## 2 Current Status of Carbon Accounting Information Disclosure in China's Steel Industry

### 2.1 Sample selection and data source

This paper selects the top five in market value in listed steel companies in China as analysis samples. Carry out carrier analysis, formal analysis, content analysis and quality analysis on the accounting information disclosed in the annual financial report, annual audit report, social responsibility report and board report of the three years from 2016 to 2018. The basic information of the sample company is shown in Table 1:

**Table 1 Basic Information of Sample Companies DD: Dec. 31, 2018**

Company name	Stock code	Listing	Market capitalization (¥ 100m)
Baoshan Iron & Steel Co.,Ltd. (Baosteel)	600019	2000	1,617.80
Inner Mongolia Baotou Steel Union Co.,Ltd. (BSU)	600010	2001	592.36
Hbis Company Limited (HBIS)	000709	1997	366.28

Angang Steel Company Limited (ANSTEEL)	000898	1997	361.56
Shanxi Taigang Stainless Steel Co., Ltd. (STSS)	000825	1998	293.92

Source: Shanghai Stock Exchange official website, Shenzhen Stock Exchange official website (the same below).

## 2.2 Carrier Analysis of Carbon Accounting Information Disclosure in Steel Industry

From Table 2 and Table 3, we can see that the sample companies use a variety of disclosure carriers when disclosing carbon accounting information, mainly including board report, social responsibility report and important matters in the annual report. It can be seen from Table 2 that the number of carbon accounting information disclosure carriers of the sample companies in each year is increasing, which reflects the increasing awareness of the importance of carbon accounting information disclosure and the importance attached to corporate image.

**Table 2 Number of Disclosed Carriers in Each Year**

Year	Note	Board report	Social responsibility report	Important matters	Total
2016	0	3	5	3	11
2017	0	3	5	5	13
2018	0	3	5	5	13

**Table 3 Proportion of Various Disclosed Carriers in Each Year**

Year	Note	Board report	Social responsibility report	Important matters
2016	0.00%	27.27%	45.45%	27.28%
2017	0.00%	23.08%	38.46%	38.46%
2018	0.00%	23.08%	38.46%	38.46%

Through Table 3, we can find that the proportion of social responsibility reports is the largest when the sample company chooses the carbon accounting information disclosure carrier. Therefore, the social responsibility report is the main disclosure carrier (Note: Baosteel issued a sustainability report, which was classified into a social responsibility report due to its attribution to the social responsibility sector.) Through Table 4, we can find that the sample companies listed on the Shanghai Stock Exchange (Baosteel & BSU) and the sample companies listed on the Shenzhen Stock Exchange (HBIS&ANSTEEL&STSS) have large inconsistencies in the disclosure carrier, especially in the board report. Steel companies listed on the Shenzhen Stock Exchange generally clarify green development in the board report, but listed on the Shanghai Stock Exchange do not.

**Table 4 Disclosed Carrier of Sample Companies**

Company	Note	Board report	Social responsibility report	Important matters
Baosteel	0.00%	0.00%	20.00%	15.38%
BSU	0.00%	0.00%	20.00%	23.08%
HBIS	0.00%	33.33%	20.00%	23.08%
ANSTEEL	0.00%	33.33%	20.00%	15.38%
STSS	0.00%	33.34%	20.00%	23.08%

**2.3 Formal analysis of carbon accounting information disclosure in steel industry**

From Table 5, we can see that the sample companies mainly use the combination of text and data to disclose carbon accounting information, and the quantitative data can understand carbon accounting information more intuitively. Among them, in the board report, because there are few parts involved in carbon accounting information, mainly based on text.

**Table 5 Form Of Disclosure (Vertical Comparison)**

Year	Note		Board report		Social responsibility report		Important matters	
	Text	Text & Data	Text	Text & Data	Text	Text & Data	Text	Text & Data
2016	0.00%	0.00%	33.33%	66.67%	0.00%	100.00%	0.00%	100.00%
2017	0.00%	0.00%	100.00%	0.00%	0.00%	100.00%	0.00%	100.00%
2018	0.00%	0.00%	66.67%	33.33%	0.00%	100.00%	0.00%	100.00%

We can find from Table 6 that the sample companies have higher consistency in the form of carbon accounting information disclosure. Although most companies do not disclose much data, they have relatively comprehensive data disclosure on green production performance. However, there are few specific data on carbon emissions, and each company's disclosure of carbon emissions data is inconsistent.

**Table 6 Form Of Disclosure (Horizontal Comparison)**

Company	Note		Board report		Social responsibility report		Important matters	
	Text	Text & Data	Text	Text & Data	Text	Text & Data	Text	Text & Data
Baosteel	0.00%	0.00%	0.00%	0.00%	0.00%	100.00%	0.00%	100.00%
BSU	0.00%	0.00%	0.00%	0.00%	0.00%	100.00%	0.00%	100.00%

HBIS	0.00%	0.00%	66.67%	33.33%	0.00%	100.00%	0.00%	100.00%
ANSTEEL	0.00%	0.00%	33.33%	66.67%	0.00%	100.00%	0.00%	100.00%
STSS	0.00%	0.00%	100.00%	0.00%	0.00%	100.00%	0.00%	100.00%

#### 2.4 Content analysis of carbon accounting information disclosure in the steel industry

From Table 7, it can be found that the sample companies mainly explain the emission reduction performance and emission reduction measures in the content of carbon accounting information disclosure, and secondly respond to the call of national policies and respond to energy conservation and emission reduction and green environmental protection development.

**Table 7 Disclosure Of Content (Vertical Comparison)**

Year	Response to national policies	Risks and opportunities	Corporate carbon accounting strategy	Emission reduction performance	Emission reduction measures	Government grant for environmental protection
2016	100.00%	40.00%	20.00%	100.00%	100.00%	100.00%
2017	80.00%	100.00%	20.00%	100.00%	100.00%	100.00%
2018	100.00%	100.00%	20.00%	100.00%	100.00%	100.00%

It can be found from Table 8 that only Baosteel has made a clear plan on the corporate carbon accounting strategy. In September 2014, it issued the “Measures for the Management of Carbon Assets of Baosteel Co., Ltd.”. Other companies in the carbon accounting strategy mostly only talk about environmental protection and sustainable development strategies, and the more specific strategic deployment of carbon accounting is vague. At the same time, Baosteel is also the only company that has disclosed data on CO<sub>2</sub> emissions, including detailed disclosures on CO<sub>2</sub> emissions and CO<sub>2</sub> emission reduction rates per ton of steel. In addition, ANSTEEL made a textual explanation on carbon emissions, mentioning that the total carbon emissions of ANSTEEL's headquarters increased with the increase of steel output, and the carbon emissions per ton of steel showed a trend of decreasing year by year. The remaining sample companies did not disclose the specific carbon dioxide emissions, which is a common current situation of steel listed companies.

The possibility of a reduction in profits caused by environmental problems is mentioned in the new risks of steel listed companies. However, it is worth mentioning that the five sample companies have given specific measures to deal with risks while disclosing environmental risks. For example, STSS mentioned in the annual report: combing the company's existing atmospheric, water, solid waste and noise, radiation control requirements, on the basis of existing online monitoring, improving the environmental remote monitoring and forecasting information system platform, while speeding up the construction progress of the environmental protection project that has been determined and meeting the national environmental protection requirements.

**Table 8 Disclosure of Content (Horizontal Comparison)**

Company	Response to national policies	Risks and opportunities	Corporate carbon accounting strategy	Emission reduction performance	Emission reduction measures	Government grant for environmental protection
Baosteel	100.00%	33.33%	100.00%	100.00%	100.00%	100.00%
BSU	100.00%	33.33%	0.00%	100.00%	100.00%	100.00%
HBIS	33.33%	100.00%	0.00%	100.00%	100.00%	100.00%
ANSTEEL	100.00%	100.00%	0.00%	100.00%	100.00%	100.00%
STSS	100.00%	33.33%	0.00%	100.00%	100.00%	100.00%

### 2.5 Quality analysis of carbon accounting information disclosure in the steel industry

In order to better understand the quality of carbon accounting information disclosure of sample companies, this paper will use the data to conduct quality analysis.

Assumptions: (1) The carrier and content of carbon accounting information disclosure have the same degree of influence on the quality of disclosure, and the weight is set to 1. Because the form of disclosure in the most important social responsibility report is the Data & Text mode, the difference is small. So it is ignored and not included in the quality score. (2) The carbon accounting strategy has long-term guiding significance and is more important, with a weight of 2; the social responsibility report is an independent reporting form with a weight of 2.

The calculation formula for the carbon accounting information quality score is:  $EID = \sum_{j=1}^{10} EID_{ij}$ .  $EID_{ij}$  means the term of j of i company, and if j is not having, it adds 0. The total score is 12 points, and Table 10 is calculated according to Table 9.

**Table 9 Quality Score Table**

Term	Score
Note	1
Board report	1
Social responsibility report	2
Important matters	1
Response to national policies	1
Risks and opportunities	1
Corporate carbon accounting strategy	2

Energy saving performance	1
Energy saving measures	1
Government grant for environmental protection	1

**Table 10 Quality Scores Of Sample Companies**

Company	2016	2017	2018
Baosteel	8	10	10
BSU	7	8	8
HBIS	9	8	9
ANSTEEL	8	9	9
STSS	8	9	9

From Table 10, we can see that the quality score of the carbon accounting information disclosure of the sample company is on the rise as a whole, which indicates that the company pays more and more attention to the disclosure of carbon accounting information. At the same time, the fluctuations of the companies are not large and relatively stable. But for the quality of the entire disclosure, the sample company still needs to improve further.

### **3 Problems of Carbon Accounting Information Disclosure in China's Steel Industry**

#### **3.1 The legal system of carbon accounting information disclosure is not sound**

Undoubtedly, China is paying more and more attention to the disclosure of carbon accounting information. However, from the steel listed companies in the selected samples, it is not difficult to find that their disclosure of carbon accounting information is not perfect and mature. This is inseparable from China's lack of a sound and complete carbon accounting information disclosure system. China has promulgated the "Guidelines for the Preparation of Enterprise Environmental Protection Books", "Guidelines for Social Responsibility of Listed Companies", "Guidelines for Environmental Information Disclosure of Listed Companies", "New Environmental Protection Law" and New Pollution Emission Standards, etc. And the government has continuously strengthened its supervision and enforcement of environmental protection, and has also made certain progress in carbon emissions trading. However, there are no rules and regulations for the disclosure of carbon accounting information. This is also one of the main reasons leading to problems in the disclosure content and quality of carbon accounting information for listed steel companies.

#### **3.2 The supervision mechanism of carbon accounting information disclosure is imperfect**

China's corporate carbon accounting information disclosure lacks a sound supervision mechanism. In terms of government supervision, China does not currently have a special supervisory body or a

clear division of supervisory powers. In terms of social supervision, although the public is concerned about corporate carbon emissions, and even dissatisfied with high-pollution industries with large carbon emissions, they are often only verbal abuses that unable to rise to the level of public opinion and fewer inspections are held. But some local governments have tried to supervise carbon emissions. As of the end of May 2018, the Jiangsu Provincial Audit Office basically completed the project to ease the congestion and reduce carbon emissions in Suzhou by the Global Environment Facility grant. This project has achieved four years of follow-up audit, which has better achieved the goal of “relieving urban congestion and reducing carbon emissions”. We can see that the audit of carbon emissions can better promote low carbon development. However, in general, China's supervisory mechanism needs to be further improved to meet the social requirements for the validity and authenticity of carbon accounting information, thereby promoting the implementation of the carbon trading mechanism.

### **3.3 The form of carbon accounting information disclosure is arbitrary and the disclosure content is insufficient**

In the form of carbon accounting information disclosure, we can find from the selected samples that only the steel companies listed on the two major stock exchanges in China have inconsistencies in the disclosure of carriers. Some only use social responsibility reports and annual reports to disclose and some use social responsibility report, board report and annual report to disclose at the same time. And, various steel listed companies also have inconsistencies in the form of carbon accounting information disclosure. For example, in the data disclosure of carbon accounting information, Baosteel adopts a more intuitive and clear form of combination of charts and data, while HBIS only uses Aggregate data for disclosure. This inconsistency has made carbon accounting information for steel companies extremely incomparable.

China Steel listed companies have insufficient disclosure of carbon accounting information. From the more important information of emission reduction performance, ANSTEEL disclosed the chemical oxygen demand per ton of steel, while Baotou Steel did not disclose it. In terms of the disclosure of the same information, ANSTEEL explained the quantity and distribution of the discharge ports and the pollutant discharge standards implemented. BSU only disclosed the total amount of emissions but compared the emissions in different years. Most steel companies disclose in their own way, and the content of carbon accounting information disclosure in the same industry cannot be compared in a deeper horizontal comparison. And there is less disclosure of carbon accounting information in the annual report, especially in the more detailed subjects, such as carbon assets, carbon liabilities, carbon rights, etc. It makes the lack of effective in-form information disclosure.

### **3.4 Lack of professional talents for carbon accounting**

Carbon accounting is a branch of accounting. Compared with traditional accounting, carbon accounting has added many aspects of environment, ecology and resources on the basis of traditional accounting theory. Therefore, carbon accounting needs to understand the latest theories related to environmental resources protection based on the knowledge reserves and skills of traditional accountants. This kind of interdisciplinary composite accountant is the professional talent required for carbon accounting. The current situation in China is that there are talents who are studying accounting, but there are few people who know and can use carbon accounting.

## **4 Improvement Suggestions and Measures**

### **4.1 Improve the relevant laws and regulations of carbon accounting information disclosure**

There are not laws to define carbon accounting elements in China's accounting field, and there is no clear regulation on the disclosure of carbon accounting information. This makes China's carbon accounting lack effective legal guidance in the actual business, and enterprises also lack strong brakes to disclose relevant carbon accounting information. Internationally, since 2009, the UK has issued the "Guidelines for the Disclosure of Greenhouse Gas Emissions", "Commitment on Carbon Emission Reduction" and "Guidelines for Reporting Compulsory Carbon Information Disclosure". In 2007, Australia issued the "National Greenhouse Gas and Energy Reporting Law". The USA introduced the "Greenhouse Gas Mandatory Reporting System" in 2009. All of them made legally mandatory requirements for the disclosure of carbon accounting information. China should complete the legislative work of carbon accounting as soon as possible, and clarify the responsibilities and obligations of listed companies in the disclosure of carbon accounting information. In the in-balance sheet and off-balance sheet, it also needs to make clear requirements for the disclosure of carbon accounting information carrier, form, content, etc. But in the process of formulating and promulgating relevant laws and regulations, it is necessary to adhere to the principle of seeking truth from facts, and complete the work of sound regulations step by step.

### **4.2 Improve the supervision mechanism of carbon accounting information disclosure**

Establishing a monitoring mechanism for carbon accounting information disclosure needs to start from three aspects: the government needs to set up or appoint relevant departments to supervise the disclosure of carbon accounting information of enterprises, and the relevant agencies of the auditing bureau can review the information disclosed by enterprises to ensure that the authenticity and legitimacy of information; enterprises need to establish an independent audit team for carbon accounting information disclosure in internal control, strengthen supervision over their carbon accounting information disclosure, and increase the supervisory authority of independent directors on carbon accounting information disclosure; Strengthen the propaganda of the environmentally friendly low-carbon economy and raise the society's emphasis on carbon accounting, so that everyone in the society can play the role of mass supervision. Only when the supervision mechanism of carbon accounting information disclosure is improved and effectively implemented can the quality of corporate carbon accounting information disclosure be truly guaranteed.

### **4.3 Establishing standard specifications of carbon accounting information disclosure**

Chinese listed companies have inconsistencies in carbon accounting information disclosure, such as content, form, carrier, etc. This requires us to establish a norm for carbon accounting information disclosure, making information disclosure more comparable. In 2016, the Ministry of Finance issued the "Interim Provisions on Accounting Treatment for Carbon Emissions Trading Pilots (Draft for Comment)". It has made a unified regulation on the handling of pilot accounting for carbon emission trading, which is conducive to regulating the disclosure of carbon accounting information in China. But further strengthening of standards construction is needed in off-balance sheet disclosure. We can build a comprehensive standard for carbon accounting information disclosure based on China's national conditions by drawing on international experience.

### **4.4 Formulate a carbon accounting professional talents training program**

Carbon accounting professionals not only need accounting knowledge, but also need a variety of subject knowledge reserves such as environmental economy and sustainable development. This makes us need to develop a more comprehensive training program for carbon accounting professionals. We should add relevant knowledge in carbon accounting, such as environmental accounting and low-carbon economy, to accounting education in China. First, students who are studying accounting courses at colleges and universities need to increase their knowledge of carbon accounting. Secondly, enterprises need to carry out relevant on-the-job training for accounting personnel to improve the functional accomplishment of accounting personnel. Only when the importance of carbon accounting is deepened in the whole society and the professionals of carbon accounting play a role in enterprises and society, can China implement the guidelines and norms for carbon accounting information disclosure.

## 5 Conclusion

Through the research of this topic, we can find that Chinese steel listed companies have achieved certain achievements in carbon accounting information disclosure. But there are also many problems, such as irregular disclosure content, lack of regulations, and shortage of professional talents. Through the joint efforts of the government, enterprises and society, we continuously improve carbon accounting laws and regulations, improve the carbon accounting supervision mechanism, establish unified standards, and carry out personnel training programs. Then, we can better and faster improve the framework of China's carbon accounting information disclosure. Only by effectively implementing various targeted measures can the carbon accounting information disclosure be qualitatively improved.

# A Study on the Influence of Interest Rate Liberalization on Enterprise Investment Efficiency: Based on the Nature of Property

Dong Xueqin, Zhang Youtang

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 15927598290@163.com, zyt@whut.edu.cn)

**Abstract:** Taking Chinese A-share non-financial listed companies as samples in 2004-2017, based on the perspective of nature of property, the research empirically tests the influence of interest rate liberalization reform on enterprise investment efficiency. The study found that: (1) Interest rate liberalization can alleviate inefficient investment of enterprises, and it has a stronger alleviation effect on state-owned enterprises than non-state-owned enterprises; (2) Interest rate liberalization can inhibit enterprise overinvestment, and it has a stronger inhibitory effect on state-owned enterprises than non-state-owned enterprises; (3) Interest rate liberalization will intensify enterprise underinvestment, and it has a stronger intensive effect on non-state-owned enterprises than state-owned enterprises.

**Key words:** Interest rate liberalization; Enterprise investment efficiency; Nature of property; Overinvestment; Underinvestment

## 1 Introduction

Under the background of the new era of supply-side structural reform, investment has become a key force to optimize the supply structure and solve the supply-side structural problems. However, there are still some obstacles to the circulation of elements in Chinese capital market. The real economy is generally suffering from "ischemia". Enterprise investment efficiency is severely constrained and the country's overall investment level still has growth potential.

The Financial Deepening Theory believes that in order to smooth capital flows and achieve a virtuous circle of mutual promotion between financial development and economic growth, it is necessary to eliminate financial regulation and guide funds to flow to high-efficiency departments. Based on the theory, China has proposed interest rate liberalization reform. Till 2019, Chinese interest rate liberalization process has reached more than 90%, but the reform deepening is still a major issue of government concern. The "Government Work Report of 2019" also pointed out that "intensify interest rate liberalization reform, lower the actual interest rate level".

Since the concept of interest rate liberalization was proposed, the academic community has studied the reform mainly based on the perspective of macro investment and commercial banks. As for its impact on enterprise micro investment, foreign scholars began research earlier. Interest rate liberalization has a crises reducing effect and the improvement of financial liberalization can alleviate enterprise finance constraints (Barrell R et al., 2016). In China, Zhao (Zhao X et al., 2019) and Yang (Yang Zheng et al., 2017) pointed out that interest rate liberalization can improve the efficiency of capital utilization and ease the inefficient investment of enterprises. However, the inefficient investment of enterprises is characterized by overinvestment and underinvestment. How does the interest rate liberalization effect on the overinvestment and underinvestment of enterprises? Under samples with different property rights, is the effect significantly different? There are no scholars to systematically

study these issues.

The possible research contributions of this paper are as follows: Firstly, based on the Financial Deepening Theory, this paper explores the impact of interest rate liberalization on enterprise investment efficiency with 24,049 research samples, distinguishing between inefficient investment, overinvestment, and underinvestment; Secondly, based on the phenomenon of “property discrimination” in Chinese financing market, the paper explores the different impacts of interest rate liberalization on investment efficiency under samples with different property nature, in order to provide relevant policies for the government, and provide a theoretical basis for enterprises to comply with policy guidance.

## **2 Theoretical Analysis and Research Hypothesis**

According to the Financial Repression Theory, in the capital market with interest rate control, the interest rate is artificially lowered to the equilibrium level, and the behavior of enterprises and financial institutions will be distorted. Under interest rate control, insufficient capital supply may lead to non-price discrimination. Banks tend to finance companies with government implicit guarantees or companies with larger scales. These companies are prone to “overinvestment” due to easily obtaining “cheap” funds, while it is difficult for other companies to obtain external financing, resulting in “underinvestment”.

### **2.1 Interest rate liberalization and enterprise inefficient investment**

With the interest rate liberalization policy, the supply and demand of funds in the credit market tend to balance, and financial resources tend to flow efficiently to enterprises with real capital needs. Secondly, under the continuous advancement of interest rate liberalization, the capital market can adjust the cost of funds according to the risk of capital utilization, thereby achieving the matching of capital risks and costs. Furthermore, according to the Capital Structure Theory, loosening interest rate control can help eliminate the friction of credit market, thus alleviating the inefficient investment of enterprises.

Under the interest rate control, state-owned enterprises can easily obtain credit funds relying on the government's implicit guarantees. As a result, when making investment decisions, state-owned enterprises take less cost-benefit factors into consideration, prone to inefficient investment (Morgenroth E, 2016). In addition, state-owned enterprises bear more “policy burdens”, and many investment decisions have strong “political motives” rather than pure market behavior. In contrast, less politically restrained, non-state-owned enterprises investment decisions can reflect management's consideration of the revenue and cost.

Based on the above analysis, this paper proposes the following assumptions:

**H1: Interest rate liberalization can alleviate inefficient investment of enterprises, and it has a stronger alleviation effect on state-owned enterprises than non-state-owned enterprises.**

### **2.2 Interest rate liberalization and enterprise overinvestment**

Under the promotion of interest rate liberalization, the real interest rate of the capital market will rise as a whole, and the rise will curb enterprise credit demand, thereby curbing enterprise overinvestment (Ji Yang et al., 2015). Furthermore, banks can collect risk premiums based on the risk characteristics of individual loans, then overinvestment can be inhibited through capital cost channels. What's more, with the competition intensifying, banks will pay more attention to the management of loan risks. As for the low-yield and high-risk projects, the difficulty of refinancing will increase, and the motivation for overinvestment will be weakened.

Compared with non-state-owned enterprises, state-owned enterprises are more likely to overinvest in the case of surplus internal cash flow (Xiao et al., 2014). Due to the “credit discrimination”, state-owned enterprises usually have lower financing thresholds, and the financing costs are lower under interest rate control, which will more easily lead to overinvestment. Moreover, state-owned enterprises generally have the problem of “soft budget constraints”, which exposes them to more serious moral hazard and agency problems. At the same time, the rigid control of executive compensation in state-owned enterprises made its managers more motivated to overinvest for self-interest. Under the liberalization of interest rates, the competition in the capital market more fair, state-owned enterprises must consider investment income more when making investment decisions.

Based on the above analysis, this paper proposes the following assumptions:

**H2: Interest rate liberalization can inhibit enterprise overinvestment, and it has a stronger inhibitory effect on state-owned enterprises than non-state-owned enterprises;**

### **2.3 Interest rate liberalization and enterprise underinvestment**

Under the interest rate liberalization, with the overall interest rate increasing, the financing burden of enterprises will increase. The tightening of deposits and loans caused by interest rate liberalization can lead to a reduction in the scale of enterprise financing (Zhang Benzhao et al., 2016), which will reduce the investment motive of the company. The study by Zhan (Zhan Minghua et al., 2015) also shows that the high discount rate brought by interest rate liberalization will reduce the present value of collateral and increase the moral hazard of borrowing enterprise, thus inhibiting the investment. In addition, with the advancement of interest rate liberalization, the banks have shown the original hidden charges as capital prices (Lv Jinsong, 2015), which will reduce the enterprise investment motive.

The research by Xiao (Xiao Wei et al., 2014) shows that it is more likely to generate underinvestment for non-state-owned enterprises when internal cash flow is insufficient. Under the interest rate liberalization, loan-deposit spreads will be tightened, which will seriously reduce the operating profit of commercial banks, leading to “reluctant loan” phenomenon. In addition, banks will conduct more rigorous review of loan targets in order to achieve the lowest bad debt rate (Zhang Benzhao et al., 2016). Non-state-owned enterprises are more difficult to become banks' lending targets for their size and qualifications. Furthermore, the interest rate increase will make enterprises more cautious in facing investment opportunities. State-owned enterprises usually undertake some government policy objectives, so when they decide to abandon investment opportunities, they must also consider multiple factors such as social responsibility and government performance. Comparing state-owned enterprises, non-state-owned enterprises will be more sensitive in giving up investment opportunities.

Based on the above analysis, this paper proposes the following assumptions:

**H3: Interest rate liberalization can intensify enterprise underinvestment, and it has a stronger intensive effect on non-state-owned enterprises than state-owned enterprises.**

## **3 Research Design**

### **3.1 Sample selection and data source**

In 2004, the central bank no longer restricted the bank loan interest rate upper limit, so the paper uses the 2004-2017 A-share listed company as the initial samples all from the CSMAR database. To ensure the integrity and comparability of the data, the financial companies, ST and ST\* companies, and

the missing samples were excluded. In addition, the sample data was subjected to 1% level winsorize processing, finally 24,049 samples obtained. All data processing was based on STATA14.0 and EXCEL software.

### 3.2 Measurement of variables

#### 3.2.1 Investment efficiency

Investment efficiency is the explanatory variable of the study, measured by the Richardson (2006) model.

$$Invest_{it} = \beta_0 + \beta_1 \times Invest_{it-1} + \beta_2 \times Size_{it-1} + \beta_3 \times Lev_{it-1} + \beta_4 \times Growth_{it-1} + \beta_5 \times Lnage_{it-1} + \beta_6 \times Ret_{it-1} + \beta_7 \times CFO_{it-1} + \sum \beta_i Industry + \sum \beta_j Year + \varepsilon_{it} \quad (1)$$

According to the model (1), the optimal investment scale of the enterprise is estimated. The actual investment scale minus the best investment scale is the residual, which means the inefficient investment level. If the residual is greater than 0, it means overinvestment, expressed by Over-Inv; if the residual is less than 0, it means underinvestment, expressed by Under-Inv. For convenience, we use the absolute value of the residual to indicate the level of underinvestment.

#### 3.2.2 Interest rate liberalization

The paper uses Peng's method (Peng Jiangang, 2014) to construct interest rate liberalization index, by combing the process of Chinese interest rate liberalization. On the basis of Professor Peng, we extend the index to 2017, and finally obtains the results of 2004-2017, as shown in Figure 1.

Figure 1 Interest Rate Liberalization Index Measurement Results

#### 3.2.3 Control variable

Based on the conventional practices of existing researches, the paper selects variables such as company size as control variables. The specific variable settings are shown in Table 1.

Table 1 Variable Definition

Variable Type	Variable Name	Variable Symbol	Variable Definition
Explained Variable	Inefficient investment	Inv	The absolute value of the residual between the actual investment scale and the optimal investment scale.
	Overinvestment	Over-Inv	The actual investment scale is larger than the optimal investment scale.

	Underinvestment	Under-Inv	The actual investment scale is smaller than the optimal investment scale.
Explanatory Variable	Interest Rate Liberalization	IRL	Interest rate liberalization index
	Nature of property	State	Dummy variables, 1 for state-owned enterprises and 0 for non-state-owned enterprises
	Company Size	Size	Natural logarithm of total assets at the end of the year
	Asset-liability ratio	Lev	Total liabilities at the end of the year / total assets
	Operating income growth rate	Growth	(Operating income of the current period - operating income of the previous period) / operating income of the previous period
Control Variable	Net cash flow from operating	NCFO	From the cash flow statement
	Return on assets	ROA	(Total profit + interest expense) / total assets
	GDP growth rate	GDP	Annual growth rate of Chinese GDP
	Industry	Inds	Industry dummy variable, according to the CSRC 2012 version of industry classification
	Year	Year	Year dummy variable

### 3.3 Model setting

According to the above research ideas, this paper constructs the following regression model. Model (2), Model (3), and Model (4) are respectively used to verify H1, H2, and H3. “IRL×State” is the intersection of interest rate liberalization index (IRL) and property dummy variable (State). In the model, *i* represents a company, *t* represents a year,  $a_0$  is a constant term,  $a_i$  ( $i = 1, 2, 3 \dots$ ) is the parameter to be estimated, and  $\varepsilon_{it}$  is a random error term.

$$Inv_{it} = a_0 + a_1 \times IRL_{it} + a_2 \times State_{it} + a_3 \times IRL_{it} \times State_{it} + a_4 \times Controls_{it} + \varepsilon_{it} \quad (2)$$

$$Over - Inv_{it} = a_0 + a_1 \times IRL_{it} + a_2 \times State_{it} + a_3 \times IRL_{it} \times State_{it} + a_4 \times Controls_{it} + \varepsilon_{it} \quad (3)$$

$$Under - Inv_{it} = a_0 + a_1 \times IRL_{it} + a_2 \times State_{it} + a_3 \times IRL_{it} \times State_{it} + a_4 \times Controls_{it} + \varepsilon_{it} \quad (4)$$

## 4 Empirical Analysis

### 4.1 Descriptive statistics and correlation analysis

From the descriptive statistics table, we can find some statistical results. (1) The samples of state-owned enterprises and non-state-owned enterprises respectively account for about one-quarter and three-

quarters, which is in line with the actual situation in China. (2) In the sample of full sample, state-owned enterprises, and non-state-owned enterprises, the number of overinvestment samples is far less than the underinvestment samples, indicating that the underinvestment of Chinese enterprises is more common. Under the three samples, the average values of Over-Inv indicators are 0.0745, 0.0709 and 0.0766 respectively, both higher than the average of Inv and Under-Inv, indicating that although the companies with underinvestment status in China are the majority, the situation of overinvestment is even worse. (3) Under the sample of non-state-owned enterprises, the average values of Inv, Over-Inv and Under-Inv are larger than the figure under the full sample and the state-owned enterprises sample, indicating that non-state-owned enterprises are facing more serious inefficient investment. (4) IRL indicator shows that Chinese interest rate liberalization process has been greatly improved and it has basically been completed. (5) There are also significant differences in control variables.

**Table 2 Descriptive Statistics**

Variable	N	Min	Max	Mean	Std.Dev.
Full sample					
Inv	24049	0.0008	0.4194	0.0525	0.0627
Over-Inv	8980	0.0006	0.6448	0.0745	0.1013
Under-Inv	15069	0.0010	0.1825	0.0401	0.0301
IRL	24049	0.5228	0.9942	0.7909	0.1730
State	24049	0	1	0.2631	0.4403
Size	24049	19.0286	25.8090	21.9450	1.2939
Lev	24049	0.0594	1.2624	0.4808	0.2232
Growth	24049	-0.6585	4.4642	0.2258	0.6109
ROA	24049	-0.1975	0.2739	-0.0325	0.06320
NCFO	24049	-2.03×10 <sup>9</sup>	1.10×10 <sup>10</sup>	4.49×10 <sup>8</sup>	1.49×10 <sup>9</sup>
State-owned enterprises sample					
Inv	6328	0.0006	0.3397	0.0500	0.0551
Over-Inv	2557	0.0004	0.4914	0.0709	0.0836
Under-Inv	3771	0.0008	0.1394	0.0364	0.0253
Non-state-owned enterprises sample					
Inv	17721	0.0009	0.4510	0.0535	0.0659
Over-Inv	6423	0.0006	0.7473	0.0766	0.1120
Under-Inv	11298	0.0010	0.1930	0.0414	0.0316

According to the correlation analysis results, the Pearson correlation coefficient between all variables is less than 0.5, which can preliminarily indicate that there is no multicollinearity problem between the variables. At the same time, the correlation coefficient between variables basically passed the significance test, indicating that the variable selection is reasonable and suitable for further regression analysis. Due to space limitations, the results of the correlation analysis are not listed.

#### 4.2 Regression analysis

In this paper, using STATA14.0 software, based on panel data from 2004 to 2017, each hypothesis is empirically tested. Table 3 shows the results of regression analysis for each model.

**Table 3 Results of Regression Analysis**

Variable	Model(2) Inv		Model(3) Over-Inv		Model(4) Under-Inv	
	coefficient	t	coefficient	t	coefficient	t
IRL	-0.0082*	-1.83	-0.0353**	-2.49	0.0091***	3.03
State	0.0199***	4.40	0.0510***	4.31	0.0080***	2.92
IRL×State	-0.0243***	-3.93	-0.0603***	-3.82	-0.0100***	-2.61
Size	0.0024***	3.02	0.0112***	5.13	-0.0042***	-8.88
Lev	0.0003	0.09	0.0420***	7.52	-0.0304***	-14.94
Growth	0.0129***	19.75	0.0211***	15.38	0.0021***	4.51
ROA	-0.0681***	-8.68	-0.1612***	-8.42	0.0011	0.23
NCFO	$-4.57 \times 10^{-13}$	-1.02	$-3.86 \times 10^{-13}$	-0.67	$-1.52 \times 10^{-12}$ ***	-3.04
GDP	0.0009**	2.49	0.0014	1.40	0.0007***	3.52
CONS	-0.0065	-0.39	0.1996***	-4.12	0.1317***	13.03
Inds& Year	control	/	control	/	control	/
N	24049	/	8980	/	15069	/
F	70.19	/	49.98	/	58.82	/

The regression results of model (2) show that the coefficient of IRL is -0.0082, which is significant at the 10% confidence level, indicating that interest rate liberalization can alleviate the enterprise inefficient investment; The regression coefficient of “IRL×State” is -0.0243, and it is significant at the 1% confidence level, indicating that interest rate liberalization is more effective in mitigating inefficient investment of state-owned enterprises than non-state-owned enterprises. Hypothesis 1 is verified.

The regression results of model (3) show that the coefficient of IRL is -0.0353, which is significant at the 5% confidence level, indicating that interest rate liberalization can inhibit enterprise overinvestment; The regression coefficient of the transfer term (IRL×State) is -0.0603, and it is significant at the 1% confidence level, indicating that interest rate liberalization has a stronger inhibitory effect on state-owned enterprises than over-state-owned enterprises. Hypothesis 2 is verified.

The regression results of model (4) show that the coefficient of IRL is 0.0091, significant at the 1% confidence level, indicating that interest rate liberalization intensifies the underinvestment; The regression coefficient of the intersection term (IRL×State) is -0.01, and it is significant at the 1% confidence level, indicating that the interest rate liberalization has a stronger effect on the underinvestment of non-state-owned enterprises than the state-owned enterprises. Hypothesis 3 is verified.

## 5 Further Research and Robustness Test

### 5.1 Further research

The above regression results illustrate the regulation role of property nature through the coefficient of the intersection term (IRL×State). In order to further explore whether the impact of interest rate liberalization on enterprise investment efficiency is significantly different under samples with different property nature, the research sample is subdivided into sample of state-owned enterprises and sample of non-state-owned enterprises. The regression results are as follows. Due to space limitations, only the regression results of key variables are listed.

**Table 4 Regression Results After Grouping by Property Rights**

Variable	Model (2) —Inv			Model (3) —Over-Inv			Model (4) —Under-Inv		
	Full	State-	Private	Full	State-	Private	Full	State-	Private
IRL	-0.0082*	-0.0424***	0.0008	-0.0353**	-0.1049***	-0.0241	0.0091***	-0.0052	0.0117***
State	0.0199***	/	/	0.0510***	/	/	0.0080***	/	/
IRL×State	-0.0243***	/	/	-0.0603***	/	/	-0.0100***	/	/
N	24049	6328	17721	8980	2557	6423	15069	3771	11298
F	76.98	15.67	67.27	54.30	11.90	51.53	65.29	20.86	34.69

The model (2) further regression results show that: (1) Under the sample of state-owned enterprises, the coefficient of IRL is -0.0424, significant at the 1% confidence level, indicating that interest rate liberalization significantly eases the inefficient investment of state-owned enterprises. (2) Under the sample of non-state-owned enterprises, the coefficient of IRL is positive but not significant, indicating that interest rate liberalization may intensify inefficient investment of non-state-owned enterprises, but the impact is not significant. (3) The state-owned enterprise IRL coefficient is less than the coefficient of the full sample. The above shows that compared with non-state-owned enterprises, interest rate liberalization has a stronger mitigation effect on state-owned enterprises' inefficient investment. Hypothesis 1 is further verified.

The model (3) further regression results show that: (1) Under the sample of state-owned enterprises, the coefficient of IRL is -0.1049, significant at the 1% confidence level, indicating that interest rate liberalization significantly inhibits state-owned overinvestment. (2) Under the sample of non-state-owned enterprises, the IRL has a negative coefficient on Over-inv, but is not significant, indicating that interest rate liberalization does not inhibit the overinvestment of non-state-owned enterprises significantly. (3) The state-owned enterprise IRL coefficient is less than the coefficient of the full sample. The above shows that compared with non-state-owned enterprises, interest rate liberalization has a stronger inhibitory effect on state-owned enterprises' overinvestment. Hypothesis 2 is further verified.

The model (4) further regression results show that: (1) Under the sample of state-owned enterprises, the coefficient of IRL is negative but not significant, indicating that the interest rate liberalization has a mitigating effect on the underinvestment of state-owned enterprises but is not significant. (2) Under the sample of non-state-owned enterprises, the coefficient of IRL is 0.0117, and it is significant at the 1% confidence level, indicating that interest rate liberalization significantly intensifies the underinvestment

of non-state-owned enterprises. (3) The non-state-owned enterprise IRL coefficient is greater than the full-sample IRL coefficient. The above shows that compared with state-owned enterprises, interest rate liberalization has a stronger effect on the underinvestment of non-state-owned enterprises. Hypothesis 3 has been further verified.

### 5.2 Robustness test

In order to test the robustness of the research conclusions, replace the interest rate liberalization measurement method to adopt Tao Xionghua's construction method. The regression results of the robustness test are shown in the following table. It can be seen from Table 5 that the key coefficient regression results of each model under the robustness test are basically consistent with the above empirical analysis, indicating that the research conclusions in this paper are robust. Due to space limitations, only the regression results of key variables are listed.

**Table 5 Robustness Test**

Variable	Model (2) Inv coefficient	t	Model (3) Over-Inv coefficient	t	Model (4) Under-Inv coefficient	t
IRL	-0.0012*	-1.87	-0.0014*	-1.82	0.0017***	4.08
State	0.0385***	4.68	0.0874***	4.19	0.0174***	3.42
IRL×State	-0.0005***	-4.35	-0.0011***	-3.84	-0.0002***	-3.26
Inds& Year	Controll	/	Controll	/	Controll	/
N	24049	/	8980	/	15069	/
F	70.01	/	48.87	/	60.01	/

## 6 Conclusion

The study found that:(1) Interest rate liberalization can alleviate inefficient investment of enterprises, and it has a stronger mitigation effect on state-owned enterprises than non-state-owned enterprises;(2)Interest rate liberalization can inhibit enterprise overinvestment and has a stronger inhibitory effect on state-owned enterprises than non-state-owned enterprises;(3) Interest rate liberalization can intensify enterprise underinvestment, and it has a stronger effect on non-state-owned enterprises than state-owned enterprises.

Based on the above research conclusions, this paper proposes the following policy recommendations. (1) Interest rate liberalization reform can effectively cope with overinvestment. In the current stage of overcapacity, China should firmly carry out a new round of supply-side structural reforms with market-oriented tools, and drastically carry out market-oriented reforms of other factors. (2) Correctly treat the different impacts of interest rate liberalization reform on different types of enterprises, introduce supporting policies for different types of enterprises to reasonably reduce the possible adverse effects of interest rate liberalization on non-state-owned enterprises. (3) Deepen the structural reform of the financial supply side, pay full attention to the issue of "credit discrimination" in the financing market, eliminate various hidden barriers to the non-state-owned economy and small-sized enterprises, create a more equitable financing environment, and ensure that all types of enterprises are legally participate in market competition fairly, to continuously improve the ability of financial services to the real economy.

# A Research on the Contributing Factors of Cash Dividend Policy in Chinese Listed Companies

Huang Ziying

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 1174284310@qq.com)

**Abstract:** This paper uses multiple linear regression method to empirically test the impact of financial indicators of Chinese listed companies on their cash dividend policy. The study finds that: (1) Since the introduction of semi-mandatory dividend policy by the regulatory authorities in China, the number of cash dividend distributing companies has shown an overall upward trend, some of which, however, focus on stock dividends while neglecting cash dividends. The policy of cash dividend distribution is divided into two extremes--either excess cash dividend distribution or insufficient cash dividend distribution; (2) Generally speaking, earnings per share, operating cash flow per share, ratio of assets to liabilities, logarithm of total assets and total assets turnover ration all have a significant impact on the cash dividend policy of listed companies, but profitability and solvency are the most important financial factors affecting the cash dividend distribution level of listed companies in China.

**Key words:** Cash dividends; Stock dividends; Profitability; Solvency

## 1 Introduction

The study on dividend policy was firstly advocated by Lintner in 1956. (Lintner, 1956) Over the years, many theories have been developed to explain the company's dividend policy. However, the "dividend puzzle" (Black, 1976) is still pending. Currently, China's securities market is still an emerging market, which has problems such as institutional defects and imperfect supervision system. The dividend policy of listed companies in China shows a "dividend puzzle" different from that of mature capital markets in the West, which has aroused widespread interest in both practical and theoretical research.

In 1961, Miller and Modigliani put forward the famous theory of "irrelevant dividend view", which marked a new era for the study of dividend distribution theory. They believed that in a completely frictionless capital market environment, corporate dividend decision-making will not affect corporate value. However, the rigorous assumptions of irrelevant dividend view are hard to be fulfilled in the real capital market. Therefore, many scholars have relaxed these assumptions from different perspectives. For example, Jensen and Meckling advocated reducing managers' opportunistic behavior by dividend payment (Jensen and Meckling, 1976), while Myers believed that dividend payment would make companies bear higher external financing risks (Myers, 1984). The life cycle model of dividend payment embodies the idea that companies should decide on dividend-payment policies according to different life stages (Grullon et al.2002; DeAngelo et al. 2006). In order to reconcile the above disputes about whether companies should pay cash dividends, Ross et al. proposed that cash dividend can only be paid when companies create sufficient internal free cash flow and can provide sufficient financial support for current and foreseeable future investment projects (Ross et al.2013).

Domestic research mainly uses the data of China's capital market to verify the classical theories abroad, so as to prove the applicability of these theories in China. In terms of the contributing factors of dividend policy, Chinese scholars find that the factors affecting dividend policy of listed companies in China include financial factors and non-financial factors. Among them, financial factors include profitability, growth ability, operating ability, cash flow status, asset liquidity, debt paying ability and asset size, etc. For example, Yang Shu'e and Bai Yong found that cash dividend policy was mainly influenced by two factors: the balance of cash and the profits available for dividend, and the policy was positively correlated with them (Yang Shu'e and Bai Yong, 2000). Xie Jun found that profitability, earnings level, cash holdings, company size and financial leverage have a certain impact on cash dividend policy (Xie Jun, 2006). In recent years, scholars have further found that cash dividend policy is related to other financial decisions, which can adjust the capital structure and reduce the cost of bond financing (Wu Yuhui et al. 2018; Hu Jianxiong et al. 2019). Non-financial factors include regulatory policies (Wei Zhihua et al. 2017), corporate governance (Yuan Hongqi, 2001; Wang Huachen et al. 2007; Jin Qinglue et al. 2016), enterprise life cycle (Xing Tiancai et al. 2018), regional factors (Zhang Weiting et al. 2015) and so on.

From the existing research on dividend payment, it can be seen that there is no consistent conclusion on whether or not dividends are paid and how much dividends are paid. Among the many factors affecting the cash dividend policy of companies, financial factors play a dominant role. The contribution of this paper lies in the fact that it comprehensively considers the financial indicators affecting the cash dividend policy and examines thoroughly the impact of the financial characteristics of listed companies on their cash dividend policies. In addition, using the latest sample and data, this paper has found out the main financial factors affecting the cash dividend policy of listed companies in China under the background of institutional changes. Therefore, it can help the regulatory authorities and listed companies make sound decisions on dividend policy.

## 2 The Institutional Background and Current Situation of Cash Dividend Policy of Listed Companies in China

Since 2000, the government and regulatory authorities have paid unprecedented attention to investor protection, and a large number of relevant laws and regulations have been promulgated intensively. Among them, the dividend distribution policies are shown in Table 1.

**Table 1 Historical Evolution of Dividend Allocation Policies**

Time	Names of Laws and Regulations	Main Contents
2001.3.28	Management Measures for New Share Issuance of Listed Companies	Securities companies acting as principal underwriters must focus on those companies that have not paid dividends in the latest three years and whose reasons for non-distribution have not been reasonably explained by the board of directors, and explain them in due diligence reports.
2004.12	Some Provisions on Strengthening the Protection of Shareholders' Rights and Interests in Public Shares	A listed company which fails to distribute cash profits in the last three years shall not issue new shares to the public, issue convertible bonds or distribute shares to the original shareholders.

2006.4.26	Administrative Measures for the Issuance of Securities by Listed Companies	The cumulative distribution of profits in cash or stock in the last three years is not less than 20% of the average annual distributive profits achieved in the last three years.
2008.10.9	Decision on Revising Several Provisions on Cash Dividend of Listed Companies	Relevant regulations have been revised in detail, such as "the company should specify the cash dividend policy in its Articles of Association, and the profit distribution policy should maintain continuity and stability", "the listed company can carry out mid-term cash dividend distribution", "the accumulated profits distributed in cash in the last three years are not less than 30% of the average annual distributable profits realized in the last three years", and so on.
2012.5.4	Notice on Further Implementing the Relevant Issues Concerning Cash Dividends of Listed Companies	From the perspective of strict refinement of information disclosure, the transparency of cash dividends of listed companies will be enhanced, and listed companies will be urged to strengthen the awareness of returning shareholders. For example, "emphasize that IPO companies should disclose specific profit distribution plans for the next three years" and so on.

According to Table 1, it can be seen that for a long time, China's A-share listed companies have been "focusing on financing while neglecting returns". China Securities Regulatory Commission (CSRC) urges listed companies to distribute cash dividends to shareholders by linking the level of cash dividend distribution with refinancing qualifications. The direct effect of the implementation of these semi-mandatory dividend policies has led to the emergence of new features in the dividend policy of listed companies. Table 2 shows the statistics of dividend distribution of listed companies on main-board market from 1998 to 2017.

**Table 2 Number/Percentage of Listed Companies that Distributed Cash Dividends**

Year				(Number/Percentage)
	Cash dividends	Stook dividends	Undistributed	Number of listed companies on main-board market
1998	264	224	430	849
	(31.10)	(26.38)	(50.65)	
1999	309	183	513	943
	(32.77)	(19.41)	(54.40)	
2000	698	198	322	1055

2015	989 (64.05)	247 (16.00)	515 (33.35)	1544
2016	1190 (70.71)	159 (9.45)	478 (28.40)	1683
2017	1427 (76.35)	258 (13.80)	425 (22.74)	1869

Data source: CSMAR

As can be seen from Table 2, the proportion of listed companies with cash dividends has increased significantly since 2000. From 1998 to 2017, the proportion of listed companies with cash dividends has increased from 31.10% to 76.35%. At the same time, it can be seen that companies that do not allocate or allocate stock dividends still account for a considerable proportion, indicating that there is still the situation of "focusing on stock dividends, but neglecting cash dividends" in listed companies in China.

The introduction of semi-mandatory dividend policy has played a positive role in guiding and regulating the dividend policy of listed companies and protecting the interests of investors. But this regulation may also have a negative impact on those companies with inadequate cash, which in order to achieve the purpose of refinancing have to pay cash dividends so that the shortage of cash is to worsen. To get over the difficulty, they have to increase external financing, especially debt financing, thus increasing the financing risk. By studying the relationship between the company's basic financial characteristics and cash dividends, this paper explores how listed companies should formulate dividend policy rationally, and provides decision-making reference for regulatory authorities and listed companies.

### 3 Research Design

#### 3.1 Hypothesis development

On the basis of drawing lessons from domestic and foreign research results and according to the present situation of dividend distribution of listed companies in China, this paper puts forward several hypotheses from the perspective of internal factors affecting dividend policy of listed companies in China.

The formulation of dividend distribution policy is closely related to the interests of shareholders and creditors, which will affect the company's financial situation and investment opportunities. In order to protect the interests of all parties, various countries regulate the formulation of dividend policy through laws and regulations, such as: company dividends can only be paid from current profits and retained earnings accumulated in the past; when a company is unable to pay its debts due, it will not be able to pay cash dividends, etc. Profitability is the basis of dividend payment and debt repayment. Cash dividend is essentially a distribution of the company's after-tax earnings. To a large extent, the dividend policy of the company will be affected by its profitability and stability. Generally speaking, the more profitable a company is, the higher its cash dividend payment rate will be. Therefore, the hypothesis 1 is made:

**Hypothesis 1: The stronger the profitability is, the higher the cash dividend per share will be.**

Flexible turnover of company funds is a necessary condition for the normal operation of the company. If the liquidity of the company is stronger, the company is willing to distribute cash dividends without worrying about financial risks. If the actual cash disbursed by the company is less than the net cash inflow from operating activities, it means that the company has surplus cash after paying dividends. In this case, the distribution of cash dividends will not endanger the liquidity of the company's operation. If the dividend is greater than the net cash flow of operating activities, it indicates that the overdraft of existing funds may damage the daily operation of the company. Therefore, the more cash flows from business activities, the more cash dividends the company can distribute. Therefore, the hypothesis 2 is made:

**Hypothesis 2: The more net cash flow per share is, the higher cash dividend per share will be.**

The heavy debt burden of the company will lower the liquidity of the company and increase its financial risk. In this case, the company tends to use retained earnings to improve the company's financial situation and avoid further deterioration of the financial structure. In addition, the restraint from creditors will also force the company to distribute less cash dividends, so as to protect creditors' rights. Therefore, the higher the company's debt ratio is, the greater the restriction on the company's ability to distribute cash dividends will be. Therefore, the hypothesis 3 is made:

**Hypothesis 3: The higher the debt ratio is, the lower the cash dividend per share will be.**

The size of listed companies has a great impact on their dividend policy. The smaller the company is, the larger the growth space and the stronger the demand for expansion will be. As a result, cash dividends are paid less and profits are retained or stock dividends are paid more. At the same time, the larger the company is, the greater its social influence will be. With the strength and reputation of large companies, it is easier to obtain funds from other sources at low cost, and it also has sufficient strength and willingness to pay cash dividends. Therefore, the hypothesis 4 is made:

**Hypothesis 4: The larger the company is, the higher the cash dividend per share will be.**

The turnover rate of total assets reflects the operation ability of the company's overall assets. Generally speaking, the more turnover times or less turnover days of assets indicates the faster turnover speed and the stronger operational capacity. The acceleration of asset turnover will increase the absolute amount of income, and the more funds will be recovered, thus guaranteeing the distribution of cash dividends. Therefore, the hypothesis 5 is made:

**Hypothesis 5: The higher the total asset turnover rate is, the higher the cash dividend per share will be.**

### 3.2 Sample selection and data sources

The sample data of this paper select A-share listed companies which have paid cash dividends on Shanghai and Shenzhen main-board market from 2014 to 2017. In order to ensure the validity of the data, this paper excludes some samples. The selection principles of samples are as follows:

- ① Companies that issue B shares and H shares at the same time are excluded;
- ② Financial and insurance listed companies are eliminated;
- ③ Companies with incomplete information are eliminated;

After screening, 3,189 samples were finally selected. The research data comes from the window

information database. This paper uses EXCLE and SPSS 20.0 statistical software to process the data.

### 3.3 Variables and model

Based on the above hypotheses, the following dependent and independent variables are defined, as shown in Table 3.

**Table 3 Definitions of Variables**

	Names of Variables	Variable Symbols	Formula
Dependent variable	Cash Dividends Per Share	DIV	Total Cash Dividends / Weighted Average Common Shares Outstanding
	Earnings Per Share	EPS	Net Income / Weighted Average Common Shares Outstanding
Independent Variables	Cash Flow from Operating-Activities Per Share	OCF	Cash Flow from Operating Activities / Weighted Average Common Shares Outstanding
	Debt Ratio	LEV	Total Liabilities / Total Assets
	Total Assets	LNSIZE	Natural Logarithm of Total Assets
	Total Asset Turnover Ratio	TAT	Net Sales / Average Total Assets

In order to analyze the impact of financial indicators on cash dividend policy of listed companies, a model is established as follows:

$$DIV = \alpha_0 + \alpha_1 EPS + \alpha_2 OCF + \alpha_3 LEV + \alpha_4 LNSIZE + \alpha_5 TAT + \varepsilon$$

Of them, DIV represents the company's cash dividend policy, which is the dependent variable of the whole model. The influence of other independent variables on it was investigated; EPS, OCF, LEV, LNSIZE and TAT are independent variables, representing profitability, cash adequacy, solvency, company size and operating capacity respectively; and  $\varepsilon$  is a residual term.

## 4 Empirical Results and Analysis

### 4.1 Descriptive statistics

Table 4 shows the descriptive statistical results of the relevant variables.

**Table 4 Descriptive Statistics**

Variables	Sample Size	Mean	Median	Standard Deviation	Minimum	Maximum
-----------	-------------	------	--------	--------------------	---------	---------

DIV	3189	0.167	0.100	0.178	0.004	2.300
EPS	3189	0.551	0.420	0.515	-0.493	6.280
OCF	3189	0.610	0.440	1.518	-8.030	25.400
LEV	3189	0.446	0.457	0.208	0.011	0.978
LNSIZE	3189	12.813	12.535	1.505	9.994	21.020
TAT	3189	0.834	0.685	0.643	0.031	8.915

As can be seen from Table 4, the absolute value of cash dividend payment of listed companies in China is generally at a low level. The average value of cash dividend per share is only 0.167 yuan per share, while the maximum value of cash dividend is 2.300 yuan per share and the minimum value is 0.004 yuan per share. The standard deviation is relatively large, which indicates that there are great differences in dividend distribution among companies, and the dividend distribution policy of listed companies in China is seriously divided into two levels. In addition, the minimum value of earnings per share is - 0.493 yuan per share, and the minimum value of operating cash flow per share is - 8.030 yuan per share. This shows that companies with negative earnings per share and operating cash flow still make cash dividends payment, and excess cash dividend distribution and insufficient cash dividend distribution coexist in China's listed companies.

#### 4.2 Correlation analysis

Pearson and Pearson correlation analysis aims to preliminarily test the relationship between independent variables and dependent variable, so as to preliminarily examine the impact of each independent variable on dependent variables. The specific results are shown in Table 5.

**Table 5 Pearson and Spearman Correlation Statistics**

	DIV	EPS	OCF	LEV	LNSIZE	TAT
DIV	1.000	0.664***	0.290***	-0.247***	0.033**	0.108***
Sig.		0.000	0.000	0.000	0.040	0.000
EPS	0.647 ***	1.000	0.327 ***	-0.140 ***	0.137***	0.166 ***
Sig.	0.000		0.000	0.000	0.000	0.000
OCF	0.243 ***	0.391 ***	1.000	0.103 ***	0.239***	0.144 ***
Sig.	0.000	0.000		0.000	0.000	0.000
LEV	-0.229***	-0.082***	0.162 ***	1.000	0.574***	0.136 ***
Sig.	0.000	0.000	0.000		0.000	0.000

LNSIZE	0.052 ***	0.189 ***	0.277 ***	0.574 ***	1.000	-0.011
Sig.	0.001	0.000	0.000	0.000		0.493
TAT	0.068***	0.104 ***	0.096 ***	0.142 ***	0.027	1.000
Sig.	0.000	0.000	0.000	0.000	0.106	

① Pearson correlation statistics are shown in the lower left part of the table, and Spearman correlation statistics are shown in the upper right part of the table.

② \*\*\* Indicates significance at 1 percent level; \*\* indicates significance at 5 percent level; \* indicates significance at 10 percent level in a two-tailed test.

From the statistical results shown in Table 5, taking Pearson correlation coefficient analysis as an example, the cash dividend per share of listed companies has significant positive correlation with earnings per share, operating cash flow per share, total assets and total asset turnover rate, and has significant negative correlation with debt ratio. It preliminarily verifies hypothesis 1, hypothesis 2, hypothesis 3, hypothesis 4 and hypothesis 5. The small correlation coefficient between the independent variables indicates that the model does not have the problem of collinearity.

### 4.3 Multivariate linear regression analysis

In order to further study the contributing factors of cash dividend of listed companies, this paper uses the multiple linear regression method to analyze the contributing factors of cash dividend payment of listed companies. The regression results are shown in Table 6.

**Table 6 Results of Multivariate Regression Analysis**

	2014	2015	2016	2017	2014-2017
intercept	0.066*** (2.83)	0.071 (1.510)	0.093** (2.275)	0.097** (2.08)	0.067*** (2.809)
EPS	0.209*** (43.135)	0.194*** (20.883)	0.189*** (20.577)	0.247*** (26.276)	0.208*** (42.655)
OCF	0.008*** (3.729)	-0.001 (-0.211)	0.017*** (3.906)	0.005 (1.135)	0.008*** (3.868)
LEV	-0.187*** (-14.044)	-0.143*** (-5.293)	-0.172*** (-7.157)	-0.209*** (-8.27)	-0.185*** (-13.759)
LNSIZE	0.004** (2.14)	0.004 (0.923)	0.001 (0.403)	0.002 (0.502)	0.004** (2.057)
TAT	0.008**	0.003	0.015**	-0.007	0.008**

	(2.401)	(0.511)	(2.355)	(-0.908)	(2.387)
YEAR					control
Adj.R <sup>2</sup>	0.456	0.432	0.483	0.504	0.456
F	616.882	124.249	168.702	247.923	385.594

\*\*\* Indicates significance at 1 percent level; \*\* indicates significance at 5 percent level; \* indicates significance at 10 percent level in a two-tailed test.

According to Table 6, the factors affecting the cash dividend distribution level of listed companies are varied in different years. Of them, whether mixed sample or annual samples, earnings per share and cash dividend per share are significantly positively correlated, which verifies hypothesis 1 (the stronger the profitability of the company is, the larger the cash dividend payment will be). The profitability has a very significant impact on cash dividend. The debt ratio has also passed the significant test. Either the mixed sample or the annual samples, the debt ratio is negatively correlated with cash dividend per share, which verifies hypothesis 3(the higher the debt ratio is, the lower the cash dividend per share will be) The solvency has a significant impact on cash dividend.

As for the three variables of operating cash flow per share, logarithm of total assets and total assets turnover, there is a significant positive correlation between them and cash dividend per share at the levels of 1%, 5% and 5% respectively in the mixed sample, which verifies hypothesis 2, hypothesis 4 and hypothesis 5 to some extent. But there are some divergence n various years. For example, operating cash flow per share is positively correlated with cash dividend per share in 2015 and 2017, but not significantly; the logarithm of total assets is only positively correlated with cash dividend per share at the level of 5% in 2014; total asset turnover rate is positively correlated with cash dividend per share in 2015, but the significance test has failed, and it is even negatively correlated with cash dividend per share in 2017. Such results indicate that the positive correlation between these three variables and cash dividend is not particularly stable.

R<sup>2</sup> is always more than 40% based on both annual samples and mixed sample, which shows that the independent variables selected in this paper have a greater impact on dependent variables.

#### 4.4 Robust Test

In order to make the results of this paper more reliable, the robust tests were carried out. First of all, this paper changes the measurement method of the dependent variable DIV, and uses paying or not paying cash dividend to reflect the willingness of the listed company paying cash dividend. That is, when the company issues cash dividends, the value of DUMDIV is 1. Otherwise it is 0. Thus, this paper can further examine the impact of financial indicators on the willingness of listed companies paying cash dividend. The result of the mixed data test shows that earnings per share, operating cash flow per share, total assets logarithm and total assets turnover rate are positively correlated to the willingness of the listed company paying cash dividend, and debt ratio is negatively correlated with the willingness paying cash dividend. So, the result further supports hypotheses 1-5. In addition, return on assets (ROA) is used to measure the profitability of listed companies. The empirical result is not significantly different from the previous analysis. Finally, this paper uses panel data to solve endogenous problem and the problem of missing variables. There are many factors affecting the cash dividend policy, but the financial factors play a major role. This paper focuses on the impact of financial factors on the cash dividend policy of listed companies, so panel data is used to solve the problem of missing variables to

ensure the validity of the model. The empirical result of panel data supports the above-mentioned research results.

## 5 Conclusion

This paper empirically examines the impact of the basic financial characteristics of Chinese listed companies on their cash dividend policies. The study finds that, on the whole, earnings per share, operating cash flow per share, debt ratio, total assets logarithm and total assets turnover rate have a significant impact on cash dividend policy of listed companies. Of them, the impact of earnings per share and debt ratio is relatively stable; mixed data and annual data support its significant impact on cash dividend. Operating cash flow per share, logarithm of total assets and total asset turnover rate have passed the test significantly based on mixed sample, but the results are not stable in various years. The results show that profitability and solvency (capital structure) are the most important financial characteristics that affect the cash dividend distribution level of listed companies in China.

Based on the above conclusions, this paper suggests that the dividend distribution of listed companies should be based on their profitability level. Excess cash dividend distribution and insufficient cash dividend distribution are not advisable. Excess cash dividend distribution will lead to insufficient investment due to lack of cash. If external financing is used to make up for the cash gap, it will increase the financing risk. The insufficient cash dividend distribution will release unfavorable signals to investors, which is not conducive to the promotion of corporate value. In addition, as a financial decision, the cash dividend policy should be considered together with other financial decisions. If the company has a high debt ratio and faces greater financial risks, it should reduce the cash dividend, ensure the solvency of the company, and make the cash dividend policy compatible with the capital structure decision. On the other hand, the regulatory authorities should further improve the relevant laws and regulations on dividend payment, guide listed companies to formulate dividend payment policies on the basis of profits while controlling financial risks, so as to complete the task of "deleveraging" in the "supply-side" reform and create a good market environment.

This paper mainly focuses on the financial factors affecting the cash dividend payment policy of listed companies in China, but the factors affecting the cash dividend payment policy include non-financial factors such as corporate governance, which need to be studied in the future research.

## Media Coverage, Political Connections and Corporate Risk

Zhou Yi, Zhang Youtang

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: zhouyi9723@163.com, zyt@whut.edu.cn)

**Abstract:** Media coverage, as an important part of the external corporate governance mechanism, plays an important guiding role in corporate behavior patterns and public opinion. Taking A-share listed companies of Shanghai Stock Exchange and Shenzhen Stock Exchange from 2012 to 2017 as research examples, this paper analyzed how media coverage and political connections exert influence on corporate risk in an empirical study approach. This paper makes the following conclusions. First, the media, as information medium and external participant of the company, significantly lower the listed company's corporate risk through closed media coverage. Second, the closer connection a company has with government, the higher corporate risk it encounters and, in the meantime, less effect of media coverage's aversion effect towards corporate risk. Third, based on a further research on the nature of company's property rights, this paper revealed that in state-owned companies, close political connections weaken much more media coverage's aversion effect towards corporate risk than that in private companies.

**Key words:** Media coverage; Political connections; Corporate risk; Nature of property rights

### 1 Introduction

The media exert profound influence on the market during the market economy era. As society and economy progress and reform constantly, vibrant rising of the media not only makes the listed companies' financial activities more transparent, but significantly lower the time cost in acquiring information. That the media closely follow listed companies ensure that information would be transmitted accurately and in a timely manner, and in the meantime, lead the public to respond to information released by listed companies, thus guiding the public opinion. In the past few years, the media has reported "Melamine scandal" of the dairy industry, " clenbuterol scandal" of Shuanghui Group and financial fraud case of Nine Top in 2017. All these cases reveal that the media play an important role in supervising listed companies, protecting investors' interests and benefiting and stabilizing market.

Corporate risk refers to the uncertainty and volatility of corporate income flow. Forty years has passed since the implementation of reform and opening policy, and China's national economy has achieved profound progress. However, many companies blindly pursue the fast growth of corporate profits, while ignoring the ever-worsening corporate risk condition. The outbreak of 2008 financial crisis in the United States indicated that the outbreak of corporate risk not only lead to corporate bankruptcy, but result in severe struck to macro economy. Therefore, when focusing on the corporate performance, the public should also pay attention to corporate risks, based on which policy-makers and the academia begin to put much emphasis on factors concerning corporate risk. Current studies on corporate risk are mostly searching the relations between corporate risk and judicial supervision mechanism, internal control and managers, yet few studies probe into the influence of the media on corporate risk. At present, the media play an ever increasingly important role in listed companies'

management, and a study researching corporate risk from the perspective of the media is highly relevant and theoretical.

Political connections are common among Chinese and foreign companies. No specific conclusions on such corporate-government ties have been made and its influence remain unknown. On the one hand, if maintaining positive communications with government, companies could be benefited from competitive advantages through preferential tax, facilitation in financing, breaking of industry barriers offered by government, and could be relieved from corporate risk to some extent. On the other hand, existence of political connections may result in problems such as excessive corporate investment and low-quality of accountant information, which will worsen corporate risks to some extent. In addition, Chinese capital market started later and is characterized by its unique institutional condition and market environment. The complexity of “Renqing”, a special nepotistic practice, result in that political connections also exist within the media. Therefore, under such a complex circumstance, it is urgent and worthwhile studying the influence that establishment of political connections have exerted on corporate risk and moderating effect that political connections have on listed companies focused by the media.

This study makes innovations in the following aspects. First, from the perspective of corporate risk management, this study examines what effects may happen to corporate risk if there were media attention and political connections, and reveals that media coverage, as an external supervision mechanism, have aversion effect towards corporate risk, which has filled in the blank of the studies in corporate management and risk management; second, through empirical method, this study verifies that political connections will cause moderating effect on media coverage’s aversion effect towards corporate risk, and based on listed companies’ different nature of property rights, carries out variation analysis of moderating effect between listed companies and their connections with government, which renders reference and advice for preventing and lowering corporate risk.

## **2 Literature Review**

### **2.1 Media coverage and corporate risk**

Over the past years, Chinese and foreign scholars studying media coverage have mainly focused on its supervision functionality and its role as information medium.

First, the media function as an information medium. Through information announcement, collection and distribution, the media benefit investors with less information collection cost and less asymmetrical information disadvantage. (Xiong Yan,2014) started from the perspective of asymmetrical information and through an empirical study, verified that media coverage on corporate behaviors significantly lower the imbalance between company and investors in acquiring information, and reduce the corporate risk as a result. (Sun Yanmei and others,2018) utilize the language analysis tools to construct index indicating media coverage and language, to analyze what influence media is going to have on risk of stock price collapse and how that happens. The empirical result of her research revealed that media spread and distribute information, which effectively alleviate information asymmetry and increase the cost, legislative punishment and reputation cost that law-breakers of company must take in hiding negative news. Therefore, it is beneficial to constraining stock prices from collapsing. (Fang and Feress,2009) also through empirical studies, found out that stocks with less media coverage are more likely to yield profit. This is because less accounting transparency lead to higher risk of information asymmetry, so more risk premiums are needed for compensation, which indirectly verified the role media has played as information medium. (Bushee and others,2016) also carried out studies on the media as information medium. Their results reported that the media could reduce the errors existing in

the corporate financial report through transmitting package information.

Second, the media also function as a supervisory body. As an important part of the external corporate governance mechanism, media coverage could investigate and reveal illegal activities infringing upon public goods, such as accounting fraud and earnings management, and thus, restrain management board from conducting opportunist behaviors. (Luo Jinhui,2012) used simultaneous equations models to conduct an empirical test on the benefits media converge produce on corporate governance. The result revealed that media coverage could reduce cost of dual agency to lower its risk. When corporate media coverage increase, corporate production efficiency, performance and social responsibility also increases, and company reported less violations in earning management. (Kong Dongmin,2013). (Li Peigong and Shen Yifeng,2010) discovered that media coverage may lead concerned supervisory bodies to intervene and drive up the violation cost, forcing companies to upgrade corporate governance and lower risk. (Dyck and others,2008) also put forward that companies encroaching outside investors are getting more attention form media, so media coverage effectively forces these companies to correct relative policies and conducts.

## **2.2 Political connections and corporate risk**

After organizing current studies in this regard, this paper discovered that at present, the academia hasn't reached consensus about the influence of political connections on corporate risk. That said, political connections may exert dual effect on corporate risk.

First, political connections could lower corporate risk. Some scholars believe that compared with companies having no political connections, those that have political connections are more likely to acquire competitive advantages such as preferential tax policy, financing facilitation and convenient business entry, and finally lower the corporate risk. (Wang Zhongwei,2015) took private listed companies from 2008-2013 as examples, and found out that China's private companies tend to establish political connections to acquire preferential tax policies. The more connections they have with the government, the more profits they benefit from tax policies. (Yu Wei's,2012) researches discovered that political connections could function as information transmitter, and thus alleviate the information asymmetry between capital suppliers and demanders. Political connections could also help strengthen private companies' ability in acquiring resources to loosen the bond in financing, thus reducing corporate risk. (Luo Danglun and Liu Xiaolong,2009) found out that private listed companies can break industry barriers, develop corporate performance and reduce corporate risk through establishing political connections.

Second, political connections add to corporate risk. Some scholars believe that political connections lead to extra burden on companies, interfere in corporate operation and decision-making, and intervene their daily operation. (Hu Guoliu,2012) research on basic information on corporate manager and investment data, and found out that because of the over-confidence of corporate managers, company may overly invest, causing higher corporate risk. In addition, (Li Tian and others,2018) also discovered on their revealing studies researching relations between corporate political connections and corporate information environment that the closer company board are with government, the lower of the accounting information quality that company release, which is an obvious negative correlation. (Shen Hongbo,2014) put forward that for private listed companies, political connections, as an unofficial mechanism, restrain companies from releasing high-quality accounting information, resulting in higher corporate risk.

### 3 Theory Analysis and Research Hypothesis

#### 3.1 Media coverage and corporate risk

Media coverage exert influence on corporate risk mainly from the following aspects:

Media coverage effectively alleviate information asymmetry between companies and investors, serving as an information medium. According to information asymmetry theory, in a market with uneven information distribution, different market players are equipped with different abilities in acquiring information, and market status is decided by how much information a market player possesses. Under such circumstance, companies with absolute advantage in information acquiring ability whitewash their earning abilities through measures jeopardizing stake-holders such as manipulating profits and producing false report. Such measures not only seriously disorder investors' decision-making process and market operation, but prevent companies from sensing risk and controlling it in a swift manner. In general, as information distributor and transmitter, the media constantly reporting on listed companies is beneficial to alleviating market information asymmetry and creating a capital market that is comparatively transparent, and hence, reduce corporate risk caused by misconducts of management board.

To function as an external supervisory body, media coverage produces an effect called "overseeing effect", which refers to that listed companies reported by the media would be under the spotlight of investors, analysts and auditing agencies, and conducts jeopardizing investors' interests decrease. For companies, any negative reports concerning them may be reported by the media, therefore, out of egoistic impulse, companies tend to manage information. The public opinion is closely following them, so their information management behaviors are more likely to be disposed than companies that are not under the spotlight. Under such circumstance, companies face not only pressure from public opinions, but possible investigation from concerning administrative supervisory bodies, which to some extent lowers corporate risk caused by unstable ethical factors of corporate management board.

Based on the preceding analyses, this study put forward with the following hypotheses:

**H1: Media coverage boasts profound risk aversion effect on corporate risk.**

#### 3.2 Political connections and corporate risk

Political connections exert dual effect on corporate risk. Positive influence on corporate risk from connections with government are mainly reflected on the following aspects:

First, in operation, companies often meet with difficulties when financing. Political connections render companies some convenience in financing. In domestic financing market, information is highly, unevenly distributed among capital supplying side and demanding side, and adverse selection problems originated from such phenomenon are important factors hindering companies' financing process. Companies with strong political connections could lift restrictions on financing through delivering positive signals of corporate performance to the market, and reduce corporate risk in the end.

Second, tax laws in China are still incomplete. Government still enjoy much decision-making power in object of taxation, applicable tax categories, applicable tax rate, taxation basis, tax reduction and exemption and other preferential policies. According to Political Power Hypothesis, the closer connections corporate management board has with government officials, the more communications they will have. Therefore, companies with closer political connections enjoy more tax preferential policies through the political advantages they possess.

Negative influence on corporate risk from political connections are mainly reflected on the following aspects:

First, compared with companies without political connections, companies that have such connection could take advantage of it and acquire bank loans easily. Under such circumstance, companies are benefited with promising financing outlook, rich capital supply and more investment opportunities, which, to some extent, will lead to excessive investment in these companies and increase corporate risk.

Second, compared with companies without political connections, companies that have such connection tend to release information of lower quality. The quality of information that companies release are simultaneously decided by incentives of management board, rent-seeking behaviors and level of financing facilitation. To be specific, when there is higher level of rent-seeking behaviors as well as other incentives in the management board, and more convenient financing channels, companies are less interested in releasing quality information. Political connections provide corporate management board with natural privileges in power and rent-seeking behaviors, and strengthen their ability in capturing interests from investors and their incentives in rent-seeking. Meanwhile, such connections also provide companies with financing facilitation and alleviate their financing pressure. Therefore, when having political connections, companies tend to lower their information released, and have less demand in seeking quality information authentication service.

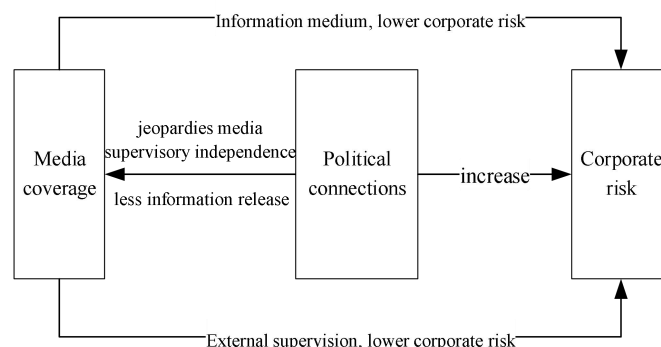

Considering that there are two completely different influence mechanism of political connections and corporate risk, this paper put forward following hypotheses:

**H2a: Political connections efficiently check corporate risk.**

**H2b: Political connections efficiently promote the corporate risk.**

**3.3 Political connections will cause moderating effect on media coverage 's aversion effect towards corporate risk**

As an important part of the external corporate governance mechanism, media coverage functions as information medium and supervisory body, yet such functions could be affected by many factors. Objectivity remains the core factor affecting quality of media information, while companies with political connections have a major influence on that objectivity. Currently, domestic laws protecting the liberty and independence of news report are not complete, and as many news agencies are under governance of local CPC committee and government, contents of news report are often censored by these authorities. Therefore, the media's role of information medium and supervisory body could be restrained by pressure from administration. Considering that a media agency released a negative report on a company that has political connections and such report had led to negative impact on corporate interests. Since this company have common interests with government, and corporate loss may carry a negative impact on government, it is reasonable to conclude that this company is very likely to protect its own interests and reputation by adopting special measures to interfere with this media agency so as to limit the scope of the negative impact. Thus, political connections can be an invisible guarantee for corporate risk. In addition, compared with companies without political connections, those

that have connection intend to cover their rent-seeking behaviors, and will release less accounting information. This will cause a sharp increase of cost for the media intending to supervise and investigate these companies, and hinder performing of the media's supervisory function.

**Figure 1 Influence Mechanism of Political Connections' Moderating Effect on  
Media Coverage's Aversion Effect Towards Corporate Risk**

Based on the analysis above, this paper made following hypothesis:

**H3: Ceteris paribus, political connections weaken media coverage's aversion effect towards corporate risk**

## **4 Research Design**

### **4.1 Sample selection and data sources**

This paper took non-financial A-share listed companies of Shanghai Stock Exchange and Shenzhen Stock Exchange from 2012 to 2017 as research samples. Information about the media reports was manually collected from China Core Newspapers Full-text Database. Background information about senior executives of listed companies was manually collected from CSMAR Database. Other accounting information was also collected from CSMAR Database. Adopting methodologies widely used by the academia, this paper has sifted and processed original information with following steps so as to eliminate abnormal samples:

(1) Financial listed companies were excluded. (2) ST and \*ST stocks were excluded when samples were collected. Because companies trapped in financial debt are always under the spotlight of the media, furthermore, these companies are always with higher corporate risk, so research results obtained from these samples are jeopardized in terms of credibility and universality. (3) Companies with inaccessible data were excluded. (4) In order to avoid outliers, this paper winsorized 1% of the data acquired. The results included 12,916 samples.

### **4.2 Variable definition**

(1) Corporate risk. Current domestic studies mainly evaluate corporate risk level through fluctuation of corporate profit capability. Based on that, this paper set three year as a time range and by using continuous calculation, calculated standard deviation of net return on equity. This standard deviation was used as proxy variable for risk level. The higher continuous standard deviation of net return on equity is, the higher corporate risk level is.

(2) Media coverage. This paper focuses on the influence that the media, as external supervisory function and information medium function, has on corporate risk, and doesn't lay emphasis on the differences caused by the preferences of different media reports. Under this circumstance, this paper chose the number of media reports as proxy variables. To be specific, drawing experience from (Li Peigong and Shen Yifeng, 2010), and (Yi yi, 2011), this paper selected eight most influential national financial daily newspapers from China Core Newspapers Full-text Database. These newspapers include *China Security Journal*, *Security Daily*, *Securities Times*, *ShangHai Securities News*, *The Economic Observer*, *China Business Journal*, *China Business News*, and *21st Century Business Herald*. This paper adopted methods of theme search and title theme to acquire all news reports about these samples by searching the full name and abbreviation of company samples. After manual collection of research

results, this paper listed news report information about non-financial A-share listed companies of Shanghai Stock Exchange and Shenzhen Stock Exchange from 2012 to 2017.

(3) Political connections. Political connections refer to an unofficial communication mechanism that companies established with government as well as its staffs, with senior executives as the medium. Most of the previous papers adopted dummy variables to evaluate whether a company established political connections, yet such method failed to measure the level of connection, thus lacking comprehensiveness. Drawing experience from research methodology of (Jia Ming,2010), this paper searched information form CSMAR Database by using key words of names of senior executives as well as their companies. After manual collection and organization of searching results, this paper set political background of senior executives (Pc) as proxy variables, and, through algorithm of value assignment, acquired the score of corporate political connections to measure the level of such connection. The value assignment standard are as follows:

**Table 1 Score Assignment Standard for Measuring Political Connections**

Categories	Score Assignment
Government Officials	Working in the State Council=7
	Working in the provincial government=5
	Working in the municipal government=3
	Working in the government below the municipal level=1
Non-government Officials	Deputy of the NPC or Member of the CPPCC=6
	Deputy of the provincial NPC or Member of the provincial CPPCC=4
	Deputy of the municipal NPC or Member of the municipal CPPCC=2
	Deputy of the NPC below the municipal level or Member of the CPPCC below the municipal level=0

(4) Control variables. Control variables refer to other factors affecting corporate risk. This paper followed the common practices of current studies, and chose six variables as control variables, including Size (size), Age (age), Operating margin (Om), Financial leverage (Lev), Operating income growth rate (Oigr), Proportion of independent directors (Indept). Specific definitions of variables are described as Table 2.

**Table 2 Definition of Variables**

Types of variables	Titles and Abbreviation of Variables	Definition of Variables
Explained variables	Corporate risk (Risk)	Continuous standard deviation of ROE from year of t-2 to year of t

Explanatory variables	Media coverage (Media)	LN (1+the number of news reports in last year)
	Political connections (Pc)	The score of corporate political connection acquired through algorithm of value assignment
	Asset size (Size)	Natural logarithm of total assets at the end of the period
	Company age (Age)	Calculated from the founding date of the company
	Operating margin (Om)	Total profits during the period/operating income during the period
	Control variables	Financial leverage (Lev)
Operating income growth rate (Oigr)		Growth amount of operating income during the period/ operating income at the beginning of the period
Proportion of independent directors (Indept)		The ratio of independent directors to total director members

### 4.3 Model design

Based on theory analysis and study hypothesis mentioned above, this paper designed Formula 1 and Formula 2 to verify hypothesis H1 and hypothesis H2 respectively to analyze the influence of media coverage on corporate risk and the influence of political connections on corporate risk.

$$Risk_{i,t} = \alpha_0 + \alpha_1 Media_{i,t-1} + \alpha_2 Size_{i,t} + \alpha_3 Age_{i,t} + \alpha_4 Om_{i,t} + \alpha_5 Lev_{i,t} + \alpha_6 Oigr_{i,t} + \alpha_7 Indept_{i,t} + \varepsilon_{i,t} \quad (1)$$

$$Risk_{i,t} = \alpha_0 + \alpha_1 Pc_{i,t} + \alpha_2 Size_{i,t} + \alpha_3 Age_{i,t} + \alpha_4 Om_{i,t} + \alpha_5 Lev_{i,t} + \alpha_6 Oigr_{i,t} + \alpha_7 Indept_{i,t} + \varepsilon_{i,t} \quad (2)$$

In these formulas,  $i$  refers to sample object,  $t$  refers to the year;  $\alpha_0$  refers to the constant term,  $\alpha_i$  ( $i=1,2,\dots,7$ ) refers to the parameter to be estimated, and  $\varepsilon_{i,t}$  refers to stochastic interference term. The explanatory variable of Formula 1 is media coverage (Media). The natural logarithm of the number of news reports that plus one is set as the proxy variable for measuring. Considering that this paper focuses on the influence caused by the number of news reports each year on the corporate risk and that corporate risk are measured by the volatility of the net return on equity at the end of the year, this paper added one time period to the media coverage (Media), which is the explanatory variable, and after that, calculated it with regression method. By this method, the internal problem that explained variable and explanatory variable are reciprocal causations were resolved in the meantime. Based on hypothesis H1, if the

variables' regression coefficient is far less than 0, then it indicates that media coverage is beneficial to lowering corporate risk. the explanatory variable of Formula 2 is corporate political connections (Pc). Algorithm of value assignment was adopted to calculate the score of corporate political connections to measure its level. According to hypothesis H2a, if the variables' regression coefficient is far less than 0, then it shows that political connections are beneficial to lowering corporate risk; according to hypothesis H2b, if the variables' regression coefficient is far more than 0, then it indicates that political connections lead to rising of corporate risk.

In addition, to testify if political connections exert influences on relation between media coverage

$$Risk_{i,t} = \alpha_0 + \alpha_1 Media_{i,t-1} + \alpha_2 Pc_{i,t} + \alpha_3 Media_{i,t-1} * Pc_{i,t} + \alpha_4 Size_{i,t} + \alpha_5 Age_{i,t} + \alpha_6 Om_{i,t} + \alpha_7 Lev_{i,t} + \alpha_8 Oigr_{i,t} + \alpha_9 Indept_{i,t} + \varepsilon_{i,t}$$

and corporate risk, this paper, based on Formula 1, added variable of political connections and multiplicity of media coverage and political connections, and designed the testing Formula 3 as this:

(3)

Corporate risk (Risk) is the explained variable for both Formula 1, Formula 2 and Formula 3, and corporate risk is measured by three-year continuous standard deviation of corporate net return on equity and thus is a continuous variable. Also, since this paper took non-financial A-share listed companies of Shanghai Stock Exchange and Shenzhen Stock Exchange from 2012 to 2017 as research samples, which is a typical panel structure of statistics, this paper, based on the result of Hausman Test, adopted fixed effect model to verify formulas mentioned above.

According to hypothesis H3, regression coefficient of the interaction term of media coverage and political connections is the core parameter to be tested in Formula 3. If the regression coefficient of interaction term  $\alpha_3$  is far more than 0, then it indicates that corporate political connections cause negative moderating effect on media coverage's aversion effect towards corporate risk. In other words, compared with companies without political connections, companies that have such connection are affected deeper by media coverage's aversion effect towards corporate risk, and as the level of political connections become higher, the media coverage's aversion effect towards corporate risk would be further limited.

## 5 Empirical Test and Result Analysis

### 5.1 Descriptive statistics

Descriptive statistical results of major variables, including corporate risk (Risk), media coverage (Media), political connections (Pc) and others described in this paper, are shown in the Table 3. The results in this table indicate that: First, mean value and standard deviation of corporate risk (Risk) is 0.0618 and 0.185, which shows that there is obvious fluctuating volatility of the net return on equity between different samples, and, in other words, that there is relatively big difference of corporate risk between different companies. Second, the mean value and standard deviation of media coverage is 1.094 and 1.128 respectively, which shows that listed companies received much different media coverage. Third, the mean value and standard deviation of political connections (Pc) is 3.715 and 2.146 respectively, which shows that the number of companies building political connections is high, and in among these companies, there is relatively large gap in terms of the level of political connections. Fourth, the differences between maximum value and minimum value of size (Size), financial leverage (Lev) and other control variables are huge, which shows that there are also huge differences between

different sample companies in terms of asset scales, liability level and other aspects.

In addition, this paper adopted Pearson analysis to test mutual relations between explanatory variables and control variables. The test results show that different variables are not revealing serious collinearities. In the meantime, since variance inflation factors (VIF) are all less than 5, the possibility of multicollinearity between different variables are excluded as well.

**Table 3 Descriptive Statistics**

Variable	N	Mean	Std.Dev.	Min	Max
Risk	12,916	0.0618	0.185	0	1.505
Media	12,916	1.094	1.128	0	6.125
Pc	12,916	3.715	2.146	0	7
Media*Pc	12,916	7.883	5.500	0	31.50
Size	12,916	22.13	1.448	19.52	27.27
Age	12,916	9.965	7.043	-0.0444	23.91
Om	12,916	0.0885	0.188	-0.790	0.715
Lev	12,916	0.437	0.224	0.0492	0.943
Oigr	12,916	0.458	1.302	-0.726	9.639
Indept	12,916	0.374	0.0528	0.333	0.571

## 5.2 Empirical results and analysis

With software Stata (14.0), this paper utilized fixed effect model to conduct fixed effect multiple regression analysis on Formula 1, Formula 2 and Formula 3 respectively. The results of multiple regression analysis are shown as in the Table 4.

As the results of Formula 1 show in Table 4, the regression coefficient of media coverage is far less than 0, which shows that the more report the media conducted on a list company, the higher of its media coverage level. Its corporate risk drops as well, which verify the hypothesis H1 made before. Therefore, based on preceding theory analyses, this paper made the reasonable research conclusion that the media, as an important information medium and a crucial part of external corporate governance mechanism, alleviate information asymmetry in the capital market and exert “overseeing effect” on companies, and enforce the companies to restrain from conduct immoral behaviors jeopardizing public interests, so as to improve corporate performance and reduce corporate risk.

As the results of Formula 2 show in Table 4, the regression coefficient of political connections is far more than 0, which shows that there is a positive correlation between political connections and corporate risk, verifying the hypothesis H2 made before. Based on preceding analysis of the positive effect and negative effect of corporate political connections, along with the regression analysis results, this paper made the reasonable conclusion that companies can break industry barriers, develop corporate performance and reduce corporate risk through establishing political connections, but such connections may lead to problems such as excessive investment and inauthentic accounting information, and such

political connections bring out much more negative effects to companies than positive effects. Therefore, overall, political connections exert negative influence on corporate governance, and lead to higher corporate risk.

As the results of Formula 3 show in Table 4, the regression coefficient of multiplication of media coverage and political connections (Media\*Pc) is evidently positive under 1% confidence level. This proves that political connections cause negative moderating effect on media coverage's aversion effect towards corporate risk, which verifies preceding hypothesis H3. Based on preceding analysis of moderating effect theory of political connections, this paper made this reasonable conclusion that as an invisible guarantee, corporate political connections may exert negative impact on the independence of the media, weaken the media's function of information medium and external supervisory body. And, out of safeguarding corporate interests and reputation, senior executive with political connections may resort to special measures to influence or even control the content of the media. In the end, the existence of corporate political connections weakens the media's aversion effect toward corporate risk. In addition, media coverage is evidently negative under 1% confidence level, and the regression coefficient of political connections is evidently positive. Both of them didn't undergo much changes, which further verify the hypothesis H1 and hypothesis H2b.

**Table 4 Multiple Regression Analysis**

### 5.3 Further analysis

This paper holds the view that for listed companies with different nature of property rights, political connections cause negative moderating effect on media coverage's aversion effect towards corporate risk, yet these negative moderating effects may vary tremendously. This is because, compared with private companies, state-owned companies have "natural connections" with the State Council or local governments, and generally have much higher level of political connections than private companies. Meanwhile, management board of state-owned companies mainly consist of government officials with relative political background. Compared with other management board in private companies, they are more likely to protect their reputations, because corporate performance of their companies are directly related with their political careers. Hence, to maintain political images and prospects, management board of state-owned companies are more motivated to take advantage of their political connections to suppress the release of negative news about their companies. Therefore, in state-owned companies, political connections cause more negative moderating effect on media coverage's aversion effect towards corporate risk.

Based on these theory analyses, this paper made following hypotheses:

H4: Ceteris paribus, compared with private companies, political connections in state-owned companies cause more negative moderating effect on media coverage's aversion effect towards corporate risk.

To further verify this hypothesis, this paper divided all samples into two groups, one group consists of private companies, the other one includes state-owned companies, in terms of nature of property rights, and analyze Formula 3 through regression analysis. This paper tested listed companies in different groups to check whether in companies with different nature of property rights, moderating effect caused by political connections on media coverage's aversion effect towards corporate risk vary, and the test results are shown in Table 5. As Table 5 shows, whether in state-owned companies groups or private companies group, the regression coefficient of multiplication of media coverage and political connections (Media\*Pc) is evidently positive, which shows that political connections cause negative moderating effect on media coverage's aversion effect towards corporate risk in both private companies and state-owned companies. In addition, the regression coefficient of multiplication of state-owned companies' group is 0.0569, which is evidently positive under 1% confidence level. And, this regression coefficient is more than that in private companies, which shows that, political connections in state-owned companies cause more negative moderating effect on media coverage's aversion effect towards corporate risk. Based on these theory analyses, this paper concludes that state-owned companies generally have much higher level of political connections than private companies, and management board of state-owned companies are more motivated to take advantage of their political connections to

suppress the release of negative news about their companies so as to avoid the negative impact on their social reputations and political careers. Therefore, hypothesis H4 is verified.

**Table 5 Further Analysis**

Variable	Dep.=Risk	
	State-owned companies	Private companies

### 5.4 Robustness test

To strengthen the robustness of the research conclusions, this paper replaced explanatory variables to further carry out empirical test on the regression model. To be specific, since the current studies take various methods to measure level of political connections of companies with different nature of property rights, this paper adopted algorithm of value assignment to calculate the score of corporate political connections to measure its level, and, in reference to research of (Faccio,2007), set dummy variable of political connections (Newpc). If the chairman of the board or general manager was or is government official, representative of the party congress, deputy of the NPC or member of the CPPCC, then the dummy variable is 1, or 0 otherwise. This paper replaced the preceding general score of political connections with the dummy variable to measure the level of political connections and substituted it into Formula 2 and Formula 3 to conduct fixed effect regression analysis. The results are shown in Table 6. As Table 6 shows, the regression coefficient of major explanatory variables didn't undergo fundamental shift, proving that the research results are robust.

**Table 6 Robustness Test**

Variable	Dep.=Risk		
	Formula 1	Formula 2	Formula 3
Media	-0.0402*** (-5.39)		-0.0183*** (-4.85)

## 6 Conclusions

### 6.1 Research conclusion

Taking A-share listed companies of Shanghai Stock Exchange and Shenzhen Stock Exchange from 2012 to 2017 as research examples, this paper analyzes how media coverage and political connections exert influence on corporate risk respectively, and the moderating effect of corporate political connections on media's aversion effect toward corporate risk. This paper makes the following conclusions. First, as a crucial part of external supervisory body, media coverage makes up deficiency of legislative supervision, and effectively alleviate information asymmetry within and outside companies. Therefore, media coverage exerts evident aversion effect on corporate risk. Second, political connections refer to a communication mechanism that companies established with government by hiring senior executives with political backgrounds. The closer connection a company has with government, the higher corporate risk it encounters. Third, corporate political connections weaken the media's aversion effect toward corporate risk. Fourth, based on further research on companies with different nature of property rights, this paper found out that in state-owned companies, political connections weaken media coverage's aversion effect towards corporate risk to a larger extent.

### 6.2 Research enlightenment

Based on preceding research conclusions, this paper offers countermeasures and advice from the perspective of the media, government and listed companies.

The media. First, the media should strengthen its independence and objectivity, and constantly enhance the spirit of obligation and self-discipline. The media should release news reports about listed companies and capital market in an objective, precise, timely and genuine manner, to build an open and transparent atmosphere for capital market and to play its role of information medium and supervisory body. Second, in order to deliver precise and credential information to the public and government in a timely manner, the media should make continuous efforts to improve capabilities of employers and develop a keen sense to various problems existing in listed companies and capital market.

The government. Political connections in listed companies may exert negative impact on function of information medium and supervisory role for the media. Therefore, the government should establish a protection mechanism to safeguard the media's rights of reporting and supervising, and should do its best to minimize the possibility that companies with political connections influence the media with unofficial measures so that the media, an important part of external corporate governance, smoothly supervise corporate performance and control corporate risk.

The listed companies. First, as an unofficial communication mechanism between government and companies, political connections are able to reduce the uncertainties of market to some extent for companies, and bring more resources and opportunities. However, companies should pay attention to the negativities of political connection, such as high cost of rent-seeking behaviors, government plundering, excessive investment of companies, etc. Second, as the media swiftly rise to prominence, more attention have been paid to accounting information of listed companies and transparency of decision-making process. Companies should closely follow media coverage, and consider it as an effective external supervisory mechanism to improve corporate efficiency.

## **A Study on Public Demand and Optimization Strategies for University Libraries Based on Big Data from Search Index**

Liu Nan

Library, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: Liu\_tushuguan@whut.edu.cn)

**Abstract:** In this paper, public demand and optimization strategies for university libraries are explored through the big data platform (Baidu Index, 360 Index) with Wuhan University of Technology and Central China universities as examples. Firstly, we analyzed the search trends, population distribution, public opinion insight and demand map of Wuhan University of Technology Library through two kinds of index platform. Then, we draw the public demand map of university libraries according to the demand graph of the other 5 universities in central China based on the same method. The public demand focuses on the following questions: how to land the university library website outside of the campus; the way of non-university workers entering the campus physical library; database website use guide; how to retrieve, download and use data resources; examination papers of the university; website links of related university libraries and other departments in the university (such as Academic Affairs). According to the demands, we suggest that the library should use texts, pictures, videos and website links as the carriers to solve the readers' questions through the school and the library homepages, the blog, WeChat platform and meet the most extensive public needs. Finally, we should dig the big data of library user' behaviors and improve the quality of library services with integration of public big data.

**Key words:** Big data; University library; Baidu index; 360 index; Public demand

### **1 Introduction**

The massive behavior data of netizens is an important manifestation reflecting the concerns and needs of netizens in the big data environment. For example, Taobao judges our consumption behavior according to our browsing footprint, and recommends us suitable products; Alipay judges our financial management tendency according to our financial management process, recommending suitable financial products to us to achieve mutual benefit (Hao, 2017). As a service organization, it is important for the library to grasp the needs of users. However, libraries have not fully utilized the value of big data, even though they are already on the road to big data (Read and Smith, 2000). At present, the library's access to user needs is mainly obtained through research, questionnaires, etc., but these research methods usually have the subjective intention of the investigator and the scope of the survey is narrow, which cannot fully reflect the user's wishes. The emergence of big data can just overcome the above deficiencies, making the national and even world-wide user surveys a reality, and the investigation process objective and fair, without personal subjective intentions (Fox et al., 2016; Fox et al., 2017). Therefore, we consider to use big data to explore the needs of national netizens for university libraries and to design targeted coping strategies based on the research results (Zhang and Guo, 2016; Tu and Liu, 2016). Firstly, the Baidu Index and 360 Index (Ilic et al., 2014; Scott et al.,

2009), which analyze the behavior of massive netizens, are used as carriers to analyze the demand of Internet users for the Wuhan University of Technology Library. Then, by comparing the other 985 and 211 universities in Wuhan, the public willingness to the university library is summarized according to the quantitative behavior data of netizens. Then, based on the summarized demand results, we develop targeted responsible strategies, optimize service forms and service contents to meet the broadest needs of the public through the library home page, Weibo and WeChat platform. Finally, we dig the existing user behavior data of the library and provide a reference plan for the library to use big data to improve service quality.

## **2 Data and Methodology**

In 2008, the journal of Nature put forward the data flood and opened a special column to introduce the present situation and the future of Big data, taking Google, Harvard and biology as examples. Since then, the concepts of Big data are raised up and developed rapidly accompanying with the development of information technologies such as cloud computing, the Internet of Things and the mobile Internet. Big data not only refers to a great amount of data, but also has four basic characteristics: large volume, strong variety, high velocity, low value density, short for 4V.

Baidu and 360 are the most two popular search engines in China and possess the biggest data of citizen behaviors. Therefore, they have established data sharing platforms based on the behavior data of massive netizens, separately. The platforms are important statistical analysis platform for the current Internet and even the entire data age and are important references for the marketing decision of many enterprises. The platforms not only provide open source of big data, but also provide an integrated tool for data mining, analysis, and visualization. So, we choose these two sites as our research platform. The websites of Baidu index and 360 index are <http://index.baidu.com> and <https://trends.so.com/>. The index platforms can tell the users the current search times and trends of certain keywords, the news and public opinion changes related to the keywords and the people who pay attention to these key words. The aim of designing these platforms is to reflect the needs of netizens who search particular keywords (Sojka et al., 2011).

Firstly, we search "the Library of Wuhan University of Technology" as the search keywords on Baidu Index and 360 Index platform, and analyzed the overall search trends of the "Wuhan University of Technology Library", the number of media reports, news headlines and media attention, the characteristics of user groups, Baidu know, search terms search index etc. to sum up the public demand. Apparently, results from only one technical university could not represent the whole demands. So, we choose some other universities from the fields of science, normal, agriculture and technology, including Wuhan University, Huazhong University of Science and Technology, Huazhong Normal University, Huazhong Agricultural University, Wuhan University Of Science and Technology as examples to summarize public demand for college libraries in Central China in the same method. Then, targeted response strategies are proposed based on the summarized public needs and the service form and contents are optimized to meet the broadest needs of the public through the library home page, Weibo and WeChat platform.

## **3 Public Demands for the Library of Wuhan Universities of Technology**

### **3.1 Exploring the demands by Baidu index and 360 index**

The demand map is the relevant search term demand expressed by the user in the search

behavior change before and after searching for the word. We count the related words displayed on the demand map of the Baidu index and 360 index platform in one year. Quantitative data shows that 80% of related words are concentrated on “Wuhan University of Technology Library vpn”, “Wuhan University of Technology Academic Affairs Office”, “Wuhan University of Technology Graduate School”, “Wuhan University of Technology mailbox”, “Wuhan University of Technology Transportation College”, web of science, Wuhan weather, Wuhan University Library and so on. Among them, at least 3-4 related words per week are related to “vpn”, such as “Wuhan University of Technology vpn”, “Wuhan University of Technology Library vpn”, “Wuhan University of Technology vpn client”, “Wuhan University of Technology vpn System”, indicating that the public most want to know is how to use the school resources outside the campus, including access, login account, password. For the remaining 20% of the related words, they change differently over time: sometimes there will be a college or department within the school, such as the material archives, the Science and Technology Party network, the welcome network etc.; sometimes other school libraries appear, such as the Hubei Provincial Library, Huazhong Agricultural University Library, etc.

The source and destination search terms reflect which search requirements the user has before and after the search center word. We also counted the weekly source and destination search terms for the “Wuhan University of Technology Library” in the Platforms. The statistical results are completely consistent with the results of the related words of the demand map.

### 3.2 Exploring the demands by Baidu Know

We count the top ten questions related to the “Wuhan University of Technology Library” proposed in the “Baidu Know” since 2013 and analyze them. The results show that the number one question is the same every year, that is how to enter the “Wuhan University of Technology Library” website outside the campus net, and at least four of the remaining nine questions are the same or similar to the first one. The Vpn problems and the remaining main questions are listed in Table 1. According to the analysis results since 2013, the questions related to the library of Wuhan University of Technology that the public focus on are external and internal network login problems, examination papers, literature search and download, CD download.

**Table 1 The Main Questions Related to Wuhan University of Technology Library on Baidu Know**

Number	Question
	how to enter the “Wuhan University of Technology Library” website outside the campus net
	how to enter the Wuhan University of Technology vpn
1	why cannot access the Wuhan University of Technology Library website
	the user name and authorization of Wuhan University of Technology Library Yirui landing system
	the campus card number and password to log in Wuhan University of Technology Library
2	whether Wuhan University of Technology Library have the examination papers
3	how to download the English literature from the Wuhan University of Technology Library

- 
- 4 how to download the CD with the book
  - 5 why cannot open the database of the Wuhan University of Technology Library homepage
  - 6 where is the new campus of Wuhan University of Technology
- 

#### 4 Public Demands for the Libraries in Other 5 Universities in Central China

According to the needs of the “Wuhan University of Technology Library”, the public will pay attention to other libraries in the same area when they pay attention to our library. Based on the above results, we select “Wuhan University Library”, “Huazhong University of Science and Technology Library”, “Huazhong Normal University Library”, “Huazhong Agricultural University Library” and “Wuhan University of Science and Technology Library” as the research objects. The same approach was used for exploring the public need for the above libraries.

##### 4.1 Exploring the demands by Baidu index and 360 index

Similarly, in the above five colleges and universities, relevant words that people search for before and after the university library on the Baidu index and 360 index are university library off-campus landing, academic affairs office, curriculum management, graduate school, employment information network, campus mailbox, journal, Web of science, Wuhan weather, Admissions Network, University Accommodation, etc.

##### 4.2 Exploring the demands by Baidu Know

Taking five university libraries as examples, the main questions on Baidu Know are listed below. We can easily find public demands are similar from table 2.

**Table 2 The Main Questions Related to 5 Other Represent Universities on Baidu Know**

Number	Question
1	How to enter the library internal website in the external network
2	How non-school persons enter university libraries
3	How to apply for library cards, borrow books and renew loans
4	Accounts and passwords for online login of university libraries
5	Access to university library databases, literature search and download
6	the use of the internal wireless network of the university library
7	download the CD with the book
8	whether the library can get the examination papers
9	the similarity check of papers

## **5 the Optimizations to Meet Public Demands for Central Libraries**

### **5.1 Library website optimization**

The analysis results of every university show that the most common question for the public is how to log in the campus library website outside the school. For example, the public ask about the VPN system of Wuhan University of Technology and the hub system of Huazhong University of Science and Technology. In response to this demand, the library should publish obvious notices including website portals, login methods, account passwords, etc. on the campus network, the library network, the official Weibo and WeChat of the school, and the official Weibo and WeChat of the library, and show the use methods through pictures and videos, enabling teachers and students throughout the world to enjoy campus resources at any time. For non-school teachers and students, it is recommended to develop appropriate compensation methods so that non-school personnel can also enjoy the school resources. Another issue of public concern is how non-school personnel enter the campus physical library. It is a good idea to take the form of paid card entry.

The use of electronic resources is another concern. The library should use the multifaceted propaganda method, such as documents, teaching ppt, teaching videos, and live broadcast, to promote the use of the database, especially Web of Science which is the public's most concerned. Meanwhile, the library should open a column to introduce database retrieval, document download, CD download and other issues on the library home page, the library Weibo and WeChat.

The analysis results of relevant search terms show that the public will retrieve the words such as the Academic Affairs Office, the Graduate School, the Employment Information Network, the campus mailbox and so on before and after the university library is searched. Therefore, the library can embed the weather, the Academic Affairs Office, the Graduate School, the Employment Information Network, the campus mailbox, and the journal links on the homepage. For enrollment and orientation, we can open a column on the homepage and Weibo and WeChat platform.

### **5.2 Organization optimization in the library**

Except the demands we dig from the two platforms, there are many other demands about library we can't dig from the Internet. These demands are called invisible demands. For example, teachers haven't realized that their teaching materials, papers and other first-hand materials should be kept in the library as a part of the internal big data of the university. The librarians in the University of Cornell, Purdue University, University of Minnesota have set a program to consummate their internal big data. They form a team including a data librarian, a subject librarian and a teacher to teach students special data literacy. No Chinese libraries have tried to reorganize the librarians. We should learn from these American universities and started to think in the big data way.

## **6 Conclusions**

In this paper, public demand and optimization strategies for university libraries are explored through the big data platform (Baidu Index, 360 Index) with Wuhan University of Technology and other Central China universities as examples. The public demand focuses on the following questions: how to land the university library outside of the campus; the way of non-university workers entering the campus physical library; database website use guide; how to retrieve, download and use data

resources; examination papers of the university; website links of related university libraries and other departments in the university (such as Academic Affairs). According to the demands, we suggest that the library should use texts, pictures, videos and website links as the carriers to solve the readers' questions through the school and the library homepages, the blog, WeChat platform and meet the most extensive public needs.

### **6.1 The utilization of the big data in the interior of the university**

However, the big data about library are not only obtained from the search engine, but also from the internal of the University. Firstly, we should dig the big data of library user' behaviors and improve the quality of library services with integration of public big data. For example, we use big data to help us purchase the books and database (Podnar et al., 2006). Teachers and students need to log in when they search for the books or electronic resource. We can analyze the search behaviors and recommend them the similar resource. Secondly, the library should collect teachers' teaching materials, including teaching PP, teaching video, and exam questions and so on. The library has already begun to establish institutional knowledge base to store their own big data of the university, serving teachers and students.

### **6.2 Big data improve the scientific research evaluation**

Another kind of big data is the papers, patents, dissertations from teachers and students. We have been analyzing all the papers and patents to investigate the research strength, heading direction, heading strategy, award scheme, funding plan and so on, providing the basis for university managers to make developing plans and policies. We can help the school managers to promote research evaluation and help to recommend similar resources such as the book category, database, and research field to readers by analyzing their activity behaviors. Meanwhile, the analysis can also give the researchers message about submitting a manuscript, looking for cooperators, communicating internationally, getting the research fronts. It's said that Obama won the president by the help of big data analysis. We library can also use the big data to value ourselves.

## Moderating Effect of Ratio of Independent Director on the Relation between Managerial Overconfidence and Enterprise Value

Dai Fei, Li Yan

Pan-Asia Business School, Yunnan Normal University, Kunming, P.R. China, 650092

(E-mail: yidoucai@126.com, 1060676974@qq.com)

**Abstract:** Based on the moderating effect of the ratio of independent director, this paper chooses the sample of Chinese Shanghai and Shenzhen A-stock listed companies from 2012 to 2015, using hierarchical regression to test the influence of managerial overconfidence on enterprise value. The study shows: (1) There exists a positive relation between managerial overconfidence and enterprise value. (2) The ratio of independent director exerts a positive moderating regulating effect on the relation between managerial overconfidence and enterprise value. This paper enriches the theoretical research on the relationship between managerial overconfidence and enterprise value, meanwhile has some enlightenment to the improvement of the enterprise value of Chinese listed companies.

**Key words:** Managerial overconfidence; Ratio of an independent director; Enterprise value; Moderating effect

### 1 Introduction

The relation between enterprise value and managerial overconfidence has always been a hotspot in corporate governance. Some studies (Roll, 1986; Heaton, 2002; Hackbarth, 2003) have concluded that there is a significant negative correlation between managerial overconfidence and corporate value while another studies (Ye Bei & Yuan Jianguo, 2008) argue that moderate manager overconfidence can enhance corporate value, and excessive manager overconfidence will reduce corporate value. Although there exists a controversial conclusion on this aspect, most studies show that managerial overconfidence can significantly improve enterprise value (Gervais, Heaton & Odean, 2011; Geol & Thakor, 2008; Rao Yulei & Wang Jianxin, 2010; Lin Huiting & Wang Maolin, 2014).

From related articles, we find that previous studies mainly focus on the general effect of managerial overconfidence on enterprise value. They don't investigate the relation under different circumstances. The ratio of independent director is one of important factors that influence the relation between managerial overconfidence and enterprise value. With his independence and expertise, independent director, using their professional knowledge, capability, and experience to make independent judgment and give valuable suggestion on board of directors, management and problem related, cast a significant influence on enterprise decision-making. The number of board seat of independent directors directly decides their speaking right in a company. Thus, it's necessary to investigate the moderating effect of the ratio of the independent director on the relation between managerial overconfidence and enterprise value.

Based on above, this paper chooses the sample of Chinese Shanghai and Shenzhen A-stock listed

companies from 2012 to 2015, and systematically investigates the influence of managerial overconfidence on enterprise value, from the perspective of the moderating effect of the ratio of independent director, with the aim of providing meaningful reference for listed company to optimize the board structure according to the degree of managerial overconfidence, by offering research result with theoretical and practical value.

## **2 Theoretical Analysis and Research Hypothesis**

### **2.1 Managerial overconfidence and enterprise value**

The overconfident performance exists among people's daily life. People tend to owe their success to personal ability and their effort, while their failure to all kinds of misfortune or external factors (Miller & Ross, 1975). In enterprise management, the manager's overconfidence is more obvious than in normal people. During the decision-making process, manager tends to overestimate the possibility of success, yet underestimate the risk of failure (Malmendier & Tate, 2005). In enterprise management, the manager holds an important position on supervision and enterprise control, their decisions determine the future performance of enterprise as well as its value. Hence managerial overconfidence and enterprise value is closely related.

Most studies show that managerial overconfidence contributes to improving enterprise value because an overconfident manager has limited possibility to make an insufficient investment. Compared with risk averse manager, overconfident manager is more inclined to underestimate project risk and exercise during the best exercise period of the project. Hence, they are more likely to invest project with positive net present value, which improves the possibility of getting extraneous income that finally improves the enterprise value (Gervais, Heaton & Odean, 2003).

Our hypotheses are as follows:

H1: Managerial overconfidence is positively related to enterprise value.

### **2.2 Moderating effect of ratio of independent director on the relation between managerial overconfidence and enterprise value**

Since independent directors have no business connection with company or management and can make independent judgment by their solid professional knowledge, capability and experience, the listed company establishes the independent director position, to supervise and constraint decision-making of manager. Therefore, an independent director is a rational outsider during enterprise daily operation. The higher the degree of managerial overconfidence is, the higher possibility that manager overestimates his ability and the chance to succeed and underestimates the cost company takes and the risk of failure. At this time, independent director corrects the inappropriate decision of manager, decreasing agent cost, improving management efficiency, and finally improving enterprise value (Hermalin & Weisbach, 1991). The more board seats of independent directors there are, the more speaking right they have. Thus, they can correct decision that undermines the interest of company (Richardson, 2006), to improve enterprise value by correcting manager's self-attribution bias.

Our hypotheses are as follows:

H2: The ratio of independent director has positive moderating effect on the relationship between managerial overconfidence and enterprise value.

### 3 Research Design

#### 3.1 Sample selection and data sources

The study chooses the sample of Chinese Shanghai and Shenzhen A-stock listed companies from 2012 to 2015. And our selection rules are as follow: (1) Excluding the sample of financial insurance industry (considering the huge difference of asset-liability ratio between financial insurance industry and other industries; (2) Excluding the sample of ST stock, \*ST stock and delisted company; (3) Excluding the sample with asset-liability ration over 100%. Finally, we get 3148 observation from 784 companies in 14 different industries during 4 years from CSMAR database and establish balanced panel data.

#### 3.2 Measurement of variables

1 Explained Variable: Enterprise value is an ability that can give stakeholder satisfactory return, which can be defined with economic meaning and measured. In previous studies, there is a lot of index and proxy to describe enterprise value, such as ROE, EVA, DCF, Tobin'Q. Considering feasibility, we take Tobin'Q (LiuXing & Li Xiaorong, 2012) as the proxy of enterprise value.

2 Explaining Variable: At present, there are 9 methods to measure managerial overconfidence. However, considering the reality of Chinese Shanghai and Shenzhen A-stock market and the feasibility of obtaining data related, we take Jiang Fuxiu et al (2009)'s method as a reference, and measure the degree of managerial overconfidence by calculating the proportion of the sum of top 3 executive compensation in total executive compensation. Then we take the mid-value of the proportion as a benchmark to tell whether there exists overconfidence. Overconfidence is defined as 1, otherwise as 0.

3 Moderating Variable: As for the measurement of the ratio of independent director, we take the proportion of the number of independent directors in the number of board directors as measurement.

4 Control Variable: Referring existing, we take Scale of company, Asset-liability ratio, Ownership property, Earning power, Ownership centration, year, Industry as control variables.

Main variables and definition are as follow:

**Table 1 Variable definition**

Variable	Variable name	Sign	Calculation
Explained variable	Enterprise value	Tobin'Q	$(\text{price per share} * \text{tradable shares} + \text{net asset value per share} * \text{non-tradable shares} + \text{market value of their debt}) / \text{total asset}$
Explaining variable	Managerial over confidence	Con	Measure the degree of managerial overconfidence by calculating the proportion of the sum of the top 3 executive compensation in total executive compensation. Then we take the mid-value of the proportion as a benchmark to tell whether there exists overconfidence. Overconfidence is defined as 1, otherwise as 0
Moderating	The ratio of independent	Dir	The number of the independent director / The number of the board

variable	director		director
	Scale of company	Size	Total asset in natural logarithm at the end of year
	Asset-liability ratio	Lev	Asset /liability
Control variable	Ownership property	State	If it is state-owned enterprise, output 1; otherwise 0
	Earning power	Roa	Net profit/total asset
	Ownership centration	Top1	proportion of the largest shareholder
	year	Year	
	Industry	Industry	SEC report

### 3.3 Model setting

To testify the main effect of managerial overconfidence on enterprise value, we build mode 1:

$$Tobin'Q_{i,t} = \alpha_0 + \alpha_1 Con_{i,t} + \alpha_2 Size_{i,t} + \alpha_3 State_{i,t} + \alpha_4 Lev_{i,t} + \alpha_5 Roa_{i,t} + \alpha_6 Top1_{i,t} + \alpha_7 \sum Year + \alpha_8 \sum Industry + \varepsilon_{i,t} \quad (\text{model 1})$$

To testify the moderating effect of the ratio of an independent director on the relation between managerial overinvestment and enterprise value, we adopt hierarchical regression promoted by Wen Zhonglin, Hou Jietai & Zhang Lei (2005) to build model 2:

$$Tobin'Q_{i,t} = \beta_0 + \beta_1 Con_{i,t} + \beta_2 Dir_{i,t} + \beta_3 Con_{i,t} * Dir_{i,t} + \beta_4 Size_{i,t} + \beta_5 State_{i,t} + \beta_6 Lev_{i,t} + \beta_7 Roa_{i,t} + \beta_8 Top1_{i,t} + \beta_9 \sum Year + \beta_{10} \sum Industry + \varepsilon_{i,t} \quad (\text{model 2})$$

In model 1 and model 2, for managerial overconfidence is pseudo-variable and the ratio of independent director is a continuous variable, referring Wen Zhonglin, Hou Jietai & Zhang Lei (2005)'s method, before doing model 2 regression, we centralize the data of managerial overconfidence and the ratio of independent director, then we do the hierarchical regression.

## 4 Empirical Analysis

### 4.1 Descriptive statistics and correlation analysis

Table 2 is the descriptive statistics and the correlation analysis of the sample data. From table 2, we find that the mean value of enterprise value is 1.611 and the standard deviation is 1.804, which means that the enterprise value of listed companies in China different greatly; The mean value and the standard deviation both are 0.500, which means managerial overconfidence exists in half of listed companies. The mean value of the ratio of independent director is 0.368, which conforms to CSRC's requirement for listed company. The mean value of asset-liability ratio is 50.4%, which means most listed companies have reasonable liability-level. State-owned enterprise account for 65.6% of the

sample; the mean value of profitability is 0.034, which means that listed companies need to find a way to improve their earning power. The mean value of the percentage of the first major stockholder is 35.2%, which means listed companies have high ownership concentration. From the perspective of the correlation analysis, Scale of company, Asset-liability ratio, Ownership property, earning power, Ownership centration, year, Industry is significantly related with enterprise value, and their sign is consistent with previous study, which primarily proves that the control variables are valid. Managerial overconfidence is significantly positive related with enterprise value, which primarily proves the hypothesis 1; the ratio of independent director is positively related with enterprise value and managerial overconfidence but not significantly, which means the ratio of independent director is a pure moderator.

**Table 2 Descriptive Statistics and Correlation Analysis**

		Mean value	Standard deviation	1	2	3	4	5	6	7	8
1	Tobin'Q	1.611	1.804	1.000							
2	Con	0.500	0.500	0.139** *	1.000						
3	Dir	0.368	0.052	0.012	0.006	1.000					
4	Size	22.596	1.285	0.459** *	0.233** *	0.071** *	1.000

#### 4.2 Regression analysis

Table 3 shows the regression result of the main effect of managerial overconfidence on enterprise value and the moderating effect of the ratio of independent director. The regression result of model 1 shows that, except for ownership concentration, other control variables pass the significance testing and their sign is consistent with previous studies; managerial overconfidence is significantly positively related with enterprise value, which further supports the hypothesis 1. In model 2, the cross term of managerial overconfidence and the ratio of independent director is significantly positively related with enterprise value, which means the ratio of independent director has positive moderating effect on the relationship between managerial overconfidence and enterprise value and supports the hypothesis 2.

**Table 3 Regression Analysis of Main Effect and the Moderating Effect**

variable	Main effect		Moderating effect	
	Model 1		Model 2	
		Step 1		Step 2

\*, \*\*, \*\*\* represent the significance at the 10%, 5%, and 1% levels, respectively, and the numeral value in the parenthesis is a standard error.

### 4.3 Robustness examination

To testify the reliability of the consequence, referring stock or stock option method of Malmendier & Tate(2008) and based on relative compensation method of Jiang Fuxiu et al (2009), we take the ratio of the quantity of executive stock keeping and the quantity of management stock keeping as the proxy of managerial overconfidence and take the mid-value of it as benchmark. If the value of the sample is higher than the mid-value, the value of overconfidence is 1, otherwise is 0. The result of the robustness examination shows that the outcomes of robustness examination and formal regression consistent. In the robustness test, all the regression coefficients are smaller than those in Table 3, which may be related to the factors that affect the whole team's ownership status rather than the personal characteristics of managers. Although the regression coefficients are smaller, it does not affect the conclusions of this study.

## 5 Conclusion

Based on the adjustment function of the ratio of independent director, this paper chooses the sample of Chinese Shanghai, and Shenzhen A-stock listed companies from 2012 to 2015, using hierarchical regression to test the influence of managerial overconfidence on enterprise value. The study shows: (1) There exists a positive relationship between managerial overconfidence and enterprise value. (2) The ratio of independent director exerts a positive regulating effect on the relation between managerial overconfidence and enterprise value.

The outcome of empirical study provides reference for the practice of enterprise management from two aspects: First, since overconfident manager tends to create more enterprise value, when introducing and cultivating management talents, besides professional skill and experience, company should focus more on heterogeneous characteristics like the degree of over confidence; Second independent director contributes to correcting management inappropriate decision-making, company should properly increase the ratio of independent director. According to OECD international comparison report data, developed countries have higher ratio of independent director. For example, the ratio of independent director in the USA is up to 62%. Research report of Kom-Ferry shows that in top 1000 American companies, the ratio of independent director is up to 81.1%. But Wu Jianhua (Wu Jianhua, 2009) finds that the ratio of independent director in China is only 33.04%, which is far less than that in developed countries. According to theoretical research and practical experience, a company in China should properly raise the ratio of independent director to give full play to independent director's function in corporate governance, which will decrease the agent cost and improve the management efficiency and improve the enterprise value.

Based on the moderating effect of the ratio of independent director, the paper investigates the relation between managerial overconfidence and enterprise value, which enrich the research in relative fields, and provides reference for the practice of enterprise management. But for relative compensation method has its range of application, it is not the best proxy of managerial overconfidence. How we can build a more proper index to measure managerial overconfidence still needs further investigation.

**Abstract:** In the 21st century, the strategic environment enterprises facing have been undergoing tremendous changes. This study explores the direction of the Group's new strategy for strategic change in response to an increasingly changing environment. This study used the method of the AHP-SWOT and case study. According to the analysis of the strategic environment of the case Guangxi Geology and Mineral Huadi Industry and Trade Group (HD), the final determination of the strategic vector is located in the first quadrant of the strategic quadrilateral, indicating that HD should give priority to the growth-oriented SO strategy in the future, give full play to its advantages and grasp the opportunities in the environment.

**Key words:** Business Group; Strategic change; AHP; SWOT analysis

## **1 Introduction**

Nowadays, the technology and economic environment is changing. China gets great success in various aspects. Advanced technology has brought huge impacts on traditional enterprises, and it has also brought new development opportunities for traditional enterprises. However, as a comprehensive industrial holding company, the Business Group often needs to have a keen market insight in the face of rapid changes in the environment. And, the Business Group needs timely to adjust the strategy of the Business Group, and to better adapt to the environment and achieves rapid development. Since 2011, Chinese provinces have been beginning to implement the transformation of public institutions into corporate policies. This study aims to discuss the strategic change of the Business Group after

implementing the “transformation reform” policy, and guides strategic choice decision-making in the strategic change of the Business Group, which has certain practical significance. At the same time, this study uses the method of AHP-SWOT to provide a strategic choice analysis model in the strategic change of the Business Group. Therefore, this study has definite theoretical significance.

## 2 Literature Review

Corporate strategy is the means through which an organization establishes the fundamental relationship between its internal environment and the external environment (Murray, J A, 1984). An ideal corporate strategy is to not only achieving internal matching of various elements of the enterprise, but also to achieve external matching between the various elements of the enterprise and the business environment. According to the definition of corporate strategy, corporate strategic change includes updating or replacing the content, process and results of enterprise attributes (Agarwal, R and Helfat, C E, 2009). Specifically, strategic change involves two aspects of change. On the one hand, the external environment changes of the enterprise, such as: re-selecting the competitive strategy (Boeker, W, 1989), increasing or decreasing the number of existing businesses (Goodstein, J, Gautam, K and Boeker, W, 1994). On the other hand, to adapt to the new strategic objectives, the enterprise adjusts the internal organizational elements, such as: innovations in the organizational structure and management system of the enterprise (Johnson, G, 1992). In short, in order to cope with the ever-changing internal and external environment of the organization, and to seek sustainable development and combine its own resources and capabilities, the process of strategic adjustment of corporate goals and behaviors are strategic change (Agarwal, R and Helfat, C E, 2009). There are many driving factors for corporate strategic change, which can be roughly divided into two categories. One type is internal factors, such as: the resources and capabilities of the company (Li Xiaoyu, Xue Youzhi, Niu Jianbo, 2015), the length of tenure of the senior management team (Wiersema, M F and Bantel, K A, 1992) and so on. And the other is the external environment, such as the government's reform policy (Smith, K G and Grimm, C M, 1987) and technology innovation (Viki, S, 2003).

The Business Group is a large company with many productions and operating organizations, with parent-subsidiary companies as the main body. From the perspective of case analysis, the strategic change process of the Business Group is related to the lifecycle of the company. Different strategies are adopted in different stages of development of the

Business Group(Liu Shaomin, Wang Yingjun,2016). Group companies that lack competitiveness are capable to achieve sustainable growth through progressive learning and entrepreneurial strategies (Shi Shengmin and Xu Yanmei,2017).

Existing scholars have conducted a wealth of studies on strategic change. But many of them only have adopted the case analysis method from the perspective of qualitative analysis, while few studies have studied the strategic change of enterprises from both qualitative and quantitative perspectives. Moreover, most scholars regard the leader of a certain industry as the research object of strategic change. Few scholars put the comprehensive Business Group as the research object of strategic change. Therefore, this study takes the comprehensive Business Group as the research object, and sets qualitative SWOT analysis and quantitative analytic hierarchy process in HD as an example to study the strategic choice in the strategic change of the Business Group.

### 3 Method

SWOT analysis is one of the most commonly used strategic analysis methods. It analyzes the strengths (S), weaknesses (W), opportunities (O) and threats (T) in the internal and external environment. AHP is a quantitative comparative analysis method, which is suitable for multi-criteria, multi-objective and complex decision-making problem analysis. So do the strategic choice of strategic change of the Business Group. Combining qualitative SWOT analysis with quantitative AHP method can not only make up for the deficiency in using one method of, but also combine the advantages of both, and be more scientific. So it provides the basis of the strategic of the Business Group. The specific steps are shown as Table 1.

**Table 1 SWOT-AHP Strategic Analysis Process**

Steps	Operating items
1.DeterminetheSWOTanalysismatrix	Through live interviews, field research and literature search, the relevant materials are widely obtained, and the data are interpreted and analyzed in detail to determine the SWOT matrix.
2.Calculate the strength and total strength of each influencing factor	<p>Influential factors strength = Estimated strength of each influencing factor × Relative importance of each influencing factor</p> <p>(1) The estimated strength of each influencing factor was obtained by using the five-level Likert scale and scoring by experts.</p> <p>(2) AHP analysis model was established, and experts were asked to compare and score the influencing factors in pairs. Establishing an AHP analysis model, letting the experts compare the influencing factors.</p> <p>(3) The total strength of each influencing factor can be obtained by</p>

3. Calculate strategic factor strength	<p>summing the influence factors of each subordinate element.</p> <p>(1) Construct strategic coordinate system, where SW is the horizontal coordinate axis and OT is the vertical coordinate axis. And according to the total strength of each influencing factor, the positions of the four points S, W, O and T in the strategic quadrangle are determined, so as to determine the strategic quadrangle.</p> <p>(2) Calculate the center of gravity of the strategic quadrilateral, and calculate the formula as: <math>(x,y) = \left(\frac{x_s+x_w}{4}, \frac{x_o+x_t}{4}\right)</math>. Connect the center of gravity (x, y) and the origin (0, 0) into a line whose angle with the S axis is the strategic azimuth <math>\theta</math>, <math>\theta = \tan^{-1} \frac{y}{x}</math>.</p> <p>(3) Calculate strategic factor strength <math>\rho</math>, <math>\rho = \frac{U}{U+V}</math>, where U represents the strategic positive strength, <math>U = S_1 \times O_1</math>, and V is the strategic negative strength, <math>V = W_1 \times T_1</math>.</p>
4. Determine the final strategy	<p>In the strategic coordinate axis, the polar coordinate system is used to determine the point where the radius is <math>\rho</math> and the angle is <math>\theta</math>. The strategic type of the location of the point is the strategy that the enterprise ultimately prefers.</p>

## 4 Case Study

### 4.1 Strategic change analysis of HD

The case chosen for this study is a multi-industry Business Group, which was used as a case study object with certain typical significance. HD is a typical Business Group, which involves more than 10 subsidiaries in many industries including commercial, industrial, real estate and financial industries. The strategic change process of HD can be divided into four stages, as shown in Figure 1.

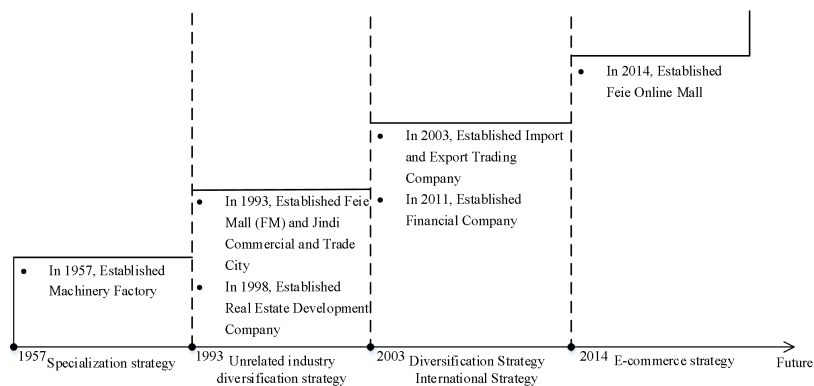

Figure 1 Strategic Change Process of HD

The first stage is the stage of specialization strategy. At this stage, HD actively responded to the call of the country for rapid development of industry, thus establishing the Prospecting Machinery Plant, which mainly produces test equipment, crushing and screening equipment. The second stage is the stage of irrelevant diversification strategy. HD made the decision of “returning two into three, the secondary industry and the tertiary industry together” and successively entered the commercial sector and the real estate industry. In 1993, the original factory was built into the Feie Mall Footwear Wholesale Center. In 1998, Real Estate Development Company was established, and the diversification strategy was initially realized. The third stage is the stage of internationalization strategy and diversification strategy. In 2003, in order to open up the international market and realize the internationalization strategy, Import and Export Trading Company was established. Moreover, at this stage, HD also continued to deepen the diversification strategy. And then in 2011, Financial Company was established. In the fourth phase, the E-Commerce phase was implemented. HD established Feie Online Mall in 2014.

## 4.2 SWOT analysis of HD

This study takes HD as a case. The following is the SWOT analysis matrix of the internal and external environment in which the Business Group is located, as shown in Table 1.

**Table 2 SWOT Analysis Matrix**

Target layer	Criteria layer	Sub-criteria layer
Strategic Change of HD	S	S1Brand strength S2 Location transportation strength
	W	W1Staff solidification, lack of high-level, innovative talent W2No outstanding expertise, lack of core competitiveness W3Multi-business at the same time, lack of main business lines W4Many systems, no uniformity, lack of operability
	O	O1Internet popularity, market expansion opportunities O2National policy orientation O3“The Belt and Road” initiative, trade scale opportunities
	T	T1More stronger competitors, and obvious competition for homogenization T2Customer demand is high-end

### 4.3 AHP-SWOT analysis of HD

Based on the SWOT analysis of the strategic change of HD, a total of 11 factors affecting the strategic change of HD were summarized. In this study, a Likert scale was designed to measure the estimated strength of each factor, in which the score of S and O was represented by positive numbers, and negative numbers show W and T. The larger the absolute value of the score, the greater the estimated strength. Inviting 11 employees of HD with rich strategic management knowledge and experience to form a team of experts to score the industry situation of HD. Finally, the weighted average of the scores of each factor given by each expert is calculated to determine the estimated strength of each influencing factor. Next, proceed from the results of the SWOT analysis. First of all, 11 experts with rich experience in strategic theory and strategic management. Using AHP's 1-9 evaluation scale, the relative importance scores of the same level factors affecting the strategic change of the Business Group and the sub-factors under the same factor are compared. Then, the judgment matrix is constructed and the consistency check is performed on the judgment matrix. When  $C.R < 0.1$ , it indicates that the consistency test passed. Under the condition of consistency test is passed, the feature vector can be used as the weight index of each level. The eigenvectors of the SWOT matrix are normalized and multiplied by the A matrix vector to obtain the total hierarchical ranking result, as shown in Table 3.

**Table 3 Strength of Each Influencing Factor**

Elements	Group weight	C.R	sub-factor	Estimated strength	Group weight	Overall weight	Strategic factor strength
A		0.0908					
S	0.4428	0.0000	S1	3.0909	0.75	0.3321	1.0265
			S2	3.6364	0.25	0.1107	0.4025
W	0.1864	0.0807	W1	-3.2727	0.3758	0.0701	-0.2294
			W2	-3.0909	0.3273	0.0610	-0.1885
			W3	-3.2727	0.1737	0.0324	-0.1060
			W4	-2.7273	0.1232	0.0230	-0.0627
O	0.2455	0.0517	O1	2.6364	0.4905	0.1204	0.3174
			O2	2.0000	0.3119	0.0766	0.1532
			O3	2.1818	0.1976	0.0485	0.1058

	0.1253	0.0000	T1	-3.5455	0.8	0.1002	-0.3552
T			T2	-3.5455	0.2	0.0251	-0.0890

According to the criterion C.R is less than 0.1, it can be seen from the table that all judgment matrices have passed the consistency test. Moreover, from the strategic factor strength of the sub-factors under various influencing factors, it can be seen that S1 is the biggest strength among the factors affecting the strategic change of HD ( $S1=1.0265$ ); the greatest weaken is W1( $W1=-0.2294$ ); O1 is the largest opportunity ( $O1=0.3174$ ); the maximum threat is T1 ( $T1=-0.0890$ ). The total strength of the influencing factors is the sum of the strengths of the sub-factors of each influencing factor. Therefore, according to Table 3, the total strength of each influencing factor can be calculated.  $S = S1 + S2 = 1.4290$ ,  $W = W1 + W2 + W3 + W4 = -0.5867$ ,  $O = O1 + O2 + O3 = 0.5764$ ,  $T = T1 + T2 = -0.4442$ . A strategic coordinate system is established here. The positive axis of abscissa of the strategic coordinate system represents S, and the negative is W. O and T are represented by the positive and negative half axes of the ordinate, respectively. Then, the total strength of each influencing factor is marked on the strategic coordinate system to form a strategic quadrilateral, as shown in figure 2.

Figure 2 Corporate Strategy Quadrilateral

Calculate the formula according to the center of gravity:  $(x,y) = \left(\frac{x_S+x_W}{4}, \frac{x_O+x_T}{4}\right)$ , the center of gravity of the strategic quadrilateral is:  $(x,y) = (0.2106,0.0335)$ , thus the strategic

azimuth is  $\theta = \tan^{-1} \frac{y}{x} = \frac{1}{20} \pi \approx 9^\circ$ . At the same time, the strategic factor strength  $U = S \times O = 0.8237$ ,  $V = W \times T = 0.2606$ , so the strategic factor strength coefficient is  $\rho = U / (U + V) = 0.7597$ . Finally, the comprehensive strategic azimuth and strategic factor strength coefficient are obtained, and the strategic vector of HD is  $(\frac{1}{20} \pi, 0.7597)$ . This result is known that HD's enterprise strategic positioning is within the first quadrant of the strategic coordinate system. And because the strategic azimuth angle  $\theta \approx 9^\circ < 45^\circ$ , HD should show priority to strength-based growth strategy. This strategy requires the full use of the company's internal superior resources to seize opportunities in the external environment.

#### 4.4 Policy suggestion

Expand the dominant effect. First, focus on building brand influence. Among the internal strengths of HD, the strength of brand advantage is the largest, so it is possible to accelerate the expansion of the business market by expanding the brand effect. For example, the commercial brand "Feie" has strong brand influence throughout the Liuzhou area. From this strength, the brand influence is expanded through online advertising, online public relations, and news public relations. Second, digging into the location strength of radiation effects. HD is located in the transportation hub of Liuzhou City. This location is very convenient for transportation within and outside the city. Based on this advantageous condition, it caters to the changes in market demand and aims to differentiate new competition and open up new markets.

Grasp the three opportunities. Firstly, rely on Internet opportunities to expand the market. HD can make use of the sales force of the Feie Online Mall platform, construct good distribution channels, and then achieve the simultaneous development of advertising and channels. Ultimately, the business market will achieve substantial expansion. Second, seize the opportunity of national policy and make rapid changes. HD should actively call for the national policy, establish a unified modern company system for all departments, and make the cadre reserve plans. Finally, with the help of the "The Belt and Road", HD will go international. The quality of the machinery produced by HD enjoys great reputation in the industry, and this opportunity can be used to accelerate the market influence of the industry of HD in the international market.

## 5 Conclusion

In this study, the AHP-SWOT analysis method and the case study method were used. First a matrix is built based on SWOT analysis. After that building a judgment matrix based on AHP analytic hierarchy processes. Then calculate the strength of the strategic influence factors and construct strategic quadrilaterals and strategic vectors. In the end, it will be a strategy that should be preferred for HD. This study aims to study the strategic choices of group companies. This research breaks through the traditional single-deterministic strategy selection method. And through the case analysis, it proves that the combination of AHP and SWOT is a scientific strategic choice method. The above strategic choices for HD are for the entire Business Group, only analyze the overall strategy of the Business Group, but lacking specific guidance strategies for particular subsidiaries. In the future, by continuously improving the AHP-SWOT method, this method will be applied to guide the competition strategy of the subsidiaries of the Business Group.

**Abstract:** With the increasing demand for urban flood control due to rapid urbanization and the traffic safety and environmental concerns, as well as convenience and services of air products, there is a shift towards liquid air as an emergent cooling source. However, its cryogenic operation and vigorous vaporization expansion restricts its widespread applications. This paper explores the conceptual application of liquid air spray/vaporization based icing and natural de-icing for urban traffic flooding control, whose conceptual developments including description of liquid air, road icing, conceptual liquid air based flash freezing of water for urban traffic flooding control and modeling and solution of natural road de-icing are described and analyzed in detail. The primary key techniques of our innovative scheme of application of liquid air spray/vaporization for urban traffic flooding control are presented specifically. Its economic estimation is performed by taking Wuhan downtown traffic flood control as an example so as to indicate our innovative scheme of application of liquid air spray/vaporization for urban traffic flooding control shall be practicable, pollution-free and cost-effective. Thus, our innovative scheme will be promising for flood control in modern cities.

**Key words:** Liquid air; Conceptual application; Liquid air spray/vaporization; Icing and natural de-icing; Urban traffic flooding control

## **1 Introduction**

Urban flooding occurs when rainfall runoff exceeds what the landscape can absorb or the drainage system can move (Louise Bertilsson et al., 2019). Since its reform and opening up dated back to 1978, China has become an increasingly urban society so that the whole country's economic growth, social advancement and life improvement shall be profoundly affected (Wei Zheng et al., 2019). Parallel to this process, however, the changes in land use associated with urban development affect flooding in many ways (Louise Bertilsson et al., 2019). As communities convert more land into roads, buildings, and other impervious surfaces, drainage systems - themselves often aging, undersized, and difficult to maintain - reach capacity faster, leaving flood waters to devastate homes and businesses. It was recognized that many cities such as Beijing, Shanghai, Wuhan, Guangzhou and Shenzhen in China are challenged by fragile infrastructure and vulnerability to flooding. Removing vegetation and soil, grading the land surface, and constructing drainage networks increase runoff to streams from rainfall and snowmelt. Common consequences of urban development are increased peak discharge and frequency of floods (ZW Kundzewicz et al., 2019; Na Zhang et al., 2019). Also, urban flooding has become more and

more severe and pervasive in China in recent years and it has historically been thought of as something that occurs in only a handful of major cities (Conrad Wasko et al., 2019; EuiHoon Lee et al., 2018).

Flooding has many impacts. It damages property and endangers the lives of humans and other species. Rapid water runoff causes soil erosion and concomitant sediment deposition elsewhere (such as further downstream or down a coast). The spawning grounds for fish and other wildlife habitats can become polluted or completely destroyed. Some prolonged high floods can delay traffic in areas which lack elevated roadways. Floods can interfere with drainage and economic use of lands, such as interfering with farming. Structural damage can occur in bridge abutments, bank lines, sewer lines, and other structures within floodways. Waterway navigation and hydroelectric power are often impaired. Financial losses due to floods are typically millions of dollars each year (C. Arrighi et al., 2019; Maochuan Hu et al., 2019).

Some of the common techniques used for flood control are installation of rock berms, rock rip-raps, sandbags, maintaining normal slopes with vegetation or application of soil cements on steeper slopes and construction or expansion of drainage channels. Other methods include levees, dikes, dams, retention or detention basins. Some methods of flood control have been practiced since ancient times. These methods include planting vegetation to retain extra water, terracing hillsides to slow flow downhill, and the construction of floodways (man-made channels to divert floodwater). Other techniques include the construction of levees, dikes, dams, reservoirs or retention ponds to hold extra water during times of flooding (Kelly Gunnell et al., 2019).

To the best of our knowledge, there is no any paper in the literatures specifically devoted to a study regarding application of liquid air for urban traffic flooding control. Although much attention has been given to new, fast and no pollution urban traffic flooding control innovation and practice, almost no information is available in the literature regarding the liquid air application for urban traffic flooding control. Therefore, application of liquid air spray/vaporization based icing and natural de-icing for urban traffic flooding control may be considered as a revolutionary contribution for urban traffic flooding control which takes something unusual advantages.

Except for the introduction and conclusions, the main body of this study is structured as follows:

Section 2: Conceptual developments;

Section 3: Innovation of application of liquid air spray/vaporization for urban traffic flooding control; and

Section 4: Economic estimation of our urban traffic flooding control scheme based on liquid air spray/vaporization by taking Wuhan downtown traffic flood control as an example

## **2 Conceptual Developments**

### **2.1 Description of liquid air**

Air consists of approximately 78% nitrogen and 21% oxygen, and thus has similar thermodynamics properties as nitrogen gas. Liquefying air reduces the volume of air by about 700 times. Liquid air is air that has been cooled to very low or cryogenic temperatures so that it shall be condensed into a pale blue mobile liquid, which is often used for condensing other substances into liquid and/or solidifying them, and as an industrial source of nitrogen, oxygen, argon, and other inert gases through a process called air

separation which is industrially to separate atmospheric air into its primary components, typically nitrogen and oxygen, and sometimes also argon and other rare inert gases based on fractional distillation as the most common method.

Liquid air has a density of approximately  $870\text{kg/m}^3$ , though the density may vary depending on the elemental composition of the air. Since dry gaseous air contains approximately 78% nitrogen, 21% oxygen, and 1% argon, the density of liquid air at standard composition is calculated by the percentage of the components and their respective liquid densities. The boiling point of liquid air is  $-194.35^\circ\text{C}$ , intermediate between the boiling points of liquid nitrogen and liquid oxygen. However, it can be difficult to keep at a stable temperature as the liquid boils since the nitrogen will boil off first, leaving the mixture oxygen-rich and changing the boiling point. Since liquid air vaporizes at  $-196^\circ\text{C}$ , the heat required to re-gasify liquid air can be wholly attainable from the environment or using low grade waste heat from the industry. Liquid air supplies can be located near demands (especially emergencies) in combination of the current market needs. Those separated air products are sometimes supplied by pipeline to large industrial users near the production plant. Long distance transportation of products is by shipping liquid products for large quantities, as Dewar flasks or gas cylinders for small quantities, or tanks for mid-short distance transport and distribution.

## **2.2 Road icing**

Accident, injury and fatality rates are much higher during freezing rain than any other type of road ice condition (including snow and sleet) due to its invisibility and element of surprise. Freezing rain/drizzle happens when raindrops in a warm air layer aloft (in the middle levels of the atmosphere) falls through a layer of subfreezing air at the surface. When the raindrops hit the ground, they freeze on contact - creating a smooth, solid glaze of ice that covers everything on the ground. This type of ice layer is the most slick of all precipitation types - creating nearly zero friction conditions with vehicle tires. Correcting a skid on black ice can be nearly impossible, as the vehicle tires will have close to zero traction. Loss of control on 'black ice' can occur even at slow speeds. 'Black ice' is so named because it appears dark, just like wet pavement. It is important to remember that 'black ice' will only appear 'black' on darker pavement surfaces such as asphalt. 'Black ice' on concrete pavement can appear gray or tan, for instance (the same color as the pavement surface) (Huaxin Chen et al., 2018).

## **2.3 Conceptual liquid air based flash freezing of water for urban traffic flooding control**

Freezing is a phase transition where a liquid turns into a solid when its temperature is lowered below its freezing point. Flash freezing refers to the process whereby objects are frozen in just a few hours by subjecting them to cryogenic temperatures, or through direct contact with liquid nitrogen at  $-196^\circ\text{C}$ . When water is supercooled to temperatures below  $-48^\circ\text{C}$ , it must freeze. In physics and chemistry, flash freezing is a naturally occurring phenomenon used commonly in the food industry and by meteorologists for the purpose of forecasting. The process is also of great importance in atmospheric science, as its study is necessary for a proper climate model for the formation of ice clouds in the upper troposphere, which effectively scatter incoming solar radiation and prevent Earth from becoming overheated by the sun. Flash freezing is closely related to classical nucleation theory, which helps us understand many materials, phenomena and theories in related situations. The science of freezing water depends on multiple factors, including how water droplets freeze, how much water is in the atmosphere, if water is in a liquid or crystal state, at what temperature it freezes, and whether it crystallizes from within or from the surface. The freezing of nanoscale water or silicon liquid drops is initiated at a number of different distances from the center of the droplet, providing new insights on a long-standing

dispute in the field of material and chemical physics. When water is in a conventional freezer, a dynamic phase transition is triggered. The resulting ice depends on how quickly the system is cooled: If the water is cooled below its freezing point slowly, an ice crystal will result, rather than the polycrystalline solid that flash freezing results in (P. J. Fellows et al., 2016).

Liquid air is not only an effective and convenient refrigerant due to its availability, low cost and human and environment friendliness but also a practical cryogen for most low-temperature applications because of its extremely low flashing temperature (78.9K) and high refrigeration capacity at atmospheric pressure. Even at elevated pressures, its favorable thermal properties make it an effective refrigeration medium to rapidly cool processes to low temperatures. Several cooling techniques take advantage of refrigeration capacities of liquid air in batch or continuous processes, among which direct liquid air injection/spray cooling can be a good choice for urban traffic flooding control. Liquid air is injected or sprayed directly onto road flood areas so that accumulated water shall be cooled and solidified by the latent heat of vaporization of liquid air; depending on the design of the cooling system, the sensible heat capacity of the cold vaporized air may also contribute to the cooling. This is an efficient use of refrigeration value of liquid air.

As shown in Figure 1, water freezes and ice expands instantaneously while liquid air is sprayed onto a catchment region. Icing occurs initially at  $0^{\circ}\text{C}$  and then it is characterized by a single indefinable surface since ice expands to infinity in all but one direction. As such a sudden temperature drop is imposed at the surface, transient, one-dimensional conduction will occur within upper ice. Based on classical theory of heat transfer, the semi-infinite solid provides a useful idealization for many actual issues. At this point, it may be used to determine transient heat transfer effects near the surface of icing or to approximate the transient response of a finite ice block. For the latter, the approximation would be reasonable for the early portion of the transient, during which temperatures in the ice interior (well removed from the surface) are uninfluenced by the change in surface conditions.

**Figure 1 Schematic Diagram of Semi-infinite Icing for Spray Liquid Air onto Water**

In general, an ice block whose thickness is at least 20cm can safely support small cars or pickups. While sensible heat changes of liquid air, ice and water compared to their powerful latent heat ones, air flash freezing and icing processes would dominate the transmission of energy. Figure 2 reflects that the ice formation thickness would be up to 20cm after spraying liquid air for about 18 minutes. At this point, small cars or pickups can go through the ice coverage block. Such period would have been short enough while all conditions for spraying liquid air shall be ready in advance. Actually, the mean temperature of the ice coverage would be below  $0^{\circ}\text{C}$ ; and the liquid air based icing thickness would be more than 30cm to ensure safe passage of small cars or pickups while natural meltdown of the ice coverage shall be very slow.

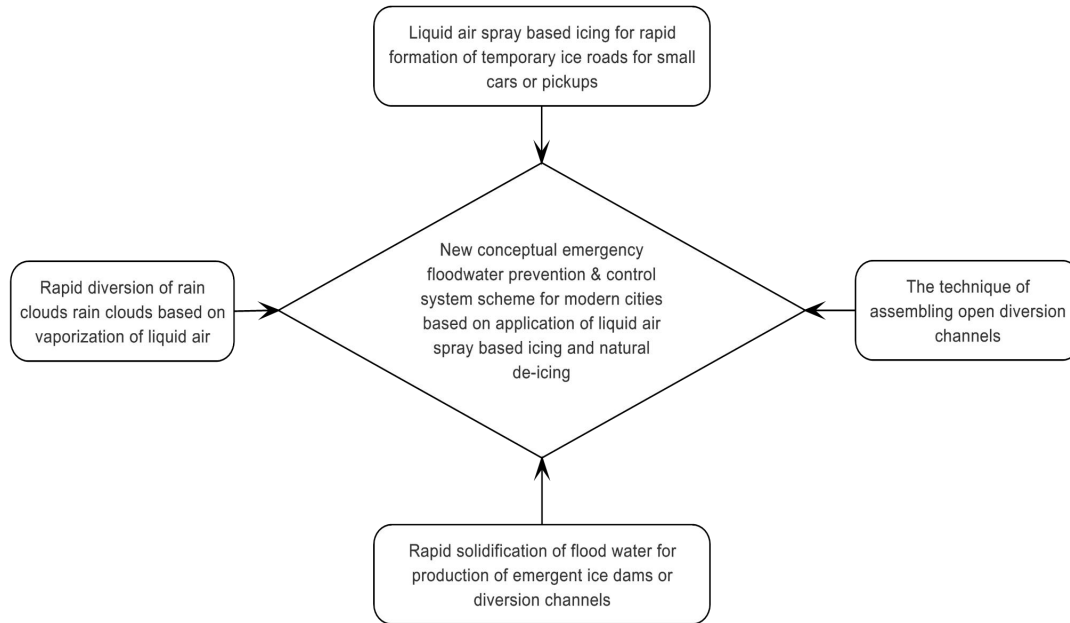

Figure 2 Icing Thickness (xm) vs. Time (t)

## 2.5 Natural road de-icing

De-icing of roads has traditionally been done with salt, spread by snowplows or dump trucks designed to spread it, often mixed with sand and gravel, on slick roads. Sodium chloride (rock salt) is normally used, as it is inexpensive and readily available in large quantities. However, since salt water still freezes at  $-18^{\circ}\text{C}$ , it is of no help when the temperature falls below this point. It also has a strong tendency to cause corrosion, rusting the steel used in most vehicles and the rebar in concrete bridges. Depending on the concentration, it can be toxic to some plants and animals, and some urban areas have moved away from it as a result. More recent snowmelters use other salts, such as calcium chloride and magnesium chloride, which not only depress the freezing point of water to a much lower temperature, but also produce an exothermic reaction. They are somewhat safer for sidewalks, but excess should still be removed.

## 3 Innovation of Application of Liquid Air Spray/Vaporization for Urban Traffic Flooding Control

**Figure 3 New Conceptual Emergency Floodwater Prevention & Control System Scheme for Modern Cities Based on Application of Liquid Air Spraybased Icing and Natural De-icing**

Here, some innovative applications of liquid air spray for urban traffic flooding control are presented. Thus, a new conceptual emergency floodwater prevention & control system scheme for modern cities based on application of liquid air spraybased icing and natural de-icing is presented in this study, which include the above four techniques and schematically shown in Figure 3.

### **3.1 Liquid air spraybased icing for rapid formation of temporary ice roads for small cars or pickups**

As for any urban traffic flood point, an ice road may be rapidly formed by means of liquid air spraybased icing (especially filling liquid air into flood) to provide a flat, smooth driving surface devoid of trees, rocks, and other obstacles and allow temporary passage of small cars or pickups. Ice roads offer the best means for moving heavy equipment and workers through roadless areas while protecting the fragile ground beneath.

While any liquid air spraybased ice cover is over deep water, it is this buoyancy that helps support the weight of loads placed on the ice. As the ice cover itself bends under this load, it displaces a volume of water equal to the weight of the load based on Archimedes Principle. The size of the ice sheet and the volume of water theoretically have to be large enough to support the load on the ice sheet. However, while most bodies of water are not large enough in relation to the load that checking for buoyancy needs to be undertaken in practice. The critical issue is whether the ice cover is strong enough to resist temporary bending caused by the load.

Although an ice cover may appear to be rigid it will bend under loading. The amount of bending will depend on the flexibility of the ice and magnitude of the load. The ice flexibility (elasticity) depends on its temperature. Heavier loads will cause more bending and

displacement. For acceptable loads, the ice covers will rebound and return to the original position when the load is removed or moves away. The ice cover deforms and distributes the load over a larger area in these cases. The depression underneath the load is often described as the deflection bowl. Ice covers can fail for a variety of reasons. Some of more common reasons for failure are loading of ice that has poor ice quality, overloading of good quality ice, overstressing ice by operating at unsafe speeds and unintended stationary load on ice.

**Figure 4 A Conceptual Ice Road View**

In contrast, most liquid air spraybased ice covers is over shallow water so that there are a variety of hazards related to operating on ice covers. The primary ice cover hazards include: 1) Operating on an ice cover that has been damaged or where the integrity of the ice cover has been compromised, this damage could be localized or widespread, 2) Overloading an ice cover beyond its capacity to support a load, and 3) Operating on undetected areas of thin ice. These hazards can be controlled through a variety of engineering and administrative controls that will provide operators overall confidence in: 1) The integrity of the ice cover, 2) The knowledge of the load that is to be placed on the ice cover, and 3) The minimum ice thickness present.

With confidence in these three elements, operations on ice can be carried out very safely. In zones where a number of intersecting dry cracks over 10cm wide are observed, the area should be repaired by allowing them time to freeze fully by means of spraying or filling liquid air. Alternatively, a reduction in the maximum load limit should be considered. The decision to reduce the load limit will be based on the frequency, width, depth, and intersection of the cracks. Once a crack completely refreezes by means of spraying or filling liquid air, the ice can be considered as strong as the original.

Some ice roads which crack over very shallow water may be utilized to ensure the continuous stream of cars though driving on cracked ice would seem that over bumpy roads. Such driving may last longer since natural de-icing is a slow process. Moreover, liquid air spraybased icing may be repeated in case of performance of more ice melting.

Knowing how to drive in icy conditions is an extremely important skill. Ice-slicked roads create treacherous driving conditions that can lead to serious accidents. When driving icy conditions, a vehicle will not act according to the laws of physics. For example, a car will keep going straight on a curve, no matter how frantically the driver turns the wheel. The inertia keeps it going in that direction. Freezing tires help and there is a reason that the local transportation authorities present some cautions for drivers, however these often aren't enough when it comes to ice. Here are some practical driving tips such as no hitting the brakes, driving slowly, changing directions gradually, avoiding fishtailing, no following to close and taking emergency measures in worst case scenarios to help avoid getting into an accident in icy conditions.

### **3.2 Rapid solidification of flood water for production of emergent ice dams or diversion channels**

Normally, ice jams occur on rivers when floating ice accumulates at a natural or man-made feature that impedes its progress downstream. Ice jams can significantly reduce the flow of a river and cause upstream flooding - sometimes called ice dams. Ice jam flooding can also occur downstream when the jam releases in an outburst flood. In either case, flooding can cause damage to structures on shore. However, a diversion dam is here to divert all or a portion of the flow of a river from its natural course. Diversion dams do not generally impound water in a reservoir; instead, the water is diverted into an artificial water course or canal. There is something special about being able to extract floodwater from a traffic stagnant water point. Keeping floodwater out of urban traffic accumulated storm water locations is essential to preserve the smooth traffic from the destruction caused by flooding. While there is no surefire way to guard against flooding, flood diversion can improve traffic chances of surviving intact.

Liquid air spraybased freezing flood control and protection systems are designed to instantly control, protect and prevent flooding issues. Essentially, such a single flood control and protection system is equivalent to many sandbags. They are eco-friendly, reusable, modular and can protect up to the requested height. Ice dams or diversion channels may be rapidly produced based on rapid solidification of flood water due to the tremendous heat transfer temperature difference by means of vaporization of liquid air flowing through roadside pipe fences onto which floodwater is pumped. They may be utilized to pump accumulated floodwater out and ensure the smooth traffic. Moreover, such ice may be transferred to those application fields such as freezers, ice storage air conditioning systems and crematoriums for cold energy utilization.

### **3.3 Rapid diversion of rain clouds rain clouds based on vaporization of liquid air**

On a hot summer day the surface of the Earth is heated by the sun. The Earth's surface heats the air just above the surface through the process of conduction. The action of warm air rising and cold air sinking (convection) plays a key role in the formation of severe thunderstorms. If the warm surface air is forced to rise, it will continue to rise, because it is less dense than the surrounding air. In addition, it will transfer heat from the land surface to upper levels of the atmosphere through the process of convection. Two of the most important ingredients for thunderstorm formation are instability (unstable air) and moisture. There are three main types of thunderstorms; orographic, air mass, and frontal, which are described as follows:

- 1) Orographic thunderstorms are caused by air that is forced up by a mountain or hillside;
- 2) Air mass thunderstorms are the result of localized convection in an unstable air mass; and
- 3) Frontal thunderstorms occur along the boundaries of weather fronts (e.g. cold front).

**Figure 5 Rapidly Dispelling Rain Clouds Based on Vaporization of Liquid Air**

Most commonly, rain clouds that produce a steady rain are referred to as nimbostratus clouds. These clouds appear low in the sky and are a medium to dark gray color. Sometimes stratus clouds are associated with a light drizzle. Stratocumulus clouds almost never produce rain, although they can turn into nimbostratus clouds if conditions allow. Mammatus clouds and green clouds are normally associated with severe weather, including hail or tornados. High types of clouds, above 18,000 feet, are known as cirrus clouds. Clouds above 6,500 feet to 18,000 feet are called alto clouds. Clouds below 6,500 feet are mainly the stratus clouds that may indicate rain.

Thus, timely dispelling rain clouds and prevention of cold air in contact with hot air shall be one effective way. Vaporization of liquid air or compound is an intensive phase transition from the liquid phase to air. The tremendous heat transfer temperature difference results in bulk boiling rather than surface evaporation. The vaporized air flow from the above rapid solidification of flood water for production of emergent ice dams or diversion channels is free of moisture so that its filling into the ambient air shall not only decrease the relative humidity of mixed ambient air but also drive the overall upward motion of air over the storm area; thus, the rain clouds integrating and interchanging hot and cold air streams may be dispersed or move away; moreover, local rainstorms cannot come off. This is called as the technique of rapidly dispelling rain clouds based on vaporization of liquid air schematically shown in Figure 5.

### **3.4 The technique of assembling open diversion channels**

Diversion channels or floodways are man-made channels built to offer a different route for excess water to flow further mitigating the effects of flooding and restoring rivers to their natural water level. Typically, diversion channels are built around communities or economic centers to prevent extensive flood damage. The diversion channels may be formed in a short period by means of rapid icing based on vaporization of liquid air. The modular diversion channels of ice (Figure 6) which may be assembled together or elevated overhead are coupled with a mobile modular pump assembly unit so that accumulated floodwater shall be pumped in a short time to any location which does not affect traffic. Such diversion channels of ice primarily take advantage of rapid modular production, no pollution and subsequent cleanup work, cooling down, convenient and flexible assembly, short construction period and reutilization of ice.

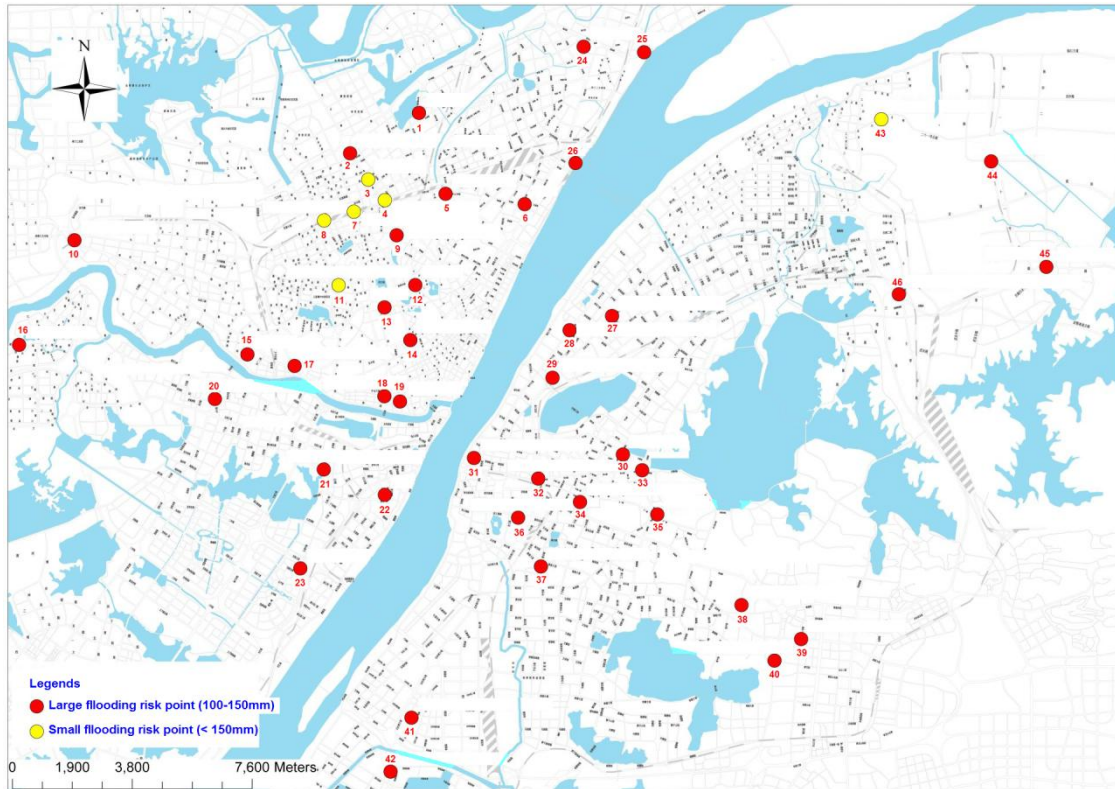

**Figure 6 Assembled Modular Overhead Diversion Channels of Ice**

#### **4 Economic Estimation of Our Urban Traffic Flooding Control Scheme Based on Liquid Air Spray/Vaporization by Taking Wuhan Downtown Traffic Flood Control as An Example**

As for our liquid air application based urban traffic flooding control scheme, Wuhan is taken here as an example for performance of its economic estimation, which is made up of the three towns of Wuchang, Hankou, and Hanyang and is the capital of Hubei Province. The three towns, separated by the Yangtze and Hanshui rivers, are linked by bridges, and because these municipalities are so closely connected by waterways, Wuhan is also called the "city on rivers." Being the largest inland port on the middle reaches of the Yangtze River and a major stop on the Beijing-Guangzhou Railway, Wuhan is one of China's most important hubs of water and rail transportation and communications. It has 46 easily flooded traffic locations (Figure 7) in urban area of Wuhan in accordance with 2019 Easily Flooded Risk Map released by Wuhan Institute of Water Sciences on March 16, 2019. It points out that Wuhan urban drain ability has been improved significantly in recent years so that the number of flooded locations, and flooding durations and areas shall fall remarkably under the same conditions of rainfall. There are many factors for its urban flooding. 40 and 46 locations may be flooded in case of torrential rains below 100-150mm and above 150mm, respectively, most of which are in low-lying urban areas. Except for those unfavorable flood drainage factors such as increasing extreme rainfall events due to climate change and special geographical/topographical conditions, those factors such as project construction related poor operation of its drainage pipeline networks, lagged support facilities, low standard drainage facilities and small drainage capacity primarily affects occurrence of flooding. The targeted emergency plans and measures are currently ready based on correspondingly conscientious analysis of Wuhan Water Authority.

**Figure 7 2019 Easily Flooded Traffic Locations in Urban Area of Wuhan**

Figure 8 presents a traffic flooding picture for a site in Wuhan on June 21, 2019, which indicates that cars were immersed in water deep about 50cm. As for such flooded site, it is assumed that one diversion channel of ice (length: 700m; weight: ~50 tons) is necessary for urgently pumping water away to a field that has nothing to do with traffic and ice sheets (area: 2000m<sup>2</sup>; thickness: 40cm; weight: 720 tons) are provided for emergency pedestrian paths. The total weight of the above two items may be magnified to 800 tons including an ample margin. Production of 800 tons of ice needs about 700 tons (~780m<sup>3</sup>) of liquid air which may release gaseous air of about  $800/0.81 \times 700 \approx 691,000\text{m}^3$  in standard state. Such amount of "boil-off" air may let the overhead rainclouds away from the sky of the flooded site. A buffer tank shall be equipped on the icing site considering such great gasification. Actually, a centralized production plant may be set up near the air separation unit so that the pipeline transportation may be taken for the required liquid air without tank transportation. A relatively small amount of liquid air needs supply to the site or reserved in a storage tank nearby the traffic flooding site according to the site needs. Thus, the main transport costs would drop and rapid release of a lot of vaporized air would cool down the hot weather and drive out the overhead rain clouds. WISCO Oxygen Industrial Gases Co., Ltd. located in Wuhan Qingshan District may provide the liquid air delivery and corresponding auxiliary services whose price is determined in accordance with RMB 1,000 Yuan/m<sup>3</sup> liquid air. 780m<sup>3</sup> of liquid air costs RMB 780,000 Yuan, which will be magnified to RMB 10,000,000 Yuan in total in consideration of labor costs and other incidental expenses. With reference to the total of such traffic flooding control case, 46 easily flooded traffic locations would cost RMB 460,000,000 Yuan per such worst flood disaster. Moreover, most of ice may be reused after flood control or naturally melt for urban cooling in steamy summer. While there had be 2 such level flood disasters every year at most in according the statistical analysis, the total costs of flood control based on our innovative approach coupled with application of liquid air spray/vaporization based icing and natural de-icing would be up to RMB 920,000,000 Yuan for Wuhan, such a metropolis in Central China, whose flood control funds are

planned for 12,985,000,000 Yuan during the period (2016-2018). RMB 920,000,000 Yuan only accounts for 21.3% of the planned flood control funds per year on average without being aware of benefits of reutilization of ice.

Further establishment of some air product supply stations can be integrated into existing flooding risk locations to reduce dependency on expensive emergency supplies. The integration of liquefied air into existing flooding risk locations addressed the grand challenge of setting up and improving the urban existing air product supply network. Liquefied gases can also be transported elsewhere to be used. A liquid air economy can also be integrated into the Central China logistics network. Wuhan, being a city with a hot climate in summer and autumn relies heavily on air-conditioning to regulate the indoor temperature. The integration of liquid air as a coolant would benefit largely from it as bulk of the cooling needs of business and organizations comes from air-conditioning. The use of liquid air in buildings as a cooling source in case of emergencies or to reduce dependence on the grid when extra power is required for excess air conditioning, the liquid air can be circulated around the building to reduce the ambient indoor temperatures.

**Figure 8 A Traffic Flooding Site in Wuhan on June 21, 2019**

There are many potential uses for liquefied air, but like all new technologies, it has to “cross the chasm” so to speak from the early adopters to the mass market for the technology to be widely accepted by the general public in China. To do this, industries and businesses must be well informed about the economic potential of employing liquefied air in their various business activities, the return on investment and the financial gains which may be expected.

## **5 Conclusion**

China has become an increasingly urban society over the past 40 years. The changes in land use associated with urban development affect flooding in many ways. Urbanization generally increases the size and frequency of floods and may expose communities to increasing flood hazards. Urban flooding is a national and significant source of economic loss, social disruption, and housing inequality. This study presents a conceptual application of liquid air spray/vaporization based icing and natural de-icing

for urban traffic flooding control, which includes some advanced and innovative techniques such as liquid air spraybased icing for rapid formation of temporary ice roads for small cars or pickups, rapid solidification of flood water for production of emergent ice dams or diversion channels, rapid diversion of rain clouds based on vaporization of liquid air and the technique of assembling open diversion channels. This paper explores the conceptual application of liquid air spray/vaporization based icing and natural de-icing for urban traffic flooding control, whose conceptual developments including description of liquid air, road icing, conceptual liquid air based flash freezing of water for urban traffic flooding control and modeling and solution of natural road de-icing are described and analyzed in detail. In addition, economic estimation of our urban traffic flooding control scheme based on liquid air spray/vaporization by taking Wuhan downtown traffic flood control as an example is presented to demonstrate that our innovative scheme will be promising for flood control in modern cities.

## Application of Scem-Ua Algorithm in Financial Modeling Analysis

Chen Yubing

Finance Department, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 445229758@qq.com)

**Abstract:** A good financial analysis depends on a good financial model, and good results of the analysis cannot leave a reasonable estimate of the model parameters, this paper uses Scem-Ua algorithm in financial analysis, it is proposed based on SCEM - UA algorithm model parameter estimation, thinks to find global optimal point under the global search algorithm, the paper build a more reasonable and effective financial model, financial analysis of the result is more reliable, besides, it also provides reference for subsequent financial analysis model selection.

**Key words:** Scem-ua algorithm; Financial analysis; Global optimal point; Reliable

### 1 Introduction

In financial analysis, it is very important to estimate the parameters of financial model accurately and reasonably. The traditional estimation method gradient search technology is widely used, but this kind of traditional gradient search method can only obtain the local optimal solution for complex parameter estimation, and sometimes even does not converge, so the results are not comprehensive enough. Another kind of global search technology, such as genetic algorithm, has the advantage of obtaining the global optimal solution, but it also has major defects and the solution accuracy is not high (Metropolis, 1953).

#### 1.1 Advantages of Scem-Ua Algorithm

Scem-Ua algorithm is a sublimation of Sce-Ua algorithm, which is a global search algorithm (Hasting, Monte, 1970). Sce-Ua algorithm is a global optimization algorithm proposed by Duan (Duan, 2003) based on the direct compound algorithm, the algorithm is based on the evolution principle of natural selection in the free world (Smith J, 2008) and the method of compound shapes mixture. The biggest advantage of Sce-Ua algorithm is that it can find the global best, but the premise is that the randomly selected initial point set should have diversity (Holland, 2009). If the selected domain degree of the initial point set is insufficient, the result will fall into the awkward situation of local optimal. In addition, the solving efficiency of Sce-Ua needs to be further improved (Cao Feifeng, Xu Yuping, 2012).

Scem-Ua algorithm originates from Sce-Ua algorithm, which has been improved greatly. The Scem-Ua algorithm USES the Markov chain Monte Carlo (MCMC) theory (Wei Xiaojing, Xiong Lihua, 2015) using the Metropolis Hastings algorithm (MH) algorithm. Replace the SCE - UA

algorithm of gradient algorithm (Wu Han,2016)And the most probable parameter set and its posterior probability distribution are estimated to avoid the problem that the algorithm falls into local poles(Long Haifeng, Li Huaxiong,2017).

### 1.2The Role of Scem-Ua Algorithm

The Scem-Ua algorithm can realize parameter estimation of complex functions and has global search ability, which are not the advantages of traditional methods such as gradient search(Yu Hui,2018).Therefore, this paper studies the Scem-Ua algorithm to realize the estimation of financial analysis model parameters.

## 2 SCEM - UA Algorithm

### 2.1 Probability density calculation method

Before introducing the Scem-Ua algorithm, the calculation method of parametric posterior probability density in parameter estimation is firstly introduced.

Where,  $\hat{y}$  is the  $N \times 1$ -dimensional vector estimated by the model,  $\mathbf{X}$  is the  $N \times n$ -dimensional matrix of the input variable,  $\theta$  is the vector containing  $N$  unknown parameters, and  $y$  is the sample data.  $\hat{y} = \eta(\xi | \theta)$   $\hat{y} \xi \theta$  make

$$E(\theta) = \hat{y}(\theta) - y = \{e_1(\theta), e_2(\theta), \dots, e_N(\theta)\}, \quad (1)$$

Then we can optimize the objective function as follows

$$\underset{\theta}{\text{minimize}} \quad SLS = \sum_{j=1}^N e_j(\theta)^2 \quad . \quad (2)$$

If the irregular difference is assumed to be independent of each other and subject to exponential power distribution, then according to literature [10], the following equation is established:

$$p(\theta | \mathbf{y}, \gamma) = \left[ \frac{\omega(\gamma)}{\sigma} \right]^N \exp \left[ -c(\gamma) \sum_{j=1}^N \left| \frac{e_j(\theta)}{\sigma} \right|^{2/(1+\gamma)} \right] \quad (3)$$

Parameter posterior probability distribution density function  $p(\theta | \mathbf{y}, \gamma)$

$$\omega(\gamma) = \frac{\{\Gamma[3(1+\gamma)/2]\}^{1/2}}{(1+\gamma)\{\Gamma[(1+\gamma)/2]\}^{3/2}} \quad (4)$$

$$c(\gamma) = \left\{ \frac{\Gamma[3(1+\gamma)/2]}{\Gamma[(1+\gamma)/2]} \right\}^{1/(1+\gamma)}$$

In the above equation, represents the residual distribution model. If  $\gamma=0$ , it means that the residual error obeys normal distribution. If  $\gamma=1$ , it is a double-exponential distribution; If  $\gamma=-1$ , it is uniformly distributed. If we assume the prior probability distribution density function  $p(\theta, \sigma | \gamma) \propto \sigma^{-1}$  Literature [10] shows that the following formula is valid:

$$p(\theta | y, \gamma) \propto [M(\theta)]^{-N(1+\gamma)/2} \quad (5)$$

Among them,

$$M(\theta) = \sum_{j=1}^N |e_j(\theta)|^{2/(1+\gamma)} \quad (6)$$

The calculation process of the posterior probability density of the estimated parameters is illustrated.

### 2.2 SEM algorithm

Calculate  $C^k$  Mean value of all parameters in  $\mu^k$  and the covariance matrix  $\Sigma^k$  and will compound  $C^k$  M sample points are arranged in descending posterior probability density;

If the sequence  $S^k$  at least one of the latter T points currently has accepted offspring, then according to  $\theta^{(t+1)} = N(\theta^{(t)}, c_n^2 \Sigma^k)$  produce offspring  $\theta^{(t+1)}$ , including  $\theta^{(t)}$  With a posterior probability density  $p(\theta^{(t)} | y)$  and only depends  $\theta^{(t-1)}$ ,  $c_n$  Is equal to, go to PI (4), otherwise go to PI (3);  $2.4 / \sqrt{n}$

According to  $\theta^{(t+1)} = N(\mu^k, c_n^2 \Sigma^k)$  produce offspring  $\theta^{(t+1)}$ ;

Calculate  $p(\theta^{(t+1)} | y)$  Outside the feasible region, let  $p(\theta^{(t+1)} | y)$  to 0; Calculate ratio =  $p(\Omega \theta^{(t+1)} | y) / p(\theta^{(t)} | y)$ ;

Z is the random number generated by uniform distribution of 0-1. If Z, accept the offspring generated; otherwise, let  $\Omega \theta^{(t+1)} = \theta^{(t)}$ ;

Use the following steps to  $\theta^{(t+1)}$  Added to the  $S^k$ :

(a) Using  $S^k$  in the middle and the bottom half, the acceptance coefficient AR is calculated. The number of descendants received divided by the length of the sequence);

(b) If  $AR < AR_{min}$  as  $\theta^{(t+1)}$  Instead of  $C^k$  is the worst point, otherwise, rotate (c);

(c) If  $AR \geq AR_{min}$  And Z randomly replaces  $C \leq \Omega^k$  one of them.

### 2.3 The Scem-Ua algorithm

Initialization. Select sample group size parameter s and compound form number q, then the number of samples in each compound form  $m = s/q$ ;

Generate s samples, and calculate the posterior probability density of each sample point according to equation (3) or equation (5);

The sample points are sorted by decreasing posterior probability density and stored in array d [1: s, 1: n+1], where n is the number of estimated parameters, and the right-most column in the array stores the posterior probability density of each sample point;

Initialize q parallel sequences  $s^1, s^2, \dots, s^q$ . that  $s^k$  is d[k, 1: n+1], where  $k = 1, 2, \dots, q$ . D[1: s, 1: n+1] is divided into q compound  $c^1, c^2, \dots, c^q$ , each compound form contains m sample points, so that the first compound form contains the points in order of, the second compound form contains the points in order of, etc., where  $j = 1, 2, \dots, q(j-1) + 1$   $q(j-1) + 2$  m;

Select parameters l, t and  $ar_{min}, c_n$ . For every complex  $c^k$ , call Sem algorithm and run it l times;

Put all composite shapes into array d [1: s, 1: n+1], and arrange each sample point in descending order according to the posterior probability density;

Check the convergence criteria of gelman and rubin (gr). If the convergence conditions are met, the calculation ends; otherwise, go to step 4.

## 3 Estimation of Financial Analysis Model Parameters

In financial analysis, there is a certain relationship between various variables, but many times the

explicit form of this relationship is difficult to get. However, some mathematical models, such as Taylor's expansion of functions of multiple variables, can be used to fit the relationship between dependent variables and independent variables. Suppose the general form of financial analysis model is  $y=f(x_1, x_2, x_N)$ , using the Taylor expansion of multivariate function to fit, and

$$y = \beta_0 + \sum_{j=1}^N \beta_j x_j + \sum_{j=1}^N \sum_{i \leq j} \beta_{ij} x_i x_j + \sum_{j=1}^N \sum_{i \leq j} \sum_{k \leq i} \beta_{ijk} x_i x_j x_k + \dots$$

The parameter is to be estimated.  $\beta_0, \beta_j, \beta_{ij}, \beta_{ijk}, \dots$ . In general, the above expansion is accurate to second order. After estimating the parameters, financial analysis and calculation can be carried out according to the model.

### 3.1 The Sample

Select 12 annual data of a company as shown in table 1, and adopt first-order model to fit  $y_i$ . With  $x_i Y$  is equal to a plus  $bx$ , where  $x$  is equal to  $x_i$  is the number of new product r&d team of the company in year  $i$ ,  $y_i$  is the  $i$ th year company profit (in millions of us dollars),  $i = 1, 2, \dots, 12$ .  $A$  and  $b$  are the required parameters.

**Table 1 Financial Data**

	i	1	2	3	4	5	6	7	8	9	10	11	12
$X_i$		150	160	170	180	190	200	210	220	230	240	250	260
$Y_i$		56.9	58.3	61.6	64.6	68.1	71.3	74.1	77.4	80.2	82.6	86.4	89.7

In the Scem-Ua algorithm, let  $s=50, q=5, L=1, T=500, AR_{min}=0.001, =0$ , and using the Scem-Ua algorithm, the estimated parameters of the formula are:  $\gamma$

$A = 8.841741, b = 0.31082198$ .

The p

Figure 1 Estimation of Parameter b

Figure 2 Estimation of Parameter a

### 3.2 Comparative Analysis Of Results

By using regression analysis, the obtained parameters are

$A = 10.282$ ,  $b = 0.3041$ .

The above parameters are estimated by hypothesis test, which shows that they accord with the actual situation expressed by samples.

Results are compared in table 2.

Table 2 Results Comparison

Methods	sum of absolute errors	mean of absolute error
SCEM-UA	3.82	0.32
Regression analysis	4.08	0.34

Table 2 shows that the Scem-Ua algorithm has better results than regression analysis in this example.

## 4 Conclusion

In financial analysis, it is important to estimate the financial model parameters accurately. Due to traditional methods such as gradient search, it is difficult to estimate parameters of complex models and easy to obtain local optimal solutions. This paper attempts to use Scem-Ua algorithm to realize parameter estimation of financial analysis model, so as to get more practical parameter estimation results.

Through actual data analysis, it is shown that the model parameters estimated by Scem-Ua algorithm are more accurate than those obtained by gradient search method, and more accurate and realistic results can undoubtedly enable financial analysts to make correct decisions and judgments.

The highlight of this paper is added the Scem-Ua algorithm into financial analysis model, as we know, Scem-Ua algorithm is mostly used in hydrological measurement research, Scem-Ua is better than the general regression analysis, and the optimal solution is relatively close to the fact, which provides certain reference value for future financial analysis and research.

**Abstract:** To build a service-oriented government that the people are satisfied with, since 2013, the Chinese government has proposed a series of innovation policies for transforming government functions and promoting the streamlining and delegating of power. The government administrative service center (ASC) is a new multi-functional and comprehensive service platform integrating public services to which the Chinese government has attached great importance. In order to assess the effectiveness of the government reform and explore the public satisfaction with the public service provided by the ASC, this paper conducts questionnaire surveys to investigate the satisfaction with the public service of 21 ASCs in Guilin and obtained 2690 valid questionnaires. The survey results shows that the perceived structure of satisfaction with public service remains 2 common factors, satisfaction with public service received at the service windows and satisfaction with public service resulting from complaint handling, and the overall score of the public satisfaction with the service of the ASC's public service window is higher than that of the public service complaint handling, and the difference is considerable. In terms of occupational differences, satisfaction with the dress code for government services vary significantly but the overall satisfaction perception is relatively high. Satisfaction among occupations regarding information disclosure on the processes of deliberation and approval, the content of government information disclosure, the timeliness of government information disclosure, and the satisfaction of the complaint handling results also vary significantly. The satisfaction of retirees is the lowest, which is significantly different from that of other occupational groups. According to the research conclusions, the next step of the ASC is to give emphasis to rule implementation by bringing the accountability system to bear on its efficacy in accordance with the law, and to provide personalized public services for retired people.

**Key words:** Administrative service center (ASC); Public service; Satisfaction perception; Differentials

## 1 Introduction

**Building a "service-oriented government with scientific functions, optimized structure, honesty and efficiency, and people's satisfaction" has become the focus of the party and government work since the 18th National Congress of the Communist Party of China (CPC). Standardizing deliberative and approval procedures and improving work related to them are important windows on and embodiment of building a service-oriented government. The report of the 19th CPC clearly points out that it is necessary to transform the functions of the government, deepen the process of streamlining administration and delegating power, innovate ways of supervision, enhance the credibility and enforcement of the government, and build a service-oriented government that satisfies the people.**

The government and researchers therefore have made the public service satisfaction a focus of attention. Park et al. investigate the current status of public perception, user satisfaction, and public relation on a free public collecting channel in Korea and the survey results indicates the most of the user express a positive opinion (Park et al.,2019). Mouwen demonstrates the influence of differences in customer characteristics on satisfaction with public transport services (Mouwen, 2015). Lindgren et al. contributes to e-government research and discuss how digitalization of public services has affected the interaction between citizens and government (Lindgren et al. 2019). Shirahada, Ho& Wilson identifies that aging satisfaction is the strongest factor in terms of influencing online public services usage, and this is developed through social interaction (Shirahada, Ho& Wilson, 2019).

Many researches that study the impact of individual characteristics on public service satisfaction have shown that factors such as residential area, income level, age group and education level have a significant impact on public service satisfaction (Guan,2017). Demographic characteristics such as age, income, education level, health status, gender, and occupation can also significantly affect public satisfaction with public services (China National Bureau of Statistics Fuzhou Investigation Team,2015). In terms of the impact of personal perception on public service satisfaction, existing research has proved that personal happiness, fairness and public service satisfaction have a significant positive correlation as well: the stronger the public's personal happiness and sense of fairness, the higher its satisfaction with public services (Feng et al.2016, Peng et al. 2016). Hu applies the fuzzy mathematics to construct the evaluation system of public service satisfaction and measures the membership degree in the four indicators of government public service based on the evaluation of public service (Hu, 2018). Zhang and Wang's research shows the satisfaction situation of public cultural service in 34 major Chinese cities that differ greatly in education, public cultural service, medical care and health, public cultural service, housing and social security, public safety and public infrastructure (Zhang & Wang,

2018).

Scholars have conducted extensive research on the perception, evaluation and influencing factors informing satisfaction with government public services from different angles. There is yet no research on public service satisfaction analysis for ASC, the newly integrated government function. ASC, as an organization integrating government functions, is the format and vehicle of government that concentrates in one location disclosure of information, convenience of services and deliberation and approval of petitions from enterprises and citizens. It ameliorates the fragmentation of traditional deliberation and approval processes, simplifies procedures and links, and enhances the efficiency of deliberation and approval altogether. ASC is an important channel of communication between the government and the masses, and an important window for the government to demonstrate the concept of service-oriented government construction. The ASC also functions as a platform to display the system of open administration. It accepts applications for government information disclosure in accordance with the law and responds to them as scheduled. It also deals with policy consultation and makes public the procedures, instructions and status of matters for deliberation and approval. Therefore, the ASC is a multi-functional and comprehensive service platform integrating all government departments, licensing agencies and public services, fully reflecting the purpose and nature of service-oriented government. In order to efficiently provide public services, to meet the public demand for public services, the Chinese government attaches great importance to the comprehensive ASCs by unifying the multilevel—viz. provincial, city and county, township-- ASCs under one standard that governs services, business transactions, supervision and management so as to provide "one window and one-stop service", which is taking shape nationwide. By April 2017, 3,058 ASCs have been set up by local governments at and above the county level covering 94.3 percent of the total (Survey on Nationwide Comprehensive Entity ASCs ,2017).

The new ASC of Guilin opened on January 25, 2016, housing 53 government agencies with a total of 229 service window. Due to space limitations that failed to accommodate more, the center set up three more branches to handle the extra workload. Six districts under Guilin and its 11 subordinate counties have also set up the corresponding ASCs. The public services defined in this study include administrative deliberation services and other services that provide conveniences for the people. In order to evaluate the effectiveness of the government reform and explore the public perception satisfaction with the public service by the ASCs, this paper conducts a case study based on the survey data of 21 ASCs in Guilin since 2013 when the Chinese government began to implement decentralization, information disclosure, accountability, immediate reply to inquiries, and scheduled deadlines for matters to be resolved all in keeping with the newly instituted systems in terms of public service satisfaction perception structure, analysis of the public satisfaction difference level, and clear ASC focus on public service in the future.

## **2. Exploration of Perceived Structure of Satisfaction with ASC's Public**

### **2.1 Sample data overview**

This study targets 56 departments of 4 municipal administrative centers in Guilin city, 6 districts and 11 county-level administrative deliberation and approval service units and windows that handle administrative deliberation and approval business and provide convenient services on the scene so as to obtain an evaluation of public's satisfaction with the government's public services. Time of the

survey ranged from November 1, 2017 to December 31, 2017. On the scene questionnaire was used as the survey method that researched respondents' satisfaction with the ASC's public services. In compliance with the policy of streamlining the administration and delegating power so as to better meet the needs of society, this study is designed according to the relevant policies and public service standard specifications at the government documents (*Decision of the Central Committee of the Communist Party of China on Some Major Issues Concerning Comprehensively Deepening the Reform*, 2013; *Notice of the State Council on Standardizing Administrative Examination and Approvals by Departments of the State Council to Improve Work Related to Administrative Approvals*, 2015; *Some Opinions of the People's Government of Guangxi Zhuang Autonomous Region on Standardizing Administrative Examination and Approval Behavior and Improving the Related Work of Administrative Examination and Approval*, 2015; *Guilin Municipal Administrative Approval Service "Immediately" Style Work Efficiency Implementation Plan*, 2014) and is categorized under four headings: "information", "service specification", "service etiquette", "accountability." Upon completion of the initial draft, a preliminary survey was conducted. After analysis of the preliminary survey results, the questionnaire was revised. The 11 administrative service satisfaction assessments that the Questionnaire ends up with includes: satisfaction with the information disclosure of the approval process, satisfaction with the content of disclosed information, satisfaction with the timeliness of information disclosure, satisfaction with the first responder accountability system, satisfaction with the immediate reply to inquiries system, satisfaction with the service window work efficiency, satisfaction with clerks' job initiative, satisfaction with the clerks' dress code, satisfaction with the clerks' language, satisfaction with complaint handling mechanism, and of satisfaction with complaint handling results. Likert 5 Scale is measurement used. Alternative key is: "1= very satisfied, 2= relatively satisfied, 3= indeterminate satisfactory, 4= dissatisfied, 5= very dissatisfied".

From 2014 to 2016, cases handled by all ASCs in Guilin totaled 179,045. The confidence interval is set at 0.95, e at 3% and P at 0.5. From the calculation formula for sample size:  $n = P(1-p) / (e^2 / Z^2 + P(1-p) / n)$  can be derived that sample size n should be no less than 1060. The sampling methods for data collection are random sampling and stratified random sampling. Stratified sample extraction is carried out according to the actual number of cases handled by the deliberation and approval departments at the municipal, district and county levels of government affairs centers in the previous year and in accordance with a certain proportion. 2810 copies of this questionnaire for this research were distributed on the scene, of which 2690 were retrieved with an effective recovery rate of 95.72%. Among those, 1584 came from the city proper ASC; 310 from its 3 branches; 663 from 11 county sites, and 406 from the 6 district locations. The Cronbach's Alpha coefficient of the 11 items in this survey is 0.936, which meets the reliability requirements. In order to facilitate the subsequent data analysis more smoothly, it is necessary to re-assign the five satisfaction variables and convert them into a definite ratio variable. The specific Assignment method is as follows: "100 = very satisfied, 75= relatively satisfied, 50 = not clearly satisfied, 25= dissatisfied, 0 = very dissatisfied". By calculating the average score of respondents' satisfactions with 11 public services, it can be seen that the public has the highest satisfaction score for the appearances and manners of the service personnel, followed by the satisfaction with the language use and job initiative of personnel involved. The least satisfaction came from the complaint handling mechanism as can see from the Table 1.

**Table 1 Public Service Satisfaction Score with ASC**

Items	Average Score	Standard Deviation
-------	---------------	--------------------

Satisfaction with the Information Disclosure of the Approval Process	86.27	19.512
Satisfaction with the Content of Disclosed Information	86.64	19.244
Satisfaction with the Timeliness of Information Disclosure	85.49	20.404
Satisfaction with the First Responder Accountability System	87.86	19.392
Satisfaction with the Immediate Reply to Inquiries System	87.46	19.892
Satisfaction with the Service Window Work Efficiency	86.35	21.063
Satisfaction with Clerks' Job Initiative	88.21	19.786
Satisfaction with the Clerks' Dress Code	90.05	16.912
Satisfaction with the Clerks' Language	89.01	18.094
Satisfaction with Complaint Handling Mechanism	78.64	23.415
Satisfaction with Complaint Handling Results	78.37	23.756

## 2.2 Quest for the perception structure of satisfaction with ASC's public service

Through correlation analysis of 11 public service satisfaction variables, we can initiate a preliminary discussion on whether it is necessary to do an exploratory factor analysis. The results showed that there was a positive correlation at the significance 0.01 between respondents' satisfaction scores of various public services. Therefore, exploratory factor analysis could be used to extract the structure between variables. It can be seen from the results of exploratory factor analysis that the KMO and Bartlett test results show that the KMO statistic is  $0.915 > 0.7$ . Bartlett's sphericity test statistics have a Sig value lower than 0.01 and reject the null hypothesis, further reflecting the suitability of factor analysis for each variable. In the process of analysis, the common factor was extracted by principal component analysis, and it was found that the best extraction result could be obtained by determining the number of common factors as two after trying the setting of the extraction method of common factors. After iteration, the initial variables are no longer of complex structure, and the minimum value of the common degree is 0.560. Table 2 provides detailed statistics of the interpretation degree of the initial variables with two common factors.

**Table 2 Common Factor Variance Statistics**

Items	Initial Value	Extraction
Satisfaction with the Information Disclosure of the Approval Process	1.000	0.661
Satisfaction with the Content of Disclosed Information	1.000	0.646
Satisfaction with the Timeliness of Information Disclosure	1.000	0.649

Satisfaction with the First Responder Accountability System	1.000	0.692
Satisfaction with the Immediate Reply to Inquiries System	1.000	0.715
Satisfaction with the Service Window Work Efficiency	1.000	0.686
Satisfaction with Clerks' Job Initiative	1.000	0.670
Satisfaction with the Clerks' Dress Code	1.000	0.560
Satisfaction with the Clerks' Language	1.000	0.661
Satisfaction with Complaint Handling Mechanism	1.000	0.947
Satisfaction with Complaint Handling Results	1.000	0.949

The cumulative sum of variance explained by the two common factors is 79.635%, indicating that the two common factors can better explain the information contained in the original variables, and the degree of interpretation is up to 79.635%. The common factors were extracted by principal component analysis, and Kaiser standardized orthogonal rotation method was used. The rotation converges after 3 iterations. The component matrix after rotation shows the load distribution of each common factor, as shown in Table 3.

**Table 3 Rotating Component Matrix**

Items	Component	
	1	2
Satisfaction with the Information Disclosure of the Approval Process	0.812	0.235
Satisfaction with the Content of Disclosed Information	0.803	0.216
Satisfaction with the Timeliness of Information Disclosure	0.785	0.262
Satisfaction with the First Responder Accountability System	0.779	0.250
Satisfaction with the Immediate Reply to Inquiries System	0.770	0.262
Satisfaction with the Service Window Work Efficiency	0.760	0.290
Satisfaction with Clerks' Job Initiative	0.753	0.287
Satisfaction with the Clerks' Dress Code	0.751	0.286
Satisfaction with the Clerks' Language	0.680	0.311
Satisfaction with Complaint Handling Mechanism	0.301	0.927
Satisfaction with Complaint Handling Results	0.321	0.919

Factor loading value is the correlation coefficient between each variable and each common factor.

For the same variable, the larger the absolute value of the load is, the more the common factor can represent this variable. You can see that the common factor 1 is representative of "satisfaction with the deliberation and approval process", "satisfaction with the content of government disclosed information", "satisfaction with the timeliness of government information disclosure", "satisfaction with the first responder accountability system", "satisfaction with immediate reply to inquiries system", "satisfaction with the job efficiency at the service window", "satisfaction with the clerks' job initiative", "satisfaction with the clerks' dress code", and "satisfaction with clerks' use of language", a total of 9 variables out of 11. In turn, common factor 2 represents the "satisfaction with complaint handling mechanism" and "satisfaction with complaint handling results". According to the connotative characteristics of respective variables represented by the common factors, common factor 1 can be named as "satisfaction with public service received at the service windows", and common factor 2 as "satisfaction with public service resulting from complaint handling". The perceived structure of satisfaction with public service remains therefore satisfaction with public service received at the service windows and the levels of satisfaction with public service resulting from complaint handling.

### **3. Analysis of the Differentials Concerning Satisfaction with ASC's Public Service.**

#### **3.1 Perception structure differentials concerning levels of satisfaction with public service**

In the exploratory factor analysis, the two common factors of "satisfaction with public service received at service window" and "satisfaction with public service resulting from complaint handling" scored 87.48 and 78.51, respectively, reflecting the satisfaction of respondents in this dimension.

#### **3.2 Perceived difference level between age and public service satisfaction.**

In order to further explore the differences in the levels of satisfaction with public service of the ASCs, a cross-analysis was made according to the descriptive statistical variables of the survey -- age and occupation, to analyze whether there is a relationship between the two variables. The null hypothesis is that there is no relationship between the two variables. The age groups were "under 25", "between 25 and 35", "between 36 and 45", "between 46 and 60" and "over 60". Cross-analysis was carried out in different age groups and 11 survey items. When the Sig. value of Pearson Chi-square inspection was less than 0.05 and the phi value and V value were both greater than 0.1, it could be determined that there was a significant difference between different age groups in this satisfaction perception level. The results showed that the Sig value of Pearson Chi-square inspection was less than 0.05 for different age groups and the phi value and V value were both greater than 0.1, indicating that there was no significant relationship between different age groups and the satisfaction the 11 items surveyed.

#### **3.3 Perceived difference level between career and public service satisfaction**

The occupational groups were "administrative staff", "public institution staff", "enterprise staff", "freelancers", "migrant workers", "retired", "students" and "other". Cross-analysis was performed in different occupational groups with 11 survey items, when the Sig value of Pearson Chi-square inspection is less than 0.05 and the phi value and V value are both greater than 0.1, it can be judged that there is a significant difference between different occupations in this satisfaction perception. Calculation results show that the different occupations and their "satisfaction with first responder accountability

system", "system of one-time immediate reply to inquiries ", "satisfaction with service window work efficiency", "satisfaction with clerk initiative", "satisfaction with clerks' language use" and "satisfaction with complaint handling mechanism" did not satisfy Pearson Cartesian inspection of Sig value being less than 0.05 and phi and V were greater than 0.1, namely there was no obvious connection between the different occupational groups and the perception the 6 above referenced project satisfaction. In the difference analysis of perceived level between "occupation" and "satisfaction with information disclosure of deliberation and approval processes", the Sig value of Pearson Cartesian inspection is 0.007, the phi value is 0.195, and the V value is 0.101, as shown in Table 4, hence meeting the requirement that the Sig value of Pearson Cartesian inspection is less than 0.05 and the phi value and V value are both greater than 0.1.

**Table 4 Chi-Square Tests and Symmetric Metric between Occupation and Satisfaction with Information Disclosure of Deliberation and Approval Processes**

a: 15 cells (37.5%) expected count less than 5. The minimum expected count is 0.15.

The results show that there are significant differences in the perception satisfaction with complaint handling results among different occupations, as shown in Table 13.

**Table 13 Satisfaction with Complaint Handling Results among Different Occupation**

<sup>86</sup> Survey on Nationwide Comprehensive Entity ASCs. Office of Government Information and Government Affairs of the General Office of the State Council, 2017 (in Chinese) [http://www.gov.cn/xinwen/2017-11/23/content\\_5241582.htm](http://www.gov.cn/xinwen/2017-11/23/content_5241582.htm)

Occupation	Very Satisfied	Relatively Satisfied	Not Clearly Satisfied	Dissatisfied	Very Dissatisfied	Average
Administrative Staff	62.0%	18.0%	20.0%	0.0%	0.0%	85.5
Public Institution Staff	37.1%	20.5%	42.0%	0.4%	0.0%	73.58
Enterprise Staff	44.3%	18.6%	35.3%	1.4%	0.4%	76.25
Freelancers	40.0%	16.2%	42.5%	1.3%	0.0%	73.73
Migrant Workers	39.5%	13.2%	39.5%	5.3%	2.6%	70.48
Retired	24.3%	8.1%	62.2%	2.7%	2.7%	62.15
Students	37.5%	28.1%	31.2%	3.1%	0.0%	74.95
Other	42.6%	19.1%	36.5%	0.0%	1.7%	75.18

## 4 Conclusion

Through the above study, it is found that the overall public satisfaction score on the public service received at service windows in ASCs is higher than that on public service rendered by complaint handling departments. Satisfaction with public service received at service windows in all their dimensions scores between 85.49 to 90.05 points. The rubric designed for the study is: 100=very satisfied; 75= satisfied. Therefore, the overall satisfaction with the public service received at service windows is relatively higher compared with satisfaction with public serviced rendered by complaint handling in its two dimensions which score respectively 78.64 and 78.37 points. Consequently, ASCs should attach more importance to the effectiveness of enforcement when implementing the accountability system in keeping with the rules and regulations.

From the perspective of occupational differences, significant differences exist in regard to various occupational groups' satisfaction with the dress code for government service personnel. The scores of each group are between 83.80 and 92.98, which is higher than the standard of "relatively satisfied score of 75" designed for the study. The public's perception of satisfaction with the dress code for government service personnel is evidently high.

Among all occupational groups, the score of satisfaction with information disclosure for the deliberation and approval es is 74.93, which is the lowest among retirees. The score from the other seven occupational groups is 79.83. Among all occupational groups, the score of satisfaction with the content of government information disclosure is the lowest among retirees, which is 69.53. The score from all other 7 occupational groups is 80.90. Among all occupational groups, the score of their satisfaction with the timeliness of government information disclosure is 71.55, which is the lowest among retirees. The score from the other 7 occupational groups is 79.25. Of all the satisfaction scores

from among all occupational groups for the complaint handling results, the lowest, 62.15 comes from the retired people while the score of the other 7 occupational groups is 70.48. The above four scoring results show that there are significant differences among occupational groups in their satisfaction with the approval process information disclosure, the content of government information disclosure, the timeliness of government information disclosure, and the satisfaction complaint handling result. The satisfaction retire is the lowest, far lower than that of other occupational groups. Therefore, for the above four public service projects, the needs of retirees should be addressed more to provide individualized public services.

# Evaluation Theory of the Core Competence of Art Design Industry Based on “Four-Three Structure” Model

Wang Jun, Zhao Yiran, Yang Zhixuan

School of Art and Design, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: wangjun1021@126.com, 595245514@qq.com, 749971088@qq.com)

**Abstract:** This paper takes the Chinese art design industry as the research object, in view of the development characteristics of the art design industry and the commonness of the traditional industry, constructs the four-three (main body, content, input and output) structure industrial core ability recognition system, evaluates the uniqueness, value, scarcity and sustainability of the art design industry in China; design efficiency contribution, design innovation, international competitiveness (referred to as three capacities) indicators, evaluate its industrial comprehensive level model, and based on the evaluation results, and build an effective core competence cultivation model and upgrading path.

**Key words:** Art design industry; Core competence; Four-three structure model; Three capacities evaluation model

## 1 Introduction

In recent years, national competitiveness has gradually become an important field of theoretical research, the formation of core competence is the key to competitiveness, and the source of sustainable development lies in whether it has the core competence to support its industrial development. For our country, in the new world competition situation, the division of labor in national strategic layout, regional strategic planning and other times of change, the emerging industries, including the art and design industry, reflect the high premium, sustainable innovation, cross-integration and other attributes, so it is of great significance to study the unique industrial development characteristics and paths in the process of industrialization. Its development has become a key factor in the new round of national competition.

From the theoretical research level, Adam Smith and David Ricardo, the representatives of classical economics, established the theory of industrial comparative advantage, Michael Porter established the theory of national and industrial competitiveness, and subsequent scholars based on the two theories, centering on the identification of industrial core competence (Li Yizhou et al.,2012), judgment (Jiang Changbao,2009) and evaluation (Wei Jiang et al.,2015), cultivation (Zhu Shuai et al.,2014) and so on launched a series of studies. In the unique field of art design industry, many scholars have discussed the differences from different angles, such as Ling Jiyao (Ling Jiyao, 2009), Li Yanzu (Li Yanzu, 2011) and Wang Shouzhi (Wang Shouzhi, 2014) combing the history of art design from the perspective of historical evolution, Lu Xiaobo Lu Xiaobo, (2012) and Xu Ping (Xu Ping, 2013) from the perspective of culture. Liu Guanzhong is engaged in exploring the common law of art design from the perspective of Neo-Confucianism (Liu Guanzhong,2008), and Lou Yongqi is engaged in exploring the development trend of art design industry from the perspective of innovation (Lou Yongqi,2016、Pan Yunhe,2016).

This article takes the Chinese art design industry as the research object, screens and explores its performance, the intrinsic cause from the value, the uniqueness, the scarcity and the sustainability and another core ability attribute. The research follows the research logic of the foundation support-object analysis- appraisal system- fosters the design, setting up five main research topics to carry on the theory and the real diagnosis, the qualitative analysis and the quantitative analysis.

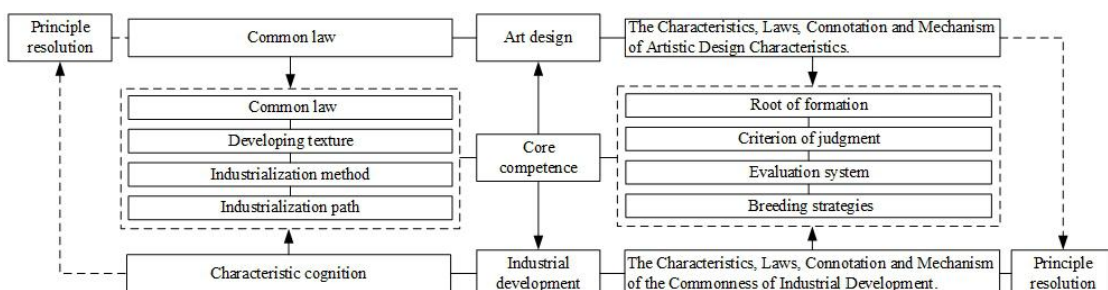

## 2 Practical Cognition of Art Design Industry

Today, with the emergence of new science and technology, new ideas and globalization, the world economy is facing a new round of industrial development direction adjustment. The development of art and design industry also shows a trend of efficient industrialization and rapid improvement of core capabilities, and it is very important to analyze the industrial development experience of typical countries and regions and the global industrial development. It is an important basis for correctly judging the development direction of China's art and design industry, and also a prerequisite for determining whether China can occupy a leading position in the new round of industrial development and global economic competition (Zou Qichang, 2014). Through comparing the development trend of the global art and design industry with the experience of typical countries, this paper summarizes the core characteristics and causes of international competitiveness of countries in the development of art and design industry, from the aspects of industry operation law, industry accommodation and policy formulation, design personnel training and innovation system, and design evaluation system, and summarizes and judges the new trend of global art design industry development.

Compared with the development of foreign mature art design industry, the overall competitiveness of China's industry is not strong, the core ability is not prominent, the problems are multifaceted. On the basis of systematic data collection, interview and research, a comprehensive survey of the status quo of China's art design industry development is done, through the historical evolution, professional accumulation, soil gestation and other multi-dimensional perspectives, revealing the current industrialization process of talent, technology, innovation ability, growth space and integration of internal and external industries, sorting out the current situation and practical difficulties of the development of China's art and design industry.

## 3 Development Principle of Art Design Industry

Compared with the general national economic industry, the art design industry and its industrialization process have the common characteristics of the existing industrial development law, and at the same time, due to its cultural elements, artistic elements and spiritual elements, the development of this industry naturally has have unique industrial characteristics, and the art design industry is also a collection of product art design, environmental art and art. Graphic art design and other comprehensive subdivisions are collectively referred to, and their subdivisions have the common characteristics of the art design industry. Based on the exploratory study of the development differences between art design industry and other national economic industries, as well as the common cognition of subdivided industries, this paper explores the formation root, judgment criteria and evaluation system of industrial development core competence, from the common law, development mechanism, industrialization method, the supporting platform system of industrial development principle should be built in terms of industrialization path and so on, through the blending principle of qualitative and quantitative analysis, the balance principle of artistic attribute and technical restriction. The unification principle of industrial commonness and industrial characteristics, the theoretical research model is

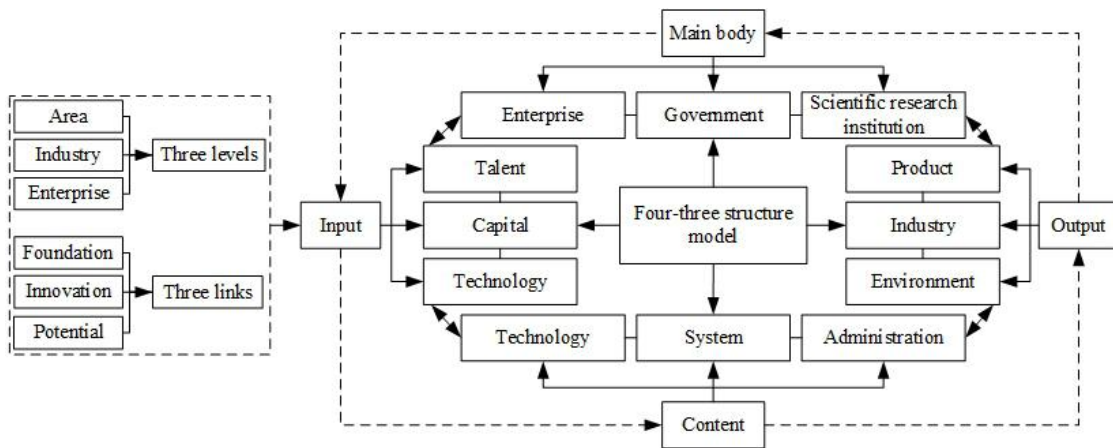

established to provide new ideas, new methods and new strategies for forming and cultivating the core competence of China's art and design industry. (Figure 1)

**Figure1 The Principle Diagram of the Core Competence of Art Design Industry**

#### 4 Cognition and Judgment of the Core Competence of Art Design Industry

Region is the soil of industrial development, and industry is the carrier of regional endogenous advantages. The development of any industry can't be separated from the cultivation of core competence, and the source of industrial sustainable development lies in whether it has the core competence to support its industrial development, so it is very important to identify the core competence and determine the factors affecting the formation of core competence in industrial development. The core competence has multi-subject, multi-content, multi-method and other systematic promoting attributes. Based on this, the four-three structure design of core competence identification in this paper constructs an internalized evaluation structure to comprehensively understand the core competence of China's art and design industry from the driving subject, innovative content and goal setting of industrial development.

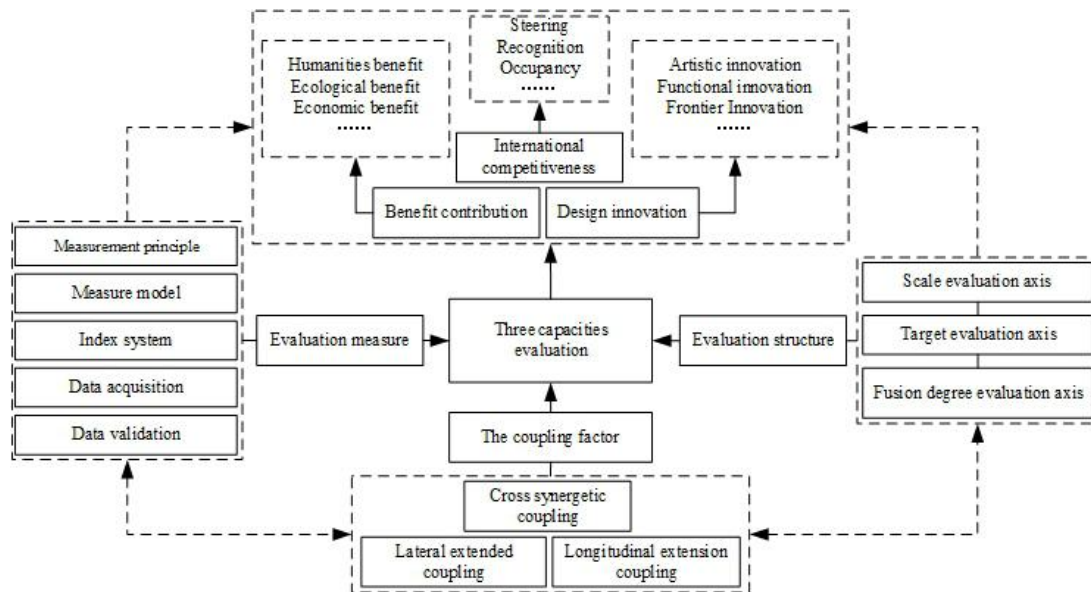

**Figure 2 The Cognitive Structure of Four-three Industrial Core Competence**

Based on the four-three structure, industrial development reflects the characteristics of systematicness, dynamics and synergy, the development of art and design industry is more obvious, and the uncertain factors such as spirituality, artistry and non-independence become the difficulties of the industry system research. From the three perspectives of design foundation, innovation and potential, the paper deduces the qualitative research on the development mechanism and internal components of core competence, and accurately reveals the composition of industrial core competence in the light of the external environment of industry, and launches systematic research from the theoretical perspective of comparative advantage, so as to provide a platform framework and strong supporting data for building an objective and mature multi-dimensional evaluation criteria. (Figure 2)

## 5 Construction of Three Capacities Evaluation Model for the Core Competence of Art Design Industry

The key to the development of a country's economy is the development of industrial economy and the promotion of industrial international competitiveness (Mu Renyan et Al., 2011). Innovation is the key to industrial upgrading and international competitiveness. Innovation is the motive force of modern economic development. Industry, as the main body of national economic development and the carrier of innovation means, whether it has core competitiveness, independent ability and sustained innovation ability of key technologies in key areas is the key factor for a country to gain competitive advantage in international competition (Hu Shuhua et Al., 2002). Industrial international competitiveness is the core of national competitiveness, and industrial core competence is an important manifestation of industrial international competitiveness, and industrial development homing is a beneficial contribution to national or regional economic development, especially in the art and design industry, the high premium performance of the art and design industry effectively promotes the income of traditional industries, and promotes the development of traditional industries. Industrial benefit contribution is the ultimate form of industrial international competitiveness and industrial innovation ability. In this study, the concept of benefit contribution is introduced to describe the degree of industrial benefit contribution. The three capacities of industrial international competitiveness, design innovation and benefit contribution

complement each other and jointly reflect the comprehensive strength of industrial development.

**Figure 3 Core Competence Assessment Model**

Therefore, the international competitiveness, innovation and contribution of industrial design can be taken as the three main indicators of industrial evaluation, so as to reflect the strength and development level of the industry more comprehensively and objectively. At the same time, due to the complex characteristics of evaluation factors, the implementation stage of evaluation and cultivation of core competence must be judged from the perspective of coupling of multiple aspects, scale evaluation axis (lateral expansion coupling), target evaluation axis (longitudinal extension coupling), fusion degree evaluation axis (cross-synergy coupling), etc., to comprehensively consider and collect art design specialty, industry and industrial classification. The coupling evaluation quantification and measurement

index (measurement principle, measurement model, measurement indices system, measurement data acquisition, verification) are set up. (Figure 3)

## 6 The Mode and Path of Cultivating and Promoting the Core Competence of China's Art Design Industry

From the perspective of predictable bottlenecks, the cultivation mode and path of promoting the core competence of art and design industry will be carried out under an interdisciplinary, cross-regional and cross-industrial framework, which is determined by the multi-disciplinary, divergent and cross-integrated industrial structure of the industry itself. The service objects of art design industry in China cover a large number of industrial categories, and the conditions and environment of each subdivision category are significantly different, so the degree and stage of integration with art design industry are different in the process of transformation and upgrading, and the interior presents a new stage of development from art design to art design industrialization, market demand and industrial development form a multi-level accumulation. In this case, how to use the core competence of art design industry to identify and evaluate the results, and design the cultivation mode and path under different conditions is the focus of research.

In this paper, we use the industrial development path and method in management science to design different industrial development strategies based on the short board of factors and environmental inferiority-spiral model, linear model and leapfrog model; Based on the subdivision characteristics of the art design industry and the advantages of design, the complementary development model of the

combination of design characteristics, speed and efficiency, the symbiotic development model, the independent development model and the dislocation development model. In terms of external environment, we should break down the barriers of traditional industries and industrial structure, establish multi-subject coordination among enterprises, governments and scientific research institutes, advocate the logic of coordinated cultivation and development of various elements of personnel cultivation, subject promotion, capital promotion and cultural guidance, realize a good institutional environment, policy environment and facility environment for the whole society, and form a balanced investment of resources, a reasonable division of labor in industrial chain. The scientific cultivation mechanism of industrial cluster layout is the key issue of whether the core competence of art design industry can be improved. At the same time, we need to consider that the success of other countries and regions has its profound historical and realistic basis, contingency and particularity, so while learning from excellent experience to design the path, we will fully consider the heterogeneity of the development of China's art and design industry, so as to avoid falling into the path dependence on successful precedent practices. (Figure 4)

Figure4 Road Map of Core Competence Cultivation

## 7 Conclusion

This paper is not only a theoretical inheritance study of industrial development under the new

situation, but also a strategic theory study combined with the actual needs, and its innovation is reflected in the following three points.

(1) It puts forward the cognitive system of four-three structures of the core competence of China's art and design industry. Although beneficial explorations have been made from the perspectives of art design, industrial development and evaluation system, it is still a key problem to enhance the core competence of industry by organically combining the three key perspectives. This article is an industrial evaluation research from the perspective of industrial development and artistic creation characteristics of the combination, and it launches in-depth research from the perspective of qualitative matching to explore the characteristics of industrial development and sub-industry common point of view to enhance the core competence of China's art and design industry.

(2) Establish the three capacities evaluation model of industrial core competence. Based on industrial cognition and judgment, China's industrial core competence is embodied in three aspects: benefit contribution (humanities, ecology, economy, etc.), independent innovation (artistic innovation, functional innovation, frontier innovation, etc.) and international competitiveness (leadership, cognition, share, etc.). It's the basis for judging the international advantages of China's industry and the evaluation system of core competence based on the evaluation criteria of three capacities. It sets up a three-level dimension of enterprise (product)-industry (industry)-region (country) and a three-link measurement model of foundation-innovation-potential to enhance core innovation ability.

(3) Design the core competence cultivation mechanism under the internal and external coupling mechanism of art design industry. Based on the comparison of the development history of global art design and the strategy of industrial development in today's countries, this paper studies the theoretical mechanism of industrial evaluation in China at this stage. From the three-dimensional perspective of industrial development, development goals and path promotion, this paper conducts an in-depth study on the evaluation and development path of China's art and design industry, breaks the traditional industry barriers and industrial structure, advocates the logic of coordinated cultivation and development of various elements of talent cultivation, subject promotion, capital promotion and cultural guidance, and provides theoretical guidance for promoting the transformation of China's art and design industry from a decentralized development, a complete but not strong island-type industrial form to a coordinated development and prominent advantages of grid-like industrial form.

# Thematic Selection and Distribution in Management Academic English Writing

Xiao Xianming

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: ericaxiao@whut.edu.cn)

**Abstract:** The trait of English for academic writing is the information exchange and idea transition. Knowing what to write will enable the flow of ideas, whereas knowing how to organize will be of help conveying the ideas in a logic clear way to the readers. Thematic progression is an effective tool to help novice learners know how to organize the information. This paper starts from combing the theoretical development of theme and rheme, and then extending the fixed three types of Thematic progression to four models. After that, the author adopts some discourses from business English to testify the hypothesized models. The result shows that theme and thematic progressions could help learners enhance their logic writing skills on argumentative articles.

**Keywords:** Theme; Rheme; Thematic progression; English for academic purpose

## 1 Introduction

Academic writing is a great challenge for the novices of academic researchers. One of the striking errors neglected by the novice writers in their English writing for academic purpose is the illogical arrangement of the discourse. This phenomenon, in the term of linguistic theory, is the unawareness of text coherence. However, coherence is the prominent characteristic for the academic writing discourse. Teun A. van Dijk argues convincingly that “coherence is a semantic property of discourse formed through the interpretation of each individual sentence relative to the interpretation of other sentences, with "interpretation" implying interaction between the text and the reader”. In the theory of the Systemic Functional Linguistics (SFL), Halliday proposes four levels to achieve the coherence in discourse, namely, from semantic level, lexical level, syntactic level and phonologic level. Among which, phonologic level belongs to the information structure. Semantic level and lexical level have been constructed to be the conventional cohesive devices while the syntactic level has been designed to be the cognitive schema consisting of two ways: the structure cohesion and the non-structural aspect. The former belongs to the grammatical category while the latter is a perceived degree of coherence in the intrinsic text ----thematic progressions.

In the grammatical category, cohesion and the five cohesive devices--- reference, ellipsis, substitution, conjunction and lexical nouns, are traditionally interpreted as the vital factors to determine whether a text is coherence or not. It is assumed that adequate cohesive device interactions will enhance the level of perceived coherence. However, cohesive ties themselves could not be naturally sufficient to build a coherent text. Therefore, some researchers hold the idea that the cohesive devices have been abusively used to judge a writing text “good” or “bad”. They argue that text connectivity should not be confined into the five linking devices, but extended to bind larger chunks of discourse throughout the text. The method for information structured in clauses and the way of combining larger chunks (the

structured information elements) shall be vital for achieving cohesion and coherence in English writing. Thematic Progression (TP) is the tool for binding larger chunks of discourse throughout the text. Studies of the relationship between genre and thematic selection are of use for deeper text connectivity. Theme and rheme, the two core concepts of TP, could be effective bricks of building the intra-clausally cohesion. Thematic progression, as the stretch of theme and rheme fanning out across in text, is a high degree of cohesive harmony, indicating the beginning and ending of topics and pointing up a text's underlying organization. Therefore, it is preferred by Hasan to account for coherence in terms of structural relations between cohesive chains.

A successful academic text is one which contains both 'certain obligatory structural elements appropriate to their purpose and context' and 'a harmonious collection of meanings appropriate to its context' (Butt et al, 2001). The purpose of this article is to apply the insights gained from combing the theoretical development of theme and rheme to help academic researchers on business and management English writing improve coherence at the discourse level. The article begins from combing the theoretical framework of theme and rheme to propose five patterns of thematic progression. And then, the quantitative analysis of the corpus data adopted from business and management research articles in English will be conducted and represented by statistic description. What's more, the research will explore the pedagogical significance of the thematic progression in business English teaching.

## **2 Literature Review**

It is a common consensus that the understanding and application of thematic progression could help writers, learners or students improve the cohesion in writing. The primary reason for this consensus lies in that thematic structure is a way of listener/reader-oriented information construction, which presented as what listener/reader already know or have at their disposal of the given information in the discourse. Therefore, if other elements being equal, readers would feel easier when the new information occurs in the rheme position, because "it is easier to make a connection to what one knows and then add some new information to it than to receive new information, store it, and then learn what it connects to". Ventola and Mauranen also pointed out that "thematic development is important for the readability and clarity of a text. In a well-formed text, the thematic patterns should reflect the organization of text-content and facilitate the reading process." Ultimately, coherence in writing is not only established by the cohesive devices in paragraphs but also created in the minds of the readers in their attempt to make sense of the writer's assumption through the smoothly information flow, namely, the TP patterns in the text.

Researchers have conducted quantitative research showing that there is correlation between students' writing quality and their consciousness of TP and their ability to use theme and rheme effectively and suggested that the thematic progression patterns should be recommended in English writing course to help learners write more coherently (Schleppegrell, 2004; Wei, 2014). Hawe and Thomas (Hawe and Thomas,2012) proposed that "there is a need for coaching in thematisation ... teaching at least rudimentary thematisation theory and giving students practice with an assortment of thematic options...based on our students' apparent inadequate familiarity with English information structure".

As for the TP theory in Chinese students' writing, Cheng (Cheng,2002) argued that TP theory could be an effective teaching method to solve the problem of coherence in Chinese college students' writing. Wang (Wang,2007) also claimed that Chinese teachers could apply theme, rheme and TP theory to diagnose students' difficulties in writing and the consciousness of TP could help students overcome

their lack of cohesion and coherence senses. Another Chinese researcher made a comparison experiment between students' scores of TEM and their ability to use TP patterns, and he concluded that the use of more multiple Themes, clausal Themes, and effective TP patterns, such as constant, linear, split Theme, and split—Rheme progressions, could make EFL/ESL English writing more coherent, based on a detailed analysis of three writings that were graded with high, medium, and low scores from TEM-41 writing sections (Wang, 2010). Wei initially conducted a quantitative research on how Chinese college students use TP in English essays before and after the construction of TP theory consciousness in her doctoral dissertation “Theme and Thematic Progression in Chinese College Students' English Essays” (Wei, 2016).

As demonstrated above, Theme and TP have been playing a prominent role in achieving coherence in academic writing by smoothly linking the ideas, sentences, and paragraphs together to be an integrated unity of a discourse. The center of research on the TP theory is around about how learners make choice of TP patterns. However, the pedagogic significance of theme and rheme in academic writing is in the need to be strengthened. There has been little more than theoretical research as to how teacher could take the TP theory into writing teaching. To put it further, a little attention has been attracted to study the teaching materials organized and compiled by TP theory.

### **3 Theoretical Development of Theme, Rheme and Thematic Progression**

#### **3.1 Theme and rheme**

Communication is the process of information/message exchange. This process will inevitably involve with the decision of how to choose a beginning point for the writers/ speakers' utterances. Whatever is chosen to be the initial place may have an enormous influence upon the hearer/reader's interpretation for the whole discourse, because the first place of the utterance will constitute the textual context that follows. In order to analyze the initial place of the utterance in discourse, Mathesius, the founder of Prague School, excavated the notion of “theme” from Germany linguist Weil in the 19<sup>th</sup> century to describe the structural division within a clause as three parts: theme, transition, and rheme (Xiao, 2017).

Mathesius defines theme as “point of departure and enunciation within a clause”. However, it is Halliday who inherited the idea of theme and rheme from Prague School and exerted the luminous attraction of the two items as the basic concept of clause within discourse in his Systemic Functional Grammar. Halliday defined theme as “what is being talked about, the point of departure for the clause as a message”. In his late research, Halliday extended this definition to be more widely scope as that: “the theme is the element which serves as the point of departure of the message; it is what locates and orients the clause within its context”. The theme orients the reader/listener to the information to be perceived and confines a framework for the interpretation of the oncoming message. For this function, theme is typically regarded to contain familiar given or old information, which might have already been mentioned in the text/conversation, or it would be a common sense, a shared or mutual knowledge understandable for the writer/speaker and reader/listener; Rheme, as the counter-partner, is defined by Halliday (2014: 64) as “the remainder of the message, the part in which the Theme is developed in the clause”. As the extension of the Theme, rheme is typically hypothesized to contain unfamiliar or new information, which a writer/speaker might assume the reader/listener may not know, but needs to obtain in order to understand the ongoing argument in the text.

### 3.2 Unmarked theme and marked theme

From the perspective of position, theme theoretically occupies the beginning of a clause and the rest part of which will be extended to be rheme. This structure might be similar with grammatical sentence structure. But theme is not surely equivalent to be the subject of a clause in grammar; nor is rheme to be the predicate. However, in unmarked sentences, theme, especially the topic theme, is generally conveyed through the grammatical subject. Halliday considers the mapping of theme on to the subject of a declarative clause as the unmarked theme; on the opposite, a theme separating from the subject of the clause is addressed as a marked theme, which contains pre-posed adverbial groups, prepositional phrase or even a dependent clause. The correspondence between unmarked theme, marked theme and grammatical subject could be identified as follows:

**Table 1 Unmarked Theme and Marked Theme**

Unmarked Theme Rheme	
It	was the German field marshal Fedor von Bock who  Foolishly repeated Napoleon's ill-fated attacked on Russia in 1812.
The lion decided to beat the unicorn to death.	
Marked Theme Rheme	
Napoleon's ill-fated attacked on Russia in 1812 was foolishly repeated by the German field marshal Fedor von Bock..	
All round the town,	the lion beat the unicorn.

According to the different function, the elements inside a marked theme can be divided into three parts: topical theme, textual theme and interpersonal theme. Theoretically, in the case of a sequence of themes, textual and interpersonal optional themes should come before the obligatory topical theme, as follow:

**Table 2 Sequence of Themes**

Therefore, it is possible that classical MAP kinase isoforms play a role in acute....			
	↓	↓	↓
<b>Textual Theme</b>	<b>interpersonal theme</b>	<b>topical theme</b>	<b>Rheme</b>
But clearly the reliability of God's statements ultimately depends on the author himself			
	↓	↓	↓
<b>Textual Theme</b>	<b>interpersonal theme</b>	<b>topical theme</b>	<b>Rheme</b>

### **3.3 Thematic progression**

As the devices for information organization, theme and rheme not only operates in a stable level merely indicating how a writer/speaker has chosen to order the information within the clause or conversation, but also exerts the dynamic force to structure the flow of information in ways that regulate the interpretation of texts logically (Martin,1995). This dynamic process of information exchange is signposted by placing elements from the rheme of the former clause into the theme of the subsequent clause, or by repeating the information (through reference and lexical reiteration) from the preceding theme and rheme. This consecutive flow of information exchange between successive themes and rhemes in a text is called “Thematic Progression” (Egins, 2004). Halliday defined it as “the method of text development” — “the choice of clause Themes plays a fundamental part in the way discourse is organized; it is this in fact, which constitutes what is often known as the ‘method of development’ of the text.” Peter Fries thought that “thematic content correlates with the method of development of a text and the nature of the text”, and he argued that thematic development dealt with the lexico-semantic contents of themes. In the core of those definitions, thematic progression is the inter-activeness of discourse foregrounding the information of the preceding theme and rheme and therefore, directing the development of the whole text.

### **3.4 Patterns of thematic progression**

Thematic Progression is the information flow exchanging between consecutive theme-rheme pairings in a text. The relations between succeeding themes and rhemes allow us to identify different types of theme-rheme progression. Daneš has been acknowledged to be the first to define the concept of Thematic Progression as “the choice and ordering of utterance Themes, their mutual concatenation and hierarchy, as well as their relationship to the hyper-themes of the superior text units (such as paragraph, chapter...). to the whole of text, and to the situation”. Furthermore, he has postulated three basic thematic progression patterns from analysis of scientific and other professional texts: linear progression, constant progression, and TP with derived Theme. Thereafter, many linguists have proposed various versions of TP patterns in terms of their selected language materials. McCabe (McCabe,1999) added split rheme pattern and multiple thematic progression. Egins categories three main patterns of TP: constant theme pattern, linear or zigzag theme pattern, and multiple theme pattern. In this article, we absorb the ideas from different schools of TP patterns and propose a modified version of TP as five patterns: linear progression, constant progression, TP with derived Rheme, and Hyper theme progression pattern.

## **4 Data and Method of TP Analysis**

Theme in a text provides the clue about that text and about the nature of the place within that genre at which the readers or listeners are on. In order to testify the five patterns of TP in academic English writing of business and management, we download and select some research articles from journals in the field of business and management to build a small scale corpus for Business and Management Academic English Writing. After then, we pick out some paragraphs or sentences as the materials for analyzing different types of TP.

### **2.1 Linear Progression**

Simple linear theme progression pattern is also called zigzag progression: The rheme of the previous clause becomes the theme of the succeeding clause, as illustrated below: (T stands for Theme and R for Rheme, N for the numbers of clauses)

**T1→R1**

**T2 (=R1) →R2**

**Tn=(Rn-1) →Rn**

Eg.: European support (T1) is one thing he might be able to offer on his return (R1). He (T2=R1) also needs to assuage the fears about Soviet involvement in the Middle East (R2). This (T3=R2) would be implicit in any conference held under the aegis of the Security Council (R3).

## 2.2 Constant progression

Constant progression refers to the theme of the first clause will be repeated to be the themes in the succeeding clauses. This pattern is easy to be considered as a monotonous way of the repetition of the same theme. However, it is helpful to make the text clear focus. The pattern of constant progression can be simplified as:

**T1→R1**

**T2(=T1)→R2**

...

**Tn=(T1)→Rn**

Eg.: The marketing mix (T1) is generally accepted as the use and specification of the ‘four Ps’ describing the strategy position of a product in the marketplace (R1). The marketing mix (T2=T1) is a set of controllable, tactical marketing tools that work together to achieve company’s objectives (R2). One version of the marketing mix (T3=t1) originated in 1948 when James Culliton said that ....

## 2.3 TP with derived Rheme

TP with derived Rheme, also known as split rheme progression, refers to a paragraph organization when a previous rheme consists of a number of different pieces of information, each of which might be used as the theme in the same number of subsequent clauses as demonstrated below. This pattern indicates a strong sense of planning from the writer for the whole paragraph development, showing the writer’s strategic ideas conducted prior to the writing activity (Emilia, 2010).

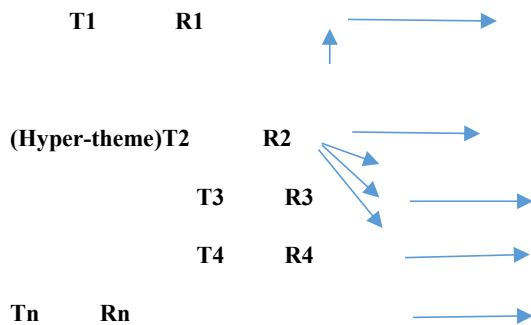

T3 → R3 →

T4 → R4 →

Eg.: SAPARD (T1) will finance 11 measures in Romania between 2000-2006 (R1). Out of these 11 measures (T2=R1), 6 are expected to be launched in 2003, namely (R2). The other measures (T3=R1) could also be launched depending on their accreditation process (R3).

## 2.4 Hyper-theme progression pattern

Hyper-theme progression pattern is characterized when the particular themes from the subsequent clauses are derived from a hyper-theme or from the same overriding theme. This pattern is always likely to take some cohesive devices, such as reference, reiteration, substitution, etc., to avoid the problem of unnecessary repetition of the same words when the same theme is repeated in the succeeding clauses. These characteristics are the featuring distinction from the constant progression. The pattern schema can be illustrated as below:

Eg.: *Spack and Zamel* (1983), studying ESL writers, corroborated *Hayes and Flower's* findings about the writing process for their populations. (2) *Raimes* compared ESL students' composing processes with other researchers' findings on L2 basic writers, and concluded that the two groups of students had much in common. (3) Both *Krapels* (this volume) and *Friedlander* (this volume) continue the discussion of ESL writing process research.

In this example, each individual clause theme is different from the shadow meaning---- they each refer to a different person who is a language researcher. However, in the deeper sense, they are all related under the super-theme of researchers on writing, referring to Spack, Zamel, Raimes, Krapels and Friedlander. The writer takes substitution, one of the cohesive devices, to avoid the direct repetition of researchers in the paragraph.

## 5 Conclusion

Theme and rheme are the blocks of building meaningful texts in terms of what occurs first, and what follows second. When theme is fixed to be taken as the point of departure for each clause and rheme follows as the development of information, a pattern of thematic progression can be established contributing to the coherence of a text by determining the way thematic elements succeed each other. This is one of the most important functions that thematic progression can take both hands of clause and text--- to direct a clause development is to orient the text coherently, as what has been perceived by Halliday:

“It is no accident that it is possible to illustrate so many of the relations in a text by reference to relations in a clause. ... In showing that the text has structure, coherence, function, development and character, we cannot help at the same time showing that a clause has all these things too, though in an interesting variety of different ways. Presumably this is how clauses evolved — as the most efficient means of encoding text.”

The four types of TP patterns are designed to wave the deeper coherence in texts. The findings of this article have confirmed Halliday’s insights of absorbing the concepts of theme and rheme into SFL. Without the theory of theme and TP, our understanding of how clauses are organized to be a coherent text would be much paler. Thematic progression is surely not a panacea for all our questions in language teaching and writing. However, it is a powerful and down-to-earth way of structuring the crucial characteristics of discourses, enriching them to be a logic coherent text. Therefore, Theme and TP should be taken into account by teachers of L2 writing.

# Evaluation of Wushu Tourism Synergic Development Based on Fuzzy Hierarchy Analysis

Yang Wei<sup>1</sup>, Yi Peng<sup>2</sup>

1 School of Economics, Wuhan Donghu University, Wuhan, P.R.China, 430212

2 Sports Department, Wuhan University of Technology, Wuhan, P.R.China, 430070

(Email: 763684285@qq.com, 13476188559@163.com)

**Abstract:** Wushu tourism is a new industry with the characteristics of Wushu and tourism. It is becoming an important part of sports tourism and a new growth point of national economic development. It is deeply loved by the people. The Wudang Wushu tourism synergic development evaluation index was constructed by using the analytic hierarchy method. The visual value, cultural value, tourism conditions, and environmental conditions were used as the secondary indexes, and the three indicators of fighting skills, novelty degree, aesthetic feelings, and practical efficacy were selected to establish a systematic and scientific evaluation system. Using fuzzy level analysis and expert weight calculation method, Wudang Wushu cultural tourism was evaluated comprehensively.

**Key words:** Wushu tourism; Synergic development; Fuzzy analytical hierarchy process; Evaluation system

## 1 Introduction

In recent years, with the healthy, sustainable and stable development of China's national economy, more and more residents have a higher demand for leisure and entertainment from visual to participatory. Wushu tourism is an important part of the sports industry and tourism industry, and has gradually become China's sunrise and emerging industries. The Wushu tourism industry is characterized by green, environmental protection, low energy consumption, high returns, and sustainable development. It is deeply loved and concerned by domestic and foreign tourists. The birthplaces of traditional Wushu schools around China make use of local scenic resources with Wushu culture as the feature to exert the function of tourism and to promote the development of sports, exhibitions, accommodation and other related industries. For example, the "Dengfang Shaolin Wushu Tourism Festival" held in Henan Province, the "Hubei Wudang International Tourism Festival" held in Hubei Province, and the "International EmeiWushu Festival" held in Sichuan Province.

Jiang Rui (2014) pointed out that Wudang Mountain has very good foundation for the development of Wushu tourism, and she gave the corresponding strategies for the development. Ezwani Azmi (2016) made a study of cultural heritage and tourism, the synergic development of which had got remarkable achievements. Peng Peng (2018) reviewed Wudang Wushu cultural heritage which has been deeply rooted in Taoist culture for a long time under the social background of the returning of Chinese traditional culture and the continuous improvement of the national cultural soft power construction. Zeng Shuai et al.(2019) pointed out that the internal advantages of Wudang Wushu resources are ecological environment, cultural background and brand effect, while the internal disadvantages are inadequate management, scattered resources and low efficiency.

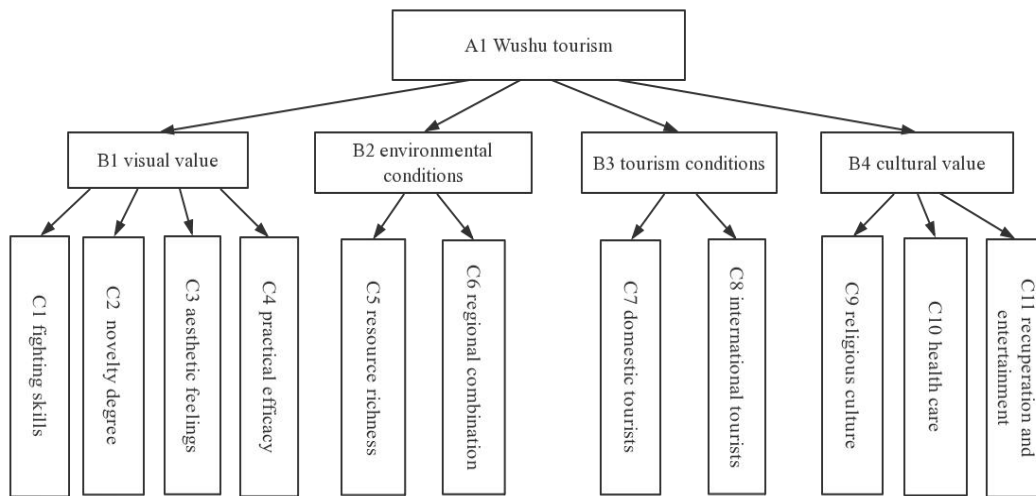

On the base of the research results of comprehensive evaluation of sports tourism at home and abroad, the evaluation index system of Wudang Wushu tourism synergic development including Weights of each index and total score were constructed by carrying out online questionnaire surveys in various places, inviting experts to evaluate, and using analytic hierarchy process (AHP) and fuzzy comprehensive evaluation method to make overall evaluation of Wushu tourism.

## 2 Construction of Evaluation Model for Wushu Tourism synergic development

### 2.1 Building a hierarchy model

The development of Wushu tourism is the integration force generated by various factors. In order to achieve the overall goal, the problem is decomposed into different components and membership structure to form a structural model. The AHP model is mainly divided into three levels. First, the highest target level is the value of Wushu tourism resources (a1). Second, the middle level is the standard level which includes visual value (b1), environmental conditions (b2), tourism conditions (b3), and cultural value (b4). Third, the lowest level r is the scheme level which includes fighting skills (c1), novelty degree (c2) aesthetic feelings(c3), practical efficacy (c4), resource richness (c5), regional combination (c6), domestic tourists (c7), international tourists (c8), Religious culture (c9), health care (c10), recuperation and entertainment(c11).

**Figure 1 Model of Wushu Tourism Synergic Development**

### 2.2 Constructing a pairwise comparison matrix

According to the expert evaluation method, the importance degree of the relationship between the elements of each level is scored. By determining the importance of the lower level indicators to the actual upper level indicators, the “1-9” scale method is used to score and construct a judgment matrix of pairwise comparison. We use the importance of AHP to assign scores to the judgment matrix of Wushu tourism synergic development.

### 2.2.1 The judgment matrix analysis on the evaluation of Wushu tourism development

Wushu tourism is a sunrise industry with characteristics of Wushu and tourism which integrates and derives from Wushu and tourism. It is gradually becoming a new bright spot of modern tourism after ecological tourism, a new growth point of national economic development, and an important part of tourism. The evaluation index system on Wushu tourism synergic development consists of four parts: visual value, environmental conditions, tourism conditions and cultural value.

**Table 1 Judgment Matrix of Secondary Indicators B1, B2, B3, and B4 for A1**

A1	B1	B2	B3	B4
B1	1	3	3	1
B2	1/3	1	3/4	1/5
B3	1/3	4/3	1	1/4
B4	1	5	4	1

### 2.2.2 The judgment matrix analysis on the evaluation of visual value

The visual value is the external appearance of Wushu performance. And the essence of Wushu performance is a way of entertainment. The audience gains an aesthetic experience and psychological satisfaction by watching Wushu performances such as: WudangKungfu Group, Shaolin Wushu Performance Group, and Wudang Taoist Kungfu Group. The evaluation index system of Wushu visual value consists of fighting skills, novelty degree, esthetic value and practical efficacy.

**Table 2 Judgment Matrix of Secondary Indicators C1, C2, C3, and C4 for B1**

B1	C1	C2	C3	C4
C1	1	3/2	2	5
C2	2/3	1	3/2	3
C3	1/2	2/3	1	5/2
C4	1/5	1/3	2/5	1

### 2.2.3 The judgment matrix analysis on the evaluation of tourism environmental conditions

The tourism environment is a harmonious combination of mountains, water, forests, deserts, Gobi, buildings, weather changes, and humanities. The Wushu tourism environment generally consists of good natural environment, humanistic environment and Wushu cultural products. Specifically, the tourism environmental conditions are composed of resource richness and regional combination.

**Table 3 Judgment Matrix of Secondary Indicators C5, C6 for B2**

B2	C5	C6
C5	1	1/2
C6	1/2	1

#### 2.2.4 The judgment matrix analysis on the evaluation of tourism conditions evaluation

The tourism conditions are generated by the evolution of the residents themselves and the process of social development, as well as the expression of human beings' pursuit of a better life. The basic conditions are the development of human consciousness, the improvement of diversified needs, and the development and progress of society, economy, culture, etc. The tourism conditions as an important part of Wushu tourism, consist of domestic tourism and international tourism.

**Table 4 Judgment Matrix of Secondary Indicators C7, C8 for B3**

B3	C7	C8	
C7	1	5	0.691
C8	1/5	1	0.309

#### 2.2.5 The judgment matrix analysis on the evaluation of Wushu culture environment conditions

Culture is a fertile ground for the Chinese nation to continue, to develop and to grow. It plays an important role in the continuation of Chinese civilization, the promotion of human civilization and the promotion of mutual exchanges. And as an important part of China's intangible cultural heritage<sup>[3]</sup>, Wushu culture is attached to the basic thoughts of ancient traditional Confucianism and Taoism. The index system of cultural environment consists of religious culture, health care, recuperation and entertainment.

**Table 5 Judgment Matrix of Secondary Indicators C9, C10, C11 for B4**

B4	C9	C10	C11
C9	1	1/5	1/3
C10	5	1	3
C11	3	1/3	1

### 2.3 Determining the Weight Value of Each Indicator

The evaluation index system of Wushu tourism co-development consists of various elements. The design of each index system and the selection of evaluation indicators must be scientific, systematic and dynamic, which can objectively and truly reflect the characteristics and conditions of the environment, the economy and social development of Wushu, and should objectively and comprehensively reflect the

real relationship between each indicator. Through systematic calculation,  $w_1=(b_1,b_2,b_3,b_4)=(0.3537,0.0966,0.1178,0.4319)$ ;  $w_2=(c_1,c_2,c_3,c_4)=(0.424,0.283,0.205,0.088)$ ,  $(b_5, c_6) = (0.5, 0.5)$ ;  $w_3 = (0.146, 0.566, 0.288)$ .

**Table 6 Table of Wushu Tourism Synergic Development Index System**

Indicator domain	Weights	Indicator domain	Weights
Visual value	0.3537	Fighting skills	0.424
		Novelty degree	0.283
		Practical efficacy	0.205
		Aesthetic feelings	0.088
Environmental conditions	0.0966	Resource richness	0.5
		Regional combination	0.5
Tourism conditions	0.1178	Domestic tourists	0.691
		International tourists	0.309
Cultural value	0.4319	Religious culture	0.146
		Health care	0.566
		Recuperation and entertainment	0.288

#### 2.4 Consistency test on the judgment matrix

When experts judge the importance of indicators, they should guarantee the consistency of their judgments and avoid contradictory results. Therefore, in order to ensure the conclusions obtained by the application of AHP analysis are reasonable, it is necessary to conduct consistency test on the constructed judgment matrix. The specific formula is:  $cr=ci/ri$ . And by doing that, we get:  $CR(A1) = 0.009 < 0.1$ ,  $CR(B1) = 0.0018 < 0.1$ ,  $CR(B2) = 0 < 0.1$ ,  $CR(B3) = 0 < 0.1$ ,  $CR(B4) = 0.037 < 0.1$ .

**Table 7 Judgment Matrix of Order, RI Values**

Matrix order	R·I	Matrix order	R·I	Matrix order	R·I
1	0	4	0.89	7	1.32
2	0	5	1.12	8	1.41
3	0.58	6	1.24	9	1.45

### 3 Fuzzy Evaluation of the Synergic Development of Wudang Wushu Tourism

#### 3.1 Data collection

This paper takes the Wushu tourism in Wudang mountain scenic as the research object and constructs the fuzzy evaluation of the synergic development of Wushu tourism. Ten experts were invited to evaluate the decision-making indicators in the indicator system according to the five levels of very good, good, normal, bad and very bad. The very good level represents that the experts highly praise the project and believe it is worthy of vigorous promotion. And the good level means that the project deserves to be recommended, but there is some need to improve in a small aspect. The general degree is relatively inferior and needs to be improved more. The poor result indicates that the project is not suitable for promotion and needs to be reformed. The very poor degree means that the project needs to be solved urgently, and even deleted and rectified. The judging statistical results are shown as follows:

**Table 8 Fuzzy Comment Evaluation Form**

Indicator domain	Weights	Indicator domain	Weights	Comment level domain v				
				Very good	Good	General	Poor	Very poor
Visual value	0.3537	Fighting skills	0.424	0.6	0.3	0.1	0	0
		Novelty degree	0.283	0	0.2	0.8	0	0
		Practical efficacy	0.205	0.2	0.3	0.4	0.1	0
		Aesthetic feelings	0.088	0.1	0.7	0.1	0	0
Environmental conditions	0.0966	Abundant resources	0.5	0	0.9	0.1	0	0.1
		regional combination	0.5	0	1	0	0	0
Tourism conditions	0.1178	Domestic tourists	0.691	0.4	0.5	0.1	0	0
		International tourists	0.309	0	0.3	0.6	0.1	0
Cultural Value	0.4319	religious culture	0.146	0.9	0.1	0	0	0
		health care	0.566	0.8	0.2	0	0	0
		Recuperation and entertainment	0.288	0.3	0.5	0.2	0	0

#### 3.2 Solution of the model

Fuzzy comprehensive evaluation is to provide some evaluation methods for practical comprehensive evaluation problems by means of some concepts of fuzzy mathematics. The specific calculation process includes: (1) giving a set of evaluation factors; (2) finding a decision set of the

evaluation level,  $Y = (y_1, y_2, \dots, y_m)$  Etc.; (3) Obtain a fuzzy relation matrix of x to y, etc. According to the above data, the following fuzzy evaluation matrix can be obtained:

$$c_1 = \begin{bmatrix} 0.6 & 0.3 & 0.1 & 0 & 0 \\ 0 & 0.2 & 0.8 & 0 & 0 \\ 0.2 & 0.3 & 0.4 & 0.1 & 0 \\ 0.1 & 0.7 & 0.1 & 0 & 0.1 \end{bmatrix} \quad c_4 = \begin{bmatrix} 0.9 & 0.1 & 0 & 0 & 0 \\ 0.8 & 0.2 & 0 & 0 & 0 \\ 0.3 & 0.5 & 0.2 & 0 & 0 \end{bmatrix}$$

$$c_2 = \begin{bmatrix} 0 & 0.9 & 0.1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \end{bmatrix} \quad c_3 = \begin{bmatrix} 0.4 & 0.5 & 0.1 & 0 & 0 \\ 0 & 0.3 & 0.6 & 0.1 & 0 \end{bmatrix}$$

Calculating the evaluation result of the scheme, and we can get:

$$[0.424 \ 0.283 \ 0.205 \ 0.088] \begin{bmatrix} 0.6 & 0.3 & 0.1 & 0 & 0 \\ 0 & 0.2 & 0.8 & 0 & 0 \\ 0.2 & 0.3 & 0.4 & 0.1 & 0 \\ 0.1 & 0.7 & 0.1 & 0 & 0.1 \end{bmatrix}$$

$$=[0.3042 \ 0.3069 \ 0.3596 \ 0.0205 \ 0.0088]$$

In the same way:

$$[0 \ 0.95 \ 0.05 \ 0 \ 0]$$

$$[0.2764 \ 0.4382 \ 0.2545 \ 0.0309 \ 0]$$

$$[0.6706 \ 0.2718 \ 0.0576 \ 0 \ 0]$$

Based on the above results, the fuzzy evaluation matrix is further constructed:

$$B = \begin{bmatrix} 0.3042 & 0.3069 & 0.3596 & 0.0205 & 0.0088 \\ 0 & 0.95 & 0.05 & 0 & 0 \\ 0.2764 & 0.4382 & 0.2545 & 0.0309 & 0 \\ 0.6706 & 0.2718 & 0.0576 & 0 & 0 \end{bmatrix}$$

According to the above calculations, the overall evaluation results are obtained:

$$A = [0.3537 \ 0.0966 \ 0.1178 \ 0.4319] \begin{bmatrix} 0.3042 & 0.3069 & 0.3596 & 0.0205 & 0.0088 \\ 0 & 0.95 & 0.05 & 0 & 0 \\ 0.2764 & 0.4382 & 0.2545 & 0.0309 & 0 \\ 0.6706 & 0.2718 & 0.0576 & 0 & 0 \end{bmatrix} = [0.4298 \ 0.3693$$

$$0.1869 \ 0.0109 \ 0.0031]$$

In order to integrate the comprehensive fuzzy evaluation A into a number, each numerical value is

given a weight according to the opinions of experts, the five levels are 100, 80, 60, 40 and 20, respectively. The total value of the evaluation is

$$Sum = \sum_{j=1}^4 a_j \times W_j = 100 \times 0.4298 + 80 \times 0.3693 + 60 \times 0.1869 + 40 \times 0.0109 + 20 \times 0.0031 = 84.236.$$

It can be concluded from the above results that WudangWushu tourism is still good in the overall evaluation system, which is consistent with the actual situation. Wudang Mountain is a world cultural heritage site and a national AAAAA scenic spot. It is also famous for Taoist mountain and the birthplace of WudangWushu which has the prerequisites for WudangWushu tourism and has unique advantages compared with other similar products.

## 4 Conclusion

The WudangWushu tourism cooperative evaluation index was constructed by using the analytic hierarchy process(AHP)and fuzzy evaluation method .In order to evaluate the WudangWushu tourism, the visual value, cultural value, tourism conditions, and environmental conditions were used as the secondary indexes, and the three indicators of fighting skills, novelty degree, Aesthetic feelings, and practical efficacy and etc. were selected as the third-level indexes to establish a systematic and scientific evaluation system, combined with the expert experience to establish the weight of each index .After evaluation, WudangWushu is still good in the overall evaluation system. The result can accord with the actual situation. At the same time, WudangWushu tourism needs further development, and the following aspects need to be achieved, including: doing WudangWushu tourism brand promotion, digging the cultural connotation of WudangWushu, improving WudangWushu tourism infrastructure, and training compound Wushu tourism talents.

\*Corresponding author: Wang Aijun, email: waj011@126.com

**Abstract:** New requirements are put forward on the contemporary outstanding talent cultivation in this new era, the development of modern education technology provides new methods for talent training. This research focused on the innovative reform of the subsequent stage course of college English, Culture and Translation. In the innovative teaching and reform practices, blended learning and teaching methods were employed, teaching resources were integrated, network platform was constructed, and learning paths were optimized. Feedback of questionnaires, tests and interviews show that the reform is effective and successful, which provides a feasible way to the cultivation of professional high-level talents with cross-cultural communication ability and humanistic qualities.

**Key Words:** Culture and Translation; Blended learning; Network platform construction; Learning path optimization; Innovative reform

## **1 Introduction**

Presently, humanities education is greatly challenged by the call of strengthening the new engineering construction to cultivate outstanding talents. However, domestic science and engineering universities and colleges, the training bases of high-tech talents, do not attach sufficient importance to humanities education. Current higher education should aim at cultivating all-round intellects with the support of modern education and network technology, enhancing the students 'comprehensive quality and innovative thinking (Xi, 2018). Among the college curricula, "College English is not only a language course that provides basic knowledge about English, but also a capacity enhancement course" (Higher Education Department of Ministry of Education in China, 2007), it provides a perfect platform for humanity cultivation.

With the development of technology and the change of education concept, college teaching mode is undergoing an historical transformation of digitization, networking and globalization in which blended learning and teaching is undoubtedly its focus. In the early 1990s, Professor Mazur in Harvard claimed the importance of computer as a tool in teaching (Mazur, 1991) and founded a brand-new teaching method, i.e., by means of peer interaction to facilitate learning, using physical environment to stimulate learning, imitation, peer teaching and modeling, and collaboration. Then the concept of flipped classroom began to take shape (Lage, et al, 2000). In 2002, by introducing e-learning into traditional learning, Garrison& Vaughan (2008) proposed the concept of Blended learning.

In China, relevant research has been made in the course of College English. Students' attitudes towards flipped classroom model were investigated and analyzed through quantitative and qualitative research (Hu&Wu, 2014). And Zhu's empirical research proved the effectiveness of blended teaching over traditional means of teaching (Zhu, 2016).However, previous researches on blended teaching of

Proceedings of the 16th International Conference on Innovation & Management - 1546 -  
College English mainly focused on the construction of teaching model (Ma & Zhang, 2011), or the improvement of listening, speaking, reading and writing skills (Liu, 2016; Huang & Li, 2015; Zhang, 2013). Comparatively, corresponding studies on translation are much less, and the limited researches are restricted to the construction of test-oriented teaching mode (Zhang, 2018; Xiang, 2017). Though “culture in language learning is never an expendable fifth skill, it’s always in the background to make sense of the world around the learners” (Kramsch, 1993), few studies have been made on cultural knowledge extension courses targeted at non-English majors in the subsequent stage of College English, let alone researches on integrating culture appreciation, cross-cultural communication and translation ability cultivation through college English course learning, which, nevertheless, is seriously inconsistent with the requirements of talent cultivation for the construction of knowledge system and the improvement of humanistic quality.

## **2 Net-based Culture & Translation Course Teaching and Reform Practices**

In line with the outstanding talents international training strategy, taking science and engineering undergraduates as the subject, this research, on the ground of network platform technology, introduced flipped classroom practice into translation teaching, combining intercultural communication ability training and humanistic quality cultivation. Up to now, nearly 4 consecutive rounds of teaching practices have been fulfilled in the course of Culture and Translation as subsequent stage course of College English, and the result has proved to be positive and notable.

The reform practices are listed as follows:

### **2.1. Integrating high-quality teaching resources**

Authentic materials were selected and culture modules were properly set. While collecting and editing teaching materials, researchers attach great importance to intercultural communication knowledge accumulation and text translation skills practice, and 8 modules were set, covering language, food, movie, tourism, art, philosophy and religion, etc.

### **2.2 Constructing net-based teaching and learning platform**

Online Culture and Translation course was built to expand learning resources. Teaching videos which were well-selected and recorded, accompanied by a number of corresponding learning resources based on each culture module were shared on the platform; exercises and assignments were systematically delivered and evaluated on the network platform as well.

### **2.3 Exploring effective teaching modes**

The course adopted blended teaching methodology, which combines online and offline teaching and learning. Online course was problem-driven and task-driven, mostly inquiry-driven, focusing on the accumulation of basic translation skills, and the extension of humanistic knowledge. Students’ learning status was monitored automatically online with self-assessment. Offline activities were mainly output driven, focusing on stimulating learners’ motivation, taking discussions and case study as the main forms of classroom organization. Various authentic cross-cultural communication texts were employed for translation exercises, classic translation appreciation and evaluation via program decomposition or interactive cooperation to cultivate students’ awareness of equal dialogue in cross-cultural communication so as to accumulate professional experience. The in-class teaching activities emphasized the cultivation of students’ critical thinking and problem-solving ability. Students were required to translate authentic materials and explore solutions to various translation problems.

## 2.4 Optimizing the learning path

To maximize the provision of learning resources, BBS interactive activities and email interaction were also adopted to provide students with learning materials and communication channels in addition to releasing video teaching resources and homework exercises on the online teaching platform.

## 2.5 Establishing a multi-evaluation mechanism

A blended teaching evaluation system was established, a multi-evaluation mechanism which involved both evaluation forms and parameters, emphasizing stage-dependent evaluation, evaluation indicators and comprehensive elements, while comparatively restricting the subjectivity and increases the objectivity and impartiality of evaluation as far as possible.

## 3 Results and Analysis

In this research, qualitative and quantitative methods were adopted to probe into the application of online translation tools, learners' motivations and basic translation ability before taking the course, factors influencing the learners' translation proficiency, effectiveness of the course, students' degree of approval when the course ended and students' evaluation to the course. Corresponding data were collected in the form of questionnaire, interview and test for analysis.

### 3.1 Pre-course data and analysis

Pre-course data (Fig.1) shows that only 49.61% of students translate all by themselves and refer to translation tools only when it's necessary before taking the course, which indicates that students have limited theoretical knowledge and practical skills of translation, and lack of translation practice, resulting in their limited translation ability, which has a great impact on their confidence in translation. Nearly half of the subjects expect that this course, which is for the subsequent stage of college English, will be of some help for them to pass CET-band 4 and CET-band 6, while most students taking this course desire to improve their language skills and broaden their horizon, which demonstrates that their lifelong learning desires and expectations are far more significant rather than utilitarian test-oriented study ( Fig.2).

Figure 1 Application of Online Translation Tools

Figure 2 Learners' Motivation vs. Factors Influencing Learners' Translation Proficiency

### 3.2 Post-course data analysis

#### 3.2.1 Effectiveness of the Course

The post-course data on the effectiveness of the course indicates students have a better understanding of translation. They've learned that the improvement of translation ability depends on many factors, translation practice, translation skills and extensive knowledge, language competence and theoretical knowledge, all of which are indispensable for the improvement of translation competence.

As Fig.3 shows, all learners admit that the course is helpful to the improvement of their translation ability, and about 1/3 of the learners think the course is very effective; and a corresponding 1/3 of the learners agree the course is very effective and half think it is effective in broadening their knowledge and horizons. In the aspect of communication ability, 97.67% of the students admit that this course is beneficial to the improvement of their cross-cultural communication ability. As to the cultivation of critical thinking ability, about 60% of the subjects believe it is of great help, but about 9% of the learners have no awareness of the objective of the course, especially in the aspect of cultivating critical thinking.

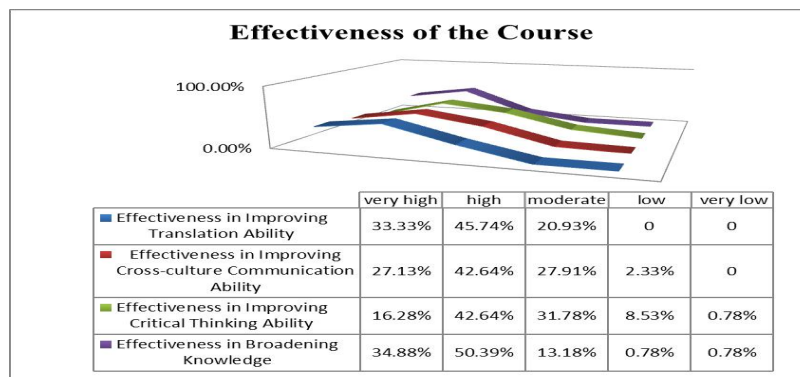

Figure 3 Effectiveness of the Course

#### 3.2.2 Level of Difficulty & Amount of Information

Investigation indicates, although most subjects agree this course is informative, only about 3% of the subjects think it is very difficult, half of the learners think it is quite difficult, but more than half of

**Figure 4 Level of Difficulty vs Amount of Information**

In total, 86% of the subjects think that the course is very informative, above average level, but less than half of the subjects think that the course is difficult, which proves that in the process of lecture preparation and course teaching, it is necessary and feasible to be highly informative to motivate the learners without much negative influences.

All the subjects agree the course is impressive, the contents of the course are well chosen and interesting, and the teaching method is effective. Only 0.78% of the subjects show no interest in the course. Figure 5 shows, the data curves of the three fit well, which suggests the three parameters are significantly corresponding and proportional to each other, proving the validity and effectiveness of the investigation. The results proved net-based innovative teaching supported with abundant materials and blending teaching practices is positively effective.

**Figure 5 Degree of Approval on the Course, the Contents & the Teaching Methodology**

### 3.2.3 Suggestions & Feedback

Open interviews and questionnaires were made focusing on learners' interest in each existing cultural module and learners' expectations for more culture modules.

**Figure 6 The Most Interesting Unit**

**Figure 7 Topics Interested if Possible**

Figure 6 & Figure 7 reveal the interest of the students. The feedback provides useful guidance for the selection of teaching materials and will play a certain reversal role in future teaching for students can always be active participants in assessing their own achievements and in planning how they will study the language (Genesee & Upshur, 1996), while teachers' reflections based on students' feedback about the most impressive and interesting culture module reveal a clue about the influence of limited in-class teaching time. With sufficient in-class time, online and offline interactive activities would be much more effectively guided and fulfilled so as to promote learners' motivation and achievements.

#### 4 Conclusion

Under the background of constructing new engineering disciplines, the present education scheme has made it harder and severer for the survival and flourishing of humanity disciplines, especially in science and technology schools which has no profound and holistic humanities education concept yet. This research shows that contemporary college students have a higher demand for the improvement of cross-cultural communication ability, knowledge extension and humanistic quality cultivation. Culture and translation course is exactly in line with the needs of the learners and the requirement of the society.

In the innovative course reform of Culture and Translation, an online platform of culture and translation was constructed to realize blended teaching and learning, by which knowledge internalization is better obtained and the combination of cultural information input and translation practice drills effectively stimulate the learners' motivation and interests, improve the learners' English translation and the output capacity. Meanwhile, learners' ability of intercultural communication and culture transmission has been significantly improved, and their awareness and concept of equal dialogue in intercultural communication are greatly strengthened.

The research shows the innovative course reform practices of Culture and Translation were highly evaluated and welcomed by learners, for the practices highlight the importance of language as a carrier of human spirit, knowledge (Xu, 1991) and an international communication tool. The reform promotes the transformation of learners' practical ability to intercultural communication ability and even scientific research ability. Finally, it may provide a feasible way to train professional and high-level intercultural communication talents that meet the needs of the society.

In addition, the research has proved that college English teaching under the network environment must attach great importance to the aspects listed as follows: the importance of breaking through the limitation of traditional teaching mode which emphasizes too much on the training of basic language

## College Students' Social Entrepreneurship:

### Status Quo, Determining Factors and Training Channels

Xiang Yongkun

Academic Affairs Office, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: xyksky@whut.edu.cn)

**Abstract:** Guided by the concept of social public welfare, there exists a new mentality which integrate economic effectiveness with social efficiency, and widening the Employment path of College students. Built upon the existing theories and the experience drawn from other countries' useful experiences, this paper studies the status quo, business environment, and determining factors of college students' social entrepreneurship in China, aiming to explore the training ways and pluralistic supporting Mechanism of Public Welfare Entrepreneurship for College students in China.

**Key words:** Social Entrepreneurship; Status Quo; Determining Factors; Training Channels

## 1 Introduction

Under the background of mass entrepreneurship and public innovation, entrepreneurship has been paid attention by colleges and universities which they have been responding to national policies and carrying out entrepreneurship education. Colleges and universities would favor Public welfare entrepreneurship because that can not only achieve economic benefits, but also create social benefits in the operation.

Social entrepreneurship, commonly defined as “entrepreneurial activity with an embedded social purpose” (Austin, 2006), has become an important economic phenomenon at a global scale (Dacin, 2010). Some striking social entrepreneurship innovations originate from developing countries and involve the deployment of new business models that address basic human needs (Seelos and Mair, 2005). As a new form of practice, public welfare entrepreneurship has achieved good social and economic benefits in Western countries. Social Entrepreneurship is the ability of entrepreneurs to optimize the integration of the resources they own or the resources they can have through efforts to create greater social value (Tang Yayang, 2009). Unlike traditional entrepreneurship, which measures results through profitability and return on investment, the achievement of public-business entrepreneurship comes mainly from the impact of the project on society (Yuan Wen, 2018). As a social innovation process that emphasizes both righteousness and benefit, Social entrepreneurship plays a significant role in promoting economic growth, ensuring employment and maintaining social equity (Ayob, 2016). Therefore, college students participate in social entrepreneurship. While cultivating the challenge spirit of the entrepreneurial and innovation, they can also cultivate the spirit of entrepreneurs to take the initiative to assume social responsibility and disseminate mainstream values.

In recent years, with the development of China's social economy and the continuous improvement of the entrepreneurial environment, many non-profit organizations and social welfare enterprises have emerged (Wang Zhong, 2015). And the social entrepreneurial activities of college students have

## 2 The Current Situation of College Students' Social Entrepreneurship

Wuhan, Hubei Province, as a city of science and education, the number of college students have exceeded 1.3 million. In order to understand the cognition and practice of college students on social entrepreneurship, this paper selects 11 colleges and universities to conduct a questionnaire survey in Wuhan, such as Wuhan University, Huazhong University of Science and Technology, Wuhan University of Technology, Hubei University, Hubei University of Traditional Chinese Medicine, Wuhan University of Science and Technology etc. The subjects included college students, organizers of public welfare teams and teachers engaged in innovation and entrepreneurship education. A total of 860 questionnaires were sent out, 836 questionnaires were collected, and 827 valid questionnaires. Through the analysis of the questionnaire, this paper summarizes the current characteristics of college students' social entrepreneurship.

### 2.1 Lack of awareness and participation

Voluntary activities are good carrier activities for college students to participate in social practice, dedicate personal strength and exercise character by means of volunteer service. Among the effective questionnaire, 652 college students chose to participate in volunteer activities regularly, accounting for 78.84% of the number of people surveyed, 138 college students attend occasionally, accounting for 16.69% of the surveyed population, both add up to more than 90%, see figure 1.

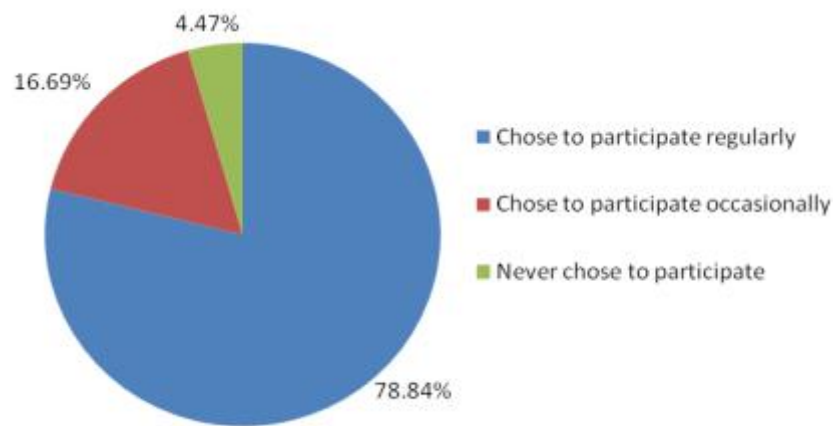

Figure 1 Status of College Students with Volunteer Activities

However, the college students' awareness about social entrepreneurship is low. They lack the understanding of the concept, connotation and value of social entrepreneurship, and participation in social entrepreneurs is rare. When the survey respondents answered the question "Do you understand the concept and characteristics of public welfare entrepreneurship", the survey statistics are shown in Figure 2.

**Figure 2 The Formation Process Model of Social Entrepreneurship Intention Activities**

When asked about “what are the works of the university's award-winning in the college students' social entrepreneurship competition” the number of people who chose “unclear” was 609, it is 73.64 percent. However, the college which the author works has achieved excellent results in social entrepreneurship in the national college students' entrepreneurship Competition in recent years. In recent years, the college which the author works has ranked first in the national college students' entrepreneurship Competition(Challenge Cup) in Hubei Province, some of the public welfare projects won national and provincial awards, but even that only 196 students know these works and achievements, accounting for 23.7% of the number of people surveyed. In the concept of public welfare entrepreneurship, 683 students have never considered social entrepreneurship, accounting for 82.59% of those surveyed. 74 students are planing their entrepreneurship projects, accounted for 8.95% of the surveyed population. 167 students said they had considered it, but they felt very difficult, accounting for 20.19% of the surveyed, see figure 3.

**Figure 3 College Students' Career Planning for the Future Intention Activities**

It can be seen that college students have a strong sense of participation and enthusiasm about volunteer activities, and they can also gain a lot by participating in volunteer activities, but their understanding of public welfare entrepreneurship is very inadequate. Even if there is an idea, due to the

Proceedings of the 16th International Conference on Innovation & Management - 1556 -  
 lack of formal, systematic social entrepreneurship education and the cultivation of entrepreneurial ability, they can't properly carry out social entrepreneurship activities.

## 2.2 Lack of motivation and rationality

Among college students' choices for future career there are 631 students who chose to work or take the postgraduate exam or get to be civil servants, accounting for 76.30% of the surveyed. Only 97 people chose entrepreneurship, accounting for 11.73% of the survey. This result is combined with the actual situation of college students. In fact, it has also shown that college entrepreneurship education and social entrepreneurship have had a certain influence in college students in recent years, see figure4.

Figure 4 Understanding of Award-Winning Works about College' Social Intention Activities

Factors aspects of promoting social entrepreneurship students: 358 respondents who chose affected by entrepreneurs success people, accounting for 43.29 percent of those surveyed, 119 people choose to be influenced by their families, accounting for 14.39 percent of those surveyed. 194 people influenced by education and the school, accounting for 23.46% of the number of people surveyed, see figure 5.

Figure 5 Understanding of Award-Winning Works about College' Social Intention Activities

Most of the motivations for college students to choose social entrepreneurship are influenced by individuals, with more enthusiasm but less rationality; the entrepreneurial process is not scientific, and

### 2.3 The difficulty of public welfare entrepreneurship

When asked about the main difficulties and obstacles in carrying out social entrepreneurship for college students, the statistics of multiple choices are shown in Table 1.

**Table 1 The Main Difficulties and Obstacles in Carrying out Social Entrepreneurship for College Students**

Alternatives	Quantity	Proportion (%)
Lack of entrepreneurial experience	625	75.57%
Lack of funds	671	81.14%
Social connections are not enough	534	64.57%
Lack of necessary reserves of knowledge and capacity	649	78.48%

The national entrepreneurial policy seems to be far away from college students. Which also shows that the knowledge and policy reserved by college students' entrepreneurship are insufficient, and there is a certain blindness. It's necessary to increase information services, policy services and entrepreneurship guidance.

### 2.4 Lack of effective operation mode

In the survey, we found that the content and scope of college students' public service entrepreneurship is too simple, and they often choose projects according to their own professional characteristics. For example, most college students majoring in normal schools are mostly concerned about the education of children left behind in rural areas and urban migrant workers in cities. Medical college students are mostly concerned about voluntary blood donation, the construction of bone marrow bank and other social issues. Due to the professional characteristics and the limitations of running schools, the existing public welfare organizations cover a relatively small scope, lack of grasp of market demand and social hot spots, and focus on the selection of public welfare projects, and the development prospects are not broad enough.

The investigation of the existing public welfare organizations of college students found that , 82% of the organizations surveyed are inspired by the voluntary activities of college students, by research on market needs are only 17%. Because college students do not investigate the social needs, the sensitivity to social problems is not positive enough, the transmission and acquisition of information are relatively single, leading to social entrepreneurship project features selected students are often high substitution, uniqueness, single project form, etc. Such as rural left-behind children, autistic children, public welfare blood donation and other projects are popular choices for social entrepreneurship among college students, and the repetition rate of the project is high.

In terms of the operation of existing public welfare organizations, most of them adopt non-market operation methods such as donation and fund raising. Therefore, the source of funds is limited, the operation difficulty is large, an effective commercial operation mode has not yet been formed, the sustainable development power is insufficient.

In summary, college students' public welfare organizations and volunteer activities are inseparable. They get inspiration through volunteer activities, and the establishment of public welfare organizations is the main mode. And established public welfare organizations can only rely on social donations to maintain the operation of the organization. Poor organizational stability, lack of business operation

### **3 The Main Influencing Factors**

#### **3.1 Society: the atmosphere has not yet been formed**

The development of social entrepreneurship in China is still in its infancy, and there is still a long way to go between college students' enthusiasm for social entrepreneurship and the support of the public and public opinions. The public has mistakenly equated social entrepreneurship with ordinary commercial entrepreneurship, and they lack an in-depth understanding of the social significance and value of social entrepreneurship, or even skepticism.

#### **3.2 Government: policies and systems are not yet in place**

The development of social entrepreneurship organizations cannot be separated from the support of policies and regulations. China's social entrepreneurship is currently in the initial stage of development, and the government's leading role in the development of public welfare organizations is lacking, so the support for public welfare entrepreneurship is extremely limited. At the same time, China's laws and regulations on social entrepreneurship are still incomplete, especially the rules of the entry of the social entrepreneurship is too harsh.

#### **3.3 Colleges and Universities: the entrepreneurship education system is not perfect**

Under the background of "mass entrepreneurship and innovation", entrepreneurship education has ushered in the spring of development. As a demonstration area for entrepreneurship education, the Hubei Provincial Department of Education requires the establishment of entrepreneurship colleges in the provinces and universities, and promotes the "professional + entrepreneurship" learning model to facilitate the cultivation of innovative and entrepreneurial innovative personnel. However, since social entrepreneurship is in the early stage of development in China, the understanding of social entrepreneurship is still inconsistent. So far, few colleges and universities have brought it into the entrepreneurship education system, let alone curriculum setting, teaching staff construction and other development measures. The ways for college students to participate in public welfare entrepreneurship are still limited to the regular volunteer activities such as public welfare organizations and social practice. The realistic conditions for the transformation of volunteer service into social entrepreneurship are not yet available. The lack of top-level design of public welfare education in colleges and universities, social entrepreneurship is not included in the mainstream entrepreneurial education system in colleges and universities, and it is a great constraint to promote social entrepreneurship.

#### **3.4 Individual: lack of entrepreneurs with public welfare personality**

According to Charles Leadbeater, a qualified social entrepreneur must have three abilities: entrepreneurial ability, innovation ability, and the ability to change the status quo (Charles Leadbeater, 2006). In addition to the entrepreneurial ability, a social entrepreneur should also have the characteristics of a special social welfare person. People with public welfare personality are often especially willing to help others, have significant dedication, have a low degree of desire for personal material return and enjoyment, and have a considerable tendency to share and encourage others to participate. Social entrepreneurship calls for entrepreneurs who are sensitive and capable of catching social problems, willing to give and altruistic.

#### 4 Searching and Structure the Support Patterns and Training Paths

Guided by the concept of social public welfare and taking into account the unity of economic benefits and social benefits, college students' social entrepreneurship is a new idea that entrepreneurship drives employment and broadens the employment path for college students. From the process of social entrepreneurship (see Figure 6), according to the analysis of Mair and Nobaa, the intention of social entrepreneurship requires a process, and entrepreneurial aspirations are influenced by two factors: personal social emotion and cognitive attitude. The feasibility of entrepreneurial cognition also needs the support of entrepreneurs' individual self-efficacy and social support (Yan Zhonghua, 2008). The organic combination of entrepreneurial desire and entrepreneurial cognitive feasibility results in entrepreneurial behavior. According to the process analysis of social entrepreneurship by Mair and Nobaa, the generation of social entrepreneurship is a process influenced by various factors. Based on the cognitive characteristics of college students, it adopts targeted encouragement and incentive measures to protect the entrepreneurial intention and promote the development of social entrepreneurship.

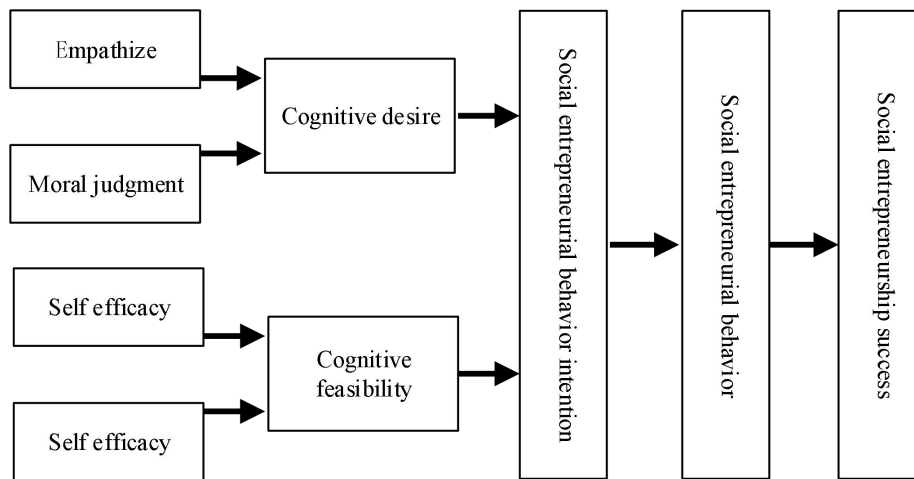

Figure 6 The Process of Social Entrepreneurship Intention Activities

##### 4.1 Strengthen the cultivation of college students' sense of social responsibility

Social mission is the inexhaustible motive force for the development of social entrepreneurship, and cultivating social responsibility awareness is the most important foundation for college students' social entrepreneurship. At present, college students have strong self-awareness, superior life, and attach great importance to personal interests, personal values, and personal futures. This has also led to the dilution of their sense of their social ownership. Therefore, in the construction of campus culture, it is necessary to pay more attention to the cultivation of college students' sense of social responsibility, expand the vision of career choice, establish a sense of citizenship, social risk awareness, charity awareness and self-discipline of fulfilling social obligations, and enhance public welfare. Therefore, broadening the social horizon, taking root in society, and tracking people's livelihood and public opinion have become the only way for college students to start a social entrepreneurship.

##### 4.2 Accelerate resource integration and increase capital investment

In recent years, the development of college students' social entrepreneurship has benefited a lot

Proceedings of the 16th International Conference on Innovation & Management - 1560 -

from the support and promotion of social enterprises and charitable organizations, including capital and technical support, information services, and personnel training, etc. The practice of foreign social entrepreneurship proves that enterprises and social organizations have incomparable advantages in the aspects of capital project docking, scientific research achievements transformation, industrial chain construction, and public welfare project financing and so on (Pan Jiajun, 2012). We can consider setting up a university student social entrepreneurship venture fund, supporting the entrepreneurial planning competition, conducting large-scale training and continuous resource tracking support for college students, conducting performance evaluation, and forming a cultural atmosphere that supports all-round social entrepreneurship.

#### **4.3 The Government formulates the supporting policies**

Social entrepreneurship is a new entrepreneurial model that has sprung up in China in recent years. The government should improve the construction of laws and regulations for the intellectual property protection system and entrepreneurship of college students. Clarify the social nature, status and role of college students' entrepreneurial organizations, safeguard the legitimate rights and interests of college students' entrepreneurship, and protect the enthusiasm and motivation of college students' social entrepreneurship. To create a good atmosphere of "everyone's support for entrepreneurship, everyone benefits", so that the whole society to care for, support and fund the entrepreneurial projects of college students, and constantly inject fresh blood into the project, but also let the successful project feed back the investment groups and individuals, forming a benign interaction.

#### **4.4 To Build a perfect educational system for public welfare in colleges and universities**

Universities are the gathering place of talents, and college students are the main body and main force of the future society. The overall quality of their entrepreneurship determines the future of Chinese society. Driven by mass entrepreneurship and innovation, universities should conscientiously implement the "Implementation Opinions on Deepening the Reform of Innovation and Entrepreneurship Education in Colleges and Universities", and comprehensively deploy and deepen the reform of innovation and entrepreneurship education in colleges and universities. Entrepreneurship education has become a positive choice for the concept and mode of innovative personnel training for local colleges and universities based on the development needs of the times and the personal development needs of students (Huang Zhaoxin, 2012). According to the actual situation, colleges and universities should formulate and implement plans in the aspects of innovative personnel training mechanism, improve the innovation and entrepreneurship curriculum system, strengthen the innovation practice

### **5 Conclusion**

First of all, in order to construct the path of public welfare entrepreneurship for college students, we must encourage college students to cultivate a sense of social responsibility and fulfill their obligations as a social ownership from the source. At the same time, they also need help and support from the society and colleges and universities in the capital, system and education system. Only in this way Only in this way can college students start social entrepreneurship easily, develop steadily and make achievements for it.

Secondly, colleges and universities should integrate various resources inside and outside the university to build a platform for innovation and entrepreneurship for college students. From the perspective of the school classroom, it is necessary to construct a scientific and innovative education curriculum system to form a benign interaction between academic and entrepreneurial education. From

Proceedings of the 16th International Conference on Innovation & Management - 1561 -  
the perspective of practice, multiple extracurricular practice and training platforms are built, such as the off-campus practice education base for college students, science and technology incubation park, creative space and so on. Encourage students to start a business while learning, and cultivate students' spirit of quest for doubt, courage to explore and innovate. In the practice of innovation and entrepreneurship, develop keen market judgment and capture the vision and courage of market opportunities.

Thirdly, the construction of the team of social entrepreneurship instructors. College students have ideas and a little bit of experience, but they are still insufficient in terms of management methods and social experience. If there is no good guidance team, the project is easy to die in the early stages of development. Therefore, it is extremely urgent to build an experienced and capable social entrepreneurship guidance team. Universities are endowed with abundant teacher resources, as well as abundant social practice opportunities and platforms. Therefore, it is most appropriate to build an education system of social entrepreneurship in universities. At the same time, it can also provide a steady stream of university students' resources for the social entrepreneurship organizations that have already successfully operated, and alleviate the current severe employment burden of college students.

## Study on Ideal and Faith Education Effectiveness of University Student Backbone Team Based on Attitude Theory

Wang Xiao

School of Navigation, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: 75170909@qq.com)

**Abstract:** Attitude theory offers a new study path to students' ideological and political education, among which attitude change and persuasion avail to promote education effectiveness. There is an internal consistency between attitude change process and university students' ideal and faith education. While the present studies at home and abroad rarely make deeper researches on their relationship and application. Therefore, this paper reviews the previous studies, makes an empirical study on ideal and faith education effectiveness of university student backbone team and then puts forward strategies for promoting education effectiveness based on attitude persuasion process of attitude theory.

**Key Words:** Attitude theory; University student backbone team; Ideal and faith; Education effectiveness

### 1 Introduction

Theories of attitude change are widely applied into the studies of sociology, economics, education, etc. The overseas researches about attitude theory and education mainly involve the following 2 aspects: the application of attitude change into various educational disciplines, for instance, moral education (Hughes et al., 1979), medical education (Wolf et al., 1991), and the application of attitude change into various educational phases, for instance, sustainable development (Arbuthnott et al., 2009). The domestic researches about attitude theory and education mainly involve the following 2 aspects: the application of attitude change into ideological and political education, for instance, study of application value (Nie et al., 2002; Zou, 2007); study of education effect (Tian, 2011; Chen, 2016), and the application of attitude change into value system education (Lin, 2018).

Theories of attitude change mainly include cognitive dissonance, cognitive balance theory and cognitive persuasion theory (Yang & Hu, 2008). Attitude change and persuasion are among the most studied topics in social psychology (Bechler et al., 2019). C. I. Hovland, an American psychologist, proposed a model of persuasion process including the external stimuli, the target, intervening process, and the response based on information communication process, and S. E. Taylor et al. simplified the model (Freedman, 1985). In essence, the process of persuasion is a process of information transmission, that is, the persuader transmits information to the receiver in a certain situation, so as to spur the corresponding psychological changes, thus change the receiver's attitude. The persuasion process includes the persuader, the receiver of persuasion, the contents, the situations etc. (Ren, 2016). Its process and factors are in consistent with the ideal and faith education of university students.

Therefore, promoting ideal and faith education effectiveness could be achieved through the interaction between the educational subject and the educational receiver, by inputting new cognition or changing the existing values and notions that fail to meet the requirements of ideal and faith educational purpose based on attitude persuasion process.

## 2 The Empirical Study of Education Effectiveness of University Student Backbone Team

### 2.1 Questionnaire design and distribution

Based on the internal consistency between attitude change process and university students' ideal and faith education, "The University Student Backbones' Ideal and Faith Education Effectiveness Questionnaire" is designed and formed by 5 influential aspects of attitude persuasion process, namely, educator's diatheses, education content, education method, education environment, the overall evaluation of educatee. The questionnaire has 20 questions of structured multiple-choice with partially Likert scale ones to ensure its objectivity and comprehensiveness.

The survey samples are student backbones in Wuhan University of Technology. During the survey, 388 questionnaires were issued and 372 valid ones were collected. The ratio of students majoring in literature, history and philosophy 9%, students majoring in science 16%, students majoring in engineering 74%, and students majoring in arts 1% is a moderate proportion in university mainly of science and engineering normal, with male accounting for 82% and female 18%.

### 2.2 Questionnaire analysis and summary

The survey results are shown in the following table.

**Table 1 Survey Results of University Student Backbones' Ideal and Faith Education Effectiveness**

Item	education concept		educator's aptitude		educator's attractiveness		helpful for personal growth	
Percentage	people-oriented	8.6%	common	35.48%	common	24.73%	very useful	44.35%
Percentage	personality-oriented	7.53%	low	2.96%	low	5.91%	useful	46.77%
Item	emotional education		volitional education		behavioral education		overall evaluation	
Percentage	uncertain	40.59%	uncertain	38.98%	uncertain	31.45%	boring & old	27.42%
Percentage	invalid	0.27%	invalid	2.42%	invalid	4.03%	improvement	59.68%
Item	infusing method		modern method		experiential education		self-education	
Percentage	uncertain	36.83%	uncertain	15.32%	uncertain	10.48%	uncertain	11.29%
Percentage	invalid	0.81%	invalid	7.26%	invalid	4.84%	invalid	3.22%
Item	by campus activities		by campus ethos		by campus culture		prominent problem	
Percentage	valid	87.91%	valid	85.49%	valid	83.87%	content	31.72%

#### 2.2.1 From the Perspective of Educator's Diatheses

Firstly, people-oriented idea and personality development are neglected. The ultimate effect of ideological education is to form or change attitudes, ideas, notions, and then to guide actions, more

Proceedings of the 16th International Conference on Innovation & Management - 1565 -  
vividly, to achieve the effect of penetrating into brain, heart and causing action. Fundamentally, the final effect is the formation or change of thoughts, the guidance and abidance of actions. Therefore, ideological education should adopt the people-oriented educational idea and pay attention to the development of students' personalities. However, the survey shows that only 8.6% and 7.53% of them think the university takes people-oriented idea and personality development as educational concepts.

Secondly, it's lack of educators' aptitudes and attractiveness. The survey shows that 38.44% and 30.64% of student backbones respectively think educators' abilities and attractiveness are insufficient respectively. On one hand, there are some existing problems such as "attaching more importance to teaching and less importance to educating", "insufficient credibility and trustworthiness", "insufficient personal charm" and 'weak authority and prestige". On the other hand, it reflects students' higher expectation for ideological education than before.

#### 2.2.2 From the Perspective of Education Content

Emotional, volitional, behavioral educations are neglected. The survey shows that 40.86%, 41.4% and 35.48% of the respondents believe that they are uncertain to obtain or can't obtain the power and appeal for struggle, the willpower for consciously overcoming difficulties and good behavioral habits during education of ideals and faith respectively.

#### 2.2.3 From the Perspective of Education Method

Firstly, infusing method is not well received with student backbones. 37.64% of them think that it is of uncertain effect, basically invalid or invalid, which reflects the traditional methods, such as party knowledge lectures, centralized training, panel discussions and seminars, mainly adopt top-down cramming method which neglect students' enthusiasm and involvement.

Secondly, modern method is widely recognized, but more emphasis should be placed on its innovation. Only 22.58% of respondents believe that modern education method is of uncertain effect, basically invalid or invalid, which indicates that more than 2/3 of them believe that the modern method of new-media platform attracts and improves students' attention, preference and participation, and helps to make better use of fragmented time, more flexible learning and assessment methods, and more vivid and visualized learning materials.

Thirdly, experiential education and self-education are most recognized. The survey shows that only 15.32% and 14.51% of respondents respectively think the two methods are uncertain effect, basically invalid or invalid, which shows that students are looking forward to taking more experiential and self-education methods.

#### 2.2.4 From the Perspective of Education Environment

Firstly, creating an ideal and faith education environment through campus activities is approved as the highest rank. The survey result shows 87.91% of them believing its validity, which shows that holding ideal faith themed activities, including speech contests, composition contests, dramas, opuscula, etc., can enrich campus life, and achieve a subtle heart-touching effect. More qualified and innovative ideal and faith themed campus activities should be held to favor students' likings and

Secondly, creating an ideal and faith education environment by improving campus ethos is approved as the second rank. The survey result shows 85.49% of them believing its validity, which shows that carrying out grass-roots party building and outstanding students' guidance, playing their pioneering role and peer models can effectively improve campus ethos and spur campus positive energy.

Thirdly, creating an ideal and faith education environment by refining campus culture is approved as the third rank. The survey result shows 83.87% of them believing its validity, which shows that compared with the widely accepted environmental factors such as campus activities and campus ethos, campus culture's promotion and attention are yet to be improved.

#### 2.2.5 From the Perspective of Educatee's Evaluation

The survey shows that the proportion of university student backbones' believing ideal and faith education promoting their personal growth is 91.12%. However, the education contents, methods, environments need to be improved. 27.42% of them think that the education contents and methods are boring and old-fashioned. 59.68% of them feel common and hope the change. 31.72% of them think that the education contents are not sound enough. This shows that many students are still not satisfied with the contents, methods and environments of ideal and faith education, calling for more diversified contents, colorful methods and pleasant environments.

### **3 Strategies for Promoting Ideal and Faith Education Effectiveness of University Student Backbone Team**

#### **3.1 Insisting student-oriented education concept**

At present, many problems in ideal and faith education of university student backbones are rooted in educator-centered rather than student-oriented. Educators always teach based on their own knowledge and feelings while ignore students' needs. This traditional educational concept doesn't meet the students' expectations. Student-oriented education aiming to satisfy students' needs should be established. Combining the solution of ideological problems with the solution of practical problems should be persisted to (Zhang, 2015).

First, it's necessary to change the educators' role. An equal, two-way and interactive relationship should be established between students and teachers. Teachers should be "scholars trusted in knowledge, tutors trusted in learning, friends relied on in living, and guiders relied on in life experience" (Qu & Zhao, 2013).

Second, it's necessary to meet students' actual needs. It's necessary to make endeavors in education methods and environments. Make more use of students' favorite educational methods, and create more education environments for students' growth and development. Besides, it's useful to permeate the education into students' daily study and life in order to achieve the effect of subtle and silent transformation effect.

Third, it's necessary to stress students' personality development. Try to guide them to set up political and moral ideals and faiths that are compatible with socialist ideals and faiths, and set up

Proceedings of the 16th International Conference on Innovation & Management - 1567 -  
professional and life ideals and faiths that are consistent with social expectations according to their own personality development and characteristics. Only by this compatibility and consistency can they establish a firmer and sounder personal ideal and faith.

### **3.2 Promoting multi-aspect education capabilities**

First, it's necessary to improve teachers' attractiveness and comprehensive abilities. The attractiveness achieves the goal of attitude change by means of emotional components (Aronson et al., 1963). Students' good impression on their teachers helps to achieve mutual emotional resonance, which proposes high requirements for the educational contents, the application of educational methods, language application, logical thinking, interactive communication and other comprehensive abilities.

Second, it's necessary to strengthen teachers' ideological guidance ability and credibility. At present, in colleges and universities, there is a general notion of "attaching more importance to teaching and less importance to educating", that is, importance is attached to knowledge conveying rather than ideological guidance. Meanwhile, credibility mainly depends on the professional level of the persuader. Professional information sources are more convincing than non-professional sources (Norman, 1976). Therefore, professional ability of teachers should be improved.

### **3.3 Improving multi-dimension education contents**

First, it's necessary to attach importance to the emotional, volitional and behavioral education of university student backbones. It is not enough only to stress the target education because it's unstable and its unsustainable education effect. Great targets of ideals and faiths should be realized step by step through the struggle motive, strong willpower and good behavior habits. The status quo lies in stressing the target education instead of emotional, volitional education, and lacking behavioral education. The teachers should teach students the willpower to overcome difficulties, the motive to struggle, and sound behavior.

Second, it's required to attach importance to all aspects of the target education of university student backbones. The complete education contents help to satisfy actual expectation of students. It's necessary to strengthen the education of moral ideals and faiths so as to promote the sense of social responsibility, collective concept and approval of socialist values; It's necessary to strengthen the education of political ideals and faiths so as to promote understanding of the party's basic theory and knowledge, cultivate the righteous motivation to join the party, and well behave as a member; It's necessary to strengthen the education of occupational ideals and faiths so as to make right occupational plan and choice, and set up the dedicating, hard-working, pioneering spirits; It's necessary to strengthen the education of life ideals and faiths so as to treat the income disparity reasonably, and understand work and life relations.

### **3.4 Adopting multi-angle education methods**

In the new era, more diversified education methods, especially experiential, independent and modern education methods, are more favored by students.

First, it's necessary to make use of immersing, edifying education methods. Educators should

Proceedings of the 16th International Conference on Innovation & Management - 1568 -  
infiltrate Marxist positions, viewpoints and methods into educational management and services. The statues of revolutionary martyrs and industry pioneers, the ancient motto and stone carvings of wise sayings should be displayed on campus to edify students with humanistic spirit and campus culture.

Second, it's necessary to make use of experiential, lifelike education methods. Political beliefs and faiths will be established through experiential activities, such as visiting old revolutionary bases, memorial halls, etc.; True feelings and improvements will be obtained by performing social practices such as voluntary services, teaching and supporting border areas, and poverty alleviation in rural areas; Lofty ideals and tenacious will should be obtained through lifelike political activities. These methods make the ideal and faith education "reaching the ups, and connecting the downs", make students feel the vivid political history and figures, feel the affinity and charisma, thus achieve the practical effect of education unconsciously.

Third, it's necessary to make use of independent, flexible education methods. Learning enthusiasm, initiative and commitment will be spurred through individual autonomous learning, group autonomous learning, reading books and newspapers, watching documentaries, etc. with more flexible learning time, and learning methods. Students will be improved in spontaneous learning, in self-demand, in self-realization.

Fourth, it's necessary to make use of networking, new-media education methods. Ideal and belief education will be carried out catering to "network generation" characteristics of the post-90s and post-00s. It's necessary to build theme websites, and promote independent learning by timing and scoring; It's necessary to use microblog and WeChat to educate based on wide range of loyal audiences.

### **3.5 Creating multi-platform education environments**

First, it's necessary to increase students' favorite campus activities. Practical effect of ideal and faith education will be achieved through drama, opusculum, dance and other colorful platform bearing the theme elements of ideals and beliefs, which can enrich students' life and instruct them with delight.

Second, it's necessary to refine widely spread campus culture. It's necessary to strengthen the refinement, promotion and attraction of campus culture; It's necessary to abstract university spirit, university ideas, university motto, song, emblem and other soft culture elements so as to encourage progress; It's necessary to build cultural walls, propaganda columns, widely collect buildings, roads, sculptures' names so as to edify character with humanistic spirit; It's necessary to make campus culture the spiritual homeland of self-improvement and ideals and faiths through extensive participation and comprehensive promotion.

Third, it's necessary to improve the campus ethos with positive energy. It's necessary to raise moral integrity by the party's pioneer guidance and assistance activities, etc. so as to make ideal and faith awareness widely recognized, and make ideal and faith spirits widely spread among the students; It's necessary to adopt accurate drip irrigation notion and heart-touching method so as to achieve the satisfactory educational effect.

## **4 Conclusion**

Based on the internal consistency between attitude change process and university students' ideal and faith education, this paper makes a survey of ideal and faith education effectiveness of university student backbones from 5 influential aspects of attitude persuasion process, namely, educator's

Proceedings of the 16th International Conference on Innovation & Management - 1569 -  
diatheses, education content, education method, education environment, the overall evaluation of  
educatee, and puts forwards strategies for promoting effectiveness accordingly. In the future, more  
studies will be carried out applying attitude theory to education, producing more interdisciplinary  
researches as well as guiding educational practices.

# James Joyce's *Araby* in Interarts Perspective of Chinese Classical Art Theories

Hu Min

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 48032797@qq.com)

**Abstract:** This paper explores the states of Chinese classical art theories in James Joyce's *Araby*, revealing the idea resonance beyond visual and language media. The research method is Ekphrasis, a burgeoning interdisciplinary humanity in the 90s of the 20th century, providing opportunities for interarts researches, not only pictures in the poetry or the poetry in pictures, but multidimensional appreciation methods. James Joyce's *Araby* is analyzed in this paper by enlightenment from calligraphy theories of Cai Yong, an official and scholar of the Eastern Han dynasty, to create interarts appreciation.

**Key words:** Interarts; Ekphrasis; James Joyce; *Araby*; Chinese classical art theories; Cai Yong

## 1 Introduction

This paper introduces Cai Yong's Chinese calligraphy theories in connection with James Joyce's *Araby* by case studies of embodiment of eastern calligraphy wisdom in western English literature. The innovative study can help better understand English literature with enlightenment from visual arts.

Chinese classical art theories include theories on paintings, calligraphy, seals, art crafts, music and dramas. The foundation is the combination of Confucianism, Buddhism and Taoism, encompassing the elements of beauty and ugliness, elegance and vulgarity, emotion and will, form and spirit, literary grace and essence, deficiency and excess, mental state, indoctrination, pleasing functionality and artistic conceptions to perfect and systemize the theories. Chinese classical art theories span five stages: Pre-Qin and Han Dynasties, Six Dynasties, Tang Dynasty and Five Dynasties, Song and Yuan Dynasties and Ming and Qing Dynasties, which include Lao Tzu's "Iridescent colors causing blindness", Gukaizhi's Painting Thesis, Xie He's "Six Techniques of Painting", etc. (Zhou Jiyin, Chen Shining, 2010)

### 1.1 Literature review

Chinese classical arts, like all arts, are the soul of China. The interarts study began early with Feng Zikai in 1920's. He published on journals articles on connection of Chinese painting and Chinese literature, like the expression of space, subjective and objective observation, and complementary coexistence of visual and literary elements (Feng Zikai, 2015). In 2007, Kuang Haoyuan comparatively studied Su Shi's theories of literature, painting and calligraphy (KuangHaoyuan, 2007). In 2010, Liu Fengxia explored the relationship between art and literary theories in Six Dynasties (Liu Fengxia, 2010). In 2013, She Zhenhua analyzed French Chinese-born author Cheng Baoyi's Chinese painting theories by his literary works (She Zhenhua, 2013). In these studies, Chinese literary works are associated with Chinese classical art theories. In this paper, Chinese classical art theories will enlighten English literature. This is the difference between this paper and the former researches.

The research method is ekphrasis. Ekphrasis in poetry has been used in the eighth century B.C. In

Homer's epic *The Iliad*, ekphrasis, has been used to describe the shield borne by the hero Achilles as a rhetorical technique. It depicts matters coming before court of law in a peaceful city and battling Troy, the home of a King, dancing young men and women, field, vineyard, sheep farm, a herd of cattle, and the earth, sea, sky, the moon and the cosmos (Heffernan, 2004). The past coexists with the future in the painting in a circle on the shield. Ekphrasis is not just rhetorical technique but a vital literary tradition related to visual arts, which perfects the aesthetic experience of perceiving the world in multidimensional perspective.

The interdisciplinary research into visual and verbal arts, ekphrasis, became a burgeoning interdisciplinary humanity in the 90s of the 20<sup>th</sup> century, exploring art of painting in language arts. Like other literary genres, ekphrasis entered postmodern times after classical, neoclassical, Romantic, Modern times. (Tan Qionglin, 2010) *A Song Handscroll Streams and Mountains Without End and Gary Snyder's Ekphrastic Poem "Endless Streams and Mountains": Perspectives on GuoXi's Essays on Landscape and its Embodiment in Modern American Painter Poems* by Tan Qionglin in 2010 analyzed American oriental ekphrasis which means American poems depict ancient Chinese landscape paintings with the form of Chinese classical poetry and Japanese haiku. Tan Qionglin put forward the term American oriental ekphrasis for the first time and developed modern ekphrasis. (Tan Qionglin, 2010)

Western authors have explored in interdisciplinarity since the 20<sup>th</sup> century.

*Pictures of Romance: Form Against Context in Painting and Literature* was written by Wendy Steiner in 1991. It was discovered that literary romance had unrealistic suspense outside of time because Renaissance and post-Renaissance paintings depicted suspended moment of perception with extraordinary clarity and condensed meaning, both of which departed from reality. The difference is that painting is the art of space while literature the art of time. The conclusion was arrived through analyses of works of Keats, Hawthorne, Joyce, and Picasso, while a return to conventions appeared later in 20<sup>th</sup> century both in painting and literary works (Wendy Steiner, 1991). Interconnection between literature and the visual arts is discovered in this book by Wendy Steiner.

Stephen Cheeke conducted the first study to offer a useful general survey of the larger philosophical and theoretical questions arising from the encounter of literary texts and artworks. (Stephen Cheeke, 2011)

The latest studies of Ekphrasis are as follows. In *Ekphrasis, Imagination and Persuasion in Ancient Rhetorical Theory and Practice*, Ruth Webb enables listeners and readers see in their imagination through words alone. The author emphasizes the importance of the visual imagination in ancient responses to rhetoric, poetry and historiography. This study includes a full analysis of the ancient technical sources. (Ruth Webb, 2016)

*Fictional Artworks: Literary Ekphrasis and the Invention of Images* compiled by Valeria Cammarata studies images in painting, photography and cinema invented by literature, the relationship between text and image, between verbal and visual in modern and contemporary literature from the point of view of aesthetics, visual culture and literary theory, trying to build a map of the notional ekphrasis. (Valeria Cammarata, Valentina Mignano, 2017)

Visual experience alone is not sufficient for the synthesis or the communication of meaning, but that a verbal answer that in turn sparks your vision. Art is not isolated but an amalgamation of varied media. (Claire Barbetti, 2011) Ekphrasis also sheds light on pictographic Chinese calligraphy.

## 1.2 Chinese calligraphy origin and theories

Cangjie, the inventor of Chinese characters, is an official historian of the Yellow Emperor. He has four eyes and four pupils, exceptional insight into the essence of everything. His invention of Chinese characters brings forth immortal wisdom, because of which ghosts cry and the sky rains millet. Cangjie observes characteristics of all things, including the sun, the moon, stars, clouds, lakes, oceans, manners of birds and beasts, as well as he himself to create pictographic Chinese characters. The outside and the inside cosmic worlds correlate. Thus visual and verbal arts are interlinked.

Chinese calligraphy theories emerge in the period of two Han Dynasties after the existence of Chinese calligraphy. The period of two Han Dynasties is between the pre-Qin period and Wei-Jin period, prospering in seal script, clerical script, semi-cursive script and cursive script, as well as calligraphy

Proceedings of the 16th International Conference on Innovation & Management - 1573 - theories by Cai Yong, Wang Xizhi and Wei Shuo, etc. The shape, size, stretch, and type of hair in the brush, the color and density of the ink, speed and surface texture of the paper are the main physical elements; while the connection of universe and calligraphy is revealed.

## 2 Cai Yong's Calligraphy Theories

Cai Yong, an official and scholar of the Eastern Han Dynasty was a master in calligraphy, music, mathematics and astronomy. One of his daughters, Cai Yan, was also a famous poet and musician.

In his *The Theory of Writing Brush*, because of the correlation of the outside and the inside cosmic worlds, one should follow the natural law. Before practicing calligraphy, one should abandon all the distractions, free from mundane affairs, concentrating. Forced to do so, one cannot practice well even with the best brush. Filled with awe and silence, sit still and contemplate as if facing the supremacy. One does not talk improperly or pant fiercely. That is the way to practice calligraphy.

In *Calligraphy Nine Potential*, calligraphy also follows the law of nature with Yin and Yang, which forms the motion of the brush.

The trace of the beginning and ending of the brush should be hidden in the character. With or without the brush on the surface of the paper, the tension and power stays within the character and the appearance is formed outside. When the force comes, it cannot be stopped; when the force is gone, it cannot be restrained. The softness of the brush decides the various changes. The upper and the lower part of the character should support each other.

There are nine ways to construct Chinese characters.

- (1) Turning of the brush should be connected and disconnected; the disconnected part should not be isolated.
- (2) The movement of the tip of the brush should be the opposite before start writing.
- (3) When the stroke starts, the middle of the brush stays right in the middle of the stroke.
- (4) The tip of brush should be hidden within the stroke when the stroke ends.
- (5) Short and quick movements of the brush are adopted to form the rhythm of series of strokes.
- (6) Contraction and release are used in the process of movement.
- (7) Resistance coexists with dynamic advances.
- (8) Horizontal strokes look like fish scales.
- (9) Vertical strokes look like reining in the horse.

(Zhou Jiyin, Chen Shining, 2010)

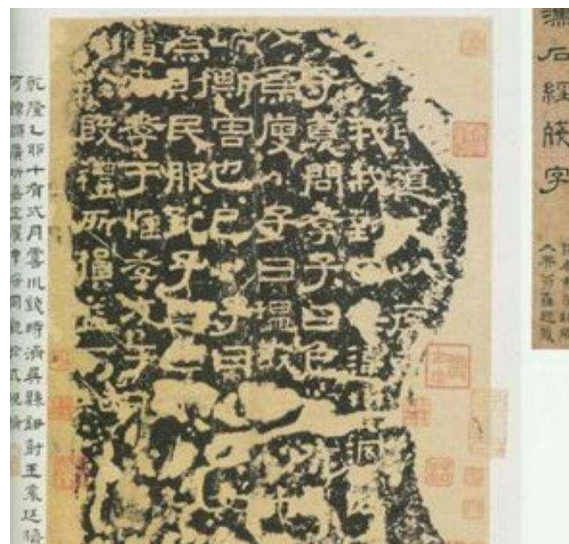

Figure 1 Cai Yong: Xiping Classics Inscription

### 3 Ekphrasis Analysis of *Araby*

James Joyce is an Irish novelist, short story writer, and poet, one of the most influential and important authors of the 20<sup>th</sup> century. As a self-imposed exile, Joyce's psychological and fictional world is always in Dublin, the city which provides the settings for all his fictions.

James Joyce's *Dubliners*, a collection of fifteen short stories, deals successively with events of childhood, youth and adulthood. All of the short stories are set in Dublin, Ireland on the themes of death, disease, and paralysis, interconnected by symbols and moods, exploring the subtleties of experiences that are common to all. All the characters in the stories struggle in minor, yet meaningful, events in everyday life with morality, personal frustrations, or restless desires. These stories contain no melodramatic conflict but those quiet moments in the characters' lives when they come to a sudden realization of the meaning of their existence (an epiphany).

The Epiphany is primarily associated with the birth of Jesus and the visit of the magi; in literature it is a sudden revelation of spiritual or moral meaning, an intellectual illumination of the nature of a thing.

Dublin is the living, symbolic backdrop of *Araby*. The gloomy atmosphere of North Richmond Street that actually sets the scene at the start of the story is an anticipation of what lies ahead for the little boy in the bazaar of Araby. The first sentence of the story begins with "being blind" and in the last sentence, the boy "saw" himself.

*Araby* is a story about a boy who wants to buy something for a girl on whom he has a crush. He looks forward to going to the bazaar. Unfortunately he misses the time for lack of money. He stands in the dark hall when he suddenly realizes that he himself is only a pitiful creature, an epiphanic moment in the end.

The story can be illustrated by Cai Yong's calligraphy theories.

#### 3.1 Dualism of Yin and Yang

In Cai Yong's *Calligraphy Nine Potential*, because of the correlation of the outside and the inside cosmic worlds, one should follow the natural law. In Chinese characters, Yin and Yang coexist. So does *Araby*.

Figure 2 Yin and Yang<sup>87</sup>

Dualism of Yin and Yang can be found in the first love story *Araby*.

*Araby* is a romantic term for the Middle East, but there is no such place. The word is used to express the romantic view of the east that had been popular since Napoleon's triumph over Egypt throughout the 19<sup>th</sup> century. And, of course, it is a romantic irony.

The beginning and the ending of the story also present the changes of Yin and Yang. The story begins with a blind street, which describes the condition of the boy's relation to reality. It is also Joyce's presentation of the Irish soul, uninhabited and detached with hopeless and discouraged color brown. In

---

<sup>87</sup> Retrieved May 29, 2019 from [https://www.ancient.eu/Yin\\_and\\_Yang/](https://www.ancient.eu/Yin_and_Yang/)

Proceedings of the 16th International Conference on Innovation & Management - 1575 -

---

the end of the story, the boy sees himself as the reader has seen him for some time, and he realizes that there is no Araby in Ireland.

The contrast of light and darkness is used to describe the boy's encounter of the girl and his inner world. The people of Dublin seem to be living ghosts; the boys, who are very much alive, are surrounded by shades of people. And the girl's basking in a halo is but an illusion. All the boy's unrestrained lusts are released at night.

These arrangements in the story are just like the construction of Chinese characters which are invented by observing Yin and Yang in nature.

### 3.2 Hidden Forces

In Cai Yong's *Calligraphy Nine Potential*, the tip of the brush is hidden within the stroke when the stroke ends. As for James Joyce's *Araby*, the symbolic details are made for Joyce's convenience, lying around in the streets of Dublin waiting for him to pick them up.

The opening paragraph has prepared us both for a story as well as for an allegory, the priest as the former tenant of the house, carries several messages, which implies that the religion is dead. The three books found in the house are not simply books. The contents of the books insinuate the boy's confusion of romantic love, religious love and materialist love. As the story proceeds, we find that he deceives himself about the sexual, spiritual, and the financial realities.

Modernist technique of showing but not telling is also applied to describe the conversation between the boy and the girl. The boy's words are fragmented to imply that he has lost his self when facing the girl, stunned and confounded. According to the boy's answer, he can hardly tell the overtones of envy and bitterness in the girl's expression, so wrapped up in his own fantasy.

The boy promises to go to Araby and to bring something for the girl. It is not just a promise but a vow which he will be unable to fulfill in the mundane world just like other wishful thinking.

All the hidden parts in the story are just like the hidden power within strokes of Chinese strokes.

### 3.3 Tranquility and Wisdom

In Cai Yong's *The Theory of Writing Brush*, before practicing calligraphy, one should abandon all the distractions, free from mundane affairs, concentrating. In tranquility, answers to all the questions can be seen clearly, just like a clean mirror reflecting clearly the world.

The moment of truth appears at the end of the story. Joyce used epiphany as a literary device within each short story of his collection *Dubliners* (1914) as his protagonists come to sudden revelation that changes their view of themselves or of their social condition.

In *Araby*, after listening to a seemingly ordinary scrap of conversation, the boy is left alone in the hall, gazing up into the darkness. The boy is totally defeated: his quest has failed and he has not achieved his aim, which was to buy a present for the girl. This is a moment of tranquility, the Joycean epiphany, no distraction from the girl and the outside world. And he suddenly realizes his irony of romantic love, religious love and materialist love, his own worthlessness, his own foolishness, his unprofitable use of time and money, and the illusive opinion he has of himself.

Just like the art of Chinese calligraphy is created in tranquility.

## 4 Conclusion

The wisdom from Chinese classical art theories will be a treasure-house to interpret English literature. Various art forms are governed by universal human moral codes, which are not decided by mankind but rather the rules of the universe, such as kindness, honesty, agreement of thoughts and behaviors. When in tune with nature, human beings' wisdom will be discovered again in all arts.

In the Republic, Book X, Plato discusses artistic forms adopted by carpenters and painters to represent the epitome of beauty by God. There are three artists: God, the maker of the bed and the painter; the latter two are creator and imitator of the appearance. This sheds light on ekphrasis. No matter which art form has been adopted, the essence created by God is beyond the apparent art form.

Considering ekphrasis, the bond of visual arts and language arts, more teaching practices of literature or painting should be conducted in a new way.

## **Original Family: An Analysis of the Key Factors Influencing the Ideological and Moral Education of Adolescents**

Cheng Gaojie

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430063

(E-mail: cgj2418122972@163.com)

**Abstract:** The adolescent period is the formation period of the outlook on life, world outlook and values, as well as the important period when the adolescent breaks away from the original family and enters the society. The ideological and moral education of the original family, as a prerequisite, plays a crucial role in the ideological and moral education of young people. Based on the cognitive behavioral theory, this paper focuses on the analysis of the impact of the original family on the ideological and moral education of adolescents and draws the conclusion that the impact of the original family on the adolescents in three aspects: family structure, family relationship and family education. This paper puts forward the corresponding countermeasures which introduced Satya for psychotherapy treatment mode for innovation.

**Key words:** Original family; Adolescent; Ideological and moral education; Cognitive behavior theory

# **1 Introduction**

## **1.1 Raising of the problem**

In China, the number of adolescents is huge so the task of ideological and moral education is heavy and urgent. About 30 million children and adolescents under the age of 17 in China suffer from various emotional disorders and behavioral problems, according to the latest data released by the national health commission for world mental health day on oct 10, 2018. With the acceleration of the process of social modernization, the pressure of adolescents on the adaptation to the surrounding environment, the choice of interpersonal relationship, learning and other aspects has increased exponentially. However, the quality of ideological and moral education is worrying. Original family is the main front of adolescents' ideological and moral education. Once there is a problem, the bad effect on adolescents will be lifelong.

## **1.2 Literature review**

There are some foreign studies on the influence of the original families on the ideological and moral education of adolescents. Foreign studies first focus on the close relationship between the original families and the ideological and moral education of teenagers, and then put forward some suggestions on how to improve the relationship between parents and children. Some scholars found that parents' external morality and principles play an important role in shaping children's external morality and principles, and play a significant predictive role. This study shows that there is a close and inseparable

Proceedings of the 16th International Conference on Innovation & Management - 1579 -  
relationship between original families and the ideological and moral education of teenagers (Fiona A. White, Ph.D. and Kenan m. Matawie, Ph.D. , 2004). Some scholars studied the Brazilian adolescent data and found that the contribution of teenagers to family resources when they grow up will be affected by the structure of original families. Their results indicate that adolescents provide resources to the family in different ways and to a different extent depending on birth order and gender; an additional sibling has significantly different implications for boys and girls. And this illustrates the importance of family structure (Leticia J. Marteleto and Laetícia R. de Souza, 2013). A series of methods and means to improve the parent-child trust relationship were put forward, and proposed to combining the uniqueness of parent-child emotion in China, which has important reference value in improving the ideological and moral education of teenagers (Shek, Daniel T. L., 2010). The influence of original families on teenagers is indelible, but some scholars also hold a more optimistic attitude, that is, how to treat the influence brought by original families is their own attitude and choice in life and learning to reconcile with original families is the most important problem (Qin Wang, Jiangjing Xia, Rui Lv, 2019).

Domestic research on this aspect firstly focuses on the relationship among original families and adolescent personality development and interpersonal relationship. Some scholars analyzed the influence of original families on the development of the next generation's personality and marital relationship from the perspective of chaos theory (Lu Jing and Cao Lili, 2011). Wu Yuwei proposed using the family system theory to analyze the impact of the original families on individual development, which includes psychological behavior problems, marital relationship and the parent-child relationship. And she also emphasized that self-differentiation is one of the key personality variables for individual maturity and mental health (Wu Yuwei, 2018). Other scholars discussed the impact of the original families on the interpersonal relationship of college students (Shen Yanting, Zheng Shu, 2018).

In terms of psychology, the influence of schoolmate relationship and self-efficacy on the mental health of college students with left-behind experience was enhanced after entering the university, while the influence of the original family environment was weakened (Zhan Liyu, Lian Qin, Wang Fang, 2017). Liu Chengxiu (Liu Chengxiu, 2018) and Liang Qi (Liang Qi, 2019) respectively explored the impact of the original families on the mental health of college students, the corresponding problems and solutions. Wang Yan and Chen Binbin (Wang Yan and Chen Binbin, 2018) studied from the perspective of the life history theory and concluded that the life history strategy plays a complete intermediary role between the democratic parenting style of the mother in the family of origin and the cooperative parenting style of the adult daughter. This result further confirms the profound influence of family of origin on individuals.

Only one discussed the influencing factors of original families on the psychological problems of adolescents with the case of psychological counseling as the carrier and proposed some countermeasures for the ideological and political education in colleges and universities based on this, indicating that there is a deep connection between original families and the ideological and political education in colleges and universities (Li Haichun, 2017).

Original family plays an important role in many aspects of adolescent individual development, among which the psychological and interpersonal problems are the most important. However, through reviewing the existing literature, it is found that domestic scholars lack studies on the relationship among the adolescent's original family and ideological and moral education. Therefore, this study attempts to analyze the impact of the original families on the adolescent's ideological and moral education from the perspective of the original family, which is of great value and significance.

## **2 The Connotation of Ideological and Moral Education of Adolescents and Original Families**

Ideological and moral education of adolescents refers to the education workers in accordance with the requirements for the development of the society and the needs of the development of adolescent physical and mental, using traditional Chinese excellent culture and socialist core values, through the education practice, purposeful, planned and organized for moral education on adolescents. It can help them to form a ideal firm belief and right ideology, to improve the ideological and moral quality of young people. (Zhang Yaocan, 1988)

The so-called original family refers to the family of parents. That is, the family where individuals were born and grew up and the family where their children were raised, which is opposite to the new family formed after marriage. New families do not include both parents. Compared with the new family, the original family is a place where individuals initially grow up and receive family education from their parents, while the new family is often the place where individuals live after they grow up.

## **3 The Necessity of Strengthening the Ideological and Moral Education of Adolescents**

### **3.1 Far-reaching significance of strengthening ideological and moral education of young people**

In the 2016 national conference on ideological and political work in colleges and universities, general secretary Xi Jinping stressed: “Ideological and political work must focus on students, care for students and serve students, constantly improve students' ideological level, political consciousness, moral quality and cultural literacy, so that students can become talents with both political integrity and all-round development.” Health is the foundation of people's comprehensive development. Therefore, college students' mental health education is the most important part of their ideological and political work.

The ideological and moral education of adolescents and their families is an important part of the ideological and moral education system. First of all, young people are the focus of ideological and political education in China and they are the main force in the construction of socialism with Chinese characteristics. Moreover, youth is also the period when people's physical and psychological development changes most rapidly, which requires proper grasp and guidance. In a sense, family environment determines a person's character and conduct, which not only plays an important role in the formation of children's ideological and moral character, but also restricts the ideological and political education in schools in the future. According to Freud's theory of personality development, the age of 5-6 is a period when individual personality is formed. At this time, family education has a great influence on children. For most adolescents, this is the time when their personality has already been formed, and the ideological and political education in school can only play an indirect role. Therefore, students with good family education tend to have more sound psychological quality and personality cultivation, and children living in the absence of appropriate ideological and moral education in the family tend to have paranoid, withdrawn behavior, which makes it difficult for children to enter the school and get the correct guidance and education.

### **3.2 Serious psychological problems among adolescents**

Contemporary adolescents' delinquency is a serious problem, among which suicide and interpersonal communication caused by psychological problems are particularly prominent. In recent years, a number of malignant adolescents' delinquency cases have occurred frequently. The reasons are all related to a variety of psychological problems of adolescents to some extent. For example, the "poisoning case of Fudan University" and "murder case of Peking University student" that shocked the whole country are all related to interpersonal relationship disorders of adolescents: hostility, extreme and indifference. According to the investigation of the case, various problems exist in the adolescents' original family to varying degrees, such as parents' neglect of discipline, doting on and family conflicts, which result in the absence of ideological and moral education in the family. From the perspective of psychology, Satya, a famous American "family therapist", believes that the occurrence and appearance of any psychological disorder are in the final analysis closely related to the original family.

970 students were investigated in the research on the correlation between interpersonal relationship disorders of college students and their original families. The investigation shows that the students with mild interpersonal disorder account for 36.9%, and those with severe interpersonal disorder account for 3.9%. The interpersonal relationship between rural and urban college students is significantly different. Only children have better interpersonal status than non-only children, and middle children have the worst interpersonal status. Parental rearing style also has influence on college students' interpersonal relationship psychology. It can be seen that the basic situation of the original families, such as the number of children, parenting style and residence location, has an important impact on the interpersonal relationship of adolescents (Shen Yanting, Zheng Shu, 2018)

## **4 Analyze the Impact of Original Families based on the Cognitive Behavior Theory**

Cognitive behavioral theory holds that people's thoughts, behaviors and feelings are interrelated, and behaviors are influenced by a person's thoughts and ideas on the world. Appropriate thoughts generate appropriate behaviors; and it is necessary to change people's psychology and thoughts to change people's inappropriate behaviors. The structure of people's ideological and moral character is mainly composed of three parts: psychology, thought and behavior. And the psychological state is mainly formed in the family environment. Adolescents just separated from original families, at this time the psychological characteristics are mainly affected by the original families. It laid a foundation for the future psychological development. Specifically, the following factors of the original families have great influence on the ideological and moral education of adolescents:

### **4.1 Family structure**

Family structure refers to the composition of family members and their interaction and mutual influence. It includes two basic aspects: family population elements and family pattern elements. The unbalanced family structure mainly includes single parent families, divorced families and so on.

From the perspective of cognitive theory, the imbalance of family structure will directly impact on the life and psychological status of adolescents, leading to deviation in thinking and abnormal behavior (Huang Ding, 2018). In addition, the parents in the unbalanced family structure are under greater financial burden and are prone to emotional depression, which will have a negative impact on their children's emotions. Because the focus of life is more on the children, parents will be more demanding of their children and the children's psychological pressure will increase.

Thirdly, adolescents living in these families will suffer from psychological malformation, self-abandonment, self-abasement and social isolation due to the lack of parental love and neglect of care. Psychological inferiority makes it difficult for adolescents to form a correct understanding of themselves, and also difficult to deal with the intimate relationship in the future, that is, from the psychological impact to the behavior. The imbalanced family structure leads to the low quality of ideological and moral education.

## **4.2 Family relationship**

Family relationship plays a very important role in the growth of adolescents. Family relationship includes the relationship between parents and the relationship between parents and children. After a person is born, his or her early interpersonal relationship is the relationship with the parents. The way parents treat their children and their interpersonal relationship patterns will have a great impact on their children's future interpersonal relationship cognition and behavior. These interpersonal relationship patterns will produce initial communicative cognition for children, which will then be projected into their daily life through behaviors.

If the parents are tense, often quarrel or there is a lot of domestic violence in the families, then the children who are exposed to these at a young age are also prone to violence and have a common temper problem. Secondly, if the role playing of parents is absent or conflicted, the inner needs of children will be easily neglected, resulting in that children cannot feel their parents' love and attention. When they grow up, their personality will easily be defective, which is reflected in their behaviors, that is, they are difficult to deal with the intimate relationship with others.

It can also be seen from many studies that the parents of teenagers with good interpersonal relationship then the teenagers also have good interpersonal processing patterns. Parents respect their children's ideas at home and are good at taking letters and other reasonable ways to communicate with children. Parents will let the child to participate in family matters of opinion and discussion. Try not to hurt the child's self-esteem and pay attention to cultivating their confidence and ability to communicate with people. Adolescents can maintain self in communication, face up to themselves. They are not excessively self-abased or arrogant, and they are decent and modest in their communication with others.

## **4.3 Family education**

Parents are the primary teachers of children. Parents' words and deeds have a huge impact on children. The way of doing things and temperament can be reflected in children, which is crucial to the formation of children's personality, ideology and morality.

Parents who adopt biased parenting methods, such as authoritarian, permissive and neglectable, are prone to problems: excessive autocracy makes children unable to give play to their own selectivity, personality repression, etc.; Permissive children tend to be overly dependent on their parents and have little regard for the feelings of others. Neglect can cause a child to lack love and turn to the outside world for attention. From the perspective of life history theory, some scholars have concluded that different mothers' parenting behaviors have different influences on daughters. The maternal democratic parenting style in the family of origin shows a more accepting and tolerant interpersonal interaction mode for children, and realizes intergenerational transmission through observation and learning(Wang Yan, Chen Binbin, 2018). Thus, it can be seen that problems in education methods will lead to extreme, dependence and indifference in adolescents' characters. Adolescents' interpersonal situation indeed has connected with the original family, verify the conclusions of classic psychology, especially Freud psychoanalysis: Adult relationships are shaped by childhood experiences.

The family tradition, is a kind of performance of the family education. The main content is the family discipline and the family rule. It carries on the profound influence to the child in the imperceptible influence. On the one hand it can influence person's thought and the behavior, on the other hand the family tradition also helps to form the social good custom.

## **5 Improving the Quality of Original Families to Optimize Education**

Although the impact of the original families on a person is profound and lifelong, we cannot blindly attribute all the failure to family education, nor can we blindly immerse ourselves in the past and refuse to face the future. No family is perfect and people also can't live in the original family for a lifetime. Adolescents are in the stage of breaking away from the original family and entering the society, at this time, they can be given appropriate guidance and help to make them accept the original defects and have the courage to overcome the pain or bondage brought by the original family, then embrace their own future and grow into a more sound personality.

### **5.1 Based on Satya treatment model**

First, the Satya family therapy model can be used as a starting point. Satya treatment model is a kind of psychological treatment method with humanism as the core and no emphasis on pathology. It aims to improve the level of individual self-esteem, improve communication and help individuals live more "humanized" instead of just blindly pursuing the elimination of symptoms(Chen Jing, 2017). Specifically, it is to link individual problems into the system of family and society to solve them as a whole. That's because the first step for a traumatized teen is to "reconcile" with original families, go back in time and open up about the past. On this basis, let other subjects use a reasonable way to intervene in the ideological and moral remodeling of young people.

A counselor can help the work get started. In the stage of parent-child relationship reconstruction, help parents and children understand the importance of mutual trust between each other, and reflect on the individual and cultural beliefs that parents and adolescents trust. The adolescents were then assessed for their level of trust in their parents and their barriers. On this basis, the relationship is built. Then psychological counselors should pay attention to the basic method of learning the Satya treatment model. When adolescents are depressed due to the original families and other similar situations, counselors can first adopt this treatment model, strengthen the practice, attempt, timely follow up and record the treatment effect. Through the use of Satya treatment model and group counseling, the interaction between students and their families will be enhanced and guide students to establish confidence. They can separate from the pain of native families and trauma, differentiate into more independent and complete self, which can reduce the expectations of others, get higher happiness, free from barriers of the original families and realize maximum personal potential.

After the treatment model of Satya achieves the effect, self-treatment and intervention of others can be adopted to carry out ideological and moral education.

### **5.2 Self-adjustment and self-rescue**

Self-regulation. Self-help is the most effective and difficult way. If a person is always immersed in the past and is not willing to climb out, then the people around him to try to pull or help him, the effect is weak. The person should develop his hobbies and interests and find his own shining points in the process of doing things, try to forget the pains brought by his original family and firmly believe that the future is in his own hands, giving himself positive psychological hints. At the same time, adolescents

Proceedings of the 16th International Conference on Innovation & Management - 1584 -  
should understand parents who are not perfect and have to bear a lot of pressure of life. It is difficult to do everything in the process of family education. If adolescents feel it is really difficult to overcome, take the initiative to seek the help of psychological consultants, or to friends, parents talk, reduce personal psychological pressure.

### **5.3 Pay Attention to children and inherit good family traditions**

From the perspective of parents, they should improve their own quality, pay more attention to their children, communicate with them and enhance their feelings. Family education for children should not be neglected since childhood. Parents actively explore a good family relationship model and create a warm and good family atmosphere. When necessary, parents can participate in the relevant courses to learn. At the same time, parents should pay attention to the child's emotional changes in life. Because when children encounter problems in life, they may talk to their friends first, and hide their worries from their parents. It should be believed that teaching children how to live a positive life is more important than giving them a rich material life. In addition, since the inheritance of family traditions and family ideological and moral education have the same goal(Zhao Shuang, 2019), parents can combine the ideological and moral education with family traditions through the inheritance of excellent family traditions. The two complement each other. Parents lead children to explore the roots, learn family traditions and teach them by words and deeds, so as to achieve better results.

### **5.4 Home-school alliance to improve psychological courses**

The inspiration for college psychological teachers and counselors is to pay special attention to the family situation and growth background of college students with interpersonal problems. They should connect more with their parents and realize home-school connection; And give different attention to their special background; Colleges and universities also need to improve the level of mental health courses, the teacher in class can take the way of psychological test, interactive games, role playing to make the course more interesting. And they should update the treatment method and mode, introducing Satya treatment mode. In this way, students will be guided to correctly understand their own interpersonal interaction mode, develop interpersonal communication skills and try to reduce the inherent thinking restrictions brought by their original families.

## **6 Conclusion**

Through the discussion of the importance of ideological and moral education for adolescents, we can further understand the urgency and importance of ideological and moral education for them. The research on the specific aspects and countermeasures of the impact of the original families on the ideological and moral education of adolescents is conducive to a better understanding of the deep connection between them, that is, the original families has an extremely important and fundamental impact on the ideological and moral education of adolescents. The improvement of the original families can help improve the quality of ideological and moral education of adolescents and help contemporary them break away from the barriers of the original families, so as to better adjust themselves, accept themselves and integrate into the society.

# **China Standards "Going Out" Strategy to Improve the International Discourse Power of Chinese Enterprises: Take Infrastructure Construction as An Example**

Mao Shisi<sup>1</sup>, Chen Shu<sup>2</sup>

1 School of Management, Wuhan University of Technology, Wuhan, P.R.. China, 430070

2 School of Foreign Studies, Wuhan Vocational and Technical College, Wuhan, P.R. China, 430074

(E-mail: 15271857896@163.com, 2758611533@qq.com)

**Abstract:** Promoting China standards "going out" is conducive to improving the compatible system of "one belt and one road" standard. This paper uses case analysis method to put forward the problems facing the China standards' "going out", which is proposed to help enhance the international competitiveness of Chinese enterprises and provide institutional and normative support. Finally come to a conclusion that under the rising background of anti-globalization, not only invisible trade barriers increase the difficulty of China's standard export, but also the lack of innovative new standard is an intrinsic factor hindering China's standard "going out"

**Key words:** China standard; Going-out; International discourse power; Infrastructure; Interconnection

## **1 Introduction**

Generally speaking, China standards system has four levels: national standards, industry standards, local standards and enterprise standards. The China standards discussed in this paper mainly refer to national standards. With the development of globalization and the reform and opening-up, China has begun to pay attention to the current situation and development problems of globalization at the micro-level supporting elements. Among them, the China standards' "going out" has aroused widespread concern and discussion. As one of the important elements of enterprises' upgrading and transformation, standards can not only enable enterprises to obtain management channels of the mainstream market, but also contribute to create a world brand, thus enhancing their market value and help cultivate enterprises' first-class talents, so as to comprehensively upgrade the development model of Chinese enterprises.

### **1.1 The current situation and research summary of China standards "going out"**

China joined the International Organization for Standardization in 1978. In October 2008, China formally became a permanent member of the General Assembly of the International Organization for Standardization, and lead the formulation of many international standards.

**Table 1 International Standard Statistics Issued by China up to March 2017**

International Standards Made and Published by China	ISO	IEC
Number	218	116

In the fields of high-speed railway, nuclear power, telecommunication and automobile, the international acceptance of the standards formulated by China is getting higher and higher, which is a typical successful example of China's standard output. However, according to the open data provided by the National Standards Committee, China's official standards submitted to ISO and IEC still account for only 1.58% of the international standard system.

At present, many scholars at home and abroad have made a thorough and detailed discussion on the "going out" of China standards. Wang Quanyong believes that, on the whole, the field and application scope of China standards' "going out" are relatively small, and coordinating the strategy of "going out" of Chinese standards and "introducing" advanced foreign standards is an important way to enhance the internationalization of standards (Wang Quanyong, 2015). While Zhi Shuping (2014)'s study emphasizes the need to deepen the standardization system reform, and identify key points to support economic transformation in a more effectively way (Zhi Shuping, 2014). Heng Hong et al. (Heng Hong et al., 2013) analyze the reasons why China standards' "going out" has been in an inferior position from the aspects of insufficient technological research and development innovation ability, low market maturity and the lack of business negotiation experience. At the same time, they pointed out that Chinese standards' "going out" should be based on independent innovation to achieve the transformation from "traditional Chinese manufacturing" to "Chinese innovation and creation" (Heng Hong, 2013).

China standards' "Going out" means that all walks of life should break away from the inertia dependence on foreign standards, develop their own standards, and constantly integrate with international standards by means of communication, sharing and innovation, until these standards exceed the existing international ones, thus gaining recognition and wide application in the international market (Yang He, 2018). In the period of economic transformation, this is the only way for China to deepen the traditional industries reform, maintain the integration and balanced development of manufacturing industry and modern service industry, and accelerate the construction of a strong socialist modernization country (Bai Nan, 2019).

### **1.2 International discourse power**

Jiang Zhaoli et al. (Jiang Zhaoli et al., 2017) hold the view that international discourse power means the right for sovereign states to know, express and participate in the international discourse platform in matters of state affairs and related international affairs (Jiang Zhaoli, 2017). Generally speaking, discourse power refers to the component of decision-making made by a small number of participants in the process of communication and cooperation with other parties, and it is an important factor leading the development of events and the direction of business decision-making.

## **2 The Role of China Standards' "Going Out" in Improving Enterprises' International Discourse Power**

### **2.1 Enhance the international discourse power of Chinese enterprises**

From the point of economic transformation, implementing standardization strategy, as well as leading the replacement of new and old kinetic energy and comprehensively assisting the upgrading of industries by standards is benefit for strengthening the international competitiveness of enterprises and participate in international collaboration (Fang Zheng, 2018).

### **2.2 Reduce Chinese enterprises' risk in the "one belt and one road" trading country**

With the gradual acceleration of Chinese enterprises' "going out" speed and the deepening of transnational cooperation projects, the risk of investment along the "one belt and one road" area has begun to emerge. After going abroad with great confidence, some enterprises' study of business rules and industry standard language in the host country is not attentive enough, and the strategic docking of standardization between the two sides is sketchy, as a result, both of them have paid high tuition fees for this.

### **2.3 Cultivate enterprises' internationalized talents**

Overseas operation involves complicated factors that should be considered carefully by every part, like laws, financial systems and industry rules of different countries. All of this requires enterprises to have a sufficient international talent reserve. Excellent composite international talents can help enterprises make correct business decisions in the complex international market and help enterprises improve their comprehensive international strength (Yu Hongjun, 2017).

## **3 Existing Problems of China Standards' "Going Out"**

Chinese standards' "going out" is an internationalized road, involving different countries and regions in the world. There are political, legal, civilized and other differences exist in these countries. What is more, China's standard system is not mature enough when compared to the international standard system. And it has a relatively short development process. There are still some problems in the aspect of perfecting China's standard system. Realizing the interconnection between national standards, as well as breaking through invisible trade barriers and shaping China's new standards are all problems waiting to be settled.

### **3.1 Needs of Chinese standards system's improving and updating**

During the rapid development of China's economy, Chinese enterprises, relying on the advantages of lower labor cost, undertook a large number of processing tasks, all with low scientific and technological content. So their ability of independent R&D and innovation was at a low level in the global industrial chain, which increased the cost burden of enterprises and the risks of production and operation (Mi Jinsheng, 2012). Nowadays, China's social and economic structure has undergone tremendous changes. The current standards are not fully applicable to the needs of enterprises in high-level development, which need to be updated and reformed as soon as possible.

### 3.2 Failure of realizing interconnection

During Chinese standards' "going out" process, some enterprises are eager to make quick achievements and fail to do standard docking work with international partners, but overemphasize the concept of Chinese standards to the host country. However, lack of international translations and timely comparative analysis documents with Western standards system makes it rather difficult for the host country to really understand the connotation and advantages China standards.

**Table 2 Current Situation of Translation of Foreign Versions of National Standards**

National Standard Items	Foreign Language Version under Translating	Foreign Language Version under Reviewing	Foreign Language Version under Approving	Published Standard Foreign Language Version	Current National Standards of China
Number	357	11	69	531	36538
The Proportion of National Standard Stock (%)	0.977	0.03	0.19	1.45	100

### 3.3 Invisible trade barriers

During the construction period of "one belt and one road", the world is at a slower pace of economic growth. Some countries begin to tend to nationalism and trade protectionism on economic and political issues. In the process of participating in the "one belt and one road" economic construction process, there are some reservations in terms of opening level, depth of cooperation, enforcement and so on, and countries' setting up invisible technical barriers for trading making it more difficult for Chinese standards to be accepted in the best sense by the host country (Liu Zhiyang, 2017).

### 3.4 Shaping new China standards

Many industries in China still depend on the standards of developed countries in technology, and lack independent innovation ability in science. Multinational enterprises often present the state as "large but not strong". Zhu Jiejun, chairman of the BRICS National Research Center, believes that "concept + system" are the two key factors in shaping new standards. The so-called new standards are the contents covered by which need to be innovative, distinguishable from the existing ones, and have irreplaceable advantages. Secondly, these "ideas" must be upgraded to a mechanism, which can work in practice (Mao Fang, 2018).

## 4 Analysis of Chinese Infrastructure Construction Standards' "Going Out"

Since 2015, China's foreign direct investment (FDI) has become the second largest foreign investor in the world in 2016. As an important part of FDI, Chinese standard infrastructure output has also experienced a rapid increase.

After 2015, China's investment in the "one belt and one way" project begins to focus more on energy, infrastructure construction and other industries. Chinese enterprises in these industries have

Proceedings of the 16th International Conference on Innovation & Management - 1590 -  
 been well integrated into the international trading system through continuous upgrading and transformation.

**Table 3 China's Outward FDI Grouped by Industry in 2009-2016 Unit: \$10 million**

year industry	2009	2010	2011	2012	2013	2014	2015	2016
Mining	13343	571.5	1444.6	1354.4	2480.8	1654.9	1125.3	193.0
manufacturing	224.1	466.4	704.1	866.7	719.7	958.4	1998.6	2904.9
Production and supply of electricity, gas and water	46.8	100.6	187.5	193.5	68.0	176.5	213.5	353.6
Construction	36.0	162.8	164.8	324.5	436.4	339.6	373.5	439.2
Transportation, Warehousing and Postal Service	206.8	565.5	256.4	298.8	330.7	417.5	272.7	167.9
Finance	873.4	862.7	607.0	1007.1	1510.5	1591.8	2424.6	1491.8

#### 4.1 Market demand

On the whole, the overall economic construction of most countries along the "one belt and one road" is lagging behind, and the risk of infrastructure construction is high. Infrastructure in Europe, America and other countries also needs to be renovated because of its long history and low transport efficiency.

**Table 4 In efficient supply of infrastructure construction assessment of countries along the one belt and one road**

country	(1) Rank of risk from the insufficiency supply of infrastructure in the assessment system	(2) Scores of the risk assess	(3) TP of investment risk for each country	Proportion (%):(2)/(3)
Russia(criterion)	10	3.9	15	26
The Philippines	2	17.9	20	89.5
The Niger	1	20.0	25	80

The People's Republic of Bangladesh	2	14.4	20	72
India	5	7	10	70
Sri Lanka	8	6.6	12	55
Liberia	5	10.7	20	53.5
Laos	5	7.5	15	50
Iran	4	9.9	20	49.5
Cambodia	4	8.4	20	42

#### 4.2 Construction strength and technology skills

Since the reform and opening up, China's infrastructure construction has achieved rapid development. The technology level of infrastructure construction is in the leading position of the world. The high-speed railway made in China has won praise from all over the world. Yaji Railway, Mongolian Railway and Indonesian Yawan High-speed Railway are the symbolic achievements of Chinese railway standards' "going out".

#### 4.3 Case study: Yawan High Speed Railway

China's high-speed railway has become a successful model of China's standard "going out". The joint venture between Chinese and Indonesia governments is the first project of Chinese high-speed railway construction industry chain standards "going out" in the "one belt and one road". The whole construction of the Yawan high speed railway is based on China's technical standards, which has epoch-making significance for China's high-speed rail technology to move towards the international stage.

##### 4.3.1 Active consultation for cooperation opportunities

Both China and Japan are powerful countries in high-speed rail. Before the formal signing of the Yawan High-speed Railway Cooperation Agreement, the competition between the two sides was very fierce. China's struggle for the right to build Yawan High-speed Railway was tortuous. However, the Chinese government has been actively negotiating with Indonesia with sincere determination and strong technical confidence, and finally successfully took down the medium-speed railway plan.

##### 4.3.2 Project construction period

The construction difficulties of Yawan High-speed Railway are mainly concentrated upon the exploit of tunnels and land expropriation. Because of the complex geology of local tunnels, it is very difficult for the construction team to work onwards. However, using advanced techniques and high-end reliable domestic excavation equipment, the Chinese Railway Team finally completed the overall tunnel penetration work. In terms of land expropriation, China has actively communicated with local governments and citizens by appeasing the interests and needs of relevant parties. By March 2019, the land expropriation process of Yawan High-speed Railway has been completed by 92%, and the construction of the project has entered into the final stage.

This 150-kilometer high-speed rail line made by China is an important symbol of the "going out" of China's high-speed rail card. The construction of the Yawan high-speed railway provides a good foundation for the economic construction of countries along the "one belt and one road" and help China's high-speed rail construction technology attain a high reputation in the world. The international discourse power of Chinese enterprises will be greatly improved, which provides support for the extensive use of China's advanced standard system in the future international cooperation of Chinese enterprises. The key to the success of China's railway "going out" lies in it combines the core advantages with the urgent needs of the host country, adjusting measures to local conditions. on the premise of comprehensive investigation of local economic situation, in-depth analysis of local market demand and accurate assessment of regional investment risks, this forms a standard system of production mode with Chinese characteristics

## 5 Conclusion

Based on the internal relationships and interactions between the "going out" of China standards and Chinese enterprises, this paper proposes that the "going out" of China standards helps enhance the international discourse power of Chinese enterprises and reduce enterprises' trading risk when participating in the "one belt and one road" construction, and takes China's typical infrastructure construction standards "going global" as an example to analyze the demand of Chinese standards in the international market.

Based on the analysis and research above, this paper puts forward the following policy suggestions: firstly, enterprises should take active part in the formulation of Chinese standards, which including increasing investment in R&D, training compound international talents, encouraging scientific and technological innovation and focusing on the development of company's core competitiveness; secondly, the government should guide Chinese enterprises to participate in the construction of "one belt and one road" project and cultivate accurate recognition of the international standard language and market rules, Building a friendly bridge between transnational cooperative enterprises is also necessary ;finally, the Chinese standards' "going out" should strengthen cooperation and set up win-win goal, highly hold the banner of economic globalization, and break the restrictions of invisible trade barriers. Above all, Chinese enterprises should put the significance of implementing Chinese standards on improving the economic situation of the host country, enhance their overseas responsibility consciousness, promote the construction and development of the community of human destiny and establish a good international image of Chinese enterprises.

## **Analysis on the Mode of Medical Care and Pension Support in Rural Areas Based on "Healthy China"**

Wu Qian, Qiu Yinggui

School of Management, Hubei University of Chinese Medicine, Wuhan, P.R.China, 430070

(Email: 1481109871@qq.com, qiuyinggui@126.com)

**Abstract:** The process of aging in China has aggravated, which is exacerbating the situation of rural pension. It is an inevitable trend to implement the mode of medical care and pension support in rural areas, and its construction requires the multi-participation from the government, the pension institutions, elderly, hospitals and private enterprises. On this basis, this paper will construct a pension mode and explore from the perspectives of policies, funds, technology and personnel to find out the countermeasures to help solving old-age problems. It will provide a reference for alleviating the pressure of rural pension and promoting the development of "Healthy China".

**Key words:** Integration of medical care and pension support; Pension mode; Rural areas; Countermeasures

### **1 Introduction**

According to the National Bureau of Statistics of China, the population over 60 years old reached 249 million at the end of 2018, of which nearly 60% were distributed in rural areas. It is estimated the population over 60 will reach 300 million by 2025, making China become a super-old country. The rapid progress of China's aging process and severe situations make the entire society have to face the bigger pressure. At the same time, with the phenomenon of "empty nest elderly" is increasing, it is forecast that the number of elder lies living alone will up to 118 million by 2020. And most of the elderly are suffering from chronic diseases, which result in the number of disabled and semi-disabled elderly are increasing year by year. Therefore, the problem of pension for the elderly in rural areas has received much attention. The elderly not only need the daily care but also medical treatments. At the 19th National Congress CPC, President Xi also pointed out that the integration of medical care and pension support is the core content of the old-age services, and medical care is the foundation of pension. Under the strategy of "Healthy China", the integration of medical care and pension support will be the greatest opportunity for the development of the old-age services.

The concept of integrated health and social care which put forward in the fifth EU framework plan in the 1990s was similar to China's current concept. It means the integration of health and social care, with the aim of forming structural, organizational, economic and social factors into a care system that is sustainable for all participants (Andy,2003). In China, Guo Dong first proposed the concept of "integration of medical care and pension support": Through the multiple combination between medical

Proceedings of the 16th International Conference on Innovation & Management - 1595 -  
institutions and pension institutions, it can share resources and complement bilateral advantages, so as to solve the problems caused by the aging of the population (Guo Dong,2005). The essence of the concept is to realize the integration of medical care and pension support.

## 2 Research Status Quo at Home and Abroad

This paper mainly uses literature research and expert consultation to collect and sort out the literature related to rural medical care in recent years by searching CNKI, Elsevier SD and other databases. Meanwhile, we also consult relevant authoritative experts, which aim to fully understand the status quo of old-age care at home and abroad, and lays a theoretical foundation for the construction of rural medical care and pension support mode.

### 2.1 Status quo at home

In China, based on the theme of “the mode of medical care and pension support in rural areas” in CNKI, we found that there were 199 academic papers by the end of 2018, and the number of literature studies were small (Figure 1). The main research contents are as follows: (1) Influencing factors. Ye Wei believes that the choice of pension mode is influenced by economic conditions, social support systems, medical needs and psychological needs (Ye Wei,2018). Lu Jianhua investigates and analyzes the willingness and influencing factors of living in a combination of medical and nursing institutions from three aspects: personal characteristics, family characteristics and old-age willingness (Lu Jianhua,2016). (2) Research on necessity. Liu Wenjun considers it is necessary to establish a long-term care insurance system for the elderly and strengthen the construction of safeguard measures such as policies and regulations (Liu Wenjun,2016). (3) Problems and countermeasures. Geng Aisheng thinks that there are problems such as insufficient financial input, backward service facilities, lack of social financing mechanism and insufficient professional talents in rural areas (Geng Aisheng,2017). Xu Guanghao talks about the development of rural medical care and pension support mode is facing the problems of backward pension concept, heavy economic burden and small number of pension institutions and so on, and explores ways from the aspects of changing the concept of old-age care, improving the medical insurance mechanism and broadening financing channels(Xu Guanghao,2018).

Figure 1 Number of Papers about the “Mode of Medical Care and Pension Support” in Rural Areas

### 2.2 Status quo at abroad

In foreign countries, through the databases such as Elsevier SD and Springer Link, there are a large number of papers under the theme of “Medical Care”, “Pension mode” and “Pension in rural areas”. If the medical care and rural pension are searched together, the number of related papers has

Proceedings of the 16th International Conference on Innovation & Management - 1596 -  
been greatly reduced. Lin Chen says that the study of nursing modes is relatively mature and stable at abroad, but it has shown a downward trend in recent years. Meanwhile, the research tends to be four modules of nursing education, management, clinical practice and theoretical studies, and nursing modes in communities may become the main research direction in the future (Lin Chen,2017). Henk Nies et al. believe that the comprehensive services provided by the mode of medical care and pension support refer the seniors' lives, mentalities and social values, especially those who suffer from chronic diseases, mental illnesses and those requiring complex treatments or emergency care. This will provide an excellent and healthy environment for them (Henk Nies,2004).

In summary, it can be found that the number of papers on rural medical care and pension mode are relatively small both at home and abroad, and the theoretical analysis is worth further exploration. At the same time, it is also recognized that the current situation of rural pension in China is severe, and there is a long way to develop the integration of medical care and pension support.

### **3 Construction of the Rural Medical Care and Pension Support Mode in China**

When exploring the mode of medical care and pension support in rural areas, this paper will further refine it from a conceptual perspective. For rural pension groups, the elderly can be divided into two categories: the rural indigenous elderly and the immigrant elderly. In exploring the rural pension mode, we can start from two aspects of medical care and pension support. This refinement can better understand and meet different needs of the rural seniors, providing reasonable suggestions and theoretical supports for the construction of rural medical treatments and health-care institutions, alleviating the rural pressure of pension to achieve the goal of "Healthy China".

#### **3.1 The concept of design**

The construction of rural medical care and pension support mode is mainly based on the two theories: hierarchy of needs and welfare pluralism. The former was proposed by American psychologist Maslow, who divided human needs into five levels: physical needs, security needs, love and belonging, respect and self-realization. The levels are from low to high, from meeting basic material needs to spiritual needs. The latter shows that government is no longer the sole provider of welfare, it emphasizes multi-participation, and social welfare can be shared by profit organizations, non-profit organizations, families and communities.

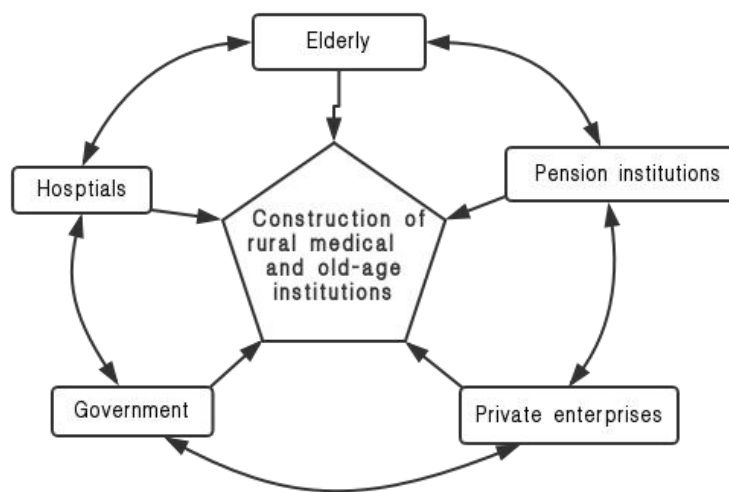

With the continuous improvement of living standards, people's medical needs are more diverse. In the process of building rural old-age care institutions, we should not only pay attention to the basic physiological and security needs of the elderly, but also improve their spiritual needs. At the same time, with the aging problem becoming more and more serious, the reform of the rural pension mechanism is imminent. To innovate the pension model, we must focus on welfare diversification and integrate the market into the rural pension. For example, some non-profit organizations and enterprises can respond to the national PPP call and invest in the construction of rural old-age institutions to provide more high-quality services for the elderly.

#### **3.2 Framework and implementation path of the mode**

Yi Cai thinks that most of the rural areas have practical problems such as insufficient economic development, inadequate social security mechanisms and scarce public services, which result in poor living conditions for the elderly (Yi Cai,2014). Liu Wenjun says that many families present a "4 + 2 + 1" mode, many adults have to support four elderly and raise at least one child, the burden of providing

Proceedings of the 16th International Conference on Innovation & Management - 1597 -  
 for the aged is too heavy (Liu Wenjun,2016). Xu Guanghao points out that most rural elderly are not willing to go to pension institutions because of the backward concept (Xu Guanghao,2018).It can be seen that the current situation of rural pension is grim and many problems still need to be overcome in the process of building rural medical and old-age institutions, such as backward concept of pension, heavily economic burden, outdated institutional facilities and single service.

Based on the above theory and taking into account the current situation of rural pension, it is not enough to rely on one side to solve the old-age problem. It requires multi-participation and cooperation. Developing the mode of medical care and pension support in rural areas and constructing rural medical and old-age institutions require a large amount of funds, technology and manual labor, which are inseparable from the support of the government, private enterprises, hospitals, pension institutions and elderly. Based on this, the following mode is constructed (Figure 2).

**Figure 2 Schematic Diagram of the Mode of Medical Care and Pension Support in Rural Areas**

### 3.2.1 Elderly

The main purpose of constructing the mode of medical care and pension support in rural areas is to alleviate the pressure of rural pension. The elderly's demands for pension point out the direction for the construction of medical and old-age institutions. Rural elderly mainly includes indigenous elderly and immigrant elderly. For the indigenous elderly, because they are mostly “empty nest elderly” and their physical conditions are not good, they have greater demands for medical treatments and health-care. For the immigrant elderly, mainly refer to those retire in cities or stay in the countryside temporarily, they pay more attention to the qualities and kinds of services provided by medical and old-age institutions, and pursue the comfort and satisfaction of life styles. Therefore, the needs of different groups should be fully considered in the construction of rural medical and old-age institutions. Meanwhile, take notice of the balanced development of old-age services and medical care, constantly innovate medical care mechanisms and provide a variety of old-age services, such as setting up entertainment centers and sports places for the elderly. Of course, we must also fully consider the local cultural development and actual situation. Eileen Griffin believes that the introduction of medical care and pension support mode

### 3.2.2 Government

The government plays an important role in the construction of the rural medical care and pension support mode, which is mainly embodied in policy and funds.

In terms of policy, the State should strengthen the promulgation of policies which benefit the people. On the one hand, the rural medical security mechanism should be improved, incorporating pension costs into the ranks of rural medical insurance and realizing the effective link between pension costs and medical insurance. On the other hand, exploring the establishment of rural social endowment insurance system. It is necessary for the state to explore a social insurance system suitable for rural endowment insurance, especially to provide effective protection for the elderly when they encounter acute or serious diseases.

In terms of funding, the government should regard the construction of rural medical and old-age institutions as its own work scope and give them economic support. At the same time, it is necessary to increase subsidies for the seniors' pension expenses and reduce the economic burden of them.

### 3.2.3 Private Enterprises

The construction of rural medical and old-age institutions requires a lot of capital investment. Funds mainly come from government and society, while social capital mainly comes from private enterprises. In order to attract foreign investment, rural medical and old-age institutions can lease to enterprises to operate, implement public construction and private operation, and can also attract investment by reducing the collection of corresponding taxes and fees and increasing the point of taxation. Lau JY indicates that difficulties in coordinating health-care and social services should be addressed when working with private enterprises (Lau JY, 2018). At the same time, rural areas can also use their own advantages, such as the development of ecotourism to attract foreign investment.

### 3.2.4 Hospitals, Pension Institutions

In the process of building the rural medical care and pension support mode, hospitals and pension institutions mainly focus on the requirements of personnel and technology.

On the technical side, hospitals and pension institutions should rely on each other to share medical resources and pension resources by building "Internet + pension" mode. Xing Yanan believes that the construction of rural medical and old-age institutions can learn from the "Internet +" to increase the intensity of intelligent medical care, intelligent pension and spiritual activities, which will enhance the people's recognition of the integration of medical care and pension support (Xing Yanan, 2018). Wang Mengjie thinks that it is important to implement "Internet + medical care combined with old-age service", it can realize the functions of remote reminder and control, automatic alarm and disposal, dynamic monitoring and recording (Wang Mengjie,2018). "Internet +" can be used to construct rural medical and old-age institutions by building information network platform, setting up information files for rural elderly, tracking the health conditions of the elderly and updating their information in real time.

In terms of talents, the biggest advantage of the medical care and pension support mode is to provide comprehensive services, which require the professional nursing workers. Scholars such as Jan Reed points out that the needs of the elderly are complex and diverse, they need different professional service providers and institutions to look after in the meantime (Jan Reed, 2005). Nursing workers mainly include living staffs, medical staffs and full-time staffs. Only by professionally training them and

### **3.3 Function of the mode**

#### 3.3.1 Strengthen the consciousness of pension and emancipate backward ideas

The backwardness of concept and weak consciousness are the first breakthrough to solve the problem of rural pension. By constructing the rural medical care and pension support mode, and giving full play to the leading role of the government. Grass-roots organizations such as township governments should do a good job in propaganda and implementation, such as convening village committees and inviting experts to give lectures to villagers, which helps to liberate the backward concept of old-age support in rural areas, so that make people know its meanings and benefits.

#### 3.3.2 Reduce the expense of pension and alleviate the burden of old-age care

The support of government policy funds and the introduction of social capital provide material security for the establishment of rural medical institutions, which will greatly alleviate the pressure of rural pension funds. The reduction of pension expenses is conducive to alleviating the life and spiritual burden of the elderly, and has positive significance for improving the sense of satisfaction and happiness of life.

#### 3.3.3 Improve service levels and meet diverse needs

In the process of building the rural medical institution, complete equipment and staffing are of great benefit to improving the level of pension services. Advanced medical equipment, diversified old-age care facilities and high-tech medical staffs can not only enrich the lifestyle of the elderly and increase their fun, but also meet their spiritual needs and continuously improve their quality of life.

#### 3.3.4 Strengthen teamwork and achieve mutual benefits

The problem of rural old-age support needs the participation and efforts of the elderly, the government, enterprises, hospitals and pension institutions. Only through cooperating together can we promote the smooth development of the rural medical care and pension support mode, and achieve the goal of "healthy China" as soon as possible.

## **4 Conclusion**

Rural pension is the most important aspect of China's old-age care. This paper explores the problem of rural pension through the construction of mode. The content is more systematic and comprehensive, which provides a theoretical reference for the construction of rural medical and old-age institutions. As for the shortcomings, this paper pays more attention to theoretical analysis and lack of empirical research, which will further exploration in the future.

# Impulse Response Analysis of Collaborative Performance to Synergy Degree in Comprehensive Design

Fang Jun, Wu Dingyuan, Zai Yue

School of Civil Engineering and Architecture, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: whutfj@126.com, woodian@163.com, fnjqmy@163.com)

**Abstract:** Based on the data of comprehensive infrastructure design of a typical industrial park, the data of synergy and collaborative performance of each subsystem of the project are calculated. This paper uses vector auto regression methods, impulse response analysis and variance decomposition to analysis the impact response of collaborative performance to synergy degree of the duration subsystem, quality subsystem, resource subsystem and information subsystem in the comprehensive infrastructure design of the large-scale park. In this paper, we use vector auto regression methods, impulse response analysis and variance decomposition. The results indicate that, there are significant responses in the collaborative performance to shocks in the synergy degree of four subsystems in the collaborative mechanism, and it shows a clear relationship between them. Considering the overall synergy of the project in the comprehensive design of large park infrastructure can enhance the competitive advantage.

**Key words:** Comprehensive design; Synergy degree; Collaborative performance; Impulse response analysis

## 1 Introduction

With the acceleration of China's new urbanization process, various large-scale parks have sprung up in many cities, and more and more attention has been paid to the management of the infrastructure construction process in large parks, especially in the design stage. Feng Zhijun, et al put forward that the infrastructure of large-scale parks relies on large-scale parks, with the aim of serving the economy, production and life of the park (Feng Zhijun, et al, 2008). Therefore, the designers of the infrastructure design in the large-scale parks need to consider the design of each major, taking into account the coordination and organic combination of various subsystems and sub-projects of the entire project.

The comprehensive design is a complex large system. According to the complex large system theory, the complex large system can be decomposed into multiple independent and interacting subsystems. The comprehensive infrastructure design management of large-scale

park is characterized by large scale and complex structure, unpredictable goals, and difficult task specificity. Therefore, it is necessary to establish a scientific collaborative mechanism. In recent years, many researchers have applied collaborative management research to comprehensive design, with fruitful results. Feland J pioneered the discipline of Integrated Design Engineering (CDE) in conjunction with economics, sociology, and technology, and described its use framework (Feland J, Leifer L, Cockayne W, 2004). Gao Zuoren et al. proposed a logical model of the collaborative design mechanism of architectural design. Based on this, the authors established a common platform for remote collaborative design work (TH-CSCDP) to help collaborative resource management of architectural design (Gao Zuoren, Wu Weiyu, Fang Qingzhou, 2004). Gao Bo et al. established the quality control process for the three-dimensional collaborative design of water conservancy and hydropower projects, and realized the collaborative arrangement and quality control of different construction environments and complex tasks in the design project (Gao Bo, Zhao Yinghong, Li Peng, Wang Ying, 2014). Scholten D and Kunneke R. propose a design framework for energy infrastructure design that links engineering and economic perspectives to energy infrastructure design to help system and market design work better coordinate (Scholten D, Kunneke R, 2016).

In recent years, the research of collaborative management has developed rapidly, which provides theoretical support for perfecting the collaborative mechanism of the comprehensive design. Fu Yuanlue et al. discussed the synergistic management effect of enterprise cluster costs, using the regression analysis verified the importance of collaborative management awareness, enterprise full cooperation, and cluster core enterprises (Fu Yuanlue et al, 2009). Nan Xingheng et al. constructed a model of intellectual capital collaborative management effect measurement from the perspective of cash flow, which provided a new perspective for the measurement of synergy degree (Nan Xingheng et al, 2013). On the theoretical basis of collaborative management, the establishment of a reasonable performance evaluation system can ensure the smooth operation of the collaborative mechanism. Wang Xujia et al. built a comprehensive evaluation method based on NSFDS urban elderly residential project design elements, and comprehensively considered each design element (Wang Xujia, Zhang Jing, Gao Qianqian, 2011). In view of the complex project design of multi-professional participation, Ren Z. et al. developed a collaborative design performance evaluation matrix (CDPM) to evaluate the performance of the building's collaborative design, which provides guidance for the improvement of the design results (Ren Z., Anumba C. J., Yang F., 2013).

The above-mentioned research shows that, many scholars have studied the collaborative management of engineering construction collaborative design and established a collaborative mechanism. The in-depth analysis of the synergy degree and collaborative performance in the collaborative mechanism will help the establishment and improvement of the collaborative mechanism. Based on the above situation, this paper takes the comprehensive infrastructure design of an industrial park as an example, and analyzes the relationship between collaborative performance and the subsystem synergy degree in the project

## 2 VAR Model Construction

In order to study the relationship between synergy degree and collaborative performance, this paper uses the method of constructing vector autoregressive model to conduct empirical analysis. The vector autoregressive model (VAR) was originally applied to macroeconomic system analysis in the field of econometrics. In 1980, Sims proposed the model in his article "Macroeconomics and Reality". It has since evolved into one of the most widely used models in empirical economics and one of the main analytical methods for studying macroeconomic systems. In 2011, Xia Yeliang et al. used the relevant data from 1949 to 2008 in Beijing to dynamically analyze the interaction between Beijing's infrastructure construction and its economic growth by establishing VAR model, cointegration test, and establishing vector error correction model (Xia Yeliang et al, 2011). In 2014, Rui Xueqin et al. used the panel data VAR measurement analysis method to study the interaction between industrial cluster upgrade and industrial transformation based on the data of 30 provinces and cities in China from 2001 to 2010 (Rui Xueqin et al, 2014). In the same year, Zhang Huan et al. selected the national data from 1992 to 2012, and built a VAR model to analyze the foreign investment, environmental pollution, environmental governance investment, and economic growth. Based on this, they conducted an in-depth study using impulse response and variance decomposition (Zhang Huan et al, 2014).

Before the VAR model was proposed, the mainstream econometric data analysis method was a simultaneous equation model. Both the model and the VAR model are unstructured multi-equation models. By introducing variables and equations, these two models attempt to simulate the real operation of the economic system. They are widely used in economic structure analysis, economic forecasting and policy evaluation. However, the economic prediction effect of the simultaneous equation model is not satisfactory, and the assumption of the zero-constraint assumptions and the division of variables are often criticized. According to Sims, the VAR model has fewer constraints when studying the relationship between macroeconomic variables than the simultaneous equation model. The method assumes that all variables are endogenous variables, and these endogenous variables are subjected to regression processing on the lag variables of all endogenous variables including themselves, so that the transition from the univariate autoregressive model to the VAR models composed of multidimensional time series to more accurately simulate the dynamic processes of economic systems.

VAR models belong to the category of multidimensional stationary time series models, which are modeled by the statistical properties of data, thus simulating the dynamic process of multiple variables. By analogy with the definition of a single-variable time series,

Let  $T = \{\dots, -2, -1, 0, 1, 2, \dots\}$ , for any fixed  $t \in T$ ,  $Y_t$  is an n-dimensional random vector, which can be expressed as a formula  $Y_t = (Y_{1t}, Y_{2t}, \dots, Y_{nt})'$ , and the whole  $\{Y_t; t \in T\}$  is recorded as  $\{Y_t\}$ ,  $\{Y_t\}$  is the n-dimensional time series on T.

Assume that the comprehensive infrastructure design collaborative performance of large-scale park is continuously optimized with the increase of target synergy. At the same time, the optimization of collaborative performance will drive project stakeholders to pay attention, invest and improve the comprehensive design collaborative mechanism, thus accelerating the goal synergy. It can be seen that the synergy and collaborative performance of the comprehensive design of the infrastructure design of large-scale parks complement each other and are related to each other. There is a two-way causal relationship between the two. The target synergy and collaborative performance of the integrated design are regarded as two sets of single time series, wherein the target synergy consists of four subsystems, namely the duration subsystem ( $D$ ), the quality subsystem ( $Q$ ), the resource subsystem ( $R$ ), and the information subsystem ( $I$ ), each subsystem can obtain the corresponding synergy degree. Collaborative performance ( $CP$ ) is composed of collaborative performance indicators. The subsystem synergy degree and collaborative performance index change with time. The synergy degree of the four subsystems and collaborative performance constitute five endogenous variables. Introduce a standard p-order vector autoregressive model, as shown in Equation 1 (Shang Hongtao, Huang Xiaoshuo, 2018).

$$Y_t = C + \sum_{i=1}^p \theta_i Y_{t-i} + \varepsilon_t \quad (1)$$

$$Y_t = (D, Q, RC, I, CP)^T \quad (2)$$

$$Y_t = \begin{pmatrix} D_t \\ \vdots \\ CP_t \end{pmatrix}, C = \begin{pmatrix} c_1 \\ \vdots \\ c_9 \end{pmatrix}, \theta_i = \begin{pmatrix} \theta_{11,i} & \cdots & \theta_{19,i} \\ \vdots & \ddots & \vdots \\ \theta_{91,i} & \cdots & \theta_{99,i} \end{pmatrix}, \varepsilon_t = \begin{pmatrix} \varepsilon_{1t} \\ \vdots \\ \varepsilon_{9t} \end{pmatrix} \quad (3)$$

$Y_t$  represents the vector consisting of endogenous variables in the t month, C is the intercept, p is the lag order,  $\theta_i$  is the regression coefficient matrix, and  $\varepsilon_t$  is the random disturbance term.

The VAR model is mostly used to analyze the interaction between variables, and the impulse response function (IRF) focuses on analyzing the impact of the innovation change impact model on various variables of the system. In this paper will use EViews software to

Proceedings of the 16th International Conference on Innovation & Management - 1605 -  
build a multi-dimensional VAR model in combination with *IRF*. After each time series passes the ADF test and the model passes the AR root test, we use IRF to analyze the impact of synergy degree disturbance of each subsystem on the collaborative performance in each period, when each endogenous variable is subject to a change in the standard deviation of the innovation rate. Finally, using variance decomposition to analyze the variance contribution rate of different endogenous variables (Lei Tian, Xu Jinliang, Shan Donghui, Jia Xingli, 2016).

## 3 Variable Selection and Data Collection

### 3.1 Variable selection

The synergy degree refers to the degree to which each subsystem cooperates, and the self-organization evolves into a collaboratively developed, efficient, and orderly complete system. The comprehensive design synergy degree is a measure of the synergy of the whole process of the comprehensive infrastructure design of the large-scale park. It is an assessment of the consistency of the synergy degree in the development and evolution of each subsystem in the comprehensive design system.

Comprehensive design collaborative performance evaluation is based on the comprehensive design pattern task attributes, set specific evaluation index system. It uses scientific comprehensive evaluation method to reflect the cooperation status, work quality and operational efficiency and quality of the comprehensive design mode. This paper uses overall satisfaction to measure the comprehensive design collaborative performance.

### 3.2 Data collection

Based on the data of comprehensive infrastructure design of an industrial park in 2013, this paper selects the semi-monthly synergy degree of each subsystem and collaborative performance as a research sample.

#### (1) Comprehensive design synergy degree

The construction process of synergy degree model of the comprehensive infrastructure design of large-scale park is mainly based on the system order degree, selecting the metrics closely related to the system order degree for power evaluation. Then, the differences and degree of dispersion between the orderliness of subsystems are measured. Finally, we use mathematical methods to analyze synergy degree of comprehensive infrastructure design of large-scale park under different schemes.

The conceptual model of collaborative target system for comprehensive infrastructure

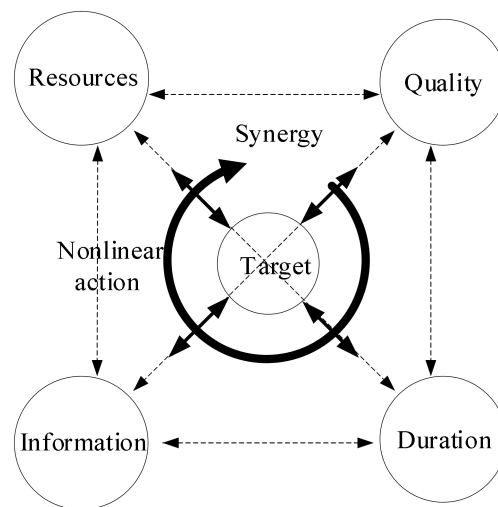

Figure 1 The Conceptual Model of Collaborative Target System

Based on the model, the multi-objective system can be divided into four interactive subsystems: duration ( $D$ ), quality ( $Q$ ), resources ( $RC$ ), and information ( $I$ ). Based on the data of an industrial park Project in 2013, this paper selects the metrics closely related to the order degree of each subsystem, evaluates the efficacy of each metric, and measures the difference and dispersion degree of subsystem order. Through the calculation and comparison, we can obtain the synergy degree data of each subsystem in 2013 under the optimal scheme.

## (2) Comprehensive design collaborative performance evaluation

This paper analyzes the collaborative performance of infrastructure design of an industrial park through fuzzy analytic hierarchy process (FAHP). In order to facilitate the rapid collection of evaluation information and to objectively reflect the real situation of integrated design collaborative management, this paper sets the overall satisfaction  $U$  as the overall target variable, internal satisfaction  $U_1$  and customer satisfaction  $U_2$  are the primary target variable. Internal satisfaction  $U_1$  is divided into cooperative attitude evaluation  $U_{11}$ , design process evaluation  $U_{12}$ , and design achievement evaluation  $U_{13}$  three secondary target variables. Customer satisfaction  $U_2$  is divided into design progress evaluation  $U_{21}$ , professional collaborative evaluation  $U_{22}$ , and design achievement evaluation  $U_{23}$  three secondary target variable. Combined with the idea of AHP, the performance evaluation system of comprehensive design on the collaborative mechanism is shown in Table 1.

Proceedings of the 16th International Conference on Innovation & Management - 1607 -  
**Table 1 Performance Evaluation System of Comprehensive Design on the Collaborative Mechanism**

Evaluation target	Primary variable	Weights	Secondary variable	Weights	
Overall satisfaction $U$	Internal satisfaction $U_1$	$w_1$	Cooperative attitude evaluation	$v_{11}$	
			$U_{11}$		
			Design process evaluation	$v_{12}$	
				$U_{12}$	
				Design achievement evaluation	$v_{13}$
				$U_{13}$	
				Design progress evaluation	$v_{21}$
				$U_{21}$	
		Customer satisfaction $U_2$	$w_2$	Professional collaborative evaluation	$v_{22}$
			$U_{22}$		
			Design achievement evaluation	$v_{23}$	
			$U_{23}$		

In the form of questionnaires, the importance of the indicators in different periods is investigated, and the results of the indexes weight can be calculated in different periods as shown in Table 2.

**Table 2 Index Weight Calculation Results in Different Periods**

Periods	$w_1$	$w_2$	$v_{11}$	$v_{12}$	$v_{13}$	$v_{21}$	$v_{22}$	$v_{23}$
1	0.50	0.50	0.33	0.33	0.33	0.45	0.45	0.10
2	0.50	0.50	0.10	0.45	0.45	0.33	0.33	0.33
3	0.50	0.50	0.10	0.45	0.45	0.33	0.33	0.33
4	0.50	0.50	0.10	0.45	0.45	0.33	0.33	0.33

For evaluation indicators that affect  $U_1$  and  $U_2$ , set the evaluation set to  $B = \{b_1, b_2, b_3, b_4, b_5\} = \{\text{very good, good, average, poor, very poor}\}$ . The value corresponding to the evaluation set is represented by  $X$ , and the corresponding score set =  $\{x_1, x_2, x_3, x_4, x_5\} = \{90, 75, 60, 45, 30\}$ . Questionnaires were distributed to professionals in owner's unit and construction units,

Proceedings of the 16th International Conference on Innovation & Management - 1608 -  
and the results of the survey were processed using FAHP to obtain the overall satisfaction  
survey results as the result of performance evaluation.

### 3.3 Data summary

By collating the data collected above, each variable from January to December 2013 are summarized as the initial data of the research variables in this paper, as shown in Table 3. It can be seen from the table that the synergy degree of each subsystem is directly proportional to the synergy performance and grows together.

**Table 3 Summary of Initial Data of Each Variable From January to December 2013**

Periods	<i>D</i>	<i>Q</i>	<i>RC</i>	<i>I</i>	<i>CP</i>
2013.01 <sup>a</sup>	0.30	0.77	0.82	0.79	0.74
2013.01 <sup>b</sup>	0.31	0.78	0.83	0.80	0.75
2013.02 <sup>a</sup>	0.32	0.79	0.83	0.81	0.75

2013.09 <sup>a</sup>	0.54	0.92	0.92	0.93	0.88
2013.09 <sup>b</sup>	0.56	0.93	0.93	0.94	0.88
2013.10 <sup>a</sup>	0.58	0.94	0.94	0.94	0.89
2013.10 <sup>b</sup>	0.60	0.95	0.95	0.94	0.90

2013.11 <sup>a</sup>	0.61	0.95	0.95	0.95	0.91
2013.11 <sup>b</sup>	0.63	0.96	0.95	0.96	0.93
2013.12 <sup>a</sup>	0.64	0.97	0.96	0.97	0.94
2013.12 <sup>b</sup>	0.65	0.98	0.97	0.98	0.95

Superscript <sup>a</sup> indicates first half of the month, and <sup>b</sup> indicates second half of the month.

## 4 Empirical Test and Result Analysis

### 4.1 ADF test

The stability of a time series means that the shock or accidental change is temporary, and its effect disappears with the passage of time. Extending its meaning to the comprehensive design collaborative mechanism can be understood that the subsystem synergy degree and collaborative performance have changed due to some sudden and unexpected impact, but with the passage of time, they will eventually return to some normal baseline value. Conversely, if the time series is nonstationary, sudden and unexpected shocks will result in permanent changes in subsystem synergy degree and collaborative performance levels, and variance will change without constraints (Ewing BT, Thompson MA, 2008).

The stationary stochastic process is the premise of establishing a VAR model. If the time series in the VAR model analysis is a nonstationary time series, the obtained results will deviate from the real situation and affect the stability of the impulse response and variance analysis. Therefore, before establishing the subsystem synergy degree and collaborative performance VAR model, the time series stability should be tested first. There are various detection methods. In this paper, this paper selects the Augmented Dickey-Fuller (ADF), uses the AIC minimum criterion to judge the optimal lag period. If the time series cannot pass the stationarity test, the data may need to be differential (Nadia Benbouzid, et al, 2018). Let X be any endogenous variable in the text, then use LX to represent the data sequence of original variable X, and DX to represent the data sequence of the variable X after the first-difference. The results of the ADF are shown in Table 4.

**Table 4 The Results of ADF**

Variable	ADF	Test critical values	Prob.	Conclusion
LD	0.0306	-3.7529 <sup>b</sup>	0.9523	nonstationary
LQ	0.4268	-3.7529 <sup>b</sup>	0.8887	nonstationary
LRC	0.0574	-3.0049 <sup>b</sup>	0.9545	nonstationary

LI	0.3856	-3.7529 <sup>b</sup>	0.8962	nonstationary
LCP	0.1480	-3.0049 <sup>b</sup>	0.9622	nonstationary
DD	-7.4162	-3.7696 <sup>a</sup>	0.0000	stationary
DQ	-4.9441	-3.7696 <sup>a</sup>	0.0007	stationary
DI	-4.2465	-3.7696 <sup>a</sup>	0.0043	stationary
DRC	-4.4548	-3.8315 <sup>a</sup>	0.0027	stationary
DCP	-7.0482	-3.7696 <sup>a</sup>	0.0000	stationary

Superscript <sup>a</sup> indicates significance at the 1% level, and <sup>b</sup> indicates significance at the 5% level.

It can be obtained from the data in Table 4 that the original sequences of the five variables are nonstationary, and become stationary sequences after the first- difference.

#### 4.2 VAR model stability analysis

VAR model stability is a prerequisite for impulsive response analysis. Analyzing the stability of VAR models for *DD*, *DQ*, *DRC*, *DI*, *DCP*, the results are shown in Figure 2. The 10 inverse roots of AR characteristic polynomial in the figure are all located in the circle, which shows that the VAR model established in this paper has stability.

**Figure 2 Inverse Roots of AR Characteristic Polynomial**

The IRF is a causal analysis method for studying the relationship between different variables of a system under certain random disturbances. This method is used to describe the process of the system deviating from equilibrium and then restoring equilibrium when the equalization system is damaged by some kind of interference. In other words, the IRF is a method of analyzing the relationship between each variable under the dynamic impact by studying the response of a certain variable in the system to a certain pulse. These functions are widely used in many fields such as econometrics, signal transmission, and engineering monitoring. In the field of econometrics, they are often used in conjunction with VAR models.

Based on the previous VAR model, the impulse response analysis of collaborative performance to each subsystem synergy degree in the collaborative mechanism is carried out to reflect the future short-term dynamic relationship between the four subsystems synergy degree and collaborative performance. The results are as shown in Figure 3.

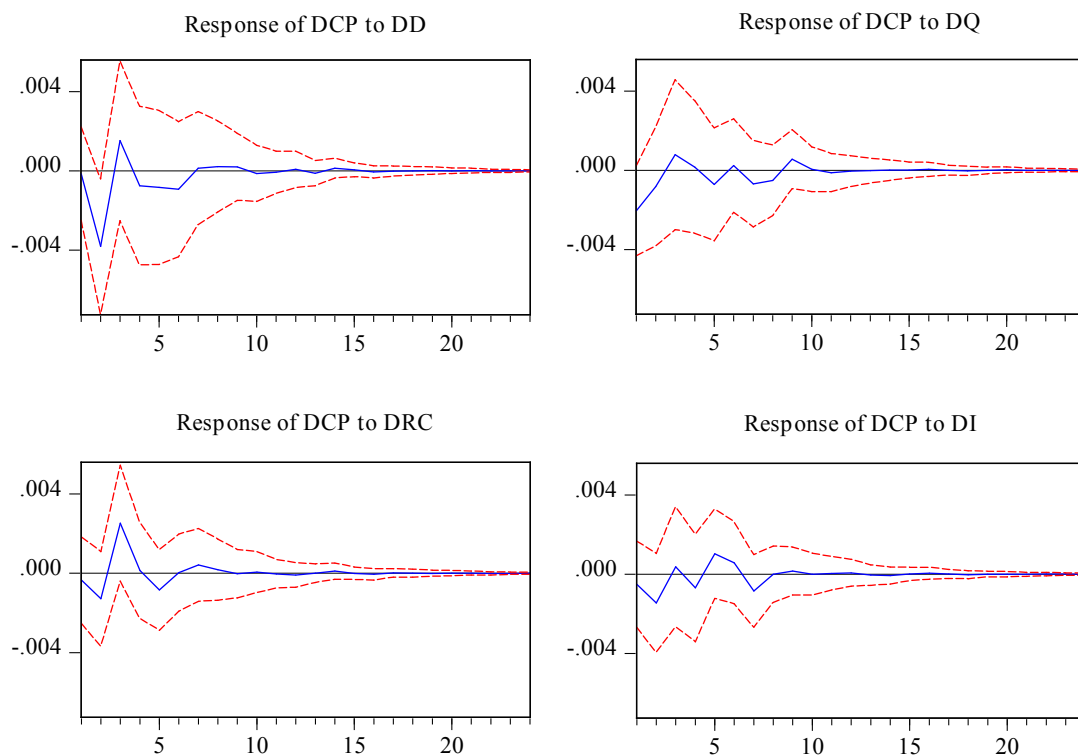

Figure 3 Impulse Response of CP to Each Subsystem Synergy Degree

The response of collaborative performance to synergy degree of duration subsystem is shown in the upper left corner of Figure 3. It can be seen that although there is no immediate response, there is a significant negative impact effect in the 1 ~ 3 periods, reaching a minimum in the 2nd phase, then rising rapidly, returning to the zero point, and reaching the

Proceedings of the 16th International Conference on Innovation & Management - 1612 -  
maximum in the 3rd phase, and then the curve is in the 4 ~ 9 periods. There was only a small fluctuation, and it was stable after the 9th period. Overall, collaborative performance has the most obvious response to the impact of synergy degree of duration subsystem.

From the upper right corner of Figure 3, we can see the response of collaborative performance to the synergy degree of quality subsystem. At the beginning, collaborative performance immediately made a large negative impact response. In the 0~2 periods, there was a significant negative impact effect, and gradually fell back. After the second period, it returned to zero and continued to rise. In the third period, it reached the maximum value and then continued to fall. Then the curve continually fluctuates back and forth and tends to stabilize after the 10th period.

As can be seen from the lower left corner of Figure 3, the response result of collaborative performance to the synergy degree of resource subsystem is shown. We can see that the collaborative performance does not respond immediately, and the negative impact effect occurs in the 1~2 periods, and falls back to the lowest point in the second period. It quickly rose back to the highest point in the third period, and the small curve fluctuated near the zero point in the 4~8 periods curve, and it became calm after the 8th period.

The bottom right corner of Figure 3 shows the response of the collaborative performance to the synergy degree of information subsystem. At the beginning, the collaborative performance did not immediately respond, and there was a significant negative impact effect in the 1~3 periods, reaching the maximum in the 2nd phase. Then quickly rose back to the high point in the fourth period and then fell back again, then the curve continued to fluctuate back and forth, reaching the highest point in the fifth period. After a large fluctuation in the 1~8 periods, there was only a small fluctuation in the 8~10 periods, and after the 10th period, it returned to the zero level and stabilized. The synergy degree of information subsystem has the least impact on collaborative performance compared to others.

#### 4.4 Variance decomposition

Using the method of variance decomposition to analyze the contribution of the synergy degree of each collaborative mechanism subsystem to collaborative performance (Zhang Yihua, Wang Yuan, 2018). The results are shown in Table 5. In Table 5, the Period column is the periods of variance decomposition. The S.E. column is the standard deviation of the collaborative performance forecast. The *DCP* column is the percentage of the variance of the forecast variation of collaborative performance change caused by itself. The remaining columns are the percentage of the variance of the forecast variation of collaborative performance change caused by the each subsystem synergy degree in the collaborative mechanism.

As can be seen from the data in Table 5, the standard deviation for the first phase of the collaborative performance forecast is 0.003959, and the standard deviation for the second

Proceedings of the 16th International Conference on Innovation & Management - 1613 -  
 period forecast is 0.005064, slightly greater than the forecast standard deviation for the first phase. Compared with the forecast in second phase, the degree of the four subsystems synergy of duration, quality, resources and information is slightly enhanced by the uncertainty of the first phase prediction. In addition, the standard deviation of collaborative performance prediction increases gradually with the number of forecast periods.

**Table 5 Variance Decomposition Result**

Period	S.E.	<i>DCP</i>	<i>DD</i>	<i>DQ</i>	<i>DRC</i>	<i>DI</i>
1	0.003959	84.374480	0.072289	14.237100	0.423462	0.892667

9	0.006915	40.218120	28.325450	10.459230	13.437750	7.559450
10	0.006920	40.211270	28.339030	10.458140	13.435700	7.555852
11	0.006924	40.198250	28.338000	10.475340	13.432870	7.555544
12	0.006926	40.202100	28.330610	10.471910	13.437380	7.557994
13	0.006927	40.193140	28.344310	10.469650	13.433620	7.559274
14	0.006927	40.177600	28.353190	10.463980	13.442290	7.562934
15	0.006928	40.176080	28.355430	10.463800	13.441850	7.562849
16	0.006928	40.170090	28.355550	10.465110	13.444240	7.564995
17	0.006928	40.169980	28.355630	10.465040	13.444300	7.565051
18	0.006928	40.168780	28.354770	10.466660	13.443910	7.565882
19	0.006928	40.168610	28.354910	10.466740	13.443880	7.565858
20	0.006928	40.168320	28.354700	10.467330	13.443840	7.565803
21	0.006928	40.168320	28.354650	10.467310	13.443870	7.565856
22	0.006928	40.168270	28.354590	10.467310	13.443900	7.565924

23	0.006928	40.168220	28.354590	10.467300	13.443940	7.565948
24	0.006928	40.168190	28.354570	10.467310	13.443950	7.565970

In the first-phase forecast, 84.37% of the collaborative performance prediction variance is caused by itself, 0.07% is caused by the duration subsystem synergy, and 14.24% is caused by the quality subsystem synergy. 0.42% is caused by the resource subsystem synergy, and 0.89% is caused by the information subsystem synergy. In the second forecast, 51.82% of the collaborative performance forecast variance is caused by itself, 29.83% is caused by the duration subsystem synergy, and 9.87% is caused by the quality subsystem synergy. 3.66% was caused by the resource subsystem synergy, and 4.82% was caused by the information subsystem synergy. Excluding the contribution of collaborative performance, we can see in the early stage that the contribution degree of duration subsystem synergy is large, and the contribution degree of resource subsystem synergy is small.

The results are basically stable in the 15th period. 40.1761% of the collaborative performance forecast variance is caused by itself, 28.3554% is caused by the duration subsystem synergy, and 10.4638% is caused by the quality subsystem synergy. 13.4418% was caused by the resource subsystem synergy, and 7.5628% was caused by the information subsystem synergy. The duration subsystem synergy has the greatest contribution to the collaborative performance, followed by the resource subsystem synergy, followed by the quality subsystem synergy, and the contribution of the information subsystem synergy is the smallest. The same result of can also be obtained from the variance decomposition graphs, as shown in Figure 4.

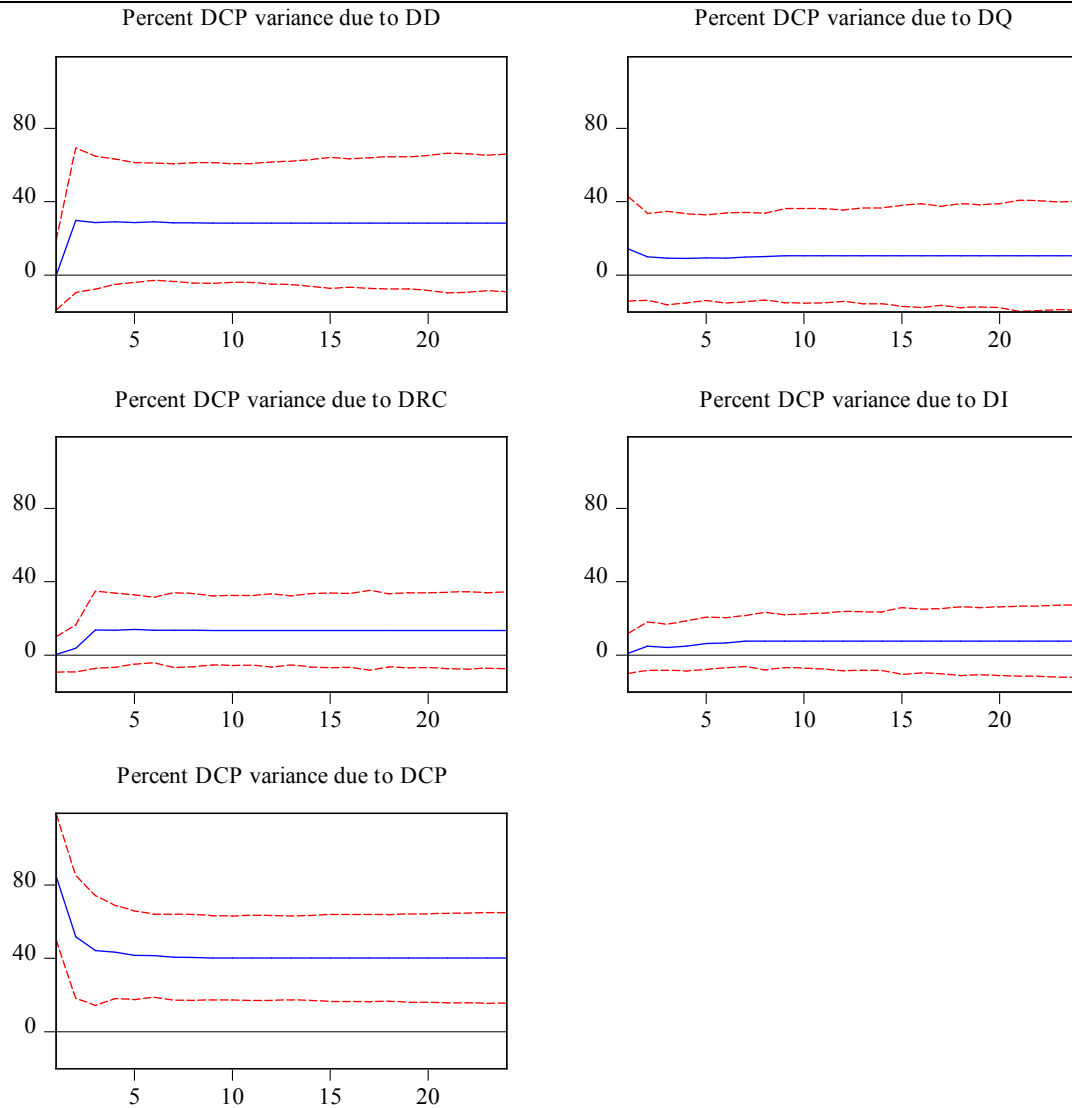

Figure 4 Variance Decomposition Result

## 5 Conclusion

This paper utilized VAR methods, impulse response analysis and variance decomposition to improve our understanding of the interdependencies that exist among the synergy degree of four subsystems in the collaborative mechanism and the collaborative performance. In general, it provides empirical evidence as to the extent to which the unexpected changes in the synergy degree are transmitted to collaborative performance of the project. The results show that the higher the synergy degree of the collaborative mechanism subsystem, the better the collaborative performance. In other words, the synergy degree is closely related to the merits of the project results. Among them, the duration subsystem synergy has the most obvious influence on the collaborative performance. The information subsystems synergy has the least impact on synergy performance. Therefore, the results of this paper support the generalization that it is an inevitable trend to establish a collaborative mechanism in the comprehensive infrastructure design of the large-scale park.

Although the existing research put forward the concept of collaborative design, it theoretically introduced the advantages of collaborative management application to construction project design, but lacked quantitative evidence on the impact of synergy degree on the comprehensive design work of actual construction projects. This paper studies the example of comprehensive design of infrastructure in an industrial park. This paper studies the example of comprehensive infrastructure design in an industrial park. The result shows that it is necessary to understand the impact of the various subsystems on the collaborative performance, and the overall synergy of the project needs to be considered when designing the comprehensive infrastructure construction of large-scale parks.

## **Learning English and Learning about English:**

### **Some Thinking on Non-English Major Graduate English Teaching**

Wu Lan

School of Foreign Studies, Wuhan University of Technology, Wuhan, P.R. China, 430070)

(E-mail: 21984559@qq.com)

**Abstract :** As a part of graduate education, non-English major graduate English teaching should focus on not only developing the students' language skills but also cultivating their' comprehensive quality and competence. For a long time, graduate English teaching and learning has been a little far from satisfaction. A questionnaire survey shows the graduate students' general English proficiency, how they know about English language and linguistics, and their attitudes on learning about English. This article introduces the major problem of graduate students' learning English as well as the current situation of graduate English curricula design, discusses the importance of learning about English and suggests offering general linguistics courses for non-English major graduate students .

**Key words:** Non-English major graduate English teaching; Learning English; Learning about English; General courses of linguistics

## **1 Introduction**

Graduate education is the highest level in higher education. Non-English major graduate English teaching should accordingly reach a high level. However, in China, for a long time, in most universities or colleges, non-English major graduate English teaching is the simple continuation of college English teaching; students only have the required English courses such as intensive reading, listening and speaking, writing, etc. They are still busy in memorizing English words and dealing with all kinds of exams. Graduate students are higher-level talents with more mature mentality as well as better ability of thinking and learning compared with undergraduates. Nevertheless, on the whole, their English proficiency is a little far from satisfaction and their comprehensive quality needs improving. We don't say that training the basic English language skills (listening, speaking, reading, writing and translating) is not important; we think there should be something more we can do to better improve their English and comprehensive quality. The course contents are single and outdated, so is the idea of course design.

Facing the problems in graduate English teaching, in order to explore new ideas of graduate English teaching, a number of graduate English teachers or researchers have made surveys and proposed suggestions on how to reform graduate English teaching. Over the past decade, the reform ideas and measures have mainly fallen into six types: (1) level-based teaching or classification teaching (Wang, 2013; Ding & Ding, 2015; Gao, 2017), (2) ESP-oriented teaching (Li & Zeng, 2013; Mu & Zhang, 2014; Ding & Ding, 2015; Wang, 2016; Hao, 2018; Lin, 2018), (3) theory-based teaching including constructivism learning, PBL (project-based learning), CBI (content-based instruction) and effective teaching theory (Yuan, 2018; Mu & Zhang, 2014; Wang, 2018; Lan & Jiao, 2016; Ming & Tian, 2017; Gan, 2017), (4) modern-information-technology-assisted teaching such as MOOC (Massive Open

Proceedings of the 16th International Conference on Innovation & Management - 1619 -  
Online Course), SPOC (Small Private Online Course), blended learning, Flipped Classroom, Microlecture, etc. (Zhao, Tan & Kou, 2015, Yu, 2016, Wang & Pan, 2018, Sun, Zhang & Zhang, 2018), (5) self-study (Gan & Wu, 2012; Lan & Jiao, 2016), and (6) diversified course design. Diversified course design, also related to other reform ideas and measures, has been widely regarded and applied to change the single and outdated course contents and course design ideas. In the past years, many university graduate English teachers and researchers have been calling for offering different types of English courses, which could be individualized elective courses, general courses, ESP courses, the combination of basic English skill courses, academic courses and cultural courses, etc. (Lin, 2005; Ju, 2010; Gan & Wu, 2012; Yu, 2016; Gan, 2017). Some have explored the teaching reform of "specialization of foreign language teaching". Their surveys show that the postgraduate students hope that besides the basic English skill courses, they can also have some practical courses or courses that can cultivate their interest, quality and professional skills such as International Conference English, Western Culture and Etiquette, News English, Popular Science Lectures, English and American Literature, English Film and TV Drama Appreciation, Brief Introduction to Britain and America, Cross-cultural Communication, English Public Speaking, English Academic Writing, Translation, etc. (Sun, 2005, Han, 2010). Another survey on the graduate English teaching system (for non-English majors) in four key universities in China shows that these universities not only offer traditional required comprehensive English courses but also diversified and individualized elective English courses including Translation, Writing, American and British Culture and Public Speaking (Han, 2010). Some other universities also have reformed the graduate English course design. One of the universities of science and technology in Northern China requires its graduate students to have five English courses: Appreciation of English Masterpieces in Literature and Film, English Newspaper Reading, English for Academic Communication, Scientific English Translation and Practice, and English Oral Communication (Xu, 2007). In our university, since 2011 some graduate students have elective English courses in the second semester, which include Cross-cultural Communication, English Film Appreciation, Translation, and Writing.

To sum up, there are almost no linguistics courses that have been offered or suggested for non-English major graduate students in China. The author of this article holds that graduate students lack linguistic knowledge and it's important for them to not only learn English but also learn about English.

## **2 Learning English**

### **2.1 Schumann's acculturation model and second language learning**

In a second language situation learners are faced with both the target language and the target culture. According to Schumann's Acculturation Model proposed in 1978, second language learning is one aspect of acculturation and there are two main variables that account for differences in the way language learners approach and acquire language: social factors and psychological factors. Schumann held that acculturation is the social and psychological integration of the learner with the target language group (Zaker, 2016). Learners' rate of development and ultimate level of language achievement is a function of the "social distance" and the "psychological distance" between learners and the second-language community. Psychological distance relates to how comfortable a learner is in relation to the surrounding social factors (Zaker, 2016). Schumann lists five affective factors that may increase the psychological distance. They are: (1) language shock (disorientation caused by learning a new linguistic system), (2) culture shock (stress, anxiety, and fear resulted from entering a new culture), (3) culture stress (prolonged culture shock), (4) motivation (instrumental and integrative), and (5) ego permeability (the degree to which an individual gives up their differences in favor of the target language

## 2.2 Learning English in China

To students in China, English is learned as a foreign language rather than a second language. Learners have no direct contact with English language community, so that their psychological feelings (the role of psychological distance) about the target language and target culture may become more pronounced (Duan, 2014). To Chinese students, English is a totally new and strange linguistic system, which is greatly different from their mother tongue, Chinese in some aspects. What's more, English is only taught and used in classroom teaching but not in a real and natural environment. Most Chinese students learn and use English to deal with various exams in almost all their life. Even if they can understand and use some English, in some sense, most of them actually are not clear about the characteristics of English and do not really accept English; they subconsciously fear and reject the language. Language shock is prevalent among Chinese students learning English. Wu's questionnaire survey shows that in her classroom English teaching, 67.9% of the students sometimes and 17.4% of the students always feel nervous when speaking English, 72.5% of the students sometimes and 24.8% of the students always have thinking blank when using English, 80.7% of the students don't know how to answer the teacher's question in English or what to say in English speaking tasks, and 60.6% of the students sometimes, and 18.3% of the students always worry that they can't speak English correctly in class. Without English language awareness and thinking pattern, Chinese students can hardly be the real master of English language; especially in speaking and writing they often fail to express themselves in accurate, natural and rich English (Wu, 2014).

## 3 Learning about English

Language as a common social phenomenon among human beings is closely linked with human social life. Language, which transmits knowledge, information, culture, etc. and expresses human thoughts and feelings, is the highest and most important cognitive ability of human beings. Halliday writes "language is at the centre of all human knowledge and human understanding". "...all our learning, and all our understanding, is grounded in language." "That is why linguistics needs to take a central place among sciences—because while all sciences share the same dependence on language, linguistics is the only one that can unify all the rest." Halliday believes there is the value of knowing about language; it's important to "understand the nature and functions of language itself" or "to have a clear picture of what a language is and how it works"(Halliday, 2015).

### 3.1 A survey: how graduate students know about English and linguistics

#### 3.1.1 Subjects

In order to know how our graduate students know about English and linguistics, the author of this article has conducted a questionnaire survey among 116 first year non-English major graduate students of Wuhan University of Technology. All the questionnaires were analyzed by SPSS; frequency and percentage have been calculated. Table 1 shows the basic information of the subjects.

**Table 1 Basic Information of the Subjects**

	Sex		Major		English Level		
	male	female	arts	science	CET-4	CET-6	others
Frequency	69	47	40	76	48	61	7

3.1.2 Results

**Table 9 Benefits of Learning Linguistics**

	Frequency	Percent	Valid Percent	Cumulative Percent
Helpful to Learning English and Other Foreign Languages	70	60.3	60.3	60.3
Helpful to Self-improvement	42	36.2	36.2	96.6
No Apparent Benefit	4	3.4	3.4	100.0

**Table 10 Students' Greatest Hope from Learning Linguistics**

	Frequency	Percent	Valid Percent	Cumulative Percent
--	-----------	---------	---------------	--------------------

Acquiring Basic Linguistics Knowledge	49	42.2	42.6	42.6
Understanding Differences between Chinese and English	18	15.5	15.7	58.3
Improving Language Skills and Communicative Ability	48	41.4	41.7	100.0
Missing System	1	.9		

According to the survey results, 18.1% of the students have understanding, 41.4% expressing, and 38.8 weak English foundation as their main problem in English learning ; 1.7% have other problems (shown in Table 2). 28.4% of the students know English well, while 70.7% not well (shown in Table 3) Only 19.8% of the students know linguistics well, 75.0% know little about it, and even 5.2 % have never heard of it (shown in Table 4). 12.9% of the students have taken a linguistics course, 60.3% have heard of but not taken a linguistics course, and 25.9% have neither heard of nor taken the course (shown in Table 5). As for the relationship between linguistics and English learning, 74.1% of the students think they are closely related, 25.0% think they are not closely related and 0.9% think they are not related (shown in Table 6).According to Table 7, 84.5% of the students consider it necessary to know about English language, while 12.9% think it not necessary, and 2.6% don't care about the issue. According to Table 8, we know that 62.9% of the students consider it necessary to offer general courses of linguistics, while 12.9% think it not necessary, and 24.1% don't care about the issue. Table 9 shows how the students think of the benefits of learning linguistics. 60.3% of the students think learning linguistics is helpful to learning English and other foreign languages, 36.2% are not sure whether it's helpful to learning English but think it helpful to self-improvement, and 3.4% hold that it has no apparent benefit. From Table 10 we can know students' greatest hope from learning linguistics. 42.2% of them hope to acquire basic linguistics knowledge, 15.5% hope to understand differences between Chinese and English, and 41.4% hope to improve their language skills and communicative ability.

### 3.1.3 Discussion

As far as the author of this article is concerned, this questionnaire survey indicates at least two things related to English learning of graduate students in China. The first is students' general English proficiency and how they know about English language. Although more than half of the students have passed CET-6, there are much more students who have expressing problem (speaking and writing) than those with understanding problem (listening and reading ) in English learning. They have been learning English for more than ten years (most students started English learning in primary school), but nearly three-quarters of them don't know English language well. As has discussed above, English is learned as a foreign language rather than a second language in China. Most students only use English in classroom teaching environment, and more importantly they are often busy in dealing with various exams. It's almost impossible for the students to know about English ; also it seems that there is no necessity for them to know about English. As Halliday cited Joan Maw in his work, "when you are learning a new language you are learning a new reality... the foreign-language learning is constructing a new reality, a reality in which people exchange different meanings"(Halliday, 2015) Schumann's Acculturation Model (also mentioned above) believes that there are the "social distance" and the "psychological distance" between learners and the second-language community, and learners' rate of development and ultimate level of language achievement is a function of the "social distance" and the "psychological distance". In a foreign language learning environment, most Chinese students actually do not know much about English and may subconsciously fear and reject the language. Without English languageawareness and

Proceedings of the 16th International Conference on Innovation & Management - 1624 -  
thinking awareness, they are unable to express themselves accurately, naturally and fully. How can you master a language if you do not know about it ?

The second thing related is how graduate students know about and think of linguistics. Three-quarters of the students know little about it and very few students have ever taken a linguistics course. More than a quarter of them have neither heard of nor taken the course. This is because linguistics courses are mainly offered to English majors in China. With the recent English teaching reform in some universities or colleges (such as WHUT), some undergraduate students might have the opportunity to take elective courses about linguistics (according to the survey result, only a very small number of students did that). However, in graduate English teaching, few universities or colleges have offered such elective courses. At the same time, we learned from the survey that a great majority of the graduate students understand the importance of knowing about English to English learning, and most of them believe that learning linguistics is helpful to learning English so that it's necessary to offer some general courses of linguistics.

Graduate education is the highest level in higher education. Generally speaking, graduate students are more mentally mature and have better ability of thinking and learning than undergraduates. Their study should be more concentrated on improving their academic level, developing their research ability, and more importantly cultivating their comprehensive quality, thus making them inter-disciplinary talents. As for language learning, they should be able to know more about the characteristics even history of the language, compare English and Chinese, and study the differences between the two languages. In this way, the students could not only overcome cultural shock and language shock, be closer to English psychologically and do better in English learning but also enhance their comprehensive quality and competence. What's more, some scholars believe linguistics takes a central place among all disciplines, for it contains rich linguistic knowledge, knowledge of language use, rigorous thinking mode, critical thinking potential and broad research space. Graduate students are more engaged in academic study and scientific research. Therefore acquiring some linguistic knowledge would be beneficial to their study and work.

### **3.2 What to do**

Based on what has been discussed above, the author of this article suggests offering general courses of linguistics among non-English major graduate students. The courses may include Introduction to Linguistics, Language Origin and Evolution, History of English, Comparison of English and Chinese languages and cultures, etc. (one or more than one courses can be offered in one semester.) Since the students are non-English majors, the textbook or teaching materials chosen should avoid being too difficult and abstruse, for fear that the students may dislike and reject the courses ; the related teaching materials and works should be appealing and comprehensible with plain language and abundant examples, which enable the students to understand and memorize the knowledge of language easily.

As for teaching, multiple methods and modes can be used : teacher's lecture, discussion, classroom interaction, self-study, bilingual teaching, and so on. In lectures, the teachers try to use simple and lively language and adopt the teaching method that is welcomed and easily accepted by the students, which can stimulate students' learning motivation and maximize the learning effect. It's important for the teachers to notice whether the students are satisfied with and can adapt to the teaching, and whether they can successfully finish the in-class or after-class tasks. If necessary, another questionnaire survey could be conducted at the end of the courses for the teachers to know what the students have learned about English language and linguistics, and what the teachers need to do to improve their teaching.

Though these courses are offered to non-English major graduate students, this initiates the trend of the "specialization of foreign language teaching", which puts forward some requirements for the ability

Proceedings of the 16th International Conference on Innovation & Management - 1625 -  
and development of the teachers involved. Graduate English teachers need to improve themselves by both extensive and intensive reading and study to broaden their horizon and be well-versed in more areas as much as possible.

#### 4 Conclusion

Non-English major graduate English teaching is faced with challenges in the new era. As a part of graduate education, graduate English teaching should aim to not only improve the students' language skills but also enable them to acquire linguistic knowledge, and to learn about English language as well as the differences between English and Chinese. Linguistic knowledge is especially helpful to enhancing the students' language awareness, cultivating their critical thinking ability and research ability, and improving their comprehensive quality. In addition, linguistic knowledge does not only belong to linguists or language researchers; it benefits a lot of people in their work and life. Therefore graduate students should not only learn English but also learn about English. Offering general courses of linguistics is expected to be helpful and effective. However, this is a general idea on improving non-English major graduate English teaching; there's a lot to be done and considered to put it into practice, such as the specific and detailed teaching plan design, how to make use of various teaching resources and facilities, how to qualify the teachers involved, etc.

## **Research on Service Level Improvement Strategy of Basic Nursing Management in College Hospitals based on PDCA Cycle**

Yu Wen

Affiliated Hospital, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: 1545997390@qq.com)

**Abstract:** The objective is to analyze the service improvement strategy of the basic nursing management based on the PDCA Cycle in college hospitals. The clinical data are collected from the 60 nursing staff and 60 patients in college hospitals from January 2017 to February 2018. During January 2017 to December 2017, the PDCA (Plan-Do-Check Action) Cycle nursing management were not applied so that the clinical data collected were regarded as control group contained 30 patients and 30 nursing staff during this period. Those data of other 30 patients and 30 nursing staff collected from January 2018 to December 2018 were taken as study group which the PDCA cycle were implemented in the nursing management. The level of nursing service, adverse events and satisfaction evaluation are analyzed among these two group. The results of the study shows that the scores of environmental management, management monitoring, document management, and nursing safety were  $(23.98 \pm 0.63)$ ,  $(23.76 \pm 0.56)$ ,  $(23.03 \pm 0.61)$  and  $(23.12 \pm 0.71)$  respectively, all improved after the PDCA Cycle carried out ( $P < 0.01$ ). The incidence of adverse reactions was 3.33% in the study group lower than 30.00% of the control group ( $P < 0.01$ ). The clinical satisfaction evaluation in the study group was 96.67% which was higher compared to the control group ( $P < 0.01$ ). The application of basic nursing management based on the PDCA Cycle in college hospitals can enhance the quality of nursing and clinical satisfaction of patients. Beyond that, the incidence of adverse events can also be reduced as well. Therefore, it is significant in clinical applications.

**Key words:** College hospitals; PDCA cycle; Basic nursing management; Service level improvement.

### **1 Introduction**

The basic nursing is referred as the most normal regulations and nursing care work (Jing, 2018). The clinical nursing is significant work in the college hospital. The efficient and accurate diagnosis and treatment associated with clinical nursing details are the basic requirement in order to ensure the satisfied clinical effect (Yingzhu, 2018). Related research shows that the level of the basic nursing management can influence the patient's clinical effect and the prognosis of the recovery quality directly as well as specialized nursing level (Qiong, 2018). Consequently, the improvement of the basic nursing level should be taken seriously. The PDCA Cycle includes the planning, doing, checking and action was proposed firstly in 1950s (Fen, 2018) which ensured the content of nursing management routinized, standardized and scientific in order to promote the nursing management level. With the purpose to further study, this paper intended to analyze the influence of the PDCA Cycle nursing management focused on the patients and nursing staff during the period from January 2017 to December 2018 in college hospital.

Some previous studies have indicated that caregivers have enough knowledge of nursing care

Proceedings of the 16th International Conference on Innovation & Management - 1628 - health (Yangisawa, 2018). Lili evaluated the effects of the blended learning applied in the course of Fundamentals of nursing utilizing the compared group (Lili, 2018). The effect of PDCA circulation model on the standardization of emergency treatment in department of neurosurgery and seek the way to improve the nursing was explored by the Ruiqi (Ruiqi, 2018). The Joanna Briggs Institute Practical Application of Clinical Evidence System and Getting Research into Practice audit and feedback tools were utilized in a evidence implementation project of Huashan Hospital, Fudan University, Shanghai (Huahua, 2016). It aims to improve nursing management of dysphagia in acute stroke patients and prevent the occurrence of aspiration in patients admitted to the neurology ward. It also shows that the PDCA cycle system can reduce the false rate of occupational exposure evidence (Qingning, 2017). Through the PDCA cycle system, the medical staff had improved the enthusiasm of occupation exposure reporting. Application of PDCA cycle system can effectively reduce the false rate of occupational exposure and remove the obstacles for occupation protection work. The training method and application effect of standardized patients in the fundamental nursing was also discussed by Qian (Qian, 2016). The nursing care system was developed as system theory through participating management with action research following the Deming Cycle (PDCA) divided into 3 phases (Mongkonthawornchai, 2012). The characteristics of best and worst clinical educators were investigated (Edwards, 2009). The effect of PDCA cycle on control of the hospital infection management quality was provided. The hospital infection rates were reduced with the PDCA which should be utilized in the clinical promotion (Lin, 2017).

## **2 Data and Method**

### **2.1 Data**

The clinical data were collected from the 60-nursing staff and 60 patients in college hospitals from January 2017 to February 2018. The control group contained 30 patients and 30 nursing staff from January 2017 to December 2017 in which the PDCA (Plan-Do-Check Action) Cycle nursing management were not applied. However, the other 30 patients and 30 nursing staff's data from the January 2018 to December 2018 were referred as study group which the PDCA cycle were implemented in the nursing management including plan, executing, inspection and conduction. The 30 nursing staff in the control group are all female aging from 20-55. The mean and deviation of the age are 29.35 and 9.25 years old respectively. As for the education background, there are 6 staff having bachelor degree or above, 12 staff with college degree in control group while other 6 staff graduated from technical secondary school. In the study group, all the staff are female ranging from 21 to 55 years old. The mean and deviation of the age are 30.34 and 9.34 years old respectively. As for the education background, there are 11 staff having bachelor degree or above, 14 staff with college degree in control group while other 5 staff graduated from technical secondary school. There are 16 male patients and 14 female patients in the control group with average age of 56.25 and deviation is 12.25. The number of male and female patients are both the 15 in the study group. The average and deviation of the age is 55.34 and 13.34 years old. So the data is the same basically ( $P>0.05$ ). There are some other standards such as integrity of information, initiative of the staff and patient's compliance. Some conditions should be excluded for example the malignant, severe liver and kidney disease, psychological and mental disease and drop out patients. Beyond that the research meet the standard of the related medical ethics. All the patients signed the informed consent before treatment.

### **2.2 Method**

All the patients were conducted routine examination and symptomatic intervention. PDCA cycle was not applied in the control group which was only provided routine basic nursing including common

Proceedings of the 16th International Conference on Innovation & Management - 1629 -

first-aid measures (aspiration of sputum, provisions, transfusion, artificial respiration, gastric lavage, common first-aid outfit and so on), general nursing (bed-making, psychology nursing, body temperature, respiratory and oral care), conventional specification (duty, ward round, sterilization, sanitary control), basic nursing knowledge and operation and so on. The PDCA was applied in the study group including four stages namely planning, implement, inspection and conducting. The planning means analyze the problem, affecting factors and causes according to the situation. Meanwhile the nursing care plan could be drawn up and conducted. Inspection refers to comparing the anticipation and actual situation. The conduction refers to discovering the problem and settling it. The nursing efficacy is stabilized as well. The standard and experience has also analyzed and evaluated. The details conducted in the basic nursing management contains plan, setting up cycling management group and combined with the data analysis. So that the detail nursing problem can be found out which are bed sheet and insufficient of the publicity and education. The reasons is analyzed to be the staff lacking of the nursing concept, poor nursing technique and unskilled operation and so on. It need to appreciate the management level and draw up related objectivity of nursing management correctly. The conducting stage the nursing staff need to be trained in group aimed at handling details problem. The educational propaganda and punishment mechanism need to be paid attention so that the staff would attach importance to basic nursing quality. The quality supervision group is necessary in the check stage. The detail performance is checked in the field investigation. Random sampling and entire check is conducting at regular intervals. The problem should be handled just after it was discovered. The related nursing training manual is studied among the staff. The periodic questionnaire survey is followed as well. The evaluation of basic nursing quality is conducted every months and seasons. So the problem can be discovered and analyzed timely. The nursing plan can also be adjusted according to the situation. The staff and department with excellent performance should be rewarded. After such improvement the basic nursing quality is raised in the end.

### **2.3 Observation target**

The scores of the nursing quality of these two group are analyzed. The nursing adverse event includes the omission, mistake, accident, disputing and unsatisfactory of patients.

### **2.4 Therapeutic evaluation**

The nursing quality of these two group is scored according to the related survey. The management evaluation contains environment, management, file and safety with 25 scores each. Higher scores means the better nursing quality. The degree of the satisfactory of patients were assessed according to the schedule of survey which includes environmental nursing, disease nursing, nursing altitude and nursing effect. The total score is 100. With the score above 90 the patients can be regarded as satisfied very well. With the score between 90 and 60 the patients can be regarded as satisfied basically. With the score below 60 the patients can be regarded as unsatisfied.

### **2.5 Statistics**

The statistics were dealt with SPSS 20.0. the related metering statistics such as age and nursing quality are repressed as  $(\bar{x} \pm s)$  which were inspected by t. The related enumeration data such as gender, education background, adverse event and satisfaction degree are illustrated as n which were inspected by  $\chi^2$ . The statistics has the significance only when the  $P < 0.05$ .

### 3 Results

#### 3.1 The scores of the nursing quality

After the intervention, the environmental management, management monitoring, file management and nursing security were all improved compared to the control group. Each scores are listed in Table 1 and  $P < 0.01$ .

**Table 1 The Scores of the Nursing Quality ( $\bar{x} \pm s$ , n=30)**

Group	Environmental management	Management monitoring	File management	Nursing security
Control group (n=30)	19.23±3.28	18.58±2.96	18.56±3.59	18.16±3.25
Study group (n=30)	23.98±0.63	23.76±0.56	23.03±0.61	23.12±0.71
t	7.7896	9.4181	6.7235	8.1665
P	<0.01	<0.01	<0.01	<0.01

#### 3.2 The adverse events

The nursing omission and the dispute of the study group is 3.33%. The adverse event is reduced from 30% after the intervention and the detail scores are listed in Table 2 and  $P < 0.01$ .

**Table 2 The Adverse Events[n(%)]**

Group	Nursing omission	Nursing mistakes	Accidents	Nursing dispute	Others	Adverse events
Control group (n=30)	2 (6.67)	3 (10.00)	1 (3.33)	1 (3.33)	2 (6.67)	9 (30.00)
Study group (n=30)	0	0	1 (3.33)	0	0	1 (3.33)
$\chi^2$	0.5172	1.4035	0.5172	0.0000	0.5172	7.6800
P	>0.05	>0.05	>0.05	>0.05	>0.05	<0.01

#### 3.3 Clinical satisfaction degree

The clinical satisfaction degree is raised to 96.67% in the study group after the intervention. The detail scores are listed in Table 3 and  $P < 0.01$ .

**Table 3 Clinical Satisfaction Degree [n(%)]**

Group	Satisfied very well	Satisfied basically	unsatisfied	satisfaction degree
Control group (n=30)	21(70.00)	8(26.67)	1 (3.33)	29 (96.67)
Study group (n=30)	11(36.67)	10(33.33)	9 (30.00)	21 (70.00)
$\chi^2$	6.6964	0.3175	7.6800	7.6800
<i>P</i>	<0.01	>0.05	<0.01	<0.01

#### 4 Conclusion

The PDCA cycle mode is also referred as quality cycle mode which belong to the general model of management theory. It was constituted by four stages namely planning, doing, check and action. The related science procedures were conducted just after this cycle sequence. The basic nursing is one of the most part of the hospital nursing work which affect the specific nursing and nursing quality entirely and directly. Therefore, the hospital should pay attention to the management of basic nursing quality, basic nursing skill's improvement and nursing quality. In such way, the patients can be supplied with better service. Recently, the PDCA cycle mode has been applied in the clinical nursing work extensively with effective results. In order to improve the basic nursing management level, this research focus on the effect of PDCA cycle mode's application in the college hospital's basic nursing management. It may also supplied somewhat reference to related research.

The result of this paper shows that the environmental management, management monitoring, file management and nursing security in the study group have higher score compared to the control group respectively. The results illustrate the application of PDCA cycle mode can help college hospital's basic nursing management to enhance the nursing quality and service's level. The PDCA cycle mode group can draw up and act nursing plan according to the situation and analysis the problem. If there is problem came up, it should be settled down as soon as possible. So the nursing effect can be assured. So that the detail nursing problem can be improved by establishing the cycle management group and analyzing combined with statistics which are bed sheet and insufficient of the publicity and education. The reasons is analyzed to be the staff lacking of the nursing concept, poor nursing technique and unskilled operation and so on. It needs to appreciate the management level and draw up related objectivity of nursing management correctly. The reward and punishment mechanism is also necessary to enhance the basic nursing quality. Meanwhile the supervise team should check the basic nursing entirely by field survey and random sampling. The evaluation of basic nursing quality is conducted every months and seasons. Thus, the problem can be found and figured out timely. The nursing quality can also be improved with new nursing plan. The clinical nursing effect and be enhanced with the improvement of the staff's basic nursing skill. The nursing omission and dispute events is 3.33% in the study group in this research less than in the control group. The satisfaction degree of patients is 96.67% in the study group higher than in the control group. It also proves that the application of PDCA cycle mode can help college hospital basic nursing management to improve the nursing service and reduced the adverse incident. Beyond that, the clinical effect is marked. However, the long term influence of the PDCA cycle mode is still need to be research.

Above all, the application of PDCA cycle mode in college hospital basic nursing management can improve the nursing quality and patients' satisfaction degree effectively and reduced the adverse incident. It worth certain degree of clinical application.

## **Study on the College French Teachers' TPACK Level and the Influence Factors under the Background of "Internet + Education": Taking Wuhan Universities as the Example**

Bai Yanyuan

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: lucie629@163.com)

**Abstract:** In order to have the understanding of college French teachers' TPACK level and its influencing factors in the era of "Internet + Education", this paper adopts a mixed research method to carry out a questionnaire survey on 30 French teachers who works at colleges and universities which locate in Wuhan, and choose 4 teachers among them to have the interviews. The results of the quantization indicate that: College French teachers' TPACK level is relatively low, and TK knowledge is weak; TPACK of male teachers is obviously higher than that of the female teachers; the older the teachers' ages, the higher the level of CK and PK, the lower the level of TK; in fact, training conducted for teachers has played a certain role in promoting teachers' knowledge such as TK; There are three main context factors which will have the impact on TPACK of French teachers namely, teachers' professional attitudes, the learning and communication between teachers and students as well as those existing among their peers, the teaching facilities. In the light of the results of the study mentioned above, this paper brings forth some suggestions from the respects of peers' mutual assistance, educational technology training and hardware facilities guarantee, in the hope of providing inspiration for the development of TPACK for college French teachers.

**Key words:** Internet + Education; TPACK; French teachers; Influence factors

### **1 Introduction**

In April 2018, the Ministry of Education promulgated the "2.0 Action Plan for Education Informatization" which puts forward the "actively promoting Internet + Education, and holds the core concept of deep integration of information technology with education and teaching". In the field of foreign language teaching, the Syllabus of French Teaching for French Majors in Colleges and Universities which points out that " College French teachers shall keep pace with the times, keep up with the development of new technologies, in order to improve their awareness, knowledge and capability of using information technology in a constantly manner, so that they are able to integrate and rationally adopt the information technology elements in the process of specific class teaching design and implementation". In the era of "Internet + Education", French teaching conducted in the Colleges and universities is closely related with the information technology. The technological pedagogical content knowledge (TPACK) has become an important factor in the knowledge system of teachers and an important standard for carrying out the evaluation teachers' teaching level.

At present, many scholars have carried out researches on TPACK at home and abroad, the main results of which are as follows. First, some mainly study the theoretical framework of TPACK. For example, Joshua M. Rosenberg and Matthew J. Koehler (Joshua M. Rosenberg and Matthew J. Koehler,2015) discuss how context has been avoided or has referred to different constructs among educational technology research, especially among research on the Technological Pedagogical Content Knowledge (TPACK) framework. Second, some focus on the application of TPACK in the course of information and communication technology, such as DY Wu who (DY Wu,2015) aims to illustrate two cases of applying TPACK framework into CALL lesson design, in hope that language teachers can apply TPACK into their pedagogical development. Third, others notice the cultivation of teachers' TPACK ability, such as Wang Xuemei believes that (Wang Xuemei,2018) teacher beliefs, teachers' learning and communication, and teaching facilities are the three main contextual factors affecting college English teachers' TPACK. Besides, Cox C.R. Graham (Cox C.R. Graham,2013) focuses on the use of educational technologies by educators in their teaching methodologies. However, in accordance with the present research situation, there are many macroscopic studies, lack of microscopic studies, which focus more on generalization, but lack any deeper investigations. The empirical research on TPACK in the field of foreign language education is very insufficient both at home and abroad, especially the study on the influencing factors of college French teachers' TPACK level.

In view of the importance of the application of information technology in respect of college French teachers, it has become imperative to improve the TPACK level of French teachers who work at Colleges. Based on the current status of TPACK level of 30 French teachers who are from 7 universities in Wuhan, this study carries out an analysis on the factors affecting the TPACK of college French teachers, in the hope of providing inspiration for improving TPACK level and their informatization teaching capabilities.

## 2 Concept of TPACK and Relevant Study

TPACK initially root in the "pedagogical knowledge" (PCK) which was proposed by Shulman, and has been regarded as an important indicator of teachers' professional development. Afterwards, Koehler and Mishra defined it as "the knowledge integrated carrier of information technology integration and class teaching", which refers to the interaction and connection of knowledge relating to the contents contained in subjects (knowledge of a specific subject which is to be taught), technical knowledge (computer, internet, digital video, etc.), teaching knowledge (practice, process, strategy, procedure and method which are involved in the process of teaching and learning), and the transformation of the integration of the three respects. TPACK framework includes three core elements including the subject content knowledge, pedagogical knowledge and the technical knowledge; and four compound elements including the subject pedagogical knowledge, subject content knowledge of integrated technology, pedagogical knowledge of integrated technology, subject pedagogical knowledge of integrated technology, as well as the context factors. (shown as Figure 1)

**Figure 1 TPACK Framework**

From the viewpoint of pedagogy, foreign scholars have made certain achievements in the field of study on the theoretical framework of TPACK (Joshua M. Rosenberg, 2015), the research on the development strategy (Kohetal, 2014), the empirical research on TPACK (Chaietal, 2018) and the application of TPACK in the course of information and communication technology. Domestic scholars have carried out some relevant studies on the theoretical summary of TPACK (Li Jianzhen, 2015), the cultivation of teachers' TPACK ability (Chen Junxian, 2018), and the study on the application of TPACK combined with specific course (Ran Quanyou, 2014).

In the field of education on foreign language, studies on TPACK conducted by the foreign scholars mainly focus on two respects: on the one hand, it is the empirical research: Huseyin has conducted an investigation on the TPACK level of 76 English teachers in Turkey, as a result, it is discovered that the TPACK level of girls is higher than that of the boys; on the other hand, it is the application of TPACK theory in English teaching (Debbagh, 2016). However, the contents contained in the studies on TPACK of foreign language teachers conducted by the domestic scholars only include the analysis on structure of TPACK of English teachers (Wang Xuemei, 2018).

In a word, the empirical research on TPACK in the field of foreign language education is very insufficient both at home and abroad, especially the study on the influencing factors of college French teachers' TPACK level. However, under the background of "Internet +", the integration of the information technology with teaching knowledge of foreign language teachers who work at colleges and universities must be enforced in order. At present, French teaching in colleges and universities is in the rising period as there are more than 160 colleges and universities across the country offer the major in French with 1500 teachers teaching French. If aiming at the realization of the all-round informatization of higher education in China, the cultivation of the informatization capability of college French teachers shall not be neglected. Therefore, the study is conducted with the purpose of carrying out the investigation on the current situation of TPACK level of 30 French teachers who work at 7 universities in Wuhan, and analyzing its influencing factors and conducting the thinking about ways to improve teachers' TPACK capabilities.

### 3 Design for the Study

#### 3.1 Questions involved in the study

Conducting of the analysis and exploration on the influencing factors of TPACK is the premise in terms of improving the level of TPACK. With regard to the shortcomings existing in the current studies, this paper has made the confirmation on the following questions for the study:

- (1) How is the current situation of TPACK level of French teachers who work at colleges and universities in Wuhan?
- (2) What is the impact of demographic variables on college French teachers' TPACK?
- (3) What are the contextual factors which have the influences on college French teachers' TPACK?
- (4) How to build the framework of TPACK of college French teachers under the background of "Internet + Education"?

#### 3.2 Subjects of the study

The subject of this study is the French teachers who work at seven colleges and universities in Wuhan. The types of colleges and universities include the comprehensive universities, university and college of science and technology and normal universities, in addition, the subjects of the study have a certain representativeness. Among them, there are 9 male teachers and 21 female teachers; from the perspective of teaching age, new teachers (teaching less than three years) account for 13.3%, skilled teachers (4-15 years of teaching) account for 73.4%, experienced teachers (teaching longer than 15 years) account for 13.3%, teachers who have participated in the trainings for teachers account for 90%, and teachers who fail to take part in the trainings for teachers account for 10%. In view of the distinctiveness of French as a subject, there are fewer teachers who have received the normal education, only accounting for 6% of the total. According to the gender, teaching age, professional title and colleges and universities where they work, four teachers were selected to have the interviews among the teachers who have participated in the questionnaire and agreed to take part in the interview conducted later. (Table 1).

**Table 1 Basic Information of the Interview Participants**

Name	Gender	Educational background	Professional title	Teaching age	School where he/she works
Tao Yulin	Male	Master	Assistant teacher	2	The university and college of science and technology
Wang Qiong	Female	Master	Professor	30	The university and college of science and technology
Wang Jing	Female	Doctor	Lecturer	10	Normal universities
Zhang Ling	Male	Doctor	Associate professor	15	Comprehensive universities

### **3.3 Tools adopted in the study**

The questionnaire adopted in this study is revised on the basis of the TPACK questionnaire designed by Schmidt for pre-service teachers together with the questionnaire designed by Archambault for the online teachers. The revision mainly adds or reduces some professional questions in accordance with the characteristics owned by college French teachers. The questionnaire is divided into two parts: the first section is the background information of teachers, including gender, age, teaching age, professional title, regular college course education background and participation of teacher in trainings; the second part is the TPACK level evaluation table (the evaluation table adopts the form of Richter five-level scale, ranging from 1 = strongly disagree to 5 = totally agree).

### **3.4 Date collection**

During this empirical study, the questionnaires are distributed to 30 French teachers who work in seven selected colleges and universities through the Internet Tool Questionnaire Star. In order to ensure the authenticity and effectiveness of the study, the answering time for each questionnaire is designed to be not less than 5 minutes. A total of 30 questionnaires were delivered, with a total of 30 questionnaires were collected, among them, there are 30 valid questionnaires. The quantitative analysis on the data obtained from the questionnaire is conducted by adopting SPSS20.0. On the basis of quantitative results, four teachers are chosen as the subjects of the interviews.

## **4 Findings of the Study**

### **4.1 Analysis on college French teachers' TPACK level**

In order to have a measurement on college French teachers' TPACK level, this study has carried out the descriptive analysis on quantitative data. The results indicate that the average values of each dimension of TPACK for teachers who teach French at seven colleges and universities in Wuhan are  $PK = TCK > PCK > CK > TPK > TK > TPACK$ . Among them, the levels of PK and TCK are higher, while the levels of TK and TPACK are relatively lower. Because most of the teachers who are chosen as the subjects of this study have the long teaching ages and rich teaching experiences, the overall level of PK is relatively high. As a result, if the level of TCK is high, then it indicates that teachers who teach French at colleges and universities are able to use information technology to better shown the subject content knowledge, but if the level of TK and TPACK are low, then it means that college French teachers have weak technical knowledge, lacking of the capability of effectively integrating information technology and French teaching. The result of this kind is similar to the results of study conducted by Wang Xuemei (Wang Xuemei, 2018).

### **4.2 The influence of demographic variables on the elements of college French teachers' TPACK**

According to the basic information of teachers set forth in the questionnaire, the descriptive statistical analysis on the data of teachers' gender, age, teaching age, professional title and participation in the trainings for teachers is carried out in order to compare the differences of TPACK of

(1) The average value of TPACK of each dimension of male teachers is higher than that of female teachers. Except there is a small difference in PK level, the male teachers have obvious advantages in TK, CK, TPACK and other knowledge levels. The reason for this is that the male teachers have stronger practical ability in respect of computer operation, causing the difference between male and female teachers in terms of TK. Moreover, in the respect of the acquisition of subject knowledge, the male teachers have more positive attitudes and wider interests than that of the female teachers. It is known through interviews that, Tao Yulin, a male teacher, likes to read classic books of foreign languages, browses French websites of other countries and pay attention to current affairs and news. While, the female teachers mostly say that they are "totally unable to read a book" or "only focus on the books which are closely related to the teaching tasks", which may be related to the needs for female teachers to take more responsibility for taking care of their families. TPACK is the integration and transformation of TK, PK and CK, and it is the superiority of male teachers in terms of TK, CK and PK levels that make the TPACK level of male teachers become higher than that of female teachers.

(2) With the increase of the teaching ages of the teachers, the levels of CK and PK are getting higher and higher. The longer the teaching time is, the more subject knowledge and teaching experience are obtained in an accumulatively way. The results of this study are in line with certain objective laws. The compound knowledge level of PCK, TCK, TPK are on the rise with the increase of teaching age, which shows that the mutual integration and transformation of teachers' knowledge are inseparable from the passing of time and the accumulation of experience. Because the new teachers have strong adaptation and receptive ability to the information technology, as a result, the TK level of new teachers is the highest, while that of the skilled teachers and experienced teachers are relatively low. The backward TK level of skilled teachers and experienced teachers also, to some extent, reflects that they have not updated their technical knowledge in time in order to apply the latest technology to the process of teaching.

(3) Teachers who have participated in the trainings often have a slightly higher level of knowledge related to TK, TCK, TPK and TPACK than those who fail to take part in the trainings. In the era of Internet and big data, the development of information technology has the never-ending changes and improvements. The emergence of mini class, mu-class and flip-over class is changing the traditional French teaching paradigm. The teachers who teach French at colleges and universities must have a training for their knowledge of educational technology on regular basis in order to keep up with the development of and changes in the times and become qualified for the requirements of French teaching at colleges and universities in the information age.

#### **4.3 The influences of context factors on college French teachers' TPACK**

Through the questionnaire on 30 teachers who teach French and the face-to-face interviews with 4 teachers, we are able to draw the conclusion that the context factors of TPACK for college French teachers mainly include three aspects: teachers' professional attitude, communication and learning between teachers and students as well as that existing among peers, and the teaching facilities provided by school.

Firstly, teachers' professional attitude is an important factor which acts to promote the development of TPACK. Teachers who have participated in the study said that, the profession of being teachers requires us to live and learn. As Mr. Wang Qiong mentioned in the interview: The knowledge

Proceedings of the 16th International Conference on Innovation & Management - 1639 -  
of computer operation I own is relatively deficient. However, if schools offer the opportunities to learn, I'd love to learn.

Secondly, communication and learning between teachers and students and that existing among peers is a dynamic factor which acts to promote the development of TPACK. It includes the communication between the teachers and students, that existing among the peers, and the communication in forms of teaching competitions, teacher training, lectures and study and training. Teaching will benefit the teacher as well as the students, we are also able to learn a lot of new knowledge from students. Four teachers who were interviewed unanimously mentioned that the PPT presentation showed by students in class was excellent. "At present, the students who are studying in universities are much better at information than ours." Zhang Ling pointed out that "In my opinion, I feel that I have learned a lot of technical knowledge from students".

Thirdly, teaching facilities are the external environmental factors which can ensure the development of TPACK of teachers. In the interview, all of the teachers held the opinion that it is an important problem that "classrooms cannot be connected to the Internet". In addition, with the development of flipped classroom and mixed teaching method, more and more courses start to have a try with the "online + offline" teaching mode. There is some feedback that teachers thought the stability of the system of network teaching platform provided by school shall be improved, and the incompatibility of some functions have the influences on the effectiveness of tutoring for students conducted by teachers on line as well as the students' voluntary learning.

## **5 Construction of TPACK Framework for College French Teachers**

The construction of TPACK for college French teachers belongs to a dynamic process. In this process, teachers should not only be proficient in applying the technical knowledge, but also ensure to be able to create flexible teaching methods by adopting technology to attract students to participate in the teaching process. The higher the TPACK level of teachers, the higher the participation of students, as a result, the better the teaching quality of the course of French. In view of the study mentioned above, we put forward the following suggestions for the improvement of TPACK ability of teachers who teach French at colleges and universities:

### **5.1 Teachers' learning and communication**

We should promote the concepts of "peers' mutual help" or "old teachers give some guidance to the new teachers" and establish a learning community. In the framework of the TPACK of courses of foreign languages, CK, as a precondition, contains the basic concepts and skills of foreign languages, including linguistic and literary related knowledge, as well as social and cultural knowledge of the targeted language. The teachers who teach French at colleges and universities are required to have a mastery of the knowledge of disciplines such as the acquisition of the second language, analysis on text, sociolinguistics, etc. At the same time, they should integrate their teaching knowledge, such as the integration of the contents of the teaching methods, curriculum development and test, in order to form a PCK which is suitable for the course of foreign language. Therefore, in practical application, we are able to improve the teachers' professional knowledge by means of teacher workshops, young teachers acting as the assistant teachers or have the lesson preparation in a collaborative manner, encourage teachers to pay attention to updating the subject content knowledge at any time, and keep

### **5.2 Educational technology training**

According to the actual demands of the teachers who teach French, the colleges and universities shall aim at conducting the training for teachers' educational technology. For the teachers who lack enthusiasm for technology themselves, it is necessary for the school to help them to build a clear understanding and open the door for the construction of TPACK framework. For the teachers who have weak knowledge of educational technology, schools shall provide regular training and guidance on the educational technology.

### **5.3 Teaching facilities**

Schools shall provide network technical support for the development of TPACK of teachers who teach French with the guidance of the concept of "Internet + Education". French teaching is required to have the basic hardware environment such as language lab and network voluntary learning center, and it is available to be made full use of other computer and network equipment to meet the basic needs of French teaching at colleges and universities. In addition, strength the popularity of online teaching in the form of Mu class and flipped class, and introduce more advanced online teaching systems and enhance the cooperation with computer professional teams, by doing these, they will help French teachers to improve their technical knowledge and make the organic integration of technology and French teaching become realization, in order to promote the development of college French teachers' TPACK level.

## **6 Conclusion**

With the development of the concept of "Internet +" in China, the French language teaching conducted at colleges and universities become more and more hardly to exist without the network information technology. Based on a survey on 30 teachers who teach French at seven colleges and universities in Wuhan, this paper carries out an analysis on the influencing factors of college French teachers' TPACK, and provides some inspiration in terms of exploring the development path of TPACK. It is shown on the study that the TPACK of teachers who teach French at colleges and universities in Wuhan is at a low level, especially TK knowledge is weak; among the demographic variables, TPACK of male teachers is obviously higher than that of female teachers; the longer the teacher's age, the higher the level of CK and PK, but the lower the level of TK; the trainings for teachers have a certain role in respect of promoting TK and other technology-related knowledge. And among the context factors, the teachers' professional attitude is the most important factor, followed by the influencing factors such as the learning and communication between teachers and students as well as that of peers, and the teaching facilities, etc.

Because there is the limitation on the time and space, this study is limited to have the analysis on TPACK level and its influencing factors of some teachers who teach French at colleges and universities Wuhan. We can predict that under the overall trend of the development of the national information, more and more colleges and universities will focus on the cultivation of teachers' TPACK abilities, and the teachers are going to pay more and more attention to the self-improvement of integration capabilities on their own. From the construction of TPACK framework for teachers who teach the

Proceedings of the 16th International Conference on Innovation & Management - 1641 -  
foreign languages to all of the teachers who teach at colleges and universities will become a subject for our further study.

**Abstract:** This paper examines the exhibit ability of popular music in terms of how popular music is interpreted in an exhibition and how the subject engages with museum audiences. It firstly discusses the debates around the changing role of museums in regards to the representation of popular music, and later investigates the current issues of popular music interpretation and museum audience. The paper recognizes the value of exhibiting popular music and proposes appropriate ways for the improvement of museum experiences through a case study by researching through site visits, archival research and ethnographic interview

**Key words:** Curation; Exhibition; Popular music; Audiences; Museum innovation

## 1 Introduction

The term 'exhibit ability' which initially stands for the suitability for being exhibited, now conveys a broader range of meanings in museology. In this paper, exhibit ability denotes the assessments of exhibiting object. It can be evaluated through audience communication, exhibition interpretation and exhibition design. There is an ongoing debate around the issues of exhibit ability of popular music in museums which is entwined with both the cultural studies and museum discourse. Some scholars expressed their doubt of the representativeness of popular music and the purpose of museums. More than two decades ago, as the traditional role of a museum was normally conceived as "preservation of artifact" and "education of facts and knowledge", this has now been challenged by studies on museology. Meanwhile, the emergence of popular music museum and other types of popular culture museum is also challenging the function of museums. One writer questioned the functions of popular music museums, by criticizing The Rock and Roll Hall of Fame for their primary purpose, as he stated, "is awards and thus promotion" (Buckley, 2003). He might not be the only person who holds suspicions, and it is a topic that would be worthwhile to examine. The present paper is rather on exhibiting popular music in traditional museum which normally has a wide range of core collections in its field.

The collection and interpretation of objects related to popular music in traditional museums have been doubted by some scholars. A former V&A curator<sup>89</sup> stated that the original contexts of performer and performing stage was lost when musical instruments entered a museum space. He further questioned the aesthetic value of exhibiting mass-produced pop music instruments in the V&A museum. Indeed, as popular culture inevitably relates to mass-production and consumerism, the problem with exhibiting this material needs to be excavated. A growing number of professionals begin to recognize the value of popular culture exhibitions. The former director of the National Football Museum has stated in *Around Museums and Popular Culture*, "Museums offer an environment to explore the meanings of popular

---

<sup>89</sup> <http://www.popular-musicology-online.com/issues/03/edge.html>

Proceedings of the 16th International Conference on Innovation & Management - 1643 -  
 culture in ways that academic texts cannot, primarily because the material culture can be directly experienced” (Moore, 1997). While museums have always been able to provide exhibition space for high culture such as Renaissance paintings or Chinese ceramics, it has been argued that museums can also develop representation of popular culture, even though there is limited existing literature that examines this issue, a growing number of curatorial practices are setting out examples to respond to the debate in a rather practical way.

## 2 Examining the Exhibit ability of Popular Music Exhibition

### 2.1 The contextual transformation of contemporary museums and pop music

One reason for the emergence of an increasing number of exhibitions around popular music and its relating culture in museums could be out of the attempt by many museums to engage new audiences. It seems obvious that the reason for doing this is to bring economic benefits to museums, but it is not the only reason. For many years, museums have been taken as a place to collect, display, research and educate, yet this traditional role of museums faces many challenges. Questions have been raised around the function of a museum, it is no longer considered as a sort of temple of knowledge, but instead museums can be thought of as a place to create experiences. In an essay focused on museum studies in the early twenty-first century, one scholar stated: “Museums, being public places where one does not usually require special qualifications to enter, have been more open to the pressure of mass democracies and have had to address more directly issues of experience” (Chakrabarty, 2002).

Museums are putting efforts to engage more audiences in the past twenty years, For people who have never set their foot in a museum or gallery, it does not necessarily mean that they are not intellectually efficient enough, it may be that they just defy the concept of a museum or they just do not agree with the value of exhibition making. Popular music could be an entry point for museum to attract new audiences, music is a language without nationality or classification, and it can communicate with many people all over the world. As Eithne Nightingale, a previously V&A Head of Access, Social Inclusion and Community Development has commented, ‘...to keep music at the door of museums seems nonsense. It cuts off an important aspect of people’s cultural and social heritage and deprives museums of one of the most effective ways of bringing in new audiences...’ (Clarke, 2008). This shift in thinking about the role of museums has not just come from within the institutions themselves, but has been motivated by wider social and political agendas. As in nowadays, museums have an important role to play in contemporary society through educating the public about social history, demonstrating community engagement and in maintaining dynamic collections which speak to and reflect today’s diverse communities. Music can be interpreted as an important part of human society and culture, while museums can serve as windows to showcase and display such significant cultural heritages. In this paper, the exhibit ability of popular music will be examined as shown in Figure 1, through audience communication, exhibition interpretation and exhibition design.

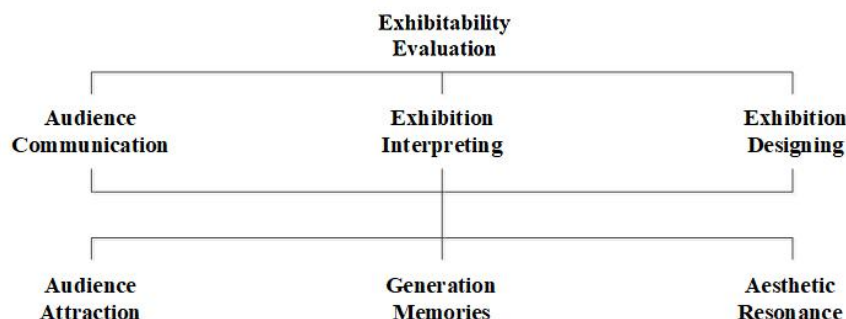

Figure 1 The Diagram of The Exhibit ability Evaluation

## 2.2 Exhibiting popular music in the Victoria and Albert Museum

The presentation of popular music in museums had started quite early in London. In 1973, the V&A became the first museum in Britain to present a rock concert. The contemporary presentation of popular music in the V&A attempted to connect the music with cultural contexts provided from its own collection. Since it is a museum dedicated for the representation of contemporary art and design, one requirement of the objects both in exhibitions and collections in the V&A would always tend to be connected with its culture evaluation, as stated by Victoria Broackes, Head of the Exhibitions for the Department of Theater and Performance at the V&A,

“In a museum of art and design where many objects are wonderful and fascinating, but may have no direct connection to people’s lives and interests, it is exciting to deal with material that is not only hugely creative but also connects with our visitor. And it has a direct relationship to many areas that we already collect and exhibit, such as costumes, such as fashion, graphic design, posters, set-design, photography... These are all things that are traditional subject matters for exhibitions. But music brings those things together and connects them in a form that people already understand, but are also eager to know more about.” (Victoria Broackes, 2017)

Indeed, with the already established categories of art and design collection, it would require some innovative elements to make an intriguing narrative of an exhibition, in order to attract new audiences. The fact that many objects in the V&A temporal popular music exhibitions were loaned from other institutions, for example musician’s archive, also indicates that inviting popular music components into the museum opens a new gate for the dialogue between modern art and traditional classic art temple.

The Victoria and Albert Museum has its collection for the popular music since the 1960s, as part of the Theater and Performance collection. The first exhibition dedicated to a pop star in the V&A is “Kylie - The Exhibition” (2007), the commercial success of this exhibition reveals the fact that this exhibition could actually attract new visitors to the museum, as shown in table 1, the table only includes the visitor number in the V&A South Kensington venue.

**Table 1 A List of Visits to Popular Music Exhibitions in the V&A Museum**

Exhibition Title	Date	Visits
Kylie - The Exhibition	Feb, 2007 – June, 2007	271,100
David Bowie Is	March, 2013 – Aug. 2013	312,000
You Say You Want a Revolution? Records and Rebels 1966-1970	Sept. 2016 – Feb. 2017	243,387
Pink Floyd: Their Mortal Remains	May 2017 – Oct. 2017	352,189

Source: data collected from V&A Annual Report and Accounts

The results of its commercial success almost simultaneously brought praise and denunciation by different commentators. Even though "Kylie" exhibition has led to many criticisms of the V&A museum, as some described it as “dumbing down<sup>90</sup>”, the museum did not seem to be defeated by these critics. In 2013, the “David Bowie Is” exhibition was held at the V&A museum as its second exhibition dedicated to a pop star. At that time, the exhibition broke the record for the V&A ticket selling and once became the most-visited show in the museum’s history, not to mention that after 5 years of this exhibition touring exhibited in more than 9 venues worldwide, it has been seen by more than 2 million visitors.

<sup>90</sup> <https://www.theguardian.com/music/2007/feb/07/kylieinogoue>

Proceedings of the 16th International Conference on Innovation & Management - 1645 -  
While there are still suspicions around the appropriateness of exhibiting popular music within a museum space, it is the high time to start recognize the value of exhibiting popular music and its utilization for visitors' attraction.

### **3 “Pink Floyd: Their Mortal Remains”: Audience Communication**

While a growing interest has shown in museums around the research of popular music, what has been left out from the investigations is, how music displays can be interpreted as ways to attract new or under represented audiences. The exhibition Pink Floyd: Their Mortal Remains was held at the Victoria and Albert museum (V&A) in London, from 13th May to 1st October 2017, during which it became the V&A's most visited music show exhibited in the venue (2017). In as early as 2006, a visitor surveys conducted for Museums Libraries Archives partnership had pointed out that the subject a museum or its collection on display is one major factor that draws visitors to a museum (Ipsos Mori, 2006). It seems hard to deny that the subject matter of popular music could have been an important motivator for attracting new and hard to reach audiences.

The Pink Floyd exhibition covered the music and cultural material of the band from its early psychedelic experimentation in the early sixties to the present day, including music, hand-written lyrics, the album design, stage design, reproduction of the installations which used to be presented on their performance stage, instruments from the members, and even technology from the original live stages of Pink Floyd. In the words of one of the co-curators, the focus of this exhibition is on visual and sound, not only in consideration of the creative representation of Pink Floyd, but also for the cultural contexts that the V&A has to present (Personal Conversation with Victoria Broackes, 2017).

The journey of this exhibition starts with a psychedelic 'groovy' telephone box (design based on the original British red telephone booth), and many of its kind continue to be a part in the exhibition, everyday material from the relevant eras were displayed in them. It seems like those telephone boxes are becoming a kind of symbolization of each period of the band's life and they help to build connection with the social events, they can be interpreted as the kind of Time Machine which reminds visitors of the significant historical event throughout this journey of time traveling in Pink Floyd's music world. In the first room, a time table named 'Pink Floyd Family tree' which shows the history of Pink Floyd is printed on the wall. For some people, it could be a brief introduction to this band, while for others, it could be an unforgettable calendar of the days that are important in their lives. The exhibition is divided into ten sections following the chronological order, the main part of each exhibiting sections presented several representative albums, such as a large space dedicated to "The Wall (1979)", and a room for the visual and sonic art creations from "The Division Bell (1994)", while the last section is dedicated to show the band's music video and concerts footage.

In the David Bowie Is, You Say You Want a Revolution and Pink Floyd exhibitions at the V&A, there is one section dedicated to the stage of artists which contains live stage scenes, concert footage and music videos. It gave many visitors the multi-sensory experience to be surrounded by music in the crowd as if they were in one concert. The section of live stage performances can be think of as a retrospect of an artist's life achievements, the communication within music itself sounds more powerful than words. When the live performance of Jimi Hendrix, the Who and Sam Cooke were presented in the Revolution exhibition, their voice does not just represent themselves, but rather represents a voice of a generation who shared the same experiences.

The reasons for creating multi-sensory interpretive tools and to choose live performance as exhibiting sections, are in a way, existing to enhance stronger connection with the audience. As stated by the exhibition's co-curator Victoria Broackes, "I actually do believe that the Live AV show could work as an experience - and that we've uncovered that rather unexpectedly as a by-product of these

Proceedings of the 16th International Conference on Innovation & Management - 1646 -  
exhibitions. The theatrical, immersive techniques we see in theatre now, and that we've employed in our exhibitions, really do give the ability to have an exceptional 'live-performance' experience (Victoria Broackes, 2017)." Music exhibitions allow people to be indulged in a multi-sensory, highly immersed environment and they allow a lot of shared knowledge and experience to be exchanged.

#### **4 Pop Music Exhibitions: Designing and Interpreting**

The traditional ways of interpretation in exhibitions has long been updated by modern technologies and a new generation. Instead of using the text panel as the main interpretive tool, more tools have been used in the exhibition making, especially when dealing with the subject around music, a multi-sensory tour with sound is an inevitable concern. The questions concerning about sound interpretation lies in: how to translate this intangible cultural form into an object and to place it under different contexts.

In the case of Pink Floyd exhibition, the whole narrative was presented in the carefully designed space, in a room where you were able to carefully read specific written material of one object and possibly feel as if building up intimate relationship with it, then in the next moment, you could be impressed by larger-than-life (scale) installations that connected with the object and the music you are listening to. This arrangement brings contrast and tension to the experience, because it allows visitor to get closer to the exhibition, allows them to feel like they became a part of this exhibition and then this could lead to positive emotional response. This kind of highly engaging interactions with the visitors worth to be examined. In the previous studies, the former director of Curatorial and Collections at Experience Music Project (EMP, in Seattle) argued, "the driving objective is to have visitors feel like they have been 'inside' the content, so the experience is more immersive and conversational than passive and professional" (Bruce, 2006). Storytelling type of exhibition helps to build connection with visitors, it doesn't just allowed people to be impressed but also to be educated.

There is another section in the Pink Floyd exhibition that has created immersive experience for visitors. A space dedicated to the album 'The dark side of the moon' was in the middle of the exhibition as a junction from their earliest practices to their later performances. The hologram of the album cover for 'The dark side of the moon' was placed in a room in which the floor, walls and ceiling were completely dark, only the three-dimensional prismatic pyramid rotating in the centre were in sight, while visitors were immersed in the moving image, their experience was also accompanied by the songs from the album on their personal headphones, however, without any label or explanatory text. This special section is said to have created the atmosphere of a cinema. This kind of visual and sonic immersive exhibition tend to create highly effective multi-sensory response from the visitors, which reflects the previous studies on the possibility to take the museum as having long been a context for multi-sensory, multi-dimensional communication (Henning 2006). It allows visitors to have a thoroughly communication with the band but also to oneself, to reflect on the previous objects, connect oneself with the past time and present, and perhaps to reach more thorough understanding of life. Moreover, when this experience is shared by a group of people from different generations together, potentially, personal memory was then transferred into a kind of collective culture which has its significance in society.

To conclude, taking the stance that exhibitions should create experience for visitors, many aspects around the use of technologies could be learned from the curatorial practices in the V&A, especially from the Pink Floyd, Revolution and David Bowie exhibitions. In order to create an immersive, multi-sensory exhibition, curators should always consider the viewpoint from visitors and to give them the space and time to think instead of being didactic. When using the right way to present music, it has the power to build connection between people and the past times.

## 5 Conclusion

Under the path of rapid development of mass media, it is important to examine the subject of an exhibition, for museums should have the responsibility to provide visitors with a reinterpretation of established collections under new critical approaches, especially when in a sense, the subject has broader audience. It was argued that the values of exhibiting popular music and its related cultural materials reflects in its materiality, emotional effects and its positive influence on attracting museum audiences. While admittedly, popular music exhibitions should not be represented as solely a celebration around music celebrities, it is high time for museums to make use of advanced technology to develop a web of popular culture which presents a diversity of experiences.

## Analysis on the Reports of French Media on People-to-People Exchanges between China and France

Zhang Rui

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070  
(E-mail: ruizoe\_zhang@126.com)

**Abstract:** Since the China-France High-Level People-to-People Exchange Mechanism has been in operation for five years, the scope of cooperation in people-to-people exchanges of the two countries has gradually expanded, resulting in a lot of substantial progress. This article aims to understand France's views on China by studying from the perspective of the recognition of French media on people-to-people exchanges between China and France. The methods of content analysis and frame analysis have been used in this article to conduct a quantitative and qualitative study on the reports on people-to-people exchanges between China and France from *Le Monde*, one of France's most influential media. This article argues that *Le Monde*'s coverage of the people-to-people exchanges between China and France is relatively friendly. At the same time, however, all the critical framework in *Le Monde*'s reports is related to politics featuring a tendency of pan-politicization. To better promote people-to-people exchanges between China and France and remove France's misunderstandings and doubts towards China, we should pay attention to the exchanges and cooperation between the media of both sides.

**Key words:** People-to-People exchanges; French media; China-France High-Level People-to-People Exchange mechanism; Content analysis; Frame analysis

### 1 Introduction

In September 2014, which marked the fiftieth year of Sino-French diplomatic relations, the China-France High-Level People-to-People Exchange Mechanism was officially established, becoming the third vice-premier-level annual dialogue mechanism between the two countries following the High-Level Strategic Dialogue and the High-Level Economic and Financial Dialogue. In the past five years, the people-to-people exchanges between the two countries have continued to operate at a high level, with the scope of cooperation gradually expanding to 10 areas including education, technology, culture and sports<sup>91</sup>. Driven by the overall promotion of the high-level dialogues, exchanges and cooperation in various related fields have been flourishing, which results in a lot of substantive progress.

With the promotion of the China-France High-Level People-to-People Exchange Mechanism, domestic media and scholars have been paying more and more attention on people-to-people exchanges between China and France, but mainly focusing on the origin, achievements and significance of this mechanism in news. Some research institutions have held think-tank conferences themed with that but haven't published any relevant research reports or papers. "Analysis of the Cognitive Tendency of

---

<sup>91</sup>News on Chinese government website, the fourth meeting of the China-France High-Level People-to-People Exchange Mechanism was held, [http://www.gov.cn/guowuyuan/2017-11/24/content\\_5242045.htm](http://www.gov.cn/guowuyuan/2017-11/24/content_5242045.htm) (In Chinese)

Proceedings of the 16th International Conference on Innovation & Management - 1649 -  
French Think Tank on Sino-French 'People-to-People Exchanges'" published by the scholar Cheng Ping is the only academic paper on Sino-French people-to-people exchanges up to now. This paper summarizes the articles, interviews and research reports on people-to-people exchanges between China and France of French experts and opinion leaders engaged in the think tank of international relations, and it analyzes the cognitive tendency of French think tank about Sino-French people-to-people exchanges (Cheng Ping, 2019). In fact, understanding France's views can help us establish effective communication to resolve the misunderstandings and doubts of France on us in time and design more pragmatic cooperation programs to enhance the role of the China-France High-Level People-to-People Exchange Mechanism. Besides, analyzing the French media's reports on Sino-French people-to-people exchanges is another important perspective to understand the French society's attitude towards such exchanges.

The domestic academic researches associating journalism with construction of national image dated from 1990s. The paper "National Image in International News Communication" (Chen Xiaou, 1996) is a representative one. The overseas researches on national image mainly focus on public relations, and Images of Nations and International Public Relations (Michael Kunczik, 1997) is a classic work. After entering the 21<sup>st</sup> century, there have been more and more domestic academic researches on the national image of China in the world, which gradually focus on public relations. In recent years, Chinese scholars have carried out a great number of researches on the national image of China in the world by analyzing the overseas media's reports on China. Researchers keep track of the researches on the national image of China displayed in the mainstream media of countries such as the United States, the United Kingdom, Russia, France, Germany, Japan, and South Korea. For the study on the national image of China built by French media, the scholars mainly carry out their researches by focusing on French mainstream media's reports on a certain aspect of China, such as analyzing the reports on the environmental issue (Chai Ling, 2005) or Diaoyu Island issue (Luo Xin, 2013) of China the French media's interpretation for the "China Dream" (Wu You, 2016), Chinese females' image (Cheng Bo, 2017), Hongkong's image (Lv Ying & Ruan Shuhui, 2015), China's Economic image (Zheng Lisha, 2015) and China's Economic Reform image (Hong Hui, 2018) in the French media. This article presented will analyze the French media's news reports on Sino-French people-to-people exchanges to get knowing of the French media's reporting attitude towards it and the image of China built in the reports.

## **2 Data and Methodology**

We have chosen Le Monde (French: The World), one of the most important newspapers in France, to conduct a study to decode the image of China in the eyes of French media. Le Monde enjoys a high international reputation, representing the French government's position in the reports of international issues. As a mainstream medium, Le Monde reflects the consciousness and values of the mainstream French society. It is convincing and significant for the study of the Chinese image in French mainstream values.

In addition, as the concept of "people-to-people exchanges" is relatively abstract, we referred to the list of the fields covered by the people-to-people exchanges in the China-France High-Level People-to-People Exchange Mechanism - education, science & technology, culture, health, news media, sports, tourism, local cooperation, youth and women - and we made judgments based on the lexical connotation of the "people-to-people exchanges". We believe that the news in the fields of the people-to-people exchanges is the sum of all news except political, economic, and military ones.

In this study, the paper medium of Le Monde in the Europresse Database was selected as the search

Proceedings of the 16th International Conference on Innovation & Management - 1650 -  
source, and the keyword China or Chinese was searched throughout the articles, with the time span of from May 14, 2017 to August 31, 2018. May 14, 2017 marks the time when the centrist independent candidate Macron became the president of France, representing the change in France's domestic political ecology and constituting a new background for the French policy towards China. After the full-text search of the keywords, the Europresse Database finally presented a total of 3,337 articles covering China or Chinese news reports. Based on the definition of the fields covered by people-to-people exchanges, the method of exclusion was used to screen these reports. In the end, we have selected 56 news reports dated from May 14, 2017 to August 31, 2018 of Le Monde that are closely related to the topic of people-to-people exchanges between China and France. We conducted content analysis and frame analysis to study these reports.

The content analysis is a research method based on various literatures, which converts non-quantitative materials into quantitative data and makes inferences based on the data. The frame analysis is a common method in communication. We summarize the words, narratives and other elements in the news to get the points of views, attitudes and corresponding emotional connotations revealed in the report writing, that is, the implicit framework of the news text.

### 3 Results

#### 3.1 Results of quantitative analysis

We conducted the content analysis from the three aspects of news writing: report content and tendentiousness. We obtained the following results:

(1) Le monde's reports on people-to-people exchanges between China and France are mainly in a detailed and in-depth form. Le Monde's most important report genres on people-to-people exchanges between China and France are press release and survey report, accounting for 51.8% of the total reports, followed by people features and exclusive interviews, accounting for 21.4%. These two genres share the common characteristics of emphasizing narrative and description to conduct detailed and vivid reports on the report objects, which, together, account for 73.2% of the total reports. (see Figure 1)

Figure1 News Forms of the Reports

(2) In terms of the report topic types, Le Monde's coverage of people-to-people exchanges between China and France is relatively friendly. With the positive and negative topics accounting for 41.1% and

Proceedings of the 16th International Conference on Innovation & Management - 1651 -  
 39.3% of the total reports respectively, the two types of reports are basically in the same amount, and the positive reports are slightly more than negative ones. The sum of the basically neutral and positive reports accounts for 60% of the total. (see Figure 2)

**Figure 2 Topic Types of the Reports**

(3) Le Monde’s news related to people-to-people exchanges between China and France in the studied period are concentrated in four fields: culture, technology, sustainable development and society, accounting for 51.8%, 19.6%, 17.9%, and 10.7% of the total reports respectively. Among them, the culture field sees the most reports, accounting for more than half of the total, with the most abundant topics. It is worth noting that Le Monde is very concerned about the development of China’s science and technology, which has become the second most concerned field followed by the culture. (see Figure 3)

**Figure 3 Topic Fields of the Reports**

(4) The tendentiousness of the report refers to the author’s attitude in the report. Le Monde’s reporting on people-to-people exchanges between China and France is dominated by neutral reports featuring being “objective and neutral”, accounting for 85.6% of the total reports; objective and positive reports account for 92.8% of the total. Le Monde’s reporters hold a friendly attitude towards people-to-people exchanges between China and France. (see Figure 4)

**Figure 4 Tendentiousness of the Reports**

### 3.2 Results of frame analysis

Based on the overall results of the previous section, we conducted a detailed analysis on the news reports in various fields, and found that they are of different characteristics.

#### 3.2.1 Culture field

There is a wide range of reports in the culture field. Le Monde's reporting interests cover Chinese art, humanistic values, architecture and Sino-French cultural exchanges and cooperation events. As a country with a long history and profound artistic background, France has maintained a high degree of attention to Chinese culture. From the perspective of the timeline, both traditional and contemporary Chinese cultural issues are involved presenting a more open and modern China. The most reported topics focus on Chinese modern movies and filmmakers, accounting for half of the reports in the field; in addition, the attention to the Sino-French cultural exchange and cooperation events and Chinese young architects is also a feature of the reports in the culture field.

In terms of films, Le Monde's interest in Chinese modern movies is concentrated on independent films, documentaries and literary films, and it pays special attention to Jia Zhangke, an independent film director and screenwriter, with nearly half of the film reports related to him. As introduced in a report that "the symbolic violence of Chinese society has always been the great subject of Zhang keJia's film"<sup>92</sup>, Le Monde's great interest in Jia Zhangke's films represents its concern about the tragedy in Chinese society to some extent. In fact, Le Monde's coverage of Chinese films features mostly negative topics, which mainly reflect the tragic and helpless fate of nobodies in Chinese society, as well as the restrictions on free expression that creators are facing and other similar issues.

The development of Chinese contemporary art and young architects has also received much attention. All reports on these two topics are positive. Le Monde outlines the group image of contemporary Chinese young architects who are professional, confident, international, open-minded and respecting traditions.

#### 3.2.2 Science & technology field

The reports of Le Monde in the science & technology field are of extensive interests and wide visions. The aspects involved are from automatic drive technology to the development of aerospace, from the world forefront quantum communication to the mobile payment which is closely connected to the convenient life of the civilians. "Today's China is a strong country in science and technology research" is the basic viewpoint of Le Monde reporting on China's Science & technology field. This condition is reported in most of the reports which have not only introduced the advanced technology strength of China, but also delivered the attitude in the articles that France and Europe need to reinforce the cooperation with China to realize win-win situation. The reports say that China's scientific and technical level is catching up with and surpassing the European and American powerhouses. Spending less than 10 years to surpass 10 countries, China has currently become the 2nd technology research powerhouse in the world<sup>93</sup>. They have confidence in China's future<sup>94</sup> and they think that "in the future

---

<sup>92</sup>Isabelle Regnier. And the gentle Jia Zhangke unsheathed her sword[N]. Le Monde, 27/05/2017:TEL20 (In French)

<sup>93</sup>Sylvestre Huet. China overturns the world scientific chart[N]. Le Monde, 07/04/2018: SCQ1 (In French)

<sup>94</sup>Simon Johnson, Jonathan Ruane. China soon to be world champion of innovation [N]. Le Monde,01/11/2018: SCQ7 (In French)

The negative reports on science & technology field are mainly established on the viewpoint that the wide application of China’s artificial intelligence technology threatens the personal information security of the Chinese citizens. Le Monde has connected science & technology with politics, establishing the news framework that the Chinese government is monitoring the Chinese citizens more strictly by using artificial intelligence technology. A long communication reporting on the application of China’s facial recognition technology is entitled “In China, facial recognition invades everyday life”<sup>96</sup>. The emotional coloring of the word “invade” (envahir) in the title is very derogatory, with the meaning of unauthorized or violent entry. The readers, especially those cultivated under the western social culture which lays emphasis on personal boundaries, may feel very uncomfortable when reading this word. Combined with the authoritative image of China which has been agitated by the western media, it has further deepened the rigid political impression on China.

### 3.2.3 Sustainable development field

During the period of being analyzed, there were 11 reports from Le Monde on China’s sustainable development, in which the topics involved include environment protection, energy and urban planning.

The environment is the most important topic of Le Monde on China’s sustainable development. Because the environmental issue is always mixed with the nation’s politics and benefits and is becoming more and more globalized which results in “environment diplomacy” (Chai Ling,2005). China’s environment has always been one of the issues that the French media focus on, which is “one of the factors that concern the desire of foreign enterprises to invest in China” (Hong Hui,2018). Among the analyzed reports of Le Monde, the main topics of the reports on the sustainable development occupy half of the number of its reports on the topics of China’s environment protection. LI Yuan pointed out that “in the analysis on the reports of Le Monde on China’s environment from the year of 2009 to 2011, the reports of Le Monde on the efforts and progress made by the Chinese government to improve environmental conditions are in the minority of its reports”(Li Yuan,2014). This reporting characteristic in the reports of Le Monde on China’s environment has changed obviously since May of 2017. No matter the governmental measures that aim to improve the quality of air, or the residents’ volunteer activities that assist with garbage classification, Le Monde has reported the efforts made by China to protect the environment.

In fact, the reports of Le Monde on China’s environmental issue show its contradiction and entanglement. France is seeking assistance from China on climate change issues. On the one hand, Le Monde is reporting the positive efforts made by China on environmental protection; on the other hand, it uses the environment issue as a breakthrough to criticize China’s social and political issues. In the reports, the environmental incidents are always used as entry points and then transferred quietly to the establishment of the governmental image of the Chinese government when facing the environmental crisis.

### 3.2.4 Society field

Compared to the reports on other fields, the portion of reports on the negative topics on society field is quite high, which is the most outstanding characteristic of these reports. The topics involved in the reports on society are all population issue, mostly reporting about youth, women and urban migrant

---

<sup>95</sup>Charles-Edouard Bouee. China is also a power of innovation[N]. Le Monde, 20/10/2017: SCQ7 (In French)

<sup>96</sup>Simon Leplatre. In China, facial recognition invades everyday life[N]. Le Monde, 11/12/2017:SCQ2 (In French)

The reports of Le Monde on China's society especially focus on the difficulties of the vulnerable groups. A nation with the tradition of liberty, equality and fraternity, which is treated as political correctness in the country, will naturally focus more on the vulnerable groups. This indicates the value orientation of the French media. However, Le Monde only reports on some specific social phenomena of China to represent the overall social condition in China. The news reporting based on ideological choices has lost its objectivity and replaces its objectivity with opinion orientation. In addition, the reports of Le Monde are immediate with great timeliness, stating the latest news and phenomena that happen in China. But the news reporting frame established via news incidents is full of platitudes. During 2009 to 2011, the reports of Le Monde on the society "shaped a social image that China is full of unsafe factors with various social contradictions being relatively activated"(Li Yuan,2014). Nine years later, the news reporting frame firmly grasped by Le Monde is still the denounce on China's human rights issues, which actually arises out of France (Western)'s attack from ideology on China that has a different political structure from it.

#### **4 Conclusion**

Through the methods of content analysis and news frame analysis, this article has conducted quantitative and qualitative analysis on the reports of people-to-people exchanges between China and France since the administration of the Macron government. We found that: Le Monde's reports focus on four fields: culture, science & technology, sustainable development and society. On the whole, Le Monde's coverage of the people-to-people exchanges between China and France has been relatively friendly since Macron, the new president, took office. After further analysis, we found that news reports on different fields have different characteristics. In general, however, the critical framework in Le Monde's reports is related to politics and has a tendency of pan-politicization. In the international exchanges, the principle of seeking common ground while reserving differences is of great importance. Except for the news reporting framework caused by ideological differences, the French media has also highlighted a progressive, open-minded, and humanistic image of contemporary China, by not only reporting the great progress that China has made in scientific research, but also describing Chinese new-generation designers with an international vision and artists reflecting on the society and caring for the vulnerable, etc.

There is still a long way to go to enhance mutual understanding between the two countries, especially for France to understand China. The China-France High-Level People-to-People Exchange Mechanism, proposed and created by the top leaders of China and France, marks a milestone on this way. At the same time, various underway exchange events under way are also an important opportunity to enhance France's understanding of China's real society. Now that we have realized the huge influence of the media, we should immediately enhance the communication and cooperation between the Sino-French media. For example, we can conduct cooperative interviews and joint drafting for major news events related to both China and France. Such deep communication and cooperation is bound to achieve a better understanding, for the Chinese and French media, of each other's perspectives and views on the other's culture and society. And there are also various potential forms of exchanges and cooperation to be achieved by our creativity.

# Research on User's Requirement of Game Handle Products Based on KANO Model

Li Qiong, Xu Wei

Department of Economic Management, Wuhan Huaxia University of Technology,

Wuhan, P.R. China, 430223,

(E-mail: liqiong913@163.com, 53589077@qq.com)

**Abstract:** Based on the KANO model, this paper analyzes and studies regarding the most important user requirements in the design of game handle products. Started with the problem of user demand response, combined with the first-hand questionnaire information, and from the perspective of user acceptance and demand weight, by using the KANO model to find the main concerns of the current game handle product users, the paper finds the Bluetooth compatibility is the most important factor affecting users' needs, followed by platform support, keys of game handles, operation of game handles, upgrade of handles and evaluation of game handles.

**Key words:** Game handle products; Users' needs; KANO model; Product demand point.

## 1 Introduction

With the popularity of the Internet and the rapid development of computer technology, the game handle from the traditional handheld start with the computer, smart phones, tablet and smart TV products began to converge, the users in a variety of smart devices play game led to the game product demand becomes diversified.

The research on KANO model and user demand at home and abroad mainly shows two angles. First, the Kano model and QFD are combined to modify the weight of the customer demand information in the QFD, by looking for the focus in the product design process, such as determining the strong and weak correlation between customer demand and product quality characteristics (Duan Liming and Huang Huan, 2008), establishing quality houses including customer needs and quality characteristics (Tang Xiaoling and He Yan, 2013), and adding the indicators of customer satisfaction (Chen Chen and Liang Gongqian, 2013), etc., to find key elements to promote new product development. Second, the Kano model and QFD are combined to find the key factors most affecting customer satisfaction (Huei-Jiun Lai, Hsin-Hung Wu, Carmen Llinares, Alvaro F. Page, 2011). However, using the KANO model to study the user needs of gamepad products is almost blank.

Proceedings of the 16th International Conference on Innovation & Management - 1657 -

## 2 Based on KANO Model Handle Product Users' Needs Confirmation and Questionnaire Generation

### 2.1 Confirm the current user's use of the game handle in the process of fuzzy needs

This stage through the brainstorming method enumeration of the game handle users in the use of the game handle the process may encounter problems, after collecting discussion, combined with practical work experience, including supporting software, game update convenience and 42 users fuzzy demand point ( Zhong Xia, Liu Wei, Xu Jialiang,2015,LiFangyu, Zhang Ruifo,2018 ) .

### 2.2 Classification and screening of users' requirements

According to the importance of the project to remove, the same meaning of the same expression of the merger, for the users to improve the class needs to join the survey and the importance of the questionnaire survey of four aspects of the fuzzy demand point of users' needs point classification and screening.

**Table 1 The Classification Filter List of Users' Demand Point**

Demand classification	demand point
	Using 2.4G wireless technology
Poor Bluetooth compatibility	Using double Bluetooth 3.0 and 4.0 optimize Using full-speed USB data cable connection
	Collaborate more partners
Support the small number of games	Open handle connection agreement to game maker Develop technology adaptation game to support handle Increase the connection agreement of handle support
The poorest support of platform	The support of independent game development platform With more partners Increase the handle reset hole to prevent recovery after the crash
Game handle key fault	Button with anti-skid design for button buffer Fixed with nonmetallic material
Game handle operation is too complicated	Unofficial game out of the handle key bitmap Key operation instructions
The handle of the shock motor does not feel strong	Using double motor design Vibration motor with adjustable motor

Support for mobile device upgrades on the basis of support for PC-side upgrades

Handle upgrade is not convenient

Support for more system upgrades such as smart TV terminal handles

Lack of game handle evaluation

Increase the game player evaluation

Media evaluation

### 2.3 Form a questionnaire model, the production KANO questionnaire

Clearly need to investigate the demand point, according to the requirements of the KANO model to generate the corresponding questionnaire to start the investigation. A total of 300 questionnaires were issued and 206 valid questionnaires were collected.

## 3 Data Processing and Results Analysis

### 3.1 Questionnaire based on the KANO model of the user needs of the initial analysis

KANO model analysis through the users to answer the positive and negative questions, analysis of the user's comments. For example, for a user's demand, the users' answers for positive questions to called "I like", and the answer to the reverse question is "I do not like", the user thinks the requirement is "expectation". The possible results for each users' requirements are summarized as follows:

**Table 2 The Possible Distribution Results of KANO Model Users Recommend**

Positive question	Reverse question				
	I like	should be so	does not matte	I can tolerate"	I do not like
I like	Suspicious result	Excitatory demand	Excitatory demand	Excitatory demand	Expected demand
should be so	Reverse result	Do not care	Do not care	Do not care	The basic needs
does not matte	Reverse result	Do not care	Do not care	Do not care	The basic needs
I can tolerate"	Reverse result	Do not care	Do not care	Do not care	The basic needs
I do not like	Reverse result	Reverse result	Reverse result	Reverse result	Suspicious result

Note: Expected demand refers to the respondents are very much looking forward to the realization of the function; excitement is the respondents in the positive question of the survey selected "I like" and reverse the problem chosen "should be so", "does not matter" "I can tolerate" the demand; the basic needs of the respondents are not sensitive to the positive problem, but the reverse problem showed great discontent; suspicious results that the user's answers contradictory; reverse results refer to the user that the answer is the opposite of the opinion of the survey designer. Do not care that the user is not concerned about the questions raised by the questionnaire, not particularly interested.

Proceedings of the 16th International Conference on Innovation & Management - 1659 -  
 After this statistic, the KANO model requirements classification table can be obtained by  
 classifying the columns with the largest number of vertical and horizontal users.

**Table 3 Summary of KANO Model Requirement Classification**

Question	Demand	KANO Model Requirement Classification
Poor Bluetooth compatibility	Using 2.4G wireless technology	Excitatory demand
	Using double Bluetooth 3.0 and 4.0 optimize	The basic demand
	Using full-speed USB data cable connection	Expected demand
Support the small number of games	Collaborate more partners	Do not care
	Open handle connection agreement to game maker	Do not care
	Develop technology adaptation game to support handle	Expected demand
	Increase the connection agreement of handle support	Expected demand
The poorest support of platform	The support of independent game development platform	Excitatory demand
	With more partners	Expected demand
	Increase the handle reset hole to prevent recovery after the crash	The basic demand
Game handle key fault	Button with anti-skid design for button buffer	The basic demand
	Fixed with nonmetallic material	Expected demand
Game handle operation is too complicated	Unofficial game out of the handle key bitmap	Expected demand
	Key operation instructions	Excitatory demand
The handle of the shock motor does not feel strong	Using double motor design	Expected demand
	Vibration motor with adjustable motor	Expected demand
Handle upgrade is not convenient	Support for mobile device upgrades on the basis of support for PC-side upgrades	Expected demand
	Support for more system upgrades such as smart TV terminal handles	Do not care
Lack of game handle evaluation	Increase the game player evaluation	The basic demand
	Media evaluation	The basic demand

### 3.2 Weight analysis of the Product of game handle demand point based on KANO model

To visually reflect the problem, we quantify all user requirements and insert weight. It can better reflect the intensity of demand because of the weight.

**Table 4 KANO Model User Demand Weight Distribution**

Sector	I like	Reasonable	Whatever	I am fine	I don't like it
Forward problem	1	0.5	0	-0.5	-1
Inverse problem	-1	-0.5	0	0.5	1

By adding weights, the actual survey data are taken into account to obtain the weight of each user's demand. please read the below :

**Table 5 User Requirements Weight Summary**

Problem	Demand	Demand value
Poor Bluetooth compatibility	Using 2.4G wireless technology	282.5
	Use dual Bluetooth 3 and 4 and optimize	201
	Use a full speed USB data line connection	198.5
	Cooperate more partners	117
Fewer games supported	Open handle connection protocol to game maker	228.5
	Development technology adaptation game support handle	161.5
Platform support error	Connection agreement with added handle support	160
	Independent development of game platform support	254.5
	And more partners	225.5
Game handle button fault	Increase the handle reset hole to prevent recovery after the crash	228
	The key adopts anti-skid design to buffer the key	221.5
	The material is fixed with metal material	24.5
The handle is too complex	Unofficial Game out handle key bitmap	232.5
	Button operation prompt	257.5
The vibration motor of the	Dual motor design	229.5

handle does not feel strong	The vibration motor adopts adjustable motor	218
Handle upgrade is not convenient	Support mobile device side upgrade on the basis of supporting PC side upgrade	229
	Support more system upgrades such as smart TV terminal handles	178.5
Lack of joystick evaluation	Add game player evaluation	227.5
	Media evaluation	231

### 3.3 Ranking analysis of user acceptance based on KANO model

Table 6 Based on KANO Model, User Acceptance and Other Analysis Summary

Problem	Demand	User acceptance	Reverse subscriber rate	Total demand value	Per capita demand weight
Poor Bluetooth compatibility	Using 2.4G wireless technology	78.64%	0.49%	282.5	1.378
	Use dual Bluetooth 3 and 4 and optimize	72.82%	0.97%	201	1.581
	Use a full speed USB data line connection	74.27%	4.37%	198.5	1.0076
	Cooperate more partners	38.35%	0.97%	117	1
Fewer games supported	Open handle connection protocol to game maker	66.02%	1.94%	228.5	1.1312
	Development technology adaptation game support handle	67.48%	0.49%	161.5	0.7878
	Connection agreement with added handle support	62.63%	1.64%	160	0.7882
Platform support error	Independent development of game platform support	74.76%	1.46%	254.5	1.2537
	And more partners	75.24%	1.46%	225.5	1.1108
	Increase the handle reset hole to prevent recovery after the crash	76.21%	1.94%	228	1.1287
Game handle button fault	The key adopts anti-skid design to buffer the key	73.30%	1.94%	221.5	1.0965
	The material is fixed with metal material	78.64%	1.46%	24.5	1.1847
The handle is too complex	Unofficial Game out handle key bitmap	77.18%	1.46%	232.5	1.1453
	Button operation prompt	72.33%	0.97%	257.5	1.2623

Proceedings of the 16th International Conference on Innovation & Management - 1662 -

The vibration motor of the handle does not feel strong	Dual motor design	75.73%	0.49%	229.5	1.1195
	The vibration motor adopts adjustable motor	73.30%	2.43%	218	1.0846
Handle upgrade is not convenient	Support mobile device side upgrade on the basis of supporting PC side upgrade	77.67%	1.46%	229	1.1305
	Support more system upgrades such as smart TV terminal handles	53.40%	2.43%	178.5	0.8881
Lack of joystick evaluation	Add game player evaluation	75.24%	3.40%	227.5	1.1432
	Media evaluation	73.30%	1.46%	231	1.1379

From table 6, we can see that according to user acceptance and demand level of weights of the top 10 key points in descending order, you can see there is overlap height of the following aspects, first of all users on whether to use the 2.4G wireless technology acceptance and demand weights are the highest, followed by the handle material for metal materials, if it is convenient for use in the mobile terminal, whether a key bitmap guidance, reset function, whether there is a dual motor design, if there is more support for cooperation, whether for user evaluation, if there is an independent game development platform, whether to use the full USB data cable.

## 4 Conclusion

From the perspective of user acceptance and demand weight, both are mainly concentrated in Bluetooth compatibility, platform support, keys of game handles, operation of game handles, upgrade of handles and evaluation of game handles. Judging from the specific needs of these six aspects, these indicators directly affect the direct experience and player communication in the game world when using the game handle products, but the direct stimulating impact on the game handle products such as the vibration motor feeling of the game handle is not strong. The final service product of the game handle product is still the game itself, and the factors of direct contributing to the experience of the game has become the main aspect affecting users' needs.

## Acknowledgement

This paper was the research on the Influence Mechanism of the EWOM Information Type and Quality on the Consumer's purchase intention in the cultural consumption industry - Hubei film industry as an example (No. 18G143) by the General Humanities and Social Sciences Projects of the Ministry of Education 2018. Also, this paper was one of the phased results of Research on the Reaction Mechanism of Online User Herding under the context of Cultural Consumption and was supported by the 2017 Annual Academic Research Fund Project of Wuhan University of Technology Huaxia College. (No.17025).

## Research on the Advantages of University Online Courses Based on "Super Star Learning platform"

Zhan Wei

School of Arts and Communications, Wuhan Polytechnic University, Wuhan, P.R.China, 430023

(E-mail:45671053@qq.com)

**Abstract:** With the continuous advancement of educational informatization reform, a number of network teaching platforms have emerged. How to select high-quality teaching resources and carry out online + offline hybrid teaching has been the focus of attention in the educational circles. Through more than one year's teaching practice and taking the course "Entering the Music World" as an example, the author uses comparative method, survey method and questionnaire method to analyze it. The author believes that "Super Star Learning Platform" should be applied in seven aspects: teaching environment, teaching idea, teaching content, teaching interaction, participation in learning, teaching evaluation and feedback reflection. It is better than the traditional way of teaching.

**Key words:** Music online course; Traditional curriculum; Advantage; Comparison

### 1 Introduction

Universities general education, as an innovative educational concept and modern talent training mode, is an indispensable supplement to professional education. Its purpose is to expand the breadth and depth of students' knowledge, so that students can develop in an all-round way (Jia Shurong, 2016). College music course has always been a popular elective course for college students. For a long time, limited by the conditions and hours of music courses in Colleges and universities, the traditional teaching methods cannot meet the needs of today's students for knowledge. In view of this situation, teachers and scholars have made some useful attempts, some of them have done some research on music courses in Polytechnic schools. Considering that students' music foundation is relatively weak, they advocate that appreciation courses should be the main course (Li Jing, 2018). Others, from the perspective of aesthetic education, have done some research on the curriculum system of general music education in Colleges and universities, and put forward that the music curriculum should be built into a comprehensive platform of aesthetic education in Colleges and universities (Ma Hua, 2019). Others study the music general education curriculum offered by three top universities abroad, especially in the United States, in order to help and draw lessons from domestic teaching (Zhang Yanli, 2017). The above contents have discussed the general music course in Colleges and universities from different aspects, but little has been mentioned about the research of network education platform. It is in this context that the online course "Entering the Music World" is carefully designed by the lecturer, specially designed and combined with online (superstar learning platform) offline hybrid teaching. Through nearly a year's operation, many problems in traditional teaching have been successfully solved. With the new teaching form, students' learning enthusiasm and initiative have been greatly stimulated, and the learning effect has been improved obviously.

## 2 Analysis

### 2.1 The openness of the teaching environment

As far as the traditional music courses are concerned, the classroom area is limited and there are considerable requirements for the quality of teaching, so there are certain restrictions on the number of students. A large number of students are not qualified to study this kind of course because the number of elective courses exceeds the limit. On-line course "Entering the Music World" completely breaks this restriction, changing "boundedness" into "unbounded", enabling students to have free time and space to learn, to truly "want to learn", and to learn the course repeatedly, so as to help students grasp the course knowledge more comprehensively.

The course was launched in 2018 on the Super Star Chu Course Alliance Learning Platform, which serves as a shared credit course for students in Universities of Hubei Province. In the past year, the rate of visits has reached nearly 200,000. At present, a total of 1,209 students have completed the course in three schools (Table 1), which can only be achieved in the traditional classroom for five years.

**Table 1 Course Selection Number of "Entering the Music World" in the Past Year**

	Jiangnan University	Spring of 2019	Wuhan Polytechnic University	Xueyin Online	Wuhan Institute of Technology
Numbers	228	355	395	123	108

### 2.2 The innovation of teaching ideas

Traditional teaching hours are limited. Generally speaking, teachers, students and after-class practice are used in the classroom. This kind of passive learning cannot really stimulate students' interest and enthusiasm in learning, the learning effect is discounted, and the teaching goal is difficult to achieve. The online course "Entering the Music World" breaks through the shortcomings of traditional teaching mode and limited teaching content. With the help of "superstar" platform, a new teaching concept of "students' initiative learning, teachers' guidance and practical experience learning" is established, which makes students' learning more interesting, convenient and efficient. From September 30, 2018 to December 20, 2018, this course was launched in Chu Class Alliance. 80.7% of the students used mobile clients to access their learning. (Figure 1)

**Figure 1 Student Visit Statistics**

Microvideos are also introduced in teaching (Nie Lei, 2018). The length of the micro-video, the emphasis and the difficulty are prominent. It can help students to "make up" for the lack of knowledge and solve the puzzles in learning in time. At the same time, it also cultivates their autonomous and spontaneous learning habits. Compared with traditional teaching mode, micro-video focuses more on students' own understanding and analysis. Pre-class preview and data collection have become an indispensable part of micro-video education mode.

In teaching, SPOC + flip classroom is effectively combined through Superstar Learning Platform, that is, students preview teaching micro-videos in advance through learning platform, while teachers have more time to analyze heavy and difficult knowledge online, or carry out flip classroom, or conduct art practice guidance exercises, etc. This kind of classroom returns to students, really. Student-centered teaching enables teachers to have more time to guide students, and students can grow up smoothly under the guidance of teachers.

### **2.3 The whole process of teaching evaluation**

In order to make college students achieve effective learning effect in the process of learning, college teachers adopt a series of evaluation methods in the process of implementing teaching activities for students. The purpose is to make students fully aware of the shortcomings and inadequacies of their own in the process of learning, so that they can correct them in time to make progress (Zhang Nuo, 2017). The traditional teaching evaluation has always paid attention to one-off, paper quality examination, while this course pays more attention to the whole process evaluation. In a letter before class, the students are clearly informed of the opening time of the course as a whole and each unit and the weight ratio of each learning content and link. The platform records every learning step of the student, whether it is attendance, participation in classroom learning, interactive mutual evaluation, group discussion, personal report, homework, class quiz, etc., each step of the score has a detailed time, time length, score record, etc. Students can also be clearly queried in the "statistics" module of the platform. In addition, the teacher has no right to change the background information settings of the students, and also eliminates the "love" at the end of the period. The occurrence of the whole process is open and transparent, which ensures the objectivity, comprehensiveness, fairness and fairness of learning evaluation.

## **2.4 The timeliness of feedback and reflection**

Teaching feedback is a process in which teachers transmit the information to students through the teaching process, and after students process and process the information, the effect will be transmitted back, which will have an impact on the future teaching. A good teaching feedback is clear, timely, two-way, real, targeted, motivating, guiding and diverse. Through teaching feedback, students' learning information can be collected, analyzed and utilized. Teachers can understand their own teaching effect and judge students' learning situation, so that they can timely and targeted control the teaching process, improve teaching and promote students' more effective learning. Only through continuous teaching feedback, can we make teaching more perfect, more conducive to promoting students' learning development, and then make teachers and students form a good teaching and learning atmosphere (Li JunXiang, 2017). The platform of "Super Star Learning Communication" understands students' learning behavior through the statistical function of background data, and can make individualized learning programs separately. Through the platform big data, we can conveniently master the universal problems existing in the learning of all students, as well as students' learning tendency, learning track and so on, which is convenient for timely teaching reflection, timely adjustment of teaching strategies and effective teaching improvement. In view of the above requirements, we try to solve them from the following aspects.

## **3 Method**

### **3.1 Customization of curriculum content**

With the national education policy gradually shifting the focus of students' education to the individualized development of students, the teaching of music courses in Colleges and universities in China began to reform in the direction of cultivating students' individuality. In teaching, teachers should adopt the teaching method of teaching students in accordance with their aptitude, adopt different educational methods according to the characteristics of different students, and formulate corresponding learning plans and contents for students to help students gradually improve their music professional level (Zhou Yaqing, 2016). General education is different from professional courses. There are no designated or fixed textbooks. Students come from different grades and majors, and their pre-knowledge level is uneven. At present, there are few general editions of textbooks in the market. The teachers of this course tailor-made the teaching content for the students according to the characteristics of students and the level of music knowledge. Music has the characteristics of the times, which requires that the curriculum content should be updated while maintaining the classicality. At the end of each semester, teachers can select music works which are both students' favorite and teaching value from the discussion and questionnaire results of students in the "Superstar" database, combined with the general courses of advanced universities abroad. The current edition of "Entering the Music World" is the content of the course, which is formulated by the teachers according to their own teaching experience of 20 years in ordinary colleges and universities through many surveys, to help students enter the music world smoothly in limited time.

### **3.2 The diversification of teaching interaction**

Interactive teaching mode is the basis of teaching students in accordance with their aptitude. Compared with traditional teaching mode, the main body of this mode changes into students, pays attention to students' feelings and thoughts, and realizes spiritual communication between teachers and students. Especially in the teaching of the abstract art of music, relying on traditional teaching methods is no longer suitable for the development of modern education, which has become a key factor affecting

Proceedings of the 16th International Conference on Innovation & Management - 1668 -

---

the improvement of the quality of music teaching in Colleges and universities. In addition, the improvement of students' cognitive ability and the maturity of their thinking at the university stage require the reform of teaching methods. The interactive teaching mode can close the relationship between teachers and students. The multiple and effective teaching interaction also directly determines the teaching effect and the achievement of teaching objectives, so as to make teaching activities more successful.

### 3.2.1 Quick check-in

We use two-dimensional code, gesture, positioning, photography and other check-in methods and can synchronously project the results on the big screen, which can be completed efficiently and interestingly in 3 minutes. We can also eliminate the phenomenon of substitution, record every check-in, and ensure the fairness and openness of check-in.

### 3.2.2 "Shake a shake" function

The head of the whole class is constantly changing and updated, and then stops at random. The students displayed on the screen participate in the interaction. This interaction starts with the teacher's questions, which can make the students highly focused, and the students reflect "like and stimulate" after class.

### 3.2.3 "Compensated rush answer"

When the teacher publishes the questions and initiates the rush answer, the students share their learning results through the rush answer, and at the same time get a certain score to refuel the usual results.

### 3.2.4 "Voting, Questionnaire"

Through these two interactions, each student can be given timely feedback, so that they know their own right and wrong, so as to guide them to find problems, and then stimulate their interest in solving problems. Teachers can also get accurate information synchronously to adjust the follow-up teaching content.

## 3.3 The initiative of participating in learning

We use the functions of "grouping tasks" and "scoring" (Table 2) to strengthen participatory learning.

**Table 2 Different Grouping and Evaluation Methods**

Grouping	Evaluation methods
Student Selective Grouping	Teacher Evaluation
Random grouping	Inter-group member review
Optional grouping	Other Group reviews

### 3.3.1 Group tasks of unity and cooperation

Teachers can set three modes: fixed grouping, random grouping and students' optional grouping

according to the course content before class. It breaks the traditional "no group" mode of choosing to study with specialty, classmates or acquaintances in dormitories, and is more conducive to students' thinking sparks when completing group tasks due to different disciplines and different ways of thinking. At the same time, it can also cultivate students' social ability, self-presentation ability and the ability of solidarity and cooperation. In group tasks, teachers can assign different roles to each student in each group, and they can also provide task menus for students to choose freely. This sub-tool and goal-oriented approach has successfully avoided the traditional classroom phenomenon of "most students are indifferent and the activists are always the ones".

### 3.3.2 Mutual learning and mutual evaluation between students and students

In traditional teaching, homework is checked by teachers, which is too heavy and inefficient to give timely feedback to students, and there is no communication channel between students. In addition to setting up "scoring function", we also have two "student assessment" modes, namely "student group members' mutual evaluation" and "inter-group members' mutual evaluation". Its advantage is that students' evaluation of others' homework is also a process of re-learning, followed by the process of students' mutual evaluation is also a process of mutual learning. Different majors, grades and individuals have different understanding, thinking and mastery abilities of the same knowledge point. When reviewing other people's homework, the advantages of their results can be used for reference to help self-learning, while the shortcomings can cause reflection and self-improvement. Through the above methods, students' active participation in learning has played a very good role in promoting.

## 4 Conclusion

Through nearly a year's operation, the online course "Entering the Music World" successfully combines online and offline teaching, and solves some problems in traditional teaching. The proposed method has certain practicality and generalization. It can improve the quality of teaching and teaching effect, expand the scope of teaching and the number of audiences. We know that students are the ultimate users of online courses. In the future work, we should make use of the functions and technologies of the Internet to give students more opportunities to participate in the optimization of curriculum design, curriculum feedback and other curriculum construction links, so that students can have a deeper understanding of the whole process of online courses, so that students can see the results of their own thinking in the course and feel the effect of their own learning. Only in this way can we more effectively stimulate students' enthusiasm for learning, enhance their awareness of curriculum participation, and become true supporters of online courses.

## **Investigation and Research on Community Property Management: Take a Certain District in Wuhan as an Example**

Wei Minghua

Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: weiminghua@whut.edu.cn)

**Abstract:** By investigating the property management situation in a district of Wuhan, this paper evaluates the three aspects of community condition, residents' awareness and residents' behavior feedback. It finds that there are some problems in the community property management, such as infrastructure, fund utilization, government participation, etc. Finally, it analyses and summarizes the above problems and summarizes the construction of the property company's internal management system, property fund management, and so on. In terms of government responsibilities, it puts forward countermeasures and suggestions

**Key words:** Property; Estate Management; Community; Community Management;

### **1 Introduction**

Property management has always been an important issue in urban management. Overseas property management is relatively mature and has a long history of development. There are mainly ways of combining government as the main body, market as the main body and government market. There are many models that can be used for reference. For example, in Germany, property management companies with government holding are fully market-oriented in Britain. With the development of urbanization in China, the modernization of urban management and governance capacity has become an important symbol of the level of urban development (Liu Zhenping,2018). Property management, as a new form of urban management, has become an important part of the modernization of urban management and governance capacity. As a new type of service industry, property management has experienced the development from disorder to orderly and standardized form, and the degree of standardization of property management has been increasing. At present, China has promulgated many laws with property content, such as the Enterprise Law of the People's Republic of China and the Land Management Law of the People's Republic of China. These laws and regulations have laid a "three-subject" structure for property management owners, property service enterprises and administrative departments. The existence of these legal provisions has helped to maintain the management order of the property industry and construct a good industry environment. However, it is unavoidable that because these laws and regulations stipulate the responsibility subject and scope of authority of property management more dispersedly, and do not form a complete policy system, the urban property management lacks standards and institutional constraints, and the property management is out of order and unbalanced development. Many urban property management will become disordered, which will further give the social environment and self-reliance. However, the environment, population flow, transportation, public security, fire prevention, disaster prevention and other aspects bring hidden dangers(Zhang Hui,2019). At the same time, property management involves owners, property service enterprises and administrative departments. The status of these subjects leads to the heterogeneity of

Therefore, the purpose of this study is to find out the current situation and existing problems of property management in a district of Wuhan through a field survey of property management in a district of Wuhan, and explore effective countermeasures to further standardize and improve property management, to create an orderly and just environment for the growth of the entire property management industry and promote the sustainable and healthy development of the property management industry.

## 2 Research and Design

In view of the current situation of property management in a district of Wuhan, the investigation team investigates the property management situation in a district of Wuhan by sending 300 questionnaires to various communities, there were 227 valid questionnaires, and the validity rate was 75.67%. We collect the data from the questionnaire, use SPSS20.0 analysis software, and use descriptive analysis method to analyze the recovered data, evaluate the basic situation of property management in a district from three aspects: community condition, residents' consciousness and residents' behavior feedback. put forward relevant countermeasures and suggestions of strengthening and Improving the construction of property management in a district of Wuhan to the existing problems found in the questionnaire survey, and combined with the opinions of residents gathered through interviews.

## 3 Research findings

### 3.1 Basic information

#### 3.1.1 Identity of the respondents

In terms of the identity of the respondents in the sample, In this survey, 208 samples of owners and family members were selected, accounting for 91.63% of the total sample; 15 samples of tenants, accounting for 6.61% of the total sample; 4 samples of owners' committee members, accounting for 1.76% of the total sample; and 3 others, accounting for 1.32% of the total sample.

**Table 1 Identity of the Respondents**

Identity	Frequency	Percentage
Owners and family members	208	91.63%
Tenant	15	6.61%
Members of the owners' committee	4	1.76%
Others	3	1.32%
Total	227	100.00%

3.1.2 On-the-job status of respondents

From the on-the-job status of the respondents in the sample, 148 respondents were in the on-the-job status, accounting for 65.2% of the total sample; 23 respondents were out of work, accounting for 10.13% of the total sample; 56 respondents were retired, accounting for 24.67% of the total sample.

**Table 2 On-the-job Status of Respondents**

Status	Frequency	Percentage
On the job	148	65.20%
Out of work	23	10.13%
Retired	56	24.67%
Total	227	100.00%

3.1.3 Types of residential housing

According to the type of residential housing in the sample, there are 180 ordinary commercial housing, accounting for 79.3% of the total sample; 21 public houses, accounting for 9.25% of the total sample; 4 affordable houses, accounting for 1.76% of the total sample; 22 private houses, accounting for 9.69% of the total sample.

**Table 3 Types of Residential Housing**

Type	Frequency	Percentage
Commodity housing	180	79.30%
Public house	21	9.25%
Affordable housing	4	1.76%
Private house	22	9.69%
Total	227	100.00%

3.1.4 Residential property management model

According to the residential property management model in the sample, 11 respondents believed that their residential districts belonged to the owner's autonomous management model, accounting for 4.85% of the total sample; 165 respondents believed that their residential districts belonged to the Professional property company entanglement, accounting for 72.69% of the total sample; 28 respondents believed that their residential districts belonged to the community management mode, accounting for 12.33% of the total sample; and 2 surveys. Those who believe that the subordinate community belongs to the management mode of unit self-management, accounting for 0.88% of the total sample; the remaining 21 people think that the subordinate community belongs to the management mode of owner and community co-management, accounting for 9.25% of the total sample; no investigators choose that the subordinate community belongs to the management of commonweal property enterprise management.

**Table 4 Residential Property Management Model**

Model	Frequency	Percentage
Owner's autonomous management	11	4.85%
Professional property company management	165	72.69%
Community management	28	12.33%
Unit management	2	0.88%
Commonweal property enterprise management	0	0%
Co-management of Owners and Communities	21	9.25%
Total	227	100.00%

### 3.2 Internal management and facilities configuration in residential areas

#### 3.2.1 Problems in property management

From the perspective of the problems existing in the property management of residential areas in the sample, 89 respondents believed that their residential areas had the problem of illegal construction, accounting for 39.21% of the total sample; 94 respondents believed that their residential areas had the problem of noise, lampblack disturbing the people, accounting for 41.41% of the total sample; 59 respondents believed that their residential areas had the problem of vegetable and chicken raising, accounting for 25.99% of the total sample; Investigators believed that there were problems of "drilling holes through walls" and "digging three feet" in the community, accounting for 23.35% of the total sample; 53 respondents believed that there were problems of capsule houses in the community, accounting for 32.16% of the total sample; 128 respondents believed that there were problems of hidden dangers of dogs in the community, accounting for 56.39% of the total sample; 150 respondents believed that the community had problems of stacking debris in the corridor. Questions accounted for 66.08% of the total sample; 123 respondents believed that their community had the problem of running training courses, accounting for 54.19% of the total sample; 71 respondents believed that their community had the problem of cutting down trees and occupying green space without authorization, accounting for 31.28% of the total sample.

**Table 5 Problems in Property Management**

Problem	Frequency	Percentage
Illegal construction	89	39.21%
Noise and lampblack disturb the people	94	41.41%
Vegetable and chicken raising	59	25.99%
"Drilling holes through walls" and "digging three feet"	53	23.35%

Capsule room	73	32.16%
Hidden dangers of dogs	128	56.39%
Stack debris in the corridor	150	66.08%
Running training courses	123	54.19%
Cutting down trees and occupying green space without authorization	71	31.28%
Total	840	370.06%

### 3.2.2 Garbage disposal condition

When investigating the condition of garbage disposal situation in residential areas, 57 people (25.11%) chose to dispose garbage not timely, 58 people (25.55%) chose to dispose garbage not always timely, 91 people (40.09%) chose to dispose garbage more timely, and only 21 people (9.25%) chose to dispose garbage very timely.

**Table 6 Garbage Disposal Situation**

Condition	Frequency	Percentage
Dispose garbage not timely	57	25.11%
Dispose garbage not always timely	58	25.55%
Dispose garbage more timely,	91	40.09%
Dispose garbage very timely	21	9.25%
Total	227	100.00%

### 3.2.3 Intact condition of camera in residential area

In the survey of the Intact condition of camera in residential area, 51 people were found that all cameras were in good condition, accounting for 22.47% of the total number; 95 people were found that some cameras can be used normally, accounting for 41.85% of the total number; 81 people were found that all cameras cannot be used properly, accounting for 35.68% of the total number.

**Table 7 Intact Condition of Camera in Residential Area**

Condition	Frequency	Percentage
All cameras were in good condition	51	22.47%
Some cameras can be used normally	95	41.85%
All cameras cannot be used	81	35.68%

Total	227	100.00%
-------	-----	---------

### 3.2.4 Treatment condition of security incidents

According to the data statistics of community security incidents, 22 people in the survey sample think that the security incidents are handled very timely, accounting for 9.69% of the total sample; 84 people think that security incidents are handled more timely, accounting for 37.00% of the total sample; 61 people think that security incidents are handled not always timely, accounting for 26.87% of the total sample; the remaining 60 people think that security incidents are handled not in time, accounting for 26.43%.

**Table 8 Treatment Condition of Security Incidents**

Condition	Frequency	Percentage
Very timely	22	9.69%
More timely	84	37.00%
Not always timely	61	26.87%
Not in time	60	26.43%
Total	227	100.00%

### 3.2.5 Elevator equipment condition

When investigating the elevator equipment of the unit building where the respondents live, 23 people chose the elevator to be able to use normally, accounting for 10.13% of the total sample number; 48 people chose the elevator to have occasional faults, accounting for 21.15% of the total sample number; 86 people chose the elevator to have frequent faults, accounting for 37.89% of the total sample number; two people chose the elevator to be damaged and unable to use. It accounted for 0.88% of the total sample number, and the remaining 68 people chose no elevator, accounting for 29.96% of the total sample number.

**Table 9 Elevator Equipment Condition**

Condition	Frequency	Percentage
Be able to use normally	23	10.13%
Have occasional faults	48	21.15%
Have frequent faults	86	37.89%
Elevator to be damaged and unable to use	2	0.88%
No elevator	68	29.96%

Total	227	100.00%
-------	-----	---------

### 3.2.6 Firefighting equipment condition

According to the investigation of firefighting equipment in residential area, 136 firefighting equipment can be used normally, accounting for 59.91%; 91 damaged equipment cannot be used normally, accounting for 40.09%.

**Table 10 Firefighting Equipment Condition**

Condition	Frequency	Percentage
Can be used normally	136	59.91%
Cannot be used normally	91	40.09%
Total	227	100.00%

### 3.2.7 Parking environment in residential area

When investigating the parking environment in residential areas, 6 respondents reported that parking spaces were adequate, accounting for 2.64%; 46 respondents reported that parking spaces were basically adequate, accounting for 20.26%; 175 respondents reported that parking spaces were too few, accounting for 77.09%.

**Table 11 Parking Environment**

Condition	Frequency	Percentage
Adequate	6	2.64%
Basically adequate	46	20.26%
Too few parking spaces	175	77.09%
Total	227	100.00%

### 3.2.8 Are there any illegal charges for property management fees?

In order to know whether the respondents think that there are illegal charges for community property management fees, 67 people think that this situation exists, accounting for 29.52%; 160 people think that there is no such situation, accounting for 70.48%.

**Table 12 Are There Any Illegal Charges for Property Management Fees?**

Condition	Frequency	Percentage
Yes	67	29.52%
No	160	70.48%
Total	227	100.00%

### 3.2.9 Are residents clear about community maintenance funds

By investigating whether residents are clear about the community maintenance fund, we can see that 15 people are very clear about the community maintenance fund, accounting for 6.61%; 82 people are not very clear about the community maintenance fund, accounting for 36.12%; 130 people are completely unaware of the community maintenance fund, accounting for 57.27%.

**Table 13 Are Residents Clear About Community Maintenance Funds?**

Condition	Frequency	Percentage
Very clear	15	6.61%
Not very clear	82	36.12%
Completely unaware	130	57.27%
Total	227	100.00%

### 3.2.10 Equipment condition of public leisure and entertainment facilities in residential areas

According to the survey on the allocation of public leisure and entertainment facilities in residential districts, 182 respondents reported that their residential districts had public leisure and entertainment facilities, accounting for 80.18%; 45 respondents reported that their residential districts did not have public leisure and entertainment facilities, accounting for 19.82%.

**Table 14 Equipment Condition of Public Leisure and Entertainment Facilities**

Condition	Frequency	Percentage
Yes	182	80.18%
No	45	19.82%
Total	227	100.00%

### 3.2.11 Maintenance condition of public leisure and entertainment facilities in residential areas after damage

According to the survey, 95 respondents reported that public leisure and entertainment facilities were not repaired after being damaged, accounting for 41.85%. The remaining 132 respondents reported that public leisure and entertainment facilities could be repaired after being damaged, accounting for 58.15%.

**Table 15 Maintenance Condition of Public Leisure and Entertainment Facilities After Damage**

Condition	Frequency	Percentage
Yes	95	41.85%
No	132	58.15%
Total	227	100.00%

A total of 149 respondents, 65.64% of them, reported that the owners' committee had been set up in their residential districts. A total of 78 respondents, 34.36%, reported that the owners' committee had not been set up in their residential districts.

**Table 16 Establishment of Community Owners' Committee**

Condition	Frequency	Percentage
Yes	149	65.64%
No	78	34.36%
Total	227	100.00%

### 3.2.13 Disposal condition of violations in residential areas after reported

According to the survey data, after the report, whether the illegal behavior of the community has been dealt with, 54 investigators think that the illegal behavior of the community has been solved, accounting for 23.79% of the total sample data; 23 investigators think that the illegal behavior of the community has only been investigated, but not dealt with, accounting for 10.13% of the total sample data; 61 investigators think that the illegal behavior of the community has been solved but the results were not good, accounting for 26.87% of the total sample data; 89 investigators believed that although the illegal and irregular acts in the community reflected, they were completely unmanaged, accounting for 39.21% of the total sample data.

**Table 17 Disposal Condition of Violations in Residential Areas After Reported**

Condition	Frequency	Percentage
Solved	54	23.79%
Only investigate, but not disposal	23	10.13%
Disposal ineffectual	61	26.87%
Reflected but unmanaged	89	39.21%
Total	227	100.00%

## 3.3 Survey of Residents' Consciousness

### 3.3.1 Residents' understanding of residential property management

When investigating residents' understanding of community property management, there are 60 people who choose property management as a matter of property company, accounting for 26.43% of the total sample; 145 people who choose property management involves the comprehensive management of multiple government departments, accounting for 63.88% of the total sample; 128 people who choose Owners should consciously fulfill their obligations in community management, accounting for 59.39% of the total sample; The number of people that choose establishment of Owner's Committee for

Proceedings of the 16th International Conference on Innovation & Management - 1680 -  
 coordination and management is 150, accounting for 66.08% of the total sample.

**Table 18 Residents' Understanding of Residential Property Management**

Condition	Frequency	Percentage
Property management is the business of property companies	60	26.43%
Property management involves the comprehensive management of multiple government departments	145	63.88%
Owners should consciously fulfill their obligations in community management	128	59.39%
Establishment of Owner's Committee for coordination and management	150	66.08%
Total	483	215.78%

### 3.3.2 Residents' understanding degrees of the responsibilities and division of labor of relevant administrative departments in community management

When investigating the residents' understanding of the responsibilities and division of labor of the relevant administrative departments in community management, 9 people who choose very familiar with it, accounting for 3.96% of the total sample, 24 people who choose more familiar with it, accounting for 10.57% of the total sample, 66 people who choose have some understanding for it, accounting for 29.07% of the total sample, and 91 people, who did not know something, it accounted for 40.09% of the total sample, and 37 people, or 16.30% of the total sample, chose to know nothing about it.

**Table 19 Residents' Understanding of the Responsibilities and Division of Labor of Relevant Administrative Departments in Community Management**

Degree	Frequency	Percentage
Very familiar with	9	3.96%
More familiar with	24	10.57%
Have some understanding	66	29.07%
Don't know something	91	40.09%
Know nothing	37	16.30%
Total	227	100.00%

### 3.3.3 The content need to be strengthened by the government management in property management

When investigating the content need to be strengthened by the government management in property management, there are 104 people who choose the comprehensive management of residential districts by government departments, accounting for 45.81% of the total sample; 133 people who choose the timely handling of complaints in residential districts, accounting for 58.59% of the total sample; 80

Proceedings of the 16th International Conference on Innovation & Management - 1681 -  
 people who choose the supervision of property service enterprises, accounting for 35.24% of the total sample; 43 people who choose to solve public service problems such as water, electricity and gas in residential districts, accounting for 18.94% of the total sample; 53 people choose the supervision by the owner's committee, accounting for 23.35% of the total sample.

**Table 20 The Content Need to Be Strengthened by the Government Management in Property Management**

Degree	Frequency	Percentage
Comprehensive management of residential districts by government departments	104	45.81%
Timely handling of complaints in residential districts	133	58.59%
Supervision of property service enterprises	80	35.24%
Solve public service problems such as water, electricity and gas in residential districts	43	18.94%
Supervision by the owner's committee	53	23.35%
Total	413	181.93%

### 3.3.4 Attitudes towards the establishment of owners' committees in residential areas

From the survey sample, 171 survey samples showed that it was necessary to set up the owner committee, accounting for 75.33% of the total sample; 42 samples showed that the owner committee was none essential, accounting for 18.50% of the total sample; 14 samples showed that the establishment of the owner committee was unnecessary, accounting for 6.17% of the total sample.

**Table 21 Attitudes Towards the Establishment of Owners' Committees in Residential Areas**

Attitude	Frequency	Percentage
Necessary	171	75.33%
None essential	42	18.5%
Unnecessary	14	6.17%
Total	227	100.00%

### 3.3.5 Whether the owners' reasonable opinions can be rectified by reflecting them to the owners' committee?

According to the survey sample, we know whether the owners think their reasonable opinions can be rectified by reflecting them to the owner's committee. Only 7 sample data show that all opinions can be rectified, accounting for 3.08% of the total sample; 30 sample data show that most opinions can be rectified, accounting for 13.22% of the total sample; 63 sample data show that partial opinions can be

Proceedings of the 16th International Conference on Innovation & Management - 1682 -  
 rectified, accounting for 27.75% of the total sample; but 127 sample numbers show that rare opinions  
 can be rectified, accounting for 55.95% of the total sample.

**Table 22 Whether the Owners' Reasonable Opinions can be Rectified**

Attitude	Frequency	Percentage
All can	7	3.08%
Most can	30	13.22%

### 3.3.6 The enthusiasm of participating in property management affairs of residential districts and performing the duties of owners

In terms of personal participation in community property management affairs and the enthusiasm of the owners to perform their duties, 83 respondents chose high enthusiasm, accounting for 36.56% of the total sample data; 74 respondents chose general enthusiasm, accounting for 32.60% of the total sample data; 70 respondents chose low enthusiasm, accounting for 30.84% of the total sample data.

**Table 23 The Enthusiasm of Participating in Property Management Affairs of Residential Districts and Performing The Duties of Owners**

Condition	Frequency	Percentage
High enthusiasm	83	36.56%
General enthusiasm	74	32.60%
Low enthusiasm	70	30.84%
Total	227	100.00%

### 3.3.7 The ways residents take when problems occur in the community

According to the survey data, 103 respondents chose to consult with the parties when problems occurred, accounting for 45.37% of the total sample data; 150 respondents chose to report to property companies, accounting for 66.08% of the total sample data; 46 respondents chose to report to the owners' committee, accounting for 20.26% of the total sample data; 70 respondents chose to report to the street communities, accounting for 30.84% of the total sample data; 55 respondents chose to report to the relevant government authorities, accounting for 24.23% of the total sample data; 101 respondents chose to make complaints call, accounting for 44.49% of the total sample data; 18 respondents chose to ignore, accounting for 7.93% of the total sample data.

**Table 24 The Ways Residents Take When Problems Occur in the Community**

Behavior mode	Frequency	Percentage
Consult with the parties	103	45.37%
Report to property companies	150	66.08%
Report to the owners' committee	46	20.26%
Report to the street communities	70	30.84%
Report to the relevant government authorities	55	24.23%
Make complaints call	101	44.49%
Ignore	18	7.93%
Total	543	293.20%

#### 4 Problem Analysis

Through the above investigation, we can find that there are many problems in community management of a district in Wuhan, and there are urgent improvements in infrastructure and environmental management, capital operation, government participation and so on.

Firstly, there are some problems in facility and environmental management of residential quarters. Installation of facilities and equipment is imperfect, the environmental situation of residential quarters is more complex and serious, and the related management is disordered. The incompleteness of community facilities brings great security risks to residents' lives, which is not conducive to providing residents with a good living environment. Failure to repair the equipment in time also greatly reduces the convenience of residents' lives. Property management in the installation and maintenance of various facilities is absent, and does not perform its responsibilities well. In addition, there are not in a minority phenomenon such as illegal building, piling up debris and running remedial classes in the residential environment. The property responsible party has not effectively supervised and managed this phenomenon, which makes the residential environment chaotic frequently.

Secondly, the related fund management is disorderly. The use of property-related funds in residential areas has not been open and transparent. Residents have no channels to supervise the flow and use of property funds and cannot guarantee the fairness and fairness of the use of funds. As a result, many community problems cannot be really solved, it also reduces the initiative of residents to participate in community affairs to a certain extent, and it causes the community to fall into a vicious circle of stagnation.

Finally, the responsibility of community property management is relatively single. The government's participation in community property management is too low. Property is fully responsible by professional property companies. The owners who have problems can only negotiate with property companies. The process of property management lacks the effective supervision and regulation of the government, which cannot guarantee the effective solution of the problem. Residents' demands to

Proceedings of the 16th International Conference on Innovation & Management - 1684 -  
property companies are often neglected, and the problem has not been solved for a long time. In the long run, there have been serious problems in community management, environment and other aspects. Property companies cannot fulfill their corresponding responsibilities, and there may be a phenomenon of freepading.

## 5 Conclusion

In view of the existing problems of property management in a district, we put forward the following suggestions:

Firstly, in view of the management problems such as incomplete infrastructure and absence of environmental management in residential districts, On the one hand, we should rectify the internal management system of property companies, urge the responsible companies to rectify the chaos in the community, establish a long-term return visit supervision organization, and form an effective management mechanism. On the other hand, we should strengthen publicity and education among the residents of the community, establish the residents' awareness of rules, consciously restrain their own behavior, and build a civilized and harmonious community.

Secondly, the government, property companies and owners should jointly establish a fund management supervision mechanism to solve the problem of non-public and non-transparent property fund management. The government should fulfil its duty of supervision and examination and protect the rights and interests of owners as consumers, Property companies should consciously and regularly disclose the use of funds, self-check and self-clean, and eliminate the possibility of embezzlement of management funds from the root. Owners should also actively safeguard their own rights and interests, actively participate in the supervision mechanism, timely raise doubts about the use of property funds in residential areas, and effectively improve the efficiency of the use of property management funds.

Finally, aiming at the absence of government in property management, the government should strengthen supervision, conduct periodic return visits and inspections of community property management, urge property companies to perform their duties, safeguard the legitimate rights and interests of both owners and property companies, implement diversification of property management subjects, break the original single pattern, promote information flow and problem solving, and effectively guarantee the effectiveness of property management and the improvement of property management level.

## **Research on the Entrepreneurship Intentions for Undergraduates in the background of “Mass Entrepreneurship and Innovation”**

Liu Jia<sup>1</sup>, Li Kai<sup>2</sup>

1 School of Business, Wuhan Huaxia University of Technology, Wuhan, P.R. China, 430070

2 School of Innovation, Wuhan Huaxia University of Technology, Wuhan, P.R. China, 430070

(E-mail: 14110689@qq.com, likaikai28@163.com)

**Abstract:** As the undergraduates increasing, employment is a problem which the government and universities have to face to. This article adopts the questionnaire survey, with TPB theoretical basis, constructing entrepreneurship intentions influence factor mode, data analysis by SPSS, to discuss on the influence relationship between Entrepreneurship Policy, Entrepreneurship Education and TPB variable. The results of the study showed that entrepreneurship education through the perceived behavior control has a positive impact on the entrepreneurial intention of college students, entrepreneurship policy has a positive impact on the entrepreneurial intention of college students through entrepreneurial attitude, subjective norm effect on entrepreneurial intention is not significant. Entrepreneurial attitude and perceived behavioral control play an intermediary role in this process. As a conclusion, it can promote the entrepreneurship intentions with perfect policies and optimize entrepreneurship education.

**Keywords:** Entrepreneurship intention; Entrepreneurship policy; Entrepreneurship education; TPB variable

### **1 Introduction**

The employment problem is always a hot concern by the government and society. As the data from the National Statistical Bureau show, the undergraduates is up to 8.6 million in the year of 2019, plus with the unemployed all previous undergraduate, the pressure for jobs is really great. With the big number of undergraduate and limited market demand, the government needs to provide more positions in many ways. Especially for “Mass Entrepreneurship and Innovation” was issued by the Prime Minister Li Keqiang from “Government Work Report in 2015”, governments at all levels and universities are trying to implement related entrepreneurship education and services, to guide the undergraduates do a good job on innovation and entrepreneurship. However, the entrepreneurship rate is around 2.5%, the low rate and big amount of undergraduates are really out of proportion. Therefore, it is necessary to analysis on the reason for low rate and research on the influence factors for the undergraduates’ entrepreneurship intentions, which is the hot issue concerned by the society, universities and undergraduates.

After reviewing the relationship between entrepreneurship education and entrepreneurial will, Zhang Xiue found: Entrepreneurship education plays an important role in promoting the promotion of entrepreneurial willingness: Firstly, the learning of the basic knowledge of entrepreneurship education can enhance the entrepreneurial awareness of entrepreneurs and awaken entrepreneurial awareness; Secondly, practical teaching with more operational can enhance entrepreneurial skills and capabilities (Ajzen I. Attitudes, 2017). Also, Shi Qiaojun did research with the sample data of the Hunan’s university,

found that: Improving the establishment of an entrepreneurial education system has a significant positive impact on improving the entrepreneurial will. Xiao Xiao found that: A comprehensive entrepreneurial policy system plays an important role in satisfying the policy needs of college entrepreneurs and improving their entrepreneurial attitudes and entrepreneurial willingness. Drucker thought entrepreneurship could be learned by Entrepreneurship Education, such as positive entrepreneurial attitude, control and subjective norms. And these characteristic advantages are crucial for entrepreneurs to engage in entrepreneurial activities (Wang Kai,2018). Stevenson thought entrepreneurial policies are often designed from the perspectives of entrepreneurial motivation, entrepreneurial skills, and entrepreneurial opportunities. The main purpose of the entrepreneurial policy is to stimulate entrepreneurs' entrepreneurial enthusiasm, help entrepreneurs master the skills and knowledge necessary for entrepreneurship, and provide a stable entrepreneurial environment for potential entrepreneurs.

## 2 Research Content and Method

It researches on the influence on the undergraduates' entrepreneurship intentions by entrepreneurship education and policies with the background of "Mass Entrepreneurship and Innovation". It analysis on the most direct influence variable factor for the undergraduates' entrepreneurship intentions, on the basis of theory carding and "Mass Entrepreneurship and Innovation", with subjective norm, entrepreneurship attitude and perceived behavioral control. It builds a perfect and advanced influence factors mode on undergraduates' entrepreneurship intentions, which chooses the planned behavior theory as the prototype pattern, and introduces entrepreneurship policies and education as the external factors. It takes the questionnaires to choose the undergraduates from 5 universities in Hubei province as respondents. 467 backed questionnaires from 500, while 18 valid ones, and the effective questionnaires rate is 89.8%. The questionnaires center on the three measurements of entrepreneurship policies, education and attitude, and also the TPB variable (entrepreneurship attitude, perceived behavioral control, subjective norm), verified by SPSS19.0 data processing tool, and finally to provide proper suggestions for promoting the undergraduates' entrepreneurship intentions and amounts. (As the Table 1-6)

**Table 1 Entrepreneurship Policies Measurement**

Variable	No.	Item
Entrepreneurship Policy	A1	Entrepreneurship education
	A2	Soft loan
	A3	Industrial and commercial breaks
	A4	Tax reduction and exemption
	A5	Site expenses reduction and exemption
	A6	Venture capital funding project

**Table 2 Entrepreneurship Education Measurement**

Variable	No.	Item
Entrepreneurship Education	B1	Enough courses and projects in the university.
	B2	The University invites outstanding entrepreneurs for lecturing frequently.
	B3	The University holds entrepreneurial design competitions frequently.
	B4	The University organizes the students to take part in entrepreneurship training.
	B5	There are perfect entrepreneurship facilities and bases in the university.

**Table 3 Entrepreneurship Attitude Measurement**

Variable	No.	Item
Entrepreneurship Attitude	C1	To prove our own thoughts
	C2	For self-challenge
	C3	For personal success
	C4	For personal independence
	C5	For reputation
	C6	For public recognition
	C7	For money and treasure
	C8	Make contribution to society
	C9	Make contribution to the national's development

**Table 4 Perceived Behavioral Control Measurement**

Variable	No.	Item
Perceived Behavioral Control	D1	I am innovative.
	D2	I can solve problems calmly.
	D3	I think the chances exist everywhere.
	D4	I can make use of many resources.
	D5	I can solve all the problems if I try my best.

**Table 5 Subjective Norm Measurement**

Variable	No.	Item
Subjective Norm	E1	My relatives have successful business.
	E2	My parents support me to start a business if conditions obtained.
	E3	My friends support me to start a business if conditions obtained.
	E4	The local culture encourages people to gain business success very much.

**Table 6 Entrepreneurship Intentions Measurement**

Variable	No.	Item
Entrepreneurship Intentions	Y1	I think I will be self-employed in the future.
	Y2	I will choose to self-employment if I meet practical difficulties.
	Y3	I think I will be self-employed within 5 years in all probability.
	Y4	I was thinking to run a business by myself.

The questionnaires adopts Lickrt five-point scale. (1=Totally Not,2=Not,3=Uncertainty ,4=Yes,5=Totally Yes)

### 3 Results

#### 3.1 Analysis on the control factor influence on the variable factors with the single factor analysis method.

Choosing and grouping the individual variable factor, analysis on if the respondents ideas of entrepreneurship education, policies, TPB variable and intentions are changed with the influence by different control variable. The conclusion is as following:

- (1) Sex differences have no prominent influence on the entrepreneurship intentions.
- (2) Major differences have no prominent influence on the entrepreneurship intentions.

#### 3.2 To verify the variable correlation, and the inclusion is as following:

(1) Between the independent variable and dependent variable, the entrepreneurship education and policies have prominent influence on entrepreneurship intentions.

(2) Between the independent variable and agent variable, the entrepreneurship education, policies and TPB have prominent influence with each other.

(3) Between the agent variable and dependent variable, the TPB and entrepreneurship intentions have prominent influence with each other.

### 3.3 Analysis of regression by SPSS19.0

Analysis on the relationship between entrepreneurship education, policies and intentions; the relationship between entrepreneurship education, policies and attitude; the relationship between entrepreneurship education, policies and subjective norm; the relationship between entrepreneurship education, policies and perceived behavioral control; the relationship between TPB variable, entrepreneurship intentions and the agent function of TPB variable. (The Analysis Results As the Table 7-10)

**Table 7 The Regression Analysis of Entrepreneurship Policy and Education for Entrepreneurship Intentions**

F-Measure	6.481***	17.494***

Note: \*/\*\*/\*\* Distinguish Represents Significant Level at 0.05/0.01/0.001

With the Results above, the inclusion is as following:

- (1) Entrepreneurship education and policies have positive influence on entrepreneurship intentions.
- (2) Entrepreneurship education and policies have positive influence on entrepreneurship attitude.
- (3) Entrepreneurship education and policies have positive influence on entrepreneurship subjective norm.
- (4) Entrepreneurship education and policies have positive influence on entrepreneurship perceived behavioral control.

## 4 Conclusion

### 4.1 Make a conclusion for the questionnaires and verifying

4.1.1 Entrepreneurship policies have prominent influence on the undergraduates' intentions. The better of the policies, and the stronger of the intentions.

The data analysis shows, the perfect policies are helpful for the intentions' strengthening. Now many university carry out the national policies to support the undergraduates to self-employed, such as temporally leaving, special funding project, provide business start-up spaces in campus. Etc., which can encourage them for entrepreneurship. (Guo Xin,2018).

4.1.2 Entrepreneurship education has prominent influence on the undergraduates' intentions.

*Entrepreneurship Education* becomes a required course in most universities, and more and more students' entrepreneurship intentions are promoting. The university is trying to improve the course, while the government invites outstanding entrepreneurs to communicate with the undergraduates.

The research shows that the entrepreneurship education cannot influence the intentions directly, but in the agent variable way. Therefore, we need help the undergraduates to set up positive attitude, better subjective norm and strengthen perceived behavioral control and finally to promote their entrepreneurship intentions.

4.1.4 TPB variable plays the agent function between entrepreneurship policies and intentions.

The government and universities issue many support policies can relieve the pressure of fund and site. The key is that the undergraduates can feel the good atmosphere for entrepreneurship, and then help them to confirm their intentions (Armitage CJ,2016). Through the entrepreneurship competitions, it helps them to get better attitude and strong abilities of perceived behavioral control, and stimulate their passion and initiative for entrepreneurship (Xu Jialun,2017).

## **4.2 Suggestions**

4.2.1 Entrepreneurship policies system needs constant innovation.

It shows the big problem that the undergraduate facing to is funds shortage, which is very important for the entrepreneurship beginning period. However, the fund support from the university is always very limited. It is an urgent problem to be solved. The government needs to cooperate with the universities to issue convenient policies to help undergraduates (Li Chao,2017). For examples, the government can work with banks to simplify the loan procedures, introduce the risk evaluation mechanism, maximum the loan line of limit or lower the lending rates for projects with better rate of return. The universities can hold more competitions to attract social capitals, and select good project to be invested and incubated before it goes to the society. Government, university and society work together to solve the big problem at the beginning of entrepreneurship, and help the undergraduates increase the entrepreneurship rate (Evans.Lee,2017).

4.2.2 The contents and forms of *Entrepreneurship Education* need constant innovation.

The course of *Entrepreneurship Education* is always short and theoretic, which is difficult to attract the interests of the undergraduates (Ai D F,2017). It's necessary to introduce Internet platform, set up micro class and Massive Open Online Courses to enrich the course contents; invite experts for lecturing; bring the undergraduates to innovate companies for visiting and learning; make a reformation of innovation evaluation system and encourage them work together to finish the business report(Wang Benxian,2017). Through the evaluation on process and result of entrepreneurship education, it can strengthen the intentions.

4.2.3 Entrepreneurship education advertising needs to be concerned.

It needs to create a good atmosphere in the society and university for entrepreneurship education. The undergraduates are young, who are acceptable for all kinds of new knowledge and have lots of new ideas with entrepreneurship. Otherwise, the economy pressure and influence from surroundings will be obstructive factors for their entrepreneurship intentions (Mao Yu,2019). The subjective norm can be increased and the intentions can be strengthened only if there is an entrepreneurship trend of thought in the whole society with entrepreneurship education advertising.

## **4.3 Research outlook**

4.3.1 Expand the number of samples and region

At the beginning of the questionnaire, only five high schools in Hubei Province were selected, it's existed a lack of persuasiveness reflected in the results of the questionnaire. So, we will increase the number of institutions and questionnaires issued, with improving the reliability and validity of the questionnaire, we will also improve quality of the questionnaire for Ensure that the results of the later investigations could be more accurately reflect the actual situation.

#### 4.3.2 Correct and rebuild a more scientific theoretical model

This study only considers the impact of entrepreneurship education and entrepreneurship policies on entrepreneurial willingness. In the future we will consider introducing more variables for exploring the effect of new variables on college students' entrepreneurial will, the theoretical model also needs to be further combined with the situation in Hubei Province, especially Wuhan City. And enhancing the applicability of the model. In order to ensure the results can be more effective in guiding practice.

#### 4.3.3 Dynamic attention to the follow-up development of entrepreneurial college students

At present, the research on college students' entrepreneurial behavior focuses more on a certain time node of their entrepreneurship, but there are not many longitudinal studies on entrepreneurial behaviors of entrepreneurial college students. This study will also focus more on the research of entrepreneurial college students in future. Through the future tracking research, it's could be better understand the actual development of the entrepreneurial process, especially the later development direction. Through the results of the continuous research, the university has improved the entrepreneurial education, and the social related departments have obvious practical significance.

# **Inheritance and Innovation, Adjustment and Accumulation: On the Modernization Thinking of Chinese Traditional Culture from the Development of the Cultural and Creative Industry of the Forbidden City**

Zhu Meifan, Ai Wenjing

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 975212912@qq.com, 1043737405@qq.com)

**Abstract:** General Secretary Xi Jinping put forward in the report of the Nineteenth National Congress a new era topic of creative transformation and innovative development of Chinese traditional culture, which put forward higher requirements for the modernization of Chinese traditional culture. The modernization of traditional culture has always been an important part of building a socialist modernization country in an all-round way, but in the process of modernization, cultural modernization, especially the modernization of traditional Chinese culture, has been shackled. Cultural industry, especially cultural creative industry, is an important model for the development of cultural modernization. Its development course provides an important experience for the modernization of Chinese traditional culture. Starting from the symbol cultural creative industry of the Palace Museum, this paper analyses the process of innovative development and creative transformation of Chinese traditional culture, focusing on the realistic dilemma of Chinese traditional culture. What is it, how to develop the modernization of Chinese traditional culture and how to guarantee the modernization of Chinese traditional culture are discussed in order to promote the modernization of Chinese traditional culture.

**Key words:** Inherit; Innovate; Chinese traditional culture; Modernization; Cultural Creation of the Palace Museum

## **1 Introduction**

The report of the 19th National Congress clearly pointed out: "The overall task of the socialist ideology with Chinese characteristics in the new era is to realize socialist modernization and the great rejuvenation of the Chinese nation." (Xi Jinping, 2017) China's excellent traditional culture is an uninterrupted cultural heritage, which shines with the wisdom of the Chinese people of all nationalities, also highlights the great innovation and creativity of the Chinese nation. The modernization of China's excellent traditional culture is also an important means of inheriting innovation and promoting Chinese traditional culture and enhancing the overall strength of culture. It is an important part of the great rejuvenation of the Chinese nation. As the largest museum of ancient culture and art in the world, the Palace Museum is the main carrier of the development of Chinese excellent traditional culture and an important window for Chinese traditional culture to go global. In recent years, the cultural and creative industries led by the Forbidden City have developed rapidly, breaking through one billion turnover in a very short period of time, and making the "Forbidden City Cultural Creation" a well-known brand. Its rapid development not only represents the vigour and vitality of Chinese traditional culture, but also provides a creative development path for the modern Chinese traditional culture to modernize.

This paper takes the Chinese Journal Full-text Database (CNKI) as a sample, and searches for 917

Proceedings of the 16th International Conference on Innovation & Management - 1697 - documents with the theme of “Chinese Traditional Culture Modernization”. A total of 6457 documents (as shown in Figure 1) are searched for “Cultural Creative Products”. It is from the field of modernization of Chinese traditional culture or cultural and creative products as research objects. The academic research has been very thorough, but the number of documents searched for common themes by “Chinese traditional culture” and “cultural creative products” is only 117. The result of this comparison is very unexpected. Through the analysis of these 117 documents, it can be seen from the research level (Figure 2) that the proportion of basic research (social science) and industry guidance (social science) is higher among the two subjects, but Less in policy research and basic applications. For example, Zhang Jing's "Sinicization of Marxism and Cultural Modernization of China" in Nankai University, through reviewing and comparing the development process of Chinese cultural modernization, deeply shows the relationship between Marxism and Chinese excellent culture and foreign culture in the process of Chinese cultural modernization. It holds that the modernization of Chinese culture can not be separated from the critical inheritance and innovation of Chinese traditional culture and foreign culture, which requires both national characteristics and world vision(Zhang Jing,2012).Fu Yan of Tianjin Normal University, in her book *The Application of Chinese Traditional Culture in the Process of Socialist Modernization*, believes that from the contemporary perspective, Chinese traditional culture can not directly lead to modernization, but China's modernization can not be separated from the modernization of traditional culture. The evolution of Chinese traditional culture since modern times tells us that the present of culture Modernization must be based on the modernization of economy. The relationship between them is dialectical unity (Fu Yan,2012).

Figure 1 Overall Trend Analysis Chart of CNKI Key Words Publication Quantity

Figure 2 Research Level Distribution Map of CNKI Related Documents

Searching for “cultural creative products” as a key word, a total of 1051 documents were retrieved, and 200 articles were selected through subjective sorting (see Figure 3). It was found that the proportion of philosophy and humanities and social sciences was very high. but through specific analysis, it will be found that the current research on cultural and creative products in the academic circles mostly stays in the art and other majors, focusing on the microscopic aspects of the research and development of cultural and creative products and product development, and the social impact on cultural and creative products. There is still very little research on the forces and the construction of socialist culture with Chinese characteristics. The role of cultural and creative industries in economic construction has become more and more prominent, just as Zhang Qiang, from the Institute of Geographic Science and Resources, Chinese Academy of Sciences, put forward in his article "The Present Situation, Layout and Development Strategy of Cultural and Creative Industries in Chinese Cities", that the cultural and creative industries in Chinese cities are developing rapidly and continuously, and have become the branches of the economy of big cities. The new impetus of pillar industry and transformation development has initially formed six cultural and creative industry clusters, as well as four spatial layout modes of central city, periphery of central city, adjacent high-tech parks and suburban counties (districts). (Zhang Qiang,2013)

Figure 3 Subject Distribution Map of CNKI Related Documents

In summary, the level of research and the distribution of disciplines, it is not difficult to conclude that on the basis of the existing literature, there are still many studies on Chinese traditional culture and cultural modernization, and the depth and breadth of research are also very Appreciable; the research on cultural and creative products has also shown a sharp increase in the past decade, and the research on cultural and creative products is also constantly deepening. On the one hand, with the advent of the new era, the construction of socialist culture with Chinese characteristics has entered a new historical orientation, and new research has emerged on the modernization of Chinese traditional culture. On the other hand, although research on cultural and creative products has been made. The depth and breadth of the culture are still deepening. with the continuous development of the cultural industry, its position in economic development is deepening, and the development of cultural and creative industries needs to be deepened, and it is mentioned at the height of promoting a strong socialist culture. To further address the importance of the cultural and creative industries, thus providing a new development path for the development of China's special socialism.

## 2 The Dilemma of the Modernization of Chinese Traditional Culture

Chinese traditional culture is deeply rooted in the practice of China's five thousand years, and

Proceedings of the 16th International Conference on Innovation & Management - 1699 -

china's vast land. It contains the strong emotional sustenance and spiritual pursuit of the Chinese nation and is the unique emotional bond and spirit of the Chinese nation. In the face of the ever-changing technological development, the process of modernization is getting faster and faster, the pace of China's transition to a modernized country is getting bigger and bigger, and the process of cultural modernization is constantly improving and developing, but it is still trapped and existing problems.

### **2.1 The contradiction between traditional culture and modern culture**

The contradiction between traditional culture and modern culture is an inevitable contradiction in the process of modernization. Some scholars believe that Chinese traditional culture is impossible to modernize, but most scholars hold a positive view. From the definition of culture, culture is the historical imprint of self-development and self-improvement formed by human beings in adapting to nature and transforming nature. Different cultures represent different people's ideas, customs and life in different backgrounds in different historical periods. Chinese traditional culture is the sum of the outstanding cultural achievements of the formation and development of the Chinese nation in all historical periods of China. This represents the existence of the Chinese tradition due to the inevitable existence of differences in different periods and the modernization. The contradiction between tradition and modernity unfolds. Judging from the historical process of China's modernization, China's modernization is not a process of active development, but a passive start. The slogans such as "Beat someone by playing his games only better", "Chinese learning as the fundamental structure, Western learning for practical use" are not only self-examination of their own systems, but also a reflection of the lack of self-confidence and even inferiority for their feudal culture in the early stage of China's modernization. Forming the pattern that the east is subordinate to the west as Marx said. In the process of modernization, the opening door of China is greater and greater. People are receiving more and more new ideas and concepts, more and more forms, more and more high-end means, under the guidance of pluralistic thoughts and values people's way of thinking and behavior practice have changed the transmission of Chinese traditional culture has been impacted and even overthrown. In the modernization process, it is especially important to deal with the relationship between tradition and modernity. In the process of building a socialist culture with Chinese characteristics, based on the reality of modern development, we must handle the relationship between Chinese traditional culture and the relationship between foreign culture and especially Western culture.

### **2.2 The problem of how to treat Chinese traditional culture correctly**

The answer to the question is not to return to the basic consensus that is considered in the macro sense - "take its essence, go to its dross", but to return to the microscopic problem of what to "take" what to "go". That is how to deal with the boundary between "essence" and "dross". This issue has also been controversial in Chinese academic circles. Some scholars believe that the generation and disappearance of culture all have their own natural evolution laws. People's understanding and change of culture should be based on the law of respecting the evolution of culture. Correspondingly, some scholars believe that culture is determined by people. Decisions, its evolution and development should be based on human subjective needs and development.

Regarding the issue of the traditional cultural modernization approach, the academic circles have given three views of "basic affirmation" and "complete reconstruction" and "compromise". Most scholars believe that it is necessary to "take the essence and go to its dross." This has created a new problem: in traditional culture, there are both "essence" and "dross". Does "essence" necessarily apply, and "dross" does not necessarily apply? Is the "essence" always the "essence", and is the "dross" always "dross"? Can the positive factors and the "essence" of traditional culture and the modernization process be equated, and can the negative factors that are not compatible with the modernization process be equal? Even positive factors that are compatible with the modernization process can maintain their enthusiasm

### **3 The Avenue of the Modernization of Chinese Traditional Culture**

The modernization of Chinese traditional culture is a process of continuous progress. The development process of The Imperial Palace's cultural and creative industries has provided reference for the development of traditional culture modernization. The success of the Palace Culture Creation reflects that the traditional culture modernization must be based on the roots of Chinese excellent traditional culture; Give play to the role of economy, science and technology and the masses of the people; the limitations of The Forbidden City Cultural Creation enlighten the modernization of traditional culture: we must persist in comprehensively deepening the reform of the cultural system, innovating various aspects of the traditional cultural modernization, and injecting vitality into cultural creation.

#### **3.1 Based on the root of the modernization of traditional culture**

Traditional culture is an important bridge connecting traditional culture and modern society and plays an important role in the process of socialist modernization. General Secretary Xi Jinping mentioned on many occasions that he should fully explore and carry forward the fine traditional Chinese culture. China's excellent traditional culture has a strong vitality, and this vitality will be a powerful driving force for the Chinese nation to prosper and rejuvenate. The modernization of traditional culture must be based on the "root" of excellent traditional culture itself, fully tap its value, strengthen cultural self-confidence, condense the cultural community, and finally drive the process of cultural modernization.

Deeply explore the value connection of Chinese excellent traditional culture. Take the Beijing Palace Museum as an example. The Forbidden City is a unit of ancient Chinese cultural art based on the old Tibetan cultural relics of the Ming and Qing Dynasties. It has collection, research and display functions. The total collection of the museum is more than 1.8 million pieces, mainly involving cultural relics, ancient buildings books and other 25 categories, it is a treasures house of art that cannot be neglected in china and even in the world. The Palace Culture is the most representative of Chinese traditional culture. For the cultural relics of the Palace Museum, it is the icy "objects" displayed in the Forbidden City, all of which are lifeless "empty shells" on the exhibition shelf. In 2013, the creative Design Competition with the theme of "Bringing the Forbidden City Culture Home" brought the Forbidden City culture to the market. So far, the number of products in the Forbidden City has been sung more than 10,000. In 2016, The Forbidden City Cultural Creation earned 1 billion yuan, and in 2017 it reached 1.5 billion. This figure exceeds 1,500 A-share listed companies. The 600-year-old Forbidden City began to become young, and the Forbidden City culture was "lived". The Forbidden City Cultural Creation products from the shelves no one cares to countless powder, this is the success of The Forbidden City Cultural Creation, but also the National Palace for the full excavation of the traditional culture of the Forbidden City, from the tall and the Great Hall of the Temple to the grass in the back garden, The Forbidden City Cultural Creation is known for its unique design philosophy and communication methods. The continuous exploration of the traditional cultural value of the Forbidden City is the source of strength and the foundation of the Forbidden City. It is the foundation of each story. It is the key to the modernization of traditional culture to express the story behind each cultural relic and express the past and present life of cultural relics.

Strengthen cultural confidence in traditional culture. Churchill once had a famous saying: I would rather lose an Indian than lose a Shakespeare. This should be an important expression of the importance

Proceedings of the 16th International Conference on Innovation & Management - 1701 -

of traditional culture. General Secretary Xi Jinping pointed out: "Chinese outstanding traditional culture is the spiritual lifeline of the Chinese nation and a solid foundation for us to gain a firm foothold in the world cultural agitation. We must inherit and promote the Chinese traditional culture in light of the new era conditions." (Xi Jinping,2014) Based on a deep understanding of Chinese traditional culture, the slogan of CCTV's National Treasures is "This is a young program, how young is it? Up and down five thousand years!" This is a great confidence in Chinese traditional culture. The extremely confident performance, the program created by the Provincial Museum of the United Nations in the Palace Museum of Beijing allows people to more intuitively understand the "previous life" and "this life" of our cultural relics, which is also a perfect presentation of the modernization of traditional culture. The strengthening of culture and going out are based on the deep treasure house of traditional culture. Chinese civilization is the only continuous civilization in the world. This is the result of cultural self-confidence. The inheritance and promotion of traditional culture is the fundamental reason for its continuation. Since the industrialization, Chinese traditional culture has been strongly impacted by Western advanced culture. However, in the long history of history, this setback is only a small wave. The Chinese civilization of 5,000 years is still luminescence, giving the Chinese nation a steady stream of self-confidence.

Correctly handle the relationship between traditional culture and modern culture. The contradiction between traditional culture and modern culture is not irreconcilable. The principle of "creative transformation and innovative development" proposed by General Secretary Xi Jinping is the correct methodology for solving the contradiction. Transforming and innovating on the basis of the positive inheritance of Chinese traditional culture. The creative transformation emphasizes breaking free from the traditional culture, based on the actual needs, guiding the positive elements in the traditional culture, and transforming with the requirements of the new era development; Innovative development refers to the improvement and transcendence of excellent traditional culture. Innovation and development on the basis of solving problems based on reality. In this principle, traditional culture is the foundation, development is the pursuit, innovation is fundamental (Wan Guangxi,2017). The Palace Museum profoundly excavated the cultural value of the Forbidden City collection, and implanted the traditional cultural elements of the Forbidden City into the fashionable and trendy modern handicrafts, so that the excellent cultural traditions and fashions can be perfectly combined, express the service concept of Bring the Palace Museum Home through the carrier of cultural products. Let more people understand and love the Forbidden City culture through cultural products, as well as the traditional Chinese culture represented by the Forbidden City culture. On the basis of creative design, The Forbidden City Cultural Creation actively participates in cultural and creative learning exchange forums and exhibitions at home and abroad, and sends the Forbidden City culture out of the country in rich cultural exchange activities, breaking the boundaries of national culture and making the Forbidden City culture a "public property".

### **3.2 Highlighting the power of traditional cultural modernization**

As a kind of soft power, culture has become more and more important in international competition. The "Cultural Policy for Development" conference held in 1998 clearly stated that "the world economic development is ultimately defined by cultural concepts, and cultural prosperity is the highest goal of development (Shen Zhuanghai,2008) . The cultural industry presents its indispensable influence with a new economic growth. The two sources of power that cannot be ignored in the process of cultural modernization are the power of economy, science and technology, and the people.

Show the "economic power" of cultural modernization. Compared with the rapid and efficient characteristics of modern culture, traditional culture is long and soft, and there is a sense of "powerlessness" in today's market economy. In the process of modernization of traditional culture, we must pay attention to the development of cultural productivity. The core part of cultural productivity is

Proceedings of the 16th International Conference on Innovation & Management - 1702 -

the cultural industry. The most important contribution to the cultural industry is the cultural and creative industry. As a pillar industry of the tertiary industry, the value-added of national culture and related industries in 2017 was 3.5462 trillion yuan, accounting for 4.29% of GDP, of which Beijing accounted for 14.3%. In the 13th Beijing Expo, 20% of the 39 cultural and creative industries that signed the 6.8 billion yuan project were mixed cultural projects. The Palace Museum is a representative of traditional culture and modern culture. According to a survey of purchasers of The Forbidden City Cultural Creation products, 70% are women, 70% are after 80s, 90s, and 80% of purchasing power is below 200. In view of this feature, Forbidden City can be described as shoot the arrow at the target, The Forbidden City Cultural Creation has developed Silk, pottery, porcelain, bronze, wooden, and other materials, paintings, key chains, pens, T-shirts, jewelry, ties, bags, umbrellas, houses, dolls, make-up, and other different products, more than 10,000 kinds It involves all aspects of life, not only for consumers to be willing to consume but also for consumption. A good cultural and creative product should be to facilitate the daily life of the people, reflect the traditional values of Chinese culture, and spread the story of China. It's not surprising that billions of sales legends. At the same time, on the basis of the full realization of economic benefits, the National Palace Museum has also placed social benefits in the first place. Yuxiang Shan, former director of the Beijing Museum, said in an interview: "The mission of the Forbidden City is not just to make money. In 2018, the National Palace Museum held more than 60,000 educational activities, and went to many countries around the world without collecting a penny. A large part of the money for public welfare and education comes from the income of The Forbidden City Cultural Creation" As a public cultural service unit, the Palace Museum is at the forefront of the modernization of traditional culture.

Perform the "scientific and technological power" of culture modernization. The most striking feature of modernization is the rapid development of science and technology. As the primary productive force, science and technology have greatly improved production efficiency and promoted rapid economic development. Its role has greatly exceeded the role of capital and labor in economic transformation. The Forbidden City Cultural and Cultural Achievements will be fully demonstrated. In product research and development, Forbidden City has independently developed and launched three ipad applications: "The Beauty of the Man", "The Forbidden City Auspicious omen" and "The Emperor's Day". In the collection display, six films were shot using virtual reality technology. It will also rely on the Duanmen Digital Museum, the "Firmament Tower" Digital Cinema, the Great High Hall Digital Museum and the National Museum of the Imperial Palace. Through the real reproduction of the film, let the audience feel the glamour of the Forbidden City culture, and taste the depth of the Forbidden City culture in the details. At the time of the 5G discussion, the Forbidden City decisively signed a strategic cooperation agreement with Huawei to allow 5G to enter the museum to provide technical support for the "Digital Palace" and further promote the digitalization, informatization and intellectualization of the Palace Museum.

Manifest the "people's power" of cultural modernization. General Secretary Xi Jinping emphasized that "literary and artistic creation, philosophical and social science research must first understand the question of who to create and who to speak for. This is a fundamental problem." (Xi Jinping, 2019) The people are the source of creation for cultural workers, only rooted in the people, entering Practice, express the voice of the people, serve the people is the vocation of the literary and art workers. The Forbidden City Cultural Creation always adheres to the people-centered and demand-oriented. From the history of the Forbidden City, it is not difficult to see that the real fire of the Forbidden City is the Cultural Creative Design Competition held in 2013. Before this, The Forbidden City Cultural Creation mainly carried out activities under the symbol of "Forbidden City", only considering the cultural, historical and aesthetic functions of the product have resulted in a series of cultural products that are uninteresting and non-practical, and naturally will be left out. After 2013, The Forbidden City Cultural Creation began to collect cultural product ideas from the public, so that the products are really close to

Proceedings of the 16th International Conference on Innovation & Management - 1703 -  
life, close to the people, like the "Forbidden City Calendar", "Chaozhu-style headphones" and "Queen's Tea Cup" in the Forbidden City Cultural Creation. It indicates that the needs of the people are the orientation of culture. The Forbidden City Cultural Creation bears the dual responsibility of inheriting culture and spreading culture. For product research and development, it must be designed and created from the perspective of the people. The most common objects in people's lives, such as headphones, calendars, teacups, wall clocks, etc., serve as carriers and then break into the basic elements of traditional culture in the Forbidden City. It not only gets rid of the rigid image of the old "souvenir" that used to talk about cultural attributes, but also adds the interesting, innovative and functional needs of the people, which makes the traditional culture more "existent" in people's daily life. "Only when they are needed by the people, the cultural relics have dignity and this is also the ultimate goal of cultural relics protection."

#### **4 The Institution of the Modernization of Chinese Traditional Culture**

The report of the 19th National Congress pointed out that "culture revitalizes the country and prospers cultural strengthens the nation and strengthens" (Xi Jinping, 2017), and the cultural construction of socialist modernization requires the establishment of a world-class c-korea. Traditional culture is the source of Chinese culture that has lasted forever and youthful vitality. To build a strong cultural strong country and accelerate the pace of modernization of traditional culture, we must accelerate the reform of the cultural system.

Since the reform and opening up, especially since the 16th National Party Congress, China's cultural system reform has achieved initial results. However, some deep-seated contradictions that restrict cultural development still exist. At the Third Plenary Session of the 18th CPC Central Committee, Comrade Xi Jinping put forward the "age strategy of comprehensively deepening reforms", stressing "adhering to the people-centered work orientation, insisting on putting social benefits first, and integrating social and economic benefits. Inspire the whole culture to create vitality as the central link, and further deepen the reform of the cultural system."<sup>97</sup>

The most important thing in the reform of the cultural system is to establish and improve the modern cultural market system. The cultural market is the sum of various cultural production relations in the process of cultural resources exchange between producers, operators and consumers. It has four functions: one is the resource configuration function. Strengthen the socialist culture's great development and prosperity by giving play to the decisive role of the market in resource allocation; the second is to balance supply and demand. The cultural market can objectively reflect and coordinate the relationship between market supply and demand; the third is creative transformation. The creativity and wisdom that will be condensed in cultural products are expressed in the form of materialization; the fourth is the function of value communication, that is, the transmission and transformation of cultural creativity through the exchange and consumption of cultural products, which is a process of creating, transferring and realizing value. The cultural market combines the commodity economic attributes of the general commodity with the unique ideological attributes of the culture itself.

The development of the current cultural market has achieved gratifying results. In 2016, the Ministry of Culture issued a series of policies and regulations on cultural development, such as the

---

"Notice on Promoting the Development of Cultural and Creative Products in Cultural and Cultural Relics Units" and "Publicities of the People's Republic of China" Cultural Service Guarantee Law, the Public Library Law of the People's Republic of China, etc. Taking the Forbidden City Cultural Creation as an example, the document "Notice on Promoting the Development of Cultural and Creative Products for Cultural Relics Units" is of great significance in exploring the cultural resources of museum collections, developing cultural and creative industries, exploiting cultural and creative products, and promoting excellent traditional culture, and inheriting Chinese Civilization. The document expands cultural and cultural relics units, promotes the combination of cultural resources and cultural production and life, and encourages cultural relics units to cooperate with social forces. Under the guidance of the policy, the prosperity and development of The Forbidden City Cultural Creation has made great contributions to enhancing the vitality of the market. However, there are still many shortcomings in the development of the cultural market, such as insufficient exploration of cultural consumption potential, insufficient supply of high-quality culture, numerous and chaotic market players, fierce homogenization competition, and insufficient protection of cultural intellectual property rights. For example, the development path of The Forbidden City Cultural Creation is not smooth sailing. When the "Changxin Pajamas" designed with the elements of the Changyue Pavilion, the bat pattern and the Qing Dynasty's old Tibetan costumes are still in the crowd funding, Plagiarism and imitation goods are already on the line and crowd funding; The flooding of the Forbidden City lipstick in the online sales platform; the public's confusion on the flagship store of the Forbidden City and the misfortune of the Forbidden City Taobao all showed the problems of the imperfect protection system of cultural property rights and the ineffective supervision of the network market.

## 5 Conclusion

If Chinese traditional culture wants to accomplish modernization, it must inherit and carry forward the excellent traditional culture of China. It is not only to refine and innovate the unique spiritual signs in traditional culture, but also to innovate on the basis of inheritance and inherit in innovation, so that Chinese traditional culture can promote the construction of a powerful socialist modernization country. Only in this way can we serve the great rejuvenation of the Chinese nation. The creation of Palace Museum prose epitomizes the process of modernization of Chinese traditional culture. Its success and misunderstanding provide experience and lessons for the road of modernization of Chinese traditional culture in the new era. They all add value to the building of a powerful socialist cultural country in an all-round way and a powerful socialist modernization country in an all-round way.

**Exploration of the Constructing Mode of Talents in Colleges and Universities Based on  
Information Technology**

Yin Yang

Personnel Department, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 825941511@qq.com)

**Abstract:** Information technology exerts a profound influence on people's lifestyle in modern society, all walks of life are transforming from traditional mode to information technology mode. Information technology promotes the efficiency and level of work. Based on summarizing the characteristics of the era of information technology, the article takes the present situation of talents construction in domestic and international colleges and universities as the background, analyzes the important role of information technology in the introduction of talent, services for talent and talent evaluation in colleges and universities of both at home and abroad, and puts forward the path of talent construction in colleges and universities based on information technology, improves the quality of talents construction and the level of services for talent.

**Key Words:** Information technology; The introduction of talent; Services for talent; Talent evaluation

## 1 Introduction

Information technology is based on modern communication, network, and database technology, and it collects and store all elements of the objects it studies in the database for specific groups to live, work, study, and assist in decision-making. With the continuous development of internet information technology, new technologies represented by the internet of things, cloud computing, big data and artificial intelligence have been applied more and more widely, information technology also profoundly affects social production and lifestyle in various aspects (Li Zhibo,2010). With the rapid increase of data in colleges and universities, data processing methods should constantly change to adapt to the new situation. Facing the rapid development of information technology and big data, how to integrate the construction of university talents with information technology is an urgent problem.

There are problems such as lag in concept and unreasonable structure in the construction of talents in domestic colleges and universities (Gao Fuan, Wang Hui, Ge Na,2009),scholars put forward improving the comprehensive ability of managers (Liu Chunlai,2005), establishing a standardized management system (Gao Jing, Tu Qinghua,2013). The use of selection, training, evaluation and incentive system in the management of teachers in foreign universities is instructive to domestic colleges and universities (Zhang Dichen,2014).

## **2 The Characteristics and Research Meaning of Information Technology Era**

### **2.1 Main characteristics of information technology**

Based on modern intelligent tools, information technology has the characteristics of scientific, efficient and accurate by information acquisition, transmission, and processing. It has two distinct characteristics (Gao Jing, Tu Qinghua,2013). On the one hand, digitization is reflected on the huge amount of data, various types of data and extremely fast speed of data. Secondly, digitization can transform many complexes and changeable information into measurable figures and data, and then use the coupling relationship between these numbers and data to establish appropriate digitization model and introduce computer for unification. On the other hand, intellectualism is embodied in the carrier of information processing. Intellectualism intellectualizes data processing through modern computer technology, which reduces the link with manual complex analysis and provides a technical guarantee of the realization of information technology.

### **2.2 The importance of information technology in talent-related work**

Talents are the first resource for the sustainable development of our society, and the construction of talents team is also an important support for the development of colleges and universities. Because information technology has a strong database system as the basis, modern computer technology as the guarantee, from the introduction of talent, services for talents, and talent evaluation, information technology plays a very important role in the development of talent work in Colleges and universities (Liu Chunlai,2005). Firstly, information technology can play a screening role in the introduction of talent to Colleges and universities. By expanding the scope of talent selection of information platform, comparing the achievements and honors of talent, analyzing the potential and prospects of talent, scientific and accurate identification and screening of talent is conducive to achieving high efficiency and normalization of the introduction of talent. Secondly, using information technology to establish a perfect database system and embedding an algorithm to improve the service level of talents, we can timely understand the needs of talents for Colleges and universities. Through the analysis of historical data, we can predict the direction of talent development, so that colleges and universities can foresee the structural changes of talents ahead of time, and provide convenient conditions for building a strong talent, so as to realize the three-dimensional service of talent for Colleges and universities. Finally, information technology can make an all-around and multi-dimensional analysis and evaluation of University talents, not just take the number of papers as a single criterion. Through scientific and quantitative data, we can widen the scope of the evaluation and accurately evaluate the results, alleviate people's subjective will, and weaken conventional thinking. From the technical level, it is possible to solve the problem of the single talent evaluation index.

## **3 Current Situation of Talents Construction in Colleges and Universities**

### **3.1 Current situation of talents construction in colleges and universities at home and abroad**

With the implementation of the strategy of rejuvenating the country through science and education, the construction of talents in colleges and universities has achieved remarkable results. In teams of the management system of construction, the introduction of talent, training, using various colleges and universities improve, especially among many colleges and universities in the new round of reform of personnel system, to create positions work personnel allocation and post-appointment as an opportunity to build up the “on-demand positioned, the open recruitment, equal competition” the system of choose and employ persons and “according to post salary, optimal reward for distribution system, effectively

Proceedings of the 16th International Conference on Innovation & Management - 1708 - mobilize the enthusiasm of teachers, enhance the vitality and dynamism of the talents (Li Pu,2004). Wu Qingwen et al. studied the characteristics of talents in research-oriented universities and put forward constructive Suggestions on the introduction of high-level talents, performance evaluation and incentive mechanism deepening of the distribution system and other issues in the construction of talents. Wang Yejunetc put forward some thoughts on the reform of personnel distribution system and the establishment of teacher management mode in colleges and universities (Wang Zheng,2008). In terms of talents building, foreign universities pay attention to the development of talent resources, attract top talents and provide humanized and high-quality services for talents American colleges and universities attach great importance to the construction of the teaching staff, the development of human resources and the recruitment of top talents Many colleges and universities have established talent committees to attract outstanding experts and scholars from all over the world The establishment of education reform center in Japan has made a great contribution to the reform of university teacher development system.

### **3.2 The main problems in the construction of the talents in colleges and universities**

#### **3.2.1 Inconsistent thoughts and lack of initiative in the introduction of talent**

In the specific work of the introduction of talent in some colleges and universities, there are common problems such as inconsistent ideas and lack of initiative in work(Gao Fuan, Wang Hui, Ge Na,2009). For example, the school has attached great importance to the introduction of talents, but it is perfunctory to the college, which has caused the school to be very urgent, and the college is not in a hurry, failing to achieve the situation of linker between the upper and lower levels (Zheng Xiaobo,2004); the work of the introduction of talent mainly relies on "waiting for" rather than "looking for", fails to give full play to the role of subject leaders, team leaders, and existing teachers, and the way of the introduction of talent needs to be broadened.

#### **3.2.2 The lack of services for talent is obvious and the efficiency is low**

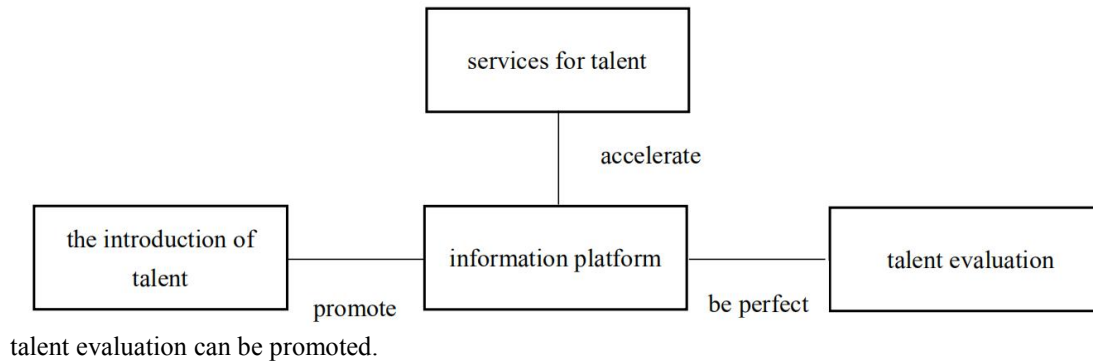

In the construction of talents, the service is very important and is the key to retain talents. For example, teachers' wing rooms, family resettlement, children's enrollment and so on, the relevant personnel services are all paid special attention to by high-level talents in today. The existence of "humanistic care" is needed more in the construction of the talents in colleges and universities. However, at present, due to the lack of timely updating of data and information, the work of services for talent is lagging behind, and it is not able to serve talents in time.

#### **3.2.3 Talent evaluation is too one-sided**

At present, it is not perfect for colleges and universities to publish articles and research funds as the main evaluation indicators. The problem is that the evaluation index of talents used at this stage is one-sided, and the real data needed is not complete enough. It only uses simple scientific research data to measure but lacks data to measure other aspects such as teachers' morality, teachers' style, and students' evaluation. The only scientific and effective evaluation criterion is to have both talents and virtues. In particular, the current talent management mechanism in many colleges and universities is in a relatively closed cycle. The one-sidedness of talent evaluation results in the poor mobility of personnel to a large extent, and meanwhile restricts the establishment of a reasonable talent diversion and elimination management mechanism. In addition, in the process of college the introduction of talent, personnel departments tend to overlook the appraisal of the most important standard of professional master degree of knowledge, lack of necessary for its comprehensive quality assessment, makes the candidate's study and understanding of the degree is limited

## 4 The Consideration and Exploration of the Construction of Talents in the Information Era

Based on information technology, the construction of an information platform for university talents will include three core functions: services for talent, the introduction of talent, and talent evaluation (Zhang Dichen ,2014). Through information platform, the introduction of talent, services for talent, and

**Figure 1 Information Platform for A Talent**

### 4.1 Improving the structure efficiency by using and information system

In the view of the existing problems in the introduction of talent, the information system can play its role in optimizing talent structure (Xue Dexiang,2017). To find out the shortage of subject talents quickly by data statistics can realize the targeted introduction of talents. In terms of the efficient introduction of talents, personal information, scientific research experience, academic ability, and other data can be captured and analyzed accurately on the Internet in the form of information data. Information technology realizes the real-time update of the talent situation. On the one hand, it can prompt universities to know the general situation of job seekers in time to avoid brain drain or placement dislocation. On the other hand, it can find out in time after it has made significant academic breakthroughs, remind personnel departments to pay attention to, and prevent the occurrence of "one size fits all" situation. The operation is simple and easy to tap talents contrapuntally.

In the actual operation process, establish a the introduction of talent and screening information system, import the basic key data of the candidates into the database through data mining technology, and set a demand standard according to the basic requirements of the University for teachers, the system will automatically screen out candidates who meet the introduction of talent benchmark of the university. Set up the classification mechanism according to the disciplines, the information system will pass the personal letter of the initial examination and the information is directly sent to the leading disciplines experts of the corresponding colleges to organize interviews and appraisals, which not only improves efficiency and saves manpower costs, but also avoids the influence of the low enthusiasm of the colleges on the introduction of talents(Zhou Shu, Fang Zhongjin,2011). In addition, the system can update the papers and project information of talents in the reserve database through data mining technology. When it achieves a major breakthrough and qualifies, the information system will promptly remind and form timely and effective communication. In addition, when some other indicators failed to meet the requirements in the process of the introduction of talent and were unfortunately eliminated in the specific assessment process, they can also be informed through the information system. When the

Proceedings of the 16th International Conference on Innovation & Management - 1710 -  
corresponding indicators meet the requirements, they can be introduced again, which can save a lot of manpower and material resources. At the same time, it can also reduce the probability of high-end talent loss.

#### **4.2 Using information technology to enhance service capacity, and serve them in every dimension**

In view of the "services for talent lag obviously, efficiency is not high" phenomenon, when high-level talent enters the school day, can enter the property status, including family placement, children's education, medical interconnection, office conditions, and other stereoscopic information into the system. And instant entry into the information platform. Do not only understand the talent situation, as a record but also know their warm and cold, timely support. (Yue Bin, Liu Chunxia, 2016) The system sets up the time reminder function, before the occurrence of talents' need, pushes the information to the University relevant department responsible personnel, and record in the Personnel Department system, causes each department to cooperate with the personnel to complete the related matters, makes them feel the warmth of home.

For example, know the status of people in advance, housing subsidies for those without housing or assistance in the settlement of resettlement procedures. In the terms of children's education, the information system will send children's message to the affiliated schools after understanding the age of their children, before the first half year of kindergarten, primary school, secondary school. After the school procedures have been completed, the system will feedback to the corresponding personnel, avoiding their trouble of going back and forth and reduce their worries. The application of talents service under information technology will not only greatly simplify the originally complicated and redundant procedures and links, but also reflect the humanistic care of colleges and universities for higher talents and their eager for talents. It is also an excellent way to establish the reputation and image of the university.

#### **4.3 Using information system to make the evaluation standard quantifiable and establishing the evaluation mechanism**

Aiming to the phenomenon that "talent evaluation is too one-sided", the information system can quantify the evaluation standard, establish the evaluation mechanism, and realize the scientific introduction of talent and evaluation mechanism. Through the construction of information, a platform to change the past rigid only the number of papers and scientific research funds as a talent assessment and evaluation of the status, the establishment of regional Talent competitiveness Evaluation Index system and evaluation model, the massive index data into it. The evaluation of colleagues, the evaluation of subject leadership, the evaluation of students and the number of papers and the proportional weighting of scientific research funds were evaluated. The quantitative and accurate generation of talent positioning can play a huge role in improving the scientific and reasonable performance appraisal system and improving the talent management mechanism. The adoption of big data analysis and processing method will promote talent assessment, job title renewal, dismissal, post adjustment and the implementation of rewards and punishments to be more scientific, reasonable and accurate.

## **5 Conclusion**

The 21st Century is a century of the talent competition. If higher education aims to train qualified and competitive creative talents, it is necessary to reserve a strong strength of human resources highland. At present, there are still some problems in the construction of talents in colleges and universities in China. By strengthening the construction of information platform, changing database's function that

Proceedings of the 16th International Conference on Innovation & Management - 1711 -  
simply store data, realizing the application function of information platform based on cloud computing and big data, expanding the scope of data collection in all directions, making qualitative evaluation into quantitative analysis, at the same time opening up information barriers, integrating multiple information technology modules into resources. From the technical level to further improve the aspects of "the introduction of talent", "services for talent", "talent evaluation", free the work from the traditional way, accurate and efficient introduction of talent, humanistic care service personnel, fair and reasonable evaluation of talent. Innovation in the system and mode, formatted to positive feedback mechanism, can better build talents in colleges and universities, so that high-level talent to attract, stay and use well. At the same time, we should select and train a group of professionals who are skilled in the application of talent building information platform in colleges and universities, strengthen the application research work of information platform, especially big data and cloud computing technology, and constantly put forward new solutions under the new trend, so that the processing and application of information and data become the general direction, so as to promote the transformation of talents construction in colleges and universities. In the future, the way of introducing and activating talents can be further elaborated.

# Effectiveness of Social Work Intervention in Classroom Management of Moral Education

Zhang Xiaoxiao

School of Law and Humanities and Society, Wuhan University of Technology,

Wuhan, P.R. China, 430070

(E-mail: zhangxx9@outlook.com)

**Abstract:** Based on the theoretical foundations and value concepts of social work such as "Self-help", this study puts forward innovating traditional management methods in moral education classroom by using various professional methods and techniques in social work. The main achievements are as follows: Firstly, the application of social work methods in moral education classroom of secondary vocational students has a significant effect, which can enrich classroom content, improve classroom atmosphere and improve classroom quality. Secondly, class-based social work intervention model is an effective and practical method, which is suitable for school social work related practice.

**Key words:** Social work; Classroom management; Moral education; Students

## 1 Introduction

The intervention of social work method in the study of moral education classroom for secondary technical vocational students belongs to the intersection and integration of social work and classroom teaching. Few innovative studies have been done on school moral education classroom in China, which is a weak area in the study of technical vocational schools. There are some problems in the teaching situation of moral education classroom, such as students' disgust with learning, lack of interaction between teachers and students, empty and outdated contents, simplification of educational methods and so on (Shen, 2013; Cheng, 2011). The classroom of secondary technical vocational students also show the following characteristics: it pays less attention to habit formation, but to form preaching; it pays less attention to practice, but to theory teaching; it pays less attention to personality guidance, but to common education; it pays less attention to ability training, but to culture inculcation (Wu&Wu, 2007). All of these provide a wide range of space for the application of social work to intervene.

Most researchers agree that social work in moral education in vocational schools is short of focus. At present, the school education field of social work practice in China is mainly divided into colleges, including the discussion of the application of adaptive education growth group in college freshmen, and the study of college student's adaptation problem. Group Activities are carried out among freshmen to tap the potential of freshmen and enhance class cohesion (Xu, 2010; Sun&Wei, 2011; Hu, Song, &He, 2012). These studies explored the practice and application of social work in the process of localization in China and reflected the positive role of social work methods in some problems and fields of students.

It has been observed that researchers always emphasize the current situation of moral education classroom and analyses the reasons for the existing problems among schools in China (Wang, Xu,

Proceedings of the 16th International Conference on Innovation & Management - 1714 - &Ding, 2017). Current moral education mostly adopts the traditional monotonous mode, which cannot meet the needs of students. Traditional moral education always tries to restrain students or reprimand them with its authority, and even takes administrative measures to punish students, rather than actively guide. The result is often counter-productive, making students hostile to teachers and losing interest in moral education. In addition, traditional moral education lacks scientific conceptual basis, which is basically based on experience and easy to become superficial in classes (Englund, 2016).

It is generally recognized that the research on classroom dilemma countermeasures mainly focuses on the proposition of innovative methods, but there are few practical applications. At the same time, there is a lack of practical experience in applying social work to the classroom, field investigation and quantitative research (Xiong, Liu, & Song, 2016). Social work absorbed the knowledge of system theory and ecology, and formed a comprehensive knowledge system of helping people. It is an educational process aimed at promoting growth through personal interaction and collaboration among members in order to achieve the common goal of class (Taylor, Oberle, & Durlak, 2017; Smith, Egizio, & Bennett, 2018). The skills of observing, communicating, establishing relationships and utilizing social resources in social work can also be applied to moral education classrooms (Mcdavitt, Tarrant, Boxall, 2018). Based on the feasibility and superiority of social work intervention in secondary technical vocational schools, combined with the field service of moral education classes, this study carries out a series of group services such as class cohesion and career planning, tries to integrate social work methods into class teaching, makes up for the shortcomings of traditional moral education classrooms, and finally achieves good service effect and is unanimously recognized by students and teachers.

## **2 Analysis of the Current Situation**

S Vocational Senior High School is a national key secondary technical vocational school in Wuhan. It has 150 teaching and administrative staffs, 48 classes and more than 2700 students. The average age of vocational students in this school is between 14 and 19 years old. They have common problems among vocational students in our country and are labeled as "poor students who can't pass the high school entrance examination". By observing, investigating and talking with the teachers and students of the school, the author finds that there are three main problems in moral education in S School.

First, the content of moral education courses is hollow. Although moral education is the main position of moral education in S School, it is still the classroom-based didactic education in moral education classroom, which mainly focuses on imparting knowledge. Teachers teach according to the series of textbooks of vocational literacy in Wuhan. However, the content of textbooks is mostly theoretical knowledge and rules, which are abstract and empty and cannot meet the requirements of the times and the needs of students. Moreover, the book content is not close to the reality of social life, and most of its cases are well-known celebrity deeds or great man's success records, which do not conform to the reality of modern secondary technical vocational school students' learning and life. It can be seen that the content of moral education classroom is divorced from reality. The author even finds that there are some wrong words in these two textbooks. It may affect the effect of moral education.

Secondly, the way of management is monotonous. In order to pursue good discipline, teachers often carry out rigid control and command over the behavior of students, criticizing or even punishing students with problems directly in class. The way of criticism and punishment can easily leave a deep negative impression in students' minds, arouse students' disgust, make students feel pressure or boredom, and even more affect the quality of teaching. Teachers still focusing on maintaining classroom order which according to the traditional way of classroom management. According to the results of

Proceedings of the 16th International Conference on Innovation & Management - 1715 -  
 investigation and analysis, we can find that teachers mainly play the role of inculcating knowledge. They pay attention to the theoretical learning(63.6%) while pay less attention to the growth and psychological state of students(only 9.0%). Moreover, teachers use punitive management which makes some students feel their self-esteem is hurt, and it may even cause students' disgust and rebellion. One-way management also makes students and teachers lack the necessary communication, teachers cannot get students' feedback and opinions in time. Table 1 presents the Evaluation of Students.

**Table 1 A Table of Students' Evaluation of Moral Education Classroom(N=44)**

	n	%	n	%	n	%	n	%
What do you think the teacher is?	The providers of knowledge		The leaders of class students		The models of imitation		The spokespersons of parents	
	22	50.0	14	31.8	3	6.8	5	11.4
Can you appreciate the teacher's concern for you in class?	Often		Sometimes		Seldom		Not at all	
	6	13.6	24	53.3	12	27.5	2	4.5
Does the teacher teach by punishment in class?	Often		Sometimes		Seldom		Not at all	
	8	19.8	15	33.4	11	24.5	10	22.3
What do you dislike most about the teacher's punishment in class?	Penalty copy		Penalty station		To criticize loudly		Not allowed to attend class	
	3	6.8	2	4.5	33	77.3	6	9.8
How do you or your classmates feel after being punished in class?	Feel educated		Damage self-esteem		Lose face		Indifferent	
	12	27.3	20	45.5	6	13.6	6	13.6
What do you do when you have an opinion about what teachers do?	Speak directly to the teacher		Tell the teacher anonymously		Never say it		Discuss with classmates	
	12	27.3	8	18.2	10	22.7	14	31.8

Thirdly, the atmosphere is dull. In class, the teacher talks on the platform and the students play or sleep below. They are not interested in the classroom and are doing things unrelated to the classroom. Some students are still alive after class, but once they have a moral education class, they fall asleep or played telephone games. Moreover, students are lack of motivation to learn. A teacher in the school thought that secondary technical vocational students were not well managed and disciplined. Students also reflect that moral education course is not the main course anyway. It has also left some teachers lack of ideological communication with students.

### 3 The Application Effect of Social Work in Moral Education Classroom

#### 3.1 Enriching the content of moral education classroom

According to the activities carried out, the students scored the interesting, enlightening and knowledgeable of the content of the activities (the highest score was 10, the lowest score was 0). A total of 44 students received questionnaires, out of which 36 students responded, yielding a response rate of 81.82%. The result of students' scoring on activity content shows that interesting of the activity content has the highest score, with an average score of 7.49; followed by enlightenment, with an average score of 7.39; knowledge is the lowest, with an average score of 7.21 and the lowest score of 4.0. It shows that the activities we carry out are more interesting and attractive to students, and students feel the deepest is whether the activities are interesting or not. On the other hand, the general scores of interesting, enlightening and knowledgeable are relatively high. The average score of the three items is 7.36, which shows that the design of our classroom activity content is relatively average in these three aspects, and the activity content has been recognized by the students in the class. The survey of students' satisfaction with the form of overall activities shows that 69.5% of them are "very satisfied" and "satisfied". Table 2 presents the activity satisfaction of students.

**Table 2 Students' Satisfaction with the Content of the Activity(N=36)**

	Very satisfied		Satisfied		Ordinary		Dissatisfied		Very dissatisfied	
	n	%	n	%	n	%	n	%	n	%
Are you satisfied with the content of the group activities?	5	13.9	20	55.6	11	30.6	0	0.0	0	0.0

According to the feedback, students have a quite good evaluation of the activity content. Many contents of group activities have left a deep impression on the students, such as "scenario play", "career auction", "interview simulation" and other games. These varied and colorful activities not only make up for the shortcoming that students only pay attention to books in traditional classroom, but also enrich the content by games such as "interview simulation", which enables students to learn knowledge beyond books in class, and enables students to better grasp the content of moral education in practice. It is conducive to enriching the content of moral education classroom of S Vocational Senior High School.

In addition, according to the results of the students' impression on the content of the activities, the average score of all 12 group activities was 7.29. The highest score was 8.38 for the "My Show" activity in the class, followed by 7.63 for the "guest symposium" activity in the vocational planning training group. "My Show" is an outdoor activity which students have a high degree of enthusiasm and participation, the group members in this game cooperate with each other and complete the task of activities in full of laughter and fun. The lowest score in group activities is 6.59, which is the "This is me" activity in the "New Journey" growth group. We analyze the reasons for this activity, which requires students to draw their own self-portraits on white paper. It requires students to sit in their seats regularly to complete. Because teachers usually let them finish their homework and topics in class, these students are more disgusted with the task of starting to write, the activity failed to attract students' interest in participating. The richer the activity content, the higher the score, which also shows that the students are more interested in the new form of activity content and methods, and the completion of classroom learning in a harmonious and happy atmosphere can enable them to better grasp the content, so as to achieve the goal of class activities.

Communications and contacts with students also reflect the effect of group activities to enrich classroom content. For example, A student mentioned in an interview, "in the past, the teacher basically talked according to the book in class, which was boring, but now there are many interesting activities, and also talked about some knowledge we did not know, which was not mentioned in the books above." The design of some group activities comes from their moral education textbooks and is not separated from the content of moral education that they should master. More importantly, social workers tend to extend the knowledge and talk about a lot of things they need to know but outside of books.

### 3.2 Improving the atmosphere of moral education classroom

Through the summary and record table of these activities, it can be found that most students gradually participate in the activities from the initial state of constraints to activeness. In the middle and late stages of the activities, students show high enthusiasm and participation, and gradually become the leader of the activities. Because the classroom atmosphere is harmonious and full of laughter and happiness, students are also willing to participate in discussions and express their opinions, and even some students take the initiative to express their feelings and experience of activities in the class. Moreover, when students scored according to their participation in the activities, the outdoor activities were as high as 8.3, and the other activities was about 7.1, if the activities are outdoors, students will have more enthusiasm. It is obvious students are more interested in new forms of activities.

The results of the evaluation show that 66.7% of the students think the number of activities is just appropriate, indicating that the number of two group activities is suitable for most students. When answering the reasons, the students who choose "Fit" think that the number of activities is "neither more nor less; just right". Some students also answer that "the activities are held just right, which not only keeps us away from the boredom of knowledge, but also learns knowledge". It shows that compared with the previous moral education classes, students are more fond of the current classroom and have a certain grasp of the content. In addition, those students who think that group activities are "Less" mentioned that "feel relaxed and open in class". This variety of open group activities enrich the classes and attract students to participate in the classroom. 61.1% thought that the time for each group activity was appropriate, the reasons were that "the activities were completed in class" and "we were able to complete the tasks and objectives of each group in class on time". Some students who thought that the time for the activity was "Less" mentioned "We should communicate more", indicating that some students were eager to have a meeting with workers and reminding workers that there is a slight lack of communication with students in class. Table 3 presents the satisfaction of students.

**Table 3 Students' Satisfaction with the Number and Time of Activities(N=36)**

	Much		More		Fit		Less		Very few	
	n	%	n	%	n	%	n	%	n	%
Do you think the number of activities?	1	2.8	7	19.4	24	66.7	3	8.3	1	2.8
Do you think the time of the activities?	1	2.8	4	11.1	22	61.1	7	19.4	2	5.6

The workers pay attention to observe the performance of each member during the whole group

Proceedings of the 16th International Conference on Innovation & Management - 1718 -

activities, pay special attention to the students who have special problems, find and deal with contradictions and conflicts among students within the class in time, and coordinate relations, all of which ensure that the group activities can proceed smoothly in a warm and pleasant classroom atmosphere. The patience and love of workers in the process of activities also infected some students. Students also realized that it was hard and difficult for workers to design and develop activities. They believed that workers who never lose their temper also made them feel the warmth of the classroom and more willing to participate in activities.

The methods and attitudes adopted by the workers are different from the traditional teaching methods and attitudes. Social workers are good at guiding each student to actively engage in group activities, fully inspiring each student to participate in group activities in class, and triggering students to talk about their inner feelings, give praise or encouragement in time; When they find that there is a phenomenon of deviation from the theme in the activities, they intervene appropriately in the members who deviate from the theme in the discussion; When necessary, they reasonably use the skills of support or prevention to interrupt the speeches of the dominant students or encourage the silent members to express themselves, in order to ensure everyone can participate in activities and role playing according to their abilities. Workers timely guide members to extend or proceed to the next issue in discussion and sharing, avoid staying too long on the same issue, let everyone experience activities and classroom in sharing and interaction, complete activities in a harmonious and pleasant classroom atmosphere, and achieve the goal of the class. It is beneficial to improve the atmosphere of moral education classroom.

### **3.3 Improving the quality of moral education classroom**

With the development of different stages of social work, the cohesion of students have been emphasized and promoted in growth group. The communication between students has obviously become more close and harmonious than before, and their ability to communicate and cooperate with each other has improved. And most of the students have made positive and optimistic comments on their own growth. The goals of social work have been implemented and basically achieved, and the results of the activities have been achieved.

Through social work in class, students have subjective evaluation of their new understanding of themselves and career planning. Most of the students think that "as long as there is hope, it is possible to succeed", "as long as we strive hard for it, everything is possible", "cultural courses and professional courses need to have a good foundation", "make great efforts, have a firm belief", "vocational school students can also have a bright future, which let me have hope", "have new understanding about working hard", "have a new understanding that compared with senior high school students, it is easier for us to find a job in secondary technical vocational school. " "as long as we work hard and earnestly, everything is possible." These show that students have more or less a clearer understanding of their future in group activities, and their attitudes have gradually changed to positive. Most of the students in the class have a significant change in their understanding of themselves and their careers. And 72.1% of the students can plan for themselves in the future after the activities. Although only 50% of the students choose to change their ideas about entering a higher school, we can find that 50% of the changes are positive according to their subjective answers, such as "more hard work", "longer-term goals", "more firm-minded, more visionary", "we had no plans for their work before, but now we have plans", "we have goals, we used to just spend time, but now we know how to work hard to achieve goals", "the importance of knowledge", "because of the communication between teachers and classmates, I know that the more places you know, the better for yourself". The application of career planning group makes the career planning ability of students in this class develop and improve effectively. They can set goals and work hard for them, and basically achieve the effect of group activities. Table 4 presents the evaluation of students.

**Table 4 A Table of Students' Evaluation for Activity Effect (N=36)**

	n	%	n	%	n	%	n	%
What do you think you know about yourself through activities?	A big change		Partial changes		The change is small		No change	
	14	38.9	10	27.8	10	27.8	2	5.6
Do you feel that your previous career ideas have changed through activities?	A big change		Partial changes		The change is small		No change	
	8	22.2	10	27.8	13	36.1	5	13.9
Do you have any changes in your career knowledge through career planning group activities?	A big change, and the understanding has increased a lot		Partial changes and basically understand		The change is small, and knows a little bit about it		No change, still doesn't understand	
	14	38.9	17	47.2	5	13.9	0	0.0
Do you think these activities will help your career planning in the future?	Very helpful		Sometimes helpful		A little helpful		No helpful	
	5	13.9	23	63.9	6	16.7	2	5.6
Do you have a plan for future career goals, including long-term, medium-term, short-term?	Yes, I know exactly what I will do after graduation.		Yes, it's clearer, but only have a short term plant.		Yes, it's just a little. I didn't think about it very carefully.		I never thought about it.	
	5	19.3	19	52.8	11	30.6	1	2.8

All activities basically achieve the goals of classroom and social work. Students have a clearer understanding of themselves as well as of themselves in the eyes of others. Most students think that they have grown up by participating in these classes, and basically adapt to the life of secondary technical vocational school in a relatively short time. Especially, they have greatly improved their interpersonal communication, peer-to-peer relationship and attitude towards learning and life. Social work makes the students in this class familiar with each other in a short period of time, stimulates their enthusiasm and initiative to participate in the classroom, and makes students feel that moral education classroom is not necessarily a way of inculcation, but also a way of enjoying teaching. From theory to practice, students can grow up happily in practice.

In addition, the students' evaluation of the two social workers showed that the average score of the two social workers was 8.8 and 8.5, which were relatively high. Workers mainly guide group members in group activities. This shows that the working methods and attitudes of the workers have been recognized by the students, which also provides support for the smooth development of group activities in the classroom. When the last group activity of the semester was held, the students felt reluctant and expressed their hope that they would be able to participate in such activities in the future. It is conducive to improving the quality of moral education classroom.

## 4 Results

Social work and classroom management are belong to different disciplines and have many differences. However, we found there are some advantages of social work intervention in classroom management through this study.

First, the value concept of social work is conducive to the innovation of moral education ideas and thoughts. There are many similarities between the theory of social work and moral education. Therefore, applying the value concept of social work to the moral education has a deep theoretical basis. The values of "people-oriented", "respect and equality" and "service" are worth learning from social work.

Traditional moral education classrooms in China focus on imparting and inculcating knowledge, neglecting students' subjective status and self-motivation in moral education, and students passively accept the views taught by teachers in the classroom. Therefore, the application of the "people-oriented" concept of social work in classes can give full play to its ideological advantages. In traditional moral education classrooms, teachers generally use preaching, warning, advice and other means to force knowledge into students, and some criticism and punishment of teachers in the classroom can easily cause students' conflicting emotions, which not only affect the classroom teaching effect, but also cause psychological impact and harm to students. Introducing the value concept of "respect and equality" in moral education class can enable the teachers to treat students equally, understand students, accept their shortcomings and believe that they have the ability to change. Introducing the concept of "service" makes classes have the advantages of wide coverage and flexibility. Emphasis on students' needs and pay attention to students. Only by providing services for students' urgent difficulties and problems can we truly solve students' various problems with the right remedy.

Secondly, the universality and individuality of social work is conducive to improving the moral education classroom model. Introducing the method of social work into classroom is conducive to solving the problem of single moral education method in secondary technical vocational schools. Under the circumstances of diversification, complexity and thorny problems, the introduction of social work has provided new ideas and methods for moral education teaching and injected new vitality into school moral education. The methods of sharing, supporting, influencing and educating in the interaction of group members in social work can be applied to the moral education classroom, bringing about changes in the attitude and behavior of students. Teachers can use these skills to diversify the teaching methods. The secondary technical vocational school students are in the adolescent period. They are active in thinking, impulsive and irritable, and are prone to encounter various problems, such as interpersonal relationship problems, learning pressure problems, self-perception bias problems and so on. During this period, they are also faced with the task of growing up, the accumulation of knowledge, the improvement of interpersonal relationships, the improvement of their own abilities and so on. Teachers can develop different groups in the moral education classes. These groups are composed of students with common characteristics. When students find that other members of the group have similar problems with themselves, they will increase their sense of identity with the group, eliminate disturbances, alleviate psychological burden, and reduce loneliness and inferiority.

The individuation of social work makes it possible for classes to set up new groups for students who have common needs in some aspects according to the needs of moral education classrooms, For example, different types of moral education teaching groups can be set up different needs, including interest groups, task groups, growth groups, education groups and service groups to carry out targeted work, as well as therapeutic groups, preventive groups and developmental groups. Different group objectives and contents can be set up according to different moral education tasks. Team activities are used differently to serve group members better according to their individual evaluation.

Third, the flexibility of social work is conducive to increasing the attraction of moral education classroom. The working methods and service skills of social work are flexible and diverse. Different from the ways of preaching, warning and persuasion used in traditional moral education classrooms, social work can set up different groups according to different educational tasks and the demands of service objects in moral education classrooms. It pays attention to enrich the content of classroom activities, which not only meets the characteristics and needs of the ages of secondary technical vocational students, but also stimulates their enthusiasm and initiative in learning, so that students can constantly improve their moral education level in the process of playing games.

At present, the main dilemma of moral education for students in our country is the lack of practical links in the process of moral education. Introducing social work to change the original isolated and static classroom teaching mode into dynamic teaching activities, providing students with plentiful group activities in the classroom, and students can interact and help each other in the group, which can stimulate students' enthusiasm and creativity, make up for the lack of practice in traditional moral education classroom, and meet the needs of moral education curriculum.

## 5 Conclusion

Through the evaluation of classroom content, process and effect in the course of service, it is found that flexible and diverse forms of social work can activate classroom atmosphere, attract students to participate in activities, stimulate students' enthusiasm, and improve their level of moral education in activities. Therefore, social work methods can make up for the shortcomings of the traditional moral education classroom for secondary technical vocational students, enrich the content of the classroom, improve the atmosphere of the classroom, and improve the quality of the classroom, and its application in the field of moral education for secondary technical vocational students is feasible and effective.

Social work respects students. Its student-centered values make the relationship between students and workers more like friends and spiritual communicators than the traditional relationship between authority and managed persons. For example, some students wrote in their evaluation of the activities, "It's OK, at least the teacher is very attentive, the students are also looking at it, we all like the teacher's lessons very much." It shows that social work respects students and pays attention to students' needs, so that students really feel the concern of workers in their hearts, and has a positive impact on students' psychology. It makes the concrete content of moral education change the students' thoughts gradually in a subtle way. The content of moral education classroom is referred and followed by every member. Social work promotes the realization of moral education goal more comprehensively. Therefore, social work service is more humanized, which promotes the full realization of moral education goals.

In addition, social work classes can more effectively solve the common problems in a class, such as classroom atmosphere, learning methods and so on. In moral education classroom, social workers can be social workers, psychological counseling teachers, class teachers and friends. The unique service concept, flexible working methods and various working forms of social work can make up for and improve the moral education classroom from various aspects. Class-based social work is an effective and practical method in the field of moral education, which is suitable for the practice of social work in the field of learning.

This research result not only helps to improve the teaching concept of moral education classroom in secondary technical vocational schools, and enriches and improves the methods of moral education teaching, but also has certain reference significance for the professional study of social work and the study of moral education classroom in secondary schools.

## **Research on the Cultivation of Chinese College Students' Global Competence from the Perspective of Internationalization**

Lu Yan

Shaanxi Normal University, Shaanxi, P.R.China, 710062

(E-mail: luyan@snnu.edu.cn)

**Abstract:** In a context where the trends of economic globalization and IT application are surging forward, the global competence of college students has become an important evaluation index for ranking talents' quality in colleges and universities at home and abroad. Cultivating global competence is not only a critical element for national development strategies and education internationalization, but also a requisite way for colleges' double first-class construction and Chinese youth's growth. Therefore, on the basis of its time value, this paper concludes the key elements of global competence so as to explore various ways for Chinese colleges to develop global competence and further promote our youth's participation in international competition.

**Key words:** The perspective of internationalization; Chinese college students; Global competence; Promotional measures

### **1 Introduction**

The trends of global multi-polarity, economic globalization, IT application, and cultural diversity are surging forward; changes in the global governance system and the international order are speeding up; countries are becoming increasingly interconnected and interdependent, especially in social, political, ideological, cultural, educational and other fields. Against this backdrop, the competition among countries' composite national strength is mainly a competition among talented professionals. Thus, global competence is getting more and more attention from all countries in the world.

"Global competence" was initially put forward by Council on International Educational Exchange during its report *Educating for Global Competence* published in 1988, which elaborates on the necessity and feasibility of overseas studying for global competence. Afterwards, some scholars also offer their understanding of global competence concerning its core components, index system and so on. Originally intended for higher education, global competence is aimed at helping students better interconnected with the world, truly understand universal changes and effectively compete in the labor market. Then on December 12, 2017, the Directorate of Education and Skills at the OECD and the Project Zero at the Harvard Graduate School of Education co-hosted the public launch of the new *OECD PISA Global Competence Framework*, which gives global competence an official account. Global competence is the capacity to examine local, global and intercultural issues, to understand and appreciate the perspectives and world views of others, to engage in open, appropriate and effective interactions with people from different cultures, and to act for collective well-being and sustainable development.<sup>98</sup>

---

<sup>98</sup> *The Public Launch of the New OECD "PISA Global Competence Framework" | Educational Counseling,*

As western researchers work on global competence, not to be behind, Chinese scholars also study this topic from various perspectives, firstly bringing in the concept and then talking about its cultivation methods, curriculum systems, assessment strategies, and other aspects. Owing to an intensified international competition, how to improve students' global competence becomes an important issue for colleges and universities to think and explore.

## 2 Time Value of Cultivating Global Competence

### 2.1 The urgent need of national development strategies

The Belt and Road Initiative and the calling for building a community with a shared future for mankind both reflect China's traditional idea "Inclusiveness", especially in the education sector. In 2018, there are 662,100 Chinese students studying abroad, in comparison with 492,100 international students in China. Hence, whether willing or not, Chinese youth have no choice but to engage in the fierce international competition.

In May 2010, *The Guidelines of the National Program for Medium- and Long-Term Educational Reform and Development (2010-2020)* clearly states that "We should strive to nurture a large number of international talents, who are equipped with international vision, familiar with international rules and also able to participate in international affairs and competition."<sup>99</sup>, which suggests that global competence is formally integrated into the national talent training system. So in the future, if China wants to play its part as a more important and responsible major country in global governance, the kind of youth with global competence must be largely trained. At the same time, China also takes an increasingly active part in international organizations. In July 2015, the Ministry of Education and other four governmental departments jointly issued *The Action Plan for Studying Abroad (2015-2017)*; in April 2016, the General Office of CCCPC and the State Council released *The Several Opinions on Opening-up Education in the New Era*; and in June 2017, the Ministry of Education promulgated *The Notice on Promoting the Internship of General College Graduates in International Organizations*. All of these documents require colleges and universities to proactively adapt to national external development strategies, to accelerate the cultivation of all-round talents competent to participate in global governance, and to improve the curriculum system and talents training plan.

September 2016 witnessed the official release of *The Key Competence of Chinese Students' Development*, a major achievement of the project "Overall Framework Research on the Key Competence of Students during the Stage of Basic and Higher Education", which is led by Beijing Normal University and jointly undertaken by many other colleges. Aimed at training all-round personnel, the achievement builds a key competence framework and proposes the characters and abilities essential for students to meet the needs of lifelong development and social development. The framework consists of three parts including cultural basis, independent development and social involvement, which can be further manifested as six major competences like humanistic knowledge, scientific spirit, learning to learn, living healthily, responsibilities and duties, and practice and innovation, and 18 minor details such as national identity and so forth. What's more, one of the major competences, responsibilities and duties has intentionally mentioned the capacity of international understanding, which is composed of the following three requirements: firstly, have a global awareness and an open mind to see human civilization history and world developments; secondly, embrace the diversity of multi-culture and

<sup>99</sup> [http://old.moe.gov.cn/publicfiles/business/htmlfiles/moe/info\\_list/201407/xxgk\\_171904.html](http://old.moe.gov.cn/publicfiles/business/htmlfiles/moe/info_list/201407/xxgk_171904.html), the Ministry of Education of the People's Republic of China.

Proceedings of the 16th International Conference on Innovation & Management - 1725 -  
 respect the differences, thus actively participating in intercultural communication; lastly, pay attention to the global challenges facing human and understand the concept and value of community with a shared future for mankind. As a result, it looks even more important for college students to understand international culture and engage in international affairs.<sup>100</sup>

In September 2016, during the G20 Hangzhou Summit, President Xi emphasizes that participating in global governance requires a large quantity of professionals who are familiar with the principles and policies of the Party and the country, understand the country's realistic conditions, possess a global vision, have a good command of foreign languages and international rules, and are skillful at international negotiations. Therefore, it is necessary to strengthen the building of a talent pool for global governance, breaking through the talent bottleneck, so as to provide strong support for China's participation in global governance. Besides, in his congratulatory letter to the first Schwarzman Scholars College of Tsinghua University, General Secretary Xi pointed out that nowadays, the people of all countries have seen their destinies woven together closer than ever, so the youth of all countries should set up a global vision through education, enhance the sense of cooperation, and create a bright tomorrow for all of us. Thus, improving the global competence of college students is of great strategic significance for China to participate in international affairs and competition.

**Table 1 The Sum of Chinese Students Studying Abroad from 2014 to 2018<sup>101</sup>**

Year	Government-sponsored	Company-sponsored	Self-sponsored	In total
2014	21,300	15,500	423,000	459,800
2015	25,900	16,000	481,800	523,700
2016	30,000	16,300	498,200	544,500
2017	31,200	35,900	541,300	608,400
2018	30,200	35,600	596,300	662,100

## 2. 2 The inexorable trend of education internationalization

The traditional education mode is facing impact and challenge in such a society with highly IT application. For instance, the pure intellectual content can be easily acquired through online search. The International Curriculum Conference held in Melbourne in May 2000 comes up with the concept of "International Curriculum". The experts at the conference also deeply discuss how to construct the national curriculum system under the background of globalization, and transfer the curriculum emphasis from teaching the closed and divided content to generating the value of students as an individual, which gives an important enlightenment to education internationalization development. During the two reports *Rethinking Education: Towards a Global Common Good* and *Education 2030 Framework for Action* published in November 2015, UNESCO points out that human society is experiencing the most grave global challenges, and the social responsibility of higher education is gradually more shouldered by the whole world than by one country. Additionally, the Institute of International Education mentions that

<sup>100</sup>The Official Release of "the Key Competence of Chinese Students' Development", [http://www.sohu.com/a/114389183\\_100928](http://www.sohu.com/a/114389183_100928).

<sup>101</sup> Data source: Ministry of Education of the People's Republic of China.

Proceedings of the 16th International Conference on Innovation & Management - 1726 -  
global competence in the 21st century is no longer a luxury, but a necessity on its release *Global Competence, the Key to the 21st Century*. And as early as 1996, the report *Learning: the Treasure Within* submitted to UNESCO by the International Education Committee for the 21st Century clearly states that education plays a special role in building a more united world.

Considering the university evaluation index, plenty of international ranking systems such as Academic Ranking of World Universities (for short, ARWU) undertaken by the Center for World-Class University at Shanghai Jiao Tong University, Quacquarelli Symonds (for short, QS), Research Center for Chinese Science Evaluation (for short, RCCSE), the Times Higher Education Supplement (for short, THE), and U.S News & World Report (for short, USNWR) all regard the ratio of international teachers and students and the amount of international publications and citations as an important indicator of a university's strength. Moreover, with the development of economic globalization and information integration, young people are in possession of a broader horizon and a greater academic, among which more and more wants to go abroad to appreciate the charms of multi-culture, therefore becoming an all-round international professional. The annual report *Education at a Glance 2018: OECD Indicators* announced by OECD indicates at the higher education level, the number of Chinese students studying abroad and international students in China keeps on a rapid growth, from 2013 to 2016 increased by 22% and 43% respectively. Therefore, with a view to underpin a sustainable economy development, China's education must be oriented to the world and the future, thus making a forward-looking plan for present and future.

### 2.3 The major mission of college development

In accordance with *The Notice of the State Council on the Overall Plan of Making Coordinated Efforts to Develop World-class Universities and World-class Disciplines*, one of the reform tasks of "double first-class" construction is to promote international exchange and cooperation. Specifically speaking, it involves the four aspects followed: first, enhance the pragmatic cooperation among world-class universities and academic institutions, effectively integrate foreign high-quality resources into our teaching and research process, and make joint efforts to cultivate high-level personnel and solve scientific problems; second, increase international collaborative innovation and actively engage in or organize major international and regional scientific programs and projects.; third, create a sound international teaching and research environment to attract more excellent foreign teachers and high-level foreign students; at last, take an active part in the formulation of international education principles and the evaluation and accreditation of international education and teaching, practically improve the international competitiveness and discourse power of China's higher education, and establish a good brand and image of Chinese universities.<sup>102</sup> Undoubtedly, all of these mentioned above can be viewed as the specification of global competence.

For one thing, at the global level, the rapid development of network technology deepens the international integration and division; the rising number of college graduates leads to a severe domestic employment situation. So competing in the global employment market becomes one of the methods for college graduates to get a job. The United Nation launches Global Education First Initiative in September 2012, one of whose priority is to nurture international citizens. For another, at the regional level, to begin with, on the occasion of the 160th anniversary of the founding of Adams College in South Africa in 2013, Ms. Zuma, the chairman of the African Union, comes up with the idea that "To train talents for AU, who are familiar with the global political and economic structure, procedures and laws." In addition, Tsinghua University proposes its global strategy in July 2016, setting the goal of "cultivating innovative talents with global competence" and establishing a guidance center for

<sup>102</sup> [http://www.gov.cn/xinwen/2017-01/27/content\\_5163903.htm#1](http://www.gov.cn/xinwen/2017-01/27/content_5163903.htm#1), the Central People's Government of the People's Republic of China.

Proceedings of the 16th International Conference on Innovation & Management - 1727 -  
developing students' global competence. Furthermore, Shanghai International Studies University pioneers an integrated-subject teaching model and opens many "multilingual plus" talent training platforms. To sum up, the whole world is taking action for cultivating global competence.

### 3 Key Elements of Cultivating Global Competence

By interoperating the domestic and foreign research results and training program of famous schools and considering national development progress and the demand of global talents, the researcher holds the view that the key elements of Chinese college students' global competence include the following three aspects:

Figure 1 Key Elements of Cultivating Global Competence

#### 3.1 Intercultural communication competence based on national identity

Culture is the soul of a country and a nation. The fate of a nation will be good with prosperous culture. A nation will be strong with prosperous culture. High sense of cultural confidence promotes the prosperity and revival of a nation. Different scholars have different understandings of the intercultural communication competence, but the core elements of it are similar. That is to say, intercultural communication competence is a kind of comprehensive ability which includes knowledge, skills, attitude and cultural awareness. Cultural communication is embodied in language and behavior. However, it does not exist only as an instrument, but also as kind of perception of the cultural connotation hiding in language. On the basis of language skills, intercultural communication competence means a conscious and profound identity to the indigenous cultural property in the first place and comprehension and application of cultural difference in the second place. In cross-cultural communication, communicators should maintain a right attitude and should not be extremely arrogant and slavish. At the same time, communicators should also pay attention to cultural tradition and the context. All of these require that college students, especially students majoring in foreign language and diplomacy studies, should lay a solid multilingual foundation and look into the political, economic and cultural background of corresponding countries. They should also realize that foreign language proficiency is not equal to intercultural communication competence for the latter tends to be the comprehensive ability of multi-culture and communicative ability.

#### 3.2 The ability of self-regulated knowledge construction based on tri-element integrated age

Nowadays, although china is in the age of school education, the stage of lifelong learning has been quietly approaching. The headmaster of Northeastern University put forward three literacies in *Robot-Proof: Higher Education in the Age of Artificial Intelligence*, which includes data literacy, technological literacy and humanics. In this book, he educated students to face the information technology wave

Proceedings of the 16th International Conference on Innovation & Management - 1728 -  
bravely. In the future, illiteracy is not those who cannot read and write, but refer to the people who does not master the way to learn and unwilling to reflect and relearn. Premier Li Keqiang once described the development of science and technology as a development of collective intelligence, which means that various subjects blend with each other, forming a kind of phenomenon of Tri-element Integration, which includes human society, information space and physical world. Especially, the integration of science and technology, society and culture and the rapid development of high education informatization reform the process that college students gain knowledge. Global competence requires learner to have more meaningful learning objectives, learn out of joy rather than out of material gains and make learning become their individual endogenous needs. Besides work skills, learners should attach great importance to strategic knowledge and discard the ineffective knowledge. Furthermore, learners should also supplement useful knowledge by the ability of knowledge transfer and develop high-level cognitive and non-cognitive skills, which are helpful to develop problem solving skills, critical thinking skills, creativity, communication skills and problem solving skills to combine cognition and imagination and realize autonomous knowledge construction.

### **3.3 International teamwork ability based on key skills**

Dating back to 2005, Thomas L. Friedman pointed out clearly in *The World is Flat: A Brief History of the Twenty-first century* that “the human society has already entered a whole new era: Globalization 3.0. Following countries and transnational corporations, individuals, relying on modern science and technology, become an importance force to accelerate the process of globalization.”<sup>103</sup> Facing international competition and multicultural work environment in the future, individuals should obtain the ability of work in teams. Learning centered on 21<sup>st</sup> century skills and key competences has become the consensus of educational reform all over the world. From the 1990s, many countries and areas, including Canada, Singapore, America, have begun to integrate 21<sup>st</sup> century skills in the curriculum, teaching progress and evaluation. PISA testing is improved constantly and has added measurement of cooperative problem solving skills. In 2015, Education 2030 Framework for Action, a global education agenda published by UNESCO, has made the strategy of educational reform stands in the center in every country’s planning. It pointed out that key skills could play an important role with the reform of technology and education. Chinese scholar Zang Lingling conducted a case study on 10 world-class universities, including Harvard University, Yale University, Oxford University, Cambridge University, Toronto University, Nanyang Polytechnic University of Singapore, Sydney University of Australia and Hong Kong University of China. In the paper *A Study on University Students’ Key Competence in International View*, she points out the world-class universities tend to converge on the core skills indicators of college students by the analysis of word frequency of three first-level indicators, including cultural accomplishment, social participation and self-development, and ten second-level indicators of core literacy, and their emphasis on teamwork also reflects the direction and trend of personnel training of higher education around the world.

## **4 Various Ways to Cultivate Global Competence**

### **4.1 Developing global awareness in strengthening national cultural identity**

Global awareness is a kind of world view which refers to how people perceive their relationship with the world and their sense of responsibility as citizens of the world. Cultivating global awareness has the important guiding significance for the promotion of global competence, and culture is one of the

---

<sup>103</sup> *The World is Flat: A Brief History of the Twenty-first century*. Hubei: Human science and technology press, 2006.

important factors which affect young people directly in global awareness. One of the prerequisites for cultivating global awareness is making learners fully understand and identify the cultural characteristics of our nation. First of all, learners should be guided to understand the relationship between Chinese culture and global culture. They are not in the opposite. However, they would interact with and influence each other. Different cultural backgrounds and diverse cultural development could foster the genealogy of global culture, and these would integrate and develop together in the future. Only by maintaining its uniqueness, developing constantly and being open to communicate with others, can national culture gain long-term vitality in the cultural world. Furthermore, learners should be cultivated the awareness to participate in the global competence actively and grow up to the "Global Talents". Although students' internationalization degree in the school and after school is closely related to their family background, major, career planning, schools' internationalization degree, campus culture, etc., the cultivation of their global awareness is indispensable. Most of the world-class universities at home and abroad focus on developing students' global awareness systematically by integrating with international needs in many aspects, such as enrollment education, campus culture developing, professional curriculum setting, foreign exchange projects, summer schools, career planning and so on. At the same time, they avoid students' participation in Culture Shock of international affairs by daily education. This kind of idea of cultivating global talents worth of thinking and drawing lessons from for research universities.

#### **4.2 To build an international curriculum system under the concept of ideological and political education**

Chinese president Xi Jinping gave a speech at the 100<sup>th</sup> anniversary celebration of the establishment of the Western Returned Scholars Association. "Overseas-educated talents are encouraged to use their advantages to promote exchange between China and other countries so that China can gain more understanding and support from the world", he said<sup>104</sup>. At present, most of international courses in domestic universities mainly include the knowledge of region, country, literature and language and they are insufficient in high-level degree program. What's more, these courses only scatter in Colleges of International Studies and the Colleges of International Sinology. These courses are not systematic and significant enough and they performed not well in guiding learners in solving the international problems. Considering that, universities should avoid two kinds of misunderstandings in strengthening the construction of international curriculum system. First of all, promoting students' global competence does not mean open a course named "Global Competence" in colleges. From the perspective of inter-subjectivity, educators and educatees, as equal subjects, should give fully play their role of subjectivity and carry out communication to realize self-promotion. It requires teachers to explain the meaning of global competence in class teaching, after-class activities and environment setting in a vivid way, embedding this teaching goal in various goal, by which the course can be international and students' ability in solving practical problems and research history can be improved. Secondly, the process of internationalization cannot be realized at the cost of reducing the inheritance of the traditional culture of our nation. Teaching in English should be encouraged, but for the courses of Chinese, Chinese history and Chinese philosophy, teachers should use Chinese and the certain amount of class hours should be guaranteed. In scientific research, researchers are encouraged to study Chinese condition and problem in foreign language. At the same time, researchers should use the evaluation standards to promote themselves, drawing conclusions and reflecting themselves in international competence, so as to participate in establishing rules and standards in the future.

---

<sup>104</sup> Xi Jinping's speech at the 100th anniversary celebration of the establishment of the Western Returned Scholars Association. [http://www.china.com.cn/legal/2013-10/22/content\\_30367173.htm](http://www.china.com.cn/legal/2013-10/22/content_30367173.htm)

#### **4.3 Applying the mode of deep experience to the practice platform in colleges**

One of the necessary ways to develop global competence is college students' global academic experience and global communication experience. On the one hand, on the basis of increasing the frequency and number of international exchanges, universities should change the mode of international activities in campus and design more activities with more cultural connotations, global elements and inspirations. Universities should also increase the number of exchange activities between Chinese students and foreign students in China, which is benefit to cultivate students' global awareness and ability in the process of experience it personally. The activities should cover the first and second classed. Consideration should be given to the training levels and objectives in different grades. At the same time, attention should be paid to factors, such as participants' interest and ability, knowledge base, cultural differences and regional characteristics. On the other hand, the government and universities should also consider how to make favorable policies in training and application for studying abroad and employment opportunities, and promote international appeal and absorptive capacity of Chinese higher education to attract more foreign students to study in China and establish campuses with more international atmosphere.

#### **4.4 Improving international development mechanism in management measures**

At present, there are still some improper phenomena in domestic universities, such as the inadequate publicity of international exchange programs, the imperfect mechanism of international visits, the imperfect policy of foreign teachers' teaching management, and complicated management of intramural international exchanges, which have brought obstacles to the cultivation of college students' global competence. Therefore, one of the important tasks of Chinese universities' internationalization is to straighten out various supporting measures and management mechanisms, which requires the leading body's overall consideration and reasonable layout. Meanwhile, full consideration should be given to the developmental gap between the east and the west and the development of geo-economy when evaluating the cultivation of global competence and international work. In cultivating global competence, the process rather than results should be emphasized for individuals. It's should be noted that promoting global competence is a lifelong process. No individuals can master the perfect global competence. What's more, the evaluation of it is also a way to promote students' ability.

### **5 Conclusion**

In a word, the cultivation of Chinese college students' global competence is not only an urgent need of national development strategies and international talent competition, but also a requisite way for future college students' growth during the course of economic globalization. It is also a call for the responsibility and mission of "slash youth" in the developmental trend of a community with a shared future for mankind. Therefore, Chinese colleges and universities must closely follow this historical trend and strengthen the cultivation of international talents with global awareness, thus promoting the realization of Chinese national rejuvenation.

**Abstract:** University culture, ideological and political education has a high degree of consistency. They have the same goals and similar functions. But there are still differences. How to clarify the relationship between the two scientifically, and make them integrate, penetrate and influence each other in practice, so as to play a greater role in combining forces, and then improve the effectiveness of education, is an important issue that we need to seriously and thoroughly study. This paper analyses the difference and homogeneity between university culture and ideological and political education, expounds the interaction between university culture and ideological and political education, put forward the double helix coupling interactive mode of university culture and ideological and political education and finally the realization path of the double helix interaction mode is discussed.

**Key words:** University culture; Ideological and political education; Double-helix coupling; Interactive mode

### **1 Introduction**

With the deepening of academic research on culture, experts have different views on the definition of university culture. Some experts believe that the carrier of university culture is the university, through the inheritance and development of each teacher and student, the synthesis of material and spiritual achievements accumulated by the university (Gao Minghui, 2016). Some experts believe that university culture can generally refer to all activities and modes of activities within the university (Wei Bin, 2018). Also some experts pointed out that there are theorists believe that the university culture is in the long-term process of running through the judgment, the choice of all teachers and students staff and pursue, innovation, and gradually formed the education thoughts of school-running idea, rules and regulations, management style, ethics and code of conduct and group consciousness, work style and spirit school image (Zhang Fan, Gao Tianqin, 2018). From the perspective of cult urology, some experts believe that university culture is a kind of subculture, which is a collection of a whole set of values, behavior patterns, language habits, institutional systems, knowledge symbols and architectural styles established around university education and teaching activities (Fan Shengwu, 2015). In terms of the basic attributes or functions of the university, some experts believe that the university culture is developed from the history of the university. People have different group consciousness and spiritual

The university cultural education function has become a hot topic in the current academic research. Scholars at home and abroad attach great importance to the study of university culture, not only have achieved more results in theoretical research, but also actively applied these results to the practice of university education. The research results of domestic scholars mainly focus on the connotation of university culture, the function of university culture education, and the way of university culture education function. The reason why the western developed countries have a higher level of higher education development and talent training has its own characteristics. One of the main reasons is the emphasis on the research of university cultural education and the importance attached to the construction of its own university culture. According to the available data, foreign scholars mainly study the following aspects of university cultural education function: research on university culture construction, university culture education function research, university culture education model research.

Because experts define the concept of university culture differently, they have different views on the connotation and structure of university culture. Some experts put forward the "Iceberg Mode" of cultural stratification, which divides university culture into two layers: explicit and implicit. Others believe that "university culture mainly includes three layers: spiritual culture, institutional culture and environmental culture". Hofstadter put forward the "onion model" of cultural stratification, and compared culture to an onion: the outer layer is called a symbol, the second layer is Heroes, the third layer is rituals, and the inner layer is Values. This theory gives a comprehensive static description of the connotation of culture from different dimensions, and also makes a dynamic analysis of the internal relations among various elements, which gradually wins consensus in the academic circle. According to the "onion" theory of cultural stratification, this paper holds that the connotation of university culture consists of spiritual culture, institutional culture, behavioral culture and material culture.

## **2 Study on the Difference and Homogeneity of University Culture, Ideological and Political Education**

### **2.1 Differences between University Culture, Ideological and Political Education**

As two different concepts, university culture and ideological and political education belong to different categories and have different theoretical bases of nature. The construction of university culture includes both spiritual and material construction, which belongs to both engineering and cultural disciplines. While the work of ideological and political education is to persuade, educate and change people's behavior with Marxist Theoretical System, which belongs to the category of political science. They also work in different ways. Ideological and political education belongs to educational activities, and the process of education must be relatively standardized and systematic. The construction of university culture guides university students to study, live and work in a subtle and silent way. If you keep good men company, you will be of the number.

### **2.2 The homogeneity of university culture and ideological, political education**

Although there are some differences between university culture and ideological and political education in concept, in essence, they both belong to social ideology and there still exists homogeneity. They have the same guiding ideology. Both of them adhere to the leadership of the Communist Party of China and are guided by the Marxist theoretical system and the socialist core values. From the perspective of content, both of them are based on the correct guidance of world outlook, outlook on life and values. From the point of view of the working objects, both of them work for "people", and the main

Proceedings of the 16th International Conference on Innovation & Management - 1734 -  
purpose of the work is "public feeling". From the perspective of goal orientation, the goal of both is to cultivate a healthy and perfect personality and promote the all-round development of people. In addition, the content of university culture and ideological and political education are similar, and the two are not static, and they are interfered and influenced by the international and domestic economic and political situations and social thoughts to varying degrees.

### **3 The Interaction between University Culture, Ideological and Political Education**

#### **3.1 The Promoting Role of University Culture in Ideological and Political Education**

The functions of university culture have been analyzed above, including indoctrination, standardization, cohesion, motivation and edification. The promotion of university culture to ideological and political education is mainly realized through these aspects. The spiritual culture of university can guide teachers and students to set up correct values, help teachers to cultivate noble moral sentiment and shape perfect personality quality. On the one hand, university institutional culture provides daily norms and codes of conduct for teachers and students; on the other hand, it also enhances their sense of awe and trust in system rules, which can provide institutional guarantee for the advancement of ideological and political education. University behavioral culture infiltrates the content of ideological and political education into a rich and colorful cultural activities, which not only enhances the appeal and appeal of ideological and political education, but also enhances the combat effectiveness and cohesiveness of teachers and students. The material culture of the university provides the material basis for ideological and political education, and continuously expands the resources and carriers of ideological and political education.

#### **3.2 Promotion of ideological and political education to university culture**

The fundamental purpose of ideological and political education in colleges and universities is to guide teachers and students to form a correct value orientation. Therefore, ideological and political education is not only an important part of university cultural construction, but also a guarantee for the direction of university cultural construction, so as to maintain its advanced nature. Ideological and political education work is also an important means of university culture construction, ideological and political education work can effectively guide teachers and students to actively play the scientific attitude of Marxism to examine and analyze university culture, so as to consciously identify and practice the noble university culture.

### **4 Construction of the Double-helix Coupling Interactive Mode between University Culture, Ideological and Political Education**

#### **4.1 Spiral Theory and Coupling Theory**

Spiral propulsion systems method logy, abbreviated as helical methodology and helical system methodology. The author of this theory holds that the solution to the problem does not necessarily have to be a one-time direct attack on the key point. It can take a spiral and circuitous way to repeatedly use a certain method, constantly win the push force, so as to promote the solution of the problem and ultimately achieve the goal. The application of spiral theory fully considers the whole and part of the problem, long-term and short-term, theory and practice, making the solution of the problem more flexible and efficient. The basic spirit of spiral propulsion systems method logy has five main points: (1)

Proceedings of the 16th International Conference on Innovation & Management - 1735 -  
determining the direction and principal axis according to the initial state of the system and its changing objectives, (2) setting the deviation range relative to the main axis; (3) flexible selection of appropriate methodologies and methods to regulate and control; (4) pushing forward; (5) pursuing relatively limited optimization in the process. The double helix model is a theoretical model based on the spiral theory. It is mainly used to describe the interaction and influence between the two acting factors, as well as the combined effect of the two on the target object, such as the double helix structure of DNA, which can only play the role of instructions under the joint action of the two chains and produce effects on the cell (Chun Dong, 2012) .

In physics, coupling refers to the phenomenon that two or more systems or modes of motion interact with each other through various interactions, or even unite together or form an integration through the interaction of internal mechanisms. It is a dynamic relationship of interdependence, coordination and mutual promotion under the benign interaction among subsystems (Huang Jianjian, Wang Baoqian, 2012) . Systematic coupling theory is a hot issue in the field of system engineering, and related theories are widely used in basic agricultural science, resource utilization and environmental science, economic management and other fields.

#### **4.2 Theoretical model of double-helix coupling interaction between university culture, ideological and political education**

Through the analysis of the relationship between university culture, ideological and political education, we can easily find that there is a coupling relationship between them, which is inseparable, mutual penetration, mutual promotion and two-way interaction. Based on this analysis, this paper establishes a theoretical model of the interaction between university culture and ideological and political education, as shown in Figure 1.

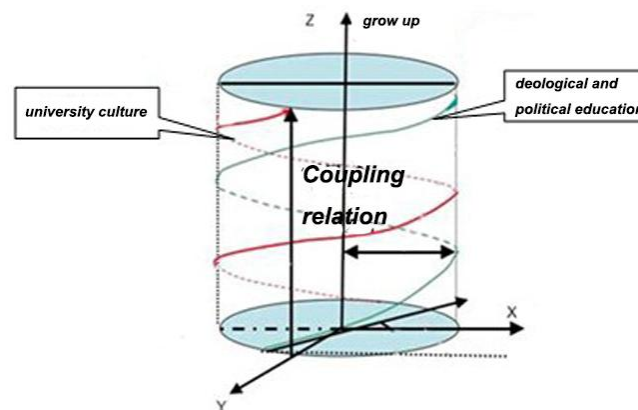

**Figure 1 Theoretical Model of Interaction between University Culture , Ideological and Political Education**

In the above model, university culture and ideological and political education, as two independent educational activities, their own structure makes them appear spiral development trend, respectively on two independent spiral curves, moving forward toward their respective goals. Because the two are intermingled in terms of resources, systems, behaviors, etc., they promote each other in the effect of the effect, and the ultimate goal is the same. Therefore, the two independent spiral curves appear parallel coupling, and finally the double-coiled coupling relationship is presented. It can be concluded that there is a double-helical coupling relationship between university culture and ideological and political education.

#### **4.3 Operation mode of double-helix coupling interaction between university culture, ideological and political education**

The theoretical model of double helix coupling mainly analyzes the static correlation between university culture and ideological and political education from the aspects of objective and content, but

Proceedings of the 16th International Conference on Innovation & Management - 1736 -  
does not reveal the coupling mechanism and dynamic processional process of the two. Therefore, based on the above research, this paper proposes the operation mode of the double-helix coupling interaction between university culture and ideological and political education (as shown in figure 2).

**Figure 2 Operation Mode of Double-helix Coupling Interaction between University Culture, Ideological and Political Education**

In this model, the construction of university culture and ideological and political education work, as a double chain of moral cultivation, spirals around individual development. The dynamic precession includes breadth precession, content precession and depth precession.

The interactive system of university culture and ideological and political education can be regarded as a whole composed of several relatively divisible parts. First of all, according to the priority of these parts and their interrelation, human, financial and other educational resources, we can make it work orderly from the breadth of rotation. Secondly, we can make a systematic plan for the construction of university culture and ideological and political education, set priorities and do first thing first and promote it spirally in content. Thirdly, the precession triangle cycle theory of system engineering is applied to precession from depth (Chang Shaoshun, 2016). That is, analysis - planning - implementation - reanalysis - reanalysis - reanalysis... The small ring can also be wrapped with big rings, spirally advancing upward until the completion of the transaction and entering the next spiral cycle.

#### **4.4 The realization path of the double-helix coupling interaction between university culture and ideological and political education**

The double-helix coupling model of university culture and ideological and political education is proposed mainly on the basis of their homogeneity and mutual promotion, without considering other interference factors, with a certain degree of idealism (Liu Wei, 2012). Whether they can be scientifically coupled and efficiently promoted in accordance with the expected goals still needs to explore specific practice paths. The author believes that the realization of the double-helix interaction between university culture and ideological and political education mainly includes the following aspects:

4.4.1 Attach importance to the coupling and interaction between university cultural construction and ideological and political education.

University leaders and teachers must deeply understand that the coupling between university culture construction and ideological and political education is an inherent requirement for achieving the goal of talent cultivation, as well as it is also an objective need for college students to grow up and become an effective way to achieve timeliness. The coordination and promotion between the two should be constantly strengthened, and the campus culture and ideological and political education should never be regarded as two juxtaposed subjects to be separated, so that the coupling interaction between the university culture and ideological and political education can be promoted from the behavioral level of unconscious to the ideological level of conscious.

4.4.2 Strengthen the team building of coupling interaction between university culture construction and ideological and political education.

The coupling interaction between university culture construction and ideological and political education is based on the benign interaction between educators and educates. The main body of interaction includes all teachers and students. The realization of the interactive goal does not depend on one department or several departments. It requires the active participation of all teachers and students, and gradually builds up a full-staff interactive main body team.

4.4.3 Improve the working mechanism of coupling and interaction between university cultural construction and ideological and political education.

The positive interaction between university culture construction and ideological and political education is a systematic project, which needs to be guaranteed by a perfect working mechanism. For example, the driving force mechanism to promote operation, the unified and coordinated operation mechanism, and the safeguard mechanism that attaches equal importance to both material and spiritual aspects.

4.4.4 Expanding the activity carrier of coupling interaction between university culture construction and ideological and political education.

Carrier is the bridge and link of the coupling interaction between university culture and ideological and political education. It plays a vital role in the establishment of interactive relationship and the impact of interaction effect (Xu Taobao, 2017). Therefore, actively expanding the carrier of activities from management, media, practice and curriculum teaching is the key path to realize the coupling interaction between university culture and ideological and political education.

## 5 Conclusion

The connotation of university culture consists of spiritual culture, institutional culture, behavioral culture and material culture. University culture, as a kind of subculture, is an important part of social culture. In the process of school development, it naturally embodies many social functions, such as indoctrination, standardization, cohesion, motivation and edification. University culture and ideological and political education have a high degree of consistency.

In the above model, university culture and ideological and political education, as two independent educational activities, have a tendency of spiral development due to their own structure. They are respectively on two independent spiral curves, advancing towards their respective expected goals. Because of their cross-integration in resources, systems and behaviors, mutual promotion in effect and the same ultimate goal, the two independent spiral curves appear parallel coupling, and eventually show

Proceedings of the 16th International Conference on Innovation & Management - 1738 -  
a double-helix-helix coupling relationship. From this, we can conclude that there is a double-helix  
coupling relationship between university culture and ideological and political education.

At present, the scientific and feasibility are analyzed from the theoretical level. The next step will  
continue to make useful explorations in practice, and find problems and deficiencies in practice in order  
to better guide practice.

# The Differences of Chinese Vocabulary between Mainland China and Taiwan: A Case Study of Picture Book Title Translation

Jiang Fan

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 264045642@qq.com)

**Abstract:** Mainland China and Taiwan are of the same language root, but there are actually many differences in their respective Chinese. This paper tries to take the picture book title as the research object. Through practical examples, this paper compares the vocabulary differences between translators from both sides of the strait when translating the same picture book. Attempt will be made to explore the factors and reasons behind this difference. Based on the comparison of a large number of translated language materials, this paper qualitatively analyzes and summarizes the research results.

**Key words:** Picture book; Title translation; Mainland China; Taiwan Mandarin; Putonghua

## 1 Introduction

The main content of children's picture books is pictures with relatively simple stories and a small amount of text narration. Readers are generally between the ages of 2 and 12. These books “combine the two kinds of arts, language and painting, together by means of re-creation without losing their characteristics, vividly showing the unique material state of book.” (Tadashi Mstui, 1997)

At the beginning of the 21st century, as a large number of children's picture books were translated into China from various countries, the translation of children's picture books gradually entered the field of translation theory researchers. Foreign translators and scholars mainly study the relationship between pictures and sounds in children's picture books, the translator's position, translation practice and power in translation. The mainland has also published related research works, such as Mei Zihan's "Children's Book - Children's Literature of Picture Books", Kang Changyun's "Study on the Reading Process of Children's Picture Storybooks", and Yu Yao's "Reading by Picture Books". In Taiwan there are Hao Guangcai's "How Good is a Picture Book", Lin Meiqin's "What's So Great about Picture Books", etc. Most of these works start with analyzing the characteristics of children's picture books, and explore the standards of excellent picture books and how to read picture books. But the question about the translation of the picture book is not involved.

In contrast, the papers on the journal online are more involved in the translation of the picture book. These papers explain the translation of children's picture books from different angles and provide reference for the research and development in this field. Many translation theories have also been applied in the study of children's picture book translation, such as functional translation theory, skopos theory, feminist theory and other theories.

According to the statistics of periodical network, 208 papers related to the translation of picture books have been published so far. There were 20 master's theses and 7 doctoral theses. Most of them

Proceedings of the 16th International Conference on Innovation & Management - 1740 -  
discuss some problems in picture book translation from the language level. Research on the translation of picture books still focuses on language, aesthetics and translation strategies. Moreover, only one paper on the comparative study of picture book translation between Taiwan and China has been found.

It can be found that, from a horizontal perspective, the application research of picture book translation is gradually deepened. For example, it is not uncommon to study some Chinese translation of picture book, such as Cheng Xiufang (Cheng Xiufang, 2014). From a vertical perspective, the theoretical study of picture book translation has gradually deepened and began to develop from the perspective of ecological translation theory. Guo Ping said, "From the perspective of ecological translation, this paper aims to explore how to adapt the picture language of picture books to linguistic, communicative and cultural dimensions, so as to do a good job in the translation and introduction of foreign picture books." (Guo Ping, 2013)

The people of both the mainland China and Taiwan are the sons and daughters of the Chinese nation, and the language used is originally Chinese or Mandarin. For more than half a century, the superposition of political, economic, historical and other factors has caused long-term cultural and geographical isolation between the two sides. In this state of complete isolation, the two places have developed their own distinctive language and cultural environment. The lingua franca on both sides of the strait have also experienced some differences in their respective developments. It is called Putonghua in mainland while Mandarin in Taiwan. The difference between words that reflect the most rapid changes in society is particularly evident.

The author of this paper tries to start from the study of the title of children's picture book, which is an important carrier of language, comparing the strategies of the translation of children's picture books on the both sides, revealing the differences in the translation of picture book titles, and analyzing the causes behind the differences.

## **2 Source of Materials and Methods of Analysis**

The object of this paper study is the title of the children's picture book. The main content of the children's picture book is a picture, accompanied by a corresponding simple story and a small amount of textual narrative. Readers are generally between 2 and 12 years old.

The source of mainland books collected is mainly from the current mainstream book websites on the market--- "Dangdang.com" and "JD. com". The other source includes the official websites of Hubei Provincial Library and the National Library. The titles of the picture books in Taiwan are obtained by browsing the "National" Taiwan Library website, the "National" Public Information Library official website and some online bookstores in Taiwan.

Based on a large number of translated materials, this paper sorts, summarizes and analyzes existing title translations by contrast and induction, the research results being qualitative and summarized.

## **3 The Expressions and Causes of Chinese Vocabulary Difference between Mainland and Taiwan**

The differences in title translation collected in this paper are mainly reflected in the following aspects:

### 3.1 Name Translation

A great feature of the drafting children's picture book titles is that they are often named after the hero of the picture book story. There is always a naughty, lovely or naive little hero in most of the picture book stories. The title directly shows the name of this little protagonist to help immediately capture the interest of the little readers, fully mobilizing the children's curiosity, and make them eager to know what kind of adventure or experience the little protagonist will encounter, attracting them to open the book and continue reading.

Therefore, the translation difference of picture book title between mainland and Taiwan is primarily and most reflected in that of picture book titles with names. See the following table 1:

**Table 1 Comparison of Names Translation**

Original English Texts	Mainland's Translation	Taiwan's Translation
①“David Gets in Trouble” by David Shannon	“da wei re ma fan” by Yu Zhiying	“xiao mao re ma fan” by Huang Yuhui
②“Brave Irene” by William Steig	“yong gan de ai lin” by Ren Rongrong	“Yong gan de xiao lin” by Song Pei
③“Max and the Superheroes” by Rocio Bonilla	“mai ke si de chao ji Ying xiong” by Xiao Lujun	“Xiao mai he chao ji ying xiong” by Wang Xinyu
④“Templeton Gets His Wish” by Greg Pizzoli	“xu yuan yao xiao xin” by Xu Yaocen	“xiao dun de yuan wang shi xian le” by Sha Yongling
⑤“Ralph Tells A Story” by Abby Hanlon	“la er fu hui jiang gu shi le” by Li Yiman	“xiao fei de zuo wen ke” by Sun Qingfeng
⑥“Alexander and the Wind-up Mouse” by Leo Lionni	“ya li shan da he fa tiao lao shu” by A Jia	“a li he fa tiao lao shu” by Sun Qingfeng
⑦“Matthew's Dream” by Leo Lionni	“ma xiu de meng” by A Jia	“lao shu a xiu de meng” by Sun Qingfeng
⑧“Gruffalo” by Julia Donaldson	“gu lu niu” by Ren Rongrong	“gu fei le” by Hao Guangcai
⑨“Stuart Little” by E. B. White	“jing ling shu xiao dl” by Ren Rongrong	“xiao bu dian xiao si te” by Wen Tingshu
⑩“Spinky Sulks” by William Steig	“si bin qi fa pi qi” by Ren Rongrong	“shi bin qi sheng men qi” by Liu Qingyan

In terms of translating people's names, the mainland translations are generally faithful to source language, but they are purely transliterated and simple in style. In contrast, Taiwanese translators tend to use the Chinese surname to apply the first syllable of the source language, as in the cases of ⑧⑨⑩.

This practice of letting foreigners' names be Chinese ones is not the creation of Taiwan, but the new cultural movement from the May Fourth Movement. At that time, Lu Xun, Yan Fu and others, the main character of the New Culture Movement, will name them with Chinese surnames when translating

Proceedings of the 16th International Conference on Innovation & Management - 1742 -  
 foreign people's names. For example: Gao Erji (Gorky)、Xiao Bona (Bernard Shaw)、Zhuo Bielin( Charles Chaplin)、Luo Sifu (Franklin D. Roosevelt) etc. After the founding of the People's Republic of China, the mainland translation field began to emphasize the transliteration of foreign names, the chinesization of foreigners' names being gradually reduced. But Taiwan has followed the practice of domestication translation strategy.

Adding the Chinese character A or Xiao in the front of translated names is a common practice among Taiwan translators. The character Ah or Xiao was commonly seen in Taiwanese nicknames, creating a sense of intimacy, such as examples ① to ⑦. In comparison, the preserving of the original pronunciation in mainland translated names appears to be relatively neutral.

### 3.2 Heteromorphic Synonyms

Here heteromorphic synonyms refer to words with the same meaning but in different forms. See the following table 2:

**Table 2 Comparison of Heteromorphic Synonyms Translation**

Original English Texts	Mainland's Translation	Taiwan's Translation
① "Charlotte's Piggy Bank" by David McKee	"xia lu te de xiao zhu qian guan" by Liu Yang	"xia lv di de pu man" by Ke Qianhua
② "Gangsta Granny" by David Walliams	"liao bu qi de da dao nai nai" by Xu Kuang	"shen tou a ma" by Xie Yawen
③ "Willy The Wimp" by Anthony Browne	"dan xiao gui wei li" by Tang Lin "wo te bie liao jie tun shu" by Xiao Pi	"xun ka wei li" by Liu Qingyan "wo fei chang fei chang liao jie tian zhu shu" by Lai Ciyun "da ye lang" by Ke Qianhua
④ "I Completely Know about Guinea Pigs" by Lauren Child	"da hui lang" by Yang Lingling and Peng Yi	"di song ping zhong xing de ren" by Song Pei
⑤ "Wolves" by Emily Gravett	"piao liun ping song xing ren" by Ye Huli	
⑥ "The Uncorker of Ocean Bottles" by Stead, Erin E		

The above table can be divided into the following former two situations.

#### 3.2.1 Minnan dialect source

Studies show that Taiwan is a bilingual region of the "Taiwanese Mandarin + Dialect" type. Mandarin and many dialects, Minnan, Hakka, Cantonese, Wu and so on, are intermingled and influence each other.

Among the many dialects in Taiwan, Minnan dialect is the largest one. In terms of geographical location, this dialect is widely distributed. The coverage and usage rate in Taiwan is also higher than other dialects. It is undoubtedly a strong dialect. Naturally, it has the greatest influence on the Taiwanese Mandarin, and the dialect vocabulary that enters the national language is also the most. As shown in Table 2, example②and③, "a ma" means grandmother in Minnan dialect. In Minnan dialect, the pronunciation of the foot is also "ka", which is extended to the meaning of people or role. More examples:

Alter John "a gong hui jia"

Tento and the Chain “xiao gou dou dou tao shang la feng de lian zi”

Zloty “ xiao ji che pao de kuai”

The "a gong", "cai niao", "la feng" and "ji che" in these translated names are all derived from Minnan dialect. They are referring to grandfather or grandfather, a rookie, stylish or fashionable and motorcycle in mainland respectively.

### 3.2.2 Old vocabulary

After the founding of New China, the mainland vigorously promoted Mandarin. The simplified Chinese character standardization movement also makes the traditional characters used before liberation gradually replaced by simplified characters. Some of the original ancient Chinese vocabulary and usage gradually disappeared.

After 1949, there was no qualitative change in Taiwan's political system, social life or even people's ideology compared with before 1949. Many words reflecting the old things are still active in the real context. Taiwan still partially retains the language and habits previously used on the mainland, and to some extent retains or partially retains the usage of ancient Chinese, such as “shu si”(bookstore), “bu si”(cloth shop), “pao jie” (salesman), “jiao xi” (teachers) and so on. This makes the Taiwanese language bear more ancient color. See the Table 2 example ①. “pu man” is a crockery of various shapes and sizes in ancient China. The ancients advocated saving, not breaking pu man until it is full. So the ancients called the piggy bank “pu man”. The "Piggy Bank" in this title is translated into the old Chinese word "pu man" by the Taiwanese translator, while the mainland translation is the modern language "xiao zhu qian guan".

### 3.2.3 Japanese loanwords

Taiwan had experienced the period of Japanese occupation as long as 50 years in modern times. During this period, Japan "colonized" Taiwan by imposing the Japanese education and finally made the Japanese language widely used in Taiwan. After the restoration of Taiwan in 1945, the authorities promoted the Mandarin with great success. A large number of Japanese words disappeared from the historical stage as a result of colonial rule, but some Japanese usages still survived and gradually penetrated into the Taiwanese Mandarin. In the mid to late 1990s, Japan began to export its culture to Taiwan, which is geographically close to it. As a strong language Japanese with their comics, animations, TV series and other cultural products once again flooded into Taiwan. The "Hari" phenomenon appeared in large numbers.

It is for these reasons that the Japanese foreign words in Taiwan Mandarin are wide-ranging and large in number. It can be said that Japanese is the most influential foreign language to Taiwanese Mandarin. This influence is reflected in the vocabulary and its content involves all aspects of social life. Many Japanese vocabulary not only integrated into various dialects, but also stabilized as the basic vocabulary for Taiwanese Mandarin, such as: kan hu fu (nurse), ci zhang (deputy minister), chu zhang (business trip), ying hua (movie), qian qin(absence), tie ban shao(Teppanyaki), ect. The

Proceedings of the 16th International Conference on Innovation & Management - 1744 -  
following examples are also found in the translation of picture book titles.

All My Feelings at Preschool “zai you zhi yuan de gan shou”

The Tiffin “bian dang xun ren qi shi”

How the Subway is Constructed “di xia tie kai gong le”

“you zhi yuan” “bian dang” and “di xia tie” in these Taiwan title translations are all from Japanese foreign words. The corresponding mainland translations are “you er yuan”, “he fan”, and “di tie”.

### 3.2.4 The difference between transliteration and free translation

When translating loanwords, relatively speaking, there are more free translation words in mainland China and more transliteration words in Taiwan. For example:

Nara de film “dian ying kai mai la /she ying ji”

Carnival at the Candlelight “feng kuang jia nian hua /kuang huan jie”

We Won the Lottery “wo jia zhong le tou /cai piao”

Lasers “lei she /ji guang”

Unidentified Flying Objects “you fu/bu ming fei xing wu”

(Note: the former slash is Taiwan translation and the latter the mainland translation)

### 3.3 The Reverse Words

Reverse words here refer to words with the same morpheme and the same meaning but opposite order. The following are some Taiwan translations:

Pandamonia “bie chao xing mao xiong”

Dirty Bertie “zang xiao di feng kuang yuan you hui”

Encyclopedia of plant “tan xun di qiu de quan yuan”

The above underlined translations of Taiwan are opposite to that of mainland. The mainland’s corresponding translations are “xiong mao”, “you yuan hui” and “yuan quan”.

## 4 Conclusions

It is true that there are many differences between mainland Putonghua and Taiwanese Mandarin due to many factors. But after all, the two sides share the same root. Both have a common cultural "gene" - ancient Chinese, which determines that there is a limit to the difference between the two.

In fact, with the close relationship between the two places, their development is inevitably influenced by each other. The differences between mainland Putonghua and Taiwanese Mandarin can be regarded as the manifestation of the development of different personalities of the same language. In addition, with the continuous expansion of cross-strait exchanges and the influence of the world

Proceedings of the 16th International Conference on Innovation & Management - 1745 -  
informatization trend, the language characteristics of both sides are constantly influencing and promoting each other. The healthy development of Chinese towards a more diversified and rich direction is undoubtedly of great benefit to the improvement of Chinese's international status and the value of communication.

## **A Study on the Path and Method of the Improvement of University Counselor's Professional Ability**

Yu Qinfang, Wang Meixia

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 303228597@qq.com,787659891@qq.com)

**Abstract:** In the university education work, counselors are the implementers of the education work and also play an indispensable part of university teachers. They take on the important responsibility of ideological and political educational work. Along with the rapid popularization of higher education and increasingly changing international situation, there are also new requirements for the work of university counselors. Thus it can be seen that building more professional university counselor team is an urgent task to improve university counselors' work quality. Based on the related policies and theories, this paper studies the connotation and improvement path to university counselors' professional ability. It focuses on the work nature, positioning, requirements and other aspects and puts forward the effective way to promote counselors' professional quality combined with the present situation of research.

**Key Words:** Professional ability; University counselor; Connotation; Improvement path

### **1 Introduction**

Since Tsinghua University established the position of student counselor in 1953, the college counselor system has a history of more than 60 years. In China's higher education system, counselors have always played an important and special role as an indispensable part of college education. In 2004, the CPC Central Committee and the State Council issued the opinions on further strengthening and improving the ideological and political Education of College students. Since then, the work significance of counselors has been affirmed, the work requirements have been continuously improved, the team is growing day by day, and the social attention to college counselors is also unprecedented. (Jiao Jia, 2016) online search for counselors in China under the title of "counselors". From the trend of "Research trend Map of counselors", since the promulgation of "opinions on strengthening and improving counselors in Colleges and Universities and the Construction of Class Teachers" in 2005, the research on counselors has entered a rapid development and has been in a continuous stage (See figure 1). (Lou Hangfang and Bai Binggui, 2017) The research of the scholars mainly plays the role of university instructors (Zhang Anhu, 2019). The current construction status and research path of university instructors (Jingshuang, 2019), the professional development of the college instructors (Zheng Yongting, 2010), the professional development of the university instructors, and the cultivation of the professional ability of the university instructors (Li Lin, 2015), but there are insufficient exploration for the practical improvement of the professional ability of the university instructors.

**Figure 1 Research Trends of Counselors**

As the main undertakers and executors of ideological and political work in colleges and universities, university counselors play an irreplaceable role in promoting university students' healthy growth, maintaining campus stability and prospering the construction of campus culture. Therefore, the improvement of counselors' professional ability is an essential way to the development of moral education in university and the inevitable result of the development of higher education reform in China. However, great mobility, lack of professionalism and ambiguous responsibility assignment of university counselor team still exist, which has affected the counselor's professional ability improvement. At present, economic and cultural situations have changed and the society has made higher requirements of counselors. Under the new situation and based on the current reality and practice, how to actively promote the improvement of the counselor's professional ability is of important significance.

## **2 Connotation of University Counselor's Professional Ability**

Professional ability refers to the capability that a person should have to be engaged in a profession and a series of stable and comprehensive characteristics that a person should possess to work successfully in the specific occupation. It is also an important factor for a person to obtain a sense of personal achievement in this position. The professional ability of college counselors means that counselors are guided by Marxism, based on the reality of contemporary society and college students' growth, taking the national culture of our country as the background, taking the relevant knowledge of developed countries as reference, promoting the all-round development of college students as the goal, relying on the subject of ideological and political education, and applying the theories and methods of relevant disciplines (or related professional knowledge). The state and ability of carrying out ideological and political education effectively. (Zheng Yongting, 2010)

### **3 Connotation of University Counselor's Professional Ability**

#### **3.1 The work nature of the counselor lacks professional identity**

There is no doubt that university counselors are an important part of university teachers. They actually bear the burden of students' ideological and political education. However, as far as the current situation of colleges and universities is concerned, counselors have higher academic qualifications, but many colleges and universities only attach importance to academic research and teaching reform and innovation, attributing the work of counselors to teaching assistance, and there are many differences between counselors and professional teachers in terms of treatment, resulting in the lack of sense of achievement and honor in the work of counselors. Counselors have a low sense of professional identity, lack of enthusiasm and autonomy, resulting in burnout psychological impact in the work and the improvement of professional ability. (Liu Yangyang and Yang Liu, 2019) Although some universities have taken the position competition system for counselors and improved the problem to a certain extent, it is still not objective on the whole. Compared with other university teachers, there are still some differences in the salary, treatment and cultivation, making most of the university counselors fail to really feel that they are members of the university teachers and cannot really dedicate themselves into the promotion of their professional working abilities.

#### **3.2 Weak professional knowledge structure and relatively insufficient educating ability**

Multiplicity and complexity of counselors' responsibility determine that they must have rich professional knowledge which is one of the important basic conditions to do a good job of a counselor. From political theories to the national policies and from the pedagogy, management, psychology, sociology, philosophy and other subjects to students' specific affairs, the national education department has made unified requirements of the knowledge that a counselor should have. The ability is based on certain knowledge, so weak professional knowledge can lead to insufficient educating ability to a certain extent, because carrying on the effective education on students must be based on rich reserves of knowledge. According to the survey, students think that counselors should improve their abilities in psychological counseling, interpersonal communication, analysis and judgment, which requires that counselors should strengthen their professional knowledge learning and constantly improve their educating abilities in various aspects.

#### **3.3 Lack perfect system for the counselor's profession assessment**

To promote the university counselor's professional ability needs to have the perfect professional evaluation standards. Through the inspection standards, universities can regulate counselors' professional ethics and working methods and put forward specific requirements of the counselors' professional abilities so as to achieve comprehensive and objective evaluation of the university counselors' work. However, for the present situation of the counselor team construction, there are seriously short of perfect professional evaluation standards and the evaluation standards between universities are not identical. There is also the lack of specific and feasible evaluation standards for the counselor's selection, training and promotion, leading to unclear direction of the counselor's professional ability improvement, indefinite work of counselors and inactive work attitude. Therefore, it is difficult for them to take the initiative to improve their professional abilities.

#### **3.4 Instability of university counselor team and lagging construction**

Along with the continuous improvement and development of the university education system, university counselors have gradually evolved into a powerful group which exists independently. They, together with full-time counselors, guarantee the students' ideological and political education. But in the

Proceedings of the 16th International Conference on Innovation & Management - 1749 -  
 current team construction of university teachers, limited importance has been attached to the status of counselors who cannot be evaluated and promoted reasonably. Hence, it is difficult to retain talents. Most people do not think highly of counselors and they even feel they are unable to get the respect from people. In the meantime, the counselor's professional belonging is indistinct and there is also the lack of corresponding system of professional training. Counselors are also short of skills and basic experience related to education management.

The current popularity of university education has brought many problems to campus management and made the school leaders focus on funds, relationships, appraisal, employment rate and other factors. There is no related overall planning or strong economic guarantee for the construction of the counselor team. In addition, the lack of competent leadership's awareness of management and development also leads to lagging construction of the university counselor team. Under the influence of traditional ideological and political education thoughts, counselors mainly give priority to practical work and ignore the learning of relevant theoretical knowledge. Therefore, they cannot really improve their rational knowledge or the teaching ability, making the counselor team construction gradually cannot adapt to the objective law of efficient development or meet the internal logic of counselor team development.

#### 4 Effective Path to the Improvement of University Counselor's Professional Ability

There are many difficulties in the improvement of the professional ability of college counselors, and the effective promotion path is proposed in a targeted way. Through the various methods of improving the professional ability of college counselors, the author summarizes the three aspects of constructing training mechanism, perfecting relevant systems and stimulating self-cultivation, see figure 2.

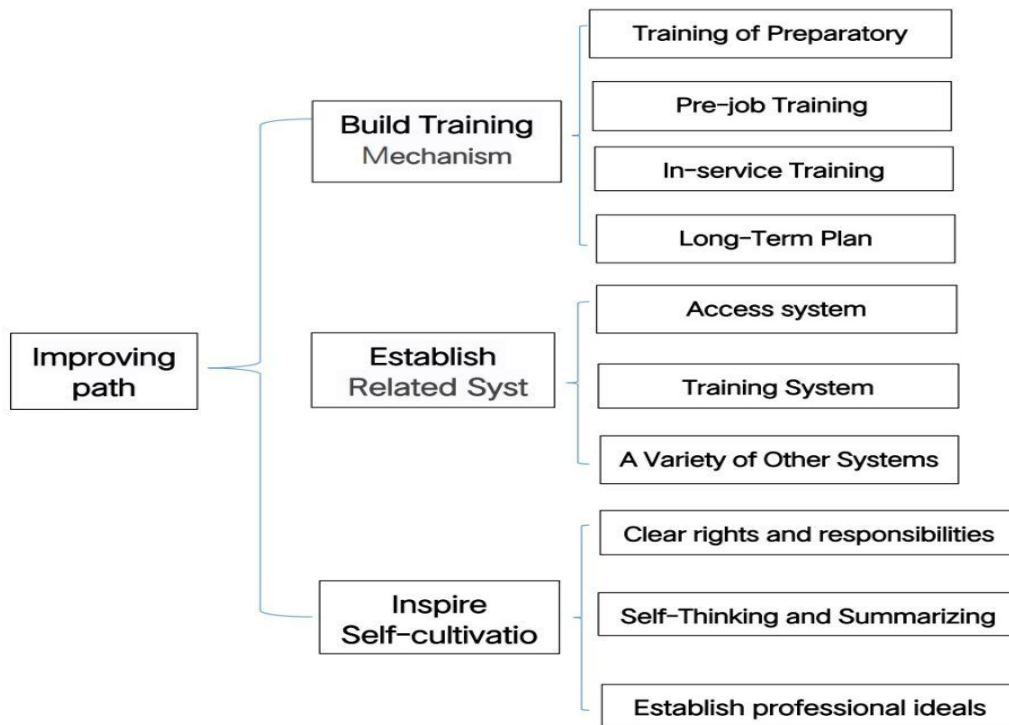

Figure 2 Effective Path to the Improvement of University Counselor's Professional Ability

#### **4.1 Strengthening quality training and constructing mature training mechanism**

For the educational training of university counselors, universities should not only guide them in theoretical learning, but also pay attention to the cultivation and exercise of the ability to practice. This is a systematic and coherent task. Therefore, a university must be based on its actual construction situation and consider how to build its counselor team and ensure the permanent vitality of the counselor team from a long-term perspective. The training of counselors in colleges and universities should reflect the characteristics of multi-level and wide fields:

The first level, the establishment of preparatory personnel training system. At present, many colleges and universities are equipped with part-time counselors for full-time counselors, mainly by excellent student cadres. On the one hand, they provide a practical opportunity for students, on the other hand, they can also be regarded as pre-service training for college counselors. These part-time counselors often have the idea of engaged in the counselor industry, colleges and universities should seize this opportunity to bring part-time counselors into the training mechanism to improve their professional and professional abilities (Sun Yu, 2017).

The second level, the establishment of pre-service training system. After the counselors sign the appointment contract with the school, they should accept the pre-service training held by the school, train first and then take up the post, and those who do not pass the assessment will not be accepted. The contents of the training include ideological and political theory, sociology, psychology, pedagogy, management, responsibility of counselors, management system and so on. At the same time, the present situation of ideological education of the students in our school is introduced, so that counselors can have a preliminary understanding of their work and present situation, and carry out their work more pertinently. The Standard stipulates that counselors need to receive 40 hours of induction training. The effect of induction training is related to the ability of counselors to get started quickly. Therefore, colleges and universities should make scientific training plans, strive to make counselors have a clear grasp of the basic knowledge and professional skills needed for their work in an effective time, and deepen the counselors' understanding of the work. Colleges and universities should provide corresponding food and accommodation arrangements for the induction and training of counselors, so that new counselors can feel the care of colleges and universities and avoid other worries about their lives outside of work.

The third level, the establishment of on-the-job training system. A variety of training methods to increase their on-the-job training opportunities, or through hanging up training, or social training, or special training, or post rotation or inter-school communication, to promote their continuous study of students' work theory and related knowledge, timely knowledge reserve and update, at the same time improve the practical ability of counselors, accumulate work experience to gradually improve the professional ability of this team. In-service training should mainly focus on the new problems or policies that arise at present to train counsellors. This kind of training has strong professionalism and practicability, and can quickly improve the vocational skills of counselors and promote the improvement of their work effectiveness. In-service the training should pay attention to the selection of time and address. It is better to carry out the time period where the instructors work in hand are relatively loose. After the training, a set of scientific theoretical papers or practical operation shall be set up to assess the instructors to inspect the effect of the training. Of course, the establishment of a perfect training mechanism is dependent on the feedback and suggestions of the group of instructors. After each training, the training effect should be investigated in order to provide the basis for the improvement of the next training.

The fourth level, the construction of sustainable development model. The development and promotion of the overall professional ability of counselors is a relatively long-term process. It is necessary to further emancipate the mind, focus on the reform of mechanism system and system innovation, formulate a long-term development plan and system management model for the construction of counselors, deepen the reform of counselors' job evaluation and employment system, the de-administrative reform of academic resources, the reform of salary system, and improve the academic governance system. With the system design to promote the construction of the team to improve quality and efficiency. So that the ability of counselors can be followed, degree can be followed, clear direction of promotion, so that the team to move forward healthily.

#### **4.2 Consummate the regulations and systems and promote steadily specialization cultivation**

The counselor team construction should be on the premise of system reform, the key of system specification, the core of professional training and the soul of shaping of professional spirit. The premise of counselor professionalization is the earnest professional training work. Strict selection and training system and professional development are the effective guarantee to improve the professional knowledge and skills of counselors, promote their working ability, management ability and psychological quality. It is necessary to thoroughly change the original mode of thinking, actively create conditions on the basis of emancipating the mind and seeking truth from facts, unswervingly follow the development road of professional training and professionalization, encourage and support counselors to design themselves according to different educational experiences, knowledge background and personal characteristics, and perfect and improve themselves according to certain professional directions.

On the one hand, colleges and universities should strictly restrict the admission system of counselors and improve the qualifications and conditions of selection and employment. Strict selection and employment access mechanism is the premise to ensure that the counselors have strong politics, good business, strict discipline and positive style of work, and is the basic condition to improve the professional ability of counselors. It is necessary to strictly choose academic qualifications and professional background. Counselors must have a master's degree or above, and their professional requirements must be based on ideological and political education, taking into account psychology, management background and other similar to the nature of their posts, from the source to improve the professional knowledge and skills of counselors, to promote their comprehensive quality and ability. As far as possible, counselors choose people who have had part-time counselors, student unions and other related experiences in colleges and universities, and assess their language expression ability, interpersonal communication ability, teamwork ability, organization and management ability, active learning ability, crisis response ability and psychological quality through interview and examination.

On the other hand, colleges and universities should pay attention to and perfect the training mechanism of counselors, establish training bases, optimize the training content, carry out the coordinated training contents of pedagogy, management, psychology, sociology and other disciplines at various levels, pay attention to the cultivation of counselors' organizational leadership ability, social practice ability, psychological consultation and employment guidance ability, improve the level of counselors' knowledge and skills in an all-round way, and expand the form of training. Pay attention to the actual effect of training, with high foresight, development, innovative thinking to promote the professional and professional development of counselors. (Lin Weiyi, 2017)

Universities must designedly build the counselor echelon, care for and support the cultivation and utilization of counselors as attaching great importance to the teaching and scientific research backbones, practically improve their statuses and treatment, make the counselor post a new profession with distinctive professional characteristics and prominent industry features and make student management work one of the important posts which allow universities to attract and absorb high-competence talents.

Universities which have conditions can gradually set up the master's and doctoral degree courses for counselors to cultivate academic and professional master and doctoral counselors. There are many factors affecting the development of university counselor specialization. The most direct restraining factor is the system construction. Without a sound, objective, standardized and scientific regulatory framework as the support, the counselor professional development and professional cultivation will be meaningless. Universities should strengthen the construction of system to guarantee, regulate and promote the counselor's professional cultivation, and constantly perfect the counselor's work responsibility system, cultivation and training system, post appointment system, assessment and evaluation system, qualification certification system, position and title promotion system, salary system of rewards and punishments, etc.

#### **4.3 Improve counselor's active growth awareness and motivate counselor's self-cultivation and improvement**

The work of counselors must get rid of the past situation of "much, disorder and miscellaneous work". The competent department should make the counselor duty manual to help counselors be clear about their own responsibilities, specific work content and the specific working methods with the combination massed learning and self-learning. They are encouraged to follow the objective law and play their own subjective initiative to consciously and independently make innovations of thoughts and methods, actively learn the latest professional theoretical knowledge, such as pedagogy, psychology, sociology, ideological and political education theories and methods, employment and entrepreneurship guidance. The counselor training system should be perfected with the combination of theory and practice to pay attention counselors' understanding of improving theoretical knowledge in practice and the counselors' self-thinking and self-summary and periodically evaluate the gains and losses of their own work so as to reach the purpose of learning lessons and summing up experience. Through teaching appraisal activities, counselors can consciously take the initiative to improve their teaching skills, apply theories they have learned to teaching in time and further enhance their professional abilities and skills. The most crucial thing is that counselors should change ideas and establish professional ideals. The lack of counselors' professional ethics will bring great losses to their own development and students' educational management. Therefore, counselors must promptly change from the ideological awareness and put the personal professional ethics in a high status to realize that the counselor's work is not only a career for living, but also a great cause of education so that they can arouse the inner love for the education work, recall the commitment of deciding to dedicate themselves into the education when choosing the work, shoulder their glorious mission and establish their own professional ideals again.

## **5 Conclusion**

Colleges and universities are the cradles of talent cultivation and stability and development of the colleges and universities are closely related to successful and effective university students' ideological and political education work. University counselors play an important role in the university ideological and political education. Therefore, to establishing a team of counselors with high professional abilities is an irresistible and imperative trend. To improve university counselors' professional abilities not only needs their own unremitting efforts, more depends on the constant deepening of the university's reform of cadre and personnel system, establishment and perfection of the corresponding social evaluation system. Only building a team of high-quality counselors based on professions and supported by the practice can practically ensure the pertinence and effectiveness of ideological and political education work and then provide a powerful guarantee for the cultivation of university talents.

# The Predicament of the Current Home-based Elderly Care Service in China and the Countermeasures for the Rule of Law

Xu Zhihua<sup>1</sup>, Zhao Jing<sup>2</sup>

1 School of Law, Zhongnan University of Economics and Law, Wuhan, P.R.China, 430070

2 School of Law, Zhongnan University of Economics and Law, Wuhan, P.R.China, 430070

(E-mail:superxzh@aliyun.com, 277864911@qq.com)

**Abstract:** Based on the current situation of home-based elderly care services in China, this paper objectively evaluates the research status of home-based elderly care services, and points out that there are many problems in the practice of home-based care services. On the basis of analyzing the causes of the problems, it puts forward some suggestions on the construction of the legal system for home-based care services: it is believed that the home-based care service must be specifically enacted, the legal system for fund protection should be constructed, and the regulatory legal system should be improved, thus drawing the conclusion that government must vigorously promote the rule of law for the home-based elderly care service in China.

**Key words:** Home-based elderly care service, Financial security system, Regulatory system, Legalization

## 1 Introduction

The aging of the population is a major social issue in the 21st century and a major feature of human development in the new century. From 2015 to 2035, China will enter a period of rapid aging, and the elderly population will increase from 212 million to 418 million, accounting for 29% of the total population. At present, with the changes in China's demographic structure and the normalization of population movements, "family elderly care" have become extremely difficult, and "home-based care for the elderly" has become the best

Proceedings of the 16th International Conference on Innovation & Management - 1755 -  
choice for reforming aged care services in the new era. Chinese government has required the establishment of an institutionalized residential care service system since 2011, and now various local regulations have been issued successively. The legalization, systematization and institutionalization of home-based elderly care services need to be determined urgently. Therefore, it is a pressing matter in the field of theory and practice to construct a legal system of home-based care services with Chinese characteristics to meet the new requirements of China's market economy for old-age services.

**Figure 1 Number of Elderly People (Unit: 100 million people)**

Home-based elderly care has been developed from the proposal to the institutionalization for many years, and rich achievements have been made in theoretical research, scholars mainly show different opinions on the main body and content of home-based elderly care services.

On the main body of home care services, Lester Parrott (2003) believes that the elderly, the government, and social groups, including the community, are the mainstays of services, forming a social service network between them, and providing social services through the integration of social resources (Lester Parrott, 2003). Sherry Anne Chapman (2002) and Hillel Schmid (2004) mainly discuss the government's dominant position in the system in the main research. In the construction of the community care service system, the government not only provides financial security services, but also plays a role in ensuring the quality of care services.

On the contents of home-based elderly care services, A. Pavey & D. Pstios (1999) argues that the main body of care service can be divided into two modes: formal care and informal care. He believes that formal care is provided by a government or specialized agency with certain authority and formality. Old-age care services, rather than formal care, are more based on the provision of old-age care services provided by families, relatives and friends based on natural ethics. Wang Zhen (2018) and Yao Hong (2018) regard the contents of services rely on the community and family, and leading by the government (Wang Zhen, 2018; Yao Hong, 2018). Pan Liping (2019) believes the services contents including the basic public elder care services provided by the government, and the professional services provided by enterprises and social organizations, at the same time autonomous mass organizations at the grass-roots level and volunteers to provide public welfare support services (Pan Liping, 2019).

Western countries pay more attention to empirical and applicable research because of their traditional thinking mode. domestic scholars focus more on the orientation of home-based elderly care services, and less on how to effectively promote the operation of home-based elderly care services and achieve good social effects. In the research process, there are too many theoretical analyses, and the case analysis and reference are few.

## **2 The Analysis of Legal Relationship in China's Home-based Elderly Care Service**

Legal relationship is the relationship between rights and obligations formed by social relations through legal adjustment. The subjects of legal relations are generally two-party. When studying the legal relationship of home-based elderly care services, because they contain multiple legal relationships, they need to be discussed separately.

The first is the legal relationship between the government and the elderly, which is mainly based on the constitutional and legal provisions of civil rights and obligations, and these rights and obligations also apply to the government and the elderly in the home care service. In the legal relationship between the government and the elderly, the government has the obligation to carry out home-based elderly care services, and the elderly have the right to demand that the government to achieve good elderly care services.

Second is the legal relationship between the government and the service provider. The government can provide services in specific communities in the form of purchasing home-based care services, and the social institutions that have won the bid directly provide elderly care services to the elderly. In this way, the government and the service provider form a legal relationship according to the provisions of the "Government Procurement Law" and other laws and regulations, including the government's obligation to publish the bidding information and guarantee the fairness of the procedure, while the social organization is responsible for submitting the bidding documents, and to ensure they compliance with the conditions of the bidding conditions. After winning the bid, the government signs a service agreement with the service provider. The specific rights and obligations are mainly stipulated in the agreement, but are also subject to the adjustment of the "Contract Law" and other laws. After signing the agreement, the government and the service provider form a new legal relationship. The government has the obligation to pay the fees according to the regulations, and the service providers are required to carry out the construction of home-based elderly care services according to the agreement. According to the agreement, the service provider has the right to request the government to pay the fee on time, and has the obligation to provide high-quality home-based care services.

Finally, the legal relationship between the elderly and the service provider based on the signed home-based elderly care service contract. The contract mainly stipulates the obligation of the elderly to pay the expenses on time, the obligation to accept the management arrangement of the service provider and the right to enjoy the good care service in a timely. According to the contract, the service provider has the obligation to provide care services to the elderly, the obligation to protect the security, the obligation to inform in a timely manner, etc. Meanwhile, it also has the right to ask the elderly to pay the service fee on time, and to modify the management method after soliciting opinions, etc.

### **3 Existing Legal Problems of Home-based Elderly Care Services in China**

At present, many regions in China have started to build home-based elderly care services, and they have begun to take shape. For example, Shanghai Government vigorously promotes the construction of “house for the care of the elderly”, promotes the integration and development of “institutional, community, and home” aged care services, integrates various types of elderly service resources, and builds a “15-minute home care service circle” in the urban area. Haishu District Government of Ningbo actively carried out socialized home-based elderly care work. After more than ten years of development, it took the lead in constructing a new community-based socialized home-based care service platform, and embarked on a “social elderly care home-based, home-based elderly care socialization”, the basic way out for the problem of social elderly care. Wuhan Government provides services for the elderly, such as food, cleaning, medical assistance and remote care, through the “three-in-one” development model of “community embedding, central radiation, and unity”, promote the development of “Internet + home care for the elderly”, and so on. However, due to the lack of a good legal system to guarantee them, many problems inevitably arise.

#### **3.1 Lack of legislation makes it difficult to establish a unified legal system for home-based elderly care**

The legislative style of the home-based elderly care law in our country belongs to the decentralized legislative system. At present, the comprehensive “Home-based Elderly Care Law” has not been formulated and promulgated. Its provisions are scattered in laws, such as the Law on the Protection of the Rights and Interests of the Elderly and various separate regulations, rules and policies. The contents cover a wide range of areas and have different levels of effectiveness, which has brought some difficulties in the implementation of the current practice of elderly work in China. In recent years, although the state has advocated the development of a model of home-based care for the elderly at the policy level, various local governments have also promulgated a number of special local policies for home-based elderly care services. From the perspective of legal texts, it is rich in content, but it is not ideal in practical applications. The reasons are as follows: the above-mentioned normative legal documents are mainly based on the principles of advocacy, lack of provisions on the rights and obligations of each subject, and lack of detailed provisions on the rules directly applicable to specific problems, which lead to numerous difficulties in the implementation process. Especially for the specific system of home-based elderly care law, such as long-term care medical insurance system, home-based pension institution investment and financing system, etc. are still based on the provisions scattered in other laws. The current legal system of home-based elderly care established by the above-mentioned legal documents does not have strong substantive normative function, nor does it conform to the codification style of comprehensive legislation in the sense of text. Due to the lack of the upper-level law of the home-based elderly care system, the legislation for the home-based care service in China lacks systematicness.

### **3.2 The legal system for home-based elderly care service funds is not sound enough**

At present, most countries encourage social forces to participate in the development of public service projects. However, in China, home-based elderly care services are still more biased towards national government responsibilities. Many regulations stipulate that the government should ensure that the home-based care service funds are adequate, with the expenditure of the financial budget and the revenue of public welfare lottery as its largest source of funds. As far as the current national policies and local regulations are concerned, the funds for home-based elderly care services are mainly based on the government financial support, while ignoring the functions of the family and society. Social capital has only made a simple "encouragement" provision in the regulations, which is not clear about its legal positioning and cannot give trust to social capital. As a result, the fund guarantee system is not sound, which is manifested in the following aspects: first, the home-based elderly care service market is relatively chaotic. Without a stable market environment, it directly leads to a small proportion of investment in social capital, and it is impossible to form a diversified source of funds for home-based elderly care services. Second, governments at all levels have not yet formed a long-term stable home-based elderly care capital investment planning system, but decided short-term investments based on the fiscal revenue and expenditure budget. Third, China's pension fund investment tax incentives, pension institutions tax incentives and other policies have stimulated the enthusiasm social capital for participating in the housing service, but in general, most of the urban home care services in China are still insufficient.

### **3.3 Weak legal supervision and evaluation mechanism for home-based elderly care services**

In the process of developing home care services, China has paid too much attention to how to build and promote, while ignoring relevant regulatory issues. The evaluation and supervision system plays the role of testing the results of service operations and is the institutional guarantee for its long-term operation. At present, there is no supervision and evaluation system for home-based elderly care services in China, and there is no special supervision department for home-based elderly care services. The corresponding communities rarely make self-assessments on a regular basis. The lack of supervision is the reason for the low level and low quality of residential services. However, if the quality of services is not improved, the elderly or their families will not trust the service, which is not conducive to the development of the service industry. It is also an important reason for the large amount of home-based elderly care demand and low actual utilization in China.

## **4 Improve the Rule of Law in China's Home-based Elderly Care Services**

### **4.1 Establishing a new concept of legislation for home-based elderly care services**

In the process of institutionalization of home-based elderly care services, legislation should be the first step, and some adjustments should be made in the legislative concept. From the perspective of multiple subjects, each role should be configured to establish a multi-linkage, harmonious and unified legal system for home-based elderly care services.

First of all, clarify the legal relationship of multiple subjects. The concept of home-based

Proceedings of the 16th International Conference on Innovation & Management - 1759 -

elderly care is a broad understanding of multi-party subjects. Governments, society, families, and communities all have the obligation to implement the care responsibility. The rights and obligations of multiple subjects constitute the legal relationships; home care service legislation should be included in these subjects. In the legal system of home-based elderly care service, multiple subjects have their own positions and are related to each other. It is of great significance to clarify the relationship between them in order to achieve effective cooperation among the subjects.

Second, clarify the results-oriented concept in regulation. The implementation of home-based care services should adhere to results-oriented, and the government, as the leader, should systematically investigate the operation and results of home-based elderly care services, timely grasp the advantages and disadvantages existing in the system operation, and make appropriate adjustments, so as to enable the whole service to achieve predetermined social benefits. Therefore, the results-oriented evaluation method should be clarified in the legislation of home-based care services. As the manager of public service, the government should accept more supervision from the society. It has the obligation to guarantee the quality of public service and fulfill the initial goal of public service in the most effective way. The fulfillment of these obligations requires social supervision and evaluation. Insist on result-oriented thinking is actually to better sum up experience and improve home care services.

#### **4.2 Build and improve the legal system for supervision of home-based elderly care services**

Establish a performance evaluation system for home-based elderly care services and give legislative confirmation. In terms of performance evaluation, China has affirmed and supported it in the form of law. The performance appraisal system should be constructed from the following aspects:

- a) Clarify service standards, including standards for service providers' standards and service methods. Standardization of service providers means that institutions are effectively regulated before they engage in the industry. For example, the capital of an institution, the professionalism of its employees, the completeness of supporting facilities and the social satisfaction with relevant responsibilities should be taken as the criteria for participation;
- b) Strengthening the government's supervisory responsibilities for public services. The important reference for regional government performance appraisal includes the implementation of service projects;
- c) Provisions on evaluation subjects in the performance evaluation system. Because the government has the responsibility to supervise the public service projects, it can evaluate the home-based care services. The government's evaluation of public services should mainly reflect the supervision role of service providers, and it should not be divorced from the reality by attaching too much importance to the results.

#### **4.3 Constructing a legal system for the protection of home-based elderly care funds**

First, the legal status of social capital is clarified. According to the 13th Five-Year Plan for National Economic and Social Development, there are two ways for social capital to participate in public services and achieve diversified supply: one is social capital and government cooperation; the other is when social capital can directly provide services, the government purchases services from them. Social capital should also be widely understood in the home-based care service system. Through the government and social capital cooperation, jointly set up the service centers for the aged in the community to provide the elderly with residential care services. Social capital will invest in the establishment of elderly care service institutions, and get the qualification to provide home-based elderly care services by participating in the government purchase method when meeting the needs. The social capital in home-based care service mainly refers to social organization. The social capital discussed in this paper not only refers to social organizations, but also includes social donation and social charity.

The second is to establish a legal system for social nursing insurance. Social nursing insurance and endowment insurance are different: social nursing insurance objects are more extensive and not limited to workers, freelance workers and farmers must also become the main insured. The conditions for enjoying rights, in addition to reaching a certain age, there are cases of illness and other self-care disability. Payment to the caring service as the principle, money payment as a supplement. Social nursing insurance is also similar to endowment insurance, both of them are stipulated by national compulsory legislation, and they assume the responsibility of achieving a more comfortable aged care in the future. Compared with social medical insurance, social nursing insurance is not responsible for the illness and the cost of illness treatment, but is responsible for the people who were illness and cannot take care themselves, and is responsible for the payment of caring services. Social nursing insurance can also be used as a source of funding for home-based care services. After insuring social nursing insurance, it is not necessary for the elderly to take out the pension and buy the aged care service. Instead, they can enjoy the aged care service directly under the social care insurance system.

## **5 Conclusion**

China's home-based care service system has initially formed a relatively complete theoretical system and institutional system, and played a greater role in relieving the survival pressure of the elderly. However, we cannot ignore the existing legal problems of home-based care services, for example, China has not yet formed a unified legal system for home-based care for the elderly, the legal system for financial security for home-based care services is not sound enough, and the legal supervision and evaluation mechanism for home-based care services is weak. Therefore with the maturity of home-based elderly care service in our country, we need to standardize the construction of the rule of law, establish the principles of home-based elderly care service by legislation, and improve the corresponding diversified

Proceedings of the 16th International Conference on Innovation & Management - 1761 -  
supervision system and fund-raising guarantee system in the statute law, and to ensure the long-term sustainable development of the system. Under the premise, we can further expand the content of the system and deepen the development. The legal system of home-based elderly care services can play the biggest role in China and provide a strong guarantee for the construction of a socialist harmonious society.

## **The Discussion on the Curriculum Management of Undergraduate Voluntary Service in University**

Chen Yinghua

Youth League Committee, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 87066728@qq.com)

**Abstract:** Focusing on the curriculum management of undergraduate voluntary service, this paper makes a theoretical study on the basic connotation of undergraduate voluntary service education, and reveals the necessity and feasibility of constructing a voluntary service curriculum system in universities. The curriculum structure was put forward that courses of theory study, service practice, environmental education and feedback sharing can be combined. It is believed that the effective way to promote the curriculum management of undergraduate volunteer service should focus on the system construction of the volunteer service curriculum including the syllabus, course materials, teachers' troop, practice platform and evaluation system. This paper drew a conclusion that curriculum management of undergraduate voluntary service has difficulties in ideological understanding, resource support, system management, etc. Only by correctly understanding the curriculum, promoting the coordinated development with teaching and establishing a network management platform for voluntary service curriculum, can we effectively promote the normalization, specialization and standardization of undergraduate volunteer service.

**Key words:** Universities; Undergraduates; Voluntary service; Curriculum; Management

### **1 Introduction**

The appearance of voluntary service has distinct characteristics of the times, it is the product of social development at a certain stage. Some foreign countries carried out voluntary service education earlier. By setting up special voluntary courses and designing servicelearning segment, many countries with a high level of volunteer service development have incorporated volunteer service into the education system to guide students to establish a sense of social responsibility and civic awareness.

The introduction of voluntary service into school education in the United States originated from the "service learning" concept in the 1980s. American voluntary service course is an experiential teaching method that takes students' learning, school education and social needs as three orientations, takes professional course and non-professional course as the main content, takes community service organization as the medium and takes activity record, credit certification, reward and punishment incentive as the evaluation method (Chen & Luo, 2016).

After the 1980, voluntary service was incorporated into the school education system in Japan. In Japan, voluntary education is mainly carried out in two ways: voluntary service

included in formal school curriculum and voluntary service outside formal curriculum. By 1999, more than 100 universities were actively conducting educational experiments to incorporate volunteering into their formal curricula. Apart from the United States and Japan, the United Kingdom, Germany and other western developed countries have all attached great importance to the voluntary service education for teenagers. The contents, methods, means, approaches and management of foreign voluntary service curriculum system are relatively systematic and standardized, which are worth learning by Chinese scholars.

Due to the differences in national conditions, the voluntary service curriculum system adopted by each country is based on respective national conditions and school conditions with its own characteristics and emphasis. Before 2008, there were no voluntary service courses in Chinese education system. After the Beijing Olympic Games, under the promotion of large-scale activities such as the Shanghai World Expo 2010 and the Guangzhou Asian Games, voluntary service was unanimously recognized by education administrative departments, schools and students. In 2009, the ministry of education issued *The Opinions on Deepening Student Voluntary Service Activities*, whose policy spirit and relevant deployment set up a platform for developing voluntary service education. At present, the voluntary service courses for university students are only in the pilot stage and have not been popularized comprehensively.

The general research idea in this paper is from theory to practice. Following the logic of asking questions, analyzing and solving problems, we will study how to construct the university voluntary service curriculum model from following four aspects: theoretical teaching courses, service practice courses, environmental education courses and feedback sharing courses. And we will further promote the normalization development of voluntary service education in universities. From the aspects of syllabus, course materials, teacher team, evaluation system, and practice platform, we will study the construction of a scientific and perfect management system of voluntary service course to improve the effectiveness of voluntary service education.

## **2 The Connotation and Significance of Voluntary Service Curriculum for Undergraduates**

### **2.1 The connotation of voluntary service curriculum**

Voluntary service generally refers to the service provided by anyone who voluntarily contributes his or her own time and energy to the promotion of human development, social progress and social welfare undertakings on the premise of not obtaining material rewards (Zhang, 2011). For universities, voluntary service is not only an important cultural carrier for moral cultivation, but also the intrinsic motivation for undergraduates to grow into talents and an effective form of practical education. The curriculum of university students' voluntary service is to bring the voluntary service education into the course of ideological education theory. The curriculum of voluntary service not only emphasizes the volunteerism of university students, but also emphasizes that college students should internalize the spirit of voluntary service in this process, turn it into knowledge reserve, and contribute to serve the society. Therefore, it is necessary for colleges and universities to construct the curriculum

structure of undergraduates' voluntary service and establish the generalized curriculum concept, that is, "all the efforts made by schools to promote students' knowledge growth, ability improvement and quality cultivation in a purposeful and planned way can be called curriculum" (Jin, 1996). The curriculum structure of undergraduates' voluntary service will be composed of four modules: theoretical learning, service practice, environmental education and feedback sharing. Under the guidance of curriculum, undergraduates will gradually learn voluntary service knowledge through "curriculum content", and cultivate correct service awareness and responsibility.

## **2.2 The significance of voluntary service curriculum**

In terms of theory, research for undergraduate volunteer service course is helpful for promoting the development of voluntary services education in colleges and universities. It helps to explore the standardization operation of voluntary service course, the new thoughts and new methods of process management. It also enriches theory knowledge in the field of voluntary service and provides theoretical basis for research on volunteer service curriculum in university. The course in the curriculum structure module is not a simple split, but it takes theory study as the foundation, service practice as the core, environmental education as the supplement, feedback sharing as the promotion. The four major course modules complement and relate to each other for completing the mission of undergraduate' voluntary service course collectively.

In terms of practical application, firstly, normalized development of voluntary services should be stimulated. Undergraduate voluntary service needs to be organized, managed and assessed in a planned, organized and standard way, so as to make university volunteer service professional, standardized and long-term. Secondly, the effectiveness of voluntary service practice and education should be promoted. The theory and practice of voluntary service should be incorporated into the ideological and political teaching to give full play to the educational function of voluntary service, cultivate the comprehensive quality and social responsibility of contemporary college students, and make them become the practical carrier to practice the core socialist values. Thirdly, the innovation of the voluntary service curriculum system should be propelled. It promotes the development of teaching syllabus, curriculum materials, teachers' team, practice platform and evaluation system to cultivate students' ability of practice and innovation, and provide a new beneficial model for the innovation of education reform. The fourth is to achieve mutual development of students, universities and society. Combining the teaching objectives of voluntary service with social needs, establishing voluntary service courses to promote the cultivation and integrated development of students' comprehensive quality, and integrating social service experience into the process of education can make universities play the real role. The combination of the voluntary service's teaching objectives with social needs can create great social and economic wealth (Prentice & Garcia, 2000).

## **3 The Main Difficulties and Reasons in the Curricular Management of Undergraduate Voluntary Service in Universities**

The curriculum of undergraduate voluntary service is a meaningful attempt in colleges

Proceedings of the 16th International Conference on Innovation & Management - 1765 -  
and universities, and there is a process for people to understand it. With the gradual deepening of the voluntary service curriculum, some aspects that are not mature and perfect become increasingly prominent, and it is easier to encounter various difficulties and obstacles in the process of trying. Therefore, the curriculum of voluntary service in universities is a process of constantly discovering problems, seeking countermeasures and improving innovation.

### **3.1 Lack of systematic management in curriculum leading by deficient ideological understanding**

As a feasible system design, the curriculum of undergraduate voluntary service is short of management experience and ideological understanding. Problems of thinking and cognition among university leaders, teachers, administrators, students and the society will be firstly met in the curriculum. At present, undergraduates are enthusiastic about voluntary service, but their rational participation is not enough and the sustainability is not strong. Although there are some measures for the curriculum management of undergraduate voluntary service, there are problems such as disorder and formalization.

### **3.2 Lack of internal motivation in curriculum management leading by shortage of supporting resources**

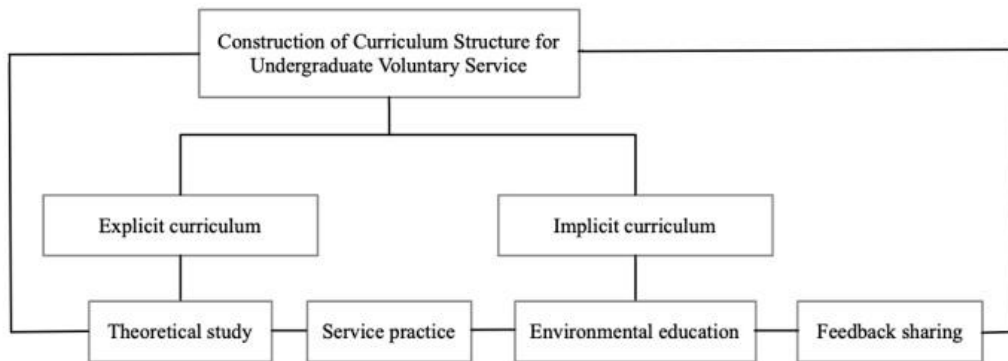

The curriculum management of undergraduate voluntary service has not yet taken shape in colleges and universities. The implementation scope of compulsory courses and elective courses is generally small, so the support of curriculum resources should be strengthened. The curriculum management of undergraduate voluntary service should follow the law of practical education, which requires the cooperation of all departments of colleges and universities. However, at present, there is a lack of unity between various departments of colleges and universities, which makes it difficult to form resultant force and scientifically design each link, resulting in serious shortage of course resources. Therefore, the current situation of university curriculum is not conducive to the implementation of curriculum management, lack of voluntary service curriculum management to promote the growth of internal power.

### **3.3 The insufficient effect of curriculum management leading by unsound system**

The curriculum of undergraduate voluntary service is conducive to improve the initiative of students to participate in voluntary service. However, there is still no reasonable scheme for how to plan and formulate the relationship between curriculum structure and management mode and how to build a reasonable curriculum management system based on the respective characteristics of colleges and universities. The education dimension of voluntary service courses is single, lacking systematic management and foundation for moving from theory to practice. It is difficult to use scientific management plan to solve the problem of voluntary service curriculum, and it's unable to bring powerful theory to the development of voluntary service curriculum management.

## 4 The Curriculum Structure of Undergraduate Voluntary Service in Universities

It is an important way to promote the curriculum management of undergraduate voluntary service for constructing the curriculum structure. According to the generalized concept of curriculum, there should be two categories: explicit curriculum and implicit curriculum. "Explicit courses mainly refer to the courses of various subjects formally included in the school's professional teaching plan, while implicit courses involve the contents that exert a subtle influence on students' personality, emotion, belief, will, value orientation and behavior choice, etc (Zhang, 2007)." Specifically, the design of undergraduate voluntary service course is constituted by four major parts: theoretical study, service practice, environmental education, and feedback sharing. It combines explicit curriculum with implicit

curriculum, gives full play to the volunteer service as effective activities of undergraduate ideological and political education carrier, digs deeper into the ideological and political education contained in the curriculum elements, and forms education experience with the characteristic of voluntary service.

Figure 1 Construction of Curriculum Structure for Undergraduate Voluntary Service

### 4.1 Theoretical course

Theoretical courses are the foundation. According to the characteristics of voluntary service activities in university, the contents of theoretical courses are designed as *The Development and Current Situation of Domestic and Overseas Volunteer Service*, *The Basic Concept and Related Theories of Voluntary Service*, *The Social Function of Volunteer Service*, *Undergraduate Development with Volunteer Service*, and *The Practice of Volunteer Service*. By learning the theoretical knowledge of voluntary service, colleges and universities can help students understand and master the phylogeny, content, characteristics, functions and professional skills of voluntary service at home and abroad, help them consolidate the theoretical foundation, and guide students to participate in voluntary service in a prepared way, so as to improve the actual effect of voluntary service education.

#### 4.2 Service practice course

Service practice course is the core. It involves the implementation of the overall process of undergraduate voluntary service and determines the educational effect and influence of voluntary service. It should include three parts: organization and training, activity implement and management, as well as assessment and evaluation. Universities should combine respective actuality and characteristics with launching volunteer service activities and building volunteer service brand projects. Through the construction of undergraduate voluntary service base and community practice platform, the long-term mechanism of volunteer service can be established to enhance the effect of practical education, guide students to actively participate in volunteer service activities, apply the theoretical knowledge learned to practical activities, and promote the all-round development of students.

#### 4.3 Environment education course

Environmental education courses are the supplement. As the implicit course, it has the characteristics of concealment, pluralism and openness (Tan, 2004). Invisibly, students are edified and influenced to develop the spirit and emotion of voluntary service. It emphasizes the environmental construction of colleges and universities, that is, the external appearance of the university and the internal influence of campus culture and spiritual tradition. This influence is carried out in an indirect and implicit way, which makes students invisibly influenced by the spirit and culture of voluntary service to generate a high sense of identity (Wei & Dai, 2012).

#### 4.4 Feedback sharing courses

Feedback sharing is the promotion. The sharing module mainly requires students to sort out their gains and feelings after each theory learning and practice, which is also interspersed in the learning process of theory learning and service practice module. In this part, students can explain their feelings, perception, shortcomings, areas for improvement and expectations for themselves. Teachers ask questions, comment and give feedback on students' sharing, then students answer relevant questions.

### 5 The Curriculum Management System of Undergraduate Voluntary Service in Universities

The voluntary service education should be included in the school training program to realize the curriculum of undergraduate voluntary service by constructing the curriculum system. Attention need to be paid to the construction of the curriculum system, including the syllabus, curriculum materials, teachers' groups, practice platform and evaluation system. Only after the volunteer service has a clear status and identity in university education can it

be standardized, organized and managed in a planned, orderly and standardized way, and undergraduate voluntary service can enter the track of the normal development, which is also conducive to promoting the reform and innovation of education and teaching.

**Figure 2 Construction System of Voluntary Service Curriculum in Universities**

### **5.1 Formulating the course outline of undergraduate voluntary service**

Syllabus is the legal document of teachers' teaching in classroom and the specific manifestation of teaching plan. The course of university students' voluntary service should consider following parts: firstly, the nature, purpose and task of the course; secondly, the basic requirements of teaching, the teaching content with key points and difficult points; thirdly, the requirements of each teaching link and the distribution of class hours. The connection with other courses, as well as teaching materials and reference books should also be taken into consideration. Since voluntary service education is not a national compulsory course and there is no national unified teaching program standard, in principle, it should be formulated by colleges and universities according to the compilation standard of the curriculum teaching program and in combination with the professional training objectives and regulations (David, 2000).

### **5.2 Compiling teaching materials for college students' voluntary service courses**

Curriculum materials are the basis of transmitting volunteer service knowledge and the important symbol of volunteer service curriculum. The theme, branch and emphasis of the teaching material are the blueprint of developing the voluntary service course, which is the important carrier of teaching thought, training target and teaching content. Colleges and universities should base on theory of voluntary service, voluntary service operations, quality and ability of volunteers, implement and technique of volunteer service activities, knowledge of voluntary management. With it, university can provide students with volunteer service authority, detailed and vivid and readable education text, as well as play an important role in education and guidance for promoting undergraduate volunteer service theory and practice (Chen et al, 2009).

### **5.3 Improving teachers' team construction of undergraduate voluntary service**

The teachers teach the knowledge and skills of voluntary service, and they are the leaders of the courses. Excellent teachers are the basic guarantee to complete the teaching tasks, and also the supporting point to improve the teaching quality comprehensively. Therefore, the construction of teacher's team is the key to achieve goals of voluntary service education in colleges and universities. First of all, we should strengthen the study of theoretical knowledge of voluntary service and have excellent professional quality. Secondly, we should establish and perfect the organization of volunteer teaching and research, and increase the support for teachers' scientific research. Finally, the number of teachers should be rationally allocated and the structure of the teaching staff should be optimized (Zhang,

#### **5.4 Building the practice platform for undergraduate voluntary service**

Practice platform is a stable place for students to receive education and develop talents. We need to establish a three-level linkage mechanism of “institute + school + community”, which is a large classroom for undergraduates to learn and obtain voluntary service experience. To achieve it, we need to take use of the community to provide a practice platform for the school, and build a voluntary service base for undergraduates. On the basis of this practice base, a series of various voluntary service projects that can not only give full play to the professional qualities of undergraduates, but also meet the practical needs of the community will be created to cultivate the spirit of volunteer service of college students. Based on the personal service experience, the essence of voluntary service will be perceived and the core socialist values will be actively promoted. At the same time, it can effectively promote the development of economy and culture in practice base.

#### **5.5 Establishing an evaluation system for voluntary service courses in universities**

The evaluation system determines the level of teaching efficiency and teaching quality, promotes the standardization and scientization of voluntary service courses, and ensures the practical effect of teaching. It means that making a value judgment on the planning, implementation, results and other related issues of the course and seek ways to improve according to certain evaluation standards. It needs systematic collection of relevant information and adoption of various qualitative and quantitative methods. It has great significance to the voluntary service curriculum. In addition, the evaluation system needs to be adjusted and designed for different evaluation contents and more detailed indicators according to the practical content, so as to ensure that the evaluation results have a positive role in promoting the curriculum of voluntary service (Li, 2012).

## **6 The Main Methods of Curriculum Management of Undergraduates'**

### **Volunteer Service**

#### **6.1 Improving the understanding of curriculum management**

In terms of nature, undergraduate voluntary service is voluntary, public spirited and gratuitous. In terms of activity content and form, it is broad, diverse and practical (Hu & Yang, 2010). Therefore, in order to change the current scattered and changeable state of undergraduate voluntary service by means of curriculum management, we must firstly have a correct understanding of the connotation and extension of undergraduate voluntary service. The management mode should be chosen according to the characteristics of undergraduate voluntary service. The undergraduate voluntary service curriculum system and specific construction need to be correctly understood, so that all parties can realize the importance that undergraduate voluntary service curriculum is existing based on Chinese university

## **6.2 Developing management with teaching of voluntary service curriculum coordinately**

Compared with other courses, undergraduate voluntary service courses are special because learning and practice can be simultaneous. Only by penetrating teaching into the whole process of undergraduate voluntary service can we give full play to the advantages of curriculum. Only by constituting a mutually rewarding circulation between the four major parts including theoretical learning, service practice, environmental education and feedback sharing in the curriculum structure, can we realize the coordination of voluntary service and course teaching. With the guidance of professional teachers and the coordination of student volunteer organizations, undergraduates will be more able to effectively use volunteer service knowledge and skills, cultivate the spirit and quality of volunteer service, and achieve the effect of learning from practice (Chen & Luo, 2015).

## **6.3 Developing an online management platform for voluntary service courses**

The management platform provided by the network is an effective way for undergraduate volunteer service curriculum to be recognized and popularized. We need to develop a set of curriculum network system to provide online course resources, and establish a set of operation system for online management platform to make the platform system run efficiently. Teachers also obtain information from the online platform, arrange course contents and provide students with professional knowledge and abilities. Colleges and universities can summarize the achievements and deficiencies in the development of undergraduate volunteer service through the operation of the network management platform, and put forward new development directions and solutions.

## **7 Conclusion**

Promoting the curriculum management of undergraduate voluntary service is conducive to improving the effectiveness of voluntary service education. It can give full play to the practical education function of volunteer service in the university education of ideology and politics, and it is able to cultivate the comprehensive quality and social responsibility of contemporary undergraduates. Combining with the current situation and typical experience at home and abroad, this paper puts forward the structure of voluntary service curriculum referring to the generalized concept of broad curriculum. By discussing the connotation and significance of the curriculum, a complete curriculum system of undergraduate voluntary service is constructed, and suggestions are put forward to solve the difficulties faced by the curriculum management. So that the development of undergraduate voluntary service curriculum in China can achieve a leap from theory to practice and open up a new world for volunteer service as well as ideological and political education in university.

**Abstract:** Informationization can be regarded as a miracle after the development of human society from the stages of industrialization. In modern society, computer and information technology play a vital role in the development of society as well. Delicacy Management is also the main idea for modern management fields. Nowadays, with the increasing number of college students, the informationization management of college students has become the focus of daily work in colleges and universities. However, in this process, some problems have gradually begun to appear in the informationization management of college students. At present, the informationization management of college students has basically covered teaching and scientific research activities, but still cannot reach the level of Delicacy. In the current era of informationization, how to integrate Delicacy Management into student affair management system has gradually become a new topic. This essay is based on the background of informationization, the needs analysis is conducted through the results of the questionnaire. At the same time, the Quantitative Analysis Method is used to derive the weight of each requirement, and then forms an information management system. The purpose of this essay is to construct a precise education system of student affair in colleges and universities, which includes meticulous training, fine classification, precise difficulty demand and accurate period, and to provide a feasible scheme for Delicacy Management of student affair.

**Key words:** Informationization; Student affair; Delicacy; Quantitative analysis method

## 1 Introduction

With the development of society and economy, the management organizations of colleges and universities are becoming larger and larger. However, in the field of management, there are still a small number of managers are influenced by the traditional management concept, they do not have enough understanding of the necessity of student affair informationization and management delicacy, their awareness of information and Delicacy Management are still relatively weak, and their sense of urgency to quickly promote the construction of informationization and Delicacy Management is not strong as well(Zhao Xiaopeng, Liu Xiong,2018);although many colleges and universities have resources invested in the Delicacy Management of informationization, most colleges and universities still lack the talents of informationization management major. The lack of informationization knowledge and talents in the field of college and university management directly leads to the imbalance between the development of information technology and Delicacy Management; at the same time, due to the asymmetry of information, there are difficulties in the process of solving the needs of students, which also causes great obstacles to democratic decision-making and scientific decision-making(Shi Rui,2016). Therefore, it is urgent to accelerate the construction of information technology and fine management.

Under the background of information, it is an inevitable trend to realize the fine management of College Student affair to adapt to the development of the times, and it is also the basic requirement of the law of student work (Judith Warren Little, Maryl Gearhart, Marnie Curry, Judith Kafka, 2003). Fine management of student affair is helpful to improve the efficiency of student affair and achieve standardization and efficiency. At the same time, teachers and staff are required to master information management technology and fine management knowledge, so as to improve the quality of work (Fu Nina, 2015). Careful cultivation, precise hierarchy, precise demand difficulty, precise period of time of fine nurturing system, more conducive to the growth of students (Chen Jin, Xia Xing, 2018).

College counselors, as the most grass-roots managers, play an extremely important role in student affair (Qi Qiran., 2018). They should be able to actively acquire information technology-related skills in order to adapt to information-based life and work, and try to refine management in student management (Ying Xiangtai, 2013). Many magazines and literature at home and abroad have studied and discussed the fine management mode of College student affair. In order to further study and construct an efficient and feasible information refinement management platform, this paper will use quantitative analysis method to evaluate students' information needs comprehensively and determine their development weights. According to the conclusions drawn from the analysis, it will be analyzed by professional programmers. Finally, it will develop a high level suitable for the actual situation. Information platform for fine management of student work in other schools.

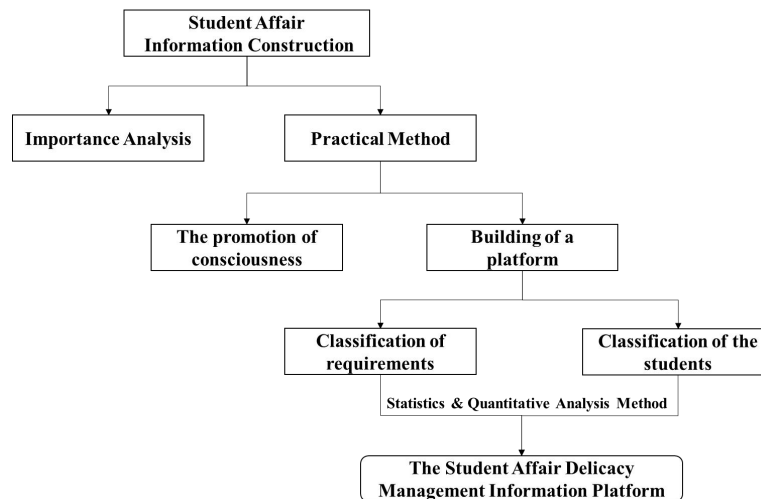

Figure 1 The Research on the Delicacy Management of Student Affair

## 2 The Importance of Student Affair Delicacy Management

Student affair is an important part of serving and managing students in colleges and universities. Therefore, under the background of informationization era, the realization of Student Affair Delicacy Management in colleges and universities is not only the inevitable trend to adapt to the development of the times, but also the basic requirement of the law of student affair.

### 2.1 The improvement of work efficiency

The implementation of Student Affair Delicacy Management is not only the inevitable requirement to improve the efficiency of student affair, but also the way to realize the standardization and efficiency

Proceedings of the 16th International Conference on Innovation & Management - 1774 -

of student affair. At present, student affair informationization has made great progress, but at the same time, good technical and environmental conditions make the demand of Student Affair Delicacy Management become more urgent (Cheng Linhong, 2013). With the entry of the students born in the 00s, the traditional informationization management mode has been difficult to adapt to the current development of colleges and universities, so speeding up the promotion of Student Affair Delicacy Management has become the inevitable trend of the development of colleges and universities.

## **2.2 The improvement of the quality of teaching staff**

In order to better implement Student Affair Delicacy Management, student affair personnel should not only have a down-to-earth and meticulous work style, but also master informationization management technology and Delicacy Management related knowledge (Zhao Chunyang, 2017). The realization of student Delicacy Management can not only simplify the routine work and business matters, but also greatly improve the work efficiency. At the same time, it can also enable student affair personnel to carry out more ideological and political research, stimulate innovative work ideas, improve the level of management, better manage students, serve students and promote the development of the school (Zhang Yanzhong, 2017).

## **2.3 Contribute to the growth of students**

For the management of students, most of the contemporary colleges and universities adopt a loose management mode, and the management environment is also very loose. As students do not have a clear guidance for study and life, which also leads to many students on the school's learning and assessment mechanism has a lot of confusion and misunderstanding. At the same time, due to the limited human resources in colleges and universities, it is impossible for the school to answer and help each student's questions (Li Yan, 2011). In the past, in the face of these conditions, colleges and universities often hope for the help of senior students or student associations, but since this year, the weakening of the nature of the work of student associations has also led to the loss of this way. If colleges and universities can realize the Delicacy Management, of student information so that each student's information can be stored in the form of visual data in the background management platform of the school, so that it can be easily viewed by teachers and provide necessary help and guidance in a timely manner. At the same time, students can view the changes of relevant information at anytime and anywhere through the network platform, quickly evaluating their achievements and after-school assignments and making corresponding study plans and arrangements as well. This way can completely improve students' autonomous learning ability, greatly alleviate the pressure of educational institutions, at the same time, it is undoubtedly of great help to the growth of students.

# **3 Practical Method of Constructing Student Affair Informationization Efficiently**

## **3.1 The promotion of consciousness**

In recent years, with the continuous development of informationization management means, the educational administration management system of our school has become the main way for most students to carry out course selection operation and information achievement inquiry. In order to further improve the delicacy of management systems and methods, more student information needs to be entered into the system, which is bound to cause many students to worry about personal privacy security (Ding Shihui, 2016). At this time, it is necessary for grass-roots educators to carry out necessary, comprehensive, and timely education and guidance to students, and to publicize the necessity, importance, new, and convenience of Delicacy Management to students through grade weekly meetings

Proceedings of the 16th International Conference on Innovation & Management - 1775 -  
 or relevant academic associations and online platforms (Chen Tiannian, 2011). Only with the recognition and approval of the majority of students, can we make the Delicacy Management of our school form a good state praised by everyone, and enhance the students' correct understanding of the importance of Delicacy Management (Li Desen, Zhou Meilan, Chen Nijishi, 2011).

At the same time, as basic education workers, we should timely feedback the students' reflection and the students' urgent need for Delicacy Management to the colleagues in charge of educational administration and the relevant leaders of the school, so as to make a good link and bridge between the students and the school, so as to make the whole school have a deeper understanding of the students' Delicacy Management and speed up the information Delicacy Management process of our school.

### 3.2 Building of a platform

Due to the wide range and deep level of content involved in student affair Delicacy Management for higher education, Therefore, only the Delicacy Management work on the various information about students<sup>105</sup> is analyzed here (Chen Haitao, 2007):

#### 3.2.1 Classification of requirements

After the study of the results of the questionnaire survey on the various measures of the school and a wide range of students, the following table of students' information service needs is drawn up. In this table, each indicator evaluates its importance, which is divided into three levels, which are "unimportant" "Important" and "very important". The proportion of demand is the proportion of people who fill in "important" and "very important". Get the following demand table (Kenneth Green, 2016).

**Table 1 Students' Information Service Demand Table**

Sorting	Classification	Number of subitems	Demand ratio	The top two subitems of demand	
1	Basic information service	17	98.90%	Student status information	Reward And Punishment information
2	Academic service	10	80.20%	Course selection	Query of exam results
3	Library service	7	64.30%	Book search function	Books materials
4	Logistics service	6	45.00%	Provide one-card service	Medical information and outpatient reimbursement
5	Admission / opening service	5	32.10%	Holiday arrangements and school information	Enquiry Admission and Admission Procedure
6	Graduation service	4	25.80%	Provide employment information and related guides online	Online graduation information registration

<sup>105</sup>Kenneth Green. The 2016 National Survey of eLearning and Information Technology in US Higher Education[EB/OL]. <https://www.campuscomputing.net/content/2016/11/21/the-2016-campus-computing-survey>, 2016.10.21

7	Management service	3	13.90%	Application and evaluation of various awards and bursaries	Declaration and notification of club activities
---	--------------------	---	--------	--	---

3.2.2 Demand analysis—Quantitative Analysis Method

Weight calculation of Level 1 Indicator;

Assign "unimportant" to 1; "important" to 2; "very important" to 3; and its weight is 0.17, 0.33, 0.5.

Then, the number of people who choose the importance of each index in the questionnaire multiply the importance weight summation to get the weighted number, from the weighted number of all indicators of the index divide weighted number of all indicators to get the weight of the index.

Weight calculation of Level 2 Indicator;

The proportion of the level 1 index multiplied by the level 2 index in the index.

**Table 2 Indicator Framework and Weight**

Classification of indicators	Level 1 indicator		Level 2 indicator		
	weight	Indicators	weight	Indicators	weight
Query information class	0.551	Basic information service	0.203	Student status information	0.179
				Reward and punishment information	0.020
		Academic service	0.195	Course selection	0.123
				Query of exam results	0.074
		Library service	0.153	Book search function	0.089
				Books and journal materials	0.052
Information notification class	0.238	Logistics service	0.126	Provide one-card service	0.057
				Medical information and outpatient reimbursement	0.068
		Admission / opening service	0.112	Holiday arrangements and school information	0.038
				Enquiry Admission and Admission Procedure	0.028
Application registration class	0.211	Graduation service	0.111	Provide employment information and related guides online	0.047
				Online graduation information registration	0.048

		Application and evaluation of various awards and bursaries	0.045
	Management service	0.100	
		Declaration and notification of club activities	0.024

### 3.2.3 The classification of the students

#### ① Classified according to the level of education

For students with different levels of academic qualifications, stratified management should be carried out according to graduate students and undergraduates, that is, different information management methods and means are implemented for graduate students and undergraduate students. In the information of undergraduate students, it should be more related to course selection and inquiry, achievement inquiry, self-study room inquiry, school news and related cultural and sports activities and so on. In the information of graduate students, it should be more related to scientific and technological innovation, employment and entrepreneurship, further studies and so on. While managing the two hierarchically, it is important to be clear that the two are not individual, but organic, so they need to stay connected and share resources.

#### ② Classify according to the type of difficulty

The types of difficulties can be initially divided into: academic difficulties, psychological difficulties, family financial difficulties, and employment difficulties. The difficulties encountered by students in economy, psychology, study and so on are important factors that affect students' life and learning status, so they should pay more attention to it.

For students who encounter academic difficulties, their curriculum information and subject achievements should be directly connected with their teachers, through the connection of the network platform, so that they can have close and timely contact with the teachers, and the teachers can help them to make relevant learning plans and give advice. At the same time, the Delicacy platform should develop the corresponding supervision and assessment mechanism, so as to urge students with academic difficulties to carry out related tasks (Olivas M, 2006).

For students who encounter psychological difficulties, the platform should provide relevant ways of talking, as well as the way of enlightenment and the help of relevant psychological teachers, so that students can find the object to talk to and get psychological guidance in the first place. At the same time, they can feedback the relevant psychological situation of the student to their counselors, so that their counselors can also carry out guidance and help. At the same time, through the timely detection of students' behavior activities, the platform can make a timely prediction of students' extreme behavior, which can reduce the harm caused by similar behavior.

For students with financial difficulties in their families, they should, in accordance with the principle of fairness, justice and transparency, establish contact with the local civil affairs institutions of the students to verify the true family situation of the student, so as to keep abreast of the real financial situation of their families. In the aspect of selection, the selection mechanism of artificial participation is realized online, and the relevant supervision mechanism is established in order to achieve the corresponding fairness and justice.

#### ③ Classify according to the grade of the student

According to the different grades of students, they can be divided into graduating class, non-graduating class, freshman class and so on. For the graduating class, you should keep abreast of the student's graduation destination, credit check, and household directory migration; For non-graduate classes, students should keep abreast of student academic progress, participation in scientific and technological innovation, etc.; For freshmen classes, we should provide admission help, answer questions, rules and regulations, cultural activities and so on.

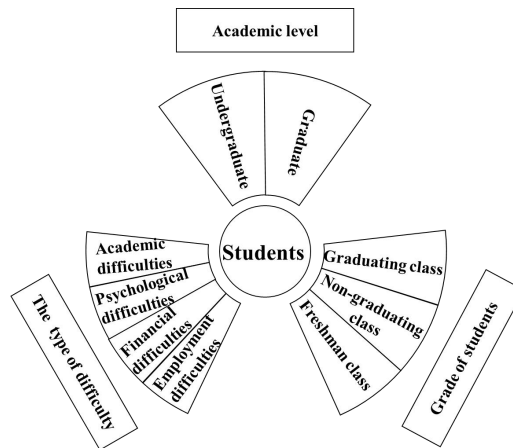

Figure 2 The Classification of the Students

### 3.2.4 The establishment of a platform

The service hierarchy model of student information is as follows:

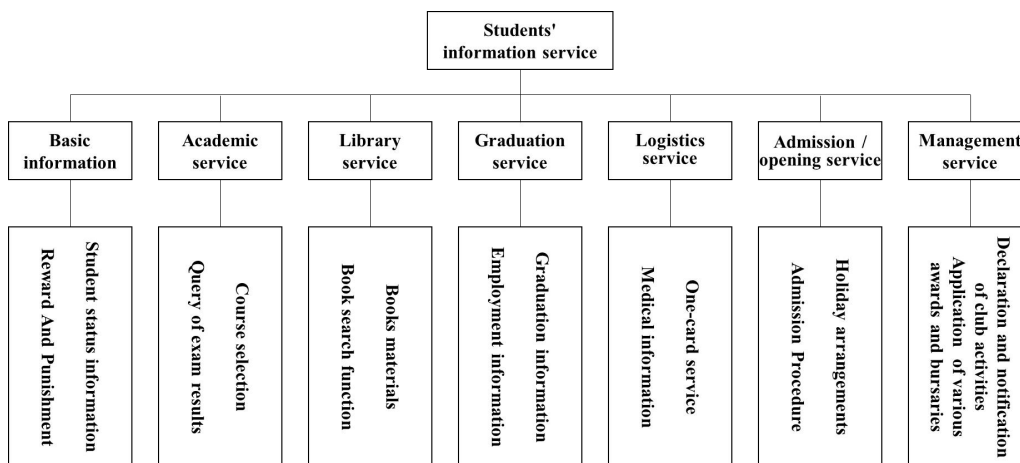

Figure 3 The Service Hierarchy Model of Student Information

According to the above table 2: indicator framework and weight table and figure 5: student information service hierarchy model diagram, at the same time, combined with the functions to be implemented in the student classification in chapter 3.2.3, it is handed over to professional programmers for analysis. Finally, the student affair Delicacy Management information platform for colleges and universities is developed, which is suitable for the actual situation.

## 4 Conclusion

To achieve the refined management of student information, and to establish a meticulously nurturing system with precise training, precise stratification, precise demand and precise time, is the courage to innovate in keeping with the development of the information age, to meet the needs of students and to enhance school work. An important measure of efficiency. Ten years of trees, a hundred years of tree people, the cultivation of talents is the top priority of any university. The refined culture method is the catalyst and propellant of "Tree Man". To achieve refined management, in the most scientific and exciting way, we will build our school into an excellent university that will satisfy the people and admire the world. I like to see the apricots and the beautiful colors.

## **Inheritance and Development of Craftsman Spirit**

### **from the Perspective of Cultural Confidence**

Han Lu, Chen Mengyun, Han Mingdan\*

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 597584281@qq.com, 404574715@qq.com, 448143757@qq.com)

**Abstract:** The spirit of craftsman has been a national temperament of China since ancient times. It is a concrete manifestation of the confidence of the Chinese nation's culture, highlighting the style of a big country and the feelings of the world. The inherent logical relationship between cultural self-confidence and craftsman spirit is manifested in the fact that cultural self-confidence is conducive to the promotion of craftsman spirit and the promotion of craftsman spirit is conducive to consolidating cultural self-confidence. Based on the field of cultural self-confidence, carrying forward craftsman spirit can enhance citizens' ability to serve the cause of socialism, practice socialist core values, enhance national cultural vitality and competitiveness, and provide a strong cultural heritage for the cultivation of craftsman spirit. The inheritance and development of the craftsman spirit not only needs to be based on practice, but also emphasizes the combination of tradition and modernity. It also requires a culture of craftsman culture to support the craftsman spirit and innovative craftsman spirit.

**Key words:** Cultural self-confidence; Craftsman spirit; Excellent traditional culture; Revolutionary culture

## **1 Introduction**

In 2016, YAOWEN JIAOZI magazine published ten popular phrases in 2016. Craftsman spirit ranked among them. In the same year, craftsman spirit was first written into the government work report. The report of the Nineteenth National Congress of the Communist Party pointed out that it is necessary to build a knowledge type, skilled and innovative laborers, carry forward the spirit of labor model and craftsman spirit, and create a glorious social style of work and a dedicated spirit of excellence (Xi Jinping 2017). The spirit of craftsmen has aroused wide resonance in society since it was put forward. In the new era, China's strategic transformation and upgrading from a manufacturing power to a manufacturing power cannot be achieved without the spirit of craftsmen and craftsmen. In addition, General Secretary pointed out that Cultural self-confidence is a more basic, deeper and lasting force in the development of a country and a nation (Xi Jinping 2017). In the pursuit of high-quality development today, craftsman spirit and cultural self-confidence are the important cultural details of China's transition from a big manufacturing country to a powerful manufacturing country. Craftsmanship and cultural self-confidence are social consensus and a key factor for success.

Use the China Academic Journal Network ([www.cnki.net](http://www.cnki.net)) to search the relevant content. The literature search and statistics were carried out with the theme of "craftsman spirit". There were 12,827 items in subject search and 6713 items in title search. It is obvious that the research on craftsman spirit is a hot topic in theoretical circles. Figure 1 shows the number of research literature from 2012 to 2018.

**Figure 1 Number of Research Literature**

In the 2016 "Government Work Report", Premier Li Keqiang first put forward the strategic task of cultivating the spirit of craftsmanship for excellence. The report of the 19th National Congress of the Communist Party of China pointed out that it is necessary to carry forward the spirit of the model workers and craftsman spirit, and create a glorious social style of labor and a spirit of dedication to excellence. Through the academic journal network to sort out the number of articles about craftsman spirit, it is not difficult to find that the number of literatures on the craftsmanship has increased dramatically in 2016 and has been increasing year by year after 2016. In sorting out the literature, it is found that the number of studies on craftsmanship spirit in academic circles is not only increasing year by year, but also the research field is expanding gradually.

**Figure 2 Distribution Map of Research Areas**

On the connotation of craftsman spirit. "The Thinkers: the amateurs, diyers, and inventors who make America great" points out that the inherent essence of American craftsman spirit is the innovative ability of "breaking through the boundaries (AlecFoege,2013), "Craftsman" thinks that craftsman spirit is the desire to do a good job (Richard Sennet,2009); Scholar carries out the connotation of craftsman spirit through professional growth and advocating technology and morality (Xue Dong,2016). A Japanese scholar believes that Japanese professional workers influence customers with their professional

Proceedings of the 16th International Conference on Innovation & Management - 1783 -  
attitude, emphasizes the spirit of self-contribution, and forbids service professionals to pursue their own convenience at the expense of personal aspects of service for efficiency (Reijiro Aoyamaa,2015).

On the logical relationship between craftsman spirit and cultural self-confidence. In the article "Inheritance and Innovation of Craftsman Spirit under the Background of Cultural Confidence", the author thinks that Chinese excellent traditional culture, revolutionary culture and advanced socialist culture have played an important role in inheriting and innovating craftsman spirit, which is a manifestation of cultural self-confidence (Song Ruinan, , Liu Huanming,2017); in "Three Spirits" leading workers' culture from In the letter, the author takes workers' cultural self-confidence as an important manifestation of cultural self-confidence as the starting point. Craftsman spirit is not only a professional belief, but also the connotation of workers' cultural self-confidence (Qiao Xin,2017).In the article" Promoting craftsman spirit and enhancing cultural self-confidence", the author emphasizes the important role of craftsman spirit in cultural self-confidence (Yang Dongmei,2018).

On the value of promoting the spirit of craftsmen. Sticking to the spirit of craftsmen is the reason why some enterprises create myths, which is also one of the reasons why modern society pays more and more attention to the spirit of craftsmen. Therefore, the study of the spirit of craftsmen must be based on its contemporary value. Professor believes that craftsmanship is the soul of contemporary manufacturing industry (Xiao Qunzhong, 2015); some scholars believe that craftsmanship is conducive to leading people to advocate labor and Practice Socialist Core values (Liu Jianjun, 2016); Professor believes that craftsmanship is a spiritual force and plays an important role in personality building and moral upgrading(Qi Shan hong, 2016).

By sorting out the relevant literature, we can easily find that under the background of cultural self-confidence, the research on craftsmanship spirit is not very rich. Most of the studies are related to the essence of craftsmanship spirit, vocational education and Made in China. In the existing studies, scholars mainly discuss the role of craftsmanship spirit on cultural self-confidence. The internal relationship between the two is neglected.

## **2 Contemporary insight into Cultural Confidence and Craftsmanship**

### **2.1 Rich content of cultural self-confidence**

Cultural self-confidence is the full affirmation of the cultural value of a country, a nation and a political party. It is also a full affirmation of the vitality of the national culture and its development prospects. It is a self-confidence and pride of culture from the heart. In the long-term practice, the Chinese nation has created extensive and profound excellent traditional culture; in the long-term and difficult practice of revolution, construction and reform, the Communist Party of China has led the people of all nationalities to form a revolutionary culture of independence, self-reliance and hard struggle; in the process of reform and construction, through continuous innovation, an advanced socialist culture with unique characteristics has been gradually formed. That is to say, cultural self-confidence refers to the self-confidence of a country, a nation and a political party to the excellent traditional Chinese culture from the bottom of their hearts. It is also the inheritance and development of revolutionary culture and the promotion and affirmation of the advanced socialist culture with Chinese characteristics. General Secretary Xi Jinping pointed out in the report of the Nineteenth National Congress of the CPC that the socialist culture with Chinese characteristics originates from the excellent traditional Chinese culture nurtured by the Chinese nation's more than five thousand years of civilization history. It is melted into the revolutionary culture and the advanced socialist culture created by the Party's leading people in the revolution construction and reform and rooted in the great practice of socialism with Chinese characteristics (Xi Jinping,2017). Excellent traditional culture and revolutionary

Proceedings of the 16th International Conference on Innovation & Management - 1784 -  
culture are the important contents of the construction of advanced socialist culture. The advanced socialist culture escorts them. They complement each other and constitute the connotation of cultural self-confidence.

## **2.2 Interpretation of the connotation of the craftsman spirit**

### 2.2.1 Respecting the teacher

Respecting the teacher is the traditional virtue of the Chinese nation. Respecting the teacher means that in life, you must respect the teacher and value your own learning. "The teacher, is also the model of the person" "Once a teacher, always a teacher" where, it fully embodies the moral values of the Chinese nation's respect for teachers. Masters and students live together and study together. Respecting the teacher is to respect the elders, and the emphasis is on the profession. The younger generation must not only respect the elders, but also respect for skills. In the daily academic life, the attitude of the apprentice to the master determines to a certain extent whether the apprentice can learn the skills, which is the foundation of a craftsman.

### 2.2.2 Dedication and hard-working

Dedication and hard-working is the source of strength of the craftsman spirit. "Dedication" is to do a job and love the job, namely loves whatever job one takes up. "Hard-working" is to be careful and serious about the work. Dedication is the traditional virtue of the Chinese nation. The Chinese nation has always had the tradition of "loyalty to duty" and "dedication". It is the basic moral norm that every citizen should have and an important part of the core values of socialism. In life, we can't just regard work as a tool for raising a family, but we should treat love and dedication as a work habit, implement love and dedication to social practice, and internalize it in mind and externalization in action.

### 2.2.3 Keep improving

Today, with the rapid development of the economy, people are eager to do everything, and they often have a quick and quick attitude toward things, excessive pursuit of speed, but neglect the quality of products. The public has always believed that craftsmen need "craftsman spirit". In fact, the craftsman spirit is a professional ethic. It is a must for every worker who is based on the post. "Thirty-sixth chapter of the Tao Te Ching" records that "the great things in the world must be done in detail", which means that the big things are all started from the nuances, and the swords are slashed and refined, and the behind them are the craftsman spirit that craftsmen are striving for excellence. The goal of craftsman spirit is to do things to the utmost and to create the highest quality products.

### 2.2.4 Realistic and innovative

Looking back at history, the important force driving social progress has always been the products created by the craftsmen who have devoted themselves to innovative inventions. Innovation has always been carried out, no matter how difficult, we must not forget the original heart, do the combination of theory and practice, and integrate what we want into the product. The reason why Luban and Edison have been passed down to the present day is not because they polish their products day after day, but because they continue to innovate and leave valuable material and spiritual wealth to future generations. Therefore, the modern craftsman spirit is not constantly repeating and persisting, but doing improvement and innovation in the work. For the public, improving their own working methods and continuously improving work efficiency is also an innovation.

### **3 The Inherent Relationship between Cultural Self-confidence and Craftsman Spirit**

#### **3.1 Cultural self-confidence highlights craftsman spirit**

##### 3.1.1 Chinese excellent traditional culture is the cornerstone of the inheritance of craftsman spirit

The Chinese traditional culture is the source of the craftsman spirit. The Chinese traditional culture is more embodied in the real thing that has been passed down to the present. These objects contain the "ingenuity". Many of the artifacts and stories that have been handed down to date record the superb skills of ancient craftsmen, such as Su Shi's "Nuclear Zhou Ji" and Zhang Zeduan's "The River on the Qing Dynasty". The broadcast of "National Treasures" has made people see the profoundness of Chinese culture for thousands of years. One piece of cultural relics is not only the inheritance of culture, but also the inheritance of craftsman spirit.

Looking back at Chinese history, the Chinese architecture and carpenter's originator Lu Ban invented a series of tools in the Spring and Autumn Period. The weight of the plain yarn unearthed from Mawangdui in Changsha is less than 50 grams, which represents the superb craftsman spirit of the Western Han Dynasty. So far, it is difficult to copy with modern technology. The Chinese nation has thousands of years of excellent traditional culture. Nowadays, we are always proud of our profound and excellent traditional culture. The excellent traditional culture is not only the source of spreading the craftsman spirit, but also embodies the craftsman spirit that the times need.

##### 3.1.2 Revolutionary culture extends the inheritance of craftsman spirit

China's revolutionary culture is guided by Marxism and has matured step by step in practice. Marxism was born in Europe in the mid-19th century. The victory of the October Revolution brought Marxism to China. When China clashed and chose various ideologies, it used Marxist theory as its guiding ideology. This kind of thinking method that combines the national conditions of the country and absorbs the external beneficial results also applies to the inheritance of the craftsman spirit. The inheritance of the craftsman spirit should take the essence of the foreign culture to the dross on the basis of respecting the local culture and continuously promote its own development.

From the Jinggangshan spirit to the Zunyi Conference, from Yanan's "reorganization of the Three Winds" to Xibaipo's "Going to Beijing to test", the Communist Party of China led the people of all nationalities in the revolutionary struggle to form a revolutionary culture of hard work. The "Not arrogant", "Endure hardships and be capable of hard work" and "Willing to sacrifice" in the revolutionary culture are the essence of the spiritual connotation of craftsmen.

##### 3.1.3 Socialist advanced culture sublimates craftsman spirit

The advanced socialist culture is the sublimation of the essence of the traditional culture of the Chinese nation. While creating the culture, the people also shoulder the important responsibility of inheriting culture. The transformation of the main contradictions in our society shows that the people's spiritual needs are getting higher and higher. Building an advanced socialist culture is, in the final analysis, to meet the growing spiritual and cultural needs of the people. General Secretary Xi Jinping put forward the goal of "China Dream" and "Two Hundred Years". To achieve these goals, the unremitting struggle of great artisans is needed.

Today's society can be said to be an Internet age. The Internet runs through people's daily lives. Similarly, the popularity of the Internet has injected new vitality into the inheritance and development of the craftsman spirit. More and more cultural relics are displayed in front of the world through the Internet, telling the world about its past legends. For example, the Gou Jian sword which is the representative of hardships, the workers use the scientific means to interpret the password of Goujian sword, lead us into the microscopic world of Goujian sword, and understand more clearly the skill of

Proceedings of the 16th International Conference on Innovation & Management - 1786 -  
Goujian sword. This is an opportunity that science and technology provide us. The advanced socialist culture of advancing with the times has sublimated craftsman spirit and further inherited innovation and development.

### **3.2 Craftsman spirit enhances cultural confidence**

#### **3.2.1 Craftsman spirit can enhance the cultural pride of the working group**

China is the country where the people are the masters of the country. The working class is the master of the country. The working class plays an irreplaceable role in the construction of socialist culture. Gao Fenglin, a great craftsman, said that "every time I see the engine I produce, I send the satellite to space. There is a sense of pride after success. This kind of pride can't be bought with money." This is not only the voice of Gao Fenglin, but also the voice of the craftsmen used. The sense of honor of the labor group is an important part of the cultural confidence of the new era.

#### **3.2.2 Products with Chinese culture let China go to the world**

Silk and porcelain are of great attraction to the world. The Silk Road brought Chinese fine silk to the Western countries and also became an important channel for political and economic exchanges between China and Western countries. The invention of porcelain is China's great contribution to the development of world culture. In addition, the thoughts, the four inventions, and the farming of the pre-Qin dynasty all reveal the profound cultural heritage of the Chinese nation, which highlights our cultural self-confidence.

In modern society, Chinese drama and Chinese kung fu are constantly going to the world, and they are touring around the world. Foreign friends have begun to learn Chinese in order to learn more about China. The enthusiasm for the establishment of Confucius Institutes is on the rise, and more and more foreign friends are approaching Chinese. All of these prove the affirmation of Chinese culture in all countries of the world and further consolidate cultural self-confidence.

## **4 The Cultural Significance of Inheriting Craftsman Spirit under The Vision of Cultural Self-confidence**

### **4.1 Improving the ability of citizens to serve the cause of socialism**

In terms of the intention, the craftsman spirit is the professional spirit that people should have in the course of their work, and it is a kind of value pursuit of people. Respecting people's labor value and promoting people's all-round development are not only the needs of the growth of the public, but also the need to promote socialist modernization. The report of the 19th National Congress of the Communist Party of China pointed out that China should speed up the construction of an innovative country and build a country with strong science and technology and a country with high quality. Cultivate a large number of strategic and technological talents, leading scientific and technological talents, young scientific and technological talents and high-level innovation teams with international standards (Xi Jinping, 2017).

In the new era of socialism, in order to further promote the process of socialist modernization and realize the transformation and upgrading of China's manufacturing industry, it is inseparable from the creation of the broad masses of workers. In order to achieve the improvement of the quality of workers, it is necessary for the majority of citizens to take up their duties and stand on their own. The craftsman spirit is introduced into the work of the workers. The craftsman spirit can enhance the cultural self-confidence of the public, guide the laborers to learn new knowledge, research new technologies, and promote the excellence and innovation to become the common value pursue and behavioral norms of the

Proceedings of the 16th International Conference on Innovation & Management - 1787 - public. And it can improve the ability of the broad masses of workers to serve the society, and contribute to the socialist modernization in the new era.

#### **4.2 Conducive to the practice of socialist core values**

Values are the deepest cultural core of a nation. Value self-confidence is the most direct manifestation of cultural self-confidence. The core values of socialism are the pursuit of value of a nation and the spiritual pillar and action orientation of the Chinese nation. The craftsman spirit is the concrete practice of practicing the core values of socialism. The professional concept of dedication and professionalism embodied in craftsman spirit. Spirit is highly consistent with the value orientation of “dedication” and “integrity” advocated by the socialist core values at the individual level. Dedication is not only the traditional virtue of the Chinese nation, but also the basic requirement of the socialist core values. It is not only expressed in the fine art of the product, but also a professional concept constructed by people at the social level.

The meticulous work concept in craftsman spirit is the concrete practice of the concept of professionalism advocated by the core values of socialism. The socialist core values need to be implemented in the ordinary work of the broad masses of workers. Good laborers must concentrate on their own work, be responsible for their own work, constantly surpass themselves, and take advantage of small and large, thus enhancing the public professionalism.

#### **4.3 Enhancing the vitality and competitiveness of national culture**

The report of the 19th National Congress of the Communist Party of China pointed out that it is necessary to adhere to the development path of socialist culture with Chinese characteristics, stimulate the cultural innovation vitality of the entire nation, and build a socialist cultural power (Xi Jinping, 2017). The key to building a cultural power is to enhance the vitality and competitiveness of the entire national culture. Cultural vitality and competitiveness are important support for building a strong socialist culture. The world has entered the era of cultural brand competition, and cultural competition has become an important part of global competition. History has proved that the formation of a powerful country in the world today cannot be separated from the respect and attention of a country to craftsman spirit. Craftsman spirit has become a symbol of national cultural competitiveness. We advocate respect for labor and promote the spirit of the model workers. It is the extension and development of the craftsman spirit. It is also the development of the Communist Party's respect for the working people and the concept of labor. In addition, the craftsman spirit reflects not only the spiritual concept of the workers' excellence, but also the charm and cultural self-confidence of the excellent traditional culture. In the new era, promoting the craftsman spirit can not only promote the transformation of the manufacturing industry, but also promote the combination of the traditional Chinese culture and the times revitalizes and rejuvenate the vitality of the times.

## **5 The Path of Cultivating Craftsman Spirit in The Perspective of Cultural Self-confidence**

### **5.1 Based on practice, focusing on the combination of tradition and modernity**

Inheriting and developing the craftsman spirit from the perspective of cultural self-confidence must pay attention to the combination of tradition and the times. The inheritance of the craftsman spirit is not the same as the old-fashioned layer. It should be combined with the times on the basis of traditional culture, innovating, creating new crafts and giving it a new era connotation.

#### **5.1.1 Cultivate craftsman spirit based on excellent traditional culture**

Cultural self-confidence mainly comes from the traditional Chinese culture. It comes from the revolutionary culture which the party leads the people of the whole country to strive for development. It comes from the advanced socialist culture. The premise of cultivating craftsman spirit in the context of cultural self-confidence is to establish a good traditional culture. To develop the craftsman spirit should carry forward the fine traditions and draw useful ingredients from the excellent traditional culture of the Chinese nation for thousands of years. The spirit of ancient craftsmen has been continuously developed through the inheritance of craftsman spirit, and the inheritance of craftsman spirit is the precipitation and integration of excellent traditional culture through history. In particular, products with generations of inheritance and crafts contain the spirit of the Chinese nation's craftsmen. While actively integrating the new standard into the trend of the new era, we should not lose sight of the value inherent in it. The core value of some old products that have been developed for decades or even hundreds of years is a profound cultural heritage. As we know the Zhangqiu iron pot, after 12 procedures, many times of fire, 10,000 hits, can be completed, Zhangqiu iron pot is because of the persistence of generations of artisans, making "Zhangqiu no pot" become a social hot word. The reason why it can compete with the same product is the heavy cultural tradition it carries.

### 5.1.2 Cultivate craftsman spirit to keep pace with the times and combine with modern society

Today, with the rapid development of science and technology, industrialized production has replaced the production of traditional small workshops. Mechanized production has replaced manual labor to a certain extent, but this does not mean that social production no longer requires craftsman spirit. In the new era, society calls for craftsmen. The return of the spirit, the core of the craftsman spirit is innovation. The craftsman Lu Ban is known as the originator of Chinese carpenters, not because he polished many products day after day, but he repeatedly thought during the process of polishing products, constantly providing creativity and leaving valuable spiritual wealth to future generations. The craftsman spirit that modern society needs is no longer simply learning the repetition and persistence of the traditional craftsman spirit, but constantly innovating and developing in practice. For companies, the innovation of craftsman spirit can be combined with traditional techniques and the science and technology and management concepts of modern society. For the general public, rationally arranging working hours, improving working methods, and improving work efficiency are also innovations in craftsman spirit.

## 5.2 Thick planting craftsman culture, using craftsman culture to support the craftsman spirit

Premier Li Keqiang said in the 2017 government work report that the soul of quality is ingenuity. It is necessary to vigorously promote craftsman spirit, plant the artisan culture, fulfill professional ethics, admire excellence, cultivate many Chinese craftsmen, build more world-renowned China Brands and promote China's economic development into the quality era (Li Keqiang, 2017). Cultivating craftsman spirit in the field of cultural self-confidence must foster culture and use craftsman culture to support the development of craftsman spirit.

### 5.2.1 Thick system culture

To cultivate and promote craftsman spirit, we need top-level design. We should establish a "craftsman system" that is consistent with the needs of the times, so that technically talented people can be economically guaranteed, have a status in society, and be respected in their personalities. First, in the work, it should ensure that skilled personnel are fully employed, especially for some highly skilled craftsmen, increase their wages, improve working conditions, and improve welfare, so that workers do not have to worry about material life. Second, companies should fully mobilize the enthusiasm of the craftsmen. Adopt a combination of encouragement and responsibility to improve the professional honor and responsibility of craftsmen. Craftsmen should adopt a life-long responsibility system for their own

Proceedings of the 16th International Conference on Innovation & Management - 1789 -  
products, and use modern technology to real-name each of the craftsmen's works. This not only protects their own intellectual property rights, but also they are responsible for their products for life.

### 5.2.2 Thick social culture

In the historical tradition of more than two thousand years of the Chinese nation, craftsmen have always been at the end of the social class. In particular, Confucianism emphasizes that "everything is inferior, only reading is high", ignoring the skilled talents, and that the handicraft industry is a bit of a singularity. So that the public is bent on pursuing reading, thus neglecting the craftsmen. When it comes to craftsman spirit, everyone naturally thinks of Swiss watches and German machinery. Although contemporary China is a big country, the whole society still lacks craftsman spirit. It is a necessary condition for cultivating craftsman spirit to build a culture that respects craftsman spirit in the society.

First, in the society, vigorously promote the era value of the craftsman spirit, so that the public can recognize the role of artisans, and abandon the notion of "gentlemen do not work on device", "He who uses his brain will govern; he who uses his strength will be governed.", respect the skilled workers, and strengthen. The sense of honor of the spirit of the national craftsman spirit has formed the mainstream values of respecting skilled talents and vying for skilled talents in the society, making the model spirit become the value pursued by the public. Second, with the help of the Internet and the media, we will vigorously promote the craftsman spirit of the new era. In recent years, the selection of craftsman spirits in various places has enabled the public to further discover that craftsman spirit is in our lives. Especially the popular broadcast of "Greater Craftsman" and "I am repairing cultural relics in the Palace Museum", the audience saw the spiritual qualities of the great craftsmen. General Secretary Xi Jinping pointed out that all valuable and meaningful literary and artistic creations and academic research should reflect reality and care for reality, and should be conducive to solving real problems and answering realistic questions (Xi Jinping, 2017). This requires media workers in the new era to take root. Social life, combined with the development of the times, fully taps the story of "craftsman spirit" in the society, enhances the cultural connotation and value of the works, and publicizes craftsman spirit in the whole society in a way that the public likes to hear, so that craftsman spirit is deeply rooted in the hearts of the people.

### 5.3 Innovative craftsman spirit and spiritual education mode

Li Keqiang pointed out at the Symposium on Higher Education Reform and Innovation held in Beijing: focus on enhancing students' practical ability, cultivating craftsman spirit, practicing the integration of knowledge and practice, providing more mobile phone conferences for students, improving their ability to solve practical problems, and helping to enhance Chinese products quality (Li Keqiang). School is an important position to cultivate craftsman spirit, so it is necessary to innovate the craftsman spirit mode.

On one hand, when the school educates students on the theory of craftsman spirit, it is necessary to integrate the dedication, excellence, meticulousness, and innovation in craftsman spirit into the classroom teaching. Teachers play their role in guiding and demonstrating, so that students can learn. In the process, I feel the charm of the craftsman spirit. At the same time, the school should also help students establish a correct professional outlook and improve professionalism while educating students about craftsman spirit. The school should actively invite some craftsmen to the campus to give students direct contact with the craftsmen in the form of lectures, so that students can directly feel the charm of the great craftsmen. On the other hand, modern apprenticeship should be further promoted. German "dual system" vocational training mode, students also need to study and accept in the enterprise while learning professional theoretical knowledge in vocational colleges professional skill in terms of training, this dual-system cultivation model has become the secret of German manufacturing's longevity. In the

Proceedings of the 16th International Conference on Innovation & Management - 1790 -  
perspective of cultural self-confidence, we must cultivate craftsman spirit, not only based on China, but also on the world, taking the essence of the world culture and discard its dross. China can learn from the education mode of craftsman spirit in Western countries and reach the goal which we called "Stones from other mountains can attack jade". In the society, a group of craftsmen with the character of the craftsman is selected as the professional teacher of the school. In the actual teaching, the teacher's words and deeds are used to achieve the purpose of the students to cultivate their own craftsman spirit, and finally internalize in mind and externalize in action.

## 6 Conclusion

This paper mainly discusses the inheritance and development of the craftsman spirit from the perspective of cultural self-confidence. The spirit of craftsman has been a national temperament of China since ancient times. It is a concrete manifestation of the confidence of the Chinese nation's culture, highlighting the style of a big country and the feelings of the world. The inherent logical relationship between cultural self-confidence and craftsman spirit is manifested in the fact that cultural self-confidence is conducive to the promotion of craftsman spirit and the promotion of craftsman spirit is conducive to consolidating cultural self-confidence. The inheritance and development of the craftsman spirit not only needs to be based on practice, but also emphasizes the combination of tradition and modernity. It also requires a culture of craftsman culture to support the craftsman spirit and innovative craftsman spirit.

## Acknowledgement

This paper is the result of the phased research on the Marxist review of the craftsman spirit and the path of the political theory teaching in colleges and universities in the 2019 Hubei University Marxist Young and Middle-aged Theoretic Project.

**Abstract:** The Chinese officialdom discourse, different from the Chinese official discourse, typically refers to the red-taped, stereotyped and empty discourse that some officials deliberately use in face of accidents or crises. It is typically characterized by vagueness, ambiguity, obliqueness and indirectness, for the purpose of evading the problem and avoiding the responsibility of the official. Thus, it is extremely essential and practically significant to make a study of the Chinese officialdom discourse in order to help people to recognize its nature and harm so as to reduce or even eliminate its use. Verschueren's Linguistic Adaptation Theory holds the opinion that using language is a dynamic process of making language choices, which can be realized because of the variability and adaptability of the language. Accordingly, the pragmatic vagueness of the Chinese officialdom discourse is a deliberate pragmatic choice of language for the purpose of evading the responsibility. Thus, the thesis, under the framework of the Linguistic Adaptation Theory, expounds systematically on the pragmatic vagueness of the Chinese officialdom discourse in terms of its pragmatic variability. To put it in detail, the variability of the pragmatic language is shown in the use of the lexical and syntactic devices to realize the pragmatic vagueness. All the examples in the thesis are derived from the news reports in the contemporary mainstream media in China.

**Key words:** Chinese officialdom discourse; Pragmatic vagueness; Linguistic adaptation theory; Variability

## 1 Introduction

Chinese officialdom discourse refers to a special discourse field used on official occasions. With its earliest history hardly traceable, it constantly associated with a negative connotation, has been criticized at home and abroad, for it runs against the audience's expectation for official language, which follows the principles of an ideal language communication: accuracy, clarity and economy – the criteria expected by Grice in his Cooperative Principle (Grice, 1975).

The officialdom discourse is different from the officer discourse. While the latter one tends to convey clear information directly, Chinese officialdom discourse, on the contrary, is intended to give indirect, stereotyped, and vague information in order to evade the issue under discussion. As the information contained in the officialdom discourse cannot meet the communication expectation, it inevitably evokes the audience's reversion. Thus, the pragmatic vagueness in the officialdom discourse is worth studying to overcome and guard against such expressions.

It is true that the pragmatic vagueness prevails in the officer discourse, just as it abounds in daily communication. Channel says that the pragmatic vagueness is "part of our taken-for-granted world" and is generally unnoticeable unless it appears inappropriate. (Channel, 2000).

However, the pragmatic vagueness achieved in the officialdom discourse is often regarded as indefensible, for on formal official occasions where language proficiency and accuracy are highly desirable, the purposely-chosen officialdom discourse is condemned for its emptiness, evasiveness and stereotype. To a certain extent, these features are seemingly defensible in order to harmonize the atmosphere, save the officers' face and avoid direct conflicts and frictions between the officers and the general public. On the second thoughts, however, the officialdom discourse should be avoided or even

Therefore, an exploration into the pragmatic vagueness of Chinese officialdom discourse is imperative, for it provides a schematic perspective in terms of pragmatic communication. A profound insight into Chinese officialdom discourse is, hopefully and possibly, an efficient and effective way to avoid and even eliminate it so as to avoid the use.

**1.1 Relevant research on Chinese officialdom discourse**

The Chinese officialdom discourse refers to the red-taped, stereotype language used by public officials or business representatives in news reports. As a special linguistic discourse, it is featured by its evasiveness, emptiness, stereotype, ambiguity, and high-blowing tone. For example, the news reporter in a newspaper is called the relevant staff members, and the real staff is named as a temporary worker.

The Chinese officialdom discourse belongs to the undesirable component of the Chinese official discourse. As put forward by George Orwell in his famous essay "Politics and the English Language" in 1946, the officialdom language used in politics is the "decline of a language", "decay of language" and "debasement of language", used as "the defense of the indefensible." The Australian scholar Don Weston, in his famous paper *Death Sentence: the Decay of Public Language* in 2011, describes the officialdom language in Australian English. He mentions that compared with the time described by George Orwell over 60 years ago, the current business organizations, public departments and newly-emerging media are still responding to the public in stereotyped, lifeless and insensible language use.

In China, some scholars describe the Chinese officialdom discourse as the linguistic corruption. For example, Professor Zhang Weiyong from Beijing University points out in 2012 that the Chinese officialdom discourse is becoming severe with the problem of the social corruption. Professor Ding Lifu also expounds on the corrupted officialdom discourse from its source, essence and prevention in 2012.

However, up to now, there is little literature on the study of the pragmatic use and pragmatic vagueness of the Chinese officialdom discourse. Thus, it is of some significance to conduct such a research in order to understand the Chinese officialdom language better so as to prevent or even eliminate it.

**1.2 Relevant research on pragmatic vagueness**

According to Verschueren, the use of language must comprise a continual procedure of intentional and unintentional language choices out of both linguistic or non-linguistic factors. (Verschueren, 1999) In a communication, both the speaker and the hearer are frequently making adaptive choices in order to reach their communication goals. According to Verschueren, humans make linguistic choices because of the three linguistic properties: variability, negotiability and adaptability, which guarantee the inseparable and dynamic language choice in people's communication. (Verschueren, 1999)

Variability, the spectrum of probabilities of language choices, clarifies the abundance and indeterminacy of the language use. The choice, as regards both linguistic forms and communicative strategies, is always dynamic in constant change.

Negotiability, the flexible communicative principles and strategies rather than the rigid or mechanic language rules, demonstrates the flexibility of speakers' continuous linguistic choices.

Adaptability, people's deliberate language choices among many possibilities for a satisfactory communication need, reveals people's motivation of linguistic choices. In the choice-making process, linguistic variability provides the possibility; negotiability provides the options, while adaptability allows language users to choose flexibly from all possibilities. Thus, the study of language adaptability must take into account social, cultural and cognitive factors. In order to illustrate his point, Verschueren has presented a sketchy summary of contextual correlates in the form of the following figure.

**Figure 1 Contextual Correlates of Adaptability**

Verschueren's three properties, fundamentally inseparable and interrelated, successfully explain the dynamic process of language user's choice making in communication. With the chosen data from news report, a one-way language choice rather than a two-way negotiation among writers and audience, the thesis is to focus on variability of Chinese officialdom discourse.

## 2 Methodology of the Study

A qualitative-descriptive approach is adapted to analyze the pragmatic vagueness in Chinese officialdom discourse. All the examples of the Chinese officialdom discourse in the thesis are selected from the news reports in the mainstream Chinese media from 2010 to 2017. In addition, the data collected for the Chinese officialdom discourse should be discriminated from the desirable Chinese official discourse.

To put it in detail, the news reports are selected based on two criteria. Firstly, the news reports touch various fields and heated issues of the Chinese society, especially the concerns and complaints of the general public and the corresponding response from the officers in the related administration branches or business organizations. Secondly, most news reports are taken from good-reputed portal websites and newspaper to ensure their authentic source in order to ensure the timeliness of the analysis, though the overall data cover almost 10 years. Furthermore, considering the general motivation for officials to use the officialdom discourse, the contents of most selected examples fall naturally to the range that covers the response or feedback of the related parties to an exposed problem or issue.

As to the selected linguistic data, the thesis applies Verschueren's Linguistic Adaptation Theory to conduct qualitative and descriptive analyses. Namely, the pragmatic vagueness of the selected samples of the Chinese officialdom discourse is studied from variability perspectives.

## 3 Variability of Pragmatic Vagueness in Chinese Officialdom Discourse

Enlightened by the Linguistic Adaptation Theory, this chapter will make a detailed analysis of the variability of the pragmatic vagueness in the Chinese officialdom discourse. To be specific, the chapter will explore the realization devices of the pragmatic vagueness at different linguistic levels.

### 3.1 Linguistic realization at lexical level

In Verschueren's view, three linguistic properties, i.e. variability, negotiability, and adaptability, determines speakers' continuous choices in language use. Among the three properties, variability defines the possibilities of language choices. Thus, it is necessary to analyze the variability of the pragmatic vagueness and its realization devices from the two levels: lexical and syntactic.

The wide use of vague words is one of the commonest ways for news spokesmen or officers to express vagueness in their language. In order to avoid touchy topics and direct answers, the officer deliberately uses some semantic vague words, namely vague words in scope to achieve the pragmatic vagueness at the lexical level.

The vague words in scope, namely, the abstract or vague words in the semantic scope, are chosen to satisfy the communicative needs in the Chinese official situations. However, the abstract and vague expressions, with some general but empty comments on the issue in question, can hardly convey any substantial meaning. These vague words in scope can be further categorized as referential vagueness and quantity vagueness.

#### 3.1.1 Referential vagueness

In a news report, the officer who does not want to specify a thing or a person usually employs lexical means, such as plural forms, abstract reference and arbitrary reference, thus giving a vague and abstract utterance without any specific reference.

##### Example 1

Many foreign brands are synonymous with 'high quality' in the minds of many people. In recent years, some big domestic and foreign brands have emerged frequently in the market. From cosmetics, milk powder to leather shoes and clothing, from mobile phones and digital cameras to computers and automobiles, the involved internationally renowned companies are far beyond the imagination of consumers.<sup>106</sup>

Example 1 is a typical example for the use of plural words which are used tactfully to realize the pragmatic vagueness. However, in the above-cited Chinese officialdom discourses, a superordinate in the plural form is deliberately chosen when its hyponyms are available. Hence, a specific mention of the

---

<sup>106</sup> Where the URL is <http://mt.sohu.com/20150422/n411705171.shtml>

specific time, companies or brands is avoided. Naturally, these vague expressions cannot satisfy readers' expectation. The readers are expected to know what companies are violating the basic labor laws and the customers' trust in the famous brand. However, Chinese officialdom discourse keeps the readers in darkness and maintains the positive image of those negative companies. In the way, the readers cannot stop their speculations that those specifically identified companies are the corporations without backdoors or powerful pulls or tactful public strategies, while a vague mention is protected. In the long run, the whole news media will lose the trust from the public. Considering the long-term potential harm, the referential vagueness of Chinese officialdom discourse in the news reports should be avoided to the greatest extent.

### 3.1.2 Quantity vagueness

The quantity vagueness, another kind of vagueness in scope, refers to a speaker's intentional use of vague quantifiers to allow certain approximation. The typical approximated reference includes "about", "some", "a little bit", "possible", "certain" etc. Admittedly, non-motivated quantity vagueness is common owing to a speaker's lack of exact or adequate information. However, in Chinese officialdom discourse, the officer will deliberately withhold certain information by using these approximates. While it is a useful strategy to avoid absolute or false statements, the quantity vagueness, in most cases in Chinese officialdom discourse, is a means to conserving or hiding the information concerned.

#### Example 2

Food safety issues has always been concerned by the people and the government departments also have attached great importance. Relevant departments claimed that they have checked the source of chicken and duck meat sold in the market at regular intervals and no unqualified frozen chicken or duck has been found in the market apart from some details. Coincidentally, regarding the report on the safety of the community swimming pool, the relevant departments responded that they would conduct inspections non-scheduled and would require rectification once they find any problems.<sup>107</sup>

The cited report, by using such vague quantifiers as "at regular intervals", "some", "it is not temporary...", "non-scheduled", answers everything but nothing at all. What the readers are really concerned with, such as the food safety examination, the legal operation of the food stands, the dangers of the reported food, is not mentioned at all. Furthermore, no specific measures are taken about how to guarantee or ensure the safety and avoid the danger. These empty words can merely lead to readers' negative impression. Similar approximators include "it is not temporarily found that...", "it is being investigated that...", "it will be handled as soon as possible", etc. The frequent use of these words can hardly be defended.

The use of the pragmatic vagueness in Chinese officialdom discourse is different from the other use of quantifier vagueness. For example, some expressions such as "within the capacity", "some", and "certain" are used to allow flexibility and scope. However, concerning the problems of the food safety or the life security in the swimming pools, the use of such vagueness can merely leave the impression that the officers are avoiding their duty. Such a use of vague expressions about quantity reflects that the officers concerned are not treating the events seriously, but are perfunctory in performing their duty. Obviously, the vagueness in concerned Chinese officialdom discourse will ruin the image of public servants in the long run.

## 3.2 Linguistic realization at syntactic level

Besides the lexical vagueness, the pragmatic vagueness of Chinese officialdom discourse can also be obtained at the syntactical level.

### 3.2.1 Pragmatic vagueness realized by moderating tone

The pragmatic vagueness can be realized by directly or indirectly moderating the officers' tones. This is most commonly used when the officers intend to mitigate the severity of the events.

---

<sup>107</sup> Where the URL is <http://news.hexun.com/2016-07-22/185099254.html>

Example 3

The Zhongmu County Committee issued an official statement saying: "A preliminary investigation revealed that this was an accident that occurred during the construction of Henan Hongyi Agricultural Technology Co., Ltd.<sup>108</sup>

The above example is a typical direct moderation of the event. In the coercing process of pulling down the residential buildings, the real estate developer, driving bulldozers directly into the peasants' land, assumed two deaths. While the police arrested the suspects for murder and slaughter, the news report declared the event as an accident. This deliberate tone-easing are hiding the truth by the tactful use of directly moderate vagueness. On the one hand, it seems that the remarks mitigate the events and avoid further tension; on the other hand, however, the typical Chinese officialdom vagueness is harmful to the social fairness by giving a prejudiced, moderated description and declaration of the events.

### 3.2.2 Pragmatic vagueness realized by shifting focus

The pragmatic vagueness can be realized by shifting the focus. Namely, the officer will deliberate shift the focus to others in order to avoid tough and sensitive questions and shuffle the responsibility.

Example 4

Director Xie said: We must focus on positive publicity. The people's difficulties will not be solved even if you come over with cameras. Not only the Zhenjiang City Housing Authority, but the whole country may do wrong things and commit mistakes.<sup>109</sup>

In Example 4, the official, unaware of the presence of the journalist' hidden camera, insisted repeatedly in his declaration that the negative report should be avoided while the positive report should be persisted. His utterances are typical of the focus shift. Namely, instead of admitting the mistakes in his own work, the officer simply attempted to shuffle the responsibilities by shifting the focus from his department to the others, from the problems to the so-called positive side. The journalist of this report further revealed that this official continuously kept warning the journalist that if the negative report were given, she should shoulder the responsibility of causing social instability. This stereotype vagueness in the Chinese officialdom discourse, common but inexcusable, should be further revealed.

In sum, the linguistic realization of the pragmatic vagueness in the Chinese officialdom discourse is explored at the two levels: the lexical level and the syntactic level. At the lexical level, the vague words in scope are illustrated in terms of referential vagueness. Furthermore, the vagueness at the syntactic level is mainly demonstrated with the Chinese officialdom discourse in news reports, during the process of which the vagueness is realized by moderating the tone, shifting the focus.

## 4 Conclusion

The pragmatic vagueness refers to the phenomenon that a speaker, in the specific context, may deliberately use the indeterminate, implicit or indirect utterances to express multiple illocutionary acts or forces. (Yu Dongming, 1993) As an inherent trait of language, vagueness has always been a heated topic that attracts the attention of scholars in the various fields. Much progress has been made. However, relatively limited work has been done in the interrelationship between the pragmatic vagueness and Chinese officialdom discourse, especially from the view of Verschueren's Linguistic Adaptation Theory.

Therefore, based on the framework of the Linguistic Adaptation Theory, this thesis is an attempt to analyze the pragmatic vagueness in the officialdom language.

The thesis studies the variability of the pragmatic vagueness in the Chinese officialdom discourse

<sup>108</sup> Where the URL is <http://news.sina.com.cn/c/2013-03-28/185426671604.shtml>

<sup>109</sup> Where the URL is [http://zzwb.zynews.cn/html/2010-01/21/content\\_154197.htm](http://zzwb.zynews.cn/html/2010-01/21/content_154197.htm)

Proceedings of the 16th International Conference on Innovation & Management - 1797 -  
from the lexical and syntactic levels. The basic approaches include referential vagueness and quantity vagueness. Furthermore, the declarative sentences are used to achieve the pragmatic vagueness at the syntactic level. The officers usually intentionally declare vague statements by moderating the tone, by shifting the focus.

The systematic study of the pragmatic vagueness of the Chinese officialdom language provides a brand-new perspective, and helps people have a clear understanding of it, recognize its harm to the society and reduce or eliminate the Chinese officialdom discourse.

In addition, such a tentative analysis would shed some light on the development of the communicative skills and the language learning and teaching. Since the study is only an initial attempt of the author, there must be some problems to be solved and much room for improvement. Firstly, the present thesis mainly focuses on the pragmatic vagueness of the Chinese officialdom discourse chosen from the mainstream Chinese news media. Thus, a quantitative study of the raw data is desired. Besides, this thesis makes a pragmatic analysis of the pragmatic vagueness in the Chinese officialdom discourse under the framework of Verschueren's Adaptation Theory. Other famous pragmatic theories, such as the Cooperative Principle, the Politeness Principle and the Relevance Theory, are not taken into consideration. So, the author will try to continue this study and make it more complete in the future.

1 The United Front Work Department of Wuhan University of Technology. Wuhan, P.R. China, 430070

2 Hubei University of Education. Wuhan, P.R. China, 430205

(E-mail: 26879451@qq.com, lingda\_zi@126.com)

**Abstract:** This article collects a large amount of datum through field interviews with J community and Z community in H district of W city. Technical methods of grounded theory are applied to processing the data by opening coding, axial coding, and selective coding with the result of 76 initial concepts, 22 subcategories and 7 main categories of the urban community residents satisfaction of public space, by refining the influence factors of residents satisfaction including community public space, community and residents behavior, and constructing the "space-community-behavior" model of Influencing factors of residents satisfaction on the urban community public space. Meanwhile, on the basis of the "space-community-behavior" story line way, we analyze the paths of different factors on the residents' satisfaction in urban community public space, and put forward suggestions on promoting residents' satisfaction from framework system, community relations and the basic rules of the community public space.

**Key words:** Community; Public space; Residents satisfaction; "Space-Community-Behavior" model

### **1 Introduction**

To strengthen and innovate social governance, it is proposed in the report of the 19<sup>th</sup> National Congress of the People's Republic of China that social governance patterns shall be created for common construction, governing and sharing. Besides, it is pointed out in the report that communities are focuses of social governance. However, with the rapid development of market economy and fast advancement of urbanization, fundamental changes have occurred to urban community life, and disintegration of unit systems brings about value deconstruction of communities in original units (Zhao Xin, Fan Bin, 2014). Thus, "place-based communities based on acquaintance societies turn into communities of strangers" (Xin Fangkun, 2018). Communities have become increasingly more mobile and heterogeneous. Common community governance dilemmas (Shu Xiaohu, 2017) highlight problems and difficulties of community governance.

Community public spaces, as the most important subjects for undertaking functions of public spaces in original units and actual fields for social mobilization (Zhao Xin, Fan Bin, 2014), are important for enhancing interactions between community residents to reduce mobility and relieve heterogeneity, in order to promote community governance. Community public spaces, as "containers for community residents' lives" (Gao Wanhui, 2016), have different people assembled in some interactions, and

Proceedings of the 16th International Conference on Innovation & Management - 1799 -  
“create infinite possibilities for people to develop social relationships and reshape personal identities beyond original individual identities developed based on common intimate relationships” (Xu Kai, Klaus KlausSemsroth, 2013). These spaces can be used as media for reciprocal interactions among diverse subjects such as grassroots governments, social organizations, community elites and community residents; they reconstruct governance relationships in optimizing public services, resolving community conflicts and cultivating public spirit (Xin Fangkun, 2018). They are favorable for promoting formation of social governance patterns for common construction, governing and sharing. It is helpful for optimizing construction of community public spaces and promoting the formation of new governance patterns by studying residents’ satisfaction with the spaces.

## 2 Literature Review

Public space emerged in 1950s as a specific noun (Chen Zhu, Ye Min, 2009), and people like Arendt are representatives studying public spaces. Hannah Arendt (Hannah Arendt,1958) demonstrated that actions were basic material conditions for people to enter public spheres by classifying people’s fundamental activities into labor, work and action. Besides, she analyzed publicity of public spheres, namely extensive publicity and equality. Habermas reckoned public spheres as tools for him to criticize the society (Chen Qinfen, 2009). The core thoughts include openness, publicity and rationality of public powers as well as bourgeois’ ideals and goals in public spheres (Chen Qinfen, 2009). Jan Gehl (Jan Gehl,2002) categorized human activities into necessary, spontaneous and social activities based on the relationships between outdoor activities and physical environment of public spaces, thus clarifying the impacts of the physical environment upon intensity of social interactions. Jacobs (Jacobs,1961) profoundly criticized harms of functional regionalism, considered that the essence for facilitating public intercourses was to build mutual trust and a social monitoring mechanism, and put forward ways for promoting public intercourses in urban public spaces. Dai Yifeng (Dai Yifeng,2011) deemed that “public spheres, which corresponded to private spheres, were physical spaces owned by the public and equally made open to all people of the society”; Bai Jing et(Bai Jing et,2007) all considered that public spaces were crucial carriers of urban ecology and urban life. They exhibited distinct social and spatial patterns and features (Yang Zhen, Xu Miao, 2008). Qin Hongling (Qin Hongling,2008) thought that the value of public spaces was reflected from how to realize the objective of promoting human development, while their humanistic features were mainly manifested from individuality, diversity, humanistic care, sense of place, pleasantness of space scale and easiness for intercourse. In addition, they regarded sense of security, sense of sphere, sense of belonging, sense of identity, and sense of participation as people-oriented value pursuits (Yu Qing, 2006).

Community public spaces refer to internal public spaces of communities. Social cultures and relationships included in these spaces are important aspects for studying these spaces. Yuan Ye (Yuan Ye,2012) paid attention to roles of community public spaces in enhancing residents’ communications and sense of belonging, investigating how to serve residents with the spaces and create favorable community atmosphere. Liu Zhongqi (Liu Zhongqi,2012) considered that community public spaces, to certain extent, played positive roles in facilitating residents’ communications and participating in community affairs, and was of positive significance for fostering residents’ sense of belonging. Shu Xiaohu (Shu Xiaohu,2017) reported that connotations of community public spaces could be analyzed based on three ideas as follows: firstly, community public spaces were physical public spaces which worked as functional vectors; secondly, they were public social and political spaces which functioned

Proceedings of the 16th International Conference on Innovation & Management - 1800 -  
as civil societies; thirdly, they were public spaces which functioned as public spheres, where material and interpersonal interactions exist. Zhang Yong (Zhang Yong, 2017) thought that functional “publicity” and spatial “openness” were major attributes of community public spaces, among which “openness” implied that the spaces were open to all people within certain range, while “publicity” meant that the spaces were critical for residents’ cultivation and development of publicity.

Satisfaction is a measure for weighing degree of satisfaction. In current studies about community public spaces, little attention has been paid to the degree of community residents’ satisfaction with measures of services and spirit of the spaces. Besides, satisfaction surveys on public spaces have mostly focused on urban public spaces as well as their planning, design and construction. Nevertheless, few studies have been conducted to explore community public spaces and pay attention to residents’ satisfaction perceived by “users”. Therefore, this paper based on the “users” perception impacting the satisfaction, studies residents’ satisfaction in community public space by field interviews and ground theory analysis so as to find out what and how impact the satisfaction and bring forth suggestions.

### **3 Coding Process and Research Findings**

#### **3.1 Research Methods and Data Sources**

Grounded theory is a qualitative analysis method frequently used in social sciences. In essence, it looks for useful information among numerous first-hand materials or raw materials and then codes them. Coding has three stages, namely open coding, axial coding and core coding. In this paper, field surveys were performed on communities J and Z in District H, City W, Hubei Province. Field interviews were conducted in the sampled communities from 1<sup>st</sup> July to 1<sup>st</sup> September 2017 and 2018 respectively to solicit community residents’ opinions on factors impacting satisfaction with community public spaces. 39 respondents were sampled from the field surveys for in-depth interview. They included 16 males and 23 females, among whom there were over 4 respondents above 60 and 9 respondents who weren’t younger than 40; their average age was 45.3; about 30% interviewees held junior college diplomas and higher degrees. After the interviews, all interview materials were promptly sorted out and saved as data subsources of this paper.

#### **3.2 Coding Process**

##### **3.2.1 Open Coding**

During open coding, main research tasks are defining, summarizing and naming phenomena. Definition refers to that primary records of interviews are scrambled and then extract the statement related to the study surmising refers to that analyzing extracted original statements and generalizing with phrases or short sentences as succinctly as possible. At last, their categories are extracted and named. In this paper, 39 interviewees’ raw interview materials were scrambled, sorted out and analyzed. Finally, 76 initial concepts and 22 categories were extracted, including management services, complaints, design, supporting facilities, road smoothness, passive participation, individual expectations, convenient accesses, entrance/exit setting, reduced use, situation about complaints, community impressions, emergency broadcast, building quality, fire fighting facilities, opinions/suggestions, spatial expectations, symbolic meanings, recommendations, visual aesthetics, trust and active participation. For information about extraction of initial concepts, refer to Table 1

**Table 1 Regarding Creation of Open Coding**

Category	Initial concept
Management service	Opinions on community management; (Public space) Poor design, no improvement in management; Later management services are not up to date; Hominization.
Complaint	Increasing property fees neither proceeds according to established procedures nor improves service quality accordingly; The quality of elevator is not good. It's useless to reflect with the estate management; Property management fees are the only consideration of estate management, but damaged walls are not repaired..
Design	The design of public space lays particular stress on aesthetics and less consideration on safety and practicality; (Public space) too scattered, making each place too small; Cars occupy the space, impeding the residents going out; Central Plaza is too small to move conveniently..
Supporting facilities	(Public space) Facilities should be complete, otherwise what does children play with? (Public space) More fitness facilities, less recreational facilities.
Road patency	(Public space) fire fighting facilities and passages make a sense of security; Neighbors hang clothes by rope in fire stairs, affecting fire drills; There's no sunrise in the corridor; Road design is unreasonable so that it can't get through to traffic in an emergency.
Passive participation	Lack of space suitable for young people, go less; The venue is too small to hold an event. I don't want to go; (Estate management) do not deal with the problems we reflect, so we are not in the mood to participate in the activities; The service level of the estate management.
Individual expectation	Not used to the small broadcasting in the community; I hope there will be a special space for our young people; I hope (public space) can push wheelchairs without steps, which is satisfactory; It's ok to have convenient and good hygiene conditions.
Convenient arrival	Location design should be convenient for old people's arrival; It's quite convenient for it to locate in the center of the community; The gates of the community are locked and not accessible.
Entrance and exit settings	The square in the district is flat and easy to get in and out; There's a water pool at the intersection of several roads, which is dangerous; The volume ratio is too high; There is only one entrance and exit for 300 families in our community, which is a hidden danger.
Reduced use	There are too many cars on the road, so there is less going out for a walk; The nearby square is too small for dancing.
Complaint status	It's no use complaining about these old and damaged facilities; Property complaints by residents are unresponsive or delayed.
Community impressions	Property management is not good, so people's impression of the community is not as good as before; The poor quality of elevators affects the overall impression of the community; There exists a gap between the ideal and the reality.
Emergency	I hope there can be some sound reinforcement equipment in the corridor, which will be

broadcast	more useful in emergencies; It is more convenient to broadcast emergency notification in residential area.
Building quality	The elevator shaft was soaked in the rainstorm and the quality is not good; The poor quality of supporting facilities affects the overall quality.
Fire protection facilities	Community (public space) should have fire fighting facilities and access, so it has a sense of security; There must be fire hydrant in the high-rise elevator building; Emergency exits are often locked, causing hidden dangers in fire fighting.
Suggestions	The hidden safety hazard was solved after the reflection; This problem has been reflected many times to the estate management but the property said they were not good at it; Most of the suggestions for property reflection are not responded.
Space expectation	Lack of rest facilities causes disappointment; Don't be too demanding; There is a gap between the advisement before buying a house and the reality after buying a house.
Symbolic meaning	The center plaza is good for us to assemble and it has become the landmark building here.
Recommend	Free clinic, repairing small household appliances, enjoy the cool party and other activities are very good; I feel good about the whole community. I'd like to recommend it; I was recommended to buy a house here.
Visual beauty	Hope the community will be more beautiful; The trees are growing up now, and they look better.
Trust	Property is now being improved; Reflected problems are solved preliminarily and trust is limited; we are confident of the re-election of the industry committee organized by the community.
Active participation	Love to participate in activities organized by the community, because of the lively atmosphere; Buildings housekeeper's service attitude is OK. I will participate in community activities when time is available.

### 3.2.2 Axial Coding

Axial coding is a coding process for core categories. It distinguishes intrinsic connections among categories forming at the preceding coding stage, and has all categories associated and summarizes core categories after raw materials are analyzed. At this stage, this paper discriminates internal connections among 22 subcategories during open coding. At last, seven core categories are identified, including spatial quality, safety, accessibility, residents' expectations, residents' complaints, community trust and community image, as shown in Table 2.

**Table 2 Axial Coding Processes**

<i>Principal category</i>	Subcategory	The Specific Meaning of Category
Spatial quality	Design	Planning of the Geographical Location, Size and Function of space
	Supporting facilities	Equipment required for corresponding functions in space

	Building quality	Quality of buildings and related facilities
	Management and Service	Management and maintenance of community public space and its facilities
Safety	Road patency	Reasonable Road Design and Barrier-free
	Entrance and exit settings	Enough number of entrances and exits will not cause congestion and other phenomena
	Fire protection facilities	Free roads, fire hydrants, etc.
	Emergency broadcast	Amplifiers in the community
Accessibility	Entity reachability	Distance and difficulty of reaching community public space
	Visual accessibility	Whether to give visual beauty enjoyment
	Symbolic accessibility	Is it symbolic and attractive with a sense of space
Residents' expectation	Personalized expectation	Residents' individualized demand expectations for the use of community public space
	Overall expectation	Residents' overall expectations for the use of community public space
Residents complaint	Complaint	Express discontent by complaining to others or communities
	Passive participation	Expressing discontent by refusing to participate in community public space activities
	Reduce use	Expressing discontent by reducing the frequency of use of public space
Community trust	Trust	The trust degree of community to realize public space service
	Active participation	Degree of initiative to participate in community public activities
	Recommend	Recommend the community and its public services to others
Community image	Overall impression	Impression on the community public space management and services
	Complaint status	Openness of complaint channels for community public space
	Suggestions	Whether the community responds to the residents' suggestions and opinions, and whether it is timely

### 3.2.3 Selective Coding

Selective coding clarifies connections among core categories. In the process of selective coding, core categories are analyzed in details in order to elaborate their relationships clearly. Specifically, the contributing factors are “space dimension”, “community dimension” and “dimension of residents’ behaviors”. Table 3 shows the typical relationships.

**Table 3 Relational Structure of Main Categories**

Influencing factors dimension	Typical Relational Structure	The Connotation of Relational Structure
Dimension of Public Space	Spatial Quality Affects Resident Satisfaction	Resident satisfaction will be affected by spatial quality
	Spatial Safety Affects Resident Satisfaction	Resident satisfaction will be affected by the security of public space
	Spatial Accessibility Affects Resident Satisfaction	Resident satisfaction will be affected by accessibility of public space
Dimension of Community	Community Trust Affects Resident Satisfaction	The degree of trust in community will affect residents' satisfaction
	Community Image Affects Resident Satisfaction	Cognition of Community Image Affects Resident Satisfaction
Dimension of	Residents' expectations affect residents' satisfaction	Residents' satisfaction will be affected by their expectations
	Residents' Complaints Affect Residents' Satisfaction	Residents' Satisfaction Degree Affected by Their Complaints to the Community

### 3.2.4 Modelling

According to the grounded theory based on typical relationships, residents' satisfaction with urban community public spaces is impacted as follows: Space dimension, as an objective factor, which affects residents' satisfaction directly; community dimension, impacted by space dimension owing to subjective cognitions like residents' trust, influences residents' behaviors as external objective environment of a community, thus impacting residents' satisfaction; residents' behaviors, affected by space and community dimensions, impact residents' satisfaction. Therefore, spaces, communities and behaviors are connected to build a related model for studying residents' satisfaction with community public spaces (Fig 3-1).

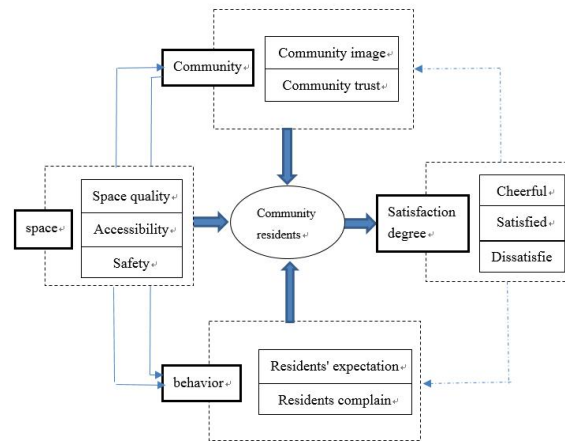

Figure 1 Factor Model on “Spaces-Communities-Behaviors”

### 3.3 Results

#### 3.3.1 Factors Impacting Residents’ Satisfaction with Urban Community Public Spaces and Impact Mechanisms

From the model on “spaces-communities-behaviors”, it is found that residents’ satisfaction with urban community public spaces is impacted by factors in three dimensions: the first is about space, including spatial quality, accessibility and safety, which as basic criteria for the state of community public space are the fundamental factor. the second is related to community, including community image and trust, which impact residents’ satisfaction with urban community public spaces by affecting their perception about communities as exogenous factors outside the spaces; the third is about residents’ behaviors, including residents’ expectations and complaints. These factors impose varying impacts upon residents’ satisfaction under different environment, and their impact mechanisms can be adjusted by changing related conditions, so they are also called regulatory factors.

From the perspective of space, three factors have direct and indirect impacts upon residents’ satisfaction. Concerning direct impacts, residents’ satisfaction is impacted by whether status quo of public spaces satisfies residents’ demands. As to indirect impacts, residents’ satisfaction is affected by spatial status from the perspective of communities and residents’ behaviors. Two factors about community also impact residents’ satisfaction directly and indirectly. In terms of direct impacts, residents’ perception about community image and their degree of trust impact their satisfaction with public spaces. As regards indirect impacts, those two factors affect residents’ behaviors, thereby impacting residents’ satisfaction. The two factors about residents’ behaviors directly impact residents’ satisfaction. Residents’ satisfaction with community public spaces is affected by their expectations and responsiveness to community complaints.

#### 3.3.2 Suggestions for Improving Residents’ Satisfaction with Community Public Spaces

Factors impacting residents’ satisfaction with community public spaces are systematically summarized based on the factor model on “spaces-communities-behaviors”. In this paper, suggestions are put forward with respect to how to improve residents’ satisfaction with community public spaces.

(1) Build a basic architecture of community public space for satisfying residents’ demands from the perspective of space. The key for building a complete basic architecture of community public space

Proceedings of the 16th International Conference on Innovation & Management - 1806 -

is to satisfy residents' demands. First of all, it is necessary to make planning/designs for community public spaces more scientific, attach importance to generally know about spatial layout, intensively study/understand space scale and corresponding systems, improve spatial functions, manifest spatial cultures, make the spaces convenient in terms of scale, endow the spaces with unique features and foster a sense of occasion, in order to increase accessibility of community public spaces from the perspective of their physical, visual and symbolic meanings. Secondly, efforts shall be made to improve intactness of facilities inside community public spaces and solve problems about current public facilities (including incomplete variety, shortage of quantities, oldness, worn-out, slow updates and incomplete functions). Thirdly, construction quality of public spaces shall be improved. The construction shall be performed in strict compliance with related national laws, rules and regulations as well as particular operating procedures. Meanwhile, rigorous requirements shall be identified for people, materials, construction standards and methods from the perspective of safety consciousness and quality consciousness.

(2) Formulate basic rules on community public spaces as behavioral restraints from the perspective of communities. Formulate basic community rules on the premise of improving community image to guarantee the enhancing community trust: Firstly, people should strive to develop community residents-oriented serving concept to improve service attitudes, optimize service performances and community image; Secondly, it is necessary to foster basic values of fairness and equality in communities to maintain good community trust among residents; Thirdly, Given that it rules on utilization of community public spaces shall be formulated through negotiation based on existing supply capacity of the spaces and in line with general community demands to further standardize community residents' behaviors in order to prevent accumulation and aggravation of internal community conflicts and guide individuals and enable them to reach a consensus on the use of community public spaces, for the final purpose of improving residents' overall satisfaction.

(3) Develop community relations in community public spaces from the perspective of residents' behaviors mainly by communication and consultation. Build favorable community relationships, which mainly cover following aspects: Firstly, residents' suggestions, opinions and complaints should be responded correctly. It is critical for the community to build sound community relationships whether a community appropriately treats its residents' suggestions, opinions and even complaints. Secondly, communication mechanisms and negotiation platform, such as residents' councils and consultative conferences, should be built so as to create necessary conditions and likelihoods for building sound community relations. Meanwhile, actively regulating community residents' psychological expectations about public spaces is one of effective ways for facilitating sound community relations and improving community residents' satisfaction, because of "meanings of appropriateness, comfort, satisfaction and efficiency will change with expectations" (Kevin Lynch,1960). People's expectations and environment jointly impact cognitive objects.

#### **4 Conclusion**

Kevin Lynch, an urban designer, reports that cognition about environment is people's common experience under environment; instead, it is not merely fostered based on researchers' and professionals' subjective aesthetics. Satisfaction is a measure for comparing performances of and expectations about used or experienced products or services based on the cognition, on the premise that differences exist between cognized actual and expected service management. In this paper, field interviews were performed on community residents based on such commonness and specific differences to know about what community residents are really thinking. In addition, the author pondered upon factors impacting residents' satisfaction with urban community public spaces and impact mechanisms in accordance with grounded theory. Thus, this paper built a factor model on

Proceedings of the 16th International Conference on Innovation & Management - 1807 -  
"spaces-communities-behaviors" and clarified the factors influencing residents' satisfaction with urban  
community public spaces. It also explored basic architectures, community relations and basic rules of  
urban community public spaces, thereby bringing forth pertinent countermeasures and suggestions.

## **On the Innovative Application of Micro-Media in Ideological and Political Education in Colleges and Universities in the New Era**

Lin Kai

School of Law, Humanities and Sociology,

Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 601428805@qq.com)

**Abstract:** By using the methods of literature research, qualitative analysis and interdisciplinary research, this paper puts forward that with the rapid development of information technology, micro-era has come, and various kinds of micro-media have emerged. It is believed that the prominent characteristics of micro-media have brought great changes to information dissemination, as well as opportunities and challenges to ideological and political education in the new era. This paper constructs innovative ideas of Ideological and political education in Colleges and universities in the new era based on micro-media. It is concluded that we should focus on the fundamental task of cultivating people by virtue, combine the characteristics and law of the micro-era, strengthen the innovation of Ideological and political education in Colleges and universities, and constantly explore new ways of Ideological and political education in Colleges and universities in the new era.

**Key words:** Micro-media; Colleges and universities; Ideological and political education; Innovation

### **1 Introduction**

General Secretary Xi Jinping emphasized at the National Conference on Ideological and Political Work in Colleges and Universities: "We should make use of new media and new technology to make the work alive, promote high degree of integration of traditional advantages of Ideological and political work with information technology, and enhance its sense of the times and attractiveness." (Xi Jinping, 2016). This provides basic guidance for ideological and political education in colleges and universities to grasp the characteristics of the development of the times and constantly innovate ways. In the whole social field, the "micro-era" based on micro-media has come. The earliest proposal of "Micro Age" is Luan Yimei's article "Value Discovery of New Media in Micro Age 2009". Luan Yimei believes that the new media in 2009 has opened three important times, one of which is the "micro" era, in addition to the 3G era, the new era of popularization and so on. The development of new media presents the characteristics of "micro-era". Both content production and consumption show the characteristics of "micro-era" (Luan Yimei, 2009). On how to correctly understand the opportunities that micro-media faces in the ideological and political education of college students in the micro-era, An Shuyi analysis is as follows: the ideological and political education of college students expands in time and space, improves in timeliness, updates in form and enriches in content; At the same time, "micro-era" also poses challenges to the implementation platform, management threshold, traditional education mode, education environment and the quality of educators of ideological and political education for college students (An Shuyi, 2015). Wang Qian research on the carrier of Ideological and political education in Colleges and universities in the micro-era, i.e. micro media, holds that for the emergence of the use of

Proceedings of the 16th International Conference on Innovation & Management - 1810 -

---

the network carrier, WeChat and Microblog, we should further strengthen the position of network education and improve the rapid intervention mechanism of network public opinion. Fully grasp the characteristics of the "micro-era" and occupy the main position of online education. As for the rise of Micro-public welfare, we should constantly enrich the forms of activities and pay attention to practical teaching, so as to improve the overall understanding of Ideological and political education (Wang Qian, 2012). There are no disciplines consistent with the "Ideological and Political Education" of China in foreign countries, and there is no special research on the micro-era, so there is no special research on Ideological and political education for College Students in micro-era. Research on the application of micro-media in foreign disciplines is mainly embodied in policy publicity, distance education, ideological education and other fields. We need to pay attention to the application of micro-media in government work and ideological propaganda abroad. Manuel Caster pointed out that the new media has become an effective means for individuals to participate in politics and promote democratic politics, and an important carrier for the government to accept public opinion supervision (Manuel Castells, 2000).

## **2 Main Characteristics of Micro-Media**

### **2.1 The dissemination of information is more efficient**

Characterized by "micro", mass media like Micro-blog, WeChat, Microfilm and so on, has gained a rapid development. (Chen Ting, 2016). Nowadays, there are more and more kinds of micro-media, such as WeChat, QQ, Microblog, micro-government, micro-film, micro-fiction and short video APP represented by Douyin, etc. At present, a remarkable feature of micro-media is that the mobile terminal is more popular than the PC terminal. Only a small number of words, pictures, videos, voice, etc. can be used to transmit information efficiently. People receiving information only need mobile or PC terminals connected to the Internet, which can effectively and timely obtain information.

### **2.2 Information content is more attractive**

The content of information disseminated by micro-media is short and abundant. In a very short time, people can learn as much information as they are interested in. For example, short videos usually only last for 15 seconds, but they deliver much more information than traditional news reports can deliver. Every frame of video can attract people's attention. More and more people are willing to receive information in this way.

### **2.3 Information dissemination is more interactive**

Micro-media breaks through the limitation of traditional media which is difficult to interact. People can transmit information and express their opinions through the platform of WeChat Moments, Microblog, Qzone and their own recording of short videos. When people accept the information transmitted by others, they can express their opinions by message, reply and compliment. People's sense of participation and interaction is stronger.

## **3 The New Situation of Ideological and Political Education in Colleges and Universities in the Micro-era**

Ideological and political education refers to social or social groups that exert purposeful, planned and organized influence on their members with certain ideological concepts, political views and moral norms, and urge them to accept such influence independently, thus forming social practice activities that conform to the ideological and moral qualities required by certain social classes (Chen Wanbai, Zhang

Proceedings of the 16th International Conference on Innovation & Management - 1811 - Yaochan, 2015). In the micro-era, it is more difficult for educators to control this process, which brings both opportunities and challenges. In order to have a more intuitive understanding about the new situation of Ideological and political education in Colleges and Universities in the micro-era, we took undergraduates in Wuhan University of Technology as respondents, conducted random surveys and interviews towards the influence micro media had on them.

### 3.1 Field investigation

500 students were randomly selected for surveys and interviews, among which there were 492 valid questionnaires accounted for 98.4%. Among the respondents, 72.39% were freshmen, who took the first place of the survey. 23.81% were sophomores, 2.83% were juniors and 0.97% were senior students. In terms of the sex ratio, boys accounted for 43.75% of the total, while girls accounted for 56.25%. The proportion of the two was relatively balanced. From the age point of view, all the students surveyed and interviewed were “post-95” college students. From the perspective of discipline attributes, the respondents were distributed in law, economics, management, engineering, art and other disciplines. Generally speaking, the sample of this survey was typical. The data of the survey is as follows:

**Table 1 The Impact of Micro-media on College Students**

Items	Strongly Agree (%)	Relatively Agree (%)	Agree (%)	Inconsistent (%)	Quite Inconsistent (%)
Have habits of constantly playing micro-media like WeChat, DouYin, etc.	232 (47.15)	116 (23.58)	103 (20.93)	29 (5.89)	12 (2.44)
Normal use in class, meeting and other collective activities	147 (29.88)	101 (20.53)	128 (26.02)	62 (12.60)	54 (10.98)
Using time often exceeds your expectations	114 (23.17)	128 (26.01)	85 (17.28)	105 (21.34)	60 (12.20)
Use micro-media as a way to relieve stress	137 (27.85)	109 (22.15)	102 (20.73)	89 (18.09)	55 (11.18)
Believing in that the amount of information in micro-media is greater than that in books.	92 (18.70)	103 (20.93)	107 (21.75)	114 (23.17)	76 (15.45)
Sometimes it's difficult for you to identify the accuracy and correctness of information	102 (20.73)	106 (21.54)	114 (23.17)	97 (19.72)	73 (14.84)

According to the investigation, we find out that college students have a high degree of attention to micro media, a high frequency of use, and diversified use categories. But they are easy to lose rational control of the use of time, resulting in a strong dependence, habits to obtain information from micro

Proceedings of the 16th International Conference on Innovation & Management - 1812 -  
media, and the lack of ability identifying information. There is a deficiency of positive direction in the use and attention towards micro media.

### **3.2 New situation of ideological and political education method in Micro-era**

Traditional ideological and political education generally concentrates on the same time and place, and carries out the same content of education. The educators are in an authoritative position among them. Traditional ideological and political education is the same model, that is, inculcation-style classroom education mode. It lacks pertinence, such as classroom teaching, seminars, reading newspapers, learning documents and other forms of education. Teachers spend a lot of energy and time preparing lessons. Students accept it passively (Wang Xiaoxue, 2016). The disadvantages of this way are more obvious in the micro-era. College students lack enthusiasm, participation and interaction in the process of education. Micro-media can provide a more equal, open, rich and interactive educational environment for ideological and political education. We can regard the educational environment with micro-era elements as the ideological and political education ecosystem in the micro-era. The innovation basis of the ideological and political education ecosystem in the micro-era is the educational platform, that is, micro-media. When ideological and political education in Colleges and universities correctly follows the operation law of the ideological and political education ecosystem in the micro-era, it will bring opportunities for ideological and political education, and more in line with the needs of the times.

### **3.3 New situation of ideological and political education content in Micro-era**

The traditional textbooks and learning contents of Ideological and political education in Colleges and universities are carefully screened by educational authorities, universities and educators. Their orientation and orientation can reassure educators and educates. However, the characteristics of the micro-era determine that the content of Ideological and political education of college students has a wider coverage and a larger amount of information, and that it is more difficult for the competent educational authorities, universities and educators to supervise the correctness of the content. Moreover, due to the increase of channels for college students to obtain information, there is no doubt that the supervision of information channels also poses difficulties for the educators. These also pose challenges to educators. In the process of contacting information, whether college students can distinguish the correctness of information, judge the accuracy of information, find wrong information and resist the induction of errors is also a common concern of teachers. While providing abundant resources and timely updating information, the openness of the network will also disseminate bad information, which will lead to the loss of value of College students. The virtual nature of the network affects the real interpersonal communication of College students, and leads to the lack of sincerity to others and themselves in the real communication, thus affecting the establishment and development of good interpersonal relationship between themselves and others (Rui Xianhong, 2016).

## **4 Innovative Application of Micro-media in Ideological and Political Education in Colleges and Universities**

### **4.1 Enhance the ability of the ideological and political education team in colleges and universities to use micro-media**

In the micro-era, the ideological and political education team in Colleges and universities must improve their abilities in order to meet the requirements of the new era and not be eliminated by the times. First of all, educators should strengthen their own education of ideals and beliefs, strengthen systematic theoretical learning, have correct outlook of world, life and values, be good at identifying wrong views in micro-media, and have a sense of responsibility to consciously maintain correct views. Educators should constantly improve their professional knowledge reserve and information quality,

Proceedings of the 16th International Conference on Innovation & Management - 1813 -  
possess more skilled information processing ability, actively participate in relevant learning and training, actively interact with students through micro-media, explore the "private customized" teaching mode in micro-media, accurately teach, and carry out ideological and political education with pertinence and creativity. It should be pointed out that young people are the main audiences in the micro-era, so we should constantly supplement the young blood of the ideological and political education team, let more aspiring and potential young people join the ideological and political education team. At the same time, we should give full play to the role of long-term struggle in the ideological and political education front workers, with management experience, teaching experience, coping with public opinion experience and so on. Promote the level of Ideological and political education.

#### **4.2 Strengthen the innovation of ideological and political education in colleges and universities based on Micro-media platform**

In the micro-era, the traditional ideological and political education methods such as inculcation can no longer be used solely, but should be innovated constantly. Educators should be guided by innovative ideas, keep pace with the development of the times, and view the positive role of micro-media in Ideological and political education with Internet thinking. We should attach importance to the construction of innovative platform for ideological and political education. In addition to using QQ and microblog as ideological and political education platform, we should further explore new ideological and political education platforms such as WeChat Moments and short video APP in the process of education. For example, we can combine the operation mode of MOOC to optimize online courses on a large scale. In order to transfer knowledge, broaden students' horizons and stimulate students' learning motivation, we mainly adopt "Mu class" and "micro class" together with "micro topic", "micro investigation", "micro teaching research" and "micro investigation" (Gao Di, 2015). Educators should make full use of the interactive characteristics of micro-media, strengthen interaction with college students, and let college students truly participate in the whole process of Ideological and political education. Through the equal relationship between educators and college students in the process of micro-media education, the effect of Ideological and political education can be fundamentally improved and the foundation consolidated.

#### **4.3 Improving the content of Ideological and political education in Colleges and Universities Based on micro-media platform**

The content of Ideological and political education in micro-era must be accurate. It should "enable students to understand the practical value of Sinicized Marxism, the wisdom power of Chinese excellent traditional culture and the significance of the times for the development of socialism with Chinese characteristics" (Gu Hailiang, 2017). First of all, educators should strengthen the selection of educational content to help students read the original works and learn the principles, so that ideological and political education can really return to the theoretical origin. Secondly, educators should ensure the attractiveness of the content of Ideological and political education. The important reason why micro-media can be quickly accepted by college students is the novelty of the content and the impact of the sense. Educators should really make the content of Ideological and political education resonate with college students through editing, beautifying and post-production. Finally, educators should ensure the minimality of educational content, take micro-media as a platform, educators should abide by the principle of "micro", strive to make the content brief and interesting, and truly make the ideological and political education work based on micro-media platform achieve remarkable results.

### **5 Conclusion**

The world has entered a micro era. Micro media brings us massive and timely information, broad and convenient platform. The world has become smaller, people's horizons have become wider, and the

Proceedings of the 16th International Conference on Innovation & Management - 1814 -  
micro era has brought people great changes in all aspects. At the same time, it also brings a lot of unknown and confusion to people. As the frontier group of receiving micro-media, college students are greatly influenced by micro-media. How to do ideological and political education in Colleges and universities well in the micro-era has become a realistic problem to be studied and solved urgently in front of every ideological and political educator. Further research needs to further increase case studies and integrate other innovative ways in the new era to deepen research on improving the effectiveness of ideological, formulating micro-media management system and comparing research at home and abroad.

# Research on the Status Quo and Influencing Factors of Art Education in Science and Engineering Universities in China

Li Fang

Committee of Communist Youth League, Wuhan University of Technology, Wuhan, P.R. China,  
430070

(E-mail: 258382815@qq.com)

**Abstract:** This paper collected and analyzed university students' evaluations on the status quo and effects of art education in science and engineering universities in China. The result shows that, in general, university students spoke highly of art education in universities while male students were less satisfied than their female peers. Students were less content with the form of art competitions; students did not think highly of the quantity of art activities, which indicates that improvements should be made in the concerning aspects. By using the regression analysis, this paper analyzed the factors influencing the effects of art education in science and engineering universities in China. Further analysis offered specific solutions by analyzing factors influencing the effects of art education. Based on analysis results, this paper proposed specific measures to improve the effects of art education in science and engineering universities in China.

**Key words:** Science and engineering universities; Art education; Art competition; Art activity

## 1 Introduction

Art is a unique way for humanity to understand and reflect the world through emotion and imagination. It is also an epitome of both real and spiritual world of human. Artistic quality is an indispensable and basic merit for modern generations, especially for innovative talents. With its enlightening and appealing characteristic, art education not only help students foster sound views on life, world and value, but also cultivate the ability of imaginal and logical thinking, which is conducive to reinforcing art education and comprehensive quality education at the same time. Carrying out art education activities is beneficial to students, and helps them develop in a balanced and healthy way. However, it is not rare to see that science and engineering universities in China lack clear understandings of artistic culture, the importance of art education and correct idea of education. As a result, science and engineering universities in China often meet with difficulties in various aspects, such as carrying out art activities and competitions, creating original artworks, placing sufficient attention on artistic activities, boasting established brands of art activities and promoting art competitions at different levels at the same time. Therefore, objectively evaluating and analyzing the status quo and influencing factors of art education in science and engineering universities in China can practically improve its effects in targeted universities.

## 2 Literature Review

### 2.1 Art education and social development

Foreign researchers enjoy a head start in studying art education. Richard (Richard,2007) considers talents as one of the 3T (technology, talent and tolerance) factors in innovation-driven economic development. Robert (Robert,2008) thinks that art can promote the advancement of science and provide scientists with a new way to explore the world, which compensated the traditional pure logical and analytical models among scientists. In China, JinYuanfu (Jin Yuanfu,2010) started relatively early carrying out researches on interaction between cultural creative industry and talents. He stressed that culture and arts not only advance the concerning industry, but strengthen the integration of artistic talents and cultural industry. Liu Juan (Liu Juan,2011) pointed out the key of creative talents education of artistic design based on creative industry: we must put emphasis on integrating the innovative quality education of students with trend of the times.

### 2.2 Art education and training of talents

American scholar Daniel (Daniel,2013) and other scholars argue that artists and scientist are alike, and they stress that due to the importance of art in understanding modern science, undergraduate education should be encouraged to combine art with science in education. In recent years, more and more Chinese scholars start to focus on the relations between art education and talents training. Ma Fengqin (Ma Fengqin,2013) argues that there is a gap between university talents supply and the demand of developing cultural industry in China, which calls for the integration of the resources of universities in China so as to build a multi-level training network that tailors to different talent demands of cultural industry. Zhang Yabin (Zhang Yabin,2014) finds out that art education plays a significant role in training scientific talents. Jia Tao (Jia Tao,2015) concludes that art education has three main functions--- liberal arts education, talent training and cultural inheritance, which makes it important in promoting the quality of students. Zheng Qinyan (Zheng Qinyan,2016) deems that by integrating art education with science education, students can effectively cultivate the imagery and abstract ability as well as the innovative thinking. Most studies concerning the status quo and effects of art education in Chinese universities are based on theoretical analysis. Few studies are built on empirical researches and even fewer cater for art education in science and engineering universities in China. Through the survey on university students, this paper analyzed the status quo and problems of art education in science and engineering universities in China and proposed suggestions so as to give the full play of the art education, hence the artistic accomplishment of students in Chinese universities are improved.

### 3 Research Design

#### 3.1 Questionnaire design

This paper adopted the method of questionnaire to collect and analyze the data, presenting the overall evaluation on university students of the status quo and effects of art education in universities; difference analysis was conducted on the evaluation of art education based on genders, majors and schools; the status quo of university art education in China was concluded and influencing factors were analyzed. The questionnaire consists of three parts: 1) evaluation of university art competitions in terms of the content, instructor team, publicity and form; 2) evaluation of university art activities in terms of the theme, form, publicity, content and quantity; 3) evaluation of the effects of university art education from two perspectives, including its role in promoting artistic quality of students and building artistic atmosphere on campus. All single-choice questions were rated by 5-point Likert scale and each indicator was divided into 5 scales (Gurnon,2013). Non-art majored students of one science and engineering university in Hubei province have been chosen to be the objects for the study. 330 questionnaires were distributed with the valid callback rate of 87.27%. 288 students participated the survey, in which 47.92% were males and 52.08% were females; freshmen accounted for 15.63%, sophomores 44.79%, juniors 22.92%, seniors 8.33%, and postgraduates 8.33%. Sample distribution is as shown in the Figure 1.

Figure 1 Sample Distribution

Sampling students from multiple levels ensured the representativeness of the results, showcasing a relatively comprehensive picture of the status quo and effects of art education of science and engineering universities in China.

### 3.2 Reliability and validity test

In order to ensure the credibility of the conclusion, the reliability and validity of the returned questionnaires need to be tested. Reliability indicates the consistency of the questionnaire (Meredith, 2014). The most used internal reliability coefficient is Cronbach  $\alpha$ , the indicator of the internal reliability of the questionnaire. The higher the coefficient is, the more consistent the measures in the questionnaire are. The formula is:

$$\alpha = \frac{K}{K - 1} \left( 1 - \frac{\sum_{i=1}^K \sigma_{Y_i}^2}{\sigma_X^2} \right)$$

Validity, namely the effectiveness, refers to how well an instrument as measures what it is intended to measure. This paper used KMO test to measure the questionnaire. Through factor analysis, it measured how suitable the questionnaire was for the hypothesis model came up by the researcher when designing it. The formula is:

$$KMO = \frac{\sum_{i=j} r_{ij}^2}{\sum_{i=j} r_{ij}^2 + \sum_{i=j} p_{ij}^2}$$

The Cronbach  $\alpha$  of the questionnaire was 0.732, indicating a high reliability. KMO was 0.873, suggesting that the validity is valid.

## 4 Empirical Analysis

### 4.1 Difference analysis

This survey designed a questionnaire with 14 questions to collect data and then analyzed the overall evaluation of all participants and evaluations of male university students and their female counterparts of art education. Then, the evaluations of male and female students were tested by T-test to show if any significant differences existed. The results are as follows:

**Table 1 Analysis of Questionnaire Results**

Objects	Assumed	Overall	Male	Female	T-test	
			university	university		
Measures	Average	Average	Average	Average	Significance	
		score	score	score		
Overall evaluation	39	41.704	40.421	42.767	0.077	
Art	Content	3	3.128	2.984	3.291	0.040
competitions	Instructor team	3	3.111	2.891	3.327	0.008

	Art performance	3	3.198	3.063	3.333	0.867
	Artistic atmosphere	3	2.969	2.813	3.125	0.137
	Interest in art	3	3.833	3.896	3.771	0.077

Compared with the assumed average score, the overall average score is higher, which suggests that university students speak highly of art education in general and the overall evaluation is above the average. To be more specific, the average scores of the form of art competitions, the quantity of art activities and the artistic atmosphere are lower than the assumed average scores (3 points), indicating that students are less satisfied with the three aspects.

From the perspective of gender differences, the results of T-test show that, under the confident level of 10%, the evaluation of art education between male and female students varies significantly, in which female students are generally more content with art education than male students. Specifically, the results of the T-test ( $p < 0.1$ ) of the content, instructor team, and form of art competitions and the theme of art activities show that female students are more satisfied than their male counterparts while male students are more content than female ones in terms of the interest in art.

#### 4.2 Regression analysis

In order to analyze the correlation among art competitions, art activities and the effects of art education, this survey adopted multiple linear regression method. The regression relationship was established by setting the total score of the effect of university art education as the dependent variable and the scores of art activities and art education as the independent variables. The respective regression models were built as follows:

$$\text{Effect of Art Education} = \alpha_0 + \alpha \sum \text{ArtCourse} + \varepsilon(1)$$

$$\text{Effect of Art Education} = \alpha_0 + \alpha \sum \text{ArtActivities} + \varepsilon \quad (2)$$

The regression models reflect the correlation between dependent variable and independent variables as shows in the Table 2:

**Table 2 Results of Regression Analysis**

	Model (1)	Model (2)
Content of art competitions	0.626	
Instructor team	0.922**	
Publicity of art competitions	1.395***	
Form of art competitions	1.547***	
Theme of art activities		0.452
Form of art activities		0.656**
Publicity of art activities		0.701**
Students' participation		0.391
Quantity of art activities		1.226***
R <sup>2</sup>	0.536	0.672
F	56.62	114.75

Model (1) shows the relation between art competitions and the effects of art education. The results indicate significant positive correlation among the instructor team, publicity and form of art competitions and the effects of art education. In terms of the regression coefficient, form of art competitions is the highest, which reflects that it has the largest impact on the effects of art education in universities.

Model (2) reflects the relation between art activities and the effects of art education. The results show significant positive correlation among the form, publicity, quantity of art activities and the effects of art education. Quantity of art activities is the highest regression in terms of the coefficient and significance, meaning that it has the largest impact on the effects of art education.

### 4.3 Further analysis

To further analyze the influence of different art competitions as well as art activities on art education, this paper conducted regression analysis with art knowledge, art performance, artistic atmosphere and art interests as the dependent variables. The results are shown in Table 3.

**Table 3 Results of Further Analysis**

	Art knowledge	Art performance	Artistic atmosphere	Art interests
Content of art competitions	0.271**	0.145**	0.134**	-0.01
Instructor team	0.044	0.036	0.250**	0.191**
Publicity of art competitions	0.253***	0.341***	0.316***	0.535***
Form of art	0.374***	0.489***	0.314***	0.068

Proceedings of the 16th International Conference on Innovation & Management - 1820 -  
competitions

Theme of art activities	-0.13**		0.511***		0.215**		-0.13	
Form of art activities	0.531***		-0.10		0.008		0.221**	
Publicity of art activities	-0.06		0.241**		0.354***		0.173**	
Students' participation	0.219**		-0.08**		0.050		0.289**	
Quantity of art activities	0.327***		0.396***		0.364***		0.137**	
R <sup>2</sup>	0.681	0.766	0.594	0.792	0.560	0.797	0.339	0.293
F	51.73	63.33	35.72	73.44	31.17	75.76	13.17	8.87

The results of further analysis indicate that among different factors influencing art knowledge, the form of art competitions and art activities are the most important, and the two factors both showcase positive influence towards art knowledge.

Among factors influencing art performance, form of art competitions and theme of art activities influence the art performance most, and the two factors both showcase positive influence towards art performance.

Among factors influencing artistic atmosphere, publicity of art competitions and quantity of art activities exert the greatest influence on the artistic atmosphere, and the two factors both showcase positive influence towards artistic atmosphere.

Among factors influencing art interests, publicity of art competitions and student's participation influence the art interests most, and the two factors both showcase positive influence towards artistic atmosphere.

Based on the results of regression coefficient, this paper concluded that the effects of art education in science and engineering universities in China can be improved in the following aspects.

#### 4.3.1 About the art competitions.

In accordance with analysis results, universities are able to improve the effects of art education through improving the professional quality of competition instructors (Malina,2018), strengthening the publicity of competition and enriching the contents of art competition.

In terms of improving the professional quality of competition instructors, since instructors determine the level of participants, universities should encourage instructors to attend concerning trainings and academic meetings. Also, universities should regularly convene seminars for the building of faculty team, spotting problems existing in the team and putting forward with solutions. Then, responsible, professional and experienced teachers can be sorted out to form the instructor team for art competitions.

In terms of strengthening publicity of art competitions, universities are suggested to host experience sharing conferences where winners of art competitions can share their thoughts and experience to others (Yang Liu,2019). Meanwhile, universities should build atmosphere for art competitions. The publicity and atmosphere building can be achieved through means such as posters on campus, publicity on official website, WeChat group, QQ group, etc.

In terms of enriching the content of art competitions, insufficiency of contents relatively reflects the lack of enthusiasm and concentration of students on the art competitions. Universities should take these factors into consideration, and enrich the contents of art competitions so that students are motivated to participate.

#### 4.3.2 About the art activities.

Universities are able to improve the effects of art education through enriching forms of art activities, strengthening the publicity of art activities, increasing the quantity of art activities.

In terms of enriching forms of art activities, universities should upgrade all forms of current art associations to attract more students to participate. At the same time, universities should plan to host annual large-scale art activities or art festivals that all faculties and students can join. Such measures will not only mobilize students to participate, but are also beneficial to professors in terms of art quality and interests, which will build a favorable artistic atmosphere around the campus (James,2019).

Similar to strengthening the publicity of art competitions, strengthening of art activities can be achieved through hosting seminars and using multiple social media tools. As for increasing the quantity of art activities, universities can combine it with enriching contents of art competitions. The two sides are interconnected and can be promoted at the same time.

## 5 Conclusion

This paper took science and engineering universities as examples and analyzed the status quo and influencing factors of art education in science and engineering universities in China. This paper studied various aspects of art competitions and art activities to conclude their influence on the effects of art education. However, this paper still bears some problems. For example, the empirical investigation of this paper was not carried out on a large scale; the sample of this paper is only one science and engineering university, which bears some deviations; the method for empirical research is regression analysis, thus, the results may bear some deviation. In the following researches, the author will continue focusing on the development of art education in China's science and engineering universities, and will constantly improve the theories and empirical knowledge so as to offer new researches for improvement of the status quo of art education in science and engineering universities in China.

# **How to Develop Cultural Resources to Promote Sustainable Development of Cultural Industry a Case Study of Yellow Crane Tower, Wuhan Cultural Resources**

Qiao Juying

Library, Central China Normal University, Wuhan, P.R. China, 430079

(Email: 492922363@qq.com)

**Abstract:** This Paper analyses The Current domestic and foreign research on cultural resources to promote the sustainable development of cultural industry, cultural resources to effectively develop Wuhan yellow crane tower, for the purpose of strengthening the Wuhan cultural resource effective development of a variety of forms, finally it is concluded that only draw lessons from foreign government as the leading factor, by using the technology of support to promote the sustainable development of cultural industry in Wuhan, only in this way can help promote the national culture of confidence and achieve the goal of cultural power.

**Key words:** Cultural resources; Cultural industries; Yellow crane tower; Sustainable development

## **1 Introduction**

Singapore has accepted the new media art form as an important part of the national culture and vigorously practiced it. Under the background of globalization, the development of Singapore's creative industry not only highlights the important role of the government in promoting the development of the creative industry, but also puts new media technology at an important position in the continuous development of cultural products (Chung, 2008). In Europe, the French government has formulated a series of preferential policies to promote the development of cultural industry, most of which are directly funded. The creative industries export promotion advisory group (CIEPAG) was set up in the UK. America has been slower than Europe to embrace cultural policy. In Asia, South Korea makes rational planning and overall management of the development of cultural industry from the perspective of national strategy, and puts forward the strategy of "cultural establishment" and "creative South Korea" (Zhou Rongguo, 2009). At the end of the 20th century, Japan put forward the "national strategy of culture" and "development strategy of cultural industry", and formed its own characteristics. In the financing of cultural industry, a collaborative system of "industry-university-research" was formed (Luo Li, 2009). According to statistics, 610 adults were employed in the cultural industry in Japan in 1995, and the proportion of the employment in the cultural industry in Japan accounts for a large proportion of the national employment (Ying Andy c. Pratt, 2004). The university of Brisbane creative industries research center was established in Australia. In Canada, a special fund, CIDE, has been established to provide working capital for the development of cultural industry.

In China, we attach importance to the effective development and utilization of historical and cultural resources from the national level. The fifth plenary session of the 18th CPC central committee

Proceedings of the 16th International Conference on Innovation & Management - 1824 -  
deliberated and approved the proposal of the central committee on the formulation of the 13th five-year plan. It is clear that by 2020, the cultural industry should become a pillar industry of the national economy, thus becoming an important part of China's construction of a strong socialist culture and rejuvenation of the great "Chinese dream". At the local level, all regions have reached a consensus to actively support the development of cultural industries and accelerate the development and utilization of cultural resources. In 2017, Wuhan formulated the 13th five-year plan for the development of Wuhan's cultural industry, which clearly proposed to actively cultivate the cultural industry to become the pillar industry of the city's economic growth. In recent years, policies on Wuhan's public cultural services, cultural resources and cultural inheritance have also been issued.

Realizing the sustainable development of cultural industry is the navigation and target of the development strategy of cultural industry in various countries. From the point of the research of scholars, to explore cultural strategic planning and development of cultural industry, some scholars mentioned cultural industry sustainable development strategy, strategic planning in discussing the culture and the cultural industry development puts forward the strategy for the sustainable development of cultural industry, this paper discusses the development of cultural industries and cultural resources sustainable capacity and the relation between the (Tom, 2002).

What are cultural resources? On the one hand, the academic circle considers it as a legacy of the historical process. On the other hand, cultural resources are the development of social history, which is a process of continuous human culture. General secretary Xi Jinping has fully developed and absorbed the precious resources in traditional culture, so as to form many important discussions on civilization exchanges with Chinese style and style and Oriental wisdom, which have far-reaching significance of pointing out the new path of human civilization development (Ren Siqi, 2019). Under the background of the Internet of things, big data, in the form of the traditional historical and cultural resources protection and inheritance has had the change, the development of cultural industry become to the protection and use of the carrier of cultural resources, not only promoted the development of cultural industry, but also conforms to the national strategy to promote the development of cultural industry fast also protect and inherits the local culture resources.

Take the yellow crane tower of Wuhan cultural resources as an example to study how to develop cultural resources to promote the sustainable development of cultural industry. The purpose of the study is to "make the accumulated cultural resources of Wuhan really alive" so that the yellow crane tower of Wuhan cultural resources can be effectively developed and utilized. It is helpful to give full play to the contemporary value of Wuhan's cultural resources, greatly improve the development level of Wuhan's cultural industry, and achieve the practical significance of promoting the sustainable development of Wuhan's cultural industry. It will also play an exemplary role in some areas, especially for the development of cultural industry in central and western cities.

## **2The Status of Cultural Resources and Cultural Industries in Wuhan**

### **2.1 Cultural Resources in Wuhan**

Wuhan's cultural resources belong to the Central Plains cultural resources and Jingchu cultural resources according to different regions or provinces. Wuhan's cultural resources include: natural ecological cultural resources and historical relics cultural resources. Natural ecological and cultural resources include: Donghu Scenic Area, Hankou Jiangtan, Nanhu Scenic Area, etc.; Yellow Crane Tower and Yangtze River Bridge have become business cards in Wuhan; There are also revolutionary historical and cultural resources, national key cultural relics protection units and so on. Wuhan National

Proceedings of the 16th International Conference on Innovation & Management - 1825 -  
Historical Relics Cultural Resources include: Wuchang Uprising Military Government Site, August 7th Site, Wuhan National Government Site, Wuhan Peasant Movement Workshop, Jianghuan Building, Hankou China Federation of Trade Unions Site, etc.; Another example: Hanyang Iron Works, Hanzheng Street, and Hankou Port Terminal founded by Zhang Zhidong have become symbols of Wuhan's early industrial and commercial culture; In addition, Wuhan's intangible cultural heritage resources are also very rich: folk literature, folk music, folk dance, Yellow Crane Tower Legends, Han embroidery and so on. These valuable cultural resources have become the advantages of Wuhan's development of cultural industry.

## **2.2 Characteristics of Wuhan Cultural Resources**

One of the characteristics: From its environmental point of view, Wuhan has its unique natural geographical environment. The Yangtze River and Hanshui meet here. "Water" has an important influence on Wuhan's history and culture. Sima Qian recorded in the "Historical Records of the Historical Records" that the geographical environment was associated with the temperament and behavior of the people (Hubei Academy of Social Sciences Research Group, 2007). Therefore, Wuhan's geographical environment also plays an important role in shaping Wuhan's local culture. In the long river of history, the Yangtze River culture and the Central Plains culture blend with each other. Wuhan has many tributaries such as the Fuhe River, the Tongjing River, and the Jinshui River. It is known as the "City of Baihu" and has developed water transportation. The ancient book has a cloud: "South of the Dajiang River, Jingchu is upstream, and the benefits of the millet are spread all over the world, and the clay clay is more than the" Gonggong ". Its land spans the rivers, Han, and Wuchang as the metropolis. Its people and widowhood. Gathering, Jiasifang, The Jiayi of the Quartet gathered. " (Hubei Academy of Social Sciences Research Group, 2007)

The second characteristic: From its content, Wuhan's cultural elements are rooted in its own history and have distinctive features; Features 3: From the perspective of its time, Wuhan's historical and cultural resources have continued for a long time, and most of them have been better protected.

## **2.3 Legend of Yellow Crane Tower**

The earliest seen in the "Nanqi Book of the 15th State Jun County" around 502 AD, this book has a record of "the world passed fairy son to take the Yellow Crane". The story of the Republic of China in Wuhan collected the "Xin Shi Xiu Lou Xie" and so on (Yu Riji, TangCunchen, Hu Shushan, 2014).

The literati of the past left many popular poems here. For example, Cuihao's "Yellow Crane is gone forever, and this place is free of Yellow Crane Tower". The legend of Yellow Crane Tower has fairy Legends, historical stories, celebrity anecdotes, and so on. For example, "ZiAn Drive Crane", "Fairy Piper", "FeiFei ascended to heaven", "Tangpi Painting Crane" and other Wuhan Untill Protection Center: and "Xin Shi Xiu Lou XieEn", "Lu Ban Shen Gong Jian Lou", "LibaidenglouCuihao", "Victory Tower Kong light. " Most of these legends promote punishment, promote good, reduce greed, and unite heaven and earth. They contain folk wisdom, fairy culture, and concepts of good and evil. The legends of the Yellow Crane Tower were accompanied by the Yellow Crane Tower. Over the thousands of years, they have spawned various poems, songs, paintings, folk arts, architecture, and music. They have great historical and cultural values, literary values, and artistic values. They are valuable folk cultural wealth in Wuhan. It is also a precious cultural resource in Wuhan.

## **2.4 How to develop Wuhan's cultural resources effectively.**

With the increasing attention of the country to cultural construction, "let the precipitated historical and cultural resources really live up" has stopped at shouting slogans but put into actual action. So how

Proceedings of the 16th International Conference on Innovation & Management - 1826 -  
to develop Wuhan's cultural resources effectively? According to the distribution and category of cultural resources in Wuhan, Wuhan cultural resources can be collected by investigating the detailed statistics of Hubei Provincial Bureau of Statistics and Hubei Provincial Statistical Yearbook. Wuhan's cultural resources are rich in content, and more representative ones such as: 3500 years of Shiwei left a rich and splendid cultural heritage. The reputation of "Hometown of Yellow Crane" is known throughout the country. This paper only chooses Yellow Crane Tower as the representative of Wuhan cultural resources, based on this research how to develop Wuhan cultural resources.

## **2.5 Taking Yellow Crane Tower as an Example to Analyze the Forms of Developing Wuhan Cultural Resources**

### **2.5.1 Collection and collection of postcards, medals, etc. related to Yellow Crane Tower**

Make full use of major newspapers in Wuhan, government work websites, Wuhan Radio and TV stations and other news media to publish postcards and medals related to the Yellow Crane Tower. The postcards and medals collected in connection with the Yellow Crane Tower will use the holidays to make large-scale theme exhibitions at the Yellow Crane Tower Tour Point to allow the public to understand the Yellow Crane Tower, know the Yellow Crane Tower, and increase the cultural resources of the Yellow Crane Tower in Wuhan. Publicity and wide dissemination.

### **2.5.2 Collection of poems, stories, folklore, etc. with the theme of Yellow Crane Tower**

Widely collect and collate poems, stories, folklore, etc. with the theme of Yellow Crane Tower, and make full use of major newspapers in Wuhan, government work websites, Wuhan Radio and TV stations and other news media to publish poems, stories, and folklore on the theme of collecting Yellow Crane Tower. The earliest record of the legend of the Yellow Crane Tower was the "Nanqi Book Book of the Fifteen Counties" contained: "Xiakouchengjuhuanghaoji, the world passed the fairy son An Yi took advantage of this also." (Liang XiaoZixian, 1972) He also conducted a poetry contest with the theme of Yellow Crane Tower, a speech with the theme of Yellow Crane Tower, and a folk legend performance with the theme of Yellow Crane Tower. The vivid image shows the Yellow Crane Tower culture in front of the public, allowing the public to relive the historical scene and deepen the impression of the Yellow Crane Tower culture. Learn more about the Yellow Crane Tower.

## **2.6 The state of the cultural industry in Wuhan.**

In recent years, Wuhan has issued a large number of policies to guide the planning of Wuhan's cultural industry. These targeted policies have played an important role in the use and dissemination of Wuhan's historical and cultural resources. On the other hand, they have also enriched the construction of Wuhan campus culture. For example: Yellow Crane Tower Fragrant Spice Industry Park, Green Brick Tea Industry Park, etc..

## **3 Effective Exploitation and Utilization of Cultural Resources to Promote the Sustainable Development of Cultural Industries.**

### **3.1 What is the cultural industry?**

The earliest research on the cultural industry was the criticism of the artistic and philosophical values of popular culture by the Frankfurt school in the 1930s. Adorno and Horkheimer first proposed the "culture education" in their "Enlightenment Dialectics". (Fang Hongting, 2011) After the 1980s spread to China, China's research on the cultural industry began in the 1990s. Scholars defined the

Proceedings of the 16th International Conference on Innovation & Management - 1827 -  
cultural industry according to the specific conditions of the country. (Fang Yinheng, Wang Ruihua, 2016) In 2012, the National Bureau of Statistics defined the cultural industry as "a collection of production activities that provide cultural products and culture-related products to the public." This concept is still used today.

Usually we think that the content of the cultural industry is to provide cultural products or services; The core of the cultural industry is "creativity"(Fang Zheng, 2015). Cultural industry needs much content from cultural resources, cultural resources processing into the public demand of cultural products, so cultural industry often rely on cultural resources as the original creation of cultural resources to create value.

At present, the research on culture industry emphasizes on economic benefits and neglects social benefits. It ignores the social value and cultural value of the cultural industry. At the same time, there is less research on the promotion of cultural communication and other spiritual aspects. The University museum can use the school history, school badge and other special historical events as materials to create cultural industry creative products cultural shirts, handbag production, word of mouth folk stories, cultural maps, advertisements, promotional films, and so on. Then "Yellow Crane Tower" as the main body can also make souvenirs and other "Yellow Crane Tower" culture effectively developed and used.

### **3.2 How cultural resources contribute to the sustainable development of cultural industries**

More and more foreign scholars are paying more attention to the development benefits of cultural resources (Li Jinyu, 2015). We believe that cultural resources can promote economic development and also promote the development of cultural industries. The case study is used to prove that cultural resources promote the development of cultural industry. It is also possible to fully exploit historical and cultural resources from various forms such as cultural tourism and cultural performing arts.

#### **3.2.1 Digitization of Cultural Resources in Yellow Crane Tower to Promote the Sustainable Development of Wuhan Cultural Industry in the Context of the Internet of Things**

The cultural resources of Yellow Crane Tower will be digitally protected and effectively disseminated and inherited. For example: Collect and collate relevant documents and publish monographs, make microfilm, build a special database of "Yellow Crane Tower", and so on. Make visual products, such as: using 2D, 3D digital animation technology to reproduce the Yellow Crane Tower culture, give full play to the vitality of the Yellow Crane Tower cultural resources (Huang Yonglin, Tan Guoxin, 2012). Make this Wuhan cultural resources from generation to generation, so that it can be preserved sustainably.

#### **3.2.2 The development of school-based resources related to Yellow Crane Tower by colleges and universities specialized departments and libraries and Wuhan primary and secondary schools to promote the sustainable development of Wuhan cultural industry**

The university library mainly organizes librarians + faculty subject teachers + primary and secondary school subject teachers to form a research team. The cultural resources of the theme of Yellow Crane Tower are effectively integrated into the primary and secondary school subject materials, and the theme of Yellow Crane Tower is compiled. Primary and secondary school quality education school book. To study the teaching materials of the language and historical disciplines of primary and secondary school students and compile corresponding research cases, such as the architectural culture, celebrity culture, poetry culture, etc. of Yellow Crane Tower, and enrich the learning materials of primary and secondary school students. The purpose is to establish students to learn relevant knowledge from an early age, so that this cultural resource can be fundamentally passed down to promote the

### 3.2.3 Training primary and secondary school students to volunteer for the Yellow Crane Tower tourist destination to promote the sustainable development of the cultural industry in Wuhan

In conjunction with primary and secondary schools, we will train cultural volunteers to explain the Yellow Crane Tower, organize primary and secondary school students to visit the Yellow Crane Tower Cultural Tourism Point, train primary and secondary school students to become instructors of the Yellow Crane Tower Cultural Tourism Point, and increase the dissemination and inheritance of the cultural resources of the Yellow Crane Tower. The "Yellow Crane Tower" cultural resources are further passed down and sustainable so as to promote the sustainable development of Wuhan cultural industry.

### 3.2.4 Widely solicit cultural and creative industry activities with the theme of Yellow Crane Tower to promote the sustainable development of Wuhan cultural industry

Carry out bookmark design competitions marked by Yellow Crane Tower, cultural shirt design competitions, and the design and development of various related cultural products, such as: Li Bai's "Sending the Guangling of Meng Haoran" in the Tang Dynasty. In modern times, Mao Zedong's "Bodhi Man Yellow Crane Tower" and other poems are the themes for the design of cultural shirts.

### 3.2.5 Development of tourism products with the theme of Yellow Crane Tower Promoting the Sustainable Development of Wuhan Cultural Industry

Industrial Park produces cultural shirts, hats, scarves, bookmarks, mobile phone stickers, refrigerator stickers, travel bags, travel cups and other souvenirs, souvenir books, and so on. In addition to sales at tourist destinations, souvenirs with the theme of "Yellow Crane Tower" can be produced in conjunction with the Wuhan University Student Union and the University Museum and placed for sale in primary and secondary schools and universities.

According to statistics: In 2009, the number of tourists receiving tourists at the Yellow Crane Tower tourist destination was 1.5 %, the ticket income was 66.84 million yuan, and the total tourism income was 66.96 million yuan. The development of the Yellow Crane Tower cultural industry is only a single ticket income. The operating development model has not yet formed a complete cultural industry chain. It is not conducive to the effective development and sustainable development of cultural resources in Yellow Crane Tower (Ma Peihong, 2013). Therefore, while developing the cultural resources of the Yellow Crane Tower, it should also be carefully studied from the perspective of diversification and in-depth development. Only in this way can the sustainable development of the Yellow Crane Tower cultural industry be promoted.

## **4 The Domestic Should Draw on the Foreign Cultural Industry Development Strategy**

Our country should draw on the study of foreign cultural industry development strategy to explore how to choose the scientific, suitable and steady cultural industry development strategy from the cultural resources of each region of our country. In recent years, cultural industry development plans have been issued at various administrative levels from the central government and ministries to provinces, cities, and counties. However, whether the cultural industry plans are actually implemented or not has become a practical and urgent problem. In view of this, the government should implement the cultural industry development strategy to the operational level of the cultural industry. For example, to increase

Proceedings of the 16th International Conference on Innovation & Management - 1829 -  
government attention, actively use technological innovation to achieve the sustainable development of the cultural industry, so as to maximize the realization of cultural resources to promote the sustainable development of the cultural industry (XieXuefang, ZangZhipeng, 2012).

## 5 Conclusion

The cultural management system and operating mechanism formed under the planned economy system affect the vitality and vitality of cultural development<sup>110</sup> Influenced by Jingchu culture, Wuhan's cultural resources contain rich Chu cultural factors, vigorously promote the Chu cultural spirit, and vigorously develop Wuhan's tourism and cultural resources. Under the background of the Internet of Things and large data, it is necessary to rely on the support of Internet of Things technology. The abundant Wuhan cultural resources will be digitally protected and effectively developed into a cultural industry. It will certainly promote the development of Wuhan's industrial economy and the sustainable development of Wuhan's cultural industry. Only in this way can it help to enhance the cultural self-confidence of the people and achieve the goal of cultural power. When advocating the sustainable development of cultural resources for cultural industries, the government must also consider the healthy development of cultural industries and the combination of social benefits, and avoid the emergence of various problems in the operation of online cultural industries. At the same time, it must also be led by the government. Like the United Kingdom's 10-year strategic plan for creative industries, the increase of funds for the development of museums, digital technology reforms, and so on (DCMS,2006.2011). Government dominance plays a decisive role in the sustainable development of the cultural industry.

## Acknowledgement

This paper is one of the research results of the humanities and social sciences project of the ministry of education, "research on the crimes of documents destroyed by Japanese troops in central China during the Anti-Japanese War ----- taking the collections of university libraries, museums and archives as examples" (project no. :15YJA770016).

## Research on the Curriculum System of International Cooperation Training of Excellent Art and Design Talents

Dai Fuxiang<sup>1</sup>, Dai Bo<sup>2</sup>

1 Graduate School, Wuhan University of Technology, Wuhan, P.R. China, 430070

2 School of Foreign Languages and Literature, Wuhan University, Wuhan, P.R. China, 430071

(E-mail: 26679038@qq.com, 876294058@qq.com)

**Abstract:** At present, there exist many problems in the training of art and design talents in China, such as backward curriculum setting, emphasizing skills over thinking, and low degree of internationalization. Therefore, it is of great importance to explore a curriculum system of internationally-cooperated training of excellent art and design talents adapted to the current social development, introduce foreign high-quality educational resources and advanced management experience, integrate the advantages of Chinese and foreign art and design education and improve the discipline construction of art education in China.

**Key words:** Art and Design; Internationally-Cooperated Training; Curriculum System

### 1 The Current Situation of Internationally-cooperated Training of Excellent Art and Design Talents

China's art and design education lacked the development experience and lagged behind the world development level for it starting late. With the development of globalization and informatization, the trend of higher education internationalization is accelerating. Therefore, if China's education wants to truly stand in the forest of the world, we must implement the "going globally" strategy, strengthen exchanges with developed countries, learn from the strengths of foreign countries, and constantly develop and strengthen ourselves, so as to cultivate top-notch talents with international perspective, comprehensive ability and creative thinking.

With the rapid pace of globalization, greater demands are being placed on our education system by constantly-changing world. The internationally-cooperated training system of excellent art and design talents is the requirement of fostering our art and design talents with international perspective to adapt the competitive international market and make our curriculum system stand out among the world art and design educations. In addition, the comprehensive art and design talents with competitiveness could benefit to boost Chinese cultural industry in order to enhance Chinese culture soft power and international competitiveness. It is of great strategic significance to enhance the overall national power as well as to construct an innovation-oriented country.

## **2 The Pattern of Internationally-cooperated Training for Excellent Art and Design Talents**

The model of internationally-cooperated training of excellent art and design talents refers to the model of establishing a scientific curriculum system and teaching content, adopting advanced teaching methods and strengthening the organic combination of various elements such as the construction of teaching staff under the guidance of the concept of excellent talents education through international cooperation, facing the industry, the world and the future, so as to cultivate top-notch talents who have strong innovative ability, practical ability and international competitiveness and can lead the development trend of art and design education.

At present, the main problems of the curriculum system of art and design specialty in China are as follows: single curriculum structure; unreasonable teaching hours; lack of international practice; outdated textbooks and courses and lack of international integration.

### **2.1 Curriculum structure**

Curriculum is the key to talent training. Therefore, the curriculum of international cooperation training of excellent art and design talents must be developed based on talent training objectives and different national conditions and academic conditions at home and abroad. It is especially crucial to strengthen communication and exchanges, develop a curriculum system suitable for the development of Chinese and foreign students and ensure the smooth development of teaching activities. The curriculum system of training excellent art and design talents consists of foundation courses, specialized courses, practical courses and graduation projects. The foundation courses are divided into public foundation courses and specialized foundation courses. The specialized courses are divided into specialized elective courses and specialized compulsory courses. The foundation courses are mainly taught in the first academic year, accounting for about a quarter of the whole curriculum system. The specialized courses are mainly taught in the second and third academic years, and the practical courses and graduation projects are finished in the fourth academic year. The course structure basically follows the principle of "basic first, and then specialized; theory first, and then practice". The study of basic theory is to accumulate knowledge and lay the foundation for professional practice, which helps students develop their comprehensive practical ability based on the basic theoretical knowledge and theories plays greater role in instructing practice for students.

### **2.2 Curriculum setup**

In the setting of public courses and foundation courses, attention should be paid to the cultivation of students' comprehensive quality. Humanities and social sciences courses related to the specialty should occupy a certain proportion in the curriculum system. In terms of setting of specialized courses, it is necessary to optimize and integrate domestic and foreign courses, so that students can master professional knowledge in the international perspective. The courses should be categorized to ensure the foundation and internationalization of the course, and both compulsory and elective courses should be included.

### **2.3 The construction of internationally-cooperated training system**

Taking the art and design specialty organized by Wuhan University of Technology and the University of Wales as an example. According to the different characteristics of Chinese and English students, and considering the different teaching modes and assessment modes, both parties divide the modular courses of the British side into specific specialized courses after full communication, and

Proceedings of the 16th International Conference on Innovation & Management - 1833 - finally complete the curriculum assessment according to the modular assessment mode of the British side; at the same time, the curriculum should focus on the combination of theory and practice; both parties should jointly develop scientific, reasonable, standardized teaching materials that meet the needs of teaching and practice according to the syllabus, and constantly revise and improve the teaching materials according to students' feedback in classroom teaching and practice. Students of this Program will study for four years in Wuhan University of Technology (international foundation courses will be taught in the first year, and specialized courses will be taught in the last three years). The training program is jointly developed by the University of Wales and Wuhan University of Technology. The course teaching is jointly undertaken by senior teachers of both universities. Both universities use English or bilingual teaching, make full use of modern information technology, adopt advanced teaching methods, and devote themselves to the cultivation of inter-disciplinary art and design professionals with international vision, innovative consciousness and Chinese and Western cultural connotations.

The core of the curriculum system comes from the relevant professional programs of the University of Wales. Considering the characteristics of Chinese students and the differences in teaching modes, both universities have revised the original training plans and reached a consensus on adding appropriate language courses in the first and second academic years, so as to facilitate the study of bilingual courses in the upper grades and the study of all-English courses taught by teachers designated by the British universities, and meet the needs of students to continue their studies in foreign universities in the future at the same time. In the third and fourth academic years, the textbooks and teaching methods of the University of Wales are adopted. According to the agreement between both parties, 14 professional modular courses are divided into 24 core courses, which are taught in English or bilingual by teachers of the British side and Wuhan University of Technology respectively. Among them, 16 courses are taught by teachers of the Chinese side (1 assistant teacher is assigned to each course by the British side), and 8 courses are taught by teachers of the British side (1 assistant teacher is assigned to each course by the Chinese side). More than 50% of the teaching hours of the core courses are assigned to teachers of the British side. The course emphasizes the combination of theory and application. During the external verification of schoolwork, 24 courses are subject to unified assessment as 14 curriculum modules.

Taking the art and design curriculum system of BA arts and design of Wuhan University of Technology as an example, see the table below for details. This training program not only maintains the teaching quality evaluation system of the British side, but also ensures the logic of linking up traditional curriculum plans of the Chinese side and the acceptability of students' learning, and innovation and win-win results have been achieved.

### 3 An Example of Internationally-cooperated Training System for Excellent Art and Design Talents

**Table 1 Art and Design Curriculum System of BA Arts and Design of Wuhan University of Technology**

Course of the Chinese and British sides				
Nature	Class hours (proportion)	Credits (proportion)	Assessment method	Proportion of Chinese and foreign teachers
Public foundation course	624 (23%)	120 (23%)	Combination of homework assessment and examination assessment	A total of 24 core courses, of which 16 courses are taught by teachers of the Chinese side. More than 50% of the teaching hours of the core courses are assigned to teachers of the British side
Specialized foundation course	360 (13%)	52 (10%)	Combination of homework assessment and examination assessment	
Specialized elective course	144 (6%)	40 (7%)	Essays	
Specialized compulsory course	1560 (58%)	320 (60%)	Coursework	

#### 4 Results of Curriculum Reformation

One of the characteristics of Sino-foreign cooperation teaching is that students' English proficiency must meet the requirements of foreign parties and students can receive professional bilingual or all-English teaching without any troubles. In other words, English proficiency is the basis for students to achieve good professional knowledge, and is related to the realization of their career planning. Emphasis on students' English proficiency and ways to improve students' English learning can be varied: the curriculum setting should be scientific and reasonable, while offering foundation courses such as listening, speaking, reading, writing and grammar, academic writing and foreign cultural introduction courses can be offered appropriately. The organic combination of basic education and exam-oriented education can also be considered while offering courses. If necessary, social English training institutions can be introduced to provide intensive English training for students. In daily life, a lot of English activities shall be organized for students, such as English corner, oral English contest and so on. In addition, students should be actively provided with conditions for English learning, open foreign teachers' oral English training posts should be set up in colleges, and one-to-one English tutoring should be provided on a regular basis. Alternatively, if conditions permit, various activities with international students and friends should be organized. Only through various forms of intensive and interesting English training, can students' English level and English proficiency be greatly improved. After entering the upper grades, through bilingual teaching and all-English teaching, students' English can also be consolidated and improved, and satisfactory learning results can be achieved.

#### 5 Conclusion

In conclusion, a curriculum system of international cooperation training of excellent art and design talents need combine the foreign high-quality educational resources and advanced management experience with the current development to make innovation and optimization. Our curriculum system should focus on the actual situation (teaching resources, teachers ability, students horizon and practical experience, language level, etc.) and be promoted by the advanced foreign experience to explore a characteristic curriculum system of international cooperation training of excellent art and design talents adapted to the current social development and foster more talents with global horizon for our country.

## **Research on Process Management of University Students with Learning Difficulties: From a Survey of Management Status**

Wang Xiao

School of Navigation, Wuhan University of Technology, Wuhan, P.R.China, 430070

(Email: 75170909@qq.com)

**Abstract:** Some university students' academic performances decline with courses failure in exams and low credits. Some even can not meet the syllabus's demand for graduation or drop-out. China's university students with learning difficulties have gradually increased in number and in problem types. These phenomena have aroused the attention of educational administrations and universities. Based on total quality management, this paper aims to explore the management status of university students with learning difficulties, and puts forward process management mechanisms for students with learning difficulties, so as to promote transformation of students with learning difficulties and education effect.

**Key words:** University; Students with learning difficulty; Process management; Empirical survey

### **1 Introduction**

Studies show that about 40% university student has learning difficulty in different degree and type (Tu & Hu, 2004); high fresh students' make-up examination rate is a general phenomenon in common universities; in the make-up examination of many courses, 78.3% of the students were above the key undergraduate admission score in the national entrance examination (Chen, 2001); compared with it before enrollment expansion, the graduation rate is on the decline. China's university students with learning difficulties have gradually increased in number and in problem types.

For a long time, domestic and international researches on learning difficulties have focused on basic education with higher education as its extensive study field (Tu & Hu, 2004). In overseas studies, "learning disabilities" is also known as "learning helpless", "learning disorders" or "under achiever" according to different study emphases. The American researchers widely use two theoretical definitions taking learning disability for the result of central nerve system disfunction, or a psychological disorder, which may be closely related to undeveloped academic potential, and may show oral or mental confusion throughout life (Kavale & Forness, 2000). Since the 1980s, researchers have made extensive use of theories and techniques of cognitive psychology to study learning disabilities or disorders from cognitive factors and non-cognitive factors (Waber et al., 2003). In higher education, several studies focus on learning strategies disorder of university freshman (Brinckerhoff et al., 1992); countermeasures for learning disabilities from different perspectives (Lindeberg, 1998). The domestic researches are mainly about education and management (Wang et al., 2018; Zhao & Tian, 2015; Wang, 2015; Wang, 2011), warning mechanism and methods (Xu & Chen, 2016; Wang & Luo, 2011), causes, status quo and support analysis (Zhao, 2018; Wang & Li, 2014; Zhao, 2013; Qiu, 2017; Pan & Hou, 2015), giving many realistic solution to problems. However, the present researchers emphasize description rather than analysis, emphasize enumeration rather than systemization, and emphasize result rather than process.

Considering domestic higher education situation, this study suggests university students with learning difficulties are those who can't meet periodic academic requirements due to course exam failure, make-up exam failure, retaken course exam failure, insufficient credit, academic warning, even lead to graduation deferment, or drop-out. This kind of learning difficulty is transformable. Under this reality, based on total quality management, this paper explores the management status of university students with learning difficulties, and puts forward process management mechanisms for students with learning difficulties, so as to promote transformation of students with learning difficulties and education effect.

## 2 The Management Status of University Students with Learning Difficulties

### 2.1 Interview survey design

To investigate the management status of university students with learning difficulties, this study selects the staff of student affairs and teaching affairs, head teachers of classes, student cadres of Wuhan University of Technology (WUT) as the survey objects. Teachers of various courses are not included yet because their participation in management is limited at present. "Interview Outline of Management Status of University Students with Learning Difficulties", involving 5 dimensions' subjective description and objective assessment, namely difficulty identification, difficulty evaluation, difficulty warning, difficulty assistance and performance evaluation consisted of 5 subjective questions and 5 objective questions. Objective questions are designed according to likert scale. The choice of "very good" represents 5 points, with "relatively good" 4 points, "common" 3 points, "poor" 2 points, and "very bad" 1 point respectively. A total of 75 people were interviewed, including 13 teaching affairs administrators, 32 counselors, 16 head teachers and 14 student cadres.

### 2.2 Interview survey results

Through analyzing 5 objective questions for the above 5 dimensions, the interviewees' assessment percentages and average scores are shown below.

**Table 1 Assessment Percentages of Management Status of University Students with Learning Difficulties**

Item	Very Good	Relatively Good	Common	Poor	Very Bad
Learning Difficulty identification	8.00%	30.67%	33.33%	18.67%	9.33%
Learning Difficulty Evaluation	10.67%	33.33%	26.67%	20.00%	9.33%
Learning Difficulty Warning	12.00%	37.33%	24.00%	18.67%	8.00%
Learning Difficulty Assistance	20.00%	42.67%	20.00%	13.33%	4.00%
Performance Evaluation	8.00%	25.33%	33.33%	20.00%	13.33%

Proceedings of the 16th International Conference on Innovation & Management - 1838 -  
**Table 2 Average Scores of Management Status of University Students with Learning Difficulties**

Item	Very Good		Relatively Good		Common		Poor		Very Bad		Average Score
	Number	Score	Number	Score	Number	Score	Number	Score	Number	Score	
Difficulty identification	6	5	23	4	25	3	14	2	7	1	3.09
Difficulty Evaluation	8	5	25	4	20	3	15	2	7	1	3.16
Difficulty Warning	9	5	28	4	18	3	14	2	6	1	3.27
Difficulty Assistance	15	5	32	4	15	3	10	2	3	1	3.61
Performance Evaluation	6	5	19	4	25	3	15	2	10	1	2.95

It shows the interviewees highly appraise learning difficulty support with average value 3.61, and proportion of “very good” and “relatively good” 62.67%, which indicates great importance is attached to supporting students with learning difficulties. The interviewees grade learning difficulty performance evaluation the lowest with average value 2.95, and proportion of “poor” and “very bad” 33.33%, which indicates that current performance evaluation is the most unsatisfactory. Learning difficulty removal effectiveness should be improved.

Through analyzing 5 subjective questions for the above 5 dimensions, the results are as follows:

Among the interviewees, teaching affairs administrators’ identification mainly relies on exam results and failures. Counselors’ attentions are paid to class attendance and performance, daily self-management besides grades and exam failures. Head teachers rely on communication with student and cadres. Student cadres depend on daily differential performance to find potential learning difficulties. The surveyed problems for the item of “identification of students with learning difficulties” are: i) Long-term and continuing identification is needed due to study performance phased change and abundant information; ii) Be lack of uniform standards to define students with learning difficulties; iii) students with potential learning difficulties are easy to be neglected.

The counselors classify students with learning difficulties according to reasons, and determine difficulty according to management and credit requirements. Teaching affairs administrators inform counselors of exam results, courses failure, retaken courses, exam cheatings and academic warnings. Head teachers and student cadres make evaluations based on perceptual cognition. The surveyed problems for the item of “evaluation of students with learning difficulties” are: i) Be lack of division of difficulty degree; ii) There is no scientific, systematic standards for the classification of difficulties.

The counselors adopt various warning methods for various types of learning difficulties. A heart-to-heart talk, etc is a common choice. Teaching affairs administrators use “one-to-one” reminding for students who cheat in exams and get academic warning punishment. Head teachers and student cadres generally hold meetings and talks to remind problematic students. The surveyed problems for the item of “warning of students with learning difficulties” are lack of systematic, scientific warning standards and implementation plans.

The interviewees all stress assisting students with learning difficulties. According to the university's academic quality improvement plan, it adopted a series of assistance measures in 7 fields including academic situation familiarization, accurate assistance, joint-effort education, standardized management, home-school linkage, risk prevention and control, and monographic study. Counselors mainly take concrete measures to offer help. Teaching affairs administrators always take punishing measures, such as exam cheating punishment notification and academic warning notification. Head teachers and student cadres cooperate to carry out assistance work. The surveyed problems for the item of "assistance of students with learning difficulties" are: i) Be lack of a systematic support closed loop and existence of attenuation phenomenon of "emphasizing planning, neglecting implementation, weakening inspection and lacking rectification"; ii) Be lack of systematic conclusion, and operational regulatory writings.

The counselors record the help process and situation, and evaluate difficulty relief based on the students' actual performance and achievements. While teaching affairs administrators, head teachers and student cadres show little participation in performance evaluation. The surveyed problems for the item of "performance evaluation of students with learning difficulties" are: i) the work performance is not significant, and difficulty relief proportion is not high; ii) Students out of trouble are easy to get back into trouble; iii) quantitative evaluation is yet to be established.

### **3 Process Management of University Students with Learning Difficulties**

#### **3.1 Guiding theory**

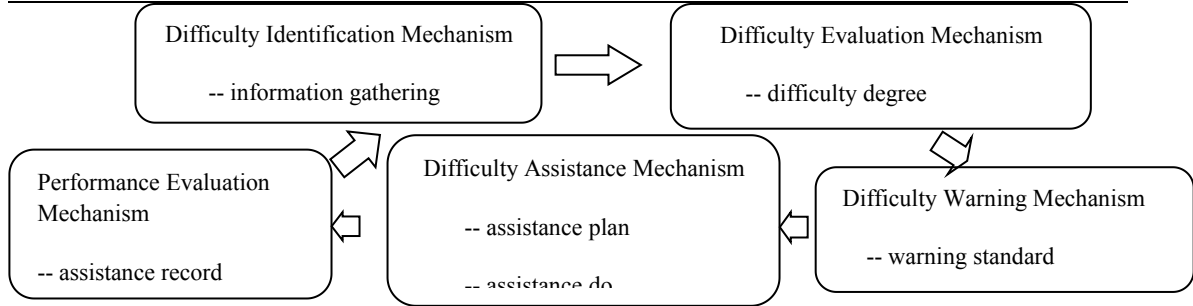

Total quality management (TQM) is taken as the guiding theory for process management of university students with learning difficulties. TQM is a quality-oriented, whole staff involved management method which aims to achieve long-term success through customer satisfaction and benefiting all the organizational members and society. It's a system of pre-control and overall control. Its core feature lies in the word "total", namely, quality management involving all staff, covering the whole process and reaching all ranges. In other words, staff involved in management is comprehensive; scope of management is comprehensive; object of management is comprehensive. TQM with "three totals" characteristics effectively helps to achieve process control and management.

#### **3.2 Principles**

The process management of students with learning difficulties in university should follow the following three principles: first, all staff participated identification and detection. It's necessary to motivate the participation of all staff, including teachers, management personnel, counselors, head teachers, and student cadres to participate in identifying and detecting students with learning difficulties constantly. Second, the whole process management. The process management of students with learning difficulties should run through the entire academic completion process until graduation. It's necessary to make precise and accurate solutions for every specific situation and problem. Third, all range coordination and assistance. It's necessary to cover all students with learning difficulties, all personnel offering support, all supporting systems, so as to make all resources coordination into effect.

#### **3.3 Mechanisms**

Several mechanisms should be established for the process management of university students with learning difficulties as shown in figure 1.

**Figure 1 Process Management Mechanisms of University Students with Learning Difficulties**

### 3.3.1 Difficulty identification mechanism

Difficulty identification is a crucial step in the process management of university students with learning difficulties. 1) information gathering. Relying on the enrollment management, teaching management, student management, teacher participation, and based on enrollment data, students basic information, freshman English placement test score, the mid-term exam achievement, the final exam grade, obtained credits information, failed subjects information and grades, students' overall learning performances are comprehensively gathered; Relying on class performance, attendance rate, morning and evening individual study participation, students' study enthusiasm and involvement information are gathered; Based on heart-to-heart conversation, daily behavior observation, classmates' feedback, students' learning objective and implementation information are gathered. 2) information analyzing. Students with learning difficulties or potential learning difficulties should be initially identified based on various information gathered. The gathering and analyzing scope should cover all students with the principles of "no one less" and "dynamic analyzing" in initial identification in order to avoid omissions.

### 3.3.2 Difficulty evaluation mechanism

Difficulty Evaluation is an important step in the process management of university students with learning difficulties. 1) difficulty degree. The degree of learning difficulty varies. It's necessary to establish 3 levels of difficulty, namely, severe difficulty, serious difficulty and general difficulty, for reasonable and efficient allocation of management resources. 2) difficulty types. There are many types of learning difficulties divided by different causes and manifestations, for example, 7 types of Internet addiction, specialty boredom, disjointed knowledge, insufficient motivation, psychological disorder, improper method, affairs troubled (Cui, 2010), as well as many subject bias, etc.

### 3.3.3 Difficulty warning mechanism

Difficulty warning is a necessary step in the process management of university students with learning difficulties. 1) warning standards. It's necessary to set hierarchical warning standards, namely 3-level warnings including red, yellow and blue warning standards which respectively represent three levels: severe, serious and general. Severe warning standards include those who fail 2/3 of the courses selected in one semester, those who miss 2/3 of the courses in one semester, those who do not take the exam without any reason, those who do not graduate until the 6th year in university (The longest period of schooling in university is 8 years generally.), and those who cheats twice in exams (at risk of expulsion). Serious warning standards include those who fail 1/3 of the courses selected in one semester, those who fail 1/3 of the courses selected in one semester, those who delay graduation or cheat in exams, those who obtain less than 27 grades in one year (27 grades a year is the lowerest requirement in WUT), etc. General warning standards include those who failed 3 courses and above in a semester, those who

Proceedings of the 16th International Conference on Innovation & Management - 1841 -  
got 60 in 3 courses and above in the final exams, and those who have long-term poor learning state, habit and performance. 2) warning implementation. According to the above warning standards, warning implementation should be done respectively. General warning should be given to students themselves; whereas serious and severe warning should be given to students and their parents. It's also necessary to make a good communication between university and students' parents.

#### 3.3.4 Difficulty assistance mechanism

Difficulty assistance is the core step in the process management of university students with learning difficulties. 1) assistance plan. It's necessary to make individualized and accurate assistance plans and programs for students with learning difficulties, and carry out process control. 2) assistance do. Implement the assistance plans, and concentrate on mutual communication and the recipient's feedback. 3) assistance check. Check the consistency of assistance plan and implementation, and check the effect of implementation. It's necessary to carry out self-check, regular check and group supervision, and give feedbacks timely. 4) assistance act. It's necessary to solve the problems occurring during assistance process timely, to analyze and adopt students' feedbacks timely so as to provide support for next plan. The difficulty assistance mechanism forms a circular closed cycle to help students' transformation.

#### 3.3.5 Performance evaluation mechanism

Performance evaluation is the conclusive step of process management of university students with learning difficulties. 1) assistance record. Integrated assistance records show the traces of process management, providing basis for performance evaluation. 2) transformation effect. A hierarchical and phased effect evaluation index should be developed to evaluate the transformation effect judging from changing study attitude and condition, reducing difficulty level, or getting out of trouble.

## 4 Conclusion

This paper has made a survey of management status of university students with learning difficulties, put forward process management mechanisms, which helps to encourage and warn students so as to improve self-requirements and reduce learning difficulties, and helps to provide an effective management model for managing university students with learning difficulties. However, the management of students with learning difficulties is a systematic, long-term and repetitive work. The current problems are as follows. i) Most researches emphasize experience description and lack scientific and systematic construction based on empirical investigation; ii) The management of students with learning difficulties shows the periodic, repetitive and individualized characters, and difficulty transformation varies from person to person, time to time, and situation to situation. Differentiation should be considered in systematic research; iii) The performance evaluation of students with learning difficulties lacks quantitative indicators, and the effect are not significant or difficult to measure. It's expected to make further breakthroughs in the above three aspects.
