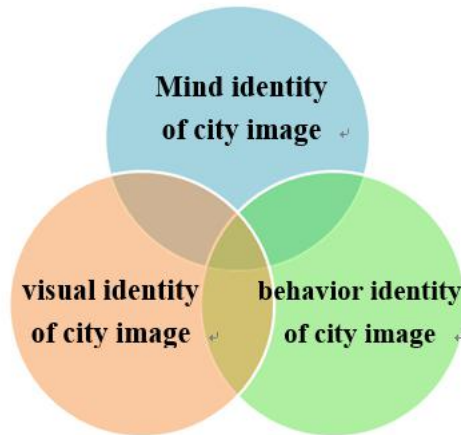

## 2 The Innovation Path of Urban Brand Image with Experience Economy

City brand image is a brand development strategy, which is mainly composed of three parts: urban concept recognition, city image visual recognition and city image behavior recognition, as shown in Figure 1(Xuqing Zhu, 2014). It shows the individualized characteristics and development vision of urban development. The identification is transmitted to people, which in turn allows people to identify

---

<sup>71</sup> Li Cheng. Brand interpretation culture pursuit. 2010. <http://theory.people.com.cn/GB/12008739.html> (In Chinese)

with the image of the city. The city brand image is mainly used to display the charm of urban brands, increase the competitiveness of urban brands, and at the same time be the public image and external evaluation accumulated by the city in the long-term development(Shunshu Xie, 2013).

**Figure 1 The Components of Urban Brand Image**

### **2.1 Mind identity of city image**

Urban development depends on the economic vitality and creation of the city. Experience service economy is an important reference factor for creating an innovative city. Only by establishing the core concept of urban development can the construction and concrete implementation of the planned city brand image be guided. The recognition of city image concept reflects the core of urban value and has strong cultural cohesion. Beijing, as China's political, economic and cultural center, carries important functions of the capital (Juai Pang, 2016). Based on the actual development of the city, Beijing puts forward the development concept of building an international and innovative city. This is not only the cultural heritage of Beijing but also the positioning of Beijing itself. Mind recognition to spread a personalized experience image to the audience.

### **2.2 Visual identity of city image**

The urban visual image recognition system is the result of visual symbolization under the development of service economy, and the city concept is displayed through unique visual modeling. The city image visual recognition system can actively display the external quality and intuitive image of the city and create good opportunities for promoting economic development and audience service experience (Hongbo Wang, 2011). Visual recognition is to enrich the visual language of the city image by visualizing symbols. The visual language of intuition, refinement, fun and experience is directly displayed in the audience experience, so that the audience can achieve a sense of identity and achieve the purpose of visual recognition of the city brand image.

Melbourne is a coastal city in southern Australia. Melbourne, under the rapid economic development, realizes that the experience service economy brings great vitality to urban development, and the establishment of urban brand image is also imperative. Melbourne has designed the urban brand image as an important city brand asset accumulation, with the aim of demonstrating the city's image of openness, service and innovation, as shown on Figure 2. The updated city brand image is constructed and optimized with the first letter "M" of Melbourne as the creative point. The shape is full of three-dimensional composition and the characteristics of the times. The image color system boldly breaks

through the colorful charm of Melbourne's urban charm and highlights the vitality, innovation and openness of Melbourne's urban image.

Figure 2 The Upgraded City Image of Melbourne

### 2.3 Behavior identity of city image

The behavior recognition is a behavioral practice integrating concept recognition and visual recognition. It is the comprehensive support of the city brand image landing, mainly applied in the administrative management, cultural education, system reform and other aspects of urban economic development (Qing Guo, 2009). The purpose is to display the urban brand image concept and convey the visual image of the city brand. Hong Kong's urban brand image is a good implementation of urban development concept and visual image creativity in behavior recognition (Xiangming Shun, 2012). Hong Kong is one of the more dynamic cities in Asia's economic development. In recent years, Hong Kong has used the service economy as a carrier and the audience experience as an opportunity to conduct cities. Brand image optimization, and also the first innovative city to promote the city brand image with commercial economic thinking.

Through the positioning of urban development, it can be seen that Hong Kong hopes to innovate its image and maintain contacts that can attract public attention to Hong Kong's urban brand image so as to give people a good association with Hong Kong, an international metropolis, and deep the loyalty of the brand image. The "Hong Kong Brand", as shown on Figure 3, which was updated by Mr. Chen Youjian, retains the original design of the original dragon pattern, making the updated image more modern and aesthetic. The historical context of Hong Kong and the atmosphere of the service economy experience have been combined perfectly. The blue dragons are coming from afar. The green ribbons and blue sky and green areas show the development ideas and positioning of Hong Kong's cities. The blue sky and green trees create the city's sustainable development. The overall image represents the open, diversity and courage of Hong Kong city with a ribbon of ethereal and ethereal gestures.

Figure 3 The City Brand Image of Hongkong

The urban brand image innovation path under the modern experience service economy should focus on the progress of consumption to experience so that the audience can fully feel the intercommunication of the city service economy, and give a true and reliable sense of belonging. The image of the city brand in experience service economy reflects the strong commercial economic needs, and it is necessary to deeply grasp the great turning point and challenge brought by the city brand image of the “experience service economy” value team. At the same time, the history and culture of the city's own development is associated with the continuity and sustainability of experience service economy, paying attention to the timely development concept of the city brand image, and implementing the urban brand visual image design into the city's brand characteristics.

To build a city brand image is to create a city brand image with great experience in service economy. The city brand image is also an experience service carrier for urban economic development. It is necessary to be good at making the innovation of urban brand image as the differentiated point of personality development with other cities. Through the city brand image strategy, the development of experience service economy could be driven and explored fully by integrating and refining the city's service economic resources and experience context.

The main path to the construction of urban brand image:

First of all, the orientation of city development is established. The city's overall core competitiveness and cohesiveness focus on the urban brand equity, which can enhance the influence and added value of urban brand image.

Secondly, urban brand image is created by people experience to improve the quality of urban branding. Through improving the experience of urban service economic development, the city's brand is built more highly and deeply so as to promote the construction of urban brand image mechanism.

In return for the city brand image assets, it promotes the high-quality development of the city's service economy. The development of urban service economy should be based on the audience's experience of urban brand image. Continuously promoting urban brand assets can make the city products and services more brand-value premium, creating a more comfortable experience environment for the future sustainable development of the city.

### **3 The Management Mode of Urban Brand Image with Experience Economy**

Effective management of the city's brand image can promote its innovation under the experience service economy development, because the city brand image has a great impact on the development of the city's service economy (Lisha Cui, 2017). It is necessary to scientifically manage the city brand image in time to make it more effective (David A. Aaker, 2012). The promotion of urban brand development emphasizes the characteristics of urban brand image management differentiation and diversification under the experience service economy environment, and builds a management model suitable for urban brand image in the experience of service economy development, and promotes the sustainable development of urban brand image.

First of all, the core of the city's brand image needs to be highlighted. The risk management and effective response measures need to be increased from the perspective of experiencing the service economy. In the process of understanding the image of the city's brand, people mainly come from the service experience. In the environment of experience service economy, the audience has an understanding of the city brand image in a short period of time. Under the experience service economy environment, the core of the experience of the city brand image should be highlighted.

Secondly, accurate management is necessary to effectively cope with the crisis of urban brand image. In the management of urban brand image, the diversified cognitive changes and public opinion monitoring should be paid attention in the environment of experience service economy. The precise management is able to improve the influence of the city brand image so that the audience can feel the connotation and differentiated personality of the development of the city brand image in the new service experience, which can improve the quality of city brand image management.

Thirdly, service experience management is taken as the target to meet the differentiated needs of the audience in the cognitive city brand image. In the experience service economy environment, it is necessary to pay attention to the competitiveness of the city brand image in real time, and take the brand management as the path to highlight the differentiation of the city brand image.

#### **4 Conclusion**

The city brand image is a booster in the era of experiencing the development of service economy, and will play an irreplaceable role in the construction of innovative cities. It is necessary to construct the city brand image with the innovation path and exert its continuous promotion role in the development of urban economic construction. The management model is taken as the starting point to maintain the whole process of urban brand image as an important task, avoiding the negative influence of urban brand image from being generated by the audience. Therefore, it is necessary to pay attention to the innovation path and management monitoring of the city brand image in the experience service economy environment, and continue to establish the audience's recognition and loyalty to the city brand image.

# House of Quality-Based Analysis of Green Supply Chain Management for the Sustainable Investment Decisions with Interval Type 2 Fuzzy Hybrid Model

Luis Martínez<sup>1</sup>, Hasan Dinçer<sup>2</sup>, Serhat Yüksel<sup>2</sup>

1 Universidad de Jaén, Spain,

2 İstanbul Medipol University, Turkey,

(E-mail: martin@ujaen.es, hdincer@medipol.edu.tr, serhatyukse@medipol.edu.tr)

**Abstract:** The aim of the study is to propose a set of criteria for the customer needs and technical requirements of green supply chain management in the sustainable investment decisions. For that, house of quality has a unique role to evaluate the customer and technical factors at the same time. Accordingly, house of quality-based analysis of green supply chain management for the sustainable investment decisions is applied for measuring the performance of technical requirements with respect to customer expectations. A hybrid decision making method is applied for ranking the technical factors of green supply chain management for the sustainable investment decisions. Interval type 2 fuzzy DEMATEL is used for weighting the criteria of customer expectations and then interval type 2 fuzzy TOPSIS is employed for ranking the factors of technical requirements for the green supply chain management. The findings show that reuse of product and services is the most significant criterion. It shows that companies should firstly focus on this issue to gain an opportunity to reduce costs. Another important conclusion is that waste management is the most important technical requirement for the green supply chain management. Therefore, it is recommended that companies should make technological investments in waste management. In this context, they should provide necessary comprehensive machines, materials and equipment in the context of innovative strategy, employ qualified personnel capable of using this equipment and give necessary training to the existing personnel.

**Key words:** Green supply chain management; House of quality; Investment; Interval type 2 fuzzy sets; DEMATEL; TOPSIS

## 1 Introduction

With globalization, there has been a significant increase in world trade. The main reason for this is the abolition of trade borders between countries. This increasing trade around the world has been effective in increasing both production and consumption. As a result, there has been a significant increase in the competition in the market. High competition has led companies to develop new strategies. Otherwise, they will not be able to continue their activities in this harsh competitive environment. Within this framework, companies have tried to produce innovative strategies in order to gain competitive advantage (Gabrielsson et al., 2016).

Logistics sector is one of the most important sectors affected by globalization. This increased trade has made the logistics sector more important worldwide. In order to maintain international trade in a healthy way, the products must be delivered to the other party completely. In this context, the concept of supply chain is the general name given to the movement of the product, service or money flow from the supplier to the customer and the activities within this process. This concept has emerged especially in order to meet the many needs arising from increasing international trade. In this period, a good logistics strategy was needed to adapt to the change in the production market and to manage more complex logistics networks (Ceniga and Sukalova, 2015).

The most important problem in the logistics sector is considered as carbon dioxide emission due to excessive energy consumption. This has become a serious problem for the ecological environment. However, sensitivity to environmental issues is increasing throughout the world. As a result, it has become necessary for logistics companies to take action against this problem (Paksoy et al., 2019). In this context, logistics companies have taken serious steps to find innovative solutions. For this purpose, the most prominent solution is the green supply chain implementation. It is a kind of supply chain management in which environmentally friendly product or service production strategies are combined (Zhu et al., 2017). It mainly aims to reduce environmental negative impacts of companies. In addition, it also increases efficiency and provides a major competitive advantage in innovation and processes. Green purchasing, green production and material management, green distribution and marketing and

reverse logistics are accepted main implementations of this issue (Shibin et al., 2016; Tachizawa et al., 2015).

In this study, it is aimed to evaluate the green supply chain management for the sustainable investment decisions. For this purpose, a set of criteria for the customer needs and technical requirements of green supply chain management is proposed. In the analysis process, interval type 2 fuzzy DEMATEL is used to weight the criteria of customer expectations. On the other side, technical requirement factors for the green supply chain management are ranked by using interval type 2 fuzzy TOPSIS approach. According to the analysis results, strategies can be developed to obtain the sustainable investment policies by selecting the criteria of green supply chain management.

This study includes many different novelties. Firstly, house of quality approach is implemented to evaluate the customer and technical factors at the same time. This situation provides us to understand the most significant technical requirement based on these expectations. In addition to this situation, interval type-2 fuzzy logic is firstly considered in this study to make analysis for logistic industry. Hence, this issue has an important contribution to the originality of this study. Finally, a weighted set of criteria is provided to understand the customer expectations regarding green supply chain management subject.

This study has mainly 5 different sections. In this section, general information related to the issues of logistic, supply chain management and green supply chain management are provided. In the second section, the studies regarding green supply chain management and investment decisions are analyzed. The third section includes the explanations about the methods used in this study. Furthermore, analysis results are shared in the fourth section. In the last section, necessary recommendations are discussed.

## 2 Literature Review

The green supply chain management subject was discussed in the literature very much. It is obvious that most of these studies are related to the performance analysis of this issue. Chin et al. focused on the green supply chain management performance in Malaysia (Chin et al., 2015). They concluded that companies should consider environmental factors to provide sustainability in supply chain management activities. Also this issue was identified in (Cousins et al., 2019). Vanalle et al. evaluated the performance of supply chain activities for Brazilian automotive industry (Vanalle et al., 2017). The similar result was also underlined according to the analysis results. Parallel to them, other studies emphasized the importance of this factor (Geng et al., 2017; Li et al., 2016; Govindan et al. 2015).

Additionally, it is seen that different methodologies were taken into consideration in these studies. (Dubey et al., 2015; Tachizawa et al., 2015; Kirchoff et al., 2016) conducted a survey analysis to measure the performance of the green supply chain in many different regions. In this process, they asked different questions to many people. According to their answers, they aimed to identify the important points. On the other side, (Uygun and Dede, 2016; Kusi-Sarpong et al., 2016) considered fuzzy multi-criteria decision making techniques to reach this objective. In the analysis process, firstly, they defined many different indicators. With the help of these methodologies, they tried to find the significances of these indicators.

Some studies defined that an important factor of green supply management is customer satisfaction. For instance, in (Laari et al., 2016) was stated that companies should consider customer expectations in green supply chain operations. Similarly, (Chavez et al., 2016; Teixeira et al., 2016; Zhu et al. 2017) conducted an analysis to improve the performance of the green supply chain activities. They reached the conclusion that customers should be satisfied for the success of the green supply chain management. Furthermore, (Zhu et al., 2017; Schmidt et al., 2017; Seles et al., 2016; Luthra et al., 2015) aimed to analyze this situation and identified that companies should understand and satisfy customer expectations to have higher performance in green supply chain management.

Moreover, risk assessment of the green supply chain management was made by many different researchers. They mainly aimed to identify the significant risk of the companies in this process. After that, they tried to identify which of these risks are more important for the companies. In the final stage, necessary actions were defined to manage these risks. For instance, (Mangla et al., 2015) determined 25 common risks of the green supply chain management by reviewing the similar studies in the literature for Indian companies. These risks are weighted by using fuzzy AHP approach. Also in (Paksoy et al., 2019) was made this analysis by using the same methodology. In addition, (Wang et al., 2016; Shibin et al., 2016; Tachizawa et al., 2015) are other studies which performed similar analysis.

On the other hand, investment decisions on green supply chain management were considered in many different studies. As an example, (Bai et al., 2016) conducted a study to manage investment in green supply management. In the analysis process, fuzzy clustering approach is considered. In (Yan et al., 2018) was also made similar analysis while implementing prisoner's dilemma on competing retailers' investment in green supply chain management. Additionally, (Sun et al., 2019) made a similar analysis and concluded that government subsidy mechanism plays a very significant role to make investment in green supply chain management, (Wu et al., 2019); Yang et al., 2019; Rostamzadeh et al., 2015) also focused on similar issues in their studies. As a result of the literature review, it is determined that a new study can be conducted to evaluate investment issues in green supply management with a new methodology, such as interval type-2 fuzzy logic.

### 3 Methodology

In this section, different methods used in this study are explained. In this framework, firstly, interval type-2 fuzzy sets are explained. After that, necessary information is given about interval type-2 fuzzy DEMATEL and interval type-2 fuzzy TOPSIS.

#### 3.1 IT2 fuzzy sets

$\tilde{A}$  refers to the type-2 fuzzy set. On the other side, the membership function is given as  $\mu_{\tilde{A}(x,u)}$ . It can get a value between 0 and 1. The details of these items are given on the equation (1) (Xu et al., 2019; Liu et al., 2019; Dinçer et al., 2019a).

$$\tilde{A} = \{(x,u), \mu_{\tilde{A}(x,u)} | \forall x \in X, \forall u \in J_x \subseteq [0,1]\} \text{ or } \tilde{A} = \int_{x \in X} \int_{u \in J_x} \mu_{\tilde{A}}(x,u) / (x,u) J_x \subseteq [0,1] \quad (1)$$

Moreover, this membership function can be replaced with  $\Sigma$  regarding the discrete universe. Equation (2) gives information about this process.

$$\tilde{A} = \int_{x \in X} \int_{u \in J_x} 1 / (x,u) J_x \subseteq [0,1] \quad (2)$$

$\tilde{A}_i^U$  and  $\tilde{A}_i^L$  explain the upper and lower trapezoidal membership functions detailed in the equation (3).

$$\tilde{A}_i = (\tilde{A}_i^U, \tilde{A}_i^L) = ((a_{i1}^U, a_{i2}^U, a_{i3}^U, a_{i4}^U; H_1(\tilde{A}_i^U), H_2(\tilde{A}_i^U)), (a_{i1}^L, a_{i2}^L, a_{i3}^L, a_{i4}^L; H_1(\tilde{A}_i^L), H_2(\tilde{A}_i^L))) \quad (3)$$

On the other side, the equations (4)-(8) give all details about the calculation process.

$$\begin{aligned} \tilde{A}_1 \oplus \tilde{A}_2 &= (\tilde{A}_1^U, \tilde{A}_1^L) \oplus (\tilde{A}_2^U, \tilde{A}_2^L) \\ &= \left( (a_{11}^U + a_{21}^U, a_{12}^U + a_{22}^U, a_{13}^U + a_{23}^U, a_{14}^U + a_{24}^U; \min(H_1(\tilde{A}_1^U), H_1(\tilde{A}_2^U)), \min(H_2(\tilde{A}_1^U), H_2(\tilde{A}_2^U))), \right. \\ &\quad \left. (a_{11}^L + a_{21}^L, a_{12}^L + a_{22}^L, a_{13}^L + a_{23}^L, a_{14}^L + a_{24}^L; \min(H_1(\tilde{A}_1^L), H_1(\tilde{A}_2^L)), \min(H_2(\tilde{A}_1^L), H_2(\tilde{A}_2^L))) \right) \quad (4) \end{aligned}$$

$$\begin{aligned} \tilde{A}_1 \ominus \tilde{A}_2 &= (\tilde{A}_1^U, \tilde{A}_1^L) \ominus (\tilde{A}_2^U, \tilde{A}_2^L) \\ &= \left( (a_{11}^U - a_{24}^U, a_{12}^U - a_{23}^U, a_{13}^U - a_{22}^U, a_{14}^U - a_{21}^U; \min(H_1(\tilde{A}_1^U), H_1(\tilde{A}_2^U)), \min(H_2(\tilde{A}_1^U), H_2(\tilde{A}_2^U))), \right. \\ &\quad \left. (a_{11}^L - a_{24}^L, a_{12}^L - a_{23}^L, a_{13}^L - a_{22}^L, a_{14}^L - a_{21}^L; \min(H_1(\tilde{A}_1^L), H_1(\tilde{A}_2^L)), \min(H_2(\tilde{A}_1^L), H_2(\tilde{A}_2^L))) \right) \quad (5) \end{aligned}$$

$$\begin{aligned} \tilde{A}_1 \otimes \tilde{A}_2 &= (\tilde{A}_1^U, \tilde{A}_1^L) \otimes (\tilde{A}_2^U, \tilde{A}_2^L) \\ &= \left( (a_{11}^U \times a_{21}^U, a_{12}^U \times a_{22}^U, a_{13}^U \times a_{23}^U, a_{14}^U \times a_{24}^U; \min(H_1(\tilde{A}_1^U), H_1(\tilde{A}_2^U)), \min(H_2(\tilde{A}_1^U), H_2(\tilde{A}_2^U))), \right. \\ &\quad \left. (a_{11}^L \times a_{21}^L, a_{12}^L \times a_{22}^L, a_{13}^L \times a_{23}^L, a_{14}^L \times a_{24}^L; \min(H_1(\tilde{A}_1^L), H_1(\tilde{A}_2^L)), \min(H_2(\tilde{A}_1^L), H_2(\tilde{A}_2^L))) \right) \quad (6) \end{aligned}$$

$$\begin{aligned} k\tilde{A}_1 &= (k \times a_{11}^U, k \times a_{12}^U, k \times a_{13}^U, k \times a_{14}^U; H_1(\tilde{A}_1^U), H_2(\tilde{A}_1^U)), \\ &\quad (k \times a_{11}^L, k \times a_{12}^L, k \times a_{13}^L, k \times a_{14}^L; H_1(\tilde{A}_1^L), H_2(\tilde{A}_1^L)) \quad (7) \end{aligned}$$

$$\begin{aligned} \frac{\tilde{A}_1}{k} &= \left( \frac{1}{k} \times a_{11}^U, \frac{1}{k} \times a_{12}^U, \frac{1}{k} \times a_{13}^U, \frac{1}{k} \times a_{14}^U; H_1(\tilde{A}_1^U), H_2(\tilde{A}_1^U) \right), \\ &\quad \left( \frac{1}{k} \times a_{11}^L, \frac{1}{k} \times a_{12}^L, \frac{1}{k} \times a_{13}^L, \frac{1}{k} \times a_{14}^L; H_1(\tilde{A}_1^L), H_2(\tilde{A}_1^L) \right) \quad (8) \end{aligned}$$

#### 3.2 IT2 fuzzy DEMATEL

DEMATEL approach is used to identify the importance of different criteria under the complex environment. In addition to this issue, the main advantage of DEMATEL approach is that it can be used to identify the impact relationship map among the criteria. Hence, it can be possible to understand the influencing and influenced criteria. This methodology can be considered with interval type-2 fuzzy logic. In the first step of the analysis process, expert opinions are converted to the interval type-2 fuzzy logic (Dinçer and Yüksel, 2019; Pandey et al., 2019; Dinçer et al., 2019b,c; Tang and Dinçer, 2019). Initial direct relation matrix is generated in the second step as in the equation (9) and (10).

$$\tilde{Z} = \begin{bmatrix} 0 & \tilde{z}_{12} & \dots & \dots & \tilde{z}_{1n} \\ \tilde{z}_{21} & 0 & \dots & \dots & \tilde{z}_{2n} \\ \vdots & \vdots & \ddots & \dots & \dots \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \tilde{z}_{n1} & \tilde{z}_{n2} & \dots & \dots & 0 \end{bmatrix} \quad (9)$$

$$\tilde{Z} = \frac{\tilde{Z}^1 + \tilde{Z}^2 + \tilde{Z}^3 + \dots + \tilde{Z}^n}{n} \quad (10)$$

Thirdly, this matrix is normalized with the help of the equations (11), (12) and (13).

$$\tilde{X} = \begin{bmatrix} \tilde{x}_{11} & \tilde{x}_{12} & \dots & \dots & \tilde{x}_{1n} \\ \tilde{x}_{21} & \tilde{x}_{22} & \dots & \dots & \tilde{x}_{2n} \\ \vdots & \vdots & \ddots & \dots & \dots \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \tilde{x}_{n1} & \tilde{x}_{n2} & \dots & \dots & \tilde{x}_{nn} \end{bmatrix} \quad (11)$$

$$\tilde{x}_{ij} = \frac{\tilde{z}_{ij}}{r} = \left( \frac{z_{a_{ij}}}{r}, \frac{z_{b_{ij}}}{r}, \frac{z_{c_{ij}}}{r}, \frac{z_{d_{ij}}}{r}; H_1(z_{ij}^U), H_2(z_{ij}^U) \right), \left( \frac{z_{e_{ij}}}{r}, \frac{z_{f_{ij}}}{r}, \frac{z_{g_{ij}}}{r}, \frac{z_{h_{ij}}}{r}; H_1(z_{ij}^L), H_2(z_{ij}^L) \right) \quad (12)$$

$$r = \max \left( \max_{1 \leq i \leq n} \sum_{j=1}^n z_{d_{ij}}, \max_{1 \leq i \leq n} \sum_{j=1}^n z_{d_{ij}} \right) \quad (13)$$

After that, in the next step, the total influence fuzzy matrix ( $\tilde{T}$ ) is created by using the equations (14)-(18).

$$X_{\tilde{a}} = \begin{bmatrix} 0 & a'_{12} & \dots & \dots & a'_{1n} \\ a'_{21} & 0 & \dots & \dots & a'_{2n} \\ \vdots & \vdots & \ddots & \dots & \dots \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ a'_{n1} & a'_{n2} & \dots & \dots & 0 \end{bmatrix}, \dots, X_{\tilde{h}} = \begin{bmatrix} 0 & h'_{12} & \dots & \dots & h'_{1n} \\ h'_{21} & 0 & \dots & \dots & h'_{2n} \\ \vdots & \vdots & \ddots & \dots & \dots \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ h'_{n1} & h'_{n2} & \dots & \dots & 0 \end{bmatrix} \quad (14)$$

$$\tilde{T} = \lim_{k \rightarrow \infty} \tilde{X} + \tilde{X}^2 + \dots + \tilde{X}^k \quad (15)$$

$$\tilde{T} = \begin{bmatrix} \tilde{t}_{11} & \tilde{t}_{12} & \dots & \dots & \tilde{t}_{1n} \\ \tilde{t}_{21} & \tilde{t}_{22} & \dots & \dots & \tilde{t}_{2n} \\ \vdots & \vdots & \ddots & \dots & \dots \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \tilde{t}_{n1} & \tilde{t}_{n2} & \dots & \dots & \tilde{t}_{nn} \end{bmatrix} \quad (16)$$

$$\tilde{t}_{ij} = (a''_{ij}, b''_{ij}, c''_{ij}, d''_{ij}; H_1(\tilde{t}_{ij}^U), H_2(\tilde{t}_{ij}^U)), (e''_{ij}, f''_{ij}, g''_{ij}, h''_{ij}; H_1(\tilde{t}_{ij}^L), H_2(\tilde{t}_{ij}^L)) \quad (17)$$

$$[a''_{ij}] = X_{\tilde{a}} \times (I - X_{\tilde{a}})^{-1}, \dots, [h''_{ij}] = X_{\tilde{h}} \times (I - X_{\tilde{h}})^{-1} \quad (18)$$

Finally, the influence degrees are calculated as in the equations (19) and (20).

$$\tilde{D}_i = \left[ \sum_{j=1}^n \tilde{t}_{ij} \right]_{n \times 1} \quad (19)$$

$$\tilde{R}_i = \left[ \sum_{i=1}^n \tilde{t}_{ij} \right]_{1 \times n} \quad (20)$$

The sum of all vector rows is represented by  $\tilde{D}_i$  whereas the sum of all vector columns is named as  $\tilde{R}_i$ . Hence,  $(\tilde{D}_i + \tilde{R}_i)$  demonstrates the total degree of the influence among criteria. Also, the defuzzification process is performed to calculate the weighting results of criteria as in the equations (21)-(24).

$$Def_T = \frac{\frac{(u_j - l_j) + (\beta_U \times m_{1U} - l_U) + (\alpha_U \times m_{2U} - l_U) + l_U}{4} + \frac{[(u_L - l_L) + (\beta_L \times m_{1L} - l_L) + (\alpha_L \times m_{2L} - l_L) + l_L]}{4}}{2} \quad (21)$$

$$Def_T = T = [t_{ij}]_{n \times n}, \quad i, j = 1, 2, \dots, n \quad (22)$$

$$\tilde{D}_i^{def} = r = \left[ \sum_{j=1}^n t_{ij} \right]_{n \times 1} = (r_i)_{n \times 1} = (r_1, \dots, r_i, \dots, r_n) \tag{23}$$

$$\tilde{R}_i^{def} = y = \left[ \sum_{i=1}^n t_{ij} \right]_{1 \times n} = (y_j)'_{1 \times n} = (y_1, \dots, y_i, \dots, y_n) \tag{24}$$

**3.3 Interval type 2 fuzzy TOPSIS**

TOPSIS approach is a type of multicriteria decision making models. The main aim of this methodology is to rank different alternatives (Opricovic and Tzeng, 2004). In this process, positive ( $A^+$ ) and negative ( $A^-$ ) ideal solutions are identified. They are demonstrated on the equation (25). In this equation, the term  $v_{ij}$  gives information about the weighted values (Yüksel et al., 2019).

$$A^+ = \max(v_1, v_2, v_3, \dots, v_n) \tag{25}$$

In addition to this process, the values of  $D^+$  and  $D^-$  are computed as in the equations (26) and (27) (Chen et al., 2019).

$$D_i^+ = \sqrt{\sum_{i=1}^m (v_i - A_i^+)^2} \tag{26}$$

$$D_i^- = \sqrt{\sum_{i=1}^m (v_i - A_i^-)^2} \tag{27}$$

Moreover, the closeness coefficient (CCi) is calculated in the final step. The details are shown in the equation (28) (Efe, 2019).

$$CC_i = \frac{D_i^-}{D_i^+ + D_i^-} \tag{28}$$

**4 Analysis**

In this study, it is aimed to analyze the house of quality-based factors of green supply chain management for the sustainable investment decisions. For this purpose, a hybrid model based on interval type 2 fuzzy sets is proposed. The steps of the analysis are detailed as follows.

Step 1. Define the problem of customer and technical factors of green supply chain management. For that, a set of criteria is defined with the supported literature as seen in Table 1 and 2 respectively.

**Table 1 Customer Expectations of Green Supply Chain Management**

Criteria	Literature
Reducing the pollution (Criterion 1)	(Franzoni, 2011; Khoshnava et. al., 2018; Sun et. al., 2017)
Clean energy sources (Criterion 2)	(Bhattacharya et. al., 2015; Tao et. al., 2016; Kucukvar et. al., 2016)
Reuse of product and services (Criterion 3)	(Kriwet et. al., 1995; Ferrer, 1997; Krikke et. al., 1999)
Varieties of distribution channels (Criterion 4)	(Onat et. al., 2015; Doll et. al. 2017)

**Table 2 Technical Requirements of Green Supply Chain Management**

Criteria	Literature
Waste management (Criterion 1)	(Deif, 2011; Islam et. al., 2017)
Energy efficiency (Criterion 2)	(Klassen and Whybark, 1999; Vachon, 2007; Baines et. al., 2012)
Recycling process (Criterion 3)	(Johnson and Wang, 1995; Mishra et. al., 2012; Misni and Lee, 2017)
Integrated transport systems (Criterion 4)	(Jensen et. al., 2001; Jensen, 2008; Martinsen and Björklund, 2012)

Step 2. Appoint the expert team to collect the linguistic evaluation for the criteria. Three decision makers are selected from the industry. They are experienced at least ten years in the field of clean technology and supply chain. The expert valuation results for the customer and technical criteria are given by using the linguistic scales in Table 3 and 4. And the results are illustrated in Table 5 and 6.

**Table 3 Evaluation Scales for the Criteria**

Criteria	IT2TrFNs
Absolutely Low (AL)	((0,0,0,0,0,0,0;1,0), (0,0,0,0,0,0,0;1,0))
Very Low (VL)	((0.0075, 0.0075, 0.015, 0.0525;0.8), (0,0,0,0,0.02,0.07;1,0))
Low (L)	((0.0875, 0.12, 0.16, 0.1825;0.8), (0.04,0.10,0.18,0.23;1,0))
Medium Low (ML)	((0.2325, 0.255, 0.325, 0.3575;0.8), (0.17,0.22,0.36,0.42;1,0))
Medium (M)	((0.4025, 0.4525, 0.5375, 0.5675;0.8), (0.32,0.41,0.58,0.65;1,0))
Medium High (MH)	((0.65, 0.6725, 0.7575, 0.79;0.8), (0.58,0.63,0.80,0.86;1,0))
High (H)	((0.7825, 0.815, 0.885, 0.9075;0.8), (0.72,0.78,0.92,0.97;1,0))
Very High (VH)	((0.9475, 0.985, 0.9925, 0.9925;0.8), (0.93,0.98,1,0,1,0;1,0))
Absolutely High (AH)	((1,0, 1,0, 1,0, 1,0; 1,0), (1,0, 1,0, 1,0, 1,0; 1,0))

**Table 4 Evaluation Scales for the Alternatives**

Alternatives	IT2TrFNs
Very Poor (VP)	((0,0,0,0,1;1,1), (0,0,0,0,0,0,0;0,9,0,9))
Poor (P)	((0,0,1,0,1,0,3;1,1), (0,05,0,1,0,1,0,2;0,9,0,9))
Medium Poor (MP)	((0,1,0,3,0,3,0,5;1,1), (0,2,0,3,0,3,0,4;0,9,0,9))
Fair (F)	((0,3,0,5,0,5,0,7;1,1), (0,4,0,5,0,5,0,6;0,9,0,9))
Good (G)	((0,5,0,7,0,7,0,9;1,1), (0,6,0,7,0,7,0,8;0,9,0,9))
Very Good (VG)	((0,7,0,9,0,9,1;1,1), (0,8,0,9,0,9,0,95;0,9,0,9))
Best (B)	((0,9,1,1,1,1;1,1), (0,95,1,1,1,1;0,9,0,9))

**Table 5 Linguistic Evaluations for the Criteria of Customer Expectation**

	C1			C2			C3			C4		
	DM1	DM2	DM3	DM1	DM2	DM3	DM1	DM2	DM3	DM1	DM2	DM3
<b>C1</b>	-	-	-	M	M	MH	M	M	MH	M	ML	M
<b>C2</b>	M	M	M	-	-	-	ML	M	MH	ML	M	M
<b>C3</b>	MH	MH	M	MH	MH	M	-	-	-	M	M	MH
<b>C4</b>	MH	MH	MH	MH	MH	M	M	M	MH	-	-	-

**Table 6 Linguistic Evaluations of Technical Requirements for the Decision Matrix**

Criteria/Alternatives	Waste management (Alternative 1)			Energy efficiency (Alternative 2)			Recycling process (Alternative 3)			Integrated transport systems (Alternative 4)		
	DM1	DM2	DM3	DM1	DM2	DM3	DM1	DM2	DM3	DM1	DM2	DM3
				1	2	3	1	2	3	1	2	3
Reducing the pollution (Criterion 1)	VG	B	B	G	F	F	G	VG	G	MP	F	F
Clean energy sources (Criterion 2)	B	B	VG	G	F	VG	G	VG	F	G	MP	MP
Reuse of product and services (Criterion 3)	G	G	G	G	F	F	B	B	VG	G	VG	F
Varieties of distribution channels (Criterion 4)	G	F	MP	F	F	F	G	F	F	B	B	B

Step 3. Weight the criteria of customer expectations. For this purpose, the computation procedures of interval type 2 fuzzy DEMATEL is applied and the results are given in Table 7.

**Table 7 Defuzzified Total Relation Matrix and the Weights for the Criteria**

	C1	C2	C3	C4	r	y	r+y	r-y	Weights
C1	3.43	3.59	3.33	3.03	13.37	14.83	28.21	-1.46	0.251
C2	3.36	3.25	3.14	2.87	12.61	14.89	27.50	-2.28	0.245
C3	3.97	3.99	3.54	3.38	14.88	13.78	28.66	1.10	0.255
C4	4.08	4.07	3.77	3.31	15.23	12.59	27.83	2.64	0.248

According to the results, Criterion 3 has the highest importance in the criteria of customer

expectations while criterion 2 is the weakest important factor among the criteria set.

Step 4. Rank the alternatives of technical requirements. The method of TOPSIS based on the interval type 2 fuzzy sets is applied for measuring the house of quality-based performance of green supply chain management for the sustainable investment decisions. The results are represented in Table 8.

**Table 8 Ranking Results for the Performance Measurement**

	D+	D-	Ci	Ranking
Waste management (Alternative 1)	0.853	1.141	0.572	1
Energy efficiency (Alternative 2)	1.206	0.438	0.266	4
Recycling process (Alternative 3)	0.819	0.886	0.520	2
Integrated transport systems (Alternative 4)	1.196	0.775	0.393	3

The ranking results demonstrate that waste management (alternative 1) has the best house of quality-based performance of technical requirement for the green supply chain management whereas energy efficiency (alternative 2) is ranked at last among the technical requirements.

## 5 Conclusion

This study aims to evaluate the green supply chain management for the sustainable investment decisions. For this purpose, the house of quality-based factors of green supply chain management for the sustainable investment decisions are determined. In this framework, 4 different criteria are defined related to the customer expectations of green supply chain management. On the other side, with respect to the technical requirements, different 4 factors are identified based on literature review. In the analysis process, the criteria of customer expectations are weighted by using interval type-2 fuzzy DEMATEL. Additionally, with the help of interval type-2 fuzzy TOPSIS method, the alternatives of technical requirements are ranked.

The results show that reuse of product and services (Criterion 3) has the highest weight. In addition, it is also determined that reducing the pollution (Criterion 1) is the second most important criterion. The issue of product reuse is the most prominent aspect in green supply chain management. The main reason for this is that thanks to re-used products, companies have the opportunity to reduce costs. This has a direct and significant impact on the profitability of these companies. In the literature, (Kriwet et. al., 1995; Ferrer, 1997; Krikke et. al., 1999) reached the similar conclusion.

In addition to them, the ranking results indicate that waste management (alternative 1) has the best house of quality-based performance of technical requirement for the green supply chain management. On the other side, energy efficiency (alternative 2) takes the second-best place among the technical requirements. As can be seen from these results, companies should make technological investments in waste management. The waste management process involves the use of many comprehensive machines, materials and equipment. In this framework, it is important that companies provide these tools and equipment in the context of innovative strategy. However, qualified personnel capable of using this equipment should also be employed. Existing personnel are also required to receive the necessary training. This will provide the necessary technical competencies for an efficient green supply chain investment. In the future studies, a different methodology can be considered to make a comparative analysis.

## **Tourist Forecasting Model of Short Holiday Based on Network Data: A Case Study of Mount Emei Scenic Area**

Ma Zhaofeng, HuangPing, Guo Chuangle \*, Abdoulaye Boiro, Wen Zhili, Zhan Fei, Yin Zizhong

School of Management, Chengdu University of Information Technology, Chengdu, P.R. China, 610103

(E-mail: 1399558415@qq.com, hping@cuit.edu.cn, chuanglewh@cuit.edu.cn, 1323083611@qq.com, 759300645@qq.com, 982435449@qq.com, 522681381@qq.com)

**Abstract:** This paper takes Mount Emei Scenic Area as a case study, establishes a theoretical framework from the perspective of tourists' behavior and reveals the correlation between Internet search data and tourist volume. By searching the keyword data related to Mount Emei tourism and synthesizing the search index, a prediction model was established for the composite index of the network search data and the actual passenger flow of Mount Emei scenic spot during the Spring Festival holiday from 2015 to 2018. The prediction model can effectively forecast the tourist volume one or two days in advance during the Spring Festival holiday.

**Keywords:** Search engines; Baidu index; Synthetic indexes; Tourist amount forecasting

### **1 Introduction**

#### **1.1 Background**

The number of tourists in China has reached 5.5 billion, there is a great demand for tourism. In 2016, *the Government Report* proposed to “meet the rising or emerging era of mass tourism”. Within just three years, the number of domestic tourists has increased rapidly from 4.44 billion in 2016 to 5.54 billion in 2018, among which the self-drive trips with great mobility and strong randomness account for the absolute majority. In 2017, the number of self-drive is as high as 3.1 billion, which is 62% of the total domestic tourist of 5.01 billion in that year.

Chinese mainly travel on holidays, which is easy to cause congestion. *The China Leisure Development Annual Report 2017-2018* pointed out that from 2012 to 2017, the proportion of urban residents in China continued to increase, and the proportion of family leisure continued to decrease. The leisure activities of urban residents are shifting from “negative” to “positive”. In 2017, the proportion of urban residents in China choosing to travel on holidays has reached 42.2%, and family leisure has dropped to 24.8%. The proportion of physical fitness and tourism shopping of rural residents has increased, but leisure activities are still dominated by family leisure. Thousands of tourists wait to descend Mount Emei's high mountain area as of 9 PM on Dec 31, 2018 due to icy roads. On October 3, 2014, tourists stranded in Mount Emei scenic area also occurred, so it is particularly necessary to establish an intuitive tourist volume prediction model for the scenic area to optimize service and improve management efficiency.

#### **1.2 Literature review**

With the deepening of the research on social behavior based on network technology, the prediction of tourism behavior has gradually joined the ranks of the research. At present, the research of tourism

behavior prediction based on Internet search technology mainly focuses on the relationship between network attention and tourist flow.

Lu et al took Australian tourism websites as the research object, studied some problems of information flow guiding tourism flow in tourism websites, and confirmed the effect of virtual network information flow on real tourism flow (Lu et al.,2007). Ma et al analyzed the main factors and marginal effects affecting the spatial and temporal changes of urban passenger flow and tourist network attention by collecting data of urban passenger flow and tourist network attention, and constructed the spatio-temporal correlation model of domestic tourist volume and tourist network attention(Ma et al,2011).Taking the Forbidden City and Mount Tai as examples,Guo et al established the National Day holiday tourist prediction model of Mount Tai scenic area by using baidu search index and the actual daily passenger flow of the National Day holiday from 2008 to 2012(Guo et al,2012). Cui et al built the traffic forecast and forewarning model based on the Internet search behavior, made use of the Internet search volume provided by Google trend, and used regression analysis, grey theory to predict and forewarn the traffic of the World Expo (Cui et al,2013). Ren et al made an empirical study of the co-integration relationship between the search data of Beijing and the monthly tourist traffic by searching relevant keyword data and synthesizing the search index, and built a prediction model of tourist traffic in Beijing by combining the search index and historical data (Ren et al,2014). Wang et al introduced the Elman neural network of the dynamic characteristics of the reactive system to establish the Elman neural network dynamic prediction model for the inbound tourists in China (Wang et al,2013). Lu et al used the model based on BP and Elman neural network as the benchmark model respectively, and proposed to introduce the EMD method to improve the traditional BP prediction model to explore the new characteristics of tourists in the Internet era (Lu et al,2019).

Stephan Goslings pointed out that tourism relies heavily on climate and natural resources, and states that global environmental changes threaten the tourism industry. More and more scholars begin to analyze passenger flow and climate and socio-economic parameters. The relationship, the ultimate goal of developing a future tourism program is economic and environmental harmony, helping the tourism industry to plan and develop suitable future tourism solutions (Stephan Goslings,2006). Stephen F. Witt et al constructed the VAR model based on passenger traffic data of eight countries or regions during the period from 2003 to 2008. The prediction model indicates that Macao will face more and more tourism needs from mainland Chinese residents (Stephen F. Witt et al, 2006). Tolega Akturk used the ARDL model to research the factors affecting Turkish tourism from OECD countries based on the 1980-2004 Turkish entry data. The study not only analyzes the tourism and econometric models, but also discusses the results of economic research and gives the future direction of tourism in Turkey (Tolega Akturk,2006).

## 2 Theoretical Framework

By the end of 2018, the number of Chinese netizens reached 829 million, the number of mobile Internet users reached 817 million, the number of netizens using mobile Internet access reached 98.55%, and mobile network users ranked first in the world. More than 84% of Chinese tourists use mobile devices to search for information about destinations on the Internet during their travels. With the maturity of the Internet and big data analytics technology, it is possible to collect these massive data generated by tourists' search behaviors. Scenic spots or destinations can use these search data to predict the number of tourists in the future. To avoid the occurrence of holiday tourists and tourists, to bring a good tourist experience (Lv,2015).

This section establishes a theoretical framework based on the correlation between Internet search data and tourist volume, and analyzes the correlation between Internet search data and tourist traffic.

Nowadays, search engine has become the preferred way for tourists to obtain information related to the tourist destination when they travel. Tourists can search and find transportation, accommodation, catering, entertainment, shopping, travel strategy, weather and other information of the tourist destination through network searching. This forms a correlation between the search data and the number of visitors, which determines that the prediction method discussed later in this paper has a strong prediction function logically. Based on this logic, this paper established the theoretical framework model of the relationship between network search data and tourist volume, as shown in figure 1.

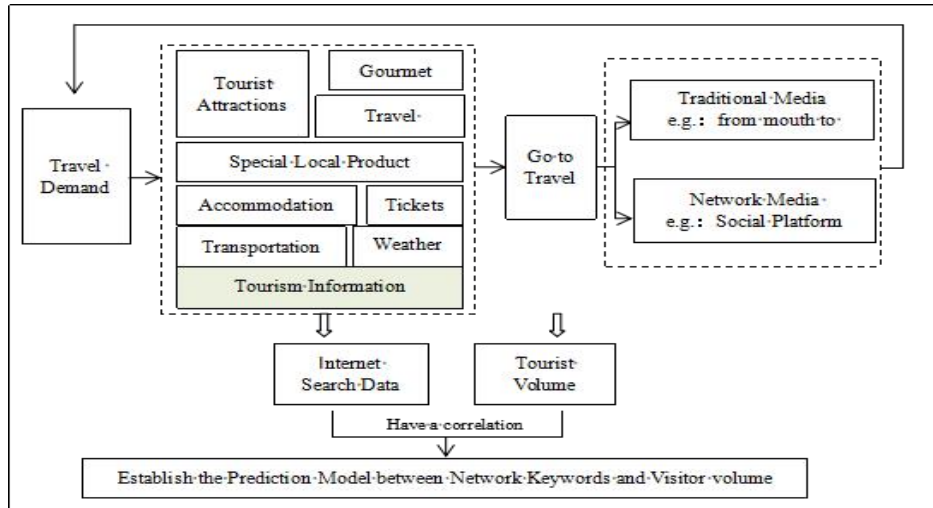

Figure 1 Network Search Data and Tourist Theory Framework

### 3 Empirical Analysis

#### 3.1 Tourism status of mount Emei

Located in the southwestern part of Sichuan Province, Emeishan City is a China Excellent Tourist City and National Garden City in China. Tourism is the pillar industry of Emeishan City. It has developed a series of tourism projects such as alpine skiing, hot spring vacation, and folk customs, which integrates ornamental and entertainment. Forming a complete reception system with food, lodging, travel, entertainment and shopping facilities. In recent years, the tourism economy of Emeishan City has continued to develop steadily, and the tourist’s volume and tourism income have increased substantially. In 2018, the number of ticket buyers in Mount Emei reached 3.295 million, an increase of 3.25% over the previous year. Ticket revenue was 473.8 million-yuan, accounting for 44.19% of operating revenue, up 3.49% from the previous year.

Table 1 Tourists Volume of Mount Emei from 2012 to 2018

year	2014	2015	2016	2017	2018
Number of visitors (thousand)	2870	3308.1	3298	3350	3295
Ticket income(million)	425	458	446	457.9	473.8

#### 3.2 Source of data

The tourist flow data of Mount Emei scenic spot adopted in this paper is derived from the real-time

visitor flow broadcast data released by WeChat official account of Mount Emei, covering the period from 2015 to 2018 Spring Festival holiday.

The search data used in this paper comes from the Baidu Index (<http://index.baidu.com>), and the time range is 15 days from the first five days to the last three days of the Spring Festival from 2015 to 2018. Based on the big data of Baidu web search and Baidu news search, Baidu Index calculates the value of user attention and media attention of each keyword.

### 3.3 Correlation analysis and keyword selection

#### 3.3.1 Correlation coefficient

First of all, this article manually selected "Traveling in Mount Emei, Guides to Mount Emei, Mount Emei Tourism Guide, Map of Mount Emei, Weather of Mount Emei, Accommodation Guide of Mount Emei, Hotel Reservation of Mount Emei, Tour Route of Mount Emei, Golden Summit of Mount Emei Tickets of Mount Emei, Tickets Price of Mount Emei, Pictures of Mount Emei, Monkey in Mount Emei ,Hot Springs in Mount Emei, A one-day tour of Mount Emei ,Mount Emei" were used as initial keywords. Then, EvIEWS software is used to calculate the correlation coefficient between each keyword and the daily tourist volume during the Spring Festival in Mount Emei, and the correlation between each keyword and the Mount Emei daily tourist volume is tested. Due to the lag between the network search data and the tourist volume, when calculating the correlation coefficient between the tourist volume and the keywords, the number of keywords searches for the first five days of the holiday, the holiday period, and the three days after the holiday is collected. Finally, 9 keywords with four-year correlation coefficients above 0.85 were selected (as shown in table 2).

**Table 2 The Correlation Coefficient between the Tourist Volume and the Number of Daily Searches for Primary Keywords During the Spring Festival Holiday**

keyword	Maximum correlation coefficient				Maximum Correlation Coefficient Date of Occurrence			
					(Number of Day in Advance)			
	2018	2017	2016	2015	2018	2017	2016	2015
Traveling in Mount Emei	0.88	0.95	0.91	0.84	1	1	1	1
Guides to Mount Emei	0.97	0.97	0.97	0.92	1	1	1	1
Mount Emei Tourism Guide	0.96	0.99	0.97	0.95	1	1	1	1
Map of Mount Emei	0.88	0.92	0.92	0.93	0	1	1	1
Weather of Mount Emei	0.97	0.98	0.97	0.97	1	1	1	1
Accommodation Guide of Mount Emei	0.89	0.94	0.91	0.94	1	0	1	1
Hotel Reservation of Mount Emei	-0.67	0.95	0.81	-0.70	2	1	4	3
Tour Route of Mount Emei	0.87	0.96	0.87	0.70	1	1	1	-1
Golden Summit of Mount Emei	0.92	0.92	0.95	0.78	1	-3	1	-1

Tickets of Mount Emei	0.98	0.98	0.97	0.93	1	1	1	1
Tickets Price of Mount Emei	0.87	0.88	0.82	0.89	1	1	1	1
Pictures of Mount Emei	0.84	0.92	0.98	0.83	-2	-2	1	1
Monkey in Mount Emei	0.96	0.62	-0.88	0.86	1	-1	-3	1
Hot Springs in Mount Emei	0.93	0.92	0.92	0.98	1	1	1	1
A one-day tour of Mount Emei	0.98	0.96	0.93	0.88	1	1	1	1
Mount Emei	0.94	0.92	0.95	0.94	1	1	1	1

3.3.2 Network search index synthesis

According to the correlation coefficient between the network search amount of the keywords selected in previous section and the actual tourist volume, the contribution rate of the network search volume of each keyword to the actual tourist amount can be determined, and accordingly, each keyword is given correspondingly. The weight value, and the keyword synthesis index during the Spring Festival holiday from 2015 to 2018 is determined according to the search volume value and weight value of each keyword. (In general, a keyword can only reflect the characteristics of a thing from one side. Therefore, it is necessary to have as comprehensive a network keyword as possible to reflect the overall trend to be measured. This paper synthesizes the selected keywords in a dimensionally reduced manner. The synthesized index is called the keyword synthesis index, and the trend analysis is carried out with the actual tourist amount of the Spring Festival holiday in the research year. It is found that the two variates have the characteristics of trend consistency (Figure 2), and the left vertical coordinate in the figure. P represents the tourist volume, the right vertical coordinate Q represents the keyword synthesis index, and the abscissa represents the seven-day holiday of the Spring Festival.

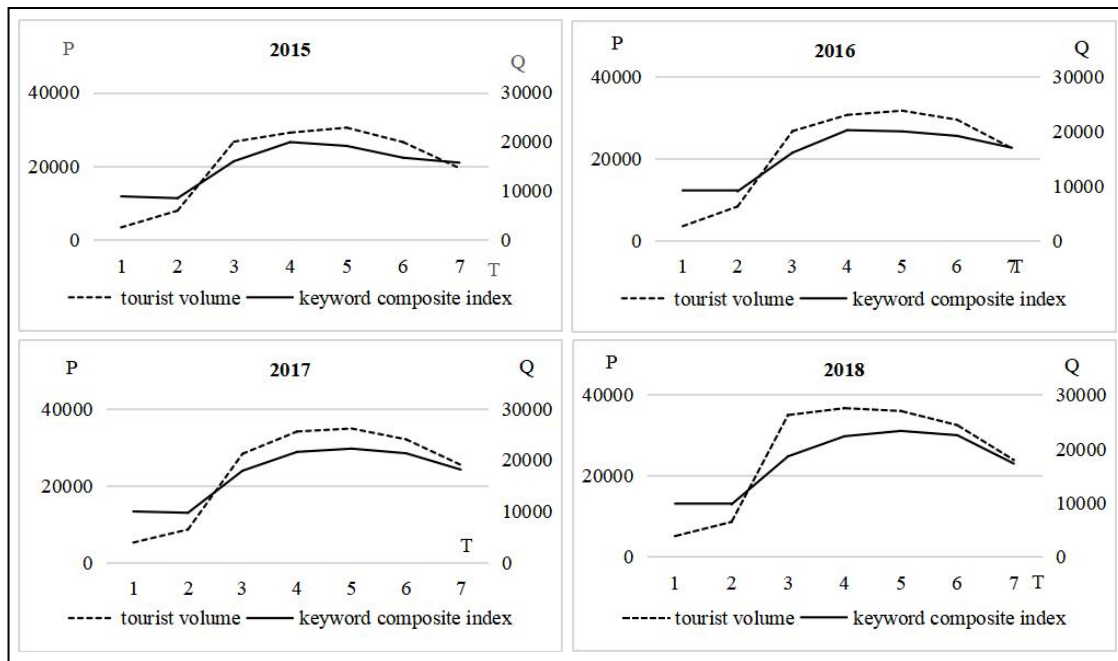

Figure 2 Tourist Volume and Keyword Composite Index Graph

During 2015 to 2018 Spring Festival Holiday

From the tourist volume of the Spring Festival holiday and the keyword synthesis index graph of the network search, it can be seen that there is a strong trend consistency feature between the keyword synthesis index and the actual tourist volume, and it is calculated that 2015 to 2018 The correlation coefficient between the actual number of visitors in the Spring Festival holiday and the keyword composite index of the online search was higher, 0.9599, 0.9899, 0.9752, 0.9651, respectively.

Therefore, using the above method, there is a strong correlation between the keyword synthesis index obtained by index synthesis and the actual number of visitors through the screening of keywords in the network.

### 3.3 Establishing a predictive model

According to the correlation between the above-mentioned network keyword synthesis index and the actual tourist volume, a regression prediction model for the number of tourists in the Mount Emei Scenic Area during the Spring Festival holiday is established.

$$y_i = c_i + \beta_i x_i$$

Among them,  $y_i$  represents the number of tourists on day  $i$  of the Spring Festival holiday of Mount Emei Scenic Area;  $x_i$  represents the selected keyword index;  $c_i$  is the constant term;  $\beta_i$  is the coefficient of the independent variable. Keyword index is based on the selected 9 keywords (Guides to Mount Emei, Mount Emei Tourism Guide, Map of Mount Emei, Weather of Mount Emei, Hotel Reservation of Mount Emei, Tickets of Mount Emer, Hot Springs in Mount Emei, A one-day tour of Mount Emei ,Mount Emei) with tourist volume correlation determine its weight, and in the process of prediction model is established, according to the size of the t-statistics and the Prob value, gradually picking variables did not pass inspection, final keyword index, for the following prediction results.

**Table 3 Variable Stationarity Test**

Constant	Coefficient	t-Statistic	Prob.	Variation Coefficient	Coefficient	t-Statistic	Prob.
$C_1$	-12902	-5.1535	0.0357	$\beta_1$	1.8197	6.8665	0.0206
$C_2$	3519	5.1391	0.0358	$\beta_2$	0.5232	7.0389	0.0196
$C_3$	-15833	-0.8432	0.4879	$\beta_3$	2.6258	2.399	0.1385
$C_4$	-29585	-7.0906	0.0193	$\beta_4$	2.9649	14.9196	0.0045
$C_5$	9146	8.413	0.0138	$\beta_5$	1.2227	22.2335	0.002
$C_6$	8915	4.524	0.0455	$\beta_6$	1.0647	10.8156	0.0084
$C_7$	-20089	-5.6532	0.0299	$\beta_7$	2.5231	12.0828	0.0068

When the model is subjected to regression test, the absolute value of t-statistic is greater than 2, indicating that this parameter contributes significantly to the model. At a 95% significant level, a Prob.

value of less than 0.05 indicates a significant effect on the model. According to the regression test, the models are 0.959, 0.96, 0.74, 0.99, 0.99, 0.98, and 0.98, respectively, and the other days have a good fitting effect except for the third day of the holiday. It can be concluded that the contribution rate of the keyword synthesis index to the model is significant, and the variables in the model have a relatively high degree of fit with the independent variables.

## 4 Conclusion

Based on theories of tourism behavior, network search technology and prediction model, this paper extensively reads the literature on tourist quantity prediction research, social behavior based on network information technology and tourism behavior research, and summarizes the research status at home and abroad. To explore and research of tourists' network behavior, explore the travel network behavior of tourists using Internet technology to obtain tourist information; study the attention and attention of tourists on online travel information, and understand the search engine of tourists who have online behavior through The Internet. The content and time of the travel information searched by the technology provide reference for the selection of network keywords. This paper mainly draws the following conclusions:

Firstly, visitors will check the information about the scenic spots before they travel. The online search volume of relevant keywords can reflect the number of future tourists in the scenic spot to a certain extent. The time for tourists to check the tourist information before traveling is concentrated in one to two days before the trip. Accommodation, transportation, weather conditions and travel routes are the information that visitors generally care about and inquire about.

Secondly, there is a strong correlation between the network keyword search volume data and the actual tourist volume data, and most of them appear to be positively correlated. This mainly depends on the travel network behavior before the tourists travel, that is, the search and Attention to relevant travel information.

On the overall, the final determination of the network keyword needs to be based on the correlation coefficient between the network search volume of the primary keyword and the historical data of the actual tourist volume. The keyword with a large correlation coefficient value can be obtained as a model Parameter. Predict the effect.

**Abstract:** Business mode innovation (BMI) is critical for building group' sustainable competitive advantage. This study focuses on influencing mechanism business mode innovation risks (BMIR). Specifically, based on the theories of risk management and strategic management, questionnaire survey data are collected from several national business groups. An influencing mechanism model is conducted by using the methods of structural equation modeling (SEM) and regression analysis. The results show that the organizational legitimacy (OL), environmental volatility (EV) and innovation ambidexterity (IA) have a significant positive correlation with BMIR, the IA plays a mediator role in the relationship between EV and BMIR, and the strategic experimentation (SE) plays positive moderating role between BMIR. The research, therefore, highlights the necessity of taking concrete and effective measures to avoid BMIR.

**Key words:** Business group; Business mode innovation risk; Influencing mechanism; SEM

### 1 Introduction

Although Business mode innovation (BMI) is critical for building a sustainable competitive advantage, market environment changes quickly and other firms may imitate the successful business modes and incorporate them into their own business (Casadesus Masanell R, Zhu F, 2013). Furthermore, business group typically consists of complex pyramidal structures, dividend policies and ambidexterity, which may lead to business mode innovation risks (BMIR). As a result, identifying the influencing mechanism and antecedents of BMIR represent a vital research topic.

In general, BMI means a new logic of a firm of creating, delivering and capturing value in a novel way by applying and deploying existing capabilities and resources (Haaker T, Bouwman H, Janssen W, et al., 2017). Tesch et al (Tesch J. F., Brillinger A., Bilgeri D., 2017) define BMIR as "all risks within the BM which can endanger the profitability and sustainability of the BM or even firm goals and value". Existing works mainly concentrate on the integration of risk management in the BMI process, offering BMI type-specific management methods, or establishing risk management frameworks and approaches. Hallikas and Varis (Hallikas J, Varis J, 2009) present an approach of risk management in value networks. Brillinger (Brillinger, 2018) created a methodology for identifying BMIR factors within the value network of a BM and unveils a set of general BMIR factors by applying the value network

analysis. Current literature mainly analyses effecting factors of BMIR by employing the approaches of risk management, focusing on the risk evaluation of BMI and studies of risk management methodology. This research presents how organizational legitimacy (OL), environmental volatility (EV), innovation ambidexterity (IA) and strategic experimentation (SE) effect BMIR from the dimensionality of external macro environment, industrial environment and enterprise internal environment.

## **2 Hypothesis Development**

### **2.1 OL and BMIR**

Prior researches of OL are mainly from the perspective of institutions and strategy, and the former focuses on how to integrate social norms into organizational cognition while the latter emphasizes that organizations should get social resources legitimately and carry out effective management. No matter from the system level or the strategic level, OL effects BMIR significantly which can not be ignored. First, interactive logic and norms from OL are provided to earn stakeholders' legitimacy and sustainability recognition. Second, High-quality resources are more readily available as OL help firms to integrate resources. Finally, OL can reduce the BMIR. So, the following hypothesis are made.

H1: OL has negative influence on BMIR.

### **2.2 EV, IA and BMIR**

EV increase the inaccuracy of management forecasts, which may lead to wrong investment decisions due to the lack of sufficient information (Goodman T. H., Neamtiu M., Shroff N., et al., 2013). Additionally, EV reflects uncertainty of market competition and stakeholders' preferences. As a result, BMI is likely to be challenged by potential competitors or deviate from customers' preferences, leading to failure of BMI. IA refers to exploitative competence and explorative competence of firms (O'Reilly III C. A., Tushman M. L., 2013), which can help enterprises to continuously allocate internal and external resources and re-establish new abilities. Hence, firms can quickly and accurately perceive environmental changes and better achieve BMI. However, excessive emphasis on exploitative and exploratory innovation will easily lead to enterprises' neglect of new market opportunities, increase the cost of enterprise innovation and increase the BMIR. Therefore, high EV can promote enterprises to establish IA. Based on the above researches, the following hypothesis are made.

H2: EV has positive influence on BMIR.

H3: IA has positive influence on BMIR.

H4: IA plays a mediating role between EV and BMIR.

### **2.3 EV, SE and BMIR**

SE can be conducted to solve the lack of experience and insight in the innovation progress. Feedback experience from SE can help enterprises to better understand the social norms and internal demand, and facilitate the experience and knowledge in strategy iteration to update quickly, which can encourage enterprises to fix BM. Thus, SE can reduce the BMIR and uncertainty in the volatile market environment, and help enterprises to establish efficient BM (Andries P., Debackere K., Van Looy B.,

2013). Thus, make the following hypothesis.

H5: SE plays positive moderating role between the EV and BMIR.

### **3 Study Design and Data**

Based on the existing mature scale and the actual characteristics of national group companies, the questionnaire is developed. (1) The BMIR is measured mainly according to opinions of Zott & Amit (Zott C, Amit R, 2007). (2) The measurement of the OL and ED mainly draws on the study of Fanghe & Zou. (3) According to Cao (Cao, Q, Gedajlovic E, Zhang H, 2009), mediating variable IA is subdivided. (4) Based on the study of Chandler et al (Chandler G N, DeTienne D R, McKelvie A, et al., 2011), the ED is divided into 2 dimensions including strategic adjustment and innovation. All variables are measured using Likert 5 scale settings. Before the formal questionnaire survey, pre-test questionnaires are issued, and 70 questionnaires were distributed to several national business groups. The reliability and validity of the original questionnaire were tested and after removing items OL1, OL4, BR1, BR6 and IA6, the overall coefficient of the scale is improved significantly. The main research objects of this study are staffs of national business groups. 150 questionnaires are made available at national business groups. 115 valid questionnaires were obtained after removing invalid ones, and the effective recovery rate is 76.67%.

### **4 Results and Analysis**

#### **4.1 Characteristics of the sample**

The characteristics of the sample indicate that there are, in terms of ownership, there are 55.7% State-Owned Enterprises, 20.9% Foreign-Invested Enterprises, 17.4% Private Enterprises, and 6.1% Collectively-Run Enterprises. There are 37.4% enterprises with more than 1000 employees, 20% with 500~1000 employees, and others with less than 500 employees. Among the 128 respondents, 5.2% were responsible for senior management, 34.8% are middle manager and 60% are entry level employee. Overall, the sample can reflect the current composition and characteristics of the business group.

#### **4.2 Preliminary analysis**

Reliability is usually judged by using Cronbach's  $\alpha$  and Combinational Reliability (CR). Structural validity is usually verified by exploratory factor analysis (EFA) and confirmatory factor analysis (CFA). Table 1 shows that all of the latent variables Cronbach's  $\alpha$  are all greater than 0.7, and the CR are all greater than 0.8, suggesting that a high internal reliability existed in the constructs. In addition, the average variance extracted (AVE) coefficients are all greater than 0.5, which suggests that the items are able to explain the variance in the constructs.

**Table 1 The Reliability Validity of the Sample**

Variable and Numbers	Number	Cronbach's $\alpha$	KMO	AVE	CR
OL	3	0.807	0.752	0.511	0.812
IA	6	0.868	0.873	0.587	0.913
ED	6	0.866	0.840	0.628	0.835
SE	3	0.698	0.662	0.535	0.868
BMIR	2	0.820	0.709	0.588	0.875

### 4.3 SEM analysis

Based on the influencing mechanism conceptual model of BMIR, the initial Structural Equation Model (SEM) is constructed including OL, ED, IA, and BMIR by employing AMOS 24.0. Fit indices of the SEM summarized in Table 2 indicate a reasonable fit of the model. In addition, the results of the parameter path show that the standardized path coefficient of OL→BMIR is negative (-0.302) while ED→BMIR, and IA→BMIR are positive (0.269, and 0.189, respectively) and significant ( $P<0.05$ ). H1, H2, and H3 are supported. This study, samples are repeated sampling 2000 times by using Bootstrap to obtain ab coefficient at 95% confidence intervals which can be divided into Bias-corrected percentile method (BC) and Percentile method (PC). The results show that whether the BC or PC 95% confidence interval, indirect effect between the ED and BMIR are significant. Thus, H4 is supported.

**Table 2 Fit Statistics of SEM**

Statistical test quantity	Normed fit index	Results
$\chi^2$	The smaller the better	269.198 acceptable
$\chi^2/df$	1~3	2.15 good
RMR	<0.05	0.047 good
RMSEA	<0.08	0.018 acceptable
GFI	>0.90	0.907 good
NFI	>0.90	0.873 acceptable
CFI	>0.90	0.853 acceptable
TLI	>0.90	0.827 acceptable
PNFI	>0.50	0.654 good
PGFI	>0.50	0.722 good

\*\*\* $P<0.001$

#### 4.4 Regression analysis

In order to verify the moderating effect in H5, multiple cross terms need to be conducted to examine by using hierarchical linear regression. In models 2 and 3, the tolerances for each dimension (Toli) ranged from 0.378 to 0.98, and the variance inflation factor (VIF) ranged from 0.817 to 2.578, which indicates that these models pass the multicollinearity test. Table 3 depicts the regression results, where, Model 1 is a regression model of independent variable ED for dependent variable BMIR, Model 2 adds SE independent variables to Model 1, Models 3 are main effect models including the independent variable, regulated variable. Model 2 shows that the ED has a positive while SE has a negative impact on BMIR. Thus, H2 is supported again. Models 3 indicates the coefficient of ED SE is positive and significant ( $\beta = 0.113$   $P < 0.001$ ). In addition, under the regulation of SE, the negative effect of ED on BM was obviously weakened ( $\beta = 0.34$  to  $0.250$ ), which indicates that SE have moderating effect between the relationship of ED and BMIR. H5 is supported.

**Table 3 The results of regression analysis**

Variable	BMIR		
	Model 1	Model 2	Model 3
ED	0.461***	0.132**	0.250**
SE		-0.181**	-0.480***
ED × SE			0.113**
F	32.392***	35.399***	38.391***
R <sup>2</sup>	0.213	0.604	0.494
Δ R <sup>2</sup>	0.206	0.587	0.481

\*\* $P < 0.01$ , \*\*\* $P < 0.001$

## 5 Conclusion
