On the basis of a sample of 115 managers, developers and employees in the national business groups, this study has empirically explored the influencing mechanism of BMIR. The findings indicate that there are significant positive relationships between OL, ED and IA with BMIR. In addition, IA plays a mediator role in the relationship between ED and BMIR, and the SE plays positive moderating role between the ED and BMIR.

Based on the above analysis, policy recommendations and implications are given as follows:

(1) Business group should correctly respond to the turbulence in the macro environment caused by BMI. In the process of business mode innovation, the business group should fully understand the national policy orientation, do a good job in market environment research, understand the current market resource allocation and market structure and other important information, to reduce the

uncertainty caused by information asymmetry and environmental turbulence. Second, enterprises can't stop to strengthen organizational legitimacy, to keep continually response to the macro environment and stakeholder value appeal. Meanwhile, enterprises can develop strategic alliances, corporate social responsibility behavior, to improve its legitimacy and obtain the value identity of key stakeholders such as government, media and the public.

(2) Business group should actively integrate into the industrial environment ecology of BMI. Business group is required to fully understand the industry environment, correctly handle the relationship with stakeholders such as the value chain upstream and downstream. Relevant experience and innovation knowledge can be obtained by conducting a small amplitude, low cost of trial and error learning. Thus, business group could easily identify BMI opportunities, clear strategic positioning and BMI options.

(3) Business group should continuously build BMI internal environment advantages. The enterprise shall carefully sort out its internal organizational structure and institutions, and adopt administrative means such as removal and merger, reorganization and new establishment. An effective platform for technology complementarity and resource sharing among departments should be developed. Enterprise will vigorously foster a good corporate culture, establish strategic alliances with research institutes and research institutions, and properly share the risks brought by the dual capabilities of innovation.

However, the empirical results are derived from a sample of national business groups, hence the findings might be region-specific. Future studies could use samples of business group from other regions or countries to test and expand the generalizations of the findings.

 (E-mail: litianbiao@whut.edu.cn, peonyshen.wh@foxmail.com,  
 867608756@qq.com,785370647@qq.com, jinshan.dai@whut.edu.cn)

**Abstract:** Based on the analysis of apparel e-commerce and existing professional third-party apparel logistics enterprises, this paper found their problems, and put forward the mode of dual pre-strategy of apparel reverse logistics. Combining the operational difficulties of professional third-party garment logistics enterprises with the needs of small and medium-sized garment e-commerce enterprises to improve customer satisfaction. Through pre-testing, shortening the return and exchange period, improving the quality of service; Through pre-processing, on the one hand, it can achieve the Scale Economies Effect of transportation and reduce the transportation cost of reverse logistics in the garment industry; on the other hand, it can classify the returned clothes to obtain the secondary value. Then, the feasibility of the model is illustrated from the perspectives of reducing the transportation cost and increasing the secondary benefits, indicating that the model can solve the problems for both e-commerce apparel enterprises and third-party logistics enterprises when the scale is big enough.

**Key word:** Reverse logistics; Professional garment 3PL; Model construction; Clothing e-commerce

### 1 Introduction

With the continuous development and advancement of Internet technology, the e-commerce industry relying on the Internet platform has also rises rapidly, which has greatly promoted the development process of the Internet era and transferred the consumption habits of most consumers from offline to online, forming a consumption boom of "online shopping for all".

After years of experience in the traditional sales mode, the garment industry has formed a relatively complete offline marketing system and a series of standardized market rules. Although the apparel e-commerce industry is emerging due to its low threshold, high exposure, wide source of customers, low operating costs and other characteristics, it also has many "growth defects" due to the virtual, regional, open and other characteristics of the network. The e-commerce boom has brought about a huge amount of garment commodities in circulation(He Zhenggang, 2018), but at the same time, the number of clothing return and exchange orders is also high, which is fundamentally related to the short popularity of garment, the great difference in consumers' personal preferences, and the lack of unified after-sales processing forms of e-commerce.

Figure 1 The Size of China's Clothing Online Trading Market From 2011 to 2016

At present, there is no systematic academic research on reverse logistics related to garment of returning and exchanging in clothing e-commerce industry, merchants are more relying on experience to handle relevant issues, under such background, because most of the small and medium-sized electric business enterprise lack post-sale experience and hardware facilities. At the same time, because of the high cost of repairing, businesses have to dispose this clothing in the form of waste. This approach not only imposes a certain economic burden on e-commerce enterprises, but also increases the pressure on the overall social logistics operation and causes great waste of social resources. Therefore, at present, the top priority of the e-commerce apparel industry is to build a new model to optimize the return and exchange process of e-commerce apparel, in order to reduce the cost of return and exchange clothing and improve the utilization rate of resources.

At the same time, with the rise of e-commerce apparel industry, some logistics enterprises have also transformed into professional third-party apparel logistics enterprises, providing a series of related logistics and value-added services for apparel e-commerce. However, due to the limited material flow of small and medium-sized garment e-commerce, the service costs are too high for these e-commerce enterprises, so they have to give up professional services. Therefore, professional garment logistics enterprises are faced with the problem of insufficient market development and fewer customers.

This article obtains from the clothing exchange areas of reverse logistics. We researched the existing traditional reverse logistics mode in the current market, finding that long return and exchange period and high cost are two serious problems. So, a new reverse logistics mode, double front of "logistics detecting point and processing center", for clothing e-commerce is put forward aiming at improving consumer satisfaction, and reducing the cost of clothing returning and exchanging and increasing the surplus value of returned and exchanged goods. Meanwhile, it puts forward a new development idea for professional third-party garment logistics enterprises and enhance the overall operation efficiency of China's logistics and improve the utilization rate of social resources.

## **2 Literature Review**

### **2.1 General overview of the development of apparel e-commerce**

Since 2005, as the e-commerce model to mature and apply, e-commerce apparel model has gradually become a way for people to buy clothes on a daily basis. In recent years, with the emergence of a series of e-commerce platforms such as taobao and jingdong, online clothing shopping has become the norm. On December 26, 2016, China e-commerce research center released "The 2015-2016 annual report on China's e-commerce apparel industry". It can be seen from the report that the development of clothing e-commerce has the following trends (Mo Qingqing, 2017):

(1) B2C apparel e-commerce enjoys a strong development momentum

B2C clothing e-commerce development has gradually shifted from PC to mobile, and major shopping apps have seized the mobile shopping market. Since 2015, the amount of mobile transactions has accounted for more than half of the industry's overall sales, and various apparel apps have flourished.

(2) More sophisticated and professional in market segmentation

The era of garment industry with large and complete characteristics has passed. Nowadays, clothing e-commerce has further segmented customer positioning, forming some clothing strategies for a specific customer group, just like personalized customization, single-category clothing stores and high-end brand clothing stores.

At the same time, the rise of major e-commerce platforms has led to the emergence of small and medium-sized garment e-commerce companies, and private and personal clothing e-commerce stores occupy most of the e-commerce interface.

### **2.2 The rise of clothing logistics enterprises**

Due to the different attributes of logistics enterprises serving storage and transportation of clothing, clothing logistics also presents different characteristics.

(1) The enterprise logistics, has great limitations and traditional flavor in the aspect of logistics due to the influence of the traditionality of the clothing industry. As a result, the business of enterprise logistics only includes warehousing and serving as a logistics center, then the mass trunk transportation and terminal distribution are outsourced.

(2) Third-party logistics enterprises can be divided into third-party logistics enterprises that

specialize in clothing logistics and comprehensive logistics enterprises. These enterprises provide standardized product services and professional warehousing business. At the same time, they have a high informatization degree of transportation and a perfect system of storage and distribution.

(3) E-commerce logistics is a logistics system based on e-commerce sales platform. The integration of warehousing and distribution is its outstanding feature. It accelerating the distribution of clothing relies on the rational layout of pre-storage and prediction of Big Data.

(4) Instant delivery is the latest mode to join the apparel logistics industry. It has the characteristics of high efficiency and single productization of distribution. It is an effective means to ameliorate the last-mile problem of garment logistics.

**Table 1 Classification of Clothing Logistics Enterprises**

Category	Characteristics
Immediate delivery	Stores in the front and warehouses in the back Deliver single piece The order failure rate is high
Internal logistics	Traditional attributes Separate trunk transportation and terminal distribution The transportation force is outsourced
Electrical business logistics	High efficiency Using big data to make predictions Integration of warehousing and distribution
3PL	Perfect network system Standardized product Stable transport power

Shanghai chunfeng as a professional third-party garment logistics enterprise which born in the traditional logistics industry, providing services such as distribution of warehouse to store, goods transfer between stores, reverse logistics of returned cloth and garment storage.

However, due to the seasonality, multi-SKU, non-standard, and large changes in the brand and business model of the apparel industry, the business flow itself is unstable. It is difficult for general clothing logistics enterprises to support the logistics solutions for many brands(Yang Chunyan., 2013). There are very few clothing logistics companies in the market that have the ability to handle the logistics operations for more than five brands. Those apparel logistics enterprises only have one-to-one or one-to-two services. Therefore, it is difficult for the clothing logistics market to develop such a professional giant enterprise(Tang Wen., 2018).

### 3 The Mode of Dual Pre-Strategy of Reverse Logistics

In view of the difficulties faced by small and medium-sized clothing e-commerce and third-party clothing logistics enterprises, we propose a “detection + processing” dual pre-mode that combines 3PL and small and medium-sized clothing e-commerce. we combined the business of professional third-party garment logistics enterprise and small and medium-sized clothing e-commerce, proposing a solution to solve the problems such as the long return period of clothing e-commerce, the serious depreciation of clothing, and the third-party clothing logistics enterprises cannot make an economics of scale, the difficulty to expand market.

For small and medium-sized clothing e-commerce, especially for personal online stores, there is only one clothing warehouse which send all the clothing to the country, and the returned clothes are directly returned to the warehouse from various logistics sites. In this case, the distance between customer and the e-commerce is far. After the customer make an application, they needs to negotiate with the after-sales personnel, obtain the return address, and send the clothing back. After the manufacturer checks and confirms and agrees to exchange or refund, they will send out the new clothes or refund. In this mode, it takes 3-6 days to solve the application of customer. Moreover, due to the lack of relevant processing equipment and the high construction cost, the cost of reprocessing a clothes is higher, so most of the clothes are recycled directly as waste fabrics, which greatly reduces the value of the clothes, bringing greater losses to e-commerce. The mode is shown in Figure 2.

Figure 2 Return and Exchange Process in the Original Mode

### 3.1 The structure of the mode of dual pre-strategy

The logistics process involves information flow, material flow, and capital flow. For return and exchange logistic, it is directly related to information flow and material flow. The e-commerce send out new clothes only if they check the returned clothes and make sure that it has the problem which the customer said. The information flow must synchronize with the material flow.

“Dual pre-strategy” means shift the detecting and processing business which process at the warehouse to an earlier date, by this way ,it can save the time of the return and exchange process and realizing the economies of scale. This idea comes from the postponement strategy in industrial production.

The postponement strategy refers to a business strategy that is carried out to reduce the risk of the supply chain system and effectively meet the individual needs of the customer. The company delays part of the production process or logistics business until the customer places an order. The essence is to postpone the customer-oriented production business (all or part of the production process including design, procurement, manufacturing, assembly / assembly, etc.) or logistics operations (including customized packaging, transportation, distribution, distribution processing, etc.) to the time at which receive customer orders or clearly know the requirements. Specifically, postponement strategy can be implemented in the field of production or logistics, in two dimensions, time or space(Hu Jianbo., 2012).

Through the postponement strategy(Gong Bengang., 2002), the manufacture can obtain economies of scale. while in the field of garment reverse logistics, the enterprise is required to respond to the customer requirements as quickly as possible, so the advance strategy in time and space is significant. Through the detection and processing advancement, the reaction time of the reverse logistics chain can be shortened, and the value of the commodity can be improved.

### 3.2 The operation of the mode of dual pre-strategy

In the mode of dual pre-strategy, on the one hand, the inspection function which is set in the manufacturer's warehouse is advanced to the logistics point. When the customer returns the clothing at the logistics site, the clothing will be tested. Then the logistics site will send the test result to the manufacturer, and the cloth will be shipped directly after the result is confirmed by the manufacturer. At the same time, the reverse logistics process will begin and return clothes to the processing center. On the other hand, the function of the manufacturer's processing center will be moved to the regional processing center(Wang Ruiming., 2011), and the clothes will be returned to certain regional logistics points for classification processing. And the processed clothes are packaged and delivered. Through pre-detection, the manufacturer can directly send out the new cloth/refund without waiting for the clothes to return and the test is completed. which can shorten the return period. Through the processing center front, the returning clothes of a certain range of logistics points can be concentrated, which can reduce the transportation cost of a single piece of cloth, and realize the cost saving for the clothing e-commerce through the economies of scale of transportation. Dual-front mode is shown in Figure 3.

Figure 3 Operation Diagram of the Mode of Dual Pre-strategy

### 3.3 Preposition of logistics detection sites based on trust mechanism

In the form of pre-detection, the customer will send the returned clothing to the nearest delivery site, and the quality inspection personnel in the express delivery point will replace the e-commerce to exercise the detection right in advance. After the logistics point detection, the detection result will be given to the e-commerce company by the form of video, photo, etc. After obtaining the test result and confirming it, the e-commerce can carry out the delivery operation without waiting for the return of the returned clothing, which shortens the customer's waiting time, improves the customer satisfaction. This mode separates the information flow that was originally synchronized with the material flow, and sends the detection information to the manufacturer for confirmation in advance. It exerts the information flow's characteristics of fast and timely, advance the delivery and shorten the return time. This mode is shown in Figure 4.

Figure 4 Preposition of Detection Sites

### 3.4 Preposition of clothing reverse logistics processing center based on value-added processing of returned clothing

Set up a regional processing center to concentrate the clothing that was sent back to the manufacturer through the logistics point in the original mode at that site, and classify the returned clothes here. The processing center can be directly constructed by the warehouse which belong to the third-party clothing logistics enterprise. As the intermediate connection point between consumers and clothing manufacturers, it can play the role of time transition and professional garment repair. The shortening of the distance and the improvement of the level of specialization can help to save the relevant returning clothing transportation costs due to returning to the clothing manufacturer, and to generate value for returning the clothes. At this point, the returned clothes are divided into three categories(Li Yaping, 2018): first category clothing is intact but the size and style are not suitable This type of clothing can be sold directly on the original price; the second category clothing needs to be repaired and it can be discounted(Qin Wei, 2014); the third category is a small amount of all the clothing which needn't repair cause it didn't have enough value. By subdividing the categories, the clothing e-commerce can obtain new profits and the "secondary utilization rate" of the clothes is increased(Zhao Xiaohui, 2016). This mode is shown in Figure 5.

Figure 5 Preposition of Processing Center

## 4 Construct the Mode of Dual Pre-strategy

Figure 6 Schematic of the Mode of Dual Pre-Strategy

In order to assist the online retailers to provide return service, we built a mathematical model for the mode of dual pre-strategy.

#### 4.1 Conditions assumption

Considering the complexity of the problem, we abstract the actual situation and make the following assumptions:

- (1) Logistics points are transformed into inspection points by introducing equipment
- (2) The daily return amount of each logistics point is consistent with (0,10) evenly distributed
- (3) The logistics points are evenly distributed in a rectangular area which is centered around the processing center.
- (4) The nature of returned clothing at each logistics point is similar, and the transportation, handling and disposal costs are the same.
- (5) After the clothing is processed, they are transported in batches, 140 pieces per batch.

#### 4.2 Modeling

The subscripts and parameters in the model and their meanings are shown in Table 2 - Table 3

**Table 2 Subscripts And Its Collections**

Letter	Meaning
L	Logistics point
R	Processing center
W	Manufacturer shipping warehouse
B	Discount store
G	Abandoned point

**Table 3 Parameter Symbols And Meanings**

symbol	Meaning
$L_i$	The number of returned clothes at the logistics point
$F_1$	Fixed cost of processing center construction
G	Average cost of sorting each piece of clothing
C	Average repair cost per item
S	Service fee charged by third party for each piece of clothing
$D_{lr}$	Distance from logistics point to processing center
$D_{rw}$	Distance from the processing center to the manufacturer's shipping warehouse
U1	Single piece clothing transportation costs of short-distance transportation
U2	Single piece clothing transportation costs of long-distance transportation
a	The proportion of the first category of clothing selected by the processing center
b	The proportion of the second category of clothing selected by the processing center

Model function:

$$TC = TC_1 + TC_2 + TC_3$$

$$TC_1 = F_1$$

$$TC_2 = \sum L_i D_{lr} U + a \sum L_i D_{rw} U$$

$$TC_3 = \sum L_i G + b \sum L_i C + S \sum L_i$$

TC refers to the total cost of construction and operation of the dual-front mode.  $TC_1$  indicates the fixed cost of construction, and  $TC_2$  indicates the transportation cost of the clothing from the logistics point to the processing center and the processing center to the manufacturer's warehouse.  $TC_3$  indicates the operating costs of processing center.

## 5 Case Analysis

### 5.1 Cost analysis

The total cost of return and exchange in dual-front mode includes the transportation cost of clothing between nodes, the cost of processing center construction/rental, processing center's sorting equipment, processing center sorting clothing, and repairing of the second category of clothing. The specific cost values are shown in Figure 7.

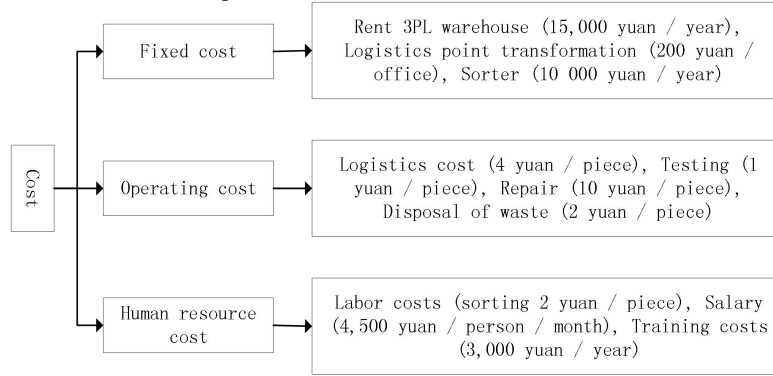

Figure 7 The Mode of Dual Pre-strategy Cost

It is assumed that there are 10 logistics points, and the clothes are returned to the processing center. 2% of all the clothes are not passed and will not be returned. After sorting by the processing center, we assume that there is 40% first category of clothing, 50% second category clothing, and 10% third category clothing. The first category of clothing is transported to the manufacturer's warehouse for sale, and the second and third categories are sold nearby. S takes 1.5 yuan / piece, U2 takes 10 yuan / piece in the original mode. Assume that each piece of clothing is 0.5KG, and each batch of clothing is 70KG. The fixed transportation cost of each batch is 30 yuan, variable cost is 2.6 yuan / KG, the total cost is 212 yuan per batch

We simulated the distribution of logistics points and the distance from the processing center through Excel as shown below. Unit: KM

Table 4 Simulation of Processing Center and Logistics Point Distribution

i	X	Y	X0-X	Y0-Y	X*X	Y*Y	D	X0=5	Y0=5
1	6.456	1.510	-1.456	3.490	2.119	12.180	3.781		
2	7.855	4.792	-2.855	0.208	8.153	0.043	2.863		
3	2.591	7.726	2.409	-2.726	5.085	7.429	3.638		
4	1.540	7.689	3.460	-2.689	11.974	7.231	4.382		
5	6.848	8.826	-1.848	-3.826	3.415	14.638	4.249		
6	4.335	1.429	0.665	3.571	0.443	12.749	3.632		
7	3.209	5.038	1.791	-0.038	3.207	0.001	1.791		
8	6.789	7.637	-1.789	-2.634	3.199	6.592	3.186		
9	7.771	3.749	-2.771	1.251	7.678	1.565	3.040		
10	1.281	1.940	3.719	3.060	13.828	9.364	4.816		

The daily return quantity of each logistics point is generated by random number, and the accumulated of 30 days is regarded as one month return quantity. The processing center processes the clothes, which make a cost. And the specific data is as follows:

Table 5 Operation Data of Logistics Point and Processing Center

i	X	Y	X0-X	Y0-Y	X*X	Y*Y	D	Li	$\sum_{i=1}^{30} L_i$	Pass the test
1	9.255	6.579	-4.255	-1.579	18.106	2.492	4.539	4	81	80
2	5.181	9.038	-0.181	-4.038	0.033	16.305	4.042	2	70	69
3	7.240	2.827	-2.240	2.173	5.016	4.722	3.121	3	67	66
4	3.908	0.145	1.092	4.855	1.192	23.574	4.977	3	85	83

5	5.795	3.840	-0.795	1.160	0.632	1.347	1.407	3	69	68
6	8.056	7.712	-3.056	-2.712	9.341	7.357	4.086	4	55	54
7	5.083	7.464	-0.083	-2.464	0.007	6.069	2.465	5	67	66
8	9.965	1.560	-4.956	3.440	24.646	11.830	6.040	3	70	69
9	9.533	6.632	-4.533	-1.632	20.544	2.663	4.817	0	60	59
10	0.863	8.630	4.137	-3.630	17.118	13.174	5.504	2	75	73
									SUM=700	SUM=686

According to the data, the processing center received 700 pieces of returned clothing in a month, and the logistics point detection cost was 700 yuan, of which 686 pieces were sent to the logistics point, and the cost of the logistics point to the testing center was  $686 \times 4 = 2,744$  yuan. The sorting cost in processing center is  $686 \times 2 = 1372$  yuan, the repair cost is  $686 \times 0.5 \times 10 = 3430$  yuan, and the service fee is  $686 \times 1.5 = 1029$  yuan.

In the dual-front mode, the total cost which include transportation and operating costs is  $700 + 2744 + 1372 + 1029 = 5845$  yuan, and the average cost of one piece of clothing is 8.35 yuan.

In the original mode, the same piece of return clothing is directly sent to the manufacturer's warehouse and the transportation costs of 7,000 yuan, and each piece of clothing costs 10 yuan.

At the same time, for repairing clothes, the resale price is greater than the processing cost, and a certain profit is obtained through low-priced sales.

### 5.2 Income analysis

By subdivision the returned clothing, the benefits for different part in this chain are as follows:

(1) Logistics service income: The logistics service fee charged by the third-party logistics enterprise for the transportation of the returned clothing, re-entry into the warehouse, etc.

(2) Service fee: The third-party logistics company provides venues and equipment for small and medium-sized online retailers, and charges a service fee for each piece of clothing.

(3) Re-sales revenue: For the online retailers, the second-class products that have been classified and processed can still recover the cost through price reduction.

(4) Government subsidies: Under the current policy environment, government departments can allocate certain funds to support reverse logistics enterprises.

For professional third-party clothing logistics enterprises, cause fixed costs such as warehouses, processing equipment, and sorting lines have been invested, the more services for small and medium-sized online retailers, the reverse logistics cost for each unit is lower. It can get a significant effect of the economies of scale and more logistics and service revenue.

## 6 Conclusion

This paper realizes the following highlights by constructing the mode of dual pre-strategy of "detection add logistics": First, the advance of detection will separate the logistics and information flow in the reverse logistics. By sending the information to the manufacturer in advance, it can shorten the return service cycle, and improve customer satisfaction. Secondly, through the establishment of processing points and move it forward, to achieve secondary sales of clothing, improve online retailer's profits and bring operating profits to professional third-party clothing logistics companies. Through the analysis of simulation, it is concluded that through the processing of professional third-party clothing logistics enterprises, when the total processing volume increases, the average processing cost of per piece of cloth will be reduced, and the surplus value of clothing will be effectively discovered, which bringing additional benefits to third-party apparel logistics enterprises and clothing online retailers. There are also some improvements in this paper. For example, it's difficult to ensure that the distribution of logistics points is evenly distributed around the testing center in real conditions. The construction cost of processing center may vary according to the real conditions. The quantity of clothing returned to the logistics point is related to the population and economy nearby. However, it can be expected that for professional third-party logistics companies, it is a development direction to form a service-oriented 4PL model by uniting small and medium-sized businesses.

**Abstract:** In recent years, cross-border e-commerce is in a period of rapid development, and governments and related groups and enterprises of all countries attach great importance to it. At the same time, the development of cross-border e-commerce has also led to the development of a series of related industries. Among them, the impact of cross-border logistics supply chain is the most profound. As the influence of e-commerce in China continues to increase, it is very important to conduct a comprehensive system research, especially to analyze the synergy between cross-border e-commerce and logistics supply chain optimization. Based on the analysis of the mechanism of cross-border logistics coordination, the optimization of cross-border e-commerce logistics supply chain system, and the current situation and problems, this paper starts from multiple angles to ensure that there can be cross-border logistics and e-commerce. Better development, including improving the synergy and mutual trust mechanism, improving the government's service system, optimizing reverse logistics and the coordination of dry wells. At the same time, it points out the future research direction of cross-border e-commerce and logistics development, and provides reference for the research on synergy between cross-border logistics and e-commerce in the future.

**Keywords:** Cross-border e-commerce; Collaborative model; Supply chain; Cross-border logistics

### 1 Introduction

According to the big data of Alibaba Cloud in 2018, in 2016, China has reached an overall scale of 6.3 trillion e-commerce, an increase of 23.5% compared with last year, and has grown to 8.9 trillion yuan in 2018. With the rapid development of cross-border e-commerce, cross-border logistics has also developed rapidly, and the high efficiency of cross-border logistics has become one of the most powerful guarantees for cross-border e-commerce. The relationship between the two is dynamic. (Zhang Baoming, Zhou Peifeng, Meng Ling, 2014) It is complicated. With the development of cross-border e-commerce industry, there are also national policies that are constantly demanding, and the difficulties encountered in the actual negotiation between cross-border logistics and e-commerce, which make cross-border logistics and electricity the synergistic development between the two has become the main development trend in the future. (Liu Yousheng, Chen Yibin, 2016) By optimizing and selecting the logistics supply chain system in cross-border e-commerce, the synergy between the two can maximize the logistics structure and minimize the operating costs to improve the core competitiveness of the company.

Compared with the existing domestic e-commerce, cross-border e-commerce is characterized by a

long supply chain, and logistics plays a very important role in its development process. They constantly interact with each other and promote each other's development. (Zhang Xiaoheng, Guo Hailing, 2016) Based on the theory of supply chain, this article analyzes the development status of cross-border e-commerce and cross-border logistics, and discusses the dilemma of cross-border logistics and cross-border e-commerce collaborative development, aiming to further research and Cross-border e-commerce development and coordinated cross-border logistics service chain development issues.

## **2 Research Status of Cross-Border Logistics Development**

As far as cross-border logistics is concerned, because cross-border logistics crosses borders in the process of transportation, it will not only involve the links of commodity inspection and customs clearance, but also the level of infrastructure, logistics resources and logistics level of cross-border countries. (Wang Chunzhi, Gao Qiang, Heiko Gebauer, 2015) The legal policies and so on have a lot to do with it. In the face of different language cultures, legal systems and various technologies, the unmanageable and complex nature of cross-border logistics has increased. Due to the influence of network information, law, technology and other differences among cross-border countries, for the time being, cross-border logistics still cannot complete the entire process to be queried and traceable, which leads to a very poor user experience. From the chain of goods circulation analysis, in many complex links, the most critical links for cross-border logistics are collection, warehousing, commodity inspection and customs clearance, international delivery, and final delivery.

Looking at the world, the development between countries and countries is not the same. As far as Russia is concerned, its domestic rail standards are different from those of other countries. Cross-border logistics requires the transfer of goods at the border during the operation of Russia, which leads to low efficiency and increased costs. Australia's location in the Pacific Ocean, which is not directly bordered by other countries, has led to certain restrictions on the development of cross-border logistics. International multimodal transport is more frequent, and the probability of damage to goods will rise linearly. (Ji Fang, Zhang Xiaoheng, 2015)

Another unavoidable problem in the development of cross-border e-commerce is reverse logistics. Negative logistics occurs because of errors in the distribution, problems with the quality of the goods, and returns from the logistics itself. (Yao Yu, 2015) The emergence of such a situation is often accompanied by huge losses and risks, especially when the goods need to return to the exporting country, in which case the cost of logistics has far exceeded the value of the commodity itself.

In recent years, China has experienced rapid development in cross-border logistics, but for those engaged in related work, this is still a new and unfamiliar field, and there are many problems that need to be solved.

- (1) National policies do not support cross-border e-commerce logistics sufficiently;
- (2) backward logistics infrastructure;
- (3) Low cross-border logistics distribution capacity;
- (4) Lack and imperfection of the third-party logistics system.

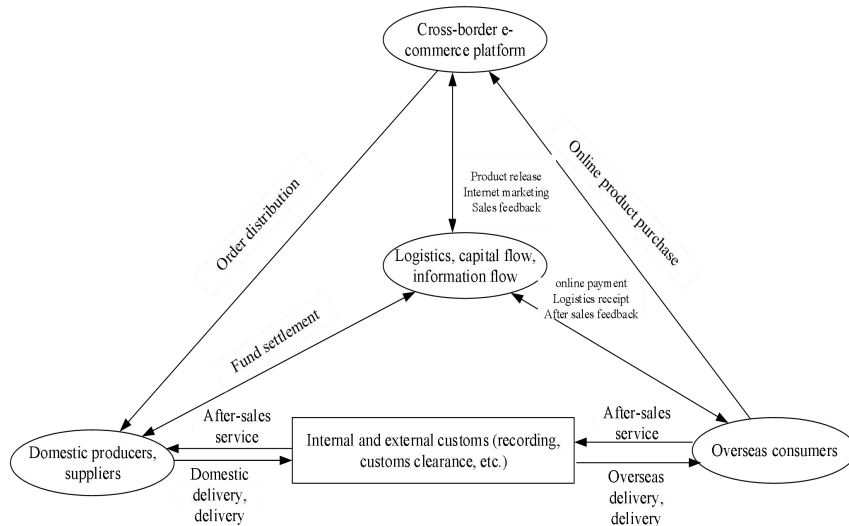

Figure 1 Cross-Border E-Commerce Flow Chart

### 3 Analysis of the Synergy Dilemma of Cross-Border E-Commerce Supply Chain

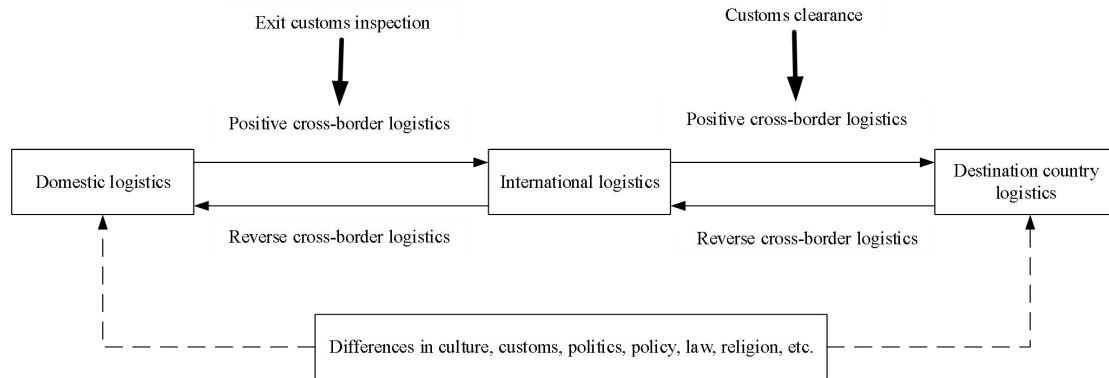

The development of cross-border e-commerce in China has experienced three major stages, namely, the budding period from 1999 to 2007, the development period from 2008 to 2013, and the outbreak period from 2014 to the present. At present, there are more than 5,000 cross-border platform enterprises in China. More than 200,000 foreign trade enterprises have been adopted through the platform, and 11 free trade zones have been built. Cross-border e-commerce has been set up in 12 cities including Tianjin. Comprehensive test area. At present, most of the enterprises engaged in cross-border e-commerce and logistics in China are mainly based on a dedicated line or special business. (Qian Huimin, He Jiang, 2016) They cannot achieve a comprehensive and efficient service system, resulting in the inefficient use of resources in all aspects, including Information, logistics, and funding, etc. In reality, there are many difficulties in achieving synergy between cross-border logistics and cross-border e-commerce. Here are a few key aspects:

(1) The lack of synergy between cross-border logistics and cross-border e-commerce. In recent years, the development of cross-border logistics is in a very backward situation compared with cross-border e-commerce. The two are not perfectly coordinated in terms of the size of the scale of development, the level of informatization, the state of infrastructure, and the service standards in the industry.

(2) Lack of mutual trust and cooperation mechanism. On the one hand, cross-border logistics companies cannot obtain the latest data of cross-border e-commerce in a timely manner, resulting in no scientific basis for the design of overseas warehousing systems and the scale of their scale, nor can they be targeted at the user base of cross-border e-commerce. (Fan Jing, Yuan Bin, 2018) The targeted construction of the logistics system is a serious waste of a lot of resources. On the other hand, cross-border e-commerce parties do not know the size of cross-border logistics and the maximum extent it can withstand, and cannot obtain accurate information and content of relevant distribution networks. Without understanding the human and material resources of the enterprise and the service scope of the outlets, the distribution capacity will be very low, and the consumer experience and service sense of the logistics service will be reduced.

(3) The system of cross-border logistics networks lacks synergy. The network system of cross-border logistics includes three large blocks, namely domestic logistics, destination country logistics and

international logistics. (Liu Xiaojun, Zhang Bin, 2017) The cross-border logistics system not only needs to coordinate the domestic system and the overseas system, but also the quality supervision department and customs of the cross-border countries. In addition, it needs to deal with issues such as long process, many links and large space span. As shown in Figure 2, from the perspective of the service network level of cross-border logistics, there are many links in the cross-border logistics network system, and there is often a serious lack of coordination between each link.

**Figure 2 Cross-Border Logistics Flow Chart**

#### **4 Cross-Border E-Commerce and Cross-Border Logistics Synergy Strategy**

##### **(1) Improve the government support service system**

The government plays a very important role in supporting and guiding the collaboration between cross-border logistics and cross-border e-commerce. (Lu Guohong, 2016) It can mainly promote cross-border logistics through the following four aspects. First, improve government resources and policy support system. Relevant departments of the Chinese government have issued a number of regulations to promote the coordinated development of cross-border logistics and e-commerce. However, cross-border e-commerce industry is still in its infancy in China, and further improvement will ensure better coordinated development of cross-border logistics and e-commerce. (Li Xudong, Wang Yaoqiu, 2018) Second, strengthen infrastructure construction. Support the development and innovation of Internet, broadband and other information technologies, and put them into practice in cross-border e-commerce industry, so as to promote the same level of information between cross-border logistics and e-commerce and ensure the synchronization of real-time information in all links. Third, vigorously promote the development of cross-border e-commerce industrial park. China established the first cross-border e-commerce industrial pilot park in Hangzhou in 2013, and the industrial park model entered a new stage. Cross-border e-commerce is very beneficial to the integration of traditional foreign trade, so as to form the scale and clustering of the industry and promote the more efficient coordination between cross-border logistics and e-commerce. Fourth, establish a comprehensive cross-border logistics service platform. Further consolidation by cross-border logistics system, and based on big data, Internet and artificial intelligence and other advanced technology to build a comprehensive service platform, together will be tactical, strategic layer and business layer to strengthen synergies, while promoting cross-border logistics network system of vertical and horizontal synergies, ensure better platform process and business integration and innovation, thus further realize express delivery, freight and other logistics and cross-border business integration between electricity, will eventually cross-border logistics and electronic business in each country and the process of synergy ascension.

##### **(2) We will improve the mechanism for mutual trust and coordination of interests**

Mutual trust between cross-border logistics and e-commerce mainly involves benefits, cooperation and capital turnover. Reasonable profit distribution mechanism is the fundamental guarantee for good cooperation and coordination. (Placzek E, 2010) The distribution scheme of benefits and cooperation can be completed and formulated under the guidance of the government and relevant departments, and the established institutions can be complete and achieve win-win goals. What is built must be a solid system with government guarantee. In terms of the distribution of benefits and the turnover of funds, in order to avoid unfair distribution, a third party can be appropriately introduced as an intermediary to maintain and manage funds through its platform, so as to further promote the rationality, fairness and transparency of the distribution of benefits. (Power T, Jerjian G, 2001) At the same time, the government and relevant departments should put forward more preferential policies, and the corresponding laws and regulations should also be improved and issued. This can give the two parties the maximum degree of mutual trust to ensure the sharing of information and resources.

Cross-border e-commerce can take supply chain synergy. Through revenue sharing in the contract, the supplier is given the benefit at the appropriate ratio in exchange for raw materials with lower price. In purchasing, lower price can get more market share and increase the benefits of cross-border e-commerce. At the same time, the economic benefits brought by the substantial increase of sales volume can enable suppliers to get more profits and returns. The strategy of supply chain synergy can also help reduce the price in the market, which is very beneficial to the development and competition of cross-border e-commerce in the market.

### (3) Optimize the collaboration between cross-border e-commerce and reverse logistics

Reverse logistics can be divided into two types, namely, reverse logistics of waste and recycling and reverse logistics of return of goods. In this paper, the logistics process caused by consumers of cross-border e-commerce returning goods to the origin of products, as opposed to forward logistics, is mainly targeted at. The rapid development of cross-border e-commerce has not only brought great development space to the logistics market, but also improved the efficiency of reverse logistics and reduced its costs, and put forward higher requirements for the development of logistics. (Quinn F J, 1997) Meanwhile, efficient and reasonable reverse logistics also ensures cross-border e-commerce can develop at a higher speed, further shorten the time of returning goods between consumers and sellers, further improve the mechanism of inventory management, and improve the quality of relevant management. If we want to solve the difficulties in the collaborative development of reverse logistics and cross-border e-commerce, from the perspective of cross-border e-commerce, we can further reduce the return rate by optimizing the cost performance and quality of goods at the front end of the supply chain. From the point of view of logistics, the mechanism of return insurance should be introduced to further minimize the loss.

### (4) Promote synergy between cross-border e-commerce and traditional foreign trade

To promote coordinated development between the traditional foreign trade and cross-border electricity, must constantly innovate new sales model, the whole channel sales model to build, in order to further promote the development of the cross-border electricity, electricity and the traditional foreign trade both offline and online are able to do better together, will eventually cross-border electricity to the new and changeable, direct the development of the road and continuously. (Sanders N R, 2007) Is analyzed from the Angle of macroscopic, need to the relevant laws and regulations to further improve and strengthen the regulation, and to the construction of infrastructure to further strengthen, constantly optimize the credit system of logistics and service system, and constantly trying new ways of the traditional collaborative development between foreign trade and cross-border electricity one step closer to optimization. Is analyzed from the Angle of microcosmic, cross-border electricity producers should

constantly will strengthen its core competitiveness in the market, constantly on technical innovation, ensure the quality of logistics service innovation and system, and further strengthen the social cooperation and division of labor, the enterprise to establish and perfect the core team, only in this way can make the traditional trade and cross-border electricity have better coordination between development.

(5) Facilitate the coordination of subsystems and multiple bodies

Only multi-dimensional cooperation can ensure the normal development of cross-border e-commerce. On the one hand, the functions of each subsystem must be fully stimulated to make them cooperate and develop together; On the other hand, national policies and departments are also needed for in-depth cooperation and collaboration. In the aspect of talent cultivation, not only the government and universities should be promoted to increase the contact, but also major enterprises should cooperate with universities to cultivate professional talents with diversified knowledge. (Simatupang T M, Sridharan R, 2005) In the market, we need to maximize the role of resource allocation.

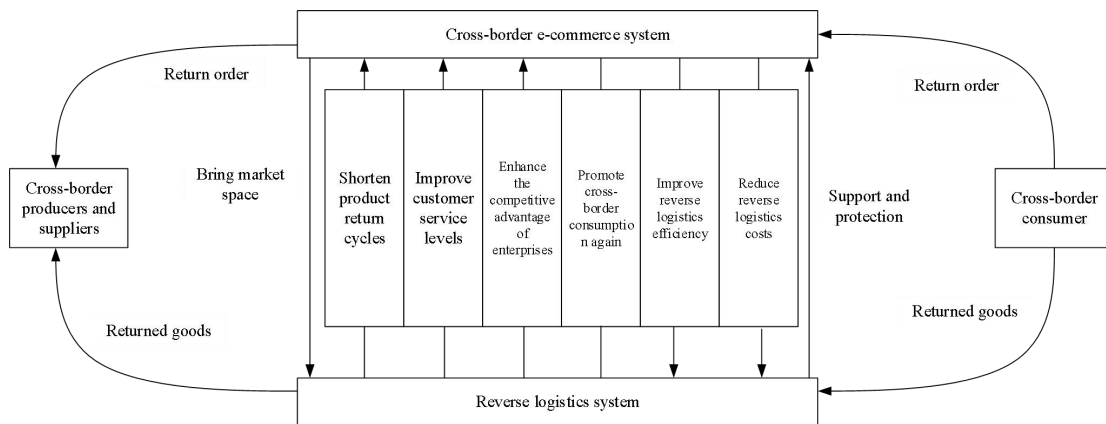

Figure 3 Synergy Diagram of Cross-Border E-Commerce and Reverse Logistics Supply Chain

5 Conclusion

At present, the world has been moving towards economic integration, so cross-border e-commerce slowly wake up from a sleepy state, and is rapidly developing. At present, cross-border e-commerce is still in the infancy stage of development. Although it is highly concerned by various fields, there are relatively few researches on it and reliable results, and some of the research results are not mature and systematic enough. In a word, cross-border logistics and cross-border agents are closely related to each other. Both sides influence each other and continuously promote each other's development. This article through the contrast analysis, for the present the problems put forward the corresponding measures, the research content is to promote the coordinated development of both B2B and B2C mode, with the help of the third party logistics to ensure efficient supply chain resources integration, to further promote the development of the localization of cross-border logistics and electronic business, promote operation, logistics and distribution patterns of innovation, and ultimately to the collaborative strategy is perfect.

# Regional Difference Analysis of Logistics Industry Service Innovation Capability in Hubei Province of China: Based on Porter's "Diamond Model"

Lv Yuejiao, Liu Mingfei

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: lvwhut@126.com, Liumingfei5223@163.com)

**Abstract:** Based on the understanding of service innovation as an important way to enhance the core competitiveness of modern logistics industry, the evaluation index system of service innovation ability in Hubei Province of China is constructed by using the theory of service innovation and the theory of Porter diamond model and combining the development status of the service ability of logistics industry in Hubei Province of China. At the same time, Principal Component Analysis and Cluster Analysis were used to evaluate the regional differences in service innovation capabilities of the 17 cities and states in Hubei Province of China in 2017, and accordingly, relevant countermeasures were proposed for the service innovation capability of logistics industry in Hubei Province of China.

**Key words:** Regional logistics; Service innovation; Diamond model; Regional difference

## 1 Introduction

Hubei Province of China pays attention to the development of the logistics industry and continuously promotes the modernization of the logistics industry. In the process of logistics modernization in Hubei Province of China, service innovation plays an important role as the key path. Logistics service innovation refers to the innovative behaviors and activities that logistics enterprises invest capital and personnel to develop new products, new technologies and new services to increase service content, improve service quality and service efficiency, and create value (Bin Hu, 2013). The improvement of logistics service innovation ability is conducive to the formation of differentiation advantage, breaking through the existing development bottleneck, so as to reduce logistics costs, enhance the core competitiveness of enterprises, and realize the sustainable development of logistics industry and the transformation to "modern logistics".

At present, the research results of domestic and foreign scholars on the evaluation index system of logistics industry service innovation ability mainly involve two levels: logistics industry and logistics enterprises (Zhang Minjie, 2018). The two levels contain multiple angles. (1) Input and output angle: (Shen Jing, Zhai Ruili, Chen Zhonghua, 2016) constructs the evaluation index system of China's logistics industry service innovation capability from the three criteria of innovation investment, innovation output and innovation environment. (2) The ability to integrate Angle: (Pimden Hertog, Wietzevander Aa, Mark W.d eJong, 2010) focus on the service ability of product innovation, service innovation capability into six dimensions, determine the dynamic capability of a set of service innovation, including customer demand insight and the choice of technology, service conceptualization ability, ability to service

composition and split and common production and arrangement ability, service scope expansion and extension of ability, ability to learn and adapt. (3) Innovation motivation: (Yang liyun,2018) made an in-depth analysis of the impact on the performance of logistics enterprises from the internal and external environment of logistics enterprises. (4) Innovation process perspective: from the perspective of service innovation process, (Tao Yan, Zhou Dan,2014) constructed an enterprise service innovation ability evaluation system including four dimensions of service development capability, service production capability, service marketing capability and organizational support capability. (5) The knowledge outlook enterprise perspective: (Gallouj,2009) has the ability to form a “knowledge base” and the ability to form an “experience base” as two types of service enterprises.

Based on the service innovation as an important way to improve the core competitiveness of modern logistics industry, this paper uses the service innovation theory, Porter diamond model theory, combined with the development status of Hubei logistics industry service capability, and builds the evaluation index system of service innovation ability of Hubei Province of China.

## **2 Theoretical Basis and Research Hypothesis**

### **2.1 Model construction**

Compared with the traditional logistics industry, modern logistics service innovation has the following characteristics: (1) Open innovation. In an open innovation environment, it emphasizes breaking the boundary of the industry (Wang Kun,LuoWenping,2015) and integrating innovation resources, and a single static resource is integrated to achieve its dynamic. (2) Technological knowledge innovation ability. At present, the logistics industry is in a transitional period, and it is making a transition from traditional logistics to modern logistics with the help of service innovation capability. The ability of technological knowledge innovation plays a more important role (Liu Mingfei, Zhou Wei,2008). (3) Regional differences. Different regions have different resources, and resources are scarce. When developing the modern logistics industry, the government should effectively identify, distinguish the levels of each region, allocate resources effectively, and equip them with the capabilities and facilities (Wang Jian, Liu He,2014).

Porter (1990) introduced the diamond model to test the industrial competitiveness of a country. According to porter's diamond, the four attributes of a country fundamentally determine the competitiveness of a country or an industry at the microeconomic level. The diamond model is composed of four factors of production, including market demand, related industries and enterprise strategy, while opportunity and government are two major variables of the diamond model. Based on the diamond model and the characteristics of logistics industry service innovation, this paper constructs a new diamond model of logistics industry service innovation capability. Compared with the influence of corporate strategy on the service innovation ability of logistics industry, the role of technological knowledge innovation ability is more obvious. At the same time, this paper mainly analyzes from the industrial level, pays more attention to the practical significance of the government perspective. Therefore, the technological knowledge innovation ability is replaced by the enterprise strategy in the diamond model.

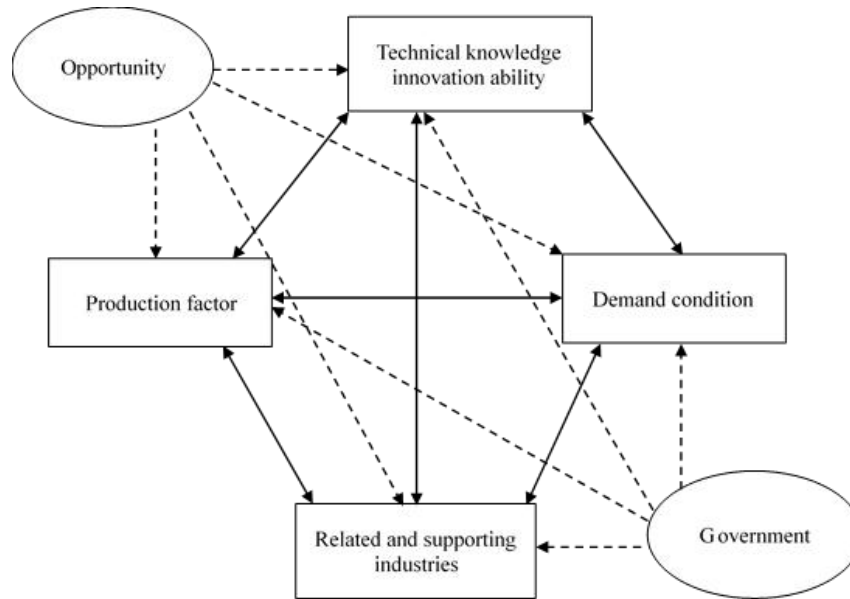

Figure 1 Improved Diamond Model

2.2 Establishment of the evaluation index system

In order to scientifically and reasonably analyze the regional differences in the service innovation capability of logistics industry in Hubei Province of China, the diamond model has been improved according to the characteristics of logistics service innovation capability. Based on the improved diamond model and service innovation theory, the evaluation index system of logistics industry service innovation ability is constructed.

Table 1 Evaluation Index System of Logistics Industry Service Innovation Capability

Primary indicator	Secondary indicators	Three-level indicators	Indicator measurement method	
<b>X1</b> <b>Innovative resource integration capability</b>	Innovation investment	Logistics infrastructure resources investment	Transportation warehousing and postal industry fixed assets investment	
		Logistics information resource investment	Fixed assets investment in information transmission, software and information technology services	
		Logistics human resources investment	Number of people employed in transportation, warehousing and postal services	
	Innovative output	Logistics infrastructure resource output		Number of logistics parks Cargo transportation volume Cargo turnover
			Logistics information resource output	Number of Internet access households

		Logistics human resource output	Average annual salary of employees in transportation, warehousing and postal services
<b>X2</b>	Innovation investment	Logistics R&D investment	R&D expenditure internal expenditure
			Total number of R&D personnel
	Innovation environment	The situation of regional logistics education	Ordinary institutions of higher learning
			Educational expenditure
			High-tech industry added value
			Number of high-tech enterprises
	Innovative output	Patent, scientific and technological achievement	Number of patent applications
			Number of patent licenses
<b>X3</b>	Environment system	Policy Support	The government issued corresponding policies
	Market environment	Supply environment	Transportation warehousing and financial investment in the postal industry
			Highway mileage
			Total post and telecommunications business
	Demand environment		The total retail sales of social consumer goods
			Total foreign trade import and export
			Industrial output
			GDP

The indicator system includes three first-level indicators: innovation resource integration capability, technological knowledge innovation capability, and innovation environment coordination capability. The ability to integrate innovative resources should not only reflect the investment of innovative resources, but also the output of using innovative resources, emphasizing the efficiency of service innovation capability. For this reason, two levels of innovation input and innovation output are selected for measurement; technical knowledge innovation the ability selects three secondary indicators of innovation input, innovation environment and innovation output for measurement; the innovation environment coordination ability selects two secondary indicators of institutional environment (macro) and market environment (micro) for measurement.

### 3 Date and Methodology

#### 3.1 Data collection

This paper takes the specific situation of logistics industry development in 17 cities of Hubei Province of China as the data source. The “Statistical Yearbook” of each city, as well as the government report and the China Economic and Trade Network statistical database are the main data acquisition channels.

#### 3.2 Data analysis

##### (1) Reliability and validity test

In order to reduce the impact of the original data dimension inconsistency on subsequent analysis, the sample data is dimensionless before the factor analysis. The validity of the original data is then checked by KMO test and Bartlett sphere, ensuring that the data can be factored and the results of Table 2 are obtained.

**Table 2 Tests by KMO and Bartlett**

<b>KMO VALUE</b>		<b>0.838</b>
<b>BARTLETT SPHERICITY TEST</b>	approximate chi square	167.06
	Df	28
	p value	0

##### (2) Evaluation of Logistics Industry Service Innovation Capability in Hubei Province of China

**Table 3 Variance Interpretation Rate**

Numbering	Characteristic root	Variance interpretation rate%	Cumulative %	Characteristic root	Variance interpretation rate%	accumulation%
1	5.991	74.885	74.885	5.991	74.885	74.885
2	1.068	13.35	88.236	1.068	13.35	88.236
3	0.579	7.244	95.479	-	-	-
4	0.165	2.063	97.543	-	-	-
5	0.085	1.068	98.611	-	-	-
6	0.066	0.827	99.437	-	-	-
7	0.03	0.372	99.81	-	-	-
8	0.015	0.19	100	-	-	-

It can be seen from Table 3 that after comparing the eigenvalues of the factors, the cumulative contribution rate of the first two principal components is found to be 88.236%, so the main factors are  $F_1$  and  $F_2$ . By calculating the coefficients of each of the two principal components, the formula for calculating the scores of the principal components is obtained:

$$F_1=0.156X_1+0.157X_2+0.161X_3+0.079X_4+0.159X_5+0.164X_6+0.162X_7+0.087X_8$$

$$F_2=0.159X_1-0.219X_2+0.046X_3+0.659X_4+0.075X_5-0.009X_6-0.026X_7-0.648X_8$$

According to the weighting weight of each principal component's variance contribution rate calculated by the contribution rate of all principal component variances, the evaluation formula of logistics industry service innovation input index of 17 cities in Hubei Province of China can be obtained:  $A_1=0.849F_1+0.151F_2$ , using the same the method calculates the technical knowledge innovation ability index and the innovation environment coordination ability index evaluation formula:  $A_2=F_3$ ,  $A_3=0.828F_4+0.172F_5$

#### 4 Results

According to the scores of the three dimensions of logistics service innovation ability of Hubei Province of China, the comprehensive score of Hubei Province of China's logistics industry service innovation ability is calculated by a certain weight (Table 4).

**Table 4 Regional Difference Factor Score, Comprehensive Ranking and Cluster Results of Logistics Industry Service Innovation Capability in Hubei Province of China**

Area	A1	A2	A3	Total score	Total ranking	Clustering
Wuhan	3.026	3.704	3.098	3.312	1	1
Fuyang	0.429	0.505	0.381	0.450	2	2
Yichang	0.505	0.426	0.385	0.450	3	2
Yellowstone	0.221	-0.127	-0.005	0.036	4	3
Jingzhou	0.200	-0.112	-0.091	0.017	5	2
Huanggang	0.203	-0.252	-0.110	-0.042	6	2
Jingmen	-0.278	-0.138	-0.232	-0.213	7	3
Shiyan	-0.258	-0.290	-0.049	-0.229	8	2
Xiaogan	-0.348	-0.177	-0.232	-0.256	9	3
Xianning	-0.258	-0.330	-0.275	-0.290	10	3
Enshi	-0.302	-0.368	-0.183	-0.305	11	3
Suizhou	-0.485	-0.402	-0.146	-0.384	12	3

Tianmen	-0.578	-0.503	-0.509	-0.534	15	3
Xiantao	-0.564	-0.535	-0.502	-0.540	16	3
Shennongjia Forest Area	-0.743	-0.566	-0.551	-0.634	17	4

It can be seen from Table 4 that the service innovation ability of logistics industry in 17 cities and counties in Hubei Province of China is from high to low: Wuhan, Fuyang, Yichang, Huangshi, Jingzhou, Huanggang, Jingmen, Shiyan, Xiaogan, Xianning, Enshi, Suizhou, Ezhou, Qiang Jiang, Tianmen, Xiantao, Shennongjia Forest Area.

### 5 Conclusion

By comparing the results of the above factor analysis and cluster analysis, it is found that the ranking of factor analysis scores of the overall city and state has a good consistency with the ranking of cluster analysis results. Only the ordering of Huangshi City and Shiyan City has a certain way out, indicating the above analysis. Effectiveness. According to the above factor analysis and cluster analysis results, we divide the logistics industry service innovation ability of 17 cities and counties in Hubei Province of China into the following four levels: (1) The first level of service innovation ability is strong and belongs to the leading area; (2) The second level of service innovation ability is general, belonging to the follow-up area; (3) the third level of service innovation ability is weak, belonging to the enhanced area; (4) the fourth level of service innovation ability is very weak, belonging to the help-oriented area. The results of hierarchical division are shown in Table 5.

**Table 5 Hierarchical Clustering Results of Service Innovation Capability of Logistics Industry in Hubei Province of China**

Ability	Clustering	Quantity	Inclusion area
Strong	I	1	Wuhan
General	II	5	Xiangyang, Yichang, Jingzhou, Huanggang, Shiyan
Weak	III	10	Huangshi, Jingmen, Xiaogan, Xianning, Enshi, Suizhou, Ezhou, Qianjiang, Tianmen, Xiantao
Very weak	IV	1	Shennongjia Forest Area

(1) Category I area: The logistics industry has the strongest ability to innovate in the category I area. Wuhan leads the other cities with a score of 3.312. As a provincial capital, Wuhan is leading the way in service innovation investment, output and support. Wuhan should play the radiation role of the city circle and drive the development of logistics service innovation in surrounding cities.

(2) Category II area: The logistics industry has a strong ability to innovate in logistics services in the category II region, with a strong catch-up situation. While maintaining the scale effect, the service innovation ability of the logistics industry should be continuously strengthened from the aspects of technology, talent and management to improve the technical efficiency.

(3) Category III area: The logistics service capacity of the category III area is weak. The overall advantages of the 10 cities in the region are insufficient, but the advantages in some aspects are very obvious, and further development can be achieved through further strengths and weaknesses. Due to problems such as backward economic development, low technical level and lack of professional talents in the region, relevant input should be strengthened.

(4) Category IV area: The logistics service capacity of the category IV area is very weak. The Shennongjia forest area is subject to restrictions such as low level of economic development and shortage of resources, and its service innovation capability is weak. The government should correctly evaluate the advantages and disadvantages of its logistics industry as well as the changes in the external environment to accurately help its development.

**Abstract:** The incubator's promotion of entrepreneurial development and the help of N.E. growth make its research have a strong practical significance. At the same time, concern for the sustainability of incubator development, the core of the problem lies in the ability to configure their incubator resources, that is, the level of incubating-efficiency. By DEA, In-depth interviews to discuss the situation in Beijing sci-tech business incubator, as well as four generations and five functional influencing factors on incubating-efficiency and the improving path of the sample derived from the incubator in China, which proposed a new hierarchical model and incubation Strategies for improving of incubating-efficiency.

**Key words:** Sci-tech business; Incubator; Innovation economy; DEA; Incubating-efficiency

## 1 Introduction

In today's world, with the continuous development of information, network, globalization, high-tech industry promoting sustained and rapid economic growth has become the trend of global development. Under such a trend, how to realize the fast innovation of sci-tech achievements commercialization industrialization, how to support high-tech new ventures effectively, has become a major problem in countries in the formulation of sci-tech progress plan and high technology industry development needs to platform (Duanyang Ren, 2015).

Business incubator is a specialized system which designs and operates the new support to sci-tech business. This concept was originally produced in the United States in the fifty's of last century. In our country, sci-tech business incubator is also known as the high-tech business service center (D. Patten, Danny P., 2009, 2011). Since the birth of the first sci-tech business incubator in Wuhan, China's sci-tech business incubator has achieved a healthy and rapid development (Beverland, 2013). According to statistics, as of the end of the year, China's sci-tech business incubators have been to 1000. China has become a big country of incubator. At the same time, due to various reasons, the current in the sci-tech business incubator of the relevant theoretical research or practical operation, there are many shortcomings and deficiencies, and the advanced level of foreign countries and a certain gap (Sean M., 2014).

In the concept of sci-tech enterprise incubator, the researchers have made many theoretical and practical aspects of the research in the decades (Diane A., 2013). At present, the domestic scholars have carried on the comparatively deep research to the sci-tech business incubator and its management, the

government function, the performance evaluation research and the operating mechanism, but in the sci-tech business incubator's business operation pattern, the network system construction and the management pattern, the incubation power promotion researches and so on, also lacks of system research, waits for the innovation (T. K. Gibson, 2013).

The development and the rise of sci-tech enterprise incubator is the inevitable requirement for the development of new sci-tech revolution. By providing research and development, production, management of the site, communication, network and office facilities, the system of training and consulting, policy, financing, legal and marketing and other aspects of support, sci-tech enterprise incubator can effectively reduce the venture and venture capital, improve the survival rate and success rate (Aberg, 2013). The experience of sci-tech business incubator in China has more than 20 years' experience. As a bridge between knowledge innovation and sci-tech enterprise, it can realize the industrialization of sci-tech achievements and promote the development of sci-tech enterprises, especially in small and medium sized enterprises.

At the same time, due to the late start of the sci-tech enterprise incubator, the relevant research is not perfect, and the vast majority of sci-tech enterprise incubator has a quasi-government background, many sci-tech enterprise incubator is not reasonable, the strategic positioning is fuzzy, the incubation efficiency level is not high, the related value-added services is limited, and other aspects of the problem (Beelitz, 2012). Through sci-tech enterprise incubator operation innovation research, it can effectively solve the problems in development, and promote the healthy and sustainable development of sci-tech business incubator in china.

## 2 Efficiency Measurement and Morphological Clustering Analysis of Science and Technology Business Incubator

With the rapid expansion of the number and scale of the sci-tech enterprise incubators in China, it has caused more and more attention. There are a lot of researches on the performance evaluation of the business incubators in China, but they are not combined with the incubator. The so-called efficiency, that is, to achieve a predetermined target. If the target of a business incubator is not clear, how to measure its efficiency? However, because of the special circumstances of the business incubator, the target of each incubator is different. A business incubator has multiple targets (Beverland, 2013). Therefore, this paper measures the incubating-efficiency of five of the most common incubating targets (functional dimension), and to explore the actual incubating behavior and morphology. Figure 1 Is

national incubator number growth curve chart from 1995 to 2012.

ve chart

**Figure 1 National Incubator Number Growth Curve Chart from 1995 to 2012**

Investors want to know whether the input is effective or not, policy makers would like to know how the technology business incubator has a real impact on the transformation of sci-tech achievements,

the development of sci-tech industry and the development of regional economy and society; Small and medium sized enterprise more need to know whether the light of technology enterprise can really promote its growth, the alternative of the technology enterprise's performance how to get drunk, what function is better. Nonetheless, there is still no convincing evidence that the Chinese tech business incubator has a good performance. Therefore, based on the different functional dimensions, it has very important practical significance for the Chinese sci-tech enterprise incubator to carry on a more detailed efficiency measure.

## 2.1 Model construction

The most common five functional dimensions of sci-tech enterprise incubator, including business incubator, technology, innovation, incubator, regional employment and regional economic dimension (Wen-Bo Wang , 2013). Specifically, the dimensions of corporate entrepreneurship is sci-tech business incubators new ventures to enhance the survival and development, and the cultivation of innovative entrepreneurs, which is enterprise of sci-tech incubator the most basic function. Technology transfer and innovation dimension is the function of incubator in technological innovation. This is one of the most important functions of the technology business incubator, including technology transfer and commercialization. Incubators profitability dimension refers to whether the sci-tech business incubator can achieve self-supporting profit, shows that the business incubator can be normal, continuous operation. The dimension of regional employment is the social function of the business incubator, which is mainly reflected in the increase of social employment and so on. Regional economic dimension is the function of the local government in particular emphasis. As an important policy tool for the government, a lot of business incubators in the establishment of the original intention is used to increase the local financial revenue, the revitalization of the regional economy (Zhenfeng Ge, 2018).

## 2.2 Research method

Efficiency is a relative concept, which is different between the actual and potential of the unit. The gap is small, that is closer to the maximum output, the higher technical efficiency, otherwise efficiency is low. The curve of the maximum output is called the production possibility. The distance between production possibility and boundary is closer, then the efficiency is high, otherwise the efficiency value is low. In this paper, the national sci-tech business incubator is considered as a decision-making unit. These resources and the utilization ratio of the business incubator determines the maximum output of the business incubator. If the actual output of the business incubator is equal to the maximum output, it is considered that the activity of the incubator is efficient, and vice versa.

At present, there are two main methods to measure the efficiency: parametric method and non-parametric method (Keying Chen, 2019). No parametric method is represented by data envelopment analysis method. The method has no need to set the function form, thus avoiding the influence of the subjective factors, and has obvious advantages in dealing with the efficiency of multi input and multi output. But this method is sensitive to outliers, which can easily lead to low efficiency, and neglect the effect of measurement error in the measurement. Parametric method is the most widely used in the stochastic frontier analysis method. It needs to estimate the model in advance, based on a more solid theoretical foundation, and can describe the production process, so as to test the efficiency of the estimation. In addition, in the measure of the efficiency value of the decision unit, we can further analyze the influence factors of the efficiency. Sci-tech enterprise incubator efficiency measure and influence factors analysis is an important research content of this paper. Therefore, the application of analysis method can just solve the problem. The general form of the model is as follows:

$$X = 2\pi k + \pi - \alpha_1 - \pi M \sin Y \quad (1)$$

It represents the actual output of the technology business incubator  $i$  in the period  $t$ .  $X$  represents a set of input elements.  $Y$  is the largest output that can be obtained in a set of inputs, i.e., at the frontier of production possibility frontier.  $\epsilon$  is the effect of random perturbation;  $\eta$  said the technology inefficiency and obey the normal distribution of non-negative tail.

The technical efficiency can be expressed as the ratio of the actual output of the decision unit to the potential output ratio, i.e. (Wenqing Wu, 2017), the following formula:

$$u_{p1}(X, Y) = \begin{cases} 0 & X \begin{cases} < 2\pi k + \pi - \alpha_1 - \pi M \sin Y \\ \geq 2\pi k + \pi - \alpha_1 + \pi M \sin Y \end{cases} \\ E/6 & X \begin{cases} < 2\pi k + \pi - \alpha_1 + \pi M \sin Y \\ \geq 2\pi k + \pi - \alpha_1 - \pi M \sin Y \end{cases} \end{cases} \quad (2)$$

It represents the technical efficiency. The decision making unit is below, where the efficiency of decision making units; When  $X$ , the decision unit is located on the front face, where the efficiency of decision making units, showing that the technology is effective.

In order to find out the factors that affect the efficiency of the technology, the following formula is needed.

$$u_{p1}(X, Y) = \frac{A_{00}}{2} + \sum_{n=1}^{\infty} (A_{on} \cos nX + B_{on} \sin nY) + \sum_{n=1}^{\infty} (A_{mo} \cos mX + B_{mo} \sin mY) + \sum_{m=1}^{\infty} \sum_{\pm 1}^{\pm \infty} [A_{mn} \cos(mX + nY) + B_{mn} \sin(mX + nY)] \quad (3)$$

$A_{mn}$  is the important factor that causes the technology to be inefficient;  $B_{mn}$  is coefficient vector for influence factors. When the value is positive, indicating that the efficiency has a negative impact; when it is negative, the impact factor has a positive effect on the efficiency value.  $\epsilon$  is random error term.

SAF needs to select the production function before the efficiency measure. At present, there are two kinds of common function forms of the production function of Douglas, and the function of the transcendental logarithmic production function. In this paper, we use the first function form.

The evaluation index system of sci-tech enterprise incubator is 100 points. The total score is the score of each index. Calculation formula for each index is:

$$A_{mn} + jB_{mn} = \frac{2}{(2\pi)^2} \int_{-\pi}^{\pi} \int_{-\pi}^{\pi} u_{p1}(X, Y) e^{j(mX+nY)} dXdY \quad (4)$$

$S_i$  is the score of index  $i$ ;  $O_i$  is observation value of index  $I$  (The observation value is the correlation index system data value of sci-tech enterprise incubator);  $S_I$  is the standard value of index  $I$  (It is the relevant index system should meet the standards) is the weight of index  $i$ .

The total score (incubator evaluation index total score: TTS) is as the following:

$$\frac{1}{\pi} \int_0^{\pi} e^{jmM\pi \sin Y} e^{jnY} dY = J_n(mM\pi) \frac{e^{jn\pi} - 1}{2}$$

(5)

Finally, the evaluation of the ability of the sci-tech enterprise incubator can be calculated by the formula (5). The higher the score, the higher the network operator of the sci-tech enterprise incubator, the weaker, otherwise weaker.

### 3 Empirical Analysis

#### 3.1 Evaluation value of incubation capacity index system of technology enterprise incubator

The evaluation model is constructed based on the index system and the formula above. First of all, the evaluation index system, weight and expected value are cited above; Secondly, the numerical value of the Beijing sci-tech business incubator is extracted, and thirdly the corresponding values are compared with the international standard; Finally, the score of each level index and the final score of the whole model are calculated by using the formula and weight above. The established evaluation model is shown in the Table 1.

#### 3.2 Incubation capacity evaluation

According to the Beijing sci-tech business incubation force of the score, you can compare the internal network, the external network and the international standards of the gap, as shown in Figure 2.

**Table 1 The Expectation Value of the Evaluation Index System of Incubator**

irst level indicator	Second level indicator	Third level indicator	Unit	Expectation	
Internal network	incubation enterprise	Infrastructure construction investment	Million yuan	20	
		Hatching success rate	%	60	
	Financial institution	Financing ratio	%	25	
		Information network construction	%	80	
		Agency	Bachelor degree number / total number	%	90
	Number of intermediaries		number	15	
	Research Institute	Patent number	number	30	
		Conversion rate of scientific and technological achievements	%	80	
	External network	The government	Preferential policies for science and technology	number	25
			Number of special funds	number	15

policy			
	Preferential tax policy	number	12
Support system	Risk investment institutions	number	20
	Government involvement in investment	Yes or not	yes
University, scientific research institute	Introduction of talent	number	150
	Cooperative project number	number	120
	Provide facilities	number	80
Incubator	Contact number	number	500

**Figure 2 Comparison between Hatching Ability and Expected Value**

According to the above, the black column indicates the standard that should be reached, and the red column indicates the actual value. While the difference between black and red column indicates the gap between the Beijing sci-tech business incubator and the international standard. From the Figure 2, the Beijing sci-tech business incubator's internal network level is significantly stronger than the external network level. Although the internal network level still needs to be improved, but the lack of external network has seriously affected the overall level of Beijing sci-tech business incubator. The internal network is made up of incubators and enterprises, financial institutions, intermediary organizations, research institutions and other internal organs. The external network consists of incubators and government, venture capital institutions, universities, research institutes, and other vessels. Smooth, tightness, safety, internal conditions and factors such as network size determine the level of enterprise of sci-tech incubator. As mentioned earlier, the credit mechanism is not perfect, between enterprises lack a sense of trust, enterprise network cooperation exists potential problems, the application of information technology is not sufficient, these corresponding have bad influence on the network close, smooth and safe existence, resulting in the incubation level of Beijing sci-tech business incubators is far from the

international level, just to meet the standard. This gap is particularly reflected in the external network is not perfect.

### 3.3 Analysis of hatching efficiency based on functional dimension

Figure 3 is the average efficiency of five functional dimensions of Chinese national sci-tech business incubators. Consistent with the results in the above table, in promote high new technology enterprise growth and regional employment growth in two aspects, the efficiency values of National Sci-tech business were significantly higher than efficiency values of the other dimensions. For obtain employment promoting the growth of high-tech enterprises, the efficiency of the national sci-tech business incubator value increased year by year. At the same time, the national sci-tech business incubators in the efficiency of acquiring profitability also showed an upward trend, showing that more and more private incubators join into the ranks of the national level, and more and more technology business incubators began to focus on profitability. Although the technology business incubators in the promotion of the efficiency of the regional employment has been rising, but the overall trend is upward. National Sci-tech business incubator in promoting regional economic development efficiency instead in decline, which may incubator with the rapid expansion of the scale. Finally, in the promotion of technology transfer and technological innovation, the efficiency of the business incubator is a rising trend. This is related to the increase in the number of intellectual property rights of the national sci-tech business incubators in recent years.

Figure 3 Efficiency Values of Five Functional Dimensions

### 3.4 Morphological clustering analysis based on efficiency

In order to further study the efficiency of the sci-tech enterprise incubator in each dimension, that's the actual incubation behavior, this paper analyzes the average efficiency value of every national sci-tech enterprise incubator in every dimension in five years. Below the average efficiency value of five functional dimensions as a variable, conduct the value cluster analysis (the paper also carried out the hierarchical clustering analysis, the results show that the more reasonable). The final cluster center table of the fast clustering method is shown in Table 2 below.

**Table 2 Clustering Analysis Results of Different Clustering Centers**

Model	Cluster number					
	3	4	5	6	7	8
INNO	0.25	0.31	0.17	0.62	0.47	0.22
JOB	0.45	0.48	0.25	0.31	0.75	0.36
PRO	0.25	0.65	0.74	0.34	0.46	0.18
SUR	0.81	0.64	0.12	0.18	0.26	0.38
ECO	0.40	0.23	0.14	0.35	0.24	0.19

**3.5 The influence of scientific and technological business incubator on convergence of economic**

In the study of the influence of the sci-tech enterprise incubator on the economic convergence of the city, the convergence of the regional economy should be measured. The use of  $\partial$  convergence method can see the level of economic development gap between the capital cities of Chinese clearly, shown in Figure 4. From the point of view of the country, the level of economic development between the urban existence obvious convergence, especially after 2008 ( $\partial$  values showed a clear downward trend). According to the traditional Eastern, middle and western regions, the capital city of the west capital city has some obvious convergence. The urban economy in the eastern part of the city has a certain convergence, and the economy of the capital city in the central part of the city has a certain divergence.

**Figure 4  $\partial$  Testing of Economic Convergence of Cities**

In order to separate the influence of the technology business incubator on the local economy and the convergence, the influence factor of the technology enterprise is added to the formula (4). Model 3, model 5 and model 4 use the least square method, the random effect method and the fixed effect method to estimation results. After comparison and analysis, the results refused the random effects of the original hypothesis, so the fixed effect model is better than the random effect model. As can be seen from the table, the fixed effect model is ideal for estimating the results of measurement. After adjusting the fitting degree has a substantial increase than before, and through the F test.

## 4 Conclusion

In this paper, the evolution of Chinese sci-tech enterprise incubator is divided into four generations, and the corresponding theory is used to explain the theory of the business incubator. Secondly, on the basis of summing up the five most common functional dimensions of business incubator, the efficiency value of the Chinese sci-tech enterprise incubator in each functional dimension is calculated, and the incubator is divided into six forms by using clustering analysis method. In the analysis of the factors affecting the incubating efficiency, this paper analyzes the area of business and the macro level from the micro level to the micro level, which is based on the theory and the externality theory. Finally, based on the new economic growth theory and endogenous economic growth theory, the influence of technology business incubator on the regional economic level and regional innovation level is studied. The main conclusions are as follows:

Overall, the efficiency of Chinese technology enterprises is low. And in promoting the transformation of sci-tech achievements, increasing the efficiency of regional employment and access to profitability is low.

According to the results of cluster analysis, the Chinese sci-tech business incubator can be divided into six forms: the entrepreneurial orientation, the economic orientation, the innovation oriented, the profit oriented, the general efficiency and the general low efficiency. And only two incubators are generally efficient, and most are still generally inefficient. This also confirms that the overall efficiency of Chinese sci-tech business incubators is low.

The ability of the business enterprise in the process of dealing with the product harm crisis is stronger than the external enterprise. This kind of enterprises have a stronger ability to survive, will have a greater positive impact on the performance of the incubator.

**Abstract:** The current status and problems of the accreditation work for the forensic science laboratories are analyzed in the paper. Meanwhile, the management and operation methods of the trace evidence laboratory under the CNAS (China National Accreditation Service for Conformity Assessment) review system are introduced. It proposes that the management of the trace evidence laboratory needs to consider factors such as personnel, equipment, samples, environment, methods and quality. Furthermore, the corresponding management procedures should be formulated to ensure the orderly operation of each link. Finally, the author shows the next research direction and prospects in the future.

**Keywords:** Trace Evidence Laboratory; CNAS; Management; Operation

### 1 Introduction

In many investigations of litigation case and accidents, it is required to identify or compare certain substances related to the case or accident. The types of these substances are very large and the amount available for identification or comparison might be extremely small. The common substances (such as paint, glass, fiber, paper, ink, rubber, grease, cosmetics, adhesives, metals, wood, soil, explosives, mineral oil or combustion aid, plastics, etc.) are collectively called as trace evidence in the field of forensic science (Yan Chunlei, 2011).

The trace evidence laboratory is a place used for trace evidence identification. It has the following distinct characteristics that are different from the ordinary laboratory. In the process of testing, it is required to keep the confidentiality of the case and preservation of material evidence. And, higher requirements have been proposed for equipment management. Some devices are specially developed for trace evidence test and lack relevant verification or calibration standards. In addition, trace evidence tests are different from ordinary tests. The examination objects are divided into known comparison samples and unknown materials, which need to be identified their type and characteristics to determine their source. They are usually taken away from the scene or left in the case site by criminals, and they both must be effectively isolated. Furthermore, standard substances required for the appraisal of trace evidence may not be available from the existing reference material supply department and need to be self-made (Quan Yangke, 2007). However, these characteristics have brought enormous challenges to the management and operation of trace evidence laboratory under the CNAS (China National Accreditation Service for Conformity Assessment) review system. In order to solve these difficulties, many scholars have researched and explored (Malkoc Ekrem, 2006, Liu Shuo, 2013). Hua Feng deeply

analyzed the present situation and existing problems in the recognition of forensic science laboratories. He thought accreditation work should be slower and the focus should be transferred to the basic work such as unifying inspection methods, training high-level and professional reviewers, organizing multidisciplinary proficiency testing, etc (Hua Feng, 2006, Hua Feng, 2009). Pan Xi proposed three measures to improve the utilization of personnel, equipment and management resources, the internal management level and the identification quality of the appraisal institution. Firstly, integrating the platform and sharing equipment. Secondly, strengthening management and standardizing the process. Thirdly, raising the threshold and building a profession (Pan Xi, 2013). Tao Qiangsong studied in forensic laboratory accreditation from the perspective of the Public Security Organs. Current status of laboratory accreditation in judicial appraisal institutions and the contradictions encountered in the reform were analyzed, and many good suggestions were put forward (Tao Qiangsong, 2013). Teng Jing also analyzed the realistic difficulties and breakthrough of forensic laboratory accreditation (Teng Jing, 2016).

Based on these studies, some suggestions for management and operation of trace evidence laboratory under the CNAS review system are put forward based on the personnel, equipment, samples, environment, methods and quality in this paper. Meanwhile, the next research directions and prospects for the development of the future trace evidence laboratory are also discussed.

## 2 Management and Operation Methods

More and more trace evidence laboratories are approved by CNAS from 2015 to the present (as shown in Figure 1). According to the quantitative statistics, it grows the fastest in 2018. Up to now, there are only 18 trace evidence laboratories in total approved by CNAS in China. It indicates that laboratory accreditation is getting more and more popular, but there are few laboratories are approved by CNAS. It is probably because that the management and operation mode of many trace evidence laboratories could not meet the requirements of CNAS. Based on the institution nature of the trace evidence laboratories at present, 44% of laboratories are private institutions and 33% laboratories are public security agencies, while the percentage of judicial administrative organ is the least (as shown in Figure 2). It indicates that the private institutions attach great importance to the management of laboratories and take a major role in the judicial identification. Then, some methods of management and operation of trace evidence laboratory under the CNAS review system are discussed in the following contents.

**Figure 1 Quantitative Statistics of Trace Evidence Laboratory  
Approved by CNAS from 2015 to the Present**

**Figure 2 Percentage Statistics of the Institution Nature of the Trace Evidence Laboratories Approved by CNAS from 2015 to the Present**

### 2.1 Personnel management

Personnel Training and Assessment Procedures and Management Function FL location tables (as shown in Table 1) which specify staffing, training, authorization, and file management requirements to ensure adequate and qualified human resources should be drawn up. The trace evidence laboratory requires at least three licensed appraisers, one of which at least has a deputy senior title or has been engaged in the related work for more than 5 years after obtaining intermediate title. In order to ensure that the on-the-job personnel have the required professional knowledge and ability, the appraisers need to receive continuing education training, supervision and assessment every year, including relevant laws, regulations, professional skills, cross-examination skills in court, etc. The training time is not less than 40 hours per year.

## 2.2 Equipment management

Equipment Management Procedure which stipulates the purchase, acceptance, identification, calibration, use, maintenance, verification, repair, and scrapping of the identification equipment (including hardware and software) should be formulated to ensure that the equipment is in good working condition and the identification result is accurate and reliable. The trace evidence laboratory should be equipped with the corresponding devices according to the instrument configuration requirements of forensic unit's accreditation. All analytical equipment and measuring instruments should be calibrated and verified periodically. For particular instruments and equipment specially developed for trace

evidence identification and without legal verification or calibration procedures, functional verification should be carried out. Subsequently, it should be confirmed whether the instruments and equipment could meet the requirements for identification and related standard specifications. The equipment should be labeled, indicating the equipment name, equipment number, equipment owner, equipment status, etc. In addition, operators of large-scale equipment must be trained, assessed and authorized. The use of the equipment should be recorded to ensure its traceability, including information such as time, user name, inspection content, instrument status and so on. Furthermore, each identification instrument or software should be uniquely identified. The key equipment that have significant impact on the identification results, such as energy disperse spectroscopy, spectrometers, etc., should be regularly maintained and build independent equipment archives. The equipment archive contains at least the following contents: name of the device and its software, unique identification, verification record, location, instruction manual, verification or calibration certificate, equipment acceptance record, equipment usage record, equipment maintenance record, etc.

### 2.3 Identification sample management

Develop Identification Sample Management Program that specifies methods for extracting, receiving, disposing and storing identification samples to ensure their integrity, confidentiality and traceability. When extracting a small amount of sample, both the carrier and sample should be photographed and fixed (as shown in Figure 3). When receiving the identification sample, its authenticity and integrity should be examined firstly. Then, its name, type, quantity, shape, storage status and time of receipt should be registered. Finally, it should be uniquely identified and status identified. If the sample needs to be damaged or destroyed during the identification process, the client must be informed and provide their written consent. Additionally, there should be a special preservation facility to store the identification samples and check them regularly.

**Figure 3 Micrograph of Common Trace Evidence under High Power Microscope**

( Notes: Figure (1)-(3) are paints respectively attached to paint, fiber, and rubber carriers, figure (4)-(5) are fibers respectively attached to plastic and fiber carriers, figure (6)-(7) are plastics attached to paint carriers and figure (8) is rubber)

### 2.4 Environmental control

Prepare Environmental Management Procedure to control the configuration and condition of facilities and the environment to ensure that they meet the requirements for identification work.

Environmental control factor includes space, dust, temperature, humidity and vibration. The non-inspectors should be restricted from entering areas in the trace evidence laboratory that may cause sample contamination. The trace evidence laboratory should be equipped with appropriate safety protection facilities, such as personal protective equipment, smoke alarms, eyewash devices, emergency sprinklers, fire extinguishers, etc. It should be ensured that the facilities and environment of the trace evidence laboratory do not affect the identification results. And, it should have corresponding conditions to ensure special requirements of some equipment. For examples, scanning electron microscopy requires no interference from magnetic fields and mechanical vibrations around, and infrared spectrometer requires constant temperature and humidity.

### **2.5 Method management**

Establish Identification Method Selection and Use Procedure to ensure that the identification methods used are accurate and effective. International standards, national standards, industry standards or technical specifications approved by the judicial administrative authorities should be preferentially used. In the absence of above standards, the approved method recommended by the Ministry of Justice or its authorized department should be preferentially used. Self-developed non-standard methods must be confirmed by the organization designated by the judicial administrative authority at or above the provincial level. Non-destructive testing methods should be used as much as possible. When it is necessary to test the same sample in a variety of ways and the amount of the sample is very little, the non-destructive testing methods should be used first, followed by the destructive testing methods.

### **2.6 Quality control**

Establish Quality Control Procedure to monitor the effectiveness of the identification results to ensure the quality of the identification (Swagman, 2000). The methods of quality control are as follows: One, use the certified standard substance or the secondary standard substance to check the result in the routine inspection and analysis process. Two, repeat the inspection of the retained sample by the same operator. Three, repeat the inspection of the retained sample by more than two person. Four, use the different analytical methods to test the same sample. Five, participate in proficiency testing (National association of testing authorities, 2012) or other inter-laboratory comparison activities. Six, results of all internal quality control plans should be recorded in detail and evaluated.

## **3 Conclusion**

This paper introduces the management and operation method of trace evidence laboratory under the CNAS review system, including factors such as personnel, equipment, samples, environment, methods and quality. It proposes perfect personnel training and assessment procedures, equipment management procedures, identification sample management procedures, environmental management procedures, identification method selection and use procedures, quality control procedures, etc., to ensure the orderly operation of all links. At present, there are few trace evidence laboratories in China passed the CNAS review system because of its high requirements, high standards and immature application in the trace evidence area. However, there are still more and more trace evidence laboratories are applying for passing the CNAS review system to improve their management system and enhance their international popularity. Therefore, the management and operation mode of the trace evidence laboratory urgently needs to be improved. Verification or calibration standards of particular instruments and equipment specially developed for trace evidence identification are imperative to be formulated. In terms of personnel, there are many appraisers who have not been engaged in the trace evidence certification field or non-related professions but have the certificates for trace evidence identification. Relevant

departments should strengthen personnel review, strictly control admittance and regularly assess. The author believes that these problems will be solved soon and the operation of the trace evidence laboratory will be better and better in the future.

**Abstract:** At present, the “work line mode” is commonly used in container terminal operations in China. There are limitations including that the workload of each line is not balanced, the utilization of quayside cranes and trucks is not high, and the terminals are quite crowded. The “multi-quayside crane cooperation mode” is proposed here on the combining of “working surface mode”, “synchronous loading and unloading mode” and “cross hybrid loading and unloading mode”. By using genetic algorithm and the simulation software, Flexterm, the study of searching optimal truck path and configuration in L port is conducted under the new mode. The result is that it shortens ship’s port time, saves energy and extends the service life of the trucks. In some degree, the study has practical reference for the operation scheduling of container terminals.

**Key words:** Container trucks; Routing optimization; Multi-quayside crane cooperation mode; Genetic algorithm; Simulation

### 1 Introduction

Container terminal is a complex system composed of multiple links, which coordinate and restrict each other. Optimizing the internal logistics of the container terminal is an important way to improve the overall management level of the container terminal. It has always been hot issues about how to make full use of limited resources under existing equipment and conditions, how to make the complex system of container terminal operate efficiently and how to reduce related costs.

There are mainly two aspects of researches about container trucks for improving terminal efficiency. One is about studying new shift modes. Yang (Yang, 2006), Wei and Zhu (Wei and Zhu, 2012), Wang and Xu (Wang and Xu, 2011) paid attention to the path optimization problem of the trucks in the “working surface” mode. Chen and Feng (Chen and Feng, 2011), Sun (Sun, 2013) studied the truck scheduling in the hybrid cross-operation mode.

The other is about optimizing container truck path under existing modes. Bish et al. (Bish et al., 2005), Byun et al. (Byun et al., 2000), Nishimura et al. (Nishimura et al., 2001), Ng et al. (Ng et al., 2007) study the optimal path of container trucks with the task of minimizing the total time of operation through greedy algorithms, genetic algorithms, etc. Koo et al. (Koo et al., 2006), Bish et al. (Bish et al., 2001) investigated the optimal configuration of container trucks.

In addition to the research results in China and other countries, there are two points that could be further studied. First, in the existing research, there is not much optimization for the “working surface”, and even if the “working surface” mode is adopted, it still actually sets the optimization object to single import or export container ship berthed at the same time whereas the loading and unloading areas are

still separate. Thus, there is still a large distance from the true multi-ship cross-mixing loading and unloading operation. Second, most of the researches have introduced optimization algorithms in which a lot of simplifications and assumptions have been made on the actual situation of the ports to solve the problems. Though the theory is strong, the actual application ability is poor, and there are still relatively few simulation cases to simulate the port production.

In this paper, a new container terminal operation mode is proposed. Besides, an actual case is tested through genetic algorithm modeling and system simulation. By re-planning the dispatch path and the loading and unloading mode of the trucks, a better working path is obtained. Through simulation, the optimal configuration is selected.

## 2 Methodology

### 2.1 Multi-quayside crane cooperation mode

Compared with the traditional “production line mode” and “single ship mixed loading and unloading mode”, the “cross-mixing operation mode” can more effectively utilize the capacity of the trucks to dynamically balance the workload of each quayside crane. However, as can be seen from Fig. 1, under the current “cross-mixing operation mode”, for one of the two ships A and B, the loading and unloading operations are still separated, that is, Ship A can only be loaded but not unloaded, Ship B can only be unloaded but not loaded (or vice versa). Based on this situation, a new operation mode which called “multi-quayside crane cooperation mode” is proposed. The operation process of “multi-quayside crane cooperation mode” can be seen in Fig.2. The specific steps follow:

- 1) The truck is departed from the Ship A, receives an import container from Ship A and sends it to the import yard behind the Ship A.
- 2) The truck is no-load and goes to the exit yard behind the Ship B.
- 3) The truck takes out an export container and sends it to the Ship B, which is loaded onto the ship by the quayside crane.
- 4) The truck receives an import container and sends it to the import yard behind the Ship B.
- 5) The no-load truck goes to the exit yard behind the Ship A.

6)The truck takes out an export container and sends it to the Ship A, which is loaded onto the ship by the quayside crane to complete the circuit.

**Figure 1 Cross-mix Loading and Unloading Operation Mode**

**Figure 2 Truck Running Process in Multi-quayside crane Collaboration Mode**

This study takes two container ships MSKT (Ship A) and AHUT (Ship B) that arrived at the L port in the same time and parked at two adjacent berths #3 and #4 as actual examples. In fact, most of the containers are transported by liner. The arrival time of container ships and the amount of packing and unloading can be easily predicted. The berth configuration and stowage plan can be done before the ship

arrives (Zhang et al.,2003). The schematic diagram of the berth is shown in Figure 3.

**Figure 3 Berth and Yard Layout**

The details of ships and container areas are shown in following tables.

1.The ship docking information is shown in Table 1.

**Table 1 Ship Information**

Ship name	Docking berth	Distribution of quayside crane	Loading amount	Unloading amount	Berthing time
MSKT	#3	3 (C20-C22)	1517	974	21h10min
AHUT	#4	3 (C17-C19)	591	815	14h29min

2.The quayside cranes information is shown in Table 2.

**Table 2 Quayside Cranes Assignment Information**

Quayside crane	Starting time	End time	Downtime (h)	Net efficiency (TEU/h)
C17	2017-2-21 14:37	2017-2-22 5:01	0.49	27.66
C18	2017-2-21 13:18	2017-2-22 10:28	3.47	17.63
C19	2017-2-21 14:03	2017-2-22 9:55	0.90	27.56
C20	2017-2-21 13:22	2017-2-22 9:59	1.87	20
C21	2017-2-21 13:33	2017-2-22 7:36	1.73	22.06
C22	2017-2-21 15:23	2017-2-22 10:14	0.00	22.86

3. The capacity/task information of the import and export container area is shown in Table 3.

**Table 3 Import/Export Container Areas Capacity/task (Unit: TEU)**

Import container area code	#1	#2	#3	#4
Ship A	405	525	625	745
Ship B	635	755	415	535

4. The distances between the ship and the import container area, the ship and the export container area, the import container area and the export container area are shown in Table 4, Table 5 and Table 6.

**Table 4 Distance between Ships and Import Container Areas (Unit: meter)**

export container area code	#1	#2	#3	#4	#5	#6
Ship A	205	275	330	425	495	550
Ship B	435	505	560	215	285	340

**Table 5 Distance between Ships and Export Container Areas (Unit: meter)**

container area code	#1	#2	#3	#4	#5	#6
Import container area capacity	172	325	651	647	—	—
exported container area capacity	280	274	336	135	351	413

**Table 6 Distance between Import and Export Container Area (Unit: meter)**

container area code	#1	#2	#3	#4	#5	#6
#1	400	330	275	640	570	515
#2	520	450	395	760	690	635
#3	220	150	95	420	350	295
#4	340	270	215	540	470	415

The loading amount and unloading amount of the Ship A are 1517 TEU and 974 TEU, respectively; the loading amount and unloading amount of the Ship B are 591 TEU and 815 TEU, respectively. The total loading amount is  $1517+591=2108$  and the total unloading amount is  $974+815=1789$ , that is, the total loading amount is 319 TEU more than the total unloading amount.

In this paper, the part that can loading and unloading match is selected as the research object, that is, the extra 319 TEU are separately loaded and unloaded by the “production line mode”, and the remaining containers which are paired are loaded and unloaded by “multi-quayside crane cooperation mode”. Here only the paired ones are discussed.

## 2.2 Truck path optimization

The shortest path of the truck under the practical case was found through genetic algorithm in this study. The problem can be demonstrated as follows:

Object:

$$\text{Min}\left\{\sum_{i=1}^K \sum_{j=1}^K d_{ij}X_{ij} + d_{aijb}Y_{aijb} + d_{bijb}Y_{bijb} + d_{aija}Z_{aija} + d_{bijb}Z_{bijb}\right\}$$

Decision variables:

$$X_{ij}, Y_{aijb}, Y_{bijb}, Z_{aija}, Z_{bijb} \in \{0, 1\}$$

Subject to:

$$\sum_{i=1}^K X_{ai}q_i + Y_{aijb}q_i + Z_{aija}q_i = U_a$$

$$\sum_{j=1}^K X_{ja}q_j + Y_{bijb}q_j + Z_{aija}q_j = L_a$$

$$\sum_{i=1}^K X_{bi}q_i + Y_{bijb}q_i + Z_{bijb}q_i = U_b$$

$$\sum_{j=1}^K X_{jb}q_j + Y_{aijb}q_j + Z_{bijb}q_j = L_b$$

where  $X_{ij}$  is a binary choice of the route from  $i$  to  $j$ ;  $Y_{aijb}$  is a binary choice of the route from ship A to ship B which includes an import and an export;  $Z_{aija}$  is a binary choice of the route from ship A to ship A which includes an import and an export;  $Z_{bijb}$  is a binary choice of the route from ship B to ship B which includes an import and an export;  $d$  is the distance from one position to another position;  $q$  is the number of the container every truck takes;  $a$  is ship A;  $b$  is ship B;  $U_a$  is the number of unloading containers of ship A;  $U_b$  is the number of unloading containers of ship B;  $L_a$  is the number of loading containers of ship A;  $L_b$  is the number of loading containers of ship B.

The 2013b version of MATLAB was used to solve the problem. After 100 times iterations, the model reached convergence. The result is shown in Figure 4.

**Figure 4 Genetic Algorithm Convergence**

Since the genetic algorithm is a random search algorithm, the results obtained by each operation are slightly different. So, after running ten times, take the average as the final result.

- 1) Min  $f = 2224.25\text{Km}$ , wherein the no-load stroke is  $690.67\text{Km}$ ;
- 2) Non-zero optimal decision variables are shown in Table 7, Table 8, and Table 9.

**Table 7 Optimal Decision Variable in Loop I (Non-zero)**

$X_{a2}$	$X_{a4}$	$X_{b3}$	$X_{1a}$	$X_{2a}$	$X_{6a}$	$X_{4b}$	$X_{5b}$	$X_{6b}$	$X_{22}$	$X_{35}$	$X_{36}$	$X_{41}$	$X_{44}$
274	317	591	280	274	37	37	178	376	274	178	413	280	37

**Table 8 Optimal Decision Variables in Loop II (Non-zero)**

$Y_{a35b}$	$Y_{a44b}$	$Y_{a45b}$
60	98	66

$Z_{a13a}$	$Z_{a23a}$	$Z_{a43a}$	$Z_{a45a}$
172	51	113	47

**Table 9 Optimal Decision Variables in Loop III (Non-zero)**

According results above, there are 12 routes finally selected to be the optimal choices.

Line 1: Ship A - #4 import container area - #4 export container area - Ship B - #3 import container area - #6 export container area - Ship A, 37 times;

Line 2: Ship A - #3 import container area - #5 export container area - Ship B - Ship A, 60 times;

- Line 3: Ship A - #4 import container area - #4 export container area - Ship B - Ship A, 98 times;
- Line 4: Ship A - #4 import container area - #5 export container area - Ship B - Ship A, 66 times;
- Line 5: Ship A - #1 import container area - #3 export container area - Ship A, 172 times;
- Line 6: Ship A - #2 import container area - #2 export container area - Ship A, 274 times;
- Line 7: Ship A - #2 import container area - #3 export container area - Ship A, 51 times;
- Line 8: Ship A - #4 import container area - #1 export container area - Ship A, 280 times;
- Line 9: Ship A - #4 import container area - #3 export container area - Ship A, 113 times;
- Line 10: Ship A - #4 import container area - #5 export container area - Ship A, 47 times;
- Line 11: Ship B - #3 import container area - #5 export container area - Ship B, 178 times;
- Line 12: Ship B - #3 import container area - #6 export container area - Ship B, 376 times;

### 2.3 Truck configuration

After truck path optimization, the suitable truck configuration is considered. Since the configuration in the proposed new mode is a discrete event dynamic system (DEDS), it's relatively hard to solve the problem by mathematical methods. In this situation, system simulation provides a more effective solution.

The task routes of the truck in this model are the 12 ones obtained through the genetic algorithm, and the task sequence function in FlexTerm is used to ensure that the truck travels according to the shortest route. Except the one-way driving on the road passing through the quayside cranes to the yard, the other roads can travel in both directions, but the rear trucks are not allowed to overtake the preceding trucks on any road section. The maximum speed limit of the road is 50Km/h. The initial state of the model is that the trucks are waiting for the container ships to berth at the place where the trucks are stored. Based on the *FlexTerm2.0.0* simulation platform, the simulation model of #3, #4 berth loading and unloading operation system of L Port Container Terminal is established, as shown in Figure 5.

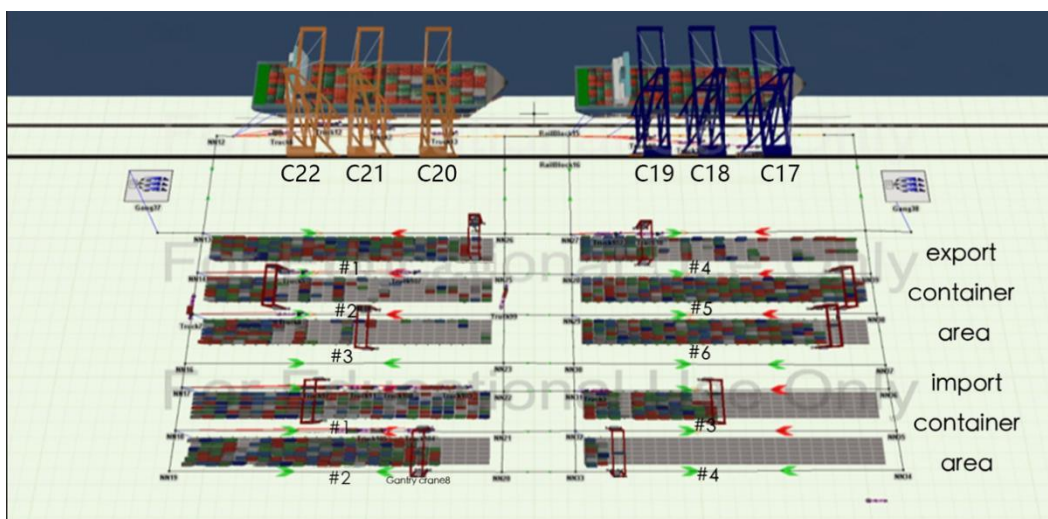

Figure 5 #3, #4 Berth Loading and Unloading Operation System Simulation Model

According to the current truck configuration strategy adopted by the terminal, each quayside crane is equipped with 5 trucks, the two ships' loading and unloading operations use 6 quayside cranes and a total of 30 trucks. Therefore, in the range of [20,35], the number of truck configuration is input to the FlexTerm model in turn, and the waiting time of each quayside crane and the blocking time of each truck are obtained by the statistic system, *Statistics*. Since the container bays are randomly generated, there is a little difference in the result of each run. Thus, the average of them is finally taken. According to this method, the average waiting time of the quayside cranes and waiting time of the trucks in different truck configurations are obtained in sequence as shown in Figure 6.

Figure 6 Waiting Rate of Quayside Cranes and Trucks in Different Truck Configurations

### 3 Result and Discussion

According to the optimal path, the total travel distance of the truck is 2224.25 Km, of which the no-load stroke is 690.67Km. With other conditions equal, in working line mode, the total travel distance of the truck is 3883.43 Km, of which the no-load stroke is 2391.47Km. The detail of results in the two modes are shown in Table 10.

Table 10 Comparison of Mode Effects

truck operation mode	Total trip (Km)	saving (Km)	Saving rate	Overload (Km)	No-load (Km)	No-load rate	Reduction
Multi-quayside crane cooperation mode	2224.25	1659.18	42.72%	1533.585	690.67	31.05%	30.53%
Working line mode	3883.43			1491.965	2391.47	61.58%	

It can be seen that with the multi-quayside crane cooperation mode, compared with the traditional "working line mode", on the one hand, the total mileage of the truck is reduced by 42.72%, which means that in the new mode, the truck can complete the loading and unloading tasks as soon as possible with a shorter path, reducing the berthing time and speeding up the truck-ship turnover. At the same time, it also means the reduction of truck loss and extension of the truck life. On the other hand, the

idling rate of the truck is greatly reduced from 61.58% to 31.05%, which greatly improves the utilization rate of the truck. This means that the same number of trucks can be used to complete more loading and unloading tasks, reflecting the concept of deepening the potential of port equipment resources and achieving fine management of terminals.

The simulation results show that when the truck configuration is small (less than 25 trucks), the quayside crane waiting rate decreases significantly with the increase in the number of trucks. When the number of trucks reached 25, the waiting rate of quayside cranes is reduced to a minimum. As the number of trucks further increases (more than 25 trucks), the waiting rate of quayside cranes gradually increases. This shows that the "25 trucks" is a critical value. When the number of trucks reaches 25, the quayside crane waiting rate is the lowest and the increase in the truck blocking rate is not obvious. Since then, as the number of trucks has increased, road congestion has become increasingly serious and the truck waiting time has become longer. In this situation, the quayside crane cannot be able to get timely service due to the blockage of the trucks on the road, and the waiting time becomes longer. The phenomenon of "effectiveness and counter-attack" reaches the maximum. It can be seen that the number of 25 trucks is the best-integrated point, so 25 trucks are determined to be the best truck configuration for this model.

In the terminal practice, it can be adjusted according to the actual situation to ensure the smoothness and efficiency of the loading and unloading operations.

## 4 Conclusion

In view of the many bottlenecks and shortcomings of the current container terminal operation modes, combining the "same-position synchronous loading and unloading operation mode", "working surface mode" and "cross-mixing loading and unloading operation mode", this paper proposed a "multi-quayside crane cooperation mode" that can be applied in the situation of "two ships simultaneously arriving at the port and synchronous loading and unloading". The genetic algorithm is used to find the optimal routes and the running times of the trucks on each route. The results show that the multi-quayside crane cooperation mode can effectively reduce the total distance traveled by the trucks compared with the traditional mode, and reduce the waste of the truck capacity. It proves that the "multi-quayside crane cooperation mode" has great advantages over traditional modes in improving the efficiency of container terminals and reducing operating costs. Using FlexTerm, the changes of the quayside crane waiting time and the truck waiting time of different truck configurations are tested. Finally, through the comprehensive analysis, the optimal configuration of the truck in the scenario is determined, the resource allocation of the L Port Container Terminal is further optimized, and good results are obtained.

There are still many shortcomings in the study. First of all, the container terminal operating system is a complex whole. What needs to be optimized is not only the transportation path problem of the trucks, it is not enough to optimize the partial part. Secondly, although the genetic algorithm has been widely applied on engineering practice due to its good robustness and adaptability and has achieved good results, the genetic algorithm is easy to fall into the local optimum. To avoid it, the genetic algorithm should be improved or the combination of different intelligent algorithms should be considered. Finally, computer system simulation is an important direction in related research. FlexTerm used in this study is just one of them. Innovations in simulation tools and modeling ideas can be future research directions.

# Simulation Research of AGV Configuration Optimization in Automated Container Terminal

Chen Ning, Tao Hui

School of Transportation, Wuhan University of Technology, Wuhan, P.R.China, 430063

(E-mail: chenning5@126.com, taohui142857@163.com)

**Abstract:** To study the optimal AGV configuration of automated container terminal, this paper takes the domestic Q automated container terminal as an example and summarizes the production and operation situation of the terminal as well as loading and unloading process, and then analyzes the composition and operation process of AGV horizontal transportation system. To achieve the goal, this article constructs the three-dimensional visual simulation model of AGV horizontal transportation system, and then carries out simulation experiments, and finally obtains the optimal ratio of AGV horizontal transportation system under different conditions. The conclusion can provide reference for production and operation of automated container terminal.

**Key words:** Automated container terminal; AGV; Configuration optimization; Flex Term simulation

## 1 Introduction

With the rapid development and overflight of global automated container terminals, China's major coastal container ports, like Qingdao port and Shanghai port, have built fully automated container terminals. Increasing attention has been paid to research of the handling efficiency of automated container terminals and the optimization of operating machinery resources allocation. Foreign scholars mainly studied and discussed the horizontal transport operation machinery of semi-automated or fully automated container terminals, and most of these researches focused on the AGV dispatching system. Gopal SL et al. constructed a simulation model with the AGV number as objective function, then found the optimal configuration of AGV under the condition of constant workload (Gopal SL et al., 1991). QIU et al. analyzed and discussed the AGV scheduling problem of automated container terminal, and selected the heuristic algorithm to solve the constructed model (QIU et al., 2002).

However, domestic research on AGV horizontal transportation system of automated container terminal was relatively less. Ma Yuehui et al. established a mixed integer programming model with the goal of minimizing the end time of last task (Ma Yuehui et al., 2016). Kang Zhimin constructed a scheduling optimization model based on the principle of minimum invalid waiting time for vehicles, and solved the model by using genetic algorithm (Kang Zhimin, 2011). Chen Hongxian et al. constructed the trucks path optimization model by using mathematical modeling and Flex Term simulation (Chen Hongxian et al., 2017). Qiu Yuelong used SPN theory to model the AGV dispatching system and established the AGV route transportation model through Witness software (Qiu Yuelong, 2005). This paper mainly studies the loading and unloading efficiency of Q automated container

terminal in China as the research object, and analyzes the resource allocation problem of AGV by establishing a three-dimensional simulation model.

## 2 Status Analysis of Automated Container Terminal

### 2.1 Basic overview of terminal production

Q automated container terminal is one of the first fully automated container terminals to be built and put into operation in China. There are six berths in the dock. The total length of coastline is 2088m. At present, there are 7 single-lift double-car quay cranes at wharf apron and 38 fully automatic high-speed rail cranes in the yard. And 38 pure electric automatic guided vehicles(AGV) are responsible for horizontal handling tasks of containers.

### 2.2 Loading and unloading operation of terminal

The loading and unloading process of Q-terminal adopts the mode of "double-trolley container loading and unloading crane + AGV + automated rail gantry crane". In this mode, the double-trolley container crane is responsible for loading and unloading tasks of container ships; AGV is responsible for horizontal transportation between apron and storage yard; and the rail gantry crane takes stacking and picking up operations tasks in the yard. The terminal loading and unloading system mainly consists of wharf apron loading and unloading system module, storage yard loading and unloading system module, AGV horizontal transportation system module and gate collection and distribution system module. The loading and unloading operation process is shown in Figure 1.

Figure 1 Terminal Loading and Unloading Operation Procedure

### 2.3 AGV horizontal transportation system of terminal

AGV is a kind of automated handling vehicle equipped with non-contact guiding device that requires no human driving, and it is hydraulically driven or electrically driven(Zhang Haiqing,2008). Q-terminal is equipped with 38 pure electric AGVs, which are responsible for horizontal handling of import and export containers. The AGV horizontal transportation system of container terminal is mainly composed of the following three parts: the connection between quay cranes and AGVs, the connection between rail cranes and AGVs, and AGV horizontal handling between yard and shoreline.

The AGVs of Q-terminal work as follows: the AGV starts working status firstly, and the Production Control System of the central control room issues a start operation command to run the AGV to a fixed parking space. When dispatching command is issued, the AGV runs according to the

instruction to the position below the designated quay crane. The sensor senses the actual position of AGV and then transmits the position information to the Production Control System. The control system then issues a parking command to the AGV to ensure that it stays in the target position accurately. The Production Control System also commands the horizontal transportation operations of AGV, including AGV fixed-point parking, travel path optimization, and container handling task management, to complete tasks of automated transport containers from the front of terminal to the yard(Wen Zhimin et al.,2009; Zhang Yuanchun et al.,2011).

The horizontal transportation operation of AGV changes through dynamic change of state of container crane. After loading a container from apron, AGV sails to the appointed box area, enters the gantry crane waiting queue, and accepts the task. Then it drives back to quayside and waits for next round of work. It repeats like that until all tasks are completed. The operation process of AGV horizontal transportation system is shown in Figure 2.

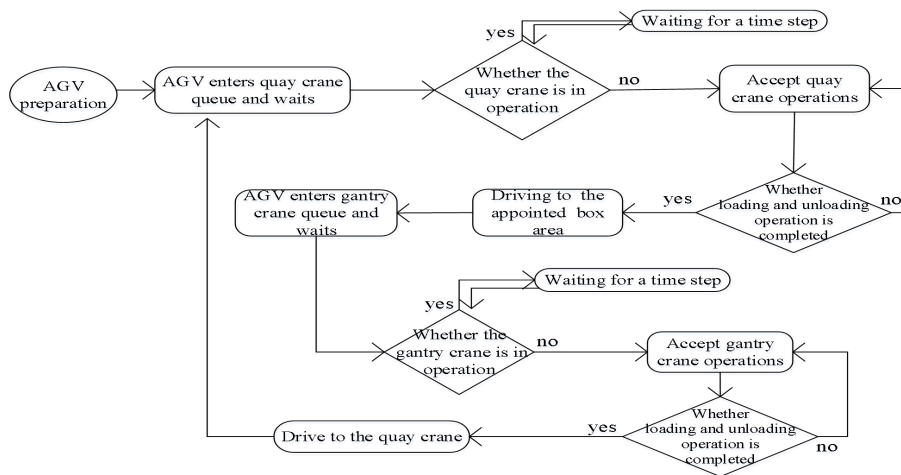

Figure 2 The Operation Process of AGV System

### 3 Simulation Modeling of AGV Horizontal Transportation System by Flex Term

#### 3.1 Flex Term simulation modeling steps

As a simulation software specifically for container terminal simulation, the Container Terminal physical library in Flex Term contains most of actual facilities and equipment in container terminals, such as berths, ships, container loading and unloading cranes, gantry cranes, AGV modules, gates and other terminal infrastructure and handling equipment. Flex Term simulation includes five basic steps(Tong Pengxiang,2018): setting up entities, parameters setting, entities connection, running model and simulation results analysis.

Step1 setting up entities: According to the characteristics of the system, drag and drop the required entity from Container Terminal entity library to corresponding appropriate position in the operation interface.

Step2 parameters setting: Set parameters of the entities according to the requirements of experimental specific data and logical characteristics described by each entity.

Step3 entities connection: According to the logical connections between model entities,

different connections are used to connect the corresponding ports of the corresponding entities one by one to form a visual simulation model.

Step4 running model: Set the simulation termination time according to actual requirements, then reset the model and run the model;

Step5 simulation results analysis: After the model simulation is terminated, the entity running effect is viewed through entity property window, and the simulation results are output and analyzed.

### 3.2 Simulation modeling of AGV horizontal transportation system

The simulation model of the terminal AGV horizontal transportation system was constructed by using Flex Term simulation platform. The 6# berth of Q-terminal was selected for this simulation. The berth is 300m in length and berth level is 70000 tons, and it is equipped with two double-trolley bridge cranes. The berth is planned to achieve weekly throughput of 1800TEU and annual throughput of 93000TEU. The following assumptions had been made to simplify model before establishment of simulation model:

- (1) Only containers of same type can be stacked in one container area during simulation time;
- (2) Container type was uniformly set as 20ft general container, regardless of special container and dangerous cargo container;
- (3) The number of containers stored in the yard at various stages during planning period was known;
- (4) Quay cranes adopted operation sequence of "loading first and then unloading" in the simulation process.

In Flex Term software, the related settings of Berth Planner and Yard Planner have been completed in turn, the arrival time distribution table of container ships and loading and unloading plans have been formulated, and the principles of containers stacking have been stipulated. Then two truck gangs and several network nodes were added to establish connections with quay cranes and yards respectively, and AGV queues were connected to the path through a certain node. Different connection methods were used to link corresponding ports of each entity. The visual simulation model is shown in Figure 3.

Figure 3 Flex Term Simulation Model

## 4 Simulation Experiments and Results Analysis

### 4.1 Simulation experiments

After construction of AGV horizontal transportation system simulation model, the optimal configurations of AGVs with different number of gantry cranes have been considered, under the condition that quay cranes operation remained unchanged. In the case of one gantry crane in each yard, one gantry crane was added to each yard one by one, and then two gantry cranes performed stacking and picking operations simultaneously; on this basis, the ratio of quay cranes to AGVs was increased one by one. The initial ratio of quay cranes to AGVs was 1:1, and the number of AGVs serving quay cranes was sequentially set from 1 to 10 by modifying property settings of truck gangs.

Considering that quay crane is not only the most important bottleneck restricting operating efficiency of whole terminal, but the most expensive and essential loading and unloading machinery of automated container terminal, the average loading and unloading efficiency of quay cranes and the percentage of waiting time of quay cranes were adopted as evaluation indicators to measure effectiveness of experiment scheme. The simulation running time of model was set to 10080min (one week), and related attributes of truck gangs were modified in each experiment. Finally the model was reset for simulation experiment and simulation data has been collected.

### 4.2 Simulation results analysis

During the process of model running, the real-time data of simulation operation was viewed and output through Dashboards and Statistics options, and the collected data results have been sorted after simulation experiments. The output is shown in Tables 1 and 2, Figures 4 and 5, where RTG represents gantry crane.

**Table 1 The average efficiency of quay cranes TEU/h**

Crane: AGV	1:1	1:2	1:3	1:4	1:5	1:6	1:7	1:8	1:9	1:10	
Number s of gantry cranes	4	38.75	42.70	42.05	42.20	43.40	43.50	43.35	44.20	44.15	44.30
	5	38.95	41.60	43.35	44.35	45.65	45.90	45.90	45.60	46.60	46.65
	6	39.30	43.10	42.90	43.55	44.40	44.65	45.05	45.95	45.95	46.20
	7	39.60	42.20	44.25	43.65	44.50	45.25	45.40	45.55	46.50	46.80
8	40.25	43.35	44.50	45.70	46.95	47.40	47.70	48.10	48.00	48.15	

**Table 2 The percentage of waiting time of quay cranes %**

Crane: AGV	1:1	1:2	1:3	1:4	1:5	1:6	1:7	1:8	1:9	1:10	
Number s of gantry	4	32.75	19.80	20.90	20.50	17.20	17.25	17.40	15.35	15.30	14.50
	5	32.05	23.25	18.35	16.95	12.05	11.80	11.55	11.25	9.70	9.50

cranes	6	31.10	19.50	19.55	17.40	14.80	15.20	13.25	12.25	12.05	9.40
	7	31.00	21.70	16.40	17.55	15.15	13.15	12.35	12.30	10.20	10.05
	8	29.45	18.90	15.35	12.45	9.85	8.50	8.00	7.65	7.45	6.30

Figure 4 Simulation Results of Average Efficiency

Figure 5 Simulation Results of Waiting Time

Taking the case of 4 gantry cranes in the yard as an example, when the ratio of quay cranes to AGVs increases from 1:1 to 1:2, the actual loading and unloading efficiency of quay cranes and the percentage of waiting time change significantly. The average loading and unloading efficiency increases from 38.75TEU/h to 42.70TEU/h, and the percentage of waiting time decreases from 32.75% to 19.80%. And then when the ratio increases to 1:8, the average loading and unloading efficiency gradually increases to 44.20TEU/h, while the waiting time percentage of quay cranes gradually decreases to 15.35%. After that, although the actual loading and unloading efficiency of quay cranes and the percentage of waiting time change slightly, it is not obvious. Therefore, the quantity ratio of 1:8 is the optimal configuration scheme when there are 4 gantry cranes in the yard. Similarly, in the case where different number of gantry cranes are configured in the yard, AGV configuration scheme has been selected in turn and the results have been shown in Table 3.

Table 3 Optimal AGV Configuration Scheme under Different Conditions

AGV configuration scheme		Evaluation indicators	
Number of gantry cranes	quay crane : AGV	Average efficiency of quay cranes / (TEU/h)	Waiting time percentage/ %
4	1 : 8	44.20	15.35
5	1 : 8	45.60	11.25
6	1 : 8	45.95	12.25
7	1 : 9	46.50	10.20
8	1 : 9	48.00	7.45

It can be seen from above charts that average loading and unloading efficiency of quay cranes increases gradually while waiting time for AGV decreases gradually, as gantry crane has been added to yard one by one. When the entire yard is equipped with 8 gantry cranes, that is, each yard is equipped with 2 gantry cranes, the average loading and unloading efficiency and waiting time percentage of quay cranes have changed significantly. Under the optimal AGV configuration scheme, the average loading and unloading efficiency of quay cranes increases from 44.20TEU/h to 48.00TEU/h, and the percentage of waiting time decreases from 15.35% to 7.45%.

Therefore, the AGV configuration optimization scheme has been specifically selected as follows: When there are 4, 5 or 6 gantry cranes in the yard for stacking and picking up operations, the optimal AGV configuration scheme is 1:8 for the ratio of quay cranes to AGVs, while the optimal AGV configuration scheme is 1:9 when there are 7 or 8 gantry cranes for loading and unloading operations.

## 5 Conclusion

In this paper, after understanding current situation of production and operation in Q automated container terminal, the composition and operation process of AGV horizontal transportation system were analyzed. The professional simulation software Flex Term was used to construct a three-dimensional simulation model of AGV horizontal transportation system, and a series of AGV configuration scheme and simulation experiments were carried out. Finally, the simulation results were analyzed to obtain the optimal ratio of AGV horizontal transportation system under different conditions, which would be useful for planning of automated container ports.

The optimal configuration of terminal AGV resources involves not only quantity configuration problem, but also some other problems like path optimization design and scheduling strategy, which need further study.

# Supplier Relationship Quality and Supply Chain Performance in Engineering Enterprises: The Regulating Role of Cooperation Vision

Yin Long, Liu Mingfei

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 962763327@qq.com, liumingfei5223@163.com)

**Abstract:** Many researches have shown that the quality of supply chain relations has an important impact on supply chain performance, but there are relatively few studies on overseas engineering and construction industry, especially based on the characteristics of engineering and construction industry and the supply chain research of cross-cultural scenarios of overseas engineering. Based on the characteristics of the engineering supply chain, this paper believes that engineering companies pay more attention to supplier quality than customer relationship quality. Based on the theory of resource dependence and social exchange, from the perspective of engineering supply chain, the concept model is constructed, and the quality of supplier relationship is divided into communication quality, cooperation quality and commitment quality, respectively, and its impact on supply chain performance is discussed. The role of cooperation in the cross-cultural context of overseas engineering. The research results show that the communication quality, cooperation quality and commitment quality with suppliers have a positive impact on supply chain performance, and the cooperative vision plays a regulatory role in the relationship between supplier relationship quality and supply chain performance.

**Key words:** Construction supply chain; Supplier relationship quality; Cooperation vision

## 1 Introduction

With the development of the country entering the "new normal", the engineering construction industry is also pursuing a low-cost and high-efficiency management mode in the increasingly fierce competition. The general contracting mode of engineering is gradually favored in the engineering construction market and has been effectively popularized and applied due to its characteristics of less resource occupation, low management cost, easy handling of industrial relations, optimization of organizational structure, easy control of cost and improvement of performance capability. Under the general contracting mode, the competition in the construction industry has gradually changed from a single enterprise to a supply chain with the general contracting enterprise as the core and formed with many suppliers.

Through the relationship management among the members of the supply chain, the establishment of trust, communication, commitment and cooperation among the members has become the key to ensure the normal operation of the engineering supply chain and improve the performance of the engineering supply chain. In the research of supply chain relationship quality, cooperative vision is becoming an important direction. Especially for some engineering and construction enterprises with overseas business, due to cross-cultural communication, there are differences in cultural background, management methods and management concepts. In this context, the construction of a good cooperative vision plays an important role in the normal development of the project. The cost of improving supply

chain performance with cooperative vision lies in the fact that the degree of improvement of cooperative vision is affected by the quality of relationships among suppliers, enterprises and customers.

It can be found that the relationship quality caused by the particularity of engineering supply chain is different from that of traditional supply chain. What is the role of cooperative vision between supply chain relationship quality and performance management? These are all problems to be solved.

## **2 Research Background and Literature Review**

### **2.1 Research background**

#### **2.1.1 Social exchange theory**

The theory of social exchange was first put forward by humans, who advocated studying the theory of social behavior from the perspective of the relationship between input and output in economics. The social exchange theory holds that the behavior activities between people are driven by "self-interest", which tends to seek benefits and avoid disadvantages in activities and gradually expand self-interest in actions. The theory of social exchange advocates avoiding people's competition in conflicts of interest as much as possible and obtaining win-win or multi-win through mutual social exchange.

In the related research of supply chain, relevant scholars believe that the existence of cooperation vision can effectively reduce supply chain conflicts and frictions and promote supply chain members to work towards common goals from the perspective of social exchange to reduce conflicts of interest and win win-win results, thus contributing to the formation of the relationship between supply chain partners and further having a positive impact on supply chain performance. Therefore, based on the social exchange theory, this paper proposes the influence of supply chain relationship quality with cooperation vision as the intermediary variable on supply chain performance.

#### **2.1.2 Resource dependence theory**

The paper on resource dependence points out that if an organization wants to survive for a long time, it must continuously reduce its dependence on external key resources and constantly find ways to stably master key resources. The resource dependence theory puts forward four important hypotheses: the most important thing for an organization is to care about survival; In order to survive, the organization needs resources, which the organization itself cannot normally produce. The organization must interact with the factors in the environment on which it depends, which usually include other organizations; The survival of an organization is based on its ability to control its relationship with other organizations. The core assumption of the resource dependence theory is that organizations need to obtain resources in the environment to maintain their survival. No organization is self-sufficient, and all organizations need to exchange with the environment.

Based on the theory of resource dependence, relevant scholars believe that the formation of a good supply chain relationship is conducive to the interaction between enterprises and other members of the supply chain, that is, the environment, so that it is easier to obtain and master key resources. The establishment of the cooperative vision is conducive to the supply chain enterprises to conduct business on the basis of mastering the key resources and organizational relationships. Therefore, based on the theory of resource dependence, this paper proposes the influence of supply chain relationship quality with cooperation vision as intermediary variable on supply chain performance.

### **2.2 Engineering supply chain**

With the wide application and development of supply chain management in traditional

manufacturing industry, many experts and scholars began to apply the supply chain management to the field of engineering construction. However, due to the characteristics of single production, centralization and decentralization, temporariness and complexity of engineering projects (Li, 2012), the engineering supply chain is also different from the common manufacturing supply chain. Xue believes that the engineering supply chain refers to the process that materials and information are transmitted between the owner, the design unit (Xue, et al., 2005), the construction contractor and the supplier during the whole process of engineering construction from design, construction, acceptance to recycling. From the perspective of resource management, Li Zhen believes that the engineering supply chain is actually a process of obtaining and allocating resources in many stages of engineering construction (Li, et al., 2017), including feasibility analysis, design, bidding, construction, etc. In addition, some scholars also look at the engineering supply chain from the perspective of engineering delivery. They think that the engineering supply chain is the process in which subcontractors deliver work to contractors, and contractors contact suppliers to build and finally deliver completed facilities to owners. But this definition is general.

Different from the traditional manufacturing supply chain, the engineering supply chain has the following characteristics: first, single-piece production, there is little demand for mass production in the general manufacturing industry in engineering projects, and it is often built for single or several complete sets of large buildings, which also means that the production and construction process is more complex, the construction site is more centralized, and the requirements for production site management are higher; Second, it is temporary, often the original project department will be dissolved immediately after the completion of the project, and a new project department will be set up to take charge of the new project, which also leads to the short timeliness of the project supply chain, unstable supply chain relations and difficult supply chain management. Thirdly, it is forward-oriented. Since the delivery standard has been determined before the implementation of the project, the project supply chain pays more attention to the link from the front-end supplier to the contractor.

### **2.3 Supply chain relationship quality**

The concept of supply chain relationship quality was first put forward by foreign scholars Crosby. It is believed that supply chain relationship quality refers to the dependence of supply chain partners on future behavior choices based on past trade cooperation (Crosby, 1990). Xu Ke believes that the quality of supply chain relationship refers to the evaluation of cognition and feelings by members of supply chain organizations in the course of their behaviors, thus forming an interactive environment and generating potential dependence on future behavior choices (Xu, et al., 2015).

In the measurement of supply chain relationship quality, Fynes believes that the quality of supply chain relationship can be studied from six aspects: trust, communication, commitment, dependence, adaptation and cooperation (Fynes, 2005). Domestic scholars have also added diversity of cooperation, complementarity of business structures, and high-level attention to measure the quality of supply chain relationships (Jiang, 2013). Qin pointed out in their research that the quality of the relationship cannot be limited to the relevant process of the relationship, nor can it be measured only by the behavioral factors of the relationship, such as communication, trust and cooperation, but should also involve environmental and contingency factors in the economy or society (Qin, et al., 2008). When measuring the dimension of supply chain relationship quality, scholars Xu believes that interactive environment is also one of the factors that need attention (Xu, et al., 2015). Its dimensions cover two aspects: the behavioral process of relationship occurrence, including communication, trust, cooperation and conflict coordination, etc. Interactive environment of relationship interaction, including adaptability and relationship atmosphere.

Based on the research on the quality of supply chain relations by scholars and the characteristics of

engineering supply chains, this paper holds that the characteristics of single-piece production of engineering projects make the quality of communication and cooperation in supply chain relations very important. The temporary nature of engineering projects makes the promised quality of supply chain relationship quality very important. This paper analyzes communication quality, cooperation quality and commitment quality as three dimensions of relationship quality in engineering supply chain.

#### **2.4 Supply chain performance**

SCOR and BSC models are commonly used to evaluate supply chain performance. For the evaluation of supply chain performance, most scholars use the above two models to construct evaluation indexes. In the performance research of the engineering supply chain, scholars Qiu Guofang has made a detailed review of the performance research of the domestic construction supply chain (Qiu, 2015). They believe that the performance evaluation of the construction supply chain can be based on the above two existing models, but also considered from the strategic objectives, including agility, finance, customers, internal operation ability, learning and innovation, supply chain closeness and so on. On the selection of performance evaluation indexes for engineering supply chain, the existing research mostly evaluates from three aspects of supply chain operation, project objectives and member relationships. On this basis, scholar Ke Hong proposed that the selection of performance evaluation indexes for engineering supply chain should not only refer to the manufacturing supply chain, but also consider the characteristics of the supply chain itself (Ke Hong, 2015). Based on ROF method and the characteristics of engineering supply chain, six performance evaluation indexes for engineering supply chain including progress, quality, cost, flexibility, core enterprise satisfaction and close degree of partners were selected. Project supply chain performance also belongs to the category of project performance. In the research on supply chain performance evaluation for large complex product manufacturing clusters, scholar Yang Jin combined with the performance characteristics of large projects such as infrastructure and evaluated them from five dimensions of synergy, reliability, flexibility, quality management and cost control (Yang Jin, 2013); He Qinghua and other scholars believe that whether rework occurs is an important factor affecting the performance of major engineering projects (He Qinghua, 2017).

Based on the perspective of external integration, this paper studies the influence of the relationship quality between enterprises and suppliers in engineering supply chain on the performance of enterprise supply chain. In the selection of evaluation indexes for supply chain performance, attention should be paid to the quality of supplier relations under the external integration strategy, and the characteristics of engineering supply chain and project management should be reflected at the same time. Compared with customer relationship quality, engineering projects pay more attention to supplier relationship quality, which requires many suppliers to supply raw materials efficiently and closely on site at the same time, while following the original plan in terms of cost. This paper measures the performance of engineering supply chain from three aspects: synergy, project progress and quality, and flexibility.

#### **2.5 Vision for cooperation**

With the deepening of research, the common vision between organizations has been frequently mentioned in the research of supply chain relationship quality. In an empirical study of Australia's road freight industry, scholar Ferrer regards cooperative vision as an important related factor to explain the quality of supply chain relationships (Ferrer, 2010). Yang believes that a common vision between organizations can strengthen constructive cooperation in the entire supply chain, and discuss the impact of the quality of supply chain relationships in the supply chain on the performance of enterprises with obvious supply chain embeddedness under the shared vision (Yang, 2018). Huang also mentioned a similar point of view in his research on the impact of supply chain relationship quality and embeddedness on the performance of manufacturers (Huang, 2015). The one-piece production and temporary characteristics of engineering projects make it possible that there is no long-term cooperation

between suppliers and enterprises in engineering projects. The cooperation vision reflects the possibility and willingness of both suppliers and enterprises to carry out project cooperation again even after the completion of the project. At the same time, in some transnational engineering projects, the long-term cooperation vision established under the background of policy support can effectively change the differences between the two sides in management methods and management concepts. Therefore, this paper believes that the cooperative vision plays an important role in the engineering supply chain management.

### **3 Research Assumptions**

#### **3.1 Supplier relationship quality and supply chain performance**

From the perspective of external integration, supply chain relationship quality can be divided into supplier relationship quality and customer relationship quality. Scholars such as Liu have proposed that supplier relationship quality has a greater impact on enterprise quality performance than customer relationship quality, and attributed it to the fundamental role of raw materials provided by suppliers in enterprise product quality (Liu, 2018). Therefore, it is necessary to study the influence degree of different relationship quality between enterprises and suppliers on supply chain performance. As for the relationship between relationship quality and supply chain performance, communication, cooperation and commitment will all affect supply chain performance, therefore, this paper puts forward assumptions.

H1: Communication quality has a positive impact on supply chain performance.

H2: Cooperation Quality Has Positive Impact on Supply Chain Performance.

H3: Commitment Quality Has Positive Impact on Supply Chain Performance.

#### **3.2 Moderating role of cooperative vision**

The characteristics of engineering supply chain make the relationship between enterprises and suppliers may be different when cooperating with suppliers. Especially for some overseas projects, the project will establish relationships with many unfamiliar suppliers. The relationships established in this situation may be more fragile and unstable than before, and the impact of relationship quality on supply chain performance may be weakened. The existence of a common vision makes the upstream and downstream partners of the supply chain have common development goals and share resources, which is expected to develop into long-term and close constructive cooperation (Yang, 2018), thus promoting the improvement of enterprise supply chain performance. Therefore, this paper puts forward assumptions.

H4a: Cooperative Vision has a positive moderating effect on communication quality and supply chain performance.

H4b: Cooperation Vision has a positive moderating effect on the effect of cooperation quality and supply chain performance.

H4c: Cooperative Vision has a positive moderating effect on the effect of commitment quality and supply chain performance.

Based on the above assumptions, this paper attempts to propose a multi-factor conceptual model to analyze the impact of supplier relationship quality on supply chain performance under the regulation of cooperative vision, as shown in Figure 1.

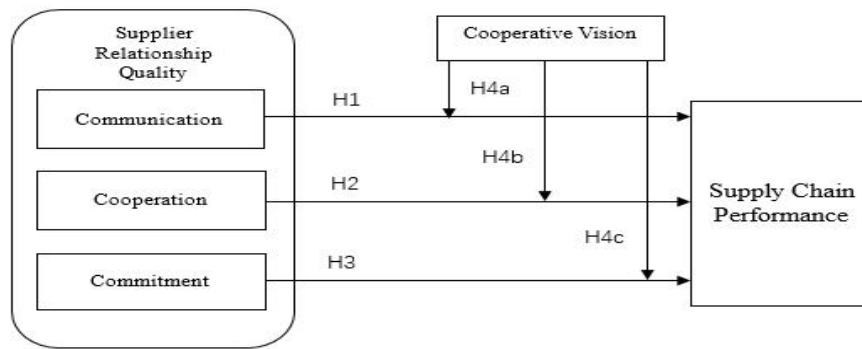

Figure 1 Conceptual Model

## 4 Research and Design

### 4.1 Sample and data collection

In engineering construction projects involving overseas businesses, the supply chain relationship is more susceptible to the influence of the cooperative vision. For example, for engineering construction projects under the Belt and Road Strategy, local suppliers are more likely to believe the reliability of the implementation of China's national strategy, believe that China's Belt and Road Strategic Initiative will greatly promote the development of all aspects of the local area, thus making it easier to share the same vision with Chinese construction enterprises. Therefore, this paper selects the engineering supply chain of overseas enterprises as the research target, and the survey object is mainly the overseas work and management personnel of Chinese construction enterprises. The topics and contents involved in the questionnaire all come from the mature scales at home and abroad, and are partially revised according to the characteristics of overseas construction supply chains. The Likert Five Scale was used to ask questions and answer the questionnaire. Respondents were required to fill in the questionnaire according to their own and actual working conditions.

### 4.2 Reliability and validity analysis

Firstly, this paper standardized the questionnaire, and tested the internal consistency of the questionnaire results with SPSS 23.0 software and clonal Bach coefficient. Generally speaking, when Cronbach coefficient is greater than 0.7, the reliability of the questionnaire is higher. The test found that the overall clonal Bach coefficient of the questionnaire was 0.941, and the clonal Bach coefficients of communication quality, cooperation quality, commitment quality, cooperation vision and supply chain performance were 0.932, 0.873, 0.823, 0.758, 0.918, respectively. The reliability of variable measurement was good, and the questionnaire had high reliability.

The validity measurement of the questionnaire mainly includes content validity measurement and structure validity measurement. The scales of communication quality, cooperation quality, commitment quality, cooperation vision and supply chain performance in this paper are all formed by using the existing mature scales for reference and revising them according to the characteristics of engineering supply chain. Therefore, they have good content validity. Therefore, this paper focuses on measuring the structural validity of the questionnaire through KMO test and Bartlett spherical test. Generally speaking, when the significant level of Bartlett spherical test is less than 0.001 and KMO value is greater than 0.5, the structural validity of the scale is relatively good.

SPSS 23.0 is used to analyze the structural validity of the questionnaire. The KMO values of the supplier relationship quality, cooperation vision and supply chain performance scale are 0.871, 0.659

and 0.754, with significance levels less than 0.001, which is very suitable for factor analysis. Therefore, exploratory factor analysis shows that the above scale has good structural validity and reasonable design. The reliability and validity of supplier relationship, cooperation vision and supply chain performance scale are shown in Table 1.

**Table 1 Reliability and validity analysis table**

Variable	KMO	Cronbach's Alpha
Communication		0.932
Cooperation	0.871	0.873
Commitment		0.823
Cooperative Vision	0.659	0.758
Supply Chain Performance	0.754	0.918

### 4.3 Hypothesis testing

#### 4.3.1 Model main effect test

H1, H2 and H3 propose the direct effects of communication quality, cooperation quality and commitment quality on supply chain performance under supplier relationship quality. H1( $B=0.331$ ,  $SE=0.077$ ,  $p < 0.01$ ), H2( $B=0.228$ ,  $SE=0.107$ ,  $p < 0.01$ ) and H3( $B=0.337$ ,  $SE=0.148$ ,  $p < 0.01$ ) have all been verified, indicating that communication quality, cooperation quality and commitment quality have positive effects on supply chain performance.

#### 4.3.2 Regulatory effect test of cooperative vision

In this paper, the adjustment effect of the cooperative vision is tested. The SPSS 23.0 is used for hierarchical regression analysis. The variable mean is centralized to construct the product interaction term, so as to verify the adjustment effect. That is, we first measure the three variables (i.e., communication quality, cooperation quality and commitment quality) under the quality of supplier relationship and the main effect of the cooperative vision on supply chain performance, and then the quality of the supplier relationship after standardization. The regression analysis is performed on the product interaction between the variable and the cooperative vision. If the P value is significant, it can be proved that the cooperative vision has a regulating effect.

H4a, H4b, and H4c propose a cooperative vision between the three variables of supplier relationship quality and supply chain performance. The interaction quality of communication quality and cooperation vision (COM\*CV) has a significant positive impact on supply chain performance ( $B=0.376$ ,  $SE=0.358$ ,  $P<0.05$ ); the interaction quality of cooperation quality and cooperation vision (COO\*CV) has a significant positive impact on supply chain performance ( $B=0.357$ ,  $SE=0.403$ ,  $P<0.05$ ); The commitment to quality and cooperation vision (CMT\*SI) has a significant positive impact on supply chain performance ( $B=0.116$ ,  $SE=0.453$ ,  $P<0.05$ ). The test results are shown in Table 2.

**Table 2 Main Effect and Regulatory Effect**

Dependent variable: SCP				
Variable	Main Effect		Regulatory Effect	
	B	SE	B	SE
COM	0.331**	0.077	0.360*	0.278
CV			0.013*	0.173
COM*CV			0.376**	0.358
COO	0.228**	0.107	0.345*	0.314
CV			0.039*	0.195
COO*CV			0.357*	0.403
CMT	0.337**	0.148	0.529*	0.320
CV			0.071**	0.231
CMT*CV			0.116*	0.453

Table 2 shows that the cooperative vision has a regulatory effect on the relationship between communication quality and supply chain performance, cooperation quality and supply chain performance, commitment quality and supply chain performance. H4a, H4b and H4c are established.

## 5 Conclusion

The research results show that communication quality, cooperation quality and commitment quality in the quality of supplier relationship have a positive impact on supply chain performance. Due to the forward-looking characteristics of the engineering industry, engineering companies pay more attention to the quality of relationships with suppliers compared to user relationships. In the process of establishing and maintaining supplier relationships, companies should pay more attention to communication, ensure cooperation and abide by commitments, which is crucial for the performance of the company's own supply chain.

In addition, with the implementation of China's "Belt and Road" strategy, more and more engineering and construction companies are going abroad to actively carry out overseas business. In this scenario, the establishment of a cooperative vision based on interest considerations is critical. Due to the differences in culture and values, it is difficult for construction companies and overseas suppliers to establish partnerships. The two sides have cross-cultural problems in establishing mutual trust and mutual assistance. The above research results show that the establishment of the cooperative vision has a significant adjustment effect on the relationship between the quality and performance of overseas engineering companies. Enterprises can improve supply chain performance by sharing resources with overseas suppliers, building strategies, and seeking common development, and actively establishing strategic partnerships and implementing strategic procurement.

**Abstract:** With the rapid development of emerging technologies such as the Internet, business mode innovation has received widespread attention from all walks of life in the past decade or so. This paper proposes an integrated analysis framework of business mode innovation by combining with the iceberg theory of business mode on the basis of dividing the elements of business mode into value proposition, key resources and capabilities, key business and profit model. The paper then applies the analysis framework to analyze the business mode innovation of Guangxi Geology & Mineral Huadi Industry and Trade Group Co., Ltd., and give some management enlightenment of business mode innovation for enterprises. The new analytical framework proposed in the paper can provide reference for scholars' research and enterprises' practice.

**Key words:** Iceberg theory; Business mode innovation; Innovation path; Case study research

### 1 Introduction

Academic research on the business mode(BM) first appeared in the 1960s. With the rapid development of emerging technologies such as the Internet, the scope of innovation is no longer limited to products and services. Business mode innovation(BMI) has received widespread attention from all walks of life in the past decade or so. Successful innovation of BMs can help companies build new capabilities that enable them to gain advantages in business competition (Martins L. L., Rindova V. P., Greenbaum B. E., 2015).

With BMI research moving forward, more and more studies on BMI for different industries has emerged. However, in the context of globalization, the external environment faced by enterprises is becoming increasingly complex. The existing analysis frameworks of BMI mostly lack the analysis of the influence of external environmental factors on BMI. Therefore, on the basis of dividing the elements of a BM into value proposition, key resources and capabilities, key business and profit model, and combining with the iceberg theory of BM, this paper puts forward an integrated analysis framework of BMI, with a view to providing reference for theoretical researchers and practitioners.

### 2 Literature Review

#### 2.1 Business mode theory

Even though academic research on BMs has been around for a long time, there is still no unified definition. The main reason is that scholars in different fields often discuss BMs from different points of view. Although definitions differ across studies, most current definitions are close to or consistent

with the definition of BM proposed by Teece, which is the design and architecture of value creation, delivery, and capture mechanisms of a firm (Teece D. J., 2009).

Scholars have proposed a number of BM research frameworks. This paper divides the existing BM research frameworks into two categories. One is the study of the components of BMs. The researchers list the elements that they think the BM should cover and explain them in detail. Osterwalder et al. clarified the nine components of the BM, and described the basic logic of value creation, delivery, and capture (Osterwalder A., Pigneur Y., Tucci C. L., 2005). Wei et al. presented a six-element business mode including business system, positioning, profit model, key resources and capabilities, cash flow structure and enterprise value (Wei Wei, Zhu Wuxiang, Lin Guiping, 2012).

The other is the study of the BM architecture. The researchers not only pointed out the components of the BM, but also explained the relationship between the various components. Yuan Lei established the "3-4-8" BM system, which links four unit structures through three interfaces to describe the composition of the BM (Yuan Lei, 2007).

## **2.2 Business mode innovation theory**

Literature review shows scholars have different opinions on the definition of BMI. The paper agrees with the definition of BMI proposed by Foss et al., which is "designed, novel, and nontrivial changes to the key elements of a firm's BM or the architecture linking these elements" (Foss N. J., Saebi T., 2016).

The research on paths to BMI has important guiding significance for enterprise practice, so it has attracted much attention. Through literature review, the studies on innovation paths mainly focus on the following three categories:

The first is based on the perspective of components of a BM. Osterwalder et al. proposed a BM canvas, which describes nine elements of a business mode and their interrelationships, and pointed out that BMI can start from these elements (Osterwalder A, Pigneur Y, 2010). Taking elements as the starting point of BMI has strong practical significance and operability for enterprises, but this perspective neglected that BMI is a dynamic process.

The second is based on the perspective of the value chain. Timmers argues that BMI can be achieved by extending, integrating and rebuilding the value chain (Timmers P., 1998). By reorganizing and improving key links and activities in the value chain, BMI can be greatly promoted. But most of the existing research is carried out in a specific industry context, and there is no universal paradigm.

The third is based on the process perspective. Teece pointed out that in order to achieve a sustainable BM, four stages are needed: market segmentation, creating the value proposition, capturing value and establishing isolation mechanism (Teece D. J., 2009). The BMI based on process perspective has dynamic characteristics, but the existing research on the innovation process is not thorough, and further research is needed in terms of progress control and resource integration.

## **2.3 Iceberg theory of business mode**

The iceberg theory is derived from psychology. Sigmund et al. defined personality as an iceberg in his book *The Ego and the Id*. In his opinion, the self-consciousness level and the unconscious level are the ice part and the underwater part respectively. And the underwater unconscious level is the

determining power of individual development and behavioral performance (Sigmund Freud, James Strachey, Peter Gay, 1962).

Based on the ideas of knowledge management and system engineering, Wang Shouyang et al. put forward the iceberg theory of BM (Wang Shouyang, AoJingning, Qiao Hao, et al, 2015). He considered the BM as a complex system, which is consist of explicit knowledge and tacit knowledge. Generally, tacit knowledge which is harder than explicit knowledge to analyze, includes factors such as external environment of organization, industry category, enterprise culture, technological development, etc. In summary, the iceberg theory of BM emphasize that environmental factors have an important influence on the formation and change of BMs.

### 3 Research Methods and Design

#### 3.1 Research methods and design

This paper adopts the single case study method, strictly following the case study process proposed by Yin: literature review → research framework design → data collection → case analysis (Yin R K, 2010). By reviewing the related research on BMs, the paper divides the elements of a BM into value proposition, key resources and capabilities, key business and profit model. Combining with the iceberg theory of BM, an integrated BMI analysis framework is put forward, as shown in Figure 1.

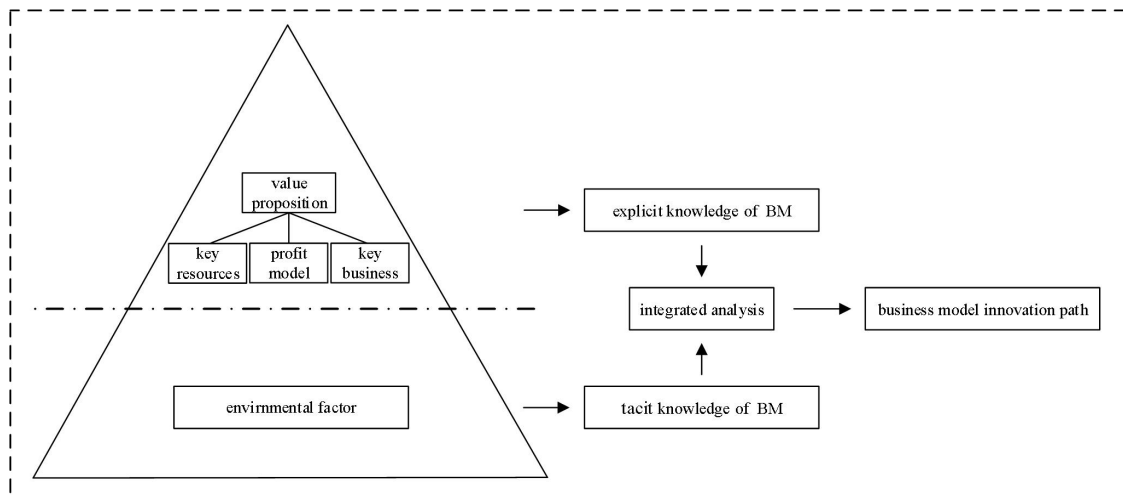

Figure 1 Business Mode Innovation Analysis Framework

#### 3.2 Case selection and data collection

According to the principle of typicality, this paper chooses HD as a case study sampled was established under the background of the implementation of government-affiliated institution reforms in China. The research on BMI of HD can provide important reference for the transformation of other government-affiliated institutions in China.

The data sources of this case include: (1) field investigation and interview.(2) internal information of enterprises including enterprise system documents, financial statements and s second-hand information.

## 4 Case Study

### 4.1 Company profile

HD was originally an institution affiliated to Guangxi Geological and Mineral Bureau. It was established at the end of 2015 on the basis of Guangxi Huadi Industry and Trade Center. It has 4 branches and more than 10 subsidiaries, the business areas of which include machinery manufacturing, import and export business agent, clothing wholesale market, real estate development, etc. The total value of HD assets is over 1 billion yuan.

Goose Mall, HD's subsidiary company, has become the gateway of Liuzhou's large-scale commodity wholesale market. In 2017, Goose Mall's rental income reached nearly 32 million yuan, which is the main source of profit for HD.

### 4.2 Business mode analysis

#### 4.2.1 The analysis of the explicit knowledge of HD's BM

Since HD has so many subsidiaries and branches, this paper divides HD's business into five modules: industry, commerce, real estate, finance and import and export trade.

(1) The industry module. This module is composed of three machinery factories. The module's value propositions include two parts: providing high quality diamond selection equipment and providing mechanical equipment and machinery parts. The key resources and capabilities of the module mainly contain two items: the "LiuTan" brand and the advanced manufacturing technology of diamond selector. The key business of the module is producing crushing and screening equipment, complete mineral processing equipment and machinery parts. The profit model of the module is selling products and services.

(2) The commerce module. This module comprises Goose Mall, JinDi Commercial Mall, and the Market Development Company. The module's value propositions include two parts: becoming a large-scale business center integrating shopping, dining and entertainment; becoming an influential and mature market of electromechanical hardware. The key resources and capabilities of the module mainly contain two items: 100,000 square meters of unsecured and debt-free commercial real estate; a strong operational capability for real estate. The key business of the module is renting shops. The profit models of the module include two ways: charging admission fees, rents and service fees; the wholesale and retail of goods.

(3) The real estate module. This module only has the Real Estate Development Company. The value proposition is providing safe and beautiful homes for people. The key capability is developing real estate. The key business contains two parts: developing real estate and leasing shops and warehouses. The profit models comprise two ways: house sales and rents.

(4) The finance module. This module is composed of the Investment Company and the Small Loan Company. The value propositions of the module mainly include two parts: building a fast and stable investment channel for investment and financing customers; providing various small loans for small and medium-sized enterprises, individual businessmen and natural persons. The key resource is the

strong capital strength. The key business mainly contains two parts: investing and financial consultation. The profit models comprise three ways: investment incomes, service fees and interest on loans.

(5) The import and export module. This module comprises the Import and Export Department of HD and the Goods and Materials Company. The value proposition of this module is providing high-quality goods and services for overseas customers. The key capability is having the right of independent import and export. The key business is exporting, and the profit model is sales profit.

#### 4.2.2 The analysis of the tacit knowledge of HD's BM

As the Sino-US trade disputes continue to intensify, the uncertainty of world economic development has gradually increased, and the downward pressure on China's economy has further mounted too. For the industry module, due to the adjustment of national energy and environmental protection policies in recent years, the market of mining equipment is becoming smaller and smaller with the increase of access threshold. For the commerce module, the rapid development of e-commerce has brought a huge threat to the survival of some traditional business, which has a great impact on HD's shop rental business. For the real estate module, housing sales of HD may continue to decline with the slowdown of China's economic growth. For the import and export module, the depreciation of RMB caused by Sino US trade war has a certain degree of promotion to the export trade. At the same time, with the continuous promotion of the "one belt and one way" initiative and the upgrading of China ASEAN Free Trade Area, the import and export business of HD has great opportunities.

### 4.3 Business mode innovation path

#### 4.3.1 Creating an innovation and start-up platform

In recent years, the government has vigorously promoted innovation and entrepreneurship, and constantly improves the support policies of innovation and entrepreneurship. HD should firmly grasp the opportunity, and integrate the internal and external resources to create an innovation and start-up platform which can provide entrepreneurs with office space and supporting services, entrepreneurship training services, information consulting services and financing services. At the same time, HD can seek financial subsidies from the government to reduce their running costs. The logic diagram of the innovation and start-up platform is shown in Figure 2.

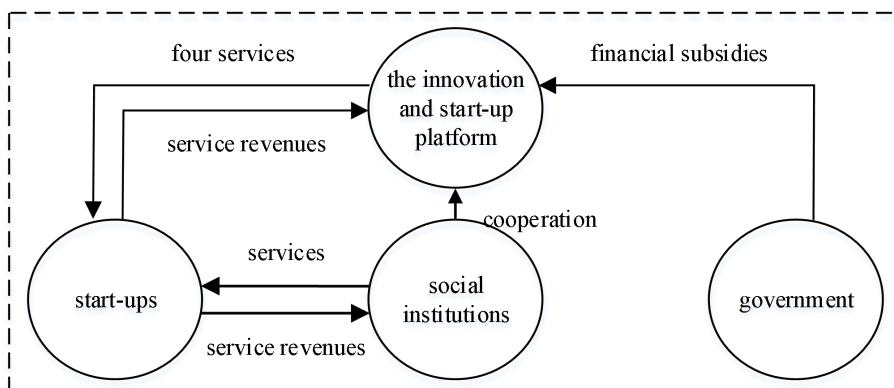

Figure 2 Logic Diagram of the Platform

(1) Office space and supporting services. HD can transform the large area of unrented shops in the Goose Mall into comfortable office space for start-ups, and equip it with complete hardware and software facilities such as computers and wireless networks.

(2) Entrepreneurship training services. HD can start various entrepreneurship training courses for entrepreneurs such as entrepreneurial marketing and financial management through utilizing the human resources of HD or employing college professors.

(3) Information consulting services. Taking advantage of the diversified business, HD can provide start-ups with technical information, market information, economic information and policy information consulting services covering various fields such as machinery manufacturing, commodity trading, real estate development, finance, and Internet.

(4) Financing services. HD can utilize the financial resources of subsidiaries to invest in potential start-ups, or provide financing services such as mortgage loans, orders loans and credit loans for start-ups.

#### 4.3.2 Establishing a community group purchase model

In recent years, the rise of e-commerce has occupied a large space for survival and development of traditional business. Only when traditional business is actively integrated into the Internet can they resolve their passive situation and find new growth points. Community group purchase is a kind of consumption behavior of resident groups. It is a regionalized and localized form of group buying relying on real communities. This model can realize mutual benefit and win-win between enterprises and consumers.

HD can establish a community group purchase model by updating the functions of the existing APP and developing corresponding WeChat applets, and target the community residents in Liuzhou city and attract them through the low prices and low transportation costs. The specific process of this model is as follows: First, each store publishes the products for sale through the APP or WeChat applet. Then the residents participate in the group purchase through the links posted by the community leaders in the WeChat group or through the APP. After the residents' payments are completed, the merchants deliver the goods to the community pick-up station. Finally, the residents take their packages at the pick-up station.

#### 4.4 Guarantee measures for business mode innovation

##### (1) Enhancing the resource integration capability of enterprises

Effective integration of enterprise resources is a critical guarantee for HD to build an innovation and entrepreneurship platform. Most of the diversified value-added services provided by the platform need to be realized through the integration of enterprise resources. Through the effective integration of internal and external resources, the enterprises can realize the maximum use effectiveness of resources and even create new resources so as to improve business performance.

##### (2) Strengthening the construction of the marketing team

To establish a community group purchase model, the most critical part is marketing. The

propaganda of the community group purchase model and the choose of a community leader really test the professional capability of the marketing team, so strengthening the construction of the marketing team is an important guarantee to establish a community group purchase model. HD needs to enhance the professional ability of the marketing team to establish a high-standard and high-quality marketing team.

### (3) Establishing a risk early warning mechanism

HD is bound to face many risks in the process of BMI. It is necessary to establish an effective risk early warning mechanism for BMI. HD should first establish the index system of BMI risk, and identify the dimensions of BMI risk and the definition of each index. Then HD should determine the weight of each index and prepare all kinds of emergency plans in advance. HD will be able to take corresponding measures to cope with possible risks through tracking the numerical changes of early warning indicators.

## 5 Conclusion

By reviewing related research on BMs, this paper divides the elements of a BM into value proposition, key resources and capabilities, key business and profit model. Combining with the iceberg theory of BM, an integrated BMI analysis framework is put forward, which may provide some guidance for enterprises to innovate their BMs. The paper applies the analytical framework to analyze the BMI of HD and presents the paths and guarantee measures for it, and gets the following management enlightenment:

(1) BMI is a dynamic process. Enterprises need to innovate constantly if they want to maintain their competitive advantage. Nowadays, the external environment that enterprises are facing is changing rapidly. Managers must have strong capabilities of analysis, forecast and plan, and make timely adjustments to the company's operation to realize the long-term development of enterprises.

(2) Effective resource integration is a critical guarantee for BMI. Resource integration capability is an important manifestation of an enterprise's competitiveness. By effectively integrating the internal and external resources of an enterprise, enterprises can realize the complementary advantages and the maximum use effectiveness of resources. In the process of BMI, the higher the degree of resource integration, the better the enterprise can play its own advantages, thus achieving high-level innovation.

# Research on B2C E-commerce Enterprise Logistics Mode Selection Based on Analytic Hierarchy Process: Taking Jindong Mall as an Example

Feng Lei

Wuhan Huaxia University of Technology, Wuhan, P.R.China, 430223

(E-mail: fl\_yutian@126.com)

**Abstract:** With the development of information technology, China's B2C e-commerce market has grown rapidly, but the logistics activities have seriously restricted the development of e-commerce, so we choose the logistics mode which adapts to the B2C e-commerce activities. It has become an important work for B2C e-commerce enterprises. First of all, this paper analyzes the influencing factors of e-commerce enterprises' selection of logistics mode. Using Analytic hierarchy process (AHP) to explore the selection of logistics mode for e-commerce enterprises, and taking Jindong Mall as an example, the analysis results are basically consistent with the actual situation, and the applicability of AHP in this issue is verified. It has some practical guiding significance.

**Key words:** E-commerce; Third-party logistics; Self-built logistics; Analytic hierarchy process

## 1 Introduction

With the rapid development of information technology and the improvement of the living standard of Chinese residents, many consumers like to shop on the Internet. At the same time, with the vigorous development of e-commerce, however, e-commerce enterprises are faced with logistics problems such as delayed distribution of goods, high logistics costs, damage or loss of goods and so on. Consumers' shopping experience is not good, and the interests and brands of e-commerce enterprises have also been seriously damaged(Wang Jiancheng,2016).

Foreign scholars began to study the selection of e-commerce enterprises logistics mode earlier. The results of the University of Tennessee show that the most effective e-commerce logistics distribution mode is the third-party logistics mode, which can reduce the logistics cost of enterprises and improve the service quality of logistics distribution(Andreas Klose,2005). Kaplinsky R and Morris M pointed out that the main factors affecting e-commerce logistics distribution are the cost of logistics distribution, inventory number, cargo characteristics, and logistics distribution mode. Lieb Robert and Miller John found that the third-party logistics can save the cost to a great extent(X.Sun,2015). Many American scholars have studied the operation mode of logistics distribution in B2C e-commerce environment, and many of them believed that third-party logistics will be the dominant mode of logistics distribution in e-commerce enterprise with the deepening of social division of labor and the rapid development of logistics industry(Yijun Huang,2014).

In China, HuangPengxiao has proposed that the difficulty of distribution of physical goods constitutes the primary bottleneck factor restricting the development of e-commerce in China, which is determined by China's objective geographical conditions and economic development

conditions(NiuXiaoxue,2016).Zhang Yuhong has proposed that many e-commerce enterprises begin to build their own logistics, and the trend is more and more obvious. The reasons for this phenomenon are the various defects of third-party logistics and the gradual growth of business volume of enterprises. Thus, enterprises have to solve all kinds of problems brought by third- party logistics in this way(Xiong Hui,2014).

## **2 Analysis on the Factors of Selecting Logistics Operation Mode in E-commerce Enterprises**

### **2.1 Size and growth rate of e-commerce online shopping market**

According to data released by iResearch, in 2017 the size of online shopping transactions in China reached 6.1 trillion yuan, up 30.3% compared with 2016, and the proportion of B2C e-commerce transactions has reached 57.6%. B2C e-commerce companies have endorsed the big platform as the brand and are more in line with e-commerce users to the quality of service and commodity security expectations(Xu Tingting,2018).Under China's economic development in a stable and positive situation, B2C e-commerce share will also be further enhanced. From the market share of online shopping, Tmall continues to lead the B2C market, while Jingdong, Vipshop and Suning grow rapidly.

### **2.2 The development level of third-party logistics industry**

China's logistics enterprises began to change from the previous mode of transportation and storage enterprises, the whole is still in the initial stage. With the development of the goods distribution industry, the third-party logistics also began to develop, and the logistics service function began to improve gradually. Now there are many domestic enterprises handing over the goods to the third-party logistics enterprises for distribution. However, the third-party logistics enterprises still have problems such as low level of logistics informatization and low level of logistics service(Wang Changqing,2016). With the rapid development of e-commerce in China, the third-party logistics industry has also gradually developed, indirectly affecting the pattern of China's logistics market, thereby indirectly affecting the selection of B2C enterprise logistics mode.

### **2.3 The enterprise strength**

The capital of the enterprise, the sales scale of the enterprise, the talent reserve of the enterprise and other indicators can measure the enterprise strength itself. For some enterprises, there are a lot of differences in the way of choosing logistics distribution, but they all start from the actual situation of the enterprise. Many small and medium-sized e-commerce enterprises, because of their own economic strength and cost factors, will choose third-party logistics enterprise with higher level of logistics services. Although self-built logistics can improve the control of logistics and customer satisfaction, due to the restrictions of funds, the most e-commerce enterprises rarely choose(Ma Shunshun,2015). At the same time, the logistics network system covering the whole country needs a large number of logistics professionals, such as supply chain managers, warehousing managers, express delivery person and so on.

### **2.4 The ability of enterprises to implement logistics management**

Even if e-commerce enterprises have the financial strength of self-built logistics, they may not be able to build the logistics system well. Because the logistics system is a very complicated system engineering, and it is not only able to establish and operate well at the expense of money. At the same time, enterprises need to have logistics information system including software and hardware technology, warehousing technology, supply chain management technology and so on. Taking Amazon as an example, it pays close attention to the research and development of software technology and storage technology from the beginning(J.Sun,2015). Relatively speaking, it has more advantages than other

enterprises in the self-built logistics system.

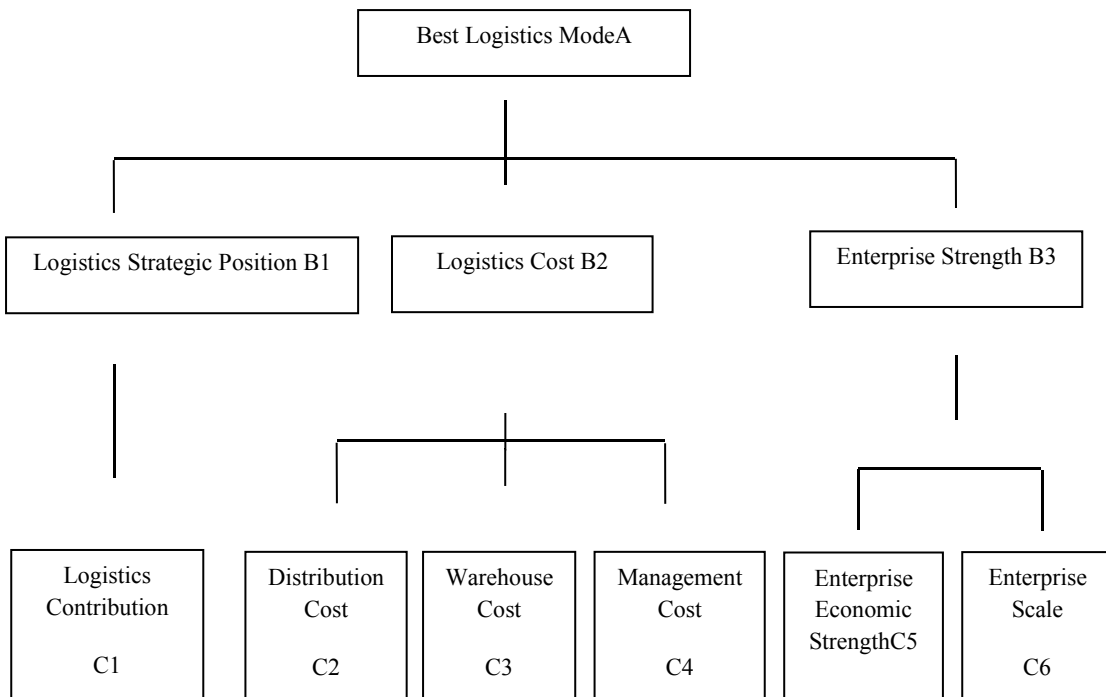

### 2.5 Logistics cost issue

Logistics cost affects the selection of e-commerce enterprise logistics mode to a certain extent. If the funds used by the self-built logistics are lower than the funds used by the third-party logistics enterprises, the enterprises can consider choose the self-built logistics, but this situation is less likely to occur; In more cases, the cost of self-built logistics is higher than the cost of using third-party logistics, which requires specific situation analysis. If the cost of self-built logistics is far greater than the cost of using third-party logistics, and the return can only be profitable in a long time, it will far exceed the enterprise's affordability. In this case, e-commerce enterprises choose third-party logistics better. If the cost of self-built logistics is only slightly higher than the cost of third-party logistics, and the revenue can be obtained in a short period of time, the self-built logistics mode can be considered.

## 3 Construction of Evaluation Model of Logistics Operation Mode in E-commerce Enterprises

### 3.1 Construction of evaluation index system with the analytic hierarchy process

Analytic hierarchy process (AHP) is a multi-objective decision analysis method which combines qualitative analysis with quantitative analysis. This method transforms the decision-making problem into three layers: objective, criterion and scheme, and then solves the eigenvectors by the method of judgment matrix. The weight of each level is obtained, and then the final weight of each scheme to the total goal is obtained by weighted sum methods(He Xinqian,2018).The final maximum weight is the optimal scheme.

Figure1 Logistics Mode Selection Scenario

### 3.2 Establishment of judgment matrix

For the determination of the weight of each index, this paper adopts the form of questionnaire survey, through the online questionnaire website, invite the users of Jingdong Mall to fill in the questionnaire.

Write out all the judgment indexes, form a  $M \times M$  square matrix, then compare each index to score, and add up the scores of each index. Ranks score according to: very important, quite important, comparatively important, slightly important, equally important assigned to 9, 7, 5, 3, 1 respectively. Especially, the element on the diagonal of the square matrix relative to itself is equally important. On the other hand, they were given  $1/9, 1/7, 1/5, 1/3, 1$ .

For example, A is the best logistics mode for the enterprise, and B1 is the position of logistics in the enterprise, B2 is logistics cost, B3 is enterprise strength, as shown in Table 1.

Table 1 Judgment Matrix

A	B1	B2	B3
B1	9	1/3	2
B2	3	1	5
B3	1/2	1/5	9

Whether or not the judgment matrix is consistent with the judgment in the standard matrix? If the judgment matrix satisfies the following relations, then the judgment matrix is completely consistent.

$$B_{ij} = b_{ik} * b_{jk}$$

### 3.3 Calculating weight

Sum product method:

①Normalized processing:

$$B_{ij} = b_{ij} / \sum_{k=1}^n b_{kj} \dots\dots\dots (i, j = 1, 2, \dots, n)$$

②To add a normalized judgment matrix to a row:

$$W_i = \sum_{j=1}^n b_{ij} \dots\dots(i = 1,2, \dots\dots n)$$

③Pair vector  $W_i=(W_1, W_2, \dots\dots W_n)^T$  normalization:

$$W_i = W_i / \sum_{j=1}^n W_j \dots\dots(i = 1,2, \dots\dots n)$$

Obtained  $W_i=(W_1, W_2, \dots\dots W_n)^T$ , That is the weight coefficient.

### 3.4 Consistency check

Consistency check are performed with Coincidence Indicator (CI), Random Consistency Index (RI) and Consistency Ratio (CR).

Coincidence Indicator is:  $CI = \frac{\lambda_{max}-n}{n-1}$

In order to judge whether the judgment matrix of different orders have satisfactory consistency, we also need to introduce the Random Consistency Index (RI) of the judgment matrix. Table 2 lists the test values of the average random consistency index calculated by the judgment matrix.

Consistency Ratio is:  $CR=CI/RI$

When the calculated value CR is less than 0.1, the judgment matrix has satisfactory consistency. Otherwise, the judgment matrix at this level should be readjusted until satisfactory consistency is achieved.

**Table 2 The Numerical Table of Random Consistency Index**

Order number	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
RI	0	0	0.58	0.8	1.12	1.24	1.31	1.45	1.45	1.49	1.51	1.54	1.56	1.57	1.59

## 4. Data Analysis and Model Validation of Jingdong Mall

### 4.1 Construct judgment matrix

In the early days of the establishment of Jingdong Mall, Liu Qiangdong, the founder of Jingdong Mall, had a very clear understanding of the capability and development trend of China's third-party logistics enterprises, and predicted that this situation would not be greatly improved in the near future. Therefore, Jingdong Mall adopts self-built logistics as its main logistics operation mode. The self-built logistics mode enables Jingdong Mall to provide authentic guarantee for users, improve distribution speed, and rationally match the receiving time of users(He Fei,2017).Considering the limitation of working hours of many consumers, Jingdong Mall can provide home delivery service at three times a day, effectively improving the shopping experience and satisfaction of users.

**Table 3 Jingdong Mall Judgment Matrix Table 1**

A	B1	B2	B3	B1	C1	B2	C2	C3	C4	B3	C5	C6
B1	1	1	1	C1	1	C2	1	1	1	C5	1	3
B2		1	1			C3		1	1	C6		1
B3			1			C4			1			

**Table 4 Jingdong Mall Judgment Matrix Table 2**

C1	D1	D2	D3	C2	D1	D2	D3	C3	D1	D2	D3	D4
D1	1	3	5	D1	1	C2	1	1	1	C5	1	1
D2		1	3	D2		C3		1	1	C6		
D3			1	D3		C4			1			

**Table 5 Jingdong Mall Judgment Matrix Table 3**

C4	D1	D2	D3	C5	D1	D2	D3	C6	D1	D2	D3	D4
D1	1	1	1	D1	1	1	3	D1	1	1	3	3
D2		1	1	D2		1	3	D2		1	3	1
D3			1	D3			1	D3			1	

**4.2 Matrix table obtained by normalization processing**

**Table 6 Jingdong Mall Combination Matrix Table 1**

A	B1	B2	B3				
B1	0.322	C1	1	C2	0.322	C5	0.74
B2	0.322			C3	0.322	C6	0.24
B3	0.322			C4	0.322		

**Table 7 Jingdong Mall Combination Matrix Table 2**

C1	C2	C3	C4	C5	C6						
D1	0.641	D1	0.3	D1	0.3	D1	0.322	D1	0.4375	D1	0.4375
D2	0.208	D2	0.5	D2	0.5	D2	0.322	D2	0.4375	D2	0.4375
D3	0.210	D3	0.3	D3	0.1	D3	0.322	D3	0.1483	D3	0.1483

#### 4.3 Get the combination weight vector matrix and normalize it again

Normalized calculation showed that  $B1 = B2 = B3 = 0.322$ , substituting  $B1, B2, B3$ , it shows  $C1 = B1 \times 1 = 0.322$ ,  $C2 = C3 = C4 = B2 \times 0.322 = 0.111$ ,  $C5 = B \times 30.75 = 0.2498$ ,  $C6 = B3 \times 0.25 = 0.08325$ .

Then  $C1, C2, C3, C4, C5, C6$  are added into the weighted calculation.

$$D1 = 0.333 \times 0.652 + 0.111 \times 0.2 + 0.111 \times 0.2 + 0.111 \times 0.333 + 0.4286 \times 0.2 + 0.08325 \times 0.4286 = 0.41937$$

$$D2 = 0.333 \times 0.217 + 0.111 \times 0.6 + 0.111 \times 0.333 + 0.111 \times 0.2 + 0.2498 \times 0.4286 + 0.08325 \times 0.4286 = 0.34017$$

$$D3 = 0.333 \times 0.131 + 0.111 \times 0.2 + 0.111 \times 0.2 + 0.111 \times 0.333 + 0.2498 \times 0.1428 + 0.08325 \times 0.1428 = 0.17255$$

#### 4.4 Evaluation result

By using Analytic Hierarchy Process (AHP), the calculated score of self-built logistics mode is 0.41937, the calculated score of third-party logistics mode is 0.34017, and that of logistics alliance mode is 0.17255. So the self-built logistics mode is the optimal scheme, the third-party logistics mode is the sub-optimal scheme.

### 5 Conclusion

The result of Analytic Hierarchy Process (AHP) proved that Jingdong Mall should adopt self-built logistics mode in China, which is also in line with the actual logistics distribution model of Jingdong Mall. Therefore, the data collected in this paper, and the influencing factors and the distribution of importance degree are reasonable. Meanwhile, the Analytic Hierarchy Process (AHP) can be applied to other B2C e-commerce enterprises in the decision-making of logistics mode selection, which has a certain practical significance.

# Synergetic Effect of Supply Chain in the Construction Industry

Chen Huilin

Logistics Affair Department ,Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: chenhuilin0127@163.com)

**Abstract:** On the basis of value chain theory, supply chain theory and synergy theory, this paper analyzes the supply chain synergy model and effects in construction industry. It establishes the index system and applies fuzzy hierarchy comprehensive evaluation method to analyze synergetic effects of supply chains in the construction industry. Finally, it applies a case to prove the index and method above.

**Keywords:** Supply chain; Synergetic effects; Construction industry; Proof

## 1 Introduction

Building enterprises are those specializing in producing building products such as civil engineering, building installations and so on. Building products are characteristic of regular worksites, large sizes, multiple types. The building processes are characteristic of mobile production, long production term and complicated coordinative relationships. Therefore, the construction industry is a widely scattered industry, in which large or small construction industry, material suppliers and design organizations are scattered all over the country, whose sizes are not big and competitiveness is not strong. The so-called scattered industrial structure results in low efficiency and high costs and thus affects the synergetic effects of supply chains in the industry. Therefore, construction industry needs synergy management of supply chains to integrate industrial resources and reduce chains without added values. This thesis applies supply chain theory and synergy theory to discuss the synergy mechanism and effects of supply in building industry, hoping to be theoretically and practically significant to promote healthy and sustainable development of Chinese building industry.

## 2 Literature Review

The supply chain synergy of construction industry refers to mutual coordination and mutual affection by enterprises in the chains such as suppliers, sub-contractors, owners and so on. Enterprises in the chains forms a network corporation through agreement or united organization, in which suppliers, sub-contractors and customers, on the basis of modern technologies, network technology and communication technology, dynamically share information, closely work together and go towards a common target, that is, leads to the lowest cost, highest profit and biggest customer benefit of the whole chain. The synergistic management of supply chain in construction industry is intended to seek for medial organizational effects, construct a group of competitiveness and keep strength of core culture, whose significance is reflected as follows:

First, to strengthen synergistic relationship of supply chain. The synergy is intended to break through limits and barriers between enterprises, enable them to share and make synergistic use of

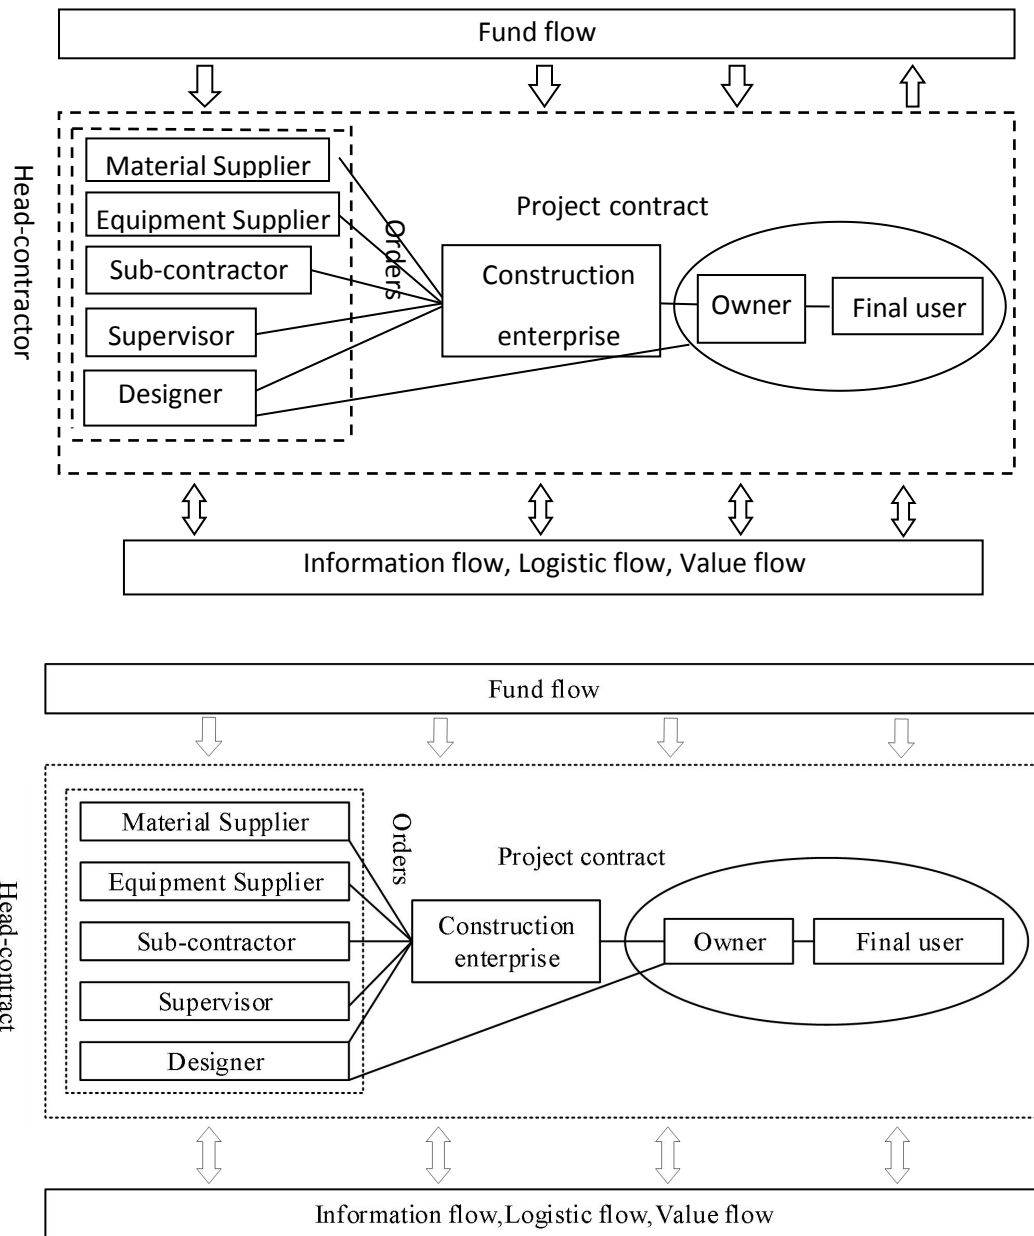

resources like people, money, materials and information on the basis of common targets. As the economy globalizes and market competition intensifies, construction industry who needs to consume large amounts of resources need the supply chain synergy to make efficient use of resources and thus optimize values.

Second, to bring synergistic effects of supply chain. The synergy is intended to obtain more benefits, that is, synergetic effects. Through synergistic operations enterprises will gain more competitiveness and more profits, which is considered as synergetic effects. Construction industry may synergize their operations like sharing knowledge or technologies in the chain to improve their efficiency of value creation and thus acquire synergetic effects.

Third, to reduce operational risks. Construction industry may expand their scales to achieve synergetic effects and create more values than rivals. While, scale expansion may lead to scale economy and upgrade of competitiveness but also may result in reducing enterprises' flexibility and strengthening barriers to withdrawal, which makes it necessary for enterprises to synergize supply chains to keep independence and obtain help from other enterprises and thus reduce operational risks.

### **3 Synergy Mechanisms of Supply Chains in Construction Industry**

The supply chain synergy is a highly integrated system of material flow, information flow, money flow and value flow, which means that in the whole process beginning from project contracting to completion, organizational members including suppliers, contractors, building enterprises, sub-contractors, owners as well as end users, based on the unitary target of the whole chain, will integrate and optimize the system, synergize operations, reduce costs, improve quality, shorten time, and thus maximize values of the whole chain. What is different from manufacture industry is that product designing and quality supervision will be carried on by independent juridical entities and thus they have to synergize operations to create values together for customers. Material flow including raw materials, equipment and so on will go from suppliers to demanders while money flow is just the opposite. Information flow includes demand information and supply information. The former such as project contracts and purchase orders will go from demanders to suppliers while the latter will go down entries and completion reports will go from suppliers to demanders. The value flow involves a set of operational activities to create values along with material flow until the end user accepts the product and finish the process, as shown in Figure 1 below.

**Figure 1** Frame Model of Supply Chain Synergy in the Construction Industry

The operational synergy involves three respects: organizational synergy, work synergy and informational synergy as follows.

-Organizational synergy. That is, building enterprises together with suppliers, the general contractor as well as sub-contractors and the owner synergize operations, form profit- and risk-sharing corporation to meet the end user's demand. Each member, based on maximizing the chain's value, shares the chain's resources and achieve high trust and synergy. Therefore, first of all, it is necessary to select those enterprises as strategic partners who have high reputation, similar values and operational ideology as well as strong core competitiveness. Secondly, in order to achieve the synergy of culture, strategy and managerial ideology, a kind of co-operating and trusting relationship based on sharing resources should

be established so as to make the culture open, make the institutions transparent and make targets coherent.

-Work synergy. Work flow differs from enterprise to enterprise in the chain. In order to maximize the chain's values, all enterprises must synergize their work flows. First of all, the end user and owner must sign a contract with the head contractor. Then the head contractor will subcontract the project to building enterprises. And then building enterprises will have to work with suppliers, supervisors, designers and sub-contractors to form the final products. Only if all enterprises in the chain work together closely, providing materials and equipment timely, design and supervise effectively, could the whole work flow be operated smoothly.

-Informational synergy. The supply chain synergy is based on information synergy, which means, the head contractor, suppliers, sub-contractors, owners and end users take advantage of modern network technology and value chain synergistic management technology to share and synergize demand and forecast information, order information, purchase information, supply information, stock information, contract information and other information. The information synergy may keep information transparent and real, and enable enterprises to reduce costs, shorten work time and guarantee quality.

In addition, the process of supply chain synergy in the construction industry may be divided into three phases: synergy formation, synergy operation and synergy control. Each phase has its corresponding contents and mechanism to make it go smoothly. The synergy process is as follows in Figure 2.

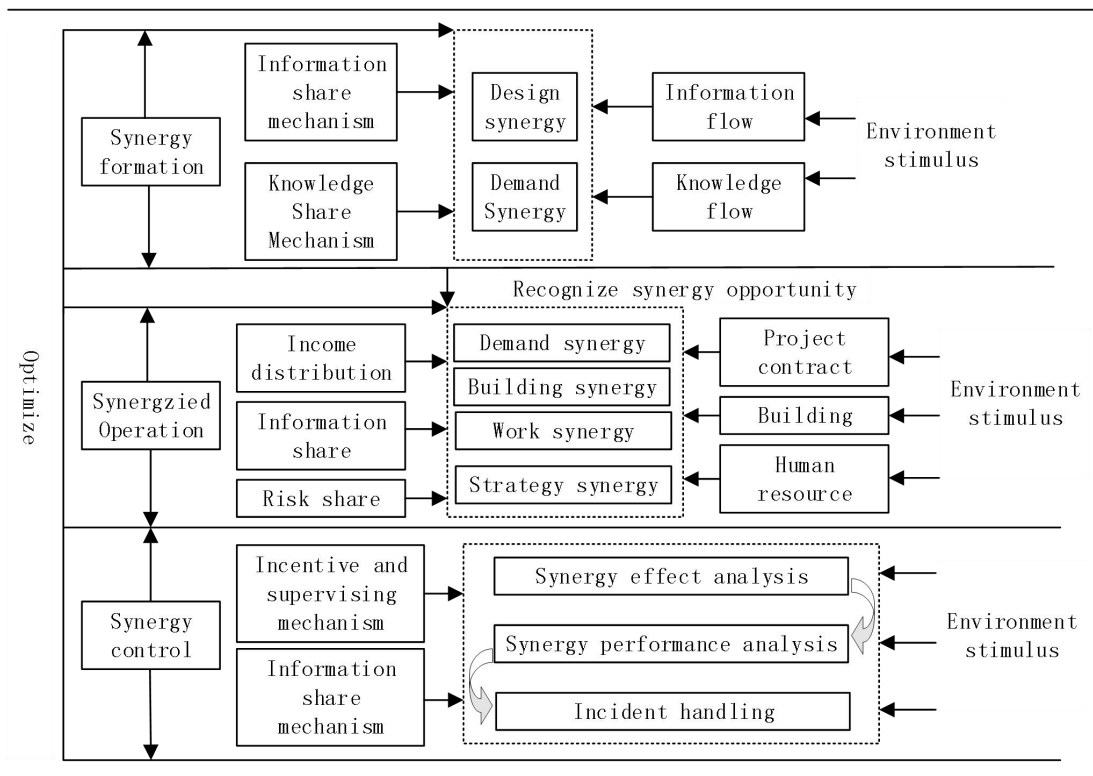

Figure 2 Supply Chain Synergy Process in the Construction Industry

As in Figure 2, in order to improve supply chain synergy, it is imperative to establish such synergy mechanisms as incentive mechanism, information share mechanism, profit distributing mechanism and trusting mechanism.

## 4 Index System, Method and Proof

The synergetic effect analysis is based on some mathematic methods to quantitatively and qualitatively calculate the total values created by such activities as project contracting, building and services. In order to put into use and improve building enterprises' synergetic effects, it is necessary to choose scientific and objective methods to comprehensively analyze the synergetic effects and find problems.

### 4.1 Index system to analyze the supply chain synergy in the construction industry

To analyze the supply chain synergetic effects in the construction industry, a scientific, reasonable and comprehensive system of indexes must be established according to the construction industry's behavioral features, work features and internal and external situation. The indexes are chosen as follows:

**Money flow.** Money is the foundation of supply chain synergy. The thesis chooses Cash turnover rate, Average loan on-time settlement rate and Cost saving rate to reflect the situation of money circulation in the chain.

**Information flow.** The information flow will go through the whole chain from the beginning to the end. The thesis chooses Information exchange rate, Information transmitting accuracy, Data sharing frequency, Timely information delivery rate and Unit cost of information exchange to reflect the statuesque of information flow.

**Work flow.** The work flow is the most important part of the synergy management of supply chain. The thesis chooses Material purchase period, Stock turnover rate, Material supply flexibility, Average timely material delivery rate, Project construction flexibility, Comprehensive quality conformance rate and Feedback question solving rate to reflect the synergizing ability the supply chain.

**Customer service.** Customers are fundamental for building enterprises' survival and development. Customers' demands are not fully satisfied are the mean reason for customer loss. The thesis chooses Customer satisfaction, Customer retention rate, Order completion rate and Order response speed to reflect customer services.

**System adaptability.** The supply chain synergy is nothing without the system's adaptability. The thesis chooses Target consistence, Coordinative and cooperative ability and Credibility to reflect the chain's synergetic ability.

**Table 1 Index System of Analyzing Supply Chain Synergy in the Construction Industry**

Primary index	Secondary index	Index quantization
Money	Cash turnover rate $A_{11}$	Total income/Total assets

flow A <sub>1</sub>	Average loan on-time settlement rate A <sub>12</sub>	Average of the times of timely account settlement in total times
	Cost saving rate A <sub>13</sub>	Actual cost/Total cost budgeted
Information flow A <sub>2</sub>	Information exchange rate A <sub>21</sub>	Times of information exchange in certain time/time length
	Information transmitting accuracy A <sub>22</sub>	times of accurate information delivery/total times of information delivery
	Data sharing frequency A <sub>23</sub>	Shared data amount/Total data
	Timely information delivery rate A <sub>24</sub>	Times of timely delivery/Total times of delivery
	Unit cost of information exchange A <sub>25</sub>	Total cost of information exchange/Total times of information exchange
Work flow A <sub>3</sub>	Material purchase period A <sub>31</sub>	Purchase period of certain material in certain time/Material purchase types
	Stock turnover rate A <sub>32</sub>	Sales amount/Stock amount
	Material supply flexibility A <sub>33</sub>	(Maximal supply quantity -minimal supply quantity)/Average supply quantity
	Average timely material delivery rate A <sub>34</sub>	Times of timely delivery/Total times of delivery
	Project construction flexibility A <sub>35</sub>	(the latest project completion time-the earliest project completion time/Acceptable project completion time
	Comprehensive quality conformance rate A <sub>36</sub>	Redone project number/Total project number
	Feedback question solving rate A <sub>37</sub>	Total producing amount/Total sales amount
Customer service A <sub>4</sub>	Customer satisfaction A <sub>41</sub>	(Total customer number-Complaining customer number)/Total customer number
	Customer retention rate A <sub>42</sub>	Old customer number/Total customer number
	Order completion rate A <sub>43</sub>	Actual delivered product number/Sellers' purchased product number
	Order response speed A <sub>44</sub>	The time from customer ordering to order finishing
System	Target consistence A <sub>51</sub>	Score by experts

adaptability A <sub>5</sub>	Coordinative and cooperative ability A <sub>52</sub>	Score by experts
	Credibility A <sub>53</sub>	Score by experts

**4.2 Method to analyze the supply chain synergy in the construction industry**

Because people do not fully understand evaluation indexes or people are possible to be disturbed by false information, meanwhile due to supply chain's complicacy and dynamics, there must be some imperfect information, that is, fuzzy information. Therefore, we choose fuzzy hierarchy comprehensive evaluation method, which integrates fuzzy mathematics and analytic hierarchy process, to comprehensively analyze the synergetic effects of supply in construction industry. The specific steps are as follows:

- Step 1: Establish index system to determine reasonable evaluating factor set;
- Step 2: Use the Analytical Hierarchy Process to determine weight of each index;
- Step 3: Establish comment set;
- Step 4: Establish fuzzy evaluation matrix;
- Step 5: Calculate comprehensively;
- Step 6: Determine score set; and
- Step 7: Calculate the results.

**4.3 Proof**

Company A is a large building enterprise while Company B is another one in the chain who synergize operations with A. According to the evaluating index system above, we apply AHP to determine the index system and check its consistency, we obtain  $W_i$ ,  $W_{ij}$ , as shown in Table 2 in which the comment is set as V1 {Excellent (>90%), V2 Good (80%-90%), V3 Average (65%-80%), V4 Fair (50%-65%) and V5 Poor(<50%)}

**Table 2 Fuzzy Computation**

Primary index		Secondary index			Fuzzy Matrix					
<i>i</i>	$U_i$	$W_i$	<i>j</i>	$U_{ij}$	$W_{ij}$	$V_1$	$V_2$	$V_3$	$V_4$	$V_5$
1	$B_1$	0.1289	1	$C_{11}$	0.6370	0	0	0.4	0.6	0
			2	$C_{12}$	0.2583	0	0.6	0.4	0	0
			3	$C_{13}$	0.1047	0	0.4	0.4	0.2	0
2	$B_2$	0.2615	1	$C_{21}$	0.1309	0	0.4	0.6	0	0
			2	$C_{22}$	0.5015	0	0.2	0.6	0.2	0

			3	$C_{23}$	0.1070	0	0.4	0.6	0	0
			4	$C_{24}$	0.2606	0	0	0	0.4	0.6
			1	$C_{31}$	0.0194	0	0	0	0.8	0.2
			2	$C_{32}$	0.0277	0	0	0	0.4	0.6
			3	$C_{33}$	0.0450	0	0.4	0.6	0	0
3	$B_3$	0.5128	4	$C_{34}$	0.2445	0	0.4	0.4	0.2	0
			5	$C_{35}$	0.0798	0	0.6	0.4	0	0
			6	$C_{36}$	0.2608	0	0.6	0.4	0	0
			7	$C_{37}$	0.3228	0.2	0.8	0	0	0
			1	$C_{41}$	0.1175	0.2	0.2	0.4	0.2	0
4	$B_4$	0.0634	2	$C_{42}$	0.5650	0.2	0.4	0.4	0	0
			3	$C_{43}$	0.2622	0	0.6	0.4	0	0
			4	$C_{44}$	0.0553	0	0	0.6	0.4	0
			1	$C_{51}$	0.1047	0	0.2	0.2	0.4	0.2
5	$B_5$	0.0334	2	$C_{52}$	0.6370	0.2	0	0.8	0	0
			3	$C_{53}$	0.2583	0	0.8	0.2	0	0

To calculate and normalize by the formula  $A=W \times R$ , the Membership vectors are as follows:

$$R_B = \begin{bmatrix} A'_{B_1} \\ A'_{B_2} \\ A'_{B_3} \\ A'_{B_4} \\ A'_{B_5} \end{bmatrix} = \begin{bmatrix} 0 & 0.1969 & 0.4000 & 0.4031 & 0 \\ 0 & 0.2039 & 0.4352 & 0.2045 & 0.1564 \\ 0.0646 & 0.5784 & 0.2610 & 0.0755 & 0.0205 \\ 0.1365 & 0.4068 & 0.4111 & 0.0456 & 0 \\ 0.1274 & 0.2276 & 0.5822 & 0.0419 & 0.0209 \end{bmatrix}$$

Then by the comprehensive evaluating model, we obtain:  $A=W \times R_B=(0.0461, 0.4087, 0.3447, 0.1484, 0.0521)$ .

When setting  $K_1=20, K_2=40, K_3=60, K_4=80, K_5=100$ , the score set is  $K=(20,40,60,80,100)^T$ . According to  $B=A \times K$ , we obtain the synergy value is:  $B=(0.0460, 0.4087, 0.3447, 0.1484, 0.0521) \times (20, 40, 60, 80, 100)^T=55.0320$ .

That is, when using the above index and method to calculate, the result is about 55, which shows that the synergetic effect is bad and which shows that they should analyze their actual situation and problems and take proper measures to optimize the synergy of their supply chain. In addition, we found the reason why their synergetic effect is bad is that their information synergy is bad. Therefore, they

should establish an effective information exchange platform, improve information exchange infrastructures and set up effective information exchange rules.

## 5 Conclusion

Products of construction industry are different from others in that they need to consume large amounts of human, money and material resources. The supply chain in construction industry is thus different so that it is urgent to use the synergy theory to analyze supply chain synergy in the construction industry. This thesis establishes a frame model and index system, uses the fuzzy hierarchical method to comprehensively analyze the supply chain synergy in the construction industry, on the basis of which it suggests as follows to improve synergetic effects in the construction industry:

-Chain members must take advantage of advanced network technology to effectively share information and synergize work flows;

-Chain members must set up an effective organizational structure to guarantee participation of leaders and close cooperation of members; and

-Chain members must set up effective rules as well as trusting mechanism, incentive mechanism, profit distributing mechanism and rewarding and punishing mechanism to promote strategic partnership.

**Abstract:** This article aims to discuss the relationship of organizational culture represented in the leadership style in the health of the people in organization. In order to do so, a search was conducted into the literature by studies that addresses the theme and allowed us to contextualize it. A proposal of this discussion we can say that the environment organization can cause occupational diseases like the burnout syndrome explored in this article. A relevant point that should be emphasized in this study is that, although relatively new, studies explore the concept of toxic leadership, which consists of a series of problems caused by the leader that affect the life of the organization as well as the life and health of the employee. Therefore, an organizational disease can be caused by an unhealthy organizational culture and a toxic leadership style.

**Keywords:** Organizational culture; Organizational structure; Culture; Leadership style; Leadership; Burnout syndrome

### 1 Introduction

How could be possible people get sick just because they work? What factors are responsible for that? There are so many questions emerging from a single question: Are leaders leading people into sickness? What is known is that people tend to react when something is not accordingly to their expectations (Herzberg, 1966; Bakker & Demerouti, 2017). It is shown by several studies such as Hackman & Lawler (1971), Muller (2011), Putthiwani (2015), Chatterjee, Pereira & Bates (2018), Chong, Shang, Richards & Zhu (2018), among others scholar that study organization and its cultures over employees. These studies are important to establish what steps are needed to contribute with the field of literature about Human Resources Management disciplines.

The comprehension of what could be considered ill, it is important to clarify the concept of the word itself. So, according to English Oxford dictionary the word ill can be understood as “suffering from an illness or disease or feeling unwell”; “poor in quality”; “bad or harmful”; “not favorable or auspicious”; “problem or misfortune”, and “evil or harm” (Ill, 2019). For this research, the concept of the word will be understood under the standpoint of a consequence of a disease. So, it could be analogically understood like something that is developing over the time and based in some situations such as stress from organizational tasks.

Once it is considered that organizations create and transfer knowledge exactly like humans do, and the existence of a pleasant environment should be ubiquitous to happen the transference, it is essential for the development of the tasks the previous understanding about what factors contribute or not to the processes of employees health or lead them to Syndrome of Burnout (Nonaka & Takeuchi, 1995; Choo, 2001; Scatolin, 2015; Silva, Sabbadini & Desiderio, 2015; Latino, Corallo, Capone, Martino & Trifoglio, 2016; Budeva, 2016; Ribera & Ceja, 2017; eÖrtenblad, 2018). Due to that, it is *sine qua non* to provide a consistent understanding about what factors are responsible for the employee's health, culture, and leadership.

Culture can be understood as the values and beliefs shared in the company, in which it gives direction of the course to be followed to achieve the goals in the company (Kim, & Chang, 2018). Oyemomi, Liu, Neaga, Chen, & Nakpodia (2018) shows that culture not only leads to the identification of the company, but also is determinant for the organization growth. According to Tsai (2011), the beliefs and values influence the attitudes and behaviors that exist for a long time, and they are related to the organizational culture.

According to Nyberg, Bernin and Theorell (2005) the organizational culture reflects on the leisure time of the employees. Tsai (2001) complements that organizational culture also gives the directions and

leadership behavior of the administrators in order to reach what the company requires from their leaders. Therefore, the company success depends on the leadership effectiveness (Lin, Ma, Zhang, Li, & Jiang, 2016).

In organizational culture terms there are many factors related to the company success (Murphy & Pardeck, 1986), but there are also others factors as important as success, which contribute to the company success though. The fact of the health of the employees is understood as quite important to maintain the company working properly. This article aims to discuss the relationship of organizational culture represented in the leadership style in the health of the people in organization. Therefore, this study seeks into the literature **how does a company organization may sick people?**

## **2 Culture, Unhealthy People, and Leadership Style Influence**

### **2.1 Organizational culture and sickness**

Taking into consideration that inside the management of the organizational culture is included into the critical success factors, and it is also responsible for leading the company into a better position if compared to its concurrent (Santos, Damian, & Valentim, 2019). Other factors such as people must be considered, once as mentioned by Kim and Chang (2018) that everything is shared into a company to people is understood as an organizational culture. Therefore, a special attention should be given to people and their needs.

Kartolo and Kwantes (2019) state that values, attitudes, and expectations shape the organizational culture. The authors explain that organizational culture not only impact on employee levels, but also on the success or failure. According to Marguardt (2002, p.27) "culture refers to an organization's values, beliefs, practices, rituals, and customs." Organizational culture could be understood as a way of shaping behavior (Tseng, 2010).

Cameron and Quinn (2006) mention that it is quite important to bear in mind that there are different types of culture (clan, adhocracy, market, and hierarchy). The authors also mention about the leadership style which it reflects the organizational culture of the company. In other hand, the authors still highlighted about an indefinite organizational culture may cause several problems in what concerns the discomfort, lack of integration and bemoan the hypocrisy.

Not only may the indefinite organizational culture cause such instability to the organization, but also some psychic problems. One of these problems is known as Burnout Syndrome, which was presented in a review named 'Organizational Culture and Job Burnout', and was concluded that organizations should look for the qualified person that have the sense of right and be at the same time, able to listen and analyze dissonant points of view. The authors highlighted that stressing situations may cause to the employees confusion to sort out some tasks or make them inapt to quick answers. Furthermore, other problems such as weakness and high levels of emotions will lead to a psychic instability (Dimitrios & Konstantinos, 2014).

Independent of the field of study, the literature that covers the syndrome of Burnout relates problems that implies in the organization and consecutively in the employees. Burnout syndrome is quite related to working environments, and it is commonly characterized by 'exhaustion, depersonalization and reduced satisfaction in performance' (Weber & Jaekel-Reinhard, 2000, p. 512). Factors like recruitment modifications, training, and job design were suggested as a possible alternative to alleviate the problems caused by Burnout (Maslach & Jackson, 1981).

### **2.2 Syndrome of burnout in organizations**

Generally, some organization factors such as organizational structure and organizational culture might be considered as causing problems (Murphy & Pardeck, 1986). It is important to say that every process resulted from described and specified activities, in which may affect the organization environment can be understood as an organizational structure (PMI, 2017). Besides, when organizational, either structure or culture, problems are caused by factors such as communication, ambiguity roles and no work flexibility, consequences like growth inhibition, absenteeism, job satisfaction and turnover are more present (Murphy & Pardeck, 1986).

Either problems concerning the development of the employee or problems such as mental dysfunction, lack of precision, disorganization, lack of drive and mainly personality changes are diagnosed in Burnout syndrome (Maslach & Jackson, 1981). However, the term has been widely used and due to that was considered a catch-all term (Sack, 1980). Yet, according to Sack (1980), there are three stages defined as job stress, feeling of tension, fatigue and exhaustion, and attitude changes.

Lilly, Cucchi, Marshall, & Katz (2019) have considered the well-being of the company employees.

As employee's well-being it would be considered all stressors present in the company (Etzion, Eden, & Lapidot, 1998). However, according to Etzion, Eden, and Lapidot (1998) there is a tendency in considering only negative factors such role ambiguity or overload, but the absence of autonomy or challenge can also lead to Burnout syndrome. It is also interesting to mention the leader influence whether for good or not in the organizational environment and employee's health (Chen, & Chen, 2018).

It is also important to say that Burnout syndrome is an accumulative syndrome, in which events of stress or, as mentioned before, role ambiguity have their contributions to it (Budeva, 2016). The author also says that there are two groups, where the first one is related to the individual characteristics called subjective/individual and the second group is related to the work responsibilities called objective/situational. Both groups depict situations or problems that tend to happen in the Burnout syndrome.

An important aspect in the sickness of the people in the organization is the level of stress caused by leaders. We can say that leaders have a strong influence on the life quality in organizations as well as the satisfaction or dissatisfaction of people in conducting their tasks.

### **2.3 Leadership styles and sickness**

Compete to the leader to give the right direction in order to achieve the goal estimated by the company, as confirmed in a study, the toxic leadership influences interpersonal conflicts, organizational constraints, and the quantity of work (Uysal, 2019). However, a leader may cause a series of problems when the style used is not appropriated (Kanwal, Lodhi, & Kashif, 2019). Although the field of leadership had been aimed in several studies Putra and Cho (2019) said it is still focus of interest of many researchers. It is important to highlight that the leadership style adopted may lead the employees take conclusions about the organization (Dartey-Baah, & Addo, 2018).

A study about 'Leadership behavior and leader self-reported well-being: A review, integration and meta-analytic examination' in which exposed five leadership behaviors, as example of task-oriented, relational-oriented, change-oriented, passive and active-destructive. The task-oriented has the focus is the task, as the proper name suggests. The relational-oriented seeks to improve the relationships and give support to the employees while the change-oriented with focus in monitoring, identifying the changes and seeking for the involvement. The last ones, named as passive, in which there is a wait to the problems arise and then address them, and the active-destructive that is related perceived responses being direct (Kaluza, Boer, Buengeler, & van Dick, 2019).

It is known that there are different styles, only few will be discussed here, once the focus is those who are more injurious and misadjust the employees' mental health. Starting with the autocratic leadership, it is a style where the leader takes your decisions according to your own and they are more coercive with your employees (Jiang & Lou, 2019). Kanwal, Lodhi, & Kashif (2019) understand an autocratic leader as someone who wants to show its power (authority). This type of leadership is quite complicated once the employee has no chance of giving its opinion or any kind of contributions, because the leader has total control of the team and the organization sector (Shrestha, 2019).

Other style is the Laissez-faire, which is considered as an absence of leadership, where the employee takes decisions and also where the role ambiguity is very common, once the roles are not delegated (Kanwal, Lodhi, & Kashif, 2019). Besides that, the problems are in not feeling the expectations of the employees as leaders and the avoidance of organization (Nielsen, Skogstad, Gjerstad, & Valvatne Einarsen, 2019). Corroborating with the authors, the laissez-faire style is generally related to negative consequences, which there is no leader effectiveness and also a huge lack of trust (Breevaart, & Zacher, 2019).

Another style, this one fairly new which is known as toxic leadership consists of a series of problems caused by the leader that affect the organization life and also the employee's life and health (Winn, & Dykes, 2019). There are other names that toxic leadership can be find, such as dark style, destructive, abusive, ineffective, harmful, and one characteristic is the way this type of style use to reach your objectives and the manners in criticizing the work done by your partners or employees to others (Milosevic, Maric & Loncar, 2019). Winn and Dykes (2019) understand as a combination of a set of behaviors such as self-centered attitudes, and motivations that impact the organization and the employee's life.

## **3 Conclusion**

The XXI century has brought many theories and conceptions concerning the do's and don'ts in the companies, yet there are many companies that discredit the theories and studies. The adoption of the

leadership style itself, just according to the need of each sector in the company is not healthy, once studies like Kim and Chang (2018), and Lilly, Cucchi, Marshall, & Katz (2019) show the importance of a better consideration of their employee's needs. The literature has shown that if you consider the needs of the employees in what concern clear roles, better communication, and more flexibility companies will contribute to the improvement of their conditions and consequently higher performance.

The literature analysis has showed a couple of health and mental problems related to the adoption of the leadership style. Furthermore, a syndrome called Burnout has got special attention once it brings up a bunch of causes that lead the employee out of company due to medical certificate. Besides that, another factor is in the organizational culture adopted by the company.

The organizational culture is the sum of values, attitudes and expectations presented in the company (Kartolo & Kwantes, 2019). It is also suited to say that everything resulted from guided activities are parts of the organizational culture. The aim was not come to conclusion of a specific subject, but the catch the reader's eyes of a subject that has been researching, and also it has contributing to the literature in what may lead the company to reach better positions, and the same time maintain its employees in total *compos mentis*.

At the end of the discussion presented in this article it is important to emphasize the relevance of studying the influence of the leadership style on the health of the people of the organization. Research that deals with culture, leadership and organizational environment can contribute to improve the performance of the organization as well as studies that research the allocation of resources. Emotional issues of the people impact both productivity when stopping a machine or lack of physical and /or financial resources.

As a conclusion, this study shows the importance of controlling factors such as high levels of stress, lack of leadership and clear role, inflexibility, keeping a better communication in other to improve the quality of work in the companies and mainly the health of its employees. Not only will such measures prevent losses but also will gauge the leadership adoption. Finally, this study catches the reader's eyes to the impact of the adoption of certain leadership and its consequences of the company workforce.

# **The Effect of Work-Family Enrichment on Employees' Task Performance: The Mediate-Moderate Effect of Work Satisfaction and Social Support**

Li Guiqing, Wang Minxia, Du Wanyan, Ji Pei

School of Management, Chengdu University of Information and Technology, Chengdu, P.R.China,  
610103

(E-mail: e2001011@163.com,742754606@qq.com,duwanyan81@foxmail.com,984342155@qq.com)

**Abstract:** There were studies found that the positive relationship between work and family helps employees improve their job satisfaction, while job satisfaction is related to employees' attitude, behavior and job performance. Enhancing employees' job satisfaction helps improving employees' work attitude, stimulating work motivation, promoting employees' performance, and thus achieve a win-win between enterprises and employees. The work-family enrichment is one of the important support resources to improve employees' task performance. This article built a theory model of work-family enrichment effect on task performance, in the model, the job satisfaction is a mediate between work-family enrichment and task performance, and the social support is a moderate. With 279 employees, the study found that work-family enrichment has a positive effect on task performance, the supervisor/colleagues support has a negative moderating effect between work-family enrichment and task performance, the family/friends support has a positive moderating effect between work-family enrichment and task performance, and job satisfaction has a partial-mediating effect between work-family enrichment and task performance.

**Key words:** Work-family enrichment; Task performance; Job satisfaction; Social support

## **1 Introduction**

The definition of work-family enrichment is based on a mechanism of Role Accumulation Theory, that is to say: the experience in one role can make positive experience and results in another role. Greenhaus& Powell (Greenhaus& Powell, 2006)suggested that this kind of mechanism well captured the concept of work-family enrichment, so that they defined work-family enrichment as the extent to which experiences in one role improve the quality of life in the other role.This definition implies the conversion of emotion, behavior or skills in one field has a beneficial impact to the receiving field, that is to say, involving in role A can make individuals perform better in role B.From the perspective of positive organizational behavior, a series of expressions similar to work-family enrichment have emerged, such as work-family positive spillover and work-family facilitation. Although these concepts are different, many scholars do not make a strict distinction in their practical application, because they actually express that the positive benefits people get in the work/family field can have a positive impact on them in another field.

The concept of work-family positive spillover was first put forward by Crouter (Crouter, 1984), which refers to the benefits individuals get in one role can be positively transferred to the other role.Clearly, both work-family enrichment and positive spillover stands on the individual level.

However, the difference is that enrichment implies the outcome of positive transfer can improve individual's performance or quality in another domain, while positive spillover just emphasize transfers. There is no agreement in the definition of work-family facilitation, but a general meaning. Wayne et al (Wayne et al , 2007) defined work-family facilitation as the development, affective, capital, or efficiency an individual acquired in one life domain (i.e. work/family) could enhance his or her function in another life domain (i.e. family/work). Grzywacz(Grzywacz, 2007)believed that work-family facilitation represents the process that the synergism of work and family playing a leading role, so that they defined work-family facilitation as the extent to which an individual's engagement in one social system, such as work or family, contributes to growth in another social system. Thus, the concept of facilitation goes further than enrichment since it emphasizes the performance improvement in the systemic level.

In summary, this paper defines work-family enrichment as follows: the emotions, behavior, skills or something else that individuals get in the domain of work (family) can improve their performance in the domain of family (work).

Through empirical research, RDJ Michel and CEJ Michel have proved that work-family enrichment is related to job satisfaction, while job satisfaction is related to organizational commitment, which shows that work-family enrichment has an indirect impact on organizational commitment(Michel & Michel,2012).

Judge et al (Judge et al, 2001). conducted a meta-analysis on 254 empirical studies made by European and American scholars from 1967 to 1979. The results showed that despite some important mediating variables, there was a significant positive correlation between job satisfaction and job performance (0.30).

In the research of the results of social support, previous studies tend to focus on the work-family field. Correspondingly, according to the different sources of social support, it can be divided into support in work situation and support in non-work situation. Among them, the social support in the work situation generally comes from the superiors, colleagues, organizations, etc., rather than the social support in the work situation, generally comes from family members, relatives, friends and so on. In empirical research, many scholars only study these two kinds of social support in two different situations. From the point of view of system engineering, these two kinds of social support are interrelated, and can play a role in different situations for employees. Therefore, this paper will include the support of both sides, mainly research the support of supervisors, colleagues, family members and friends.

Driven by global economic integration, China has entered into the economic new normal, shifting from pervious abnormal growth patterns that relied on investment, resources, export-led to the new sustainable development patterns that rely on innovation, markets and domestic demand-driven. Therefore, this is the time that best suited to innovation. Enterprises should continue to pursue innovation in order to ensure having lasting competitive advantage in this rapidly changing era. However, the innovation of a company is ultimately relied upon the employees who are the important component of the company. Thus, the actions that employees do for innovation is extremely important for the survival and development of enterprises. And studying the political measures of how to promote employees' innovative behavior is one of the focus that be concerned by behaviorists and entrepreneurs.

## **2 Theoretical Model and Research Hypothesis**

Research on the outcome variables of work-family enrichment mainly focuses on the three levels of individual, work and family, among which the most is at the work level, which is mainly reflected in the study of job performance and job satisfaction. Therefore, how to effectively motivate employees' task performance? According to Role Theory, employees play different roles in work and family, but the two roles attributed to the same person. Thus, there is always something affect to each other, and the experience, emotion and skills which be gained in the work will naturally have an impact on family life, vice versa. However, the good influence among them can be called work-family enrichment, yet, is it reasonable to have such speculation? Therefore, future research of the influence that work-family enrichment on employees' task performance should be increased, which is one of the starting points of this article. If it can be confirmed that work-family enrichment can significantly promote employees' task performance, namely, giving more attention to employees' family lives and providing much more welfare that is helpful to improving employees' family life so that it can be more easier to reach work-family balance. What's more, employees will have more willingness to making task performance in order to achieving win-win between business and employees.

### **2.1 Hypothesis**

#### **(1) The impact of work-family enrichment on employees' task performance**

Task performance, namely the traditional personnel evaluation, selection of concern, it is related to the work results, can directly, it includes two forms: one is the use of raw materials for organization to create products, services, activities and other tangible things; the other is to provide service for the organization's core technology or maintain work activities. Now, the task performance is more as a dimension of job performance, and job performance is a comprehensive concept, it is the combination of the results, behavior and personal qualities. Therefore, the author believes that can affect the performance of factors can impact on task performance have commonly. Overview of domestic and foreign scholars on the factors that affect job performance literature, can be found that it can be roughly divided into two aspects: on the one hand is the employee's own characteristics, such as personality, character and skill levels, also study more; On the other hand is to be able to affect employee performance environment characteristics, the scholars in the research is not many, the study also focused on the role of the environment for the staff's psychological aspects are studied, such as authorized, perceived organizational support, job satisfaction, the in the mind.

Wayne (Wayne, 2007) pointed out that work-to-family facilitation may has positive relationship with the relationship quality of leader and subordinate, the cohesion of the work teams and the performance of the teams. Woodman, Sawyer & Griffin (Woodman, Sawyer & Griffin, 1993) found that characteristics of team and organization have an impact on creative process and situation, resulting in organizational creative products. Therefore, we predict:

Hypothesis H1: Work-family enrichment has a significant positive impact on employees' Task performance.

#### **(2) The impact of work-family enrichment on employees' job satisfaction**

Job satisfaction is a state of mind that describes how pleasure people get form work. Job satisfaction determines employees' behavior, making individual performance clearly and affecting the function of organization as well as determining organizational performance (Danica,2012).

Employees' innovative behavior may be one of the consequences of job satisfaction, however, not too

much researches about it carried out by scholars.

The practical research took by Jaga & Bagraim (Jaga & Bagraim, 2011) showed that work-to-family enrichment can significantly predict job satisfaction and career satisfaction. Boyar & Mosley (Boyar & Mosley, 2007) found that work to family facilitation is significantly associated to job satisfaction, while job satisfaction negatively predict turnover intention. The meta-analysis of McNall et al (McNall et al, 2010) showed that both work-to-family enrichment and family-to-work enrichment positively correlated to job satisfaction and affective commitment. Therefore, we predict:

Hypothesis H2: Work-family enrichment has a significant positive impact on employees' job satisfaction.

Hypothesis H3: Job satisfaction plays a mediating role between work-family enrichment and task performance.

### **(3) The moderation of social support**

Social support the word first appeared in the 1970 s in the field of psychiatry, experts found that social support has positive effect to health of body and mind. Then, social support gradually into the organization behavior science and management science and other fields. Caplan and Cobb (Caplan and Cobb, 1975) points out that social support is an individual and between individuals or between individuals and groups. Cohen and Syne '(Syne, 1986) social support is defined as the individual can get help from others he provide tangible or intangible, such as all kinds of resources, wealth, friendship, affection, etc. Eisenberger (Eisenberger, 1986) after a series of studies have found that employees feel support from organizations will be encouraged and motivation, thus puts forward the theory of perceived organizational support, which is the so-called sense of organizational support staff for awareness from the support group, which is for the organization in the view of their work and take care of their interests in terms of perception and understanding.

Although on the definition of social support, different scholars view is not the same, but on the basic content of social support or classification is the basic consistent, that is, from nature, social support can be divided into two parts: the part is the objective support, including to the individual in material gifts, as well as the establishment of a social relation network, generally able to quantify; Is another part of the spiritual subjective support, such as for staff to understand, praise and attention, in the emotional support for employees, etc., that part of the support is reflected in the employee's subjective feeling, cannot be quantified.

Karatepe and Bekteshi (Karatepe and Bekteshi, 2008) by 107 Albania a gleam of hotel staff's investigation and study, using LISREL8.30 path analysis results show that the work of social support can enhance work (family) and family role between (work); And family social support can relieve work - family conflict, and increase the family - work to promote. When managers support, they care about employees' feelings and needs, encourage them to speak their own concerns, provide positive, concise information feedback and promote the development of employee skills (Oldham & Cummings, 1996). As a result, put forward the following hypothesis:

H4a: support of supervisor/colleagues play a moderation role between work-family enrichment and task performance.

H4b: support of family/friendlies play a moderation role between work-family enrichment and task performance.

And studies have shown that in the context of non-working staff for support in improving their life

satisfaction at the same time, also can have positive effect on their work behavior. For example, the support from the other half with the individual's physical health and positively related to job satisfaction (Karatepe & Bekteshi, 2008), As a result, put forward the following hypothesis:

H5: Social supports (support of supervisor/colleagues and support of family/friends moderate the work-family enrichment indirect effect on task performance through job satisfaction.

### 2.2 Model construction

Figure 1 Theoretical Model

## 3 Questionnaire Design and Sample Analysis

### 3.1 Questionnaire design

The scales in the questionnaire of this study all uses translated foreign mature scales and have been corrected according to actual Chinese mainland situation. The scales using Likert Scale method which value “1, 2, 3, 4, 5, 6, 7” reflecting respondents’ degree from totally disagree to totally agree of various questions of work-family enrichment, innovative behavior and job satisfaction. In addition, the questionnaire also includes demographic variables, such as gender, age, education, work experience, marriage, business size, business type and so on.

The specific sources of scales are shown in Table 1:

Table 1 Overview of Each Scale

scale name	source	No. of items	main content
work-family enrichment	Carlson et al(2004)	18	the development of work to family, the impact of work to family, the capital of work to family, the development of family to work, the impact of family to work, the efficiency of family to work, etc.
job satisfaction	Schreisheim&Tsui(1980)	6	employees' satisfaction of work itself, including payment, supervisor, colleagues, development opportunities, etc.
Task performance	Tsui(1997)	6	The quantity and quality of work outcome, work efficiency, quality standards, norms, etc.
Social support	Caplan (1975)	12	Support from supervisor, colleagues, family and friends.

### 3.2 Descriptive statistics and correlation analysis of the main variables

The main respondents of this survey are 2013 classes of part-time MBA students of University of Electronic Science and Technology of China, 2013 classes and 2012 classes of part-time MBA students of Sichuan University, as well as 2013 management training classes of Sichuan University and University of Electronic Science and Technology of China. These students come from various companies all across the country, having broad representation. In this study, a total of 350 questionnaires had been distributed, with 279 effective questionnaires been recycled. The effective rate of questionnaires was 79.71%. The sample of men (50.5%), women accounted for 49.5%. 20-30 years old (47.3%), 31-40 of accounted for 40.9%, 41 to 50 years old accounted for 11.8%. Table 2 shows the mean value, variance and correlation coefficient of each variable by using the SPSS statistical analysis software.

**Table 2 Mean, Variance and Correlation Matrix (N = 279)**

Dimension	Mean	Variance	1	2	3	4	5	6
work-family enrichment	5.095	0.888	(0.6810)					
Task performance	5.155	1.808	.730**	(0.8700)				
job satisfaction	4.87	1.933	.836**	.619**	(0.9100)			
Support of supervisor/colleagues	5.344	1.653	.795**	.558**	.793**	(0.8710)	(0.6630)	
Support of family/friends	5.792	1.171	.586**	.226**	.315**	.345**	.362**	(0.6630)

### 3.3 Reliability and validity analysis

#### 3.3.1 Reliability analysis

Reliability is an important indicator measuring the degree of the internal consistency of the results of the research. In order to ensure the quality of the measurement, it must examine the reliability of the questionnaire before doing data analysis. This study uses Cronbach's  $\alpha$  to evaluate the reliability of the scales. Generally, Cronbach's  $\alpha$  should be greater than 0.7, and the larger the value, the higher the reliability of the scale. The Cronbach's  $\alpha$  of work-family enrichment is 0.929, The Cronbach's  $\alpha$  of task performance is 0.892, The Cronbach's  $\alpha$  of job satisfaction is 0.823, The Cronbach's  $\alpha$  of support of supervisor/colleagues is 0.802, The Cronbach's  $\alpha$  of support of family/friends is 0.906.

#### 3.3.2 Confirmatory factor analysis

This study uses the method of confirmatory factor analysis (CFA) to verify the construct validity of each scale. In the overall goodness of fit indicators, this study chooses the absolute fit indicators used for evaluating of individual models like  $\chi^2 / df$ , RMSEA and RMR. Generally speaking, that the model can be accepted if  $\chi^2 / df < 5$ , RMSEA  $< 0.08$ , RMR  $< 0.08$ . In the relative fit index, this study chooses the index of GFI, NF and CFI. Generally speaking, these three indicators should be between 0.9 and 1, and

the closer to 1, the better the fitting degree. After amending and the correlation processing of part of the residuals, the major goodness of fit index of each scale are shown in Table 2.

**Table 3 The Goodness of Fit Index of Each Scale**

scale	$\chi^2$	df	$\chi^2/df$	RMSEA	RMR	GFI	NFI	CFI
work-family enrichment	297.062	112	2.652	0.077	0.081	0.901	0.95	0.968
Task performance	16.14	5	3.228	0.09	0.039	0.98	0.984	0.989
job satisfaction	27.076	6	4.513	0.112	0.059	0.972	0.955	0.964
Support of supervisor/colleagues	7.794	3	2.598	0.076	0.040	0.991	0.988	0.992
Support of family/friends	12.774	6	2.129	0.064	0.033	0.985	0.988	0.994

It can be known from Table 2 that except that RMSEA of job satisfaction is a little high, all the other goodness of fit index of the scales are perfect. Thus, the validity of the model can be accepted.

## 4 Hypothesis Testing

### 4.1 Test of moderation effect

This inspection doesn't consider the effect of moderation variable, before the inspection moderation effect, to avoid collinearity, separate the independent variables as moderation variable first centralized processing (minus the respective average), then after the centralized variables to build the product items, become interactive items. First step, the introduction of control variable demographic variables, independent variables (work-family enrichment), moderation variable (support of supervisor/colleagues, support of family/friends), the first step, the regression of the results variables; the second step, after centralized regression equation, introduced the product of item, if the product of the regression coefficient significantly, that regulation significantly, as a result, as a result, as shown in table 3 (it control variable regression coefficient).

**Table 4 The Multiple Linear Regression Analysis of Moderation Effect**

variables	Task performance( $\beta$ )	
	First step	Second step
gender	0.075	0.066
age	-0.261*	-0.162
marital status	-0.001	-0.005
position	-0.196*	-0.199**

education	0.062	0.036
tenure	0.114	0.037
regression analysis of independent variable and moderation variable on outcome variable	0.114	0.037
Work-family enrichment	0.427***	0.433***
Support of supervisor/colleagues	0.206***	0.185**
Support of family/friends	-0.065	-0.070
Work-family enrichment×Support of supervisor/colleagues		-0.135*
Work-family enrichment×Support of family/friends		0.125*
$\Delta R^2$	0.267	0.285
$\Delta F$	10.199***	9.533***

It can be seen in Table 5-1, in the absence of mediation variable, work-family enrichment have significant positive effects on task performance ( $\beta=0.427$ ,  $p<0.001$ ), it shows that H1 verified; Support of supervisor/colleagues play a moderation role between work-family enrichment and task performance( $\beta=0.135$ ,  $p<0.05$ ). It shows that H4 verified, support of family/friends paly a moderation role between work-family enrichment and task performance. Therefore, in the absence of mediation, social support plays a significant impact on task performance.

#### 4.2 The test of mediation-moderation effect

Step1: the influence of independent variable on the results variable. To do the regression of work-family enrichment, support of supervisor/colleagues, support of family/friends on task performance. The results of regression analysis are shown in Table 4.

After controlling for moderation variables, the results reflect that work-family enrichment has a significant influence on task performance ( $\beta_1=0.427$ ,  $p<0.001$ ), so that hypothesis H1 has been verified.

Step2: the influence of independent variable on the mediation variable. To do the regression of work-family enrichment, support of supervisor/colleagues, support of family/friends on job satisfaction. The results of regression analysis are shown in Table 4.

After controlling for moderation variables, the results reflect that work-family enrichment has a significant influence on job satisfaction ( $\beta_2=0.156$ ,  $p<0.05$ ), so that hypothesis H2 has been verified.

Step3: the effect of mediation effect. After controlling for moderation variables, it tests the influence of independent variable on results variable. To do the regression of work-family enrichment, support of supervisor/colleagues, support of family/friends and job satisfaction on task performance. The results of regression analysis are shown in Table 4.

The results reflect that job satisfaction has a significant influence on task performance ( $\beta_3=0.181$ ,  $p<0.01$ ). After controlling for job satisfaction, work-family enrichment has a significant influence on

task performance ( $\beta_4=0.339$ ,  $p<0.001$ ), so that hypothesis H3 has been verified.

Due to the  $\beta_3$  is significantly as well as  $\beta_4$ , and  $\beta_4$  less than  $\beta_1$ , so after controlling for moderation variable, job satisfaction has partial mediation effect between work-family enrichment and task performance.

Step4: the effect of mediation-moderation effect. To put the product results of mediation variable and moderation variable in the regression equation, to do regression test of work-family enrichment, job satisfaction, support of supervisor/colleagues, support of family/friends, the production results of job satisfaction and support of supervisor/colleagues, the production results of job satisfaction and support of support of family/friends on task performance, after controlling for work-family enrichment, job satisfaction, support of supervisor/colleagues, support of family/friends, the production results of job satisfaction and support of supervisor/colleagues has a significant influence on task performance ( $\beta_5=-0.177$ ,  $p<0.01$ ).

Due to the significantly of  $\beta_5$ , support of supervisor/colleagues moderate the work-family enrichment indirect effect on task performance through job satisfaction. so that hypothesis H5 has been verified.

**Table 5 The Multiple Linear Regression Analysis of Mediation-moderation Effect**

variable	Job satisfaction	Task performance
gender	-0.106	-0.119*
age	-0.360**	-0.215*
marital status	0.071	0.065
position	-0.062	-0.066
education	0.086	0.047
tenure	0.303*	0.191
First step: regression analysis of independent variable and moderation variable on outcome variable		
Work-family enrichment		0.427***
Support of supervisor/colleagues		0.206***
Support of family/friends		-0.065
$\Delta R^2$		0.267
$\Delta F$		10.199
second step: regression analysis of independent variable and moderation variable on mediation variable		
Work-family enrichment	0.156*	
Support of supervisor/colleagues	0.217***	

Support of family/friends	0.210**
$\Delta R^2$	0.207
$\Delta F$	7.595***
Third step: regression analysis on outcome variable absence of mediation variable	
Work-family enrichment	0.339***
Support of supervisor/colleagues	0.167**
Support of family/friends	-0.103
Job satisfaction	0.181**
$\Delta R^2$	0.29
$\Delta F$	10.476***
Fourth step: regression analysis on outcome variable absence of interaction term	
Work-family enrichment	0.404***
Support of supervisor/colleagues	0.137*
Support of family/friends	-0.089
Job satisfaction	0.179**
Job satisfaction $\times$ Support of supervisor/colleagues	-0.177**
Job satisfaction $\times$ Support of supervisor/colleagues	0.069
$\Delta R^2$	0.304
$\Delta F$	9.676***

---

## 5 Conclusion

### 5.1 Social support plays a moderation role between work-family enrichment and task performance.

Social support at work - family rich and played a regulation role between employee task performance. Through multiple regression analysis found that, in the absence of job satisfaction as the intervening variable, two dimensions of social support (support supervisor/colleagues, family/friends) are rich with employees at work - family play a significant role in regulating between task performance, specific displays in: under the effect of the regulation of social support, the task performance is with the increase of work - family rich, and on the same level of work - family rich, task performance under high boss/colleagues support is higher than in lower boss/colleagues support, speed is also the former than the latter, and on the same level of work - family rich, task performance under low family/friends support than in high boss/colleagues support, speed is also the former than the latter.

## **5.2 Social support moderates the work-family enrichment indirect effect on task performance through job satisfaction.**

After controlling for social support, job satisfaction at work - family rich and played a partial intermediary role between task performances.

And the role of the two dimensions of social support are also different, the results of multiple linear regression analysis showed that boss/colleagues support through job satisfaction to adjust work - family rich and indirect influence task performance, namely a regulating intermediary effect is remarkable. And adjust the effect with the boss/colleagues support degree of different and different, although with the improvement of work - family is rich, the task of employee performance has improved, but the speed of increase is not the same, with low supervisor/colleagues support than with high boss/colleagues support, staff's task performance improve faster. However, family/friends support and failed to pass the job satisfaction to adjust the relationship between the work - family rich and task performance, namely a regulating intermediary effect was not significant. This explains the research model can only partially explain the role of social support, in the follow-up study, should be in-depth study.

Since the two dimensions of work-family enrichment——work-to-family enrichment and family-to-work enrichment both have a significant positive effect on employees' job satisfaction and innovative behavior, manager can try to make policies that are helpful to improve employees' family life when thinking hardly for making the work policies that can encourage employees' innovative behavior. For instance, give more freedom of working hours for employees, so that employees can take appropriate time to family life and then acquiring knowledge and skills that can't be acquired from the work. For another instance, establish internal nurseries, pensions and welfare institutions to help employees ease the burden of caring children and parents and improve the well-being of their family, helping employees become better workers and enhancing innovative thinking.

**Abstract:** Gamification is the use of games elements in different contexts out of the games. It is a tool with potential application in several areas in management, like marketing and human resources, including training and development. Departing from this reference, this study has objective to identify the perception of efficiency and the measurable results in the gamification processes in training and development in a sample of the Brazilian market. This research is divided into two samples. The quantitative sample investigated the perception of efficiency of the professionals who already participated in the gamified training, the information was collected through an online form with Likert scale responses and treated with Minitab statistical software. The other sample was qualitative and sought to identify the perception of the professionals who developed the gamified training, and the results were submitted to the content analysis technique. The compiled results confirmed the presence of engagement and its influence on motivation as one of the advantage points for the application of gamification in training. It was also possible to find in these results the relevance of the design for the game / training interaction to work effectively. Among the trends of higher incidence found in this research are the possibility of associating gamification with virtual reality and augmented reality to enhance the experience lived by the player during training. As a secondary's incidents, but also relevant and congruent with market trends, are the incidents of concision with relevance, interaction, applicability and the digital trail, items present in the concept of learning in micro-moments.

**Key words:** Gamification; Training; Development; Engagement

### 1 Introduction

The last two decades have witnessed a rapid deployment of central human resources activities, making the area function responsibilities evolve to a more strategic level. The first evolution progressively added to human resources management procedures in the areas of labor and union relations, recruitment and selection, compensation and benefits, performance, quality of life, training and development. In a more recent cycle, this evolution also reached computerization and the use of algorithms in the composition of the management of these subsystems of human resources, as approached by Posthumus *et al.* (2017).

One of the subsystems is the training and development area, which is an effort to improve the skills of the people applied in their work context, and which progressively brings improvement of performance to the organization. Training is an education process that externalizes the individual's potentialities, providing information to learn new knowledge and to develop skills and new skills for application in the professional context. It is also a process of short-term assimilation that aims to recycle knowledge, skills or attitudes directly related to the tasks performed at work (Marras, 2016).

According Dutra (2016), the learning process goes through different stages, with actions of

different natures interacting synergistically among each other and allowing the individual to reach his personal development goals as well as contribution to the organization.

One of the pillars in the composition of a training process is the survey of needs and the selection of the method for its application that has adherence to the needs and the context, making possible to verify the advances and the points of improvement at the end of the training (Noe *et al.*, 2005).

With the emergence of new responsibilities in human resources management, new trends have become prominent in business in general. Meeker (2019) pointed to a trend report made possible by the widespread use of the Internet, the speed of adopting disruptive technologies, the availability of the internet and computing in the cloud, and how these new technologies are changing the way communication, learning and the world of work in general.

In the Meeker report (2019), in the list of online services that had the most increase of subscription during the years 2017 and 2018, the service of Sony PlayStation's access to games was in fourth place, behind only the popularity champions of content in entertainment Netflix, Amazon and Spotify.

In this context of increasing access to the use of new technologies, there are also new tools available, such as the increasing use of gamification based platforms for collaboration and sharing of information. The use of games in training and development is an issue addressed in the literature since the 1990s (Gramigna, 1994; Falcão, 2008), already approaching the theme of learning in a playful way, having a greater force at the time in face-to-face, board games, or offline, when compared to the years after 2000.

With the availability of technologies and their increasing cheapness and popularization, training possibilities with the use of gamified and computerized elements and through virtual reality also begin to be more widely used and listed among prominent trends for years to come, as defined in the Great Place To Work report<sup>72</sup>.

The projection that the market for digital games and serious games has been taking in Brazil in recent years is also notable, and in 2018 was published with the support of the Ministry of Culture, the II Census of the Brazilian Digital Games Industry. Among the companies participating in the census, 16.3% refers to the development of games used for corporate training purposes (Sakuda, Fortim, 2018).

According to Poyatos Neto (2015) and Mattar (2018), the term "gamification" originated in the 1980s, although the first documented uses of the term "gamification" appear only in 2008. However, only in the mid of 2010 the term was consolidated as a technical language and became widely adopted.

The classic, well-quoted definition by Deterding *et al.* (2011), approaches gamification as "the use of game design elements in non-game contexts." Gamification consists of the application of mechanisms, aesthetics and reasoning used in games, outside its usual context, associated with entertainment, with the purpose of solving practical problems, arousing engagement and promoting knowledge.

By elements of games, we refer to well-designed rules, points, challenges of competition, collaboration, puzzles, scenarios, among other factors related to the mechanics of motivation, interaction and reward (McGonigal, 2011; Marczewski, 2017). The use of the process of gamification is not synonymous of the use of games, but of the use of elements and mechanics present in game design.

Activities of different sectors can be gamified, such as in children's or adult education, in

---

<sup>72</sup> <https://gptw.com.br/conteudo/>

administration, in marketing, applied for example in branding or sales to help relationship with a certain brand in tourism, as an example in programs of points that have seen discount on tickets offered by airlines, in the sciences, and in more diverse possibilities, activities and segments. Examples of papers in this line are presented by Mattar (2018), who also cites cases, already referenced in Meister (2013) and Vianna (2013), with applied examples of gamification aimed at the corporate and business area.

The main objective of the present study is to identify the perception of efficiency and measurable results in the gamification process, as an increase of high relevance in training and development actions, from the contextualization of the relationship between training, development and tendencies in gamification.

## **2 Theoretical Framework**

### **2.1 Training and development**

Authors who studied human resource management have been subdivided into three or four groups since the 1980s, with training and development being one of these areas, such as Tichy, Fombrun and Devana (1982). Fidelis and Banov (2006), define training as a process of qualification and supply of professional needs that prepares the person to perform specific tasks for the position he occupies. Marras (2016) conceptualizes training as a way to help the adaptations in the knowledge, skills and attitudes of the individual in relation to the job or position occupied.

In his studies, Swanson (2009) defines the area of training and development as a process of development and encouragement of proficiency in order to improve the performance of the organization, the work processes, the group and each worker, culminating beyond learning and performance, career development and leadership.

The training in corporations, managed by human resources, is a process that can be planned by the company to facilitate the learning of the employees of the functions or competencies related to the performance of their work (Noe *et al.*, 2005). These competencies include knowledge, skills, or behaviors that are elementary to performance that drives a successful performance. The learning that is generated by training can come through observing and experiencing doing together, and through interaction with other employees, and joint use of all these means is common.

As success metrics for evaluating a training module, we can use observation of increased productivity, improvement in quality of results, reduction of costs related to time and rework, optimization of efficiency, perception of change in behaviors, elevation of knowledge and awareness. It also leads to improved organizational climate and increased personal motivation according to the report published by McKinsey (2018).

In studies on the subject, training and development situations that were not effective when considered within the context of the organizational culture also have their own studies and are cited for example in Argyris (1986), which addresses the problems of actions in which the author names of 'defensive looping', with the training and development programs that appear for leadership, which even come in their purpose of developing new skills, but in practice the situations where one should put this knowledge into action simply does not happen, generating this ironic looping.

For the training, the concern is to execute with quality and efficiency the application of the modules that were planned, the factors influencing the quality of the program being according to Marras (2016): Didactics and technical preparation of the training disseminators; Logic of the module, which should show the learning proposal and its application in the daily work; The source of the resources

used, which can be diversified, such as the expository activities, with lectures, with the use of slides, films and audios; or interactive activities, with activities such as workshops, case studies, simulations, interactive activities on the internet, computer or smartphone, or the use of games or activities with elements of games that bring an experience of the context addressed.

New technologies are changing faster than at other times in history, the way people live, how they relate and how they work, thereby also substantially altering the way companies operate and how they interact, both internally and in the environment external and with the society (Folan, Browne, 2005; Malone, 2006; Cardador *et al.*, 2016; Schwab, 2016; ILO<sup>73</sup>, 2018).

## **2.2 Gamification**

Gamification through computerized elements becomes a resource that can be explored in training and development activities. The term "gamification" originated in the 1980s, when Essex University professor Richard Bartle used the term "to make something that is not a game in a game."

Marczewski (2017) also argues that the application of game elements in other contexts can be called gamification or game thinking design, which the author defines as application of mechanisms, philosophies and rules of games in different contexts. Werbach and Hunter (2012) defines gamification as "the use of game elements and game design techniques in contexts other than games".

According Brathwaite and Schreiber (2009), game design is the "process of creating the content and rules of a game", the process of creating goals that a player feels motivated to reach and rules that a player must follow as he makes making meaningful decisions in pursuit goals.

Zichermann and Linder (2013) argue that gamification can be defined as the inclusion of a mechanics, style, thinking or game design techniques to involve people in problem solving.

McGonigal (2011) and Marczewski (2017) explain the elements of games referring to well-defined rules, scoring score, competition challenges, collaboration, puzzles, among other factors related to the mechanics of motivation, interaction and reward. The use of the gamification process is not synonymous of the use of games, but the use of elements and mechanics present in game design.

## **2.3 Games, gamified elements and player profiles**

From Huizinga's (2000) survey on games and playability, it is possible to identify eight main characteristics common to all activities considered or classified as games. These are: voluntary participation; play as distraction; play as external to reality; with limits of space and time, with a defined goal; with clear rules; with feedback system; and with an end.

Gamification is a methodology based on the dynamics of games, and aims to use tools based on elements of games, such as involvement, engagement, use of rewards and awards, and feedback, for example. According to Penenberg (2015), gamification in the corporate context improves performance precisely because of factors such as the use of rewards that reinforce positives, and engagement. The objective of using this methodology is to use the reward and rewards strategy to stimulate the participant or player to achieve their goal, generating a sense of accomplishment, receiving continuous feedback, stimulating progress, and consequently progressing towards the ultimate goal, according to Marczewski (2017).

---

<sup>73</sup> <https://www.ilo.org/global/topics/future-of-work/lang--en/index.htm>

The proposal of the gamification activities, when applied to the training processes, is to provide learning with playful, natural and dynamic, aiming to stimulate problem solving skills, motivate the player or participant to continue to reach the next objectives, supported by the feedback received in the (McGonigal, 2011, Adams, Dormans, 2012). A proposal of activity with the use of gamified tools is characterized by clear and well-defined objectives, which lead to the escalation of small achievements, which can be divided into specific moments and activities and with adaptive time, with advances evidenced through continuous feedback. The participation of the player must always be voluntary, with prior knowledge of the rules of the activity, just as it works in a game.

According to McGonigal (2011) and Deterding *et al.*, (2011), the game contains rules that will generally represent challenges to be faced by the player to achieve the ultimate goal. The gamified task, by providing continuous feedback and rewarding small goal achievements in the player's performance, allows the player to have a clear view of their progress, as well as recognition through awards or badges, elements that combined bring to these activities characteristics of engagement similar to what is perceived in games. Both in the material environment and in the digital environment, it is important that the game has its clear message, its goals and its objective must be clearly understood by the player.

Tracking progress through well-defined task completion is another point that must be made very clear (Chandler, 2012, McGonigal, 2016). This element is linked to the developmental issue perceived by the player, or the individual participating in the training, and also to the feedback issue that is received at the end of each small task, at the end of a phase or grouping of tasks. The feedback process is also tied to receiving the rewards, either by the scoring level or by the chosen award method used by the environment. Also, the user interface, especially in digital environments, also needs to be context-appropriate to achieve the desired results.

In order to understand how the game and its elements work in interaction with the player - an essential aspect in the interplay between game and training expectations - it is important to highlight which are the main profiles of players, since each profile participates in the game for a purpose or a motivation main. One popular type of player proposal is the 'Bartle Test', also explored by the studies of Zichermann and Cunningham (2011). The four basic player profiles are the conquerors or achievers, the explorers, the socializers, and the predators or killers.

According to Yee (2006), Salen and Zimmerman (2012), although each player has a dominant profile characteristic, all types can coexist with aspects of the other profiles of lower dominance, depending on the context and type of the game with which the player is interacting at a certain moment. In his analysis, Yee (2006) adds three types of components that influence the motivation of the players, composed of goals, social context and immersion in the game environment.

Tracking progress through well-defined task completion is another point that must be made very clear (Chandler, 2012, McGonigal, 2016). This element is linked to the developmental issue perceived by the player, or the individual participating in the training, and also to the feedback issue that is received at the end of each small task, at the end of a phase or grouping of tasks. The feedback process is also tied to receiving the rewards, either by the scoring level or by the chosen award method used by the environment. Also, the user interface, especially in digital environments, also needs to be context-appropriate to achieve the desired results.

Game dynamics are composed of elements that support the user or player over the duration of the game. Included in the dynamics proposed by Werbach and Hunter (2012) are the narrative that keeps the game coherent and the emotions that the player experiences during the game; Mechanics are actions that can be performed, directing and engaging the player, serving as an element of transition between the player's experience and their interaction with the digital medium. Werbach and Hunter (2012) list as

main mechanics the challenges, the rewards and the random elements; The components are elements that can be used in the interface of the game, such as defined goals, medals and avatars.

According to Marczewski (2017) and McGonigal (2011, 2016), the use of games may trigger some triggers for the player, especially regarding the mechanisms of motivation, emotion and behavior, due to the reactions generated by the activities of feedback that generate what these authors call engagement looping.

In the game environment, the unpredictability that in real life is viewed with tension, can take on a playful aspect and bring learning, exactly because the game environment represents safe space, away from real risks. According to Burke (2015), and Mullins and Sabherwal (2018), gamification involves people in an emotional context, and this is revealed as a powerful factor of engagement. Not forgetting the intrinsic motivation generated by the sense of autonomy, which progresses along with the domain of a certain topic, such as learning some subject addressed in a training.

Just as in a game, a tool has the essential characteristic of formulating clear and well-defined goals. The participation of the user must always be voluntary, with prior knowledge of the rules that will generally represent challenges to be faced by the player to achieve the goal. For Suits (2005) play is a voluntary attempt to overcome obstacles. According to McGonigal (2011), the presence of challenges requires the use of the player's creativity and skills to achieve the goal, which makes the task rewarding when solved. The game provides continuous feedback on performance in the activity, so that the player has a clear notion of their progress and is recognized by him, characteristics that, coordinated and combined, bring to the gamified activities similar engagement to that perceived in the users of games in relation tasks proposed by the games.

The authors Werbach and Hunter (2012) define six steps for a good implementation of gamification, the 6 D's of gamification. The six steps are:

- Define business objectives – understand and make clear the target goal. In order to define the objectives, the process suggested by the authors is to list the objectives in order of priority and to justify them;
- Delineate target behaviors – defined the objectives and the reason why gamification will be used, it is necessary to delineate what is expected of the users, their activities and behaviors in the system or in the game;
- Describe your players – what the relationship that the game will have with the players, if they are employees, if they are customers, what may motivate them to continue in the tasks are items to be described in this step;
- Devise activity cycles – define activity cycles so that players remain interested in participating in and overcoming the next challenges proposed, thinking about the type of feedback that will be provided to players or users of the game, and how these users will be engaged by activity loop based on tripod motivation , action and feedback;
- Don't forget fun! – users must voluntarily participate in the game, and this should be fun in the right measure;
- Deploy the appropriate tools – to check if there are tools already defined or developed for the proposed gamification that is to be implemented, to verify the possible tools to be used with the best cost-benefit.

With these steps suggested by Werbach and Hunter (2012) developed in a well-structured and well-linked way it is possible to develop a gamified process, but the authors do not guarantee that following these steps will be enough to succeed in the gamified process, if the design of the process as a whole makes sense in the context in question, if the elements are well designed, if the interaction with the game is satisfactory. As Chandler (2012), Adams, Dormans, (2012), Cherry (2012) and Alves (2015) insist, it is necessary to verify if the system interfaces are satisfactory, if the analysis of information transfer or, if knowledge also happens in a satisfactory way, to satisfy convincingly the objectives

proposed by the gamification.

#### **2.4 New technologies and trends**

Advances in technology have provided more efficient ways of performing activities and have increasingly transformed society's behavior in many ways, as we have seen in trend reports such as Meerker's (2018) for example.

The II Brazilian Census of the Digital Games Industry (Sakuda, Fortim, 2018) showed that about 43% of all games produced in Brazil are designed to run on mobile devices or smartphones, 24% are designed for computers, 16% are developed for the web platform, 10% are already developed to be executed with the aid of augmented reality and virtual reality technologies, 5% are executed via consoles, and about 0.5% are developed for social networks.

In comparison with the data of the I Census of the Brazilian Industry of Digital Games published in 2016 by the same researchers Sakuda and Fortim (2018), there was an average numerical growth of 290% of games developed to be executed with the aid of virtual reality technology or augmented reality, not only for games of pure and simple fun, but also for games of training processes for industries and for services. Gamification developed in digital and virtual environments, with the help of technology, has also generated new and incremental experiences.

The use of virtual reality and augmented reality to increase the experience of a game in the form of training (for experiences in situations that represent a greater degree of danger or insalubrity), as discussed in experiments exposed by Xtreme VR (2018) and by Kelly (2017).

Augmented reality is technology that allows the virtual world to blend in with the real world, opening up a greater number of possibilities for interaction and a new dimension in how to perform a task. Augmented reality literally 'augments' the real world with digital information from the virtual world (Godoy, 2017). Godoy (2017) also highlight that interactions can bring emotions as well as innovation to lived experiences.

The advantage of augmented reality in relation to virtual reality is mainly the cost of technology, more accessible thanks to the use of smartphones associated with augmented reality glasses (Xtreme VR, 2018). The challenge of its use is the same as mentioned in the process of gamification by Werbach and Hunter (2012), to define the points and the objective of the training, so that the transfer of the knowledge one wishes to do happens in an aggregating and satisfactory way.

In this process of evolution, it is mandatory to verify that technology is a tool, not an end in itself. The technological advance, therefore, assists and enhances the results sought by the training programs in the most varied contexts, but must be inserted together with relevant content (Sousa; Rocha, 2019; Gattulua *et al.*, 2019).

Another trend that has become possible with the features implemented by the smartphone and tested in many models of online courses is the use of small moments to learn something relevant, a resource exploited in models created by Google with the Primer app, and the LIT platform that received digital maturity recognition among Brazilian companies in the McKinsey survey in 2018.

Develop information technology enabled feedback systems it is a way that looking for interaction and mediation capabilities that can be harnessed to support more focused and timely feedback.

According Webb and Ifenthaler (2018), the results of an effective feedback process will be good teaching focused on students' needs and students who understand or are coming to understand their own

learning needs. This increased understanding is prerequisite for students to be able to self-regulate their learning and thus to achieve autonomy in learning.

Self-regulated learning is generally regarded as desirable for learning especially for online learning. There is evidence of improved performance in online learning correlating with some aspects of self-regulated learning. Furthermore, intelligent adaptive algorithms for personalized feedback also have been developed in informational ambiances, which collaborates in the context of self-regulated learning, that the participant shape their own rules of advancement in relation to their learning or their time and training.

### **3 Methodological Procedures**

This exploratory research intends to aid the systematization of information in the area (Selltiz, 1975), and is composed of two groups or steps:

The qualitative step, with data collection from interviews with semi structured questions, performed with professionals who have already applied or participated in the development of a trained training. The selection of this non-random sample was defined by the requirement that the interviewee work in companies that foster specific area of training by gamification or because they have developed solutions with specific and recognized consulting support, and the data are interpreted through content analysis according to with the proposal of semantic categorization of Bardin (1995).

The quantitative step, performed through a survey style questionnaire applied in an online environment for professionals who have already participated in some gamification training, with option of answer in Likert format arranged from 1 to 10, and with analysis of information through means and standard variance, Cooper and Schindler (2003), and research strategies with an approach and method designed in a manner appropriate to the research and its way of communication, according to Vergara (1998). and Creswell (2007).

## **4 Results**

### **4.1 Quantitative results**

The form for the quantitative research step was built using the Google forms online tool, and received 56 valid responses, who said they had already participated in corporate training. The collected responses were stored in a spreadsheet automatically generated by the Google forms response manager, and for the treatment of the data the statistical software Minitab version 18 was used. With the database transferred to the Minitab 18 software, the database of questions Q07 to Q11 was normalized, assigning the scale from 0 to 100 for the answers. In this step questions Q01 to Q06 were characterized as validator fields, personal data or grouping profile.

From this range of questions, we highlight: Q07 – “When I start a gamification training, I feel motivated to continue until I move forward or finish the cycle of proposed tasks” and Q09 – “I realize that I have constant feedback on my advancement when I am on a gamified training”.

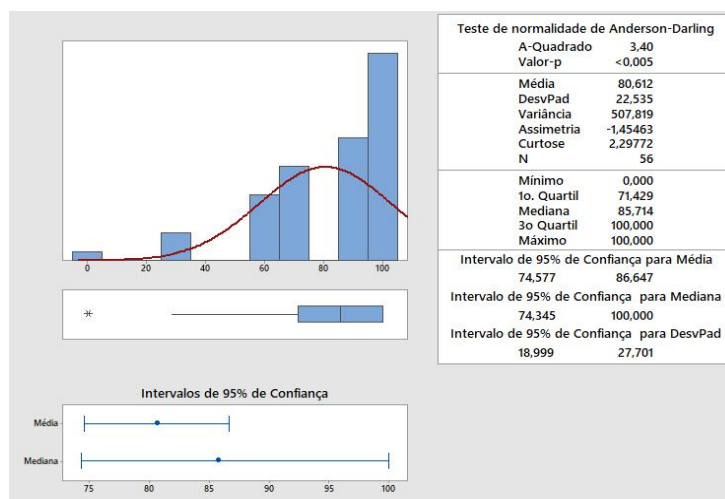

The indicator that had the best index was the question Q07 of perception of engagement by the participants, with 83.214 of average, who are mostly motivated to continue and advance in the training phase. But there is an outlier presence.

For the question about perception of feedback the average was 80,612, median 85,714, and standard deviation 22,535, being the second largest number average between the range of questions Q07 to Q11.

This index also follows in the direction of Marczewski's (2017) diagram on the feedback loop and on the advancement of the player or user in the game.

**Figure 1 Q07 - Motivation to Move forward**  
Source: Minitab research data, 2018.

**Figure 2 Q09 - Feedback**  
Source: Minitab research data, 2018.

#### 4.2 Qualitative results

The questions to construct the qualitative step of the research were elaborated in order to answer these objectives: to enumerate the main triggers of motivation of the gamification that can be explored in training and development; highlighting the main difficulties encountered in the application of gamification training; and describe characteristics that indicate a contribution to a skillful training and development.

The answers were given through an interview with ten professionals who have already participated in the construction and elaboration of gamification training. The contact with these professionals

occurred initially through events in the area of human resources and technology, endorsed in most cases through contact via LinkedIn social network. All professionals interviewed have relevant professional experience in this area, work in some position in development projects and implementation of corporate training, with an average time of experience of five years.

The questions Q09e and Q13e had their content analyzed according to the analysis of content and categorization proposed by Bardin (1995), highlighting the frequency with which certain content characteristics arise. In this step questions Q01e to Q08e were characterized as validator fields, personal data or grouping profile.

Starting from a global analysis of the categories listed by the research, we can highlight the frequency that the code "engagement" appears as an answer to questions Q09e and Q12e, about factors that the interviewee liked more and about what he believes to be an advantageous aspect in training. There is a link between engagement and the individual's intrinsic motivation, as can be seen in the excerpt: "E01: it signals its progress and engages, and it is by intrinsic motivation."

According to Alves (2015) approach, this engagement is directly linked to the relevance of the content addressed to the users of the game, and the form used to promote learning.

This factor is directly linked to the next major item of research codes, the "design flaw" issue, and the

strategy diversification, which is important to maintain attention and interest and achieve a satisfactory result with all player profiles, so its relevance and importance in appearing as a category in the analysis, as addressed by Zichermann and Cunningham (2011) in the main activities that interest each of the four player profiles.

According to Werbach and Hunter (2012), one of the six elements of gamification is the fun and playful factor that exists in the game, but Werbach and Hunter (2012) also point out the importance of using fun in the right measure, without exaggeration, a factor that also coincides with the results found in the interviews.

Following the code list, the "trend" category was singled out by four of the respondents in question Q13e on the general perception of training, and addresses interesting points, alluding to the use of gamification as a tool to reach the attention of generating new aspects inspired by games and citing even new technologies that can be associated with the gamification process, such as virtual reality or augmented reality, which can be used not only for corporate executive training but for many technical trainings, heavy industry or pharmaceutical industry. Kelly (2017) addresses in his history and studies on the "forces that will change the world", the way that smartphone has leveled and popularized the use of technologies such as augmented reality, which generally require lighter technology compared to programs that run virtual reality.

**Figure 3 Codes Incidence Q09e - Q13e**  
Source: Research data, 2018.

Dynamics, mechanics and components of game elements, as proposed by Werbach and Hunter (2012), also appear as categories in some responses: Dynamics of "interaction" with other players, Q12e response item on advantageous aspects, Mechanics of "collaboration", response item for Q09e about item you liked most in a gamified training; and mechanics of "feedback" on progression in the game, also listed in response to the Q09e; and Components, which are all the elements that can be used to build the game interface, represented in one of the answers found by the research by the category "diversified strategy" and also the category "ranking", both categories quoted for question Q09e .

Some of the categories cited relate closely to the objectives listed in training and development theory, before they even connect with the goals of gamification in any given process, but actually linking purposes to a better outcome, such as the categories:

- "Clear strategy ", one of the points of attention raised by Marras (2016) and by Noe *et al.* (2005) is the list of steps to establish the need for training, making sure what items are covered by both the individual and the organization's needs list, the readiness level of the individual who will receive the training and the environment, and material to be used for this purpose, and also in the game, item evidenced in the six 6 D's for the gamification of Werbach and Hunter (2012).
  - "Technology": one of the training strategies is the resources used in its application (Marras, 2016). In this category was mentioned the use of simulators and consoles as something that is used, but that has space and potential to evolve the quality.
  - "Applicability": In the context of the training, if the person does not see value or relevance in the proposed action, there will be no relevant results. As stated by Dutra (2016), if the need is not latent or perceived by the user, there will be insufficient engagement in development actions.
  - The category "concision with relevance" also demonstrates an aspect that encompasses the concern to present an efficient solution that is able to hold and maintain the attention of the user, and was cited as a category in the answers to question Q10e about what most contributed to the results.
- Another interesting aspect of concision with relevance is that it can work information more

accurately in shorter time frames, which is exactly the concept used in the theoretical example of Google Primer, and with the programs that are proposing activities in micro moments, that is, taking advantage of 5 or 10 minutes to learn something or to make some activity. Concision with relevance walks along with applicability, as it becomes clear if the concept is straight to the point.

For questions such as metrification and evaluation, the discussion is more advanced not only in measurement of results of the training, but also in other areas of human resources, such as recruitment and selection through gamification processes, according to the list and interviews of the Brazilian HRTech's report of LIGA Ventures<sup>74</sup>.

The "digital trail" issue relates directly to this "metrics" point as well as to "data privacy", with the additional fact that the information left by everyone in the online virtual environment and in the cloud is a history and can be used for customizations, but can also invade privacy, since the line is no longer so well delimited. Certainly, the issue of data privacy and authorization for its use is one of the global problems of modernity on the agenda for discussion in times of network data, process digitization and digital gamification. An early discussion in Brazilian legislation is the new LGPD - General Data Protection Act, which will take effect, if there are no changes, in August 2020, but this is already a subject for another study.

The "mobility" category was mentioned by only one of the interviewees, but also highlights the possibilities brought by technology, specifically with the possibility of carrying out more activities remotely through the internet on a computer or a smart phone.

## 5 Conclusion

The results of this research aimed to identify the main central elements of gamification and its relation with training and development practices, from the compilation of the two steps of the research.

The high frequency rate of the word "engagement" was the strongest indication of gamification agreement in training and development processes, because the game helps to encourage this engagement on the part of the individual, and on the other, a training that hopes to achieve results must have its members engaged to reach the final purpose. The engagement is well quoted by professionals, and also have a good index of perception by the users, which strengthens the information.

Another interesting aspect was the presence of the categories "playfulness" and "ludicity in the right measure", the first being addressed in its positive aspects, and the second, quoted negative in cases of exaggeration or in applications outside contexts.

The new forms of interaction brought into the theoretical framework, tools created from augmented reality and virtual reality, also appeared and were confirmed in the interviews through categories such as "trend" and "innovation".

The issue of technology insertion in this process also confirmed the facilities generated by the possibilities of large-scale application, metrics, mobility to access training through a game on a smartphone, but also brought insight into new issues, including "Data privacy" that gets registered on the network, and the question of history that people may end up leaving through their game logs, as quoted in the "digital trail" category.

---

<sup>74</sup> <https://insights.liga.ventures/hrtechs/>

According to Meeker's Internet trends report (2019), gamification continues to grow in trends, bringing interaction through gaming, video, voice and text, has been used in online education and has also had significant growth in the problem-solving, stimulating recreation, collaboration and learning at the same time, as well as being pointed as a tool in the context of digitization.

Other categories such as "create habits", although it has been mentioned only once in the categorization, also makes ties with both the habit-forming proposed in the learning loop of Herger (2014) and what is expected of a development program, such as proposed by Marras (2016).

The results of feedback process increased understanding for participants to be able to self-regulate their learning and thus to achieve autonomy in learning. Self-regulated learning in the context of gamut activities linked to the categories "concision with relevance", "applicability" and "metrics" allows the training participant to have more control and mastery over the time he has available for each task, against the tendency of learning in micro moments, that is, in periods composed by half an hour or a quarter, for example.

The research sought to highlight what is applied in gamification of training processes with professionals who have already developed and applied training in this format successfully, but also listing difficulties and potential areas for improvement.

In the same way, we seek the opinion of professionals who have already been trained through this tool, so that each public could register their opinions and their perceptions for the composition of this scenario.

For games be considered a viable tool, they must provide some means of testing and progress tracking and the testing must be recognizable within the context of the training they are attempting to impart.

The subject that studies gamification focused on the actions of human resources still has space and potential for growth in its actions and applicability researches and its results, for this reason some of the suggestions for new studies are:

- (i) Continue to follow the growth of this market and the professional sectors that use gamification with more success, both in Brazil and in emerging markets;
- (ii) Understand more about the elements that can cause design flaws, and which ones are the most successful for the experiment,
- (iii) Investigate which common mistakes to avoid according to the type of training, the area of professional performance and the business segment, and
- (iv) Study the application of gamification in other areas of HR, such as recruitment, performance evaluation, or other business areas, such as marketing.

## Research on the Influence Mechanism of Transformational Leadership on Enterprise Innovation Performance

Na Risu, Cui Hainan, Zhang Di

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 1612480712@qq.com, 13213673837@163.com, 281855439@qq.com)

**Abstract:** This paper uses literature review method, questionnaire survey method and regression analysis empirical research method to propose the relationship between transformational leadership, enterprise innovation performance and innovation self-efficacy. It believes that transformational leadership has a significant positive impact on corporate innovation performance. This paper constructs a mediating role model of innovative self-efficacy between transformational leadership and corporate innovation performance. Finally, it is concluded that transformational leadership has a significant positive impact on corporate innovation performance, and innovation self-efficacy plays a part in mediating between the two. The result of the action. This paper enriches the research on transformational leadership and innovation performance, and provides a new theoretical perspective for the formation and promotion mechanism of organizational innovation performance.

**Key words:** Transformational leadership; Innovation performance; Innovative self-efficacy; Mediating Role

### 1 Introduction

The transformational leadership proposed by Bass in 1985 is an environment that builds trust commitments. Leaders encourage employees to make changes to adapt to the development of the company, that is, to make employees aware of the importance of self-ability in the work environment and to mobilize the work motivation of employees. Strengthen employees to sacrifice personal interests to realize the overall value of the organization's interests (Bass, 2003).

The style and behavior of leadership influences employees' work attitudes, motivations, and behaviors, which have an impact on job performance. Current research has shown that transformational leadership can exert influence and assume responsibility by encouraging employees to compete for their long-term goals.

Podsakoff demonstrates that demonstrative guidance of leaders' correct behavior can encourage employees to observe learning and improve self-efficacy. Innovation is the coexistence of risks and benefits, so for the employees of the organization, if you want to innovate, you must have strong support within the organization. This kind of support is to let employees have confidence in innovative behavior (Ma Lin et al., 2017). The famous American psychologist Bandura (Bandura, 2003) pointed out "innovation requires unwavering efficacy" (Bandura A et al., 2003). The concept of "self-efficacy" was also first proposed by Bandura in his book *The Social Basis of Thought and Behavior*, defined as "the belief that individuals have the ability to accomplish a certain task." Becoming a social cognitive theory, which not only affects the individual's ability to adapt and adapt, but also regulates the transformation of their thoughts and behaviors through their influence on their cognition, emotion, and motivation (Bandura A, 1997). Relevant empirical research has found that transformational leadership can improve organizational performance well, while self-efficacy and organizational identity play a mediating role between transformational leadership and employee performance. Self-efficacy also provides a new perspective for transformative leadership to promote innovation performance.

Based on the previous researches on the impact of transformational leadership on corporate performance, this paper further deepens the internal mechanism of the dynamic process of transformational leadership to organizational innovation performance, and introduces it in the model framework of transformational leadership and innovation performance relationship. This variable of innovation self-efficacy focuses on the mediating role of innovation self-efficacy between transformational leadership and organizational innovation performance.

## **2 Theory and Hypothesis**

### **2.1 Transformational leadership and organizational innovation performance**

Transformational leadership is considered by some scholars to be the most effective leader (Mhatre & Riggio, 2014), Transformational leadership is the process of linking the roles of leaders and employees to each other and trying to create a level of mutual improvement and motivation between roles (Burns, 1978). Li Chaoping and Shi Kan conduct in-depth research on transformational leadership and propose four-dimensional transformational leadership (Rosing & Zacher, 2017). They are vision incentives, leadership glamour, virtue and individual care.

Jansen and Ypere believe that innovation performance is a new concept proposed by the organization, which is actively generated, implemented and implemented by employees. The innovative performances pointed out by Rosing, Zacher and Baer are the design-to-execution efforts of employees for innovative activities, including the generation of ideas and actions put into practice .

In recent years, domestic and foreign scholars have combined revolutionary leadership with innovation performance. Basu and Green pointed out that transformational leadership stimulates employees to break the original situation and stimulate innovative behavior through the motivation of the vision. Research by Boehm shows that transformational leadership enhances the organization's innovative identity through the individualized care of the employees, and thus enhances the innovation performance (Boehm et al., 2015). Walumbwa believe that transformational leadership will lead organizations to challenge the status quo and continue to innovate and learn (Walumbwa et al., 2017). Zhu Shaoying and other domestic scholars have found that the organization led by transformational leadership has created a strong atmosphere of innovation, and the performance of innovation is more obvious. Chen Rui and Jing Runtian have demonstrated that there is a positive correlation between transformational leadership and creativity. They generally believe that transformational leadership expands the organization's stated goals and enhances work confidence, taps the creative thinking of employees, and makes the organization full of creativity (Chen Rui et al., 2012).

Therefore, transformational leadership has a guiding role in employee creativity, can promote the creation of employee innovation behavior and collaboratively organize the overall creative behavior, thereby enhancing the organization's innovation performance. Therefore, given that transformational leadership is validated in most cases to promote innovation performance, the paper proposes the hypothesis:

H1: There is a positive correlation between transformational leadership and innovation performance.

### **2.2 Analysis of the mediating role of innovative self-efficacy**

Self-efficacy is the result of social cognition theory. Innovative self-efficacy is a pioneering concept proposed by Tierney and Farmer (Tierney and Farmer, 2002) combined with Amabile's creativity theory along the theory of self-efficacy (Tierney & Farmer, 2002). The definition is "individuals are able to the belief in obtaining innovative results. Transformational leadership can be

motivated by the vision, internalized into the values of employees, and enhance employees' confidence in achieving the overall goals of the organization. Gong conducted a questionnaire survey with Taiwanese employees as a sample to explore the relationship between transformational leadership and employee innovation behavior. Research shows that transformational leadership is positively related to employee innovation behavior, and innovation self-efficacy plays a full intermediary role in this process. Therefore, in the process of transformational leadership affecting employee behavior, transformational leadership will benefit employees' sense of innovation and self-efficacy. Based on this, the paper proposes the hypothesis:

H2: There is a positive correlation between transformational leadership and innovation self-efficacy.

The improvement of innovative self-efficacy will inevitably improve innovation performance. Tierney and Farmer argue that when individuals work in an environment full of innovation, innovation self-efficacy positively affects innovation performance (Tierney & Farmer, 1999). Chinese scholars Gu Yuandong and Peng Jisheng divide organizational innovation into innovative thinking and implementation of innovative practices, and explore the relationship between innovation self-efficacy and finally conclude that innovation self-efficacy is positively related to organizational innovation process (Gu Yuandong & Peng Jisheng, 2010). Therefore, according to the research theories of the previous scholars, it can be considered that the sense of innovation self-efficacy has a positive effect on the improvement of innovation performance. Based on this, the paper proposes the hypothesis:

H3: There is a positive correlation between innovation self-efficacy and innovation performance.

H4: Innovative self-efficacy has a partial mediation between transformational leadership and innovation performance.

Through the above theory and hypothesis analysis, this paper explores the direct influence of transformational leadership on innovation performance and the indirect impact mechanism of innovation self-efficacy. The research model of this paper is shown in Figure 1:

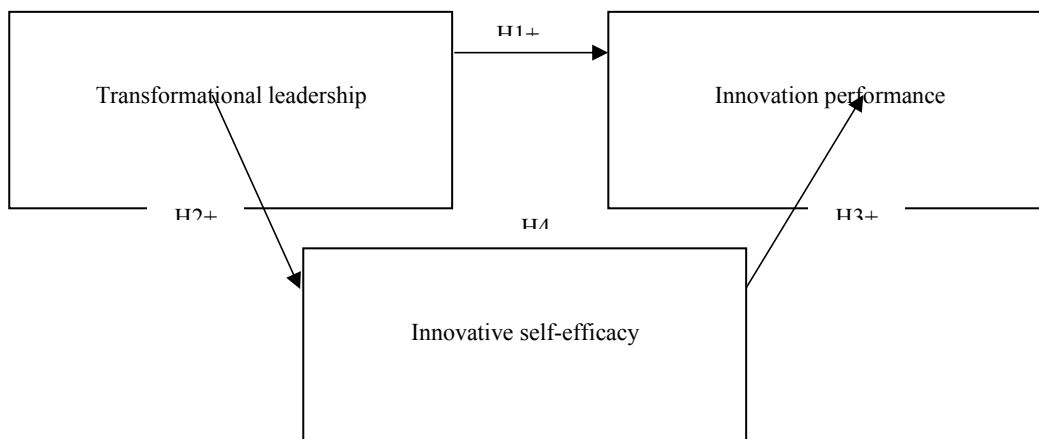

Figure 1 Hypothetical Model

### 3 Data and Methodology

In this paper, 316 questionnaires were distributed to employees of science and technology enterprises in Shanghai and Hangzhou, and 268 questionnaires were collected, of which 211 were valid questionnaires, the questionnaire recovery rate was 80.72%, and the questionnaire efficiency was 63.55%. After collecting the relevant data, the data analysis software SPSS22.0 was used to analyze the correlation and regression analysis of the questionnaire results.

#### 3.1 Scale of transformational leadership

The transformational leadership behavior measurement uses the four-dimensional scale of the transformational leadership behavior with Chinese cultural characteristics compiled by domestic scholar Li Chaoping and Shi Kanxue: leadership charm, vision incentive, morality and individualized care. The degree of validity was good. The survey used the Likert five-point scale (1-very non-conforming, 5-very consistent).

#### 3.2 Scale of innovation performance

Some items of innovative behavior in innovation performance measurement. This study combines the previous researchers' scales, drawing on some of them and adding some options. Using the Likert five-point scale (1-very non-conforming, 5-very consistent).

#### 3.3 Scale of innovative self-efficacy

Using Carmeli and Schaubroeck 's Creative Self-efficacy scale, all aspects of employee's creative performance, such as innovative work, creatively overcome the challenges at work Etc., the questionnaire is also based on the Likert five-point scale (1-very non-conforming, 5-very consistent).

## 4 Results

### 4.1 Statistical description

Table 1 gives the mean, standard deviation, and correlation coefficient between variables for all study variables. Among them, there is a significant correlation between transformational leadership and innovation performance (0.908). Transformational leadership is significantly correlated with innovation self-efficacy (0.850), and innovation self-efficacy is significantly correlated with innovation performance (0.910).

Variable	M	SD	1	2	3	4	5	6	7
Gender			0.40	0.500	1				
Age			2.20	0.913	-0.639**	1			
Education			2.96	1.020	0.376	-0.394	1		
			2.16	1.510	0.696**	0.727**	0.300*	1	

**Table 1 Correlation Coefficient Matrix**

Notes: \*\*\*p<0.01; \*\*p<0.05; \*p<0.1 . N=211.

#### 4.2 Verification hypothesis

To verify hypothesis 1, regression analysis was conducted on innovation performance with transformational leadership as an independent variable. According to Model 4, the regression coefficient of transformational leadership for innovation performance is significant ( $b=0.912$ ,  $p<0.01$ ), and Hypothesis 1 is validated: there is a positive correlation between transformational leadership and innovation performance. To verify hypothesis 2, a regression analysis of innovation self-efficacy was conducted with transformational leadership as an independent variable. According to Model 2, the regression coefficient of transformational leadership for innovation self-efficacy is significant ( $b=1.032$ ,  $p<0.01$ ), and Hypothesis 2 is validated: there is a positive correlation between transformational leadership and innovation self-efficacy. To verify hypothesis 3, regression analysis was conducted on innovation performance with innovation self-efficacy as an independent variable. According to Model 4, the regression coefficient of innovation self-efficacy on innovation performance was significant ( $b=0.753$ ,  $p<0.01$ ), and Hypothesis 3 was validated: there was a positive correlation between innovation self-efficacy and innovation performance. According to Model 5, when transformational leadership and innovative self-efficacy enter the regression equation together, the influence of transformational leadership on innovation performance is reduced ( $b=0.486$ ,  $p<0.01$ ), and the impact of innovation self-efficacy on innovation performance. The effect is still significant ( $b=0.413$ ,  $p<0.01$ ), and hypothesis 4 is validated: innovation self-efficacy has a partial mediation between transformational leadership and innovation performance.

**Table 2 Regression Analysis Table**

Variable	Dependent variable: Innovative self-efficacy			Dependent variable: Innovation performance

#### 5 Conclusions

This paper firstly reviews the literature on transformational leadership, innovation performance, and innovation self-efficacy. On this basis, the feasibility study direction is selected. Through sample survey, the transformational leadership and innovation performance and innovation self-efficacy are the relationship between these two variables has been studied and the conclusions are as follows:

- (1) Transformational leadership has a positive and significant impact on innovation performance.

(2) Innovative self-efficacy has a partial intermediary role between transformational leadership and innovation performance.

Through empirical analysis, this paper can prove the positive influence of transformational leadership on organizational innovation performance and the intermediary relationship between innovation self-efficacy. However, due to resource and time constraints, this study has some shortcomings, and it is hoped that it can be further improved in future research.

(1) The sample that should be selected is for enterprises with innovative agglomeration. The innovation performance of research and innovation enterprises is more targeted, and the applicability and rigor of the research conclusions can be guaranteed. Therefore, the organizational behavior of high-tech innovative enterprises should be explored in a targeted manner.

(2) A study of employees' innovative self-efficacy behaviors and transformational leadership behaviors, combined with horizontal and vertical data analysis, can better understand the impact of other variables on research variables and outcomes.

(3) Based on the previous researcher's maturity scale, combined with the actual situation of the respondents, the development and design of a specific questionnaire scale can be more targeted to the research group, making the research results more targeted and authoritative.

## Impact of Emotions on Conflict Management Styles

Qamaruddin Maitlo, Farhan Aslam, Khaliq Ur Rehman

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: qamar.maitlo@iba-suk.edu.pk, aslam.farhan@outlook.com, khaliqcheema@gmail.com)

**Abstract:** The objective of the present study is to classify the factors underlying different conflict management styles of individuals (Integrating, Dominating, Compromising, Avoiding and obliging) with pertinence to their emotions (positive emotions and negative emotions). For this objective a sample of 178 individuals from three different banks in Pakistan were selected with proportions of 80% being male and 20% being female. To assess the conflict management styles of the individuals ROCI-II measure was used, and the emotions of the individuals measured using PANAS scale. The regression analysis was applied to test the hypothesis which concluded to Integrating and compromising tactic of conflict management positively related to positive emotions while Avoiding and Dominating styles were positively related to negative emotions. The conclusion is that emotions do play a prime role in addressing the type of conflict management style preferred by individuals.

**Key words:** Negative emotions; Positive emotions; Conflict; Conflict management; Styles.

### 1 Introduction

Much of the research done connecting emotions and conflict management takes the aspect of teams within an organizational perspective and few have looked upon interpersonal dimension of conflict and emotion. Many researchers have focused on the team aspect in order to develop quality and efficiency, and ascertain sustainability of an organization (Alper, Tjosvold, & Law, 2000). But again, as said 'history repeats its self' the individual difference element comes into play. As for an organization to develop and sustain, it is important to understand the teams working inside it similarly teams are made up of individuals, in order to increase the efficacy and effectiveness of the teams its internal blocks that is team members, have to be effective and efficient. One of the key issues that any organization would undertake to be effective at is to keep conflict at a minimum or turn it constructive. Therefore, the present study wishes to address the conflict management element of individuals with respect to their emotions.

### 2 Literature Review and Hypothesis Development

#### 2.1 Conflict and Conflict Management Styles

Conflict has been defined in a multitude of ways although being a challenge every time to be able to exactly elaborate its very nature. This is because of the term conflict itself being incommensurable in various disciplines (Obeidi, Hipel, & Kilgour, 2005) and differing perceptions of parties and interpretation of other's behavior (MAITLO, BHUTTO, ANWAR, & MAHAR, 2012). Nevertheless the efforts taken by researchers, specialists and practitioners who have defined conflict with myriad of facets is worth appreciation. Authors have an array of views about conflict each presenting a different perspective due to different presumptions underlined and depending on the discipline it is taken in (Hipel, 2002; Obeidi et al., 2005). generally conflict is believed to be as a contest of contrasting forces, striving over resources, struggle over one's ideas, beliefs, needs, wishes (Pondy, 1967). It is also viewed as a difference of opinions dissimilarity of interests (Thompson, 1998) and also as incongruity of goals (Carnevale, 1990). A more comprehensive and elaborative definition found yet is proposed by Sandole (1998, p.1) as a "situation in which at least two parties try to pursue their perceptions of mutually incompatible goals by undermining, directly or indirectly, opponent's goal-seeking capability". it is seen that even if the persons *perceive* that their goals, interests, values, beliefs, needs and wishes are opposed they take it as an actual conflict situation and tend to hinder their opponents from attaining their goals and aspirations or try to control (Elena Losa Iglesias & Becerro de Bengoa Vallejo, 2012; Fletcher, 2001). As rightly advocated by Obeidi, Hipel and Kilgour (2005) and Pondy (1967) conflict is the real or perceived perceptions of individuals. Perception of individuals is the initiation point of conflict and one of the pivotal property of conflict, one's perception may be far off from reality it may have nothing to do with the actual situation or context of the real issue but then again may impose quite an impact on the behavior of the individuals leading towards conflicting actions, which in turn lead the other opposing party to act in a similar way, hence giving rise to a conflict situation.

Conflict management started being recognized in literature mainly through the Dual Concern

Model proposed by (Blake & Mouton, 1964) and since then many research theories followed this framework. Most studies on interpersonal conflict-management patterns have adopted the Dual Model as a theoretical framework (Blake & Mouton, 1964; Prause & Mujtaba, 2015; Rahim, 1983). The Dual Concern Model postulates that there are two basic underlying motives shaping the individual's style of managing conflict: concern of one's own self that is to say when person gives more priority to himself rather than the other party, whereas the second facet is concern for other party as a priority over one's self, which makes it the opposite of the first point.

**Integrating:** It is characterized by high concern for self and high concern for others. Most experimental researches indicate that high mutual rewards are achieved through integrating styles such that of Pruitt et al. integrating style involves characteristics as openness, creative problem-solving exchange of information and examination of differences to reach an effective solution acceptable to both parties (Afzalur Rahim, 2002).

**Obliging:** It is low concern for self and high concern for others. This strategy involves giving-up of one's own interests, wishes, ambitions etc. in order that the other party's interests, wishes and objectives may be achieved. It is associated with attempting to play down the differences and emphasizing the commonalities to satisfy the concern of the other party. Researches indicate that individuals, who apply obliging style of conflict management especially in newly formed couples, tend to give in rapidly that they miss mutual rewards (Afzalur Rahim, 2002; Fletcher & Williams, 1996)

**Avoiding:** It is low concern for self and others. Avoiding approach is associated with withdrawal, buck-passing, or side-stepping situations. Individuals employing avoiding style lack consideration for self and others thereby lack awareness about themselves and the interests of others. They are also unaware about the actual problem or a better solution to it hence. With no effective solutions to the disagreement, the conditions elongate needlessly causing more troubles for the individuals.

**Dominating:** It is high concern for self and low concern for others. It is identified with win-lose orientation or with forcing behavior to win one's own position. Persons who use dominating method towards conflict fail to notice shared gains as with obliging style. With the dominating approach only half of the conflict aspect is addressed hence presenting a partial solution to the problem.

**Compromising:** It is intermediate concern for self and others. It involves give- and- take where by both parties give-up something to make a mutually acceptable decision.

## 2.2 Emotions

Emotions have been with human as long as human being itself, but understanding emotions and their impact has just started to blossom in research literature. It is quite difficult and the same time important to understand emotions especially in situations like conflict.

**Positive Emotions:** Many social psychological research suggests that positive affect leads to better decisions and improved consequences in an array of contexts (Isen, Daubman, & Nowicki, 1987; Kopelman, Rosette, & Thompson, 2006) it is common finding that positive emotions increase cooperative tactics and enhance the quality of agreements (Kopelman et al., 2006). As apparent from studies of Carnevale and Isen (1986), individuals with positive emotions achieve more mutually and individually beneficial outcomes. With the impact of positive emotions the consequences of conflicts becomes more favorable and satisfying because positive emotions lead to creative thinking and innovative problem solving (Isen et al., 1987), setting bigger, higher and challenging objectives (Baron, 1990) increased effectiveness in resolving the issues and individuals with positive emotions tend toward a more cooperative method in conflict handling and negotiation (Unkelbach, Forgas, & Denson, 2008)

**Negative emotions:** Negative emotions, for most reasons have their own benefits in conflict. Individuals displaying negative emotions can get their share by positioning the issue in their favor and influence the opposition to give in to their demands (Kopelman et al., 2006). With the use of negative emotions, parties get bigger concessions while bargaining According to (Sinaceur & Neale, 2005) individuals who openly display negative emotions in the form of threats to end the negotiation were likely to draw out concessions. on the other hand, prolonged exposure to negative emotions even takes away the greater favorable impact of positive emotions (Baumeister, Leith, Muraven and Bratslavsky, 1998). One other aspect of negative emotions is that these gains can only be achieved when one party perceives or believes that the other is a negative negotiator, then they incline towards giving in (Van Kleef, 2009; Van Kleef, De Dreu, Pietroni, & Manstead, 2006), and even when the negative negotiator sees that the opposite party is weak there happens to be a concession. But then again display of negative emotions reduces the probability of mutually achieving higher and the possibility of future negotiations as with the findings of Allred and co-workers.

## 2.4 Hypotheses

**Hypothesis 1: The individuals' positive emotions will be positively related to the integrating, compromising and obliging style of conflict management.**

**Hypothesis 2: The individuals' negative emotions will be positively related to the dominating and avoiding style of conflict management.**

## 3 Method

**Sampling:** The data was collected from the three different banks from the Pakistan. Total 415 questionnaires were distributed, out of which 205 return and 178 were used in the analysis, which comprises 43% response rate. The average age of participate were 36 years, the ration of the male and female were 80% and 20% respectively.

**ROCII-II:** Instrument used to measure the conflict managing styles in this paper is the Form C of Rahim Organizational Conflict Inventory (Rahim, 1983)The ROCII-II instrument consists of 28 items designed to assess the five different styles of conflict management which are: Avoiding, Compromising, Dominating, Integrating and Obliging. Individual will respond to each and every of the 28items corresponding to a five point Likert scale, where 1 represents strongly agree and 5 represents strongly disagree.

**PANAS scale:** The positive and negative emotions were measured using the PANAS scale which is developed by (Watson, Clark, & Tellegen, 1988). This scale measures 9 positive emotions which are interested, alert, attentive, excited, enthusiastic, inspired, proud, determined, strong and active. The 10 negative emotions measured with is scale are distressed, upset, guilty ashamed, hostile, irritable, nervous, jittery, scared and afraid. Respondents rate each of the emotion on a 5-point Likert scale where 5 being strongly agree and 1 being strongly disagrees.

## 4 Results

**Table 1 Descriptive Statistics**

	Mean	Std. Deviation
Positive Affect	3.1951	0.68984
Negative Affect	2.6618	0.62671
Integrating	3.9738	0.75670
Obliging	3.8567	0.87167
Dominating	3.7045	0.69215
Avoiding	3.7491	0.97750
Compromising	3.9368	0.64703

PA: Positive Affects, NA: Negative Affects, I: Integrating, O: Obliging, D: Dominating A: Avoiding, C: Compromising.

**Table 3 Regression of Conflict Management Styles and Emotions**

	Integrating		Dominating		Avoiding		Compromising		Obliging	
	b	$\beta$	b	$\beta$	b	$\beta$	b	$\beta$	b	$\beta$
Positive Affects	0.44	.48**	0.23	0.1	0.12	0.09	0.39	35**	0.13	0.9
Negative Affects	-0.05	-0.9	0.22	.21*	0.28	0.21**	-0.7	-0.7	0.1	0.11

\*p <0.05 \*\*p <0.01

In the table 1 value of the mean and standard deviations are given. The mean values of conflict management styles (Integrating, Obliging, Dominating, Avoiding and compromising) are 3.9738, 3.8567, 3.7045, 3.7491, and 3.9368, and the values of standard deviations are 0.75670, 0.87167, 0.69215, 0.97750, and 0.64703 respectively. The mean values emotions (positive affects and negative affects) 3.1951, 2.6618 and the values of standard deviations are .68984 and .62671 respectively.

In the table 2 the set of analysis include Pearson correlations and in table 3 the regressions are given to test the hypothesis. In table 3 the values of the regression are given, it shows the regression of conflict management styles on emotions. It shows in the table that compromising and integrating conflict management styles were positive related to the positive emotions, which support the Hypothesis 1. Avoiding and dominating conflict management styles were positive related to the negative emotions; it means Hypothesis 2 was also conformed.

## 5 Conclusion

This study examined the relationship between the feelings of the individual and her/his preference for conflict management styles. Study show explicit role of emotions in the individual context. In present study finding shows that, there were positive association between the cooperative mood and positive emotions. Arguable conflict management styles were also positive related with the positive emotions. Emotions like “attentive”, “excited” or “alert” (PANAS) not only reflect the positive mood but also the alertness. Therefore, both types of the conflict management style, i.e., integrating and dominating were positive related to the positive emotions consist of the alert component. By contrast the inactive style of avoiding was associated to the negative emotions. This study contributes to enlightening the trend on conflict management style of the individual signifying the important role of emotions. It nearby expanded the preference of conflict management style outside of only rational elements. Study indicate the perception of the nature of conflict issues they face apply constitute the antecedent of their emotional reaction, linking indirectly to their preference of conflict management styles.

**Abstract:** Personality of leadership is one of the critical factors which influence team creativity. It is an unavoidable problem whether leaders could effectively integrate team knowledge and form innovation. Different leadership qualities have different effects on team creativity. This paper sorts out the concept of narcissistic leadership, the causes of narcissistic leadership, the behavioral performance and the factors that influence narcissistic leaders by reviewing the literature, and puts forward the key unresolved issues in the field of narcissistic leadership.

**Keywords:** Narcissistic leadership; Concept; Research Status; Prospect

### 1 Introduction

Latest studies have shown that the team's creativity is closely related to the characteristics and styles of the leadership (Zhang, Ou, Tsui & Wang, 2017; Boies, Fiset & Gill, 2015). However, an interesting phenomenon is that many leaders have an obvious trait which is narcissism. For example, Steve Jobs who is the Apple's brilliant founder was very famous for his narcissism; the CEO of the Gree, Dong Mingzhu who sets her computer startup screen as her own "beauty"; the founder of Alibaba Ma Yun etc. Some scholars point out that narcissism is a culture that exists among leaders (Feng Li and Li Feng, 2015). An interesting experimental study shows that narcissistic individuals could easily stand out and become the leaders in the fierce competition of organizations, namely narcissistic leadership (Ong et al., 2016). This paper sums up the concept of narcissistic leadership, the causes of narcissistic leadership, the behavioral performance and the influence resulted by reviewing the related literature home and abroad, and puts forward the key unresolved issues in the research of narcissistic leadership.

### 2 The Definition and Connotation of Narcissistic Leadership

The concept of narcissistic leadership stems from the concept of narcissism. Freud (Freud, 1914) systematically proposed the concept of narcissism in his book *On Narcissism: An Introduction*. He believes that individuals with narcissistic personality have a strong sense of independence, self-confidence, are unpersuadable and a strong desire to pursue power and honor, which could be regarded as a personality disorder. De Vries and Miller (De Vries and Miller, 1985) analyzed the behavior of leaders and found that leaders' behaviors were determined by their narcissistic personality, and proposed constructive narcissism leadership, reactive narcissism leadership and deceptive narcissism leadership based on psychology-related theories, as well as discussed the relationship between narcissism and leadership. Constructive narcissism leadership belongs to a benign narcissistic leadership, but reactive narcissism leadership and deceptive narcissism leadership is vicious, which is harmful to the organization. Rosenthal and Pittinsky (Rosenthal and Pittinsky, 2006) found that many leaders had narcissistic personality attributes, and summarized the characteristics of narcissistic

leadership. They believed that narcissistic leadership had the same characteristics, such as over-ambitiousness, arrogance, self-respect and fragility. They proposed that the behavior of the leader arose from extreme self-interest rather than organizational interests. Based on reviewing previous research, Ouimet (Ouimet, 2010) defined narcissistic leadership as a leadership style that was attractive, self-influenced, pursuing grand and self-interested goals, and suppressing and superficially caring for others. As for the conception of narcissistic leadership, scholars have basically completed the transition from a personality trait to a leadership type. Although, scholars have analyzed and concluded that the behavioral characteristics of narcissistic leadership are similar to narcissistic personality traits, they also affirm the uniqueness of narcissistic leadership (Rosenthal & Pittinsky, 2006; Huang Yili & Li Wei, 2014; Stein, 2013). But until now the scholars still hold different opinions of narcissistic leadership as a personality trait or a leadership behavior style (Liao Jianqiao, Shao Kanghua and Tian Ting, 2016). Although a few scholars have proposed the behavioral view of narcissistic leadership (Mai Reba, Mai Maiti, Li Ye and Wang Hui, 2017), a majority of scholars still equate narcissistic leadership to the leader's narcissistic personality. The concept of narcissistic leadership is not strictly defined. As for the measurement of narcissistic leadership, the Narcissistic Personality Inventory (NPI) is used to measure the narcissistic personality traits of leaders. It did not develop a special scale for the measurement of narcissistic leadership. Based on previous research, this paper defines narcissistic leadership as a type of leadership that is influenced by narcissistic traits.

### 3 Research Status of Narcissistic Leadership

Because of the universality and particularity of leadership narcissism in the organization, the scholars have paid more attention to this phenomenon. Previous studies have accumulated certain results in the field of psychology and management, especially in the field of psychology. A large number of studies have summarized the characteristics and behavioral tendencies of this personality trait. However, there are still relatively few studies on narcissistic leadership in the field of management. In general, the existing research focuses on the formation, behavioral performance and impact outcomes of narcissistic leadership. It goes as follows:

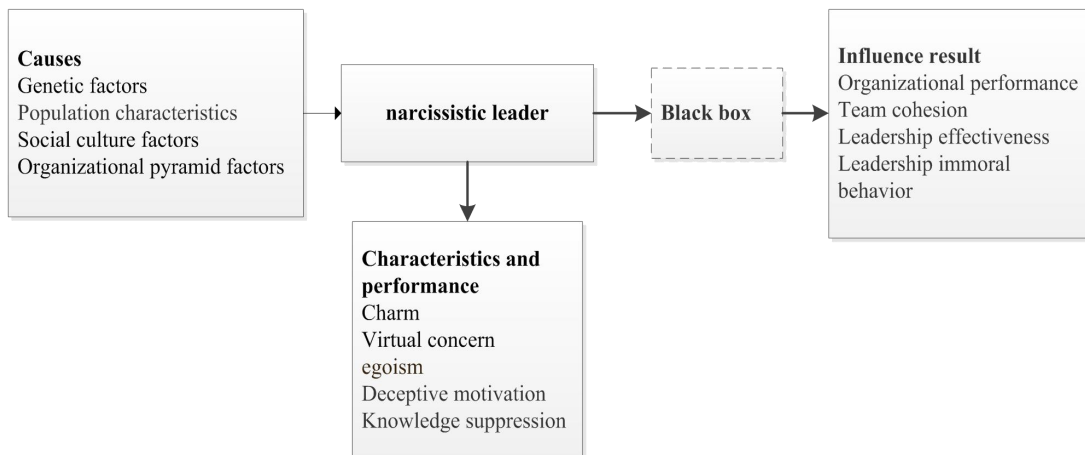

Figure 1 Distribution Map of Narcissistic Leadership Research Status

Firstly, the existing research has analyzed the formation of narcissistic leadership. The research mainly explores the causes of narcissistic leadership from genetic factors, demographic characteristics, environmental factors, social cultural and organizational structure. For example, Vernon et al. (Vernon et al., 2007) found that narcissistic personality is the same as that of extroverted and attached personality which is decided by genetic personality and environmental factors through analyzing the traditional dark triangle personality (narcissism, Machiavelli and psychopathology). The genetic factors explained the variation of narcissistic personality as high as 0.45. Foster (Foster, 2003) found that there is a negative

correlation between age and narcissism. He found young employees in the organization had higher narcissistic tendencies than older employees, which may be related to the experience of life and self-improvement. Kohut (Kohut, 2009) considered narcissistic personality as a morbid personality trait. It is a kind of personal center formed by individuals who have suffered setbacks or traumas during childhood (such as parental divorce) and cannot adjust through adaptive self-confidence. Duchon and Burns (Duchon and Burns, 2008) pointed out that the organization emphasized individualistic culture, requires self-transcendence, and pursuance of power and fame, which greatly promoted the formation of narcissists. A large number of empirical and experimental studies have shown that narcissists are more likely to be favored by enterprises because of organizational structure and environmental requirements, and are more likely to be in the leadership position in the fierce competition. Narcissistic leadership is more prominent under the high reward system (Brunell et al., 2008; Maccoby, 2004, 2007; Nevicka et al., 2011).

Second, due to the influence of narcissistic personality traits, narcissistic leaders also present some typical characteristics in behavior and psychological performance. In the concept of self-cognition, narcissistic leadership has a high sense of self-superiority (Chatterjee & Hambrick, 2007; Davis et al., 2008). In terms of behavioral motivation, narcissistic leadership usually has a strong self-improvement tendency, are more ambitious, and focus on self-influence, as well as pursue power and praise (O'Reilly III et al., 2014). In dealing with others, narcissistic leaders show false concerns about subordinates and tend to suppress the performance of others (Ouimet, 2010). Although narcissistic leaders usually have high social skills, they are self-centered, not good at understanding opinions, and sensitive to criticism, and are not good at reflection, so it is difficult for them to learn from mistakes (Morf & Rhodewalt, 2001; Exline et al., 2004). In terms of behavior, narcissistic leaders usually do things directly, recklessly, aggressively, vigorously, they like to create a sensational effect, tend to take risky behavior, and thus easily make corporate performance unsteady (Maccoby, 2004; Patel & Cooper, 2014). Rosenthal and Pittinsky (Rosenthal and Pittinsky, 2006) suggested that narcissistic leadership included arrogance, inferiority, pursuit of praise and superiority, high sensitivity, immorality, lack of compassion and paranoia based on summarizing previous studies. Ouimet (Ouimet, 2010) believes that narcissistic leadership includes charisma, selfish pursuit of self-influence, inhibition of others and hypocrisy. On the basis of reviewing previous studies, Huang Yili and Li Wei (Huang Yili and Li Wei, 2014) summarized the four behavioral tendencies and characteristics of narcissistic leadership, such as charm, self-interest, deception motivation and knowledge inhibition.

Third, the existing research has some controversy about the effectiveness of narcissistic leadership. On one hand, narcissistic leadership is overconfident and risky, and it is easy to make the organization in crisis (Brunell et al., 2008); liking false care and deception, it is easy to increase the ineffectiveness and immorality of the subordinates to the leader (Hoffman, et al., 2013). Similarly, narcissistic leaders are selfish, only care about themselves, ignoring the efforts of others thus easily destroying the good atmosphere of the team and ultimately reduce team cohesion (Morf & Rhodewalt, 2001). Chatterjee & Pollock (Chatterjee & Pollock, 2017) proposed that narcissistic CEOs meet two needs of people. Firstly, they are in pursuit of their praise by others and secondly they want to be in control of the needs of others, so they work hard and therefore can contribute to the organizational goals. The effect of existing research on narcissistic leadership tends to be negative and destructive, and its positive impact remains at the speculative stage, lacking sufficient empirical evidence. The existing research institutes target most of the leaders with absolute power such as CEO or political leaders, while the middle leaders who target small and medium-sized teams in the organization lack of sufficient attention.

#### **4 Conclusion**

Although the existing research has explored the conceptual characteristics, formation and influence of narcissistic leadership, it has unveiled narcissistic leadership to a certain extent, providing a research foundation for a correct understanding of narcissistic leadership. However, there are still some issues to be explored and solved for the study of narcissistic leadership. Firstly, the existing research on narcissistic leadership is mostly based on theory and lacks sufficient empirical research to test it and establish relationships between narcissistic leadership and important outcome variables, such as creativity, advice, and organizational citizenship behavior. Secondly, although previous studies have to some extent have explored, the relationship between narcissistic leadership and performance, the results

are controversial and needs further verification. Most of the research targets high-power leaders such as CEOs or political leaders, but there is a lack of attention to middle-level team leaders. Different levels of narcissistic leaders have different effects, but the existing research does not give an answer. In addition, the existing research on the effect of narcissistic leadership lacks the testing of its formation mechanism. There is also a need to clarify the behavioral tendencies of narcissistic leadership which are the key to the positive or negative outcomes of employees or organizations. Finally, the existing research on the effects of narcissistic leadership focuses on its internal influences, but lacks attention to external influences. The leader is the representative of the team, usually an important bridge between the team and outside the team (Yoon, Kim, & Mah, 2017).

**Abstract:** In this study, we examine the fit perception and satisfaction obtain by students from their designers as part of the creativity in the design process. Empirical data on design processes were obtained from two locations in two different tertiary institutions in Ghana. Also, four experienced designers, whose designs were measured on general quality and on a range of aspects plus creativity were also involved. From the data, we identify aspects of creativity in design related to the formulation of the design problem and to the concept of originality and much-preferred designs by students. We also apply SNA to our data to evaluate the centrality of designers as preferred by students as to know what satisfaction they obtain from these designers. Our results confirmed that, although students preferred most of the designers and their garments fits them very well, their satisfaction was obtained from designers who were flexible with their little requests and quires which gives students the ability to wear those garments confidently. It is therefore recommended that designers should take into consideration the little inputs and comments of students to give them the needed satisfaction.

**Keywords:** Creative design; Design process; Garment satisfaction; Students fit perception; SNA

### 1 Introduction

Fit is a vital measure in a consumer's assessment of a designer's product. According to Kurt Salmon Associates, 2000, 50% of women and 62% of men cannot find a good fit. Other studies have shown that, fit problems to be the reason for 50% of catalog returns. With the widespread diversity of body shapes and sizes and a drift towards more fitted garments (Lee, Y., Hwang, C.&Baytar, F., 2019), fit difficulties continue to be an issue for garment manufacturers and designers, with no clear resolution. Creativity in the design process is often described by the number of important proceedings (C.H. Dorst and N.G. Cross, 2001). Such proceedings occur as a swift insight which the designer instantly sees as important, but often it is only in a survey that the designer is able to recognize a point in the design process by which the key idea begins to develop. Surveying accounts of creative proceedings in design made by the designers themselves may not be wholly reliable (Lawson, B., 2005). The increasing number of designers has brought more competition in the industry which is very healthy and this has shaped the behavior and activities of designers who intern try to give customers the needed satisfaction they deserved.

Designing to suit a group of people is seen as problematic because there can be no guarantee that a creative design will satisfy your customers which they will see as creative and unique and prefer yours to others (Hinds, B. K., & McCartney, J., 1990.). Social networks analysis is an extremely important area of research. With the advancement in areas of research, the growth of social networks is used in a lot of studies (Shiau, W. L., Dwivedi, Y. K., & Lai, H. H., 2018). The development of social networks have been concentrated on three branches of research, which are, the network's statistical properties (M. E. J. Newman, 2003), which characterize its structure and topology network models that represent and help to understand the meaning of a said properties and finally, the analysis of dynamics and developing behaviors within networks. While garment fits may be complicated by many factors including quality, price, delivery schedule and production operations, they are important because they lead directly to consumer satisfaction or dissatisfaction with fit. Designers that maximize the potential of their fit production, can generate better-fitting garment (Lee, Y., Hwang, C.&Baytar, F., 2019). This problem is common as far as design practice is concerned, which means, it calls for the combination of a diversity

of aspects, such as ergonomics, establishment, production, aesthetics and business aspects. The main aim of this study was to enrich the understanding of customer’s satisfaction with garment fit in general (i.e., the awareness of garment fit in a broad-spectrum which is possible when acquiring garment). The over-all perceptions of garment fit satisfaction may be influenced by many factors (Brownbridge, K. et al, 2018), all of which come into play when customers measure whether the garment fit meets their anticipations during and after purchasing garments. This study tries to refine the idea of garment fit and satisfaction with fit in particular as pointed out in existing studies, to qualitatively explore customers’ perceptions of garment fit and the factors that affect fit satisfaction, and to develop an understanding of customers’ general satisfaction with fit. This empirical study is aimed at examining the satisfaction students obtain from designs they chose from their designers, and how these satisfactions are obtained, which includes ways to measure the supposed inspiration and the overall ‘quality’ of the subsequent designs. The members we engaged for this study were four designers with over five years of professional skills. With two designers each from the two locations who were directly linked with these students. A total of 120 students were interviewed with 60 students from each location. The outline of the problem in the light of the designer is to, introduce the stakeholders and define the designer’s position. The limitation of the study was our inability to expand the participants of the study to both students and non-students, and also include more designers. It is therefore recommended that, to improve on this study, the participants should not be limited to only students, but workers and non-workers as well. In order to get a deeper understanding of fit satisfaction among people of different sense of taste. The paper is organized as follows. Section 2 describes the materials and method used in the study. Then the study’s data analysis is presented in Section 3 and then the discussion of the results would be in Section 4. Finally, we conclude with a summary of our study and a conclusion in Section 5

## 2 Materials and Method

A distinctive condition in the experiment was the way in which information was provided to the designers (Labaree, R. V. & Scimeca, R., 2016). All the needed information was prepared earlier, with specific areas on sheets. Areas involved interviews with the students, facts about supplies and production techniques, or a survey of students. If a designer wanted to know something, they asked the student, who would then hand over the appropriate sheet with their required need. The facts on the sheets were presented as if it had come from other sources other than students. In this study, we were concerned in the overall quality of the resultant design models produced (Niina H. et al, 2018) by the designers and how it satisfies the student who will be using the product.

The method was as follows:

- The task was read and instructions as to how to do it was also given to both students and designers. They were then allowed to ask questions for further explanation.
- Then shots of all the models were shown in random, together with a sentence summarizing the way each of them was happy with their models.
- The first scoring was then done, with each student grading the models individually in this category.
- Also, students were asked to give a total judgment of them all, which was the mean of the other scores.

This rather painstaking multi-step procedure enabled us to analyze the rationale behind the judging behavior and to test the consistency between students.

**Table 1 The Mean Scores of all Students (on a 1–10 Scale)**

Designer	Ergonomics	Technical aspect	Aesthetics	Business aspects	Creativity	Total judgement
Designer 1	6.2	5.5	6.3	6.4	7.2	5.2
Designer 2	7.3	6.3	7.5	7.2	6.3	7.1
Designer 3	4.4	4.1	5.4	3.2	2.2	4.8
Designer 4	6.3	7.4	7.1	7.7	7.6	7.8

## 3 Data Analysis

The authors observed fit sessions at six designers’ facilities. A survey was developed based on

these observations and was sent to 200 students who participate in fit sessions as part of their quest for satisfaction with their garment fits. The survey included multiple choice, Likert scale and open-ended questions. A return rate of 70% provided response from 120 students and four designers. It was from this 120 students and four designers that our empirical studies were done. Information on participants' overall satisfaction with fit in general as well as demographic data on participants' personal backgrounds were measured quantitatively. The quantitative phase was conducted using a paper-based survey, followed by focus group interviews to obtain qualitative data. The quantitative results are helpful in understanding the level to which participants are satisfied/dissatisfied with fit, and enable comparison of qualitative responses between gender groups. However, quantitative results are not sufficient to fully explain what participants think about fit and why they are satisfied or dissatisfied with fit; hence, the need for a qualitative component. The purpose of the qualitative phase was to explore possible dimensions of consumers' perceptions of fit and gain a deeper understanding of consumers' experiences and thoughts regarding garment fit. From the data obtained from our experiment, students and designers, we now transformed our data into matrices and use UCINET (Borgatti S. P., et al, 2002) to analyse it. These matrices were the basis for our social network analysis.

#### 4 Results and Discussion

An overview of the scores given for each design on the different aspects can be found in Table 1. The concepts of designers 2 and 4 clearly stand out as the best on most aspects (from table 1 and figure 1). Design concepts of Designer3 are consistently bad in all aspects. Which implies students have a taste for designers 2 and 4 although others are also interested in designers 1 and 3

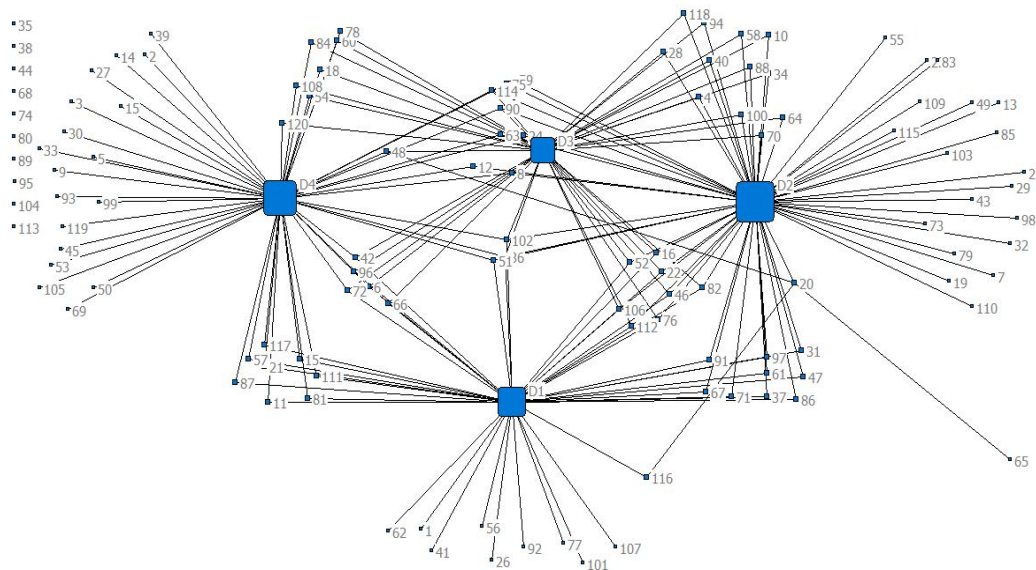

Figure 1 Degree Centrality Network of all 120 Students and 4 Designers

Figure1 shows us that, not all students were connected. There were 10 students who were not connected to any of the 4 designers which shows that they might have a special need which was not solved by any of the 4 designers. There are also students who were also connected to more than one designer which also indicates that their needs could be met if they connect to more designers. We now concentrate on designers 2 and 4 since they have the highest degree centrality and found out more from students how their products fit them and how they derive their satisfaction from those products.

**Figure 2 Degree Centrality Network of All 120 Students and the 2 Designers**

Figure 2 also shows that not all students were connected. There were 6 students who were not connected to any of the 2 designers which shows that they might still have a need which was not solved by any of the 2 centralized designers. There were also students who were still connected to more than one designer which also indicates that only one designer cannot satisfy their needs.

**Figure 3 Degree Centrality Network of All 120 Students and the Centralized Designer**

Figure 3 shows that almost all students are connected except student 1 and 64. This shows that, as the options for students get narrowed, they then tend to get more connected to the only option they have. This also means that, if the leader of the market is able to compete very well, he will in the long round take over the market.

A designer's aim is basically to attain high-quality models (Shin, E. & Damhorst, M. L, 2018), with freshness, uniqueness or originality being preserved as an overall, cohesive design model. A student aim is also to wear a garment that fits her very well and feels satisfied with it. They used a variety of techniques to ensure this freshness, such as searching for technical, social or cultural factors that were not addressed in the design of the current product. Our findings suggest that creativity can practically happen as follows:

- Free, surprising information is linked to a logical piece, which offers an outline of the design problem.
- The acknowledgment of the outline happens swiftly and is experienced as an idea.
- Thus the obvious choice and arrangement of information lead to the same core idea for all the modeled products.
- The designer only has to turn the problem around to arrive at a solution.
- The designer needs to take into consideration the customers' needs, comments, and request
- The customers' satisfaction is derived from the little input she is able to make in the design process.

## 5 Conclusion

In this paper, we examined how the creative and design process affects the fit perceptions and satisfaction among tertiary students in Ghana. We have shown that the 'problem-solving' aspect of design can be described usefully in terms of listening to the student who will be the user of the end product. The connectedness of a student to a designer was depending on the fit perception and satisfaction the student derives from that designers' product. As shown in the network, the degree centrality of a designer shows how many students are connected to that designer. And these decisions are made based on the perception and satisfaction the student derives from the designers' garment. Based on our analysis from the centrality measures used, the following results were obtained: For students, only fit perception will not attract them to a particular designer. Also, their friends fit perception on the garment they wear do not make much influence on their own perception, but what actually influences them most is their taste for the design and the satisfaction they derive from those garments from their designers. It is more likely also for a designer who takes the little comments into consideration to own the market. This means that the chances for the other designers to get more students to their side do not only depend on their designs but also taking into consideration the customers' needs and comments or little details. This also means that the probability for students to run to the designer with more customers is also very high. Naturally, firms with higher probability to satisfy the customers will have higher chances to take the marketplace in the end. It is therefore recommended that designers should take into consideration the little inputs and comments of students to give them the needed satisfaction.

# **An Analysis and Solution Research of the Voluntary Unemployment of College Graduates from the Perspective of Employability**

Han Fang

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 1149939096@qq.com)

**Abstract:** A large amount of statistics has indicated that the number of college graduates who intended to get employed has been dropping year by year, while the number of graduates who are voluntary to remain unemployed is growing. Such phenomenon, if unresolved, will bring about instability to society as well as market. The voluntary unemployment of college graduates posed new challenges to the building of harmonious society and work of college graduates' employment in the new era. This paper is innovatively based on the perspective of employability, analyzed reasons behind voluntary unemployment from the view of college graduates and enterprises, and, based on the perspective of employable ability, offered enlightenment and solutions to voluntary unemployment from the four dimensions of market, enterprises, college graduates and colleges.

**Key words:** Employability; College graduates; Voluntary unemployment; Analysis research

## **1 Introduction**

The employment situation of college graduates is becoming more and more serious. The unemployment rate of college graduate's half year after the graduation amounted to 8.1% in 2017. Among these graduates, demission rate within half year after the graduation surpassed 33%, and 98% of them voluntarily quit the job. The main reason for quitting is "not enough space for personal improvement," which accounts for 48% of unemployed group, while 42% of the rest quitted because of "relatively low income and compensation." The voluntary unemployment of college graduates has become a crucial point in college employment. Most of the voluntarily unemployed graduates chose to continue education or participated examination for civil servants so as to avoid employment. Unemployment of college graduates not only increase social cost, but hinder the further progress of education.

Literally, employable ability refers to "the quality, characteristics and capability of individuals, and to which extent the individual can be employed and remain employed." It is first proposed by the British scholar as regard to employment of college graduates (W.H.Beveridge, 1909). It refers to labors' potential to be employed, and later was used as public policy tools for "stimulating" environments as well as fighting against unemployment. Thus, this term is widely used in all walks of life and has spread in Europe and America. Scholars from China and abroad have carried out researches regarding this topic from various aspects.

Foreign scholars carried out researches mainly from such two aspects, the narrow sense and broad sense. In the narrow sense, Labor Development Committee of Canada (1994) defined employable ability from the perspective of supply-demand of labor force. It deemed that employable ability is an interaction based on personal condition and labor market and refers to the regarding ability that individual possess for acquiring meaningful jobs. Based on individual ability, HM Treasure (1997)

defined employable ability as that when exploring jobs with high demand and adaptability, individuals endeavor to explore their skills, knowledge, techniques and adaptability so as to guarantee that they remain employed throughout their careers. In a broad sense, market economic environment is also under consideration. Scholars take personal operation space, including living condition and status quo of labor market, into consideration, and deemed that employable ability is necessary for acquiring first jobs, remaining employed and seeking new jobs when necessary (Hillage and Pollard, 1998). This definition stressed the multidimension and dynamism of employable ability. From the perspective of Human Resources Management, employable ability is defined as the process of continuously completing tasks, getting jobs and creating jobs by making the best of abilities (Van der Heijde and Van derHeijden, 2006).

With a late start, China's researches regarding this topic show relatively consistent definition of employable ability. Employable ability refers to abilities that college graduates acquired through study and exploration of personalities during residency in school, with which college graduates could achieve career goals, meet social demand and fulfill personal value in social life (Zheng Xiaoming, 2002). Employable ability consists of ability in acquiring jobs, and must be renewed throughout careers (XieJinyu and Song Guoxue, 2005), that everyone possesses to successfully acquire various vocations of labor market, or individual's ability and willingness to attain success in various vocations (Zhou Lulu, 2008).

## **2 Category and Classification**

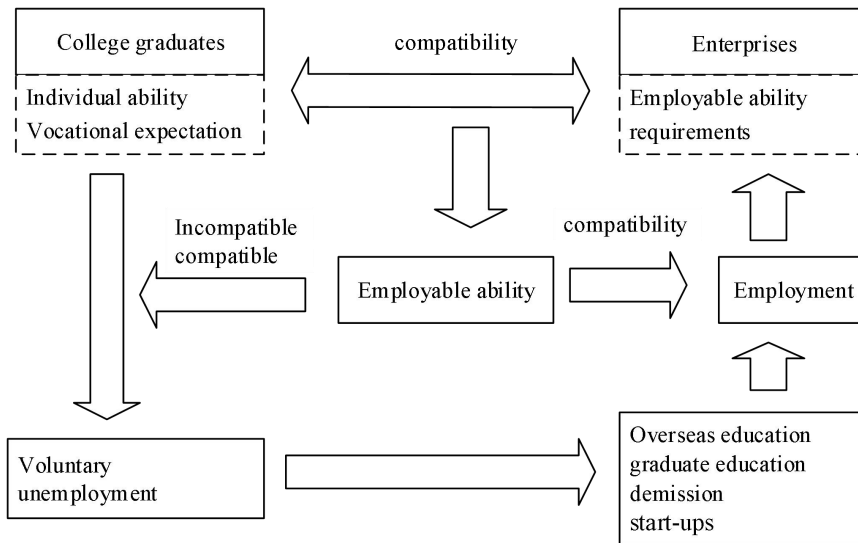

Unemployment refers to a state where workforce who reached the work age and work ability requirements fail to acquire the employment opportunity, and is further classified into passive unemployment and voluntary unemployment. Passive unemployment is also known as involuntary unemployment, which refers to people who are willingly to accept current income and working conditions yet fail to get employed. Compared with passive unemployment, voluntary unemployment is out of the individual's willingness.

The author classified the voluntary unemployment of college graduates into the following categories. First, voluntary employment out of the gap between expectations and reality. It refers to conditions where college graduates did not find their ideal jobs so that they voluntarily remain unemployed. Second, voluntary unemployment due to other career planning. This refers to the group of graduates who turned to overseas education, graduate education and start-ups so as to avoid employment. Third, voluntary unemployment out of voluntary demission. It includes people who had been employed but quitted jobs due to such reasons as "little promotion space", "incompatibility between the job and major". 49% was the match rate for college graduates in 2017 in terms of the jobs and vocation expectations. To be specific, the figure for undergraduate graduates and higher vocational school graduates in 2017 was 52% and 46% respectively. Voluntary unemployment not only add to the time cost and economic cost of employment, but easily develop laziness and idleness among job-seekers (Mi Lingjia, 2015). Therefore, despite the classifications, voluntary unemployment lead to resources waste to some extent, which should be avoided. We need to probe into the reasons behind voluntary unemployment.

## **3 Analyses of Reasons**

Based on previous research conclusions as well as characteristics of this paper, the author intended to carry out analysis from the narrow sense. In a narrow sense, employable ability focuses on the ability that an employee possesses so as to meet the employers demand in employment. The author started from the perspective of employability and concluded that the fundamental reason for voluntary employment

of college graduates lies in the incompatibility between the abilities that college graduates possess and abilities that enterprises require. The analysis of mechanism for reasons behind voluntary employment of college graduates from the perspective of employability is show as the figure 1 below.

**Figure 1 Reasons behind Voluntary Unemployment from the Perspective of Employability**

For a long time, most of employers have held contradictive views about the college graduates' highly employable abilities. On the one hand, enterprises have been longing for college graduates with highly employable abilities, because such graduates possess excellent qualities as well as abilities, and they can instantly achieve effective outcomes for enterprises. In the meantime, such graduates value personal development and are able to achieve self-value improvement through self-study or organizational training so that the total competitiveness of enterprises is improved as well. For college graduates, highly employable ability contributes to psychological feelings, including self-content, satisfaction and self-effectiveness, etc. On the other hand, out of avoiding risks and leveraging labor cost, enterprises are concerned about the return from investment in college graduates who are not equipped with enough employable abilities, hence, enterprises intend to avoid such responsibility(Fan Youmeng, 2019). Therefore, from the perspective of employability, this paper analyzed reasons behind voluntary unemployment from the view of two main parties, college students and enterprises.

### 3.1 View of college graduates

College graduates have a relative vague concept about their future vocational plan. They selected ideal jobs, vocational spots as well as income level, etc. However, most of graduate choosing voluntary unemployment have little social experience. They lack correct understanding about the ideal jobs and ideal income, and also fail to meet the ability requirements of the job they apply for. Therefore, during the process of finding jobs, college graduates are seriously frustrated by gap between reality and personal expectation as well as incompatibility between requirements of jobs and personal incompetence, which led to emergence of voluntary unemployment. Based on the classification of voluntary unemployment, this paper concluded that people who choose voluntary unemployment out of gap between expectation and reality or those who turn to voluntary unemployment because of career planning are consistent with the definition of voluntary unemployment. Due to lack of understanding about their own abilities, they over estimated themselves when targeting ideal jobs, which led to the

incompatibility between real vocational conditions and vocational requirements. Overseas education or graduate education, to some extent, is to meet the requirements of ideal jobs or to improve personal abilities so as to get the ideal job.

Through analyzing compatibility and employable ability, this paper also concluded reasons behind voluntary unemployment caused by voluntary demission. The reason behind voluntary demission lies in the fact that college graduates lack career planning before employment and lack basic understanding about future vocational promotion, income and other conditions so that job contents and income after the employment did not meet their expectations, thus, they choose demission or reemployment. Some of them also chose graduate education or start-ups.

### **3.2 View of enterprises**

College graduates turn to voluntary unemployment mainly because they lack comprehensive understanding about the jobs that enterprises offered and also the lack of hireable employability abilities in enterprises. The requirements enterprises have on employability abilities are on the opposite direction with current college education system. Enterprises usually conduct comprehensive evaluation on college graduates in terms of professional skills (including academic skills and practical skills), communications skills, personality (honesty, sense of obligation, self-management, etc.), learning ability, interpersonal skills and other aspects. However, most of college graduates lack understanding and acquaintance about the skills mentioned above. Hence, there is an incompatibility between employability abilities of enterprises and abilities that most college graduates master, which led to insufficient talent pool and contributed to voluntary unemployment.

## **4 Solutions**

Based on employability, this paper analyzed reasons behind voluntary unemployment of college graduates from the view of college graduates and enterprises. On such basis, this paper took market and colleges into consideration for policy-making process, because market and colleges are the closest factors interacting with enterprises and students. This paper will offer solutions and advice to voluntary unemployment from the following dimensions, including market, enterprises, college students and colleges.

### **4.1 Perspective of the market**

For market, increase the flow and transparency of information in the labor force market. There is a serious information asymmetry between the employment information that college graduates acquire and the information that market display, which is one of the most important reasons leading to unreasonable income expectation of college graduates. Therefore, the labor force market shall carry out effective reform so as to ensure that such information as vocations demand, income, and career development is transparent and instant among college graduates. On the one hand, the authority shall organize concerning department of labor force or human resource to conduct investigation on current labor force so as to report to society, and especially, college students about labor force market information, such as layers, structure and average income level, and carry out in-depth analysis on this information. Such measures will not only contribute to alleviating information asymmetry of work force in the labor force market, but help college graduates adjust reserve income so that it can match social real income and promote fair employment.

### **4.2 Perspective of enterprises**

As the demanding side in the labor force market, enterprises should develop talent program in

accordance to future plan and type of talents needed, and communicate closely with colleges about these programs. Such cooperation between enterprises and colleges could specifically trained students' abilities. On the basis of investigations this paper made and previous researches, employable ability is the key ability lying in enterprises' demand. Therefore, enterprises should closely cooperate with colleges to add employable ability training into daily disciplines and increase effectiveness of employable ability training. Hence, cooperation between enterprises and colleges not only help enterprises develop talents pool and lower the cost in labor force, but resolve the current incompatibility between ability college graduates possess and enterprises' demand, promoting positive employment and reducing voluntary unemployment. Colleges and enterprises should carry out cooperation mainly by establishing college-enterprise coalition, and carry out "order-based" training. Through college-enterprise coalition, students acquire internships from enterprises so that they can be involved in projects, strengthen abilities such as team management, cooperation and communication, allocation of talents and team cooperation. Such cooperation programs help college undergraduate students with employable ability and more social experience. In turn, enterprises provide college students with specific requirements of certain vocations, pointing directions for students and improving their ability in adapting to jobs.

#### **4.3 Perspective of college students**

College graduates should establish the concept of "employment first, selection second." During a given period, the resources that society provides are limited, and materials produced by the limited resources to meet our need are also limited. Limited resources as well as material produced from it shall never completely fulfill human' endless need, which is referred to as Scarcity. Similarly, the ideal jobs that graduates pursue are limited, as most of graduates could not get what they want. Therefore, graduates should develop reasonable employment value. They should get employed first, accumulate experience and then select their ideal jobs, rather than unreasonably go after better jobs. College graduates should improve themselves through employment, establish their advantages and be clear about the jobs that fit them. It is because only in practice can college graduates understand the value of their knowledge and gradually become aware of their orientation. In addition, besides knowledge acquiring during residency in college, students should actively participate in academic, scientific and entertainment activities of all kinds. College, in nature, is like a mini-society, of which students should be aware of. They should effectively use this opportunity to adapt themselves to the society, conduct specific trainings so as to improve their employable abilities.

#### **4.4 Perspective of colleges**

Colleges should integrate employable ability training into classroom instruction. Higher education and vocational education should be merged, while the key lies in that during training program, colleges should effectively respond to human resources demand of the society, and importantly, the training of employable ability for college graduates are links connecting higher education system with labor force market. Vocational undergraduate colleges should set clear goals on professional talents training, and integrate employable ability training into classroom instruction, or in other words, improve employable ability of college graduates through class instruction. Classroom instruction is the cornerstone where Vocational undergraduate colleges achieve employable ability training for students. The implementation and quality of classroom instruction play an important role in training students of vocational undergraduate colleges. To effectively integrate employable ability training into classroom instruction, colleges should start from the following aspects. First, colleges should classify core knowledge of each discipline into different groups, establishing a systematic and complete discipline theory system. In the meantime, colleges should integrate employable ability enterprises need into this system so that when studying theory and knowledge, college students understand what employable ability they need. By

doing so, colleges are able to guide students in establishing scientific career planning. Career demand should be regarded as the “mirror” to form self-awareness; social demand be regarded as the ruler to locate specific vocations; vocational experience be viewed as the basis for role adaptation; vocational activities be used as the platform for gaining experience. Second, colleges should upgrade courses design so that students effectively combine knowledge with skills. All phases of talents training should be appropriately designed. When carrying out academic education, colleges should integrate innovative start-up education, and imbed training of employable ability into various educational stage and methodology, including academic theory, class experiment, internship and others so that students can apply knowledge into practice and further improve their ability in innovation and start-ups through constant study in all these stages above. Also, graduate internship and academic paper should be improved as well. Graduate internship should integrate into vocations, combining the source of graduate papers with local economic growth and social development. By doing so, college students could acquire professional knowledge as much as possible and improve their employable ability. In addition, the voluntary unemployment can be solved as well.

## 5 Conclusion

Under the circumstance of serious employment condition, the training of employable abilities for college graduates should be based on the four-dimension employment guiding system with students at its core, government as the guider, colleges as the leader and enterprises as the guarantee. In accordance with employable ability of college graduates and the needs of enterprises, different parties in this regard should do their best to enhance the training of college graduates' disadvantaged aspects.

To sum up, first of all, college students should develop reasonable career value and design feasible career planning. Second, colleges should reform education methodologies in accordance to the training of employable ability and opinions from enterprises. In the meantime, enterprises are advised to upgrade cooperative interaction mechanism between colleges and enterprises, and enterprises should focus on the growth of their employees and organizations. Last, but not the least, government, as the coordinator of the overall social development, should play a leading role in this regard. An active labor market policy mainly improving employable ability of labor force should be formulated so as to increase the flexibility of policies. In cooperation with colleges, enterprises and college students in the labor force market, government should contribute to the successful compatibility of supply and demand in employable ability. It should also motivate college students to improve their employable ability so that the employment rate of college students will increase finally.

(E-mail: sunwei@wust.edu.cn, 345461479@qq.com, 5403400@qq.com)

**Abstract:** Customer trust has a critical impact on its buying decisions. This paper examines the impact mechanism of Salesperson's Characteristics on customer trust through empirical studies. Empirical studies have shown that salesperson's affinity, response ability, sales ability, learning ability and communication ability have a positive impact on customer trust, but performance ability has a negative impact on customer trust. The research results provide valuable theoretical basis and suggestions for enterprises to enhance customer trust through effective salesperson management.

**Key words:** Salesperson's characteristics; Customer trust; Influence mechanism; Empirical studies

### 1 Introduction

Salesperson plays an important role between the company and the customer. Salesperson's personal performance not only affects the business-customer interaction, but also directly affects the company's sales performance. Winning customer trust is one of the keys to successful sales of salesperson. In recent years, salesperson trust issues have been increasingly valued by the business community and the academic community, but most of the research is based on the salesperson trust problem under the B2B marketing scenario, and there is little research on the trust between consumers and salesperson (Du Jiangang et al, 2006; Bateman, 2015), the theoretical community is still not deeply researching the factors affecting the trust of sales personnel (Zhang Shengliang, Liu Gang, 2013; Friend et al., 2018). This paper empirically tests the relationship between salesperson's characteristics and customer trust, enriches the theoretical research of customer relationship management, and provides valuable theoretical basis and suggestions for enterprises to enhance customer trust

through effective salesperson management.

## **2 Theoretical Basis and Research Hypothesis**

### **2.1 Salesperson's characteristics**

Salesperson's characteristic refers to all the characteristics and attributes of the salesperson perceived by the customer. Scholars have studied the specific dimensions of salesperson's Characteristics. Brush and Wilson (Brush and Wilson, 1976) divided salesperson's characteristics into five dimensions: knowledge absorption, experience similarity, professional level, performance ability, and interpersonal communication. Weitz et al. (Weitz et al., 1986) divided it into three dimensions: internal reward-oriented and knowledge ability, and information acquisition ability. Swan et al. (Swan et al., 1988) divided it into five dimensions: honesty, reliability, responsibility, ability, and affinity. Erika (Erika, 1999) divides it into 10 dimensions: self-will, urgency, self-motivation, determination, and willingness to take risks, social ability, conceptualization ability, sound suspicion, creativity, empathy and so on. This paper divides the salesperson's Characteristics into three dimensions: personal characteristics, behavioral characteristics, and professional characteristics.

### **2.2 Customer trust**

Customer trust refers to the positive expectation that the customer can trust the transaction partner in the case of possible risks, and is the perception of the reliability of the transaction partner's integrity. In the fields of psychology and sociology, many scholars agree to divide trust into two dimensions of cognitive trust and emotional trust (Johnson, Grayson, 2005, Kanawattanachai, Yoo, 2002; Tyler et al., 1996). This paper agrees with this point of view. Cognitive trust is a customer's belief in the credibility and reliability of salesperson, based on certain reasons to believe the other person's ability, integrity, honesty, fairness and reliability. Emotional trust is the mutual relationship and care of customers based on each other, reflecting the specific emotional basis and emotional connections between the customer and the salesperson.

### **2.3 The impact of the personal characteristics of salesperson on customer trust**

Salesperson's characteristics can be divided into two dimensions: affinity and response ability. In the process of social cognition, the previous information will have an effect on the following cognition process. Goodwin and Smith (Goodwin and Smith, 1990) believe that customers have a strong preference for kindness and courtesy, which can shorten the social distance between customers and service providers, and develop friendly relationship. Individuals felt connected with each other due to the salesperson's friend behavior. The friendlier the salesperson is, the better the customer will feel good about the salesperson. This paper proposes the following assumptions:

H<sub>1</sub>: Salesperson's affinity has a positive impact on customer trust.

H<sub>1a</sub>: Salesperson's affinity has a positive impact on customer's cognitive trust.

H<sub>1b</sub>: Salesperson's affinity has a positive impact on customer's emotional trust.

Response ability refers to a collection of reaction states and coping capacities. Su Qin et al. (Su Qin et al., 2007) showed that the rapidity and response ability of salesperson could affect the quality of customer relationships. Response ability will make customers feel valued and strengthen the relationship between the company and the customer. In the sales process, if the salesperson can timely respond to the customer and quickly deal with the customer's needs, it should increase the customer trust. When the customer thinks that the object of trust really cares about the interests of the customer, it will generate emotional dependence and input. This paper proposes the following assumptions:

H<sub>2</sub>: Salesperson's response ability has a positive impact on customer trust.

H<sub>2a</sub>: Salesperson's reaction ability has a positive impact on customer's cognitive trust.

H<sub>2b</sub>: Salesperson's reaction ability has a positive impact on customer's emotional trust.

#### **2.4 The impact of salesperson's behavioral characteristics on customer trust**

The behavioral characteristics are composed of the actions exhibited and the states exhibited by the individual, including the two dimensions of communication ability and performance ability. Communication ability refers to the ability of salesperson to effectively communicate information with customers. Suprenant and Soloman (Suprenant and Soloman, 1987) showed that communication has a positive impact on the evaluation of employees and services. Morgan and Hunt (Morgan and Hunt, 1994) showed that smooth communication is an important factor in achieving close relationships. This paper proposes the following assumptions:

H<sub>3</sub>: Salesperson's communication ability has a positive impact on customer trust.

H<sub>3a</sub>: Salesperson's communication ability has a positive impact on customer's cognitive trust.

H<sub>3b</sub>: Salesperson's communication ability has a positive impact on customer's emotional trust.

The salesperson's performance ability is reflected an externally active expression in the whole process of contact between the salesperson and the customer. Cooper et al. (Cooper et al., 2003) show that salesperson's external behavior plays an important role in influencing customer relationships. This paper proposes the following assumptions:

H<sub>4</sub>: Salesperson's performance ability has a positive impact on customer trust.

H<sub>4a</sub>: Salesperson's performance ability has a positive impact on customer's cognitive trust.

H<sub>4b</sub>: Salesperson's performance ability has a positive impact on customer's emotional trust.

## **2.5 The impact of the professional characteristics of salesperson on customer trust**

Professional characteristics are a combination of specific specialized knowledge and abilities expressed in a particular position, including both sales skill and learning abilities. Sales skill refers to the degree of ability and knowledge that a customer has perceived salesperson possesses when providing basic services or products. Salesperson's professional skill is positively affecting the trust between buyers and sellers (Crosby et al., 1990; Doney, Cannon, 1997). Crosby et al. (Crosby et al., 1990) showed that salesperson's professionalism directly affects the sales effect, and affects the long-term sales effect through customer relationships. The more professional the salesperson is, the easier it is to adopt effective sales techniques, provide effective information to customers, and gain customer recognition. This paper proposes the following assumptions:

H<sub>5</sub>: Salesperson's sales ability has a positive impact on customer trust.

H<sub>5a</sub>: Salesperson's sales ability has a positive impact on customer's perception trust.

H<sub>5b</sub>: Salesperson's sales ability has a positive impact on customer's emotional trust.

Learning ability is the comprehensive ability of observation, memory, abstract generalization, attention, and understanding. Doney and Cannon (Doney and Cannon, 1997) have shown that the salesperson with efficient learning capabilities are more likely to change customer attitudes and opinions. The stronger the salesperson's learning ability, the more he can understand customer needs in shorter time, and use existing knowledge to meet customer needs, and the easier it is to build trust with customers. This paper proposes the following assumptions:

H<sub>6</sub>: Salesperson's learning ability has a positive impact on customer trust.

H<sub>6a</sub>: Salesperson's learning ability has a positive impact on customer's cognitive trust.

H<sub>6b</sub>: Salesperson's learning ability has a positive impact on customer's emotional trust.

## **3 Research Design**

### **3.1 Data collection**

This paper selects some customers of a beauty salon in Shenzhen and a large enterprise employee in Shenzhen as the survey object. Beauty salon customers often have relatively long-term contact with beauty salesmen during facial or weight loss treatments, and they have a clear perception of salesperson's characteristics. Large enterprise employees have relatively stable work and purchasing power. A total of 200 questionnaires were distributed in this survey, and 180 valid questionnaires were collected. The effective recovery rate was

90%. To ensure the validity of the survey results, respondents are asked to respond to the salesperson who has the deepest impression and the longest contact time. The questionnaire included six dimensions of salesperson's characteristics, cognitive trust, emotional trust, and personal background information (gender, age, education level, and monthly income, etc.).

### 3.2 Sample characteristics

The results of the demographic information in 180 valid questionnaires are shown in Table 1. Women accounted for 43.3% of the respondents and men accounted for 56.7%. The age of 20-29 years old accounted for 66.7%, and the age of 29-39 years old accounted for 24.4%. The proportion of university education was 78.3%, and the degree of graduate education was 12.2%. Respondents with a sales relationship of less than three months accounted for 54.4%, and respondents accounted for 90% within one year. The respondents with monthly income of 4,000-11,999 yuan accounted for 70.6%.

**Table 1 Sample Characteristics**

Item	Demographic characteristics	Sample size	Percent (%)	Item	Demographic characteristics	Sample size	Percent (%)
Gender	male	102	56.7	Relationship duration	Less than 3 months	98	54.4
	female	78	43.3		3 months to 6 months	46	25.6
Age	20-29 years old	120	66.7		6 months to 1 year	18	10
	30-39 years old	44	24.4		More than 1 year	18	10
	40-49 years old	8	4.4	monthly income	3,999 yuan and below	44	24.4
Education Level	50 years old and above	8	4.4		4,000 - 7,999 yuan	64	35.6
	High school	17	9.4		8,000 - 11,999 yuan	63	35
	University	141	78.3	More than 12,000 yuan	9	5	
	Graduate	22	12.2				

### 3.3 Measures

All the scales used in this study were adapted from previously published research. Affinity was measured with three-items from Swan et al. (Swan et al., 1988). Response ability was measured with three-items from Lee and Dubimky (Lee and Dubimky, 2003). Communication ability was measured with three-items from Hawes and Baker (Hawes and Baker, 1993). Performance ability was measured with three-items from Coulter and Coulter (Coulter and Coulter, 2002). Sales ability was measured with three-items from Pilling and

Eroglu (Pilling and Eroglu, 1994). Learning ability was measured with three-items from Doney and Cannon (Doney and Cannon, 1997). Cognitive trust was measured with four-items from Jollson et al. (Jollson et al., 1982). Emotional trust was measured with four-items from Jollson et al. (Jollson et al., 1982).

## 4 Data Analysis and Results

### 4.1 Reliability analysis

This paper used internal consistency to measure the reliability of the scale. The reliability analysis of the collected questionnaires using SPSS 17.0 showed that the Cronbach's  $\alpha$  value of the initial variables and factors ranged from .511 to .798, indicating that the scale had good internal consistency.

### 4.2 Validity analysis

In this paper, exploratory factor analysis was performed using SPSS 17.0 to test the validity of the questionnaire. The results show that the KMO value of each factor of the scale is between 0.611 and 0.768, both of which are greater than 0.6, indicating that the scale has a high construct validity. The value of Bartlett's test is  $p < .001$  indicated that the data has the conditions for factor analysis. As shown in table 2, the results of factor analysis showed that the normalized load factors of the observed variables were all above .7, and all passed the t-value test, which was significant at the level of  $p < .001$ , indicating that each variable has sufficient convergence validity.

**Table 2 Factor Analysis**

items	Factor load	Interpretation variation (%)	items	Factor load	Interpretation variation (%)
Affinity(A)			Sales ability(SA)		
A1	.786		SA1	.771	
A2	.806	64.465	SA2	.806	58.890
A3	.817		SA3	.723	
Response ability(RA)			Learning ability(LA)		
RA1	.847		LA1	.811	
RA2	.740	65.177	LA2	.762	56.176
RA3	.831		LA3	.669	
Communication ability(CA)			Cognitive trust(CT)		
CA1	.773		CT1	.812	

CA2	.882	65.521	CT2	.772	
CA3	.768		CT3	.706	54.509
			CT4	.653	
Performance ability(PA)			Emotional trust(ET)		
PA1	.761		ET1	.835	
PA2	.543	51.171	ET2	.710	
PA3	.813		ET3	.842	62.893
			ET4	.778	

### 4.3 Hypothesis verification

In order to test hypothesis 1, hypothesis 2, and hypothesis 3 is established or not, this paper carries out regression analysis, as shown in Table 3 and Table 4.

It can be seen from the regression coefficients of Tables 3 and Table 4 that the p-values are all less than .05, and the regression coefficients of performance ability and customer cognitive trust and emotional trust are negative. Except that H<sub>4a</sub> and H<sub>4b</sub> are not supported, all other hypotheses are established. That is, there is a positive correlation between the other five dimensions of the salesperson's characteristics and the customer's cognitive trust.

**Table 3 Regression Analysis of Salesperson's Characteristics on Customer Cognitive Trust**

	Non-standardized coefficient		standard coefficient	t value	sig.
Affinity	.608	.050	.646	2.213	.000
Response ability	.215	.047	.243	4.586	.000
Communication ability	.345	.056	.387	6.117	.000
Performance ability	-.036	.066	-.419	6.630	.003
Sales ability	.385	.075	.367	5.123	.000
Learning ability	.284	.070	.291	4.065	.000

**Table 4 Regression Analysis of Salesperson's Characteristics on Customer Emotional Trust**

	Non-standardized coefficient		standard coefficient	t value	sig.
Affinity	.699	.000	.127	2.755	.007
Response ability	.061	.056	.204	2.963	.003

Communication ability	.223	.063	.235	2.553	.000
Performance ability	-.070	.073	-.516	1.732	.003
Sales ability	.426	.084	.383	5.039	.000
Learning ability	.180	.079	.174	2.291	.023

## 5 Research Conclusions and Management Implications

### 5.1 Research conclusions

Empirical studies show that salesperson's affinity, response ability, sales ability, learning ability and communication ability have a positive impact on customer trust, and the performance ability of salesperson has a negative impact on customer trust.

(1) Salesperson's affinity as a special personal characteristic, build a bridge of trust between salesperson and customers.

(2) Salesperson's response ability is related to whether the customer's demand can be met in time, and affects the customer's shopping experience and the establishment of the trust relationship between the customer and the salesperson.

(3) Excellent salesmen with customers with good sales ability can influence customers, and establish trust relationship.

(4) The professional knowledge provided by salesmen with strong learning ability can effectively reduce the perceived risk of customer purchase decision and enhance customer trust.

(5) Effective communication between salesmen and customers enable the salesmen to timely understand the special needs of the customer, and can bring a good interactive communication experience to the customer and enhance the customer's trust level.

(6) The performance ability of salesperson may hinder the establishment of customer trust, which is contrary to the assumptions. The possible reason is: in the sales process, the customer really cares about whether their demand can be satisfied. The salesperson's initiative is too strong, which may put psychological pressure on the customer, increase their psychological resistance, and reduce the customer's trust.

### 5.2 Management implications

Through effective salesperson management, enterprises can shape salesperson's characteristics, improve customer trust, and establish a good interaction between customers and salesperson. (1) Enterprises should strengthen sales knowledge training in sales etiquette, sales methods and techniques, sales communication, customer service ability, etc., enhance

salesperson's affinity (service ability), sales ability, communication ability and response ability, and encourage salesperson. Continuously accumulate and exchange experience and enhance the professional quality of sales. (2) Salesperson should constantly update existing knowledge, pay attention to the daily learning and accumulation of sales knowledge, product knowledge and customer service knowledge, continuously sum up experience in the process of sales visit, provide accurate and valuable information to customers, and provide services to customers in good faith. Meet their needs and increase customer trust. (3) In the salesperson's recruitment process, companies need to correctly consider the importance of the sales staff's performance capabilities. Enterprises need to use sales training to help salesperson correctly understand the latest marketing concepts and sales concepts, and avoid the strong sales behavior of salesperson in order to excessively pursue performance, but reduce customer trust.

## 6 Conclusion

This paper examines the impact mechanism of salesperson's characteristics on customer trust through empirical research. The results of this study provide valuable theoretical foundations and recommendations for companies to improve customer trust through effective sales force management. Of course, this article still has the following shortcomings: (1) the survey respondents focused on a beauty salon in Shenzhen. Although the conclusions of this study are representative, it may be difficult to apply to all industries. Subsequent research will focus on expanding the sample size and make the sample more distributed in the industry. (2) This paper only discusses the impact of Salesperson's Characteristics on customer trust, but there are many factors that affect customer trust. This paper does not consider the impact of customer characteristics on customer trust. Subsequent research can consider incorporating customer personal characteristics into the research model to explore its role in regulating hypothesis.

## Research Prospect of Children's Education Network Platform from the Perspective of Organizational Behavior

Chang Yuming

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 1120105867@qq.com)

**Abstract:** Organizational behavior is mainly to study the impact of individuals, groups, and structures on behavior within the organization, with the aim of improving the effectiveness of the organization. This paper takes "family" as the organizational unit and adopts the behavior research method to analyze the behavioral rules and interactions between children and parents. It is believed that children's educational theory knowledge can be well integrated into mobile products. This paper proposes the idea of building a children's education network platform. Let children learn in a free environment, improve children's enthusiasm, enhance children's self-confidence, stimulate children's potential, and at the same time promote parent-child relationship, make families more harmonious, and make the relationship closer.

**Key words:** Organizational behavior; Children's education; Network platform; Parent-child relationship; Research prospect

### 1 Introduction

#### 1.1 Background of the external aspect of the organization

With the rapid development of the mobile internet, mobile application of children's education has become a new industry with great potential. By using fragmented time, children can learn scientific and cultural knowledge and common sense of life. (Zhao Wenyu, 2018) Overseas, universities, educational institutions and enterprises in developed countries, such as Europe, America, Japan, and Korea, have put the research on mobile application of children's education in key projects. (Xu Xin, Yin Jun, 2014)

In recent years, the number of netizens in China has increased dramatically, and the development of young netizens is on the increasing trend. The current situation of the development of children netizens cannot be ignored. (Dai Jiang, 2011) The Report on Internet Use and Reading Practice of Chinese Minors, published by the Institute of Journalism and Communication, Chinese Academy of Social Sciences, showed that the proportion of Chinese minors who had access to the Internet before the age of 10 is as high as 73.1%. 64.2% of primary school students had their own mobile phones, who were more active in network communication. 62.0% of teenagers used social networking sites, 74.8% of

teenagers liked online games, and 86.7% of pupils used online games.

(Data sources: 29th China Internet Development Statistics Report, China Internet Development Statistics Report, Erie Consulting Child Internet User Survey)

**Figure 1 Age Distribution and Internet Permeability of Chinese Children's Housing Netizens in 2011**

With the gradual coverage of home computers, teenagers have gradually diversified online sites. (Sun Jue, 2016) In today's era, the huge base of computer users determines that the mobile application industry of children's education has great potential for development, and the development of intelligence will change the way of education. (Liu Lu, 2016)

**1.2 Internal impact of the organization**

Primary school students are keen on chatting, playing games and doing homework on the network platform. Some parents joked that their children preferred mobile phones to parents. The jokes belong to jokes, but the problem behind it cannot be ignored. (Wang Xinzhuo, 2017) Children are addicted to the media and cannot extricate themselves, neglecting communication and interaction with their parents in reality, thus forming a spiritual barrier between the two generations. (Yin Guoqiang, 2019)

The traditional family education for children uses toys and books, which content is dull, the amount of information is small, and cannot arouse children's enthusiasm for learning. At present, although the number of mobile applications for children's education on major platforms in China is huge, the phenomenon of homogeneity is serious, the mode is monotonous, the innovation is insufficient, and the learning effect and quality performance are relatively weak. For children, playing is their natural instinct, and "learning by playing" is the ideal learning state. At the same time, parents also hope that children can learn knowledge while experiencing fun. (Wang Xiuli, 2016)

Based on the internal and external factors, this paper focuses on the development prospects of children's education network platform and analyses its benefits to complementary education and the parent-child relationship.

**2 The Impact of the Internet on Children's Education**

**2.1 The characteristics of children's mental development**

For children, the enlightenment education is very important, related to the formation of children's interests and personality, and the development of their studies. There is an old saying in China that "three-year-old look big, seven-year-old look old". The age of 3-12 is a person's preliminary understanding of world values but also a critical period for the development of mental and sensory abilities. With a solid foundation, children can achieve twice the result with half the effort in their future studies. (Sun Zilin, Li Shiguo, 2015)

**Table 1 Erickson's Children's Mental Growth Theory**

Approximate Age	Major Development Tasks	Positive and Important Influencing Factors
0-1 years old	Develop a full sense of trust in the world to explore	Mother, Warm and loving communication.

1-3 years old	Develop a sense of control over behavior, recognizing the ability to put goals and intentions into action	parental support, and imitation
3-6 years old	Developing the meaning of "self" through parents' identifying behavior and their sense of responsibility for their own behavior	believing that they are identical with others
6-Adolescence	Developing self-worth through communication with peers	schools, teachers; learning and education; encouragement
Adolescence	Developing a strong sense of identity-self; choosing among various potential selves	peer and role-building; social stress
Early adulthood	developing close relationships with others; gaining intimacy that requires a long-term commitment	spouses, colleagues, partners, Society
Mid-adulthood	An adult role that assumes responsibility in the community; contributes; is socially valuable	spouse, child, friend, colleague, community
Late adulthood: facing death	overcoming potential despair; understanding the meaning of life	support from friends, relatives, children, spouses, communities, and religions

In the process of children's growth and development, each stage has its own characteristics. According to Erickson's theory of children's mental growth, we can see that parental care has a great impact on children's growth. In the era of mobile Internet, the Internet isolates communication between parents and children, which will affect children's mental growth and development at this stage. How to use the "double-edged sword" of new media is particularly important in today's society. (Liu Xiaodan, 2016)

## 2.2 Current situation of adolescent students' use of the Internet

According to the survey on the dependence of adolescent students on new media, 14.1% of students have a psychological dependence on new media. More students (73.1%) use new media forms

such as the Internet to relax and entertain. Only 12.8% of students study through the Internet.

**Figure 2 Data on the Dependence of Adolescent Students on New Media**

It can be seen that although the phenomenon of Internet addiction dependence is not serious among adolescent students, online activities mainly focus on online entertainment such as chatting rather than learning. Children's education network platform is a cultural platform that integrates study, entertainment, and social interaction. In addition to the embedding of authoritative theory and quality of children's education content, it should also add many interactive elements and some puzzle game elements, which help to improve children's observation, memory and logical thinking, so as to construct a scientific and professional children's education product for children, making them happy to play, happy to learn.

### 2.3 The influence of the internet on children's communication

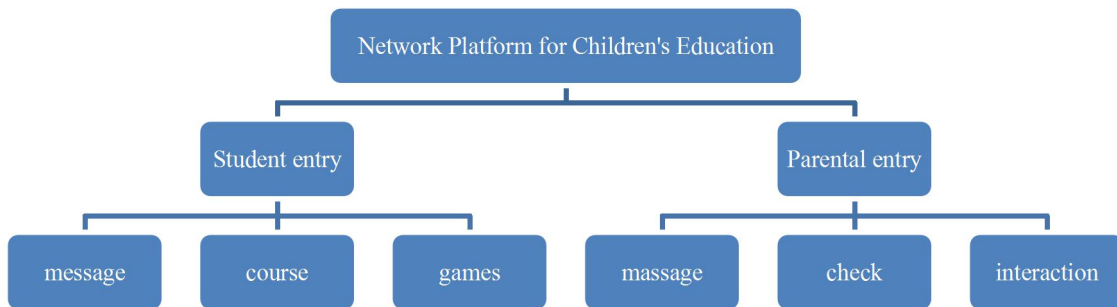

Children's values and behavior choices are based on the media, neglecting the traditional role of parents' words and deeds, and forming a spiritual gap between the two generations.

Although cities provide a variety of public leisure places, people are facing the double threats of television media, Internet resources and increasingly closed and independent buildings in their lives. Communities are always silent and quiet. Many communities can protect residents but cannot integrate them into the community. The lack of communication between children and their neighbors makes them timid and nervous in public

## 3 Content Prospect of Children's Education Network Platform Based on Organizational Behavior

### 3.1 The Enlightenment of organizational behavior to the construction of children's education network platform

Family is the organizational unit for children aged 6-13 and their parents. The preliminary structure

and content of the website are as follows.

**Figure 3 Preliminary Framework and Content of Website**

#### 3.1.1 Message

Parents can not only see whom their children are in contact with but also delete or add their children's contact list to control whom they can communicate with.

Turn off the child's communication function when the child needs to do his homework or go to bed.

Parents can recommend friends to the child, such as teachers, family members, and friends, with the child's consent.

### 3.1.2 Course

**Table 2 Course Content**

Language expression	Cognitive understanding	Learning ability	Mental control ability
A. Language imitation ability (pronunciation, word order, etc.)		A. 6-9 years old: operation and concentration ability.	Adaptability, self-control,
B. Language comprehension (objects, persons, instructions)	life cognition, social cognition, social basis, self-cognition,	B. 10-13 years old: memory ability, logic ability, thinking ability, learning method.	leadership, emotional control,
C. Language expression (see pictures, speak in an active language, ask and answer)	Self-management.		resistance to setbacks.

### 3.1.3 Game

Only when learning has reached a certain time or the homework has been completed well, can they start the game.

Game mode, K song mode, Self-presentation platform (short video).

## 3.2 Research issues

### 3.2.1 Parents' worries in the Internet Age

The virtual nature of the Internet world has realized the substitution and migration of real life, but adults' worries about children are increasing day by day. The previous generation was uneasy about the technology that children possessed, thus affecting the generation gap and the cold war between parents and children.

### 3.2.2 Intergenerational education

With the development of the times, some parents are busy working, divorcing or working in other places, neglecting the spiritual education of children, resulting in little communication between parents and children.

### 3.2.3 Loss of emotions

Children born in the one-child era will face the breakdown of traditional family relationships when they are born.

### 3.2.4 The influence of the Internet on children's growth

The Internet attracts children but also becomes the concern and anxiety of society.

### 3.2.5 The study of children's play psychology

Game spirit is the nature of children. The reality and the virtual world of games in the digital age influence children's various choices.

### 3.2.6 Social Relationship Research

The impact of modern online social tools on children's interpersonal relationships and countermeasures.

## **3.3 Problems to be solved**

### 3.3.1 Virtual and Reality

Children's behavior on the Internet is participated by their parents, and feedback to real-life enhances emotional communication.

### 3.3.2 Entertainment and education

Entertainment and education are both entertaining and educational in nature so that children can experience the joy of learning in a happy game. Parents can not only satisfy their children's curiosity but also guide their children in a safe and green atmosphere, and cultivate their scientific spirit and rational attitude to deal with problems.

### 3.3.3 Family emotional education and school knowledge education are useful supplements

The starting point of life to cultivate self-confidence in communication and life.

### 3.3.4 Children's self-organization in the new media network social environment

The network has changed the way of communication, children need to learn to play creative ability, and realize virtual and realistic community self-organization.

### 3.3.5 Parent control system

Parents can set up procedures and time to allow their children to use according to specific circumstances. Parents can manage their children's learning and playing time more easily so that they can learn happily without indulging in it.

### 3.3.6 User experience research on children's social networks

Many existing children's websites have a wide range of content, the target audience is not clear, and there are many problems with usability.

## **4 Conclusion**

It is both entertaining and educational, allowing children to experience the fun of learning in a cheerful game. Parents can satisfy their children's curiosity, guide children in a safe and green atmosphere, and cultivate children's scientific spirit and the attitude of dealing with the problem. The real user of children's educational products is children. Only by starting from the actual application needs of children, continuous research and exploration can be made to design products that are suitable for children.

New media is a "flood" but not a "beast". We should choose the method of dredging rather than blocking. Just like Dayu's water control, we should correctly guide young people to use new media.

According to children's personality characteristics and growth needs, combined with children's acceptance ability, on-line for children to build an advanced concept, rich content, vivid form of learning game world (children's education network platform). When children wander around the world and forget to return, over time, parents will find that children not only broaden their horizons, increase their knowledge and develop their intelligence but also become more interested and meet their growing needs. It can be anticipated that the future child education network platform will have broad development prospects.

# Research on the Influence of College Students' Entrepreneurial Team Heterogeneity on Innovation Performance: Taking Team Cohesion as Moderator Variable

Zhou Yu, Hu Yan

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 1264379036@qq.com, 898913420@qq.com)

**Abstract:** At present, college students' entrepreneurship is strongly supported by the government, which has become an important force to ease employment pressure and increase social innovation efficiency. Team heterogeneity, as an important factor of entrepreneurial team, has always been the focus of entrepreneurship research. This paper focuses on the particularity of college students' entrepreneurial team, screens the measurement indicators of team heterogeneity and innovation performance, and takes team cohesion as a moderator variable to explore the relationship between them. Empirical research found that: professional heterogeneity positively affects team innovation performance and value heterogeneity negatively affects team innovation performance, while team cohesion positively regulates the relationship between professional heterogeneity, value heterogeneity and team innovation performance. The research conclusion provides reference suggestions for college students to form an entrepreneurial team and improve innovation performance, and has certain theoretical and practical value.

**Key words:** Entrepreneurial team; Heterogeneity; Team cohesion; Innovation performance

## 1 Introduction

The call of the "mass innovation, mass entrepreneurship" policy has set off a new wave of entrepreneurship. As an important special group in the wave of entrepreneurship, college students' entrepreneurial team has played an important role in easing employment pressure and increasing social innovation benefits. In 2007, the Ministry of Education launched the "National Innovation and Entrepreneurship Training Program for College Students", which is funded by the state to encourage college students to engage in scientific research and entrepreneurial activities. Subsequently, colleges and universities have also successively established College Student Entrepreneurship Incubation Base and College Student Entrepreneurship Service Center. At the same time, various entrepreneurship competitions also provide opportunities for college students to practice entrepreneurship theory, and the entrepreneurship activities of college students are gradually valued by all sectors of the society.

Team heterogeneity is an important factor affecting team innovation performance. The relationship between heterogeneity of college students' entrepreneurial team and entrepreneurial performance has always been the focus of academic debate. There are two opposing views in the theoretical circle. Some studies show that team heterogeneity is closely related to team innovation decision-making optimization and organizational performance. In order to better deal with the complexity of entrepreneurial enterprises, skill diversification teams have more advantages than skill homogenization teams. Therefore, the study of the characteristics of entrepreneurial team should focus more on the heterogeneity of entrepreneurial team rather than homogeneity (Kamm, Shuman and Seeger, 1990). On the other hand, studies by some scholars show that the diversity of teams and organizations may increase conflicts within teams, lead to tension among members, and reduce the level of team

cooperation. At the same time, different types of heterogeneity may affect the team development process in different ways (Robert, Erich and Jonas, 2011). In the research of many scholars, the research results have no unified conclusion, both positive results and negative results. At the same time, member heterogeneity does not necessarily affect team performance directly, so people investigate and introduce moderating and mediating variables for further research.

In recent years, although the research on heterogeneity of the entrepreneurial team has gradually attracted the attention of academic circles, it is mainly focused on the senior management team, and the research on the entrepreneurial team of college students is relatively small. In view of the shortcomings of the current research, this paper introduces team cohesion as a moderator variable based on the reading, research and specific analysis of relevant literature at home and abroad, and explores the internal mechanism of team heterogeneity, team cohesion and team innovation performance in order to promote team innovation performance.

## **2 Framework Research Assumption and Theoretical Framework**

### **2.1 Heterogeneity and innovation performance of college students' entrepreneurial team**

Team heterogeneity has many dimensions. This paper focuses on the study of heterogeneity in grade, specialty and values.

The age span of college students' entrepreneurial team members is not large, which is concentrated between 19 and 28 years old. The age difference is reflected in grade. Faced with complex entrepreneurship activities, senior and junior members can form complementary functions, learn from each other, constantly improve, cooperate and communicate with each other, and share more efficient and valuable information. Based on this, this study proposes Hypothesis 1:

H1: The heterogeneity of the college students' entrepreneurial team grade has a positive impact on team performance.

Differences in professional background will bring about differences in cognitive level (Huang Yufang and Qin Mingqing, 2010). In the process of team development, they show rich experience and ability to deal with problems. They can respond differently when facing difficulties and crisis, and provide diversified solutions for the team to effectively deal with risks and crises. It is conducive to the innovative development of the team, the improvement of the team's ability to analyze and deal with problems, and the improvement of the team's performance. Also, the professional differences in the educational background of the entrepreneurial team heterogeneity can make members produce creative ideas in the process of cooperation (Sun Kai and Zhao Yang, 2015). Based on this, this study proposes Hypothesis 2:

H2: Heterogeneity of entrepreneurial team majors of college students has a positive impact on team performance.

Values heterogeneity mainly refers to the differences formed by the different beliefs, values, preferences and interests of members. The influences brought by such differences are various. Teams with large values heterogeneity may have different understanding of task objectives due to cognitive information processing, which hinders the team from achieving correct decision-making objectives. According to the research of scholars, heterogeneity of values may cause tension in team relations, resulting in misunderstanding bias and other adverse effects. When team members had highly consistent

values, their age and specialty contributed more to team effectiveness (Chatman, Polzer and Neale, 1998). Based on the above analysis, this study proposes Hypothesis 3:

H3: College students' entrepreneurial team values heterogeneity negatively affects team performance.

## 2.2 The regulating role of team coherence

Team cohesion is the emotional centripetal force and task aggregation force that brings team members together. A highly cohesive team has the following advantages in its development: high input, low tendency to absenteeism and high cooperation (Beal, Cohen and Burke, 2003). In a highly cohesive team, the atmosphere of innovation is more harmonious and more innovation performance can be produced. When used meta-analysis to test the relationship between team cohesion and team performance, it was confirmed that there was a stable positive relationship between them, and the relationship between them was stronger in the high collaborative and normative task environment (Evans and Dion, 1991). Enhancing team cohesion can effectively reduce internal conflicts and increase the frequency of message communication, thus further affecting team decision-making and promoting the development of team performance. Therefore, this study believes that team heterogeneity is a static description of the team structure, and the enhancement of team cohesion can help the team realize the potential benefits brought by heterogeneity and reduce the negative impact of heterogeneity. Based on the above analysis, this study puts forward the following assumptions:

H4: Team cohesion positively regulates the relationship between grade heterogeneity and innovation performance.

H5: Team cohesion positively regulates the relationship between professional heterogeneity and innovation performance.

H6: Team cohesion positively regulates the relationship between values heterogeneity and innovation performance.

Based on the above analysis, the theoretical framework of this study is proposed, as shown in Figure 1.

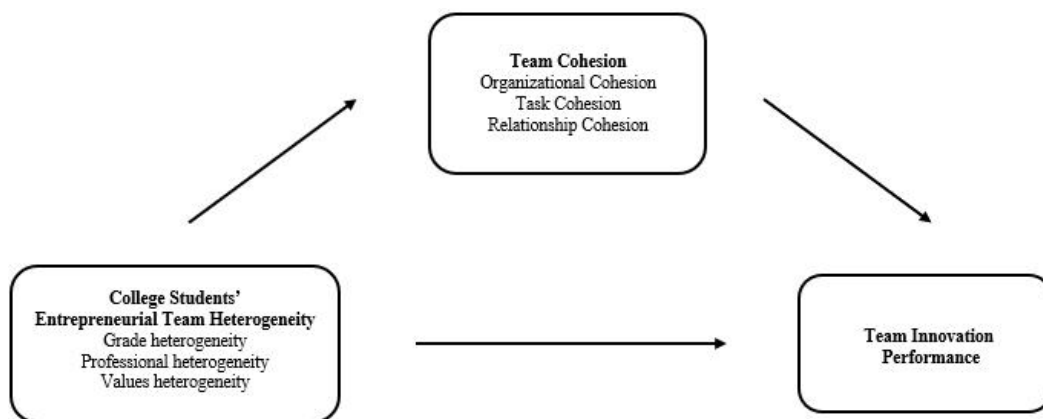

Figure 1 Theoretical Framework

### 3 Research Design

#### 3.1 Data source

This study collects relevant data by means of questionnaires. The object of study is college students' entrepreneurial team. The respondents were mainly from Wuhan University of Science and Technology Pioneer Park, as well as team members who participated in authoritative entrepreneurship competitions such as China Innovation and Entrepreneurship Competition. A total of 250 questionnaires were distributed in this survey, and 217 valid data were finally obtained after the questionnaires were recovered and the invalid questionnaires were filtered out. The recovery rate of valid questionnaires was 86.80%.

#### 3.2 Variable measurement

The scientific nature and rationality of the questionnaire are very important to the reliability of the research. The research adopts Likerts 5.0 Scale to score. The items in the questionnaire are declarative sentences. Each item has five choices, of which 1 represents "very disagree", 2 represents "disagree", 3 represents "neutral", 4 represents "agree" and 5 represents "very agree".

Regarding the design of the heterogeneity scale for college students' entrepreneurial teams, this paper finally determines the scales of grade heterogeneity, professional heterogeneity and values heterogeneity by referring to the existing research on team heterogeneity at home and abroad (Jehn, Northcraft and Neale, 2011). In the heterogeneity calculation of entrepreneurial team, the Herfindal-Hirschman coefficient proposed by Blau is used to measure the heterogeneity of transformed entrepreneurial team. The formula is: heterogeneity index  $D = 1 - \sum p_i^2$ , and  $p_i$  represents the proportion of members of the first category in the team.

The design of Team Cohesion Scale follows the team cohesion scale developed by Carless. The scale is widely accepted and used. It contains 12 items. Team cohesion is evaluated from three angles: organizational cohesion, task cohesion and relationship cohesion. Based on this design, this research has been slightly improved to make it more suitable for the research subjects of the university student entrepreneurial team.

The team innovation performance scale refers to many team performance measurement scales, including five items, such as "innovative ideas are often put forward in the process of team tasks"(Han Yi, Liao Jianqiao and Long Lirong, 2007), "team members can work efficiently"( Lovelace and Weingart, 2001), "team has the flexibility to deal with emergencies", etc.

### 4 Data Analysis and Hypothesis Testing

#### 4.1 Reliability and validity test

In this study, Cronbach's  $\alpha$  coefficient proposed by Cronbach was used to test the reliability of the questionnaire. After the initial scale data were collected, SPSS2.0 was used to test its reliability and validity. Through statistical analysis, we have obtained the following results: entrepreneurial team grade heterogeneity, professional heterogeneity, values heterogeneity, organizational cohesion. The Cronbach's  $\alpha$  coefficients of task cohesion, relationship cohesion and innovation performance are 0.767, 0.754, 0.869, 0.930, 0.922, 0.867 and 0.922 respectively, which are all greater than 0.7, with all variables  $KMO \geq 0.7$ . The significance probability of Bartlett Spherical Test is less than 0.001, which

indicates that the internal consistency of the factors tested is good, and the reliability and validity of the survey data are good.

#### 4.2 Descriptive statistics and correlation analysis of variables

The statistical results of the means and standard deviation of each variable and the correlation analysis results are shown in Table 1. In descriptive statistics, the means value of variables is between 2 and 4, and the standard deviation is greater than 0.5. The results of person correlation analysis show that college students' entrepreneurial team grade heterogeneity and professional heterogeneity are positively correlated with all dimensions of team cohesion, and their overall correlation coefficients are 0.407 ( $p < 0.01$ ) and 0.624 ( $p < 0.01$ ) respectively. Values heterogeneity is negatively correlated with team cohesion and its dimensions, with an overall correlation coefficient of -0.714 ( $p < 0.01$ ). In team heterogeneity, besides the negative correlation between value heterogeneity and innovation performance, grade heterogeneity and professional heterogeneity are positively correlated with team performance, with correlation coefficients of 0.437 ( $P < 0.01$ ) and 0.737 ( $P < 0.01$ ) respectively. All dimensions of team cohesion are positively correlated with innovation performance. The overall correlation coefficient was 0.871 ( $P < 0.01$ ). The results show that there is a good correlation between the variables, which is suitable for the next step of regression analysis to get the causal relationship between variables and the degree of influence.

**Table 1 Descriptive Statistics and Correlation Analysis**

	M	SD	1	2	3	4	4.a	4.b	4.c	5
1 Grade heterogeneity	3.264	.699	1							
2 Professional heterogeneity	3.612	.586	.616**	1						
3 Values heterogeneity	3.645	.648	.390**	.674**	1					
4 Team cohesion	3.729	.600	.407**	.624**	-.714**	1				
4.a organizational cohesion	3.884	.603	.361*	.616**	-.691**	.946**	1			
4.b task cohesion	3.628	.691	.314*	.537**	-.705**	.954**	.840**	1		
4.c relationship cohesion	3.674	.596	.500**	.641**	-.641**	.958**	.872**	.873**	1	
5 Innovation performance	3.721	.589	.437**	.737**	-.720**	.871**	.861**	.792**	.843**	1

\*\* . At the 0.01 level (two-tailed), the correlation is significant. \* . At the 0.05 level (two-tailed), the correlation is significant.

#### 4.3 Regression analysis

When testing the model, in order to avoid the influence of other factors in the analysis process, team size and gender are introduced as control variables. In this study, a multi-level regression method is used to analyze the data. Firstly, Model 1 is a regression model of control variables on team innovation performance. Secondly, Model 2 adds independent variables grade heterogeneity, professional heterogeneity and values heterogeneity to test its main effect. Thirdly, Model 3 introduces moderator variable to test its influence on dependent variables and the overall model. Finally, Model 4 is a full-effect regression model after all interaction items are added.

**Table 2 Regression Analysis Results**

	Independent variable: innovation performance			
	Model 1	Model 2	Model 3	Model 4
Team size	.062	.094	.014	.020
Gender	.005	.066	.035	.055
grade heterogeneity		.023	.052	.014
professional heterogeneity		.503*	.311*	.316*
values heterogeneity		-.401*	-.058*	-.520**
team cohesion			.521*	.537**
grade heterogeneity × team cohesion				.050
professional heterogeneity × team cohesion				.346**
values heterogeneity × team cohesion				.329*
R <sup>2</sup>	.004	.397	.427	.505
Adjusted R <sup>2</sup>	.046	.341	.397	.439

Listed are standardized regression coefficients. \* means  $p < 0.05$ , \*\* means  $p < 0.01$ .

As can be seen from Model 2 in Table 2, the regression coefficient of grade heterogeneity to team innovation performance is 0.023, which is not significant, assuming 1 is not valid. The regression coefficients of professional heterogeneity and values heterogeneity to team innovation performance are 0.503, -0.401, and both are significant at 0.05 level. The regression results prove that professional heterogeneity positively affects innovation performance and values heterogeneity negatively affects innovation performance. Assumptions 2 and 3 hold. In the interaction model of Model 4, team cohesion has no significant effect on the relationship between grade heterogeneity and team innovation performance, and Hypothesis 4 is not valid. Team cohesion positively regulates the relationship among professional heterogeneity, value heterogeneity and team innovation performance. The regression coefficients are 0.346 and 0.329 respectively. The regression coefficients are significant at 0.01 and 0.05 levels. Hypothesis 5 and 6 are valid.

## 5 Conclusion

This study analyzed the role of heterogeneity in innovation performance of college students' entrepreneurship team and the moderating role of team cohesion in it. The major conclusions are as follows: Firstly, professional heterogeneity presents a notable positive correlation with team innovation performance. The differences in team members' expertise can help provide multifaceted and

professional advice in the process of team development and improve the quality and efficiency of team processing issues. At the same time, professional heterogeneity can make team members have thinking collisions, which help team create more innovative ideas and improve innovation performance effectively. Secondly, values heterogeneity presents a significant negative correlation with team innovation performance. Excessive differences in values can lead to communication contradictions and team conflicts, hinder the cultivation of team cohesiveness, and are not conducive to creating a good atmosphere for cooperation and innovation, which can reduce the performance of the transform from innovation to technology. Thirdly, grade heterogeneity does not show a significant positive effect on innovation performance. This paper infers that the main reason is that the lower grade students account for a relatively small proportion of college students' entrepreneurial teams, and the grades of the team members are not much different. Although the grade heterogeneity is related to the team's innovation performance, the effect is not decisive. Fourthly, team cohesion positively regulates the impact of professional heterogeneity and values heterogeneity on innovation performance. Team cohesion can enhance the friendship between team members, strengthen the connection of social and emotional bonds and reduce unnecessary conflicts and contradictions. It also helps team members better understand the work objectives and promote cooperation and innovation of team members.

According to the research conclusion, college students should try their best to jump out of the circle of the same specialty when selecting members of the team, and consider more members from different specialties to form the team, paying attention to the complementarity of the team members in terms of knowledge and skills. A single specialty of the team is not conducive to improving innovation efficiency. At the same time, we should pay attention to the similarity and matching degree of team members' values, which can easily lead to team conflicts. Similar values can promote good team interaction, form a positive team atmosphere, and then promote team performance. Team cohesion needs to be strengthened within the team. Team members learn from each other, help each other, build deep friendship, solve the difficulties in team work together, and improve the efficiency of cooperation and innovation.

# An Analysis on the Management Mode of Universities' Target Responsibility System

Ding Huifang

Personnel Office, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: dinghuifang@whut.edu.cn)

**Abstract:** The target responsibility system is an effective management mode for the implementation of secondary management of universities. By means of literature research, survey analysis and interview, this paper analyzes the operation mechanism and achievements of target responsibility system in Wuhan University of Technology after consulting a large number of literatures and visiting many functional departments such as personnel department, party and government office and academic affairs office. On this basis, this paper deeply discusses the main problems existing in the implementation of target responsibility for colleges and universities, and puts forward effective ways to implement target responsibility system in colleges and universities.

**Keywords:** Goal management; Target responsibility system; Assessment; Result application

## 1 Introduction

The concept of target responsibility management stems from the goal management theory proposed in the book *Management Practices* published by American business management expert Drucker in 1954. Goal management refers to the modern management method, which aims at achieving goals by decomposing and executing goals, and makes management works closely surround and serve the goal center (Muhammad& Asad, 2016).

In recent years, the target responsibility system has been widely used in universities. The basic idea is to determine the overall goal according to the strategic direction and key work of the university's development, and then to decompose the overall goal and expand it to each secondary unit step by step to formulate the sub-goals at each level, thus establishing a target system that is developed from top to bottom and guaranteed from the bottom up. At the same time, the accomplishment of the goal is taken as the basis of the assessment of the secondary units, thus forming a management system with full participation, full management and full implementation.

Domestic and foreign scholars have carried out a lot of research on the target responsibility of colleges and universities. Liu Ye used the example method and STOW analysis method to put forward an effective way to implement the target management responsibility system in colleges and universities. Taylor used the assessment as a means to measure the achievements of college education activities, emphasizing that assessment is the best way to measure the educational activities to achieve the set goals. Qiu Yongmin took Shanghai Ocean University as an example to study how the management of target responsibility system in colleges and universities changed from rigid to rigid and soft.

This paper expounds the significance of the implementation of target responsibility system in universities, and introduces the organization and implementation of the target responsibility system with Wuhan University of Technology as an example. Finally, it analyzes the problems existing on the

current implementation of the target responsibility system in universities, and it gives the recommendations of the implementation of the target responsibility system in universities from three aspects, namely, the combination of the annual and cyclical goal assessment, the combination of the goal management and the post management, and the focus on the application of the assessment results.

## **2 The Significance of the Implementation of Target Responsibility System in Universities**

It is of great significance to construct a scientific and rational target responsibility system, to do well in the performance appraisal of secondary units, to establish and improve a modern university system, and to promote the development of the university's connotation.

( i ) It is conducive to the in-depth development of the management system reform of universities. It is the inevitable trend of modern university management to deepen the reform of the college as the entity and to implement the management mode of target responsibility system and the faculty-based management model, which also meet the requirements of scientific management. The implementation of the target responsibility system can not only realize the scientific operation and maximum management efficiency between universities and schools management, but also conform to the development law of the university system reform(Ning Jianan, 2016).

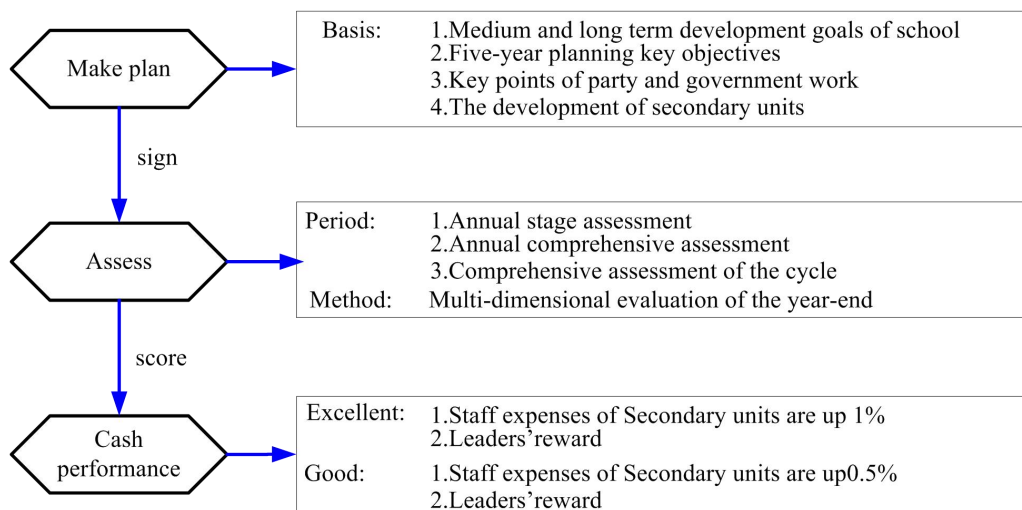

( ii ) It is beneficial to macroscopically supervise and guide the secondary colleges. After the focus on university management shifts to the college, the college has great autonomy in teaching, research, personnel and finance. It is necessary to establish a supervision system for the college in order to make rational use of these resources and promote the continuous development of university education. The establishment of the target responsibility system makes it feasible to assess the college from various indicators, so as to grasp and guide the development of each secondary college at a macro level (Guan Yan, 2017).

( iii ) It is conducive to promoting optimal allocation of resources. The resource allocation of each secondary unit on the basis of the completion of the target responsibility system, can effectively improve the current situation of waste of resources and unreasonable configuration(Meadows, 2015). Meanwhile, through the implementation of the target responsibility system, the university can supervise and constrain the whole process of the resource allocation and the benefits of resources, so as to ensure the overall resource utilization efficiency and the overall efficiency of the university.

## **3 The Organization and Implementation of Target Responsibility System in Universities**

In recent years, with the expansion of the enrollment scale of universities and the development of discipline construction, the administrative management model has gradually been transformed into a secondary administrative model based on schools and colleges from the model based on department and teaching and research section in the past. Under the secondary management system of the school and the college, the target responsibility system management mode can fully mobilize the motivation of the secondary units, further streamline administration and institute decentralization, and shift down the focus on management, which is conducive to promoting the development of various undertakings in universities, and comprehensively improving the quality of personnel training and scientific

research(Daniel L&Duke,2015). Taking Wuhan University of Technology as an example, which its content, formulation and assessment of the target responsibility system are all representative in universities, as shown in Figure 1.

**Figure 1 Operational Mechanism of Target Responsibility System of Wuhan University of Technology**

### 3.1 The content of target responsibility system

According to the actual situation of universities, the content of the target responsibility system generally includes teaching, scientific research, management work, team building and student work etc. Wuhan University of Technology's assessment of secondary units sets different indicator systems according to the nature of the unit. The first-level assessment indicators for teaching and research units are generally six: party and government management, undergraduate teaching, discipline construction and postgraduate training, scientific research, team building and student work. The assessment method of functional departments and subordinate units is mainly the multi-dimensional evaluation including online evaluation, conference evaluation and letter evaluation, which covers five aspects: evaluation of teaching and research units, evaluation of faculty representatives, and evaluation of work style construction (specific service objects), evaluation of key work completion and evaluation of party and government management work. In addition, Wuhan University of Technology has set up different secondary indicators, assessment requirements and proportion based on the full consideration of the differences between each secondary unit.

### 3.2 The formulation of target responsibility system

The School System Reform and Target Responsibility leading work group is responsible for the target responsibility system work of all secondary units of the university. The goal content is combined with the medium and long-term development strategic planning of the university, focusing on the orientation, representation and difference of the goal. The target responsibility system of teaching and research units should be formulated by different departments. The assessment of management objectives should be led by the principal's office and the party committee's office, and the relevant departments shall cooperate with them. The undergraduate teaching shall be undertaken by the Academic Affairs Office and the discipline construction and postgraduate training should be undertaken by the Graduate School. The Science and Technology Development Institute takes charge of scientific research and the

Personnel Department is responsible for the team building. The student work is led by the Student Affairs Department, with the cooperation of the Graduate School. The target responsibility system of the functional departments and subordinate units shall be formulated by the university. The common indicators shall be formulated by the System Reform and Target Responsibility leading work group. The individual indicators and additional indicators should be formulated respectively by each secondary unit according to their work duties and work characteristics (Donaldson & Morgaen L, 2016).

### **3.3 The assessment of target responsibility system**

The goal assessment is carried out by combining the phase assessment, the annual comprehensive assessment and the periodic comprehensive assessment, with the annual assessment as the main evaluation method. A multi-dimensional evaluation method is used to conduct the annual assessment.

#### **3.3.1 Phase Assessment**

The assessment of the phase of the year is carried out by all functional departments, combined with the phased work tasks and inspections, focusing on helping each unit to identify problems and solve problems, and supporting each unit in innovatively carrying out the work on the basis of the actual situation of their respective unit and accomplish the goal with high quality.

#### **3.3.2 Annual Comprehensive Assessment**

The annual assessment is organized by the School System Reform and Target Responsibility leading work group. The relevant functional departments make evaluation according to the completion of the work objectives of the teaching and research units. The assessment results are authorized by the Standing Committee of the Party Committee after review made by the School System Reform and Target Responsibility leading work group.

#### **3.3.3 Periodic Comprehensive Assessment**

After three years of expiration, the management work and business works objectives will be assessed according to the first-level indicators. The units that have completed the speriodic objectives, have made symbolic achievements and have ranked the top ones are rewarded; and their leading groups are also rewarded.

### **3.4 The effectiveness of the target responsibility system**

Since the implementation of the target responsibility system in 2002, Wuhan University of Technology has achieved remarkable results.

Firstly, the target responsibility system is closely integrated with the university's development plan, so that the school development plan can be completely implemented by target responsibility system.

Secondly, the school implements target management for the secondary units, shifts the management focus downward, strengthens the process management of the secondary units, and implements the supporting policies and binding requirements for the secondary units to give full play to the role of the two levels of the school.

Lastly, the target responsibility system has formed a management, assessment and evaluation system for the "three in one" of the secondary units. It has promoted the change of work style and the improvement on service quality. For example, it has promoted the improvement on teaching and scientific research capabilities of teaching and research units, and has transformed work style and improved service quality of functional departments and directly affiliated units.

## **4 Key Problems Existing in Universities' Target Responsibility System**

The target responsibility system is an important means for universities to improve management efficiency and quality of running schools. It is related to the development of schools and the vital interests in faculty and staff. However, there still exist many problems with the actual implementation process of it.

### **4.1 Too rigid and less flexible indicators**

According to the operational rules of the target responsibility system, the university decomposes the goal tasks into secondary colleges, and then the colleges decompose the goal tasks into individual teachers. Under the multiple pressures on teaching hours, number of papers, and scientific research funds, teachers must complete the teaching tasks of the college on the one hand, and try to apply for research projects and research funds, and write papers on the other hand. In this case, the academic freedom and creativity of teachers are squeezed from "administrative tasks". As the "de-administration" has not been put into practice from the concept, teachers can only concentrate on the production of "papers" and "projects" like the scientific research machine, and the quality and scientific value of the "papers" and "projects" that have been hurriedly produced are inevitably unsatisfactory. And they are probably "cultural rubbish" that does not have much value (Saniya Saniya, 2016). Therefore, the rigidity of indicators of the target responsibility system is in conflict with the academic freedom of the university.

### **4.2 The focus on result assessment and overlook of process management**

The university implements the target responsibility system management for the secondary units, aiming to improve the management efficiency of the secondary units and effectively supervise and guide their development. Process control is key to ensuring that performance goals are achieved. However, in the course of operation, the university only pays attention to the performance appraisal at the end of the year or the annual performance appraisal, with ignoring the process control (Zhang & Li, 2017). Under the guidance of the university's focus, the secondary colleges focus on short-term goals and only make efforts to complete the assessment tasks, neglecting the overall planning of the colleges' long-term development, which is undoubtedly not conducive to the long-term development of the university.

### **4.3 The focus on rewards and punishments of assessment and overlook the result uses**

The university implements the target responsibility system assessment for the secondary colleges, and its ultimate goal is to improve the quality of teaching and personnel training. Therefore, the analysis and application of the assessment results are particularly important. However, in actual operation, the assessment department of the target responsibility system only pays attention to the rewards and punishments according to assessment results. And the completion of the goal is only used as the basis for issuing performance subsidies, but the analysis and feedback of the assessment results are ignored. Emphasis on rewards and punishments and overlook of the uses of the results greatly reduce the implementation effects of the target responsibility system (Liang & Motoko, 2015).

## **5 Recommendations for the Implementation of the Target Responsibility System in Universities**

### **5.1 The combination of the annual and cyclical goal assessment**

In the formulation of the objectives of each secondary unit, the university atmosphere of academic

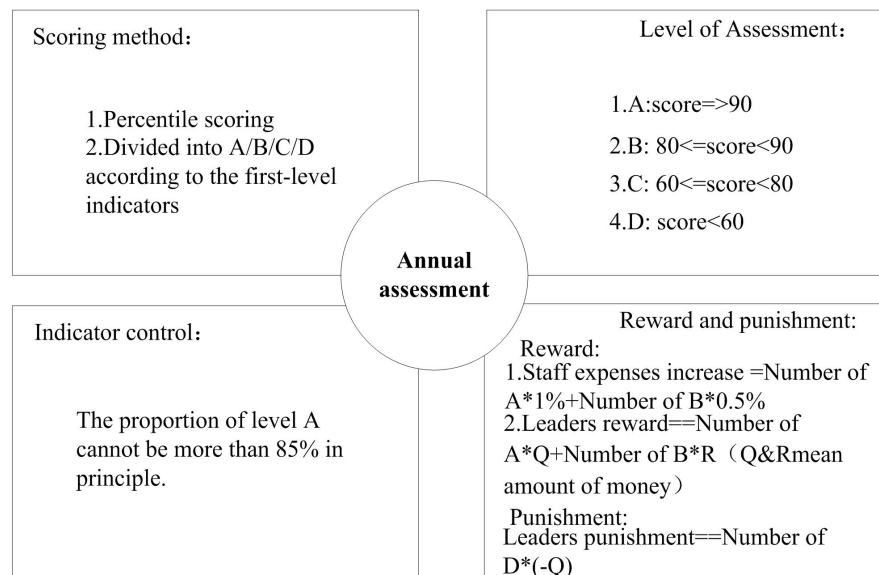

freedom and the management philosophy of “de-administration” should be fully considered. The indicators should be set in a relatively reasonable range so that they can not only motivate teachers, but also prevent teachers from becoming scientific research machines(Ho&Hui-Chung, 2017). To combine the annual assessment with the cyclical assessment and to fully consider the phenomenon those teachers may have “big years” and “small years” in scientific research are highly recommended. If the goal is not achieved at the end of the year, a certain buffer time will be given, and the overall goal of the cycle achieved within the cycle can be regarded as the achievement of the annual goal.

**5.2 The combination of the goal management and the post management**

To conduct post management and to clarify post duties are necessary and further corresponding post objectives with school strategic goals is to ensure consistency in development direction. At the same time, the development of the target responsibility system is combined with the promotion of posts, and the assessment indicators are set up, with the combination of the year-end assessment and job title evaluation, so as to play the practical role of the target responsibility system(Song Yafeng, 2018). Taking Wuhan University of Technology as an example, the assessment results of the target responsibility system serve as an important basis for the assessment of the leading group of the secondary unit.

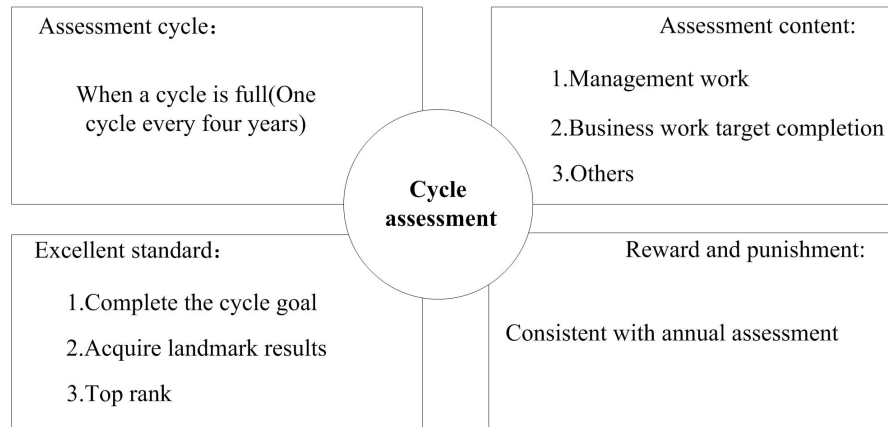

**5.3 The focus on the application of the assessment results**

In addition to being an important basis for the rewards and punishments of the secondary units, more importantly, the assessment results promotes the improvement of the work of various departments, which is an in-depth application of the results of the secondary target responsibility system. It is conducive to the management department to improve work efficiency and is beneficial to the improvement of the quality of running schools by teaching and research units. It is also conducive to the improvement of service standards by directly and indirectly affiliated units and to the promotion of institutionalization, standardization and scientization of school management. The annual assessment and cycle assessment results can be used as shown in Figure 2 and Figure 3.

**Figure 2 Annual Assessment Results and Application**

**Figure 3 Cycle Assessment Results and Application**

## 6 Conclusion

Under the secondary management system of the school and the college, the management mode of target responsibility system can fully arouse the initiative of the secondary units, further streamline administration and institute decentralization, and shift down the management focus, with the responsibility to the people, which is conducive to promoting the connotative development of universities. However, the target responsibility system of universities still has various problems, such as unreasonable indicators and inadequate implementation in terms of indicator setting, organization and implementation. Further reflection and studies are needed from the indicator setting of the target responsibility system and the application of assessment results.

# The Influence of Teacher Support on the Positive Behavior of College Students

Duan Zhaolin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:dzl@whut.edu.cn)

**Abstract:** From the perspective of social exchange theory, this paper studies the influence mechanism of teachers' support on college students' positive behaviors, and provides a new way to improve the relationship between teachers and students in undergraduate education. Undergraduates are the main research objects, and 128 valid questionnaires are collected. Data analysis shows that teacher support has a significant positive correlation with positive behaviors of college students. From this we have drawn the following conclusions and recommendations: 1. Teacher support has a positive effect on the positive behavior of college students, and the more teachers' support students perceive, the greater the internal incentive to make positive behavior; 2. Different teacher support produces different positive behaviors for College Students. It is suggested that in higher education, teachers and students should be attached to the support of teachers.

**Key words:** Teacher support; Positive behavior of college students; Out-of-role behavior; Social exchange theory

## 1 Introduction

The report of the Nineteenth National Congress pointed out that priority should be given to the development of education, the connotative development of higher education, the construction of teachers' morality and style, and the cultivation of high-quality teachers. Based on the above policy background and training objectives, teacher-student relationship as a special interpersonal relationship, with the further development of higher education, colleges and universities need students and teachers to participate in the construction of teacher-student relationship. Students and teachers are two kinds of social roles in social relations. The communication between teachers and students is a kind of social exchange. Teachers play an important role in students' learning and life. Teachers' teaching methods and personality characteristics will have a positive or negative impact on students. Although the theory of social exchange has a significant role in promoting the improvement of the incentive system of enterprises, there are some shortcomings in previous studies, and there is a lack of research and investigation in the context of universities. In recent years, with the increasing efforts of educational reform, teacher-student relationship has gradually been paid attention to by all walks of life, and there is a new research direction for teachers' behavior perceived by students. Previous studies have shown that teacher support has a significant relationship with college students' autonomous motivation. In view of the importance of teacher support to students, the research on the factors affecting teacher support has aroused heated discussion among scholars. The self-efficacy and perceived teacher support interact with mathematical CBM growth (Mercer S H, Nellis L M, Rebecca S. Martínez and Kirk.M,2011). Ouyang Dan believes that teacher support can be divided into competence support, emotional support and academic support (Ouyang Dan,2005). However, in the current research on teacher support, middle school students and online students are the main objects of study. It is lack of investigation and

Research on College students. The purpose of the research on teacher support is mostly to explore the influence of teacher support on students' learning motivation, while neglecting that teacher's support behavior can lead to students' positive behavior beyond academic level, such as mediating contradictions and caring for others. Out-of-role behavior is a positive, voluntary behavior that is not within the scope of the responsibility, but it has a significant positive impact on the organization. Among them, the out-of-role behavior is divided into: organizational citizenship behavior, peripheral performance, voice behavior, pro social organization behavior and organizational spontaneity (Jinyun Duan and Jianan Zhong, 2004). Therefore, based on the existing research and social exchange theory, this study explores the influence mechanism of teacher support on College Students' positive out behavior.

## **2 Literature Review**

### **2.1 Social exchange theory**

Social exchange theory generated from the late 1950s. It studies human behavior from a microscopic perspective using theories of economics, sociology, and psychology (Homans, 1958). Social exchange theory refers to the relationship between cost and remuneration in social communication. From the perspective of social exchange theory, teacher-student communication is also a social exchange. Because teachers and students have different "remuneration", "unequal social exchange" has become an important feature of current teacher-student exchanges in China. It also gives birth to the "power" of teachers to students in the communication between teachers and students.

### **2.2 Out-of-role behavior**

The Out-of-role behavior of employees is more dependent on the self-conscious voluntary dedication sacrifice from the heart to the organization, they will not follow the organization whether the giving and the self-pay to decide whether to put into the out-of-role behavior (Yi Fan, Yi Men and Yan Liang, 2013). In summary, external perception support is favorable for students to make positive extra-role behavior. However, the research on the out-of-role behavior mostly focuses on the incentive measures of internal employees of enterprises, and there are few related researches on college students.

### **2.3 Teacher support**

In foreign research on teacher support, teachers' support has a positive impact on student development and can stimulate students' interest and confidence in learning (Reeve and Johnmarshall, 2013). That means the young people who have strong learning ability and rich social skills are supported by more teachers, they will be more active in motivating themselves and more motivated to learn (Kathryn R. Wentzel, Ann Battle, et al., 2010).

Domestic research on teacher support currently indicates that teacher support can have a positive impact on students. Lei H showed that teacher support was significantly correlated with students' academic emotions (Lei H., 2017). From domestic research, some scholars believe that teacher support is an important component of the social support system and belongs to a kind of social support, which is of great significance to students' learning and mental health. The definition of teacher support can be divided into the perspective of teacher autonomy and student perception. From the perspective of teachers, the concept of teacher support behavior can be traced back to Deci and others who proposed "Teachers encourage students to consider the various elements of the problem, and let them find solutions themselves (Deci, E.L. Ryan and R. M, 1987). Ouyang Dan puts forward the behavior of students' perceived teacher support behavior from the perspective of students. It refers to the behaviors and attitudes that teachers perceive in their learning life, from the three dimensions of learning support, emotional support and ability support (Ouyang Dan, 2005). Therefore, teacher support may have a

certain impact on students' teaching efficacy and professional identity.

Comprehensive research at home and abroad has found that in the teaching of undergraduates, the communication between teachers and students, teachers are generally in a leadership position, so that students and teachers have a sense of distance, teachers' supportive behavior has certain stimulating effect on college students' psychology. But at present, in the existing research, there is still little research on how the teacher support will produce positive behaviors for college students, and the degree of influence needs further research. It provides a new direction to improve teacher-student relationship.

### 3 The Research Hypothesis

This study uses a questionnaire survey, which combined the Student Perceive Teacher Support Behavior Questionnaire compiled by Ouyang Dan (Ouyang Dan, 2005), and the "Organizational Citizenship Behavior Scale" compiled by Bachrac and Wang H et al. (Bachrac and Wang H et al.,2007). Research is conducted from two aspects: teacher support and positive behavior. The teacher support includes three dimensions: emotional support, academic support and ability support. The positive behavior includes two dimensions: civic moral behavior and help behavior. The purpose is to examine the influence of teacher support on the behavioral behavior of college students and to the differences in the positive behavior of college students with the different support of different teachers. Mostly theories and related research have shown that teacher support has an impact on students' academy motivation, but it does not affect all students. Because compared with college students, the time of communication with teachers is less than that of junior students and primary school students. Middle school and primary school teachers mostly provide support actively but students passively perceive. For college students, college students and teachers are mostly limited to communication in the classroom. College students rarely forwardly perceive teacher support, so the impact is different. Teacher support is divided into teacher self-support and student perception. Therefore, this study mainly proposes the following hypothesis based on the above-mentioned research on teacher support:

H<sub>1</sub>: Teacher support has a significant correlation with positive behavior

H<sub>2</sub>: There is a difference in the impact of teacher support on the positive behavior of college students

### 4 Empirical Analysis

The situation items that do not take college students as research objects are deleted, and the expressions of some problems are revised. After continuous testing and screening, a questionnaire on the impact of teachers' support on positive behaviors of college students is formed. Undergraduate students from major universities in Wuhan were the main research subjects. A random sampling method was adopted 150 students were randomly selected as research subjects. A total of 150 questionnaires were distributed and 128 copies were effectively collected, the effective recovery rate was 85.33%. Ratio of men to women were 42.97% and 57.03%, and the age distribution was between 18-24 years old. The impact of teacher support on the positive behavior of college students was analyzed by spssau18.0.

#### 4.1 Cronbach trust level analysis

Table 1 Cronbach Trust Level Analysis

Name	Correction Item Total Correlation (CITC)	Correction Item Total Correlation (CITC)	Correction Item Total Correlation (CITC)
Civic morality	0.579	0.815	0.834

Help behavior	0.735	0.785
Emotional support	0.631	0.801
Capacity support	0.6	0.831
Academic support	0.743	0.774

The reliability coefficient value is 0.834, which is greater than 0.8, thus indicating that the research data reliability is high. In summary, the value of the reliability coefficient of the research data is higher than 0.8 and the reliability coefficient value after the deletion of the item is not significantly improved. The comprehensive description indicates that the data reliability is high and it can be used for further analysis. There is an information can be effectively extracted.

#### 4.2 Teacher support validity analysis

**Table 2 Teacher Support Validity Analysis**

	Factor load factor	
	Factor 1	Commonality
Emotional support	0.834	0.696
Capacity support	0.791	0.626
Academic support	0.898	0.806
Characteristic root value (before rotation)	2.128	-
Variance interpretation rate % (before rotation)	70.931%	-
Cumulative variance interpretation rate % (before rotation)	70.931%	-
Characteristic root value (after rotation)	2.128	-
Variance interpretation rate % (after rotation)	70.931%	-
Cumulative variance interpretation rate % (after rotation)	70.931%	-
KMO value	0.659	-
Bart sphere value	124.736	-
Df	3	-
p value	0	-

It shows the KMO value is 0.659, which is greater than 0.6, which means that the data is valid. In addition, the variance interpretation rate values of one factor were 70.931%, and the cumulative variance interpretation rate after rotation was 70.931% > 50%. This means that the amount of information in the research item can be extracted efficiently. The absolute value of the factor load factor is greater than 0.4, there is a correspondence between the option and the factor. This means that the amount of

information in the research item can be extracted efficiently.

#### 4.3 Positive behavioral validity analysis

**Table 3 Positive Behavioral Validity Analysis**

	Factor load factor	Factor load factor
	Factor 1	
Civic morality	0.905	0.819
Help behavior	0.905	0.819
Characteristic root value (before rotation)	1.638	-
Variance interpretation rate % (before rotation)	81.913%	-
Cumulative variance interpretation rate % (before rotation)	81.913%	-
Characteristic root value (after rotation)	1.638	-
Variance interpretation rate % (after rotation)	81.913%	-
Cumulative variance interpretation rate % (after rotation)	81.913%	-
KMO value	0.5	-
Bart spherical value	65.663	-
Df	1	-
P value	0	-

It can be seen from the above table that the common value corresponding to all the research items is higher than 0.4. In addition, there are currently only 2 studies and the KMO value is 0.5. In addition, the variance interpretation rate values of one factor were 81.913%, and the cumulative variance interpretation rate after rotation was 81.913%>50%. It means that the information in the research item can be extracted efficiently.

#### 4.4 Analysis of teacher support and positive behavior

**Table 4 Analysis of Teacher Support And Positive Behavior**

	Civic morality	Civic morality
Emotional support	0.373**	0.623**
Capacity support	0.480**	0.465**
Academic support	0.443**	0.655**

\* p<0.05 \*\* p<0.01

From the above table, we can use correlation analysis to study civic ethics, help behavior and emotional support, academic support and ability support, and use Pearson correlation coefficient to indicate the strength of the relationship. The specific analysis shows that the correlation coefficients of citizen morality and emotional support, ability support and academic support are 0.373, 0.480 and 0.443, which indicates that there is a significant positive correlation between civic moral behavior and teacher support.

## **5 Conclusions and Recommendations**

### **5.1 Teacher support is significantly positively correlated with the positive behavior of college students**

In the past research, the influence of teacher support and academics was emphasized. Based on the previous studies, this study deeply studied the influence of teacher support on the out-of-role behavior of college students. The results of the study show that there is a significant positive correlation between teacher support and positive behavior of college students. This is consistent with the conclusion of previous scholars: the close relationship between college students' perception of teacher support and autonomous motivation. A foreign scholar Anna D et al. believes that although emotional support provided by teachers does not predict student engagement, teachers' emotional barriers are inversely related to student engagement (Strati, Anna D, J. A. Schmidt and K. S. Maier, 2016). It shows that in the undergraduate teaching of higher education, to improve the teacher-student relationship, teachers can give them more support from the three aspects of students' ability, academics and emotions, and encourage students to maintain a good mental. And motivating them to make some positive behaviors, so the research result supports the conclusion that "teacher support is a factor that influences college students to make positive behaviors". The more perceived teacher support, the richer the positive behavior. Teachers should give support that is more emotional to students, and they have already satisfied the students' emotional needs to encourage students to make more help behaviors. Teachers' support will enable students to pay attention to their own social citizenship behavior besides their studies to develop more comprehensively.

### **5.2 Difference in the influence of teacher support on the positive behavior of college students**

According to the data analysis, we can conclude that teacher Support Behavior in Different Aspects have different effects on college students' positive behaviors. Teachers' emotional support and academic support can promote students' help behaviors such as "helping students". In the study of Ouyang Dan, it was found that students of different grades perceived different support from teachers, so the incentive effect was different (Ouyang Dan, 2005). In some previous studies, more scholars focused on the analysis of the impact of teacher support on students' learning motivation. They believed that college students' perception of teacher support had different effects on their psychological needs and academic performance. Compared with previous studies, the results of this study suggest that college students' perception of teacher support can produce social behaviors other than students' roles, thus promoting their own more comprehensive development. Teacher-student relationship is a kind of social relationship, it is necessary to communicate with students equally and establish a social relationship of mutual trust. In terms of the method of teacher support, we should avoid using too harsh language in the process of communication between teachers and students.

### **5.3 Deficiencies and recommendations**

The scope of the study is limited. Only the undergraduate students in Wuhan are surveyed. It is not representative of the actual situation of all universities. The subjects are only from undergraduates. Neglected the research from the teacher's point of view and the students with higher education. In the

follow-up study, subjects from different sources can be considered and the influence of teacher support on college students can be further explored. Because the current higher education undertakings are constantly reforming and innovating, we should attach importance to teachers' support for students, especially action support.

# The Influence of Differential Leadership on the Innovation Behavior of Platform-based Enterprises Employees

Yang Kun<sup>1</sup>, Gui Ping<sup>1</sup>, Xie Tong<sup>2</sup>

1 School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

2 School of Economics and Management, Wuhan University, Wuhan, P. R. China, 430072

(E-mail: 1090019744@qq.com, guiping518@163.com, 1337347851@qq.com)

**Abstract:** Platform-based enterprises are the epitome of modern enterprises development. It is of great significance to study how platform-based enterprises can motivate employees to innovate. Based on the questionnaire survey of platform-based enterprises employees, this study discusses the mechanism of differential leadership affecting the innovation behavior of platform-based enterprises employees. The study results show that differential leadership has a positive impact on the innovation behavior of platform-based enterprises employees, and work autonomy plays a partial mediating role in the relationship between the two variables. The study results help platform-based enterprises to more effectively stimulate employees' innovation behavior, and thus promote enterprises' innovation performance, providing a certain management enlightenment for platform-based enterprises.

**Keywords:** Platform-based enterprises; Differential leadership; Work autonomy; Employees' innovation behavior

## 1 Introduction

In the context of the "Internet +" economy, innovation has increasingly become a decisive factor for enterprises, especially platform-based enterprises. Platform-based enterprises refer to a new type of enterprise organization model that forms a value-creating network, its employees are self-driven, self-managing, and self-innovative (Miron et al., 2018). Employees' innovation is the foundation of enterprises' innovation, it is important to motivate employees' innovation behavior (Amabile and Prat, 2016). Studies have shown that leadership style has a direct impact on employees' innovation behavior (Mokhber et al., 2018). However, at present, there is little research on the influence of local leaders who have Chinese social, cultural characteristics and connotations on employees' innovation behaviors. At the same time, the innovative research on emerging organizations such as platform-based enterprises focuses on the macro-organization level. Research on the micro level that employees' innovation behavior is even more limited.

Differential leadership means that the leadership will select the subordinates of the "circle" according to "pro, loyalty, talent" to show different treatment. Existing research shows that differential leadership has a positive impact on employees' social behavior, suggestive behavior, and team creativity (Wang et al., 2018; Tanget al., 2018); Yuan Ling and other studies show that differential leadership is positively correlated with employees' innovation behavior (Yuan Ling et al., 2016). However, some studies have shown that the team difference atmosphere or the differential mode of association is significantly negatively correlated with innovation performance (Wang, 2018). Compared with the Western leadership style that regards employees as equal individuals, whether the biased leadership with Chinese cultural characteristics will have an impact on the innovation behavior of

platform-based enterprises employees, compared with other leadership styles, what are the differences in the influence mechanism of innovation behavior, and what factors will be affected by the adjustment process, which are worthy of in-depth study and discussion. Therefore, it is of great significance to further study the internal mechanism of differential leadership affecting the innovation behavior of platform-based enterprises employees.

Work autonomy as a positive work attitude has a certain adjustment or mediation between leadership style and individual behavior. Platform-based Enterprises employees are self-driven, self-managing, and self-innovative (Miron et al., 2018), so work autonomy may be more important to employees of platform-based enterprises than to other traditional types of businesses. Therefore, this paper takes work autonomy as a mediating variable, and studies the mechanism of the influence of differential leadership on the innovation behavior of platform-based enterprises employees, in order to clarify the boundary conditions of differential leadership affecting employee innovation behavior, and enrich the theory of differential order leadership. At the same time, it helps platform-based enterprise managers to better understand and play the practical role of differential leadership to effectively stimulate employees' innovation behavior and enhance corporate innovation performance.

## **2 Theory and Hypothesis**

### **2.1 The influence of differential leadership on the innovation behavior of platform-based enterprises employees**

Individual innovation behavior refers to all individual actions that employees generate innovative ideas and apply to the organization, which contribute to the improvement of work efficiency or the improvement of management procedures and work relationships. Existing studies have shown that leadership style is an important factor affecting employees' innovative behavior. (Amankwaet al., 2019). In the previous research, scholars focus on the role of organizational leadership, but these studies mostly use Western-derived variables or constructs as research tools, and mainly focus on active leadership such as transformational leadership and participatory leadership. On the other hand, the leadership model developed by Chinese traditional culture and concepts has been less discussed. Differential leadership is a leadership style with Chinese local culture characteristics and widely exist in Chinese organizations, which refers to leaders taking different leadership styles for different subordinates and giving more bias to subordinates who are very preferred (Jiang Dingyu and Zhang Yuzhen, 2010).

According to the theory of social information processing, employees in the circle and outsiders will each have different classification model. The subordinates in the circle are treated with partiality, and they are grateful to the leader, who will improve their ability or actively cooperate with the leadership behavior. At the same time, some subordinates may not have a strong sense of injustice because they cannot obtain partiality, but try to enter the circle of leaders by showing loyalty to leaders, strengthening relationships with leaders, or improving their abilities. It is an inspiring leadership style. The leaders will be more tolerant of the mistakes made by the subordinates in the circle, so that the subordinates dare to innovate and take risks caused by innovative behavior (Bammens,2016). Leaders may improve the subordinates' work autonomy and studies have proved that work autonomy has a positive effect on employees' innovation behavior (Spiegelaere et al., 2014). At the same time the subordinates of the circle think that they are the cronies of the leader and believe that they are more likely to be promoted than others. In order to be promoted, the subordinates will continue to improve their working methods, propose new organizational improvement methods and processes. Not only that, the subordinates of the circle will also have a reciprocal attitude towards the bias and appreciation of the leader, will think about the problem from the perspective of the leaders, and try to put forward suggestions for leadership

and organization. , continuously improve their ability to innovate and contribute to the innovation of the company.

For outsider subordinates, the leader's bias towards the subordinates in the circle may provoke dissatisfaction and anxiety. The outsider subordinates often hold lower role expectations for the leader, keeping this anxiety and dissatisfaction within a moderate range. Studies have shown that moderate anxiety helps employees identify problems, and moderate dissatisfaction can be a driving force for innovative behavior. (Tunget al.,2018).And when a leader is biased towards a talented, loyal, or well-connected employee, if the outsider subordinates approve the leader's classification, they may be motivated to change their behavior to put themselves into the circle. This motivation for sub-private subordinates also motivates them to show their talents and loyalty by proposing new ideas or working methods. Not only that, but as a symbol of leadership and cronies, the creative work of the circle may become a role model for the outsider subordinates, and encourage the outsider subordinates to actively learn their innovative knowledge or skills, thereby improving their ability to innovate. Based on this, this study proposes hypothesis 1:

H1: Differential leadership will have a positive impact on the innovation behavior of platform-based enterprises employees

## **2.2 The mediating role of work autonomy**

Work autonomy refers to the degree of freedom of employees in their work and decision-making, that is, the extent to which employees can freely decide to dispose of and choose their own working methods. Employees who work in a high degree of autonomy can create positive benefits for the organization. (Nesheimet,et al., 2017).According to the theory of social information processing, employees will take certain actions of the leadership, such as: encouraging subordinates to participate in decision-making, allowing subordinates to have the opportunity to express their opinions on issues like working methods, work schedules and work standards, etc., as important social clues. Making employees believe that they can participate in discussions and decisions in my work, which will make employees feel more work autonomy. For subordinates, the differential leadership will have more authorization and less control over tolerance and trust, provide more training and education opportunities in promoting rewards, and provide timely feedback, care in communication to help improve work autonomy (Yuan Ling et al.,2016). For the subordinates, the role relationship caused by the differential pattern will not always be static, the harder work performance and more frequent leadership-member interaction will make the peripheral members realize the role of the outsiders to the insiders (Zhou et al., 2016).

Leaders motivate outsiders through a recognized biased approach (giving empowered or loyal employees in addition to recognition, promotion, rewards, interactions, etc.), which can be motivating. When they expect to be the leader's own person, they will want to express themselves to gain the favor of the leader. This kind of thinking will make them constantly strive to improve their various aspects and improve the work autonomy of the subordinates. Some researchers believe that work autonomy can promote innovation performance (Spiegelare, et al., 2014). In the work of high work autonomy, employees are free to choose their working methods, freely use company resources, and establish their own work standards based on organizational standards. These can encourage employees to break the rules and develop new ideas and ideas (Sappleton and Lourenco, 2016). On the contrary, if employees are engaged in work that lacks work autonomy, employees' creative behavior may be objectively suppressed. Employees do not have the opportunity to innovate and do not have the motivation to think creatively. Complete the work in accordance with the established procedures. Work autonomy gives employees the freedom to choose their work methods. Then employees will choose more efficient methods in their work, and they can think creatively, solve problems in a creative way, and help

employees innovate. Based on this, this study proposes hypothesis 2 3 4:

H2: Differential leadership will have a positive impact on the work autonomy of platform-based enterprises employees

H3: Work autonomy will have a positive impact on the innovation behavior of platform-based enterprises employees

H4: Work autonomy will play a mediating role in the influence of differential leadership on the innovation behavior of platform-based enterprises employees

Figure 1 Hypothetical Model

### 3 Data and Methodology

#### 3.1 Simple

This paper mainly uses the questionnaire survey method to obtain research data, and the formal sample comes to two platform-based enterprises (fitness industry and volunteer service industry). In order to ensure that the samples are effectively recycled, this paper uses questionnaire network platform to issue and mail distribution and other methods and distributed 230 questionnaires for the platform-based enterprises employees in Wuhan. Finally, 215 questionnaires were returned and 208 questionnaires were valid. The recovery rate was 93.478%, and the effective questionnaires rate were 90.435%.

#### 3.2 Variables measurement

In addition to the control variables, the questions covered in this article use the Linkert 5-point scale. In order to ensure the reliability and reliability of the measurement tools, based on the existing scales at home and abroad, according to the characteristics of the platform-based enterprises employees, the wording of the questionnaire items has been appropriately revised. Finally, according to the results of pre-test research, the number of questionnaire items is deleted and improved, and the final scale is formed.

The differential leadership scale uses the 14-item Chinese differential leadership scale compiled by Jiang Dingyu and Zhang Yuzhen (2010). From the six dimensions of tolerance trust, communication care, and promotion rewards, the higher the score of each item, the stronger the difference in the leadership style that the subordinates feel. The scale is compiled in conjunction with China's national conditions and culture .After testing, the scale's Cronbach's  $\alpha$  coefficient is 0.917, and the reliability is good.

The work autonomy scale uses a nine-item work input brief questionnaire prepared by Kirkman et al (2004). After testing, the scale's Cronbach's  $\alpha$  coefficient is 0.877, and the reliability is good.

The employee innovation behavior scale uses a nine-entry scale developed by Janssen (2004).After

testing, the scale's Cronbach's  $\alpha$  coefficient is 0.867, and the reliability is good.

This study controls the platform-based enterprise employees' gender (male = 1, female = 2), age (24-30 years = 1, 31-37 years = 2, 38-43 years = 3, 44 and over = 4) and educated degrees (specialties and below=1, undergraduate=2, masters and above=3).

### 3.3 Confirmatory factor analysis

This Paper used Lisrel 8.80 to verify the discriminant validity of each variable by confirmatory factor analysis. It can be seen from the results in Table 1 that the Three-factor model ( $\chi^2=1275.15$ ;  $df=650$ ;  $\chi^2/df=1.96$ ; GFI= 0.912; IFI=0.960; CFI=0.959; NFI=0.959; RMSEA=0.046) fits the actual data better than the two- factor and single factor models, indicating that the three variables involved in this study do represent three different constructs with good discriminant validity. At the same time, this also indicates that the common method bias in this study is not obvious.

**Table 1 Confirmatory Factor Analysis Results**

Model	$\chi^2$	df	$\chi^2/df$	GFI	IFI	CFI	NFI	RMSEA
Three-factor model	1275.15	650	1.96	0.912	0.960	0.959	0.959	0.046
Two-factor model	2865.43	663	4.32	0.801	0.933	0.930	0.933	0.067
Single factor model	5796.19	674	8.6	0.553	0.920	0.913	0.921	0.183

## 4 Results

### 4.1 Correlation analysis

The mean, standard deviation, and correlation coefficients for all variables are shown in Table 2. From the correlation coefficient matrix table, we can find that differential leadership and work autonomy are significantly related (0.701), work autonomy and innovation behavior of platform-based enterprises employees are significantly related (0.695), and differential leadership is significantly related to innovation behavior of platform-based enterprises employees (0.737).Preliminary indicates that there is a positive correlation between three variables.

**Table 2 Correlation Coefficient Matrix**

Model	Mean	Standard deviation	1	2	3	4	5
1 Gender	1.30	0.462	1				
2 Age	2.18	0.922	0.212	1			
3 Educated Degree	2.36	0.650	0.254	-0.112	1		
4 Differential Leadership	3.17	0.383	0.112	0.312*	0.622**	1	

5 Work Autonomy	3.20	0.429	0.087	-0.271	0.332*	0.701**	1
6 Employees' Innovation Behavior	3.17	0.506	0.075	-0.025	0.263	0.737**	0.695 **

Notes: \*\*\*p<0.01; \*\*p<0.05; \*p<0.1. N=208.

#### 4.2 Hypothetical test

For hypothesis testing, SPSS 22.0 was used for multiple regression analysis in this study.

This study assumes that differential leadership has a positive impact on platform-based enterprises employees' innovation behavior. Models 3 and 4 in Table 3 show the test results of this hypothesis. In Model 3, we examined the effect of control variables on the innovation behavior of platform-based enterprises employees. Model 4 shows that after controlling the control variables, there is a significant positive correlation between differential leadership and the innovation behavior of the platform-based enterprises employees. Hypothesis 1 is verified.

This study assumes that differential leadership will have a positive impact on the work autonomy of platform-based enterprises employees. Model 1 of Table 2 examines the effect of control variables on work autonomy. Model 2 shows that there is a significant positive correlation between differential leadership and work autonomy after controlling for gender, age, and level of education. Hypothesis 2 is verified.

The hypothesis 3 in this study assumes that work autonomy has a positive impact on innovation behavior of platform-based enterprise employees. The model 5 in Table 2 shows that after controlling the control variables, there is a significant positive correlation between work autonomy and innovation behavior of platform-based enterprise employees. Hypothesis 3 is verified.

Next, we test the hypothesis 4. The model 6 in Table 2 shows that compared with model 4, after joining the work autonomy variable, the correlation coefficient of differential leadership becomes 0.632, and the correlation with the innovation behavior of platform-based enterprises employees is reduced, and the significance is also reduced. At the same time, the regression coefficient of work autonomy is 0.427, which is significant. This shows that after joining the work autonomy variable, differential leadership has a lesser impact on innovation behavior of platform-based enterprises employees, and work autonomy has partially replaced the effect of differential leadership on innovation behavior of platform-based enterprises employees. Therefore, work autonomy plays a partial mediating role between differential leadership and the innovation behavior of platform-based enterprises employees. Hypothesis 4 is verified.

**Table 3 Regression Analysis Table**

Variables	Work Autonomy			Employees' Innovation Behavior		
	Model1	Model2	Model3	Model4	Model5	Model6
Gender	0.346	0.357	0.158	0.170	0.085	0.057

Age	-0.353	-0.338	-0.012	0.001	0.233	0.108
Educated Degree	0.312	0.095	0.299	0.061	0.080	0.031
Differential Leadership		0.715***		0.767***		0.632**
Work Autonomy					0.745***	0.427*
R <sup>2</sup>	0.229	0.611	0.091	0.548	0.470	0.587

Notes: \*\*\*p<0.01; \*\*p<0.05; \*p<0.1. N=208

## 5 Conclusions

### 5.1 Results and contributions

The four hypotheses in this paper have been verified. This paper proves that:

(1) Differential leadership have a positive impact on the innovation behavior of platform-based enterprises employees.

(2) Differential leadership have a positive impact on the work autonomy of platform-based enterprises employees.

(3) Work autonomy have a positive impact on the innovation behavior of platform-based enterprises employees.

(4) Work autonomy plays a mediating role in the relationship between the relationship between differential leadership and innovation behavior of platform-based enterprises employees.

At the same time, this study has two contributions:

(1) Theoretical contribution: This paper verifies the positive role of differentiated leaders in the innovation behavior of platform-based enterprises employees and introduces work autonomy into the relationship between differentiated leadership and innovation behavior of platform-based enterprises employees. The empirical research on enriching the order of difference is of great significance to the research on the leadership behavior of platform-based enterprises in the context of network economy. And this paper reveals that the differential leadership is positively affecting the internal mechanism of the innovation behavior of platform-based enterprises employees, that is, the intermediary role of work autonomy and the adjustment role of the employment relationship atmosphere.

(2) Practical contribution: Leaders should control the level of differential treatment within the acceptable staff so that everyone can be persuaded. Leaders should fully examine the loyalty and talent of their subordinates. If the leader gives a medium-private, more diligent or loyal subordinate, the subordinate will feel the purpose of the leadership and strive to innovate in order to be appreciated by the leader in the future. And leaders should pay full attention to the individual's work autonomy. Focus on the design of work, improve the autonomy of employees, and expand and enrich the work content, so as to enhance the happiness experience of employees at work, and promote their high-level passion to work, thus promoting their innovative behavior.

## 5.2 Deficiency and prospect

The deficiency and the future research prospect of this paper are listed as follows:

(1) This paper takes the differential leadership as a whole study, and does not specifically refine the research dimension. In order to further clarify which kind of biased leadership leads to a greater impact on employees, follow-up research should analyze the role of employees in the three dimensions of differential leadership.

(2) This paper only considers the mediating role of work autonomy. Work autonomy plays a partial intermediary role between differential leadership and employee innovation behavior, indicating that there may be other intermediary variables. For example, the bias of the leader may motivate the subordinates who want to get promoted, the desire of the outsiders to be recognized, and the achievement motivation is positively related to the innovative behavior. Therefore, the achievement motivation may be an intermediary between the two, of course there are other possible intermediary mechanisms to be explored in the future.

(3) In terms of data collection, the source of the questionnaire in this paper is all employees, and the objective data such as the leadership questionnaire can be more convincing in the future.

## Personality Traits of Risk-learning Serial Entrepreneur

Cao Qian

School of Management, Wuhan University of Technology, Wuhan, P.R.China,430070

(Email: 1428310202@qq.com)

**Abstract:** As the atmosphere of innovation and entrepreneurship continues to grow, the number of new entrepreneurs continues to increase, and serial entrepreneur play an important role in economic development. This paper discusses the personality traits of risk-learning serial entrepreneur. Through interviews, questionnaires, and SPSS software, regression analysis is conducted to try to explore the commonality of serial entrepreneurial personality traits, successful serial entrepreneur and personality traits. The relationship between the researches suggests that successful serial entrepreneurs are closely related to achievement motivation and personality traits of risk identification.

**Key words:** Serial entrepreneur; Personality traits; Risk learning; Competency model

### 1 Introduction

Serial entrepreneur plays an important role in the development of entrepreneurial economy worldwide. In European countries, a large number of entrepreneurs belong to serial entrepreneurs. In the UK, serial entrepreneur account for 19% to 25% of entrepreneurs. In the Netherlands, more than 30% of entrepreneurs are entrepreneurs in a row, even if In Germany, which has the lowest proportion, the proportion of consecutive entrepreneurs has also reached 18%.(Hyytinen & Ilmakunnas, 2007) Under the background of “mass entrepreneurship and innovation” in China, the scale of China's serial entrepreneur is increasing day by day, and the economic value it brings cannot be ignored. In order to start a business more efficiently, this study focuses on the personality traits of serial entrepreneur, analyzes the relationship between personality traits and the intentions of serial entrepreneur and the personality traits of successful entrepreneurs, and concludes that it provides a reference for successful entrepreneurs to succeed in entrepreneurship.

Domestic research on the personality traits of entrepreneurs mainly explores the personality traits of entrepreneurs by constructing competency factors. Most of them use questionnaires and in-depth interviews. Among them, Tao Man (Tao Man, 2018) adopts NEO Personality Measurement Questionnaire, Wang Haoquan (Wang Haoquan, 2007) The Essenck Personality Questionnaire (China Standard Edition) (EPQ-RSC) is used to better measure the personality traits of entrepreneurs through scientific methods. Domestic scholars usually use SPSS, Python language, and analytic hierarchy process (AHP) (Shi Zhenhua, 2018) to establish a variety of model analysis and verification, study the personality traits of entrepreneurs, and explore the relationship between entrepreneurial success and personality traits. This paper focuses on the personality traits of risk-learning serial entrepreneurs. However, at present, there is very little research literature on the personality traits of serial entrepreneurs in China. Wang Quanhao believes that there is a relationship between college students' entrepreneurial intention and personality traits. Correlation, entrepreneurial intention and extroversion are positively related, Neuroticism is negatively correlated, but from a correlation perspective, EPQ-RSC, which is difficult to use it alone as an evaluation tool for entrepreneurial intentions. (Wang Quanhao,2017) At the same time, in the field of entrepreneurial research, there is no conclusion about the relationship

between personality traits and entrepreneurial success.

Based on the competency model, this paper explores the intrinsic relationship between the personality traits of risk-learning serial entrepreneur and serial entrepreneurial experience, and has both theoretical and practical value. The theoretical significance of this project research is to reveal the personality traits of risk-learning serial entrepreneur, improve the research theory of serial entrepreneur, and fill in the gaps in the research field of risk-learning serial entrepreneur. The practical significance of this project research is that the research in this paper is helpful to help serial entrepreneur to consciously cultivate self-personality traits in the process of entrepreneurship, improve the risk identification ability and risk aversion ability of serial entrepreneur, and thus improve the chance of serial entrepreneurial success and improve the economic efficiency.

## **2 Theoretical Framework**

### **2.1 Personality trait**

Personality traits are the psychological characteristics of individuals who are influenced by genetic and environmental interactions, as well as the ability to control individual activities. They are also reactions that are consistent with their thoughts, feelings, and behaviors in the process of contact with the environment and others.(Chen Anning, Zhu Guanghua,2017)In the study of long-term personality traits, the most widely identifiable personality traits that scholars admire and widely recognize are some research findings, and there is a link between general personality traits and entrepreneurship. The most common application in the general personality trait theory is the Big Five personality theory. The Big Five personality theory has been widely used in organizational behavior.(Tao Man,2018;Costa & McCrae, 1992) Five factors of personality include neuroticism (N), extraversion (E), openness of experience (O), seriousness (C), and amenity (A). This paper attempts to use the in-depth interviews with consecutive entrepreneurs to issue questionnaires and use software to analyze the relationship between Big Five personality and successful entrepreneurship, especially the commonality of the Big Five personality of successful consecutive entrepreneurs.

### **2.2 Serial entrepreneur**

A serial entrepreneur is an entrepreneur who has more than one entrepreneurial experience and starts his next business after the end of his previous entrepreneurial activities (Wright et al., 1997; Westhead & Wright, 1998; Lin lin, Peng Huatao,2016). The process of serial entrepreneur in serial entrepreneur is essentially a process of serial learning. Entrepreneurial learning is the risk identification of entrepreneurs based on previous work or entrepreneurial experience, which serially accumulates experience and transforms into new knowledge to improve entrepreneurship, risk aversion ability, and the act of increasing the chances of success in entrepreneurship. This paper assumes from a practical point of view that the personality traits shaped in the process of serial entrepreneur and serial learning are general.

### **2.3 Competency model**

Competency models are related knowledge, skills, and attitudes that affect most of a person's work (role or responsibilities). They are closely tied to the performance of the work and can be measured by some widely accepted criteria and can be trained. In recent years, there has been some research on entrepreneurial competence in China. Zhang Wei and Wang Chongming (2004) pointed out the combination model of entrepreneurship and conducted a preliminary analysis of the competency

characteristics of entrepreneurs.(Zhang Wei ,Wang Chongming,2004).Feng Hua and Du Hong (2005) established a relationship model between entrepreneurial competence and entrepreneurial performance through research, and systematically analyzed the model (Feng Hua, 2005).In recent years, domestic scholars have gradually begun to study the competence of entrepreneurs, but in general, the scope and depth of research are still relatively small, and further research is needed. This paper uses the literature survey method to design a competency model questionnaire for serial entrepreneur to explore the commonality of personality traits of serial entrepreneur.

### 3 Data Sources and Methodology

#### 3.1 Data sources

##### 3.1.1 Depth interviews

This study conducts in-depth interviews with two serial entrepreneurs with more than ten years of entrepreneurial experience, and designs an interview outline for the personality traits of risk-learning serial entrepreneurs. Based on the interview content, the author extracts the competency personality elements of consecutive entrepreneurs. At the same time, this study designed a questionnaire, distributed a total of 40 questionnaires, received 31 valid questionnaires, extracted relevant data according to the questionnaire scale, and analyzed the relationship between successful serial entrepreneurship and the personality traits of serial entrepreneurs. Part of the interview content and the corresponding competency elements are as follows.

**Table 1 Serial Entrepreneur Interview**

Entrepreneur	Interview Record	Competency Elements
	1. Finally, you still chose to do this. That is to make up your mind, and don't sway.	Decisiveness, persistence, self-reflection,
	2. From the objective evaluation, this thing I did is not right. Although I am a girl, he does not know that I am very powerful. First, my personality is very strong. Second, my management experience is very good. Third, my technical ability is very strong.	self-confidence
Miss Huang	3. I have trained employees to improve efficiency and polish the team...	cultivating others' awareness and ability, organizational cognitive ability, analytical thinking ability
	4. When they contacted me, they felt that I was not the kind of business person. They felt that this person is very honest, worthy of cooperation, people with word of mouth,	principle, honest
	5. His idea is to be an industrial Internet of Things, to be made that kind of unmanned. Automated, intelligent factory, this is my dream.	enterprising spirit, innovation ability, achievement motivation

Mr. Liu	1. The partner lacks cooperation awareness and strategic vision. It is easy to be proud of satisfying the changes in the market. Therefore, the wrong decision has been made and the market demand has been miscalculated. The national policy misled enterprises to expand production, and there are risks	organizational cognitive skills, self-reflection, insight, conceptual thinking, risk anchoring, risk learning
	2. I cut through the layoffs, bad customers, slim down, stop loss, sell old equipment, invest in new equipment, and gradually realize profitability.	management expertise, technology, self-confidence
	3. Years of entrepreneurial experience tells me that people are the most difficult to copy.	teamwork spirit and ability to develop others
	4. Entrepreneurship has risks. To avoid risks, you must improve your own strength. At the same time, accumulate experience and improve the ability of enterprise risk identification and risk resistance.	risk learning ability, risk anchoring ability,

Based on the above analysis, the study concludes that the competency model entry for risk-learning serial entrepreneur.

Decisiveness, persistence, self-reflection, self-confidence, enterprising, cultivating others' awareness and ability, organizational cognitive ability, insight, innovation ability, principle, achievement motivation, risk anchoring ability, analytical thinking ability, self-confidence, management expertise, technology, teamwork spirit, conceptual thinking ability, risk learning ability.

**Figure 1 The Competency Model Keyword**

3.1.2 Questionnaire

The content of the questionnaire and its corresponding competency elements are as follows.

**Table 2 Questionnaire**

Family	Competency elements	Question
Opportunity strategy family	Risk propensity	You tend to risk more opportunities
	Risk Aversion	Based on past entrepreneurial experience, you can better avoid risks
	Exposures	You bear the consequences of risk
	Risk Identification	You can identify the risk
	Risk learning	Is your first entrepreneurial experience a big second for entrepreneurship?
Shock and influence	Interpersonal understanding	You are good at building good relationships with your customers and profiting from them.
	Influence	You gain new entrepreneurial opportunities with your own influence

	confidence	Every time you start a business, you believe that you can succeed.
	self-reflection	You can reflect on yourself from past entrepreneurial experiences and lessons.
	Organizational cognitive ability	You realize the importance of the team
Management family	the awareness and ability of Cultivating others	You will polish the team to start a better business.
	spirit of teamwork	You obey the opinions of the majority of the team
	Team leadership	You are good at team division
	Command/decisive force	You can make decisive decisions when opinions are not uniform
	Analytical thinking ability	You are good at analyzing and summarizing the reasons for entrepreneurial success.
	Conceptual thinking ability	You are good at combining various factors to decide whether to start your next business.
Cognitive family	technology	You know the basic technology every time you start a business.
	Management expertise	You have basic management knowledge
	Enterprising heart	You will actively learn and learn the advantages of your competitors.
	Insight	You are good at discovering the nature of things and the direction of development and the ability to do things new.

According to the characteristics of the serial entrepreneur and the competency model elements, the competency quality table is divided into 5 families and 22 elements. Each question corresponds to different competency factors. It is impossible to correspond to 0-10 points. The items designed by the questionnaire and their corresponding competencies in this study are shown in the table above.

Analysis of the reliability and validity of the questionnaire

### 3.1.3 Reliability analysis

Questionnaire reliability index was calculated by using SPSS22.0. The overall  $\alpha$  coefficient of the questionnaire was 0.961, and the half-point reliability reached 0.949, which exceeded the reliability standard value of 0.9. Therefore, the questionnaire measurement results can be considered to be highly credible. After the SPSS reliability test, the overall alpha coefficient of the questionnaire of the personality traits of the serial entrepreneur was 0.961, indicating that the reliability of the questionnaire was very high and fully met the requirements of the questionnaire.

### 3.1.4 Validity analysis

Exploratory factor analysis was carried out on the 22 competencies in the questionnaire. Four

factors with initial eigenvalues greater than 1 were extracted. The variance interpretation rate of the first factor reached 57.0%, and the first factor eigenvalue and the second factor. The factor characteristic value ratio is much larger than 3, so the data result can be considered to have a higher single dimension.

The sub-model loads 22 competencies into five factors: achievement and action family, opportunity strategy family, and calculates the load of five factors and serial entrepreneur. The model fitting calculation results are shown in the following table.

**Table 3 Questionnaire Validity Analysis**

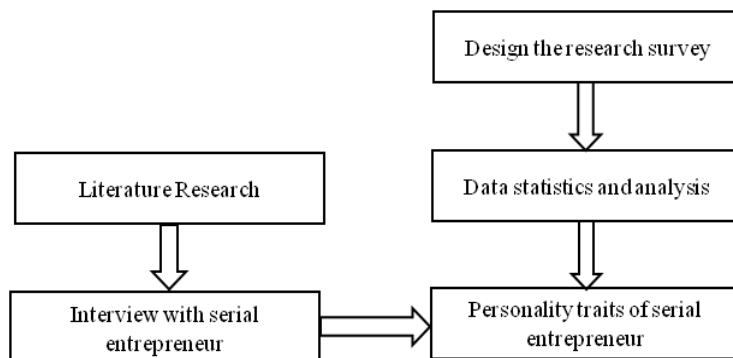

Model	RMSEA	CFI	TLI	Bangla/df
Model 1	0.000	1	1	1
Model 2		unfit		

Note: model 2 is unfit.

According to the data in the table, the model 1 will directly load the competency elements to the serial entrepreneurial success indicator, and the model fits the standard.

### 3.2 Methodology

This research combines literature research methods, interview methods, questionnaire survey methods

and statistical analysis methods to reveal the personality traits of risk-learning serial entrepreneur. The research map is below and the main research methods used in this study are as follows:

**Figure 2 Research Roadmap**

#### 3.2.1 Literature research

In CNKI China Knowledge Network (full text), through the selection of "serial entrepreneur", "personality traits" and other key words to review and collate relevant literature, summed up the emergence of research conclusions and opinions, inspiring the author on research issues Further thinking. The literature research method guarantees the scientific, accurate and cutting-edge information of the information obtained by the author, which is conducive to ensuring the quality and benefit of the author's research content.

#### 3.2.2 Interview

In order to collect the core competency indicators of authoritative entrepreneurs, this article conducts in-depth interviews with typical small and micro enterprise serial entrepreneur, and generates

text data in the later stage, which is conducive to qualitative analysis and more in-depth understanding the personality traits of risk-learning serial entrepreneur. The interview outlines and interviews with consecutive entrepreneurs are as follows.

What changes have you made in your first business and the second to deal with risks?

Do you have a systematic summary of the reasons for the failure of entrepreneurship?

Why do you want to start a business serially?

Do you think that you have succeeded because of the experience of previous entrepreneurship?

What is the difference between subjective and objective after you start your business and experience many times?

Based on the relevant literature of the competency model, the elements of the competency model of the serial entrepreneur are refined, the survey scale is designed, and a questionnaire about the competency of the risk-learning serial entrepreneur is prepared. By issuing 40 questionnaires, we obtained 31 effective questionnaires and established a large number of sample libraries to improve the scientific and reliability of the research.

### 3.2.4 Statistical analysis

This paper uses statistical analysis method to process the collected data. It mainly measures the reliability and validity of the questionnaires of consecutive entrepreneurs by SPSS22.0, and analyzes the relationship between the success serial entrepreneur and personality traits using the multiple linear regression methods in the later stage.

## 4 Model Constructions and Statistic Analysis

Since the dependent variable “serial entrepreneurial success” is a dichotomous variable, a two-class logistic regression model will be established for analysis in the regression analysis.

First, 22 competency elements are included in the model. The method is input, and the HL model fit is calculated. At this time, the model does not reach the convergence state. The Block0 results show that when the first, second, fourth, 23, 8, 10, 11, 13, 15, 18, 20, 21 and other topics are included in the model, the model changes significantly and can enter the equation, as shown in the table below.

**Table 4 Variable Not In Equation**

Step	Variable	Score	Degree of freedom	Significant
	T1, you have a strong passion and sense of accomplishment for serial entrepreneur.	12.253	1	0
Step 0	T2 you have the sense of innovation and ability	4.796	1	0.029
	T3 you tend to risk more opportunities	1.571	1	0.21
	T4 based on past entrepreneurial experience, you can better	4.992	1	0.025

avoid risks			
T5 you can take on the risk consequences of starting a business	1.534	1	0.215
T23 Is your first entrepreneurial experience a big second venture?	5.091	1	0.024
T6, you are good at building good relationships with customers and profiting from them.	1.901	1	0.168
T7, you gain new entrepreneurial opportunities with your own influence	3.620	1	0.057
Every time T8 starts a business, you believe that you can succeed.	4.368	1	0.037
T9, you can reflect on yourself from past entrepreneurial experiences and lessons.	3.449	1	0.063
T10, you realize the importance of the team	5.632	1	0.018
T11, you will polish the team to start a better business.	5.428	1	0.02
T12, you will obey the opinions of the majority of the team.	3.66	1	0.056
T13, you are good at team division	6.344	1	0.012
T14, you can make a decisive decision when opinions are not uniform.	3.838	1	0.05
T15, you are good at analyzing and summarizing the reasons for entrepreneurial success.	3.879	1	0.049
T16, you are good at combining various factors to decide whether to start your next business.	2.938	1	0.087
T17, you know the basic technology of every business.	1.593	1	0.207
T18 you have basic management knowledge	4.158	1	0.041
T19, you will learn to learn the advantages of competitors.	2.556	1	0.11
T20, you are good at discovering the nature and direction of things and emerging things.	4.403	1	0.036
T21 you can identify the risk	9.385	1	0.002

Note: Overall statistics: score: 27.985; Degree of freedom: 22; Significant: 0.176

The above questions were included as explanatory variables in the model. The independent variable screening method was forward and the likelihood ratio test using maximum partial likelihood estimation was used to eliminate the independent variables. The coefficient test results are shown in the following table, and the model is statistically significant.

**Table 5 Omnibus Test Of Model Coefficients**

Step		Bangla	Degree of freedom	Significant
Step 1	Step size (T)	13.996	1	0
	Piece	13.996	1	0
	Model	13.996	1	0
Step 2	Step size (T)	4.348	1	0.037
	Piece	18.344	2	0
	Model	18.344	2	0

When T1 and T2 are used as explanatory variables, the load factor reaches the significance level, and when the remaining variables are included in the model, the change of interpretation rate is not significant. Therefore, T1 and T2 are used as the final explanatory variables of the model. The regression equation is:

$$\text{Logit (T22)} = 0.703 * T1 + 0.671 * T21 - 8.518$$

**Table 6 Variable In the Equation**

Step	Variable	B	S.E.	Wald	Degree of freedom	Significant	Exp(B)
Step 1 <sup>a</sup>	T1, you have a strong passion and sense of accomplishment for serial entrepreneur.	0.802	0.29	7.62	1	0.006	2.229
	constant	-4.643	1.917	5.866	1	0.015	0.01
Step 2 <sup>b</sup>	T1, you have a strong passion and sense of accomplishment for serial entrepreneur.	0.703	0.293	5.758	1	0.016	2.019
	T21 you can identify the risk	0.671	0.339	3.911	1	0.048	1.956
	constant	-8.518	3.109	7.509	1	0.006	0

a. Step 1 : [%1:, 1:

b. Step 2 : [%1:, 2:

**Table 7 Variables Not In The Equation**

Step	Variable	Score	Degree of freedom	Significant
Step 1	T2 you have the sense of innovation and ability	1.217	1	0.27
	T4 based on past entrepreneurial experience, you can better avoid risks	1.401	1	0.237
	T23 Is your first entrepreneurial experience a big second venture?	1.392	1	0.238
	Every time T8 starts a business, you believe that you can succeed.	0.936	1	0.333
	T10, you realize the importance of the team	1.108	1	0.293
	T11, you will polish the team to start a better business.	2.868	1	0.09
	T13, you are good at team division	0.257	1	0.612
	T15, you are good at analyzing and summarizing the reasons for entrepreneurial success.	0.331	1	0.565
	T18 you have basic management knowledge	0.21	1	0.647
	T20, you are good at discovering the nature and direction of things and emerging things.	1.965	1	0.161
Step 2	T21 you can identify the risk	4.789	1	0.029
	T2 you have the sense of innovation and ability	0.319	1	0.572
	T4 based on past entrepreneurial experience, you can better avoid risks	0.264	1	0.607
	T23 Is your first entrepreneurial experience a big second venture?	0.281	1	0.596
	T8 Every time starts a business, you believe that you can succeed.	0	1	0.987
	T10, you realize the importance of the team	0.06	1	0.806
	T11, you will polish the team to start a better business.	0.877	1	0.349
	T13, you are good at team division	0.443	1	0.506
	T15, you are good at analyzing and summarizing the reasons for entrepreneurial success.	0.494	1	0.482
	T18 you have basic management knowledge	1.744	1	0.187
T20, you are good at discovering the nature and	0.252	1	0.615	

direction of things and emerging things.

---

Note: step 1 overall statistics: score: 11.335; degree of freedom: 11; significant: 0.416

step 2 overall statistics: score:8.939;degree of freedom:10;significant:0.538

From the above data analysis, the significance of the two variables in Table 6 indicates that the strong enthusiasm of serial entrepreneurship and the sense of accomplishment gained in the entrepreneurial process and the ability to identify and anchor risks have the greatest contribution to successful serial entrepreneurship.

## 5 Conclusion

Based on comprehensive regression analysis and interview records, we can conclude that the success factors of successful continuous entrepreneurs are mainly self-confidence, awareness of others, risk anchoring ability, risk learning ability, sense of achievement, etc.

Through regression analysis and other methods, it can be known that the personality traits of successful risk-learning serial entrepreneur are mainly achievement motivation and risk identification, and other personality traits have low contribution to the success of serial entrepreneur. It is hoped that through this research, it will be able to inspire the risk-learning serial entrepreneur, strengthen the risk identification and risk aversion ability, and maintain the motivation for serial entrepreneur, which is the key to success. The research field of personality traits of risk-learning serial entrepreneur in China is not mature yet, and there is a lack of a complete scientific theoretical system. It is hoped that more scholars will pay attention to this field, enrich the theoretical system and provide theoretical guidance for serial entrepreneur.

**Abstract:** As time goes by, the service industry plays an increasingly important role in the development of developed countries and developing countries, and has gradually become an important index to measure the national economic strength and the core competitiveness of the country. Since human capital is the main input of producer service industry, the competitiveness of human capital plays a vital role in the development of producer service industry. Based on substantial literature research, this paper objectively analyzes Chinese GDP, service industry and producer service industry from 2000, and the research method of location quotient is used to compare and analyze the human capital competitiveness and the development of producer service industry in 31 regions of China from 2005 to 2016 by constructing “human capital-added value” location quotient average value matrix, and then put forward policy recommendations to accelerate the development of producer service.

**Keywords:** Human capital; Producer service industry; Location quotient; Location quotient average value matrix.

## 1 Introduction

### 1.1 Producer service industry

American economist Greenfield firstly put the definition of producer service forward (Greenfield H I, 1966). He defined producer service as the products and labors provided by enterprises, governments and non-profit organizations for producers but not for ultimate customers. From the concept of the functions of products, Coffey deemed that producer service is the intermediate input in the form of other products or services but not the ultimate services that costumed by customers (Coffey J, 2000). Jiao Pin argued that producer service should include Transportation; Technology service; scientific research; financial service; Software and Information technology service and Wholesale and retail trade (Jiao Pin, Lin Xiumei, 2016). In one word, scientists think that producer service should have characteristics that including: meet intermediate need, divestiture from manufacturing, directly provided for producers, human capital is the main input, do not have direct material output.

Based on the definitions given by *the Outline of the Eleventh Five-Year Plan* and *China Statistical Yearbook*, in this paper, producer include Transportation, warehousing and postal service (T service); Information transmission, software and information technology service (I service); financial service (F service); Real estate service (R service); Leasing and business service and scientific research (L service) and Technology service (S service).

## 1.2 Literature review

In 1989, economists Grubel and Walker insisted that human capital is the most important input for the development of producer service (Grubel H G, Walker M A, 1989). They thought that producer service industry could make a great contribution for increasing the productivity of labor and improving the quality of products. High-quality human capital is the fundamental requirement of high-speed and steady growth of producer service. At the same time, Sven Illeris argued that the aggregation of producer service was caused by the aggregation of human capital with the aim of enjoying the profit produced by producers and consumers (Sven Illeris, 1989).

Since knowledge and human capital was the major input of producer service, Chinese economists gradually attached great importance to human capital and started to investigate what is the functions of human capital for producer service. Yang Ling, Guo Yudan pointed out that producer service was the most influential reason why considerable rise could be seen in the ratio of labor capacity to output (Yang Ling, Guo Yudan, 2010). Yang Qinghai argued that under the background of new knowledge production model where the infrastructure of public knowledge and the knowledge-intensive service industry were closely integrated, if China wants to achieve successful economic catch-up, it must firstly realize the catch-up of human capital by system innovation (Yang Qinghai, 2005). Tong Rui, Gao Xu, Wang Weiqin argued that technic was the most crucial input for the high-speed development of Chinese brand-new high-tech industry and it was high-quality human capital that created technic (Tong Rui, Gao Xu, Wang Weiqin, 2008). Zhang Ziran got the conclusion that technological progress and improvement of technological efficiency devoted to Chinese huge development in producer service by TFP model (Zhang Ziran, 2009). Since technological progress and improvement of technological efficiency are the results of high-quality human capital, human capital is the main cause of Chinese rapid economic growth.

## 1.3 Basic facts about Chinese producer service industry form 2005

### 1.3.1 China's GDP soared in the period of 11 years.

As shown in Figure 1, steady growth can be seen in the development of Chinese producer service from 2005 to 2016. In 2005 the total added value of Chinese producer service is only 35466.6 billion RMB, it soared to 198344.5 billion RMB in 2016, average annual increase of 17.08% is far more higher than that of China's GDP (13.30%) and the added value of China's third industry (10.40%).

### 1.3.2 The development of producer service was the main reason why China's GDP soared.

As shown in Figure 1, share of added value of producer service in GDP also increased sharply from 18.93% to 26.67% in the period from 2005 to 2016. Devoting more than a quarter of China's GDP made producer service became one of the most important industry of China. Besides producer service is helpful for the development of both the secondary industry and the tertiary industry, it's very crucial to the improvement of the Chinese industrial structure.

Figure 1 The Added Value and Growth Rate of Producer Service in China from 2005~2016

Data sources: China Statistical Yearbook, 2006-2018.

## 2 LQ of Chinese Producer Service Industry

### 2.1 Location quotient

Location quotient was first used by Haggett in location analysis. It can measure the spatial distribution of elements within a given region, to evaluate the specialization in the industry (Cui Gonghao, Wei Qingquan, Chen Zongxing, 1999).

The location quotient was calculated by:  $LQ_{ij} = (L_{ij}/L_j)/(L_i/L)$ ,  $LQ_{ij}$  is the location quotient of added value of the region  $j$  in  $i$  industry;  $L_{ij}$  is the added value of region  $j$  in  $i$  industry;  $L_i$  is the added value of the whole country in  $i$  industry,  $L_j$  in the added value of region  $j$  in all industries.  $LQ_{ij} < 1.00$ ,  $LQ_{ij} = 1.00$  and  $LQ_{ij} > 1.00$  means the  $i$  of region  $j$  less, equal and better than the average level of the whole country.

### 2.2 Location quotient of added value & human Capital

Due to the different statistical standards, Hebei, Liaoning, etc. 13 regions lack the added value data of Information transmission, software and information technology service, Leasing and business service and Scientific research and technology service industry from 2005~2016. So this paper only research the left 18 regions of China in Information transmission, software and information technology service, Leasing and business service and Scientific research and technology service industry.

### 2.3 Human capital-added value location quotient matrix

Figure 2 is Human Capital-Added Value Location Quotient Matrix of Transportation, warehousing and postal service (T service) in 2005~2016, and Figure 3~7 are Human Capital-Added Value Location Quotient Matrix of Information transmission, software and information technology service (I service); Financial service (F service); Real estate service (R service); Leasing and business service and Scientific research (L service) and technology service (S service) in 2005~2016.

**Data sources:** Statistical yearbook of each region.

Calculated by the formula, the averages of location quotient of added value and human capital from 2005~2016 in each producer service industry are shown at Table 1.

**Figure 2 Human Capital-Added Value Location Quotient Matrix of T Service in 2005~2016**

**Figure 5 Human Capital-Added Value Location Quotient Matrix of R Service in 2005~2016**

**Figure 3 Human Capital-Added Value Location Quotient Matrix of I Service in 2005~2016**

**Figure 6 Human Capital-Added Value Location Quotient Matrix of L Service in 2005~2016**

**Figure 4 Human Capital-Added Value Location Quotient Matrix of F Service in 2005~2016**

**Figure 7 Human Capital-Added Value Location Quotient Matrix of S Service in 2005~2016**

Regions located at top right of the diagram are more developed than the average level of the whole country at both human capital and added value in the industry; regions located at bottom left of the diagram lag behind the average level of the whole country at both human capital and added value in the industry; regions located at bottom right of the diagram are more developed than the average level of the whole country at human capital in the industry but lag behind the average level of the whole country at added value; regions located at top left of the diagram are more developed than the average level of the whole country at added value in the industry but lag behind the average level of the whole country at human capital.

### 3 Conclusion

Based on above, the development of producer service and human capital are shown in Table 2, 3.

To improve Chinese producer service industry China should:

**Table 2 Regions Where Industry LQ of Added Value > 1.00**

Industry	LQ of urban employees < 1.00	LQ of urban employees > 1.00
T service	Guizhou, Hebei, Fujian, Jiangxi, Xinjiang, Hunan, Shandong	Nei Monggol, Ningxia, Shanxi, Gansu, Hainan, Liaoning, Tianjin, Chongqing, Guangxi, Shanghai, Beijing
I service	Ningxia, Zhejiang	Beijing, Shanghai, Guangdong, Qinghai
F service	—	Beijing, Shanghai, Zhejiang, Tianjin, Ningxia
R service	Zhejiang	Beijing, Hainan, Guangdong, Shanghai
L service	Jiangsu, Anhui, Fujian	Beijing, Shanghai, Guangdong, Tianjin
S service	—	Beijing, Tianjin, Shanghai

**Table 3 Regions Where Industry LQ of Added Value < 1.00**

Industry	LQ of urban employees < 1.00	LQ of urban employees > 1.00
T service	Henan, Anhui, Jiangsu, Xizang, Guangdong, Sichuan, Zhejiang, Yunnan	Heilongjiang, Shaanxi, Hubei, Jilin, Qinghai
I service	Shanxi, Hainan, Hunan, Fujian, Jiangsu, Xinjiang, Tianjin, Anhui, Shandong, Henan	Jilin, Nei Monggol
F service	Guangdong, Jiangsu, Yunnan, Sichuan, Guizhou, Fujian, Xinjiang, Tibet, Guangxi, Hubei, Hainan, Shandong, Gansu, Henan, Jiangxi, Heilongjiang	Chongqing, Shanxi, Qinghai, Shaanxi, Liaoning, Anhui, Hebei, Nei Monggol, Hunan, Jilin

	Jiangsu, Anhui, Guangxi, Shandong, Liaoning, Tibet, Hubei,	Fujian, Chongqing, Tianjin,
R service	Sichuan, Jiangxi, Heilongjiang, Ningxia, Hebei, Henan, Yunnan,	Guizhou, Hunan
	Gansu, Shaanxi, Shanxi, Jilin, Xinjiang, Nei Monggol, Qinghai	
L service	Jilin, Hunan, Shandong, Qinghai, Shanxi,	Zhejiang, Hainan
	Nei Monggol, Xinjiang, Henan, Ningxia	
S service	Guangdong, Zhejiang, Jiangsu, Xinjiang, Anhui, Hunan, Ningxia,	Qinghai, Jilin
	Hainan, Shandong, Fujian, Henan, Shanxi, Nei Monggol	

### 3.1 Attach more importance to human capital, invite and cultivate talents

Since China is the most populous country in the world, human capital is the most precious resource for the economic development. Human capital is the main input of producer service, the knowledge and intelligence of human capital realize the rapid growth of producer service, so China should attach enough importance to human capital and try it's best to invite and cultivate talents. As shown in Sheet5-2, regions where the averages of location quotient of added value and urban employees are both less than 1.00 in one industry are not competitive at human capital in this industry, so their government should come up with policies inviting talents in this field to the regions, hope to make progress in the industry with the help of them. As for regions where the averages of added value are less than 1.00 but the averages of urban employee are more than 1.00, they do have large numbers of human resource but they cannot support the development of producer service industry. So they should attach great importance to the cultivation of human resource, governments and enterprises should educate employees and promote the upgrade of knowledge and skills.

### 3.2 Enhance communications and collaborations among regions of producer service industry

Devoting a quarter of China's GDP, producer service becomes more and more important in the development of Chinese economy. But Hebei, Liaoning, etc.13 regions ignore the added value data of information transmission, software and information technology service, leasing and business service and scientific research and technology service industry from 2005~2016. So government should attach great importance to the producer service because it can promote the development of both second industry and third industry. Due to the geographical difference unbalanced development can be seen in China, the enhancement of communications and collaborations between regions will help them help each other and benefit all of them.

### 3.3 Keep optimizing the inner structure of producer service industry

Regions where are not competitive in producer service industry should follow the trend, try their best to develop high-tech industry such as Information transmission, software and information technology service and Scientific research and technology service in the future. Hope to realize the high added value industry with the help of development of science and human capital. Meanwhile they should try to accept the transfer of industry construction. In this way they can improve their inner structure of producer service industry and realize the high-speed growth of producer service industry.

### 3.4 Promote integration of producer service industry and manufacturing industry

Producer service is the combination of manufacturing and services, China should know that

nowadays producer service is not the accessory of manufacturing anymore, producer service is as important as manufacturing for the development of China's economy. Industry like Information transmission, software and information technology service and scientific research and technology service are helpful for the development of high-end manufacturing, high-end manufacturing can also prosper and optimize producer service industry, the integration of producer service industry and manufacturing can accelerate the growth of China's GDP.

**Abstract:** Based on the feature of times and the theory of educational ecology, this paper explores the problem of the ecological niche change of college students' ideological and political education from the perspective of crisis. The evolution of the ecological niche of college students' ideological and political education is analyzed, and the performance of ecological crisis of college students' ideological and political education is revealed, including the failure of vertical subject connection and the lack of horizontal subject interaction. Meanwhile, it traces the reasons for the ecological crisis of college students' ideological and political education, and analyzes the ecological upgrade path of college students' ideological and political education from the niche theory, and proposes suggestions for ecological niche optimization of college students' ideological and political education, such as suitable misplaced participation, distributed extension width and breaking the negative effect cycle.

**Key words:** Crisis; Ideological and political education; College students; Ecological niche

### **1 Introduction**

After more than 100 years' development, the niche theory has gradually enriched and improved its connotation. Now it has formed a number of niche theory points, including niche separation theory, niche expansion theory, niche optimization theory, and niche coordination theory. The "educational ecology" was proposed by the famous American educational historian Lawrence Cremin (1983), using the general principles and methods of modern ecology to study a new educational concept system formed by educational phenomena (Wennersten, 1977). The educational ecological balance mainly refers to the comprehensive balance of the education system, efficient operation, perfect function and coordination of social environment (Carruthers P, 2012). Educational ecology regards relevant educational elements as a complex network (Russell J L, 2013), and education ecology can effectively describe and explore the complex phenomenon of the subject interaction of ideological and political education and its internal mechanisms. Ecological niche has a unique position in educational ecology. It refers to the time and space position and functional relationship of individuals or groups in a population or community. The subject should have its own unique

niche (Jia C, 2016). Besides these, Internet and Internet of Things become a powerful phenomenon, which is radically transforming much of our economy, politics, culture, education, business and social processes, and almost everything else. This brings many differences to our thinking and lifestyle.

At present, in the practice of college students' ideological and political education, the awareness to ecological or ecological niche of college students' ideological and political education activities is not enough. In order to improve the quality and level of ideological and political education, "time, degree, and efficiency" must be grasped. Big data is changing the way people live, work and think, and has a major influence on the educational environment of college students. The exploration of the ecological nature of college students' ideological and political education is conducive to the integration of college students and social environment, which in turn affects college students' acceptance of ideological and political education, thus forming a positive cycle. However, there are still various crises in the education ecosystem, such as the niche deviation of educator, the biased responsibility in the ecosystem, and the incoordination between educational ecology and the characteristics of the new age. With the help of the education ecosystem, from the perspective of crisis, this paper conducts an ecological discussion on ideological and political education, guides the practice of ideological and political education, and innovates the ideological and political education mode of college students.

## **2 Evolution of the New Niche**

### **2.1 The performance of ecological crisis of college students' ideological and political education**

Solving the contradiction among college students' ideological and political education, social environment, and individualized development of college students, and solving the contradiction between production and ecology in talent cultivation is the key to solve the ecological crisis of ideological and political education for college students.

#### **2.1.1 The failure of vertical subject connection**

The ecological system of college students' ideological and political education is a balanced situation in which the energy flow, material circulation and information transmission of the open system adapt to each other, coordinate and unify (Hickman R, 2017). At present, with the continuous impact of the external ecological environment, the ideological and political education of college students is alienated, the main ecological chain is broken, and the main power imbalance is prominent. It faces the dilemma of convergence failure, which is mainly manifested by the alienation of ecological niche, that is, for different universities' ideological and political education, the particularity of its structural function in the ecological environment of college students' ideological and political education is incorrectly considered. It fails to fully consider the balance between the basic resources that different subjects can use and the basic functions they should assume. There is no strict definition and distinction aimed the relationship between their rights, responsibility and interests. The ecological niche of the subject of ideological and political education of college students has made a major deviation.

### 2.1.2 The lack of horizontal subject interaction

In practice, the task of the horizontal subject of ideological and political education of college students is unclear, their responsibilities are unclear. They have low degree of cooperation, and lack effective resource integration mechanism, leading to insufficient in horizontal interaction between college students' ideological and political education. The main performance is that they are mutual independent (LI Xinyi, 2016), for example, the work scope of counselors is expanding, diversity of professional theory is weak, so it is difficult for them to be competent in the increasingly generalized ideological and political education work under the existing system

## **2.2 Reasons for the ecological crisis of college students' ideological and political education**

The source of the ecological crisis of college students' ideological and political education is in many aspects, but it also has its own characteristics, mainly manifested in diversity, uncontrollability, overall relevance, high diffusion, and strong dynamics.

College students have diverse ideas and diverse personality characteristics, which are easily influenced by the external environment. The ecological dilemma is a mixture of multiple interrelated factors, and the possibility of accumulation and evolution is extremely high. In the times of big data, the relationship between college education and society transcends the distance between time and space, and the ideological and political education of college students depends more on the "climate" of society (Weaver-Hightower, M. B, 2008). The source of the ecological crisis of college students' ideological and political education can be traced back to the following points:

### 2.2.1 The niche is not clear

Ideological and political educators are not clear about their own niche, their ideological concepts have not been effectively improved, and they have not clearly realized that their own qualities are related to dominant effect they play a part in.

### 2.2.2 Inaccurate grasp of the relationship between the host and the guest

Some ideological and political educators position themselves in an unequal position above the educated, and the deviation and absence of the ideological and political educators' orientation in colleges and universities highlights the contradiction between the educator's "discourse hegemony" status and negligence for the individual life of the educated, which causes the relationship between the two to be uncoordinated.

### 2.2.3 The role of factors is not well understood

The educational goals of "high, big, far, and empty" in ideological and political education, single and single-board educational methods, too abstract theoretical concepts, boring and monotonous educational contents, and the misunderstanding of the role of goals, content, and method elements, leads to the effectiveness not obvious. In the implementation, the relaxation of the human nature of the educated, the law, characteristics and continuous process of individual self-education are neglected (WANG Abdul-Kadir S, 2011).

### 2.2.4 The ecosystem mechanism is not sound

An important reason for the imbalance of the ideological and political education

ecosystem of college students is that the internal mechanisms of the system are not perfect, resulting in inadequate system functions, defects, looseness or breakage (Wen P, 2009).

#### 2.2.5 Ignoring the law of ecological chain

The ecological chain law refers to the influence of different educational environments on students in the ideological and political education ecosystem of colleges and universities. Ignoring the law of ecological chain leads to the division of time and space for all employees, and it is difficult to form a synergy. The speed of adjustment and reform of ideological and political education planning lags behind the reform of society.

### 3 The Upgrade Path of the 'Ecological Niche'

The effectiveness of the dissemination of ideological and political education for college students is not only reflected in the realization of social values such as the dissemination of social dominant ideology and value orientation, the function of political education, but also the realization of personal values (GUO Yi, 2016). In the process of college students' ideological and political education, it is necessary to identify the resonance point of college students' thoughts and the intersection of college students' interests, and to define the niche of each university student, considered the differences in the basic niche of each university student and the possibility of changes in actual and potential, respect the subjective status of college students, attach importance to the personality development and diversity needs of college students, and create an ecological environment suitable for the free growth of college students, so that each college student's niche enhancement ability is strengthened.

This paper mainly explains the upgrading path of the "ecological niche" of ideological and political education for college students through the theoretical application of niche separation, niche expansion, niche optimization and niche coordination. The theory of niche separation is the elimination of niche overlap and the generation of niche differences, mainly emphasizing the "The degree of separation of resources used by two species in resource series" to achieve dislocation development, that is, how to use limited resources in a specific environment. To reduce competitive exclusion and achieve symbiosis between species. The purpose of niche expansion is to open up new resources and living spaces for living things to maintain the dynamic balance of the entire ecosystem. Niche optimization optimizes its niche by improving the structure of its internal elements or improving external eco-environmental factors. The main purpose of niche coordination is to enable a species or population to maximize the use of matter and energy in the environment within ecosystems and to enable species in the natural ecosystems to co-evolve.

The "top limit" of population growth is analyzed from the niche dimension. The performance characteristics of this "top limit" are diverse, and the high overlap of niche within the limit threshold is also a feature. Therefore, ecological carrying capacity is an important condition for the rational layout of higher education niche. Among the elements of ecological carrying capacity, environmental carrying capacity plays a central role in the corresponding relationship between carrying capacity and niche. By improving the environmental carrying

capacity of various subjects in the ideological and political education system, the occupational niche of education is optimized. The pursuit for ecological evolution according with sustainable development of ideological and political education is also an environmental support for the optimization of the niche of higher education.

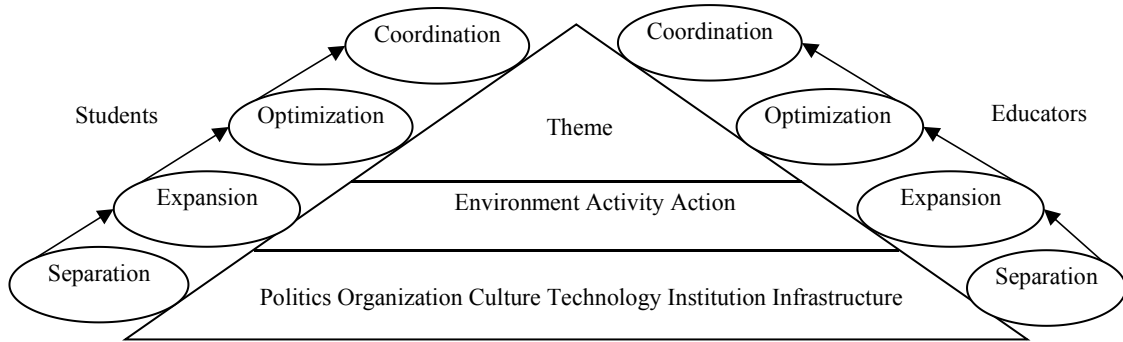

Figure 1 Niche Development Framework of Ideological and Political Education System

As shown in Figure 1, the politics, organization, culture, technology, system and infrastructure in the ideological and political education system are the basis of education, and synthesize the basic ecological factors of ideological and political education. Based on this, students and educators aiming at a certain theme, form environmental, behavior and activities according to the policy system. And each level involves the separation, expansion, optimization and coordination of the niche, which makes the ideological and political education system share a common vision and resources, thus expand the influence of ideological and political education.

Due to the complex dimensions of the educational ecosystem, the actual university ideological and political education will face many uncertain factors around students' mental health, academic development, career planning and personality development. The strength of ideological and political education has a direct influence on the niche. The niche breadth can characterize the extent to which an organism unit occupies a sequence of resources. The niche breadth of ideological and political education in colleges and universities can be quantitatively calculated by Levin formula.

$$B = \frac{1}{\sum_{i=1}^s P_i(s)} \quad (1)$$

In the above formula,  $P_i$  is the proportion of ideological and political education subjects in the  $i$  unit of a subject resource sequence;  $S$  is the total number of units of each subject resource sequence.  $B$  is in the range of  $[0, 1]$ ,  $B_{max}=1$ , the wider the niche breadth of ideological and political education, indicating that the higher the diversification of the subject resources utilization by the ideological and political education subject, the stronger the ideological and political education role; The closer to 0, the subject of ideological and political education is

less adaptable and weaker. The niche breadth of ideological and political education is static at a certain time point, but the niche breadth is in a random dynamic change as measured by the overall ecological dimension, showing the phenomenon of “generalization” and “specialization”. It can be obtained from the formula that with the expansion of the niche, the ecological complexity and diversity will be improved, and the resources and space that can be used will also be expanded, giving ideological and political education more space and mobilizing resources.

Batstone R T (2018) Used niche breadth theory to explain generalization in mutualisms. By viewing mutualisms through the lens of niche breadth evolution, Batstone R T outlined how the environment shapes partner availability and relative quality, and ultimately a focal mutualist's partner breadth.

## **4 The Ecological Niche Optimization Strategy**

### **4.1 Suitable misplaced participation**

Strive to maintain a balance between the internal tension of the ecosystem and the external environmental pressure. Regulate the disorder of various levels of relationships and ecological imbalances, attach importance to the internal tension of the ecosystem, and pay attention to external environmental pressures. Continuously optimize teaching methods, enrich teaching content, and establish a harmonious interaction between teachers and students. In the design of specific higher education governance process, the misplaced participation in different aspects of higher education governance should be realized, such as job experience among educators, student management experience, and activity planning training.

### **4.2 Step-by-step expansion of width**

Construct an ecological mechanism of “three in one” of schools, families and society. For college students at different stages, design a niche supplement program to strengthen the physical and mental perception of each educated person.

The prerequisite for realizing the ecological interaction between school, family and social education is the secret communication, intensive communication and continuous communication among the three. Support and encourage parents to actively participate in the schools' educational activities. We must actively promote mutual penetration and participation of families, schools and social education through various means, channels and channels, and promote mutual understanding, understanding and supervision of families, schools and society. Encourage parents to participate in school education's enthusiasm and initiative, and jointly strengthen the cultivation of students' ideological and moral qualities.

### **4.3 Breaking the negative effect cycle**

Use advanced thought and culture to occupy public opinion. Strengthen the positive guidance and propaganda work, create a healthy and harmonious campus public opinion environment, be highly vigilant against non-mainstream or wrong values intrusion to the audience, and open channels for weak opinions. The phenomenon of “silent spirals” often leads to unbalanced discourse imbalances in ideological and political education. Once a “silent spiral” is formed, educators cannot understand the true state of the audience's acceptance of

information, and only get false feedback (Tian Liangchen, 2016).

## **5 Conclusion**

In the same ecosystem, multiple species or populations will evolve different competitive strategies to have a better niche, and thus occupy more resources and adapt to a wider ecological space. Eventually they show commonality or similarity in the environment and resource dimensions, which is called niche overlap. Appropriate niche overlap can improve resource utilization, such as ideological and political material and facility sharing across sub-units. Through an ecological discussion on ideological and political education, this paper proposes several suggestions including suitable misplaced participation, step-by-step expansion of width and breaking the negative effect cycle, which could enhance ecological environment in universities. Moreover, some practices and survey on feedback of political education mode should be supplemented in the future study. The ecosystem is an open and dynamic system. Various ecological factors are externally driven by social development and technological renewal, and its internal systems are in a state of continuous evolution and optimization. As a subsystem of ideological and political education, it is also in a corresponding state of evolution. The formation of the niche of ideological and political education in colleges and universities is the result of interaction with factors such as environment and information resources. The ideological and political education in colleges and universities must adjust and optimize the educational content, educational methods and educational technology in real time according to the changes of the situation. If we maintain the inherent niche and do not adapt to the new ecological environment, we will eventually weaken our competitiveness and even be excluded from the network ecosystem.

# Institutional Transformation of Public Institutions to Enterprises

Xian Lei<sup>1</sup>, Wu Xiaoyan<sup>2</sup>

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 454573637@qq.com,1055383683@qq.com)

**Abstract:** With the deepening transformation of public institutions to enterprises, the institutional transformation of enterprises in China are facing severe challenges. This paper constructs the theoretical framework for public institutions into enterprises. Based on the existing research integration and in-depth interviews, this study takes Guangxi Geology & Mineral HuaDi Industry and Trade Group Co., Ltd. (“HD”) as an example to analyze the reasons and potential risks of the transformation. Using the starting-development-complement system transformation dynamic process, proposes the transformation framework of HD, and gives the policy recommendations that can be used for the transformation of the public institutions to enterprises.

**Keywords:** Public institutions to enterprises; Institutional transformation; Transformation framework; Case study

## 1 Introduction

Institution is not the subject of collective interests, but is created and reconstructed by a group of people. It is sometimes harmonious and sometimes conflicting (Figart, 2017). Studying institutional design and transformation can help us understand the changes that have taken place in enterprises (Thornton, 2012). A large number of scholars have studied the problems of enterprises in institutional transformation, convergence and countermeasures, which provide a theoretical basis for promoting the transformation of public institutions into enterprises.

Existing researches mainly focus on the institutional transformation of state-owned enterprises and private enterprises. The main reason for the institutional transformation of Guangxi Geology & Mineral HuaDi Industry and Trade Group Co., Ltd. (“HD”) is that the state promotes the transformation of public institutions. Based on literature analysis and in-depth interviews, this paper constructs a theoretical analysis framework for institutional transformation of public institutions. Taking HD as an example, it deeply analyses the process, path and potential risks of institutional transformation. Finally, it puts forward relevant policy suggestions for ensuring the success of institutional transformation of public institutions.

## 2 Literature Review and Theoretical Framework

### 2.1 Literature reviews

Overseas, public institutions correspond to non-profit organizations (NPO) and non-governmental organizations (NGO). Lakmal mentioned that NGOs and NPOs are facing a decline in government funding and the instability of limited resources as government support shifts and social expectations continue to rise (Lakmal, 2019). This is also the case in China. The government hopes to reduce

financial pressure and improve the efficiency of enterprises by transforming public institutions into enterprises.

In previous literature, there are different definitions of "institution". Bush believes that "institution" is a mode of behavior related to social regulations (Bush, 1987). Hodgson proposed that "the institution" is a common rule of interaction in society (Hodgson, 2006). This paper adopts North's viewpoint that institution is the norm of human behavior. In the enterprise institution, Lin studied the power sector in China, systematically understood the problems of the system, and pointed out the institutional form and effectiveness under the new model (Lin, 2019). Azaaviele pointed out the importance of institutional background for company development (Azaaviele, 2018). When there are bottlenecks or turning points in the development of enterprises, it is the focus of this paper that policy makers change the existing institution in order to bring enterprises into the right track as soon as possible.

Institutional transformation involves transformation, which is equally important for the study of institutions. It is becoming more and more important in strategic and organizational behavior research (Dean, 2010). Enacted through the system, constrains organizational behavior and safeguards organizational interests.

At the same time, previous studies did not clearly point out that institutional transformation has brought development to enterprises. The existing literature does not have a definitive framework for institutional research, and companies need a theoretical framework that comprehensively guides future work. Therefore, based on the study of the HD history and the existing institution, this paper analyzes the impact of internal and external environmental impacts on the system.

Based on the above theoretical basis, this paper proposes a start-development-complete institutional transformation research framework. This paper draws lessons from the combination of top-down institutional transformation and practice (Cloutier, 2016), emphasizing process analysis (Haigh, 2009). This paper mainly provides suggestions for institutional transformation from top to bottom and from the inside out from the perspective of the leadership of HD.

## **2.2 Theoretical frameworks**

Based on the integration of literature on enterprises institutional transformation, this paper compares the changes before and after enterprises institutional transformation, and provides some ideas for the transformation framework. At the same time, the feasibility of the theoretical framework is determined according to the in-depth interview method and the actual situation of the enterprise. Finally, the theoretical framework is revised according to the actual case. Through this series of processes, the theoretical framework of institutional transformation from starting-development-complement put forward.

As shown in Figure 1.

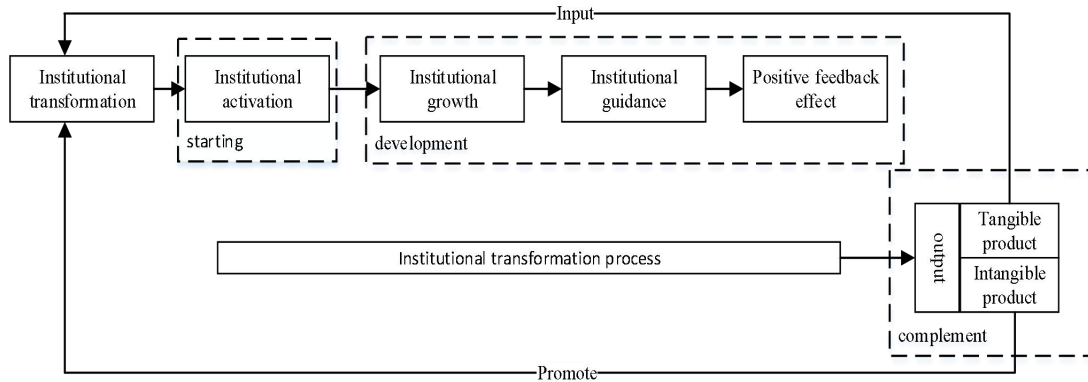

Figure 1 Institutional Transformation Model

### 3 A Case Study of HD Institution

#### 3.1 Overview of institutional transformation

This paper analyzes the public institutions, current enterprises, and HD from the perspective of property, governance structure, organizational structure and institution.

As shown in Table 1.

Table 1 Before and after the Transformation of HD

Compare Content	Public Institutions	Enterprises	HD
Property	State funding	Investor is clear	Investor isn't clear
Property	People	Separation of ownership and property rights	Property isn't clear
Property	/	Separation of decision-making power, executive power and supervision power	The three powers are not separated
Organization structure	/	Separate functions	Basic match
Organization structure	/	Unity of rights, responsibility, unity of interests	Incompatible
Organization structure	/	Crisscross	Basic match
Institution	/	Strategic management institution	Missing
Institution	Clear financial institution	Financial institution	Basic match

/	Market institution	Missing
Clear personal institution	Human resource management institution	No system
Clear security institution	Security institution	Basic match

Institution system is not perfect. With the reform of the government and the liberalization of the market economy, the drawbacks of public institutions have become increasingly prominent. First, the administrative functions of public institutions are not clear, and the overlapping of government subordinate units makes it difficult to carry out horizontal and vertical work. Secondly, past wages, finance, auditing and other institutions have not been applied to the market economy. Thirdly, in today's market segmentation, government functions are also broadening, and the more subdivided the institutions, the more serious the overlap of functions. Fourth, practitioners choose institutions because of this "iron rice bowl", the transparency of public institutions is not high, and the unit "big pot" is serious. Fifth, different units belong to different government departments and their functions are repeated.

Convergence of restructuring environment. Our country is moving from a planned economy to a socialist market economy. The open market environment requires enterprises to continuously improve product quality and service level in order to have their own place. The government receives market conditions and needs to change the original solidified structure to optimize the overall structure.

The personnel structure is redundant. The unclear structure of personnel causes financial waste and becomes an obstacle to government reform. At the beginning, most of the personnel of public institutions introduced "backdoor" and secondment by their relatives. The number of staff and registered personnel was too high, which was not conducive to the smooth development of the unit functions

### 3.2 Risk analysis of institutional transformation

Employee concerns. In the process of visiting, we can clearly feel the doubts and conflicting mentality of the employees of HD. The average age of HD staff is old. Most of them have been working in the institutions for a long time. The idea of "big pot rice" has been deeply rooted. At the same time, although HD has completed the transformation of enterprises, but the salary system still follows the public institutions. For enterprises, employees' salary mainly depends on their performance and encourages them to exert their greatest creativity. Secondly, the retirement security of retired employees. In the process of enterprise transformation, we should not only ensure the welfare of employees, but also ensure the interests of retirees.

Not suitable for market development. In the process of transforming public institutions into enterprises, it is necessary to change various institutions. Public institutions were born in the planned economy era. Institutional transformation needs to adapt to the development of market economy and adjust enterprises from function and structure. From a higher perspective, the state should not only take control of the functions of public institutions, but also bear part of the responsibility of transferring enterprises, and share some pressure for the public institutions. Such production and operation institutions such as HD after the transfer of enterprises, mainly create profits through their own operation and management. Such institutions are prone to capital chain breakage in the process of transferring enterprises.

Talent loss. Many employees choose to enter the public institutions because of the "iron rice bowl"

in the system. Most of them adapt to the comfortable and comfortable environment in the system and do not want to work hard. After the transformation, the company pursues high profits and high performance. The employees can't afford the work intensity and choose to return to the public institutions in other systems. After the transformation to the enterprise, there is no financial allocation, the enterprise's capital chain breaks the competitiveness, and the employees may choose stronger business employment. After the transformation of enterprises, different people will have different choices according to their own will. Whether or not they continue to stay in the enterprise after the transformation, they need to make reasonable and excessive arrangements. The stability of talents and the stability of capital are equally important to the development of the company and are the key factors in maintaining the competitiveness of the company in the market

E-commerce shocks. Flying Goose Mall, the pillar industry of HD, mainly adopts off-line store management mode, which is greatly impacted by e-commerce. With the rapid development of science and technology, people's shopping will mainly focus on the Internet world in the future, and the competitiveness of the offline market will be greatly reduced. At the same time, online shopping reduces the time and money costs of intermediaries' transactions and facilitates consumer purchase steps. Secondly, the convenience brought by online sales is widely recognized in consumption, and shopping habits and shopping preferences are deeply rooted.

### **3.3 Implementing path of institutional transformation**

#### **(1) Starting**

Institutional activation. In the transformation of public institutions into enterprises, not only the promotion of the external environment of the market, but also the driving force of the enterprises themselves is needed. People-oriented, unify the company's development and employee development, and enhance employee recognition, integration and support for the system. Ensure that the institution is implemented, comprehensive and systematic implementation. Promote the enthusiasm of employees through institutional activation. In the process of the transformation of the HD, employees were twisted into a rope to stimulate employee enthusiasm and potential creativity. Formulate effective reward and punishment measures to allow employees to dispel their concerns. Incentives are used to motivate employees' creativity, and punitive measures are used to regulate employee behavior, which will lay a solid foundation for the initial stage of transformation. At the same time, we will attract outstanding talents and continuously improve the work ability of employees to develop enterprises.

#### **(2) Development**

Institutional growth. On the basis of the existing institutions, through continuous growth, the system is perfected. Firstly, HD should pay attention to the existing institutions, continuously improve the institutions and gradually try it out. Secondly, the whole and internal components of the growth process are connected, interact and promote each other. For example, CCTV animation clearly distinguishes itself from modern enterprises in the transformation of enterprises, and does a good job of connecting itself. Thirdly, the whole and internal components of the growth process are connected, interact and promote each other. In this process, HD should pay attention to feedback and adjustment, collect opinions and suggestions from employees, and constantly improve and improve the existing system.

Institutional guidance. At this stage, the institution has been developed relatively well. Leaders actively guide employees to propose amendments to the institution that does not adapt to formal development, to ensure that the system does not deviate from the actual situation.

Positive feedback effect. After the initial stage of starting and development, a certain feedback mechanism is formed. On the one hand, it can reduce the loss of business operations, and on the other hand, motivate employees to work.

### (3) Complement

Output. Finally the sum of the tangible and intangible products created in the completion phase. The tangible products produced, such as the revised institution and the outstanding talents will be invested in the transformation of the institution. Intangible products such as corporate culture, employee enthusiasm, and employee cohesiveness promote the cycle of institutional transformation.

### **3.4 Guarantee measures for institutional transformation**

Take the improvement of the original online mall as a guarantee. Flying Goose Mall is the main business of HD. First, companies should provide more training for merchants and let them fully realize the popularity of e-commerce in life. Second, in the early stage of the website promotion, a large discount was used to provide personalized service to each user system and establish user loyalty.

Design of performance appraisal institution as a guaranteed. In the visit, the post-enterprise salary structure is a key factor in employee concerns. The assessment of the employee's situation is conducive to the company's leaders to understand the current situation of employees, work ability, and completion of work indicators.

Established with a good corporate image as a guarantee. Actively participate in activities such as donating blood, donating money, caring for the elderly, and establishing an excellent corporate spirit. Strengthen the construction of its own website, provide investors with more corporate information, and understand the dynamics of the company in real time.

## **4 Conclusion**

This paper takes HD as an example to explore the institutional transformation of public institutions to enterprises. The article takes the starting-development-complement as the theoretical framework, and proposes the system according to the comparison, transformation reasons and transformation obstacles before and after the transformation of HD. Transform the research framework and propose transformation guarantee according to its own situation.

Taking HD as an example, this paper hopes to provide reference for other public institutions to enterprises with guidance. At the same time, it also hopes to provide comparisons for other enterprises that have already transferred enterprises, analyze their own advantages and disadvantages, and effectively control their own internal and external environmental risks.

Because the institutional transformation model used in this paper is not a mature model of existing research, there may be some inapplicability to other enterprises. At the same time, this paper does not adopt a vertical analysis of the historical system of HD, and there are deficiencies in the case study.

## Influencing Mechanisms of Responsible Leadership towards Employees' Voluntary Green Behavior: A Multi-theory Perspective

Ma Ying, Naveed Ahmad Faraz, Cheng Yanxia, Hammad Mushtaq, Ali Raza

(E-mail: mying331@163.com, naveedahmadfaraz@outlook.com, chengyanxia221@126.com, hammadmushtaq@hotmail.com, ali\_khawaja818@hotmail.com)

**Abstract:** Environmental issues pose a great challenge for the sustainability of organizations. Employees' voluntary green behavior (EVGB) is indispensable in realizing the environmental sustainability goals of organizations. Building upon responsible leadership (RL), self-determination, and social identity theories we first examined the effects of RL on EVGB directly and then through the mediation of autonomous motivation for environment and leader's identification. Cross-sectional data from the dyadic sample of 357 subordinate-supervisors were collected from the Power Sector of Pakistan. Partial least squares structural equation modeling employed through Smart-PLS 3.2.8 software to analyze the hypothesized relationships. The results revealed interesting findings. Theoretical and managerial implications are offered along with the suggestions for future research.

**Key words:** Responsible leadership; Employees' voluntary green behavior; Autonomous motivation for environment; Leader identification

### 1 Introduction

The physical and psychological well-being and collective future of the humanity depends upon reinstating and reserving the quality of environment. Organizations significantly contribute in the climate change (Robertson & Barling, 2013). Environmental issues pose a great challenge for organizations and require considerable resources and capabilities to achieve a transition towards sustainability (Andersson, Jackson, & Russell, 2013). Corporate greening is one of the grave problems that organizational world is facing today (Andersson et al., 2013). Corporate greening objectives are widely recognized to be dependent on the employees' wide range of pro-environmental behaviors (Lülf & Hahn, 2014). Employees' inertia pertaining to the environmental issues had been a major concern for managers that lead to explore a wide range of research avenues in the hope of gaining a better understanding of the factors related to environmentally responsible behaviors. In recent years, there is a burgeoning scholarly interest to explore employees' pro-environmental behaviors (Yuriev, Boiral, Francoeur, & Paille, 2018) providing valuable insights on promoting employees' green behaviors at workplace. Despite progress on academic and business fronts, organizations continue to face significant human resource challenges in implementing environmental sustainability initiatives (Daily, Bishop, & Govindarajulu, 2009). EVGB is defined as green behavior involving personal initiative that exceeds organizational expectations including prioritizing environmental interests, initiating environmental programs and policies, lobbying and activism, and boosting others (Norton, Parker, Zacher, & Ashkanasy, 2015). The concept of EVGB closely aligns with the notions of pro environmental behaviors or organizational citizenship behavior for the environment (OCBE)(Norton et al., 2015). Leadership is considered to be at the heart to nurture individual, group and organizational outcomes (Yukl, 2013). Leaders are usually in a position to influence diversified organizational outcomes including environmental considerations (Priyankara, Luo, Saeed, Nubuor, & Jayasuriya, 2018). Albeit literature reported the influence of different leadership styles like transformational leadership, transactional leadership, ethical leadership, and spiritual leadership on employees' extra role behaviors towards the environment. Noticeably there is scarcity of research investigating the effect of responsible leadership on EVGB. Maak and Pless (2006) define RL as a "social-relational and ethical phenomenon, which occurs in social processes of interaction". They argued that the key distinction between other leadership styles and RL is the latter's focus on environmental and social objectives of sustainable value creation and positive change. Besides, responsible leaders can transform their subordinates' into other 'responsible leaders' who can further help others to engage in VGBs and contribute to the environmental sustainability. Hence, investigating the influencing mechanism of RL in relation to EVGB is genuinely justified.

Besides investigating the direct impact of RL on EVGB, a comprehensive understanding of the mechanisms through which RL predicts EVGB is also under consideration of this research. Autonomous motivation for the environment (AME) examined as mediator through which RL exerts its influence on EVGB. To enhance explanatory power of the research model and better understanding of the paths through which RL leads to EVGB, leader identification (LI) employed as another mediating variable. The theoretical lens for this research based on self-determination theory and social identity theory in addition to responsible leadership theory.

From the above discussion, this research aimed to offer three substantial contributions. At first, despite call for research to explore the influence of different leadership styles on EVGB (Norton et al., 2015), there is scarcity of empirical studies that examined the influence of responsible leadership on EVGB. Second, understanding the mechanisms through which leaders exerts their influence towards employees' outcomes is of vital importance for academicians and practitioners (Van Dierendonck, Stam, Boersma, De Windt, & Alkema, 2014). Third, this study is being conducted in Pakistan that is among the top in the list of badly affected countries due to environmental change and global warming. Thus, the context of this research is highly meaningful.

## **2 Literature Review and Hypotheses**

### **2.1 Responsible leadership and employees' voluntary green behavior**

EVGB refers to those discretionary actions of the employees that contribute to the sustainability of the environment and such behaviors are often not rewarded or required by the organization's formal reward system (Boiral, 2009). Employees' such behavior is a useful supplement to the environmental protection behavior of citizens and the green development strategy of the enterprise (Daily et al., 2009). Employees' saving paper in the workplace, reducing energy consumption, assisting colleagues to practice green behavior, and making environmental protection recommendations are typical examples of EVGB. Norton et al. (Norton et al., 2015) clarified that the concept of EVGB aligns closely with the notions of pro-environmental behaviors or organizational citizenship behavior for the environment. RL occupies a central position in the stakeholder relation network and plays a variety of roles (Maak & Pless, 2006). The key difference between RL and other traditional forms of leadership is its focuses on the society and the environment, sustainable value creation and positive change (Pless & Maak, 2011). Responsible leaders' considers the interests of various stakeholders related to the business and exchanges information and opinions with employees. Through such behavior, RL transmits relevant information to employees by interacting with them, and the subordinates gradually accept and internalize these values of the leadership through observing and imitating. Existing studies revealed that RL significantly affects various employees' outcomes including organizational citizenship behavior for the environment (Han, Wang, & Yan, 2019). In the light of this discussion, we hypothesize:

**H1:** Responsible leadership positively related to EVGB

### **2.2 Mediating role of autonomous motivation for the environment**

According to self-determination theory (SDT) there are three types of motivation that an individual can have namely: amotivation, autonomous motivation, and controlled motivation (Deci & Ryan, 2008). Autonomous motivation highlights that the self-determination of an individual that consist of identified motivation, integrated motivation and intrinsic motivation (Gagné & Deci, 2005). Under identified motivation, an individual performs those actions that are consistent with his/her goals and values. Within integrated motivation "people have a full sense that the behavior is an integral part of who they are, that it emanates from their sense of self and is thus self-determined" (Gagné & Deci, 2005). The last component of AM is the intrinsic motivation wherein people perform those actions that are inherently exciting or pleasing for them to involve in. Generally, people with AM experience self-endorsement or volition of their actions (Deci & Ryan, 2000). Leader's support for environment augments the sense of competence and autonomy of employees' which provides nutriments of autonomous motivation for the environment. Most recently, AME investigated as predictor of OCBE and a mediator in the relationship between RL and OCBE (Han et al., 2019). It is argued that autonomous motivation is one of the mechanisms through which RL would exert its positive influence on EVGB. Through internalizing the values of RL and aligning themselves with the environmental goals of such leadership, employees enhance their AME, which in turn further prompts the employees to participate in EVGB. Therefore, we hypothesize:

**H2:** Autonomous motivation for environment positively mediates the influence of RL on EVGB

### **2.3 Mediating role of leader identification**

According to social identity theory, identification is the process in which an individual forms a mental connection with “targets”, including organization, occupation, leaders, or co-workers (Scott, Corman, & Cheney, 1998). Among the different “targets”, leader identification implies that the ways in which subordinates emulate and learn from their leaders depend on the level at which those subordinates identify with their leaders (Li & Sun, 2015). RL transforms traditional leadership from the dyadic leader-follower model to leader-stakeholder interactions (Pless, 2007). As a key stakeholder, RL takes employees seriously and exerts its influence on employee self-concepts such as personal identification. Responsible leaders show commitment in articulating a promising vision and they also pay greater attention to the needs of their subordinates’. For example, responsible leaders are willing to produce humanized decisions, care about employee benefit and, if possible, seek mutually beneficial solutions (Pless, 2007). These measures express leaders’ concerns and attract employee sympathy, while increasing their sense of higher purpose. Employees’ identify more with leaders when their needs are satisfied (Van Knippenberg, Van Knippenberg, De Cremer, & Hogg, 2004). Under these circumstances, RL can increase employee-leader identification. Further, RL is seen as a leadership style of great charm because of its characteristics such as global view, CSR consciousness, long-term perspective, etc. In the presence of these characteristics, the emulation process will help subordinates foster a mental connection with responsible leaders. RL is likely to encourage employees to share the leader’s norms and goals, and thus, to incorporate the leader as an essential partner in their own self-identity. Social identity theory further proposes that when subordinates’ are feeling greater leader identification, they tend to be more willing to act on the leader’s behalf. Because they share similar interests with their leaders and treat the leader’s perspectives and beliefs as their own, they become inclined to imitate and respond to the leader’s values, norms, and visions to define their own job roles. More recently Zhao and Zhou (2019) found positive results where LI was investigated as a mediator between RL and OCBE. Thus, we hypothesize the following:

**H3:** Leader identification positively mediates the influence of RL on EVGB

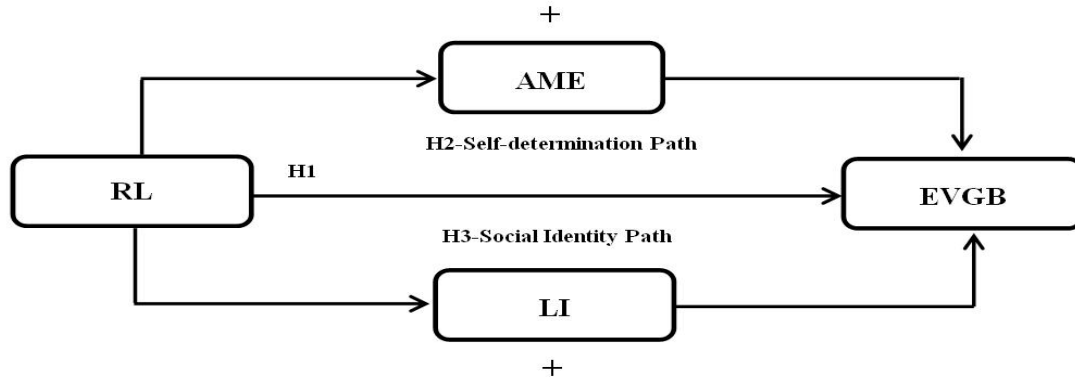

Figure 1 Theoretical Model

### 3 Methodology

#### 3.1 Sample and procedure

Data were collected from multi sources to alleviate the likely occurrence of the common method bias (Podsakoff, MacKenzie, & Podsakoff, 2012). Two separate questionnaires with the help of Google docs were prepared, one each for entry level officers (subordinates) and their immediate supervisors (Managers). The questionnaire for subordinates’ contains questions related to RL, AME and LI. On the other hand, the questionnaire for supervisors consists of questions related to EVGB. Webb-links of the questionnaires were sent to respondents through an email requesting their voluntary participation. Through systematic sampling technique, 701 subordinates and their immediate supervisors were selected as participants of this research. The final matched responses included a dyad of 357 ‘subordinate-supervisor’ with a response rate of 50.93 percent.

#### 3.2 Measures

All the constructs were measured on a 7-point Likert scale ranging ‘1’ strongly disagree to ‘7’ strongly agree. **EVGB** measured by the supervisors’ rating on a ten-item scale developed for organizational environmental citizenship behavior (Robertson & Barling, 2017). Employees assessed the level of **RL** of their immediate supervisors’ on a five-item scale developed by Voegtlin (2011). **AME** measured by the twelve-item from the Motivation towards Environment Scale of Pelletier, Tuson,

Green - Demers, Noels, and Beaton (1998). LI scale consisted of five-item adopted from the studies of (Mael & Ashforth, 1992) and (Shamir, Zakay & Popper, 1998).

**4 Results**

The analysis of this study was carried out by employing partial least squares structural equation modeling (PLS-SEM) through the Smart-PLS 3.2.8 software. In recent years PLS-SEM has shown its footprints over diversified management disciplines (Joseph F Hair, Sarstedt, & Ringle, 2019). A two stages approach namely (i) measurement model evaluation, (ii) structural model evaluation was employed to analyze the results of PLS-SEM.

**4.1 Measurement model evaluation**

In the evaluation of measurement model, distinction between ‘reflectively’ and ‘formatively’ designed constructs must be considered at the outset. All the constructs in this study were reflectively designed. The evaluation of the reflectively designed models in PLS-SEM ensured through individual indicator reliability, internal consistency-reliability of the construct, convergent validity, and discriminant validity (Joe F Hair, Risher, Sarstedt, & Ringle, 2018). At first, individual indicator reliability was examined by the standardized factor loadings. Reliability is established when an indicator has a standardized factor loading of  $\geq 0.708$  on its respective construct (Joe F Hair et al., 2018). Values of the factor loadings for all the constructs are presented in Table-1. Second step requires examining internal consistency/reliability of the reflectively designed constructs. The latest guidelines recommended the use of Dijkstra and Henseler (2015) ‘ $\rho_A$ ’ as an approximately precise measure. Third step requires establishing convergent validity of the constructs and for this purpose average variance extracted (AVE) is a widely used metric. Findings presented at Table-1.

**Table 1 Reliability, Convergent Validity, and Quality Indicators**

Construct	Loading (Range)	Cronbach’s ( $\alpha$ )	Rho-a	CR	AVE	R <sup>2</sup>	Q <sup>2</sup>
EVGB	[0.737, 0.876]	0.866	0.806	0.897	0.728	0.820	0.552
AME	[0.812, 0.875]	0.831	0.826	0.848	0.826	0.517	0.401
LI	[0.791, 0.827]	0.825	0.830	0.895	0.825	0.616	0.408
RL	[0.801, 0.859]	0.823	0.828	0.839	0.687	---	---

Lastly, to establish discriminant validity of the constructs, Henseler, Ringle, and Sarstedt (2015) proposed Heterotrait-monotrait (HTMT) ratio of the correlations. A threshold value upto 0.85 is recommended. The HTMT values are presented at Table-2.

**Table 2 Assessment of the Discriminant Validity through HTMT Approach**

Construct	AME	EVGB	LI	RL
Autonomous Motivation for Environment				
Employees’ Voluntary Green Behavior	0.825			
Leader Identification	0.803	0.811		
Responsible Leadership	0.815	0.702	0.815	

**4.2 Structural model evaluation**

The standard criteria for evaluating the structural model includes the statistical significance of the path coefficients ( $\beta$ ), the coefficient of determination (R<sup>2</sup>), the blindfolding based cross validated redundancy measure (Q<sup>2</sup>), and the effect size (f<sup>2</sup>). Values of all of these indicators are consistent with the established threshold. Results are presented at Table-3.

**Table 3 Results of Hypothesized Relationships**

Direct Path	$\beta$	t-Value	p-value	f <sup>2</sup>	Confidence Interval		Decision
					5 % LL	95 % UL	
RL -> EVGB	0.727	17.529	0.000	0.290	0.675	0.790	Supported
Indirect Path	DE	IE	TE	Confidence Interval		Nature of Mediation	
RL -> AME -> EVGB	0.053	0.419	0.725	0.332	0.513	Partial	
RL -> LI -> EVGB	0.053	0.253	0.725	0.162	0.348	Partial	

Note: LL (Lower limit), UP (Upper limit), DE (Direct Effect), IE (Indirect Effect), TE (Total Effect), and  $p < .01$  (one-tailed).

Figure 2 Structural Model

## 5 Conclusion

The results showed that 82% of the variance in EVGB was explained by RL, AME and LI. After introducing multiple mediators (AME & LI), the direct effect of RL on EVGB becomes non-significant which confirms that AME and LI fully mediate the relationship between RL and EVGB. This means that whatever the influence RL exerts on EVGB is through AME and LI. However, the mediation through AME yielded more values of  $\beta$  and  $t$  as compared to LI. Overall the results are consistent with theoretical underpinnings and empirical evidences.

Although, some studies have already investigated the impact of RL on concepts like OCBE, however, the first theoretical contribution of this study is that it is the pioneer to investigate influence of RL on EVGB. Secondly, this study employed self-determination and social identity theories to investigate the influencing mechanism of RL towards EVGB. Employing a multi-theory perspective is another unique contribution of this study. Lastly, the mediation results give deeper insights where AME is found to be more closely associated with RL and EVGB relationship as compared to leader identification. Moreover, the results also shown a full mediation model which highlights that whatever the influence RL exerts on EVGB is through AME and LI.

In the developing economies, organizations can enhance EVGB through RL. RL promotes employees' independent motivation for the environment and enhance their leader identification. Thus, there is dire need to emphasize the role of responsible leadership in the sustainable development of organizations. It is imperative to inspire the AME of employees' to engage in environmental activities. Responsible leaders can shift the continuum of employee's autonomous motivation from identified motivation to intrinsic motivation. RL also enhances EVGB through leader identification. Therefore, organizational leaders should pay attention on those attributes that can enhance their identification with their employees. An environment of trust, support, and satisfaction should be developed to encourage EVGB.

Besides above mentioned theoretical and managerial implications, this study also has some limitations. At the outset, it is accepted that this is a cross-sectional study and hence lacks in proving causality. This limitation can be undermined through a longitudinal research design. Further, this research investigated the role of only two mediators (AME & LI); future research should include additional mediators and moderators to enrich understanding about the RL and EVGB relationship. Lastly, this research included employees only from the Power Sector of Pakistan. Inclusion of multiple industries and contextual settings will enhance the generalizability of our findings.

# Research on the Relationship between Work Stress, Psychological Capital and Turnover Intention of Frontline Service Personnel

Xiao Shuzhen, Qin Yuanjian

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 2725626785@qq.com, qyjhb@163.com)

**Abstract:** This paper takes the frontline employees of China's service industry as the research object, and uses questionnaires and field interviews to explore the relationship between employees' work stress, psychological capital and turnover intention from the perspective of psychological capital theory. The results show that work stress correlates with employee turnover intention significantly and positively; employee's psychological capital plays a mediating role between work stress and turnover intention. This study is important for service industry practitioners looking for solutions to work stress and turnover.

**Key words:** Work stress; Psychological capital; Turnover intention; Frontline service personnel

## 1 Introduction

The departure of qualified employees is a headache for any business, and previous research has shown that one of the most important factors that disrupt employees is work stress. As we all know, high levels of work stress can easily induce physical and psychological problems for employees, which in turn leads to a series of problems such as work slack and turnover. There are two ways to effectively address employee turnover: reducing workplace stress and increasing employee stress tolerance.

With the rising of positive psychology and active organizational behavior, psychological capital has been widely concerned by scholars at home and abroad. Psychological capital transcends human capital and social capital and is a core positive psychological element that can be effectively developed and managed and can have a significant impact on individual performance (Luthans, Youssef, & Avolio, 2007). Some scholars believe that psychological capital affects employees' attitudes toward work and increases employee endurance (Avey, J. B. et al., 2009). Some scholars have confirmed that psychological capital can positively predict employee organizational citizenship behavior and negatively predict employee cynical and anti-production behavior (Avey, Luthans, and Youssef, 2010). Some Chinese researchers have explored the relationship between teachers' psychological capital and professional well-being. It is found that psychological capital promotes professional well-being through energy supplementation and motivation-inducing dual processes, and in the context of Chinese culture, interpersonal psychological capital (compared to transactional psychological capital) has a greater impact on professional well-being (Wu Weijiong et al., 2012).

This research is important because there is some room for development in the subject of observation. The existing research on the problem of this paper mostly carried out within the framework of Western culture, and the research in this paper mainly develops some arguments within the framework of Chinese culture. According to Hofstede's research, Chinese culture differs from other cultures in collectivism and has a high avoidance rate in terms of ambiguity and power distance (Lerner W J, Berry J W, Hofstede G H., 1981). Just as centralized decision made, strong leadership and limited empowerment are prominent features of Chinese culture. Therefore, testing the results of Avey et al, in a

culture different from the West, will make a significant contribution to the existing literature on this topic, both in terms of norms and values.

In addition, the object of this research - frontline service personnel, which characterized by high contact and interaction between employees and customers. The mistakes of employees in the service industry directly affect customer satisfaction, and the work stresses quite high, too. The results of this research can help organizations implement preventive measures or develop actions to reduce employee stress levels at work and separation from work stress. A reduction in work stress will also result in a worker's reduced level of error, resulting in a high level of customer satisfaction.

## **2 Theories and Hypotheses**

### **2.1 Work stress and turnover intention**

The turnover intentions defined as the probability that an employee will leave his or her job within a certain time/period (Chao M C et al., 2015). In short, turnover intention refers to the idea or willingness of an individual that want to leave the current job and look for other job opportunities. Turnover intention has been widely shown to be an important, practical antecedent variable of turnover and is the best predictor of actual turnover behavior. The turnover of employees is mostly unpredictable and often unwilling to see. Employee turnover will bring a series of costs to the organization, including acquisition costs, development costs, vacancy costs, mental impact on other employees, and threats to the company after knowledge workers (such as important technologies or trade secrets Leaked, customer lost), opportunity cost, etc.

As stress becoming more prevalent, research on stress and turnover tendencies has increased. Work stress is the change and reaction process of employees' physical, psychological and behavioral problems caused by stressors from inside or outside the employee's individual during work (Büssing A et al., 2017). Work stress is the product of the interaction between people and the environment. Existing research has shown that employees with higher pressures have higher dissatisfaction with the workplace and are more likely to lead to career withdrawal. For example, two Chinese scholars used the Guangxi Provincial Hospital as an example to study the relationship between work stress and turnover intention. The results show that work stress have a positive impact on turnover intention(Lin Yuanjie and Li Guangyu, 2018). Li conducted research on the work stress and turnover intention of 153 middle managers in private enterprises. The results showed that work stress correlate with turnover intention positively and had a positive predictive effect on turnover intention(Li li, 2017). Therefore, forming the following hypotheses:

H1: Work stress correlate with turnover intention positively.

### **2.2 Work stress and psychological capital**

Work stress refers to factors that affect the work of the members of the organization. These factors act on the members of the organization and cause them to produce abnormal psychological performance, physiological performance and behavioral performance(Han Ping et al.,2017).Studies have shown that organizational trustcorrelatewith work stress significantly and negatively, and psychological security plays a mediating role between organizational trust and work stress (Han Ping et al.,2017).In the context of the positive psychology movement, Luthans et a proposed the concept of psychological capital and

defined it as “an individual’s positive psychological state of development” that is characterized by self-efficacy, optimism, hope and resilience(Luthans et al., 2017).

Although the number of studies on stress and its coping strategies has been increasing, research on the causes of stress, coping mechanisms, and methods for effective management of stress are still insufficient. Psychological capital considered as a very important variable in dealing with stress. People believe that psychological capital can improve by training, and plays an important role in reducing the cause of stress, gaining resilience and fostering a positive working attitude (Luthans, F.et al.,2008). Based on the theory of resource conservation and social exchange theory, Song Yuan explored the impact of work stress on employee behaviors, and constructed a research model of psychological capital mediated work stress and employee behavior. The results show that psychological capital has a negative impact on work stress(Song Yuan, 2018). Fu Yao et al used knowledge surveys and multi-level regression analysis methods to study the relationship between work stress, work input and psychological capital of knowledge workers. The results also show that psychological capital has a negative impact on work stress(Fu Yao et al., 2017). Based on theoretical interpretations and research results, forming the following hypotheses:

H2: The psychological capital of employees will have a negative relationship with their work stress.

## 2.4 Psychological capital and turnover intention

At present, there are relatively few articles directly studying psychological capital and turnover intentions. Most studies focus on the process of negative adjustment of psychological capital to turnover. For example, there is a scholar pointed out that psychological capital regulates the effect of organizational support on turnover intention, and psychological capital reduces the high turnover intention when organizational support is low(Ipek, 2014). People who are satisfied with work and the workplace are less likely to leave, which indicates the positive impact of psychological capital on turnover intention. In fact, as Avey et al had confirmed, psychological capital has a negative impact on employee turnover and the tendency to find new jobs(Avey et al., 2009). Two Chinese scholars conducted a survey of 224 special teachers in Hebei Province, and found that the psychological capital of the special post teachers correlate with their turnover intention negatively(Yan Xiaojun&Zeng Xiaojuan, 2018). Wei Fengxu surveyed knowledge workers in different industries and regions, and found that psychological capital has a significant negative impact on employee turnover intention(Wei Fengxu, 2017). Therefore, forming the following hypotheses:

H3: The psychological capital of employees correlate with their turnover intention negatively.

Because psychological capital has an impact on turnover intention and work stress, and because work stress has an impact on turnover intention, the impact of a certain degree of psychological capital on turnover intention may transfer through work stress. Therefore, in order to verify this point, forming the following hypotheses:

H4: Work stress mediates the relationship between psychological capital and turnover intention.

The following is the research model of this paper.

Figure 1 Research Model

### 3 Data and Methodology

#### 3.1 Data collection

The survey respondents are mainly frontline service personnel. The survey covers a wide range of industries, including catering, clothing, and tourism. The way of collecting data in this study are questionnaire survey and field interview. The questionnaires were answered anonymously. The questionnaires conducted in a small-scale pilot survey firstly, if it is feasible, then to carry out large-scale distribution. There are 400 questionnaires were distributed, 324 were recovered, and 275 valid questionnaires were obtained. Among them, there are 98 males and 177 females, and the age group is concentrated between 20 to 45 years old, mostly college degree or below.

#### 3.2 Measurements

Independent variable: work stress. Using the Occupational Stress Indicator (OSI). Work stress measurement system mainly including the work itself, the work stress source outside the work itself, the evaluation of the stress strategy method, and the impact of stress on the individual (Cooper, Cary L., 2013). The measurement of the four major parts, a total of 23 topics.

Mediator variable: psychological capital. In order to determine the level of psychological capital of employees, we used the psychological capital scale developed by Luthans et al. The 24 mental capital scales consist of four parts, including hope, self-efficacy, resilience and optimism, each of which contains six projects (Luthans et al., 2008).

Dependent variable: turnover intention. The current turnover scale which widely accepted by foreign scholars was developed by Mobley. Mobley believes that employees' turnover intention can change their organizational cognition, generate exit ideas, find new jobs, and find new jobs (Mobley, 1997). The measurement of the four aspects. The scale is widely used and the reliability and validity are creditable.

All survey items are using the Likert 5-point scale to score. The Likert 5-point scoring standard has the following meanings: 1 means "completely disagree" and 5 means "completely agree". We used SPSS software 22.0 in data processing. The analysis methods of data including reliability and validity

analysis, descriptive statistical analysis, correlation analysis, and simple multiple linear regression analysis.

## 4 Results

### 4.1 Reliability and validity analysis

The KMO values of all the scales were above 0.7, the Cronbach coefficients of the work stress scale, the psychological capital scale, and the turnover intention scale were 0.804, 0.873, and 0.902, which indicating good internal consistency. Since all measured subjects from the maturity scale, we used the confirmatory factor analysis (CFA) to evaluate the discriminant validity between variables, and used the Mplus7.0 software to compare the three-factor, two-factor and single-factor models. As shown in Table 1, the three-factor model has the best fitting effect (CFI=0.92, TLI=0.91, RMSEA=0.08). This shows that there is a high degree of discriminant validity between work stress, psychological capital and turnover intention, and further statistical analysis can be carried out.

**Table 1 Confirmatory Factor Analysis (CFA)**

Model	$\chi^2$	df	CFI	TLI	RMSEA
Three-factor model	481.85	183	0.92	0.91	0.08
Two-factor model	1078.42	186	0.76	0.73	0.14
Single-factor model	1416.75	189	0.67	0.63	0.16

### 4.2 Descriptive statistics and correlation analysis

The results of the correlation analysis of the study variables are shown in Table 2. As we can see from Table 2, the work stress and turnover intention were significantly and positively correlated ( $r=0.74$ ,  $p<0.01$ ), and had a significant negative correlation with psychological capital ( $r=-0.605$ ),  $p<0.01$ ). There was a significant negative correlation between psychological capital and turnover intention ( $r=-0.725$ ,  $p<0.01$ ).

**Table 2 Mean, Standard Deviation and Correlation Coefficient of Study Variables**

Variables	Mean	SD	1	2	3
Work stress	3.64	0.87	1		
Psychological capital	4.05	0.79	-0.605**	1	
Turnover intention	4.17	0.86	0.74**	-0.725**	1

notes: \*\* $p<0.05$ ; \* $p<0.1$ (Two-tailed).N=275.

### 4.3 Hypothesis testing

This study analyzed the 275 valid questionnaires that we collected to examine the main effects of work stress and turnover intention. We also examined the mediating role of psychological capital in work stress and turnover intention. In this study, the hypothesis was tested by using the hierarchical regression method. The results are shown in Table 3.

**Table 3 Hierarchical Regression Results**

Variables	Psychological capital			Turnover intention		
	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
1. Control variables						
Gender	0.05	0.02	0.01	0.05	0.03	0.02
Age	0.04	0.04	0.01	0.04	0.04	0.02
Education	-0.04	-0.01	-0.02	0.06	0.08	0.08*
2. Independent variable						
Work stress		-0.66***		0.74***		0.46***
3. Mediating variable						
Psychological capital					-0.43***	0.37***
R <sup>2</sup>	0.08	0.24	0.31	0.08	0.26	0.31
Adj. R <sup>2</sup>	0.01	0.16	0.29	0.01	0.23	0.27
F	2.083*	18.199***	2.98**	20.642***	27.081***	46.016***

notes: \*\*\*p<0.01; \*\*p<0.05; \*p<0.1(Two-tailed). N=275.

#### 4.3.1 Main effect

In the model of Table 3, gender, age, and education level are control variables. Model 3 is the relationship among control variables and turnover intention. Model 4 added independent variables and dependent variables. The results show that work stress has a positive impact on employee turnover intention ( $\beta=0.74, p<0.01$ ). Thus, Hypothesis 1 is supported.

#### 4.3.2 Mediating effect

As mentioned earlier, we already know that work stress related to turnover intentions significantly and positively. In order to test the mediation effect, we still need to take three steps.

First, we tested whether the mediator is affected significantly by the independent variables. As shown in Table 4, Model 2 is a regression model of the psychological capital independent variable. The results reveal that work stress is significantly negatively correlated with psychological capital ( $\beta = -0.66,$

$p < 0.01$ ). Therefore, Hypothesis 2 is supported.

Second, we tested whether the mediator has a significant effect on the dependent variable. Model 5 shows a significant negative correlation between psychological capital and turnover intention ( $\beta = -0.43$ ,  $p < 0.01$ ), which means that the higher the psychological capital level of frontline service personnel, the lower their turnover intention. Therefore, Hypothesis 3 is supported.

Third, we put the mediator into the equation at the same time and tested whether the independent variable still significantly affects the dependent variable. Compared with model 5, after adding mediator variables, the positive impact of work stress on turnover intention is weakened ( $\beta = 0.46$ ,  $p < 0.01$ ), indicating that psychological capital plays a partial mediating role between work stress and employee turnover intention, and Hypothesis 4 is supported.

## 5 Conclusions

This study focused on the relationship between job stress, psychological capital and turnover intention of the frontline service personnel and the possible mechanism of action. It is expected to achieve the goal of further reducing the turnover intention by intervening psychological capital level.

### 5.1 Theoretical significance

The analysis results show that there is a significant relationship between the three variables. First, work stress correlates with employee turnover significantly and positively. The greater the work pressure, the mental state and physiological state of the employees cannot be guaranteed, it is easy to occur late, early leave, absenteeism, and even leave, and other counter-productive behaviors. This conclusion is consistent with previous studies. Second, work stress correlates with employee psychological capital negatively. The higher the level of psychological capital, the stronger the self-regulation ability and the higher the ability to withstand stress. Finally, psychological capital correlates with turnover intentions negatively. Psychological capital plays a mediating role between work stress and turnover intention. That is to say, psychological capital can improve employees' ability to withstand stress to a certain extent, and alleviate the tight mental state of employees, thereby reducing a series of absenteeism and turnover intentions.

### 5.2 Managerial implications

Analysis of the research data demonstrates that lowering employee stress levels by raising employees' psychological capital levels, initial expectations of implementing preventive measures or taking action may help reduce employees' turnover. Some HR departments will adopt some methods before they finally decide to recruit. One way is to conduct some tests on potential candidates during the recruitment process to determine their ability to withstand stress. Unfortunately, in these tests, some candidates were disqualified due to their weak stress. However, these candidates can get professional assistance to strengthen their ability to withstand stress. Therefore, psychological capital helps to increase an individual's resilience threshold by providing them with resistance to stress skills and it has been seen as a very important factor in this regard. With the help of training programs, applicants with weaker resistance to stress are no longer as barriers to the workplace. Department managers and HR departments should consider these conclusions more seriously.

## 5.3 Limitations and future prospects

One limitation of this study is that employees have predicted their perception of stress levels. This is a very important limitation considering the psychological state of the participants at the time of the survey and the stress in life. Another limitation is the employee's tendency to quit. Many employees may not be honest with their ideas because they are afraid to be known by their superiors, even though they were told that their identity would be kept confidential. At the same time, the research framework of this paper is relatively simple, and can be discussed in more detail and in-depth in future research.

There is a need to strengthen longitudinal tracking and intervention research on psychological capital. Most of the existing researches use horizontal research, and there are few longitudinal tracking studies, which are difficult to reveal the dynamic laws and specific mechanisms of psychological capital development. Therefore, on the one hand, longitudinal research on psychological capital should be intensified (such as investigating the cross-time effect of psychological capital through multiple measurements). On the other hand, intervention experiments should be conducted for different groups to reveal the specific mechanisms of psychological capital and the utility of intervention.

## Research about Precision Incubation Model of Innovation and Entrepreneurship Based on the Incubation Network

Wen Ge, Xia Yongmei, Huang Yangbo, Han Yu

School of Management, Chengdu University of Information Technology, Chengdu, P.R.China, 610103

(E-mail: 8829177@qq.com, 1061525967@qq.com, 404387471@qq.com, 2443326672@qq.com)

**Abstract:** Traditional incubation network emphasizes the link function of network resource, ignores the supply ability and actual demand of network members, and lacks precise and effective resource matching. In this paper, the causal analysis method of system dynamics is used to analyze the main influencing factors in incubation network. It further analyses the recognition and matching mechanism of precise incubation and constructs the framework of precise incubation network platform. The function orientation of precise incubation network platform is to integrate different incubating functions, refine incubation services, avoid information asymmetry, and provide highly matched cooperation between supply and demand in the incubation process, to solve the contradiction that single incubator cannot meet the needs of incubating enterprises and form idle resources or insufficient resources.

**Key words:** Innovation and entrepreneurship; Precision Incubation; Incubation Network; System dynamics

### 1 Introduction

Innovation and entrepreneurship incubation promote all kinds of ideas and projects to stand out, so that start-ups can improve the speed of development and build stronger vitality. Incubator organically links scientific and technological innovation with the growth of industrial economy and becomes the key link of national innovation system (Baraldi, 2016). Incubator achieves information and knowledge transfer and improves incubation efficiency by continuously improving the process of enterprise residence and graduation, building platform for start-up enterprises and resource sharing platform (Vanderstraeten et al., 2014). At the same time, the growth of enterprises has its own regularity. Simply emphasizing resource support is not conducive to the effective growth of start-up enterprises, but will cause the waste of entrepreneurial resources (Dirk, 2015). The process of entrepreneurship is a complex and dynamic process. Enterprises in different growth stages should adjust dynamically. As incubators, they should make corresponding adjustments to match the development of enterprises.

According to China's "Thirteenth Five-Year Plan for the Development of National Science and Technology Business Incubators", by the end of 2020, there will be 10,000 entrepreneurship incubators, more than 1,500 state-level incubators and more than 3,000 state-recorded incubators. Faced with such a huge number of innovative and entrepreneurship incubators, how to provide precise and targeted services according to the actual needs of different stages of business activities from the "demand side" is an important issue facing the incubator platform. Accordingly, this paper analyses the dynamic mechanism of each element in the incubation network, studies the precise identification mechanism of supply and demand and the precise matching mechanism of supply and demand, and puts forward the framework of precise incubation platform, which has three functions. One is to put the specific services

provided by multiple incubators on one platform, the other is to link incubating enterprises on the network platform, and the third is to provide incubation services according to the specific needs of incubating enterprises in different development periods. This study has a certain reference value for the rational and effective use of limited resources to achieve precise service in the incubation of innovation and entrepreneurship.

## 2 System Dynamics Analysis of Main Influencing Factors in Incubation Network

### 2.1 Causality diagram of elements

As a platform of social resources integration, incubator can conclude the competitive and cooperative relationship between upstream and downstream enterprises, and establish a platform of production, education and research among universities, research and development institutions and enterprises (Zhou Jianhua et al., 2011). Incubation network is an organizational network with resource sharing effect produced by the close cooperation between incubator and other kinds of behavior nodes in the network. (Tiago et al., 2010). Incubator operation capability enhancement is the core driving force of regional incubation network collaborative innovation. With this goal, local governments, incubators and related auxiliary entities are unified in the framework of collaborative innovation system (Li Zhenhua et al., 2016). incubating enterprises or project and the incubation chain constitutes the core of the incubation network, which includes links with the government, universities and research institution, financial institutions, intermediaries, and trade associations. These links have a systematic impact on incubating enterprises through incubators. At the same time, resource complementarity among incubating enterprises will affect the evolution effect of incubation network (Zhang Han et al., 2014). The causality of each element of incubation network is shown in Figure 1.

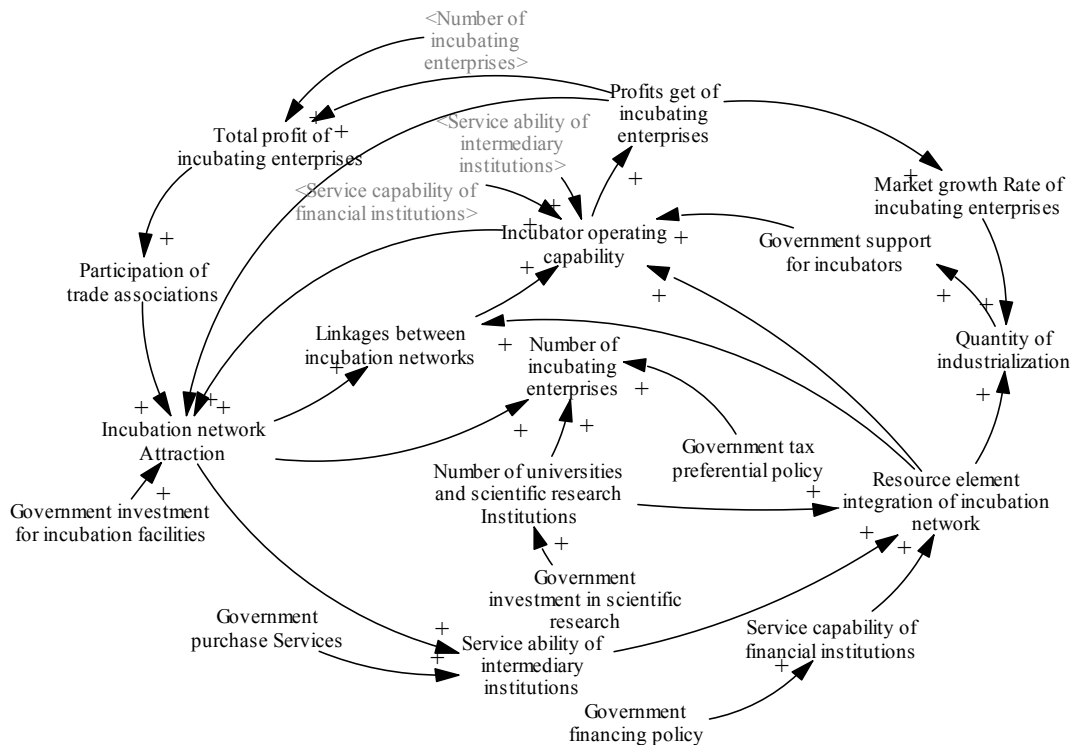

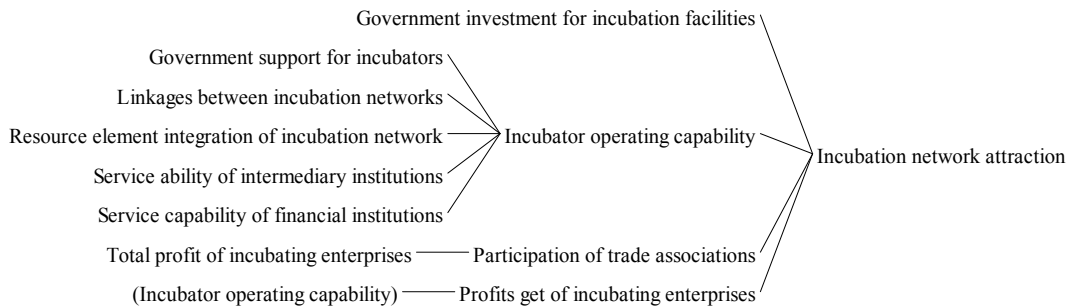

Figure 1 Causality Among Elements in Incubation Network

This is a positive feedback system with 24 elements, forming a positive feedback loop, each of which reflects the interaction between the elements. Among them, there are four direct factors affecting the attractiveness of incubation network, namely, the profit gets of incubating enterprise, the incubator operation, the government investment for incubator facilities, and the participation of trade associations. There are six indirect influencing factors, namely, service capability of intermediary institutions, linkages between incubation networks, resource elements integration of incubation network, and government support for incubators.

**2.2 Analysis of the dynamic mechanism of the attraction of incubation network**

There are four direct factors affecting the incubation network attraction, which are government investment for incubation for facilities, incubator-operating capability, participation of trade associations, and profits get of incubating enterprises. There are six indirect influencing factors, namely, government support for incubators, linkages between incubation networks, resource element integration of incubation network, service ability of intermediary institutions, service capability of financial institution, and total profit of incubating enterprises. As shown in Figure 2. Incubation networks need to pay attention to these factors if they want to enhance their attractiveness. Among these factors, the operating capacity of incubator is within its control. It can be improved by choosing intermediary agencies, establishing good incubation network relationship and strengthening communication with the government. The government's investment in incubation facilities is uncontrollable by themselves, because it is influenced by many factors such as national policy, financial budget and so on.

**Figure 2 Cause Tree Analysis of the Incubation Network Attraction**

At the same time, the incubation network attraction will have a direct impact on the linkages between incubation networks, number of incubation enterprises and service ability of intermediary institution, and indirectly affect the incubator operating capability, total profit of incubating enterprises, and resource element integration of incubation network. Shown as Figure 3. Combining with the analysis of Figure 2, it can be found that the incubation network attraction is not only affected by the service ability of intermediary institutions, but also affect it, which cause a positive feedback. Therefore, the incubation network needs to make a thorough investigation and be cautious when introducing intermediary service institutions. After introducing intermediary service institutions, it needs to cooperate sincerely with intermediary service institutions and make win-win situation.

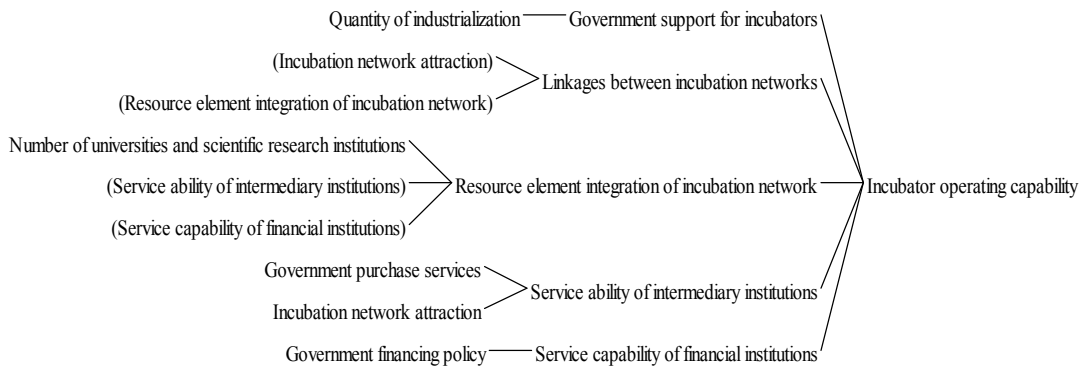

**Figure 3 Result Tree Analysis of the Incubation Network Attraction**

**2.3 Dynamic mechanism analysis of incubator operating capability**

There are five direct factors affecting incubator's operation capability, namely, government support for incubators, linkages between incubation networks, resource element integration of incubations, service ability intermediary institutions, and service capability of financial institutions. There are also five indirect factors, namely, quantity of industrialization, number of universities and scientific research institutions, government purchase services, and government financing policy. As shown in Figure 4. There are many factors affecting the operation ability of incubators. It is obvious that the operation of incubators is a systematic project. It is not only to select the incubated enterprises or projects, but also to carry out the work from all directions and from many angles. Incubator can further establish the index system of self-operation ability, analyze its advantages and disadvantages one by one, make up for the shortcomings and improve the operation ability.

**Figure 4 Cause Tree Analysis of Incubator Operating Capability**

At the same time, the incubator operating ability directly affects the incubation network attraction and the profit of incubating enterprises, and indirectly affects the linkages between incubation networks, number of incubating enterprises, service ability of intermediary institutions, market growth rate of incubating enterprises and total profit of incubating enterprises. As shown in Figure 5.

**Figure 5 Result Tree Analysis of the Incubation Operating Capability**

### 3 Analysis of Recognition and Matching Mechanism of Precision Incubation

#### 3.1 Accurate identification mechanism of supply and demand

Simply increasing the supply of entrepreneurial resources does not bring about changes in the number of incubating enterprises and hatched rate. Only by combining the supply of entrepreneurial resources with the promotion transformation ratio of enterprises in each stage can improve the efficiency and income of entrepreneurial incubation (Zhang Baojian et al., 2017). It can be seen that accurate identification of supply and demand is the premise of effective resource provision of incubators. In order to realize the accurate identification of supply and demand, On the one hand, it should have the data about incubating enterprises for incubating enterprises from gestation period to establish a detailed database. It contents mainly three aspects. Firstly, the basic information of an enterprise, include registered capital, shareholder structure, industry structure, enterprise type and business scope. Secondly, the business data of an enterprise, include market share, market growth rate, sales revenue, and profit and tax payment. Thirdly, the management data of an enterprise include its organizational structure, number of enterprises, personnel structure and personnel increase or decrease, etc. On the other hand, it should have data about hatching which also contains three aspects. One is the detailed decomposition of services provided by incubators within or even across regions; the other is the latest developments of industries or industrial technologies in the whole country; and the third is successful incubation cases at home and abroad. These data are the basis of accurate identification. The finer the classification, the more real the data, and the stronger the recognition ability. Through the coupling of supply and demand data, the accurate identification can be achieved, as shown in Figure 6.

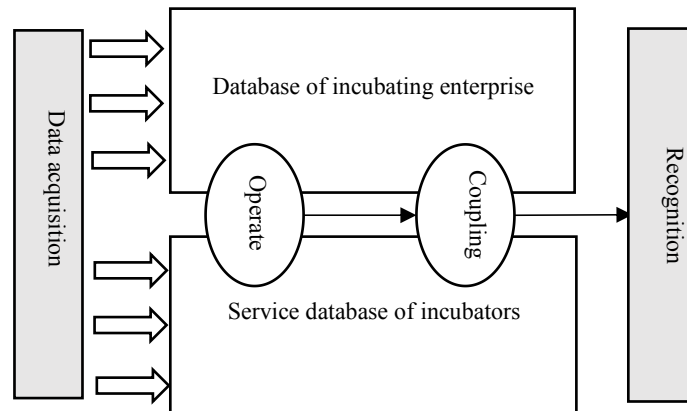

Figure 6 Accurate Identification Mechanism of Supply and Demand

#### 3.2 Precise matching mechanism between supply and demand

In the process of incubation, because the policies supporting SMEs are not clear, the driving force of incubators is insufficient, and the effect of resource investment is not clear, the establishment of incubation network relationship and the resource allocation are greatly uncertainty. Therefore, incubators and incubating enterprise will pay more for this. On the other hand, in the process of incubation cooperation, information asymmetry is also a problem that perplexes incubators and incubating enterprise, forming obstacles to effective cooperation between them. It is necessary to improve the efficiency of incubation services by effectively matching service providers and consumers and choosing appropriate service implementation paths to reflect the customization of service content and process (Zhang Li et al., 2018). In the incubation network, there are such situations. Firstly, multiple

incubators will provide the same incubating enterprise. Secondly, different incubators will provide different services even for the same incubating enterprise. Thirdly, different institutions provide different services for same demand. Fourthly, the demands of incubating enterprises are different. Fifthly, Even if the demand is the same, the effect of the same service is quite different due to the differences of the industry, scale, product characteristics and managers of the enterprise. Precise matching of supply and demand is to solve the waste of resources caused by uncertainty and information asymmetry, so that incubators can provide accurate services for incubating enterprises. When matching, big data is needed to calculate the data of incubating enterprises and the specific services of incubating institutions. At the same time, we also need to refer to the relevant case base to predict the effect of service matching, as shown in Figure 7.

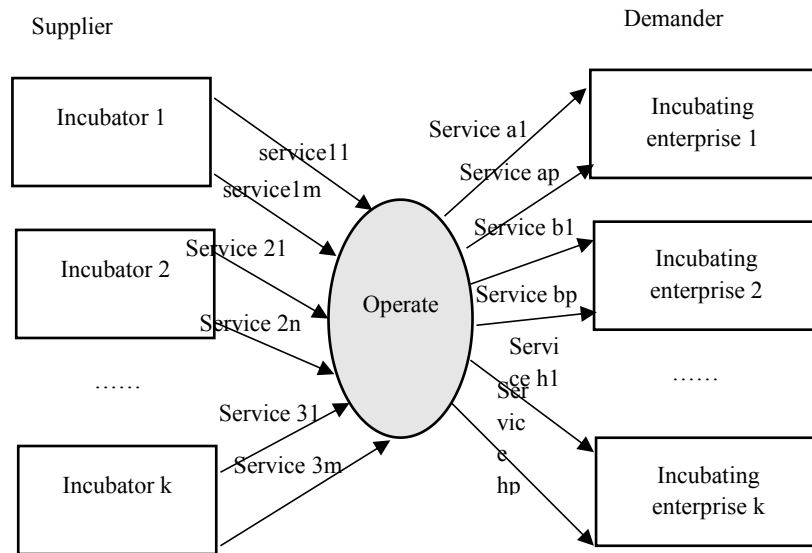

Figure 7 Precise Matching Mechanism Between Supply and Demand

## 4 Construction of Precision Incubation Network Platform Framework

### 4.1 Functional orientation of precision incubation network platform

At different stages of the development of incubators, the demand for the use of incubating resources is changing (Cheng Xiaoxiao, 2016). There are three functions of the Precision Incubation Network Platform. One is to put specific services provided by multiple incubators on one platform. Second, the incubating enterprises will be linked to the network platform. Thirdly, according to the specific needs of incubating enterprises in different development stages, it should provide incubation services in a targeted manner.

Unlike traditional incubation networks. First, on the precise incubation network platform, the specific services provided by incubators need to be refined as much as possible. On the one hand, due to different specific needs of different incubating enterprises, on the other hand, based on resource saving, it is reflected in reducing costs for incubating enterprises and reducing waste for incubator's resource. Secondly, it is able to accurately judge the development stage of incubating enterprises, complete recording and analysis of data, suggesting for incubation service demand of incubating enterprises, which is important, because many enterprises are unable to carry out objective quantitative analysis of themselves. Thirdly, the matching of incubation services must be targeted.

#### 4.2 Network architecture model

Network architecture model is divided into three layers, which is core layer, support layer and external environment layer. The core layer is mainly the interaction between incubator and incubating enterprises, and its interaction foundation depends on the support of big data. From the choice of incubating project to the final completion of incubation, there are big data analysis as the technical basis for decision-making. Because of the precise calculation of big data, the boundaries of "entrepreneurial nursery", "incubator" and "accelerator" becomes indistinct on the precise incubator platform. The support layer mainly includes universities and research institution, relevant intermediaries and regional incubator associations, etc. Universities and research institution provide a continuous stream of innovative entrepreneurship projects. Relevant intermediaries provide various differentiated services, while regional incubator associations monitor incubation behavior, they make incubation network run orderly. The external environment includes the policy support, external markets and industry associations. At the same time, there are talent flow, policy flow, knowledge flow and capital flow in the whole network, which constantly form internal and external interaction, making the whole platform a developed system that constantly exchanges energy with the outside world.

The framework model of precise incubation network platform is shown in Figure 8.

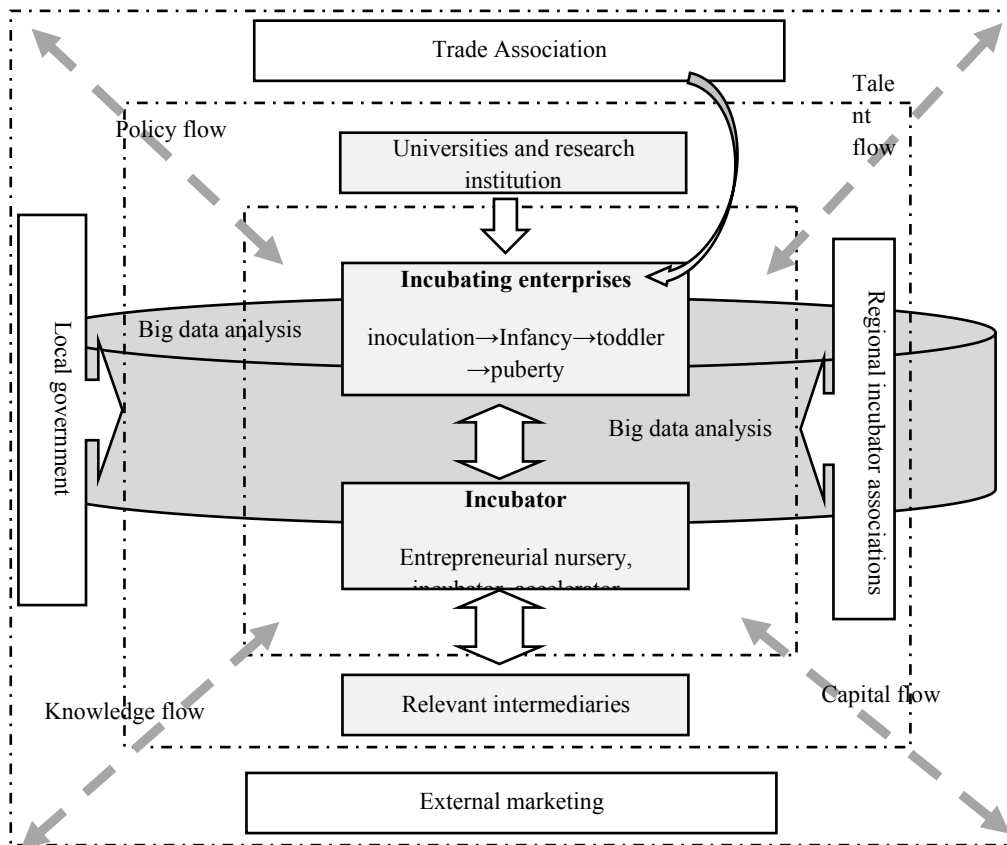

Figure 8 Framework Model of Precision Incubation Network Platform

Network members with high overlap of technology build incubation network around core node professional incubator. The homogeneity of technology, knowledge and resources is conducive to the

construction of ability trust and behavior ability among network members (Wang Zhaoqun et al., 2018). Multi-center governance is simpler through the network platform. Local governments, regional incubators associations, incubators, related intermediaries and incubating enterprises integrate their data on one platform to achieve the cumulative effect of incubation resources. The coalition of incubators and related incubator service providers is the core component of the network. It provides services for incubating enterprises, provides policy support for local governments, and supervises and maintains the network by regional incubator associations.

## 5 Conclusion

Traditional incubation network emphasizes the link function of network resource, ignores the supply ability and demand of network members, and lacks precise and effective resource matching. Precision incubation mode is to make the information function of innovation and entrepreneurship incubator more perfect and precise through incubation network platform. Through large data analysis, it can improve the ability of information analysis and processing, and make the incubators and incubating enterprises effectively avoid the waste of resources caused by information asymmetry. Incubator network platform integrates different functions of incubators, provides a high degree of matching between supply and demand in the process of incubation, resolves the contradiction that single function of incubator cannot meet the needs of incubating enterprises, and forms the contradiction of idle or insufficient resources. Incubator can realize dynamic and timely adjustment and maintenance on the network platform that keep the vitality of the whole incubation behavior.

Achieving precise incubation requires the necessary supporting elements and service segmentation. Therefore, future research can further study the stage division index of start-up enterprises and the segmentation method of incubation business.

**Abstract:** Based on Knowledge integration theory and social exchange theory, the conceptual model of the influence of knowledge heterogeneity on team creativity is constructed in Chinese cultural context. Based on multiple regression analysis based on 308 samples, the findings are as follow. On the one hand, the relationship between knowledge heterogeneity and team creativity is inverted U type. On the other hand, as the moderating variables, the three dimensions of internal social capital positively moderate the relationship between knowledge heterogeneity and team creativity. The implications and limitations of this study are put forward.

**Key words:** Team creativity; Knowledge heterogeneity; Internal social capital; Curve Impact

### **1 Introduction**

Team cooperation is one of the effective ways to promote innovation, but it does not necessarily mean that it must be able to promote innovation. The biggest problem limited team creativity is low working enthusiasm and creativity of team members. Team creativity is not the simple addition of individual creativity, but it is the crystallization and sublimation of knowledge exchange and thinking collision of team members. It becomes the key issues to be solved by the team to improve the creativity how to motivate team members to actively expand knowledge exchange and thinking collision.

It is one of the hot topics in innovation research how to form creative force by condensing team members effectively. Scholars have discussed the external factors that affect the team creativity, such as leadership behavior (Luo, Men and Zhong, 2014), innovation culture (Li, Yang and Ma, 2018), organizational climate (Young, Jing and Nam, 2018), innovation support (Eisenbeiss, Knippenberg and Boerner, 2008) and so on. However, it still fails to discern the mechanism of team creativity. On the one hand, there is little literature on team creativity focused on the external knowledge network produced by knowledge heterogeneity.

There is a gap between the team members, so how to cross the knowledge gap is a key issue to solve for team cooperation. Creativity is the result of continuous collision and integration of heterogeneity knowledge, rather than individual "behind closed doors". On the other hand, the study on the relationship between team members and team creativity is not much. It is the key to gain the benefits of knowledge heterogeneity completely that connecting the knowledge heterogeneity completely (Ni and Xue, 2013). Therefore, it is very important for knowledge sharing among members to keep good communication and cooperation.

As far as team creativity is concerned, the greater the degree of knowledge heterogeneity is the better. Knowledge heterogeneity is bound to lead to creative thinking. There is no conclusion about these questions above. For the lack of existing research, this paper is devoted to analyzing the influence of knowledge heterogeneity among team members on the team creativity, and to exploring the moderating effect of different dimensions of internal social capital. The conclusions could enrich the research of team creativity from the theoretical level, and provide some practical support to improve the creativity for the team.

## **2 Research Hypothesis**

### **2.1 Creativity**

The study of creativity is a classical psychological proposition. Based on different perspectives, scholars have different understanding on creativity. On the one hand, based on the trait theory, creativity is a kind of characteristic and that the individual has in itself and a kind of ability to show. On the other hand, creativity is the process by which an individual puts forward and actually uses novel and useful ideas for work tasks. Innovation is the impact of various thinking; collaborative innovation relies on team operation gradually replace the "heroism" innovation rely on individuals' power in the rapidly changing market demands. On the one hand, innovation is a new combination of production function, so knowledge reorganization is an inevitable requirement. In this process, knowledge heterogeneity is an important source of stimulating team creativity. On the other hand, team creative activity has a high complexity; therefore, seamless cooperation between team members is highly required. As the interests of the team members are not unique, the mechanism is necessary to promote team members to work together for innovation.

### **2.2 Knowledge heterogeneity**

According to the definition of Tiwana and McLean, knowledge heterogeneity refers to the extent of the expertise differences among team members (Tiwana and Mclean, 2005). According to the classification of team heterogeneity, knowledge heterogeneity is subordinate to task-related heterogeneity and underlying diversity (Lv and Zhang, 2015). This indicates that knowledge heterogeneity directly points to the completion of the task, by which a series of team behavior caused will have a role in the team's tasks and objectives. In addition, the difference is not significant, and it is not easy to be directly found by team members. Knowledge heterogeneity would gradually appear when team members communicate, discuss and argue in order to accomplish teamwork. The impact of knowledge heterogeneity on the

team has been controversial. On the one hand, cognitive resource theory believes that knowledge heterogeneity can bring a variety of knowledge to the team and improve the degree of diversification of team cognition, and ultimately improve team output (Chow, 2018). On the other hand, social classification theory believes that knowledge heterogeneity can lead to team members' Stratification and the problem of small groups, which is not conducive to cooperation and even lead to vicious competition, and ultimately limit team production (Vegt and Bunderson, 2005).

### **2.3 Internal social capital**

Social capital is derived from the field of sociology, which refers to the "relationship assets" such as relationship and friendship between people. After the introduction of the field of management and organizational behavior, social capital is generally used to characterize the structure and characteristics of social networks in the modern sense. It is generally believed that social capital has the same importance as other capital, and even more important. According to different levels of research, social capital can be divided into external social capital and internal social capital. Within the organization, individual activities are more influenced by internal social capital. Internal social capital mainly refers to personal communication and exchange, trust and common values and common language, which is called structural social capital, relational social capital and cognitive social capital (Nahapiet and Ghoshal, 1998).

### **2.4 The influence of knowledge heterogeneity on team creativity**

Previous research shows that knowledge heterogeneity and innovation team performance have a strong correlation, but the correlation is not unique. Most of the research points out that knowledge heterogeneity implies that there are differences in cognitive basis, and these differences will facilitate the team's positive discuss related issues. First, knowledge heterogeneity can stimulate knowledge exchange and promote the generation of knowledge conflict that can cause ideas that are more creative. Secondly, the cognitive differences caused by the knowledge heterogeneity can make the team member's vision become open and help to break the thinking mode, which is conducive to the burst of creative sparks (Amason, 1996). Finally, knowledge heterogeneity can increase the centrifugal force, and thus it is helpful to integrate potential ideas based on different fields and perspectives (Dong, Yang and Li, 2015).

However, some scholars believe that the team members are not willing to communicate with each other in heterogeneous team, and the lack of communication leads to a lower cohesion and a higher cost to absorb and utilize knowledge (Shin, Kim and Lee, 2012). Excessive heterogeneity leads to an increase in coordination costs. At the same time, the conflicts caused by the coordinated difficulty of the heterogeneous knowledge will have a negative impact on innovation (Fong, et al, 2018). Low compatibility among heterogeneous members increases the learning input of team members and reduces the utilization of knowledge. Sampson (Sampson, 2007) pointed out that a certain degree of overlap in knowledge and ability is required in terms of the best use of partner learning.

In view of knowledge view, the overlapping knowledge and distributed knowledge also named heterogeneous knowledge exist in the team at the same time. For the overlapping

knowledge, the team can achieve a tacit understanding without too much communication and sharing. By contrast, sparkle generated by the diversity of resources brought by knowledge the heterogeneity may be conducive to the creation of a revolutionary innovation, but it is also possible to burn the team out. In general, the role of overlapping knowledge in the team is essential, which makes the team members to coordinate action. However, more is not necessarily better. Too many overlapping knowledges not only limits the team knowledge innovation but also wastes the team's cognitive resources (Hughes, et al, 2018). Theoretically, the reduction of knowledge collision caused by cognitive differences can lead to a very difficult to produce innovative ideas, when knowledge heterogeneity is too low. However, when knowledge heterogeneity is too high, poor team communication and lower member satisfaction will lead to team members to ignore the value of each other's views and even generate emotional confrontation (Wang and Peng, 2011).

Therefore, this study proposes the following research hypothesis:

Hypothesis 1: there is an inverted U relationship between Knowledge heterogeneity and team creativity.

## **2.5 The moderating effect of internal social capital**

Social cognitive theory points out that the factors that affect the team may be rooted in their internal core beliefs. Internal social capital, the perception of internal relations of team members, can well explain the complexity of the relationship between knowledge heterogeneity and team creativity. Firstly, it will often require more communication to integrate these views and solutions caused by knowledge heterogeneity. Therefore, the communication and exchange among team members both promote the full collision of heterogeneous knowledge and avoid knowledge misunderstanding. Secondly, common belief is the key factor to influence knowledge sharing (Goh and Hooper, 2009). According to the "similar-attract" paradigm, individuals with the same attributes tend to have higher mutual recognition. The degree of knowledge sharing between individuals belonging to the same group is relatively high, and knowledge conflict is unlikely to occur. Conversely, team members belong to different groups realize each other that they are not easy to cooperate with each other and their ability is limited. In this case, Knowledge will not be fully shared, and knowledge conflict will appear accompanied by the disagreement with each other. Thirdly, Dai, Yang and Li (2019) believe that one of the main important factors influencing knowledge sharing is the establishment of trust relationship. The trust in each other can reduce the doubt and resistance to heterogeneous knowledge, and upgrade the courage to accept and absorb heterogeneity knowledge for their own use. Once the trust is missing, the knowledge-isolated island caused by the knowledge heterogeneity will appear.

Therefore, this study proposes the following research hypothesis:

Hypothesis 2: The structural social capital has a positive moderating effect on the relationship between knowledge heterogeneity and team creativity.

Hypothesis 3: The cognitive social capital has a positive moderating effect on the relationship between knowledge heterogeneity and team creativity.

Hypothesis 4: The relational social capital has a positive moderating effect on the relationship between knowledge heterogeneity and team creativity.

Based on the above analysis, the conceptual model of this study is shown in Figure 1.

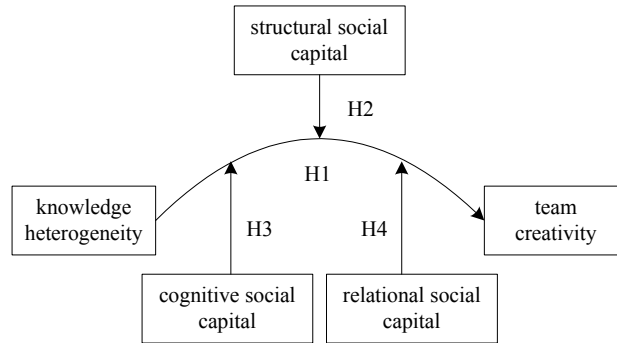

Figure 1 The Conceptual Model

### 3 Research Design

#### 3.1 Sample collection

High tech enterprise, the most obvious creative industries, was selected as the research object. The sample includes 6 main categories of high-tech industry statistics. At the same time, in order to make the research conclusion both representative and universal, the sample of this study will try to contain the most active areas of innovation, including Bohai Rim, Yangtse River Delta area, Pearl River Delta area and Hubei and Hunan Economic Zone. Data collection was from July 2017 to January 2019, and data collection method is a field survey. The respondents were R & D team leader. A total of 500 questionnaires were distributed, 399 copies were collected, and the recovery rate was 79.8%. After rejecting invalid samples, 308 samples are remained as formal research object with 77.19% efficiency.

#### 3.2 Variable measurement

The scale of team creativity adapted from Dai, Yang & Li (2019), which is total of 3 questions (Cronbach'a = 0.71).

The scale of knowledge heterogeneity adapted from Tiwana & McLean (2005), which is total of 3 questions (Cronbach'a = 0.71).

The scale of internal social capital adapted from the internal social capital scale in Tsai & Ghoshal (1998), which is total of 9 questions, including structural capital (Cronbach'a = 0.80), relational capital (Cronbach'a = 0.90) and cognitive capital (Cronbach'a = 0.93).

The above scales are used in the 5-Likert scale. Meanwhile, in order to avoid the interference of population statistics, we chose region, primary business, property and size as control variables.

## 4 Results

The results of this study are verified by regression analysis by SPSS 22.0. Before the construction of the square item and the interaction term, the variables are standardized to further solve multicollinearity. The results are shown in Table 1.

**Table 1 Results of the Regression Analysis (Dependent Variable = Creativity)**

		M0	M1	M2	M3	M4	M5
Control variables	Region	-0.09	-0.11	-0.12	-0.12	0.09	-0.09
	Primary business	-0.11	-0.10	-0.10	-0.10	-0.12	-0.07
	Property	-0.02	-0.02	-0.02	0.01	0.01	0.01
	Size	0.03	-0.01	-0.01	0.02	0.02	0.02
Independent variables	Knowledge heterogeneity		0.32***	0.13*	0.14*	0.16*	0.17*
	Knowledge heterogeneity <sup>2</sup>			-0.20**	-0.17*	-0.15*	-0.12
Moderating variables	Structural social capital				0.21**		
	Cognitive social capital					0.24**	
	Relational social capital						0.20**
Interactive items	Structural social capital × Knowledge heterogeneity <sup>2</sup>				0.12*		
	Structural social capital × Knowledge heterogeneity				0.23**		
	Cognitive social capital × Knowledge heterogeneity <sup>2</sup>					0.15*	
	Cognitive social capital × Knowledge heterogeneity					0.20**	
	Relational social capital × Knowledge heterogeneity <sup>2</sup>						0.17*
	Relational social capital × Knowledge heterogeneity						0.17*

\*\*\*. Correlation is significant at the 0.001 level (2-tailed).

\*\* . Correlation is significant at the 0.01 level (2-tailed).

\*. Correlation is significant at the 0.05 level (2-tailed).

First, the influence of control variables on team creativity is tested. By model 0, the effect of region, primary business, property and size on team creativity is not significant.

Secondly, the direct influence of knowledge heterogeneity on team creativity is tested. By model 1, Knowledge heterogeneity is significantly positive effecting team creativity ( $B=0.32$ ,  $p<0.001$ ). Moreover, nonlinear effect of knowledge heterogeneity on team creativity is tested by model 2. As can be seen from the regression results, the square of knowledge heterogeneity is significantly negatively influencing team creativity ( $B=-0.20$ ,  $p<0.01$ ). Therefore, hypothesis 1 is supported.

Thirdly, the moderating effect of structural social capital on the relationship between knowledge heterogeneity and team creativity is tested. By model 3, the interaction between structural social capital and the square of knowledge heterogeneity has a significantly positive effect on team creativity ( $B=0.12$ ,  $p<0.05$ ), and the interaction between structural social capital and knowledge heterogeneity has a significantly positive effect on team creativity ( $B=0.23$ ,

$p<0.01$ ). Therefore, hypothesis 2 is supported. By model 4, the interaction between cognitive social capital and the square of knowledge heterogeneity has a significantly positive effect on team creativity ( $B=0.15$ ,  $p<0.05$ ), and the interaction between cognitive social capital and knowledge heterogeneity has a significantly positive effect on team creativity ( $B=0.20$ ,  $p<0.01$ ). Therefore, hypothesis 3 is supported. By model 5, the interaction between relational social capital and the square of knowledge heterogeneity has a significantly positive effect on team creativity ( $B=0.17$ ,  $p<0.05$ ), and the interaction between relational social capital and knowledge heterogeneity has a significantly positive effect on team creativity ( $B=0.17$ ,  $p<0.05$ ). Therefore, hypothesis 4 also is supported. In order to show the moderating effects of three dimensions of internal social capital more intuitively, this study draws the simple slope interaction plots, as shown in Figure 2.

**Figure 2 The Simple Slope Interaction Plots**

## 5 Conclusions

### 5.1 Discussion

*Based on the Chinese culture situation, this study explored the influence of knowledge heterogeneity on the team creativity, and explored the moderating effect of different dimensions of internal social capital using 308 samples. Two conclusions are as follow.*

First of all, as a "double-edged sword", knowledge heterogeneity has an inverted U-shaped effect on team creativity. This indicates that there is an optimal heterogeneous knowledge combination for team creativity. Before reaching the optimal level of knowledge heterogeneity, the increase of knowledge heterogeneity can improve the innovation performance. However, the increase of knowledge heterogeneity will result in the decrease of the innovation performance after the optimal level. This is consistent with the latest research conclusions (Ye, Ren and Hao, 2015). This means that team members should not only pay attention to the importance of knowledge heterogeneity, but also avoid the negative effects of high heterogeneity.

Secondly, the three dimensions of internal social capital have positive moderating effect on the relationship between knowledge heterogeneity and team creativity. This shows that knowledge heterogeneity would promote the improvement of team creativity, when the value of be fully utilized with the increase of communication, the promotion of trust and the integration of common values among team members. Therefore, it is very important to construct a good atmosphere for cooperation.

## **5.2 Implications**

There are two implications for management practice in this paper. On the one hand, knowledge heterogeneity among team members can promote the integration of knowledge and innovative ideas within a certain range, but it only limits the creativity of team members when more than this degree. This finding has some reference value for the settlement of the mainstream literature. On the other hand, Chinese people have always attached importance to "Guanxi", especially in cooperation. In this paper, we find that the positive effect of knowledge heterogeneity is significantly greater in a relatively harmonious relationship than in a team that is not so harmonious. This conclusion not only reveals the effect of knowledge heterogeneity on the team creativity, but also helps to enlighten the follow-up study from different perspectives to analyze and define the function boundaries of knowledge.

## **5.3 Limitations**

There are still some limitations in this research. On the one hand, the data were from self-reporting, thus, there may be a homologous bias. Data collection with a combination of superior supervisor reports and self report is research trends in the future. On the other hand, the internal social capital is introduced as an only moderating variable between knowledge heterogeneity and team creativity in this study. However, leadership style, governance structure, organizational support and other variables may also affect the relationship between knowledge heterogeneity and team creativity. Future research can further explore that which factors improve or worsen the relationship between knowledge heterogeneity and creativity.

# Impact of Employee's Resilience on Organizational Resilience: Mediating Role of Compassion

Khaliq Ur Rehman, Farhan Aslam, Qamar Uddin Maitlo

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: khaliqcheema@gmail.com, aslam.farhan@outlook.com, qamar.maitlo@iba-suk.edu.pk)

**Abstract:** Main aim of this research was to investigate the protagonist of individual's resilience to build up organizational resilience. Individual's resilience is much needed at the time of crises, restructuring, transformation, turbulent and unfavorable conditions. Second objective of this research is to test the mediating role of compassion between the relationships of individual's resilience and organizational resilience. This research contributed in the body of knowledge while bring new concepts together and the main contribution is testing the role of compassion between the relationships. Empirical test like correlation, regression and Sobel test was run to test the hypothesis. Test of the correlation and regression analysis demonstrate that there exist a positive and momentous association Employee's Resilience and Organizational Resilience. Sobel test was used to test the mediating role on compassion and results show that there is a partial mediation, but results are significant.

**Key words:** Organizational Resilience; Individual Resilience; Compassion; SMEs of Pakistan

## 1 Introduction

Term resilience basically adopted from microbiology and cell regeneration studies, material processing and other aspects of engineering into the organizational sciences. In organizational studies the term resilience introduces first in psychology, economics and then the financial management especially managing risk in financial crises and stock exchange crises (Hamel and Valikangas, 2003). Resilience was defined by several authors in its parent school of thought and after its adoption into the organizational studies. But for the sake of simplification and operationalization current research defines resilience as "The maintenance of positive adjustment under challenging conditions" (Sutcliffe and Vogus, 2003). This study is basically designed to investigate the role of individual's resilience in developing the organizational resilience Werner conducted a study amid the children whose parents were facing problems and suffering from the miseries of psychological illnesses. While living in those conditions, children capacity/resilience was one of the most important reasons behind their survival. Their capacity to bounce back from these severe conditions helps these children to survive (Werner and Smith, 2001). So same is the case with organizations as it was with the children. The resilient behavior of employees and organizations itself, allows companies the development of new learning and implementing new routines and a better use of its resources under uncertainty conditions (Lengnick-Hall and Beck, 2009).

One of the main reasons for failure in business / organizations is the doubts and non-believe of the businessmen towards their own ideas, and the other problem is with the organizations are they are not sure that they can transform gradually or they need to of repair or reinvention the business model(Lingard, 2007). The authors believe that the adaptability or resilience capacity must be a strategic aspect and should not respond to specific crises or momentary losses, but being able to anticipate changes and prevent their businesses from being adversely affected by them. According to Hamel and Valikangas (2003), an organization is resilient when it is able to build the future, rather than defending the past.

### **1.1 Objective of this study**

Objective of this study is twofold, one major objective of this study is to investigate individuals/ employees/ Intrapreneurs resilience capacity on organizational resilience, or in other word we can say that how individual resilience helps to develop organizational resilience. Second objective of current research was to examine the mediating role of organizational compassion between the relationship of organizational resilience and individual resilience.

### **1.2 Research questions**

What is the relationship between individual resilience and organizational resilience?

What is the relationship between individual/organizational resilience and compassion?

Does compassion mediate the relationship between individual resilience and organizational resilience?

### **1.3 Significance of research**

This research is bringing entirely new concepts together. This research basically tries to validate and expand the theory of resilience both individual / organizational, as we are testing this theory into entirely different setting. Second important contribution of this research is that this research has test the role of compassion between the relationship of individual resilience and organizational resilience. Compassion is not studied as mediator before in any of the research. As compassion is very important for developing resilience, theoretically it is well proven but not empirically yet tested.

## **2 Literature Review**

This section briefly discusses or provides overview of available literature on the variables of this research study i.e. Organizational Resilience, Individual/Employee/ Intrapreneurs resilience, and compassion in organization. This section will also discuss about the mutual relationship between these variables.

### **2.1 Organizational resilience**

From Vieira et al. (2012)point of view, those organizations are considered as resilient organizations which have the aptitude to acclimatize to change, fitting the trends and being able to change the generation of profit. Authors like Ortiz-de-Mandojana and Bansal (2016)and Lewis and

McCann (2004) relate resilience to the strategic agility of an organization and also its performance. (Lengnick-Hall and Beck, 2009) Point out that the ability of an organization to resilience occurs by incorporating a set of policies and reforms. Concept of resilience was introduced to the organizational studies literature through crisis and disaster management concept has discussed in preview of high-reliability organizations and positive organizational scholarship literatures (Weick, 1993 , Weick et al., 2005 , Bruneau et al., 2003 , Griffiths et al., 2001). In the organizational field and in competition scenarios, the organizations' success depends on the ability to understand and adapt to the nature and dynamics of the business environment. These elements are related to: competition, technology, costs, taxation, policies and customer expectations (Hamel and Valikangas, 2003). The adaptive management is an integrated and multidisciplinary approach to address uncertainty, which is necessitated by the recognition that the managed resources are changeable as a result of human intervention new uncertainties, will emerge. Resilience is the most important area of research where the recent literature is more available. And from the below mentioned diagram one can clearly identify that this area of research is trending.

## **2.2 Employee / Intrapreneurs resilience**

Resilience as a psychological capacity of employees has recently come into focus with the rise of Positive Psychology. A critical element of a positive view of resilience involves viewing adverse events as an opportunity to develop and become a better person. A review of previous measures and theories of resilience shows this perspective is largely missing and suggests possible dimensions of it. Survival, high tolerance, adaptation and "bounce back" are amongst the synonyms for resilience adopted in recent psychological and organizational studies. Resilience in the Psychological capital model is characterized as "having the ability to bob once more from difficulty, disappointment or even positive yet apparently overpowering changes, for example, expanded duty" (Luthans et al., 2007) Of all the part influence expresses that involve Psychological capital, resilience has been given minimal consideration in authoritative writing. Prior work in any case, especially in the zone of kid brain science, recommends that resilience is a marvel coming about because of typical human adaptation reactions and is "described by great results notwithstanding genuine dangers to adjustment or advancement"(Masten, 2001). Masten goes ahead to infer that building resilience ought to along these lines require the improvement of the versatile frameworks (counting psychological and learning forms). Adding to the versatile procedure both a clear impression of reality, taking into account powerful and discerning reactions to given conditions, and the slant to look for or make significance from occasions, permitting them to "manufacture spans from present-day hardships to a more full, better built future" (Luthar et al., 2000 , Britt et al., 2016). Little research has been finished with respect to Resilience in the working environment. However, there is impressive proof that Resilience, once accepted to be an uncommon dis-positional quality, is state-like and open to advancement.

## **2.3 Compassion**

(Goetz et al., 2010 , Lazarus, 1991 , Coetzee, 2016) posited, —one of humankind's noblest virtues seems to arise incidentally from our sympathies becoming softer and more widely diffused, until they are extended to all sentient beings." According to the (Lama, 2002) who finds much inspiration in Darwinism, "Compassion is a state of mind that is non-violent, non-harming, and non-aggressive. It is a

mental attitude based on the wish for others to be free of their suffering and is associated with a sense of commitment, responsibility, and respect towards the other". In essence, compassion is based on the rationale that all human beings have an innate desire to overcome suffering in order to be happy, and that they have the natural right to fulfill this fundamental aspiration. (Lama and Kit, 1995) Identified that interior plays a key role in empathy, which indicates a neural mechanism for empathetic aspects of compassion. It is debatable whether compassion for others and self-compassion are in fact part of the same overarching construct. While Buddhist thinking argues that differentiating compassion for others from self-compassion means drawing a false distinction between the self and others, and moreover that self-compassion is a prerequisite for showing 'true' compassion towards others, recent research has found that associations between self-compassion and other-focused compassion may be weak, or even non-existent for some populations (Shoss et al., 2018).

### 3 Conceptual Framework

Figure 1 Proposed Framework for Research Hypothesis

In the light of above mentioned literature and theoretical framework following hypothesis were developed for testing.

- Individual resilience has positive impact on organizational resilience
- Individual resilience has positive impact on compassion
- Compassion has positive impact on organizational resilience
- Compassion mediates the impact of individual resilience on organizational resilience

### 4 Research Methodology

Following the positivist paradigm current research adopts the quantitative research strategy and collects the data from 930 individual employees working in Small and Medium Enterprises of Pakistan through a self-administrative questionnaire. Internal consistency/reliability of the used questionnaire was tested through Cronbach's Alpha and instrument was found reliable. Correlation and simple linear regression was conducted to test the direct hypothesis. And to test the mediating hypothesis Sobel test was used. According to the results of the research all the hypothesis were accepted.

### 5 Results and Discussion

This section of the research papers deals with empirical investigation and involves some statistical tools to empirically validate some of our claims.

### 5.1 Reliability of scale

Before going towards further analysis adopted instrument were tested for reliability/ internal consistency through Cronbach’s alpha test. Hair Jr et al., 2016 suggested that value of cronbach’s alpha should be greater than 0.70 in order to claim that the instrument is exactly measuring what it is expected to measure. Results mentioned in table 1 clearly shows that every variable has successfully pass the test.

**Table 1 Reliability Test**

Instrument /Variable	Reliability
Organizational Resilience Questionnaire	0.87
Compassion Questionnaire	0.91
Employees Resilience Questionnaire	0.89

### 5.2 Correlations

**Table 2 Correlations**

		Organizational Resilience	Employee Resilience
Employee Resilience	Pearson Correlation	.469*	
	Sig. (2-tailed)	.000	
Compassion	Pearson Correlation	.461*	.907*
	Sig. (2-tailed)	.000	.000

Correlation was analyzed through Cronbach’s Alpha, results of the correlation in Table 2 shows that organizational resilience is 47% positively and significantly related to employees resilience which means one unit change in employee resilience will enhance the organizational resilience by 47% results are supporting the findings of (Shin et al., 2012). Compassion also has moderate positive relationship with organizational resilience, whereas compassion has highly positive and significant relationship with employee resilience. All the relationship are very significant as (p<0.05) as suggested by (Zhu, 2012).

### 5.3 Regression

**Table 3 Impact of Employees’ Resilience on Organizational Resilience**

Model Summary						
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin Watson	
1	.593 <sup>a</sup>	.352	.350	.15861	1.7	

a. Predictors: (Constant), ER

**Table 4 ANOVA Table for Regression**

ANOVA							
Model		Sum of Squares	df	Mean Square	F	Sig.	
1	Regression	4.955	1	4.955	196.953	.000 <sup>b</sup>	
	Residual	9.132	363	.025			

b. Predictors: (Constant), ER

To analyse the impact of employee resilience on organizational resilience, simple linear regression was used. Results of the regressions shows that organizational resilience is almost 35% being explained by employee resilience, which means the organizations that have resilient employees are tend to be

more resilient than the other competitor organizations. There are very less chances of failure for such type of organizations. Durbin Watson and significance values are also within the standard range. Standard values of Durbin Watson should be between “1.5 and 2.5”(White, 1992), and p value should also be less than 0.05(Hair Jr et al., 2016).

### 5.4 Mediation

Mediation analysis is basically a chain of analysis in which relationship of variables are being explained through another variable. In Mediation analysis, an interaction term is being created and in result of this interruption the second variable influence the third one. This second variable is also known as intervening variable and in particular we name it as mediator and it is being denoted as “M”. This intervening variable mediates the relationship or influence of first/Independent/predictor variable on dependent/outcome variable. There are several methods to test the mediation but this research opted to use **Sobel test** to test the mediating role of individual/employee’s compassion towards organization in relationship between employee’s resilience and organizational resilience. Below mentioned tables are the results of the mediation analysis.

### 5.5 Sobel test

**Table 5 Sobel Test**

\$`Mod1: Y~X`				
	Estimate	Std. Error	t value	Pr (> t )
(Intercept)	2.3271275	0.05079715	45.81217	5.860e-153
Pred	0.0089744	0.01242392	34.52811	9.848739e-117
\$`Mod2: Y~X+M`				
	Estimate	Std. Error	t value	Pr (> t )
(Intercept)	1.97212952	0.06683661	29.506727	2.408445e-98
Pred	0.41410475	0.01173814	35.278557	3.431392e-119
Med	0.09846866	0.01309613	7.518914	4.391746e-13
\$`Mod3: M~X`				
	Estimate	Std. Error	t value	Pr (> t )
(Intercept)	3.6051873	0.1895968	19.015021	1.948963e-56
Pred	0.1510089	0.0463714	3.256508	1.234130e-03

\$Indirect Effect: **[1] 0.01486964**  
 \$SE: [1] 0.004975999  
**\$z. Value: [1] 2.988272**

Sobel test for mediation provides the detailed results in which it tests the relationship between predictor and outcome variable in presence of mediator and it also test their relationship without the

presence of mediating variable. Results indicate that Indirect Effect, which means the influence of independent variable in presence of mediating variable, is greater than direct effect. Significance of the mediating relationship is always denoted as  $z$  and  $Z$  value should be greater than **1.96** to prove that the mediating effect of intervening variable is significant, which is **2.98** in this research which clearly indicates that compassion act as a partial mediator between organizational resilience and employee resilience.

## 6 Conclusion

According to available body of knowledge and results of the current research, we can withdraw the following conclusion. Individual resilience is very important in organizations especially at the time of crises management, change management, organizational development and transformation. In turbulent conditions of the organizations individuals to be more resilient. Individuals/Intrapreneurs compassionate actions towards organizations are much more needed in the organizations. Compassion is one of the key trigger of resilience in the organization. Individual resilience impacts the organizational resilience. Compassion mediates the relationship between individual resilience and organizational resilience. The authors believe that the adaptability or resilience capacity must be a strategic aspect and should not respond to specific crises or momentary losses, but being able to anticipate changes and prevent their businesses from being adversely affected by them.

# **Study on Employee Reward System Satisfaction and the Impact on Their Sustainable Behavior: A Case of High Learning Institution Employees in Tanzania**

Jacob Julius Rombo, Luo Fan, Monhesea Obrey Patrick Bah

School of Management, Wuhan University of Technology, P.R. China, 430070

(Email: jajurombo@yahoo.com, sailluof@126.com, monheseabah@yahoo.com)

**Abstract:** This paper examines the role played by the employees rewarding system satisfaction and its impact on their continuous productive behavior-sustainable behavior as observed from the practices of higher learning employees in Tanzania. As well known that the sustainable behavior of the employees in any organization has a direct relationship with the performance of that organization. From the secondary data as well as the interviews and author's personal experience and observation of the working conditions in Tanzania, this paper entails the existing relationship of the sustainable behavior of the employees when they are highly satisfied by the rewarding system employed by any institution as the focus for this paper is on the high learning institutions.

**Key words:** Reward system; Employee satisfaction; Sustainable behavior; Productive behavior

## **1. Introduction**

For the better performance of the employees in any institution, there should be several factors to observe including the rewarding system of the employees. To satisfy the employees, rewarding system of the organization (Variable 1: Reward System) this variable has the direct impact on the Satisfaction of the employee to keep staying and deliver to the organization (Variable 2: Employee Satisfaction); meanwhile the well rewarded and satisfied employee will always create a good working spirit for the organization or company, this is what is known as sustainable behaviour of an employee in an organization (variable 3: Sustainable Behaviour).

Reward system is a planned and structured approach to reward one or more persons who act in good way. Mostly studies are done to look on to customer satisfaction with regards to the services provided by the companies or organizations, whereas companies marketing departments often facilitate customer rewards systems or programs to motivate people to buy more or to purchase certain things.

Rewarding system is such a way that, the institution or company designs several ways onto how they can get their employees satisfied so that they can be well performing.

Employee Satisfaction is the term used to describe whether employees are happy and contented and fulfilling their desires and needs at work. Many measures purport that employee satisfaction is a factor in employee motivation, employee goal achievement, and positive employee morale in the workplace. Employee satisfaction, while generally a positive in any organization or company, can also become a problem if mediocre employees stay because they are satisfied and happy with your work environment. Factors contributing to employee satisfaction include treating employees with respect, providing regular employee recognition, empowering employees, offering above industry-average benefits and compensation, providing employee benefits and company activities, and positive management within a success framework of goals, measurements, and expectations.

The critical factor with employee satisfaction is that satisfied employees must do the job and make the contributions that the employer needs. If they do not, all that the employer does to provide an environment that satisfies employees is for naught.

Sustainable behaviour is the ability to continue a defined behaviour indefinitely, as for an employee the sustainable behaviour, that the company or organization would like its employees to retain indefinitely is the working spirit that results to the major performance of an organization or company. Therefore, the employee is usually motivated to retain their well working spirit in order to make the company keep performing well to achieve its objectives. The companies nowadays try to motivate the employees to ensure that the green or good behaviour of the employees sustained for the sake of the well performance of the companies.

Paying employees for productivity has been the cornerstone of industrial and business development for centuries. Financial reward has always been important in managing employee's performance, but over the last 29-year other elements of compensation have developed to provide employers with more scope to reward and ensure that employees poses the working behaviour and sustain it, thus, by motivating employees the concept of the green working behaviour would be achieved.

Performance is a behaviour that accomplishes results. Performance management influences performance by helping people to understand what good performance means and by providing the information needed to improve it (Armstrong & Taylor 2010). Reward management influences performance by recognising and rewarding good performance and by providing incentives to improve it and for that it has, seems the direct link between the performance of an individual and the resulted objectives of the company or organizations.

### **1.1 Statement of the Problem**

High turnover is a well-pronounced trend in most private as well as public institutions in nowadays the labour mobility has highly increased. One of the main challenges faced by organisations in employee retention is the competition factor. Many professional organisations are in a dilemma because of the competition that is present in attracting and retaining highly skilled workers because they fail to match the salaries offered by their competitors or to offer more than the competitor does (Frost,2001). The challenge for many organisations today is therefore is to come up with an efficient reward system and strategy for retaining these core employees for the success of the organisation.

That is to say, the choice of the study intends to determine the inter-relationship that exist between the reward system satisfaction and the sustainable behaviour of the employees to be retained in the high learning institutions in Tanzania by considering the outlined factors above.

## **2 Theoretical Background**

Scholars have come up with various theories that hold in the rewarding system, for the interest of reviewing in order to better analyse and understand the real situation that happens in the Tanzania context. The motivational and two Factor theories are well preferred thus for an institution to be able or to be able to create a sustainable behaviour for an employee, there should be certain theories that would lead to the best practice on observing whether there is an impact of the reward system satisfaction. With reference to this study, the two-factor motivational theory.

Companies rely on their employees to produce products or provide services in a timely fashion. In addition, while employees can easily learn the tasks and procedures required to carry out their roles, organizations can benefit from providing motivational incentives for exceptional job performance. Motivational theory in an organization has to do with the way in which a company motivates its employees to perform as a group and within their individual job roles.

Being a successful business leader involves a lot more than making good products or understanding marketing and sales reports in understanding the performance of the company or organization. One need to be able to motivate and inspire the employees to work toward the organizational vision. At times, it may seem like degree in psychology needed to understand what to do in ensuring that the employee do sustain their productive behaviour. There are basics of applying the various motivational theories developed to help to get the results that are expected from the employees.

This theory considers two factors: motivation and hygiene. Motivation factors include receiving recognition for good efforts, enjoying work and having a career path. Hygiene factors include salary,

benefits and relationships with co-workers and managers. The two factors applied in the workplace through comprehensive salary and benefits programs, developing team-building workshops and creating ways to recognize good performance. Be competitive when recruiting so you motivate people to stay and remain loyal.

### **3 Methodology Applied and the Model**

The present research aims to determine the impact of incentives, rewards and recognition on employee's sustainable behaviour of high learning institutions. The study adopted a qualitative approach/paradigm and it specifically made use of case study in its design. Case study helps the researcher to develop an in-depth analysis of a case, often a programme, event, activity, process, or one or more individuals. It bounded by time and activity and the researcher collects detailed information using a variety of data collection procedures over a sustained period (Creswell, 2014). A case study consists of the intensive observation of a single unit and this may be an individual person, company, the researcher may prefer institution and more. Hence, for this case, the study was done keenly by observing and reviewing various literatures in regards to the concept of sustainable behaviour of employees as maybe affected by the rewarding system, the attention was paid to the Tanzania contexts by studying the characteristics and issues that happening in the higher learning institutions in Tanzania.

#### **3.1 Demographics characteristics**

The demographic section of the questionnaire shows the information about the age, gender, marital status, sector, industrial composition, establishment size, job tenure and position of employees to have a better understanding of their responses and resulting conclusion for the research. In the current sample, the number of male respondents is more than females, as there are N=160, (81%) males and (19%), N=40 are females. The majority of the respondents are of age between 25-30 years (43.2%), N=95 whereas the lowest majority of the respondents fall in the age of 20 or less (.9%), N=2 the demographics showed that majority of the respondents in the sample are married (55%), N=121 whereas unmarried respondents are (45%), N=99. Majority of the respondents belongs to the organizations having an establishment size of more than 500 employees, N=74 (34%) whereas the least respondents are from organizations with 100 to 199 employees, N=24 (11%). Most of the respondents have a job tenure between 2 to 3 years, N=64 (29%) while least respondents having job tenure of less than one year are N=12 (6%). Most of the respondents in the sample having a non-managerial position in the job, N=161 (73%). While N=59, (28%) have a managerial position in their respective organizations.

The Reward of Work Mode is as Figure 1. This model is for employee compensation that links Business results to employee compensation. Its entails that, the reward for work of an individual in an

organization comprises of compensation procedures, benefits, the work contents and well as the presence of clear career development for an individual (Segal and Sibson 2006)

**Figure 1 The Reward for Work Model**

When the stipulated ingredients forming rewarding system above are present, then the employee is likely to create a loyalty to the organization with a working spirit (sustainable behaviour) thus employee is likely to retain and the performance will improve. As results, the productivity, customer satisfaction, innovation and growth will be the business outcomes.

### **3.2 Hypothesis development**

The reward system has studied from different aspects; this proposed study topic aims to find out the relationship between the reward System Satisfaction and the sustainable behaviour of an employee. The proposed study topic intended to use two-dimensional point of view; Transactional Contract and Relational Contract. In case of a workplace performance deviance, the study intended to investigate the organizational level work place performance deviances.

As per the topic, the following hypothesis are obtained in making the close look and close study of the Impact of Reward System Satisfaction on Sustainable Behaviour of Employees.

H1: There is a significant positive relationship between rewards system satisfaction and employee sustainable behaviour

H2: Employee rewards system leads to employee performance at a work place.

H3: There is a significant positive relationship between employee sustainable behaviour and employee performance at work place.

Following these hypotheses, we have drawn the research model as Figure 2.

**Figure 2 The Conceptual Model**

## 4 Results

In order to create the proper sustainable working and peacefully working behaviour that would pronounce to the better performance of higher learning institutions in Tanzania, several of the factors need to be paid attention and considerations as since they do play an important role as the rewarding system concept is concerned. The followings are the rewarding and motivational factors that play important roles for the high learning institutions employees in Tanzania and as results of the better performance of those institutions.

The recruitment, appointment and promotional procedures: this realizes to be among the rewarding factors that has the direct influences to the employees in the high learning institutions in Tanzania. Thus, the more employees of any institution or organization realizes the procedures used for promotion and recruitment, the more they get motivated and as a result they do work hard to attain the target and objectives of the institution hence the creation of a sustainable behaviour.

The working Conditions and leadership: From the study done the observation is that, the working conditions can affect the sustainable working behaviour of an employee at any institution. In the context of Tanzania learning institution, the employees who are having good working conditions seems to have a morally in their working behaviour.

The Salary package and Compensation Strategies: for several years now in most of African high learning institutions for which Tanzania context is not an exception, there tensions between academic staff and students on one side and the administration and proprietors/government on the other. In several instances academic staff has withdrawn their labour (laying down their tools) due to inadequate remuneration and scholastic materials. The academic intellectuals are the most highly trained human resource in society and yet they are poorly paid or rewarded.

This is why there is a high turnover of academic staff in African institutions of higher learning. Its therefore, recommended that for the high learning institutions to retain the working behaviour/sustainable behaviour, attention should be given onto the packaging and benefit strategies.

Government and International policies: the policies provided by both government of Tanzania as well as international educational partners also has direct influence to the creation of the sustainable working behaviour of the high learning institutions employees in Tanzania. This is due to the facts that, if the policies do not put into account the hard work done by the employees at that level, they will definitely be demotivated and as a result, there will not be the proper creation and retaining of the hard-working spirit of an individual in an organization.

## **5 Conclusion**

In this study, our contribution focuses on identifying the impact of reward and recognition on job satisfaction and motivation to the sustainable behaviour of employees. The findings of this paper have exposed a significant relationship among numerous dimensions of job satisfaction and motivation.

Numerous scholars have given evidence that employees are satisfied and motivated by financial rewards. Moreover, the findings are also consistent with previous research results that generally employees are satisfied and motivated with incentives and financial rewards.

Reward system of the organization is an integral part of the measure of the competitiveness of an organization. As a key component of the overall human resource strategy, reward system management is central to the productivity of employees, which is a link to the overall profitability of an organization, as well as its long-term survival and the sustainable behaviour of the employees. As according to the study done, when the reward to the employee is well, their performance becomes higher than those who do not get satisfactory reward. This study as discussed above on the various models and consideration of various theories of motivation has established a clear link between reward management system of an organization and the sustainable behaviour of employees in attainment of organization goals and objectives through the contribution of extrinsically and intrinsically motivated employees.

In establishing the reward policy for an organization, the organization's corporate objectives are important inputs to the entire process. An alignment between these aim and objectives and the reward policy is strategically important to the effectiveness of the reward policy to make a better rewarding system in the organization and thus can be applied in various contexts including the higher learning institution contexts in Tanzania.

Therefore, if supervisors boost their subordinates, motivate and give them an appreciation and recognition, these deficiencies can be reduced and will increase their job satisfaction and as a result sustainability of good and working spirit behaviour. In addition, the managers' increase semi-annually and annually salary, allowances, commissions, bonuses, fringe benefits and other indirect compensations keeps employee's morale high and makes them more motivated and hence a creation of sustainable behaviour.

Finally, the study steps in towards the development of the relationship between employee and employer in creating good working environment.

# Homesickness and Proactive behavior: Collectivist Human Resource Management Practices as a Cross-Level Moderator

Zheng Weili

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: zhengwelli@163.com)

**Abstract:** Employees' proactive behavior is a kind of employees' free decision. It will undoubtedly promote the effectiveness of the organization, and it will benefit the development of the employees themselves. Based on the conservation of resources theory, this study selected the homesickness variable as an antecedent variable of employees' proactive behavior. Through the investigation and analysis of the 160 employees in 32 organizations, it was found that: (1) Homesickness is negatively related to employee's proactive behavior. (2) The relationship between homesickness and proactive is related via mediation by emotional exhaustion. (3) The collectivism human resource orientation moderate the relationship between the homesickness and the employees' proactive behavior. This article enriches the research on the antecedents of employees' proactive behavior from the perspective of emotional perception, and confirms that employees' homesickness emotions will have a series of effects on employees and reduce employees' proactive behaviors.

**Key words:** Proactive behavior; Homesickness; Emotional exhaustion; Collectivism human resource Management Practices

## 1 Introduction

How can we improve employees' proactive behavior? What factors influence employees' proactive behavior? At present, most scholars' research on antecedents of employees' proactive behavior mainly focuses on leadership style and personal characteristics of employees, such as abusive management, narcissism. Neglect the concern of personal emotional factors of employees. Emotion is a kind of strong emotion, which directly points to people or things and refers to the reaction to the object. Including anger, sadness, missing, etc. Existing studies have confirmed that employees' emotions at work directly affect employees' work behavior.

Dan (Dan, 2017) explained that homesickness weakens the positive impact of work resources on

work performance through the work-family resource model. Based on this, this paper will build a research model of the relationship between homesickness, emotional exhaustion, collectivist human resource management practice and employee's proactive behavior, explore the mechanism of homesickness's influence on employee's proactive behavior, and study the mechanism of emotional exhaustion in homesickness. The mediating role between the proactive behavior of employees' and the moderating role of collectivism orientation between homesickness and the proactive behavior of employees.

## **2 Theory and Hypothesis**

### **2.1 Homesickness and proactive behavior**

Employee's proactive behavior plays a vital role in the organization (Schmitt et al., 2016), but it is a kind of spontaneous behavior of employees, which is affected by many factors. This study considers that homesickness is the emotional appeal of employees who have left home, often accompanied by negative emotions (Rekšć, Magdalena, 2015). It will affect the physical and mental health of employees, personal performance and organizational performance to a certain extent. On the one hand, from the perspective of resource preservation theory, employee's homesickness will consume emotional resources of employees and make them face enormous psychological and physical pressure. From the perspective of resource preservation, employees will reduce the occurrence of their proactive behavior, because employees' proactive behavior needs to consume personal resources such as time and energy. On the other hand, homesickness, as an indicator of people's mental health, is likely to lead to a decline in physical function and the efficiency of resource utilization (Beal et al., 2005). Therefore, we believe that homesickness accompanied by negative emotions will reduce the probability of employees' proactive behavior in work. Based on this, this paper proposes the following assumptions:

Hypothesis 1: Homesickness has a negative impact on employees' proactive behavior.

### **2.2 Mediating effect of emotional exhaustion**

First, resources are not inexhaustible; there will always be a day of exhaustion. According to the classification of resources according to the theory of resource preservation, emotional resources are defined as an energy resource (De et al., 2008). Generally speaking, it is difficult for employees who work outside their hometown alone to communicate effectively with their relatives and friends who are far away from their hometown (Thurber, Walton, 2012). Missing home, relatives and friends and not adapting to unfamiliar working environment will consume employees' emotional resources. That is to say, homesickness will consume the emotional resources of employees. Employees invest emotional

resources but get no return. They cannot make up for the loss of resources, and then the continuous loss of resources will eventually lead to emotional exhaustion.

Secondly, emotional exhaustion can effectively predict employees' proactive behavior. The degree of emotional exhaustion will affect employees' enthusiasm for work. Previous studies have shown that emotional exhaustion is related to job burnout, which not only affects the physical and mental health of employees, but also is detrimental to personal and organizational performance. According to the theory of resource preservation, we know that when the individual's resources are lost or the investment of resources fails to get the corresponding return, they will have the motivation to protect the existing resources and make up for the lost resources (Kilroy S, 2016). As we said before, homesickness consumes employees' emotions and eventually leads to emotional exhaustion. After this happens, employees need to consume more resources than usual to maintain normal work and emotions, and they will lack resources to do other activities that are beneficial to the organization. Therefore, this study believes that employees will reduce their proactive behavior in the case of emotional exhaustion caused by homesickness. Accordingly, the following assumptions are made:

Hypothesis 2: Homesickness has a positive effect on emotional exhaustion

Hypothesis 3: Emotional exhaustion has a negative impact on employees' proactive behavior

Based on the conservation of resources theory, resources are limited and very important to the activity process. Homesickness brings about negative emotional experience, which consumes resources to a certain extent and causes emotional exhaustion of employees. Furthermore, exhaustion leads to a shortage of individual resources. Furthermore, exhaustion leads to a shortage of individual resources. Because of their desire to conserve resources and obtain more resources, it is difficult for them to engage in active behavior, that is, homesickness causes emotional exhaustion of employees and affects their practice of active behavior. The following assumptions are made:

Hypothesis 4: Emotional exhaustion plays a mediating role in the process of homesickness affecting employees' proactive behavior

### **2.3 Collectivist human resource management practices as a cross-level moderator**

In this study, we also pay attention to the interaction between homesickness and collectivism human resource management practices (Zhang, 2015). If employees fall into homesickness, they will reduce the occurrence of proactive behavior in order to preserve their existing resources, but one thing cannot be ignored. Collectivist human resources practice may also have an impact on employees' proactive behavior. Emphasizing collectivism in human resources management, employees will have a strong sense of collectivism. Even if there are emotional thoughts, they will take the overall view of the

primary task and put more resources to control their negative emotions, to minimize unnecessary negative impact on the organization. However, organizations that do not emphasize collectivism in human resources work have a relatively weak sense of collectivism, and their own emotional resources are losing because of homesickness, resulting in a lower willingness to take initiative in favor of the organization. Based on this, this study proposes the following hypotheses:

Hypothesis 5: Collectivist human resources practice has a cross-level regulating effect on the relationship between homesickness and employee's proactive behavior. When the collectivist atmosphere in organizational human resources management is stronger, the negative correlation between homesickness and employee's proactive behavior is weaker.

Figure 1 Research Model

### 3 Methods

#### 3.1 Sample and procedures

The participants in this study were all from organizations in southwest China. In March 2019, they were distributed through QQ, WeChat, Weibo, Questionnaire Star and E-File Questionnaire, involving 32 organizations and 200 people. After sorting out and matching, 200 questionnaires were distributed and 174 questionnaires were recovered, of which 14 were invalid and 160 were valid, with an effective recovery rate of 92%. Among them, 44.4% were male and 55.6% were female, with an average age of 27.6 years, and 79.1% were bachelor degree or above.

#### 3.2 Measures

In order to ensure the reliability and validity of each scale, the scale used in this paper has been verified by scholars and widely used in academic circles. All measures used a 5-point Likert-type scale.

Homesickness: This study used a scale developed by Margaret et al. in 2002 to assess the degree

of homesickness of employees in the past month. The scale includes five dimensions, such as "missing family" and "loneliness". The Cronbach's alpha coefficient was .89.

**Emotional exhaustion:** This study used emotional exhaustion subscales developed by Maslach (2001) to measure employee emotional exhaustion. The Cronbach's coefficient is 0.89.

**Collectivist Human Resource Practice:** This study chooses the Collectivist Human Resource Practice Scale developed by House (2004), which includes six items with Cronbach's coefficient of 0.8.

**Proactive behavior:** The scale was translated from three dimensions of the Active Performance Measurement Scale developed by Griffin (2007). The Cronbach's coefficient of the scale is 0.893.

**Controlling variables:** In the course of the research, this study controlled the characteristic variables that may influence employees' proactive behavior, such as age, gender, tenure, education level, position level, role breadth self-efficacy. The role breadth self-efficacy scale developed by Carolyn (2003) et al. in 1998 was used to measure the role breadth self-efficacy. The Cronbach's alpha coefficient was .89.

## **4 Result Analysis**

### **4.1 Preliminary analysis**

Using Mplus 7.0, 160 samples were analyzed by confirmatory factor analysis (Table 1), and several competition models were compared. The results show that the fitting degree of three-factor model, two-factor model and single-factor model is not as good as that of four-factor model, which shows that the model in this paper can well reflect the factor structure of variables, and the discriminatory validity between variables has been verified. Descriptive statistics and correlation analysis are shown in Table 1.

### **4.2 Hypothesis tests**

As shown in Table 3, we tested our hypothesis with SPSS23.0. The results showed that homesickness significantly negatively affected employees' proactive behavior ( $\gamma = 461, P < .001$ ) and significantly positively affected emotional exhaustion ( $\gamma = 76, P < .001$ ), H1 and H2 were validated. Meanwhile, emotional exhaustion significantly negatively affected employees' proactive behavior ( $\gamma = 614, P < .001$ ), H3 was validated in combination with model 2 and model 4, after adding emotional exhaustion, the effect of homesickness on proactive behavior becomes insignificant ( $\gamma = 013$ ), while emotional exhaustion on proactive behavior is still significant ( $\gamma = 625, P < .001$ ), indicating that emotional exhaustion plays a completely mediating role between homesickness and employees'

proactive behavior, and H4 has been verified. We tested Moderated Mediation with Mplus7.0. The results showed that the 95% confidence interval of the moderate variable did not contain 0 (CI= [0.105, 0.392]), and H5 was verified.

**Table 1 Confirmatory Factory Results for Model Comparison**

Model	X <sup>2</sup> /Df	RMSEA	TLI	CFI

## 5 Conclusion

In this paper, we use the conservation of resources theory to explain the impact of homesickness on employees' proactive behavior. Data from 160 employees in 32 organizations show that homesickness increases emotional exhaustion, which in turn leads to a decrease in employees' proactive behavior. Collectivist human resources practice weakens the negative impact of homesickness on employees' proactive behavior. Our research also gives managers some practical inspiration:

(1) Enterprises should emphasize collectivism in the process of human resource management. On the one hand, it can improve the relationship between employees and other members of the organization, thereby reducing the negative emotions caused by homesickness perception. On the other hand, it is helpful for employees to put their organizational goals above their personal wishes and make them more willing to take out their own resources and work actively.

(2) As far as employees are concerned, they should control their emotions reasonably and face

homesickness positively. Take effective measures to reduce their emotional exhaustion. For example, keep in touch with relatives and friends, learn to get along with strangers, improve their ability to adapt to the environment and so on. Employees should also enhance their sense of collectivism and closely link their personal and corporate goals in order to enhance their willingness to take initiative.

### **5.1 Research limitations and future research directions**

Firstly, this paper uses the same time point and single data source to conduct a questionnaire survey. Although it simplifies the process of the questionnaire survey, it has not effectively avoided the homologous variance, nor has it conducted a longitudinal survey. It is suggested that a multi-time data survey should be conducted in future research, and other evaluation methods should be adopted to measure employees' proactive behavior.

Secondly, this paper fails to test the causality between variables. For example, this paper studies that homesickness may have a negative impact on employee's proactive behavior, so will employee's proactive behavior have an impact on employee's homesickness perception? What is the impact mechanism? All of these need to be further studied.

Thirdly, emotional perception is transient and dynamic. It is suggested that follow-up studies use log method to capture more delicate emotional changes within individuals

# Research on Relationship Marketing Framework and Implementation Path of Railway Freight Oriented by Customer Value

Xu Fengwei, Zhang Zhenfang

School of Economics and Management, Dalian Jiaotong University, Dalian, P.R.China, 116028

(E-mail: xu\_fengwei@163.com, zzfxsz@163.com)

**Abstract:** With the increasingly fierce competition in freight market, relationship marketing has become one of the most important aspects of railway freight marketing. And the key to relationship marketing lies in whether enterprises can create more customer value. Therefore, this paper discusses the concept of railway freight relationship marketing oriented by customer value, constructs the theoretical framework of railway freight relationship marketing oriented by customer value and further designs the relationship marketing implementation path from the perspective of customer value so as to provide enlightenment for the theoretical construction of railway freight relationship marketing and improve the core competitiveness of railway transport enterprises.

**Keywords:** Customer value; Railway freight; Relationship marketing; Framework

## 1 Introduction

With the rapid development of highway, waterway, air transport and other transportation modes as well as the continuous improvement of the overall service level in transportation market, the competition in which is increasingly fierce and the share of railway transportation in freight market shows a descending trend. The changes of transportation market environment and consumption concept make the focus of market competition from meeting the material needs of customers to meeting the service needs of customers so as to make customers satisfied and maintain loyalty. While the formation of freight service runs through the whole process of freight enterprises' service, that is to say the development of freight service depends on the maintenance of stakeholder relationship. It is certainly the focus of relationship marketing theory. And because of this, relationship marketing is also one of the most important aspects of railway freight marketing. Therefore, how to build a perfect relationship marketing system has become an essential issue for China's railway transport enterprises to obtain comparative advantages and enhance their core competitiveness in the transportation market competition.

Meanwhile, with the intensification of market competition and the deepening of economic globalization, the role of customers is gradually changing from a single consumer to multiple roles such as consumer, co-operator, value co-creator, knowledge and ability co-creator, etc. And the status of customers is becoming more and more important. In practice, enterprises have realized the importance of customer value for relationship marketing and have gradually focused on the creation and transmission of customer value. Therefore, with the theory of customer value to understand and grasp the value demand and value orientation of customers for freight service, to create and deliver excellent value for customers so as to improve customer satisfaction and loyalty, which is inevitably the core and key to build relationship marketing system of railway freight.

In practice, railway freight relationship marketing is widely used in foreign countries, but there are few theoretical studies. For example, Bodmer M. and Martins J. analyzed the role of customer relationship marketing in transportation marketing from the aspects of transportation service level and social responsibility (Bodmer M., et al., 2005). Domestic research on relationship marketing of railway freight mainly focuses on railway customer segmentation, customer relationship selection, customer relationship management, optimization of value chain and other aspects. For example, Huang Guiqun, et al. put forward the railway freight marketing model based on customer relationship management, and the corresponding countermeasures based on the difficulties in its implementation (Huang Guiqun, et al., 2003). Yang Jinhua et al. interpreted the classification and orientation of customers, the selection of customer relationship from the perspective of customer relationship management and proposed the measures for the establishment of railway customers with examples (Yang Jinhua, et al., 2008). Wang qian et al. classified customers and put forward different marketing strategies based on the customer relationship life cycle theory (Wang qian, et al., 2012). Zheng Pingbiao et al. classified railway customers by establishing customer value evaluation index system, and proposed corresponding marketing strategies for different groups (Zheng Pingbiao, et al., 2014).

To sum up, there is a lack of systematic research on railway freight relationship marketing from the perspective of customer value at home and abroad. As relationship marketing attaches great importance on the long-term relationship between enterprises and customers, so we must emphasize the creation of customer value to keep customers satisfied and loyal so as to increase and expand market share. Therefore, constructing the theoretical framework of railway freight relationship marketing from the perspective of customer value is very important and necessary for the improvement of customer satisfaction and loyalty and further enhances the core competitiveness of railway freight enterprises.

## **2 The Concept of Railway Freight Relationship Marketing Oriented by Customer Value**

### **2.1 The connotation of customer value**

At present, the academic circles have different interpretations on customer value from customer perspective. For example, Zaithaml pointed out that customer value is the overall evaluation on the utility of a product or service after weighing the perceived benefits of customer against the costs acquiring for products or service (Zaithaml V., 1988). Woodruff believed that customer value is the preference and evaluation perceived by customers on product attributes, attribute performance, application and the application result (Woodruff R.B., 1997). Among them, Gronroos' research achievements provide more valuable references for this paper. He believes that customer perceived value is a self-evaluation process of customers for service, product, information, contact, service remedy and other elements when customers consume products or service in the process of relationship development. The equations go as follows:

$$\text{Customer perceived Value} = (\text{Core product} + \text{Additional service}) / (\text{Price} + \text{Relational cost}) \quad (1)$$

$$\text{Customer perceived value} = (\text{Long-term benefits} - \text{Support costs}) / (\text{Price} + \text{Relational cost}) \quad (2)$$

In relationship marketing, customer value is perceived with the development of time. In formula (1), price is a short-term concept, relationship cost occurs with the development of relationship, and marginal cost witnesses a diminishing trend. Besides, core product and additional service are also reflected with the development of relationship. Formula (2) is similar to formula (1), which explains the comparison between the economic benefits and the costs of the enterprise. Accordingly, the duty of an enterprise is to use resources and interact with customers to support the generation of customer value (Wei Fuxiang, 2009).

### **2.2 The meaning of relationship marketing**

Relationship marketing theory was first put forward by European scholars on the basis of studying service market and industrial product market in the 1980s. However, the concept of "relationship marketing" was first proposed by Berry, an American scholar, who believed that "relationship marketing is to attract, maintain and enhance the relationship with customers". At present, there are three opinions interpreting relationship marketing. A relatively common view holds that relationship marketing is to maintain a good cooperative relationship between buyers and sellers in transaction activities. Meanwhile, some scholars believe that relationship marketing refers to the establishment of a good relationship between the trading parties in the previous trading activities, so that more trading activities will be carried out through such a good cooperative relationship in future. Some other scholars believe that relationship marketing is that all parties involved in the transaction shall abide by

the trading principles of honesty, good faith and timely fulfill the trading commitments so that the interests of all participants are realized in the relationship marketing activities (Yuan Guohua, 2004). In a word, relationship marketing is a new marketing theory, which takes the establishment, maintenance and promotion, improvement as well as adjustment of relationship as the core and innovates the traditional marketing.

### **2.3 The connotation of railway freight relationship marketing oriented by customer value**

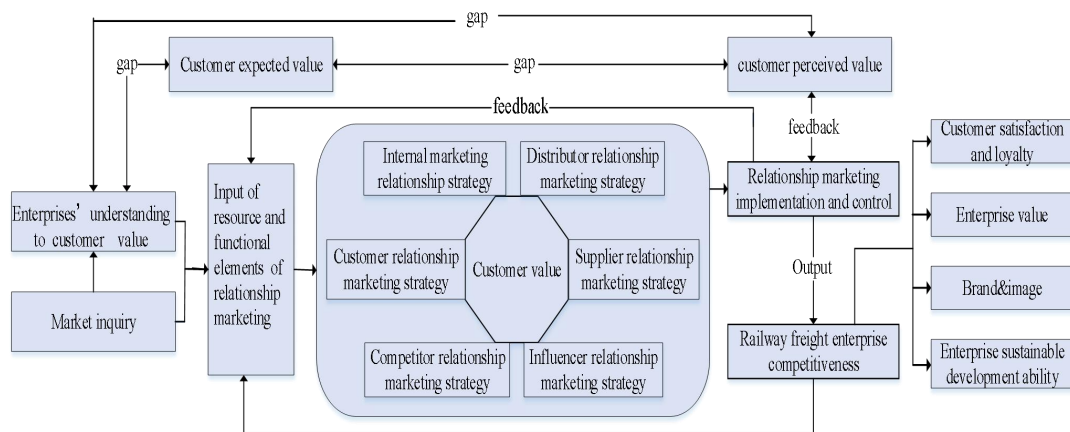

Goods transportation is the movement of goods in space with the help of transportation capacity, and goods transportation products are transportation services for transportation demanders. Transportation marketing is a comprehensive marketing process in the transportation market to meet the actual or potential needs of transportation demanders through the exchange of transportation products (Liu Zuoyi et al., 2008). It starts before the transportation production and runs through the whole process of the transportation production.

By drawing lessons from the meaning of transport marketing, relationship marketing and combining the actual conditions of railway freight, railway freight relationship marketing refers to the realization of the interests for all parties under the guidance of relationship marketing. Railway freight enterprises adopt measures to motivate railway workers and internal organization, establishing competitive and cooperative relations with external competitors. And the external competitors refer to third-party logistics enterprises, highway, aviation, shipping and other enterprises. Before providing transportation services, railway freight enterprises should analyze the market demands and opportunities, determine the target market and design transportation service scope and quantity accordingly; in the process of transportation organization, the railway freight enterprises combine and use the related marketing strategies as well as the public relations means to complete the organization processes of the transportation service; after completing transportation service, the information feedback should be completed to provide the basis for analyzing the changes of market demand, improvement and innovation of the transportation service or products. This progress goes around and round and eventually forms a virtuous cycle to constantly meet the needs of shippers and create value for them so as to better play the role of relationship marketing.

It is obviously that the enterprises can't meet the needs of modern market competition if they are only limited to develop good relations with customers. Besides, establishing, maintaining and developing a good relationship with all stakeholders is an inevitable choice for an enterprise to achieve its goals in the new marketing environment. Railway freight relationship marketing oriented by customer value aims to create maximum value for customers, which is based on the common development of win-win relationships with relevant stakeholders and finally achieves the goal of improving the competitive ability for railway freight business.

### 3 The Theoretical Framework of Railway Freight Relationship Marketing Oriented by Customer Value

Modern marketing framework is a basic theoretical framework of marketing theory(Guo Yuhua, 2011). Although emphasizing the importance of customer and customer relationship, it still passively adapts to customers and fails to actively create higher customer value beyond competitors as well as fails to solve the problems of marketing strategy combination and implementation of customer value creation. Therefore, on the basis of theoretical framework of modern marketing and the six-market model of relationship marketing, this paper puts forward the theoretical framework of railway freight relationship marketing oriented by customer value, which includes the contents, functions and targets of railway freight relationship marketing. Besides, relationship marketing strategy contains customer, internal market, distributor, supplier, influencer and competitor relationship marketing strategy. This framework centers on customer value with an outer layer around the relationship marketing strategies. Each part of the framework clearly defines customer, demand identification and strategy formulation, strategy selection, implementation evaluation as well as feedback based on customer value. Figure 1 clearly represents more details about this theoretical framework.

**Figure1 Theoretical Framework of Railway Freight Relationship Marketing Oriented by Customer Value**

As can be seen from figure 1, railway freight relationship marketing oriented by customer value consists of six parts. The first part is market exploration, which includes not only market research and prediction, market segmentation, target market selection and market positioning, but also important contents related to strategic planning. The second part is the relationship marketing resources and corporate functional elements on the basis of market research and enterprises' understanding of customer value. And the resource elements of railway freight relationship marketing are an organic combination of personnel, capital, entity, technology, equipment and information. At the same time,

these resources and functional elements must be planned and executed to achieve the output function of creating value for customers. All resource elements should follow the guidance of relationship marketing oriented by customer value. The third part is the relationship marketing strategy oriented by customer value. This part considers the particularity of railway freight products and services as well as six markets model of relationship marketing theory. Besides, this strategy contains six aspects and the key point of railway freight relationship marketing is just to be developed from these six aspects. The fourth part is the implementation and control of relationship marketing strategy. In the implementation process, it not only should implement the input of relationship marketing resources, but also strengthen the risk control and crisis management of relationship marketing. Besides, more attention should be paid to the identification and evaluation of customer value driving factors to guide and control the implementation of relationship marketing strategy. The fifth part is the customer value driving factors identification and evaluation, this is the core of the theoretical framework of railway freight relationship marketing oriented by customer value. It runs through the whole process of implementing the theoretical framework of railway freight relationship marketing and plays a decisive role in the effective input of relationship marketing resources as well as effective implementation of relationship marketing strategy. The sixth part is the target level of railway freight relationship marketing, namely the promotion of the core competitiveness of railway freight enterprises. The goal of relationship marketing for railway freight should be to coordinate the balance of enterprise's own interests, customers' interests and social interests. Therefore, the goals of railway freight relationship marketing oriented by customer value must consider the different interest orientation and demand from subject and object of relationship marketing which realizes mainly from the aspects of customer loyalty and value, enterprise value, enterprise brand and image as well as sustainable development ability.

#### **4 The Implementation Path of Railway Freight Relationship Marketing Oriented by Customer Value**

Feasible plans and implementation path maps are the key to any theoretical framework being translated into actionable plans and guidelines. Therefore, the design of the implementation path of railway freight relationship marketing oriented by customer value becomes the key to the implementation and control of railway freight relationship marketing.

##### **4.1 Identify and analyze customers' freight demands through market exploration**

Due to universality of freight service demands and limited resources of freight enterprises, railway freight enterprise must find the key customers of enterprise through market exploration, analyze their demands for freight products and the dynamic changes of demand to create higher customer value, which is the key to railway freight relationship marketing oriented by customer value.

#### **4.2 Identify the driving factors of customer value**

For different freight products, the driving factors of customer value are different, and it changes dynamically in different time periods. Therefore, analyzing the driving factors of customer value is the premise for railway freight relationship marketing and it is also the necessary link for enterprises to reasonably locate customer value so as to invest resources and provide freight service.

To identify and evaluate the driving factors of customer value, first of all, we need to look for possible drivers of perceived customer value for railway freight business owners based on the literature research on marketing, relationship marketing, consumer behaviors, consumer psychology and logistics and then obtain the relevant variables through qualitative methods such as group interview so as to generate the measurement items driving factors of customer value; After that, the stage of formal questionnaire design was carried out to obtain the perceived value data of railway freight enterprises' shippers on railway freight services; Finally, through relevant statistical analysis to find the perceptual gaps of customer value between the freight enterprises and shippers and conclude the factors that should be paid attention to and the areas that need to be improved.

#### **4.3 Develop railway freight relationship marketing strategies oriented by customer value**

After identifying the key driving factors of customer value, we can develop the relationship marketing strategies of railway freight by combining the capabilities and resources of the enterprise.

#### **4.4 Implement and control of railway freight relationship marketing oriented by customer value**

After making good relationship marketing strategies, the enterprise will implement these strategies through the corresponding organization, planning and implementation of activities. In the process of implementation, as the dynamic changes of the customer value driving factors and the gaps of perceived value between enterprise and the customer, thus the enterprise needs to set up customer value driving factors of the dynamic measurement system, analyzes the gaps of customer value perception and enterprise's understanding of customer value as well as customer expectation value at any time to adjust the relationship in time.

### **5 Conclusion**

The theoretical core of relationship marketing is to maintain and enhance customer relationship, while the development of freight service lies in maintaining the relationship among stakeholders. Therefore, railway freight marketing should not only stay in the customer market, but also integrate the distributor market, competitor market, influencer market and internal market in a systematic way to highlight the core position of customer value in railway freight relationship marketing. Railway freight relationship marketing oriented by customer value is the reform and innovation of railway

freight marketing theory and practice brought by the changes of freight market environment and consumption concept. Besides, it is the development of railway freight marketing based on customer value and relationship marketing theory. Clarifying the theoretical framework on railway freight relationship marketing oriented by customer value, which helps railway freight enterprises to clarify the full path of the implementation on freight relationship marketing, create more satisfactory value experience for customers and enhance customer loyalty so as to build the unique competitive advantages of railway freight enterprises and improve their core competitiveness.

# A Study on Enterprise Life Cycle, Executive Compensation and Earnings Management

Du Wanxin

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070  
(E-mail: 17839219707@163.com)

**Abstract:** With the method of empirical research, this paper puts forward the issue that the executive compensation will have an impact on the earnings management behavior, and believes that the impact of the enterprise in different life cycles is different. This paper constructs relevant models to verify this hypothesis. The conclusion of this paper is as follows: the greater difference in executive compensation, the greater degree of earnings management, and the life cycle of an enterprise will affect the relationship between the two. Compared with the mature stage, the salary comparison psychology of the management in the growth stage has a greater impact on earnings management.

**Keywords:** Life cycle; Executive compensation; Earnings management; Corporate governance

## 1 Introduction

Earnings management has always been one of the key research areas of modern financial accounting. Executive compensation is related to corporate efficiency and social equity, and a reasonable executive compensation contract can effectively alleviate the agency conflict between shareholders and managers, and achieve incentive compatibility between principals and agents. As a result, a large number of domestic and foreign literatures have conducted normative and empirical studies on such issues as whether there is correlation between executive compensation and earnings management, and whether higher PPS salary contract will lead to more serious earnings management. Foreign scholars mostly studied executive compensation, earnings management and enterprise life cycle, and found that the compensation contract of managers was the direct cause of the earnings management behavior of enterprises (Watts & Zimmerman, 1986; Armstrong, C.S., A.D. Jagolinzer, 2010; Sun, 2014). During the growth period, the manipulative accruals of enterprises tended to be positive, while during the decline period, the manipulative accruals tended to be negative (Liu, C.C. and S.G. Ryan, 2006). Domestic scholars combined the three factors and found that industry characteristics would have a moderating effect on the relationship between salary comparison and salary manipulation (Luo Hong, Zeng Yongliang and Wan Lingyu, 2016). Li Lanyun and Ren Guohui found that with the advance of enterprise life cycle, the monetary compensation incentive effect of senior executives presented a "u-shaped" distribution. Zhang Zenan and Ma Yongqiang found that the strength of the marketization process would also lead to the heterogeneity of earnings management implemented by executives induced by the compensation gap of companies with different property rights. However, based on the literature at home and abroad, the life cycle characteristics of enterprises are rarely considered in the research of this field, and most of the research starts from the perspective of equity incentive. Therefore, this paper will study the relationship between executive compensation and earnings management from the perspective of enterprise life cycle, so as to enrich the research on earnings management.

## **2 Theoretical Analysis and Hypothesis Development**

### **2.1 Executive compensation and earnings management**

Based on the analysis of agency theory, in order to obtain greater private benefits, the management is more likely to realize its own private interests by manipulating enterprise accruals, choosing accounting policies and changing accounting estimates, etc. (Luo Hong, Zeng Yongliang and Wan Lingyu, 2016). Equity theory holds that the perceived fairness and reasonableness of compensation will directly affect the effort level and behavior choice of executives (Li Yanxi et al, 2007). Social comparison theory points out that people tend to compare their efforts and returns with others (Wu Liansheng, Lin Jingyi, Wang Yaping, 2010). In the absence of reference system, general executives will choose to compare their remuneration with that of executives of similar enterprises in the same industry and employees of the same enterprises, so as to evaluate the rationality and fairness of their remuneration. When larger pay gap, executive level of perceived pay unfairness is bigger, to conduct self-compensate the lack of this kind of satisfaction, it is more likely to through other ways to get more compensation, at the same time also reduces its degree of positive work hard, and surplus management is closely related to total compensation, therefore, the compensation for the larger gap, salary gap present positive correlation relationship between earnings management (Bergstresser, D. and T. Philippon, 2006; Bo, S., 2014; Li Yanxi et al, 2007). Based on this, this paper put forward the research hypothesis:

H1: executive compensation gap is positively correlated with earnings management, that is, the higher the degree of compensation gap, the higher the degree of earnings management of the management

### **2.2 Enterprise life cycle, executive compensation and earnings management**

Different companies have different life cycles. Each life cycle has different goals, strategies, development direction, market share, profitability, sales pressure, business risks, agency problems, etc. (Chen Chen et al. 2016). Due to the small market share and certain resistance to product sales in the growth stage, the management personnel may not be able to achieve the purpose of obtaining considerable remuneration solely on the basis of product sales performance, which will prompt the management personnel to use the earnings management method to send a good signal to the enterprise and the outside world. Manipulation of performance for high pay. On the contrary, mature enterprises occupy a large share of the market, have a stable source of customers, and have considerable sales profits. Management personnel can improve their performance through normal sales profits of products, so as to improve their salary level. These mean that the managers of mature enterprises will have less incentive to take risks to carry out more costly earnings management after being discovered. Compared with mature enterprises, the external market competition faced by enterprises in the recession period is more brutal, and even there is a risk of bankruptcy. Management's performance could be hit hard, and lower performance could further affect executive compensation. At this time, the management, in order to stabilize and improve the salary, the management will choose the method of earnings management to maintain or improve performance (Wang Yun et al, 2016; Chen Chen, Li Zhe and Wang lei, 2017; Wu Liansheng, Lin Jingyi and Wang Yaping, 2010). Therefore, this paper proposes the second hypothesis:

H2: Compared with mature enterprises, the salary level of management staff in the growth period and decline period has a greater impact on earnings management.

### 3 Research Design

#### 3.1 Sample

In this paper, a-share listed companies from 2012 to 2015 were selected as the initial samples and screened according to the following criteria : (1) ST and \*ST companies were excluded; (2) financial and insurance industries were excluded; (3) samples with missing financial data and corporate governance projects were excluded. In this paper, Winsorize method is adopted to conduct 1% and 99% indentation processing for continuous variables, and finally 3741 research samples are obtained. All data in this paper are from Wind database and CSMAR database.

#### 3.2 Variable definitions

##### 3.2.1 Accrued earnings management

In this paper, the modified Jones model based on industry and annual classification, Dechow et al., is used to estimate the manipulable profit as an indicator of earnings management. The specific formula is as follows:

$$\frac{TA_{it}}{A_{it-1}} = \frac{\hat{a}_1}{A_{it-1}} + \frac{\hat{a}_2 \Delta REV_{it}}{A_{it-1}} + \frac{\hat{a}_3 PPE_{it}}{A_{it-1}} + \varepsilon_{it} \quad (1)$$

$$NDA_{it} = \frac{a_1}{A_{it-1}} + \frac{a_2(\Delta REV_{it} - \Delta REC_{it})}{A_{it-1}} + \frac{a_3 PPE_{it}}{A_{it-1}} \quad (2)$$

$$DA_{it} = \frac{TA}{A_{it-1}} - NDA_{it} \quad (3)$$

DA<sub>it</sub> refers to the total accrued profit of a company in period , which is the difference between the net profit of the company and the net cash flow from operating activities. A<sub>it-1</sub> is the total assets of the company at the beginning of period t. REV<sub>it</sub> represents the difference between t period operating income and t-1 period operating income, and REC<sub>it</sub> represents the difference between t period and t-1 period receivables. PPE<sub>it</sub> means the original value of fixed assets at the end of period t. When studying earnings management, this paper referred to the research of li yanxi et al., namely, executive compensation was only positively correlated with positive earnings management. Therefore, this paper only considered the samples of earnings management DA<sub>it</sub> greater than 0, totaling 3,741 samples.

##### 3.2.2 Enterprise life cycle

In this paper, based on the research of DICKINSON and the research of Chen Chen and wang yun, the research samples are divided into three stages: growth stage, maturity stage and decline stage. See table 1 for details.

**Table 1 Symbol of Net Cash Flow of Enterprises in Different Life Cycles**

Symbol of net cash flow	Introduction period	Growth period	Maturity period	Recession period1	Recession period2	Recession period3	Recession period4	Recession period5
Operating activities	-	+	+	+	+	-	-	-

Investment activities	-	-	-	+	+	-	+	+
Financing activities	+	+	-	+	-	-	+	-

### 3.2.3 Control variables

Based on previous studies, this paper selected audit quality, return on equity, equity nature and financial leverage as control variables. In addition, it controlled the industry and year.

**Table 2 Variable Definitions**

Variables	Variable Symbol	Variable Declaration
Explained Variable	DA	Accrued Earnings Management
Explanatory Variables	Gap	AVGTOP3/AVGEMP=Average compensation for the top three executives /Average salary of ordinary employees
	Lifel	Growth
Explanatory Variables	Life2	Mature
	Life3	Degenerating
Control Variables	Qlt	Audit quality, if the accounting firm hired by the enterprise belongs to the "big four" international accounting firm, the value is 1, otherwise it is 0
	ROE	Return on equity ratio of net profit to average net assets
	Nature	If the enterprise is a state-owned enterprise, the value is 1, otherwise it is 0
Control Variables	Lev	Financial leverage is equal to total liabilities divided by total assets
	Year	Annual factor, annual dummy variable
	Industry	Industry factors, industry dummy variables

### 3.3 Model

Model 1: Test the relationship between the comparison psychology of management personnel and earnings management

$$DA_{it} = \beta_1 + \beta_2 Gap + \beta_i \Sigma control + \beta_j \Sigma year + \beta_k \Sigma industry \quad (4)$$

$$EM = \beta_1 + \beta_2 Gap + \beta_i \Sigma control + \beta_j \Sigma year + \beta_k \Sigma industry \quad (5)$$

Model 2: examine the relationship between enterprise life cycle, competitive psychology and earnings management

$$DA_{it} = \theta_1 + \theta_2 Gap + \theta_3 life1 + \theta_4 life2 + \theta_5 Gap * life1 + \theta_6 Gap * life2 + \theta_i \Sigma control + \theta_j \Sigma year + \theta_k \Sigma industry \quad (6)$$

$$EM = \theta_1 + \theta_2 Gap + \theta_3 life1 + \theta_4 life2 + \theta_5 Gap * life1 + \theta_6 Gap * life2 + \theta_i \Sigma control + \theta_j \Sigma year + \theta_k \Sigma industry \quad (7)$$

Model 1 is used to test hypothesis 1: the smaller the compensation comparison coefficient is, the larger the compensation gap between the executive compensation and the employees of comparable companies in the same industry will be, and the higher the executive's comparison psychology will be, and the greater the degree of earnings management conducted by the management. If 2 is significantly negative, it means that the smaller the comparison coefficient is, and in turn, the larger the comparison psychology is, the greater the degree of earnings management of the enterprise will be. In model (2), the life cycle of the enterprise and the interaction between the comparison coefficient and the life cycle of the enterprise are added to verify whether the life cycle of the enterprise will have an impact on the relationship between the salary comparison psychology and earnings management. In model (2), the introduction of interaction terms usually requires the centralization of independent variables and regulating variables. Therefore, this paper centralizes Gap, life1 and life2 variables in model (2). To avoid multicollinearity, this paper studies to mature companies as a benchmark, regression results are compared with the mature of the results. The 6 are significantly negative, then compared with the mature period, growth and decline enterprise management comparing coefficient is smaller, the greater the peer, can lead to greater earnings management executives.

## 4 Empirical Results

### 4.1 Descriptive statistics and correlation analysis

Table 3 shows the descriptive statistical results of the main variables in this paper. Where, the average of earnings management DA is 0.0634, which is basically similar to the results of existing studies (Liu Qiliang, 2009). The mean and median of the comparison coefficient are both greater than 1, which indicates that there is a comparison phenomenon in the formulation of executive compensation in China's listed companies. In addition, the standard deviation of the comparison coefficient is 0.8396, the minimum value and the maximum value are 0.1750 and 5.2480 respectively, which indicates that there is a big gap in the executive compensation of China's listed companies. When the executive compensation is lower than the median of comparable companies in the same industry, the executive's comparison mentality may be larger. This also implies that we can discuss the impact of salary comparison in different life cycles on earnings management from the perspective of the life cycle of enterprises. In addition, the Pearson correlation coefficient between variables was calculated and the variance inflation factor vif of each variable was tested. The results showed that there was no multicollinearity between variables.

**Table 3 Descriptive Statistical Results of Main Variables**

Variable	N	Mean	Median	Standard Deviation	Minimum	Maximum
DA	3741	0.0634	0.0448	0.0642	0.0000	0.5030
Gap	3741	1.2130	1.0119	0.8396	0.1750	5.2480
Life1	3741	0.5001	1.0000	0.5001	0.0000	1.0000

<b>Life2</b>	3741	0.2029	0.0000	0.4022	0.0000	1.0000
<b>Life3</b>	3741	0.2970	0.0000	0.4570	0.0000	1.0000
<b>Qlt</b>	3741	0.0591	0.0000	0.2358	0.0000	1.0000
<b>ROE</b>	3741	0.0726	0.0683	0.0909	-0.4312	0.3680
<b>Nature</b>	3741	0.3994	0.0000	0.4898	0.0000	1.0000
<b>Lev</b>	3741	0.4273	0.4143	0.2171	0.0496	0.9346

#### 4.2 Main results

To test hypothesis 1, table 4 shows the regression results of the impact of executive compensation comparison on earnings management. As can be seen from table 4, after controlling the industry and the year, the coefficient of the comparison coefficient Gap is -0.0067, and it is significantly negative at the level of 1%, which indicates that the smaller the compensation comparison coefficient is, the greater the executive's comparison psychology will be, and the management will conduct a greater degree of earnings management. This also verifies hypothesis 1.

**Table 4 Influence of Salary Comparison on Earnings Management**

<b>Variable</b>	<b>DA</b>	<b>EM</b>	<b>P values</b>
<b>Intercept</b>	0.0522	0.0613	0.0000
<b>Gap</b>	-0.0067	-0.0075	0.0000

<b>Adjust-R2</b>	0.0736	0.0756	
<b>N</b>	3741	3741	

In order to verify the second hypothesis, put forward in this paper, this paper studies whether the enterprise life cycle will have an impact on the relationship between the competitive psychology of executives and earnings management. On the basis of model (1), this paper introduces the life cycle of the enterprise and the interaction term of the enterprise life cycle and the comparison coefficient, mainly focusing on whether the interaction term's coefficients (5 and 6) are significant. After controlling for industry and annual impact, table 5 lists the regression results of the impact of enterprise life cycle on salary comparison psychology and earnings management. Chips can be seen from table 5, comparing coefficient and the interaction of the item \* Life1 (Gap) and comparing coefficient of interaction with the recession (Gap \* Life2) coefficient of 5 and theta. Theta 6 is respectively 0.0082 and 0.0084

respectively in 1% and 5% significance level, it shows that compared with the mature period, growth and decline of executives comparing coefficient is smaller, on behalf of executive pay and comparable industry personnel salary Gap, the greater the management cannot ascend with the results to improve the compensation, alleviate intense sentiment, which causes the executives to earnings management motivation, It verifies hypothesis 2 of this paper that the relationship between the comparison psychology of executive compensation and earnings management will be affected by the life cycle of the enterprise. The results show that compared with the mature stage, the competitive psychology of executives in the growth stage and the decline stage has a greater impact on earnings management.

#### 4.3 Robustness checks

In order to test the robustness of the above conclusions, the life cycle of the enterprise in the sample was regression according to the growth period and maturity period samples, to verify the impact of salary comparison psychology on earnings management in different life cycles. The grouped regression results also verify the above conclusions, indicating that the conclusions are robust. Due to space constraints, it is unnecessary to elaborate here.

## 5 Conclusion

This paper combines executive compensation and earnings management of listed companies, and applies the knowledge of behavioral economics to analyze the impact of executive compensation gap on earnings management. Through empirical analysis, the following conclusions can be drawn: when the gap in executive compensation is larger, the executive will have the psychology of comparison, and this

negative psychology will bring the executive a negative and uneasy mood. In order to alleviate the salary gap, the executives of listed companies will increase the motivation of earnings management. In addition, the different life cycle, the executives' pay gap have different influence on earnings management degree, compared with the mature period, the growth and decline enterprise executive pay gap bigger impact on earnings management degree, and he said, as a long-term and mature enterprise executive pay gap, the greater the they compare motivation, to a greater degree of earnings management. Mature enterprises can alleviate the relationship between executive compensation gap and earnings management. This also provides a certain reference for China's listed companies in salary design. However, this paper focuses on accrual earnings management in measuring earnings management, and does not carry out relevant research on real earnings management. Future research can also focus on real earnings management, so as to make this research more adequate.

# Organization and Human Resource Transformation Based on Three-Pillar Theory

Du Ya

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: 1395497770@qq.com)

**Abstract:** Under the background of fierce market competition, the game is the competition of talents and human resources. This paper studies the organization and human resource transformation (HRT), and explores the new mode of human resource management (HRM). Taking the organization and HRT of Guangxi Geology & Mineral Huadi Industry and Trade Group (HD) as an example, through the questionnaire survey to understand the satisfaction of employees. This paper analyzes the current situation of human resources and the problems existing in the transformation, and then put forward suggestions and safeguard measures combined with the theoretical model of three pillars. The result provides new thinking for the transformation of human resources in modern enterprises.

**Key words:** Human resource management; Organization structure; Three-pillar theoretical model; HD.

## 1 Introduction

At present, China's economy is changing from the stage of high-speed growth to the stage of high-quality development, and is in the key period of changing the mode of development, optimizing the economic structure and changing the power of growth. President Xi also pointed out that in order to really gather talents from all over the world in the new era, innovating the mode of HRM and consolidate the talent base for innovative progress, which is also the inevitable requirement of change of the times, social transformation, and innovative development. In the face of the unpredictable market environment, most enterprises lack accurate strategic guidance on human resources and perfect HRM technology and system. Therefore, enterprise must change the organizational structure scientifically, and improve the existing inherent mode of HR. Organizational structure refers to how tasks are divided, grouped, and coordinated (Henry Moon, S P R D, 2008). HRM (White Buck, 1958) must be understood, maintained, developed, hired or used effectively and to make these resources an integral part of the whole work. In addition, the management of human resources performance (Dai Yuxin, 2019) can be explained as the co-ordination and control of business, business, learning, strategy, human resource delivery and personal reputation.

The current research is aimed at the macro environment of the entire industry, little attention is paid to the HRM model of an enterprise. Based on previous studies on the theory of HRM, this paper uses the theoretical model of three pillars of HRM to explore the universal model of HRT. Through the methods of questionnaire and case analysis, this paper analyzes the present situation and existing problems of human resources in HD, and puts forward the countermeasures for the transformation of HRM under the background of the Internet and big data era.

## 2 Literature Review

About performance management, this paper puts forward the combination of the performance effect of HRM and the personal work performance (Marsman, E, Bondarouk, T and Rekers, M, 2014). Studies use multiple management control and performance measurement systems to manage performance (Pešalj, B, Pavlov, A and Micheli, P, 2018). Vu, T A, Plimmer, G and Berman (Vu, T A, Plimmer, G and Berman, 2019) believe that workers can work in line with organizational goals. In addition, there is no lack of people to use the combination of complex network and human capital (Wang X, 2019) to solve the problem.

On the impact of digitization on HRM (Van Kruining, I, 2017), it can be found that HRM has become or is in the process of become more strategic because of digitization. In addition, with regard to the four main functions of HRM (Azeem, M F and Yasmin, R, 2016) is also a major innovative research on the combination of HRM and the Internet. There is also a study on effect of the intention of using e-HRM on the relationship between the determinant of e-HRM (Obeidat, S M, 2016).

Despite the fact that a more comprehensive study of HRM in all aspects of the content, whether the theory and technology can really be used in the daily operation of the enterprise is not yet known. Therefore, research on HRM also needs to combine the current situation of human resources in specific enterprises, specific problems specific analysis, under the premise of combining theory with practice, the innovative model of human resource management in the new era is proposed.

## 3 Research Methods and Theoretical Models

The most important part of HRM is performance management, which has been investigated from different perspectives. On the one hand, it starts from the performance of enterprise management and the individual performance of employees. This paper uses the method of text analysis, questionnaire and case analysis. Have a deep conversation with the employees, so as to design the employee satisfaction questionnaire of HD and distribute it to the employees. Based on the survey data, this paper analyzes the problems existing in HRT of enterprises. Then combined with the theoretical model of three pillars, this paper makes some feasible measures to solve each specific problem.

The three-pillar theory model (Devi Ulrich, 1997) is made up of the Human Resources Expert Center (COE), the Human Resources Business Partner (HRBP), and the Human Resources Sharing Service Center (HRSSC). COE's basic responsibility is intended on the formulation and optimization of various policies and processes (Yue Yang, 2018). For the HRBP, Zang Yuefan(Zang Yuefan, 2019)believes it is aimed at the different needs of human resource. HRSSC is directly oriented to customer service, dealing with numerous daily tasks of the human resources department (Zhang Suning, 2018).

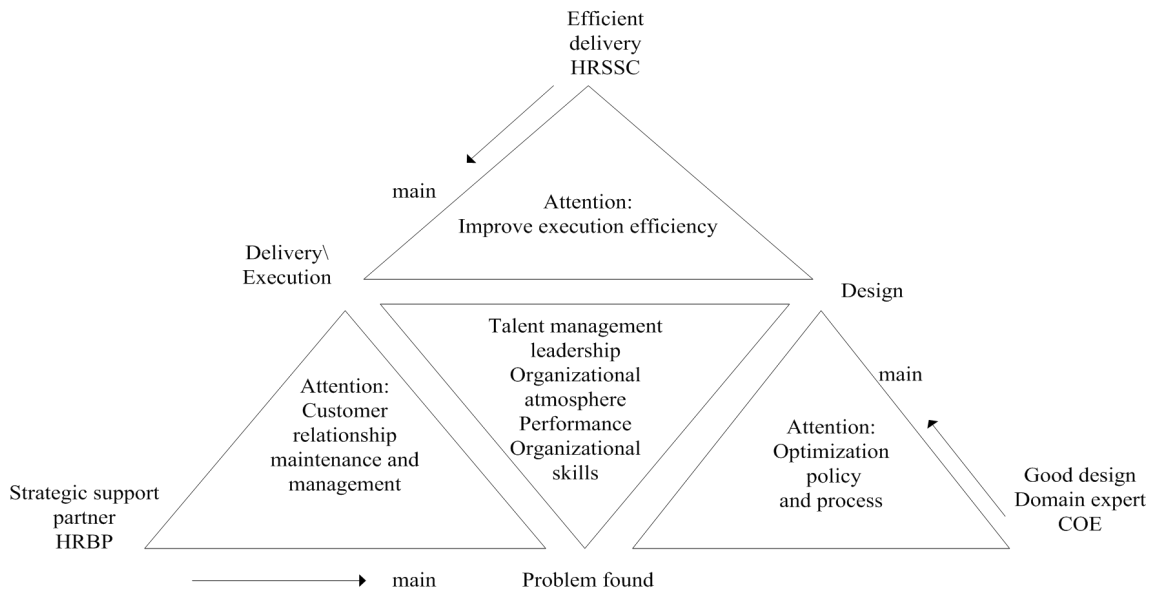

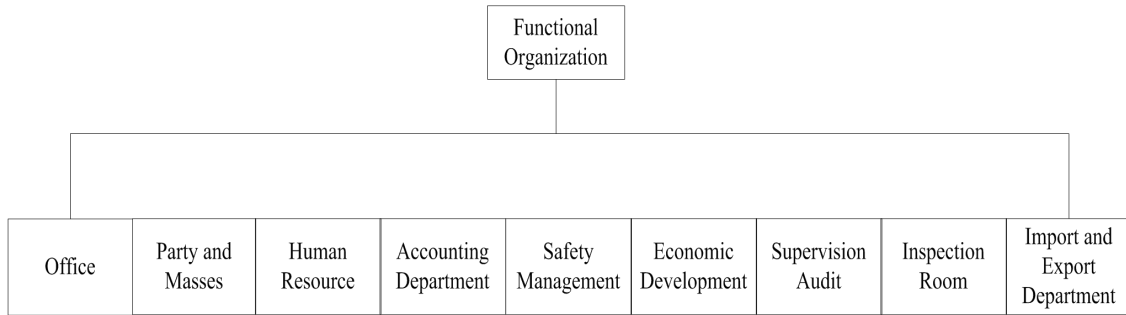

Figure 1 Three-Pillar Theory Model of Human Resource Management

## 4 Case Analysis

### 4.1 Overview of the organization and HRT of HD

Since the transformation of HD from institutions to enterprise groups in 2015, its organizational structure has modified to a certain extent. The Group divides the organizational structure into functional and operational entities (Figure 2). From the picture, we can see that the organizational structure of HD is perfect, the rights between the functions are independent of each other, but the business is closely tied. The establishment, of a separate human resources department shows that its human resources have formed a certain scale and are an indispensable part of the daily operation of the group.

The current situation of human resources is not optimistic (Table 1), with a small staff base, including staffing and hiring. The overall academic qualifications of employees are on the low side, and highly educated talents are scarce. Overall, HD's HRM level is low, the quality of staff is uneven.

**Figure 2 Functional Organization of HD**

**Table 1 Number and Quality of Staff in HD (unit: person)**

Number of employees and forms of employment	Total number of employees	249	Establishment staff	120	Employment personnel	126	\			
Educational background	Doctor	1	Graduate student	4	Undergraduate student	56	Junior college	55	Below junior college	133
Professional title situation	Senior	10	Middle	22	Primary	31	\			
Management situation	Department level	5	Middle-level cadres (at or above deputy level)			29	\			

**4.2 Research on the transformation of HD**

**4.2.1 Investigation and Analysis of employee satisfaction in HD**

HRM is a human-centered management method, so the degree of employee satisfaction is tied to the quality of HRM model. According to the Minnesota satisfaction scale (S.R. Hathaway, J.C. McKinley, 1942), this paper designs a questionnaire on worker satisfaction of HD to analyze the problems of the group's HRT after the restructuring. By checking one of the answers in "Very Disagree", "Disagree", "General", "Agree" and "Very Agree", the respondents were given a score of 1, 2, 3, 4 and 5, respectively. At the same time, the basis of the survey was added. This information, such as job type, gender, position, age, education level, etc. A total of 78 valid questionnaires was collected in this survey. The following is a descriptive statistical analysis of some of the questions in the questionnaire (Figure 3).

Figure 3 Survey of Employee Satisfaction in HD

According to statistics, HD employees are generally satisfied with the company's prospects and environment (Q1, Q2, Q9), this shows that the Group's economic benefits are not good, making employees less confident in the group. About performance management (Q4, Q5), most employees do not think that the group's human resource performance management is effective and fair. In terms of remuneration packages (Q8, Q10), only a few employees believe that remuneration packages are reasonable. This shows that the group has a large loophole in the remuneration system. About group system (Q6, Q7), most employees disagree with employee training, job rotation and employee career development planning. This shows that the Group's human resources system has not been improved.

#### 4.2.2 Specific issues of HRT in HD

(1) Lack of strategic planning for human resources. Through interviews with the head of the industry and trade human resources department in HD, it was learned that the group had not developed a clear strategic plan related to human resources. Compared with its human resources planning documents in the past two years, it only stays on the content of basic human resources affairs, and there is not any big change. Delete enterprises, strategic human resources planning are the overall planning and control of human resources. If there is the absence of systematic guidance, it will not be possible to form a unique HRM model. Therefore, enterprises cannot stand from a higher point of view to examine the defects and omissions in HRM, which is the biggest problem in the transformation of human resources management in the group.

(2) Dispute over compensation and benefits of employees. After the transfer of enterprises from public institutions, although some employees of HD retain their original establishment, they do not have previous benefits, especially in retirement protection, which makes them controversial about the salary system and the social security system. In the face of this situation, managers do not give specific solutions, or extend the innovative system, which indirectly increases the labor costs of enterprises, so that enterprises in the operating profits and no obvious increase in the premise, bear more economic burden. In addition, since employees have signed employment contracts with enterprises after the transfer of enterprises, many high-quality talents are more inclined to work in state-owned enterprises to protect their own economic interests, resulting in enterprises without changing the wage system. Can not recruit high-tech, superior academic experience personnel. The question of salary and

welfare benefits limits the long-term development of enterprises and the speed of improving the quality of personnel.

(3) Mismatch between the quality of staff and the development level of information technology. It is not difficult to see from Table 1 that more than 70% are college degrees and below. The distribution level of staff quality leads to the group cannot keep up with the pace of the Internet and big data era, difficult to master electronic human resource management technology, but also unable to combine online and offline business development. Today is the world of information technology, only on the basis of mastering high-end technology and introducing advanced technology and equipment, can we always catch up with the ever-changing market. The lack of high-quality talents has become the fundamental reason why HD gradually lags behind the same type of enterprises. In addition, as most of the employees are transferred from institutions to enterprises, the degree of aging of employees is also gradually improving, there are fewer young employees within the group, lack of innovative thinking, resulting in the lack of vitality of enterprises and low motivation for reform.

#### **4.3 Countermeasures for the HRT in HD based on the three pillar theory model**

(1) Establishing Shared Service Center (HRSSC) to integrate human capital. HD has numerous subsidiaries with different business contents, but the information between the parent company and the subsidiary is not shared. Establishing HRSSC can make the maximum use of the human resources of all groups. HRSSC can reduce the burden and workload of group managers, improve efficiency and the satisfaction of employees with the group.

(2) Leverage Business partner (HRBP) to improve Management. HD should formulate a performance appraisal system suitable for various departments. In addition, the service object of human resources business partners is not only enterprise customers but also enterprise employees, which regard employees as customers and can change and check the performance appraisal system. The applicable connection between HRBP and HRSSC is the focus and core of the future work of HD.

(3) Constructing human resources expert center (COE) to train high-end talents. COE can make the corresponding recruitment plan, select the recruitment method suitable through the integration of recruitment channels. The establishment of COE cannot only introduce high-end talents, but also systematically train the bottom staff and formulate corresponding self-development plans.

#### **4.4 Implementation guarantee of HRT of HD**

(1) Cultivate a good corporate culture. The group should combine the comprehensive ideas of senior managers and grass-roots employees, according to the different stages of the group, establish the group corporate culture. Through regular group enterprise culture education lectures, the distribution of the group enterprise culture propaganda manual, the production and promotion of enterprise culture propaganda video and other ways to spread and cultivate the HD enterprise culture. In a word, the basis of the implementation of the HRT in the group is to cultivate and implement a sound corporate culture.

(2) Increase the investment in personnel training. HD should carry out planned and organized staff quality training, provide various ways of foreign exchanges, so as to create a suitable environment to cultivate excellent technical talents. In addition, actively looking for prestigious and strong headhunters to recruit outstanding professionals. Professionals should be given high pay and appropriate rights, so as to deepen the loyalty and satisfaction of the staff and workers of the group.

From this point of view, increasing investment in talent cultivation is an important way to make sure the implementation of the transformation of human resources in the group.

(3) Establishing a scientific and reasonable HRM system. According to the current situation, the needs of employees and other aspects, the group should formulate an HRM system that can be implemented for a long time. On the basis of the system, we should standardize illegal behavior, abolish some unwritten provision and break the inherent mode of thinking. Through the standardized system, it is the human resources department to better perform the responsibilities of the department, improve the professional level and the quality of the department staff. Therefore, the establishment of a scientific and reasonable human resources management system can provide the guarantee and support for the implementation of the transformation of human resources in the group.

## 5 Conclusion

This paper through establishing HRSSC, training HRBP, and establishing COE, the human resources of HD will be re-integrated and the Group's human resources management model will be strengthened. On the basis of combining the electronic human resource management and service platform, it creates a human resource management method that belongs to HD. However, because the three-pillar theoretical model itself has certain limitations, and there are gaps in theoretical and practical operations, the process of introducing the three-pillar model into enterprise needs to be more cautious.

# Research on the Cultivation Status and Measures of Innovative Talents of Marketing Major

Ma Ying, Chen Long

School of Management, Wuhan University of Technology

mying331@163.com, 498733358@qq.com

**Abstract:** In order to cultivate talents that serve the construction of an innovative country, it is necessary for higher education institutions to actively explore innovative talent training models in the context of the new era. Based on the investigation and analysis of the current situation of the cultivation of innovative talents in marketing major in colleges and universities, this paper summarizes the achievements and shortcomings, reconstructs the training objectives of talents, reforms the training program and curriculum system, and proposes measures for the cultivation of innovative talents in marketing major based on industry-university-research cooperation.

**Keywords:** Cultivation mode; Innovative talents; Marketing major; Industry-university-research cooperation

## 1 Introduction

Innovation is the theme of The Times and the inexhaustible source of development. High-quality talents with innovative spirit and ability are the promoters of enterprise development, the leaders of economic prosperity, and the guarantee of social progress.

The cultivation of innovative talents has become one of the important goals of college teaching.

Throughout China's college education, special measures have been taken to cultivate innovative talents, and some results have been achieved.

However, it is worth noting that China's higher education has not formed a perfect system in the cultivation of innovative talents, training programs and social needs are not fully matched, innovative talents training is not particularly outstanding. The cultivation of innovative talents should not only allow the campus and teachers to play a role, but also integrate enterprises into the

cultivation system, connect all links of production, study, research and use, and realize the effective cultivation of innovative talents.

In the research on the cultivation mode of innovative talents of marketing specialty, American universities attach great importance to the individualized education of students and adhere to the diversified talent cultivation model (Zhang, 2006). German universities hold that the purpose of university education is to cultivate a "perfect person" with all-round development (Huang, 2008). Japanese universities put forward the training model of "industry-university-government cooperation", attach importance to students' national education (Xie, 2004).

In the exploration of the cultivation mode of innovative talents of marketing major in China, researchers put forward some different cultivation modes. For example, Wang et al (2018) propose that the so-called "order-type" training is to determine the enrollment number and professional talent training program based on the "order" of enterprises. Gao et al (2019) believes that the modern apprenticeship training model can connect apprentices, training institutions and employers, and enable students to integrate theoretical knowledge with practice. Zhu & Wu (2014) puts forward that the cultivation of innovative talents in marketing majors should adhere to the results-oriented, focus on students, provide more learning resources for students.

It can be found that the training mode of practical teaching and industry-university-research cooperation has been unanimously recognized by the researchers. However, there are two deficiencies in the existing research. First, the research lacks targeted investigate and practical guidance. Secondly, the cultivation mode of Chinese universities is still the imitation and copy of foreign universities, lacking of innovation and feasibility.

## **2 Investigation of Innovative Talents of Marketing Major**

### **2.1 The existing mode**

In the first investigation, the students majoring in marketing in several universities in Wuhan were surveyed through the Internet. A total of 100 questionnaires were sent out and 87 were collected. In terms of teaching methods, (Figure 1) Case teaching and students' self-discussion method are widely used. And teachers will adopt different teaching methods according to the teaching content.

Figure 1 Teaching Method of Marketing Major

In addition, students from several universities in Wuhan are not satisfied with the course setting of marketing major. As shown in figure 2, the main reason why students are not satisfied with the curriculum is that the curriculum pays too much attention to the theory but ignores the practice, and their comprehensive ability is not well explored and exercised, which leads to their insufficient practical ability.

Figure 2 Problems in the Curriculum Setting of Marketing Majors

## 2.2 Social benefits

In order to know the social demand for innovative talents of marketing major in China's universities, and the social satisfaction on students' knowledge level, learning ability and social ability. In the second investigation, the marketing managers of enterprises of different economic types were investigated through network survey. 150 questionnaires were sent out and 116 were recovered. The research results are as follows:

From the perspective of enterprise demand, most enterprises are in urgent need of recruiting innovative talents of marketing majors. In terms of vocational skills, market development, market research and prediction, and marketing planning have gradually become the focus of enterprise needs and concerns.

On the basis of constructing the evaluation index system of social benefits for innovative talents

of marketing specialty, this study uses the fuzzy AHP comprehensive evaluation method to evaluate their social benefits, as shown in Table 1.

**Table 1 Evaluation Results of Social Benefits**

Primary index	Weight	Score	Secondary index	Weight	Score
Levels of knowledge (U <sub>1</sub> )	0.0906	69.39	U <sub>11</sub>	0.5278	67.8
			U <sub>12</sub>	0.1397	66.8
			U <sub>13</sub>	0.3325	73.0
Ability to learn (U <sub>2</sub> )	0.1578	71.98	U <sub>21</sub>	0.1551	72.0
			U <sub>22</sub>	0.1178	71.0
			U <sub>23</sub>	0.2886	76.6
			U <sub>24</sub>	0.4385	69.2
			U <sub>31</sub>	0.3137	68.8
Social ability (U <sub>3</sub> )	0.1041	69.09	U <sub>32</sub>	0.0873	71.2
			U <sub>33</sub>	0.1552	72.4
			U <sub>34</sub>	0.2612	65.0
			U <sub>35</sub>	0.1826	71.6
			U <sub>41</sub>	0.3108	68.0
Ability to work (U <sub>4</sub> )	0.4026	73.00	U <sub>42</sub>	0.1958	75.4
			U <sub>43</sub>	0.4934	75.2
			U <sub>51</sub>	0.0988	67.2
The innovation ability (U <sub>5</sub> )	0.2449	71.05	U <sub>52</sub>	0.5369	72.6
			U <sub>53</sub>	0.3643	69.8

The comprehensive score of enterprises on social benefits of innovative talents majoring in marketing is as follows:

$$\text{Social benefit score} = (0.0906, 0.1578, 0.1041, 0.4026, 0.2449) * \begin{pmatrix} 69.39 \\ 71.98 \\ 69.09 \\ 73.00 \\ 71.05 \end{pmatrix} = 71.63$$

From the point of view of score, enterprises are quite satisfied with the social benefits of innovative talents of marketing specialty, which fully shows that the cultivation of innovative talents of marketing specialty in Colleges and universities can meet the basic requirements of the development of enterprises in China.

### 2.3 Cooperative resources for cultivating

The third investigation is mainly to survey the marketing teachers of several universities in Wuhan by means of network survey. 150 questionnaires were sent out and 92 were recovered. The results are as follows:

In terms of the form and content of cooperation, as shown in Figure 4, there are three main modes of school enterprise cooperation: Internship provided by the enterprise, School-enterprise order-type training, School-enterprise guidance project or competition. It can be seen from the data that the cooperation between modern enterprises and universities is increasingly frequent and diversified in content and form, and students can get more exercise in cooperation opportunities, and gradually meet the requirements of enterprises for compound talents.

Figure 4 Content and Form of School-enterprise Cooperation

From the perspective of the motivation of cooperation between universities and enterprises, for universities, enterprise financial support and the conversion rate of scientific research achievements are the main factors to be considered. For enterprises, the uncertainty of cooperation income, the economic loss of personnel training and the lack of government preferential policies will affect the enthusiasm of enterprises to carry out school enterprise cooperation.

### 2.4 The main problems of Innovative Talents of Marketing Major

According to the survey, the following problems exist in the training of marketing innovation talents in colleges and universities:

First, the training target is not accurate. Under the condition of market economy in China, there is a large demand for practical talents, so most colleges and universities should focus on practical talents. Secondly, colleges and universities should combine their own reality and external environment to make the destination of marketing graduates.

Second, the curriculum is not reasonable. On the one hand, the content of the course is not closely related to practice, and there is no local development practice in China, so the theory cannot be applied to practice. On the other hand, the relevance of the curriculum is not strong, most of which are simply stacked, which do not take into account the relevance between courses, nor design the curriculum according to the professional characteristics and teaching expertise of school.

Third, the practical teaching link is weak. On the one hand, many universities do not regulate the management of training bases, therefore the number of training bases outside universities is small and the quality is not high. On the other hand, most of the teachers are not strong in practice and lack of knowledge of enterprise marketing management. In addition, universities have not established a complete evaluation system of practical teaching, and there is not enough emphasis on practical teaching evaluation.

### **3 Measures for Cultivating Innovative Talents**

#### **3.1 Cultivating the "reverse" concept of talent cultivation**

##### **3.1.1 "Order-type" talent training**

"Order-type" talent training mode is a cooperative school-running mode in which both the school and the enterprise jointly formulate the talent training target, sign the employment agreement. In this process, the school formulates the talent training program according to the requirements of different posts, and the enterprise evaluates students and takes up employment according to the agreement. Colleges and universities should do a good job in market research, actively seek "orders" from enterprise units, actively seek partners, and strive to train talents in positions, and at the same time establish a teaching management system that is appropriate to them.

##### **3.1.2 School-enterprise cooperation training**

According to the practice of colleges and universities in China, many problems of cooperative education are caused by the lack of close cooperation between schools and enterprises. Enhance the level of industry-university-research cooperation from the following three aspects: On the one hand, schools and enterprises need to jointly develop application-oriented talent training plans, such as

curriculum setting, practical teaching, and teacher management; On the other hand, schools and enterprises jointly build laboratories, simulation training bases and off-campus training bases. In addition, through the establishment of the industry-university-research cooperation committee, more social forces can directly participate in the management of cooperative education, and promote the education comprehensive and lasting.

### 3.1.3 Optimize the subject knowledge structure and curriculum system

The training of marketing talents under the mode of industry-university-research cooperation should integrate all disciplines as a whole knowledge. On the one hand, under the premise of following the discipline and specialty rules, the discipline and specialty structure should be optimized to achieve the close connection between theory and practice. On the other hand, the education concept of cultivating students' innovative thinking should focus on the cultivation of post ability and build a multi-disciplinary integration curriculum system.

## 3.2 Reforming the "open" teaching

### 3.2.1 Treat the company as a second class.

On the one hand, teachers can participate in marketing practice under the guidance of enterprise experts, and become a window for teachers to lead to society, research society and transition to "double-qualified" teachers. On the one hand, On the other hand, students can walk out of the classroom and participate in organizing marketing activities, planning, promotion and other practical activities to enhance their practical and logical thinking skills.

### 3.2.2 Strengthen the campus practice construction.

First, build simulation training room. The marketing training room is the main place to implement the practical teaching link. The students' basic operation skills training and simulation operation training are mainly carried out in the training room. Second, operate the "second-hand market" and "plaid supermarket". Establish a business base, operate in accordance with the business model of a limited liability company, and employ professional teacher as manager for business management, conduct daily professional guidance for students, and rotate student-related marketing practice.

### 3.2.3 Expand the training base outside the school

In order to enhance students' practical operation ability, it is difficult to meet the needs of practical training only by the on-campus training base. It is necessary to expand the off-campus training base and establish internship and training bases in enterprises or related industries, which not only can cultivate students' ability to solve problems. And it can cultivate the spirit of students'

dedication and dedication.

### **3.3 Optimizing the "double-qualified" teams**

At present, there is a relative shortage of "double-qualified" teachers in marketing major in colleges and universities. Most of the teachers are "from school to school", who have a good grasp of professional theoretical knowledge, but they are quite short of application ability and practical operation experience of knowledge and technology. To build a high-quality "double-qualified" teacher team with both professional knowledge and practical skills, the following three aspects should be carried out.

#### **3.3.1 "Introducing part-time teachers" and "teacher training"**

Employ enterprise experts, social celebrities, department managers, or managers with many years of work experience in the company as part-time teachers outside the school. There are two ways for teachers to pursue further education. One is to arrange teachers to go to business operations for internships and technical consulting services; the other is to select some young teachers with potential or teachers with practical experience to go to famous universities in China for training.

#### **3.3.2 Develop a reasonable teacher evaluation system**

Formulating a reasonable performance appraisal system will help mobilize the enthusiasm of teachers and motivate teachers to fully engage in their work. Therefore, it is necessary to clearly define the duties of the post, and the experts should evaluate the comprehensive ability of the young teachers' teaching ability, practical application ability and scientific research analysis ability. The assessment follows the principle of superiority and inferiority, and the method of rebuilding is adopted for those who fail to pass the examination. Moreover, it is necessary to carry out spot checks on the performance of "double-qualified" teachers from time to time to ensure the quality of the "double-qualified" team.

### **3.4 Establishing the "sustainability" evaluation mechanism**

On the basis of exploring the new mechanism of school-enterprise cooperation and deepening the new connotation of school-enterprise cooperation, colleges and universities should improve and optimize the "double-certificate" mechanism, reform the course teaching and evaluating mechanism. Furthermore, colleges and universities should explore and practice the enterprise-led in-post internship mechanism, and finally form the "enterprise-oriented" talent training evaluation model and build its supporting system. The construction idea is shown in figure 5.

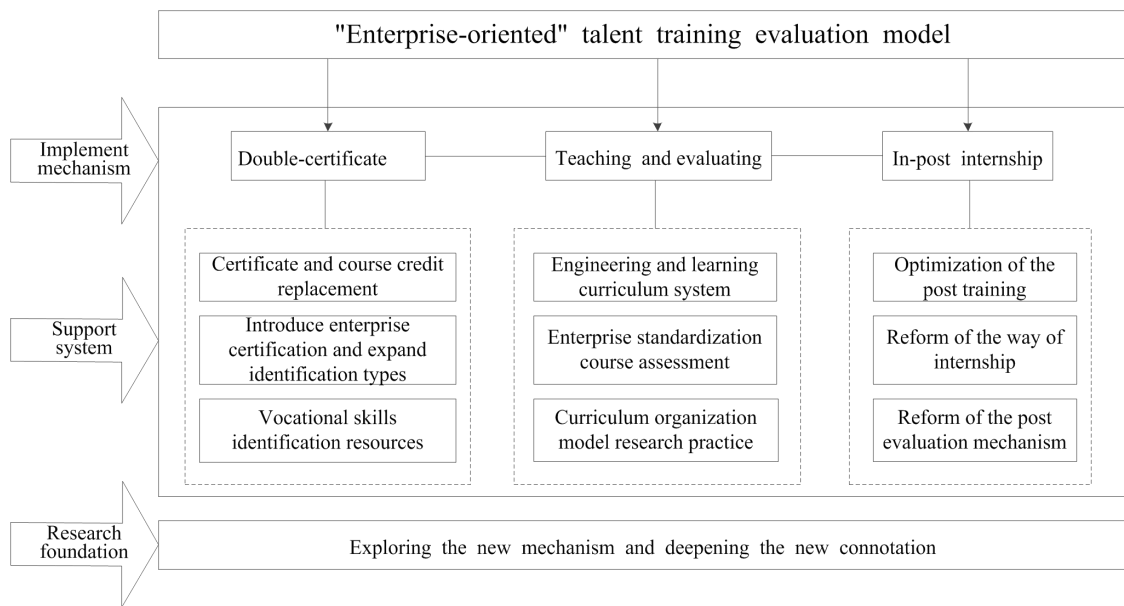

Figure 5 Thoughts on the Construction of Talent Cultivation Evaluation System

#### 4 Conclusion

This paper focuses on the cultivation of innovative talents, researches the cooperation model of industry-university-research on the cultivation of innovative talents, and takes the marketing profession as an example.

Based on the investigation of well-known universities and a large number of enterprises in Wuhan, this paper investigates the cultivation mode, social benefits and cooperative resources of innovative talents in marketing majors in universities. The results show that there are some problems in the cultivation of innovative talents, such as inaccurate orientation, unreasonable curriculum and weak practical teaching. In view of these problems, this study proposes measures to cultivate innovative talents in marketing majors based on industry-university-research cooperation, such as cultivating the "reverse" concept, reforming the "open" teaching, optimizing the "double-qualified" teams, and establishing the "sustainability" evaluation system.

This study integrated theoretical analysis and practical investigation, combined with experience summary and put forward the innovation model, has important theoretical and practical value. Moreover, the specific mode and measures proposed in this study can make up for the deficiencies in the existing training system and effectively promote the cultivation of innovative talents

## Evolutionary Game Analysis on Credit Behavior of Three Parties in Logistics Finance

Xu Fengwei, Zhang Zhenfang, Yu Bowen

School of Economics and Management, Dalian Jiaotong University, Dalian, P.R.China, 116028

(E-mail: xu\_fengwei@163.com, zzfxsz@163.com, 875956854@qq.com)

**Abstract:** In view of dynamic evolution of three parties' credit behavior in logistics finance, this paper constructs evolutionary game model on credit behavior of three parties in logistics finance, and analyzes the evolution dynamic stability of their behavior choices. The results show that: whether logistics enterprises choosing "to supervise" strategy and financing enterprises choosing "not cheating" strategy depend on normal cost, penalty, cheating cost, additional benefit after successful default and the size of performance cost under financial institutions' supervision as well as the interaction among those factors; whether financial institutions choosing "to supervise" strategy depends on supervision cost, penalty, the size of fraud losses and the interaction among those factors.

**Key words:** Logistics finance; Credit behavior; Risk; Evolutionary game

### 1 Introduction

Financing difficulty has always been the bottleneck for development of small and medium-sized enterprises, therefore logistics finance serving as an innovative financial service comes into being. It has effectively solved the problems of insufficient credit standing, pledged goods and other problems in traditional credit and also alleviates the financing predicament of small and medium-sized enterprises to some extent. However, though logistics finance eases the default risk of financing enterprises in traditional credit, it also expands the risk from two parties (financial institutions, financing enterprises) of traditional credit to three parties (financial institutions, financing enterprises and logistics enterprises) in logistics finance because of special third-party principal-agent relationship of its business. Besides, risk in logistics finance is more complex and unpreventable. Therefore, identification and prevention of logistics financial risk are essential to healthy development of logistics financial business.

In recent years, scholars at home and abroad have gradually shifted their focus from objective risk to subjective credit risk concerning the logistics finance risk. For example, Cossin and Hficko thought that pledged goods with price risk has a complex impact on pricing of credit risk after we established a model and analyzed the valuation of credit risk with pledged goods in different situations (Cossin and Hficko, 2003). Suo i subjective credit risk faced by logistics enterprises, financial institutions and financing enterprises in logistics financial services, and proposed corresponding preventive measures (Suo Na, 2013). Xu Mingchuan made a game analysis on related subjects in logistics finance business, which provided a new method for credit risk control of logistics finance (Xu Mingchuan, 2006). Wu Hao made a game analysis on logistics finance subjects of China Guangfa Bank, and put forward suggestions on credit risk control of logistics finance (Wu Hao, 2012). He Juan et al. established a three-party stackelberg dynamic game model of logistics enterprises priority decision based on the business of inventory pledge financing, and results show that logistics enterprises and banks have comparative advantages in "bilateral market" (He Juan et al., 2012). Guo Chunxiang and Shi Ruili established a tripartite subject signal game model based on incomplete information hypothesis, and results show

that financing enterprises are more likely to send information beneficial to themselves or attract logistics enterprises and banks to participate with high remuneration and interest rate. Besides, logistics enterprises and banks are more willing to take risk to participate in logistics finance (Guo Chunxiang and Shi Ruili, 2013). Tao Zhengxu and Zhou Gengui made evolutionary game analysis between logistics enterprises and financing enterprises based on the unified credit model, identified the influencing factors of credit risk, and proposed management countermeasures (Tao Zhengxu and Zhou Gengui, 2016).

From what has been discussed above, current researches on the game analysis of logistics finance subjective credit risk are mostly based on traditional static, dynamic and repeated game analysis, or simple two-party evolutionary game analysis. In view of this, this paper applies evolutionary game theory to study the motivation and dynamic evolution on credit behavior of three parties in logistics finance, and analyses the fundamental reasons of credit behavior between logistics enterprises and financing enterprises so as to provide theoretical basis and practical references for preventing credit risk of logistics finance.

## 2 Basic Assumptions and Model Building

For simplicity, this paper mainly studies the game relationship among logistics enterprises, financing enterprises and financial institutions. And strategy set of logistics enterprises  $A = \{ \text{to supervise, not to supervise} \} = \{ A_1, A_2 \}$ , strategy set of financing enterprises  $B = \{ \text{not to cheat, to cheat} \} = \{ B_1, B_2 \}$ , strategy set of financial institutions  $C = \{ \text{to supervise, not to supervise} \} = \{ C_1, C_2 \}$ .

Assumption 1: Under the condition that both financing enterprises and logistics enterprises are integrity compliance, we assume that  $I_1, I_2, I_3$  respectively represents normal revenue of logistics enterprises, financing enterprises and financial institutions. Meanwhile,  $C_1$  represents supervision cost of logistics enterprises avoiding risk,  $C_2$  represents management expense of financing enterprises' normal projects,  $C_3$  represents supervision cost of financial institutions.

Assumption 2: When financing enterprises choose cheating or logistics enterprises choose non-supervision, financing enterprises need to pay  $Y_2$  for whitewashing their credit information for obtaining loans, logistics enterprises also need to pay  $Y_1$  for their failing of supervising financing enterprises. Meanwhile,  $R_2$  and  $R_1$  represent respectively additional benefits obtained by financing enterprises' cheating successfully and logistics enterprises' non-supervision but are not detected by financial institutions. On the other hand, financial institutions will suffer losses  $S_2, S_1$  caused by financing enterprises' cheating and logistics enterprises' non-supervision.

Assumption 3:  $F_2$  and  $F_1$  respectively represent penalty imposed by financial institutions because of financing enterprises' cheating and logistics enterprises' non-supervision. In addition, logistics enterprises also need to pay  $H_1$  for new overheads to conduct supervision due to the original commitment and financing enterprises will also generate new management expense  $H_2$  because of cheating.

Based on above assumptions, the payoff matrix on credit behavior of three parties in logistics finance is shown in table 1.

**Table 1 Payoff Matrix of Tripartite Game**

Strategy Set	Logistics Enterprises	Financing Enterprises	Financial Institutions
(A <sub>1</sub> ,B <sub>1</sub> ,C <sub>1</sub> )	$I_1 - C_1$	$I_2 - C_2$	$I_3 - C_3$
(A <sub>1</sub> ,B <sub>1</sub> ,C <sub>2</sub> )	$I_1 - C_1$	$I_2 - C_2$	$I_3$
(A <sub>1</sub> ,B <sub>2</sub> ,C <sub>1</sub> )	$I_1 - C_1$	$I_2 - F_2 - H_2 - Y_2$	$I_3 + F_2 - C_3$
(A <sub>1</sub> ,B <sub>2</sub> ,C <sub>2</sub> )	$I_1 - C_1$	$I_2 + R_2 - Y_2$	$I_3 - S_2$
(A <sub>2</sub> ,B <sub>1</sub> ,C <sub>1</sub> )	$I_1 - F_1 - H_1 - Y_1$	$I_2 - C_2$	$I_3 + F_1 - C_3$
(A <sub>2</sub> ,B <sub>1</sub> ,C <sub>2</sub> )	$I_1 + R_1 - Y_1$	$I_2 - C_2$	$I_3 - S_1$
(A <sub>2</sub> ,B <sub>2</sub> ,C <sub>1</sub> )	$I_1 - F_1 - H_1 - Y_1$	$I_2 - F_2 - H_2 - Y_2$	$I_3 + F_1 + F_2 - C_3$
(A <sub>2</sub> ,B <sub>2</sub> ,C <sub>2</sub> )	$I_1 + R_1 - Y_1$	$I_2 + R_2 - Y_2$	$I_3 - S_1 - S_2$

### 3 Equilibrium Analysis of Tripartite Evolutionary Game

Suppose that logistics enterprises choose “to supervise” strategy with a proportion  $x$ , and choose “not to supervise” strategy with a proportion  $1-x$ ; financing enterprises choose “not to cheat” strategy with a proportion  $y$ , and choose “to cheat” strategy with a proportion  $1-y$ ; financial institutions choose “to supervise” strategy with a proportion  $z$ , and choose “not to supervise” strategy with a proportion  $1-z$ .

Based on table 1, the expected revenue  $E_{11}$ ,  $E_{12}$  and average revenue  $E_1$  of logistics enterprises choosing “to supervise” strategy or “not to supervise” strategy is as follow:

$$E_{11} = (I_1 - C_1)zy + (I_1 - C_1)y(1 - z) + (I_1 - C_1)(1 - y)z + (I_1 - C_1)(1 - y)(1 - z)$$

$$E_{12} = (I_1 - F_1 - H_1 - Y_1)yz + (I_1 + R_1 - Y_1)y(1 - z) + (I_1 - F_1 - H_1 - Y_1)(1 - y)z + (I_1 + R_1 - Y_1)(1 - y)(1 - z)$$

$$E_1 = E_{11}x + E_{12}(1 - x)$$

The expected revenue  $E_{21}$ ,  $E_{22}$  and average revenue  $E_2$  of financing enterprises choosing “not to cheat” strategy and “to cheat” strategy is as follow:

$$E_{21} = I_2 - C_2$$

$$E_{22} = -(F_2 + H_2 + R_2)z + (I_2 + R_2 - Y_2)$$

$$E_2 = E_{21}y + E_{22}(1 - y)$$

The expected revenue  $E_{31}$ ,  $E_{32}$  and average revenue  $E_3$  of financial institutions choosing “to supervise” strategy or “not to supervise” strategy is as follow:

$$E_{31} = (I_3 - C_3)xy + (I_3 + F_2 - C_3)x(1 - y) + (I_3 + F_1 - C_3)(1 - x)y + (I_3 + F_1 + F_2 - C_3)(1 - x)(1 - y)$$

$$E_{32} = xyI_3 + x(1 - y)(I_3 - S_2) + (1 - x)y(I_3 - S_1) + (1 - x)(1 - y)(I_3 - S_1 - S_2)$$

$$E_3 = E_{31}z + E_{32}(1 - z)$$

### 3.1 Replication dynamic analysis of logistics enterprises choosing “to supervise” strategy

Replication dynamic analysis is a dynamic differential analysis method to study the degree of adaptability of a strategy within population in evolutionary game(Xu Jianzhong and Lu Xichen,2014). The replicator dynamics equation of logistics enterprises choosing “to supervise” strategy is as follow:

$$F(x) = dx/dt = (E_{11} - E_1)x = [-(C_1 + R_1 - Y_1) + (F_1 + H_1 + R_1)z]x(1 - x) \quad (1)$$

(1) When  $z = C_1 + R_1 - Y_1 / F_1 + H_1 + R_1$ , we let  $F(x) \equiv 0$ , then for  $x \in [0,1]$  is evolutionary stability point. That means any proportion of logistics enterprises choosing “to supervise” strategy will not change over time.

(2) When  $z \neq C_1 + R_1 - Y_1 / F_1 + H_1 + R_1$ , we let  $F(x) = 0$ , then  $x = 0$  and  $x = 1$  are evolutionary stability points. And we take the derivative with respect to  $F(x)$ , the result thereby is as follow:  
 $F'(x) = [-(C_1 + R_1 - Y_1) + (F_1 + H_1 + R_1)z](1 - 2x)$ . And under this circumstance, we can analyze it in two cases:

Case 1: If  $z < C_1 + R_1 - Y_1 / F_1 + H_1 + R_1$ , for  $F'(x)|_{x=0} < 0$ ,  $F'(x)|_{x=1} > 0$ , so  $x = 0$  is evolutionary stability point; Case 2: If  $z > C_1 + R_1 - Y_1 / F_1 + H_1 + R_1$ , for  $F'(x)|_{x=0} > 0$ ,  $F'(x)|_{x=1} < 0$ , so  $x = 1$  is evolutionary stability point. It suggests that logistics enterprises choosing “to supervise” strategy is closely related to the proportion of financial institutions choosing “to supervise” strategy. When proportion of financial institutions choosing “to supervise” strategy is higher than  $C_1 + R_1 - Y_1 / F_1 + H_1 + R_1$ , logistics enterprises are willing to supervise considering penalty imposed by financial institutions and cost saving; when the proportion is lower than  $C_1 + R_1 - Y_1 / F_1 + H_1 + R_1$ , logistics enterprises will not to supervise.

### 3.2 Replication dynamic analysis of financing enterprises choosing “not to cheat” strategy

The replicator dynamics equation of financing enterprises choosing “not to cheat” strategy is as follow:

$$F(y) = dy/dt = (E_{21} - E_2)y = [-(C_2 + R_2 - Y_2) + (F_2 + H_2 + R_2)z]y(1 - y) \quad (2)$$

(1) When  $z = C_2 + R_2 - Y_2 / F_2 + H_2 + R_2$ , we let  $F(y) \equiv 0$ , then for  $y \in [0,1]$  is evolutionary stability point. This means any proportion of financing enterprises choosing “not to cheat” strategy will not change over time.

(2) When  $z \neq C_2 + R_2 - Y_2 / F_2 + H_2 + R_2$ , we let  $F(y) = 0$ , then  $y = 0$  and  $y = 1$  are evolutionary stability point. And we take the derivative with respect to  $F(y)$ , the result thereby is as follow:

$F'(y) = [-(C_2 + R_2 - Y_2) + (F_2 + H_2 + R_2)z](1 - 2y)$ . And under this circumstance, we can analyze it in two cases:

Case 1: If  $z < C_2 + R_2 - Y_2 / F_2 + H_2 + R_2$ , then  $F'(y)|_{y=0} < 0$ ,  $F'(y)|_{y=1} > 0$ , so  $y = 0$  is evolutionary stability point; Case 2: If  $z > C_2 + R_2 - Y_2 / F_2 + H_2 + R_2$ , then  $F'(y)|_{y=0} > 0$ ,  $F'(y)|_{y=1} < 0$ , so  $y = 1$  is evolutionary stability point. It suggests that the behavioral choice of financing enterprises is closely related to proportion of financial institutions choosing "to supervise" strategy. When the proportion of financial institutions choosing "to supervise" strategy is higher than  $C_2 + R_2 - Y_2 / F_2 + H_2 + R_2$ , financing enterprises are willing to choose "not to cheat" strategy considering penalty and cost saving; when the proportion is lower than  $C_2 + R_2 - Y_2 / F_2 + H_2 + R_2$ , financing enterprises tend to cheat because of poor supervision of financial institutions.

### 3.3 Replication dynamic analysis of financial institutions choosing "to supervise" strategy

The replicator dynamics equation of financial institutions choosing "to supervise" strategy is as follow:

$$F(z) = dz/dt = (E_{31} - E_3)z = [(F_1 + S_1 + F_2 + S_2 - C_3) - x(F_1 + S_1) - y(F_2 + S_2)]z(1 - z) \quad (3)$$

(1) When  $y = -(F_1 + S_1)x + (F_1 + S_1 + F_2 + S_2 - C_3) / F_2 + S_2$ , we let  $F(z) \equiv 0$ , then for  $z \in [0, 1]$  is evolutionary stability point. This means any proportion of financial institutions choosing "to supervise" strategy will not change over time

(2) When  $y \neq -(F_1 + S_1)x + (F_1 + S_1 + F_2 + S_2 - C_3) / F_2 + S_2$ , we let  $F(z) = 0$ , then for  $z = 0$  and  $z = 1$  are evolutionary stability point; And we take the derivative with respect to  $F(z)$ , the result thereby is as follow:

$F'(z) = [(F_1 + S_1 + F_2 + S_2 - C_3) - (F_1 + S_1)x - (F_2 + S_2)y](1 - 2z)$ . And under this circumstance, we can analyze it in two cases:

Case 1: If  $F_1 + S_1 + F_2 + S_2 < C_3$ , then  $F'(z)|_{z=0} < 0$ ,  $F'(z)|_{z=1} > 0$ , so  $z = 0$  is evolutionary stability point. It suggests if supervision cost of financial institution is higher than sum of revenue obtained through punishment between financing enterprises and logistics, losses caused by non-supervision, financial institutions are willing to supervise to avoid further losses.

Case 2: If  $(1 - x)(F_1 + S_1) + (1 - y)(F_2 + S_2) > C_3$ , then  $F'(z)|_{z=0} > 0$ ,  $F'(z)|_{z=1} < 0$ , so  $z = 1$  is evolutionary stability point. It suggests that if sum of penalty imposed by financial institutions for logistics enterprises' non-supervision and financing enterprises' cheating, losses avoided by financial institutions is higher than financial institutions' supervision cost, financial institutions are willing to supervise logistics enterprises and financing enterprises for their own benefits.

### 3.4 Evolutionary stability analysis on credit behavior of three parties

Simultaneous replicator dynamics equations (1), (2), (3), and we obtain a three-dimensional dynamic system, which describes evolutionary dynamics on credit behavior of three parties. Then let  $dx/dt = dy/dt = dz/dt = 0$ , we get equilibrium points of three-dimensional dynamical system. And if equilibrium of evolutionary game  $x$  is evolutionary stability point, so  $x$  must be the strict Nash equilibrium. Besides, strict Nash equilibrium is pure strategy Nash equilibrium (Selten R., 1980; Ritzberger K. and Weibull J. W., 1995). Besides, strict Nash equilibrium is pure strategy Nash equilibrium. Therefore, we discuss asymptotic stability of eight points, that is (0,0,0), (1,0,0), (0,1,0), (1,1,0), (0,0,1), (1,0,1), (0,1,1), (1,1,1), and obtain the stability of these points through local stability analysis of Jacobian matrix. The results of evolutionary stability are shown in table 2.

**Table 2 Stability Analysis of Equilibrium Points**

Equilibrium points	Stability condition	Result
(0,0,0)	$C_1 + R_1 > Y_1, C_2 + R_2 > Y_2, F_1 + S_1 + F_2 + S_2 < C_3$	ESS
(1,0,0)	$C_1 + R_1 < Y_1, C_2 + R_2 > Y_2, F_2 + S_2 < C_3$	ESS
(0,1,0)	$C_1 + R_1 > Y_1, C_2 + R_2 < Y_2, F_1 + S_1 < C_3$	ESS
(1,1,0)	$C_1 + R_1 < Y_1, C_2 + R_2 < Y_2$	ESS
(0,0,1)	$C_1 - Y_1 > F_1 + H_1, C_2 - Y_2 > F_2 + H_2, F_1 + S_1 + F_2 + S_2 > C_3$	ESS
(1,0,1)	$C_1 - Y_1 < F_1 + H_1, C_2 - Y_2 > F_2 + H_2, F_2 + S_2 > C_3$	ESS
(0,1,1)	$C_1 - Y_1 > F_1 + H_1, C_2 - Y_2 < F_2 + H_2, F_1 + S_1 > C_3$	ESS
(1,1,1)	—	Unstable

As can be seen from table 2, there are seven evolutionary stability strategies for game system under certain conditions, that is (0,0,0), (1,0,0), (0,1,0), (1,1,0), (0,0,1), (1,0,1), (0,1,1). The analysis results show that: when supervision cost of logistics enterprises is higher than difference between cost of whitewash for choosing “not to supervise” and additional benefits, which is net fees of non-supervision or higher than sum of penalty imposed by financial institutions for logistics enterprises’ non-supervision, new supervision fee, expense of concealment, then logistics enterprises tend to “not to supervise” strategy, otherwise they are willing to supervise. Similarly, the same goes for financing enterprises. If supervision cost of financial institutions is relatively higher than sum of penalty paid by both parties for their nonperformance of normal credit, losses avoided by financial institutions because of their supervision; or higher than sum of penalty paid by one party for their non-performance of normal credit and losses avoided by financial institutions due to their supervision, financial institutions eventually tend to choose “not to supervise” strategy, otherwise they are willing to supervise.

### 4 Conclusion

Identifying reasons and nature of participants’ credit behavior is fundamental to control credit

risk of logistics finance. Therefore, this paper constructs evolutionary game model on credit behavior of three parties among logistics enterprises, financing enterprises and financial institutions, and analyzes evolutionary process of their credit behavior selection over time. The results show that normal expenses between logistics enterprises and financing enterprises, additional benefit after successful default or concealment of unsupervised behavior are smaller, and cost of cheating or concealment, the performance fee and penalty after being supervised by financial institutions are relatively larger to a certain extent, logistics enterprises and financing enterprises will observe the contract, otherwise they will breach the contract. Besides, financial institutions will choose "to supervise" strategy when penalty, fraud losses are larger and supervision cost is smaller to a certain extent, otherwise they will choose "not to supervise" strategy. Lastly, financial institutions' behavior choice has a significant impact on credit behavior selection of logistics enterprises and financing enterprises. If financial institutions strengthen supervision, logistics enterprises and financing enterprises are willing to keep the contract, which suggests that supervision of financial institutions is an important guarantee to prevent credit risk of logistics finance.

**Abstract:** With the development of rapid economy, construction industry has been the focal point among the public, especially in quality management. Quality evaluation model, as a significant aspect of quality management, has been paid more attention by construction industry. In this paper, we first establish a complete and systematic quality evaluation system based on the rules of comprehensiveness, operability and hierarchy. Then an integrated BWM and MOORA method for engineering quality evaluation is developed, which has higher consistency and less computation complexity. Therefore, it is easy to be implemented for practical evaluation situation. Finally, a case study is carried out to verify the effectiveness of the proposed model.

**Key words:** Best worst method; MOORA method; Quality evaluation; Project management

## **1 Introduction**

Project management involves three key goals, cost management, quality management and progress management, which are mutual restriction and interaction in the process of a project. Quality management, as a crucial link, is related to the life of the project and the safety of personnel. Compared with general projects, quality management of construction projects is more complicated owing to mobile construction process. But with the development of economy, construction quality was improving as a decreasing rate (Yung and Yip, 2010). Therefore, it is necessary to establish a quality evaluation model and propose a quality evaluation method.

Existing researches focus on the following several aspects. Yung and Yip (2010) reviewed some literatures concerning on the construction quality in China, where proper management was emphasized to improve the construction quality. From the perspective of contractor quality performance, Xiao and Proverbs (2002) made a comparison among contractors in Japan, the UK and the USA in terms of construction quality. They discovered the deep-rooted quality consciousness in Japan is beneficial to better quality performance. Gransberg and Molenaar (2004) explored and analyzed existing approaches to evaluating quality in design/build proposals, and they identified the six methods to articulating design/build quality requirements. With the development of modern technology, building information model (BIM) as a new management mode, has been paid more attention by a great deal of scholars. Chen and Luo (2014) developed a BIM-based quality model

integrating organization and process model and it was applied into the quality control during the construction phase of the Wuhan International EXPO Center. Kim et al. (2016) proposed a new dimensional quality assurance technique for full-scale precast concrete elements, denoted as a BIM-based practical method for dimensional quality assurance data storage and management. Besides, based on the same idea, Sacks et al. (2010) applied BIM technology to improve work effectiveness by visualization, which is beneficial to quality management. Although these researches have great contribution to quality management in engineering management, it has some limitation in establishing the quality evaluation system and evaluating the quality of project. Therefore, we first establish a quality evaluation system for engineering management based on a series of rules. And then an integrated best worst method (BWM) and multi-objective optimization based on ratio analysis (MOORA) method is developed.

The method is proposed based on two reasons. For one thing, BWM has better consistency and lower computation complexity compared with some criteria determination method, such as analytic hierarchy process and analytic network process (Rezaei, 2015; 2016). It has been extended into multiple different environments, such as fuzzy environment (Guo and Zhao, 2017), intuitionistic fuzzy environment (Mou et al., 2016) and interval-valued fuzzy-rough environment (Pamučar, et al., 2018). For another, MOORA method was developed in the light of multi-objective optimization with discrete alternatives (Brauers and Zavadskas, 2006), which was applied into multiple fields such as manufacturing environment (Chakraborty, 2011), materials selection (Karande and Chakraborty, 2012a) and ERP system selection (Karande and Chakraborty, 2012b). Therefore, to exploit the advantages of BWM and MOORA, we integrate these two methods named as BWM-MOORA method and it is applied to the quality evaluation in engineering management.

This paper is organized as follows. In section 2, we first introduce the rules of establishing a quality evaluation system in project management including comprehensiveness, feasibility and hierarchy, and then a quality evaluation system is constructed. In section 3, an integrated BWM and MOORA method is put forward for engineering quality evaluation. Section 4 provides a case study concerning on the construction engineering quality evaluation is implemented in virtue of the proposed method in section 3. Finally, conclusions and future research direction are given in section 5.

## **2 A Quality Evaluation System in Project Management**

In this section, we mainly introduce the rules of establishing quality evaluation system and the context of the quality evaluation system.

### **2.1 Rules of establishing quality evaluation system**

The indicators need to be hierarchically decomposed and classified to make them an organic whole. At the same time, it is necessary to ensure that the quality evaluation system should meet the principles of comprehensiveness, feasibility and hierarchy.

#### **Comprehensiveness**

Construction projects often involves the participation of owners, surveying, design, construction and supervision companies. Therefore, quality evaluation system should be established by considering the impact of the various participants, which makes the quality evaluation system enormous.

Evaluators need to pay attention to the influencing factors in an all-round and meticulous way.

**Feasibility**

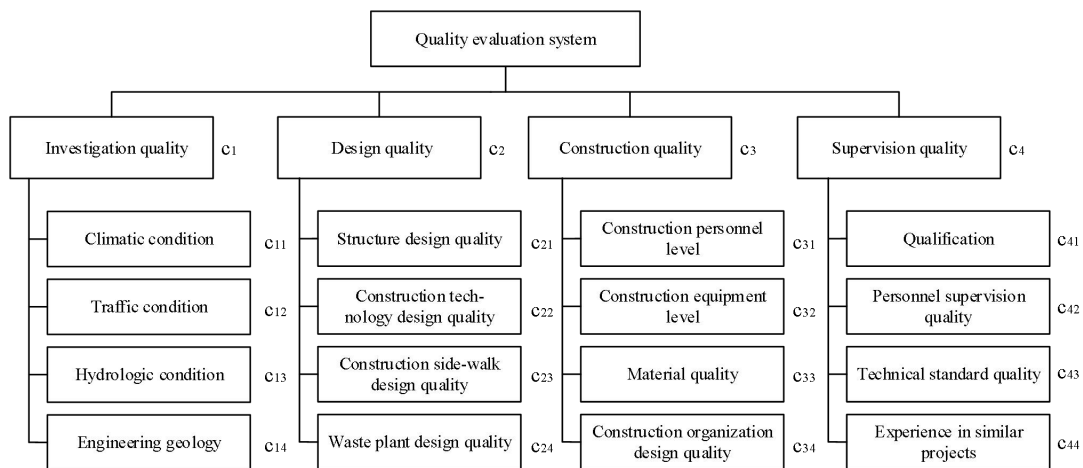

The establishment of quality evaluation system should be feasible, that is, easy to operate and implement. The selected factors should be easy to collect and be consistent with the actual situation. The number of evaluation indicators should not be too large, where human, material and financial resources should be considered comprehensively. Owing that the knowledge and experience level of evaluators are not uniform, a readable, understandable and applicable quality evaluation system is required to be established.

**Hierarchy**

The established evaluation system should be clearly structured and organized, where the adjacent two layers should be closely linked, and the lower layer should be logically consistent with the upper layer. The same level factors must be independent of each other, no overlap and inclusion.

**2.2 Establishment for a quality evaluation system**

Based on the above rules shown in section 2.1, we establish a quality evaluation system shown in Fig. 1. It is comprised of four parts, investigation quality, design quality, construction quality and supervision quality, which integrates exploration, design, building and supervision corporations. In detail, investigation quality is comprised of climatic condition, traffic condition, hydrologic condition, and engineering geology. In terms of design quality, there are four elements, structure design quality, construction technology design quality, construction sidewalk design quality and waste plant design quality. For construction quality, we select construction personnel level, construction equipment level, material quality and construction organization design quality as basic components. Besides, supervision quality includes qualification, personnel supervision quality, technical standard quality and experience in similar projects.

**Figure 1 Construction Engineering Quality Evaluation System**

### 3 An Integrated BWM and MOORA Method for Engineering Quality Evaluation

In this part, we first introduce an integrated BWM and MOORA method. The advantages of this method lie in the following two aspects. On one hand, BWM has the merits in consistency level and computation complexity. On the other hand, MOORA method is easy to understand to decision makers. Therefore, we develop an integrated BWM and MOORA method, and the procedures are depicted as follows:

**Step 1.** Select the best criterion and the worst criterion respectively as  $C_B$  and  $C_W$ .

**Step 2.** Provide pairwise comparison relationships among the best and worst criterion and other criteria using number 1-9.

**Step 3.** Construct an optimization model to minimize the maximum the difference  $\{|w_B - a_{Bj}w_j|\}$  and  $\{|w_j - a_{jW}w_W|\}$  as follows:

$$\begin{aligned} & \min \max_j \{|w_B - a_{Bj}w_j|\} \text{ and } \{|w_j - a_{jW}w_W|\} \\ & \text{s.t.} \begin{cases} \sum_j w_j = 1 \\ w_j \geq 0, j = 1, 2, \dots, n \end{cases} \end{aligned} \quad (1)$$

Then Eq. (1) can be equivalently transformed into the following optimization model:

$$\begin{aligned} & \min \zeta \\ & \text{s.t.} \begin{cases} |w_B - a_{Bj}w_j| \leq \zeta, j = 1, 2, \dots, n; \\ |w_j - a_{jW}w_W| \leq \zeta, j = 1, 2, \dots, n; \\ \sum_j w_j = 1; \\ w_j \geq 0, j = 1, 2, \dots, n \end{cases} \end{aligned} \quad (2)$$

Solving the above model, we can obtain the optimal weight  $w_j = (w_1, w_2, \dots, w_n)^T$  and  $\zeta$ . The bigger  $\zeta$  means the higher consistency ratio, and consistency ratio is derived by using Eq. (3).

$$\text{Consistency ratio} = \frac{\zeta}{\max \zeta} = \frac{\zeta}{\text{Consistency index}} \quad (3)$$

where the  $\max \zeta$  can be calculated based on  $(a_{BW} - \zeta) \times (a_{BW} - \zeta) = (a_{BW} + \zeta)$  and  $a_{BW} \in \{1, 2, \dots, 9\}$ . The consistency index is listed in Table 1.

**Table 1 Consistency Index**

$a_{BW}$	1	2	3	4	5	6	7	8	9
Consistency Index	0.00	0.44	1.00	1.63	2.30	3.00	3.73	4.47	5.23

**Step 4.** Provide the evaluation matrix, denoted as  $X = (x_{ij})_{m \times n}$ .

**Step 5.** Normalize the evaluation matrix, denoted as  $R = (r_{ij})_{m \times n}$  using Eq. (4).

$$r_{ij} = \frac{x_{ij}}{\sum_{j=1}^n x_{ij}^2} \quad (4)$$

**Step 6.** Obtain the weighted normalized matrix using Eq. (5).

$$v_{ij} = r_{ij} \cdot w_j \quad (5)$$

**Step 7.** Drive the overall rating of benefit criteria using Eq. (6) and cost criteria using Eq. (7) for all alternatives.

$$S_i^+ = \sum_{j=1}^n v_{ij}, \text{ if } i \in J^{Max} \quad (6)$$

$$S_i^- = \sum_{j=1}^n v_{ij}, \text{ if } i \in J^{Min} \quad (7)$$

where  $J^{Max}$  and  $J^{Min}$  represents the benefit criteria and cost criteria.

**Step 8.** Determine the overall performance index by integrating overall ratings for benefit and cost criteria using Eq. (8).

$$S_i = S_i^+ - S_i^- \quad (8)$$

**Step 9.** Rank the alternatives in virtue of  $S_i$ . The ranking rule is that the bigger  $S_i$  is, the better the alternative  $a_i$  is.

#### 4 A Case Study for Quality Evaluation in Construction Project Management

In this section, the proposed method is applied into the quality evaluation in construction project management. Government want to evaluate and select the best quality's project so as to award a China Construction Engineering Luban Prize. Five projects  $\{a_1, a_2, a_3, a_4, a_5\}$  pass preliminary review. Next, we assess the performance of these projects.

**Step 1.** In the quality evaluation system, the first level, investigation quality  $c_1$ , design quality  $c_2$ , construction quality  $c_3$  and supervision quality  $c_4$ , are of equal importance provided by experts.

**Step 2.** The best criterion, the worst criterion with regard to each first level criteria and the corresponding comparisons relationships are shown in Table 2.

**Table 2 The Comparisons Relationships under Each Criterion  $c_j$**

Comparisons relationships	$c_{j1}$	$c_{j2}$	$c_{j3}$	$c_{j4}$	
The best criterion under $c_1$	$c_{12}$	3	1	5	7
The worst criterion under $c_1$	$c_{14}$	6	7	3	1
The best criterion under $c_2$	$c_{21}$	1	3	8	4
The worst criterion under $c_2$	$c_{23}$	8	6	1	3
The best criterion under $c_3$	$c_{33}$	5	2	1	7
The worst criterion under $c_3$	$c_{34}$	3	6	7	1
The best criterion under $c_4$	$c_{44}$	2	6	3	1
The worst criterion under $c_4$	$c_{22}$	5	1	3	6

**Step 3.** Establish the optimization model to obtain the importance of each criterion. Taking  $c_1$  for an example, we establish the optimization model as follows:

$$\begin{aligned}
 & \min \zeta_1 & \min \zeta_2 \\
 & \left\{ \begin{array}{l} |w_{12} - 3w_{11}| \leq \zeta_1; |w_{12} - 5w_{13}| \leq \zeta_1; \\ |w_{12} - 7w_{14}| \leq \zeta_1; |w_{11} - 6w_{14}| \leq \zeta_1; \\ |w_{13} - 6w_{14}| \leq \zeta_1; \\ \sum_{j=1}^5 w_{1j} = 1; \\ w_{1j} \geq 0, j = 1, 2, \dots, 5 \end{array} \right. & (9) \quad \left\{ \begin{array}{l} |w_{21} - 3w_{22}| \leq \zeta_2; |w_{21} - 8w_{23}| \leq \zeta_2; \\ |w_{21} - 4w_{24}| \leq \zeta_2; |w_{22} - 6w_{23}| \leq \zeta_2; \\ |w_{24} - 3w_{23}| \leq \zeta_2; \\ \sum_{j=1}^5 w_{2j} = 1; \\ w_{2j} \geq 0, j = 1, 2, \dots, 5 \end{array} \right. & (10)
 \end{aligned}$$

$$\begin{aligned}
 & \min \zeta_3 & \min \zeta_4 \\
 & \left\{ \begin{array}{l} |w_{33} - 5w_{31}| \leq \zeta_3; |w_{33} - 2w_{32}| \leq \zeta_3; \\ |w_{33} - 7w_{34}| \leq \zeta_3; |w_{31} - 3w_{34}| \leq \zeta_3; \\ |w_{32} - 6w_{34}| \leq \zeta_3; \\ \sum_{j=1}^5 w_{3j} = 1; \\ w_{3j} \geq 0, j = 1, 2, \dots, 5 \end{array} \right. & (11) & \left\{ \begin{array}{l} |w_{44} - 5w_{41}| \leq \zeta_4; |w_{44} - 2w_{42}| \leq \zeta_4; \\ |w_{44} - 7w_{43}| \leq \zeta_4; |w_{41} - 3w_{42}| \leq \zeta_4; \\ |w_{43} - 6w_{42}| \leq \zeta_4; \\ \sum_{j=1}^5 w_{4j} = 1; \\ w_{4j} \geq 0, j = 1, 2, \dots, 5 \end{array} \right. & (12)
 \end{aligned}$$

Solving all established optimization models, the weights of all criteria are derived in Table 3, where the first level criteria have the same importance.

**Table 3 The Comparisons Relationships under Each Criterion  $c_j$**

Weight	$c_{1j}$	$c_{2j}$	$c_{3j}$	$c_{4j}$
$w_{j1}$	0.0584	0.1389	0.0299	0.0682
$w_{j2}$	0.1413	0.0556	0.0747	0.0170
$w_{j3}$	0.0350	0.0139	0.1297	0.0455
$w_{j4}$	0.0154	0.0417	0.0157	0.1193
$\zeta_j$	0.0584	0.1389	0.0299	0.0682

From Table 3, we can see that all computation results satisfy the consistency level.

**Step 4.** Experts provide the evaluation matrix in Table 4.

**Table 4 The Initial Evaluation Matrix  $X$**

$X$	$c_{11}$	$c_{12}$	$c_{13}$	$c_{14}$	$c_{21}$	$c_{22}$	$c_{23}$	$c_{24}$
$a_1$	0.3	0.2	0.5	0.3	0.4	0.5	0.3	0.4
$a_2$	0.4	0.4	0.5	0.5	0.2	0.1	0.4	0.3
$a_3$	0.6	0.4	0.4	0.6	0.4	0.3	0.3	0.2
$a_4$	0.6	0.6	0.3	0.4	0.3	0.4	0.2	0.3
$a_5$	0.5	0.3	0.2	0.5	0.6	0.5	0.3	0.4
	$c_{31}$	$c_{32}$	$c_{33}$	$c_{34}$	$c_{41}$	$c_{42}$	$c_{43}$	$c_{44}$
$a_1$	0.2	0.4	0.5	0.4	0.5	0.6	0.3	0.6
$a_2$	0.4	0.3	0.6	0.6	0.3	0.4	0.7	0.2
$a_3$	0.5	0.4	0.3	0.4	0.7	0.6	0.6	0.3
$a_4$	0.6	0.2	0.4	0.7	0.4	0.7	0.4	0.3
$a_5$	0.8	0.5	0.5	0.5	0.6	0.3	0.5	0.4

**Step 5.** Normalize the evaluation matrix using Eq. (4) shown in Table 5.

**Table 5 The Normalization Initial Evaluation Matrix  $R$**

$R$	$c_{11}$	$c_{12}$	$c_{13}$	$c_{14}$	$c_{21}$	$c_{22}$	$c_{23}$	$c_{24}$
$a_1$	0.07	0.05	0.32	0.08	0.20	0.33	0.19	0.30
$a_2$	0.13	0.20	0.32	0.23	0.05	0.01	0.34	0.17
$a_3$	0.30	0.20	0.20	0.32	0.20	0.12	0.19	0.07
$a_4$	0.30	0.44	0.11	0.14	0.11	0.21	0.09	0.17
$a_5$	0.20	0.11	0.05	0.23	0.44	0.33	0.19	0.30
$a_1$	$c_{31}$	$c_{32}$	$c_{33}$	$c_{34}$	$c_{41}$	$c_{42}$	$c_{43}$	$c_{44}$
$a_2$	0.03	0.23	0.23	0.11	0.19	0.25	0.07	0.49
$a_3$	0.11	0.13	0.32	0.25	0.07	0.11	0.36	0.05
$a_4$	0.17	0.23	0.08	0.11	0.36	0.25	0.27	0.12
$a_5$	0.25	0.06	0.14	0.35	0.12	0.34	0.12	0.12
$a_1$	0.44	0.36	0.23	0.18	0.27	0.06	0.19	0.22

**Step 6.** Obtain the weighted normalized matrix using Eq. (5) shown in Table 6.

**Table 6 The Normalization Initial Evaluation Matrix  $V$**

$V$	$c_{11}$	$c_{12}$	$c_{13}$	$c_{14}$	$c_{21}$	$c_{22}$	$c_{23}$	$c_{24}$
$a_1$	0.0043	0.0070	0.0111	0.0012	0.0274	0.0183	0.0027	0.0123
$a_2$	0.0077	0.0279	0.0111	0.0035	0.0069	0.0007	0.0047	0.0069
$a_3$	0.0172	0.0279	0.0071	0.0050	0.0274	0.0066	0.0027	0.0031
$a_4$	0.0172	0.0628	0.0040	0.0022	0.0154	0.0117	0.0012	0.0069
$a_5$	0.0120	0.0157	0.0018	0.0035	0.0617	0.0183	0.0027	0.0123
$a_1$	$c_{31}$	$c_{32}$	$c_{33}$	$c_{34}$	$c_{41}$	$c_{42}$	$c_{43}$	$c_{44}$
$a_1$	0.0008	0.0171	0.0292	0.0018	0.0126	0.0042	0.0030	0.0580
$a_2$	0.0033	0.0096	0.0421	0.0040	0.0045	0.0019	0.0165	0.0064
$a_3$	0.0052	0.0171	0.0105	0.0018	0.0247	0.0042	0.0121	0.0145
$a_4$	0.0074	0.0043	0.0187	0.0054	0.0081	0.0057	0.0054	0.0145
$a_5$	0.0132	0.0267	0.0292	0.0028	0.0182	0.0011	0.0084	0.0258

**Steps 7-8.** Drive the overall rating of benefit criteria using Eq. (6) and cost criteria using Eq. (7) for all projects. Owing that all criteria are benefit criteria, the overall performance index are obtained by integrating overall ratings for benefit and cost criteria using Eq. (8), i.e.  $S_i = S_i^+$  shown in Table 7.

**Table 7 The Overall Performance Index of All Projects**

$a_i$	$a_1$	$a_2$	$a_3$	$a_4$	$a_5$
$S_i$	0.2111	0.1577	0.1870	0.1910	0.2532

**Step 9.** Based on the ranking rule, we can obtain the ranking result as  $a_5 \succ a_1 \succ a_4 \succ a_3 \succ a_2$ . Therefore, project  $a_5$  has the good whole quality including investigation quality, design quality, construction quality and supervision quality.

## 5 Conclusion

In this paper, we introduce a new quality evaluation system considering investigation quality, design quality, construction quality and supervision quality, which provides a new idea in establishing construction engineering quality evaluation system. In addition, an integrated BWM and MOORA method is developed to solving the problem of quality evaluation in project management, which is easy to be understood and implemented by managers. This method is effective and applicable in terms of evaluating construction project quality. A practical case study is carried out to illustrate the effectiveness of the proposed method.

In the future, some research directions can be considered. First, BIM technology can improve the efficiency and effect of quality management. Therefore, it is worth noting that BIM technology can be integrated into the process of quality management. Moreover, some other evaluation methods can be developed considering the computational complexity and practicability, such as decision-making trial and evaluation laboratory (DEMATEL) method and complex proportional assessment (COPRAS). Also, BWM can be extended into other environments, such as hesitant fuzzy sets, hesitant fuzzy linguistic sets, probabilistic linguistic sets. Finally, some other management fields such as safety management, cost management, progress management should be discussed and analyzed, and the relationships among these management fields can be explored.

## The Impact of China's Monetary Policy on Bank Risk-Taking

Feng Rui, Xie Xiaoping, Chen Yuchun

School of Economics and Statistics, Guangzhou University, Guangzhou, P.R. China, 510006

(E-mail: fengrui0605@hotmail.com, xiexp@gzhu.edu.cn, cyc9702@163.com)

**Abstract:** In the post-crisis era, monetary policy, as a key policy to regulate macro-economy, has an important impact on bank risk taking and the financial system. Based on data of 50 banks in China from 2012 to 2017, this paper empirically tests that monetary policy has a significant impact on bank risk-taking, and the impact of different monetary policy tools on bank risk-taking is significantly different. The research shows that: (1) under the same conditions, quantitative monetary policy instruments have more obvious influence on bank risk-taking than price-based monetary policy instruments. (2) Structural monetary policy tools have a negative impact on bank risk-taking. Therefore, the monetary policy formulated by China's monetary authorities should fully consider the changes in the risk level of Banks, implement more stable monetary policy and prevent financial crisis.

**Key words:** China's monetary policy; Bank risk-taking; Impact; GMM

### 1 Introduction

After the outbreak of the crisis, all sectors of society realized that the loose monetary policy changed banks' risk-taking willingness and behavior, stimulated banks to increase credit supply and investment, and finally triggered the financial crisis. At present, the slowdown of global economic growth continues. It is particularly important for the central bank to formulate scientific and effective monetary policies to maintain financial stability. Therefore, in the context of China's long-term loose interest rate, whether the monetary policy can effectively affect the investment and credit scale of banks by changing their risk-taking behaviors, and finally achieve the sustainable development of the real economy, is a major issue facing China's macroeconomic governance.

Foreign scholars study this aspect earlier than domestic scholars. Some domestic scholars believed that the loose monetary policy led to the decrease of interest rate and reduced the return rate of banks. In order to pursue high profits, banks allocated high-risk assets and eventually took on more risks (Rajan, R.G,2005). After the financial crisis in 2008, some scholars believed that there was a risk-taking channel and formally defined it. The so-called bank risk-taking channel is the central bank through the interest rate adjustment, thus affecting the bank's risk tolerance and risk perception, and thereby affecting the bank's investment risk position (Claudio Borio, Haibin Zhu, 2008). Other scholars believed that by

increasing the money supply with low interest rate and implementing expansionary monetary policy, the supply of variable credit increases, which will increase the number of non-performing loans and thus increase the risk (Taha Zaghoud, Samir Maktouf, 2017). Domestic scholars have also conducted in-depth research on the effect of monetary policy on bank risk-taking.

Some scholars analyze the influence of monetary policy on bank risk bearing, and find that the influence of monetary policy on bank risk bearing depends on the capital status of banks (Jiang Shuxia, Chen Yuchan, 2012). Some scholars prove that there are great differences in the influence of different factors on various risks in different corporate governance mechanisms (Kong Delan, Dong Jin, 2008). Some views argued that the bank risk-taking channel of monetary policy exists, which is comprehensively influenced by macroeconomic and bank characteristics (Li Jing, Huang Juan, 2014). Some scholars select the macro data of China from 2006 to 2014 and the microcosmic data of 16 listed banks in China, compare the risk weighted asset occupation as a measure index of commercial bank risk bearing, and empirically analyze the existence of risk bearing channels of monetary policy banks in China by using the method of differential GMM (Hong Shuang, 2016). Based on the data of 53 Banks from 2005 to 2014, Some domestic scholars took provisions coverage ratio, Non-performing loan ratio and Z-score as proxy variables of commercial banks' risk-taking, M2, DRR and other indicators as monetary policy proxy variables, and adopted GMM method to confirm the existence of banks' risk-taking channels (Wang Jinbin, Li Bo, 2017). Other scholars based on the data of 24 banks from 2013 to 2017, the empirical test shows that there is risk-taking effect of quantitative and price-based monetary policies, but there is no risk-taking effect of structural monetary policies. Banks' provisions for loan losses can mitigate the adverse effects of monetary policy on bank risk-taking (Ba Shusong, Huang Shangping, 2018). Some scholars concluded through empirical research that in the transmission process of monetary policy, there is a bank risk-taking channel, and the interaction between the two shows a significant negative correlation, which is also affected by economic development, industrial structure and individual characteristics of the bank (Guo Tianyong, He Yalan, 2019).

Scholars at home and abroad have made some progress in theory and demonstration. Firstly, from the perspective of research, foreign scholars mainly start from the perspective of macroeconomic development and competition between banks, while domestic scholars start from different monetary policy tools and monetary policy cycle. Secondly, most scholars at home and abroad use GMM method for analysis. Thirdly, scholars at home and abroad have put forward some suggestions such as optimizing the monetary policy target system and improving the monetary policy tool combination. But the foreign research is obviously earlier than the domestic research. In addition, domestic and foreign literature are not uniform in the mechanism of monetary policy's action on bank risk-taking, and there are some differences in the selection of explanatory variables and control variables. Most domestic scholars have not included structural monetary policy tools into the empirical research part. In view of the above deficiencies, this paper will take the Standing Lending Facility (SLF) as the representative of structural monetary policy tools, and include it in the empirical research part to discuss the impact of different monetary policy tools on bank risk-taking.

## **2 Theoretical Analysis**

### **2.1 The effect of income and valuation**

If a country's monetary authorities carry out loose monetary policy for a long time, it will increase M2 and lower interest rates. First of all, under the environment of low interest rate, enterprises can reduce their cost of capital use, cash flow, income and asset valuation will rise, asset price and collateral

price will rise, enabling enterprises to expand income and increase profits, which will change the bank's estimate of default probability, loss amount and future market fluctuation. As collateral valuations rise, banks' risk perception and recognition will decline, and banks will take on more risk. Second, loose monetary policy can increase people's incomes and develop the economy. Bank lending rates are lower, making it easier for businesses to borrow. It is also easier for companies to raise money. Banks will relax corporate financing requirements and improve risk tolerance, so that the overall risk of the bank's asset portfolio will increase and banks will engage in more risk businesses.

## **2.2 The effect of pursuing interests**

One is the currency illusion. Investors tend to ignore the fact that nominal interest rates are falling to compensate for low inflation, blindly increasing the proportion of risky assets and reducing the proportion of risk-free assets in the portfolio. Before the financial crisis, for example, persistently loose monetary policy in the us allowed many investors to shift money from low-risk government bond markets to riskier corporate bonds and bonds of emerging economies for higher nominal yields. The other is institutional constraints. Some financial institutions with long-term commitments, such as pension funds and insurance companies, hold nominal liabilities with long-term fixed interest rates. When interest rates are low, these institutions will turn to high-risk assets with higher returns to balance their long-term returns. Similarly, for private investors, they tend to use short-term returns to measure the competitiveness of fund managers. If short-term returns are low, private investors will withdraw their money. This will encourage fund managers to take an aggressive approach to investing at low interest rates.

## **2.3 The effect of habit formation**

The loose monetary policy improves the liquidity of the market. Influenced by the inertia of thinking, bank operators and consumers may be too optimistic and believe that the prosperity of the market will last for a long time, thus ignoring the judgment of financial market risks and reducing the degree of risk aversion. Bank operators expect the market to be prosperous and stimulate banks to take higher risks by reducing risk premium, risk levels and risk aversion. Meanwhile, consumers are blindly optimistic, and it is difficult to change the consumption habit formed under the loose monetary policy in the short term. The consumption will increase than before, but it is difficult to reduce.

## **2.4 The communication and communication effect of the Central Bank**

The effect mainly reflects in the insurance effect and the transparency effect. First, in a depressed economy, financial market participants expect monetary authorities to ease monetary policy or rescue policy, thus reducing the risk of economic downturn and the probability of bankruptcy, and risk-taking will increase this amounts to implicit central bank insurance. Secondly, the transparency of monetary policy and the predictability of monetary policy decisions affect the stability of the financial system. If a country's monetary policy is highly transparent and predictable, uncertainty about short-term interest rates and ex ante inflation will decrease, and thus about medium-and long-term interest rates and financial market prices. Thus, greater transparency in monetary policy can reduce future uncertainty, enhance banks 'pricing power and encourage banks' risk-taking.

## **3 Empirical Analysis**

### 3.1 Variable selection and model setting

This paper selects the panel data of 50 banks in China from 2012 to 2017 as the analysis sample, considering the availability and reliability of the data, the banks with less than 4 periods are excluded.

At present, Z-Score, Expected Default Rate (EDF) and Non-performing loan ratio (NPL) are the main explanatory variables used by scholars at home and abroad. Although Z-Score measures the bankruptcy risk of commercial banks, but China has formally implemented the deposit insurance system since May 1, 2015, the 21st century has not yet occurred the case of commercial bank bankruptcy. Therefore, Z-Score cannot reflect the reality of our country. At the same time, considering the availability of data, risk-weighted assets to total assets ratio (RWAR) and NPL are selected as the proxy variables of risk-taking. These figures are derived from the annual reports of the banks.

In terms of explanatory variables, China uses more quantitative monetary policy tools. Central Bank used to use the "three magic weapons" of monetary policy to regulate the economy. As one of the "weapons", the Statutory Deposit Reserve Ratio (SDRR) has a strong notice effect. Thus, it plays an important role in China's monetary policy practice. At the same time, China is still carrying out the Interest rate liberalization. Benchmark Deposit Rate (BDR) is also one of the important tools for the central bank to achieve monetary policy goals. As China's economic development has entered the new normal, China has successively launched such structural monetary policy tools as SLF and put them into use in due course. Therefore, based on the situation of China's economic development, this paper adopts SDRR, BDR and natural log of year-end balance of SLF (LnSLF) as proxy variables of China's monetary policy. These three proxy variables are respectively representative of quantitative, pricing and structural monetary policy tools. As China's depository financial institutions are large and small, this paper also divides the selected 50 banks into large and small depository financial institutions. The data at the end of each year from 2012 to 2017 were selected, which come from the Wind Database.

In terms of control variables, this paper selects Capital Adequacy Ratio (CAR), Loan-to-Deposit Ratio (LTD), bank size (SIZE) and return on assets (ROA) as control variables at the bank level. The annual growth rate of GDP (GDP) is chosen as the controlling variable at the macro-economic level. In addition, since most of China's banks with large assets are listed on the Shanghai Stock Exchange, the annual rate of return of the Shanghai Composite Index can better represent the overall development of China's Capital Market. Therefore, this paper also regards the capital market situation (STOCK) as one of the control variables at the bank level. The figures come from National bureau of statistics and Wind Database.

**Table 1 Selection of Variables**

Research variables	Variable Symbol	Variable name	Variable Definition
Explained variables	NPL	Non-Performing Loan Ratio	Non-performing loans in the bank as a proportion of the total loan balance
	RWAR	Risk-Weighted Assets to Total Assets Ratio	Total risk-weighted assets as a proportion of total assets
Explanatory variables	SDRR	Statutory deposit reserve ratio	Commercial Banks must pay the ratio of the central bank's statutory reserve to their total deposits
	BDR	Benchmark Deposit Rate	The benchmark one-year deposit rate of the

	LnSLF	Standing Lending Facility	people's bank of China The natural logarithm of the year-end standing loan facility balance
Control variables	CAR	Capital Adequacy Ratio	Net capital/total risk-weighted assets in and out of the statement at the end of the period
	LTD	Loan-To-Deposit Ratio	The ratio of total bank loans to total deposits
	SIZE	Bank size	The natural logarithm of a bank's total assets at the end of the year
	ROA	Return on assets	Net profit as a percentage of average assets
	STOCK	Capital market conditions	Annual return on the Shanghai composite index
	GDP	Macroeconomic variable	Annual growth rate of GDP

This paper adopts the following dynamic panel model:

$$risk_{it} = \alpha + \rho * risk_{i,t-1} + \beta_1 * mp_t + \beta_2 * ltd_{it} + \beta_3 * size_{it} + \beta_4 * roa_{it} + \beta_5 * stock_t + \beta_6 * gdp_t + \mu_{it} + \varepsilon_t$$

In the model,  $i$  represents the sample bank,  $t$  represents the year,  $risk_{it}$  represents bank risk-taking, which is the explained variables, the index selected in the benchmark model is RWAR.  $risk_{i,t-1}$  represents the first order lag of bank risk-taking.  $mp_t$  represents monetary policy and is the core explanatory variable.  $\mu_{it}$  represents individual effect,  $\varepsilon_t$  represents random disturbance term. The quantitative analysis software used in this paper is Stata12.0. In the measurement method, this paper adopts System GMM method.

### 3.2 Empirical Analysis

The data in this paper are the dynamic short panel data. Therefore, when processing the data, the Hausman Test is firstly used to determine whether the model uses fixed effect model or random effect model. Null hypothesis  $H_0$ : there is no fixed effect. Since the p value is 0.0000, the null hypothesis  $H_0$  is strongly rejected, and the fixed effect model should be used instead of the random effect model. The test results of the impact of China's monetary policy on bank risk-taking are shown in Table 2.

**Table 2 Test Results of the Impact of China's Monetary Policy on Bank Risk-Taking**

Explained variable		RWAR (1)	RWAR (2)	RWAR (3)
Lag variable	L.RWAR	0.562**	0.371	0.849***
		(1.97)	(1.34)	(3.25)
Explanatory variables	SDRR	-2.927***		
		(-3.12)		
			-2.801**	
	BDR		(-2.27)	

	LnSLF			-0.852*** (3.72)
Control variables	CAR	-0.828*** (-3.04)	-0.616** (-2.37)	-1.249*** (-4.29)
	LTD	0.230*** (3.16)	0.279*** (4.44)	0.106 (1.17)
	SIZE	-11.86*** (-3.75)	-8.924*** (-3.79)	-20.90*** (-3.78)
	ROA	-0.288 (0.15)	-0.264 (-0.15)	-1.325 (0.62)
	STOCK	0.0418* (1.86)	0.0105 (0.66)	0.306*** (3.52)
	GDP	6.219** (2.32)	2.452 (1.01)	-6.745* (-1.75)
	AR (1)	0.0329	0.0234	0.0198
AR (2)	0.6780	0.5099	0.9133	
Sargan Test	3.4983	2.2816	2.2816	
(P values)	(0.8354)	(0.9426)	(0.9426)	
_cons	351.6*** (3.31)	260.5*** (3.29)	614.7*** (3.52)	

Note: \*\*\*, \*\* and \* respectively mean significant at the significance level of 1%, 5% and 10%; The values in brackets are standard deviations.

As can be seen from Table 2, the coefficients of the first-order lag terms of RWAR are all positive, which indicates that the bank's risk-taking has a persistent feature and verifies that the setting of the dynamic short panel model in this paper is correct.

When RWAR is taken as the explained variable, the coefficients of the three explanatory variables are significantly negative, which to some extent verifies the bank risk-taking channels of monetary policy in China. Among them, the coefficient of SDRR is -2.927, indicating that when the central bank implements loose monetary policy, the statutory reserve ratio of banks will be reduced, which will make banks take higher risks. The coefficient of BDR is -2.801, indicating that the deposit benchmark interest rate is negatively correlated with the ratio of risk-weighted assets to total assets. The coefficient of LnSLF is -0.852, indicating that SLF and RWAR are significantly negatively correlated. But the absolute value of the coefficient is less than the absolute value of the coefficient of SDRR and BDR, this

is because in SLF, the central bank and financial institutions can implement one-to-one transactions, financial institutions can be based on their current situation actively apply to the central bank, the financial institutions in the active position, so in the face of the impact of market uncertainty, its ability to cope with risks rise, risk-taking level drops.

In terms of control variables, the coefficients of CAR are all negative, indicating that the higher CAR is, the more cautious banks will be in investment. The coefficients of LTD are all positive, which indicates that banks with good liquidity usually pay more attention to the safety of assets, are more capable to deal with the liquidity risk of banks, pay more attention to risk supervision, and have higher risk levels. The coefficients of SIZE are all negative, which indicates that banks do not assume higher risks due to their larger SIZE, but the larger the bank size, the lower the risk level. The coefficients of ROA are all negative, but not significant. This may be because banks, in order to pursue higher returns, lower their lending standards and lend to high-risk enterprises, thus resulting in higher risk levels. The coefficients on STOCK are all positive, suggesting that the better the capital markets are, the higher the risk banks will take. The coefficient of GDP is negative when the explanatory variable LnSLF is used, but positive when the explanatory variable is quantitative and price-based monetary policy tools. This indicates that when using these two types of monetary policy tools, the risk-taking behavior of Chinese banks is pro-cyclical.

### 3.3 Robustness test

In order to make the experimental results more reliable, this paper uses NPL as another explained variable to conduct robustness test, and the results are shown in Table 3.

**Table 3 Robustness Test Based on the NPL**

Explained variable		NPL (1)	NPL (2)	NPL (3)
Lag variable	L.NPL	0.165 (1.11)	-0.0938 (-0.52)	0.0958 (0.50)
	SDRR	-0.206* (1.90)		
Explanatory variables	BDR		-0.0616 (-0.96)	
	LnSLF			-0.0125 (-1.20)
Control variables	CAR	-0.00718 (-0.16)	-0.00994 (0.20)	0.00896 (0.20)
	LTD	0.00802* (1.66)	0.00859** (2.06)	0.0111** (2.51)
	SIZE	-0.301*** (-3.28)	-1.001*** (-3.12)	-0.684** (-2.50)

	ROA	-1.640*** (-2.69)	-1.494** (-2.46)	-1.391** (-2.47)
	STOCK	-0.000542 (-0.31)	0.00247** (2.29)	-0.00215 (-0.58)
	GDP	0.799*** (-3.63)	0.514*** (-3.39)	0.405** (-2.54)
<hr/>				
	AR (1)	0.0240	0.0305	0.0482
	AR (2)	0.0545	0.0646	0.0572
	Sargan Test	92.1228	88.6307	103.9624
	(P value)	(0.7640)	(0.5549)	(0.6188)
	_cons	12.75*** (4.49)	33.34*** (3.42)	23.60*** (2.93)

Note: \*\*\*, \*\* and \* respectively mean significant at the significance level of 1%, 5% and 10%; the values in brackets are standard deviations.

As can be seen from Table 3, when NPL is taken as the proxy variable of bank risk-taking, the significance of coefficient decreases, and the estimated coefficient of each variable decreases as a whole, but the coefficient sign of other control variables does not change significantly. The coefficients of SDRR, BDR and LnSLF are all negative, which once again verifies the existence of bank risk-taking channels of monetary policy. It also proves from another perspective that loose monetary policy will increase bank risk-taking. In terms of control variables, the coefficients of SIZE and ROA are both negative, while the coefficients of GDP and LTD are both positive and significant. The difference is that when NPL is the explained variable, the coefficient of LnSLF is negative, indicating that this tool has a negative impact on bank risk-taking, but its impact on bank risk-taking is not as great as that of SDRR and BDR. In addition, the significance is lower than that of the benchmark model. Due to the change of explained variables, the significance, absolute value and sign of related control variables may also be changed. However, in general, the empirical results of the benchmark model are basically consistent and pass the robustness test. And from the results of Table 2 and Table 3, the change of SDRR has a greater impact on the bank's risk-taking.

## 4 Conclusion

This article is based on the 50 bank of China in 2012-2017 panel data, using GMM method for the effect of Chinese monetary policy on bank risk-taking theory and empirical analysis, the following conclusions are drawn: one is China's monetary policy on bank risk-taking exists, the influence of China's monetary policy on bank risk-taking level was significantly negative correlation relationship, the central bank's loose monetary policy, will make the bank pay a higher risk. Second, it can be seen from the empirical results that SLF has a certain impact on bank risk-taking, but the impact is not as great as

that of the other two types, possibly because the transparency and predictability of monetary policy have been improved as China's economic development enters the new normal. Third, China's monetary policy has a variety of mechanisms for the impact of bank risk-taking, among which the effects of income and valuation effect, pursuit of interests effect and habit formation effect are more prominent.

Therefore, this paper puts forward the following policy suggestions. First, implement a more prudent monetary policy. When setting monetary policy, central bank should extend the time limit for considering monetary policy. That is, the central bank should take into account the situation of economic downturn when it implements tightening monetary policy. Second, flexible adjustment of monetary policy tools. In terms of policy tools, the central bank should broaden the scope of the use of alternative monetary policy tools and innovate the use of structural tools, such as SLF and MLF. Finally, develop risk identification and measurement models. In the process of selecting explained variables, the data of EDF is almost impossible to get, and Z-score is also excluded because it is not in line with China's reality. Therefore, it is very necessary to establish a risk identification and measurement model, which is introduced into bank management, especially risk management, and combined with bank practice.

## Research and Design of University Student Honor System Based on Information System

Lv Zuheng, Wang Jinsong, Dou Zihan

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 983456443@qq.com, 2290613411@qq.com, 1411558441@qq.com)

**Abstract:** Honor management is one of the routine summative work of colleges and universities. It is an important means to strengthen the construction of campus civilization. It is related to the vital interests of students, and plays an important guiding role in promoting the all-round development of college students and establishing good values. Based on the major colleges and universities, this paper aims to explore the improvement programs of college students' honor management work in the information age. It uses the literature review method, research method, experimental method, action research method and object-oriented method to analyze the honor management work of colleges and universities. At present, it summarizes the problems existing in the honor management work, builds the honor incentive system for college students, and implements it by means of management information system.

**Key words:** Honor management; University management; Management Information System; Multiple parameters

### 1 Introduction

In recent years, the concept of informationization in colleges and universities has been continuously improved, and the informationization methods for dealing with affairs have become increasingly abundant. (Jiang Hang, 2015) The network management platform of colleges and universities is more and more perfect, and the informationization construction of colleges and universities will develop in a more efficient and convenient direction. (Kong Fang, 2017) Chinese scholar Xiao Peng believes that in the basic information management of students, most universities in China have realized informationization and basically bid farewell to traditional paper documents. (Ma Zhongbao, Xiao Peng, 2017) However, in terms of student honor management, most universities in China still rely on manual operations, and few universities have their own honor management systems. (Xu Qi, 2015)

American colleges and universities are important birthplaces of contemporary information technology, and its level of informatization, information management and application are the highest in the world. Information technology has become one of the keys to the quality of personnel training and scientific research innovation in American universities. The application of information technology has penetrated into all aspects of teaching, research and management in higher education institutions. (Motta

S M,2010) At present, the "American University Informatization Research Project" is still being carried out in various universities in the United States. It has been in existence for more than 20 years and is one of the most representative university informatization research projects in the world. (Sierles F S, Kushner B D, Krause P B,1988) In terms of student honor management and teacher-related performance management, foreign formal colleges have basically achieved full coverage. Incentives for students and incentives for teachers are more advanced than domestic ones.

## 2 Survey Results and Analysis

This paper investigates the personnel who participate in the honor management of students in Wuhan universities, and issues 100 questionnaires and 91 valid questionnaires. The recovery rate is 91%. Through investigation and analysis, it is found that there are still many problems in the honor system of college students in China, which are embodied in the following two aspects.

### 2.1 Honor management method is poor in functionality

Honoring honors by praising excellence, establishing typical, and recommending experiences to motivate and motivate honor winners to make progress and to appeal to other individuals in the organization, ultimately motivating the entire organization to achieve specific goals with high enthusiasm. However, at present, most of the university's honor management, its thought-leading, commendation and motivational functions have not been well played. (Qu Shasha, Xiang Hui, Zhang Qiguang,2015)

#### 2.1.1 Honor project lacks thought leadership

Through investigations, it is found that most of the honorary projects involved in the honor management system of colleges and universities generally include scholarships, honorary titles, competition awards, etc. Basically all honor management systems are dedicated to the special interests of students, such as evaluation and evaluation. Without combining it with thought leadership, some honor projects are in the form, which reduces the incentive effect.

#### 2.1.2 Existing honor management system review methods are not universal

It can be seen from Figure 1 that there are 43 people with "honor management system but no unified standards", accounting for 47% of the total number. Therefore, it can be considered that most universities have not perfected the construction of honor management system, and the honor system is different. There are differences in meeting the different requirements of different universities and departments in the environment, and there is no universality, which makes the evaluation results unfair.

Figure 1 Status of Honor Management System

### 2.1.3 Existing honor management methods are not time-sensitive

It can be seen from Figure 2 that “70 people are concentrated in a certain period of time”, accounting for 77% of the total number. Therefore, it can be considered that the honor management methods of most universities are not time-sensitive, and real-time data update and real-time capability cannot be realized. Honor management staff did not pay attention to the continuity and procedural nature of individual student development, and did not regard the evaluation work itself as an educational process, and could not grasp the dynamic development of students well.

**Figure 2 Honor Management Work Time Density Type**

## 2.2 Honor management informatization needs to be strengthened

In the current era of rapid development of information technology, in the context of office automation, the development of management information systems for college students' honor management work is a powerful complement to campus office automation, and is important for improving campus office environment and improving office efficiency. However, the information construction of the honor management work is still very backward. The honor management work is mostly manual, and the data source is unreliable and the data utilization rate is low.

### 2.2.1 Manual operation with high error rate and low efficiency

As can be seen from Figure 3, there are 80 people in the “No” group, accounting for 88% of the total number. Therefore, it can be considered that the university conducts the honor management work by manual operation, and the data is manually entered into the Excel table. The data redundancy is large and docked. Problems such as complexity are widespread.

**Figure 3 The Status Quo of Honor Management Informatization Construction**

### 2.2.2 Honor data has not been deeply explored

As can be seen from Figure 4, there are 52 people in the “simple presentation”, accounting for 57% of the total number. Therefore, it can be considered that most universities do not process the data in

depth when processing the honor data, and the data islands and data archiving scope are chaotic. The phenomenon is widespread, the data utilization rate is low, and the honor data is not visualized.

**Figure 4 Data Utilization Status Indicator Collection Method**

### 2.2.3 Unreliable data source, lack of authenticity check

As can be seen from Figure 5, when collecting honorary information, the school uses the method of letting students report it themselves. For these data, the school has not taken effective measures to supervise the check. This easily leads to unreliable sources of underlying data, and once there is a problem with the underlying data, it will cause a series of subsequent problems.

**Figure 5 Indicator Collection Method**

## 3 System Design

### 3.1 The idea of multi-parameter honor management information system

Through the investigation and research on the honor management work of several universities in Wuhan, we found that the original working methods can no longer meet the requirements of carrying out honor management work. Based on the above problems, the soundness and reconstruction of a systematic, convenient and flexible honor management system is particularly important. Therefore, the multi-parameter honor management information system for colleges and universities is envisioned.

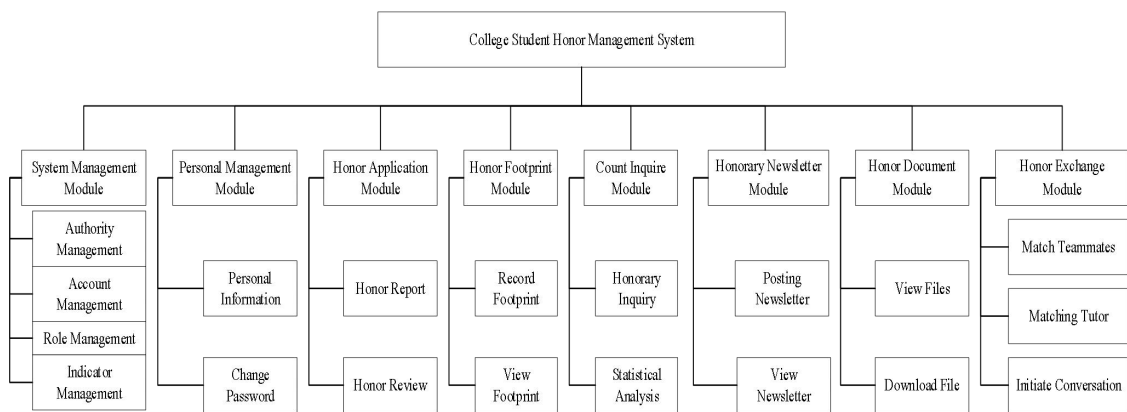

### 3.2 Design of multi-parameter honor management information system

### 3.2.1 System organization design

The overall planning and unified deployment will enable the students' honor management staff at all levels to cooperate with each other, link up and down, strengthen the organizational management system, and establish a shared data center, so that the student management can achieve the high-quality integration of resources and the normalization of core data sharing. Avoid problems with information silos, data fragmentation, and wasted data resources. (Wang Liping,2008)

### 3.2.2 System function design

The system is divided into eight functional modules, namely system management, personal management, honor application module, honor footprint module, statistical query module, honorary newsletter module, honor file module, honor exchange module and so on. Each module is interconnected, and the honor application is the basis of all modules.

**Figure 6 Functional Design of the Honor Management Information System for College Students**

#### 1) Flexible setting of indicators and weights of each indicator

When conducting student honor management, the ratios of indicators and indicators selected for each category may be different. Based on the above analysis, the indicator management in the system management module adopts the multi-parameter setting method. The honor management staff can independently design the index system such as honor type and honor diversion according to the actual situation of the college, so that the diversified talents training objectives of different institutions The needs of the university are met, so that the university student honor management system can adapt to various environments. This part of the function shows the flexibility and operability of the entire system.

#### 2) Establish a student data platform for automatic screening

The honor report of the system honor application module can realize integration and integration of a large number of scattered and diverse data resources. When the user determines the selection conditions, the system can automatically filter and meet the required student information, thereby directly Synchronize to a database of statistics for award-winning students. At the same time, the use of database related knowledge to reduce data redundancy (Wang Hu, Zhang Jun,2007), if there is a data modification, other data associated with it will be modified to prevent data inconsistency or modification between the manual operation stage and the table, so that the data is consistent and accurate from the source.

3) Relevant personnel upload and review student honor information in real time

The system honor application module can realize the real-time application of honorary items by relevant personnel, and a special group set up by each school to conduct real-time review of the honor information of students. Optimize the work from short-term high-intensity to regular work, real-time data viewing management, reduce manpower consumption, and at the same time structure is rigorous, trustworthiness and execution are strong.

4) Labeled record growth footprint, modular management honor record

The System Honor Footprint module enables you to record your honor footprint on the calendar in terms of time, or you can design your own labels and manage your personal honors modularly. At the same time, when adding and modifying personal honors, you can upload relevant honorary documents. The system can systematically store and maintain honor information and honor related files, and support batch download.

5) Long-term storage of honor data and deep exploration of data potential

The system can store all honorary information for each student's university during the long term. (Rong Rong, Yang Xianmin, Chen Yaohua, Zhao Qiujin,2014)The system statistical query module can implement functions such as multi-condition query and data visualization, and analyze and process data from different angles. Using the algorithm to analyze the student's honor text co-words, drawing on the students' advantages and disadvantages, students can develop according to their own advantages and disadvantages. The system provides the honor management personnel with the inquiry of the students in any section of the indicator. The honor management staff can determine the development target according to the plan and focus on training.

6) Building a communication platform

The system honor exchange module enables matching of qualified teammates and mentors based on input criteria, and students can initiate conversations and communicate with teammates or mentors in this module.

## 4 Conclusion

Through interviews and questionnaire surveys of honorary management staff and ordinary students in major universities in Wuhan, this paper collects and integrates the problems commonly found in the honor management of college students at the present stage, and adopts literature review, investigation and experiment methods. Analytical methods such as action research method and object-oriented method are used to deeply analyze the causes of problems. Finally, combined with the relevant work experience of major universities and the investigation and understanding of related work at home and abroad, we put forward targeted solutions and constructed " The multi-parameter honor management system is implemented by means of management information systems.

The establishment of the university student honor management information system platform enables the institutions to flexibly set evaluation indicators according to the actual application environment, which meets the needs of the university's diversified talent training objectives. In addition, the university student honor management information system is connected with the responsible

departments of honor management in major universities to realize the automatic entry and calculation of student related index information, simplify the information modification process, and realize the timeliness and incentive effect of honor management.

With the advent of the era of big data, the honor management information system will further develop into the big data platform. (Yang Yu ,2018) The university information management should also establish a big data decision-making model, and use big data to make scientific decisions to ensure that the honor assessment work is fair, just and open.

**Abstract:** Rapid satellite data streams in operational application was studied and have clear benefits for monitoring land cover. Information examined help in the fast changing surface conditions using Landsat satellite imagery from 2002 to 2018. The study examined how remote sensing as a key tool for monitoring and predicting environmental variables by using land surface monitoring and land cover mapping to vegetation decrease. The data use for the study was from Ghana and case of New Juaben municipality. We found out that dense vegetation lost was 13344 square Kilometers between 2002 and 2013. This means that, the area covered by dense vegetation are now covered by other features as at 2013. Also an area of 55375 square Kilometers to other features between 2013 and 2018. This means that, areas covered by dense vegetation in 2013 are now covered by other features as at 2018. The NDVI value range for 2002 was 0.09 – 0.66 which means that the health of vegetation was high. The health of vegetation decreased in 2013 with NDVI range value of 0.07 – 0.62 and further decreased to 0.65 - 0.10 in 2018. Hence the consequences of climate change on the territory in our opinion, should be divided and classified. Mainly - on the positive and negative consequences directly and indirectly affecting the nature of public life for socially unprotected segments of the population of countries.

**Key words:** NDVI range; Landsat satellite; Vegetation in Ghana; Land use

### **1 Introduction**

The decrease in the health of vegetation is increasing dramatically in most developing nations. In Africa and in the New Juaben municipality of Ghana, in particular, expansion of farmlands and buildups in particularly settlements (urbanization), roads, industries, shops among others have contributed to the high rate of decrease in the health of vegetation in the municipality. The municipality falls into the semi-lit climate zone of the rainforest with a bi-modal rainy season of between 1200 mm and 1700 mm and reaches its maximum during the

two peak periods of May to June and September to October (Attua E.M. & Fisher J.B., 2011). The dry season was relatively short and experienced between November and February (Attua E.M. & Fisher J.B., 2011). Humidity and temperatures are generally high ranging between 20 °C and 32 °C. The mild temperatures have an important influence on making the municipality an important tourist destination. The vegetation is characterized by tall trees with evergreen undergrowth and rich in economic trees including *Chlorohorae excelsa* (Odum), *Ceiba pentandra* (Onyina), *Antaris Africana* (Kyenkyen), *Triplochinton scleroxylon* (Wawa) (Ministry of Food & Agriculture, 2019), (Chinea-Rivera J. D., 1990). These species largely support the activities of logging and estate development. However, logging, agriculture, and construction activities have contributed to the degradation of the original vegetation.

## **2 Land Change Prediction Mapping Technique**

Various spatial modeling techniques have been used within an RS-GIS environment to clarify and predict land change processes. These models described consist of three main components: multitemporal land cover maps, a transitional function that modifies the values and spatial planning of the initial land cover maps, which makes a definitive prediction map of land changes. An important advantage of the Markov modeling technique is its operational simplicity and the ability to project land use change with minimal data requirements. This was particularly relevant in each study area where there was a lack of historical data on land use or land cover. Once a transition matrix has been constructed, only the current land cover information and not the previous one needs to project the future distribution of the land cover. In the absence of reliable and accurate historical data from the study area, we considered the Markov chain application to be the most suitable for studying the historical and future changes in the land area of the study area. The study area was the New Juaben municipality in Ghana, West Africa, which is wedged between 5.55826.158N and 0.10820.248W and forms part of the southern boundaries of the semiprecious forest-agro-ecological zone of the country (Ghana Statistical Service, 2005).

## **3 Data and Methodology**

### **3.1 Method one**

Landsat images of the study area were downloaded from the United States Geological Survey (USGS) web site (United States Geological Survey, 2018). Selection had to be made from the available free download satellite images to exclude those that were more than 10% cloud covered and 10% scene cloud cover respectively. This made it impossible to use much more recent image scenes. However, the images of the New Municipality acquired was Landsat 7 ETM+ (Enhanced Thematic Mapper) 2002, 2013, and 2018. We removed the scan lines and calibrated the images 7, 4 and 2 using the ENVI (Environment for Visualizing Images) Remote Sensing Software.

#### **3.1.1 Discussing about method one**

We however choose the layer stack combination 7-4-2, since that gives a natural color and suitable for this study. We went ahead to subset using Region of Interest (ROI) by overlaying the Ghana district shape file on the layer stack 7-4-2 image. After that we took note of the district code, converted vector to ROI, selected the specific attribute query, changed the option to Dist\_code, entered the New Juaben district code derived the attribute table and extracted the New Juaben municipality out of the layer stacked image. The assessed land cover types were vegetation, farmland and buildups. Figures 1,2 and 3 show maps of historical changes in land cover for 2002, 2013 and 2018. Normalized Difference Vegetation Index (NDVI) quantifies vegetation by measuring the difference between near-infrared which vegetation strongly reflects and red light which vegetation absorbs (GISGeography, 2018). NDVI always ranges from -1 to +1. But there isn't a distinct boundary for each type of land cover (Jinru X and Baofeng S., 2017). For example, when you have negative values, it's highly likely that it's water. On the other hand, if you have a NDVI value close to +1, there's a high possibility that its dense green leaves (Jinru X and Baofeng S., 2017). But when NDVI is close to zero, there isn't green leaves and it could even be an urbanized area. As shown below, Normalized Difference Vegetation Index (NDVI) uses the near-infrared (NIR) and red channels in its formula.

$$NDVI = \frac{(NIR - Red)}{(NIR + Red)} \quad (1)$$

Healthy vegetation (chlorophyll) reflects more near-infrared (NIR) and green light compared to other wavelengths, but it absorbs more red and blue light. This is why our eyes see vegetation as the color green (Bramhe, V. S., 2018). If you could see near-infrared, then it would be strong for vegetation too (Kooti. Sh, Naseri. A, Boroomand Nasab. S., 2017). Satellite sensors like Landsat and Sentinel-2 both have the necessary bands with NIR and red (Oleson, K.W., et al, 2010). The band 4 represents the Near-Infrared and band 3 represents Red respectively. Figures 1,2 and 3 show the NDVI range for the years, 2002, 2013 and 2018.

### 3.2 Method two

The changes in the area over time associated with individual PFT's are prescribed through a forcing dataset, referred to here as the dynpft dataset. The dynpft dataset consists of an annual time series of global grids, where each annual time slice describes the fractional area occupied by all PFT's within each grid cell. Interpolation of PFT weights between annual time slices in the dynpft dataset uses a simple linear algorithm, based on the conversion of the current time step information into a floating-point value for the number of calendar days since January 1 of the current model year (cday). The interpolation weight for the current time step  $tw_{cday}$  is shown in the equation below (Oleson, K.W., et al, 2010).

$$tw_{cday} = \frac{366 - cday}{365} \quad (2)$$

Where the numerator is 366 instead of 365 because the time manager function returns a value of cday =1.0 for a time of OZ on January 1. The weights  $w_p(nt_1)$  and  $w_p(nt_2)$  obtained from the dynpft dataset for PFT p at the bracketing annual time slices  $nt_1$  and  $nt_2$ , the

interpolated PFT weight for the current time step ( $w_{p,t}$ ) is shown in the equation below (Oleson, K.W., et al, 2010).

$$w_{p,t} = tw_{cday} [w_p(nt_1) - w_p(nt_2)] + w_p(nt_2) \quad (3)$$

The change in weight for a PFT between the current and previous time steps ( $\Delta w_p$ ) is shown in the equation below (Oleson, K.W., et al, 2010).

$$\Delta w_p = w_p^n - w_p^{n-1} \quad (4)$$

Where n denotes the current time step and the area of a given PFT increases for  $\Delta w_p > 0$ , decreases  $\Delta w_p < 0$ . The above equations 2, 3 and 4 was used to plot the graphs in figures 12 and 13 which shows the inter- annual time series averages of NDVI Jan 2008 to Dec 2011 and Jan 2012 to Dec 2015 respectively.

## 4 Results and Discussion

### Patterns of Land Cover and Change

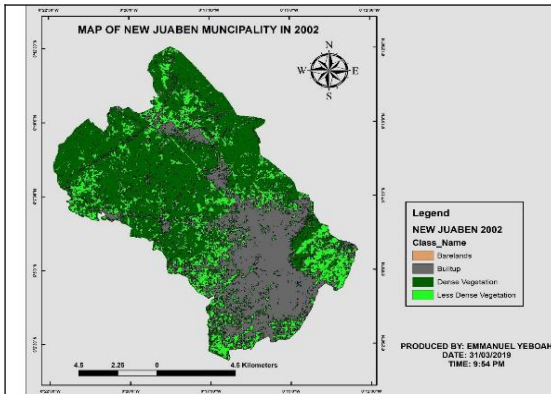

Figure 1 Range Value of 0.09-0.66 for the Year 2002

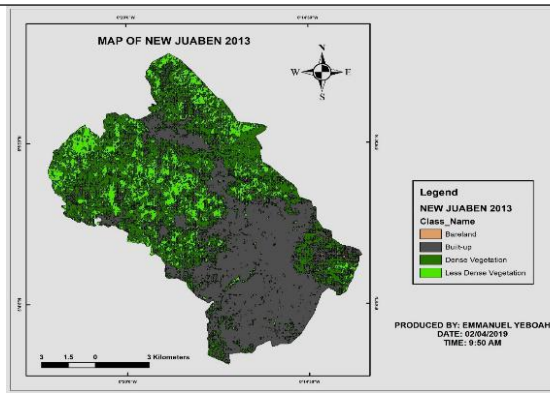

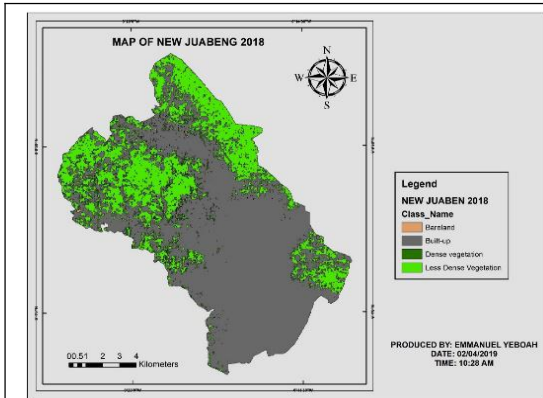

Figure 2 Range Value of 0.07-0.62 for the Year 2013

**Figure 3 Range Value of 0.10-0.65 for the Year 2018**

**Figure 4 Inter-annual time series average NDVI for Jan 2008 to Dec 2011.**

From the images and maps above figures 1,2 and 3, it was observed that there was a continuous decrease in Dense Vegetation the deep green color across the years. However Less Dense Vegetation light green, Bare lands Orange and build-up houses, Industries, roads, market places, schools, churches, among others continue to increase across the years. The tables below show the change detection statistics of land use and land cover change of the New Juaben Municipality in 2002, 2013 and 2018 in terms Area in square kilometers for the initial stage 2002, 2013 and the final stage 2018.

**Table 1 Change Detection Statistic Showing Land Use and Land Cover Change Between 2002 and 2013**

Class	Sq. Km (2002)	Sq. Km (2013)	Difference (2002 - 2013)
Bare lands	334	1496	1162
Less Dense Vegetation	40415	31758	-8657
Built-up	47048	67887	20839
Dense Vegetation	72275	58931	-13344

The change detection statistics in table 1 above, dense vegetation lost 13344 square Kilometers to the other Classes between 2002 and 2013. This means that, the area covered by dense vegetation are now covered by other features as at 2013. However less dense vegetation also lost 8657 square kilometers to other Features. This means that, 8657 square kilometers of the areas covered by less dense vegetation in 2002 are covered by other features as at 2013. However, Built-up gained and area cover of 20839 square Kilometers between 2002 and 2013 respectively. This means that, areas covered by other features such as dense vegetation and less dense vegetation in 2002 are now areas covered with built-up as at 2013. Also, bare lands gained an area of 1162 Square Kilometers between 2002 and 2013.

**Table 2 Change Detection Statistic Showing Land Use and Land Cover Change Between 2013 and 2018**

Class	Sq. Km (2013)	Sq. Km (2018)	Difference (2013 - 2018)
Bare lands	1496	268	-1228
Less Dense Vegetation	31758	49365	17607
Built-up	67887	106883	38996
Dense Vegetation	58931	3556	-55375

The change detection statistics in table 2 above, dense vegetation lost an area of 55375 square Kilometers to other features between 2013 and 2018. This means that, areas covered by dense vegetation in 2013 are now covered by other features as at 2018. However, less dense vegetation gained an area of 17607 square kilometers. This means that, areas covered by other features in 2008 are now covered by less dense vegetation as at 2018. Buildups gained an area of 38996 square Kilometers between 2013 and 2018 respectively. This means that, areas covered by other features such as dense vegetation, bare lands and less dense vegetation in 2013 are now areas covered with built-up as at 2018. Also, bare lands lost an area of 1228 Square Kilometers between 2013 and 2018.

**Table 3 Change Detection Statistic Showing Land Use and Land Cover Change Between 2002 and 2018**

Class	Sq. Km (2002)	Sq. Km (2018)	Difference (2002 - 2018)
Bare lands	334	268	-66
Less dense vegetation	40415	49365	8950
Built-up	47048	106883	59835
Dense vegetation	72275	3556	-68719

**Figure 5 Shows Change Detection Statistics Bar Chart of 2002 and 2018.**

The change detection statistics table 3 and figure 5 above, dense vegetation lost a total area of 68719 square Kilometers to other features between 2002 and 2018. This means that, areas covered by dense vegetation in 2002 are now covered by other features as at 2018. However, less dense vegetation gained an area of 8950 square kilometers.

## 5 Conclusion

In conclusion, areas covered by other features in 2002 are now covered by less dense vegetation as at 2018. Build-up gained an area of 59835 square Kilometers between 2002 and 2018 respectively. This means that, areas covered by other features such as dense vegetation, bare lands and less dense vegetation in 2002 are now areas covered with build-up as at 2018. Also, bare lands lost an area of 66 Square Kilometers between 2002 and 2018. The NDVI value range for 2002 was 0.09 – 0.66 which means the health of vegetation was high. The health of vegetation decreased in 2013 with NDVI range value of 0.07 – 0.62 and further more decreased to 0.65 - 0.10 in 2018. Implications from figure 4 shows that, the entire Ghana health of vegetation decreased in monthly inter-annual time series average NDVI using the MODIS-Terra MOD13C2 for 2008-2011. From the graph, it is evident that there are fluctuations in the Normalized Difference Vegetation Index (NDVI) across the respective month. The NDVI value is high during the rainy season from the following months April, May, June, July, August, September and November, as evident in the graph above. This was because, during the rainy season the leaves of plants reflects more greens so the satellite is able to detect high reflectance from vegetation. During the dry season from the following months January, February, March and December the NDVI values are relatively low and this is because during the dry season, the leaves are generally dry and therefore they reflect less green so the satellite is able to detect very low reflectance from vegetation during the dry season. Hence

consequences of climate change on the territory in our opinion, should be divided and classified. These should be based mainly on the positive and negative consequences directly and indirectly affecting the nature of public life for socially unprotected vegetation and segments of the population of countries.

(E-mail: 271348851@qq.com, whhw02@163.com, 2725326421@qq.com)

**Abstract:** This paper takes the A-share listed state-owned enterprises in China from 2013 to 2017 as research samples, and applies empirical approach to study the influence of the equity structure in the mixed ownership of state-owned enterprises on the agency cost. The study found that there is a significant negative correlation between the diversification of the number of shareholder categories and the nature of shareholdings and excess management costs; there is a significant positive correlation between the diversification of the number of shareholder categories and the nature of shareholdings and the quality of internal control. In addition, this paper studies the mechanism of path effect from the perspective of the quality of internal control and the structure of the board of directors, from which it is found that the quality of internal control and the structure of the board of directors are both intermediary variables that the equity structure plays a role in the corporate governance effect.

**Key words:** Mixed Ownership Reform; State-owned Enterprises; Equity Structure; Governance Effect; Agency cost.

### 1 Introduction

At present, in a large number of state-owned enterprises, there are many systemic problems, such as excessive interference of government administration, serious administration of internal management, serious "insider control" and inexpensive control of management. These problems have seriously restricted the long-term development of state-owned enterprises, and have great influence on corporate governance of state-owned enterprises. Effectiveness has had a serious impact. An important reason for these problems is the unreasonable ownership structure of state-owned enterprises, the existence of state-owned capital "dominated by one share", the softening of debt constraints, the lack of equity of human capital and other issues. The Third Plenary Session of the Eighteenth Central Committee of the Communist Party of China has proposed and implemented major strategic measures for the reform and adjustment of state-owned enterprises. By introducing non-public economic elements, the public economy and non-public economy can be integrated and infiltrated into each other, the phenomenon of "one share is dominant" of state-owned capital can be changed, and diversified mixed ownership economy can gradually replace single ownership. First, establish and improve the modern enterprise system in the public ownership economy. Therefore, it is of great practical significance to study the governance effect of ownership structure in the reform of state-owned mixed ownership.

Previous research found the effect of mixed ownership reform of state-owned enterprises from different angles. Such as, Liu Shaojia, et al. (Liu Shaojia, et al., 2003) pointed out that mixed ownership reform can significantly improve the performance of state-owned enterprises, and the effect of eastern region is significantly higher than that of the western region. Xue et al. (Xue et al., 2018) found that the mixed ownership reform of state-owned enterprises can improve the technological innovation ability and efficiency of enterprises. Sun Yongxiang (Sun Yongxiang, 2001) found that the mixed ownership reform can effectively improve the innovation efficiency of enterprises and compared with other ownership enterprises, the innovation efficiency of state-owned enterprises after the mixed ownership reform is higher than that of foreign-funded enterprises, private enterprises and Hong Kong, Macao and Taiwan enterprises. These research results have played a theoretical guiding role in the mixed ownership

reform of state-owned enterprises. However, there is little research on the impact of the mixed ownership reform of state-owned enterprises on corporate governance from the perspective of equity structure. The essence of mixed ownership reform is the main form to make joint-stock system become the public sector of the economy, which makes state-owned capital, private capital, collective capital and foreign-funded capital integrate with each other. Therefore, the mixed ownership reform is to re-optimize and combine the equity structure of enterprises. It can be seen from this that there is an inevitable connection between the mixed ownership reform and the selection of the enterprise's equity structure. This paper applies property rights theory, corporate governance theory and capital structure theory, takes listed companies in Shanghai and Shenzhen A-share markets from 2013 to 2016 as research samples to study the governance effect of equity structure. Its contents include two aspects: the governance effect of the equity structure and the intermediary influence path in the mixed ownership reform. And the robustness test guarantees the reliability of the results.

The contribution of this paper is manifested on following aspects: firstly, the paper integrates the mixed ownership reform of state-owned enterprises with the selection of ownership structure. The existing research has no research on the mechanism of the governance effect of the mixed ownership reform equity institutions. However, this paper studies the intermediary path of the governance effect of the equity structure in the mixed ownership reform. It is found that the quality of internal control and the structure of the board of directors are intermediary paths for the governance effect of the equity structure in the mixed ownership reform, which is of great significance for deepening the understanding of the reform of state-owned enterprises and enriching the research on the reform of state-owned enterprises. Secondly, the paper enriches the research contents of relevant capital structure theories. The western capital structure theory mainly studies the public companies, but this paper takes the state-owned enterprises in China as the research objects. The state-owned enterprises in China have the special status and the management way in the market economy, their capital structure constitution also has certain particularity, so taking the state-owned enterprises in China as the research objects has the very vital significance to deepen the research of capital structure theory.

## **2 Research Assumptions**

The mixed reform of state-owned enterprises is a reform of the stock price structure. From the perspective of theoretical research, the mixed ownership reform is essentially a reorganization of the stock ownership structure of the enterprise (Yuan, 2019). According to the relevant decisions of the Third Plenary Session of the 18th Central Committee of the CPC, China's mixed ownership reform at current stage is to combine public ownership capital with other non-public ownership capital to form cross-holdings, which is essentially an organizational form of enterprise capital and a re-selection of the equity structure of enterprises. From the realistic point of view, the mixed ownership reform in China is to introduce different economic components such as private economy, foreign-funded economy and private economy into the state-owned economy to form a diversified ownership structure, activate the vitality of the state-owned economy and enhance the economic competitiveness of the state-owned enterprises. Therefore, the mixed ownership reform is also a selection of equity structure (Yang and Tong, 2015; Yang et al., 2015).

At present, the ownership of the state-owned enterprises in China is state-owned, which will lead to a serious phenomenon of the omission of ownership and will make the government as the ownership of the enterprise unable to effectively exercise its rights (Bebchuk et al., 2009). Therefore, in order to better manage the state-owned enterprises, the government will choose to give the management rights of the enterprises to the management of the enterprises. However, because the government does not have a clear organization and system to effectively supervise and manage the management of the state-owned enterprises, the management of the state-owned enterprises has absolute rights in the process of enterprise management. As a rational economic person, they inevitably seek personal gain for themselves, such as excessive investment and on-the-job consumption, which will lead to serious problems of insider control and thus serious principal-agent problems (Core et al., 1999).

By introducing non-public sector of the economy, the mixed ownership reform allows the public

and non-public sectors of the economy to merge and penetrate into each other, changes the phenomenon of dominant state-owned capital, and gradually allows the single public ownership system to be replaced by the multiple property rights system of mixed ownership, allowing the public and non-public sectors of the economy to merge with each other, and realizing the diversification of the equity of state-owned enterprises (Chen and Liu, 2019). On the one hand, although the introduction of non-public sector of the economy in state-owned enterprises leads to the decline of state-owned enterprises' equity and the dispersion of enterprise equity, the increase in the number of shareholders can restrain the problem of insider control caused by the phenomenon of ownership vacancy in state-owned enterprises, clarify the company's property rights, form multiple supervision by multiple management levels, and restrain the excessive investment and on-the-job consumption of management (Gui et al., 2019). On the other hand, private capital, collective capital and foreign-funded capital have clear main bodies and have stronger characteristics of "economic man". Unlike the holders of tradable shares, they pursue the growth of long-term value of enterprises and attach more importance to the improvement of long-term performance of enterprises and the discovery of enterprise growth (Qi et al., 2015). Compared with state-owned capital, private capital, collective capital and foreign-funded capital have stronger supervision power and ability. Therefore, based on the above analysis, this paper proposes the following research hypothesis 1:

H<sub>1</sub>: The equity structure has a governance effect on the mixed ownership reform of state-owned enterprises.

Based on the principal-agent theory and the equity structure theory, this paper analyzes and finds that the equity structure in the mixed ownership reform has a good governance effect, but the mechanism behind this is still unclear. What kind of transmission channels are used to form the governance effect of the equity structure in the mixed ownership reform? Therefore, this paper will analyze how the equity structure in the mixed ownership reform affects the corporate governance effect from the following two ways.

Effective internal control can restrain the principal-agent problem between management and shareholders, and equity structure is the fundamental reason for the principal-agent problem between management and shareholders (Zhang and Li, 2018). Therefore, there is a certain correlation between internal control and equity structure. A large number of empirical studies have also proved this point. Fan, et al. (2002) have found that there is a significant positive correlation between the shareholding ratio of the largest shareholder of the enterprise and the effectiveness of the internal control of the enterprise. Based on the data analysis of listed companies in China, Wang and Chen (2004) found that only the moderately centralized equity structure can have a positive effect on the internal control of enterprises and highly centralized and highly dispersed equity structure may have a certain negative impact on the internal control. From the perspective of internal control and corporate governance effect, an important content of internal control is the control of the board of directors and management. Internal control and corporate governance are interrelated and interactive. Effective implementation of internal control is based on a good corporate governance environment (Liu, 2018). Therefore, internal control and corporate governance effect are closely related. Based on the above analysis, this paper proposes research hypothesis 2:

H<sub>2</sub>: The quality of internal control is the intermediary path for the equity structure to affect the governance effect of state-owned enterprises in the mixed ownership reform.

In addition to the internal control path, the governance effect of the change of equity structure on the enterprise in the mixed ownership reform can also be achieved through the board structure path. According to the requirements of the Third Plenary Session of the 18th Central Committee of the CPC that the market plays a decisive role in the allocation of resources, enterprises must become the real main market players. Then, the legal status of the board of directors will be finally confirmed and it will become the most important decision-making body of the enterprise. In this way, the composition of the board of directors is crucial. The board of directors is an important organization that connects the shareholders and the management of an enterprise and plays an important role in the management of an enterprise. Its work and governance efficiency are related to the legitimate rights and interests of shareholders and the operating performance of the company. The establishment of an efficient board of

directors can help realize the interests of shareholders (Harris and Raviv, 2016). The board of directors is elected by all shareholders, which is mainly responsible for the strategic system and its implementation of the enterprise and employs management to be responsible for the daily operation and management of the enterprise and the implementation of the strategy. It is an important joint between management and shareholders. Before the mixed ownership reform, the main shareholders of our state-owned enterprises were the government, the members of the board of directors of the enterprises mainly came from administrative appointment, and their independence and professional management level were relatively low (Xie et al., 2019). After the mixed ownership reform, the phenomenon of dominated state-owned capital can be changed and the results of state-owned enterprises' equity can be diversified. Therefore, it is necessary to change the previous recruitment and selection method of the board of directors, and to add directors' representatives of the shareholders of collective shares, private shares and foreign-funded shares in the board of directors. These directors' representatives are generally selected through the market mechanism (Core et al., 2017). They have the ability to effectively supervise the management while they are representatives of collective shares, private shares and foreign-funded shares, and they have the power to ensure that the interests of non-public capital are not damaged. Therefore, the mixed ownership reform and the diversification of corporate equity structure can have an impact on the structure of the company's board of directors, thus affecting the corporate governance level. Based on the above analysis, this paper proposes research hypothesis 3:

H<sub>3</sub>: The structure of the board of directors is the intermediary path for the equity structure to affect the governance effect of state-owned enterprises in the mixed ownership reform.

### 3 Research and Design

#### 3.1 Sample selection and data source

This paper selects the data of China's A-share listed state-owned enterprises from 2013 to 2017 as research samples. In order to ensure the authenticity and validity of the data, this paper screens the data according to the following rules: companies whose net assets are negative and whose stock code is ST forced by the stock exchange are excluded and financial listed companies are excluded. In order to eliminate the influence of extreme values on the empirical results, this paper carries out Winsorize processing on each variable according to the 1% of the front and back ends, and finally 3,546 data are obtained.

#### 3.2 Variable and model design

We construct the model (1) to test the impact of the mixed ownership reform on the company's principal-agent cost to prove Hypothesis 1.

$$Agent_{i,t} = \beta_0 + \beta_1 MC_{i,t} + \gamma \sum ControlVar_{i,t} + \varepsilon_{i,t} \quad (1)$$

In the formula,  $Agent_{i,t}$  refers to the principal-agent cost,  $MC$  refers to the equity structure in mixed ownership reform,  $i$  refers to the individual enterprise, and  $t$  refers to the year mark.

According to the research of Liu et al. (2015), the excess management fee is used to measure the principal-agent cost between the management and shareholders. The specific measurement adopts the following two formulas. Firstly, each coefficient is calculated according to (2), then the observed value is brought into (2) again according to the calculated coefficient to calculate the management fee  $\overline{CE}_{it}$ , finally, it is brought into (3) by subtracting the expected management fee from the actual management fee to obtain the principal-agent cost.

$$CE_{it} = \sigma_0 + \sigma_1 sale_{it} + \sigma_2 lev_{it} + \sigma_3 grow_{it} + \sigma_4 dsh_{it} + \sigma_5 sj_{it} + \sigma_6 age_{it} + \sigma_7 roa + \sigma_8 first + \sigma_9 industry + \sigma_{10} year + l \quad (2)$$

$$Agent = CE_{it} - \overline{CE}_{it} \quad (3)$$

In the formula,  $CE$  represents the current management expenses divided by operating income,  $\ln$  refers to the natural logarithm of operating income,  $lev$  refers to the asset-liability ratio,  $dsh$  represents the size of the board of directors,  $sj$  refers to a virtual variable, whose value is 1 if it is the top ten accounting firms, and whose value is 0 otherwise,  $age$  refers to the natural logarithm of the company's age,  $roa$  refers to the rate of return on assets,  $first$  represents the shareholding ratio of the largest shareholder, and controls the industry and annual influence.

The ownership categories of mixed ownership and the nature of shareholder ownership are diversified (Feng, 2016). For the diversification of shareholder categories  $MC1(4)$ , this paper according to Li et al. (2012). Firstly, the collective nature, foreign-funded nature, state-owned nature and private nature are assigned to 1, 2, 3 and 4, and the proportion and number of shares of different natures are summed up, so as to obtain the shareholding ratio and the number of shareholders of each kind of shares in each company in each year; secondly, it is measured by Herfindal coefficient, and we constructs the model(4)as follows:

$$MC1 = 1 - \sum p_i^2 \quad (4)$$

Where,  $p_i$  indicates the proportion of type I shareholders in the top ten shareholders.

In view of the diversification of the nature of shareholder ownership  $MC2(5)$ , this paper uses the research of Jensen et al. (2016) for reference and adopts entropy index as its measurement standard. Firstly, it assigns values to shareholders of different natures as above and calculates the number and shareholding ratio of shareholders of different natures, and then uses entropy index. We construct the model (5)as follows:

$$MC2 = \sum X_i * Ln\left(\frac{1}{X_i}\right) \quad (5)$$

Where,  $x_i$  indicates the proportion of the number of shares of type I shareholders in the number of shares held by the top ten shareholders.

Meanwhile, in order to test the intermediary path to prove Hypothesis 2 and 3,, according to Sobel intermediary factor test, the test is conducted in accordance with the following test procedures: step 1, the governance effect of equity structure in the mixed ownership reform is tested; step 2, the effect of the equity structure in the mixed ownership reform on the structure of the board of directors (the quality of internal control) is tested; step 3, According to model (7) , the effect of equity structure and the structure of the board of directors in the mixed ownership reform on the company's principal-agent cost is tested.

$$ETR_{i,t}(Borad_{i,t}) = \alpha_0 + \alpha_1 MC_{i,t} + \gamma \sum ControlVar_{i,t} + \varepsilon_{i,t} \quad (6)$$

$$Agent_{i,t} = \chi_0 + \chi_1 MO_{i,t} + \chi_2 ETR_{i,t}(Borad_{i,t}) + \chi \sum ControlVar_{i,t} + \varepsilon_{i,t} \quad (7)$$

According to model (6),  $ETR$  refers to the internal control, Board refers to the structure of the board of directors,  $i$  refers to the individual enterprise,  $t$  refers to the year mark,  $\beta_1$  coefficient refers to the impact of the equity structure in mixed ownership reform on the principal-agent cost of state-owned enterprises, and  $\alpha_1$  and  $\chi_2$  coefficients refer to whether the board structure and the quality of internal control have intermediary effects between the equity structure and the principal-agent cost of state-owned enterprises in mixed ownership reform.

Internal Control ( $ETR$ ). This paper uses Dib Internal Control Index as a substitute variable of internal control quality. Dib Internal Control Index is based on the five basic indexes (financial report, internal control standardization, enterprise operation and management, enterprise asset safety and enterprise strategy) combined with the current situation of internal control of listed enterprises in China. Structure of the board of directors ( $Board$ ). According to Ye et al. (2011), we use the board size as a substitute variable for the structure of the board of directors. The calculation method is the total number of directors included in the board of directors.

## 5 Regression Analysis

### 5.1 Basic analysis of the governance effect of the equity structure in the mixed ownership reform

Table 3 show the regression results of equity structure in the mixed ownership reform on the principal-agent problem between management and shareholders. Model (1) is the regression result of the diversification of the number of shareholder categories. Its regression coefficient is -0.088 and it is significant at the level of 1%, which reflects that there is a significant negative correlation between the diversification of the number of shareholder categories and the excess management cost of the enterprise. This indicates that the higher the degree of diversification of the number of shareholder categories is, the lower the principal-agent cost between the management and the shareholders of the state-owned enterprises is, and increasing the diversification of the number of shareholder categories can effectively inhibit the principal-agent problem between the management and the shareholders. Model (2) is the regression result of the diversification of the nature of shareholders' holdings. Its regression coefficient is -0.056, which is significant at the level of 5%, which reflects the significant negative correlation between the diversification of the nature of shareholdings and the excess management cost of the enterprise. This indicates that the higher the diversification of the nature of shareholdings is, the lower

the principal-agent cost between the management and shareholders of the state-owned enterprises is, and increasing the diversification of shareholdings can effectively inhibit the principal-agent problem between the management and shareholders. Therefore, Hypothesis 1 is verified. Meanwhile, through the comparison of the two regression results, we can see that the diversification of the number of shareholders' categories has better inhibitory effect on the principal-agent problem between management and shareholders than the diversification of the nature of shareholdings, which has guiding significance for the mixed ownership reform of state-owned enterprises.

## 5.2 Path analysis of the governance effect of the equity structure in the mixed ownership reform

### 5.2.1 Quality of internal control

Table 4 the column 1 shows the regression results of the influence of the quality of internal control as the intermediary path of the governance effect of the equity structure in the mixed ownership reform. Models (1) and (2) test whether the ownership structure in the mixed ownership reform will affect the quality of internal control governance. We find that the regression coefficients of the diversification of the number of shareholders' categories and the diversification of the nature of shareholdings in models (1) and (2) are 0.554 and 0.352, respectively, and both are significantly correlated at the level of distribution of 1% and 10%, which indicates that the equity structure in the mixed ownership reform can have a positive impact on the quality of internal control. Models (3) and (4) test the influence of equity structure and the quality of internal control on the company's principal-agent cost in the mixed ownership reform. We can find that the regression coefficient of the diversification of shareholder's categories in model (3) is -0.233 and is significantly correlated at the level of 5%, and the regression coefficient of the quality of internal control is 0.434, which is significantly correlated at the level of 5%. Meanwhile, in model (4), the regression coefficient of the diversification of shareholdings is -0.122, and is significantly correlated at the level of 10%, and the regression coefficient of the quality of internal control is 0.532 and is significantly correlated at the level of 5%. The above regression results show that the structure of the board of directors is the full intermediary path for the governance effect of equity structure in the mixed ownership reform. It supports Hypothesis 2.

### 5.2.2 Structure of the board of directors

Table 4 the column II shows the regression results of the influence of the structure of the board of directors as the intermediary path of the governance effect of the equity structure in the mixed ownership reform. Models (1) and (2) test whether the ownership structure in the mixed ownership reform will affect the structure of the board of directors. We find that the regression coefficients of the diversification of the number of shareholders' categories and the diversification of the nature of shareholdings in models (1) and (2) are 0.663 and 0.231, respectively, and both are significantly correlated at the level of distribution of 1%, which indicates that the equity structure in the mixed ownership reform can have an impact on the structure of the board of directors. Models (3) and (4) test the influence of equity structure and the structure of the board of directors on the company's principal-agent cost in the mixed ownership reform. We find that the regression coefficient of the diversification of shareholder's categories in model (3) is -0.712 and is significantly correlated at the level of 5%, and the regression coefficient of the structure of the board of directors is -0.012, which is significantly correlated at the level of 5%. Meanwhile, in model (4), the regression coefficient of the diversification of shareholdings is 0.063, and is significantly correlated at the level of 1%, and the regression coefficient of the structure of the board of directors is -0.022 and is significantly correlated at the level of 1%. The above regression results show that the structure of the board of directors is the intermediary path for the effect of principal-agent cost between management and shareholders in the mixed ownership reform. It supports Hypothesis 3.

### 5.3 Robustness test

This paper conducts the robustness test for the empirical results, mainly from the following two aspects: (1) Substitution of variables. This paper uses the method of Li (2007) for reference and uses the turnover rate of total assets as a substitute variable of agency cost between management and shareholders. this is mostly due to agent cost produced by the low service efficiency of enterprise capital caused by opportunism such as decision-making mistakes or laziness in enterprise economic management. (2) Endogenous problems. According to econometric theory, there may be endogenous problems caused by the measurement deviation of variables, thus affecting the robustness of research results. In order to reduce the endogenous problem caused by variable measurement errors, this paper applies the method of eliminating industry differences to improve the robustness of the conclusion. Firstly, in view of the impact of industry differences on mixed ownership reform and principal-agent costs, this paper utilizes annual industry mean to adjust mixed ownership reform and principal-agent costs to eliminate the impact of industry fixed effect differences on regression results.

## 6 Conclusion

Based on the data of A-share listed state-owned enterprises in China from 2013 to 2017, this paper empirically studies the influence of equity structure on the agency cost between shareholders and management in mixed ownership of enterprises, and studies the mechanism of path effect from the perspective of the quality of internal control and the structure of the board of directors, and obtains the following conclusions: there is a significantly negative correlation between the diversification of the number of categories of shareholders and the diversification of the nature of the shareholdings and the excess management costs, which shows that the equity structure in the mixed ownership reform can effectively reduce the principal-agent cost between the management and shareholders, protect the legitimate rights and interests of shareholders and reduce the infringement of the management on the legitimate rights and interests of shareholders. There is a significantly positive correlation between the diversification of the number of shareholders and the diversification of the nature of shareholdings and the quality of internal control, while there is a significantly positive correlation between the quality of internal control and excess management costs, which suggests that the quality of internal control is the intermediary path through which the equity structure affects the principal-agent problem between management and shareholders in the mixed ownership reform. There is a significantly negative correlation between the diversification of the number of shareholders and the nature of shareholdings and the structure of the board of directors, while there is a significantly positive correlation between the structure of the board of directors and excess management fees, which indicates that increasing the size of the board of directors is an intermediary path through which the equity structure produces effects on the principal-agent problem between management and shareholders in the mixed ownership reform.

# A Study on Earnings Management, Analyst Forecasts and Equity Liquidity

Fu Keke

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 1023830171@qq.com)

**Abstract:** This paper empirically examines the impact of earnings management on stock liquidity by taking a-share listed companies in Shanghai and Shenzhen Stock Markets from 2009 to 2016 as research samples. Combined with the role of analysts in the market and enterprises, this paper further tests the moderating role of analyst forecasts in the relationship between earnings management and stock liquidity, and reveals the mechanism of earnings management on stock liquidity. The main conclusions of this paper are as follows: (1) earnings management behavior of enterprises will reduce stock liquidity; (2) analyst forecast can effectively reduce the negative correlation between earnings management and stock liquidity.

**Key words:** Earnings management; Analysts; Analyst forecasts; Stock liquidity

## 1 Introduction

Corporate earnings management has always been a hot topic in academic research. Earnings management refers to corporate management using accounting methods or arranging real transactions to change financial reports to mislead stakeholders' understanding of corporate performance or affect contracts based on reported earnings (Healy and Wahlen, 1999). Over the years, relevant scholars in the academic circle have been enriching the researches on earnings management, but most of them focus on the motivation, means and influencing factors of earnings management (Kothari, 2015). The research on economic consequences also focuses on the enterprise level (Chen H, 2012), and pays less attention to the impact on the capital market.

At present, many theories focus on the relationship between information disclosure quality and stock liquidity (Lambert et al., 2007), and earnings management will reduce the quality of financial reports and report disclosure. Foreign studies on the relationship between earnings management and stock liquidity found a significant negative correlation (Amihud, 2002). For the domestic stock market where the information disclosure quality of listed companies is worse, listed companies may implement earnings management strategies to a greater extent. Meanwhile, considering the intermediary role of analysts in corporate information disclosure and investors, can they regulate the relationship between earnings management and stock liquidity to some extent? This is also the issue discussed in this paper.

This paper from the perspective of analysts, examine the analysts' estimates on earnings management and the role of relationship between stock liquidity, with abundant liquidity surplus management and research of the theory and empirical evidence, and to further strengthen the company's earnings management governance, improve the quality of information disclosure of listed companies, perfect our country capital market to provide experience and theoretical basis.

## **2 Theoretical Analysis and Research Hypotheses**

### **2.1 Earnings management and stock liquidity**

At present, some scholars study the relationship between earnings management and stock liquidity from the perspective of information disclosure quality. Amihud took the illiquidity index as the measure index of stock liquidity (Amihud,2002), and studied the relationship between earnings management and stock liquidity based on comprehensive consideration of accrual item earnings management and real activity earnings management of enterprises, and found that there was a significant negative correlation between them. The result of earnings management is that the company's external disclosure information is distorted, the quality of information disclosure is reduced, the judgment of investors on the real enterprise value of the company is affected, and the stock liquidity of the company is finally reduced. Corporate earnings management behavior will reduce the quality of accounting information disclosure, intensify information asymmetry, and reduce stock liquidity (Ascioglu,2012). This rule is also applicable to China's capital market (Wang Xiaoliang ,2016). They believe that the earnings management behavior of a company will reduce the quality of accounting earnings information disclosed by the company, reduce enterprise value, reduce the attractiveness of the company's stock to investors, and thus reduce the liquidity of the company's stock.

Earnings management is the management of accounting earnings to manipulate the behavior, the result is that investors will mislead the real performance of the company's understanding. Based on the theory of efficient market hypothesis, capital market can reflect the earnings management behavior of enterprises to some extent, reduce the value of enterprises and ultimately reduce the stock liquidity. In view of this, this paper proposes hypothesis 1:

H1: *Ceteris paribus*, earnings management reduces stock liquidity.

### **2.2 The moderating effect of analyst forecast on earnings management and stock liquidity**

Earnings forecast is one of the core information in the research report of securities analysts, and it is also an important reference information for investors to make investment decisions. For investors, the earnings forecast of securities analysts can provide important reference basis for investors to evaluate the company value, form the company's earnings expectation and select valuable stocks (Brown, 1993). As a result, more accurate earnings forecasts are more valuable to investors.

Analysts can serve as information intermediaries to enhance the transparency of the company, but they do not have to accept the direct choice of management as auditors, so they are more independent and can play a potential supervisory role over the management (Lang&Miller,2004). Analysts can not only alleviate information asymmetry and convey more useful information to the securities market, but also play a governance role and restrain the company's earnings management behavior(Knyazeva,2007).Therefore, this paper believes that analyst's earnings forecast is binding on the earnings management behavior of the company, and the more accurate analyst's forecast is, the lower the degree of earnings management of the company will be (Yang Yulong, Yu Xiang, 2013). At the same time, the more accurate the analyst's earnings forecast is, the higher the accuracy of the information provided to investors reflecting the intrinsic value of the company will be, so that the private information may be reflected in the stock price more quickly, thus reducing the uncertainty of the asset value and improving the liquidity of the stock. Based on this, this paper proposes hypothesis H2:

H2: *Ceteris paribus*, analysts' prediction can effectively reduce the negative correlation between corporate earnings management and stock liquidity.

### 3 Data and Methodology

#### 3.1 Sample selection and data sources

This paper takes China's a-share listed companies in Shanghai and Shenzhen from 2009 to 2016 as the research sample, and selects them according to the following criteria: (1) the companies with missing relevant data during the research period were excluded; (2) excluding samples from the financial industry; (3) to avoid IPO effect, companies with less than two years of listed years are excluded; Finally, 12,320 sample observations were obtained, all of which were from CSMAR database. In order to eliminate the influence of extreme values, this paper winsorize the continuous variables at the level of 1%.

#### 3.2 Variable measurement

##### 3.2.1 Earnings management

The modified Jones model is the most powerful model for measuring accrual earnings management (Dechow, 1995), so this paper uses the modified Jones model to calculate controllable accruals:

$$TAC_{i,t} = NP_{i,t} - CFO_{i,t} \quad (1)$$

$$\frac{TAC_{i,t}}{TA_{i,t-1}} = a_0 + a_1 * \frac{1}{TA_{i,t-1}} + a_2 * \frac{\Delta REV_{i,t}}{TA_{i,t-1}} + a_3 * \frac{PPE_{i,t}}{TA_{i,t-1}} + \varepsilon_{i,t} \quad (2)$$

$$= a_0 + a_1 * \frac{1}{TA_{i,t-1}} + a_2 * \frac{\frac{NDA_{i,t}}{TA_{i,t-1}} - \Delta REC_{i,t}}{TA_{i,t-1}} + a_3 * \frac{PPE_{i,t}}{TA_{i,t-1}} + \varepsilon_{i,t} \quad (3)$$

$$|DAC_{i,t}| = \left| \frac{DA_{i,t}}{TA_{i,t}} \right| = \frac{TAC_{i,t}}{TA_{i,t-1}} - \frac{NDA_{i,t}}{TA_{i,t-1}} \quad (4)$$

where, total accruals ( $TAC_{i,t}$ ) is the difference between net profit and net cash flow from operating activities, and total accruals can be further divided into non-discretionary accruals ( $NDA_{i,t}$ ) and discretionary accruals ( $DAC_{i,t}$ ).  $TA_{i,t-1}$  is the total assets of company i at the beginning of year t.  $PPE_{i,t}$  is the net fixed asset value of company I at the end of year t;  $\Delta REV_{i,t}$  is the change in operating income of company i in the year i;  $\Delta REC_{i,t}$  is the change in receivables of company i in the year t.

##### 3.2.2 Stock liquidity

Amihud 's illiquidity index accurately measures stock liquidity and the required data is easy to obtain in practice (Goyenko et al., 2009). In this paper, Amihud was used for reference to calculate the illiquidity index as follows:

$$ILLIQ_{i,t} = \frac{1}{D_{i,t}} \sum_{d=1}^{D_{i,t}} \frac{|R_{i,t,d}|}{Vol_{i,t,d}} * 100 \quad (5)$$

where,  $|R_{i,t,d}|$  is the absolute value of the return rate of the ith stock on day d in year t.  $Vol_{i,t,d}$  is the

trading volume of the  $i$ th stock on day  $d$  of year  $t$  (in millions of dollars);  $D_{i,t}$  is the number of trading days of the  $i$ th stock in year  $t$ . This index measures the change of average price caused by the trading volume per unit. The larger the ILLIQ value is, the lower the stock liquidity level will be.

### 3.2.3 Analyst prediction accuracy

Based on the practice (Tang Songlian & Chen Wei, 2017), this paper adopts securities analyst prediction accuracy  $ACC_{i,t}$  for measurement, and the calculation formula is as follows:

$$ACC_{i,t} = \left| \frac{Feps_{i,t} - Reps_{i,t}}{Reps_{i,t}} \right| \quad (6)$$

where,  $ACC_{i,t}$  represents the accuracy of the analyst's earnings per share forecast for company  $i$  in the year  $t$ ;  $Feps_{i,t}$  represents the analyst's predicted earnings per share in company  $i$  in the year  $t$ ;  $Reps_{i,t}$  represents the real value of company  $i$ 's earnings per share in the year  $t$ ; the greater  $ACC_{i,t}$ , the lower the accuracy of the analyst's earnings forecast.

### 3.2.4 Control variables

In addition, in order to consider the influence of other factors on the stock liquidity of the company (Wang Xiaoliang and Yu Jing, 2016), this paper selected the asset-liability ratio, return on equity, growth rate of total assets, shareholding ratio of the largest shareholder and the nature of the company as control variables. The definitions of main research variables and control variables are shown in table 1.

**Table 1 Definitions of Primary Variables**

Variable	Definition
DAC	Absolute value of discretionary accruals, as shown in formula (1).
ILLIQ	Amihud's (2002) illiquidity index is shown in formula (2).
ACC	See formula (3) for the prediction accuracy of securities analysts.
Lev	Long-term debt to total assets.
Roe	Net income scaled by total assets.
Grow	Growth rate of total assets
Top1	The largest shareholder shareholding ratio
State	State-owned enterprises are 1, while private enterprises are 0

### 3.3 Regression model

In order to study the impact of accrual earnings management on stock liquidity, that is, to verify H1, this paper constructs the model (4) as follows:

$$ILLIQ_{i,t} = \alpha_0 + \alpha_1 * DAC_{i,t} + \alpha_2 * Controls_{i,t} + \sum Year + \sum Industry + \varepsilon_{i,t} \quad (4)$$

$$ILLIQ_{i,t} = \alpha_0 + \alpha_1 * DAC_{i,t} + \alpha_2 * ACC_{i,t} + \alpha_3 * DAC_{i,t} * ACC_{i,t} + \alpha_4 * Controls_{i,t} + \sum Year + \sum Industry + \varepsilon_{i,t} \quad (5)$$

Model (4) is used to verify H1. If  $\alpha_1$  is positive, it indicates that accrual earnings management will reduce the stock liquidity of the company; if  $\alpha_1$  is negative, it indicates that accrual earnings management has a promoting effect on the stock liquidity of the company, and the expected test result is positive. Model (5) is used to verify H2. If  $\alpha_3$  is negative, the higher the accuracy of securities analyst's prediction is, the weaker the relationship between the degree of accrued earnings management of listed companies and stock liquidity is. If  $\alpha_3$  is positive, it means that the higher the accuracy of securities analyst's prediction is, the stronger the relationship between the degree of accrued earnings management of listed companies and stock liquidity is, and the expected test result is negative.

## 4 Results

### 4.1 Descriptive statistics

Table 2 provides descriptive statistics for the main variables. It can be seen that the average value of accrued earnings management (DAC) is 0.165, the maximum value is 1.785, and the minimum value is 0.001, indicating that the behavior of accrued earnings management varies greatly among different listed companies in China. The average value of ILLIQ is 0.068, the maximum value is 0.618, and the minimum value is 0.003, indicating that there are differences in stock liquidity among Chinese listed companies. This conclusion is in line with the development status of China's stock market. The mean value of analysts' earnings prediction accuracy is 1.832, the maximum value is 24.080, and the minimum value is 0, indicating that analysts' forecasting behaviors vary greatly among different companies.

**Table 2 Sample Descriptive Statistics**

Variable	N	Mean	Median	SD	Min	Max
ILLIQ	12320	0.068	0.040	0.090	0.003	0.618
DAC	12320	0.165	0.065	0.290	0.001	1.785
ACC	12320	1.832	0.566	3.747	0.000	24.080
Lev	12320	0.476	0.473	0.221	0.054	1.141
Roe	12320	0.068	0.074	0.149	-0.788	0.464
Grow	12320	0.218	0.103	0.544	-0.342	4.274
Top1	12320	35.890	33.760	15.490	8.804	75.780
State	12320	0.462	0.000	0.499	0.000	1.000

## 4.2 Regression analysis

In order to test the influence of accrual earnings management on stock liquidity and verify H1 and H2, this paper conducted a regression analysis on model (4) and model (5). The specific regression results are shown in table 3.

**Table 3 Regression Results**

Var	Model (4)		Model (5)	
	coefficient	t-stat	coefficient	t-stat
DAC	<b>0.054***</b>	19.92	0.057***	18.84
ACC			-0.000	-0.17
DAC*ACC			<b>-0.001**</b>	-2.90
Lev	0.047***	6.54	0.046***	6.42
Roe	-0.023***	-3.78	-0.023***	-3.76
Grow	-0.020***	-13.40	-0.020***	-13.45
Top1	-0.000*	-1.83	-0.000*	-1.87
State	0.005	0.95	0.005	1.01
_cons	0.049***	7.70	0.049***	7.74
<i>Year</i>	control		control	
<i>Industry</i>	control		control	
<i>N</i>	12320		12320	
adj. <i>R</i> <sup>2</sup>	0.0515		0.0519	

\*, \*\*, \*\*\* Indicate significance at 0.10, 0.05, and 0.01, respectively (two-tailed).

It can be seen from table 3 that the regression coefficient of accrual earnings management (DAC) in model (4) is significantly positive at the confidence level of 1%, indicating that the degree of accrual earnings management of listed companies negatively affects the stock liquidity of companies, which is consistent with H1. It can be seen that when the negative effects of earnings management behaviors of China's listed companies are transmitted to the stock market, there will be a signal feedback of stock liquidity reduction.

In the model (5), the regression coefficient of accrual earnings management significantly at the 1% confidence level is positive, analysts predict regression coefficient is negative but not significant, and accrued earnings management and analysts predict accuracy of by item (DAC \* ACC) of the regression coefficient significantly at the 5% confidence level is negative, said analysts predict negative regulation accuracy accrued earnings management and the relationship between the stock liquidity. Explain the

accuracy of analyst earnings forecast the company's earnings management behavior, to a certain extent, reduce the possibility of a management by earnings manipulation, prompted the company to offer investors reflect the company's intrinsic value information to improve accuracy, thus weakened the degree of earnings management negative impact on stock liquidity, consistent with H2.

## 5 Conclusion

This paper examines the relationship between earnings management, analyst forecasts and stock liquidity. The research results show that: (1) earnings management behavior of enterprises will reduce stock liquidity. Earnings management can reduce the value of the enterprise, send a bad signal to investors, will reduce investors' expectations of trading stocks, stock liquidity will naturally reduce. (2) analysts' prediction can effectively reduce the negative correlation between earnings management and stock liquidity. Analyst is not directly involved in the management process of accounting information, but with its own professional financial knowledge, convenient access to information channels and information dissemination channels, through long-term tracking of the listed company business process, management can effectively restrain the improper earnings management and the risk of material misstatement, improve the quality of accounting information.

This empirical result is of great value to both listed companies and investors. First of all, listed companies should be clearly aware that excessive use of earnings management will increase the illiquidity of their stocks and thus increase the cost of equity financing, which is very unfavorable for their refinancing. If listed companies want to obtain low-cost equity financing, they must reduce the level of earnings management. Secondly, relevant departments should continue to strengthen the construction of analyst industry, improve the professional quality and independence of Chinese analysts, and provide more reliable information for investors. Finally, when investors allocate their asset portfolios, they should consider the financial information disclosure of the company. If the company carries out a higher degree of earnings management, it will have a higher degree of information asymmetry, and thus a higher degree of illiquidity and greater risk.

The main prospect of this paper is that stock liquidity is a large indicator of short-term changes, which changes from day to day and even from minute to minute. However, due to the availability of data and other reasons, this paper adopts annual data for research, which will affect the accuracy of the research to a certain extent. In the future, more accurate data can be used for research.

## Does Cost Stickiness Affect a Company's Financial Risk?

Li Yiwen

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(Email: 850955998@qq.com)

**Abstract:** Based on the resource-based theory, this paper examined the relationship between cost stickiness and corporate financial risk by taking the a-share manufacturing listed companies in Shanghai and Shenzhen from 2010 to 2017 as samples. The research finds that: the increase of cost stickiness will aggravate the financial risk of the company; Further research shows that the property nature has a moderating effect on the above relations, and the relationship between the two is closer in state-owned enterprises than in non-state-owned enterprises. This result provides a new perspective for the study of the economic consequences of cost stickiness and the influencing factors of corporate financial risk.

**Key words:** Cost stickiness; Financial risk; Ownership; Resource allocation

### 1 Introduction

The development process of an enterprise is a process of dynamic allocation of various production factors and enterprise strategies, and production factors inevitably produce surplus, especially in the case of macroeconomic uncertainty. Based on the resource surplus caused by the change of business volume, foreign scholars put forward the concept of "cost stickiness" (Anderson et al., 2003). From the perspective of cost management, domestic scholars believe that the existence of cost stickiness is an adverse influence. The essence of cost stickiness is the incomplete match between business volume change and resources, that is, the existence of surplus resources. Foreign studies show that surplus resources can promote or inhibit corporate risk (Cheng J C, Kesner I F, 1997). Some scholars believe that the influence of surplus resources on corporate risk is not a simple promotion or inhibition, but a curvilinear relationship exists between them. Then, what role does the cost stickiness with the core content of surplus resources play in the financial risk of enterprises? In recent years, many scholars have studied financial risk and corporate governance environment, internal control management and other aspects (YuFusheng et al., 2008). However, there are not many researches on the influence of cost stickiness on financial risk, and the correlation between cost stickiness and financial risk under the influence of different ownership factors is rarely discussed. Therefore, the impact of cost stickiness on corporate financial risk and the differences among companies with different ownership have become a topic worth discussing. The contribution of this paper is to examine the relationship between cost stickiness and corporate financial risk from the perspective of resource-based theory, and further explore the role of cost stickiness on corporate financial risk under internal

influencing factors based on the ownership. This article has theoretical and practical significance for correctly understanding cost stickiness and enterprise financial resource allocation and reducing enterprise financial risk.

The first part of this paper briefly introduces the research status of cost stickiness and financial risk at home and abroad, leading to the research topic, that is, whether cost stickiness affects the company's financial risk. The second part first introduces the concept of cost stickiness, and then carries on the theoretical analysis to put forward the hypothesis of this paper. The third part takes Chinese listed companies from 2008 to 2015 as samples to empirically test the relationship between cost stickiness and corporate financial risk. The fourth part shows the research results of this paper. The research finds that: the increase of cost stickiness will aggravate the financial risk of enterprises; After further study, it is found that the nature of ownership has a moderating effect on the above relationship, and the relationship between the two is closer in state-owned holding companies than in non-state-owned holding companies. The conclusion is in the fifth part.

## **2 Theoretical Analysis and Research Hypotheses**

### **2.1 Concept of cost stickiness**

Cost behavior is a very important concept in management accounting. It says that changes in firm costs depend on changes in business volume, which are proportionally variable. The traditional cost-state model is proposed in an ideal state, which means that the cost only changes with a fixed proportion of the business volume, and the manager does not need to carry out active cost management. However, studies abroad show that under realistic conditions, the relationship between cost and business volume does not always change proportionally, and the total cost is often related to managerial decision-making. Through the demonstration of cost and business volume, it is found that for every 1% increase in sales revenue, sales management expenses increased by 0.55%; for every 1% decrease in sales revenue, sales management expenses decreased by 0.35% (Anderson et al., 2003). For the first time, it is confirmed that there is an asymmetry change between the company's expenses and the business volume. Quoting the price volatility of economics, the phenomenon of showing "easy to increase and hard to decrease" is called cost stickiness. Once the concept of cost stickiness has been proposed, research on cost stickiness at home and abroad has also grown rapidly. After demonstrating the existence of cost stickiness, domestic and foreign scholars began to conduct more in-depth research on cost stickiness in order to discover the characteristics, causes, impact mechanism and economic consequences of cost stickiness.

### **2.2 Impact of cost stickiness on financial risks of enterprises**

Cost stickiness is inevitable in the resource allocation process of a company, and

resource scheduling is the basic premise of cost stickiness. Domestic and foreign scholars have proved that the imbalance of resource allocation will lead to the emergence of cost stickiness and anti-cost stickiness (James n. Cannon, 2014). Sun Zheng and Liu Hao (2004) summarized the "contract view" when explaining the stickiness of cost, believing that the sustainable operation of a company comes from the stability of contract adjustment cost. The high adjustment cost of long-term contract means that the change in the short term is not enough to prompt the enterprise to make cost adjustment, resulting in the inertia of cost change, so the cost stickiness is reflected in the company's cost change. While cost occupies resources, cost stickiness will bring resistance to the adjustment of cost and make the cost deviate from the optimal resource allocation (Xie Huobao, Hui Lili, 2014). Cost stickiness will lead to the improper allocation of resources, so that resources cannot be efficiently used in projects with core competitiveness, thus affecting the economic interests of the company (Kama I, Weiss D, 2013). Cost of the influence of viscous nature is the enterprise resource allocation. As an important part of internal resources, the optimal allocation of financial resources will also be affected by cost stickiness. For listed manufacturing companies, the input of production resources is relatively large. When the macroeconomic environment changes, the change asymmetry between cost and income will increase, leading to the increase of internal risks (Xie Huobao, Hui Lili, 2017). It also increases the company's financial risk. Based on the above analysis, this paper proposes the following hypotheses:

**H1: Cost stickiness of listed companies is positively correlated with financial risks.**

### **2.3 The influence of ownership on the relationship between cost stickiness and financial risk**

Under China's unique economic environment and institutional background, will the difference in the nature of ownership have a different effect on the stickiness of expenses? Some scholars have conducted relevant researches. Weiss D (2010) believed that for enterprises with different ownership, the stickiness of expenses is different, and the effect of external audit on reducing the stickiness of expenses is also different. To be specific, compared with non-state-owned enterprises, state-owned enterprises have higher stickiness of expenses, and external audit plays a more significant role in reducing the stickiness of expenses. Under the impact of the financial crisis, the cost stickiness of state-owned holding companies increased, while that of non-state-owned holding companies decreased (Balakrishnan R, Gruca T S, 2008). Liang Shangkun (2015) pointed out that the excessive separation of the two rights in China's state-owned listed companies leads to the higher stickiness of expenses in state-owned listed companies than in non-state-owned listed companies. Jiang Wei and Hu Yuming (2011) pointed out that due to the more serious principal-agent problem in state-owned enterprises, their cost stickiness is more likely to be affected by the development level of factor market. Based on this, this paper proposes the following hypotheses:

**H2: The influence of cost stickiness of state-owned enterprises on financial risk is greater than that of non-state-owned enterprises.**

### 3 Research Design

#### 3.1 Sample selection and data sources

This paper takes the a-share manufacturing listed companies in Shanghai and Shenzhen from 2010 to 2017 as the research sample, and selects them according to the following criteria: (1) exclude the companies that are specially treated during the study period; (2) the companies with missing relevant data during the research period are excluded; (3) the samples of IPO year are removed; (4) exclude the data that do not meet the calculation conditions of the model (Sticky calculation requires that the company's revenue and cost change in the same direction in the same year), 15683 sample observations are finally obtained, all the sample data are from the CSMAR database. In order to eliminate the influence of extreme values, winsor processing is carried out on continuous variables at the level of 1%.

#### 3.2 variable definition

##### 3.2.1 Financial risk warning value

In this paper, the enterprise financial risk is calculated with reference to the z-score model proposed by Altman (1968), which uses 22 financial ratios to establish the five-variable z-score after mathematical statistical screening. The specific formula is as follows:

$$Z_{i,t} = 1.2 * X_1 + 1.4 * X_2 + 3.3 * X_3 + 0.6 * X_4 + 0.999 * X_5 \quad (1)$$

In formula (1),  $Z$  represents the financial risk warning value;  $X_1$  = working capital/total assets;  $X_2$  = retained earnings/total assets;  $X_3$  = ebit/total assets;  $X_4$  = Stockholders' equity/total liabilities;  $X_5$  = sales revenue/total assets. When  $Z < 1.8$ , the company is in the bankruptcy zone; When  $1.8 \leq Z < 2.99$ , the company is in the gray area; When  $2.99 \leq Z$ , the company belongs to safe zone. That is, the smaller  $Z$  is, the greater the financial risk of the enterprise is.

##### 3.2.2 Cost stickiness

Dan Weiss (2010) <sup>[9]</sup> proposed the formula (2) when studying the influence of cost stickiness on the earnings forecast of enterprises. This model is suitable for studying the economic consequences of cost stickiness.

$$Sticky_{i,t} = \log \frac{\Delta COST}{\Delta SALE_{i,\mu}} - \log \frac{\Delta COST}{\Delta SALE_{i,\bar{\mu}}} \quad (2)$$

Among them, the Sticky said cost stickiness,  $\mu$  for the recent sales incomes fall in quarterly revenue,  $\bar{\mu}$  as recent sales rise in quarterly revenue.  $\mu, \bar{\mu} \in \{t, \dots, t-3\}$ ,  $\Delta SALE = SALE_{i,t} - SALE_{i,t-1}$ ,  $\Delta COST_{i,t} = (SALE_{i,t} - EARNING_{i,t}) - (SALE_{i,t-1} - EARNING_{i,t-1})$ . When Sticky is negative, it means there is cost stickiness, and the smaller the value, the higher the level of stickiness.

### 3.2.3 Control variables

In order to consider the influence of other factors, this paper draws on the practice of relevant scholars(Liang Shangkun,2017<sup>[13]</sup>) and selects the return on equity (ROE), earnings per share (EPS), growth rate of net assets per share (Pbvg), growth rate of net profits (Netp) and enterprise size (Size) as control variables.

**Table 1 Variable Definition Table**

Variable Symbol	Variable Name	Definition
Z	Financial Risk Warning Value	See formula (1)
Sticky	Cost Stickiness	See formula (2)
Roe	Return on Equity	Net profit/shareholders' equity
EPS	Earnings Per Share	(net income - preferred stock dividends)/weighted average of common stock outstanding
Pbvg	Growth Rate of Net Assets Per Share	Increase of net assets per share this year/net assets per share at the beginning of the year
Netp	Growth Rate of Net Profits	Net profit increase of this year/net profit at the beginning of the year
Size	Enterprise Size	Take the natural logarithm of the company's total assets at the end of the year

### 3.3 Regression model

To verify hypothesis H1, the model (3) constructed in this paper is as follows.

$$Z_{i,t} = \alpha_0 + \alpha_1 Sticky_{i,t} + \alpha_2 ROE_{i,t} + \alpha_3 EPS_{i,t} + \alpha_4 Pbv_{i,t} + \alpha_5 Netp_{i,t} + \alpha_6 Size_{i,t} + \varepsilon_{i,t} \quad (3)$$

In model (3), if  $\alpha_1$  is positive, the existence of cost stickiness will aggravate the company's financial risk. If  $\alpha_1$  is negative, it indicates that the cost stickiness has an inhibitory effect on the company's financial risk, and the expected test result is positive.

In order to verify hypothesis H2, this paper, on the basis of model (3), divides samples into state-owned enterprise group and non-state-owned enterprise group, and then conducts grouping regression. If H2 is to be verified,  $\alpha_1$  of soe group needs to be significantly positive, while  $\alpha_1$  of non-soe group needs to be insignificant.

## 4 Test Results and Analysis

To verify H1 and H2, this paper selected the fixed-effect model for regression analysis based on the results of Hausmann test. The empirical regression results are shown in table 2.

Table 2 Regression Results

Z	Model_1	Ownership	
	(1)	Soe (2)	Non-soe (3)
Sticky	0.157*** (3.55)	0.335*** (7.20)	0.043 (0.61)
Roe	-0.445*** (-3.90)	0.138 (1.17)	-0.742*** (-3.90)
EPS	1.448*** (34.50)	0.982*** (23.93)	1.814*** (25.00)
Pbv	0.134*** (3.83)	-0.0273 (-0.63)	0.212*** (4.21)
Netp	-0.000999 (-0.93)	0.00154 (1.47)	-0.001 (-0.57)
Size	-0.339*** (-16.53)	-0.213*** (-9.07)	-0.554*** (-16.35)
_cons	9.672*** (21.54)	6.561*** (12.53)	14.515*** (19.87)

N	15683	7050	8633
Adjusted R <sup>2</sup>	0.2110	0.1629	0.1722

\*, \*\*, and \*\*\* denote significance at the 10, 5, and 1 percent levels, respectively, in two-tailed tests.

As can be seen from column (1) of table 2, the cost stickiness of an enterprise is significantly positively correlated with the value of financial risk. That is to say, the higher the value of cost stickiness, the higher the value of financial risk. It has been shown above that the smaller the value of cost stickiness, the greater the degree of cost stickiness. The smaller the value of financial risk, the greater the financial risk of the enterprise, so the degree of cost stickiness is positively correlated with the financial risk. Thus, verifying the hypothesis H1 of this paper.

As can be seen from the regression results of column (2) and column (3), in the sample group of state-owned enterprises, the coefficient of cost stickiness is significantly positive at the confidence level of 1%, indicating that state-owned enterprises have a significant positive regulating effect on the relationship between cost stickiness and financial risk. However, in the sample group of non-state-owned enterprises, the coefficient of cost stickiness is not significant, which indicates that the cost stickiness of non-state-owned enterprises has little impact on financial risk. Therefore, the hypothesis H2 in this paper is verified.

## 5 Conclusion

This paper takes the optimization of financial resource allocation as the entry point, discusses the relationship between cost stickiness and corporate financial risk, and further discusses the impact of cost stickiness on corporate financial risk under different property rights. According to the data of China's a-share manufacturing listed companies in Shanghai and Shenzhen from 2010 to 2017, it is found that :(1) there is a significant positive correlation between the cost stickiness and the company's financial risk. (2) further discussion shows that the property right nature of a company has a moderating effect on the relationship between cost stickiness and financial risk. The influence of cost stickiness of state-owned enterprises on financial risk is greater than that of non-state-owned enterprises.

The research conclusion of this paper provides an important reference basis for Chinese enterprises to effectively allocate financial resources: on the one hand, surplus resources have a negative effect, enterprises should keep a low level of cost stickiness according to their situation and current financial risks; On the other hand, Chinese enterprises need to treat cost stickiness according to different property rights. In state-owned enterprises, we should be alert to the increase of cost stickiness, while in non-state-owned enterprises, we can moderately relax the control of cost stickiness.

The contributions of this paper are as follows :(1) the relationship between cost stickiness and enterprise financial risk is studied, which makes up for the gap in relevant

literature and paves the way for future scholars to improve financial risk warning formula; (2) from the perspective of property right nature, the moderating effect of property right nature on cost stickiness and financial risk is studied.

# The Feasibility Analysis of Popularizing Prefabricated Buildings in the Project of College Student Dormitory

Zheng Feng

Infrastructure Department of Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: 5102265@qq.com)

**Abstract:** Chinese government has been upholding the development of prefabricated buildings. This paper, by analyzing the research and application status at home and abroad, summarized the technical characteristics of prefabricated buildings, and concluded the applicability of prefabricated buildings in the projects of college student dormitory. Besides, based on specific cases, the fuzzy comprehensive evaluation method was used to compare the construction technology with conventional construction technologies. Accordingly, this paper verified the advance and feasibility of prefabricated concrete construction technology and laid a basis for the promotion of prefabricated buildings in the projects of student dormitory.

**Key words:** Feasibility analysis; Prefabricated buildings; Student housing; Fuzzy comprehensive evaluation method

## 1 Introduction

Student dormitory project is vital for college capital construction projects. With the continuous expansion of university scale and the gradual improvement of student accommodation conditions, both the number of students and the index of per student accommodation area have increased remarkably, making the contradiction between supply and demand of student apartments increasingly prominent. Thus, the construction of student dormitory project faces multiple challenges (e.g. large scale, shortened schedule and high standard)<sup>[1]</sup>. At present, the cast-in-situ concrete construction scheme is widely used. Though this technology is mature, problems (e.g. bad qualification of construction enterprises, prolonged construction period and large amount of engineering changes) still occur in the process of project bidding and construction. This significantly affects the security ability of the student dormitory project and does not contribute to the control and management of the construction target of the university.

Prefabricated construction refers to an industrial construction method. According to this method, some or all components of a building are prefabricated in a factory, transported to the project site, and then overlapped and assembled. According to relevant data statistics, adopting prefabricated construction technology is capable of significantly shortening the construction period and improving main performance (e.g. the surface smoothness of concrete building and structural firmness). In the meantime, because the external wall tiles, insulation, doors and windows and other components can be processed as a whole with the concrete wall, the waterproof, heat preservation performance of the building will be better than those of the cast-in-place concrete building<sup>[2]</sup>.

Based on the fuzzy comprehensive evaluation method, this paper compared the cast-in-place concrete construction scheme with the prefabricated concrete construction scheme. Then, the feasibility of the prefabricated construction scheme in the college student dormitory project was analyzed and verified, and some suggestions on the promotion and application were proposed based on the comparison results.

## 2 Features of Prefabricated Technology

### 2.1 Advantages of fabricated technology

Compared with the conventional construction method, the prefabricated construction technology has the following advantages:

#### (1) Short construction period

In the factory, standardized components are prefabricated following standard procedures and then installed in an integrated manner. Thus, a large number of manual operations on the construction site can be converted into production line operations, significantly enhancing production efficiency, reducing the time delay caused by weather, technology and other reasons, and saving the time consumed by cast-in-place. According to the existing research at home and abroad, using prefabricated technology can shorten the construction period by 20%-30%.

#### (2) High engineering quality

The factory and mass production of building components can enhance dimensional accuracy of components and reduce the defects in structural stability, sealing and waterproofing caused by dimensional errors. In the meantime, because exterior wall decoration materials, insulation materials and doors and windows and other attachments can be produced together with wall body, assembly-type technology can to the greatest extent avoid the quality problems (e.g., tile falling off, insulation stripping and leakage of door and window joints) after the project is put into use, thereby improving the project safety, durability and amenity and reducing maintenance costs.

#### (3) Saving energy and protecting environment

In the implementation stage of the project, through component prefabrication, the noise, dust, waste water and other pollutants in the construction process and the nighttime construction workload are greatly reduced. On the other hand, mass production can improve labor productivity, reduce the input of raw materials (e.g. cement and template), and save resources (e.g. labor and materials); Due to the consistent size of prefabricated components, the mass production and prefabrication of furniture can be achieved during the decoration construction to improve the space utilization rate, reduce the waste caused by "secondary decoration" and save the cost of furniture purchase and depreciation<sup>[3]</sup>.

#### (4) High controllability

From the perspective of the owner's project management, prefabricated technology can reduce the time delay and cost changes caused by policy changes, material price changes, technical defects of construction personnel or adverse construction site environment during the construction period; In the meantime, the general contracting mode of integrated design, component production, construction and procurement is adopted in the current implementation of assembly-type projects, thereby raising the technical requirements for general contracting enterprises, and reducing the owner's bidding risk and contract management workload. Thus, it is conducive to achieving project management objectives<sup>[4]</sup>.

#### (5) Strong support from government

With the rapid development of the construction industry, construction technology is also constantly improving and updating. In recent years, the country and provinces and cities have issued relevant opinions and measures in succession, in an attempt to boost the development of prefabricated building and improve the overall level of the construction industry.

In September 2016, the general office of the state council issued and implemented the Guideline on Vigorously Developing Prefabricated Buildings (no. [2016]71). It is stressed that we should, in accordance with the requirements of applicability, economy, safety, green and beauty, press ahead the market leading, government promotion, regional promotion and gradual promotion, adhere to the top-level design and coordinated development, promote the innovation of construction methods, and constantly improve the proportion of prefabricated buildings in new buildings.

From January to March 2017, the ministry of housing and urban-rural development issued national standards, including the Technical Standards for Prefabricated Wooden Structures (GB/T 51233-2016), Technical Standards for Prefabricated Steel Structures (GB/T 51232-2016), Technical Standards for Prefabricated Concrete Buildings (GB/T 51231-2016), and Action Plan for Prefabricated Buildings during the 13th Five-year Plan. The prefabricated building standard system covering the whole process of design, production, construction and use and maintenance has been further improved, and the phased work objectives have been defined.

With the deepening of the deployment of national strategies, various provinces and cities actively uphold and support the development of prefabricated buildings by means of floor area award, capital subsidy, tax preference and interest rate reduction<sup>[5]</sup>.

## **2.2 Defects of assembly technology**

### **(1) Poor flexibility**

Though the industrialized prefabrication of prefabricated buildings enhances production efficiency, it reduces the flexibility and diversity of architectural design, making it difficult to meet the personalized needs of users in building facades, apartment types and other aspects, which is also one of the difficulties facing the promotion process of prefabricated buildings.

### **(2) High construction cost**

The calculation of the cost of completed prefabricated buildings reveals that because the prefabricated technology remains in the early stage of application and development, and there is no reasonable valuation standard for prefabricated buildings in China. At present, the cost of mono-project of most prefabricated building projects is generally higher than that of traditional similar buildings, and the increased cost primarily originates from the prefabrication, transportation and installation of components.

### **(3) Lack of experience**

The development of prefabricated buildings in China lags behind that of Germany, Japan, the United States and other developed countries with a higher degree of industrialization. Various technical standards and management norms are still being established and improved. There is a lack of experience in the design of prefabricated buildings and the production of components. Besides, general contracting enterprises, which can coordinate the implementation of the design, production, construction and installation of prefabricated buildings, are lacked. These factors hinder the overall promotion of prefabricated buildings.

## **3 An Applicability Analysis of Prefabricated Buildings in College Student Dormitory Project**

### **3.1 Structural adaptability**

The structure of the student dormitory project is characterized by simple design and consistent apartment type. The construction area, internal structure, reserved openings, doors and windows, and decoration of each dormitory are exactly the same. Adopting prefabricated technology to the student dormitory project, the lack of flexibility of this technology is circumvented. This accordingly reflects the applicability of assembly technology and student dormitory project in structural design.

### **3.2 Applicability regarding schedule**

Compared with residential and commercial buildings, university infrastructure projects are built on campus. The shorter the construction period, the smaller the study and life of teachers and students will be affected, and the smaller the campus environment and security will be affected; At the same time, due to the expansion of college enrollment and the adjustment of college building area index, most of the current colleges and universities face problems (e.g. poor student accommodation, inadequate accommodation area, and unreasonable allocation of teaching resources). It is urgent to build new student apartments to improve the living environment and re-plan the functions of the campus<sup>[6]</sup>. Adopting the prefabricated technology can significantly expedite the project construction progress and shorten the construction cycle; it is more suitable for the student dormitory project in terms of progress control than the conventional construction method.

### **3.3 Applicability regarding quality**

The quality level of the student dormitory project is linked to the vital interests of every student studying in the university, reflecting the infrastructure management and logistics ability of the university, which has always been highlighted in the university infrastructure work. The construction quality of traditional student dormitory project is primarily determined by the technical level of the successful construction enterprise, and the owner is in a relatively passive position in quality control<sup>[7]</sup>. On the one hand, in the process of public bidding, bidding enterprises may have poor qualification or non-standard bidding behaviors, which may affect the impartiality of construction enterprises. On the other hand, project managers and construction teams selected by successful construction enterprises have various technical levels, affecting the quality of project construction as well. The main components of the prefabricated building are produced in the factory. The manufacturing environment of the components is more standardized than that of the construction site, and it is not easy to be affected by the external environment. Accordingly, the quality of the components is more guaranteed. In the meantime, since most enterprises that can undertake the prefabricated construction projects are large-scale enterprises with leading scale and technology industries, the backward construction technology and enterprises lacking competitiveness are eliminated naturally.

### **3.4 Environment applicability**

The construction of infrastructure projects in colleges and universities will inevitably occupy the public resources (e.g. roads and green spaces), which have been put into use. Adopting assembly-type technology can effectively reduce the noise, dust and other pollution during the construction, and further shorten the time occupied campus resources; At the same time, since the work of external wall decoration, door and window installation, furniture procurement can be advanced to the component manufacturing stage, adopting assembly technology can also reduce the air pollution caused by decoration and installation work, to provide students with a more environmentally friendly and healthy accommodation environment.

### **3.5 Applicability regarding administration**

There are many problems in the management of university capital construction, including heavy

construction task, tight construction period, scattered projects and few management personnel. Adopting the general contracting model of assembly construction integrating design, component manufacturing, construction and procurement can effectively reduce the workload of bidding and contract management of infrastructure management departments and decrease the probability of engineering changes. This can not only reduce the workload of project managers, but also facilitate the control of project management objectives, so that project functions can be better achieved<sup>[8]</sup>.

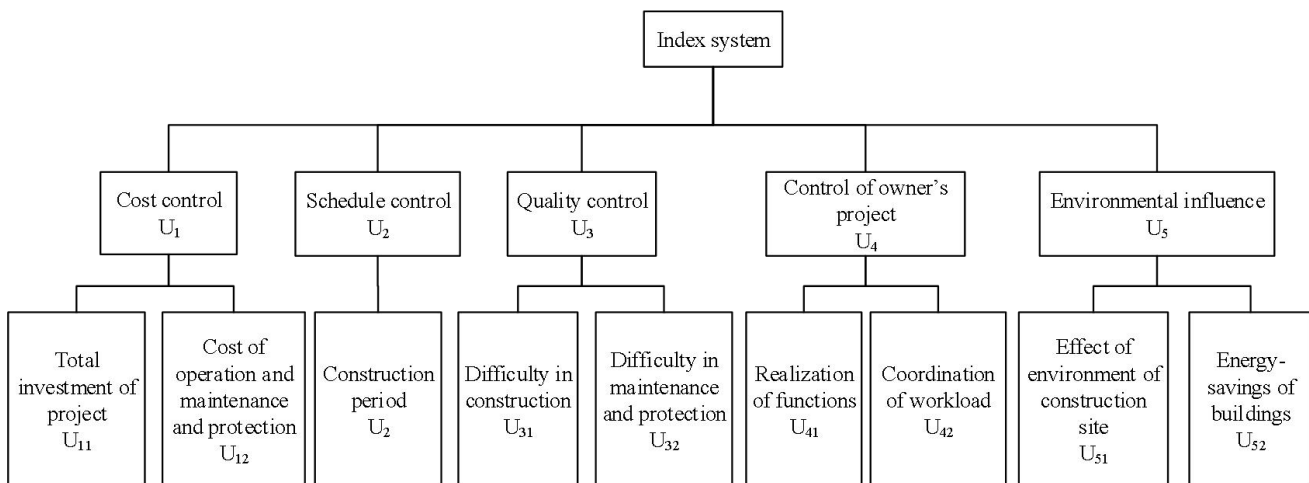

#### 4 A Comparative Analysis of Construction Scheme of Student Dormitory Project Based on Fuzzy Comprehensive Evaluation Method

Through the above analysis, it can be seen that the prefabricated building has strong applicability in the college student dormitory project. To compare the technical and economic benefits of prefabricated buildings and conventional construction schemes more intuitively, this paper examined the feasibility of promoting prefabricated buildings in the projects of student dormitory. This paper took the newly built student dormitory project of a university in Wuhan as an example. The fuzzy comprehensive evaluation model was used to compare the prefabricated concrete with the cast-in-place concrete<sup>[9]</sup>.

The total construction area of a new student dormitory project in a university in Wuhan is 74,684 square meters, including 7 student dormitories with 6 floors, 1,288 planned rooms. Besides, the single building area and indoor structure are basically the same. This paper applies fuzzy comprehensive evaluation method. Twenty judges, including teachers, students and industry experts, were invited to judge the cast-in-situ concrete construction scheme and the prefabricated concrete construction scheme respectively.

##### 4.1 Index selection

According to the characteristics of the student dormitory project, in the selection of indicators, besides considering the three basic objectives of cost, schedule and quality, the project management of the owner and the realization of environmental impact objectives were also emphasized. A target set was created, containing the above 5 items. Subsequently, the index system affecting the realization of the

goal and the evaluation of the scheme was analyzed and established<sup>[10]</sup>.

Figure 1 Establishment of Index System

#### 4.2 Weight definition

The following evaluation results were obtained by calculating the evaluation results of the weight of indicators.

**Table 1 Result of Index Weight Evaluation**

Target Set	Target Weight $A_i$	Factor Set	Factor Weight $A_{ij}$
cost control $U_1$	0.20	Total investment of projects $U_{11}$	0.68
		Cost of operation and maintenance $U_{12}$	0.32
schedule control $U_2$	0.30	construction period	1
quality control $U_3$	0.22	difficulty in construction $U_{31}$	0.64
		difficulty in maintenance and protection $U_{32}$	0.36
control of owner's project $U_4$	0.17	realization of functions $U_{41}$	0.80
		coordination of workload $U_{42}$	0.20
environmental influence $U_5$	0.11	effect of environment of construction site $U_{51}$	0.57
		energy-savings of buildings $U_{52}$	0.43

The target set of the project  $A = \{0.20, 0.30, 0.22, 0.17, 0.11\}$ , where the weight set of the cost control target  $A_1 = \{0.68, 0.32\}$ ; likewise,  $A_2, A_3, A_4$  and  $A_5$  can be yielded.

#### 4.3 Membership calculation

In order to facilitate the evaluation by the judges, this paper divided the 9 evaluation factors into two categories: functional factors and wastage factors. Among them, functional factors include function realization and building energy conservation. The greater the effect of such factors, the better the evaluation will be. The other 7 items are loss factors. The larger the value or effect of such factors is, the worse the evaluation will be. According to the above evaluation methods, the judges evaluated the advantages and disadvantages of each factor of the two technical schemes.

**Table 2 Evaluation Results of the Technical Scheme by the Judges**

Target set	Factor set	Evaluation rating							
		cast-in-situ concrete				Prefabricated concrete			
		Best	Good	Moderate	Worst	Best	Good	Moderate	Worst
cost control U1	Factor set	12	6	2	0	4	9	4	3
	Total investment of projects U <sub>11</sub>	4	8	4	4	6	6	6	2
schedule control U <sub>2</sub>	construction period	1	6	9	4	6	8	4	2
	difficulty in construction U <sub>31</sub>	7	2	5	6	9	5	3	3
quality control U <sub>3</sub>	difficulty in maintenance and protection U <sub>32</sub>	3	4	10	3	8	5	5	1
	realization of functions U <sub>41</sub>	11	4	3	2	10	5	4	1
control of owner's project U <sub>4</sub>	coordination of workload U <sub>42</sub>	2	2	9	7	9	6	3	2
	effect of environment of construction site U <sub>51</sub>	0	3	11	6	13	3	4	0
environmental influence U <sub>5</sub>	energy-savings of buildings U <sub>52</sub>	3	3	6	8	4	9	5	2

According to the evaluation of the factor set by 20 judges, the votes of each grade were summarized to obtain the above evaluation results. Taking the cast-in-place concrete scheme as an

example, the membership matrix of the cost control objective was obtained  $R_1 = \begin{bmatrix} 0.6 & 0.3 & 0.1 & 0.0 \\ 0.2 & 0.4 & 0.2 & 0.2 \end{bmatrix}$ .

Each target membership matrix can be obtained R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> successively.

#### 4.4 Fuzzy synthetic evaluation model

The fuzzy comprehensive evaluation set of each target  $W_i = A_i \times R_i$ . Then, the objective fuzzy comprehensive evaluation matrix is established.

$$W_{\text{prefabricated}} = \begin{bmatrix} 0.472 & 0.332 & 0.132 & 0.064 \\ 0.050 & 0.300 & 0.450 & 0.200 \\ 0.278 & 0.136 & 0.340 & 0.246 \\ 0.460 & 0.180 & 0.210 & 0.150 \\ 0.065 & 0.150 & 0.442 & 0.343 \end{bmatrix}$$

Likewise, the objective fuzzy comprehensive evaluation matrix of prefabricated concrete scheme can be calculated.

$$W_{\text{prefabricated}} = \begin{pmatrix} 0.232 & 0.402 & 0.232 & 0.134 \\ 0.300 & 0.400 & 0.200 & 0.100 \\ 0.432 & 0.250 & 0.186 & 0.132 \\ 0.490 & 0.260 & 0.190 & 0.060 \\ 0.457 & 0.279 & 0.221 & 0.043 \end{pmatrix}$$

The evaluated results of each target  $B = A \times W$ . The fuzzy comprehensive evaluation results of the two schemes are obtained.

$$B_{\text{cast-in-place}} = \{0.25586, 0.23342, 0.32058, 0.19015\}$$

$$B_{\text{prefabricated}} = \{0.364955, 0.33029, 0.203985, 0.10077\}$$

In order to compare the evaluation results more intuitively, this paper assigned values to the evaluation grades of the judges, and made the excellent, good, medium and poor represent 90, 70, 50 and 30 points, respectively. Assigned matrix  $F = \{90, 70, 50, 30\}^T$ , the quantitative evaluation score of each scheme can be obtained  $S = B \times F$ , Score for in-situ concrete schemes  $S_{\text{prefabricated}} = 61.10$ , prefabricated concrete project scores  $S_{\text{prefabricated}} = 69.19$  (reserve two decimal places),  $S_{\text{cast-in place}} < S_{\text{prefabricated}}$ . In other words, based on the above evaluation and taking into account the project's cost, schedule, quality, owner's project management and environmental impact objectives, the prefabricated concrete scheme has a higher score than the cast-in-place concrete scheme.

## 5 Conclusions

This paper analyzed the feasibility of the prefabricated building in the student dormitory project through the applicability analysis and program comparison, and drew the following conclusions and suggestions

(1) The prefabricated building itself is highly matched with the characteristics of the student dormitory project in terms of structural design, progress control and quality control. The application of the prefabricated construction technology to the student dormitory project can effectively shorten the construction period, improve the construction quality and improve the construction environment<sup>[11]</sup>. At the same time, compared with the traditional cast-in-place concrete construction scheme, the prefabricated construction scheme is more conducive to the university's control of project cost, quality, schedule, owner's project management, environment and other objectives in the case of student dormitory project, and has the feasibility of promotion and application.

(2) In the early stage of the promotion of prefabricated building, there are still some problems, such as high cost, imperfect technical specifications and few construction enterprises with the ability to implement, which restrict the wide application of prefabricated building technology. Component processing enterprises can gradually reduce the unit cost of prefabricated components by innovating process and expanding production scale, and construction enterprises can accelerate the transformation to assembly-type industry by improving technical capacity and changing management mode. The government and the construction industry can also promote the development of prefabricated buildings by issuing incentive policies, implementing standards and other means, and providing cost compensation and technical support for projects adopting prefabricated technologies.

(3) On the basis of prefabricated student dormitory project construction, colleges and universities can also explore the construction mode of integration of decoration and main structure, modularization of interior design and furniture, etc. We should give full play to the knowledge-intensive advantages of institutions of higher learning and strengthen the application of building informatization and industrialization<sup>[12]</sup>. We are required to innovate the design standard, construction specification and project management mode of prefabricated buildings, and build a number of demonstration projects with advanced management and advanced technology.

# Optimization Design of Wuhan Riverside Landscape Regulatory Plan

Peng Yuhao

Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: 1138362753@qq.com)

**Abstract:** Rapid urbanization and industrialization have caused serious damage to the natural ecological environment, and people attach great importance to the optimization design of Wuhan riverside landscape regulatory plan. At the same time, the rapid development of city also highlights the ecological, economic and cultural sustainability issues of Wuhan riverside landscape regulatory plan. In this context, under the guidance of sustainable development theory, this paper conducts research on optimization design of Wuhan riverside landscape regulatory plan. By analyzing the current status of existing riverside landscape facilities, this paper summarizes three riverside landscape regulatory plan management strategies from adaptive design and development, appropriate intervention and coordination, cultural inheritance and protection. Based on the management strategies of sustainable development of riverside landscape, the optimization design of Wuhan riverside landscape regulatory plan is explored from five aspects: landscape axis combing, landscape node integration, landscape facade planning, green landscape implantation and service landscape setting.

**Key words:** Regulatory plan; Optimization design; Management strategy; Riverside landscape

## 1 Introduction

Optimization design of regulatory plan is an important part of urban riverside landscape design. In the 1950s and 1960s, western developed countries began to redevelop the riverside space. At that time, many optimization design of riverside landscape were born.<sup>75</sup>After that, Canada, Japan, and the United States began to research systematic management of riverside design, and deepened relevant<sup>76</sup>theories from the material, economic, and social levels. In the 21st century, riverside design management began to focus on the ecological environment. With the practice of China's sustainable development theory, the optimization design of riverside landscape regulatory plan has gradually received attention. At the ecological level, the optimization design of riverside landscape regulatory plan enables people to live in harmony with the environment; at the economic level, the optimization design of riverside landscape regulatory plan covers high-quality commercial resources and cultural connotations; at the social level, the optimization design of riverside landscape regulatory plan can enhance the livability of the city to provide space for various social activities.

The riverside landscapes in American are mostly distributed in the economically developed areas of the rivers and estuaries. The riverside landscape has many nodes and the landscape layout is compact.

---

<sup>75</sup>Breen A. and Rigby D. 1996

<sup>76</sup>Ali Madanipour. 1996

The design focuses on optimizing the daily activities and public gatherings of the citizens. The riverside landscape in Europe are mostly distributed on both sides of the alluvial plains of the rivers. The terrain is wide and the riverside has a long history. The design emphasizes the urban characteristics and emphasizes the harmonious coexistence between man and nature. The riverside landscape of Japan and South Korea are mostly located in large-scale cities with dense populations. The water body spans narrowly, and the design focuses on enriching people's waterfront leisure activities. Although China's riverside landscape design started late, after the Economic Reform and Open Up, relevant research results have developed rapidly. The related design of China's riverside landscape has a strong tendency, focusing on commercial development and the driving role of the surrounding service industry, but lack of ecological The overall consideration of the environment and the riverside green belt. The theory of sustainable development requires that the natural environment, social history, and human activities be organically integrated in the optimization design of riverside landscape regulatory plan. The regulatory plan design of the riverside landscape must take into account the ecological effects, aesthetic effects, commercial effects, and the sustainability of social effects so as to let people, city and natural environment live in harmony.

## **2 Issues of Wuhan Riverside Landscape Regulatory Plan**

However, Wuhan City, which is located in the middle of the Yangtze River, started late in the urban riverside landscape regulatory plan. In the initial construction of the city, the importance of the development and construction of the riverside landscape were not fully understood, and there was no professional design management theory guidance, the construction conditions were also not complete enough. The riverside landscape design in Wuhan is more likely to ignore the connection between the historical context of the city and the river without comprehensive consideration of the natural environment, which is also the shortcoming in the regulatory plan of the riverside landscape in Wuhan. In today's Wuhan riverside landscape regulatory plan, on the one hand, the problems of paying much attention to economy and exploitation while ignoring ecology and protection in urban construction are ubiquitous, which make the natural environment and regional context of Wuhan riverside landscape greatly damaged. Moreover, the riverside landscape once became the gray area in the city. On the other hand, the old riverside landscape facilities can no longer meet the needs of the increasingly demand of residents. Many of the existing facilities are overloaded and suffer serious losses. In the face of the unreasonableness of the original design, it is necessary to rethink the Wuhan riverside landscape and regulatory plan optimization design issues.

Wuhan Riverside landscape is relatively simple, with no change and depth, and the overall sustainability is not strong. The existing design focuses on flood protection and practical functions, making the near water area less aesthetic sense. Wuhan is hot in summer, with strong sunshine intensity and long time. The lack of shade facilities in the riverside landscape makes the use in summer is low and lacks rationality. Fitness facilities are located in open areas and lack maintenance, resulting in higher scrap rates. The landscape type of riverside landscape in Wuhan is relatively simple, and the utilization of aquatic plants is lacking in the greening of landscape vegetation, resulting in a large number of near-water wetlands being wasted. Grassland and shrub vegetation are less, and rainwater flows directly into the Yangtze River along the slope, lacking natural infiltration and filtration purification. Wuhan existing riverside landscape has problems such as unreasonable landscape configuration, single landscape function, less recreational facilities, and space planning that do not meet the needs of use. Optimization design of riverside landscape regulatory plan improves urban ecology through landscape vegetation and greening, supporting the construction of service-oriented landscape facilities, enriching the way of life and leisure of citizens, rationally planning the layout of the space, highlighting the characteristics of the

urban landscape, and ultimately aiming at designing the urban riverside landscape that in line with the slogan “Core City of the Yangtze River Economic Belt and the Central City of Wuhan”.

### 3 Current Situation Analysis of Wuhan Riverside Landscape Regulatory Plan

First of all, the adaptive design of the riverside landscape functional configuration is one of the important management strategy of riverside landscape regulatory plan. The landscape regulatory plan of riverside area does not adapt to the development of the city, which will inevitably lead to chaos and disorder in the area and natural coordination is harder to talk about.<sup>77</sup>The original riverside landscape design lacks a unified plan for the green landscape. The riverside landscape has a rigid slope protection, and the space lacks change and flexibility, resulting in the overall function that not adapting well to the development of the city. Some repetitive and underlying industries occupy good resources in the riverside area. The riverside area is mixed, messy without overall coordination, and the characteristics of the riverside landscape are gradually disappearing. Wuhan riverside landscape regulatory plan should move towards an adaptive design management model of “coordination between people and nature”. It is the key direction of Wuhan riverside landscape regulatory plan optimization design.

Secondly, the rational allocation of land resources in the riverside landscape also faces many problems, and the government is in urgent need of appropriate intervention and coordination. It is necessary to follow the management strategy of appropriate intervention and coordination so as to protect the natural landscape of riverside district and control the commercial development of land.<sup>78</sup>At the same time, the excessive density of industrial land and civil buildings has led to an extremely scarce open space such as riverside square and landscape greening, and the imbalance in spatial scale is very serious. Therefore, in order to realize the harmony of Wuhan riverside landscape between people and nature, it is necessary to coordinate and intervene in urban construction activities and protect natural resources through government intervention, and adopt a compact and efficient land use model for land resource management strategy in riverside district.

Optimization design of Wuhan riverside landscape regulatory plan emphasizes the management strategy of cultural inheritance and protection of urban cultural background. The riverside landscape in Wuhan has a long history. It blends the architectural styles and landscapes of various countries during the old lease period, reflecting the wisdom of Wuhan people. Today's Wuhan riverside landscape develops rapidly, while the riverside landscape design management does not show the traditional Wuhan riverside culture. Many designs are pursuing modernization, seeking new forms of landscape expression while ignoring local differences, which lead to the lack of using traditionally excellent landscapes. Today's landscape construction design cannot adopt the extensive mode of “large-scale demolition and construction”. The riverside landscape should be updated and replaced step by step, respecting the urban memories, the urban environment, the local spirit. The specific performance is highlighted by the characteristics of the human environment, the functional replacement of buildings, the expression of design forms, and the application of appropriate techniques and measures.<sup>79</sup>

#### **4 Optimization Design Methods of Wuhan Riverside Landscape Regulatory Plan**

To create comfortable and livable environment under people-oriented concept is an important method to achieve the Wuhan riverside landscape regulatory plan. In the optimization design of Wuhan riverside landscape regulatory plan, only focusing on economic development will lead to a decline in the ecological vitality of the riverside region. To fully exert the economic potential and human settlement value of the riverside region, it is necessary to create comfortable and livable environment under people-oriented concept. In the “Blue Ribbon Network” of the Thames in London, the government advocates protective restoration and constructive renovation of the water system, adding greening, shops and sightseeing facilities on both sides of the Thames, and actively organizing social activities to enhance the vitality of the city and highlight the livable characteristic. The city's riverside area has a long history of development, various social ecology, diverse living content and scenes are part of the characteristics and charm of the city's riverside region. The urban riverside area has a complex composition of migrant workers, as well as indigenous people and new citizens in the old city. They are responsible for social relations and diverse living needs. Optimization design of regulatory plan should improve the infrastructure and facilitate the diversification of Wuhan riverside landscape regulatory plan through the method of livable transformation.

Optimization design of Wuhan riverside landscape regulatory plan should rely on ecological regulation and various methods to shape the characteristics of Wuhan riverside landscape, form a distinctive landscape different from other regions, and then combine with the artificial landscape to form an overall riverside ecological landscape. Ecological regulation can be understood as the protection and restoration of the ecology, combined with the local climate, vegetation, hydrology characteristics and etc., showing their ability to highlight the characteristics and individuality of the landscape as a whole ecological balance and stability. For example, in the near-water environment of the riverside landscape, the landscape vegetation enhances the penetration of groundwater and strengthens the natural purification ability of the water flow. At the same time, it can promote the ecological restoration ability of the riverside landscape and achieve self-regulation. A good riverside landscape ecology can promote the integration of city and nature. Paying attention to protecting, repairing and reshaping the natural ecological environment such as water bodies and vegetation in the riverside area, and recreating the ecological regulation and vitality of the riverside interface has become the top priority of urban riverside landscape design.

According to the traditional urban characteristics of Wuhan riverside district, optimizing and protecting the historical context of riverside, adopting the humanistic linkage design methods is the key to realize the optimization design of Wuhan riverside landscape regulatory plan. People form an abstract subjective feeling through various elements and contents in the landscape, such as regions, roads, borders, nodes, markers, reflecting the linkage process between landscape and people. Take the Royal Theatre in Copenhagen, Denmark as the example, the port was an important naval base during World War II and the riverside landscape has a long history. Under the condition of changing the landscape axis of the original Royal Opera House, new buildings are laid out, forming new and old echoes. In the process of transformation, humanities linkages will be realized, highlighting public services and regional cultural characteristics. The road arrangement and architectural pattern of Wuhan City are closely related to the Yangtze River and have a strong riverside landscape. Landscape elements such as bridges, piers and old leased buildings form a riverside landscape with humanistic features. In the process of riverside landscape renewal in Wuhan, the humanistic linkage method was adopted to show the urban humanities in Wuhan, emphasizing the characteristics of the riverside landscape, and vividly presenting the historical accumulation and cultural connotation of urban development.

## **5 Optimization Design Practice of Wuhan Riverside Landscape Regulatory Plan**

The main axis is the spatial link of the entire riverside landscape, which plays the role of combing the interior space of the landscape and conveying the flow of people. Optimization design of Wuhan riverside landscape regulatory plan, it is necessary to analyze the current situation of landscape use and decide what design form to adopt. When conducting the main landscape axis combing, it is necessary to fully consider the traffic flow elements. In the design, we must first ensure the accessibility of the walking system, and implement the diversion of people and vehicles to reduce mutual interference between tourists and motor vehicles or non-motor vehicles. When designing, try to ensure that the main road is smooth and convenient for people with disabilities. The boundaries of the road are indicated by changes in the paving. In addition, it is necessary to set up rest facilities such as seats along the axis of the landscape, which can weaken the flow speed of the tourists in the linear space and enable the tourists to continue to play after a short stay.

The Wuhan riverside landscape has a mature and perfect human landscape. It promotes the development of the surrounding commercial service industry through high-quality human landscapes, and the focus of sustainable development of Wuhan riverside landscape design management. Through optimization design of Wuhan riverside landscape regulatory plan, the landscape nodes in the entire riverside landscape are evenly distributed, the utilization rate of the riverside landscape in different time periods is improved, and the flow of personnel in various regions is promoted. The Wuhan riverside landscape regulatory plan enhances the leisure service capacity of the Wuhan riverside landscape by adding convenience service facilities, riverside cultural districts, consumer dining venues, and leisure sports venues.

Due to the lack of maintenance and extensive management, the Wuhan riverside landscape has undergone many alterations, expansions, constructions, and renovations, resulting in different styles of the facades. The riverside landscape facade with landscapes, shops and docks has gradually formed, and some landscapes have even been partially deformed and damaged. It has reached the point where repairs must be rectified and redesigned. Optimization design of Wuhan riverside landscape regulatory plan combines the architectural style and color of the riverside facade with the landscape greening and lighting effects, and combines with the city skyline of riverside to become a beautiful riverside landscape. The design of the riverside facade needs to consider the unification of the landscape facilities with the surrounding buildings and natural topography. The boundary between the buildings and the natural topography in the landscape view is the background of the riverside facade. Therefore, in order to make the riverside landscape facade cooperate with the surrounding buildings and topography, it must be integrated with the natural boundary line, and attention should be paid to the change of elevation and distance.

Optimization design of Wuhan riverside landscape regulatory plan highlights the interaction between people and nature, enabling citizens and tourists to fully appreciate nature during leisure visits. Vegetation is the ecological basis in the design of waterfront landscapes, including herbs, shrubs and various large and small trees. The implantation of interactive landscape can be roughly divided into revetment landscape implantation, platform landscape implantation and green lane landscape implantation. Most of the revetment landscapes are near water areas. Considering the tidal fluctuations, most of them are aquatic plants. The green vegetation can be planted with reeds and other plants for easy maintenance. Most of the green lane plants are mainly herbaceous plants and shrub plants. Through the landscaping, they will guide the flow of people and beautify the environment without affecting the sight of the tour.

The landscape service facilities mainly include the functions of rest, protection and display, such as

fences, seats, signs, garbage bins, etc. They not only provide practical functions and values such as rest and protection, but also embellish the landscape, render the atmosphere, and beautify the role of the environment. The so-called pleasantness of the landscape is that the scale of the landscape is within the scope of the human senses. At the same time, the humanized barrier-free design is equally important for the optimization design of Wuhan riverside landscape regulatory plan. Therefore, it is necessary to consider the basic considerations of many aspects such as the configuration and size of the landscape facilities.

## **6 Optimization Evaluation of Wuhan Riverside Landscape design**

The functionality of the riverside landscape reflects the role of landscape optimization design in sustainable theory. Compared with the landscape itself, the function needs to change rapidly from time to time, so the sustainability of service functions is particularly important. Riverside scenery will inevitably lead to the function that does not meet the needs of people's life because of the changes of the times. This requires that the design of the riverside landscape needs to consider the functional status of its service facilities. The evaluation of landscape quality is based on three types of data: service type, service intensity and service area. When the service area of the landscape is larger, it can be considered that it can carry more users, and its functionality is better. Service intensity refers to the frequency of use within a certain service time. The higher the frequency used, the better the functionality of the landscape. If the variety of services that a landscape can provide is diverse, the more types of visitors the landscape can attract, the better the functionality.

Starting from the establishment of the relationship between people and nature, the degree of pleasantness of the landscape is an important factor in the sustainable riverside landscape optimization design. By observing people's participation in the riverside activities, it can directly reflect the livability of the riverside region and the pleasantness of the landscape. It determines the quality of the riverside landscape optimization design. The evaluation of the landscape's pleasantness includes six main indicators: the number of tourists, road conditions, vegetation coverage, number of service facilities, public space and safety. The six indicators were scored and the rankings were evaluated by the scores. The greater the number of visitors to the landscape, the more people are covered by the landscape, the more livable it is. The better the road conditions, the better the accessibility of the landscape. The higher the vegetation coverage, the higher the environmental quality from the side. The greater the number of service facilities, the larger the area of public space, the more people can be accommodated. The higher the security, the better the protection of the people in use.

The relationship between human activities and natural landscapes is interdependent with common evolution and symbiosis coordination, which is the fundamental reason why the riverside landscape can flourish. It reflects that the riverside landscape optimization design cannot be separated from human activities. The evaluation of landscape sustainability includes four main aspects: the type of flora and fauna of the landscape, the proportion of the original flora and fauna, the adaptability of the artificial landscape and the natural landscape, the self-purification of the landscape and the waste treatment capacity. The more types of flora and fauna in the landscape, the stronger the risk resistance to the natural environment. The higher the ratio of the original flora and fauna, the stronger the continuity of the landscape. The better the adaptability of artificial landscapes and natural landscapes, the smaller the impact of artificial landscapes on natural landscapes. The more self-cleaning and waste treatment capacity of the landscape, the better the landscape ecological cycle.

## 7 Conclusion

The original Wuhan riverside landscape is worthy of affirmation and learning for the improvement of urban infrastructure. However, due to the lack of consideration of regulatory plan design in early urban development, the landscape style of Wuhan riverside is relatively unchanged, the layout of landscape facilities is unreasonable, the elevation level of the riverside is monotonous and short of alterations and the overall landscape lacks recognition. It can be said that Wuhan riverside landscape design has great potential for development. In order to achieve healthy and sustainable development of Wuhan riverside landscape control planning and design, more attention should be paid to the designer as an intermediary, the transformation and innovation of Wuhan riverside landscape should be realized by designers' professional knowledge.

## **The Analysis of Effectiveness of Cost Control Strategy on the Profitability of Coca-Cola Company from 2015 to 2017**

Xiao Zhiqi, Zhang Jingxian

School of International Education, Wuhan University of Technology, Wuhan, Hubei, P.R. China,  
430070

(Email: 2143898477@qq.com, zhangjx@whut.edu.cn)

**Abstract:** This paper is aiming to evaluate the effect of cost control strategy on the profitability of Coca-Cola Company from year 2015 to 2017 by using the ratio analysis and offer essential recommendations for the company. This paper is divided into three parts. First part is to introduce the current business operation activities and basic background information. This paper adopts desk research as data collection method. The major sources of information are the annual report of Coca-Cola Company, the database of World Health Organization and other scholastic websites such as Wan Fang Database. Second, financial statements analysis and profitability analysis. This part contains three data analysis methods that are horizontal analysis and ratio analysis. Third part is the conclusion which is from year 2015 to 2017, Coca-Cola Company has strengthened its profitability through cost control strategy but there are fatal hazards in the profitability of Coca-Cola Company that is the worse utilization of its assets to generate profit and dispute with IRS. The recommendations are also provided based on the conclusion which could be referenced by other companies to some extent.

**Key words:** Horizontal Analysis; Ratio Analysis; Profitability Ratio; Financial Statement Analysis; Coca-Cola Company

### **1 Introduction**

Although Coca-Cola Company is the world's largest beverage company who owns and markets four of the world's top five non-alcoholic sparkling soft drink brands and was recognized as the number one global brand in 2010; however, as the awaken of people's awareness toward healthy diet, the soft-drink industry is facing a great recession, which has caused the revenue of Coca-Cola Company to decrease consecutively since 2015. According to the annual reports of Coca-Cola Company, the net operating revenue for Coca-Cola Company in 2015 amounted to about \$44,294 million; however, in 2017, the Coca-Cola Company's net operating revenues worldwide amounted to about \$35,410 million. The continuous decrease in revenue, as well as the market share and profits took a hit on the financial position of Coca-Cola Company. Therefore, it is crucial to analyze the financial report of Coca-Cola Company to detect the reasons for the recessions, moreover, to propose appropriate remedies or recommendations for its financial risks, in order to regain its financial stronghold and business success.

In 20<sup>th</sup> century, as the development of second Industrial Revolution, the owners' right and the management right has been separated, which lead the stakeholders to concern the profitability of their companies. The growing concerns of the profitability has led the study of profitability analysis to begin and develop rapidly. Charumathi has proved that the main factors of the profitability are the asset scale, management effectiveness and the loss ratio (Charumathi, 2012). Bisbe and Malagueno has also detected that the effectiveness of the cost management is the most important factor to influence the

change in profitability of a company (Bisbe and Malagueno, 2012).

Through studying the dissertation of the foreign and domestic scholars, the system of profitability analysis is fully fledged. Wang has created a comprehensive profitability analysis system by dividing the measurement standard into the gross profit analysis and the quality analysis of profitability analysis (Wang, 2006); Zhang has combined the gross profit analysis and the cash flow analysis with the profitability analysis as the standard to measure the profitability (Zhang, 2007). Meanwhile, Huang has proved that the gross profit ratio and loss ratio could also be the standard to measure the profitability of a company (Huang, 2013).

## **2 Financial Statement Analysis**

### **2.1 Method data collection and analysis**

This paper has adopted desk research to obtain secondary sources of data. In order to obtain reliable and verifiable financial data, the most frequent used secondary source of data is annual reports on the official website of Coca-Cola Company. Scholastic databases including China National Knowledge Infrastructure, Wanfang Database, and Google Scholar are used to attain data that might contribute to gain a better understanding of the financial position and business operation of Coca-Cola Company. Papers published by professional analysts that related to the financial aspect are used as secondary sources of data as well. The data gained from secondary resource provides annual financial reports of Coca-Cola Company in last three years and the recent finance and investment activities it engaged in. It demonstrates the financial position and business operation strategy of Coca-Cola Company from 2015 to 2017.

The main financial data analysis tools adopted in this paper are horizontal analysis and ratio analysis. Horizontal analysis is used to compare the historical data over a number of accounting periods that presents the changes in the amounts of corresponding financial statement account over a period of time, which is useful to determine trends of change for Coca-Cola Company from year 2015 to 2017 and future trends of change in financial position for Coca-Cola Company. Ratio analysis is a quantitative analysis used to obtain indications of a firm's financial performance in critical accounting areas (Goel, 2015). Profitability ratios are essential tools to evaluate the profitability of Coca-Cola Company through year 2015 to 2017. Profitability ratio involves gross profit ratio and operating profit ratio that measures and evaluates the ability of Coca-Cola Company to generate profit relative to revenue, which is more meaningful than just comparing the revenue or profit generated by Coca-Cola Company, since it presents how well Coca-Cola Company utilizes its assets to generate profit with concerns of cost of sales and other costs.

### **2.2 Horizontal analysis**

In the Income Statement, there are some changes in the accounts from 2015 to 2017 that should be noticed. As shown in the Table 1, from 2015 to 2017, both Net Operating Revenue, Cost of Goods Sold, Gross Profit, Operating Expenses and Operating Income have decreased continuously; moreover, both accounts have worsened more seriously in 2017 than 2016. Net Operating Revenue has decreased by 5% and 15%. Cost of Goods Sold has decreased by 6% and 19%. As a result of decrease in the Net Operating Revenue, Gross Profit has decreased by 5% and 13% respectively. The Operating Expenses has decreased by 9.27% and 8.74%. As a result of decrease in Gross Profit and Operating Expenses, Operating Income has decreased by 1% and 13% respectively. The Interest Cost for Coca-Cola Company has decreased by 14% from 2015 to 2016, however, it has increased by 15% in 2017. The consecutive decreases of Gross Profit and the Operating Income are due to the large decrease in Net Operating Revenue by 5% and 15% respectively. The reasons given for the consecutively decreases in 2017 Coca-Cola Company Annual Report are "currency fluctuation and acquisitions and divestitures". It

specifies that the currency fluctuation is responsible for 1% decrease in Net Operating Revenue in 2017 and 3% decrease in 2016. This means that the 2% decrease in 2016 and 14% decrease in 2017 are due to the acquisition and divestitures. The reason for the decrease in the acquisition and divestitures in 2017 is due to the deconsolidated of German bottling operations in December 31, 2016. The end of partnership with German bottling operations greatly decreases the revenue of acquisition and divestitures for Coca-Cola Company. Another reason for the decrease in the Net Operating Revenue in 2017 is an article of World Health Organizations (WHO) named 'Effect of Nutrition in Coke to Diabetes in Ecuador' that disclosed the unhealthiness of Coca-Cola Company which raised widely concern toward sparkling soft-drinks.

**Table 1 Main Financial Data in Consolidated Statements for Coca-Cola Company.**

<i>(Amounts in millions, except per share data)</i>	Fiscal Years Ended January 31,		
	2017	2016	2015
Net Operating Revenue	\$35,410	\$41,863	\$44,294
Cost of Goods Sold	13,256	16,465	17,482
Operating expenses	14,653	16,772	18,084
Gross Profit	22,154	25,398	26,812
Operating income	7,501	8,626	8,728
Cash and Cash Equivalents	6,006	8,555	7,309
Trade Account Receivables	3,667	3,856	3,941
Short-term Investments	9,352	9,595	8,322
Asset Held for Sale-Discontinued Operations	7,329	-	-
Total Asset	87,896	87,270	89,996
Total Current Liabilities	27,194	26,532	26,929

*Source: Data comes from Consolidated Financial Statements for Coca-Cola Company, from 2015 to 2017.*

There are some alternations in the Statement of Financial Position that has led to changes in the financial position of Coca-Cola Company. Referring to the Table 1, Cash and Cash Equivalents in 2017 is 30% less than 2016, but 13% more than 2015. From 2015 to 2017, the Short-term Investments increased by 15% in 2016, however, it decreased by 3% in 2017. The Trade Account Receivables from 2015 to 2017 has decreased consecutively by 2%, and 5% respectively. The Marketable Securities decreased by 5% in 2016, however, it increased by 31% in 2017. As a result, the Total Assets decreased by 3.12% in 2016, but increased by 0.71% in 2017. Total Current Liabilities decreased by 1.50% in 2016 and increased by 2.43% in 2017.

### **3 Implications for Profitability Ratio Analysis**

#### **3.1 Profitability ratios**

Profitability ratios are a class of financial metrics to assess a business's ability to generate earnings

relative to its associated expenses by means of a series of ratios (Williams and Carcello, 2008). The data and calculation of profitability ratios are presented numerically in table 2 and graphically in figure 1.

### 3.2 Gross profit ratio

Gross profit ratio is a profitability ratio that shows the relationship between gross profit and total net revenue. It is used to evaluate the operational performance of the business. The ratio is computed by dividing the gross profit figure by net revenue (Groppelli, 2006). The Gross Profit Ratios of Coca-Cola Company in 2015, 2016 and 2017 are shown in Table 2 and their trend is shown in figure 1.

From 2015 to 2017, the trend for the Gross Profit Ratio has been steady with a slight increase. In 2016, the Gross Profit Ratio has increased by 0.14%, which is due to the decrease in both cost of sales and net revenue. As a result of the deduction of \$1,017 million in cost of sales and deduction of \$2,431 million in revenue, the decrease in gross profit of \$1,414 million has been outweighed. In 2017, the increase of 1.89% in the Gross Profit Ratio is due to the same reason. Although the gross profit in 2017 is \$3,244 million less than it is in 2016, the reduction of \$3,209 million in cost of sales and reduction of \$6,453 million in revenue ensures the elevation in Gross Profit Ratio.

Based on the 2016 annual report and 2017 annual report of the Coca-Cola Company, the result of the decrease in net revenue is due to the global arising of concerns on the health issues and the deconsolidated of German bottling operations in December 31, 2016. In 2016, the partnership between Coca-Cola Company and its German bottling operations has been terminated, which caused the revenue that generated from bottling business to decrease and the consolidated revenue to decline by \$2,431 million. Moreover, in 2017, the World Health Organizations (WHO) has published an article written by nutrition specialists that indicates the ingredient of Coke produced by Coca-Cola Company could largely increase the possibility of diabetes (Carpio et al, 2017). Although Coca-Cola Company has responded to adapt the recommendations by WHO, it still suffered a decrease of \$6,453 million in revenue and a decrease of \$3,244 million in profit. However, Coca-Cola is able to reduce its manufacturing cost and material cost in both 2016 and 2017. There are main reasons for the decrease in cost of goods sold that are currency fluctuation and backward integration. In 2016, the currency fluctuation has led a 2 percent decrease in the cost of goods sold for Coca-Cola Company and 1 percent decrease in 2017. Another important factor is the backward integration strategy adopted by Coca-Cola Company. The divestitures of Coca-Cola Company such as bottling company saved the distribution and production cost greatly that allows it to reduce cost of sales by \$1,017 million in 2016 and \$3,209 million in 2017, which elevate the Gross Profit Ratio consecutively.

### 3.3 Operating profit ratio

Operating profit ratio calculates the percentage of profit a company produces from its operations, prior to subtracting taxes and interest charges. It is calculated by dividing the operating profit by total revenue and expressed as a percentage (Pizzey, 2001). The Operating Profit Ratios for Coca-Cola Company from year 2015 to 2017 are shown in Table 2 and the graph of the trend is shown in figure 1.

From 2015 to 2017, the trend for operating profit ratio is increasing steadily and slowly. The Operating Profit Ratio has increased by 0.91% due to the decrease in the operating cost of \$1,312 million and the decrease in revenue of \$2,431 million which outweighed the decrease in operating profit of \$102 million. Although the operating profit in 2017 is \$1,125 million less than it is in 2016, the reduction of \$2,119 million in operating costs and reduction of \$6,453 million in revenue ensures the elevation in Operating Profit Ratio. The increase of 0.57% in the Operating Profit Ratio is due to the decrease in operating

costs.

According to the 2016 annual report and 2017 annual report of Coca-Cola Company, operating costs include the selling costs, general costs, administrative costs and other operating costs. The decrease in the operating cost is due to the large reduction in advertising costs and shipping and handling costs. In 2016, the divestitures of Coca-Cola Company have saved \$1,312 million for Coca-Cola Company which is benefited from the back-ward integration strategy. In 2017, Coca-Cola Company adopts strategy that allocates estimated full year marketing expenditures that benefit multiple interim periods to each of our interim reporting periods, then use the proportion of each interim period's actual unit case volume to the estimated full year unit case volume as the basis for the allocation. This methodology results in its marketing expenditures being recognized at a standard rate per unit case. As a result, the marketing costs reduced by \$627million. The backward integration strategy also benefits the reduction of shipping and handling Costs for Coca-Cola Company. The holding distribution companies and distribution partners reduced the distribution costs by \$0.9 billion in 2017, which elevates the Operating Profit Ratio by 0.57%.

**Table 2 Profitability Ratio for Coca-Cola Company**

	Fiscal Years Ended January 31		
<i>(Amounts in millions, except per share data)</i>	2017	2016	2015
Gross Profit	\$22,154	\$25,398	\$26,812
Net Operating Revenue	35,410	41,863	44,294
<b>Gross Profit Ratio</b>	62.56%	60.67%	60.53%
Operating profit	7,501	8,626	8,728
Net Operating Revenue	35,410	41,863	44,294
<b>Operating Profit Ratio</b>	21.18%	20.61%	19.70%
Operating Profit	7,501	8,626	8,728
Employed Capital	60,702	60,738	63,067
<b>Return on Capital Employed</b>	12.36%	14.20%	13.84%
Net Income Attributable to Shareowners	1,248	6,527	7,351
Number of Ordinary Share	4,303	4,322	4,350
<b>Earnings per Share</b>	\$0.29	\$1.51	\$1.69

*Source: Data comes from Consolidated Financial Statements for Coca-Cola Company, from 2015 to 2017.*

Figure 1 Graph for Profitability Ratio from 2015 to 2017

### 3.4 Return on capital employed (ROCE)

Return on capital employed (ROCE) is a profitability ratio which detects the efficiency of a company generating profit from utilization of its capital (Lee, 2009). ROCE is an indication of how much profit that one dollar of capital employed could generate. The ROCE for Coca-Cola Company from 2015 to 2017 are shown numerically in the Table 2 and graphically in Figure 1.

From 2015 to 2017, the trend for ROCE for Coca-Cola Company increases first, but decreases rapidly to the lowest rate among the three years. The increase from 2015 to 2016 is due to the decrease of \$2,329 million in employed capital. Since there are less capital employed, the profit generated from each dollar employed increases, which means that Coca-Cola Company is more efficient in utilization of its assets. However, from 2016 to 2017, the operating profit decreases by 15%, which exceeds the decrease in the capital employed of less than 0.01%.

On the basis of the 2016 annual report and 2017 annual report of Coca-Cola Company, the capital employed is composed by total assets and total current liabilities. The main reason for the decrease in the capital employed in 2016 is the decrease of \$2,324 million in the 'Bottler's Franchise Rights with Indefinite Lives', which is caused by the decomposition of the German bottling partner in 2016. Another main factor for the decrease in capital employed is the decrease of \$2,481 million in the 'Other Investments'. Available-for-sale securities is the major factor for decrease in the 'Other Investments', this is due to the periodic recession in economy, which reduced the estimated fair value for the securities investment of Coca-Cola Company. From 2016 to 2017, the capital employed is stable, however, the operating profit decreases dramatically. The decrease in operating profit of 15% is due to the decrease in the revenue as analyzed in the operating profit ratio, which leads the ROCE to recess by 1.84%.

### 3.5 Earnings per share (EPS)

Earnings per share (EPS) identifies how much money that each ordinary share could receive from the attribution of company's profit (Lee, 2009). The EPS for Coca-Cola Company from 2015 to 2017 are shown numerically in the Table 2 and graphically in Figure 1.

From 2015 to 2017, the EPS for Coca-Cola Company decreases steadily and rapidly from \$1.69 to \$0.29. On the basis of financial statements of Coca-Cola Company, the number of ordinary share is steady with a little decrease that is too meager to make an impact. The major factor for the decrease in EPS is the decrease of \$6,103 million in 'Net Income Attributable to Shareowners' in 2017. As per the 2017 annual report of Coca-Cola company, the major reason for the decrease in the 'Net Income Attributable to Shareowners' is due to the increase in the 'Income Taxes'. In 2015, Internal Revenue Service (IRS) has sent a Statutory Notice of Deficiency to Coca-Cola Company claiming that the Company's US taxable income should be increased. In 2017, IRS created a potential federal income tax liability of approximately \$3,300 million for the period plus interest. Moreover, IRS also filed an amended answer to the Company's petition in U.S. Tax Court in which it is increased its penalties by \$523 million. As a result, the "Net Income Attributable to Shareowners" decreases rapidly in 2017, which leads to a dramatic decline in EPS.

#### **4 Conclusion**

This paper aims to evaluate the effect of cost control strategy on the profitability of Coca-Cola Company from year 2015 to 2017 and offer essential financial recommendations. The profitability of Coca-Cola Company has been strengthened from 2015 to 2017, which is done by reducing cost of sales and operating costs. The gross profit ratio indicates that Coca-Cola Company has a 2.03% increase and the operating profit ratio indicates that it has a 1.48% increase. However, both the revenue, the gross profit and the operating profit have decreased, which leads to the decrease of 1.84% in the Return on Capital Employed and \$1.4 in the Earnings per Share. In order to remain the advantage in profitability when the market is recessing and avoid any future financial crisis, there are some possible ways that Coca-Cola Company could consider. First, Coca-Cola Company should remain its cost reduction strategy by executing its backward integration strategy to reduce the material cost and the marketing costs calculation methodology to reduce its marketing costs. Second, Coca-Cola Company should insist its foreign currency fluctuation control strategy to ensure that company would be beneficial in currency fluctuations. Moreover, Coca-Cola Company should adopt the recommendations by World Health Organization to adapt its syrup ingredients in accordance with the health to restore the confidence of the customer and boost the revenue. Besides, Coca-Cola Company should reconstruct relationship with IRS in order to avoid filing more lawsuit and penalties.

From this paper, the influence of various costs on the profitability and the relationship between the effectiveness of cost control strategy and the profitability has been revealed. The theory that cost control strategy is the most efficient way to ensure the stability of profitability for a company when the market recesses and revenue declines is drawn based on the horizontal analysis and ratio analysis. This paper could be valuable for scholars to review and develop future study on the profitability analysis. Companies and organizations who seek to improve their profitability could also reference to this dissertation to find solution that is to advance its cost control strategy.

**Abstract:** Competence is responsible and recognized act of knowing, that involves mobilizing, integrating, transferring knowledge, resources, skills, that adds economic value to the organization and social value to the individual. Knowledge management is the systematic and deliberated coordination of people, technologies, processes and organizational structure of the company with the purpose of adding value through use, reuse and innovation. The relationship between the two practices increases the organization's competitiveness potential. In order to understand this relationship, this research analyzed data on the practices related to knowledge management and corporate education and management by competences of Brazilian organizations through the database of the survey 'Best Places to Work' - using a quantitative approach. The data analysis allows us to infer a positive relationship between the practices that can demonstrate a human resources area more active next to the business strategy and seeking to raise the competitiveness of the organization.

**Keywords:** Management by competence; Knowledge management; Corporate education; Organization

### 1 Introduction

Knowledge is the most precious asset of a company and their contributors. That one that know how to use and share properly in a organization reach better results in productivity, information flow and end customer service (BARNEY, 199 *apud* DUTRA, 2017).

Fleury and Fleury (2001) remember that, for long decades, prevailed Taylorist and Fordist models of work organization, based on the production line and on the task fragmentation process. Discussions about competences mobilized in Europe, mainly in France, took in account the employee delivery for the execution of a work, or a task, using their knowledge to improve not only their work capacity, but also the productivity with its knowledge, aligning theory and practical applicability, that is: the attitude of doing different and bring improvements.

For Zarifian (1999 *apud* Fleury and Fleury, 2001), competence is the practice intelligence for situations that are supported by acquired knowledge and transform they harder, how much more grows complexity. Le Boter (1995 *apud* Fleury and Fleury), presents competence as a knowledge about knowing how and the way that is recognized by the others. It implies knowing how to mobilize, integrate and transfer the knowledge, resources and abilities, in a certain professional determined context.

Eboli (2008) promotes reflection about corporate education, as a development system of person, based on competence management and presents researches that evidence the strategic role about it, in Brazil, as well as their alignment with organizational competences.

Fischer and Amorim (2010) emphasize that, although they are interconnected, knowledge management and corporate education have some different elements, such as the character of learning and the production subject process of knowledge.

As a way of searching comprehension of in what way competence management and that one of knowledge coexist in the Brazilian organizational environment, this research analyzed data of large organizations by the research 'Best companies to work' [MEPT], annually published, since 1997.

## 1.1 Objectives

This research has as its general objective identifying knowledge management practices and education, together with Brazilian organizations and verify if they are together with a competence management by competencies.

Specific objectives are:

- (1) List which companies have knowledge management practices and corporate education; and,
- (2) Identify if there is a relationship between companies that have a competence management system.

## 1.2 Justification

Understanding possible relationship between systems of competence and knowledge management, and current relevance of these practices for organizations differ in a competitive environment, postulates the importance of identifying if there is relationship between practices of knowledge management and management competence and management system, as well as how it happens, in a Brazilian context of organizations.

MEPT research is on its third decade of existence, and since 2006 works in partnership with the Program of Studies in Management of People of Administration Institute Foundation [PROGEP-FIA] and Abril Publishing Company responsible for *Você S/A* magazine publication, whose research is linked. By academic viewpoint, this scientific work looks for support studies, where data are processed products to the professional public active in human resources (FISCHER, AMORIM, FEVORINI, & SILVA 2018)

## 2 Theoretical Foundation

### 2.1. Competence management

Fleury and Fleury (2000) define competence as “know how to act responsible and recognized, that involves mobilizing, integrate and transfer knowledge, resources, skills that add economic value to the organization and social value to individual.

The debate about competence management permeates some chains. Mirabile (1997 apud Fleury and Fleury, 2001) remembers that Mc Clelland started up the debate about competence between psychologists and administrators in the USA. It, according to this author, was one of the characteristics underlying a person, casually related to the superior performance in carrying out a task, or in a given situation. It made a difference, in this way, aptness competence: natural talent of the person that may be improved, from skills, demonstration of a particular talent in practice and knowledge, what people need know to perform a task.

For Fleury and Fleury (2001), while prevailed Taylor’s and Ford’s model of work organization and business strategy definition, the concept of qualification provided the necessary reference to work the individual-organization professional relationship. Qualification is, usually, defined by requirements associated with the position, or position, or knowledge, knowledge stock of the person that can be classified and certificated by educational system.

The French debate on competence was born in the 1970s, precisely the questioning of the concept of qualification and the process of professional training, mainly technical. Unsatisfied with the gap between the needs of the world of work (mainly industry), they sought to bring education closer to the real needs of enterprises, with a view to increasing the skills of workers and their chances of employment. It was sought to establish the relationship between skills and knowledge - the know-how - in the framework of diploma and employment (FLEURY and FLEURY, 2001).

According to Dutra (2001), in the last decades, there was a change in the profile of the people required by the companies. To the obedient and disciplined profile, one prefers an autonomous and enterprising profile. The change, in the demand pattern, generated the need for an organizational culture that stimulated and supported individual initiative, creativity and the autonomous search for results for the company or business.

Le Boterf (1995 apud Fleury and Fleury, 2001) situates competence at a crossroads, with three axes formed by the person (his biography, socialization), his educational background and his professional experience.

Competence is the set of social and communicational learning nurtured upstream by learning and training and, downstream, by the evaluation system. According to Le Boterf (1995 apud Fleury and Fleury, 2001), competence is a responsible act of knowing that is recognized by others. It involves knowing how to mobilize, integrate and transfer knowledge, resources and skills in a given professional context.

### **2.3 Knowledge management and corporate education**

According to Dutra (2001), knowledge plays an important role in economic processes, and investments in intangible goods grow faster than those in physical goods. Countries, companies and people with a higher degree of knowledge are more successful, productive and recognized.

Knowledge originates from a set of experiences, information and values that allow to evaluate and to incorporate new data in a simultaneously fluid and structured way, allowing to subsidize the making of better decisions, which translate into actions more aligned to the reality of a company and of their objectives (DAVENPORT & PRUSAK, 2003).

The creation of knowledge in the organization is subjected to the context in which it is inserted, and focused on the dialectic of thought and action that opposes and integrates contrasting elements, to transcend its original contradictions and meanings, while exercising and receiving influences from the environment with which relates (Nonaka & Toyama, 2003). In companies, the information cycle and its positioning in the market means that there is the exercise and accommodation of viable information for the creation of knowledge; companies are influenced by external variables, which means that knowledge strategies are adapted and modified to their needs to exist and grow in a market.

Such organizations generate and use knowledge and therefore must manage them, although knowledge is more a process than an object (Davenport, 1998). The generation of knowledge, mentioned by Davenport, occurs in a conscious and intentional way, and not necessarily unprecedented, only new to the organization itself.

Knowledge management is defined by Dalkir (2005) as the systematic and deliberate coordination of people, technologies, processes and organizational structure of the company, with the purpose of adding value through use, reuse and innovation. Such coordination is carried out thanks to the actions of creation, sharing and application of knowledge, besides feeding from lessons learned, best practices and important elements for corporate memory, directed to continuous organizational learning.

Barroso and Gomes (1999), in their studies, directly relate the importance of knowledge management to the growth of intangible assets of companies in relation to tangible assets, and defines knowledge management as: the transformation of intangible assets into values, through analysis, development and use of processes related to such knowledge.

In research with technology companies, Kuniyoshi and Santos (2005) identified practices and management initiatives, such as:

- (1) Declared knowledge management strategies and policies;
- (2) Corporate portals; repositories of lessons learned and best practices;
- (3) Recognition and award of best practices;
- (4) Taxonomy and ontology as facilitators of content management;
- (5) Document repositories and virtual or physical corporate libraries;
- (6) Corporate education and e-learning;
- (7) Network of experts;
- (8) Innovation centers.

For Fischer and Amorim (2010), corporate education and knowledge management, as organizational innovation movements of contemporary organizations, have emerged to revolutionize the way in which organizations treat the processes of training and learning.

According to Eboli (2008), the processes of knowledge management and corporate education gain strategic character, when they come to have as reference the organizational competencies of the company. Corporate education responds to the competitiveness challenges of organizations, making the processes of behavioral, technical or theoretical qualification strongly aligned with company strategies and with the precepts of modern management.

In common with knowledge management, corporate education focuses on the organizational phenomenon, learning and the product of this: knowledge. However, there are elements that define the specificities of each system: how learning is planned and performed and who is responsible for its production and appropriation (Eboli, 2008).

### **2.3. Competence management and knowledge management**

Corporate education has played an important role in building organizational competitiveness through the development of human skills related to organizational competencies (Eboli, 2008).

In dynamic markets with dispersed resources, organizational structures must foster learning and the generation of new knowledge, to integrate the company's intangible assets and use it as a sustainable competitive advantage (Teece, 2007). Part of this knowledge must be provided by the company, using the training, the search for new knowledge in the market and adapting to the reality of the business.

According to Garvin (1993 apud Dutra, 2001), learning organizations are those able to create, acquire and transfer knowledge, as well as modify their behaviors to reflect these new insights and insights. They need to change to become competitive and, for that, they must invest in individuals who, with their knowledge, will be able to manage new forms of work and competitive models for it. Therefore, the relationship between a competency system and knowledge management becomes important, aiming at providing conditions so that employees can acquire such knowledge and, at the same time, deliver their work to improve their way of working.

For Senge (1990 apud Dutra, 2001), an organization is always expanding its capacity to create future. This ability translates into the need for flexibility and adaptability to the market where, in a globalized era, the external variables affect the internal variables of the organization, such as: human resources, machinery, equipment and product and service development areas.

According to Zarifian (1999 apud Fleury and Fleury, 2001), "competence is practical intelligence for situations that rely on acquired knowledge and transform it with more force, the more the complexity of situations increases." In this scenario, the required competencies of individuals are increasingly complex and therefore both employee and company must strategically know how to use knowledge to generate deliverables that add value to the business. Therefore, knowledge is fundamental for the creation of new competencies, that make the company modernize and be competitive in the market where it operates.

Corporate education, in turn, plays a fundamental role in breaking paradigm to seek improvements in the way it works, providing a return to the organization and its individuals.

## **3 Methodological Procedures**

A quantitative research was carried out, with data analysis of the MEPT survey for the year 2017, published by Editora Abril, which lists the companies with the best evaluations based on the proposed criteria.

Lakatos and Marconi (2010) present the definition of technique as a set of precepts or processes that serve a science or art; is the ability to use such precepts or standards, the practical part. All science uses innumerable techniques in pursuit of its purposes.

According to them, besides the specific methods of the Social Sciences, such as the approach and procedure, the qualitative and quantitative methods are also very important in scientific research.

The quantitative method is characterized mainly by the use of statistical instruments such as: percentage, mean, standard deviation, correlation coefficient, regression analysis, among others. Moreover, Lakatos and Marconi (2010) also affirm that the way of collecting and analyzing data also differ from a qualitative method:

"In the quantitative method, the researchers rely on large samples and numerical information, while in the qualitative the samples are reduced, the data are analyzed in their psychosocial and the collection instruments are not structured" (LAKATOS AND MARCONI, 2010). , P. 269).

The methodology, in general, encompasses two distinct moments: the research / data collection and the analysis / interpretation, when one tries to investigate a certain subject.

In order to make feasible the statistical analysis, dichotomous questions related to the same variable within a construct were grouped in a Likert format. The use of numerical scales from questionnaires in a quantitative approach aims to obtain analyzes that would not be immediately available through formal records or simply observation of the phenomenon to be studied (HAIR, BABIN, MONEY, & SAMOUEL, 2005).

The MEPT research database is composed of approximately 79 issues related to the theme of this article, of which 16 are related to demographic and / or identification information, while the others, to the validation and correlation between the proposed constructs.

The consultation to the MEPT database, which was accessed by the PROGEP-FIA team, returned a total of 456 respondent companies, with 33 main activities.

The authors' concern was to carry out a bibliographical survey to obtain a basis and support to the ideas explained during the text, both in the theoretical reference, as well as in the analysis of data collected by the MEPT research, seeking to satisfy the need to know, quantitatively, how the knowledge management and the corporate education collaborate to improve the competences in the analyzed companies. This provides a significant response to the importance of knowledge and the incentives provided by companies to improve their skills.

## 4 Discussion of Results

### 4.1 Characterization of companies and the role of human resources

According to MEPT data, out of a total of 456 companies surveyed, there is an average operating time of 42 years. 45% are service providers; 23.4% belongs to industry; 9.2% are from the commercial branch in general; 4.4% work with agribusiness; 3.3% belong to business and technology; 1.2% to education; 12.9% of them did not identify the branch of activity.

The data showed that the main Human Resources decisions occur in: 45%, with managers consulting the HR area; approximately 17% with the HR area, consulting managers and the same index showing HR autonomy in making decisions; 2.4% of the decisions are taken, only, by the managers. It can be inferred that, based on the data, HR is a protagonist in the decisions, or involved in it, which allows for the integration in the different areas of the organization and better dissemination of HR practices. Thus, HR is the main source of consultation of managers and, therefore, is a strategy adopted by most companies surveyed.

### 4.2 Results about competence management

Data analysis showed that 84.2% of companies adopt formal practices to define, disseminate, evaluate and internalize a competency profile for their leaders; and 15.8% reported that they did not have a defined competency profile, according to Chart 1. Of the 84.5% of them, 32.7% of the companies started to practice periodic review of the leadership profile, with the participation of managers, in up to 3 years and 67.3% revise the profile more than 3 years ago.

**Figure 1 They Adopt Formal Practices Related to Skills Assessment.**

Data is sourced from MEPT (2017) and treated statistically and interpreted by the authors.

When asked if company formally announces the leadership profile, 40,1% of organizations informed that disseminates these practices by internal communication, like on: newspapers, magazines, intranet and murals; and, 59,9% disseminates these practices on interactive activities like: meetings, lectures or formal training.

It was raised that 48.2% of companies offer training, or guidance to managers on how to disseminate the leadership profile and 30.3% of these practices started in the last 3 years. 69.7% have been guiding and training their managers for more than 3 years (table 1).

**Table 1 Percentage of Companies that Offers Training or Guidance to Disseminate Leadership Profile**

Question	Percentage
Companies that offer training or orientation to for leaders on how to disseminate the leadership profile.	48,2%
There are over 3 years	69,7%
Started in the recent 3 years	30,3%

Data source from MEPT (2017)

For 71.3% of the companies, the leadership profile is taken into account for the performance evaluation, whereas in 28.5% they included this consideration in the last 3 years and 71.5% have practiced it for more than 3 years, remembering that the profile can be elaborated by the company, through HR, in partnership with the managers, by the description of the positions of the company.

According to the survey, 89.1% of companies use tools for leadership appreciation, such as performance and competency assessment. The main source used for this is the immediate manager, and self-assessment, for 21% of companies. 10.9% of them do not use tools for this procedure. As verified, the evaluation is validated by a committee within the organization, composed of high and medium management, a fact quite common in companies in Brazil.

Finally, 96.2% stimulate the practice of feedback to employees; and 3.8% of them promote some stimulus action. In 85.5% of the analyzed, managers are formally oriented on how to provide feedback; in 71%, the managers are charged in this sense, in relation to their leaders; in 39.5%, non-managers are formally encouraged to provide feedback to their colleagues and managers. It is important to emphasize that this practice makes possible the subsidy for the employee, its performance and which way to improve or develop the skills required by the organization.

#### 4.3 Corporative education and knowledge management results

According to MEPT data, 72,3 companies that were searched adopt a consolidated formal system of corporative education. 25,8% started a practice of this system last 3 years and 74,2% have an education system for employees, contributors and leadership more than 3 years ago.

**Figure 2 Companies that Adopt the Formal System of Corporate Education.**

Data is sourced from MEPT (2017) and treated statistically and interpreted by the authors.

This result may indicate an evidence about importance given by Brazilian companies, nowadays, to knowledge management and the perception of this system, while competitive differential to them.

**Table 2 Percentage of Companies Surveyed Adopting a Formal Consolidated Corporate Education System**

Question	Percentage
Companies that adopt a formal consolidated corporate education system	72,3%
For over 3 years	74,2%
Started in the last 3 years	25,8%

Data source from MEPT (2017).

Of the companies that adopt a corporate education system: 56.4% of the practice is focused on the development of skills considered critical, for the viability of business strategies; and, 33.7% promote actions for the external public (eg society in general, customers, suppliers etc).

**Figure 3 Corporate Education and Skills Development**

Data is sourcee from MEPT (2017)and treated statistically and interpreted by the authors.

As one of the focal points of the present article, the data show that 46.8% of the companies have formal systems of management aimed at stimulating the sharing of knowledge and the exchange of experiences. 67.7% have done this for over 3 years, and 32.2% have begun to stimulate sharing in the last 3 years.

**Table 3 The Following Practices Related to Knowledge Management Were Identified**

Question	Percentage
The system is focused on the development of skills considered critical for the viability of business strategies	56,4%
Promotes actions for the external public (e g, society in general, customers, suppliers)	33,7%
There are formal systems of management aimed at stimulating the sharing of knowledge and exchange of experiences	46,8%
Managers are formally charged for the development of their subordinates	44,7%
Partnerships are established with higher education institutions, focusing only on specific positions, such as executives, trainees and professionals considered talents	7,9%
Partnerships are established with higher education institutions for all employees	42,2%

Data source from MEPT (2017).

In 44.7% of the companies analyzed, managers are formally charged for the development of their subordinates. When asked if there are partnerships with higher education institutions, 7.9% of companies have such partnerships focused on specific positions, such as executives, trainees and professionals considered as talents and 42.2% for all employees. Of which 73.5% have more than 3 years of service and 26.5%, up to 3 years.

86.6% of the companies carry out systematic evaluations of the training and development actions: 79.7% of the evaluations are aimed at verifying that the courses, programs and training have met the expectations of the participants. 37.9 establish a development plan, as assessed by training and development actions; finally, only 26.9% stated that they performed performance evaluations of the participants before and only after the training actions (table 4).

**Table 4 Systematic Evaluations of Training and Development Actions.**

Question	Percentage
Verify that the courses, programs and training met the participants' expectations	79,7%
Establishes development plan, as assessed by training and development actions	65%
Carry out performance appraisals of participants before and after training actions	26,9%

Data source from MEPT (2017).

59.5% adopt formal development practices specific to young employees: 34.9%, Young Apprentice Program; 30.6% have an Internship Program with a minimum duration of six months; 8.2%, Internship Program on vacation, or short-term; 15.3% Trainee Program; and, 11% Young Talent Program (table 5).

**Table 5 Facilitating Corporate Education and Knowledge Incentive Programs**

Question	Percentage
Specific formal development practices for young employees	59,9%
Young Apprentice Program	34,9%
Internship Program with a minimum duration of six months	30,6%
Short Term or Internship Program	8,2%
Trainee Program	15,3%
Youth Talent Program	11%

Data is sourced from MEPT (2017) and treated statistically and interpreted by the authors.

53.7% have a program to stimulate employees who are participating in long-term courses (equal or superior to six months, such as technologists, undergraduate and graduate). Of these, 44% provide data from their operations to set up case studies and other academic research; 33.7% offer flexible scheduling options to facilitate employee education; in 16.7%, employees can go through job rotations, in areas related to the study developed, to facilitate the practical application of the learning; and, 5.6%, the companies reward the employees who develop their conclusion work based on topics of interest to the company

## 5 Conclusion

When analyzing the use of knowledge management and corporate education in organizations, and its connection with the management by competences, this research identified evidence that allows to infer that there is an investment in managing its employees through a system of management by competencies, identified, especially when addressing the profile and management of leadership, as allocated in item 4.2 of the paper.

It is postulated that the use of knowledge management practices and corporate education make possible the implantation and institutionalization of organizational and individual competences. For this purpose, companies train, communicate, evaluate performance and establish practices to stimulate the development of individuals. It is also understood that companies work with proposals aimed at training, to generate knowledge and knowledge sharing.

Most companies have a formal corporate education system, providing knowledge management to improve the skills of employees, in order to guarantee the development of human capital and its competitive differential in the foreign market.

Some degree of maturity, or path, is observed for practices of knowledge management or corporate education and management by competencies, considering that, whenever questioned about the time that these practices were adopted, the majority was positioned indicating that they are previous the last 3 years.

The research provides us with elements capable of inferring that, in the majority, companies are concerned with the profile of the employees' competences and, to this end, they provide actions aimed at corporate education, as a way of generating and managing knowledge management in the organization, seeking to achieve, in this way, the organizational results are achieved, also being made possible by the sharing and dissemination of knowledge. It is possible to observe, and also, that the greater focus, when it comes to practices focused on the proficiency profile, is directed towards the leadership positions.

# **Research on Development Tendency of Chinese Automobile Industry from the Perspective of International Industrial Chain**

Gu Zhiqiang, Wang Chaoyang

School of Automotive Engineering, Wuhan University of Technology, Wuhan P.R.China 430070

(Email: gxkwhut@whut.edu.cn, 252011502@qq.com)

**Abstract:** With overcapacity of major auto producing countries and declining profit ratio, automakers are no longer able to obtain the highest profits from manufacturing. After entering the Internet Plus Era, the deepening economic globalization has promoted the globalization of automobile service industry at the core of marketing globalization, after-sales service globalization and service trade globalization. The wide application of new service trade methods such as auto finance and E-commerce has accelerated the extension of international competition from manufacturing to trade and service. From the perspective of international automobile industrial chain, the development strategy of Chinese automobile industry needs to be adjusted according to new development tendency of international automobile to formulate the strategy, which matches the consumption characteristics of automobile industry.

**Keywords:** Automobile; Industrial chain; New energy automobile; Auto finance

## **1 Introduction**

At present, due to the high oil prices and the softening of consumer confidence, sales of new cars in Europe, America and Japan have declined sharply in recent years. Driven by the environment, automobile sales shrink rapidly. In addition to the cost and market competition pressures, there are also higher requirements for the safety and comfort of automobile products from users. In addition, the society pays more attention to environmental protection. Mao Zhenhua, for example, pointed out that China urgently needed to break through the technical bottleneck of the disposal of old power batteries and find an industrial path that was both environmentally friendly and economical. It was necessary to promote the promotion of new energy vehicles in China by developing viable business models (Mao, 2016).

In recent years, Chinese automobile industry has made significant progress in terms of styling, interior, workmanship, quality stability, engine performance, and driving experience. It is narrowing the

gap with joint venture brands, especially in small and medium-sized SUV market with growing competitiveness. However, from the point of view of mastering the key technologies of vehicle produce, there is still a big gap between China and foreign countries, Technical problems are always closely related to the market. Xavier Richet and Joel Ruet put forward that China should strengthen independent innovation and not rely excessively on joint ventures to master technology (Xavier Richet and Joel Ruet, 2008). As Chinese economy enters New Normal era, automobile output and sales have shifted from high-speed to steady growth, and the industry has gradually stepped into a relatively steady developing phase with high base and low growth rate. Under the impetus of new energy vehicles, great changes have taken place in the form and pattern of China's automobile industry chain. For example, based on the analysis of the new energy automobile industry chain, Huo Guoqing and others concluded that the new energy automobile industry chain has the characteristics of integrating "new energy", "new material" and "new generation information technology" (Huo and Jiang, 2016). Since the "Twelfth Five-Year Plan" period, Chinese automobile output and sales have reached a new high of 20 million. In 2017, automobile output and sales broken world record and exceeded 28.8 million. It also has been ranked first place in the world for nine consecutive years. But the average growth rate is only about 6% during this period (Lv, 2017). It shifted from high-speed to steady growth, the whole industry has gradually stepped into a steady developing phase with high base and low growth rate. In particular, the development of new energy vehicles in China still lags far behind that of foreign new energy vehicles. Tang Baojun and Liu Jiangpeng proposed that the government and enterprises should make overall planning to promote the development of power batteries and the construction of related infrastructure. At the same time, they should actively introduce private capital to control the financial risks brought by subsidies (Tang and Liu, 2015). From the perspective of international automobile industrial chain, the development strategy of Chinese automobile industry needs to be adjusted according to new development tendency of world automobile to formulate strategy, which matches consumption characteristics of automobile industry.

## **2 The Development Tendency of World Automobile Industry**

### **2.1 The world automobile industry presents a pattern of “overall lower growth with differential development”**

The world automobile market divides into traditional automobile market and emerging automobile market. After major developed countries finishing their industrialization, automobile, a durable consumer commodity, has entered a mature period. Over past 16 years, annual growth rate of output and sales has been mostly less than 3%.

**Figure 1 Data of Global Automobile Output from 2003 to 2017**

Data Source: The International Organization of Motor Vehicle Manufacturers (OICA)

From the perspective of market, traditional automobile powers such as the United States, Japan, and Europe countries own stable sales market. While Asia has become a new growth point in global sales market, especially countries in East and Southeast Asia (including China, India, Thailand, etc.) have become emerging automobile markets. The market has gradually shifted from developed countries to developing countries, which in turn has led to the shift of vehicle manufacturing enterprises to emerging markets. Among the top 10 automobile sales countries in 2017, four "BRIC" countries are on the list with increasing concentration. The main sales markets are basically concentrated in China and the United States.

**Figure 2 2017 Automobile Sales Statistics of Major Countries (10,000)**

Emerging markets such as China, India, Brazil, Russia and South Africa will drive global automobile sales to a record high, and the industry is expected to enter a rapid growing period in next three years, with record 120 million by 2020. With maturing automotive technology and increasing per capita income and purchasing power from emerging countries, it will inevitably lead to rapid development.

## **2.2 The globalized automobile industrial chain configuration**

The emerging markets and the cost-reducing requirements for automotive R&D have led to global transfer of automotive R&D resources to emerging countries. Its manufacturing part has been shifted to low-cost countries and regions, while the shifting scope has gradually extended to high-level R&D, designing, procurement, sales and after-sales service. China is at center of international automobile manufacturing and parts shifting process because of relatively small enterprise scale and lower manufacturing export price.

Figure 3 Map of World's Major Automobile Parts Industries

Note:

**USA:** 80 primary suppliers

**Canada:** battery; auto logos; optional parts

**Spain:** rubber seal; fixator

**Sweden:** regulator

**Germany:** seat parts; clutch; rapid charger; valve system; tire/trimming strip; glass; engine control system; vehicle information display; thermal resistor; door lock/handle; auto light; semi-axis; converter

**India:** forging component

**China:** radio; display; iron casting; auto logos/garniture; automotive electronics;

**Republic of Korea:** instrument; wiring harness

**Mexico:** safety belt; AC system; mobile headrest; loudspeaker/amplifier; antenna/cable

**Brazil:** compressor; resin

In recent years, automobile parts globalization has been further accelerated, and the matching relationship between finished vehicle and parts companies has also undergone some changes. Three

typical enterprise relationship models have been formed: parallel supply system, pagoda-shape supply system, diversified supply system represented by Germany, Japan and the United States respectively. Along with changing organizational structure of automobile parts industry, automakers tend to conduct global procurement for parts and components. Three major automobile makers General Motors (GM), Ford and Chrysler have contributed more than 300 billion dollars in global procurement process.

Growing paths of world's excellent parts enterprises can be summarized as three typical categories:

(1) System integration capability-driven enterprises: Representative enterprises are Continental, Delphi, Denso, and Visteon, etc. They have two common characteristics: firstly, the wide product series with strong system integration capability, which can provide modular products in various assembly types; secondly, they are once a part of large-scale automobile enterprises and have established close cooperative relations with world-class finished vehicle enterprises.

(2) Technological innovation-driven enterprises: representative enterprises are Bosch in Germany, Magna in Canada and Behr in the United States. They usually attach great importance to continuous investment, advanced research and development, and constantly strengthen competitive advantages with professional technical ability as the core. They can lead certain professional technologies in the world and realize continuous improvement of their products.

(3) Scale output-driven enterprises: Representative enterprises are Skoito, Yazaki in Japan. They focus on development and output of a single product, support large enterprises around the world with significant scale economy and occupy an absolute leading position in professional product market.

All these three types of enterprises became trans-regional and trans-boundary ones comprehensively implementing various business strategies such as self-expansion, mergers and acquisitions, and joint development. They can be active in vibrant automobile markets areas. Based on continuous development of quality, cost, timely supply, simultaneous development, service, technology and other basic capabilities, their effective product supply ability is formed, and then established close and stable supporting partnership with downstream enterprises. Furthermore, they have cultivated a strong endogenous ability with independent research and development capabilities as the core that based on advanced R&D investment and technological progress, thus realized the continuous innovation and development of their core competence.

Price, quality and service affect global automobile parts procurement. Chinese automobile parts enterprises own great labor cost advantages as well as improved quality and service. The global procurement strategy from multinational automobile enterprises provide favorable opportunities to Chinese enterprises. With obvious cost advantages, Chinese automobile parts manufacturers are becoming important output bases and global procurement destinations for multinational automobile

enterprises (Zhu, 2017). Within a certain period, international buyers become rational and practical in procurement in China. They intend to promote procurement process through selecting and cultivating potential core suppliers, enhancing logistics integration, strengthening communication with foreign domestic factories to promoting export, scattering procurement destinations, determining destination after comparing with other emerging markets and other ways.

### **3 Specific Manifestations of Significant Development form Changes in Automobile Industry**

Assisted by big data and cloud computing, automobile manufactures promote business model innovation and value chain reconstruction, which directly connect automobile output and consumption terminal. The product itself will no longer be the main profit point, while the customization carried on the product and its behavior information will bring major profit in future automobile ecosystem. And business model and competition and cooperation relationship of the industry will be different.

#### **3.1 Profound changes in product modality and production mode**

With continuous breakthroughs in energy revolution, new materials and information technology, automobile products move forward to new energy, light weight, and intelligent networking direction. Automobiles are transforming from communication media to large mobile intelligent terminals, energy storage units, and digital space (Sun and Jiang, 2015). Crews, vehicles, cargos, operating platforms and infrastructure can achieve intelligent interconnection and data sharing. Automobile production mode has evolved into an intelligent manufacturing system with full interconnection and cooperation. The up-downstream relation is closer, the global production resources are efficiently allocated, the R&D and manufacturing efficiency is greatly improved, and customized production mode will become a tendency.

#### **3.2 Internet Plus accelerates the emergence of newly demand and business models like diversified trip**

The deep integration of Internet and automobile fully releases safe driving demand, convenient trip, mobile officing, local service and entertainment. User experience(UE) becomes a vital factor in automobile consumption. The Internet social circle plays an increasing guiding role in consumption. The diversified consumption demands are becoming more obvious. The proportion of aging and new generation users continues to increase, while shared trip and personalized service have become main direction.

By the end of 2017, Didi platform owned more than 450 million users and covered more than 400 cities in China. International automobile giant Mercedes-Benz, domestic vehicle rental enterprises such

as Eduo Auto, Ehi, etc. Finished automobile enterprises such as BAIC, SAIC, Geely and many other brands are also actively swarming into Chinese shared trip market.

### **3.3 Traditional automobile enterprises transformed from manufacturers to manufacturers plus service providers**

In a complete mature international automobile market, 50% to 70% profits are generated from service industry, and automobile service business volume in the United States has exceeded the total sales of finished automobiles. As a major global automobile market, Chinese automobile industry owns synchronized development law with international market. In the future, automobile industrial chain will gradually shift to automobile service operators, electronic equipment suppliers, software manufacturers and communication operators from manufacturers. Moreover, enterprises those with software and hardware advantages and comprehensive solution providers for smart trip will become the center of industrial chain.

Traditional automakers have started transformation. GM is focusing on create an interconnected ecosystem of people, vehicle, and society in the future and provide intelligent transportation solutions to lead a new interconnected lifestyle of smart auto society in the future. Mercedes-Benz is transforming from an automobile manufacturer to an Internet trip service provider. BMW has turned itself into a luxury trip service provider. Volkswagen has determined to develop every vehicle into a moving smartphone by 2020. SAIC Group has proposed a strategic transformation from a traditional manufacturing enterprise to integrated suppliers that provide both product and service. Dongfeng Group has positioned itself as an excellent enterprise to provide comprehensive high-quality products and services. RI-Ring Group also has started the transformation from “product manufacturer” to “system solution provider “with the principle “product orientation” to “service orientation”.

### **3.4 Profound adjustments in industrial pattern and ecological system**

Developed automobile powers have proposed industrial upgrading strategies and accelerated industrial innovation and integrated development. While developing countries are also stepping up their efforts to take advantage of costs and markets to actively, undertake international industries and capital transfers. China is deepening reform and accelerating the internationalization of automobile industry. With increasingly blurred industrial boundaries, emerging technology enterprises from Internet are entering the automobile industry. Traditional enterprises and emerging enterprises are competing and developing with each other. Value chain, supply chain and innovation chain have undergone profound changes. Global automobile industry ecology is undergoing reshaping process. IT enterprises like Google, Apple, Tesla, and BAT have actively entered the automobile industry assisted by intelligent network. Apple entered the automobile industry through Car play vehicle-mounted system and it is currently supported by more than 200 models including Chery, MG and Roewe and other Chinese self-

owned brands. Baidu established Automated Driving Division and planned to achieve mass output by 2020. Alibaba and SAIC jointly launched YunOS vehicle-mounted system.

Interconnection between automobile and other industries has brought about tremendous changes in industrial form and business model, and created new industrial power. For instance, promoting platformization and webifying automobile electronics supply chains, managing, updating and adapting automotive electronic firmware and software. Conducting business model innovations in automotive repair and maintenance, auto insurance, used car trading, car sharing and other aspects through industry-oriented big data information service and application development. The profound integration of new information technology and traditional automobile industry is triggering far-reaching industrial revolutions and cultivating new production methods, industrial forms, business models and economic growth points.

### **3.5 The rise of Chinese finished automobile brands**

From 2010 to 2017, passenger vehicle sales volume maintained steady growth by relative slow rate. The overall sales volume of Chinese domestic passenger vehicle increased slowly. Competitions from international brands, especially Germany brands like Volkswagen and American brands like GM have resulted in a decline its market share. Since 2014, market share of Chinese passenger vehicle has increased gradually from 38.4% to 42.4% in 2016 with a total volume of exceeding 10 million. SAIC-GM-Wuling(SGMW), Great Wall Automobile and Geely Automobile are top three Chinese brands while SGMW have been sold 1.8782 million. Chinese self-owned SUV accounted for 58.2% of entire SUV market, and the top three brands are also from China. On one hand, they are benefited from 50% purchase tax cut policy. On the other hand, Chinese brands have improved their competitiveness obviously.

Data Source: China Association of Automobile Manufacturers

Figure 4 Passenger Vehicle Sales in China and Proportion of Chinese Brands

### 3.6 Consumption characteristics of Chinese automobile industry

Compared with developed countries, China has relative low automobile popularizing rate. At present, 1,000-person vehicle inventory in China is about 150, while 800 in the United States, around 600 in Japan, around 550 in Europe. The average number of the world is about 200. Judging from development law of vehicle ownership in major countries, the number in China will exceed 300 in next 15 years, and by then the annual output will be 42 million. This shows that there is still huge developing space and potential purchasing power in Chinese automobile industry.

From demand perspective, China's process of build a moderately prosperous society in all aspects

covers the consumption structure upgrading. During this process, driving effect of automobile as imitative and wave-type consumption still exists, and automobile products become increasingly prominent in individualization and diversified consumption. In addition, the current situation of Chinese automobile market is: huge demand for upgrading and repurchasing in first and second-tier cities, and market potential in third and fourth-tier cities is gradually being released, which support the development of Chinese passenger vehicle market. The demand for automobile products has brought great potential to Chinese automobile market. In period to come, automobile market will still maintain a stable and rapid growing speed. It is estimated that annual output and sales volume will reach 33 million vehicles in 2020, and will reach 40 million by 2030 with large market space.

#### Market forecast of Chinese automobile industry

The data of Chinese automobile output and sales collected from 2001 to 2016 are fitted according to exponential model  $y=3e-95e0.1119x$ , and the coefficient of determination is  $R^2=0.8758$ , which indicating well-fitting degree. The index model is used to forecast output and sales of Chinese automobile industry. The specific data are shown in the table.

**Table1 Forecast of Chinese Automobile Output and Sales Volume from 2008 to 2020**

<b>Year</b>	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
										e	e	e	e
<b>Output</b>	935	1379	1826	1842	1927	2212	2372	2450	2811	2980	3122	3280	3500
<b>Sales</b>	938	1364	1806	1850	1931	2193	2349	2460	2803	2950	3118	3275	3492

## 4 Countermeasures for Chinese Automobile Industry Development Strategy

Nowadays, although global economy has recovered to some extent, the overall situation is still complicated. The future global and Chinese economic growth will be influenced by following reasons: coordinated withdrawal of fiscal and monetary policies made by major economies, sovereign debt crisis of European highly indebted countries, global financial system reform, and global emission reduction issues at post-Kyoto Protocol.

### 4.1 Chinese automobile industry entered "Silver Decade" instead of "Golden Decade"

With long industrial chain, wide coverage, and increasing up-downstream related industries,

automobile industry has become one of the pillar industries that support and promote sustained and rapid growth of Chinese national economy with increasing significance. Since 2000, Chinese automobile market has shown rapid growth with an average 25% increase from 2001 to 2010.

Data Source: Chinese Automobile Industry Yearbook (2011-2018)

China Association of Automobile Manufacturers

**Figure 5 Output and Growth Rate of Chinese Automobile from 2001 to 2018**

From 2012 to 2017, the industry-wide investment growth rate of Chinese automobile were 30.37%, 15.15%, 9.39%, 14.2%, 1.5% and 10.20% respectively. The declining growth rate indicating that simply relying on investment to expand production capacity cannot expand market share. Technical effect has become the focus of finished automobile manufacturers. Enterprises need to continuously increase R&D investment, improve product technology, master core technologies, form an innovation-driven development mechanism, and ultimately have technological advantages and enhance core competitiveness. Those who masters the core auto parts technology will be valued by the finished automobile enterprises. The parallel developing ability of parts enterprises similar to finished automobile enterprises has become the basic requirement for entering the complete supporting system. The development of automotive parts technology is drove by actively implementing finished automobile synchronous or advanced development with deeper involvement its development and production process. It can be judged that Chinese automobile industry will develop from "Made in China" to "Created in China."

Data Source: Chinese Automobile Industry Yearbook (2011-2017)

**Figure 6 Investment Growth Rate of Chinese Automobile Industry**

**4.2 New energy and intelligent networked automobile become mainstream when Chinese automobile industry face transformation and upgrading**

"Made in China 2025" initiative proposes to focus on "energy-saving and new-energy automobiles" and to master core automobile lightweight, information, and intelligent, technologies. Enhancing engineering and industrialization capabilities of core technologies such as intelligent control. Forming a complete industrial and innovation system from key components to finished automobile. In terms of new energy vehicle industrialization, the initiative puts emphasis on the lightweight research and application of chassis system. In the aspect of energy-saving vehicles, it promotes the application of lightweight materials and bodywork for aluminum alloy, magnesium alloy, high-strength steels, plastics and non-metal composite materials. While lightweight design should be realized in body work, chassis, power system and other core components. Since 2011, Ministry of Industry and Information Technology has successively issued "Several Opinions on Accelerating Integration of Informatization and Industrialization " (Ministry of Industry and Information Technology [2011] No.160) and "Notice on Special Funds Reporting for Development of Internet of Things in 2011" (Ministry of Industry and Information Technology ([2011] No.88) and other special projects. Intelligent networked automobile is one of key supporting areas, and technology roadmap of intelligent networked automobile also has been released. Notice issued by the ministry to implement the "Guidelines on Actively Advancing the

"Internet Plus" Initiative by the State Council (2015-2018)" to accelerate construction of industrial chain coordination by manufacturing enterprises such as automobiles and electronic information. The R&D system, which integrates various types of innovative resources, shall develop an Internet-based collaborative design model, and "develop Cyber Physical Systems (CPS) and apply it in key industries such as automobiles." Opinions on Automobile Industry Development in 13th Five-Year Plan" proposes to develop energy-saving and new-energy vehicles, and promote upgrading of advanced materials, key components, basic components, and high-end intelligent equipment. Automobile shall develop in direction of low-carbon, informatization and intelligent. As for development goals, it proposes to promote automobile intelligence and network connection, and to establish a foundation for the comprehensive promotion of intelligent networked vehicles.

In recent years, Chinese new energy vehicle adopted a technical route that focusing on pure electric vehicle (PEV), plug-in hybrid electric vehicle (PHEV), and observing and tracking hydrogen fuel cell vehicles(HFCV)(Li, Ren and Huang, 2017). PEV and PHEV are in hot sales. In 2017, the global sales of new energy vehicles were 1.2236 million with 58% year-on-year growth, of which 0.777 million were from China with 53% year-on-year growth (Dong, Xu and Pang, 2018).

At present, with rapid international intelligent automobile development, mainstream automobile manufacturers will master automatic driving technology within five years. In contrast, China has an obvious gap in terms of technology, infrastructure planning, related policies and test specifications.

#### **4.3 Chinese automobile parts industry is developing toward business globalization and technological innovation**

Chinese parts enterprises are faced with dual pressure of uncompetitive high-end products and increasing labor costs in low-end products. Automobile-related enterprises can effectively break industrial bottleneck to achieve rapid development by mastering technology from oversea mergers and acquisitions and upgrading its industrial chain. In recent years, encouraged by "self-developed core component" policy, increasing enterprises regard oversea bottom selling as the shortest path to obtain core technology. Especially after the global financial crisis in 2008, some Europe and America countries were shocked by economic crisis, and some vehicle parts enterprises were in financial crisis. This has provided favorable conditions for the acquisition of Chinese enterprises on a global scale. The domestic enterprises have increased overseas acquisitions through capital. They also have mastered the advanced technology and entered the international supporting market. For instance, Beijing Pacific Century (PCM) acquired Nexteer steering system of US General Motors, Weichai Power acquired French engine manufacturer Moteurs Baudouin and KION from Germany. China Aviation Industry Corporation (AVIC) acquired Henniges from the United States. China National Tire & Rubber Co., Ltd acquired Pirelli. Shenglong Group acquired more than 90% stock of BorgWarner's SLW Co., Ltd. in \$15.94

million. Beijing West Industry (BWI) acquired related business equipment, intellectual property, customers and product supply contracts of Delphi in less than \$90 million.

#### 4.4 Commercial vehicle market entered a “surplus in low-end and scarce in medium and high-end” stage

Commercial vehicle has always been the driving force behind Chinese automobile industry and market. From 1997 to 2004, domestic commercial vehicle market kept 10.5% annual growth rate, which higher than GDP growth rate. Among them, heavy truck sales grew at a rarely seen rate of 36.5%. Moreover, commercial vehicle made over 50% contribution to domestic market.

Since 2005, due to fundamental changes in overall demand structure of Chinese automobile market, automobiles became less commercial but more functional. Especially after 2010, Chinese commercial vehicle entered a mature stage as a whole. Slowing macroeconomic growth rate resulted in declining commercial vehicle sales, especially the heavy truck sales fell from 1 million in 2010 to 550,000 in 2015. Light truck and mini truck markets are relatively stable with small decline.

**Table 2 Output and Sales of Chinese Commercial Vehicle from 2010 to 2018**

Year	Output (10,000)	Annual growth rate	Sales (10,000)	Annual growth rate
2010	436.8	28.2%	430.4	29.9%
2011	393.4	-10.0%	403.3	-6.3%
2012	374.8	-4.7%	381.1	-5.5%
2013	404.2	7.6%	405.5	6.4%
2014	380.3	-5.7%	379.1	-6.5%
2015	342.4	-10.0%	345.1	-9.0%
2016	369.8	8.0%	365.1	9.0%
2017	420.9	13.8%	416.1	14.0%
2018	428.0	1.7%	437.1	5.0%

In the short-term, the increasing demand for raw materials like coal and steel, national overload-control management, the rise of logistics equipment has expanded the demand of heavy truck. While the rapid development of logistics and express delivery industry over past two years has driven the growth of medium and light trucks. Passenger vehicles sales were boosted by the rapid domestic tourism

industry development. Generally, demand for heavy truck and medium truck will increase because of supporting policies. The passenger vehicle market keeps steady growth. Passenger vehicles are still being competed by high-speed trains, and there is requirement space for new energy and urban buses (Li, Liu, Wang and Zhang, 2016).

In the long run, the growth rate of commercial vehicle is strongly correlated to macro economy. Fixed assets investment, road freight and passenger transportation are direct factors of commercial vehicle sales, and GDP growth rate has a strong positive correlation with future growth rate of commercial vehicles. The correlation coefficient can be above 0.9 between GDP growth rate and commercial vehicle growth rate in mature commercial vehicle countries such as the United States, Japan and Europe. In addition, industrial policy changes will lead to sale changes beside the macroeconomic impact.

The slowing Chinese macroeconomic growth has made it impossible for commercial vehicle sales to grow rapidly. The supply of domestic commercial vehicle continues to be “surplus in low-end and scarce in medium and high-end”.

#### **4.5 Automobile finance is accelerating the penetration into the entire automobile industrial chain**

Under the new normal of low demand growth in Chinese automobile market, competition is becoming more intense with declining profit. The sales of automobiles are transformed from sellers' market to buyers' market. Consumers become more rational when purchasing a car and they gradually become main buyers in diversified and personalized way. Secondly, marketing channel will shift from single 4S stores to 4S (3S, 2S) stores, large automobile stores and city exhibition halls. Extensive penetration of the Internet into post-automobile market will lead to major changes in business models in finished vehicle sales, second-hand vehicle trading, maintenance service, automotive parts supply, auto finance and auto service. It shifted from "product orientation" to "service orientation", "sales above service" to "service is priority", the transformation of business philosophy has enabled the dealers' revenue and profit structure to be continuously optimized. The proportion of new vehicle gross margin dropped sharply, while the gross profit proportion of post-market business such as auto finance and insurance, parts and maintenance services has increased significantly in Chinese automobile dealer's gross margin structure.

As the most valuable and energetic part of automobile industry value chain, auto finance service will greatly promote the industrial transformation and stimulate automobile consumption, and help manufacturers to occupy profit-bearing high point during transformation period. From perspective of market practice, automobile consumption loan from bank occupied dominant position in early developing stage. In recent years, with the relaxation of access and improvement of regulatory environment, auto finance companies have continuously expanded their asset scale. However, there are

still many bottlenecks in terms of policy, financing channels, scale development and marketization. Internet giants such as Alibaba and Tencent, as well as P2P lending companies stepped into auto finance, which also brought huge competitive pressures to commercial banks and auto finance companies. Meanwhile, continuous innovations from Internet enterprises in data accumulation, user experience, transaction payment will create more business models for auto finance market. Insurance companies, bonding companies, petty loan enterprises, and P2P online lending platforms all entered auto finance, and they competed for different target group markets by their respective advantages and differentiated positioning. Auto finance will become a new growth engine for Chinese automobile market and keep playing a key role in industry's structural adjustment.

Observing from current developing situation of Chinese auto finance market, it is urgent to develop innovative and efficient financial services in entire automobile industrial chain, and support refined and intensive mode transformation. Therefore, the future development direction of auto finance is supported by whole industrial chain to become a crucial method to resist traditional businesses decline and connect various service sections (Li, 2018).

## **5 Conclusion**

The paper studies the development tendency of Chinese automobile industry from the perspective of international industrial chain, and combines domestic and international automobile industry development to analyze specific manifestations of its development process. It proposes comprehensive, coordinated and sustainable development countermeasures based on unique development and opportunities of China. In the future, research shall be strengthened in strategy materialization and actualization, and then help the further development of Chinese automobile industry.

# A Research on The Innovation Performance of Agricultural Science and Technology Achievements Transformation in Sichuan

Tang Ling, Wan Guochao

School of Management, Chengdu University of Information Technology, Chengdu, P.R China, 610103

(Email: tangling@cuit.edu.cn, wgc@cuit.edu.cn)

**Abstract:** This paper is based on the innovation theory, the competence theory and the sustainable competition theory. Using the method of entropy weight method combining gray comprehensive evaluation method, the performance evaluation method of agricultural science and technology transformation and innovation was established after perfecting the evaluation index system of innovation ability of agricultural science and technology transformation. It took the major agricultural science and technology conversion projects for empirical testing, and summed up the top-ranking enterprises shared experience, ranking the coexistence of enterprises after the issue, in order to provide meaningful reference and to forecast the value of agricultural enterprises for external investors.

**Keywords:** Agricultural science and technology; Achievements transformation; Innovation performance; Entropy method; Gray comprehensive evaluation method

## 1 Introduction

Under the background of the structural reform of the agricultural supply-side, it has become a consensus to "strengthen the driving force of scientific and technological innovation and lead the development of modern agriculture". Agricultural Science and Technology Achievements Transformation has greatly promoted the agricultural science and technology innovation in China (Mao Xuefeng et al., 2012). How to evaluate the technological innovation ability undertaken by projects, those problems are attracting more and more attention from the society.

At present, the research on China's Agricultural Science and Technology Achievements Transformation funds (referred to as agricultural transformation funds) can be divided into two aspects: Theoretical research and Empirical research. Theoretical research is mainly focused on the problems faced in the implementation of agricultural transformation funds, the evaluation index system on the transformation of agricultural scientific and technological achievements and other aspects (Wright, B., 2010). Empirical research is mainly focus on the evaluation of agricultural science and technology transformation funds, for example, The results of agricultural science and technology in Chengdu were studied by fuzzy comprehensive evaluation (Xu Bin, 2011). Through the questionnaire survey of 966 subjects of different types of agricultural science and technology innovation, the performance evaluation and comparative study were carried out on their patent authorization number, ability to drive farmers, and product sales income (Wang Zhidan, 2013). Based on the systematic study of the performance of the funds for the transformation of agricultural scientific and technological achievements in China, a performance evaluation system suitable for the transformation of agricultural scientific and technological achievements in China is constructed, and the performance of the national projects for the transformation of agricultural scientific and technological achievements from 2006 to 2010 is evaluated and analyzed (Zhang Li, 2014). The comprehensive evaluation method is used to evaluate the comprehensive performance of the funds for the transformation of agricultural technological achievements in different technical fields, regions and units (Liu Xiaobing, 2015). Through the inductive analysis of the existing literatures, the research on agricultural transfer funds focuses on the evaluation

of capital performance. The evaluation of scientific and technological innovation ability of agricultural transfer funds projects is still in its infancy, and the research carried out is often focused on the regional agricultural technology transformation. The evaluation is lack of comprehensive innovation ability analysis of the main enterprises of agricultural transfer funds and the research on innovation performance is even rarer.

After perfecting the agricultural science and technology achievements transformation innovation performance evaluation index system, based on the innovation theory, core competence theory and sustainable development theory, this paper establishes the agricultural science and technology performance evaluation method by combining the Entropy method with gray comprehensive evaluation method. This paper tests the major agricultural science and technology transformation projects during the “Twelfth Five-Year Plan” period in Sichuan Province and sums up the experience shared by the top companies and the problems of the coexistence of the lower ranking enterprises to find out research conclusions and implications. This paper enriches the agricultural science and technology innovation evaluation theory and has an important reference value for government departments, agricultural investors and agricultural managers.

In the evaluation of the innovation performance of agricultural science and technology transformation projects, according to the different process of transformation of scientific and technological achievements, a dynamic monitoring index system is put forward to evaluate the effect of transformation of scientific and technological achievements(Zhao Zhiyun et al.,2011).The evaluation index system of the transformation of agricultural scientific and technological achievements is constructed from five levels: policy evaluation index, economic benefit index, social benefit index, ecological benefit index and contribution rate index of scientific and technological progress(Dai Yuankun et al.,2012).The evaluation index system of applied development, soft science and basic research is constructed from three aspects of technology, benefit and risk(Jia Jingdun et al.,2015).This paper hopes to highlight the essential characteristics of agricultural science and technology innovation activities. In order to achieve the evaluation objectives, there are five basic principles must be followed in the setting of indicators: (1) Comprehensive principle. The performance of scientific and technological innovation is a multi-level, multi-dimensional complex system, covering everything from innovation investment to business performance, stressing the comprehensiveness and systematisms of evaluation indicators; (2) Scientific principle. Indicators should be selected around the essence of innovation performance in the transformation of scientific and technological achievements. The indicator system constructed can highlight the generality and particularity of agricultural science and technology innovation activities, and can also take into account the availability of data and the comparability of indicators; (3) Operational principle. The purpose of research of innovative performance evaluation methods is application. The selected indicators must be easy to obtain reliable data and accurate quantification from enterprises; (4) Prominent principle. The indicators are selected according to the evaluation aim and evaluation content, the characteristics of the scientific and technological achievements transformation project and the internal linkage between the indicators. Besides we must ensure the originality of the innovation performance evaluation method.

## **2 Construction of Innovation Performance Evaluation Model for Agricultural Science and Technology Achievements Transformation**

### **2.1 Agricultural science and technology achievements transformation innovation performance evaluation index system**

At present, scholars have proposed different indicator systems of agricultural science and

technology innovation performance. There are two main reasons for this: on the one hand, the situation involved in the transformation of agricultural science and technology is complex and diverse, the content involved in it is very specific, and the evaluation factors affecting its innovation performance are various; on the other hand, the research objects selected by scholars are different. People considers different internal and external environmental of the research subjects, which makes the screening process for the evaluation indicators of their innovation performance produce different results. Based on the basic principles of the establishment of agricultural science and technology achievements transformation innovation performance evaluation indicators, the agricultural science and technology achievements transformation innovation performance evaluation index system constructed in this paper is shown in Table 1.(1)In the aspects of agricultural science and technology achievements transformation and innovation input capacity, continuous investment in technological innovation is the endogenous driving force for sustainable growth of enterprises, and technological innovation capability is positively related to corporate performance, however, the most important factor affecting technological innovation investment is the input level of R&D, external financing amount and R&D staff density. Among them, the input level of R&D not only measures the intensity of R&D investment but also shows the importance attached to the ability of technological innovation. Selecting the density of technicians and the quantity of high-end agricultural talents not only takes into account the human capital investment but also considers the impact on the long-term development of the quantity and quality of technical labor. The amount of external financing reflects the level of external funding support for agricultural science and technology transformation projects. The R&D investment rate reflects the intensity of R&D investment and the importance of technological innovation. (2) In the aspects of agricultural scientific and technological achievements transformation into technological innovation output capacity, we should consider both technical output and economic output. From the perspective of intangible assets and fixed assets output, we need to select the number of domestic patent grants, the number of awards at the provincial and ministerial level, the number of conversion technology achievements, the number of new technology demonstration bases, and the number of new expansion and expansion lines to present technical output. Besides, we can consider the two levels of profitability and international competitiveness to measure economic output, the former uses the gross profit margin to reflect the impact of innovation on overall profitability of agricultural science and technology achievements transformation, while the latter uses export earnings to reflect the ability of agricultural scientific and technological achievements transformation enterprises to participate in international competition.(3)In the aspects of the transformation of agricultural scientific and technological achievements into sustainable development, the theory of sustainable development believes that the ability of sustainable development of enterprises is the ability to continuously obtain competitive advantage in the market. It comes from those valuable, scarce and non-replicable heterogeneous resources(Yuan Zeming et al.,2015).The sustainable development of agricultural science and technology transformation stems from the ability of serving regional economy(Zhou Mindan et al.,2017).Therefore, we can select four indexes(Industrial cross-integration, Achievement transformation area, Cultivate agricultural professionals and Cultivate new farmers) to represent the sustainability of creating excess profits and market value by companies.

**Table 1 Agricultural Science and Technology Achievements Transformation Innovation**

**Performance Evaluation Index System**

Primary Indicators	Secondary Indicators	Indicator Definition
Innovative Input	Technician Density ( $X_{11}$ )	R&D Technicians/Total Staff Number

Capability $B_1$	Talent Introduction ( $X_{12}$ )	The number of high-end agricultural science and technology talents introduced
	External Financing Amount ( $X_{13}$ )	Financial Investment, Equity Financing, Venture Capital and Bank Loan
	R&D Investment Rate ( $X_{14}$ )	R&D Spending/Operating Income
	Domestic Patent Grant Amount ( $X_{21}$ )	Patents, Invention Patents, Identification Results, New Varieties, Software Copyrights, Industry Technical Standards
	Received Higher than Provincial and Ministerial Level Awards ( $X_{22}$ )	Number of Awards at the Provincial and Ministerial Level
	Number of Conversion Technology Achievements ( $X_{23}$ )	Number of Conversion Technology Achievements
Innovative Output Capacity $B_2$	Number of New Technology Demonstration Bases ( $X_{24}$ )	Number of New Technology Demonstration Bases
	Newly Improved and Expanded Production Lines ( $X_{25}$ )	Newly Improved and Expanded Production Lines
	Gross Profit Margin ( $X_{26}$ )	New Profits and Taxes/Operating Income
	Export and foreign exchange generation earnings ( $X_{27}$ )	Export and Foreign Exchange Generation Earnings
	Industrial cross-integration ( $X_{31}$ )	Drive the Upstream and Downstream Industries to Achieve the Number of Output values
Innovative Sustainable Development Capacity $B_3$	Achievement Transformation Area ( $X_{32}$ )	Achievement Transformation Area
	Cultivate Agricultural Professionals ( $X_{33}$ )	the number of Agricultural Professionals
	Cultivate New Farmers ( $X_{34}$ )	the number of New Farmers

## 2.2 Construction of innovation performance evaluation model for agricultural science and technology achievements transformation

(1) Entropy method. The Entropy method is a method for objectively weighting data. The main steps of using the Entropy method to determine the index weight are: ① Dateless non-dimensional processing. The indicators selected in this paper are all positive indicators (that is, the numerical values change in the same direction with its reflected content), and there is no need to change direction. However, there are different magnitudes between the index values, so the data needs to be dimensionless. In this paper, the min-max method is used for standardization:  $\text{New data} = (\text{Initial Data} - \text{Minimum Value}) / (\text{Maximum} - \text{Minimum Value})$ . The data value after Min-max standardization is between 0 and 1 (closed interval). To ensure the calculation result of the Entropy method is practical, all

the data after standardization will be moved forward by 1 unit, so that the final indicator data will be obtained between 1 and 2 (closed interval). Then, according to the formula (1), we should calculate  $P_{ij}$ , the proportion of  $j$  indicator value to the sum of all  $j$  index values, by following a sequence. ② Calculate the entropy value of the  $j$  indicator according to formula (2). ③ Calculate the coefficient of variation  $G_j$  according to formula (3). ④ Calculate the weight  $W_j$  of the  $j$  indicator according to formula (4). Among them,  $\sum_{i=1}^n W_j = 1$ . The entropy weight obtained is the weight in constructing the agricultural science and technology transformation innovation index.

$$P_{ij} = r_{ij} / \sum_{i=1}^m r_{ij} \quad (m \text{ is the number of samples}) \quad (1)$$

$$E_j = - \ln(m)^{-1} \sum_{i=1}^m P_{ij} \ln P_{ij} \quad (2)$$

$$G_j = 1 - E_j \quad (3)$$

$$W_j = G_j / \sum_{i=1}^n G_j \quad (n \text{ is the number of indicators}) \quad (4)$$

(2) Gray comprehensive evaluation method. The gray comprehensive evaluation method is a method based on gray correlation analysis to compare the pros and cons of different objects. The specific calculation steps are as follows: ① Determine the optimal indicator set. An optimal value is selected from the same index of different evaluation objects, and the optimal value of each evaluation index is composed of the optimal index set. In this paper, all of the selected indicators are positive indicators, so the maximum value of each indicator is selected as the optimal indicator set, which is recorded as  $U^* = (r_{01}, r_{02}, \dots, r_{0n})$ . ② Combine the optimal indicator set with other indicator sets to form a matrix  $Z = \begin{bmatrix} r_{0j} \\ r_{ij} \end{bmatrix}$ .  $r_{ij}$  means the standardized data of the  $j$  indicator of the  $i$  evaluation object, where,  $i = 1, 2, 3, \dots, m; j = 1, 2, 3, \dots, n$ . ③ Calculation of gray correlation coefficient and determination of evaluation matrix. After the above processing, the optimal index set and the index set of evaluation objects are respectively determined as a reference sequence and a comparison sequence. The gray correlation coefficient between the  $i$  evaluation object and the  $j$  index of the optimal index set is  $\rho_{ij} = \frac{\min_i \min_j |r_{0j} - r_{ij}| + \xi \max_i \max_j |r_{0j} - r_{ij}|}{|r_{0j} - r_{ij}| + \xi \max_i \max_j |r_{0j} - r_{ij}|}$ ,  $i = 1, 2, 3, \dots, m; j = 1, 2, 3, \dots, n$ . In the formula,  $\xi \in [0, 1]$  is the resolution coefficient, it is generally taken as the value  $\xi = 0.5$ ;  $\min_i \min_j |r_{0j} - r_{ij}|$  is the minimum difference of two-level, and  $\max_i \max_j |r_{0j} - r_{ij}|$  is maximum difference of two-level, both of them are constants. The indicator  $r_{ij}$  is closer to  $r_{0j}$  of its optimal index set,  $|r_{0j} - r_{ij}|$  is smaller, and the gray correlation coefficient  $\rho_{ij}$  is bigger, indicating that the closer the evaluation object is to the optimal index, obviously,  $\rho_{ij} \in (0, 1]$ . At last, an evaluation matrix  $R = [\rho_{ij}]_{m \times n}$  will be formed.

(3) Formation of agricultural science and technology achievements transformation innovation performance evaluation model: linear integration of weight and gray correlation degree. Through the selection of evaluation indicators and the setting of index weights, the weights are linearly integrated with the gray correlation degree. The final model of agricultural science and technology achievements transformation innovation performance is as follows:

Agricultural Science and Technology Achievements Transformation Innovation Performance Evaluation Score =  $\sum$  Innovative input capability +  $\sum$  Innovative output capacity +  $\sum$  Sustainable development capability

$\sum$  Innovative input capability =  $\sum W_j \times \rho_{ij}, j=11, 12, 13, 14;$

$$\Sigma \text{ Innovative output capacity} = \Sigma W_j \times \rho_{ij}, j=21,22,23,24,25,26,27;$$

$$\Sigma \text{ Sustainable development capability} = \Sigma W_j \times \rho_{ij}; j=31,32,33,34.$$

### 3 Empirical Analysis on the Performance Evaluation of Agricultural Science and Technology Achievements Transformation Innovation

#### 3.1 Sample selection, data source and indicator processing

According to the above-mentioned agricultural science results and technology achievements transformation innovation performance evaluation index system, a questionnaire survey was conducted by 142 major agricultural scientific and technological achievements transformation projects completed since the “12th Five-Year Plan” in Sichuan Province. The questionnaire survey involved 59 super-species of agricultural and livestock specialties, 83 special agricultural specialties involve advantages and characteristics, 142 questionnaires were all recovered, 3 invalid questionnaires were eliminated, and 139 valid questionnaires were obtained. The questionnaire covers all evaluation indicators. Of course, some indicators are calculated based on the survey data. According to the dimensionless processing method mentioned above, the data is standardized, and the final index data is between 1 and 2 (closed interval).

#### 3.2 Weight calculation

According to the calculation steps and formulas of the Entropy method introduced above, the weights of each index about the index of agricultural science and technology achievements transformation innovation performance evaluation are calculated (see Table 2).

**Table 2 Determination of the Weight of Agricultural Science and Technology Achievements**

**Transformation Innovation Performance Evaluation Index System**

Primary indicators and weights	Secondary indicators	Weights
	Technician density ( $X_{11}$ )	0.160
Innovative input capability $B_1$	Talent introduction ( $X_{12}$ )	0.058
0.333	External financing amount ( $X_{13}$ )	0.075
	R&D investment rate ( $X_{14}$ )	0.041
	Domestic patent grant amount ( $X_{21}$ )	0.112
	Received higher than provincial and ministerial level awards ( $X_{22}$ )	0.109
Innovative output capacity $B_2$	Number of conversion technology achievements ( $X_{23}$ )	0.075
0.516	Number of new technology demonstration bases ( $X_{24}$ )	0.029

Innovative sustainabilityB <sub>3</sub> 0.151	Newly improved and expanded production lines (X <sub>25</sub> )	0.086
	Gross profit margin(X <sub>26</sub> )	0.029
	Export and foreign exchange generation earnings (X <sub>27</sub> )	0.075
	Industrial cross-integration (X <sub>31</sub> )	0.038
	Achievement transformation and extension area (X <sub>32</sub> )	0.034
	Cultivate agricultural professionals (X <sub>33</sub> )	0.029
	Cultivate new farmers (X <sub>34</sub> )	0.05

### 3.3 Empirical results and conclusion analysis

Through the calculation of the grey correlation coefficient and the determination of the evaluation matrix, the scores of the agricultural enterprise scientific and technological achievements transformation innovation performance evaluation of the sample enterprises are calculated and ranked according to the comprehensive innovation performance scores (see Table 3、 Table 4).

**Table 3 Sample Enterprise Agricultural Science and Technology Transformation

Through the ranking results of the sample enterprise's comprehensive innovation performance score and the analysis of the integrated innovation input capability, innovation output capability and innovation sustainability single index in the empirical analysis process, we can find:

(1) From the results of weight calculation, the innovation output capacity has the highest weight in the agricultural science and technology achievements transformation innovation performance score, indicating that the industrialization of agricultural science and technology achievements has a prominent role in agricultural science and technology achievements transformation. According to the coefficient of variation, the 15 secondary evaluation indicators can be divided into three categories: technician density, the patent authorization amount and the number of rewards at the provincial and ministerial level, and the sum of their weights reaches 38.1%; the second is the introduction of talents, the external financing amount, the number of foreign exchange earned by exports, the number of scientific and technological achievements in conversion, and the number of newly expanded production lines have a weight of nearly 37%. The weights of other indicators are no more different, and the impact on the innovation performance of agricultural scientific and technological achievements is equivalent.

(2) The experience shared by the top companies. According to the score of comprehensive

innovation performance, this paper selects the top 20 agricultural science and technology achievements transformation projects. The correlation trend of comprehensive innovation index, innovation input index, innovation output index and innovation sustainability index are shown in Figure1.

Figure1 The top 20 agricultural Science and Technology Transformation Project

### Innovation Index Correlation Degree Trend

As it can be found from Figure 1:(1) Innovation input capacity is generally higher. The average technician density of the top 20 enterprises reached to 49%, which was significantly ahead of the average technician density of 19% of the sample enterprises, and the overall quality of the employees was generally higher. The financing constraint is a little low, the average external financing amount of the top 20 enterprises reaches 45 million yuan, which is higher than the average external financing amount of 20 million of the sample enterprises, the external financing mode is diversified, the proportion of institutional investment and personal investment is generally higher than that of bank loans, and equity financing has become the main financing mode of the top 20 enterprises.(2) Innovation output capacity is generally high and balanced. The average patent authorization of the top 20 enterprises was 9.5, which was much higher than the average patent authorization amount of 3.5 items in the sample enterprises, and the average number of awards above the provincial and ministerial levels was 0.75, which was much higher than the average number of awards above and above 0.2 in the sample enterprises, and the gross margin for sales reached 34%, higher than the average gross, The profitability is higher, which reflects on the better growth.(3) From the geometric view, around the comprehensive innovation performance curve, the innovation input, innovation output and innovation Sustainable index curve of the top 20 enterprises have high convergence, which is generally in line with the trend of the innovation ability of enterprises. Moreover, the innovative sustainable index curve and the comprehensive Innovation Index curve have a higher degree of fitting, which indicates that the sustainable development ability has obvious effect on the basic optimization of agricultural science and technology innovation.(4) The Innovation ability of agricultural science and technology is in line with the development trend of regional science and Technology Service industry. Among the top 20 enterprises, the proportion of agricultural science and Technology transformation Enterprises in Chengdu is 65%, which is closely related to the importance of the development of science and technology innovation Drive strategy to the local science and Technology service industry, as well as the formulation and implementation of related policies, which promoted the development of agricultural Science and Technology Service industry in Chengdu, followed by is Meishan, which accounted for 20% Mainly the Meishan Government attaches great importance to the development of the kimchi industry, lift the strength of the city to promote, has been the Dongpo kimchi industry into a "tens of billions" of industries.

(3) The problem of the coexistence of lower ranked companies. According to the above, this paper selects the last 20 transformation projects of agricultural science and technology achievements according to the level of comprehensive Innovation index, and the correlation trend of its innovation performance is shown in Figure 2.

**Figure 2 Trend of Innovation Index Correlation Degree of the last 20 Ranking Agricultural Science and Technology Transformation Project**

As can be found from Figure2:(1) Innovation input capacity is low, lacking of technician. The average technician density of the latter 20 enterprises is only 6.5%, the overall quality of the staff is not high, and its R &D input rate is only 2.3%, which will affect the company's innovation activities. The financing constraint is higher, the average external financing amount of the latter 20 enterprises is only 4.9 million, only one enterprise obtains the investment of the institutional investors, the external financing way is mainly the financial science and technology investment and the mortgage loan, the industrialization development needs the capital quantity is extremely tight and difficult to obtain.(2) The ability of innovation output is generally poor. The average patent authorization for the last 20 enterprises was 0.45; the average number of awards above the provincial and ministerial levels was zero; the gross margin for sales was only 13%, which was lower than the average gross margin of 19% of the sample enterprises.(3) From the geometric view, around the comprehensive innovation performance curve, the innovation input, innovation output and innovation sustainable index curve of the last 20 enterprises are more dispersed, reflecting the imbalance of innovation ability. Moreover, the innovative sustainable index curve and the comprehensive innovation index curve show a low overall operation, which indicates that the sustainable development ability is poor.(4) As for the last 20 enterprises, there is only one company in Chengdu, most of which is distributed in the region where the scientific and technological service industry developed slowly.

## 4 Conclusion

This study draws the following conclusions and inspirations:(1) The density of technicians is of great significance to the improvement of agricultural science and technology achievements transformation and innovation performance. While increasing the R&D investment, senior executives of agricultural science and technology companies should vigorously improve the quality of R&D personnel, and increase the technological innovation capability of enterprises by introducing and cultivating high-quality R&D personnel to create excess profits and value. Government departments should increase support for the introduction and cultivation of high-level talents in agricultural enterprises; conduct

targeted vocational and technical training for personnel in the agricultural science and technology service industry, improve the professional quality and ability level of agricultural technicians; optimize colleges and universities. The institute's production, study and research cooperation methods encourage colleges and universities to reserve relevant talents for the agricultural science and technology service industry. (2) In terms of the number of patents, the distribution of patents among sample companies is not balanced. Most enterprises have less patent grants and weaker innovation capabilities. In terms of patent quality, the gap between invention patents representing higher technology content is even more disparity in sample companies. The average number of invention patents in the top 20 companies is 6.5 times than the average of the last 20 companies. Therefore, agricultural enterprise executives and government departments should encourage enterprises to pursue innovation in the "high-tech" field and promote the development of innovation-driven development strategies.(3) The direction of agricultural science and technology transformation and innovation should be in line with regional advantages and characteristics of agricultural industries, and improve the maturity of transformation technology. Guided by the "Belt and Road" national strategy, we will adjust the agricultural industrial structure and improve the international competitiveness of agricultural products. At the same time, it should be guided by agricultural science and technology policies, financial funds guidance, build a multifunctional synergy mechanism, and encourage agricultural enterprises, international financial institutions and other multi-field, multi-form to participate in agricultural science and technology transformation projects.(4) External investors can understand the basic situation of the company in terms of comprehensive innovation capability, market competitiveness and development potential through the transformation of agricultural science and technology achievements into innovative performance rankings, and then judge its market valuation to provide reference for investment decisions.

**Abstract:**With the development of economy, science and technology globalization, the capacity of scientific and technological innovation in China has been enhanced. The boundary of the countries tends to dilute. It is obvious that the internationalization of science and technology innovation cooperation is very popular. The government of China adjusts the mode of international science and technology cooperation. The situation and trend of international science and technology cooperation in China are analyzed at first. And then the traditional trinity mode is analyzed. Meanwhile, the new mode of international science and technology cooperation is proposed. Finally, the conclusions and future works are summarized

**Keywords:** International science and technology cooperation; Trinity mode; Six-element mode; Cooperation mechanism;

### 1 Introduction

International cooperation is a remarkable mode of science and technology development. The science and technology involves cross-border and global cooperation among the multi-disciplinary and multi-field, and they are intersection, integration and mutual penetration. In order to promote the breakthrough of science and technology, it is necessary for scientists with different disciplines, different specialties and different cultural backgrounds to cooperate and communicate widely. Meanwhile, with the information globalization, networking and digitization, in view of this scenario of global interdependence the research methods and mode are changed which cooperate with all over the world. It provides a convenient way for the research and cooperation of science and technology.

The 21st century has been called the knowledge era, the international cooperation have been increasingly (Andrade and Carvalho, 2015), and knowledge, technology and information can easily be spread by countries (Keohane and Nye, 2001). Teemu et. al (2018) presented a novel concept of cross-border regional innovation system, which was introduced to assess the integration processes in cross-border regions. Wang and Xu (2018) believe that knowledge management ability has an indirect impact on innovation, exploratory learning ability has a significant impact on innovation, and knowledge-oriented high-level leadership can improve knowledge management ability and open innovation results (Jasimuddin and Naqshbandi, 2018). Saebi and Foss (2015) combine open innovation

strategy with core business, and propose an open business contingency model. Zynga et al. (2018) through the investigation of 756 international organizations in the world, it is found that the standardization and organizational structure of the organization are the important influencing factors of open innovation. Calof et al. (2017) put forward the idea of open innovation in the form of innovation cooperation, and considered that the prospective performance of open innovation can effectively remove the obstacles to innovation. In the process of constructing sustainable and open scientific and technological innovation, we should pay attention to the ability of innovative value creation and value acquisition (Chesbrough et al., 2018). Chen et al. (2015) provide do pinions about the challenges and potential opportunities of German-Chinese cooperation in science and technology. However, there are fewer researches about the international science and technology cooperation mode.

Reform, opening up and innovation are the three force of China's rapid economic development (Cheng and Huizingh, 2014). Science and technology opening up and cooperation is one of most important factor for China to become second largest economy in the world. The situation of international science and technology cooperation in China is analyzed in Section 2. The trinity is analyzed, and then the new mode--six-element mode is provided in Section 3. Finally, the conclusions and future works are summarized in Section 4.

## **2 The Situation of International Science and Technology Cooperation in China**

### **2.1 Three stages**

The international science and technology cooperation in China can be divided into three stages, as shown in Fig. 1. (1) Recovery of the development stage (1978-1985). Recovering the international science and technology cooperate with international organizations such as the former USSR, Eastern Europe and the United Nations. (2) Rapid development stage (1986-2000). The trinity mode (Project-Research base-Talent) of international science and technology cooperation is effective and success. The international science and technology cooperation has developed rapidly. (3) Overall development stage (since 2001). The international science and technology cooperation presents an omni-directional, multi-level and multi-way cooperation trend.

**Figure 1 Three Stages of International Science and Technology Cooperation in China**

There has a lot of successful experience about international science and technology cooperation, and achieved a great success. China has established science and technology cooperation relations with 160 countries, signed 114 intergovernmental cooperation agreements, 346 talent exchange agreements, and participated in more than 200 international organizations and multilateral mechanisms. The construction of AIIB led by China, "The Belt and Road" and other major international strategic measures, as well as the construction of free trade zone, Guangdong-Hong Kong-Macau Greater Bay Area construction and other major actions, have expanded the geographical space and institutional space for the future opening and cooperation of international science and technology. It has been formed an international competitive advantage through integrate the international technology, such as the high-speed rail technology. There are many successful examples that gather global innovative talents and technology.

## **2.2 The trend of international science and technology cooperation**

The trend of international science and technology cooperation is shown in the following.

① The science and technology of western countries are more mature than China, which are in the dominant position. The competition of science and technology is getting fierce, especially in the strategic and strategic industries

② The new trade protectionism and environmental protection are proposed in the world. Trade war is taking place between the countries. The core technology becomes an indispensable magic weapon for the competition of international comprehensive strength.

③ International open innovation has become the main form of science and technology innovation. The international innovation cooperation has evolved from the three helix to the five helix used in political science and technology.

④It is very important that aggregate the innovation elements and technological in competition and cooperation.

⑤The structure of global technology governance and governance mechanism are undergoing profound changes. The technology groups in key areas, such as android and IOS in mobile operating system, may be concurrent technology groups.

In general, the trend of science and technology is to international cooperation and scientific and technological innovation.

### 3 The Six-element Mode of International Science and Technology Cooperation in China

#### 3.1 Traditional trinity mode

According to the condition and the stage of international science and technology cooperation in China, the trinity mode was proposed, and it has achieved certain success and experience. The trinity mode is project-base-talent, which integrate the international project, research base and talent. Project includes various forms of science and technology cooperation project, as shown in Fig.2. Base includes international science and technology cooperation bases, international cooperation laboratorie sand international joint technology centers. Based on the project and base, the talent is introduced, and share with resources and mutual benefit.The trinity mode has been adopted by many local governments and achieved success.It plays to the synergy of bases, projects and talents, and the limited financial investment in science and technology has brought into benefits.

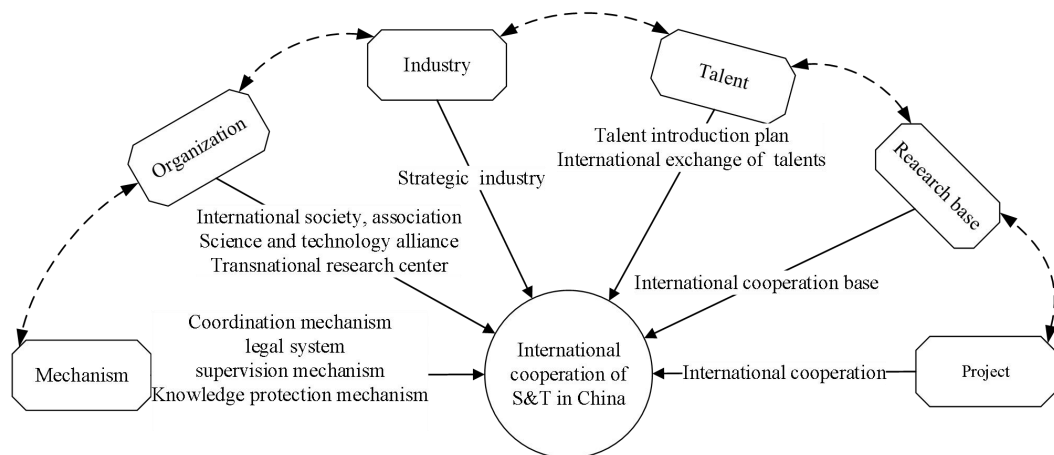

Figure 2 The Trinity Mode of International Science and Technology Cooperation in China

#### 3.2 The six-element mode

On the basis of the trinity model of project-base-talent,the six-element mode is proposed which includes project, base, talent, industry, organization and mechanism, as show in Fig.3. The six-element mode emphasizes cooperation with industries,organizations, and the advanced mechanism of science and technology cooperation. It is important to strengthen the linkage between the government, enterprises and institution, and the university-industry cooperation of universities.

**Figure 3 The Six-element Mode of International Science and Technology Cooperation in China**

About the industry, the international science and technology cooperation projects and bases supported by the state, which target key industries, especially strategic emerging industries, and should support the innovative development of key industries. In terms of the introduction of innovation elements, the talents should be introduced and emphasis on the introduction of innovation capital. We should introduce overseas public welfare science and technology funds and folk funds to China's public welfare research and basic research. Meanwhile, it is important to introduce venture capital, angel fund and private equity capital to invest in China's high-tech start-ups, which create a large number of gazelle enterprises and unicorn enterprises. Besides it, the science and technology insurance should be provided for overseas insurance companies, and suggest taking the lead in lowering the entry threshold of foreign insurance companies in the field of science and technology insurance.

About the organization, firstly, the overseas academic organizations and R&D innovation institutions are introduced. Secondly, the international societies, associations, science and technology alliances should be supported actively. Thirdly, it is a good way to encourage multinational companies to set up R&D centers or branches in China. Besides it, actively strive for Europe to set up international technology transfer stations in China, which has its own characteristics and can be connected with China's international technology transfer centers. Moreover, actively initiate, join and play a leading role in various forms of international alliances, for example, international science and technology alliance, research and development alliance, patent alliance and standard alliance and so on. Finally, it is important to join the global innovation network, or take lead in creating international innovation network in key and strength areas, and carry out in-depth cooperation and innovation by relying on it.

About the mechanism, we should actively introduce management system and operational mechanism about foreign science and technology innovation. It includes the central and local coordination mechanism, the legal system of science and technology, science and technology planning and supervisory system, promotion and protection system of the intellectual property, scientific and technical personnel evaluation system of long-term and short-term combination, scientific and technical personnel employment system of Tenure system, scientific and technical personnel salary system of annual salary system, science and technology project funds management system of contract system, academic holiday system, scientific and technical personnel flow system.

## 4 Conclusion

According to the analysis of the present situation and trend of international science and technology cooperation in China, the six-element mode was proposed based on the traditional trinity mode. The industry, organization and mechanism have been added to the six-element mode, which is more comprehensive and scientific.

However, the international science and technology cooperation of China is in the stage of overall development stage, and there are some shortcomings. In this paper, we just analyzed and studied the mode of international science and technology cooperation. The linkage of industry-university-research cooperation should be strengthening in the future.

In the further research, the introduction policy and mode of international science and technology cooperation in China be studied, and the way to learn from international cooperation. The deeply study about the industry, organization and mechanism will be researched.

# Research on the Development of Compound Fertilizer Industry Based on Patent Analysis

Liu Li

The Library of Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: lib-liuli@whut.edu.cn)

**Abstract:** Depending on Patsnap worldwide patent database and insights patent analysis platform, the development of compound fertilizer industry in China was clarified from the time and space, technology, assignee, and market value. The results showed that compound fertilizer industry increased rapidly, and mainly concentrated in the Yangtze River Economic Belt, the Pearl River and Huaihai River Basin provinces. Patents covered the formula, application, production and pack of fertilizers, but mostly focused on basic researches, lacking of core patents with uncoordinated number and quality. Enterprises became the main innovation part; whose patent applications are much higher than that of universities and institutes. Consequently, it would be considerable to promote the sustainable development of compound fertilizer industry in China, including strengthening cooperation between industrial production and scientific research, and guiding the involvement of intellectual property service agencies.

**Key words:** Patent analysis; Intellectual property; Compound fertilizer industry; Development trend

## 1 Introduction

As one of the most important forms of intellectual property, patent includes technical value, legal value and market value (Tseng et al., 2007). According to the big data mining and analyzing of patent information, the development of a certain technology or industry can be researched and tracked (Narin, 1995; Li et al., 2018). Since the middle of the 20th century, Schmookler proposed that patent information analysis could be applied to the studies of industry and related technology economy (Schmookler, 1950, 1953). Utilizing patent analysis, Sinigaglia et al (2019) mapped the development of the hydrogen fuel economy skills and Ardito et al (2018) investigated innovation dynamics of the Internet of Things domain. Additionally, the patent analysis will provide more effective and competitive information for enterprises and governments. Ribeiro and co-worker studied the patents of space debris mitigation, and noticed that the dominant spacefaring nations paid more attention to enhance the technologies of detecting and removing space debris from low Earth orbit (Ribeiro et al., 2018). Pilkington et al (2002) analyzed the assignees of the electric vehicle patents and found that car firms had formed links with competitors inside or outside the automobile industry to improve their technologies. Furthermore, promising and emerging technologies also will be monitored and forecasted through patent analysis (Kim and Bae, 2017; Joung and Kim, 2017). In summary, the comprehensive analysis of the patents in a certain field will provide suggestions and strategies for national industrial development (Li et al., 2018).

The development of the fertilizer industry is closely related to the agriculture evolution. As a new type of fertilizer industry, compound fertilizer has developed rapidly in recent years. The "No. 1 central

document" signed by the CPC Central Committee in 2007 and "Outline of the National Program for Long- and Medium-Term Scientific and Technological Development (2006-2020)" clearly pointed out that it was essential to accelerate the development of related technologies in the compound fertilizer industry and promote the structural adjustment of the fertilizer industry. Previous studies have analyzed the problems encountered by the compound fertilizer industry in China and put forward relevant countermeasures from the development status view (Zang et al., 2017; Chen and Wang, 2018). Based on the perspective of market economy, Xu showed that the transformation of commodity price, income growth rate of main operation margins, and market share of domestic high-end compound fertilizer (Xu, 2017). Moreover, the main production methods of compound fertilizer and its applications have been studied (Chen, 2000; Zhang, 2014). However, none of the above studies has studied the compound fertilizer industry from the perspective of patent information analysis. Patent is the combination of technology, law and market value, which is of great significance for the research and analysis of the industry development. Therefore, this paper takes the compound fertilizer industry as the research object, and analyzes its patent information to understand the development trends and research hotspots, to provide information support and reference for the development of China's compound fertilizer industry.

## **2 Data and Methodology**

The data were collected from the Patsnap worldwide patent database, covering more than 130 million pieces of patents information from 116 countries and providing accurate, multi-dimensional, visual intelligence in relation to patent, research and development. The patent retrieval was conducted on December 3, 2018. Key retrieval words included nitro\* and phosph\*, nitro\* and potas\*, phosph\* and potas\*, blend\*, formula, compound, mix\*, and fertilizer, and all the valid or reviewed patents were retrieved. After data deduplication and manual screening by experts of compound fertilizer field, 13,578 domestic patents were detected. Due to the time lag from application to publication, the patents in 2017 and 2018 are referenced only. The statistics mainly relied on the statistical analysis functions of Insights platform such as patent landscape and text clustering, and it made use of Excel, origin, and R Studio software to complete the data analysis and draw.

## **3 Results**

### **3.1 Time and space level**

#### **3.1.1 Development trend**

Since 1950s, blended fertilizers began to emerge in the international market, and various compound fertilizer production processes were born, opening the prelude of the compound fertilizer industry (Chen and Wang, 2018). From the Chinese patent applications of compound fertilizer (Figure 1), it revealed that the domestic patent application firstly appeared in 1999, and it developed slowly from 1999 to 2003, during which the average annual patent application was only 8 pieces per year. Starting from 2004, the patent applications had increased, with the average annual application of 80. With the development and promotion of soil testing and formula fertilization technology, the compound fertilizer industry had developed rapidly and patent applications quick increased from 2010 to 2014 at five times during the five years. The explosive growth started from 2015, and the patent applications reached 3,459 in 2016 that maintained an annual growth rate of about 150%. It is similar as the patents application of mixture fertilizer described in the previous study (Xiang, 2016). As mentioned in Chen and Wang (2018), this explosive growth is mainly due to the government's protection of intellectual property rights, the support

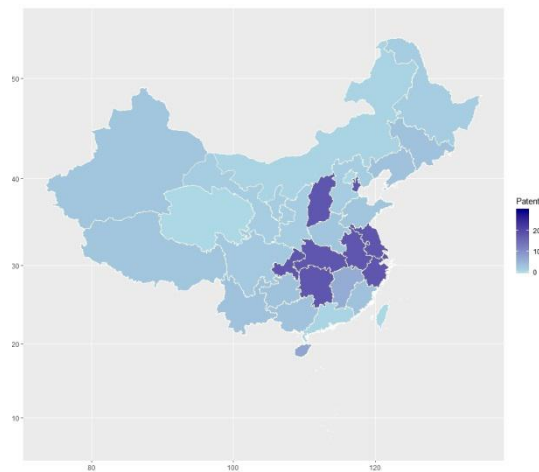

of national policies, the deepening supply-side reforms of agriculture and the structural adjustment of fertilizer industry.

**Figure 1** Development of the Patents of Compound Fertilizer Industry in China

### 3.1.2 Patent area distribution

Figure 2 shows the dominant provinces of the patent applicants of compound fertilizers. Applicants of patent in the compound fertilizer industry come from different regions and provinces, and they are mainly distributed in the Yangtze River Economic Belt and the Pearl River Basin, which accounts for 66.7% of the total domestic patent applications. Anhui and Guangxi Province rank the first and third place in patent application of compound fertilizer with nearly 3,000 and 1,400 patents respectively. In addition, the advantage of Shandong Province in the Huaihai River Basin is also obvious, which applies 1,814 applications and ranks second in all provinces. Patent applications of the northwestern provinces are relatively rare, that the total amount of Gansu, Xinjiang, Inner Mongolia, Ningxia and Qinghai provinces is only 397, which is lower than the national average of 435 pieces.

**Figure 2** Distributions of Patents of Compound Fertilizer in China

From the time and space level, the compound fertilizer industry in China started late, however, it has

dramatically developed in recent years with the national incentive and support. China has become one of the leading countries in the compound fertilizer industry. Nonetheless, regional differences in the development of compound fertilizer industry are serious, and it may relate to the regional agriculture environment and the provincial economic strength.

### 3.2 Technical level

#### 3.2.1 IPC classification

IPC is currently the only universal patent document classification tool in the world. The IPC group with a large number of patents is usually an active area for technology research and development (Liu et al., 2018). It can be seen from Figure 3 that the domestic compound fertilizer industry technology is mainly distributed in eight IPC sub-class, such as C05G (mixtures of fertilizers), C05F (organic fertilizers), and A01C (planting; sowing; fertilizing), accounting for more than 90%. Under C05G sub-class, C05G3 (mixtures of one or more fertilizers with materials not having a specifically fertilizing activity) is the most concentrated group, and C05G1 (mixtures of fertilizers covered individually by different sub-classes of class C05) is the second largest group, consistent with Xiang's research (Xiang, 2016). The C05F17 (preparation of fertilizers characterized by the composting step) is the most concentrated group in C05F sub class. Since C05C (nitrogenous fertilizers) and C05B (phosphatic fertilizers) are involved in the composition of compound fertilizers, there are a certain amount of applications. Additionally, some patents covered specific application of formula compound fertilizers, such as A01C (planting; sowing; fertilizing) sub class and A01G (horticulture; cultivation of vegetables, flowers, rice, fruit, vines, hops, or seaweed; forestry; watering) sub class.

Figure 3 Main IPC of Compound Fertilizer Industry in China

#### 3.2.2 Technology topic

Using the Lingo3G text document-clustering algorithm, the most common keywords in the latest 10,000 patents of compound fertilizer field were extracted in the Insights patent analysis system, displaying the hotspots in the field. The most common 20 keywords of compound fertilizer industry are illustrated in Figure 4. There are four keywords with ultra-high frequency including phosphate amount, compound fertilizer, special fertilizer and potassium dihydrogen phosphate, which were included in more than 2000 patents. Organic matter, weight fraction, lower cost, slow release fertilizer, composite fertilizer and NPK fertilizer are also high frequency keywords that are contained in more than 450 patents. Patents containing other keywords are less than 200 pieces. Further analyzing these keywords, it could be found that phosphate amount, potassium dihydrogen phosphate, and NPK fertilizer are related to the basic composition of compound fertilizer; organic matter and composting fermentation are

inorganic-organic blending fertilizer technology; fixed connection, feeding port, dryer, and mixing tank are related to the mechanical equipment technology of compound fertilizer production.

**Figure 4 Technology Topics of Compound Fertilizer Industry in China**

Combined analysis of IPC classification and technology topic, the patents of Chinese compound fertilizer industry involve various aspects such as formulation, use, production and packaging of fertilizers. However, most of them are simple and centralized; mainly focusing on basic researches such as the fertilizer ratio of different nutrient and the improvement of formula ingredients, the research and development of industry-related technologies is still in its infancy.

### 3.3 Assignee level

The patent assignee is the owner of the patent right including law and use when the patent application is approved. From the perspective of structural composition, the assignee of Chinese compound fertilizer industry is mainly composed of enterprises, individuals and scientific research institutions. Patents of enterprises are significantly higher than that of individuals and scientific research institutions, accounting for 72%. In the top ten ranks of patent assignees of the compound fertilizer industry (Table 1), nine assignees are enterprises, and only one is research institution, namely the Guizhou University, but it ranks first with 211 patents, which are nearly 50 patents more than the Shenzhen Bartian Ecology Engineering Company as the second largest patent applicant.

Overall, the enterprises have become the most important part of technology development and promotion in the compound fertilizer industry with strong consciousness of intellectual property rights. Scientific research institutions have strong scientific research strength, but most of them have insufficient awareness of intellectual property protection and weak willingness of achievement transformation. It indirectly reflects that the cooperation between enterprises and research institutions is not close enough and further exploration and utilization should be developed.

**Table 1 Top 10 Innovation Assignees of Compound Fertilizer Industry in China**

Assignee	No. of patent	Main IPC
GUIZHOU UNIV	211	C05G3; C05G1; C05F17; A01C21; C05G5
SHENZHEN BATIAN ECOTYPIC ENG	165	C05G3; C05G1; A01C21; C05G5
GUIZHOU KAILIN GRP CO LTD	130	C05G3; C05G1; C05F17
GUIZHOU KEXIN CHEMICAL CO LTD	123	C05G3; C05G1; A01C21

KINGENTA ECOLOGICAL ENG GRP	119	C05G3; C05G1; A01C21; C05G5
ANHUI SIERTE FERTILIZER IND	114	C05G3; C05G1; C05F17; A01C21; C05G5
QINGDAO HAIYICHENG MANAGEMENT TECH CO LTD	105	C05G3; C05G1
STANLEY AGRI GRP CO LTD	95	C05G3; C05G1; C05F17; A01C21; C05G5
DENGFENG LAOSHUAN FER CO LTD	82	C05G3; C05G1; A01C21
MAANSHAN KEBANG ECOLOGICAL FER CO LTD	71	C05G3; C05G1; C05F17; C05G5

### 3.4 Market value level

Patent market value analysis is one of the core functions of Patsnap, which analyses simple patent families using a set of 25 objective value indicators (e.g. forward- and backward-citations, patent family sizes, geographical coverage, patent age, legal status etc.) and visually reflects the market value of patents in the form of currency valuation (excluding design patents). Comparing with different values, it is possible to better evaluate the strength distribution of patents and help to judge the research and development focus in the technical field. Generally, the higher of patent market value, the stronger of core technology. As described in Figure 5, there are only five core patents with a patent market value higher than 2.5 million dollars, accounting for about 0.04%. In contrast, the market value of 9224 patents are less than 25,000 dollars accounting for 77.7%.

**Figure 5 Market Value Distributions of Patents of Compound Fertilizer in China**

Further analyzing the 10 highest currency valuation patents of the compound fertilizer industry (Table 2), it is found that the top ten patents owners are foreign companies, that 5 of them come from US companies, and the others are averagely distributed in Germany, Canada, Japan, the Netherlands and Israel companies. In addition to their own research capabilities, US companies have precise investment vision and improve their competitive strength by purchasing other core technologies such as CN101687720B, CN102781880B and CN100434399C. From the technical view, the top ten patents' skills are mainly concentrated in C05G and C05C, consisting with the main IPC structure of the compound fertilizer industry. In particular, the IPC classification of the highest valuation patent is C02F,

and it involves the conversion of organic sludge into inorganic-organic compound fertilizer technology, which belongs to the cross filed of wastewater treatment and compound fertilizer preparation. Moreover, CN102369171B applied by Japanese company is also a technological research in the cross-disciplinary field that mixed pesticides and chemical fertilizers.

As stated previously, there are large amounts of general patents, but lacking core patents and mismatching between the number and quality of patents would restrict the development of compound fertilizer industry in China. Nowadays, the core technology of the compound fertilizer industry is still in the hands of European and American countries, and these companies are sensitive to the market by paying great attention to the global layout. It is worth noting that cross-field research is one of new directions in compound fertilizers industry, which has higher technical requirements and greater market values.

**Table 2 Top 10 Market-valued Patents of Compound Fertilizer Industry in China**

Patent	Current assignee	Country	Value (USD)
CN101687720B	ANUVIA PLANT NUTRIENTS CORPORATION	USA	\$3,420,000
CN101945837B	FERTIVA	GERMANY	\$3,020,000
CN101287688B	ARCHER DANIELS MIDLAND	USA	\$2,800,000
CN102781880B	ANUVIA PLANT NUTRIENTS CORPORATION	USA	\$2,620,000
CN104271535B	UNITY FERTILIZER	USA	\$2,570,000
CN103547550B	SULVARIS INC	CANADA	\$2,300,000
CN102369171B	KUMIAI-CHEM IND	JAPAN	\$2,220,000
CN102300835B	ROYAL DUTCH SHELL	NETHERLANDS	\$2,130,000
CN100434399C	MOSAIC CORP.	USA	\$2,030,000
CN101400627B	ROTEM AMFERT NEGEV LTD	ISRAEL	\$1,740,000

### 3.5 Limitation

Compared with Chen and Wang's research, Kingenta, Xinyangfeng and Stanley were the top three companies of market share in the Chinese compound fertilizer industry (Chen and Wang, 2018); however, the patent applications of these three companies were less. Kingenta and Stanley were ranked in the fifth and eighth, respectively, and Xinyangfeng was not in the top ten. This inconsistency between market share and patent application is not analyzed in the research due to lacking of market data, but the further analysis will provide more comprehensive information to promote the development of compound fertilizer industry. Besides bibliometric patent analysis, patent portfolio has become one of the new approaches for distinguishing and measuring the core skills and market competitiveness of patentee. Therefore, the patent portfolio of entire compound fertilizer industry could be studied further to help Chinese enterprises to compete and control overseas market.

## 4 Conclusions

According to the analysis of the relevant patents related to the domestic compound fertilizer industry, it shows that the compound fertilizer industry has entered a rapid development stage in China with the implementation of the national fertilizer industry strategy. Until December 2018, the number of patents has reached more than 13,000. Domestic enterprises, scientific research institutions and individuals at the Yangtze River Economic Belt, Pearl River and Huai River Basin have invested a large amount of capital and human resources in the research and development of compound fertilizer industry technology. The prospect of compound fertilizer industry is increasingly promising. From technical view, it involves various aspects such as formulation, use, production and packaging of fertilizers.

However, most of them focus on basic research such as the ratio of different nutrient, which is simple and easy to be copied. From the perspective of the assignee, the enterprise is the main innovation body of the compound fertilizer industry, who plays an important role in the technology development and promotion of the industry. Although the scientific research institution has strong scientific research strength, it always neglects the protection of intellectual property rights and the transfer of the technology. From the perspective of market value, there are large amounts of patents in China, nonetheless, it lacks key patents and the number and quality of patents are obviously uncoordinated. The top ten patents with the highest valuation of compound fertilizer industry belong to the foreign companies and the cross technologies between compound fertilizer industry and other fields will have greater market value.

Therefore, the following suggestions are proposed for the patent technology innovation activities of Chinese compound fertilizer industry:

(1) Deepen the supply-side reform, formulate an industrial strategy conformed to current development needs, and lead the healthy and sustainable development of China's compound fertilizer industry;

(2) Further promote the cooperation of industry, university and research institutes, give full play to the research and development advantages of scientific research institutions and the market sensitivity of enterprises, and improve the innovation ability of the compound fertilizer industry;

(3) Emphasize cultivating compound and innovative talents, increase the research and development of core technologies, explore cross-development with other fields, strengthen patent layout, and enhance international competitiveness;

(4) Guide the involvement of intellectual property service agencies, improve intellectual property and legal awareness, enhance intellectual property protection and risk control capabilities, strengthen analysis of industrial situation and market demand, and provide information support for technological innovation of the compound fertilizer industry.

# Research on the Improvement of Mental Health Education Ability of College Counselors Based on Knowledge Management Process

Zhu Xi

College of Automotive Engineering, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 1192282575@qq.com)

**Abstract:** In recent years, the mental health problems of college students in China have become increasingly serious, which has brought severe challenges to the educational management of colleges and universities. College counselors are the major managers of college students in school, and also the main participants in solving the psychological problems of college students. Therefore, it is necessary to improve counselors' ability in mental health education to cope with various psychological problems of college students. By adopting the methods of investigation, comparative study, literature study and qualitative analysis, this paper analyses the reasons for the insufficiency of mental health education ability(MHEA) of college counselors at present, studies the concept and process of knowledge management(KM), the concept and composition of MHEA of college counselors, and holds that knowledge is the core resource of MHEA of college counselors, and KM theory can be applied to the research of improving counselors' ability of mental health education. Based on the process of KM, the model of improving MHEA is built up. In accordance with the key points of knowledge acquisition, knowledge storage, knowledge sharing and knowledge innovation, countermeasures such as combining professional training with self-learning, knowledge platform construction with mental health archives construction, learning organization construction with multichannel communication, and the integration of incentive mechanism construction with practice and innovation are proposed. This paper provides a new research perspective and ideas for the improvement of college counselors' ability in mental health education, and enriches the research theory, which has a strong practical guiding significance for improving counselors' ability in mental health education and effectively solving the psychological problems of college students.

**Key words:** Knowledge management; Process; Colleges and universities; Counselors; Mental health education ability

## 1 Introduction

In recent years, the mental health status of college students does not look optimistic. Based on the existing research, the number of college students with psychological problems is increasing, which

brings serious challenges to the work of college education (Yu Guoliang, 2018). As an important supplementary force of mental health education in colleges and universities, counselors need to talk with students with mental distress and psychological crisis on a regular basis and offer psychological counseling and guidance. Meanwhile, they should pay close attention to students with serious psychological problems and intervene in time in order to prevent the occurrence of major mental crisis events among students. The role and orientation of counselors in guiding students determines that counselors must have good ability in mental health education.

However, it is a complicated job to carry out mental health education among college students, which requires professional knowledge and skills in psychology, pedagogy and sociology. Many counselors do not have relevant professional backgrounds, resulting in their lack of knowledge reserve. Meanwhile, most counselors are fresh graduates and postgraduates, who are insufficient in the ability and experience to find and solve problems. Worse still, since the daily work is very trivial, complex, they just cannot concentrate their energy on their work, and sometimes they even have no time to take into account the work of mental health education, which eventually leads to the failure of counselors to carry out mental health education in a timely and effective manner on many occasions. Therefore, it is necessary to improve counselors' ability in mental health education.

Knowledge management (KM) is an important management theory in the era of knowledge economy. As a typical knowledge-intensive organization, colleges and universities have the basic conditions and abundant foundation for KM. This paper tries to study the improvement of college counselors' mental health ability from the perspective of KM process, and puts forward corresponding countermeasures and suggestions. The existing research findings mainly apply KM theory to the research of counselors' team building. The research contents mostly concentrate on the team building, specialization, knowledge sharing, management of college counselors and the construction of professional competence evaluation model based on KM. However, from the perspective of KM process, the research on the improvement of counselors' ability in mental health education is scarce, and the research perspective and ideas are relatively novel, which has great theoretical and practical research value.

The modern campus mental health education originated in the United States and developed first in Britain, France and other countries, but the trend of localization in practice development is obvious (Pan Xin, 2017). Counselors are the byproduct of our country's unique education model system and an important part of our country's education system. Therefore, there are few studies abroad on the improvement of mental health education ability (MHEA) of college counselors in China based on KM process.

In China, some scholars have carried out research on the improvement of counselors' ability in

mental health education, which mainly focuses on the content analysis, factor analysis, path, measures and strategies of the improvement of college counselors' ability in mental health education. For example, Sun Yuan thinks that colleges and universities should adopt such strategies as school support and counselors' self-improvement to enhance counselors' ability in mental health education (Sun Yuan, 2012); Xue Jihong thinks that colleges and universities should build a scientific training system to improve counselors' ability in mental health education (Xue Jihong, 2009); Luo Pinchao believes that college counselors should constantly improve their core competence of mental health education by strengthening the study of psychological knowledge, participating in the practice of mental health education, setting up an online learning platform, and holding psychological salons on a regular basis, so as to meet the needs of the development of higher education (Luo Pinchao, 2008).

There are also scholars who apply KM theory to the study of counselors' team building. Their research mainly focuses on the team building, specialization, knowledge sharing, management of college counselors and construction of professional competence evaluation model based on KM. For example, Zhu Jianfei believes that to apply KM theory into practice in the construction of college counselors, it is necessary to pay attention to the top-level design, establish relevant organizations and technical platforms, build exclusive and efficient "knowledge base" and actively promote the sharing and dissemination of tacit knowledge in counselors' work field (Zhu Jianfei, 2017); Yu Jiangtao and Liu Shiyong believe that counselors should carry out KM from the aspects of strengthening the study and accumulation of knowledge on student affairs, dissemination and sharing, development and application, innovation and regeneration, etc. (Yu Jiangtao, Liu Shiyong, 2013).

At present, the research on improving counselors' ability in mental health education from the perspective of KM process is relatively scarce in China, but the existing research results still open up ideas for this study and provide experience for reference.

## **2 The Concept and Process of KM**

Knowledge is the subjective reflection of human beings, which can be divided into explicit knowledge and tacit knowledge based on its level of expression (Yan Yun, 2005). To enhance the adaptability and competitiveness of organizations and individuals, people urgently need to convert tacit knowledge into explicit knowledge, which is the key to KM (Zhu Jianfei, 2017).

KM was first put forward at the end of the 20th century. So far, there has been no unified expression of its concept. Bassi (Bassi, 1997) believes that KM is the process of creating and acquiring knowledge to enhance the performance of an organization. K. Wiig (K. Wiig, 1997) holds that KM mainly involves four aspects: top-down monitoring and promoting knowledge-related activities; creating

and maintaining knowledge infrastructure; renewing organization and transforming knowledge assets; and utilizing knowledge to improve its value(Chen Wei, 2014). The definition of KM in China mainly has the following two perspectives: first, the narrow and broad concept of KM put forward by Professor Qiu Junping. Second, Professor Zuo Meiyun proposed the division of KM definitions into the technical school, the behavioral school and the comprehensive school(Chen Wei, 2014). Although the expression of the aforementioned concepts is inconsistent, their connotations are the same. KM is a management concept that regards knowledge as an important resource and people as the core. It relies on information and network technology to collect, process, organize, sort out and disseminate knowledge, which gives full play to people's creativity, improving the accumulated value-added knowledge of individuals and organizations, so as to obtain better adaptability and competitiveness.

In terms of the division of KM process, many different methods have been proposed. Huang Yunjie and Liu Dongrong divide KM into knowledge acquisition, knowledge transfer, knowledge sharing and knowledge application based on process management(Huang Yunjie, Liu Dongrong,2010); Tian Shuo and others thought that KM can be divided into four dimensions: knowledge acquisition, sharing, use and creation, when they were doing research on KM analysis framework, which was based on the process perspective(Tian Shuo,2010). Chen Hongmei and others divided KM into four basic processes: acquisition and creation of knowledge, organization and storage of knowledge, transmission and sharing of knowledge, application and innovation of knowledge when they studied the design of training mode for business management professionals based on KM process(Chen Hongmei,2015).In view of the previous research findings and the needs of social development under the new situation, this paper attempts to divide the process of KM into four basic processes: knowledge acquisition, knowledge storage, knowledge sharing and knowledge innovation.

### **3 Definition and Composition of MHEA of Counselors**

So far, the academia has not put forward a relatively complete and unified concept of MHEA. For the time being, most scholars tend to think that MHEA is mainly that educators use the psychological knowledge and skills acquired according to the characteristics of educational objects to help them improve their mental quality, promote their mental health level, develop their psychological potential, cultivate their good psychological ability, which bestows them with the ability of overall development of personality and comprehensive quality(Pan Xin, 2017).

The role orientation of college counselors and full-time psychological teachers in mental health education is different. The role orientation of counselors is the demonstrator and nurturer of mental health(Hui Xiao,2017), the defender, discoverer, counselor, referral and tracker of mental problems. However, the orientation of full-time psychological teachers is the consultant and the therapist. The

breadth and depth of their orientation are different, so their requirements of MHEA are also different.

Through literature research and survey, combined with the orientation of counselors' mental health work and actual needs of work, the composition of counselors' MHEA is analyzed as follows:

First, it is necessary to get the hang of the basic knowledge of psychology. Dealing with psychological problems is a complex task. Counselors participating in mental health education should master basic psychological knowledge, such as general psychology, developmental psychology, personality psychology, mental health counseling, adolescent psychology and social psychology, etc.(Gu Yanqun,2017). Meanwhile, counselors should also be proficient in various skills of mental health education and apply the knowledge they have learned to practical mental health education.

Secondly, the ability of finding psychological problems of college students should be cultivated. Psychological problems often have a greater impact on college students' daily learning and life. Counselors should be good at observing students' interests, learning situation, behavior, emotions and feelings. Students with abnormal situations should be measured and analyzed by psychological methods, and counselors are supposed to communicate with students to understand the actual psychological situation of students for further confirmation.

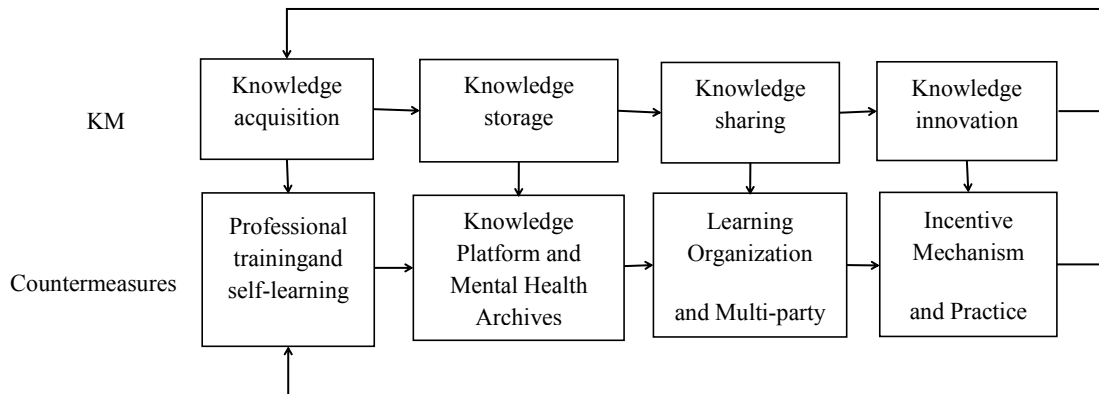

Thirdly, the evaluation ability of college students' psychological problems should be mastered. Counselors should integrate and analyze the psychological information of college students based on psychological knowledge they have learned, identify the types of psychological problems of college students, and evaluate the severity of psychological problems.

Fourth, the ability to solve psychological problems of college students should be acquired. If the psychological problems of college students are general psychological distress, counselors can actively intervene in them and apply the knowledge and skills of mental health education to solving the students' psychological confusion, offering guidance on the students' psychological mood and eliminate the psychological problems in the embryonic stage. If it is more serious mental illness and psychological crisis, counselors should provide timely referral to full-time psychological counseling teachers to cope with.

From the aforementioned analysis of the concept and composition of counselors' MHEA, counselors' MHEA is an ability, which is centered on counselors' knowledge and skills. The cultivation and improvement of counselors' MHEA cannot be separated from the development of knowledge resources, which is fully in conformity with the concept of KM. Therefore, the concept that KM is introduced into the research on the enhancement of counselors' MHEA is not only rational but also completely feasible.

#### 4 Strategies Based on KM Process to Improve MHEA of Counselors

The improvement of counselors' ability of mental health depends not only on the efforts of counselors themselves, but also on the corresponding measures taken by universities to provide better conditions for counselors. With the KM process as the key line, colleges & universities and counselors can be well integrated, with the two parties complementing each other.

Aiming at improving counselors' ability in mental health education, this paper puts forward four countermeasures in accordance with the focus of work during the four stages of KM process, and builds up a model of improving college counselors' MHEA based on KM process (Fig.1). Through the implementation of this model, the dynamic improvement of counselors' MHEA can be realized.

**Figure 1 Improvement Model of MHEA for Counselors Based on KM Process**

##### 4.1 Professional training and self-learning based on knowledge acquisition

Knowledge acquisition is the first stage of KM, the foundation of KM, and the basis of professional competence enhancement. Therefore, the key task at this stage is to enable counselors to acquire knowledge.

Colleges and universities should strengthen the training of counselors, institutionalize, and standardize it. Training is an important way to improve college counselors' MHEA. Colleges and universities should regularly organize counselors to participate in professional and systematic training, hire professors and experts in psychology to circulate their experience and skills, and systematically improve counselors' mental health education knowledge and skills.

Counselors themselves should also strengthen their self-learning. First of all, counselors should make clear their role in higher education through learning, and constantly strengthen their awareness of mental health education. Secondly, they should constantly expand their knowledge reserve. College

students' psychological problems are often comprehensive problems, which require counselors to strengthen the accumulation of knowledge in psychology, general psychology, personality psychology, mental health counseling, adolescent psychology, social psychology, etc. Thirdly, counselors should actively take the initiative in learning. College students have many kinds of psychological problems, so counselors should actively learn through the Internet, training courses online, professional papers, professional books and other ways to solve the problems in an effective manner in view of their own situation and the actual problems they encounter. Finally, counselors themselves should also strengthen the improvement of self-psychological quality and self-psychological adjustment ability in order to deal with various emergencies in psychological education more calmly and efficiently. Meanwhile, counselors also need to shape a good image of being good at solving problems, caring for students and being positive in the hearts of students, so as to set an example for college students' mental health, and stimulate students' enthusiasm and expectation for a better life.

#### **4.2 Knowledge platform of mental health education and construction of mental health archives based on knowledge storage**

Knowledge storage is the second stage of KM, in which explicit knowledge and tacit knowledge can be analyzed and systematized, and knowledge can be saved, retrieved and reused by establishing a database. Therefore, the main task of this stage is to establish a series of data resources that are beneficial to mental health education.

Colleges and universities should establish a knowledge platform for mental health education. Counselors can use the prediction function of big data to predict students' potential crisis psychology and behavior by analyzing the changes of students' relevant data, and effectively identify students with psychological crisis. Furthermore, the knowledge platform of mental health education should have a knowledge base of mental health education, a tool to support acquisition, classification, editing and storage of knowledge, an instrument to support teachers and experts to share, apply and innovate knowledge, and a function to connect with the Internet(Wang Xin, 2008). The establishment of the platform not only can help counselors and students easily achieve knowledge acquisition, storage, sharing, application and innovation, but also builds up a communication bridge between students, counselors, psychological counseling teachers and experts on the basis of the Internet, which is of great help to improve counselors' MHEA.

Counselors should establish students' mental health archives. The main purpose of establishing students' mental health archives is to understand and keep track on students' mental state, and then put forward pertinent measures and solutions. On the one hand, counselors can select students with abnormal psychological symptoms through the "Mental Health Questionnaire", and through in-depth

communication, understand the root causes of the problem, give corresponding psychological counseling, and finally establish psychological archives for follow-up observation, effective intervention in case of abnormal situation(Gao Liwei,2011). On the other hand, counselors can also dynamically record and manage students' daily learning, work, life and other information, focusing on students who have gone through major life events, timely keep track on their psychological changes and dynamics, so as to effectively target the groups that need to be mainly concerned about, carry out effective psychological intervention in advance, and enhance the effectiveness and initiative of work.

#### **4.3 Construction of learning organization and multiparty communication based on knowledge sharing**

Knowledge sharing is the third stage of KM, and an important stage to realize the transformation from tacit knowledge to explicit knowledge. Therefore, the main task of this stage is to make the tacit knowledge of counselors' mental health education explicit.

Colleges and universities should organize exchanges of psychological education skills and cases between new and old counselors. On the basis of organizing training, colleges and universities should also organize counselors to carry out experience exchange and sharing meetings between new and old counselors on a regular basis, discuss typical cases, and set up groups of psychological counseling work on some certain conditions. The counselors with longer length of service can give lectures to the new counselors about the cases of more difficult and typical psychological crisis intervention they have handled, and teach them appropriate handling methods to increase the effectiveness and scientific of counselors in dealing with psychological problems, thus passing on some experience, methods and even skills(Liang Yujia,2017).

Counselors should take the initiative to do well in many aspects of exchanges and communication. Counselors are the teachers that are closest to college students, and they are an important hub for contacts among universities, parents and students. Counselors should first establish a good relationship with students. They should be able to get close to students, help students, take the initiative to solve difficulties for students, treat every student with tolerance and equality, and gain the trust of students. Meanwhile, counselors should also pass on basic knowledge of psychology to students through various ways, such as class meetings, student activities, individual conversations, lectures, online conversation, so as to enable students to learn about mental health themselves, enhance mental health awareness, and stay away from mental illness. Secondly, counselors should play an active role in communicating with students, colleagues, leaders, counseling teachers and students' parents try to understand students' learning, life, family, emotions and other aspects, listen to colleagues, leaders, counseling teachers' opinions, and treat every student with psychological problems in the right way. Moreover, counselors need to fully utilize the resources of parents, head teachers, professional counselors, psychologists, class

cadres, etc. to form a joint force to deal with psychological crisis and serve the mental health education of college students.

#### **4.4 Incentive mechanism construction and practice innovation based on knowledge innovation**

Knowledge innovation is the fourth stage of KM, and it is also an important stage to complete the dynamic upgrading of knowledge. Therefore, the main task of this stage is to trigger the motivation of counselors and carry on the continuous innovation of mental health education.

Colleges and universities should establish incentive mechanism. So far, Chinese colleges and universities have incorporated counselors' mental health education into the assessment, and established a certain punishment mechanism. At present, most colleges and universities adopt such kind of measure: when serious psychological crisis happens to students, such as disappearing, committing suicide and other incidents, counselors are to shoulder great responsibility for the consequences, which results in huge negative impact on their future career. This punishment mechanism brings too much pressure and insufficient motivation to counselors. Many counselors have made great efforts in the field of mental health education, but because one case of a psychological crisis, their work has been totally denied; while some counselors are lucky and even though they are not hard working in their work, as long as there is no crisis among students, everything will be fine for them. That is to say, the current punishment mechanism cannot truly reflect the actual performance of counselors. Therefore, colleges and universities should also establish incentive mechanism. Motivation produces driving force, and innovation is created by the driving force. The workload of mental health education should be included in counselors' work performance, and the workload should be quantified according to the number of students with psychological crisis that are supervised by counselors and the effectiveness of assistance. Not only should the results of counselors' work be considered, but also the process of assessment should be emphasized. Counselors with outstanding performance should be praised and rewarded, and priority should be given to their career promotion and evaluation.

Counselors should place an emphasis on practice and innovation. With the development of society and the transformation of economy, many new features have emerged in the student groups. The reasons for students' psychological distress and mental illness are also quite different from those before. Counselors should combine their theoretical knowledge with specific problems in their daily work, strive to be proficient in knowledge and improve their skills in practice, and explore new methods and schemes suitable for the development of the generation and the needs of students. Meanwhile, counselors should pay attention to the innovation of work methods and carriers, making full use of such a new means as network to carry out mental health education, so as to keep pace with the times and change with the situation. For example, they should use the convenience and timeliness of the network, and use new media platforms such as QQ, WeChat, Weibo and Yiban to assist students in mental health

education. At the same time, counselors should hold up to the bottom line of online communication, actively offer positive orientation to public opinion, pay close attention to the dynamic changes of students' thoughts in real time, make timely feedback to students' online messages, dispel students' doubts, and finally guide students to establish a positive and optimistic outlook on life and values, thus obtaining the timely results.

## 5 Conclusion

Under the guidance of KM theory, it is a meaningful exploration to carry out the research on the improvement of college counselors' MHEA. Through the analysis of concepts, this paper holds that knowledge is the core resource of college counselors' MHEA, and it is feasible to utilize KM theory to conduct research on improving college counselors' ability in mental health education. The process of KM is a process of dynamic cycle. The countermeasures proposed in this paper can also realize the dynamic improvement of counselors' ability in mental health education, enable counselors' ability to keep pace with the times and constantly satisfy the needs of social development, which has certain guiding significance for the management of colleges and universities. However, this paper still has some limitations, because it only puts forward some countermeasures and suggestions for the improvement of mental health education ability of college counselors from the perspective of qualitative analysis. However, the analysis of the internal relationship between KM and the improvement of counselors' ability in mental health education is still unclear. The next step will be from the perspective of quantitative analysis, and this paper will explore the internal mechanism of applying KM to improve counselors' ability in mental health education.

**Abstract:** The development of economic globalization and the implementation of the “Belt and Road Initiative” put forward new requirements for MTI education in colleges and universities in China. MTI education requires the balance between "quality" and "quantity". The paper explores curriculum designs, internship arrangements and translation studies of current MTI education through questionnaire data analysis and finds curriculum designs generally good, internship arrangements the weak link and translation studies developing smoothly but lack of innovation. Improvement on RUI-based educational model of MTI that combines practice with theory, integration of teaching and research with research facilitating teaching, cooperation between university and industry for common progress, and enhancing links between research, university and industry with regional differences considered jointly guarantee the sustainable development of RUI-based educational model of MTI.

**Key words:** Masters of translation and interpreting; Translation industry; RUI; Sustainable development

### 1 Introduction

Economic globalization and the advance of information technology contribute to more extensive and closer international cooperation. Frequent flow of international trades and the expansion of multinational companies provide opportunities for translation industry with the demand for translators and interpreters ever-increasing. Master of Translation and Interpreting, MTI for short, was approved by Academic Degrees Committee of the State Council in 2007, affiliated to Ministry of Education, to develop translation industry so as to meet the market demand. (Mu Lei et al., 2010) People of educational circles, theoretical circles and business circles all follow MTI education with interest. Scholars and experts, home and abroad, from different perspectives and positions, have various understandings, annotations and even practices of teaching model of MTI within 253 universities with MTI in the past 10 years. As a result, it is necessary to reform and optimize the training model of MTI. Cooperation between research, university and industry is considered as a vital means of linking technology, education and economy closely. Prompted by economy-technology integration, Cooperation between R-U-I in countries across the globe is becoming more innovative, larger in scale, constantly upgraded, more flexible and adaptive. It is the trend of the times and the joint demand of universities and enterprises to conduct university-enterprise cooperation. (Esther Wit-

de Vries et al., 2019) Through cooperation, enterprises can attract high-caliber future employees and increase their popularity, and universities can acquire much training resources, technology and market information which are conducive to teaching and research. (Cai Hui, Zhang Chengzhi, 2013) In abroad, Esther Wit-de Vries et als studied knowledge transfer in university-industry research partnerships which has inspired Chinese Scholars to explore more. Mu Lei has explored distinctive training mode of MTI and others including Zhong Wenming and Ping Hong have emphasized MTI quality assurance system. Scholars like Xu Jun, Fu Jingmin also showed their reflections on MTI teaching. It can be seen that this field has aroused broad attention from different perspectives in China. However, problems do exist, such as mismatch between quality and quantity; supply and demand and cooperation mode being inflexible.

## **2 Survey on the Present RUI-based MTI Education**

The improvement on RUI-based MTI education depends on the balance between “quality” and “quantity” of MTI development. Quality means level, capacity and degree; quantity means number, scale and scope. They can turn into each other under certain conditions. Too rapid expansion of quantity may lead to uneven distribution of resources and “free rides”, which will spoil the environment where MTI develops. Too slow growth of quantity may lead to inefficient use of resources and serve as a wet blanket so that the market demand cannot be met and it takes time to increase the supply. (Ping Hong, 2019; Zhong Wenming, 2018) Therefore, the sustainable development of MTI relies on the balance between Quality and Quantity. With limited resources, MTI education should show its professionalism and characteristic and take regional differences into consideration.

Therefore, the questionnaire was designed with both quality factors and quantity factors included. After surveying translation providers and universities through interviews and questionnaires, the authors acquired data about translation industries, MTI education, translation studies and RUI platforms. At first, the authors gave out 80 questionnaires in Wuhan University of Technology where they belong with 62 filled-out questionnaires handed back and collected information about MTI education, translation studies and RUI platforms through telephone interviews with lecturers and professors in Wuhan University of Technology. After that, the authors revised the design of the questionnaire to lay stress on the key points. Later, the authors gave out questionnaires in nine universities in Wuhan, Guangdong University of Foreign Studies and Chongqing University with 92 filled-out questionnaires collected and communicated with lecturers and professors in those universities. Meanwhile, the authors got information about translation industry through interviewing with renowned translation providers in Wuhan.

### **2.1 Curriculum design**

Curriculum design involves six modules - mission, faculty, teaching content, quality of online courses, teaching management and quality of teaching. In each module, 8%-18% of the respondents rate it as very good; 65%-84% of the respondents rate it as average or above average. 4% of the respondents rate quality of online courses as very bad and 1% of the respondents' rate teaching content as very bad. In each of other four modules, no respondent rates it as very bad. The mean value of each module is as follows. It can be seen that quality of online courses needs improving; teaching content should be enriched; and other modules should be kept on continuous upgrade.

**Table 1 Basic Analysis of Curriculum Design**

	Module	Mean value
1	Mission of MTI	3.78
2	Faculty of MTI	3.75
3	Teaching content of MTI	3.48
4	Quality of online courses	3.41
5	Teaching management of MTI	3.67
6	Quality of MTI teaching	3.59

Curriculum design is an important link in MTI education. But few universities invite outstanding translators, interpreters, and experts in translation industry to take part in it.

**2.2 Practice arrangements**

Practice arrangements also involve six modules - scale of local translation companies, degree of standardization of local translation companies, resources the university has for MTI practice, class periods of practice, number of students who sit for CATTI and percent of pass for CATTI, number of times a student is in charge of interpreting a major conference.

Practice arrangements are a vital link in MTI education. But privileged universities or those have geographic advantage occupy the majority of resources for MTI practice. Besides, many bases and laboratories for MTI practice terminate when in construction or shutdown due to a lack of proper management.

The survey shows that in each module of practice arrangements, 3%-10% of the respondents rate it as very good; 47%-86% of the respondents rate it as average or above average; 1%-6% of the respondents rate it as bad with 6% of the respondents rating the number of times a student is in charge of interpreting a major conference as very bad. 15% of the respondents give the fourth module a below-average; 22% of the respondents give the fifth module a below average; 44% of the respondents give the last module a below average. The mean value of each module is as follows.

**Table 2 Basic Analysis of Practice Arrangements**

	Module	Mean value
1	Scale of local translation companies	3.46
2	Degree of standardization of local translation companies	3.36
3	Resources the university has for MTI practice	3.41
4	Class periods of practice	3.29
5	Number of students who sit for CATTI and percent of pass for CATTI	3.08

6	Number of times a student is in charge of interpreting a major conference	2.59
---	---	------

It can be seen that the performance of practice arrangements is worse than that of curriculum design, especially in terms of the last three modules. Therefore, MTI students should be given more chance to practice, be encouraged to sit for CATTI and work harder to pass it, and be cultivated to be good enough for posts in major conferences. Companies and universities have evident contradictions concerning practice arrangements because interns tend to have lower productivity than regular employees and companies, for profit, are reluctant to take efforts to train interns. Universities purchase professional tools to simulate the operation of enterprises but are short of guidance from professional translators and interpreters.

### 2.3 Translation studies

Translation studies involves innovation in translation technology, attention to localization, the standard of translation services and the development of translation industry. In each module, only 4% to 8% of the respondents rate it as very good; 77% to 83% of the respondents rate it as above average or average. The mean value of each module is as follows.

**Table 3 Basic Analysis of Translation Studies**

	Module	Mean value
1	Innovation in translation technology	3.10
2	Attention to localization	3.28
3	The standard of translation services	3.29
4	The development of translation industry	3.20

The “research” in RUI puts too much emphasis on translation theories but ignores the importance of the market and the application in the industry. As a result, translation studies receive little appreciation from translation industry.

### 2.4 Comprehensive analysis of different regions

**Table 4 Comprehensive Analysis of Different Regions**

Region	Curriculum design	Practice arrangements	Translation studies	Comprehensive index
Guangzhou	3.79	3.23	3.30	3.43
Wuhan	3.37	3.14	3.10	3.20
Chongqing	3.86	2.99	3.14	3.30

It can be seen that comprehensively MTI education in Guangzhou is better than that in Wuhan

and Chongqing. However, Guangzhou's curriculum design is a little behind that of Chongqing. Wuhan is much weaker in curriculum design, which leads to low comprehensive index. Chongqing performs well in curriculum design and poorly in practice arrangements. Overall, MTI education of all regions surveyed is above average with practice arrangements being the weak link. Due to limited resources for MTI practice in all three regions with no platform in the industry connecting major to career, it is hard to integrate teaching with practice. On some occasions of conference interpreting, students are only allowed to participate but not fully get involved or receive little attention or guidance. Students may feel frustrated as a result.

### **3 On Sustainable Development**

#### **3.1 Practice must be carried out.**

According to the CEO of a renowned translation company, the cooperation between universities and enterprises is superficial and unsystematic. Practice and teaching should be tightly knitted with universities putting the design of practice into the teaching plan. Practice serves as a complement to teaching as well as a test to teaching results. Special faculty should be assigned to follow the process of practice and evaluate its outcome. Currently, RUI integration is hard to carry forward due to the lack of faculty who have enough firsthand experience in translation industry. (Zhang Shidong, Peng Shuang, 2018)

#### **3.2 Innovation should be put into application.**

Innovation, both in translation courses and in translation theories, is evaluated by the way it is applied and its influence. (An Jing, 2016) Universities can outsource their courses in various ways. They can even build up their own industry chains to make RUI integration operated inside the universities by recruiting well-experienced professionals of research and management in translation industry.

#### **3.3 The ideal should be carried through with determination.**

RUI integration is generally considered as the trend of the times. However, whether it should be career-, demand-, industry- and society-oriented and how to keep its sustainability require in-depth discussion. The ideal of RUI integration is excellent yet its influence is small. Many universities may try it without determination to carry it through.

## **4 Data and Methodology**

This study intends to find the factors affecting MTI education through literature research to set up reliable indexes based on the factors, construct the framework of factors affecting MTI education, and compile the questionnaire on factors affecting MTI education. Through the questionnaire, Excel and SPSS19.0 are used to conduct the difference analysis between the survey data, descriptive statistical analysis, correlation analysis and multiple linear regression analysis, so as to test the factors. Finally, some suggestions for balancing the quality and quantity to keep MTI education sustainable are proposed based on the research results.

## **5 Suggestions on RUI-integration in MTI education**

### **5.1 Improving on RUI-integration to build a system that combines theory with practice.**

To develop various abilities in students, universities should make teaching and research integrated with research facilitating teaching; universities should cooperate with translation industry to make interactive progress together. MTI education should be based on the learning of basic theories and cultivation of all-round abilities with practical skills and innovative capacity as the focal point. Various resources should be used to improve the quality of MTI education and comprehensive strength of students. (Fu Jingmin, 2018)

### **5.2 Taking regional differences into consideration to enhance links between R-U-I.**

The links between R-U-I differ when in different regions. Universities should adjust their cooperation models with governments, translation providers, multinational companies and institutions according to the regional conditions, industries and translation demand of where they lie. They can develop cooperative projects with large multinational companies or translation companies, pay visits to language service providers to learn skills, jointly establish laboratories with institutions and introduce translation software and equipment. (Wang Hongyan, Lin Bin, 2013)

## **6 Conclusion**

The path of RUI-integration never runs smooth and requires persistence and innovative efforts. Excessive pursuit of innovation may lead to weak foundation and short life-span. Innovation, coupled with down-to-earth work, contributes to the sustainable development of RUI-integration. Online courses are an essential part of curriculum design and contribute to the integration of resources from inside universities and from outside. In internship arrangements, the practice should be closely connected to contents of paper exams. Universities should spare no efforts to put students into applying what they have learned and to keep them following the demand of society. Translation technology in translation studies is in urgent need of improvement. The innovation and continuation of translation technology lies in guidance from high-caliber translators and interpreters, introduction of translation tools and reform in teaching plans. (Chai Mingkui, 2010) Generally, Guangzhou performs better than Chongqing and Wuhan in MTI education, which indicates regional differences. To bridge the gap between regions requires platforms between regions for exchanges and communication. But building platforms is a complex and long-haul project. This paper creatively gives suggestions on the development of RUI-based MTI education: improving on RUI-integration to build a system that combines theory with practice; taking regional differences into consideration to enhance links between research, university and industry.

But, owing to limited time, there is still more room to better this research by collecting more data through different cities and ranks of the universities in a national scale to upgrade MTI education accordingly.

## **Optimization of transformation path based on conversion rate analysis of scientific and technological achievements**

Ma Yinbo<sup>1</sup>, Lu Jing<sup>2</sup>

1 Science and Technology Cooperation and Achievement Transformation Center, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 2502546233@qq.com, 752374940@qq.com)

**Abstract:** The conversion path determines conversion efficiency. The paper analyzes the constituent elements of the conversion rate of scientific and technological achievements, and proposes to establish a "three categories and twelve items" evaluation index system, which provides a quantitative analysis and qualitative analysis basis for the evaluation of scientific and technological achievements conversion rate, and solves the single analysis and evaluation index of scientific and technological achievements. The problem of low fairness of evaluation conclusions; based on the internal relationship and mechanism of the conversion rate of scientific and technological achievements and the transformation path, the paper proposes a strategy to optimize the transformation path, and has practical guidance for constructing a perfect scientific and technological achievements transformation system and improving the transformation ability of scientific and technological achievements significance.

**Key words:** Scientific and technological achievements; Conversion rate of scientific and technological achievements; Evaluation index; Path optimization strategy

### **1 Introduction**

The transformation of scientific and technological achievements is a way to realize the transformation and upgrading of enterprises and the quality development of the economy. In addition, patent technology and other innovative scientific and technological achievements have become one of the important indicators to measure innovation ability (Archibugi and Pianta, 1992). Optimizing the supply of scientific and technological achievements, smoothing the transformation channels, and building a good environment are conducive to shortening the cycle of achievement transformation, improving the efficiency of transformation of scientific and technological achievements, and transforming innovation capabilities into economic development advantages.

A method of characterizing talents based on scientific and technological achievements data is disclosed, which is suitable for realizing the construction and visualization of talents'

scientific research ability portraits according to the scientific research results database, which helps to quickly and intuitively understand the research ability of talents (Xu, Zhang and Wang, 2017).

The Notice of the General Office of the State Council on Printing and Distributing the Action Plan for Promoting the Transformation of Scientific and Technological Achievements pointed out that it is necessary to establish a performance evaluation system for the transfer of scientific and technological achievements and a system for transferring scientific and technological achievements, and provide reference for supporting units. Therefore, how to correctly evaluate the transformation effect of scientific and technological achievements has become a concern of current research institutes and relevant departments.

However, when it comes to the transformation of scientific and technological achievements, most of them believe that China has a large number of scientific and technological achievements, low conversion rate, and insufficient contribution to economic and social development. It is true that due to factors such as the ability of scientific research and innovation, and the imperfect system of scientific and technological achievements, the conversion rate of scientific and technological achievements is indeed low. According to the National Intellectual Property Report of the Ministry of Education of the People's Republic of China, the conversion rate of scientific and technological achievements in China's universities is only about 10%, far lower than the level of some countries and regions (The editorial department of the journal, 2016). However, it is one-sided to take the conversion rate of scientific and technological achievements as a hard index to evaluate scientific and technological innovation and require that all scientific and technological achievements can be transformed.

The author believes that the problem of low conversion rate of scientific and technological achievements should be viewed objectively and dialectically, and the "anxiety disorder" of scientific and technological achievements should be overcome. Through the establishment of a reasonable and perfect evaluation index system for the conversion rate of scientific and technological achievements, we will explore the strategy of optimizing the transformation path of achievements and focus on promoting the effective transformation of scientific and technological achievements.

At present, the degree of informationization of scientific and technological achievements management is getting higher and higher. The scientific research management system researched and developed by colleges and universities covers information such as scientific research funds and CNKI Wan Fang DATA provided support for in-depth mining of scientific and technological data and intelligentization of scientific and technological achievements conversion rate evaluation.

In the research on the conversion rate of scientific and technological achievements, some scholars have formed a more objective understanding of the conversion rate of scientific and technological achievements. Chang Linong believes that the transformation of scientific and technological achievements is an important measure to promote the transformation of economic development mode, but it is not appropriate to emphasize the improvement of the conversion rate of scientific and technological achievements (Chang, 2013). Cai Yuezhou pointed out that there are some deviations in the understanding of the transformation of scientific and technological achievements in various sectors of society, and on the basis of combing the connotation boundaries and influencing factors of scientific and technological achievements, the paper has conducted a comprehensive discussion on the measurement and evaluation of the transformation of scientific and technological achievements (Cai, 2015).

After scholars have formed a relatively objective and comprehensive understanding of the conversion rate of scientific and technological achievements, some scholars have also strengthened the empirical research on the transformation of scientific and technological achievements, and explored the factors affecting the transformation of scientific and technological achievements by constructing models. Sun Tao based on evolutionary game theory, decision-making and scientific and technological achievements cost investment decision-making to construct the evolutionary game model between scientific research institutions and enterprises (Sun, 2019). Luo Qian take the 32 colleges and universities in Jiangsu province for example, three core concepts of impact factor including national policy factor, regional environmental factor and organizational behavior factor are extracted (Luo, 2019). Ji Chengjun based on the micro panel data of Chinese universities from 2008 to 2016, this paper measures and analyzes the conversion efficiency of scientific and technological achievements in colleges and universities through the network DEA model; Based on the innovative ecosystem perspective, the dynamic panel GMM differential model is constructed to empirically test the factors affecting the efficiency of scientific and technological achievements transformation in colleges and universities (Ji, 2019).

The deviation of people's understanding of the transformation of scientific and technological achievements often comes from the inadequate basic work such as measurement and evaluation. Foreign scholars such as Nordfors believe that traditional indicators to measure the transformation of scientific and technological achievements include patents, licensing, publications and derivative companies (Nordfors, Sandered and Wessner, 2003). Langford et al., when evaluating the transformation of scientific and technological achievements in colleges and universities, divided the evaluation indexes into three categories: input indexes, output indexes and effect indexes (Langford, Jeremy and Pete, 2006). For the research on the evaluation index system of scientific and technological

achievements, Chinese scholars also put forward different viewpoints according to different research perspectives. Zhang Mingxi and Guo Wei built a performance evaluation system for scientific and technological achievements based on the experience of international scientific and technological achievements. According to the availability and operability of the data, the data envelopment analysis method was used to study the transformation efficiency of scientific and technological achievements (Zhang and Guo, 2013). Li Xiuquan, Xuan Zhaohui explained the misunderstanding of the current research achievement conversion rate in the use of indicators from the perspective of conceptual definition, measurement and data sources of scientific and technological achievements conversion rate (Li and Xuan, 2015). Mai Weinan believes that scientific and technological achievements have not yet been fully transformed into project performance. Therefore, it is necessary to establish a sound performance evaluation index system for conversion projects, and also analyze the main mechanisms of performance formation and influencing factors. Based on this, a multidimensional evaluation index system was established (Mai, 2017).

In addition, many scholars have proposed different suggestions and directions for the research on the transformation strategy of achievement transformation. Based on the background of China's new economic normality, Zhang Wujun and Xu Ning analyzed the problems existing in the transformation of scientific and technological achievements, and combined with the advanced experience of foreign countries, proposed countermeasures for the transformation of scientific and technological achievements from the aspects of legal protection and policy support (Zhang and Xu, 2016). Cheng Xiong and Lv Jianqiu based on the survey of ten universities in eight provinces, summed up six experience suggestions for the transformation of scientific and technological achievements: stimulate the transformation of scientific and technological achievements, create a good environment for the transformation of achievements, improve the evaluation mechanism for scientific research, establish specialized institutions for the transformation of achievements, increase the conditions for the transformation of achievements, and play the role of the intermediary of science and technology (Cheng and Lv, 2018). Qi Yong, Zhu Tingting and Guo Yi divided the scientific and technological achievements into three categories: basic public welfare, common technology and proprietary technology. According to different social functions, proposed different modes and countermeasures for different types of scientific and technological achievements (Qi, Zhu and Guo, 2015).

## **2 Scientific and Technological Achievements Conversion Rate Evaluation Index System**

The evaluation index of scientific and technological achievements conversion rate has the characteristics of multi-dimensional, three-dimensional and dynamic, and can be divided into three categories and twelve indicators, as shown in Table 1.

**Table 1 Evaluation Index of Scientific and Technological Achievements Conversion Rate**

Serial number	Primary indicator (Score)	Secondary indicators (Score)
1	Scale of achievements (quantity, quality) A1 (30%)	Industrialization suitability B1 (5%)
2		R&D investment B2 (3%)
3		Research and development cycle B3 (7%)
4		Achievements attention B4 (8%)
5		Achievement innovation B5 (5%)
6		Achievement citation B6 (2%)
7		Type of achievement transformation B7 (15%)
8	Achievement transformation effect A2 (50%)	Quantity of achievement transformation B8 (20%)
9		Achievement conversion cycle B9 (8%)
10		Achievement conversion price B10 (7%)
11	Transformation of achievements into social impact A3 (20%)	Economic benefits B11 (8%)
12		Social benefits B12 (12%)

Chai Guorong et al. constructed an index system consisting of three primary indicators, seven secondary indicators and 30 third level indicators including transformation conditions, supporting capacity and transformation effects to comprehensively evaluate the transformation of regional scientific and technological achievements (Chai, Xu and Zhai, 2010). Liu et al. used the analytic hierarchy process to select the three aspects of science and technology input, output and transformation to construct a transformation of scientific and technological achievements including 35 basic indicators (Liu and Li, 2010).

1. Scale of achievements (quantity, quality) A1. Score is 30%, evaluation is dynamic, based on a model, questionnaire survey and experience analysis. This includes five indicators: First, the industrialization suitability B1, the achievements are suitable for the degree of industrialization; second, the R&D investment B2, divided into direct input, indirect investment; third, the research and development cycle B3, the longer the research time, the higher the value of the achievements; fourth, the achievements attention B4 reflects the company's interest in the achievements, and the industrialization suitability of the achievements can be obtained through network access, enterprise docking and other means; fifth is the achievement innovation B5, focusing on the practicality of the technology; sixth, the achievement citation B6, through his data analysis.

2. Achievement transformation effect A2, Score is 50%, including type B7, quantity B8, conversion cycle B9 and price B10. The evaluation is objective and quantifiable, and it is the easiest and most objective. The single item of achievements in the form of priced investment is highly converted, and the single item generally exceeds one million yuan; the single conversion price of achievements in the form of cash transfer is between 50,000 yuan and 300,000 yuan, and few can reach one million yuan, which is the ideal price pursued by the transformation of achievements; achievements in the form of license adopt "threshold price + income commission", the threshold price is relatively flexible, and the ideal income can be achieved after successful transformation. Liu Yintian points out the transformation period of setting up scientific and technological achievements of enterprises is set at 2 years. If it is more than 2 years, it is regarded as no conversion; the transformation period of scientific and technological achievements of universities and research institutes is 5 years, and it is regarded as not converting for more than 5 years (Liu, Ma, Zhang and Jiao, 2018).

3. Transformation of achievements into social impact A3. Score is 20%. The evaluation has the lag, the qualitative analysis and the quantitative analysis combine. This aspect includes two indicators: first, the economic benefit of achievement transformation B11, which can be calculated and quantified; the second is the social benefit of achievement transformation B12, which is based on qualitative analysis.

### **3 Relationship between Conversion Rate of Scientific and Technological Achievements and Optimization of Transformation Path**

The conversion rate of scientific and technological achievements is the ratio of the number of transformed achievements to the total amount of achievements. The scale of achievements A1, composition and technological innovation of scientific and technological achievements and industrialization suitability determine and influence the conversion rate of scientific and technological achievements. Scientific and technological achievements include innovative knowledge and technologies such as intellectual property rights and proprietary technologies. The number of intellectual property rights can be accurate to specific number, while proprietary technologies are not easy to be counted and quantified. Therefore, the total amount of scientific and technological achievements is a dynamic variable, and the conversion rate of scientific and technological achievements calculated with a variable as the denominator is bound to be neither comprehensive nor objective.

From the perspective of the purpose of scientific research and the composition of scientific and technological achievements, scientific and technological innovation activities cover science, engineering, medicine, management and many other disciplines, including basic research and applied research. It has both academic research achievements and applied research achievements. Some of them are high-level research papers for scientific and technological exchange, some can be used and protected by applying for intellectual property rights, and some cannot be applied for intellectual property rights. Therefore, not all the achievements can be transformed, such as the mathematical research achievements

supporting brain science and artificial intelligence. Scientific research and innovation activities can be divided into high-level and low-level activities. Low-level scientific research and innovation activities may be the "exercise" for scientific and technological workers to exercise and improve their research ability. If we all require that all scientific and technological achievements can be applied and transformed, giving all science and technology workers the task of transforming achievements, it is easy to bring the misunderstanding of one-sided performance and national cognition in performance evaluation, and it cannot accurately reflect the actual situation of the transformation of China's scientific and technological achievements. At the same time, it will dampen the innovation enthusiasm of scientific and technological personnel, and does not conform to the law and status quo of scientific and technological achievements transformation.

The transformation of scientific and technological achievements is a complex process of the game of interests between the transferor and the transferee. It is not only affected by the transferor's technology maturity, advancement and other factors, but also depends on the transferee's development strategy, carrying capacity, risk preference, financial status and other factors. In the actual work, the enterprise is very willing to accept some scientific and technological achievements of the author's work unit, and the business negotiations between the two sides are very harmonious. But in the end, limited by the size of enterprise development, carrying capacity and price concession, no deal is reached. Only in line with market demand, enterprises to undertake the achievement are suitable for transformation. Scientific and technological innovation should aim at the market, strengthen project analysis and selection, and strengthen precise docking services. However, we should not "only follow the market" and deny basic and original research, or else it is a short-term behavior eager for quick success and quick profits. We should establish a system for classifying and evaluating scientific and technological achievements, organize the evaluation of scientific, technological achievements regularly, analyze scientific, technological achievements that may be transformed, make an annual list of transformation of scientific, and technological achievements, define the task of transformation and promote it with goals and plans.

#### 4 The Strategy of Optimizing the Transformation Path of Scientific and Technological Achievements

Figure 1 Matching Chart of Supply and Demand of Scientific and Technological Achievements

Ma Lisha et al. suggested that according to the transformation of scientific and technological achievements and its development rules, the scientific evaluation indicators should be selected around the industrial chain, and the existing evaluation indicators and systems should be selected to establish a normalized monitoring system covering

comprehensive data and statistical basis. Guide research and development institutions to carry out knowledge and technology transfer suitable for their nature, mission and positioning (Ma, Yu, Tia, Ma, Zhang and Guo, 2019).

To evaluate the transformation of scientific and technological achievements, it is not possible to simply look at the conversion rate, but also to examine indicators such as conversion speed and conversion efficiency ratio. Compared with the conversion rate of scientific and technological achievements, the transformation cycle and input-output ratio of scientific and technological achievements can better reflect the real level of scientific and technological achievements transformation. We should improve the diversified evaluation index system and insist that the main body of evaluation is the transferee and the scale of evaluation is the contribution to economic and social construction.

**Focus on improving the timeliness of achievements transformation.** From the perspective of time, the transformation of scientific and technological achievements starts from scientific and technological innovation activities and ends with the transferee of achievements forming new technologies and new products. The short transformation period indicates the efficiency of the transformation. On the contrary, if the transformation cycle is too long, it may be replaced by advanced technology, resulting in a waste of scientific and technological resources and missing development opportunities. We must focus on improving the timeliness of scientific and technological achievements, and adhere to the "five synchronization" : namely, scientific research projects adhere to the achievement transformation oriented, define the transformation target tasks synchronously, plan the transformation plans synchronously, the scientific research implementation shall be synchronized with the transferee, the project acceptance shall be synchronized with the assessment of conversion indicators, and the project evaluation shall be synchronized with the initiation of conversion procedures. We will provide order-oriented services for the transformation of scientific and technological achievements. For major applied scientific research projects of government departments at all levels, expected achievements can be announced, and interested enterprises may be invited to participate in the research and sign transformation agreements to accelerate the transformation of scientific and technological achievements.

**Focus on achieving effective transformation of achievements.** At home and abroad, it is generally believed that the conversion criteria include two aspects: First, the proportion of the part that has been converted accounts for the whole. If some studies believe that more than 15% of the proportions are applied when they are applied, the second is the scale of economic, ecological and social benefits. If the economic benefits generated exceed 1 million yuan, it will be converted. From the perspective of input and output, the conversion efficiency to cost ratio is the ratio between the economic benefits generated by conversion and the transfer funds and the indirect costs of conversion. If scientific and technological achievements are merely transferred without successful transformation into productive forces, they cannot be regarded as effective transformation. From the perspective of the

transformation price of scientific and technological achievements, if the price of a single transfer is less than ¥50,000, the price is equivalent to the cost of an enterprise to apply for a new invention patent. The main motivation for the enterprise to purchase is to apply for high-tech enterprises, apply for government support for scientific and technological projects, and improve the enterprise brand, but the actual implementation is not much. Therefore, we should improve the evaluation and funding methods for the transformation of scientific and technological achievements, change the "sprinkling pepper" approach, turn "universal funding" into major and targeted funding, and focus our human, material and financial resources on major projects to transform scientific and technological achievements into effective ones. For example, the "Science and Technology Achievements Transformation Project" in the 2018 Science and Technology Subsidy Project of Wuhan Science and Technology Bureau adopted a competitive distribution method to determine 20 scientific and technological achievements transformation projects through evaluation, each of which was supported by funds of RMB 3 million to 5 million.

**Focus on strengthening the management of transformation relations.** The transformation of scientific and technological achievements is a technology transfer with intellectual property rights as the carrier. It is a scientific and technological cooperation between the transferor and the transferee, not a one-time transaction, nor a simple transfer of achievements. It condenses the arduous and complex technological value of the scientific and technological personnel to re-create and re-invest. It requires a long process and painstaking post-transfer technical support and management input. In addition to the value of scientific and technological achievements, enterprises pay more attention to the scientific research and innovation ability of the team of scientific and technological achievements as well as the creativity generated by the person who gets the achievements relying on the engineering conditions provided by enterprises. From the case analysis of the transformation of scientific and technological achievements, the scientific research level of the scientific and technological achievements team and the reputation of scientific and technological personnel directly determine the transfer price of scientific and technological achievements. Therefore, the transferee hopes to take scientific and technological achievements as the link to obtain continuous and effective research and development technologies, obtain innovative scientific and technological talents, and increase the value generated by management resources, network resources and brand advantages based on the background of universities and research institutes.

**Strengthen investor relations management.** Investor relationship management is a bridge connecting scientific and technological personnel and enterprises, which is conducive to promoting the benign relationship between the transferor and the transferee of scientific and technological achievements, enhancing the transferee's further understanding of the scientific research strength of the transferor, eliminating the estrangement and misunderstanding between the transferor and the transferee in time, and establishing a long-term good strategic cooperative relationship. Before the transfer of the achievements, the transferor shall assist the transferee to fully understand the scientific and technological

achievements and conduct extensive research, understand the needs of the transferee, discuss cooperation plans, promote scientific and technological cooperation, and determine the transfer price. After the transfer of achievements, the transferor shall follow up the progress of the project, feedback the demands, suggestions and appeals of the transferee, and coordinate and guide the scientific and technical personnel to provide follow-up technical services.

**Promote the combined transformation of scientific and technological achievements.**

The benefits of single scientific and technological achievement are limited. Only the technology group, technology combination and related technology supporting single scientific and technological achievement can realize the maximum benefits of transformation. We should strengthen the coordinated supply of scientific and technological achievements and promote the cross and integrated development of various technologies.

**Limitation.** Although this paper analyzes the specific indicators of the conversion rate of scientific and technological achievements, there are many factors involved in the transformation of scientific and technological achievements, many quantitative indicators, and many qualitative influence factors. The data acquisition is difficult, the difficulty of evaluation of conversion rate is increased, and the construction of data model is difficult. Further innovation index setting is needed to verify the weight of specific indicators. Secondly, this paper studies the transformation law of the same transformation unit. Subsequent research can further expand the time span and explore the relationship between time evolution and conversion rate change. Finally, research on the relationship and function of transformation input and output in different regions, especially cross-regional comparative research, and vertical and horizontal comparison of conversion rates between regions and research institutes to further enrich the conversion rate of scientific and technological achievements. The results provide a theoretical reference for improving the ability to transform scientific and technological achievements.

## **5 Conclusion**

The paper explores the relationship between the transformation path, the conversion rate, and its mechanism of action, which has important theoretical and practical significance for improving the conversion rate. In theory, it has constructed an index system for the conversion rate of scientific and technological achievements, and linked the conversion rate with the input of scientific and technological achievements, the scale of output, the transformation effect, and the social influence. It has certain scientific and comprehensive characteristics. At the same time, this paper is transformed according to scientific and technological achievements. Data, suggesting that the lowest price of a single scientific and technological achievement is less than 300,000 yuan; it is not a successful transformation, enriching the practice of scientific and technological achievements transformation. In addition:

First, we should establish a correct value system for the transformation of scientific and

technological achievements, combat anxiety about the transformation of scientific and technological achievements, combine the transformation rate of scientific and technological achievements with the contribution to economic and social development, carry out efficient progress in a planned and step-by-step manner, and strive to optimize the effective supply of scientific and technological achievements to improve the quality and efficiency of the supply of scientific and technological achievements. Second, we will correct the motivation for transformation, carry out scientific and technological innovation in line with major needs and practical difficulties, optimize the transformation path, and build a multi-dimensional evaluation and evaluation index system to maximize the efficiency and benefits of transformation. Third, we should broaden the channels of transformation, strengthen the management of transformation process, and promote the establishment of a virtuous circle mechanism of "transformation of achievements -- enterprise development -- feeding scientific research -- promoting disciplines".

## **Language Management on Language Choice of Chinese Singaporeans: Balance between Ethnic Identity and Utilitarian Value?**

Wang Jue, Chen Long (Corresponding Author)

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: Shirleywang\_2003@126.com, annachen03@126.com)

**Abstract:** Singapore is characterized as a multicultural and polyglot society. After decades of implementation of bilingualism, it intrigues people to know how Chinese Singaporeans define themselves in such a multi-ethnic country and how language management influences their language use in a complicate language context. By analyzing Chinese Singaporeans' language use in terms of various categories, including different domains where languages are used, social status and age of language users, the tendency of language choice among Chinese Singaporeans has indicated the language hierarchy in Chinese community is English, Chinese Mandarin and Chinese dialects if ranked from high to low. For such hierarchy, language management is a determinant to its formation. Besides, a range of other influential factors, including history, geography, personal motivation, etc. also play a large part in directing Chinese Singaporeans' language choice, and sometimes, their influence even overrides the power of language management. Therefore, the results of language management in Singapore may deviate from government's original intention of balancing between ethnic identity and utilitarian value.

**Key words:** Language management in Singapore; Chinese Singaporeans; Language choice; Ethnic identity; Utilitarian value

### **1 Introduction**

As a country composed of various ethnic groups, Singapore is a typical multi-cultural and polyglot society. Among these groups, Chinese consists of 74.2% of the whole population, Malays 13.4%, Indians 9.2%, and other ethnic origins 3.2% (Turnbull, 2016). Conditioned by factors of linguistics, history, geography, politics...etc, this peninsula witnesses English being widely accepted by the residents as lingua franca. In addition to English, Mandarin Chinese, Malay and Tamil make up other three official languages in Singapore. Bilingualism of language policy in Singapore aims at achieving among Singaporeans bilingual proficiency in English and a mother tongue that has been officially assigned to specific ethnic communities (Peter, 2016). Since language is not merely a tool of communication, but also has rich cultural connotation, Lee Hsien Loong stated language policy concerns such fundamental issues as "how we see this world, how we express ourselves culturally as people,... and have the confidence and identity to chart our future" (Li, 2014). However, language policy is not the only determinant in Chinese Singaporeans' language use in such a complicating language context.

From a bunch of researches we can generally conclude that ethnic identity, language policy& educating planning, and utilitarian value are dominating factors for linguistic behaviors of Chinese Singaporeans. Actually, those deciding factors do not only work separately, but also correlate with each other. Some researchers focus on how language attitude interacts with ethnic awareness through investigation among Chinese Singaporeans (Chai, 2010; Jacob, 2014; Peter, 2016); some scholars attempt to find how language policy and bilingual education influence the language-based ecological

balance in Singapore (Tan, 2014; Tang, 2016; Chen, 2012; Zhou, 2015); Someone else give an insight into the prospect of Chinese language in Singapore from the perspective of its economic and utilitarian value (Guo, 2008; Shang, 2016). Singapore government is always searching for a language management in expectation of a balance between maintaining ethnic identity and maximizing utilitarian value. Based on previous researches, this essay will investigate further the Chinese Singaporeans' ethnic identity through analyzing their attitude to different languages reflected from their language choice in various dimensions, and explore reasons for their language choice.

## **2 General Review of the Language Situation in the Community of Chinese Singaporeans**

Singapore's language system is diglossia. Bazaar Malay and Chinese dialects are low languages, employed in the streets and market places. English and Mandarin are high languages, used in education, government offices, and public celebrations (Turnbull, 2016).

Of the Chinese Singaporeans, Hokkien, Teochews, Cantonese, and Hakkas were the four major dialects spoken by Chinese Singaporeans. In the early years of colonial period, the education needs of large part of population were mainly financed and staffed by the racial and dialect groups (Turnbull, 2016). After the Second World War, English education was greatly encouraged by colonial government. Meanwhile, Mandarin-medium schools sprang up with surge of nationalism. In 1956, the committee in Chinese education issued a report of recommending equal treatment for all schools and all four leading languages. It also promoted bilingual primary education, with a common syllabus, common textbooks, and equal grants for teachers and equal opportunities for school leavers of all language streams to enter government service. However, due to the remaining influence of colonial education policy and the superiority of English in job-market, in this period, the students enrolled into Chinese-medium school reduced sharply to 36.91% while that into English-medium school increased to 55.58% (Tan, 2014). Since the Singapore's independence proclaimed on 9 August 1965, the situation of Chinese education had even deteriorated with the implementation of the new language policy. To create a feeling of nationhood posed special problems in mixed immigrant society; the Federation precluded building up any exclusively Singapore identity and stressed the role of English as a unity language (Li, 2014). The drift towards English schooling led to another dramatic drop of students' number in Chinese schools. It was reported that in 1959, the students registering at Chinese schools was 47.4%, but the rate decreased to 9% by 1979. In 1979, with enthusiastic support from the Chinese press and the Singapore Chinese Chamber of Commerce, the government launched a Mandarin Speaking Campaign, urging all Chinese Singaporeans, including government clerks, hawkers, bus conductors and taxi drivers to use Mandarin; at the same time the Chinese traditional ideology – Confucianism was also highlighted in this Campaign. From then on, among Chinese Singaporeans the most noticeable shift has been shown from Chinese dialects to Mandarin and English (Zhou, 2015).

## **3 Language Choice in Terms of Different Categories**

According to the asymmetric principle of multilingualism, "All the languages in the repertoire of a multilingual community are not equally distributed in terms of power, prestige, vitality, or attitude" (Kachru, 1985). The language choice of Chinese Singaporeans in their everyday life is a case in point to illustrate this principle. Nearly all the members of Chinese Singaporeans speak at least two languages or codes, and their use of these languages varies in terms of different domains where the languages function differently.

Xiao (Xiao, 2010) conducted a survey concerning the Chinese Singaporeans' language choice in two kinds of domains – talking with colleagues about work and study, and talking with friends about

privacies. The general tendency of language choice demonstrated in the figure 1 is “code-mixing” (i.e. using Chinese and English at the same time) accounts for the largest proportion when talking about work and study; while “using Chinese only” dominates their language choice when talking about privacies with friends. This indicates that Chinese serves essentially as an emotional interaction tool, on the other hand, its relatively low social status considered by Chinese Singaporeans. This result is consistent with what has been found in Chen’s (Chen, 1999) investigation -- English is adopted most frequently in official occasions, which accounts for 73% of language use; while Chinese is mostly used in non-official, private occasions, which accounts for 53%.

**Figure 1 General Tendency of Language Choice among Chinese Singaporeans**

In addition, the research reveals some important variables largely affecting language choice. Among these variables, social status is the one that affects the result most.

Education status, career and salary are three main components of one’s social status. It is not difficult to figure out the model of ripple effect “higher education status—better career—higher salary—use English” from figure 2. By Contrary, the people of lower social status are more likely to use Chinese in their talk. This finding is compatible with the result of Chen & Huang’s research (2012) on students’ view about different languages in Singapore, in which 74% Chinese Singaporeans believe English is the most authoritative, influential and useful language. What’s more, people’s emotional attitude towards English varies within a decade. Chen’s investigation (Chen, 1999) shows a majority of Chinese Singaporeans think Chinese is the most elegant and friendly language despite their belief that English enjoys the highest status. However, Chen and Huang’s research (Chen and Huang, 2012) indicates that English is not only the most honorable language, but also the most elegant and melodious language. It means, English is favored by Chinese Singaporeans not only rationally, but also emotionally in recent years.

In fact, when the researcher compares the language choice in the domain of talking about privacies, he gets similar result. If the results drawn from the neutral talk can reflect more the effects of some common social factors on language choice like history, government policy, etc., the similar result gained from the intimate conversation can show more the speakers’ psychological inclination on culture and ethnic identity. In a multilingual and plural-culture society, mother tongue distinguishes itself from other languages with the function of “expressing ethnic identity, and powerful connotations of warmth and intimacy” (Benedict, 2011), and if such function of mother tongue language for a speech community has weakened so severely that even the members in this community do not use it in the personal private communication, it is dubious whether the language is still where the speaker’s emotion and ethnic value live.

Another study (Gupta, 2012) which also elicited data on how language choice related to perception of social class was carried out by a student to explore her husband's language use. Her husband, a Chinese Singaporean, was dressed in two guises -- in the middle-class professional guise he wore white shirt, trousers, and tie; while in his factory worker guise he wore a worker's overall. He looked around twenty furniture shops in each guise, the second visit being after an interval of a week. The shops were in two categories: HDB shops (in government housing estates) and up-market shops. When he was approached by an assistant, the student noted down his languages use. The results were summarized as shown in the table below:

**Table 1 Language Choice of a Chinese Singaporean in Different Guises**

Guise	Middle Class				Working Class			
	English	Mandarin	Hokkien	None	English	Mandarin	Hokkien	None
HDB	1	6	3	-	-	4	6	-
Up-market	9	1	-	-	1	4	3	2

It was found English and Mandarin were the most frequently used language in HDB and up-market store respectively when her husband was in Middle class guise; while when in working class guise, Mandarin and Hokkien were the language choices. The occasional use of Hokkien when in Middle class guise just occurred when faced with a "working class" customer. The researcher said "just as the assistants in the up-market shops tended to shift from English to Mandarin when faced with the factory workers, the assistants in the HDB shops tended to shift from Mandarin to Hokkien". In fact, those records show a very interesting implication that in Singapore, English, Mandarin and Hokkien are three levels of Languages ranked from high social status to low.

Benedict holds that "ethnic groups are formed by persons who share common cultural characteristics which are wholly learnt, typically very early in life" (Benedict, 2011). If family is the first school which builds one's initial value system, the social stratum where one is placed should be the second most important school to shape one's pre-existent value system, even change it drastically.

The second important clue revealed from both studies above is the relationship between age and language choice. The first survey discovered if taking 55 years old as the boundary to classify age groups, the difference of language choice between the older group and younger group is quite distinct. Chances of using Chinese in the older group are much greater than younger group both when talking about work and privacies. The second study also indicated quite a few irregular incidents of language use were concerned with age. For example, the sales assistants in the up-market shops who used Mandarin to the "Middle class" customers were in their fifties and it were the same assistants who switched to Hokkien when faced with the working class' customer. By contrast, the only assistant in HDB shop that spoke English was in her thirties. The close link between language choice and age, undoubtedly, can be attributed to the language policy change in history. The people above 55 years old were born before or around 1950s; their school years, if it was possible for them to go to school, were mostly spent in the Chinese-medium schools teaching in mandarin or even dialects. While the youth were born after the independence of Singapore, when English education was thriving and nearly all the students swarmed into English-medium school. Furthermore, as the younger group is far from the historical origin and susceptible to western culture, it is no wonder that their tendency to speak English is higher than the older group.

As a generation which clings to their native accent and bears stronger “root” complex, the old people always assume the responsibility of transmitting the ethnic culture from one generation to another. Obviously, mother tongue is such a powerful tool to fulfill this project. However, as there is a big difference in language use between the young and the old, the hereditary values and beliefs, conceivably, will be gradually lost owing to the increasing generation gap. One case study focusing on two Cantonese families’ language use in family reunion can reflect this problem (Xu, 2014).

The two families are Wong and Tham. They have close ties and the grandmother in the Wong Family is also the maternal grandmother in the Tham family. For Chinese, Mid-autumn day connotes “gathering” and “tightly-knitted family membership”, thus, all the members of the two families attended this gathering. All of them could speak English although the English ability of the grandparents limited them to some simple topics; only the first and second generation could speak Cantonese and Mandarin, while the grandchildren could speak no or just a little Mandarin. During the observation, the author found although the grandparents “make an effort to speak the language that their grandchildren are comfortable in”, the grandchildren “cannot do the same for them and sometimes have difficulty answering even in Mandarin.” Adult conversation due to language barrier, and “huddle off to have candle light conversation among themselves” quickly bored the grandchildren. Then the conversation between the first and second generations continued comfortably in Cantonese and on Cantonese poems of the mid-autumn festivals and Cantonese jokes were shared and laughed over. Within such an atmosphere where the elder members could communicate and express themselves fluently in Cantonese, the first generation could feel at ease. Meanwhile, the grandchildren were happily talking and laughing about boyfriends, conveying jokes, and complaining about their studies and homework. They spoke English in the whole course in spite of occasional code-switch to Mandarin.

As a matter of fact, it is not uncommon to see such a scene in Chinese Singaporean families. To a certain extent, it is the varying language policies that create the huge cultural gap between different generations, thus, lead to the difficulty in communication among family members.

#### **4 Discussion on the Tendency of Language Choice among Chinese Singaporeans**

If we review the studies above, it is not difficult to find the regulation of the language choices in Singapore Chinese community: English comes to replace the role of Chinese as a home language; English has been the dominant language held by people from higher social stratum; English has gradually been transferred into the role of native language of the new generation.

Undoubtedly, the foremost reason for this trend is the language policy. In the four official languages in Singapore – English, Mandarin Chinese, Malay and Tamil, English was promoted as a “neutral” language for inter-ethnic communication. The bilingualism education policy stipulates that all students in Malay-, Tamil-, and Mandarin-medium school should learn English as the second language. All those in English-medium schools should learn the language associated with their ethnicity as a second language (Peter, 2016). This policy eventually made English the lingual Franca of Singapore. In 1987, English was officially adopted as the first language in schools (Wikipedia, 2019). Tollefson pointed out language planning “cannot avoid the historical relationship between groups; nor can it avoid the political, ethnic, racial, social, and economical issues that are involved in defining their current relationship” (Tollefson, 1994). Singapore’s language planning is not an exception. From sociolinguists’ view, social groups seek to exercise power through their control of language and the language is also the prize in the struggle among different groups, with dominant groups gaining control over language (Fairclough, 1989). Language policy can be analyzed as the outcome of struggle as well as component in it. In such a linguistically and racially diverse country as Singapore, choosing English as the most important official language can be considered as a compromise among different racial strengths.

Although Chinese is the overwhelming majority of the whole population, the federation bears in mind this nation stands for all the races instead of the strongest. In the aim of establishing a cosmopolitan nation where all races live and work harmoniously together, choosing English is a sensible decision as the language of unity in relation to which the three major racial groups are equal.

Furthermore, geographically speaking, Singapore is surrounded by Indonesia and Malaysia – two predominantly Malay and Islamic nations, Singapore needs to carefully manage its image. “With a predominantly Chinese population, the leaders had to assure their neighbors that Singapore would not be an extension of China, but was first of all devoted to its position as a Southeast Asian nation” (Li, 2014). Therefore, choosing English as the first language is a strategy to gain a favorable international environment.

In addition, as Singapore has no natural resources of its own, its leaders were convinced that “economic survival was possible only a part of the Federation and had worked hard to bring that about” (Wee, 2003), since Singapore’s economy is largely dependent upon international export commerce, English, seen as the world language, provides this nation with access to science, technology, economic development and social mobility. Just as the former Prime Minister Lee Kuan Yew said, “without the English language, we might not have succeeded in teaching so quickly a whole generation the knowledge and skills which made them able to work the machines brought in from the industrial countries of the West” (2011).

Government policy is indeed a powerful external strength to direct the trend of language change, while people’s attitude and motivation are another determinant of language choice.

One’s attitude towards certain language is always shaped by the social context and personal experience. Due to Singapore’s colonial history, English, as the symbol of elite minority, enjoys high prestige in this society; on the other hand, “its association with currently valued domains of higher administration, science and technology, international commerce, Western culture and pop entertainment makes it perceived as all-powerful and a ticket to upward mobility” (Scridhar, 2013). Such adoration of English is likely to be transferred into an intrinsic motivation for one’s language learning and use.

What’s more, the economic value and a range of favorable conditions brought by English also stimulate Singaporeans to be proficient in English. McGroarty points out, “the position of a given language on the hierarchy is determined by very pragmatic consideration. The larger the number of desired roles a language enables its speaker to play in a given society, the higher its place is on the hierarchy” (2012). The parents may value their home dialects in certain contexts but insist that their children have ample opportunity to develop pragmatic skill in the prestige standard. Although Singapore government has ever encouraged Chinese education, as long as parents find the students who graduate from English-medium school are much more competitive nearly in all aspects, such as well-paid job, promotion etc., they would still send their children to English-medium schools. The younger generation may learn Mandarin as well in school as the bilingual policy requires that students be taught their mother tongue, but with little motivation, Chinese cannot be continuously used as English in a variety of domains outside the education system for ensuring that it flourishes. Lee Kuan Yew agreed that “while parents and students wanted emotionally to keep their mother tongue, sentimental reasons are not as strong as the economic value of the language” (Lee Kuan Yew, 2011). It’s quite possible with the motivation of economic value, the function of Chinese as a communication tool would be ignored for those young Chinese Singaporeans, along with mother tongue’s function of transmitting ethnic culture.

Nowadays, for the youngsters in Singapore Chinese community, Singapore Colloquial English, the low variety of English, plays an increasingly important role to express solidarity and nationality identity (Jacob, 2014). However, “the question is whether with the greater use of English, we may lose some

aspects of our identity. These are the traditional values of our forefathers” (Lee Kuan Yew, 2011). Although English has brought new knowledge which could support the development of a modern industrial nation, at the same time, it carries the “mindless pop culture of west” (Jacob, 2014), and it is the “gateway to decadence, liberalism, Westernization” (Bokhorst-Heng, 1999). For the sake of “re-culturalize” and “re-ethnicize” Chinese Singaporean, the government developed the “Speak Mandarin Campaign” from 1979 with the slogan “Hua Ren Hua Yu”, which means “If you are Chinese, make a statement in Chinese”. Goh Chok Tong said in his speech delivered in 1991 “Speak Mandarin Campaign”, “Values and language cannot be easily separated...A Chinese Singaporean who does not know Chinese runs the risk of losing the collectivist wisdom of the Chinese civilization” (Zhang Yue & Zhang Kun, 2015).

After so many year’s implementation of “Speak Mandarin Campaign”, the result displayed from statistics seems fall short of people’s expectation. Although the Chinese literacy has a noticeable improvement, the status of Chinese in language use is still shown to be inferior to English. Members of Chinese community concerned that merely having Mandarin as the vehicle of traditional Chinese culture and emblem of Chinese identity does not guarantee its survival, unless Mandarin has its market value (Li & Huang, 2012). The Surge of Linguistic instrumentalism in Singapore led to the “old politics of identity” being increasingly abandoned “in favor of a new pragmatic position where language and culture were valued as commonly identifiable resources” (Heller, 1999). Therefore, maybe whether Chinese can still maintain its role as a culture vehicle and ethnic value transmitter will largely depend on its economic value.

## 5 Conclusion

By analyzing Chinese Singaporeans’ language use in terms of various categories, including different domains where languages are used, social status and age of language users, the tendency of language choice among Chinese Singaporeans has reflected the language hierarchy in Chinese community is English, Chinese Mandarin and Chinese dialects if ranked from high to low. For such hierarchy, language management is a determinant to its formation. Besides, a range of other influential factors, including history, geography, personal motivation, etc also play a large part in directing Singapore Chinese language choice, and sometimes their influence even overrides the power of language management.

The declining trend of Chinese use in Chinese Singaporeans probably put them at risk of losing their culture and ethnic identity. Although Singapore government has realized the importance of remaining traditional culture to Singapore’s future prosperity, and develop the “Speak Mandarin Campaign” among Chinese Singaporean to restore the language and culture, the results seems not so satisfactory.

Therefore, how to change Chinese Singaporeans’ attitude to Chinese and strike a balance between the linguistic instrumentalism and identity orientation remains a key issue in the following researches.

# **A Case Study of Chinese Students' Attitudes towards Flipped Classrooms**

Tang Xiaofei

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: xiao-fei.tang@whut.edu.cn)

**Abstract:** Higher education in China has been under a significant transformation from an elite educational system to a stage of massification over the past few decades. This calls for the use of a Small Private Online Course (SPOC) embedded flipped classroom. A question raises is the proposed model perceived by students as important and effective? This study reports on the feedback of a four-month experiment using a SPOC embedded flipped classroom format for a compulsory English-major course at a public university in Wuhan. Adopting an online-based questionnaire, the study looked into the attitudes of undergraduates toward learning of English language and culture through the proposed format. Major results showed that the proposed model was partially perceived as contributing to the development of students' autonomous, active and collaborative learning skills. However, some issues remained such as the time allocation of online learning and face-to-face instruction. Pedagogical suggestions were proposed including the provision of an introductory program.

**Key words:** Student's attitude; Flipped classroom; SPOC; Blended learning

## **1 Introduction**

Higher education in Mainland China has experienced a significant transformation from an elite educational system to a stage of massification since the first decade of the 21<sup>st</sup> century. In 2007, the Department of Higher Education launched the College English Curriculum Requirements, promoting a computer-assisted and classroom-based teaching model (Department of Higher Education of Ministry of Education of P.R.C, 2007). Furthermore, the National Foreign Languages Teaching Advisory Board draw up the *Guidelines on College English Teaching*, pointing out that computer and information technology should be widely applied to college English education since they not only facilitate the reform of teaching approaches and practices but also provide a large range of innovative learning resources (Ministry of Education, 2015).

One of blended learning approaches, the Small Private Online Course (SPOC), is called for as an alternative to enhance and innovate on-campus curricular contents through the platforms, technologies, and patterns of MOOCs (Zhang, 2017). According to Fox (2013), the SPOC supplements the traditional classroom experience with free online learning materials delivered through MOOCs. In a sense, the SPOC combines the features of face-to-face and online instruction and extends the existed courses of higher education to online education.

However, an interesting issue raises: how can we distribute and arrange face-to-face and online instruction for a SPOC-embedded English as a foreign language (EFL) course in higher education? A flipped classroom approach has the potential to address this issue. Compared to the traditional knowledge-transmission teaching, the flipped classroom approach removes face-to-face lectures from class time; instead, class presentations are transferred to as home activities whilst homework and projects are shifted to in-class tasks (Abeysekera & Dawson, 2015; Sohrabi & Iraj, 2016). Since the learning process is inverted in a flipped classroom, students have more access to using English inside and outside the classroom (Bergmann & Sams, 2012). Accordingly, students watch pre-recorded instructional videos via online platforms at home and engage in homework and activities collaboratively with their classmates during the class.

Although the recent attention has been paid to the flipped classroom approach (Akçayır & Akçayır, 2018; Bishop & Verleger, 2013; Butt, 2014; Jaster, 2013; Lee, Lim, & Kim, 2017; Lee & Wallace, 2018; Shih & Tsai, 2017; Zain Uddin & Attaran, 2016), there is little empirical evidence of the real status of the SPOC embedded flipped classroom model in Chinese higher education and whether it is perceived as important and effective, particularly in EFL classrooms. The established studies focus on the design and principles of flipped classrooms in Mainland China (Jiang & Hu, 2018; Luo, 2017; Wang, 2017; Zhang, 2017; Zhang & Tao, 2017; Wang, Chen, & Zhang, 2016). Therefore, this study aims to investigate undergraduate students' perspectives on the SPOC embedded flipped learning model in an EFL course at a Chinese public university.

## **2 Methodology**

### **2.1 Informants**

This study involved a compulsory EFL course for undergraduate English majors, “*Society and Culture of Britain and America*”, collaboratively taught by three lecturers who were affiliated with the same department in the autumn semester of 2018 at a public university in Wuhan, Hubei. One hundred and fifty students enrolled in this course with six classes, and each lecturer instructed two classes. The number of students in each class was 25. A total of 122 students voluntarily participated in this survey and completed an online questionnaire at

the end of the semester. The majority of the participants were freshmen (94.26%), while the remaining consisted of six sophomores (4.92%) and one junior (0.82%). Prior to attending this course, only 13.93% had experience in online learning, while more than one-fifth (21.31%) claimed that they previously had no idea about this concept. The remaining participants (64.76%) demonstrated a limited or little understanding of online learning.

## **2.2 The SPOC embedded flipped classroom**

The course lasted for four months, throughout September to December, 2018. Each class ran twice a week for 90 minutes. The three teachers had a regular meeting every Friday to determine the topics of discussion and collaborative tasks as well as the face-to-face instruction process for the next session. All the teaching materials were developed on the basis of the course outline and curriculum requirements and then produced into a SPOC on the China Universities MOOC.

The teachers implemented the flipped classrooms through requiring students to complete self-paced online learning before class, including watching instructional videos, listening to recorded audios, reading passages, and making use of online learning resources via the SPOC platform. Additionally, students were required to undertake an online quiz each week, which was designed for evaluating the students' work and progress. The students received the results of the quizzes immediately through the online platform.

During the face-to-face sessions, the instructors facilitated the collaborative learning through leading students to engage a variety of in-class tasks and activities. Firstly, students were required to bring their own smart devices, including smart phones, tablets, or laptops, to complete homework via the SPOC platform. Each homework consisted of 10 multiple-choice questions and was created according to individual lessons. The results of homework were released instantly through the online learning system. The instructors also provided feedback to address the unclear issues proposed by students. Secondly, students were asked to participate in group discussion, concentrating on a range of pre-determined topics. The teachers offered a summary of group discussion at the end of every session. Lastly, students were told to share their questions and concerns with respect to pre-class online learning, while other classmates were encouraged to provide corresponding solutions, followed by the teachers' comments.

## **2.3 Instrument and procedures**

The researcher carried out an online survey to investigate the attitudes of students towards the proposed approach and their perceived benefits. The questionnaire comprised 10 multiple-choice questions (see Table 1-3) and 1 open-ended question. All the survey items were

designed on the basis of the nine principles for the flipped classroom developed by Kim, Kim, Khera, & Getman (Khera, & Getman, 2014) which provided a comprehensive insight into the application of flipped teaching in urban universities with computer-assisted technologies. The nine design principles for flipped teaching are listed as below (see Kim et al., 2014, pp. 43-46).

- provide an incentive for students to prepare for class;
- provide a mechanism to assess student understanding;
- provide prompt/adaptive feedback on individual or group works;
- provide enough time for students to carry out the assignments;
- provide facilitation for building a learning community;
- provide technologies familiar and easy to access;
- provide an opportunity for students to gain first exposure prior to class;
- provide clear connection between in-class and out-of-class activities;
- provide clearly defined and well-structured guidance.

For the current questionnaire, the 10 multiple-choice questions aimed to look into students' attitudes towards the SPOC and flipped classroom model, active and autonomous learning mode, and collaborative learning mode, while the open-ended question was intended for learning students' opinions of benefits or shortcomings of the flipped classroom structure. Cronbach alpha <sup>80</sup>for the five Likert scale items was conducted and revealed a value of .72, which was considered an acceptable value for reliability. To avoid misunderstanding, all the questions were presented in Chinese.

At the end of the final session, all the participants were invited to use their own smart devices to complete the online questionnaire anonymously within 20 minutes. The participants were delivered a consent form and an instruction of the online survey in advance. The researcher and the course instructors did not enter the class whilst questionnaires were being completed by consenting students and were not allowed to access any survey data until after final grades had been submitted.

The quantitative data from multiple-choice questions were analyzed through SPSSAU v16.0 Software. In order to obtain a more comprehensive picture of the students' perspectives,

---

<sup>80</sup> Please check Santos (1999) for reference.

the researcher checked through the participants' responses to the open-ended question and marked the key words concerning their likes, dislikes, and suggestions to identify specific topics. The similar patterns within the topics were then generalized according to the overall features of SPOC embedded flipped classrooms, such as subtitles of the instructional videos, teaching content, homework, discussion, and peer interaction.

### 3 Results

Table 1 shows the results regarding the undergraduates' attitudes towards the SPOC and flipped classrooms through five survey items. Firstly, 60.66% of the respondents agreed or strongly agreed that they liked the online learning mode and enjoyed interacting with the instructor through flipped classrooms, and 33.61% were not sure. Secondly, 33.61% agreed or strongly agreed that they did not adapt themselves to the SPOC embedded flipped classroom very well, and over half of the informants (51.64%) held a neutral attitude. Only 14.75% showed a positive attitude about their adaptation to the proposed teaching approach. Thirdly, over a fifth of the respondents (22.13%) agreed or strongly agreed that they did not feel free while engaging with the SPOC embedded flipped classroom, while more than one-third (33.61%) indicated the opposite perspective. The rest of the participants (44.26%) were not sure. Fourthly, over two fifths of the respondents (43.45%) agreed or strongly agreed that they preferred the traditional knowledge-transmission classroom than the SPOC embedded flipped classroom, whilst less than one fifth (19.67%) held the opposite attitude. The remaining (36.89%) held a neutral position. Fifthly, 38.52% agreed or strongly agreed that the SPOC embedded flipped classroom approach was more beneficial than the traditional classroom instruction, while only 8.2% clearly opposed that. Over half of the respondents (53.28%) showed a vague attitude.

**Table 1 Attitudes toward SPOC and Flipped Classrooms**

	Strongly agree	Agree	Not sure	Disagree	Strongly disagree
I like online learning and interacting with the teacher	4.1%	56.56%	33.61%	3.28%	2.46%
I don't adapt myself to the new model very well	2.46%	31.15%	51.64%	13.93%	0.82%
I don't feel free while engaging with the new model	4.1%	18.03%	44.26%	31.97%	1.64%
I prefer traditional classrooms than flipped classrooms	9.02%	34.43%	36.89%	18.03%	1.64%
I reckon that the new model is more beneficial	0.82%	37.7%	53.28%	6.56%	1.64%

Table 2 reveals the findings of the students' attitudes towards the active and autonomous learning mode. First, over two fifths of the participants (40.99%) agreed or strongly agreed that they were able to arrange their online learning and manage their learning progress well, and approximately half of the respondents (49.18%) indicated an unsure position. Second, more than half (51.64%) agreed or strongly agreed that they had more available time to consider the relevant questions while studying the SPOC, and nearly two fifths (39.34%) were unsure about that. Last but not the least, 45.9% affirmed that the SPOC embedded flipped classroom model advanced their autonomous learning skills and enabled them to learn more actively, while almost the same amount of the respondents (45.08%) had a neutral attitude.

**Table 2 Attitudes toward Active and Autonomous Learning**

	Strongly agree	Agree	Not sure	Disagree	Strongly disagree
I can arrange online learning and manage learning progress	4.1%	36.89%	49.18%	7.38%	2.46%
I have more time to think through the questions	8.2%	43.44%	39.34%	7.38%	1.64%
It advances my autonomous and active learning skills	2.46%	43.44%	45.08%	8.2%	0.82%

As Table 3 indicates, the results of the undergraduates' attitudes regarding the collaborative learning mode are tabulated according to two survey items. First, nearly half of the informants (45.9%) showed agreement or strong agreement that they could interact better with other classmates and learn more from each other, whilst 43.44% held an unclear position. Next, over a half (53.28%) agreed or strongly agreed that their teamwork spirit and cooperative skills were advanced via the SPOC embedded flipped classroom approach, and 36.07% were not certain about their perspectives of that.

**Table 3 Attitudes toward Collaborative Learning**

	Strongly agree	Agree	Not sure	Disagree	Strongly disagree
I can interact better with and learn more from classmates	0.82%	45.08%	43.44%	9.02%	1.64%
My teamwork spirit and cooperative skills are advanced	2.46%	50.82%	36.07%	9.84%	0.82%

In addition, the open-ended comments<sup>81</sup> of the online survey were highly varied and difficult to pin down significant consistencies. The categories and keywords that were most frequently mentioned in the students' comments were that of the "online" and "time" aspects of the course. The time allocation of online learning and face-to-face instruction appears to be the most conflicting issue among the students' responses. Some students clearly indicated that they favored online-based learning and recommended further implementation of SPOCs instead of traditional in-class lectures, as exemplified in "Online learning is very interesting, and I can manage my study time. I suggest this course should be developed as 100% online instruction mode" (Student A) and "I learned a lot from online course. Hope the teacher can increase the online lessons and upload more supplementary materials to the SPOC" (Student B). However, responses to weaknesses of the proposed model tended to suggest more use of traditional in-class sessions rather than online learning, such as "The time allocation for online learning seems a bit too much, which sometimes makes me stressed" (Student C), and "More units should be delivered by in-class sessions" (Student D).

#### **4 Discussion**

First, with respect to general attitudes towards SPOC and flipped classrooms, the students showed significant consistency in favoring online learning and interacting with teachers and approximately two-fifths believed that the new teaching format was more beneficial. However, a majority of students did not feel or were hesitant that they got along well with the new model and preferred it to traditional face-to-face instruction. Most of students were open to this new attempt, but they were less satisfied with classroom structure than those in a traditional class were. This finding is relatively consistent with the result reported in Jaster (2013) which concludes that a majority of students enrolling in a first-year algebra course at an American college prefer a traditional lecture approach to a flipped classroom. A possible account for students' converse preference is that almost all the participants are first-year undergraduates and they may not get prepared for an immediate transition from a familiar instructional mode to an unfamiliar one. Those students mostly graduated from public high schools in Mainland China where traditional face-to-face lectures were exclusively employed. Thus, the lack of self-confidence might result in their conservative attitudes towards the SPOC and flipped classrooms.

In terms of active and autonomous learning mode, the students demonstrated more satisfaction with the flipped classroom structure. Approximately half of students became

---

<sup>81</sup> The students' responses to the open-ended question were originally presented in Chinese. The author translated the comments quoted in Section 3.

positive towards their self-paced learning through the online platform and believed that the new model contributed to their autonomous and active learning skills and critical thinking. This result generally follows Zain Uddin & Attaran (Zain Uddin & Attaran, 2016) which finds that 78% of students favor the innovative learning mode of flipped approaches since it provides more time for them to perform individual study and practice teaching contents outside the class. However, slightly over half of students did not believe or felt uncertain that they could manage their learning progress. This may result from the fact that most of students still feel more comfortable about passively receiving knowledge from the instructor in a teacher-centered classroom and thus have not established a strong motivation for self-driven learning. Moreover, a majority of them previously had a limited or no understanding of flipped learning, so they might not be familiar with how to properly carry out autonomous and online learning.

In regard to collaborative learning mode, over half of students were positive towards their teamwork experiences and peer cooperation via the flipped classroom, whilst slightly less showed their confidence in peer learning and interaction. Similarly, 67% of students as reported in Zain Uddin & Attaran (Zain Uddin & Attaran, 2016) claim that flipped learning helped develop good virtual rapport among them outside the class. The flipped classroom model is a student-centered pedagogical approach, and thus students have more opportunities to communicate with their classmates by means of technology out of class and to actively participate in collaborative hands-on tasks or activities during the sessions. However, the result also suggests that more efforts need to be made in order to strengthen students' faiths and motivation in acquiring knowledge and skills through active helping and supporting their classmates.

In addition, the students' comments on the open-ended section draws our attention to a highlighted issue of flipped classrooms, namely, the time allocation of online learning and face-to-face sessions. Some students liked the ability to work at their own pace and time through online platforms, while others raised their concerns including more workloads from online course stressing them out and seemingly imbalance between online learning and face-to-face instruction. These concerns are similar to what have been discussed in the literature regarding criticisms of flipped learning (DeGrazia, Falconer, Nicodemus, & Medlin, 2012; Toto & Nguyen, 2009). They are possibly caused by the heterogeneity of students in class. The diversity of their English proficiency and learning demands may determine their different preferences for instructional formats.

## **5 Conclusion**

This study reports on English-major undergraduates' perspectives on a SPOC embedded flipped classroom model at a public university in China. The results revealed that, on average,

around half of students were positive about the use of the SPOC-embedded flipped classroom model in the current course, but the feedback from a few of survey items was somewhat mixed in regard to students' general attitudes toward SPOC and flipped classrooms, active and autonomous learning mode, and collaborative learning mode.

Several suggestions are proposed in order to improve the effectiveness of the current flipped classroom model. Firstly, an induction program for SPOCs and flipped classrooms needs to be established, so that students can obtain more guidance in developing their online, autonomous, and cooperative learning skills. Secondly, the instructors need to check the discussion board of the SPOC platform more regularly and address individual questions posted by students more efficiently. Regular assistance from student tutors may be an addition to practicing teaching strategies. Thirdly, a pre-course assessment may be helpful to have a better understanding of different levels of students' English proficiency. In addition, online learning materials need to be graded into fundamental and advanced materials in line with students' learning readiness.

Noteworthy, the following two limitations may influence the generalizability or interpretation of the present findings. The first issue concerns the validity of the collected data. Due to the limited scope and length of the current case study, the future research requires an appropriate quantitative data analysis approach in order to offer a better understanding of the students' attitudes toward the SPOC embedded flipped classroom model. The second issue relates to the limited range of survey items. A broader range of survey items needs to be considered in the design of questionnaire.

## The Impact of CBI on non-English Majors' Critical Thinking Skills

Wan Zi

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wanzi@whut.edu.cn)

**Abstract:** Recent research on critical thinking (CT) centers on the CT facilitation model for English majors and the construction of theoretical hierarchy of CT, but there are few studies concerning the approaches and practices of the development of CT skills in College English context. In an attempt to improve non-English majors' CT skills and produce innovative international talents, content-based instruction(CBI) that features CT development is proposed, which aims at building up a questioning atmosphere in classroom context, exploring relevant themes by focusing on contents, constructing online learning platforms, and combining summative and evaluative assessment. In order to test to what extent CBI has impacted learners' CT skills in College English classroom context, a survey was conducted by issuing questionnaires to respondents (n=108) in Wuhan University of Technology. The results show that CBI is beneficial to language learners in facilitating CT skills; however, there still exist problems such as the difficulty in choosing appropriate teaching and learning materials, students' varied receptivity of the teaching strategy based on their respective levels of English and how to strike the balance between CT skills development and language skills enhancement.

**Key words:** Content-based instruction; Critical thinking; College English; Non-English majors

### 1 Introduction

It is proven by the fact that traditional pedagogy lays more emphasis on the pattern drills of language and the training of language skills, neglecting the cultivation of higher order thinking--CT skills of students, which has become the greatest barrier to fostering students' analytic, evaluating and creative abilities. Language classes in China are more like language centers aimed at improving language proficiency than places where English learners with independent and innovative thinkers are trained (Huang, 2010). Such teaching methodologies have brought about undesirable consequences in teaching objectives, curriculum setting, construction of knowledge and students' ways of learning English, which call for entire transformation in educational pedagogies.

Large quantities of overseas and domestic studies of CBI have proven the validity of CBI. The notion CBI (content-based instruction) emerged as solutions to social needs especially for immigrants who took immersion programs to cope with language problems and there emerged successful teaching prototypes (Duenas, 2004). Content-based instruction (CBI) means language learning rests upon a certain discipline or theme teaching with integration of language learning and disciplinary learning with an aim to enhance learners' language competence while improving learners' abilities of cognition and disciplinary learning. CBI teaching mode combines language forms and the meaning of learning together, eliminating the partition between language learning and disciplinary learning make by people deliberately (Mohan, 1986), which is beneficial in stimulating learners to think and learning new knowledge in the target language, thus integrating the four languages skills such as listening, speaking, reading and writing. According to Stryker & Leaver (1997), CBI should follow three major principles that feature disciplinary learning as the core, authenticity of language learning materials and fitting in

with the needs of special groups of students. Domestic studies reveal that CBI not only helps improve learners' English competence, contributes to enlarging learners' knowledge of their specialties but also generate positive effects on learners' motivation, English learning strategies, interests in learning English (Chang, 2007) and comprehensive qualities required by workplace (Yuan & Yu, 2008).

There is an increasing number of studies on critical thinking (CT), which center on the integration of the fostering of CT and foreign language skills. CT is fundamental to higher education and is presented to students as an integral part of learning at university (Moore, 2011) and it is a purposeful, self-regulatory judgment which results in interpretation, analysis, evaluation, and inference, as well as explanations of the evidential, conceptual, methodological, or contextual considerations upon which the judgment is based (Facione, 2015). Educational researchers (Halpern, 1993) find that better thinking can be "learned through instruction". Paul & Elder (2008) regard CT as the art of analyzing and evaluating thinking with a view to improving it. Abrami et al. (2008) has demonstrated that explicit teaching have better effects on CT development compared with implicit teaching and Bensely & Spero (2014) also prove that direct teaching of specific CT skills in regular course such as argument analysis and critical reading skills significantly improved college students' CT performance and metacognition. In China, researches centered on CT have gained concern from scholars recently, which mainly fall into three categories: the urgency of promoting instruction of CT skills in second language learning and approaches to cope with the status quo (Luo, 2000), the revision of the Chinese version of CT assessment tools and the establishment of theoretical framework of measuring CT abilities (Wen, 2010), and empirical studies on the CT skills of non-English majors and instructors at tertiary institutions (Li, 2011) According to Wen (2010), she proposed a theoretical hierarchy of measurement on critical thinking skills that is operational in real teaching process. The first meta-critical thinking refers to the abilities of planning, checking, adjusting and evaluating skills; the second level of critical thinking includes the skills and criteria related to cognition and affective CT qualities.

Overseas studies have tested the effectiveness of CT instruction through empirical support; however, relevant studies have not tackled the impact of CBI on English learners' critical thinking, especially under the framework of College English. This study aims to test whether CBI might be of help in improving non-English majors' critical thinking skills and attempts to demonstrate the model of applying CBI for practitioners and professionals. The lack of CT will affect people's creativity, research abilities and problem-solving abilities, therefore the problem that prevails among non-English needs to be addressed. CBI integrates language learning and disciplinary learning, thus helping language learners to think and acquire new knowledge in the target language, which might be of benefit to the cultivation of CT skills of non-English majors at the tertiary level. And this study aims to find out how CBI could facilitate language learners' CT skills and what adjustments in CBI can be made to enhance comparatively weak CT skills of the non-English majors and present a prototype for language practitioners and teachers at the tertiary level.

For this study, it will mainly focus on the correlation between the implementation of CBI and its impact on CT skills of non-English majors at the tertiary level.

## **2 An Example**

In order to implement CBI into real teaching practice with a view to cultivating language learners' CT skills, a framework has been established, featuring a classroom context that encourages questioning,

Content-based Instruction(CBI) and the combination of summative and evaluative assessment.

First, a classroom setting where students could question and cultivate their affective CT qualities is constructed. To this end, teachers should interact with students on an equal basis where teachers are the facilitator, mediator and manager instead of being an authority on the stage. For instance, in the teaching design, students are supposed to watch TED talks and summarize the main ideas, give presentations on the topic and answer questions from the audience concerning the contents they have presented. For the TED talkers, they are able to meet the challenges with full preparations that were done previously, including understating relevant concepts or definitions, training delivering skills, distinguishing facts and opinions and developing their own ideas during the process of which their questioning spirit has been enhanced.

Second, CBI is employed as the strategies that run through the completely teaching procedures. The teaching contents can centre on disciplinary knowledge and any themes in the knowledge system in the target language. Under such a teaching concept, the choice of teaching materials can create a meaningful learning context by combining language learning and disciplinary knowledge, thus challenging students' cognition. In real teaching practice, project-based teaching is implemented, which is a concrete application of CBI. Based on Stoller's research, a project is carried out in 6 procedures: choosing topics, setting schedules, carrying out projects, analyzing and summarizing data or resources they have collected, sharing their findings in presentations and evaluating their gains and room for improvements. For teachers, they should guide students to find the themes that may arouse their interests, keep up with social issues, raise their awareness of analyzing the reasons behind and ultimately form their own cognition and judgements by integrating language skills and disciplinary learning. For instance, in the study the teacher divides themes into different categories including education, environment, science and technology, economy and politics and career planning from newspapers, magazines or journals such as the Economist, New York Times or New Scientist. While helping students to broaden their cross-cultural horizons, the teacher provides timely help in training students' language skills that include topic sentence writing, distinguishing opinions and evidence, making comparison and contrast, writing summaries and group reports. Take Unit 4, College English 4 for example, one of the group project is the theme of globalization and the group members should gather data from every possible source to explore the definition of globalization, benefits and drawbacks of globalization as well as how to tackle the current problems associated with globalization under the global context of trade war between America and China by referring to relevant essays, TED talks and news reports. After the group has presented their research findings, they will defend their stance in class in response to the audience's questioning and finish self-assessment after class.

Third, online English learning platform is under construction. According to Wen (2010), she points out those cognitive skills are the major expression of CT skills including analyzing, reasoning and evaluating. Learners can regulate and adjust their cognitive process by planning, monitoring and assessing skills. One of the most effective strategy for learner training and mastering cognitive skills is learner autonomy that helps to cultivate their positive affective qualities. The construction of online learning platform that supplements classroom teaching can meet students' individualized needs, thus increasing classroom efficiency. Though the combination of off-line and online learning, learners can get access to large quantities of real-context language drills, immerse themselves in English environment with a purpose of exploring the assigned project and improve their language skills and CT skills.

Fourth, summative and evaluative assessment should be combined. Learners' profile should be made and students' classroom performance should be taken into consideration and the attributes of assessment should include learners themselves, group members and teachers. Though such dynamic evaluation, learners will be able to review, assess and revise their performance or assignments, which is one of the most important targets of self-regulation concerning CT skills.

### 3 Data and Methodology

#### 3.1 Research questions

The overarching goal of this project is to discover the impact of CBI on critical thinking skills among non-English majors at the tertiary level in China. The research questions to be addressed are as follows

- 1) Does the application of CBI in College English classroom context affect CT skills of non-English majors?
- 2) What adjustments in CBI can be made to enhance CT skills of the non-English majors while promoting their language learning?

#### 3.2 Subjects

The respondents (n=108) are non-English majors who study at Wuhan University of Technology in the second semester, their disciplines ranging from material engineering(28), business administration(24), industrial design(14), civil engineering(12), vehicle engineering and others(30). There are 61 male and 47 female freshmen.

#### 3.3 Instruments and design

An online survey in the QQ group was conducted before the end of the semester when the course was drawing to an end. During the whole semester CBI was employed as the major teaching strategies that guide through all teaching procedures. Based on the Chinese version of California Critical Thinking Skills Test (CCTST) that is the most extensively used CT skills testing instrument(Albrami et al., 2014) and Wen's (2010) framework of CT skills, a questionnaire was issued online to four classes, consisting of three parts that mainly include the evaluation of self-regulatory skills, cognitive skills and affective qualities. 108 copies of results were obtained.

Based on the data gathered from the two groups, the research will analyze to what extent CBI plays in fostering CT skills and adjustments in CBI that can be made to enhance CT skills of the non-English majors.

### 4 Results

The results can be analyzed from four angles in accordance with the theoretical hierarchy of CT. Altogether 108 responses were obtained.

**Table 1 Mean Scores of the Items for Measuring Respondents' Self-regulatory Skills**

Self-regulatory skills	Mean
I know my own strengths and weaknesses during the whole project and how to work on my weaknesses with a specific plan after adjustments.	3.82

The lower level of the theoretical hierarchy of CT concerns whether learners could regulate their own study plans and make adjustments based on their own evaluation on the previous performance. The respondents show rather positive assessment of their employment of self-regulatory skills with a mean score of 3.82, which demonstrates that they know their strengths and weaknesses in the whole project. However, they still express the problems in CBI in the semi-structural interview, such as how to distribute group work, difficulty in presenting their ideas due to lack of language competence, how to grasp the usage of new vocabulary when the explanation of words and phrases is greatly reduced and how to handle those large quantities of sources that might cause trouble in deciding the priorities of them, and etc. Therefore, relevant guidance should be given to students through different channels to cultivate their self-regulatory skills. First, teachers should let students understand the goal of CBI is not only confined to enlarging vocabulary, mastering vocabulary and understanding the superficial meaning of information but guiding them to learn how to discuss, question and evaluate different arguments, thus thinking from cross-disciplinary perspectives and raising their own ideas. For instance, social, cultural and economic issues such as climate change, whether to celebrate foreign festivals, globalization etc. might be chosen as discussion or debating topics, which requires students to follow certain research methods to get convincing evidence that could serve as support for their arguments. By doing this, language competence can be enhanced through the integrated methods.

**Table 2 Mean Scores of the Items for Measuring Respondents' Cognitive Skills**

Cognitive skills	Mean
1. I am able to choose, analyze, categorize and make comparisons among the source materials.	3.95
3. I can distinguish thesis statements and their support in TED talks or reading materials	3.82
4. In other groups' presentations, I often evaluate the plausibility of their arguments.	3.55
5. I can decide on the important concepts or definitions in the presentations accurately.	3.56
6. I am good at making a systematic plan to handle difficult problems.	3.52
7. In my group's presentation, I could explain my points clearly with appropriate support.	3.87
8. In order to finish the project, we refer to convincing newspapers, essays and website.	3.96

According to the theoretical hierarchy of measurements on CT skills presented by Wen (2009), the items in Table 2 mainly measure the cognitive skills of the respondents. Overall, the respondents' assessment of their own skills in analyzing, distinguishing opinions and support, finding out the major concepts, viewing things from a holistic point of view and being aware of providing convincing source is relatively positive, with Q 1 and Q8 ranking the highest (3.95 and 3.96). However, the figure for Q 4, Q 5 and Q 6 are comparatively low with 3.55, 3.56 and 3.52 respectively, which means the respondents tend not to easily analyze how plausible others' arguments are and might encounter troubles in finding out the important concepts or ideas that are essential as premises of their arguments; what's more, they assume that they could not give a holistic point of view of tackling difficult problems while they are preparing presentations.

Based on the results obtained from the survey, the respondents are on the preliminary stage of applying critical thinking skills, exercising analyzing, distinguishing opinions and evidence and

summarizing skills to a certain extent, which shows the application of CBI is beneficial in cultivating students' critical thinking skills. For teachers, they should know that while maintaining students' language training, they need to guide students to use English as the media for reading, thinking and language output. Besides, teachers should give students certain academic training and help them to absorb disciplinary knowledge by learning English. In real classroom settings, teachers should know how to raise questions that could provoke their critical thinking. For example, Socratic questioning can be adopted in the procedures of clarification, giving explanation, presenting viewpoints or perspectives as well as making summaries. What's more, individual and group tasks should be made explicitly so that student could know what preparations they should make, which research methods they should follow and how to tackle specific tasks more efficiently

**Table 3 Mean Scores of the Items for Measuring Affective Quality**

Affective emotions	Mean
9. My curiosity and desire for knowledge is appreciated by others	3.25
10. I respect others' different views and am willing to revise my own opinions if they are wrong.	4.27
11. I am afraid to ask questions concerning the contents, especially when others' presentations are over.	3.10

Another category that belongs to the second theoretical hierarchy of CT model is affective emotions. In this section, the degree of curiosity, openness to different views, self-confidence, integrity and perseverance is the measurement of CT skills. The mean score reaches 4.27 in Q 7, meaning the respondents are willing to listen and modify their own opinions with openness; when it comes to Q 11, the subjects generally shows uncertainty about the cause of their unwillingness to challenge other presenters by raising questions. A follow-up semi-structured interview was conducted along with the survey. The reasons behind the phenomenon are as follows. Firstly, they are too shy to raise questions for they are unable to organize their ideas in a grammatically correct way; second, they do not know how to ask questions because they are afraid the questions they raised might be meaningless; thirdly, others' presentations sometimes fail to provide them with a better understanding of the topic, causing boredom in the audience. As for Q 9, the figure is not high as expected for cultivation of curiosity is what should be enhanced in CBI. Only if the teaching contents and the group projects they undertake bear close relevance to their personal experiences and solutions to certain social issues can their curiosity be stimulated to a large extent.

The results can provide some hints for CBI teaching. The training of CT skills in college English teaching might yield negative results if an atmosphere that encourages critical thinking is not established. Teachers should work as scaffolds to offer relevant vocabulary and phrases, sentence drills, question types and discussion samples for them so that they can imitate instead of all working by themselves, thus helping them developing confidence little by little and ultimately building up open-mindedness, fairness and integrity in the thinking process.

## 5 Conclusion

The results of the survey demonstrate that CBI featuring the integration of language learning and

disciplinary learning does facilitate students' CT skills that help them to become more confident and build up a questioning mind by engaging themselves in the activities such as presentations, analyzing, interpreting, questioning and evaluating. In order to achieve the desired effect of adopting CBI, the classroom setting that promotes questioning, open-mindedness and fairness, the appropriate approaches that are combined with Socratic questioning, the online platform that works as scaffolds to offer learners relevant sources and guidance should be integrated in order to enhance learners' language competence and critical thinking skills at the same time.

The research on the impact of CBI on CT skills gives the following implications. First, language is not only the study subject but also a tool for adjusting language learning; second, language as an intermediate tool can promote the cognitive development of learners as well as language building; third, language learning is a social activity that involves many agents such as language, interactive tasks and real socio-cultural learning settings, which requires language learning to be interwoven with disciplinary learning, making learning tasks more meaningful and related to learners' needs.

The greatest hinderance to the cultivation of talents who can meet the challenges of the era of science and technology is lack of CT skills among undergraduates at the tertiary level. Innovations need those who have good language skills as well as innovative spirits that could be promoted by training students' CT in English classroom context. The teaching concepts of CBI can fit in with the requirements by combining the cultivation of language competence and disciplinary learning. However, a more specific test should be given to the respondents to get more objective results of the changes in their employment of CBI before and after the experiment, which might be revised in the future. Besides, the choice of materials that can facilitate CBI need to be reckoned with in the era of big data. Teachers should rely on the statistics of the big data to decide on the appropriate materials that might arouse students' interests and train students' competence in a more comprehensive way.

# **Research on the Influence of Five-chain Coordination on Regional Innovation Capability**

Teng Liangwen, Zhou Jiang, Chang Yuming

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: gy\_tlw@whut.edu.cn, 376304265@qq.com, 1120105867@qq.com)

**Abstract:** With the national innovation-driven development strategy continues to advance, the coordinated development of regional innovation is becoming more and more important. This paper explores the key factors affecting regional innovation capabilities from the perspective of “five-chain co-ordination”. On the basis of the research on “industrial chain”, “innovation chain” and “financial chain”, the “talent chain” and “policy chain” are introduced: constructing a "five-chain coordination" system including "industrial chain, innovation chain, financial chain, policy chain, and talent chain". According to the panel data of the National Innovation Reform Experimental Zone, the paper studies the concept, mechanism, causes of the “Five-chain Coordination” and the concepts, dimensions of regional innovation capability, and the impact mechanism of the two, in order to provide reference and basis for the government to formulate relevant policies for regional innovation systems.

**Key words:** Five-chain coordination; Regional innovation capability; Policy balance; Regression analysis

## **1 Introduction**

In May 2016, at the National Science and Technology Innovation Conference, General Secretary Xi Jinping pointed out that “innovation is a systematic project. The innovation chain, industrial chain, financial chain, and policy chain are intertwined and mutually supportive. Deepening reform must be fully deployed and coordinated.” At the same time, talents are the mainstay of innovation. To build a world of science and technology, it is necessary to constantly inspire the innovative vitality and potential of all types of talents. Therefore, how to implement “innovation chain, industrial chain, financial chain, policy chain and talent chain” in the practice of innovation reform, analyze the influence mechanism and effectiveness of “five-chain coordination” on regional innovation, and promote innovation-driven development and regional collaborative innovation have important practical significance.

The foundation of “five-chain coordination” comes from the theory of collaborative innovation between industry, university, and research. Etzkowitz proposed the Triple Helix Model in 1995, through this model, he explained the spiral relationship between the university, enterprise and intergovernmental knowledge innovation (Etzkowitz, 1995), Leydesdof developed and systematized the triple helix theory (Leydesdof, 2011). The three main points of the market-oriented, enterprise as the main body and government-led reflect the connotation and characteristics of the industry-university-research cooperation system with Chinese characteristics at this stage (Li Jian, 2011). Based on previous research, Chen Jin and others focused on and explored the integration dimension and interaction intensity, and constructed a framework for collaborative innovation. (Chen Jing, Yang Yinjuan, 2012)

In the field of “three-chain integration” of industrial chain, innovation chain, and financial chain, Tidd and other scholars pointed out that due to the lack of systematic comprehensive considerations, many innovations have not achieved the expected results, because the interaction between the various elements in the system is neglected in the innovation process. The synergy between the elements. In 2016, Wang Xiangwang, then the director of the Wuhan Municipal Development and Reform Commission, proposed the “five-chain coordination” of scientific and technological innovation, and for the first time expounded the internal logic of “talent chain, policy chain, industrial chain, innovation chain, and financial chain”.

In summary, at present, scholars at home and abroad have already studied the basic theories and principles of “industry, university, and research” cooperation and collaborative innovation. However, there are few studies on the theoretical mechanism and the empirical test of the “five-chain coordination” of scientific and technological innovation. Therefore, the relevant results and model design of this paper are of great significance to national strategies such as innovation-driven development, the development of the Yangtze River Economic Belt and Beijing-Tianjin-Wing coordinated development.

## **2 The Definition and Principle of "Five-chain Coordination"**

Before the Wuhan Municipal Development and Reform Commission put forward the “five-chain co-ordination” in 2016, relevant research at home and abroad is mainly aimed at the research of traditional “industry, university, and research” cooperation, the research on the three-chain integration of industry chain, innovation chain and financial chain, or the collaborative innovation of the internal elements of the chain. In recent years, domestic scholars have gradually increased the research on “five-chain co-ordination”. However, the definition of “five-chain co-ordination” is still inconclusive.

By studying the relevant literature on collaborative innovation of industry, university, and research, based on the research on the integration of industry chain, innovation chain, and financial chain. In this paper, the definition of “five-chain coordination” is as follows: “five-chain coordination” refers to

promoting the coordinated development of regional innovation, deploying the innovation chain around the industrial chain, focusing on the innovation chain to improve the financial chain, and integrating three chains to build talent chain, support policy chain, to achieve high-end industrial chain, full chain of innovation chain, diversified financial chain, rationalization of talent chain, precise policy chain, and ultimately enhance the process of innovation.

The process of coordination is actually the process of interaction between the various chains. The innovation chain drives the industrial chain, which is the process of “deploying the innovation chain around the industrial chain”. In fact, the innovative approach is to improve and optimize the issues of scale, profitability, structure, and transformation in the industrial chain. The essence is to improve regional innovation capability.

The financial chain supports the innovation chain, which is to explore "focusing on the innovation chain to improve the financial chain." The process of innovation is inseparable from the support of funds. Scientific and rational allocation of funds can maximize innovation. Targeting different types of configurations for different types, different stages and different scenarios of the innovation chain, the financial chain can truly achieve the goal of supporting the innovation chain.

Finally, it is "integrating three chains to build talent chain, support policy chain " It is the important reason and ultimate goal of “five-chain coordination” to realize the integration and coordination among various innovation systems, among various chains, among various innovation entities and innovation elements through the talent chain and policy chain. The talent chain and policy chains are the guarantee and guidance for the three chains. The talent chain and policy chain must serve all links of the industrial chain, follow up the various stages of the innovation chain, and standardize the various forms of the capital chain. Realize the integration of resources and finally realize the systematic coordination between the five chains.

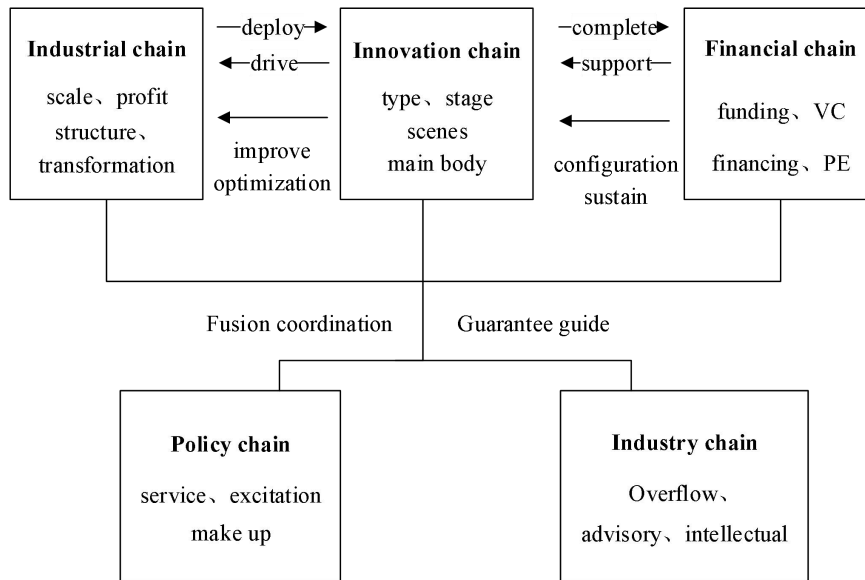

Figure 1 The Principle of "Five-chain Coordination"

### 3 Analysis and Assumptions

#### 3.1 Basic analysis

This paper starts from the macro-level of "five-chain coordination" and conducts empirical research and analysis. To further study the effects of these concepts, it is necessary to find the appropriate variables to measure. Since it is a macro level of inquiry, its variables are relatively more high-level. Therefore, in the conceptual model, this paper proposes two variables such as policy balance and regional innovation capability. Exploring the impact of "five-chain coordination" on regional innovation capabilities by exploring the relationships between these variables.

#### 3.2 Policy balance and regional innovation capability

The current problems in China's current regional innovation system mainly focus on the fragmentation of industrial innovation resources, unclear innovation subjects, and poor investment and financing channels. These problems happen in the three major segments of the industry, innovation and financial. The policy chain is needed for overall planning to guide the regional innovation system.

Table 1 Distribution of Three-chain Policies in Shanghai, Beijing, Hubei, and Heilongjiang

province	years	Industrial chain	Innovation chain	Financial chain
Shanghai	2013	58	68	65
	2014	66	86	76
	2015	112	146	127
Beijing	2013	38	43	40
	2014	33	42	33

	2015	45	59	53
	2013	66	81	87
Hubei	2014	74	84	84
	2015	83	110	107
	2013	31	27	41
Heilongjiang	2014	54	40	50
	2015	59	49	63

This paper proposes the use of policy balance as a proxy variable for measuring region for the three-chain integrated policy chain. Through the analysis of regional policies related to industry, innovation and financial in recent years, and the word frequency statistics, to measure the correlation between policies and the three major chains, the number of related policies is counted, and the calculation of Gini coefficient is used to measure the degree of uniformity of policy distribution across regions, combined with the ratio of the number of four-chain related to the total number of policies, gives the policy balance of each region.

Therefore, this study proposes the following assumption:

**Policy balance has a positive effect on regional innovation capability**

## 4 Model

### 4.1 Measurement indicators and calculations of policy balance

This paper attempts to measure the policy balance from the perspective of policy balance and the number of policies.

The Gini coefficient is an important method and tool for measuring the balance of wealth distribution. This paper proposes the policy Gini coefficient to measure the fairness of the policy chain in the industrial chain, innovation chain, and financial chain, that is, the degree of policy balance. But in addition to the degree of balance in policy distribution, the number of policies certainly plays an important role, indicating the absolute number of government-guided policies through policy. However, direct comparisons with quantities may be subject to fluctuations due to regional differences or major central decision-making. Therefore, it is more reasonable to use the number of policies related to the three chains as a percentage of the total number of policies.

According to the calculation formula of the Gini coefficient, the calculation method of the Gini coefficient is as follows:

$$G_g = \frac{1}{n} \sum_{i=2}^n \sum_{j=1}^i (P_i - P_j) = \frac{1}{nF} \sum \sum (F_i - F_j) \quad (1)$$

In the above formula,  $G_g$  is the policy Gini coefficient, and  $n$  is the number of groups. (In this study, the policy is divided into three groups: “industrial chain”, “innovation chain” and “financial chain”, so  $n=3$ ),  $P_i$  represents the proportion of the total number of documents in the  $I$  group related documents,  $F_i$  represents the total number of documents related to the  $I$  group, and  $F$  represents the total number of documents.

#### 4.2 Measurement indicators and calculations of regional innovation capability

Considering that the “five-chain co-ordination” process itself measures the process of innovation input, to avoid or reduce the problem of collinearity or endogenous impact in subsequent analysis. This paper focuses on innovation and economic benefits in selecting indicators for measuring regional innovation capabilities. Drawing on the above research results, combined with the indicators involved in various documents, and considering the availability of data, this paper constructs a regional innovation capability indicator system as shown in Table 2.

**Table 2 Regional Innovation Capability Indicator System**

	Primary indicator	code	Secondary indicators
<b>Regional innovation capability</b>	Innovation	Q1	Number of patent licenses
		Q2	Number of scientific papers included in the three systems
		Q3	Number of new product projects
	Economic benefit	Q4	New product sales revenue
		Q5	Per capita GDP
		Q6	10,000 yuan of GDP per ton of standard coal

In this paper, the entropy method is used to measure the weight of the known indicator data by using the entropy value to determine the weight. The main principle is to determine the weight by the degree of difference in indicators. The greater the degree of dispersion of the indicators, the larger the difference between the indicators and the smaller the entropy, which has a greater impact on the evaluation results. The amount of effective information provided is larger and the weight is correspondingly larger. Conversely, the smaller the degree of dispersion at this time, the entropy value is larger and the weight should be smaller. However, it is worth noting that if the value of an indicator of each evaluation index is completely consistent, the entropy value reaches the maximum at this time, which means that the indicator has no valid information and should be removed from the indicator system. According to the process of scholars applying the entropy method, the calculation method of regional innovation capability is as follows:

For a sample set with  $n$  regions and  $m$  indicators, organize them into a data matrix  $X$ :

$$X = (x_{ij})_{n \times m}, 1 \leq i \leq n; 1 \leq j \leq m; i, j \in Z$$

Where  $x'_{ij}$  represents the data value of the  $j$ th indicator of the  $i$ th region. To eliminate the influence of dimensional and data differences, the standard method is used to obtain the standardized data value  $x'_{ij}$ . And calculate the weight of the  $j$ th indicator in the  $i$ th region in turn (that is, normalize the data value matrix to normalize the column vector to obtain the weighted matrix of the data):

$$P_{ij} = \frac{x'_{ij}}{\sum_{i=1}^n x'_{ij}} \quad (2)$$

Subsequently, the information entropy value of the  $j$ th indicator is determined:

$$e_j = -k \sum_{i=1}^n P_{ij} \ln(P_{ij}) \quad (3)$$

Among them,  $k = \frac{1}{\ln(n)}$ ,  $e_j \geq 0$ .

The utility value of certain indicator information depends on the difference between the information entropy value  $e_j$  and 1 of the indicator. For the  $j$ th indicator, the greater the difference in value, the greater the impact on the comprehensive evaluation. Thus, the differential coefficient of the  $j$ th indicator is calculated:

$$g_j = \frac{1-e_j}{m-E_e} \quad (4)$$

In the middle,  $E_e = \sum_{j=1}^m e_j$ ,  $0 \leq g_j \leq 1$ ,  $\sum_{j=1}^m g_j = 1$ . Based on this, the weight of the  $j$ th indicator can be finally calculated:

$$w_j = \frac{g_j}{\sum_{j=1}^m g_j} \quad (5)$$

This is to use the information value coefficient of the indicator to calculate the comprehensive index, the higher the value coefficient reflected, indicating the greater importance to the indicator system. From this, the regional innovation capability index of the  $I$  region can be calculated.

$$s_i = \sum_{j=1}^m w_j P_{ij} \quad (6)$$

## 5 Hypothetical Test

### 5.1 Regression analysis

In order to explore the relationship between policy balance and regional innovation capability, this study uses the comprehensive energy consumption of GDP of the 10000 yuan area, energy industry

investment, natural gas consumption, and population density as control variables, with policy balance as the independent variable, with regional innovation capability as the dependent variable, linear regression analysis. The results are shown in Table 3.

**Table 3 Regression Results of Policy Balance and Regional Innovation Capability**

variable	Dependent variable: Regional Innovation	
	Model 1	Model 2
the comprehensive energy consumption of GDP of the 10000	0.415***	0.428
energy industry investment	-0.279***	-0.269
natural gas consumption	0.557***	0.512
population density	-0.078**	-0.084
Policy balance	-	0.116*
R <sup>2</sup>	0.678	0.690
R <sup>2</sup> after adjustment	0.668	0.678
F	68.521	57.386

Note: \*represent  $p < 0.05$ , \*\*represent  $p < 0.01$ , \*\*\*represent  $p < 0.001$

Model 1 tests the regression results of the control variables on the dependent variables and finds that population density has no significant effect on the dependent variables, and the other three have significant effects. Model 2 examines the impact of policy balance on regional innovation capability. It can be seen that after adding policy balance, the interpretation of policy balance to regional innovation capability is increased compared to the control variable,  $\Delta R^2 = 0.012$  ( $p < 0.05$ ), and the normalization coefficient  $\beta$  was 0.116, which was significant at the  $p < 0.05$  level, and thus the assumption was assumed that test support was obtained.

## 6 Conclusion

This paper is based on the theory of collaborative innovation and the theory of regional innovation. Exploring the mechanism and connotation of the five-chain coordination. Based on the hypothesis model, regression analysis is performed on the calculated variable values and the hypothesis is verified. Verifying the impact of “five-chain coordination” on regional innovation capability.

Since 2014, the joint research on innovation chain, industrial chain, and the financial chain has begun, focusing on basic theoretical and paradigm research, as well as its specific practices to promote the development of various chains. But there are not many introductions on how to integrate between various chains. This paper proposes the mechanism of five-chain coordination, the driving, supporting and coordinating roles between various chains, thus affecting the innovation output of the entire region, and thus affecting regional innovation capability.

Since the method used by the machine to identify text generics is only recognized from the text

classification level, there is no further semantic mining analysis of the text, so the study of policy balance needs to be further deepened. The next step is to further analyze the role of policy texts from machine learning and policy tools, to make the measurement and analysis of policy balance more precise.

Based on the comparative regression analysis of different regions, combined with the mechanism of “five-chain coordination” and the impact on regional innovation capability, this paper puts forward the following suggestions for China to promote “five-chain co-ordination” and enhance regional innovation capability:

Integrating the three chains (industrial chain, innovation chain, financial chain) to create a “talent chain” and supporting “policy chain” should pay attention to the importance of talents and consider the balance of policies. The layout of the policy should be comprehensive. At the same time, consider the coordination of the three links of industry, innovation, and capital. It is necessary to combine the characteristics of its region, timely adjust the policy for the lack of links, ensure the balance of policy release, and ensure the organic integration of the “five-chain”.

**Abstract:** According to the characteristics of biological and new medical technology achievements, a scientific, comprehensive and operational evaluation index system was constructed. By determining the set of factors, evaluation sets and weights of indicators at all levels of the evaluated technical achievements, the relevant experts were organized to relevant technologies. The distribution of the evaluation value of the outcome value is obtained, and the corresponding membership degree vector is obtained. On this basis, the fuzzy evaluation matrix is constructed, and the evaluation results of a certain biological and new medical technology results are finally obtained.

**Keywords:** Construction of evaluation index system; Evaluation of technical achievements; Fuzzy comprehensive evaluation; Biology and new medicine

## 1 Introduction

As a high-tech core industry in the 21st century, the biology and new pharmaceutical industry is a leading and strategic industry in the world economy. It is also one of the strategic emerging industries that China is focusing on. The State Council issued the "Twelfth Five-Year Plan" for the development of national strategic emerging industries. The Plan proposes that by 2020, the industry will be cultivated as a pillar industry of the national economy (Wang Gang, 2012). Evaluation of technical achievements as the premise and basis for the transformation of biological and new medical technology achievements (Fred D. Wood, 1997), improve its evaluation work, help optimize the allocation of resources in the field of biology and new medicine, accelerate the commercialization and industrialization of biological and new medical technology results, and promote the development of research and development personnel. Personal growth (Wang Jia, 2010). Therefore, it is of great theoretical and practical significance to construct a scientific and rational evaluation index system for biological and new medical technology achievements and to design an objective and fair evaluation process. This paper starts with the analysis of the characteristics of

biological and new medical technology achievements, builds the evaluation index system of biological and new medical technology results based on the principle of establishing evaluation index system in similar research, and proposes a fuzzy comprehensive evaluation model for evaluation. Value evaluation of the results.

## **2 Analysis of the Characteristics**

In the past 20 years, modern biotechnology represented by genetic engineering, cell engineering, enzyme engineering, and fermentation engineering has developed rapidly. At present, more than 60% of human biotechnology results are concentrated in the pharmaceutical industry to develop new specialty drugs or to improve traditional medicines. This has caused major changes in the pharmaceutical industry, and the development history of the global biological and new pharmaceutical industries. It can be summarized as a long-term, high-tech, high-input, high-risk, high-yield "one long four high" feature (Lu Xiao, 2015).

### **2.1 Long cycle**

From the beginning of development to the final conversion of biopharmaceuticals into products, there are many links: laboratory research phase, pilot production phase, clinical trial phase (I, II, III), large-scale production phase, market commercialization phase, and supervision of each link. The strict and complicated drug administration approval process of the link, and product cultivation and market development are difficult; therefore, the development of a new drug cycle is long, generally takes 8-10 years, or even more than 10 years.

### **2.2 High-tech**

The latest technologies in different periods of human society are often first applied in the military and medical fields, and cover almost all major technological achievements, such as radiology, electromagnetic technology, computer technology, laser technology, etc. The rapid development of bioengineering science and technology in recent years has also taken the lead in applications in the field of biology and new medicine and has become a strong technical support for the advanced development of the pharmaceutical industry in the future.

### **2.3 High commitment**

The high input of the biological and new pharmaceutical industries is more obvious than the general medicine. In general, generic drugs have the characteristics of simple production process, low input, low technological content of products, and large market demand. The development and production of new drugs requires a lot of investment, and the production process is complicated and the development cycle is long. It usually takes an average of \$250 million to develop a new drug, some as much as \$1 billion, and it takes 10 years from

screening to clinical use. Some famous foreign pharmaceutical companies attach great importance to the development of new drug products, and spend a lot of money to develop new drugs to improve the competitiveness of products.

## **2.4 High risk**

Biology and new pharmaceutical companies have disparate business performance and are volatile. Due to the strong specificity of the drug, the market space is mainly determined by its performance. The high technical content and good performance often have extremely broad market and right-end prices. Enterprises that develop such drugs can achieve high profits, but instead have performance. Even if the average price of a drug falls, it will not increase the market size. Once the supply increases, it means that the company's efficiency is rapidly declining. Since the selling period of a drug is generally only 3-5 years, and many pharmaceutical companies rely on one or two products, the risks can be imagined, even for some large international companies; their performance often fluctuates greatly.

## **2.5 High profitability**

The high input and high technology content of the biological and new pharmaceutical industries determine the added value characteristics. Once a new drug is successfully developed and put into use, despite the huge initial investment, the revenue generated is huge.

According to statistics, the annual sales of a successful new drug can be as much as 1.0-400 million US dollars; the profit rate of the top ten pharmaceutical companies in the world is about 30%; the patented product can monopolize the product market during the validity period of the patent, therefore, A huge monopoly profit can be obtained during the income period.

# **3 Index System Construction**

According to the comprehensive, systematic, hierarchical, qualitative and quantitative principles (Yang Sisi et al., 2013) of the evaluation index system construction, combined with the technological development characteristics of biological and new medical technology achievements, the value evaluation index system of biological and new medical technology achievements is set. The indicator system mainly examines the five aspects of technical value, benefit value, intellectual property value, team value and system risk of the technical achievements, and sets four first-level indicators such as technical value, benefit value, team value and system risk; There are a number of second-level indicators, a total of 17 secondary indicators; each of the secondary indicators has a number of third-level indicators, a total of 58 three-level indicators.

### **3.1 Technical value**

Mainly concerned with the quality of the technical achievements themselves, including the innovative, scientific and technical feasibility of the technical solutions.

(1) Innovative: Evaluate the characteristics of biological and new medical technology outcomes in improving or creating new things, methods, elements, pathways, and environments. Specifically include: Number of innovation points, Technical innovation difficulty, Technological innovation complexity.

(2) Advanced: Evaluate the excellent characteristics of biological and new medical technology outcomes relative to other outcomes. Specifically include: Level of innovation, Scope of application, Industry trends.

(3) stability: Evaluate the characteristics of biological and new medical technology results when they are stimulated by external factors. Specifically include: Reliability Reproducibility of technology, Technical life.

(4) Maturity: Evaluate the extent to which biological and new medical technology results are promoted and applied. Specifically include: Degree of industrialization, Technical radiation level.

(5) Intellectual property: Evaluate the exclusive rights enjoyed by biological and new medical technology results in accordance with the law. Specifically include: Patent authorization, Standard situation, Number of papers published, influence factor, rate of introduction, Monograph situation, Number of patent applications, New drug certificate and new varieties of animals and plants.

### **3.2 Benefit value**

Mainly concerned with the economic, social and ecological benefits that can be obtained after the application of technological results.

(1) Economic benefit: To evaluate the economic benefits of the promotion and application of biological and new medical technology results. Specifically include: Sales revenue after converted, Market share after converted.

(2) Social benefit: Evaluate the possible impact on the social development of the promotion and application of biological and new medical technology results. Specifically include: Promote the development of related industries, Degree of driving employment, Reduce patient suffering or reduce product side effects, Reduce the patient's medical burden.

(3) Ecological Benefits: Evaluate the environmental and ecological impacts that may result from the promotion and application of biological and new medical technology. Specifically include: Promote the effective use of energy resources, Benefits of energy saving

and emission reduction

### **3.3 Team value**

Mainly concerned about the role of scientific research team in scientific and technological achievements and future development potential.

(1) Scale and structure: Judging the current state of the team with the talent team structure and knowledge structure, research platform and knowledge reserve. Specifically include: Professional and technical background and tracking learning ability, Average age of professional and technical personnel, Senior and middle-level professional and technical personnel and proportion, Number of outstanding talents, Base or laboratory, Research infrastructure and experimental capabilities, Proportion of funds for horizontal research projects undertaken and completed.

(2) Technological innovation ability: Judging the scientific and technological achievements that have been achieved in the form of results to demonstrate social influence. Specifically include: Invention patents granted in the past 3 years, Published papers and monographs in the past 3 years, Nearly 3 years of research awards, Nearly 3 years of academic exchange.

(3) Internal management: Judging the execution and efficiency of the research team in an institutional form. Specifically include: Project management system, Project management system.

(4) sustainable development: Reflect the future development potential of the R&D team. Specifically include: Number of outstanding talents introduced in the past three years, Talent training in the past 3 years, Team building and future development planning, Innovation goal.

### **3.4 System risk**

The main concern is the possibility of not meeting the expected technical and economic indicators due to the uncertainty of external environmental factors. According to the purpose of evaluation, it can be divided into technical risk, market risk, policy risk and legal risk.

(1) Technical risk: Evaluate the loss or harm caused by technical know-how or defects that may exist in biological and new medical technology outcomes. Specifically include: Possibility of generating potential biosafety risks or hazards, Possibility of generating potential social ethics, Potential technological development risks or hazards, Dependence of supporting technology, Technical alternative.

(2) Market risk: Evaluate the market competition of biological and new medical technology achievements. Specifically include: Entering the market, Competitor's competitiveness.

(3) Policy risk: Evaluate the degree of matching between biological and new medical technology outcomes and policies. Specifically include: Industrial policy fit, Regional policy fit.

(4) Natural risk: Assess the natural risks that biological and new medical technology outcomes may face. Specifically include: Degree of climate factor impact, Degree of geographical influence, Factors such as pests and diseases.

(5) Legal Risk: Evaluate the legal risks that may be faced by the promotion and application of biological and new medical technology results. Specifically include: Potential equity disputes, Legal risk avoidance, Patent infringement decidability, Validity period.

## **4 Construction of Value Evaluation Model**

### **4.1 Brief introduction of fuzzy comprehensive evaluation method**

The fuzzy comprehensive evaluation method is an evaluation method proposed for the evaluation system with a large number of non-quantitative factors. On the basis of determining the evaluation index, its weight and evaluation scale, it uses the fuzzy membership degree to measure the evaluation object, and obtains the evaluation result of the technical achievement value (Shu Fuhua, 2018).

The basic idea of value evaluation of technical achievements based on fuzzy comprehensive evaluation method is to sort the evaluation index of the value of relevant technical achievements by the index system, the evaluation set and the weight of each factor to determine the value of the evaluated technical achievements. The corresponding membership degree vector (Reid N, 1988). On this basis, the fuzzy evaluation matrix is constructed, and the fuzzy evaluation matrix and the fuzzy calculation of the factor weight vector are realized by MATLAB software programming. Finally, the fuzzy comprehensive evaluation result is obtained, which is the evaluation of the value of related technical achievements.

### **4.2 Construction of value evaluation model of technical achievements based on fuzzy comprehensive evaluation method**

The fuzzy comprehensive evaluation method is used to evaluate the value of biological and new medical technology results. The factor set weight vector is the influencing factor and weight in the value evaluation system of biological and new medical technology results. The comment set is determined by consulting experts. The content of the comment collection and its corresponding analysis, after several experts (at least 7) evaluation, get the evaluation matrix  $R$ , then perform fuzzy transformation with the weight vector  $A$ , and finally multiply

with the score matrix to obtain biological and new medical technology results. Value evaluation score for value. Specific steps are as follows:

**(1) Determine the set of evaluation factors**

Through literature review and interview research, the homogenization commonality and heterogeneity of the value of technological achievements in various fields of high and new technology are clarified, and the evaluation index system of biological and new medical technology results is established, and the evaluation factors are determined.

**(2) Determine the star rating**

Star collection is the evaluation level of experts on the value of biological and new medical technology. Generally, the elements of the star collection are preferably 3 to 5, too few are not high enough, the level is too much, and the experts are not very good. . After comprehensive consideration, set 5 evaluation levels,  $V = \{V_1, V_2, V_3, V_4, V_5\}$ , the greater the number of stars, the higher the value of the technology. The corresponding comment set score:  $W = \{1, 3, 5, 7, 9\}$ , as shown in Table 1.

**Table 1 Star Rating and Corresponding Score**

Level V	Star Rating	Score W	Partition room
V <sub>1</sub>	★	1	[0,2]
V <sub>2</sub>	★★	3	(2,4]
V <sub>3</sub>	★★★	5	(4,6]
V <sub>4</sub>	★★★★	7	(6,8]
V <sub>5</sub>	★★★★★	9	(8,10]

**(3) Determine the single factor evaluation matrix.**

Using the fuzzy comprehensive evaluation method to evaluate the value of biological and new medical technology results, firstly, fuzzy evaluation is carried out from one factor, and the evaluation element of the evaluation object and evaluation set V is determined, which is called one-way evaluation. And then get a three-level indicator fuzzy evaluation matrix.

The three-level index fuzzy evaluation matrix R is based on the scores of 7 experts in the field, that is, the single-factor evaluation matrix  $R=(r_{ij})$ , wherein each row in the single-factor evaluation matrix R represents the score of each indicator.  $R_{ij}$  said the expert approval rate for each indicator under each comment.

Its matrix model is:

$$R = \begin{pmatrix} r_{11} & r_{12} & \cdots & r_{1j} \\ r_{21} & r_{22} & \cdots & r_{2j} \\ \vdots & \vdots & \ddots & \vdots \\ r_{i1} & r_{i2} & \cdots & r_{ij} \end{pmatrix}$$

**(4) Determine the weight**

Through the questionnaire survey of relevant experts, the Delphi method (Luke Georghiou, 2000) is used to determine the weights of the 1-2 indicators in the value evaluation system. The reasonable degree of expert selection determines the success or failure of research (Brown. B., 1987). The expert group is determined based on the level of knowledge and knowledge required for the value of the technological achievements in the field of biology and new medicine. The expert group shall be composed of at least 10 experts, and the same administrative unit shall be the same professional expert. In principle, the expert group shall only employ one person. The expert group includes experts in the fields of technology, management, finance, etc., with rich practical experience and a deep understanding of biology and new medicine. At the same time, the selection of experts should cover a wide range of industries, as far as possible related to industries related to biology and new medicine. Generally, after three to five rounds of opinion summarization and information feedback, the final indicator weights are obtained.

After scoring by experts, the arithmetic mean method (AlanClarke, 1999) is used to summarize the expert analysis and obtain the weights of the biological and new medical technology results. The calculation formula is as follows:

$$M_j = \frac{1}{m_j} \sum_{i=1}^{m_j} C_{ij}$$

In the formula,  $M_j$  is the arithmetic mean of the  $j$  index,  $m_j$  is the number of experts participating in the evaluation of the  $j$  index, and  $C_{ij}$  is the evaluation value of the  $j$  index by the  $i$  expert.

**(5) The fuzzy transformation**

Through the expert's classification of the value of biological and new medical technology results, the comprehensive evaluation model of fuzzy transformation is established as:  $B=A \times R$ , where  $B$  is the degree of description of each graded object, and  $A$  is the third-level indicator. Weight,  $R$  is a three-level indicator fuzzy evaluation matrix, and  $b_j$  indicates the degree to which the rated object has a comment  $v_j$ .

Its calculation model is as follows:

$$B=A \times R = (a_1, a_2, \dots, a_i) \begin{pmatrix} r_{11} & r_{12} & \cdots & r_{1j} \\ r_{21} & r_{22} & \cdots & r_{2j} \\ \vdots & \vdots & \ddots & \vdots \\ r_{i1} & r_{i2} & \cdots & r_{ij} \end{pmatrix} = (b_1, b_2, \dots, b_j)$$

In order to improve the efficiency of the evaluation process, the process of evaluating the value of biological and new medical technology results by MATLAB.

#### **(6) Obtain the second-level indicator evaluation score**

By the score value corresponding to the 3-star set element of the table 1, the corresponding score vector  $W=\{1,3,5,7,9\}$  is obtained, and the fraction vector  $W$  is multiplied by the transposition vector of the evaluation vector  $B$  to obtain two The evaluation score of the level indicator is recorded as  $V$ .

The formula for calculating:  $V=W \times B^T$

This step is also programmed using MATLAB software to obtain calculation results to improve work efficiency.

#### **(7) The final evaluation score and the corresponding star rating**

From the sixth step, the scores of all the secondary indicators  $V$  can be obtained. There are four first-level indicators in the value evaluation index of biological and new medical technology achievements, and the scores are  $T_1, T_2, \dots, T_4$ , respectively, and their weights are respectively  $S_1, S_2, \dots, S_4$ , there are  $n$  secondary indicators under the  $i$ -th level index, and the second-level index weights under each level index are  $G_{ij}$ , respectively, and the scores are respectively  $V_{ij}$  ( $i=1, 2, \dots, 4; j=1, 2, \dots, n$ ).

The formula for calculating the score of its primary indicator is:

$$T_i = \sum_{j=1}^n V_{ij} \cdot G_{ij}$$

The final evaluation score for the value of biological and new medical technology results is:

$$T = \sum_{i=1}^4 T_i \cdot S_i$$

In the end, the scores of the value scores of biological and new medical technology achievements will be between 0-10. In order to make the evaluation results of the value of technological achievements more intuitive and clear, the evaluation results of the value of technological achievements are presented in star form.

## **5 Conclusion**

### **5.1 Research results**

Based on the analysis of the characteristics of biological and new medical technology

results, this paper sets several levels of indicators from the aspects of technical value, benefit value, team value and system risk. On the one hand, the construction of the indicator system can further improve the evaluation of biological and new medical technology achievements, on the other hand, it can guide experts to conduct more reasonable, objective and fair evaluation, and improve the scientific and authoritative work of reward evaluation.

In the past, the literature found that the indicators for the evaluation of results in the field of biology and new medicine rarely considered the indicators of the value of the R&D team. In addition, the evaluation method used the Analytic Hierarchy Process and the Delphi method. This paper improved the evaluation index system of biological and new medical technology results. It can not only make an assessment of the development capability of specific technological achievements, but also collect information on technological achievements with potential for development in the fields of biology and new medicine, and lay a good foundation for the development of China's biological and new pharmaceutical industries. In addition, the use of fuzzy comprehensive evaluation method increases the scientificity and reliability of the evaluation method.

## 5.2 Limitations and future research

This paper designs the evaluation index system and model of biological and new medical technology achievements. No specific empirical research has been carried out. In the future, specific technical achievements can be evaluated through practical operation, the effectiveness and scientificity of the indicators are evaluated, and the existing indicators are guided. Adjust and screen to improve the existing evaluation index system. In addition, this study does not discuss the comprehensiveness, independence and easy accessibility of the primary indicators. Future research needs to be further explored.

**Abstract:** Library makerspace is a rapidly developing platform for integrating innovative and entrepreneurial resources and an important form of makerspace. How to apply the makerspace more effectively to the construction of libraries in our country has become the focus of the education department at this stage. Based on the research on the hierarchical structure, operation mode of operation platform, composition of interest subjects and their cooperative assistance mode of makerspace operation system of university libraries, this paper explores the problem of interest distribution in the makerspace innovation management system by means of game theory methods and shapely value method.

**Keywords:** University library; Makerspace; Operational management mode; Game theory; Shapley value method

### 1 Introduction

Makerspace is "a real physical place, an open communication laboratory, workshop, machining room, an innovative place where people can get together to manufacture, participate in design and study" (Mai DB et al.2017) . In recent years, with the promotion of the national innovation and entrepreneurship policy of "Mass innovation, Mass entrepreneurship", the innovation and entrepreneurship service platform mode of makerspace has also developed rapidly in China. One of the important forms is the library makerspace(Li X,et al.2014).

Library makerspace has developed rapidly both at home and abroad, and relevant theoretical and practical research has also attracted much attention. In terms of the basic operation mode of makerspace, David et al. (2017) conducted a detailed case study on typical foreign guest-creating space modes and successful elements. Sun (2016) mainly studied the development status, user needs, existing problems and corresponding countermeasures of makerspace in our country's libraries, and proposed the importance of the relationship between the interest subjects of makerspace. Ma (2017) focused on the structural construction of makerspace in university libraries, and put forward the concept of ecological system construction of makerspace. Meanwhile, the development strategy (Vanholm, 2015) and the construction of development model (Han et al., 2016) of the library makerspace have also received corresponding research attention.

As for the operating mode of makerspace, Li et al. (2015) insisted that in practice, the construction and application of community makerspace have been emphasized. All regions and communities need to consider integrating the operation of manufacturers into local development. Based on this, the driving force, function and application of American community makerspace under the library makerspace operation management system were studied and discussed. Kong et al. (2013) systematically expounded

the concept, origin, development and significance of makerspace, and discussed the significance of library makerspace operation management to makerspace from the perspective of social function, service and competitiveness by using relevant engineering cases. On the basis of analyzing the transfer value of tacit knowledge in library makerspace, Wang et al. (2017) summarized how to re-understand the effective transfer of tacit knowledge under the makerspace operation management system through the concept of makerspace.

In view of the structure of interest subjects in library space and the distribution of interest, the modeling and analysis method based on game theory provides an important and effective research tool. Zhang et al. (2016) and Dai et al. (2016) discussed the income distribution of alliance enterprises by Shapley value method, analyzed the motivation of partners to join the alliance and the important principles of income distribution from the perspective of value creation, and proposed a correction algorithm based on risk factor.

On the one hand, the existing research has already achieved some valuable research results in the development mode, system structure, service transformation and other aspects of the domestic and foreign library makerspace. On the other hand, the structure of the interest subject and the distribution of the interest need to be further studied and discussed in combination with practice, so as to promote the stable, healthy and efficient growth of the library's space system platform for makerspace. On the basis of analyzing the collaborative model of stakeholders in the library space system platform, this paper will further study the multi-party benefit distribution by Shapley value method.

## **2 Basic Structure of Library Makerspace Operation System**

### **2.1 Basic structure**

The operating system of library makerspace roughly includes three progressive levels or stages:

(1) Creative stage, that is, basic layer mode. In the basic layer model, it mainly covers capital, personnel and educational resources, innovative supporting equipment in hardware construction, horizontal cooperation in software services, such as expansion of maker activities and regulatory publicity, and vertical cooperation, such as crowd funding, introduction of external resources, professional training and government enterprise investment.

(2) Entrepreneurial phase, that is, the mode of industrial level. In the industrial layer mode, it mainly covers the preliminary industrial chain mode of customer-centered and market-oriented project construction, screening, research and development, trial operation, small batch production and sales.

(3) Commercial phase, that is, the scale layer model. In the scale layer model, the mature industrial chain model is mainly covered. The ecosystem in the scale layer is a loose network composed of suppliers, distributors and outsourcers, manufacturers of related products and services, and provision of related technologies.

### **2.2 Operation mode**

The basic principle for the construction of the library makerspace system platform is "user-centered and market-oriented". Its operation mode is divided into the following stages:

(1) Creative evaluation stage. The government and upstream and downstream enterprises mainly provide funds, infrastructure support, policies, etc. for the makerspace. Through horizontal cooperation of library makerspace, innovation resources will be integrated and cross-industry and cross-discipline

innovation will be carried out to optimize and integrate industry platforms. Makers can make full use of Internet resources and information technology to generate ideas.

(2) Development phase. Within the scope of the controllable resources of the enterprise, creative products are developed, refined and tested. After initial commercial products are formed, small-scale pilot production is put into the market. After market feedback, the professional project team of the enterprise improves the products, and then the products are tested and hatched to finally form mature products.

(3) Market stage. Market forecast is made first, then market creation (i.e. market expansion) is carried out according to the forecast situation, then mature products are produced in small batches and put into the market. Finally a commercial industrial chain is formed, and suppliers, distributors and outsourcers form a chain cooperation relationship in the industrial chain.

(4) income stage. The industrial chain income obtained through the industrial platform and trading platform serves as the income of makers, makerspaces, the government and upstream and downstream enterprises. To sum up, a closed loop is formed, and the above processes are repeated in the system platform, forming a benign and sustainable ecological circle.

### **3 Stakeholder Composition and Cooperation Mode of Library Makerspace Operation System**

The operating system of library makerspace mainly has three main stakeholders: makers, makerspace, enterprise and government.

The roles and synergic relationship of the three major stakeholders are as follows:

(1) Library makers. The creative theme of the makers on the system platform takes the library's creating space as the carrier, and carries out creativity, innovative research and development, practical operation and final innovative creative achievements through online and offline platforms.

(2) Library makerspace. Makerspace provides makers with funds, equipment, information technology and basic resources for innovation and entrepreneurship, and actively cooperates with the outside world, such as upgrading of resources, technologies and services, so as to strengthen and expand its own innovation capability, and seeks the support of the capital policy of the enterprise government. a) Library makerspace provides basic services for makers, including software and hardware equipment, internet plus technology, physical space, etc. b) The library insists on the market-oriented innovation mode in makerspace. With the participation of enterprises, the makerspace is guided by the development trend of the market and the latest development of the industry to provide innovative basic resources for enterprises that connect with the market.

(3) The government and upstream and downstream enterprises. Government enterprises provide financial policy support for makers and makerspace in the library's operating system. a) The advantages of enterprises and libraries are complementary. The enterprise's own innovation ability is deficient, while the library's advantage lies in its innovation ability, but its capital, material and hardware equipment are deficient. The cooperation between the two will make up for each other's deficiencies. b) Enterprises can gradually establish and perfect the training mechanism of innovative talents. During the docking between the enterprise and the makers, the process of training the experience and knowledge of makers by the enterprise technicians is also the process of discovering, selecting and cultivating innovative talents useful to the enterprise. c) Enterprises can strengthen enterprise publicity and

strengthen enterprise brand effect. While investing in the makerspace, enterprises also improve their reputation, gather the strength of three parties, and effectively strive for government support policies. In the final incubation results, enterprises can improve their market competitiveness and achieve fame and fortune. d) In the process of cooperation, enterprises can reduce the cost of trial and error and maximize the benefit efficiency.

There are two modes for the transformation of makers' achievements: a) makers search for matching enterprises and cooperates with them; b) Makers take makerspace as the carrier and makerspace searches for matching enterprises to cooperate with. No matter what kind of cooperation method is adopted, the main bodies of the innovation ecosystem are seeking to maximize their own interests, which will easily lead to conflicts in cooperation, inefficient transformation of innovation achievements, and even lead to the failure of cooperation.

Interest distribution is always the most critical contradiction in the operation system of library makerspace. Therefore, how to solve the problem of multi-party benefit distribution is the key to promote the construction and development of library makerspace operation system.

## 4 Benefit Distribution Mode of Library Makerspace Operation System

### 4.1 Basic assumption of benefit distribution model

In the process of building the platform of library makerspace operation system, there is a problem of benefit distribution, namely, the benefit game among makers, makerspace and the enterprise government. The rationality of benefit distribution is directly related to their cooperation. In general, makers ( $M$  for short) devote themselves to innovative research and produce innovative results in makerspace. Makerspace ( $S$  for short) firstly carries the innovation achievements of makers in the form of carrier, which is an integration of innovation achievements. Then it commercializes the innovation achievements and seeks the cooperation of enterprise government ( $F$  for short) for makers' innovation achievements. Therefore, how to distribute the benefits among the above three needs a game. All parties involved in the study are risk-neutral and stable equilibrium. The time length of any period is represented by  $\Delta$ . This paper discusses the case of continuous time, so  $\Delta \rightarrow 0$ . The discount rate is expressed by  $k\Delta$ , and  $\lambda\Delta$  is used to represent the utility loss rate of innovation achievements in each cycle. The basic model considers direct negotiations between the makers and government enterprises. Whether or not it has innovative resources in the end, makers have tacit knowledge of key value to the product development of innovative achievements. After the search phase, makers successfully match with the enterprise and obtain the support of government funding policies through lobbying. The development costs invested by both parties in the development phase are  $C_M$  and  $C_F$ . When the makers participate in the cooperative development, the probability of successful development is  $P$  and  $P_0$  respectively, and the value market generated by the innovation results is  $T$  and  $T_0$  respectively, then the expected revenue of the development activities is  $E=PT-C_F-C_M$  and  $E_0=P_0 T_0-C_F$  respectively.

The utility at the beginning of the search phase of the makers and the government enterprise is expressed by  $U_M$  and  $U_F$  respectively, and the utility at the beginning of the development phase is expressed by  $u_M$  and  $u_F$  respectively. In the process of searching for each other, due to the influence of various non-willed reasons, in each cycle, the probability that a maker searches for a matching enterprise and the enterprise searches for a matching maker is different, namely  $g_M\Delta$  and  $g_F\Delta$ . The search cost in each cycle is also different, namely  $C_M\Delta$  and  $C_F\Delta$ , and  $C_M$  and  $C_F$  are assumed to be standard convex functions. Then the expected utility  $U_M(t)$  of the creator in the  $t$  period is:

$$U_M(t) = q_M(t)\Delta u_M(t) + \frac{1}{1+k\Delta}(1-q_S(t)\Delta - \lambda\Delta)U_M(t+\Delta) - C_M(t)\Delta$$

So,

$$U_M = \frac{q_M u_M - C_M}{k + \lambda + q_M}, \quad U_F = \frac{q_F u_F - C_F}{k} \quad (1)$$

According to formula (1),  $U_M$  and  $U_F$  have basically the same molecular form, but different denominators, which is due to the different wills of makers and government enterprises. For this innovative achievement, the belief in innovation is only to advance or retreat, while government enterprises are always in the market. If this fails, they will continue to look for other innovative achievements.

#### 4.2 Bargaining game of makers' achievements independent of makerspace

According to Nash's bilateral bargaining model, this section discusses the game of profit distribution between makers and government enterprises when the creative achievements of makers are independent of makerspace. Since makers own innovation achievements, they will manage the achievements themselves. Assuming that there is always a successful match between the maker and the government enterprise after the search phase. Before entering the later development stage, benefit distribution is an important component of signing the contract. The bargaining game between the two parties takes place at this time, and their expected utilities are  $U_M$  and  $U_F$ .

First of all, the results of scientific research without the protection of makerspace operation system are analyzed. Because there are always various reasons leading to the independence of innovation achievements and the makerspace for makers to produce by themselves, it is necessary to disclose its core technical data for commercialization in cooperation with enterprises. In this case, no matter whether it can be negotiated or not, in the absence of makerspace as a carrier, the enterprise is likely to embezzle the achievement and develop it by itself after obtaining the data. The only bargaining chip of makers is their own tacit knowledge, because the intervention of these tacit knowledge can greatly enhance the value of project development. According to the scheme of this document, the bargaining result is obtained:

$$u_M^{ne} = \frac{\beta - \beta_0}{2}, \quad u_F^{ne} = \frac{\beta + \beta_0}{2} \quad (2)$$

Then the results under the protection of the operating system are analyzed. At this time, the bargaining chip for makers not only has tacit knowledge, but also has commercial and organized space for makers. In the case of makerspace as the carrier, if no talks can be reached, even if the technical secrets are involved, the enterprise cannot embezzle the achievement and can only give up with zero effectiveness, and both parties can only restart the search phase. Therefore, the prior effects of both parties in the next cycle are the same. Nash bargaining results are as follows:

$$u_M^e = \frac{\beta(k + \lambda + q_M) - C_M}{2(k + \lambda) + q_M}, \quad u_F^e = \frac{\beta(k + \lambda) + C_M}{2(k + \lambda) + q_M} \quad (3)$$

Example: Suppose there is an innovation achievement to be commercialized, and after evaluation  $\beta=100$  (unit: million, same below),  $\beta_0=40$ ,  $k=0.05$ ,  $\lambda=0.2$ ,  $q_M=0.6$ ,  $q_F=0.85$ ,  $q_S=0.8$ ,  $C_M=3$ ,  $C_F=5$ ,  $C_S=1$ . Obtained from formula (2) and formula (3),  $u_M^{ne} = 30$ ,  $u_F^{ne} = 70$ ,  $u_M^e = 14.6$ ,  $u_F^e = 5$ .

After calculation,  $E_M^{ne} = 30$ ,  $E_F^{ne} = 70$ ,  $E_S^{ne} = 0$ . The numerical results are analyzed and summarized as follows:

In the innovation management and operation system of makerspace, the actual benefit of makers will be reduced when makers search for enterprise matching successfully by themselves compared with when makerspace is used as the carrier to search for enterprise matching successfully. Therefore, when makers want to innovate, they are more willing to join in the creation space, and will be more enthusiastic to participate in the commercialization process of scientific research results and promote the transformation of results. When the innovation behavior of makers takes makerspace as the carrier, the benefit of innovation results is higher than that of makers' own search for matching enterprise protection, and the actual benefit of makerspace ranks highest among the three. Therefore, makerspace will actively search for cooperative enterprises in order to obtain higher benefits.

## 5 Conclusion

This paper mainly studies the hierarchical structure, system operation mode, stakeholder composition and its assistance mode of library makerspace operation management system. Game theory tools are used to explore the benefit distribution strategies of the three parties in the innovative operation system: makers, makerspace and government enterprises. In the collaborative relationship of makerspace operation system, makers gain more actual benefits from searching and docking enterprise resources through makerspace than from searching and docking on their own. Makerspace is used as a carrier to search for matching cooperative enterprises in the cooperative relationship of innovation operation system, accelerating the transformation of innovation achievements and obtaining maximum practical benefits. After government enterprises invest funds and resources for makerspace, although the actual income will not increase in the short term, in the long run, they inject innovative vitality into the development of enterprises and benefit from promoting the synergy of innovative operation systems. In this paper, from the perspective of the collaborative relationship of makerspace operation system, it is expected to provide valuable academic research reference for promoting the construction and improvement of makerspace for libraries in China.

# Characteristics of R&D Teams and Innovation Performance under Different Innovation Strategies: The Mediating Effects of Organizational Climate in Joint Ventures

Li Shunjun, Peng Huatao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 904611892@qq.com;416295790@qq.com)

**Abstract:** The paper studies the relationships between the characteristics of R&D team and the innovation performance of joint ventures from the view of emerging countries. To do this, we apply Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA) and multiple regression models based on data gathered from 375 Chinese R&D employees from three automobile JVs in China. Our main findings are: (i) Network ties of R&D teams are more positively associated with integrated innovation performance than with imitation performance. (ii) The JV's organizational climate has a partial mediating effect on the relationship between network ties of R&D teams and innovation performance. (iii) R&D team learning is more positively associated with imitation performance than with integrated innovation performance. (iv) The JV's organizational climate has a partial mediating effect on the relationship between R&D team learning and integrated innovation performance, and it has a complete mediating effect on the relationship between R&D team learning and imitation performance. Our research is helpful to guide the R&D management of joint ventures in emerging countries.

**Key words:** R&D team; Team learning; Organizational climate; Network ties; Innovation strategy

## 1 Introduction

Many scholars have explored the factors that influence JV's innovation performance at the firm level, including organizational culture (Asmawi and Mohan, 2011), upstream and downstream members (Banerjee and Lin, 2001), and R&D outputs. However, many factors at the team level, especially in the case of R&D teams, may have an important effect on innovation performance as well (Swierczek and Dhakal, 2004). R&D teams are often considered to contribute positively to innovation performance. Prior studies have linked certain characteristics of R&D team to innovation performance

with respect to certain JV innovation strategies. For example, network ties of R&D teams and R&D team learning is shown to have a positive effect on innovation performance (Nieves et al., 2006). However, the extent to which the characteristics of R&D team promote JVs' innovation performance under different innovation strategies depends on the advantages and potential barriers (Gassmann and Han, 2004). Under certain innovation strategies, different characteristics of R&D team may lead to different levels of innovation performance.

Integrated innovation and imitation are two typical JVs' innovation strategies (Massini et al., 2005). Integrated innovation integrates many potential innovation elements (Mahmood and Zheng, 2009), and imitation is based on the assimilation of imported technology. During the cooperation and learning process, the innovation strategy of the host company in JVs is usually a combination of integrated innovation and imitation. If the host company has many subsidiaries and cooperates with different foreign companies, characteristics of R&D team may have multiple effects depending on JVs' different innovation strategies. It is also unclear whether other factors have moderating effects on the relationships between characteristics of R&D team and innovation performance. Therefore, we open up the black box of firm-level literature, building on related studies that emphasize the importance of the relationship between characteristics of R&D team and innovation performance under different strategies.

The following analysis will contribute to the understanding of how network ties of R&D teams and R&D team learning influence JVs' innovation performance under integrated innovation and imitation strategies, and we will explore the mediating effects of the JV's organizational climate.

## **2 Theory and Hypotheses**

R&D team learning contributes to knowledge accumulation and an improved ability to assimilate new ideas and concepts (Nieves et al., 2006). R&D team learning has a positive effect on innovation performance. The JV R&D team has members from different firms. Thus, knowledge/resource complementarity is high (Berdrow and Lane, 2003), and the complementary knowledge/resources can be combined to create value that did not exist in either firm prior to the formation of the JV (Kim and Finkelstein, 2009); this improves integrated innovation performance.

### **2.1 Network ties of R&D teams and JVs' innovation performance under different strategies**

Network ties of R&D teams normally refer to the ties between one R&D team and other teams inside the same organization, and also the inter-organizational ties between R&D teams in one company and some other companies or research institutions. Network ties, which can both promote innovation activities and create innovation performance, are often regarded as an intangible asset (Nieves et al., 2006; Chen et al., 2008). R&D teams can exchange innovative ideas with other teams or

think tanks, leading to new products, concepts, and models (Chen et al., 2008). These then contribute to the formation of the innovation orientation, the innovation scheme, and the overall innovation strategy. Vertical network ties are ties between R&D teams and material suppliers, product manufacturers, and product development departments. Such ties can improve the overall technological innovation of JVs (Asmawi and Mohan, 2011). Vertical ties often provide key information about technological innovation. They therefore support every aspect of R&D innovation, including the orientation, cost, implementation, product launch, and profitability. Goerzen and Beamish (2005) also stressed the importance of network ties for innovation performance. They found that the higher the heterogeneity of the network ties, the greater the likelihood of strong innovation performance. This leads to the following hypothesis:

**H1: Network ties of R&D teams are positively associated with JVs' innovation performance.**

According to the research on integration mechanisms, network ties of R&D teams contribute to the collaboration of many different specialists, and their work can be integrated to create a coherent whole to realize innovation. On the other hand, imitation innovation is inclined to imitate existing technologies or products. To some extent, these technologies or product information are also from network ties of R&D teams, whereas product innovations require less tacit, complex and systematic knowledge, namely rich network ties are not always needed. The relationships in JVs are observed in light of imperfect information and double moral hazard (Sinha, 2001), therefore the network ties of R&D teams in JVs are not instable. 'Learning by doing' in cooperative networks allows the host firm in JVs to imitate without any cost at the beginning, but the technology imitated by the host firm is inferior comparing to advanced technology, so the host firm cannot really catch up with foreign technology through imitation (Sinha, 2001). Comparing with imitation performance, integrated innovation is relatively helpful to gain competitive advantages through innovations. This leads to the following hypothesis:

**H1a: Network ties of R&D teams are more positively associated with JVs' integrated innovation performance than with imitation performance.**

**2.2 Network ties of R&D teams, organizational climate, and JVs' innovation performance under different strategies**

As a characteristic of network ties, the proximity of network members supports trust. Economic actors are more likely to focus on co-operating with those partners whom they maintain a stronger interpersonal trust relationship. Furthermore, A high level of trust among teammates facilitates the exchange of highly confidential information by diminishing the risk of opportunism, which is partly beneficial to improve the innovation performance. JVs' organizational climate difference may affect the ongoing relationship between partners, minimize knowledge flows and even create obstacles to

innovation-specific performance, while team orientation and learning orientation can be modified by certain characteristics of organizational climate in JVs. When the members of a group are encouraged to learn and to develop new ideas, and are able to influence group decisions, the group is more innovative. This leads to the following hypothesis:

**H2: The JVs' organizational climate has a partial mediating effect on the relationship between network ties of R&D teams and innovation performance.**

### **2.3 R&D team learning and JVs' innovation performance under different strategies**

Organizational learning is a process related to the development of new knowledge and provides the foundation for competitive advantage (Revilla et al., 2005), and therefore affects organizational innovation performance. Thamhain (2003) highlights the importance of experiential learning in JVs' innovation, namely by learning the experience of other high-end ventures, R&D teams can make breakthroughs based on existing knowledge and experience, through repetitive trials and risk taking. Recent research has argued that innovative teams with higher learning ability can learn their partner's concepts and technologies and improve the effectiveness of existing resources, thus achieving better innovation performance. This leads to the following hypothesis:

**H3: R&D team learning is positively associated with JVs' innovation performance.**

According to the principles of JVs' establishment, the innovation resources of the different companies in the JV are complementary. R&D teams should not simply imitate each other, but they should integrate multiple resources. Innovation depends on new ideas and the integration of new resources (Mahmood and Zheng, 2009). Thus, organizational learning should not only create and share knowledge, but also reconstruct the knowledge. Innovation is therefore the result of the creative integration of existing knowledge (Kogut and Zander, 1992). JVs' innovativeness culture and innovation capacity create the ability of the organization (including R&D team) to integrate others' organizational know-how and capabilities instead of merely copying or imitating. This leads to the following hypothesis.

**H3a: R&D team learning is more positively associated with integrated innovation performance than with imitation performance.**

### **2.4 R&D team learning, organizational climate, and JVs' innovation performance under different strategies**

A good organizational climate can enhance the effects of organizational learning on innovation performance. Organizational learning changes behavior and ideology, for example by encouraging employees to actively seek new ideas, and this positively influences the innovation potential of the

R&D team in JVs (Kandemir and Hult, 2005). At the same time, R&D team learning helps to build a strong collective learning environment, and organizations with such an environment are more adept at knowledge creation, acquisition, and transfer. This improves the innovation behavior that reflects new knowledge and ideas. Moreover, when team members contribute new ideas, the internal learning model will depend on the organizational culture, such as the degree of participation in decision-making, the management style, and the commitment of the team. The internal learning model will influence the innovation results. In a good learning climate, R&D team learning positively influences innovation performance. This leads to the following hypothesis:

**H4: The JV's organizational climate has a mediating effect on the relationship between R&D team learning and innovation performance.**

Organizational learning has different effects on different types of innovation performance (Song and Thieme, 2009). On one hand, R&D team learning stresses the development and use of new knowledge during the integrated innovation process (Kandemir and Hult, 2005), and the R&D team realizes the objective of sustainable innovation by integrating the new knowledge. The cooperation between teams increases the possibility of internal cooperation and enhances the team commitment, leading to a good organizational environment, which can reduce risk and improve the integrated innovation performance of the entire JVs. When the absorptive capacity and learning effect in the organizational climate is low, it is difficult for the host firms in JVs to integrate knowledge, and therefore the integrated innovation performance is also low. It can be induced that a certain organizational climate (eg. Greater cultural distance) in JVs is associated with a lower probability that an innovation-oriented alliance of JVs will be formed, and visa versa. On the other hand, during the imitation process, R&D technological knowledge mainly comes from external clients and competitors (Kohler et al., 2012), so positive internal and external cooperation can enhance the imitation performance. R&D teams also need a stable internal support system to provide an environment that encourages the transformation of creative ideas into successful technologies or new products. This leads to the following hypothesis:

**H4a: The JV's organizational climate has a partial mediating effect on the relationship between R&D team learning and integrated innovation performance, and it has a complete mediating effect on the relationship between R&D team learning and imitation performance.**

The theoretical framework for our hypotheses is shown in Figure 1.

**Figure 1 Theoretical Framework**

### 3 Data and Method

#### 3.1 Samples

This study focuses on Characteristics of R&D team and innovation performance under different innovation strategies of JVs in emerging countries. We studied the three JVs of DFM, namely DPCA (Dongfeng Peugeot Citroen Automobile Company Ltd.), DFPV (Dongfeng Nissan Passenger Vehicle Company), and DHAC (Dongfeng Honda Automobile Co., Ltd.). These JVs, presented in Table 1, were established by DFM and Peugeot Citroen, Nissan, and Honda respectively.

**Table 1 Details of the Three JVs**

JV	DPCA (Dongfeng Peugeot Citroen Automobile Company Ltd.)	DFPV (Dongfeng Nissan Passenger Vehicle Company)	DHAC (Dongfeng Honda Automobile Co., Ltd.)
Partners	DFM & PSA Peugeot Citroen	DFM & Nissan	DFM & Honda
Date established	18 May 1992	16 Jun 2003	16 Jul 2003
Capital structure	1:1	1:1	1:1
Registered capital	¥7000 million RMB	¥16.7 billion	\$560 million
Original objective	Establishment of competitive motor enterprise on economical scale and production technology to advanced foreign level	Production of motor engines, site security, and functional parts	Progression from technological cooperation to value-chain cooperation
Sales volume for 2012 (in tens of thousands)	44	77.3	28.2
Number of researchers	1400	600	236
Average age of researchers (2012)	33	28	28
Professional titles (2012)	Senior Expert: 0.5%		Senior Engineer: 4.8%
	Expert: 5.9%	Senior Engineer: 15%	Program Engineer: 12.6%
	Third Engineer: 14.3%	Engineer: 30%	Chief Engineer: 16%
	Second Engineer: 72.2%	Junior Engineer: 55%	Engineer in Charge: 23.3%
	First Engineer: 7.1%		

### 3.2. Measures

Unless otherwise indicated, all measures use a seven-point Likert-type scale (1 = strongly disagree and 7 = strongly agree).

The number of responses from DPCA, DFPV, and DHAC were 204, 100, and 116 respectively, which represents a response rate of 93.3%. There were 192, 88, and 95 effective responses, for a total of 375, and the effective response rate is 89.3%. The sample characteristics are given in Table 2. Following Armstrong and Overton (1977), Li et al(2011), Lin(2003), Prügl and Schreier (2006), the late 25% respondents are assumed to be very similar to non-respondents, then the  $\chi^2$  tests were applied to assess non-response bias. Our results of  $\chi^2$  tests on employees' professional title and R&D employees' age are  $\chi^2_{(2)}=3.160$ ,  $p=0.206>0.05$  and  $\chi^2_{(3)}=3.057$ ,  $p=0.383>0.05$ , therefore, there is no problem of nonresponse bias in our data due to R&D employees' professional title and age.

**Table 2 Sample Characteristics**

Basic Information	Classification	Number of responses	Percentage
JVs	DPCA	88	23.5%
	DFPV	192	51.2%
	DHAC	95	25.3%
Professional Title	Assistant Engineer	163	43.5%
	Engineer	146	38.9%
	Advanced Engineer	66	17.6%
Age	<30	180	48.0%
	31–40	151	40.3%
	41–50	41	10.9%
	51–60	3	0.8%

#### 3.2.1 Dependent variables

Our dependent variables measure innovation performance under an integrated innovation strategy and imitation strategy. In our study, DPCA and DHAC demonstrate integrated innovation, and DHAC demonstrates imitation. Table 3 lists the differences in their strategies.

**Table 3 Differences in Innovation Strategies among the Three JVs**

JV	DPCA/DFPV	DHAC
Innovation strategy	Integrated Innovation	Imitation
R&D work mode	Often co-work with partner's R&D employees	Simply manufacture according to Honda's design drawing
R&D team	Many foreign R&D employees come from PSA and Nissan	Only a few auxiliary staff members come from Honda
Supplier selection and participation	Suppliers selected by both DFM and foreign partners; many, including Chinese suppliers, involved in R&D	Suppliers mainly selected by Honda; few Chinese suppliers involved in R&D
Independent design rights	Granted for some components	Almost none
Structural design	PSA and Nissan lead; DFM is involved	Complete acceptance of Honda's design
Number of authorized patents	214 and 45	11
Representative products	C5,408/ CIIMO	D50/R50
Creative manifestation	Formation of new ideas and training of locals who can then develop own-brand cars	Slight changes to reduce costs and satisfy aesthetic standards and local driving practices

### 3.2.2 Independent variables

The first independent variable is related to network ties of R&D teams. It is derived from the ties between the R&D center and other departments within each JV and the ties between the R&D center and external departments in other firms.

The second independent variable, R&D team learning, is composed of three variables that indicate whether the R&D team members can acquire new knowledge and make progress under the restriction on imitation, whether R&D team learning activities are promoted (Chen, 2008), and whether R&D employees have learning opportunities (Kandemir and Hult, 2005).

### 3.2.3 Mediating variable

The JV's organizational climate is measured by six variables (see Table 4). They measure the decentralization, openness, and trust in the organizational climate and organizational culture

(Kandemir and Hult, 2005), the effects of vision and participative safety in the organizational climate on team innovativeness (Açıkgöz and Günsel, 2011), and the aspects, including structure, rewards, warmth, support and identity, in organizational climate of the R&D.

#### 3.2.4 Control variables

To better capture the influence of characteristics of R&D teams on innovation performance, we used two control variables, the professional title and the age of the R&D team members. Professional title was controlled because more senior employees have more expertise, and to some extent their behaviors can determine the overall innovative performance (Thamhain, 2003).

### 3.3 Method

The method and application in our research are as follows:

Step 1: Exploratory factor analysis. Having conceptualized the theoretical framework of characteristics of R&D team and innovation performance under JVs' different innovation strategies from the literature, the first step of the research was of an exploratory nature (Reid and Roberts, 2011). Exploratory factor analysis (EFA) is a powerful method to analyze the dimensional structure of observables in terms of latent variables. Step 2: Confirmatory factor analysis. The results of the EFA led to a refined list of items, which were used to construct a new questionnaire. As the latent variables are relatively new constructs in our research context, automobile JVs in China, we deemed it necessary to validate its measure empirically (Mu and Di Benedetto, 2011). To do so, we performed confirmatory factor analysis (CFA). Structural equation modeling (SEM) techniques have often been used for confirmatory factor analysis (Reid and Roberts, 2011). In our research, SEM was also used for CFA.

Step 3: Multiple regression models. Multiple regression models are often used to test mediating effects. We entered the control variables, independent variables, and mediating variables into the model step by step.

## 4 Results and Discussion

### 4.1 Exploratory factor analysis and confirmatory factor analysis

Using SPSS 19.0 and choosing half of the samples at random, we performed EFA using principal component analysis with the varimax rotation approach. This revealed 4 factors (see Table 4).

**Table 4 Results of Exploratory Factor Analysis (N=188) and Confirmatory Factor Analysis (N=187)**

Item	Factor				Standardized Coefficient	T-value
	I	II	III	IV		
R&D Team Learning (AVE=0.520)						
TL1: R&D members can acquire new knowledge and make continuous progress in cooperation	0.296	0.254	<b>0.769</b>	0.055	0.68	9.99
TL2: Key personnel in the R&D team play a crucial role in learning	0.209	0.107	<b>0.785</b>	0.286	0.71	10.51
TL3: R&D members have opportunity to take challenging assignments beyond their capabilities	0.395	0.259	<b>0.646</b>	0.217	0.77	11.69
Organizational Climate (AVE=0.550)						
OC1: R&D team often carries out internal activities such as entertainment, experience communication, and training	<b>0.690</b>	0.344	0.156	0.067	0.57	8.18
OC2: All R&D members have opportunity to participate in planning and some decision making	<b>0.685</b>	0.198	0.291	0.257	0.73	11.15
OC3: R&D members can get direct and clear feedback on performance	<b>0.778</b>	0.256	0.345	0.056	0.83	13.62
OC4: R&D work is supported by supervisor department and others	<b>0.562</b>	0.227	0.465	0.043	0.65	9.58
OC5: R&D bonus distribution scheme is fair	<b>0.785</b>	0.237	0.225	0.238	0.81	12.93
OC6: R&D member has opportunity to be promoted	<b>0.690</b>	0.344	0.156	0.067	0.82	13.23
Network Ties of R&D teams (AVE=0.603)						
NT1: Center receives support from research institutes, universities and colleges, suppliers, etc.	0.285	0.315	0.164	<b>0.748</b>	0.73	11.03
NT2: R&D members are close to experimental validation and other relevant research work within the same company.	0.147	0.258	0.208	<b>0.800</b>	0.82	12.80
Innovation Performance (AVE=0.649)						
IP1: Center is strong in automotive electronic systems design	0.286	<b>0.813</b>	0.064	0.207	0.79	12.65
IP 2: Center is strong in powertrain design	0.305	<b>0.817</b>	0.227	0.116	0.81	12.99
IP 3: Center is strong in chassis-system design	0.304	<b>0.755</b>	0.275	0.250	0.85	14.11
IP 4: Center is strong in vehicle body design	0.158	<b>0.765</b>	0.218	0.271	0.77	12.19
Percentage of variance explained by each factor	25.4	21.0	16.0	11.4		

Reliability 0.902 0.903 0.787 0.771

These 4 factors explained 73.8% of the total cumulative variance. The reliability coefficients of the 4 latent variables in our study are 0.902, 0.903, 0.787, and 0.726 respectively (see Table 4), which are all greater than 0.7. The total reliability achieved was 0.935. Therefore, the scales have good inter-item consistency.

Using the other half of the samples and running LISREL 8.70, we find that the Kaiser–Meyer–Olkin measure of sampling adequacy is 0.921, which is greater than 0.9 and shows that the dataset is appropriate for factor analysis. The item-to-respondent ratios for CFA should range from 1:4 to 1:10 (Reid and Roberts, 2011). In our study, there are 17 items and 187 respondents, so our data are suitable for CFA. Table 5 shows that all the standardized coefficients are positive and greater than 0.5, and all the T-values are greater than 3.28. Table 4 also shows that Chi-Square=164.67, df=84, Chi-Square/df=1.960<3, RMSEA=0.072<0.08, CFI=0.98, and TLI=0.98, so the model gives a good fit to the data.

#### 4.2 Inter-correlations for variables studied

Table 5 reports the means, standard deviations, and correlations for the variables studied. R&D Team learning is significantly positively correlated with network ties of R&D teams ( $r=0.537, p<0.01$ ), which indicates that R&D team learning interacts with network ties of R&D teams. Organizational climate is significantly positively correlated with both network ties of R&D teams ( $r=0.516, p<0.01$ ) and R&D team learning ( $r=0.719, p<0.01$ ). Innovation performance is significantly correlated with network ties of R&D teams ( $r=0.656, p<0.01$ ), R&D team learning ( $r=0.547, p<0.01$ ), and organizational climate ( $r=0.582, p<0.01$ ).

**Table 5 Correlation Matrix for All Variables Studied**

	Mean	SD	1	2	3	4	5	6
1. Professional Title	1.74	0.738						
2. Age	1.65	0.705	0.686**					
3. NT	4.772	1.213	0.034	0.027	<b>(0.777)</b>			
4. TL	4.816	1.098	-0.072	-0.047	0.537**	<b>(0.721)</b>		
5. OC	4.123	1.125	-0.019	0.056	0.516**	0.719**	<b>(0.742)</b>	
6. IS	4.403	1.214	-0.009	-0.008	0.656**	0.547**	0.582**	<b>(0.806)</b>

Note: \*\* $p<0.01$ ; Professional Title: 1= Assistant Engineer, 2= Engineer, 3= Advanced Engineer; Age: 1:  $\leq 30$ , 2: 31–40, 3: 41–50, 4: 51–60

The EFA and CFA results have shown that our scales have good validity. In Table 5, the data in brackets are the square roots of the AVE values. The minimum value, 0.721, is greater than the maximum correlation coefficient, 0.719. Overall, the observable variables can explain the corresponding latent variables effectively, and they have better convergence and can be categorized as R&D team learning (TL), organizational climate (OC), network ties of R&D teams (NT), and innovation performance (IP).

### 4.3 Mediating effect

We use multiple regression models to test the hypotheses, table 6 presents the results of our hypothesis tests. The Max-VIF value in Table 6 is the maximum value of the variance inflation factors in each regression model. These values were all less than 3.0 and indicated that there were no multicollinearity problems among the control variables and independent variables.

**Table 6 Regression Results: Effects of R&D Characteristics on Innovation Performance under Different Innovation Strategies**

Samples	Innovation					Integrated Innovation					Imitation				
	PDCA, DFPV, and DHAC (N=375)					DPCA and DFPV (N=280)					DHAC (N=95)				
	OC		IP			OC		IP			OC		IP		
Variables	I	II	III	IV	V	I	II	III	IV	V	I	II	III	IV	V
Professional Title	0.009	-0.067	0.079	0.000	.019	0.082	0.123*	0.106	0.035	0.054	-0.086	0.057	-0.204	0.102	-0.128
Age	0.004	0.126*	0.064	-0.010	-0.044	0.000	0.119*	-0.129	-0.008	-0.027	0.383*	0.198*	0.259*	0.088	-0.004
NT		0.181**		0.509*	0.460**		0.186***		0.628**	0.598**		0.188*		0.307**	0.219*
TL		0.623**		0.273**	0.102 <sup>+</sup>		0.637***		0.224**	0.123*		0.596**		0.406***	0.127
OC					0.274**					0.159*					0.468**
F	1.779	112.676	0.016	86.590	79.139	0.933	91.148	1.117	103.540	86.363	6.016	31.375	2.291	14.797	16.969
ΔR <sup>2</sup>		0.540		0.484	0.033		0.563***		0.593	0.011		0.466		0.350	0.091

R <sup>2</sup>	0.009	0.549	0.000	0.484	0.517	0.007	0.570	0.008	0.601	0.612	0.116	0.582	0.047	0.397	0.488
Max-VIF	1.890	1.903	1.890	1.903	2.282	2.114	2.141	2.114	2.141	2.400	1.508	1.594	1.508	1.594	2.394

The network ties of R&D teams have a significantly positive effect on innovation performance ( $\beta=0.509$ ,  $p<0.001$ ), thereby supporting H1. The standardized coefficients are 0.628 ( $p<0.001$ ) for integrated innovation and 0.307 ( $p<0.01$ ) for imitation, so the network ties of R&D teams are more positively associated with integrated innovation performance than with imitation performance, thereby supporting H1a.

Although the standardized coefficients of network ties of R&D teams for overall innovation performance, integrated innovation performance and imitation performance are all significant, after the organizational-climate mediator enters the regression models, these coefficients become lower (i.e.,  $0.460$  ( $p<0.001$ )  $<$   $0.509$  ( $p<0.001$ )). Therefore, the organizational climate has a partial mediating effect on the relationship between network ties of R&D teams and innovation performance, so H2 is supported.

Similarly, R&D team learning has a significantly positive effect on innovation performance ( $\beta=0.273$ ,  $p<0.001$ ), thereby supporting H3. The standardized coefficients are 0.224 ( $p<0.001$ ) for integrated innovation performance and 0.406 ( $p<0.01$ ) for imitation performance, so R&D team learning is more positively associated with imitation performance than with integrated innovation performance, failing to support H3a.

When the organizational climate enters the regression models as a mediator, the standardized coefficients of R&D team learning become lower ( $0.102 < 0.273$ ,  $0.103 < 0.224$ ,  $0.127 < 0.406$ ), so H4 is supported, namely the JV's organizational climate has a mediating effect on relationship between R&D team learning and innovation performance. In particular, the standardized coefficient for imitation performance becomes insignificant, which implies that R&D team learning has a complete mediating effect, thus supporting H4a. Namely, the JV's organizational climate has a partial mediating effect on relationship between R&D team learning and integrated innovation performance and a complete mediating effect on relationship between R&D team learning and imitation performance. Table 7 gives the final results.

**Table 7 Overview of Hypotheses and Findings**

Hypothesis	Finding
H1: R&D network ties are positively associated with JVs' innovation performance	Supported
H1a: R&D network ties are more positively associated with JVs' integrated innovation performance than with imitation performance	Supported
H2: JVs' organizational climate has partial mediating effect on relationship between network ties and innovation performance.	Supported

H4a: JVs' organizational climate has partial mediating effect on relationship between R&D team learning and integrated innovation performance and complete mediating effect on relationship between R&D team learning and imitation performance.	Supported

The findings of our research show that characteristics of R&D teams, including network ties and team learning, promote JVs' innovation performance. JVs' integrated innovation should focus on network ties of R&D teams, while imitation should focus on R&D team learning. Moreover, JVs' integrated innovation strategy should emphasize organizational climate as a key mediator for enhancing innovation performance. For imitation, organizational climate has a complete mediating effect.

## 5 Conclusion

Our findings demonstrate the mediating effect of organizational climate on the relationship between characteristics of R&D teams and innovation performance under different innovation strategies. The JV's organizational climate is a key mediator between characteristics of R&D teams and innovation performance. Our study further explores the mediating effects of the JV's organizational climate on the relationship between two important characteristics of R&D teams and integrated innovation or imitation performance. For host firms in JVs, network ties of R&D teams with foreign companies do not mean that they can innovate easily. Thus, network ties of R&D teams positively influence imitation performance under the mediating function of the organizational climate. However, the JV's organizational climate has a different effect on the relationship between R&D team learning and innovation performance under different strategies. The host firms in JVs cannot learn all the key technology for political, economic, or other reasons (Li and Zhou, 2008; Mahmood and Zheng, 2009).

The JV's organizational climate has a partial mediating effect on the relationship between R&D team learning and integrated innovation performance, and it has a complete mediating effect on the relationship between R&D team learning and imitation performance.

(E-mail: jessicafyl@126.com, hanyuelexi@163.com)

**Abstract:** This paper mainly discusses the innovative construction of blended teaching patterns of college English online open courses in the new age from the qualitative approach. With literature research, four problems in domestic college English online open courses are analyzed, namely, less amount of course diversity, less innovation of course content, less interaction of course participants and low utilization of course resources. To further advance the development and the effect of college English online open courses in Chinese universities and solve the related problems, four innovative blended teaching patterns: student-based teaching pattern, problem-based teaching pattern, humanity-based teaching pattern, and mutual evaluation teaching pattern are put forward in this paper.

**Key words:** Innovative construction; Blended teaching patterns; College English; Online open courses

### **1 Introduction**

The unprecedented development of science and technology in this information explosion age has put the whole society under the background of big data, stimulating the revolutions in education field, especially in the constructions of teaching and learning patterns. In this new age, science and technology are being updated every moment, leaving a large quantity of information and knowledge to university students to learn about in order to keep pace with this rapid developing society. Thomas Friedman once claimed that nothing has more potential to lift more people out of poverty— by providing them an affordable education to get a job or improve in the job they have (Thomas Friedman, 2013). Open online courses provide public access to learning materials, usually organized in an academic format with components like lectures, readings, assignments, discussions and quizzes (Center for Online Education, 2014). The academic format encourages participants to share knowledge of different levels of experience and skill among them. Many of these courses allow universities to provide credits to their learners, after getting enough credits, they will be offered a degree from those universities.

In the popularity of online open courses, the United States began earliest, with MIT (Massachusetts Institute of Technology) first launching its open courses program called OCW (Open Course Ware) in 2001, and a wave of constructing open online courses was brought up. After that, many prestigious universities followed MIT's step and built their own online open courses platforms. Currently, there are three large online open courses platforms: EdX, Coursera and Udacity. In recent decades, online open courses have been developed rapidly in China, which expand the teaching time and space, increase the teaching attraction, motivate the learner's learning enthusiasm and independence as well as enlarge the high-quality education resources benefit fields (China Education Information Network, 2015). The amount of existing open online course platforms such as MOOC (Massive Open Online Courses), XuetaoX and iMOOC in China keeps growing under the encouragement of Chinese Ministry of

Education.

English is not only a compulsory<sup>1</sup> course for college students, but also a language that need to be mastered in this era of globalization. College English online open courses are widely needed and of great importance in universities. Consequently, it is necessary to construct blended teaching patterns of college English online open courses. This paper discusses four problems in domestic college English online open courses on the base of literature research, which are less amount of course diversity, less innovation of course content, less interaction of course participants and low utilization of course resources. In order to improve the quality and enlarge the expansion of college English online open courses, this study advances four innovative teaching patterns, namely, student-based teaching pattern, problem-based teaching pattern, humanity-based teaching pattern, and mutual evaluation teaching pattern.

## 2 Research Methodology

This paper mainly adopts the following methods: Firstly, comparison and contrast are adopted. In this paper, the present situation of online open courses at home and abroad is compared and contrasted, so that the similarity and difference is obtained for the development of online open courses in China. Secondly, literature inquiry is used. In organizing the paper, the related information about online open courses is inquired from different kinds of materials, in order that more information can make the argumentation persuasive. Thirdly, interdisciplinary research method is adopted. In discussing the blended teaching patterns of college English online open courses, the knowledge background of higher education, second language teaching and learning, course design and so on is fully involved, needing the mixed interdisciplinary background.

## 3 Existing Problems in College English Online Open Courses

Overviewing the history and application of college English online quality courses in China, it is not difficult to find that the curriculum construction and application have achieved fruitful results. It has basically formed a multi-disciplinary, multi-level and multi-type online curriculum system pattern, which plays a significant and positive role in expanding teaching time and space, enriching teaching content, sharing teaching resources, and innovating teaching activities (Yang Fangqi, 2018). Despite the success achieved in domestic online open courses, there are still some problems to be solved.

### 3.1 Less amount of course diversity

This paper takes Chinese University MOOC, the most popular online open course platform at present in China, as the research target. There are over three thousand online open courses from 329 Chinese universities and colleges in total distributed in 15 subject categories including engineering, science, medicine, law and so on. However, take OCW as an example, since MIT launched the OCW, according to the latest site statistic report, around 2,500 courses of MIT have been issued and its total visits have reached to approximately 2.8 billion (MIT Open Course Ware, 2019).

**Table 1 Course Distribution in Chinese University MOOC**

Course Type	Engineering	Science	Computer	Management	Psychology	History	Philosophy	College English
Quantity	701	466	288	271	38	50	43	57

As Table 1 demonstrates, courses in Chinese University MOOC are mainly distributed in engineering, science, computer and management, which are 701, 466, 288, 271 respectively, with a total of 1,726 courses, accounting for nearly 57% of the total courses. While courses of psychology, history and philosophy are obviously less, which are 38, 50, 43 respectively, only account for 4% of the total courses. College English online open courses even less, which only has 57 courses. Having a comparison of online open courses between domestic and abroad, it is apparent that there is a huge gap in the amount of college English online open courses.

### 3.2 Less innovation of course content

Course content plays an important role in online open courses, which, to a large extent, determines the quality of the course. Furthermore, the course quality is the core of improving the quality of personnel training (Fan Lixin, Jiang Shengyong, Huang Longjun, 2015). Nevertheless, according to existing college English online open courses, most of them are based on lecture videos, multimedia courseware, and text lesson plans. Most contents are subject-centered. To a certain extent, these contents may effectively help students to define the basic logical structure of the subject and understand the unique way of inquiry of the subject, but they may weaken students' interest in learning, which is not conducive to cultivating students' practical ability and comprehensive quality. There are also significant gaps in the design concept of the new curriculum content that focuses on the students and development of their abilities (Yang Fangqi, 2018). Some contents are simple, some are too difficult, and some of the content are so academic that the courses become an online version of a professional class, which limits the entry of non-professionals (Li Hai, 2019).<sup>82</sup>As for college English online open courses, the contents of some courses are obsolete because the teachers just upload the courses videos on the platform and may not up<sup>83</sup>dating them in time.

### 3.3 Less interaction of course participants

College English online open courses offer an opportunity for college students to learn knowledge not only in a traditional class but also after class— from the Internet. However, due to the traditional concept and incorrect cognition on teaching and learning, many teachers and students simply consider the online open courses as a digitalization of teaching and learning activities, which unconsciously set an obstacle when taking online open courses. In quality courses, there are only teaching contents such as syllabus, teaching plans, courseware, lecture videos and homework, but no interactions. At present, MOOC provides learners with many online course activities like comment and question function, discussion community, online note tools and quiz to offer learners better learning experience. Unfortunately, due to the lack of supervision, although many improvements have been done on the teaching and learning activities of college English online open courses, there are still separation between the course participants.

### 3.4 Low utilization of course resources

In December 2018, the number of online education users in China reached 201 million, and the online education usage rate was 24.3%. Mobile online education users reached 194 million, with a usage rate of 23.8% (The 43<sup>rd</sup> China Statistical Report on Internet Development, 2019). These figures demonstrate that though the number of registrations on online education has reached to a huge amount, the actual

<sup>82</sup> The 43rd China Statistical Report on Internet Development [EB/OL]. (2019-02-28) [2019-05-15]. [http://www.cnnic.net.cn/hlwfzyj/hlwxyzbg/hlwtjbg/201902/t20190228\\_70645.htm](http://www.cnnic.net.cn/hlwfzyj/hlwxyzbg/hlwtjbg/201902/t20190228_70645.htm)

<sup>83</sup> MIT Open Course Ware. Dashboard Report [EB/OL]. (2019-04-14) [2019-05-15]. [https://ocw.mit.edu/about/site-statistics/monthly-reports/MITOCW\\_DB\\_2019\\_03\\_v1.pdf](https://ocw.mit.edu/about/site-statistics/monthly-reports/MITOCW_DB_2019_03_v1.pdf)

usage rate is still at a low level. Over 15-year development, the number of quality online open courses reached to a considerable figure, however, after visiting dozens of university websites, many online open courses are found out missing or with few visits. The number of quality course visits on many websites has not increased, the daily maintenance of the website is not timely and the interaction with users is reduced, and the development speed of the online open courses is slow, which causes many websites to upload and update the quality course resources less frequently so that the website content become less resourceful and even some of the site's resource contents were uploaded a few months or a year ago (Cao Xiyang, He Yinghong, He Fuhui, Liu Liyang, 2019).

#### **4 Innovative Construction of Blended Teaching Patterns**

College English online open courses are increasingly called for by college students in this new age. But language teaching online is quite special because online courses may neglect the social attribute of language teaching and lack of language learning environment as students just watch the videos and have no interaction with teachers, which doesn't meet the needs of English learners in the new age. The foreign language by means of e-learning often manage to apply more slowly than it in technical subjects and sciences. That is why in the foreign language teaching gradually the seemingly most suitable method had been set—the method of blended teaching (Sarka Hubackova, 2015). Blended teaching provides more guidance by integrating face-to-face teaching with web-based teaching, as well as adding flexibility and accessibility to traditional learning through online learning (Reem Alebaikan, Salah Troudi, 2010). Therefore, in order to have a better application of online open courses in college English teaching and learning, this paper puts forward four innovative blended teaching patterns.

##### **4.1 Student-based teaching pattern**

The traditional teaching pattern is centered on the teacher's teaching. The students are only passively accepting knowledge. It is difficult to teach students in accordance with their aptitudes and targeted guidance and education. Under the student-based teaching pattern, students actively participate in the peer and self-assessment process, in conjunction with teacher assessment, for formative assessment. In other words, the students learn to analyze and evaluate their own learning process with the support of teachers, rather than wait for teachers to tell them where their learning is deficient (Renandya, Willy A., Handoyo Puji Widodo, 2016). The development of online open courses makes it possible to apply student-based teaching pattern in college English teaching and learning. In online open courses, students are the main body of the course while teachers are instructors to help students integrate and optimize teaching resources and helping students develop relevant teaching plans (Liu Xiaoyong, 2019). Student-based teaching pattern requires that teachers concern the characteristics of student, therefore, the difficulty of teaching resources and the level of details and focus of the course video should be fully considered, so that students with different levels of English and different interests can be offered with a variety of choices. This kind of teaching pattern promotes students to stimulate high-level learning motivation, fully develops students' potential, and enables students to self-educate (Xing Cong, 2019).

##### **4.2 Problem-based teaching pattern**

Problem-based teaching is an approach to structuring the curriculum which involves confronting students with problems from practice, which provide a stimulus for learning (Boud D, Feletti G, 2013). However, homework is a good approach to reflect students' problems. No matter in the traditional classes or online open courses, homework is no doubt an indispensable way to consolidate course content and test learning outcomes. Homework is an essential part of learning. Students need the opportunity to practice and apply the concepts and skills demonstrated by their instructors. Online homework systems allow students to retrieve, complete, submit and receive feedback on homework via their web browsers. Many studies demonstrate two main characteristics of an effective instructional

technology regarding online homework completion: immediate feedback and the allowing of multiple attempts to answer a question (Bibi Rabia Khan, 2018). Consequently, homework design is of great importance. In college English online open courses learning, students may have different questions and problems, most of which cannot be answered and solved. It is quite efficient to combine problems and homework. Many online open courses platforms set some new functions such as “chatting room” and “Discussion”, which can tell teachers the questions and problems students have. Then according to these questions and problems, teachers can design targeted homework. Students are required to complete the relevant online course content before class and complete the hierarchical and differentiated preview tasks, such as study notes, preview reports, project reports, forum questions, forum discussions, etc. (Liu Xijuan, Han Xiao, Xia Hengxia, 2018). After the offline course, students need to do the designed homework to internalize the learning content.

#### **4.3 Humanity-based teaching pattern**

“Humanities” is a concept that covers a wide range of things. In the modern sense, “humanities” mainly refers to the social morality, value idea, aesthetic taste and thinking mode formed in the process of social development. The essence of the humanistic quality education lies in the cultivation of humanistic spirit (Li Yifei, 2015). High-quality, rich online course resources can provide strong support for the reform of online open courses and the improvement of teaching quality (Li Hongjuan, Wang Xiang, 2018). Online courses offer a wide range of learning extended resources to enrich course resources and meet the learning needs of different students. Rich course resources can reduce the blindness of students’ learning without spending a lot of energy on online search, which can maximize student convenience and provide students with an immersive learning experience. Under the pressure of examinations and credits, students just study hard to get a better grade while neglect the development of their humanistic qualities. English language teaching is not only a simple text teaching, but also teaching a different culture. Understanding different ways of thinking and spiritual connotation, students can respect the differences of different cultures, eliminate cultural prejudice and cultivate their cultural adaptabilities and cross-cultural communication skills (Shi Qianqian, 2019). This pattern not only encourages teachers to teach students more humanistic knowledges but also increases students’ interest in college English online open courses.

#### **4.4 Mutual evaluation teaching pattern**

Teaching evaluation aims to test the effectiveness of teaching and learning, discover problems in teaching, and better promote teaching. Since online open courses are conducted through the Internet, students take these courses outside the classroom. In the virtual teaching environment, learning is inevitably boring and difficult to sustain due to less supervision and constraints. At present, the evaluation methods of many online open courses are mainly divided into classroom exercises, tests and examinations. The evaluation of college English learners should pay attention to the process evaluation, adopt the combination of online and offline evaluation, pay attention to monitoring the students’ learning status, and examine the students’ learning attitude and the ability of independent learning and collaborative learning (Zhang Jinhong, 2016). Mutual evaluation incorporates the activity of students in the forum and the participation of the curriculum into the evaluation indicators, and forms an evaluation system covering teacher’s evaluation and student’s mutual evaluation. Through mutual evaluation, both teachers and learners are under the supervision of an invisible eye, which stimulates the teachers to be responsible for the online open courses and the students have a good performance in the courses.

### **5 Conclusion**

The rapid development of modern information technology has brought unprecedented opportunities for college English teaching and learning. China’s college English online open courses have been

continuously developed, and the English teaching pattern has been innovated, enriching the content and resources of English teaching. Although there are some problems in the college English online open course for the time being, with the development of technology and the changing people's concept, the online open courses will gradually get on the right track. The college English online open course itself is a complicate project that cannot be accomplished overnight. It requires long-term experience to accumulate and improve. Blended teaching is one of the common teaching patterns with the development of college English online open courses. This paper puts forward four innovative teaching patterns, hoping they could give some inspiration to the construction of blended teaching in college English online open courses.

## The Practice and Innovation of Task-Based Language Teaching

Lu Xiaoli , Ke Jianhua

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: luxiaolily@hotmail.com, 2506009814@qq.com)

**Abstract:** Task-Based Language Teaching (TBLT) is an influential language teaching mode proposed by the international applied linguistics community in the 1980s. This paper introduces the principles of task design and implementation steps of Task-Based Language Teaching and details the teaching procedures through a spoken English class. Next the paper proposes the innovation practice based on the problems and advantages with Task-Based Language Teaching. Last the paper concludes that TBLT is a strong communicative approach by providing opportunities for implicit, incidental and meaningful learning.

**Keywords:** Task; Task-Based language teaching; Practice; Innovation; Problems; Advantages;

### 1 Introduction

Task-Based Language Teaching (TBLT), a language teaching mode with important impact on foreign language teaching and second language acquisition, was proposed by the international applied linguistics community in the 1980s, with reference to the theories and methods of pedagogy, psychology and other related disciplines, through a large number of studies and practices. This mode takes specific tasks as learning motivation, the process of completing tasks as learning process, and presenting task results as teaching achievements. However, there is no agreement on the definition of "task" in language teaching at home and abroad. Nunan (Nunan, 2004) defined "task" as a piece of classroom work which involves learners in comprehending, manipulating, producing or interacting in the target language while their attention is principally focused on the meaning rather on the form. The task should have a sense of completeness being also to stand alone as a communicative act in its own right. According to Breen (Breen, 1987), tasks refer to various work plans with stimulating language learning being the overall goal. Ellis (Ellis, 2003) pointed out that task is a work plan that requires students to use and process languages. Richards and others believe that task is an activity or action that learners complete on the basis of understanding and processing language. Here is a definition by Prabhu: "An activity which required learners to arrive at an outcome from given information through some process of thought and which allowed teachers to control and regulate that process was regarded as a task." (Prabhu, 1987:24) Examples of tasks include: preparing a meal; ordering food in a restaurant; making an

appointment with a doctor on the phone; solving a problem; designing a brochure; making a list of the qualities of a good husband/wife. From these different definitions, we can easily see that task involves communication with language which focuses on the meaning rather than the forms of that language. The core idea of Task-Based Language Teaching is to cultivate the ability to use language in the process of accomplishing tasks.

## **2 Activity Design and Implementation Steps of Task-Based Language Teaching**

In Task-Based language teaching, task design is mainly considered from the following five aspects: (1) degree of difficulty and individual differences. The author believes that Task-Based teaching activities should have moderate difficulty and follow the principles of from easy to difficult, from simple to complex, and layer upon layer in a progressive way. Task-Based teaching is "student-centered" and "people-oriented". Since every student is an independent individual, the teacher should try to create conditions and opportunities for each student's individual development according to the individual differences. For example, in group activities, tasks should be shared reasonably according to the level and expertise of each student. Students with poor foundation can do some simple and static tasks, such as describing things or processes. Students with good foundation should be given some abstract and dynamic tasks. (2) authenticity and interestingness. In classroom teaching, efforts should be made to create a real-life language environment which makes English classroom teaching have real communicative nature of language and enables students to have lifelike language experience so that they can apply what they have learned. (3) diversity. Language communication is a kind of creative mental activity. We should design different kinds of activities that can inspire students' thinking and stimulate their enthusiasm for learning so as to improve students' comprehensive ability of using language. Common activities are using table format, categorizing, conversation, contest, writing, debate and so on. (4) extensibility. Considering students' ages and hobbies, teachers are supposed to actively carry out various Task-Based extracurricular activities to help students increase knowledge, broaden horizons and show talents. The suggested activities are as follows: English songs, English calligraphy, English handwritten newspapers, English textbooks plays, English evening parties and other activities (Sun Kuoxing, 2006)

Task-Based learning offers an alternative for language teachers. In a Task-Based lesson the teacher doesn't pre-determine what language will be studied, the lesson is based around the completion of a central task and the language studied is determined by what happens as the students complete it. Jane Willis (Jane Willis, 1996), in his book "Task-Based Learning Mode", put forward the three-stage mode of TBLT classroom activities: pre-task, task-cycle and language focus.

The pre-task stage is also the warming-up stage or the preparation stage. Teachers first introduce subjects and tasks to students, and help them understand the instructions of tasks and make preparation.

Students understand the tasks to complete and the goals to achieve and receive relevant language input for the task. It is worth mentioning that to complete a task is to do things and students need some background and language knowledge to pave the way for the task.

The task-cycle stage includes task section, plan section and report section. First, students perform tasks. In this section, in order to complete the communicative tasks (such as discussion, debate, role-play etc.), students try their best to express themselves with the language knowledge they have learned. During this period, the focus of students' attention is not form of language but meaning. Teachers should by all means relieve various pressures to complete tasks on students so that they think they are capable enough to handle the task. Next comes the plan section. Students think about and discuss how to organize and choose the language and determine the content of the report through individual, pair and group work. In this way, learners can get more chance to communicate and meanwhile they help each other and practise cooperative learning, thus their language competence advance considerably. During this time, teachers should offer students specific guidance and language counseling in time. In the following report section students give report on the task they perform. Teachers then summarize and encourage students to reflect on what they've done. Learning is a process of discovering, solving and summarizing problems. Only by constantly internalizing and externalizing knowledge, reflecting and summarizing can we finally form our own knowledge system.

Language focus includes language analysis and practice. The purpose is to master some important language points and review language knowledge previously learned, meanwhile extract and summarize language points of this lesson.

### **3 Teaching Practice**

The following is the author's attempt to design tasks in an oral class with the topic "love" by using Task-Base language teaching mode.

**(1) Teaching objectives:** Through this lesson, students master relevant language points and focus on understanding what love is. The difficult point is the cultural differences in understanding love between Chinese and westerners.

**(2) Activities:** games, discussions, role plays, oral reports etc. in the form of pair work and group work.

**(3) Teaching procedures:**

Pre-class Tasks

A. Students are required to preview reading "What I have lived for" by Bertrand Russell to

understand the main idea of the article.

Excerpt: I have sought love, first, because it brings ecstasy---  
ecstasy so great that I would have sacrificed all the rest of life for a few hours of this joy. I have  
e sought it, next, because it relieves loneliness---  
that terrible loneliness in which one shivering consciousness looks over the rim of the world i  
nto cold unfathomable lifeless abyss. I have sought it, finally, because in the union of love I h  
ave seen, in a mystic miniature, the prefiguring vision of the heaven that saints and poets have i  
maged. This is what I sought, and though it might seem too good for human life, this is wh  
at --- at last --- I have found.

B. Students are required to watch the movie “Notting Hill” online and prepare a three-minute oral  
report on the storyline.

#### Classroom Tasks

A. After students read together parts of the article, teacher explains several key language points to  
enable students to have a deeper understanding of the article.

B. Teacher introduces the topic and the main objectives of this lesson to students.

C. The whole class is divided into two groups, A and B. The two groups compete in the vocabulary  
game "I love my love". After the teacher announces the winner she/he presents some pictures via  
multimedia to help students memorize the new vocabulary.

D. In each group of four students are encouraged to write as many love-related words or phrases as  
possible and classify them.

E. Each student in the group does the following blank-filling exercises: “Love starts  
with \_\_\_\_\_, advances with \_\_\_\_\_, breaks with \_\_\_\_\_, recalls with \_\_\_\_\_ and lasts with \_\_\_\_\_ till the end of  
happiness.” Then the students in each group communicate with each other to get to know people's  
different ideas about love.

F. Listen to the theme song "she" from the movie “Notting Hill” and then complete the lyrics.  
Teacher then summarizes how love is interpreted in the song -----Love is full of paradox---sweet  
torment.

Excerpt: The trace of pleasure or regret

May be my treasure or the price I have to pay

May be the song that summer sings  
May be the chill that autumn brings  
May be the beauty or the beast  
May be the famine or the feast  
May turn each day into a heaven or a hell  
I'll take her laughter and her tears

G. Role-play. A girl student and a boy student act out a love story between a Chinese girl studying in the United States and an American lawyer. Then students discuss the cultural differences in understanding love between Chinese and Westerners and the possible reasons behind that. This is to cultivate students' cross-cultural awareness.

H. Questions based on lifelike scenarios. Question for boys: How to let your girlfriend split the bill without ruining the date? Question for girls: You love your boyfriend but he is frugal as he comes from a poor family. You want to pay for a date but don't want to hurt his dignity. So, what do you do? Question for all: How to have a perfect night with only 50 yuan? With these questions students better understand how to deal with the relationship between love and money.

I. Group discussion: How to maintain vigorous love especially after the couple have kids? Representatives from each group give oral reports to the class and teacher makes comments on each one.

After-school Tasks.

A. Review the key words and phrases in this lesson.

B. Summarize useful expressions used to express likes, dislikes and comparisons, such as I enjoy/like.....I'm afraid I don't like....., I prefer .....to.....

#### **4 Problems and Advantages with Task-Base Language Teaching**

Some teachers criticize TBLT for focusing mainly on fluency at the expense of accuracy. Task-Base Language Teaching emphasizes meaning rather than language form, but this does not mean that teachers don't have to correct students' language errors. Teachers need to think about when to and how to do it. Since Task-Base Language Teaching mode is student-centered. Students need to actively cooperate and participate in various activities. However, some students tend to take negative and passive roles in class because of psychological and language barriers. This requires teachers to use right skills helping students overcome their fear and undertake intensive language input before the task. TBLT requires a high level of creativity and initiative on the part of the teacher. In Task-Base Language Teaching mode group activities are often carried out. What usually happens is that students have no idea where to start

and what to say after being given the task. This is mostly due to inappropriate task design. Thus it is quite necessary for teachers to study the principal involved in task design. Another common phenomenon is that when one group is making the presentation the other groups do not pay much attention to it and just wait for the teacher to make comments. In view of this, the author believes that proper interaction between students on and off the stage is quite needed. For example, the interaction can take place in the form of questions and answers.

The current English teaching in colleges is still characterized by the adoption of the traditional teaching method, which is known as the 3Ps approach (presentation, practice, production) and in which student participation and interaction are quite limited. Task-Based learning has some clear advantages: 1. Unlike a PPP approach, the students are free of language control. In all three stages they must use all their language resources rather than just practicing one pre-selected item. 2. A natural context is developed from the students' experiences with the language that is personalized and relevant to them. With PPP it is necessary to create contexts in which to present the language and sometimes they can be very unnatural. 3. The students will have a much more varied exposure to language with TBL. They will be exposed to a whole range of lexical phrases, collocations and patterns as well as language forms. 4. The language explored arises from the students' needs. This need dictates what will be covered in the lesson rather than a decision made by the teacher or the coursebook. 5. It is a strong communicative approach where students spend a lot of time communicating. PPP lessons seem very teacher-centered by comparison. Just watch how much time the students spend communicating during a Task-Based lesson. 6. It is enjoyable and motivating.

## **5 Innovation Practice**

(1) The combination of traditional teaching and Task-Based teaching. In China English learning environment is dominated by classroom teaching. The size of classes and the number of students is relatively large. Compared with other countries, classroom management is more complex and inconvenient. If we follow the concept of Task-Based teaching and completely rely on the students' cooperative learning or independent exploration of knowledge, it would be difficult to ensure the completion of tasks and achieve the proper teaching objectives. So, it is necessary to combine the traditional 3P (presentation, practice, production) teaching with Task-Based teaching.

(2) The combination of in-class collaborative tasks and extracurricular extended tasks. In class, teachers should make full use of limited time to promote cooperative learning among students and encourage exchange and discussion, rational division of labor, consultation and mutual assistance and summary. Students should be familiar with the task objectives, operation steps and thus lay a good foundation for task execution. Efforts should be made to create a humanized teaching environment and extend beyond class.

(3) Tangle language input and output appropriately. Traditional teaching pays more attention to language input, while Task-Base teaching pays more attention to language output. On one hand, Language input is a prerequisite for language learning. On the other hand, without language output and necessary training knowledge and information cannot be translated into skills, which makes language input and knowledge reserve meaningless. Input Innovation requires teachers to systematically design and present key and difficult language points in the early stage so that students have a better understanding of it. And the exploration during the task-cycle make language output more effective and the whole task would be more smoothly completed.

(4) Advocate group cooperation and encourage individual thinking. Cooperative learning is a student-centered and group-based learning. More cooperation is needed in more demanding tasks. In Task-Base teaching, teachers should guide each student for both cooperation and independent thinking. And students shall never develop the habit of relying on other group members. During the task -cycle there are occasions when some skillful students control the speak. In this case, teachers are required to have a higher sensitivity and encourage the timid and silent students to talk so that every student is involved and feels fulfilled.

## **6 Conclusions**

### **6.1 Implicit learning**

The aim of TBLT is to help learners develop implicit knowledge of the language that will enable them to participate easily and naturally in communication. The learners get the form and use of the target language without being explicitly being taught. The role of the teacher is to design tasks by replicating and creating the conditions for language learning and for communication that exists outside the confines of the classroom. The aim is that the learners' inter-language will gain implicit language knowledge while doing tasks.

### **6.2 Incidental learning**

Much of our everyday learning is incidental. TBLT provides opportunities for unplanned learning. Completing a real-world task allows the acquisition to take place without any deliberate intention on the part of the learner or the teacher.

### **(3) Meaningful learning**

TBLT allows meaningful communication to occur during the accomplishment of tasks.

**Abstract:** Role of the Small and Medium Enterprises in economic development is immense. However, in the growing literature of SMEs management, inadequate consideration has been devoted on the financial literacy of the SMEs, and the mechanisms through which it impacts on SMEs performances. Drawing upon knowledge-based view and dual process theory, we tested the impact of financial literacy and risk attitude on SMEs performances in an integrated model. The sample included 244 chief financial officers of SMEs in three provinces of Sri Lanka (Central, Western and Southern provinces). The output of structural equation model revealed a direct positive effect of financial literacy and risk attitude on SMEs performances. Further, financial literacy also has a significant positive impact on risk attitude. Moreover, risk attitude was found to be partial mediator between financial literacy and SMEs performances. Accordingly, we conferred managerial and theoretical implications for policymakers, industry practitioners and academics.

**Key words:** Financial literacy; Risk attitude; SME performances

## 1 Introduction

The emerging significance of financial literacy (FL) is well documented in recent literature. Financial literacy has been defined as the knowledge and cognitive capabilities entail to manage and to make effective decisions on finance (Adomako et al., 2016). Further, Korutaro Nkundabanyanga et al. (2014) defined FL as “the ability of an individual to make informed judgment and take effective decisions regarding the use and management of money”. Thus, FL is vital for SMEs to make financial decisions. It helps to empower and educate SMEs on finance and to use that knowledge for evaluating and making decisions on financial issues in their businesses. Further, it is expected that financial literacy would help to deal with challenges in cutting edge credit markets. Moreover, financial literacy enables SMEs to manage risks through the strategies such as maintaining financial reserves, diversifying investment portfolio and buying insurance policies. Accordingly, in this complicated, competitive and risky business setting, financial literacy helps SMEs through improving the skills to manage financial resources productively while effectively managing risks arise with financial decisions.

Presumably, business and financial risks are rapidly increasing with prevailing unstable situation of the economic systems. Specially, SMEs in emerging markets have to deal with more challenging economic conditions and most of them are struggling to survive in the market. Consequently, financial managers of SMEs have to undertake and control all these risks to safeguard their organizations from these jeopardizes (Jaroslav et al., 2014). Thus, risk attitude is important for SMEs to survive and

develop in this challenging economic environment. In psychological literature, risk attitude has been extensively used as an entrepreneurs' personality characteristic while measuring SMEs success (Rauch and Frese, 2000). Further, the importance of risk attitude for SMEs in developing countries is also well documented in the literature (Krauss et al., 2005). Economic theories also explain the relationship between risk and return. Accordingly, risk aversion entrepreneurs would accept low return in exchange of less risk exposure while entrepreneurs who are willing to take higher risk will compensate with high expected return. Further, the risk attitude of the entrepreneur is relevant in selecting business sector to invest. Some sectors generate higher return with higher variance which creates more risks for investors. Similarly, a sector which entails a large initial capital implicates additional risk through bankruptcy. Risk aversion entrepreneurs will not invest in those sectors. While theory suggests inverse relationship among risk attitude and performances, the findings of empirical studies is rather complicated about this issue. For instance, Krauss et al. (2005) and Koop et al. (2000) found a positive impact of risk attitude on SMEs performances while Rauch and Frese (2000) and Naldi et al. (2007) found a negative relationship between risk attitude and SMEs performances. Therefore we argue that SMEs performances are not solely determined by risk attitude, but the competent of the CFOs' such as sound financial literacy to manage those risks.

Despite the recognized importance of financial literacy and risk attitude in the empirical literature, there impact on SMEs performances has not been extensively studied. Further, most empirical researches has been used experimental research designs and focus only on the effect of financial literacy and risk attitude on predefined decision such as investor behavior (Norton and Moore, 2006). Moreover, most SMEs development researches has been carried out focusing on developed economies while only few researches have been focused on the SMEs sector of developing economies (Florio and Leoni, 2017). Therefore, this research is attempted to investigate the roles of financial literacy and risk attitude on SME performance in Sri Lanka. Furthermore, this study aims to investigate the mediating role of risk attitude in SMEs development of Sri Lanka.

This study contributes to financial literacy and SME development literature in four ways. First, we examine the direct impact of financial literacy on SMEs performances with the support of Knowledge Based View, confirming the findings of previous studies. Second, we add novel mechanism through which financial literacy impacts SMEs performances by testing the mediating role of risk attitude. Specifically, these novel relationships which explain how FL impact on SMEs performances, would expand the boundaries of financial literacy and SME development researches. Third, FL is identified as a predictor of risk attitude with theoretical reasoning from dual-process theory. Fourth, this study applies knowledge-based theory and Dual-Process theory to conceptualize the determinants of SMEs performances.

## **2 Theoretical Background and Hypotheses**

### **2.1 Impact of FL on SMEs performances**

The impact of financial literacy on firm performances rigorously studied in the literature and revealed the positive relationship among them (Huston, 2010). Firms that are financially literate can provide informed insights for financial perspectives on strategic issues, thereby improving firm

performance. Wise (2013) revealed the importance of financial literacy for the survival of SMEs in both developed and developing countries. Low level of financial literacy caused to poor financial management practices and to commit frequent financial mistakes. Huston (2010) pointed out the importance of financial literacy to cope with rapid economic changes. Similarly, Widdowson and Hailwood (2007) find that those who have strong financial knowledge were more likely to invest in complex assets and succeed. Davidson III et al. (2004), has also confirmed the association between financial literacy and firm performance. Further, financial literacy is known to be an important factor for the effectiveness of firm performance as well as wealth accumulation. Accordingly, financial literacy has become one of the most important driving forces in organizational decision-making and strategic long term financial planning. Financial literacy in a firm may encourage the company to employ sound financial management practices that can have beneficial effects on the development and sustainability of a vibrant firm performance. Thus, financial literacy is conceived to positively effect to the SMEs performance.

Thus, this research hypothesized that:

H1: Financial Literacy positively related to SMEs performance.

#### **2.4 Impact of financial literacy on risk attitude**

In the growing literature on financial literacy, scant consideration has been devoted to study on the role of financial literacy in relation to risk attitude (Ryack, 2011). Risk Attitude can be defined as the extent to which firms are willing to pursue risky financial resource opportunities in ventures with unknown outcomes. In other words, the term risk attitude explains the level of enthusiasm of an organization to make large and risky resource commitments. However, as claimed by Hillson and Murray-Webster (2006), risk attitude is affected by both cognitive and emotional factors. Intuitively, different firms will exhibit different responses to the same situation as a result of their differing underlying attitudes towards risk taking. Some firms can accept more risk than others and some can manage the risk better than others, depending on their attitude and orientations to uncertainty. However, human attitude on risk is often associated with the losses. Renn (1998) revealed the significance of understanding the human behavior to define the term risk. Further, he noted that the risk is highly associated with the investors' expectations and future results of an event. Accordingly, risk is subjective.

Knowledge on financial literacy and risk attitude may help to understand the business uncertainty and so perform better financially and strategically. For instance, Hallahan et al. (2004) found a correlation between both financial literacy and education level with risk attitude. Further, Gustafsson and Omark (2015) found a positive relationship between financial literacy and risk attitude. Moreover, Van Rooij et al. (2011) examined the effect of financial literacy on financial decisions and revealed that weak financial literacy caused to poor financial decisions. Increasing financial literacy within the firm may empower it to attain relevant knowledge and attitudes in dealing with financial risks and challenges. Further, financial literacy would help to improve both knowledge and managerial skills which led to effective management of financial resources and affairs of the organization.

Accordingly, second hypothesis posits as follows.

H2: Financial literacy positive effect to the risk attitude

## **2.5 Risk attitude and SMEs performances**

Firm performance is also dependent on the risk attitude of the firm. The risk attitude allows a firm to identify opportunities and risks that are associated with informed financial decisions. Gärling et al. (2009) also found risk attitude as a significant factor which affected to financial decision process of the organizations. Such attitudes have an impact on not only the decision but also the survival and failure rates of firms. The influence of risk attitude may also vary with the nature of the business owners and the management. For instance, entrepreneurs are evaluating business situations more positively than non-entrepreneurs as they are focusing on the business opportunities than the threats. Accordingly, differences in risk attitude can have a strong influence on the business performances. Thus, it is proposed that attitude towards risk taking may play a prominent role in successful SMEs performance.

Considerable research has attempted to provide empirical evidence on risk attitudes' impact on SMEs success. Empirically, Grable and Lytton (1999) showed that total income is positively related to the risk attitude. Xiao et al. (2001) report that those who are willing to take substantial risks, generally had a larger share of assets than those who were unwilling to take risks. In general, the likelihood of engaging in the risky activity reflects the tradeoff between expected activities' benefits and its riskiness. As attitude towards risk taking become more established, the firms will be able to view the potentially risky situation with greater enlightenment, and thus have a greater confidence in managing and undertaking higher risk strategies. Hence, firms who have taken their risks effectively can be expected to better produce high performance.

Accordingly, third hypothesis posits as follows.

H3: Risk Attitude is related positively to SMEs performance.

## **2.6 The link of risk attitude, financial literacy and SMEs performance**

According to the Dual-Process Theory thoughts are affected by both cognitive and intuitive processes. Intuition is the ability to acquire knowledge without conscious reasoning or evidence. Intuition provides views, judgments, understandings or beliefs that cannot be empirically verified or rationally justified. Individuals who are highly depend on intuition willing to use mental short-cuts and thus their thoughts are highly influenced by their emotions (Chan and Park, 2013). Cognition can be identified as a mental process which is acquiring knowledge and transform, evaluate, elaborate, stored and used those sensory inputs with thoughts, experiences, and the senses. Cognition is includes the comprehending, calculating, reasoning, problem solving and decision making (Chan and Park, 2013). Prevalence of both cognitive and intuitive thinking patterns influence to the human behavior (Lusardi and Mitchell, 2014). Decisions taken with the higher financial literacy would influence by cognitive and intuitive processes thereby the risk attitude. Thus, the financial literacy will not always cause for an optimal decisions. In fact, financial literacy significantly influence on business decisions hence to the business performance. Thus, we argued that the financial literacy has both direct and indirect influence to the firm performances. In other words, financial literacy may influence to firm performances through the factors such as risk attitude.

Empirically, Widdowson and Hailwood (2007) suggest that a better financial literacy would facilitate to take advantage of increased financial market competition through the knowledge and skill

on risk management. Further, financial literacy may facilitate the decision process, which provides an empowering ability to think rationally and to take critical stances. Firms identify those risky situations and within them a set of potential actions that have the least possibility of failure. That consequently minimizes the probability of making costly decisions. The notions of risk attitude relate to the belief that the greater the firm's dealing with strategic risk-taking, the less uncertainty it will have regarding the likely outcome of taking the risks and the more reasonable the decision will be. Moreover, financial literacy may reduce the degree of potential loss associated with taking a particular risk by facilitating firms to more comprehensively judge and rationalize taking actions that might otherwise be deemed too risky without such resources. The level of financial literacy may influence the extent to which particular strategic responses were understood as tolerable risks. Financially illiterate firms may lack adequate awareness to efficiently judge risks, which might limit their chances to achieve very high returns. Firms with high levels of financial literacy may be more likely to be involved in more strategic risk-takings and can be expected to better produce high performance.

Given this discussion, it is hypothesized that:

H4: Risk attitude mediates the relationship between financial literacy and SMEs performances

The hypothesized relationships and the variables are shown in Figure 1.

Figure 1 Research Model

### 3 Methodology

#### 3.1 Sample and population

The population of this study was comprised with SMEs in Sri Lanka. After considering number of definitions on SMEs, we considered the firms having 5 - 99 employees to select the sample, lying on the definition for Sri Lankan SMEs by World Bank. However, sample was selected from the western, central and southern provinces as more than 60 percent of Sri Lankan SMEs are located in these three provinces. Structured questionnaires were used to collect data and it was comprised with four main sections; Section 1- Demographic factors, Section 2- Financial literacy, Section3- Risk attitude and Section 4- SMEs Performances. Further, firm size and age used as controllable variables as both variables have an impact on firms' performances.

Data were collected from Chief Financial Officers (CFOs) of the SMEs considering their involvement and responsibility for the financial affairs of the organization (Anwar, 2018). We were approached to 250 CFOs of three different industries namely Manufacturing, Service and Trade to collect data. All the CFOs agreed to participate for the study and provided necessary information.

However, six questionnaires were eliminated due to the incompleteness and final sample comprised with 244 responses. Further, structural equation model (SEM) were used to achieve research objectives. Table 1 illustrates the constructs of the questionnaire.

**Table 1 Constructs of the Questionnaire**

	<b>Content</b>	<b>No. of Items</b>	<b>Source</b>
Sec. II	Financial literacy	13	Bongomin et al. (2018)
Sec. III	Risk Attitude – Risk Perception	6	Blais and Weber (2006)
	Risk Propensity	6	Blais and Weber (2006)
Sec. IV	SMEs Performances	6	Kropp, Lindsay and Shoham (2006)

## 4 Results and Discussion

### 4.1 Preliminary analysis

The sample of 244 responses was adequate for Structural Equation Model (SEM) analysis as it exceeds minimum required level of 200 (Loehlin, 1987). In the data screening stage few missing values were found and all missing values were replaced with the mean of non-missing values of the respective case (Hair et al., 2010). Normal distribution of the data confirmed with the absolute skewness values of financial literacy, risk propensity, risk perception and SMEs performances and all values were within the range of +1 to -1 (Curran et al., 1996). Then the linearity of the data were confirmed ( $p = 0.000$ ). All the Variation Inflation Factor (VIF) values were below the cut-off value of 3 and hence data were free from the multicollinearity issues (Hair et al., 2010). All the Durbin-Watson values were closed to 2 and it was confirmed data were free from autocorrelation (Field, 2013). All scale reliabilities (Financial Literacy:  $\alpha = 0.87$ ; Risk Propensity:  $\alpha = 0.92$ ; Risk perception:  $\alpha = 0.90$ ; SMEs performances:  $\alpha = 0.89$ ) are exceeds the threshold Cronbach's Alpha value of 0.7 (Hair et al., 2010). Table 2 illustrates the means, correlation coefficients and standard deviations of the variables which were employed in the study.

**Table 2 Means, Standard Deviations, and Correlations.**

<b>Variable</b>	<b>FL</b>	<b>RPR</b>	<b>RPE</b>	<b>FP</b>	<b>Mean</b>	<b>Standard Deviation</b>
FL	1.000**				3.56	0.609
RPR	0.503**	1.000**			3.28	0.781
RPE	0.614**	0.402**	1.000**		3.34	0.615
FP	0.731**	0.263**	0.307**	1.000**	3.96	0.593

\*\* Correlation is significant at the 0.01 level (1-tailed); FL, Financial Literacy; RPR, Risk Propensity; RPE, Risk Perception; FP, Firm Performance

When data is collected from same person at the same time through a questionnaire, there is an opportunity to arise common method bias (CMB). We used Harmon's One Factor test with the SPSS to detect the existence of CMB. The results confirmed that the absence of CMB in our data set as first factor explains only 32.76% variance which is less than 50%.

#### 4.2 Confirmatory factor analysis

We executed Confirmatory Factor Analysis (CFA) to evaluate the standardized factor loading, validity and reliability of the variables. The Cronbach alpha, composite reliability (CR), and average variance extracted (AVE) were used to assess the reliability and validity of the reflective constructs. Few items were dropped from the study due to low indicator outer loadings (<0.4) while, deletion of some items (0.04-0.07) increased the construct reliability and validity (Hair et al., 2014). All other indicator outer loadings were above 0.7 and thereby explain more than 50% of the indicators' variance, supporting a satisfactory degree of indicator reliability. The study found acceptable model fits (Chisq /df = 2.196, GFI = 0.87, AGFI = 0.84, NFI = 0.91, RMR = 0.019 and RMSEA = 0.061) after drawing few covariance among the error terms of the redundant items.

Moreover, we employed convergent validity test to identify the variance of the items with respect to their constructs. All the constructs have convergent validity above 0.50, thereby convergent validity of the variables are confirmed (Hair et al., 2010). The composite reliability (CR) is also has been used to evaluate the internal consistency of the constructs. Accordingly, internal consistency of constructs was confirmed as all the CR values of the constructs were above the threshold value of 0.7 (Hair et al., 2010). Discriminant validity explains the degree of the differences among the constructs of the model (Hair et al., 2010). Discriminant validity of the constructs was confirmed as AVE values are greater than the squares of inter-construct correlations. Table 3 illustrates CR values, AVE values and the discriminant validity of the constructs.

**Table 3 AVE values, Composite Reliability and Squares of Inter Construct Correlations.**

Latent Variable	FL	RA	RAPR	RAPE	CR
FL	<b>0.859</b>				0.893
RARP	0.402	<b>0.734</b>			0.923
RAPE	0.175	0.616	<b>0.816</b>		0.901
FP	0.058	0.312	0.174	<b>0.823</b>	0.961

Note: AVEs are given in diagonal in bold. FL, Financial Literacy; RPR, Risk Propensity; RPE, Risk Perception; FP, Firm Performance

#### 4.3 Structural model and hypotheses testing

This study used structural model in AMOS to test the hypotheses (Figure 2). We examined the direct relationship between FL and SMEs performance, FL and RA and RA and SMEs performance. More specifically we assessed the impact of FL on SMEs performances in the presence of RA as a mediating variable. Accordingly, the outcome of Chisq/df = 2.346, GFI = 0.90, AGFI = 0.87, NFI = 0.92, RMR = 0.029 and RMSEA = 0.071 shows a good fit in the structural model (Hair et al., 2010).

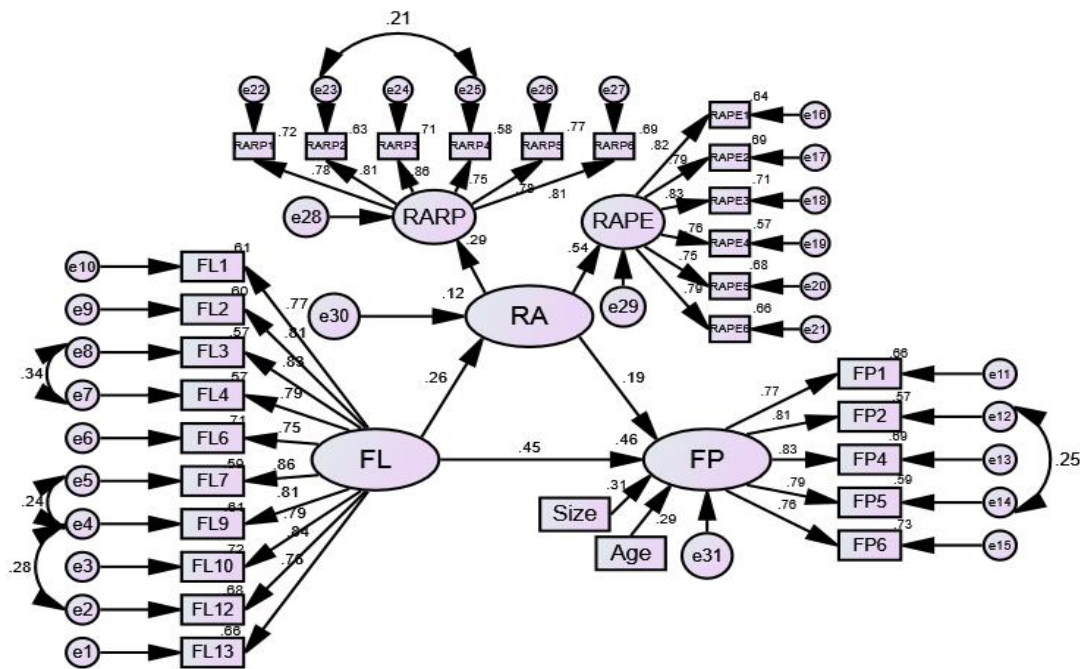

Figure 2 Structural Model

The outcome of the structural model analysis is demonstrated in the table 4. The analysis of the mediation effect initiates by showing that the direct effect of FL on SMEs performance and it was significant ( $\beta= 0.390, p < 0.05$ ). Thus, the first hypothesis was accepted. Next, mediating variable RA enters the model and results indicates that direct effects of FL on RA ( $\beta=0.211, p < 0.05$ ) and RA on SMEs performances ( $\beta=0.134, p < 0.05$ ) are significant. Accordingly, second and third hypothesis of the study was also accepted. While the direct influence on FL to SME performance remain significant, the indirect influence of FL on SME performance through RA is also found to be significant ( $\beta=0.046, p < 0.05$ ). It denotes that the construct RA does partially mediate the relationship between FL and SMEs performances, so the H4 is partially supported. The selected control variables namely firm size and firm age also shows a significant effect in the model. Further, the R-squared value demonstrates that FL, through RA, accounts for 46% variance in SMEs performances.

Table 4 Hypothesis Testing (With Mediation)

Hypothesis	Direct Effect	p	Indirect Effect	p	Total effect	p
FP < ----- FL (Through RA)	0.390	0.001	0.046	0.005	0.436	0.001
RA < ----- FL	0.211	0.007	-	-	0.211	0.007
FP < ----- RA	0.134	0.004	-	-	0.134	0.004
FP < ----- Size (Through RA)	0.153	0.001	-	-	0.153	0.001
FP < ----- Age (Through RA)	0.167	0.001	-	-	0.167	0.001

Note: FL, Financial Literacy; RA, Risk Attitude; FP, Firm Performance

## 5 Conclusion

In the emerging research area of behavioral finance, this research endeavored to answer the research

problem: How does financial literacy and risk attitude influence on SMEs performance? In particular, based on knowledge base view and dual-process theory, we developed a conceptual model that included risk attitude as mediator between financial literacy and SMEs performances. The sample of this study was consisted with 244 Sri Lankan SMEs and data were collected through a structured questionnaire. We used SPSS for the preliminary analysis and AMOS to test the hypotheses of the study. The results demonstrate that financial literacy and risk attitude directly impact SMEs performance while risk attitude partially mediate the relationship between financial literacy and SMEs performance. Therefore, financial literacy was found to be an important factor in predicting risk attitude and SMEs performance. This research expanded the SME financing literature by incorporating risk attitude as an antecedent of SMEs performance and proposed new mechanism to promote SMEs performance especially in the developing economies. Further, financially literate SMEs can enjoy outstanding status in emerging markets with increased performances.

# Information Disclosure, Executive Compensation Incentive and Analysts' Earnings Forecast Errors

Chen Yu, Zhang Youtang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: xll319@foxmail.com, zyt@whut.edu.cn)

**Abstract:** Taking the 2011-2018 Shanghai-Shenzhen A-share listed company as a sample, the empirical test examines the relationship between executive compensation incentive, company information disclosure and analysts' earnings forecast errors. The results show that there is a negative correlation between the company information disclosure and the analysts' earnings forecast errors. The executive compensation incentive plays a positive role in the relationship between the two, promotes the negative correlation between the company's information disclosure and the analyst's earnings forecast errors. Further research finds that the promotion effect of executive compensation incentive will change with the degree of internal compensation gap of executives. When the internal compensation gap of executives is small, the promotion of executive compensation incentive is more significant. When the gap is large, the promotion effect of executive compensation incentive is not obvious.

**Key words:** Information disclosure; Analysts' earnings forecast errors; Executive compensation; Earnings management

## 1 Introduction

With the deepening of economic system transformation, China's capital market development has steadily advanced and become an important part of the country's core competitiveness. The "China Securities Industry Development Report (2018)" issued by the China Securities Regulatory Commission also affirmed the role of securities analysts as an important part of the capital market and promoted the improvement of the capital market. As the most important information bridge between listed companies and investors, analysts provide investors with high-quality earnings forecast information and help investors to make accurate investment decisions, with their good professionalism, rich experience and informed information channels. The securities analyst research report can effectively alleviate information asymmetry and help accelerate the transmission efficiency of price-reflecting value, thereby ensuring that capital markets play a more active role in resource allocation (Ahmed A,

2005; Lee, 2013), to ensure the healthy development of the capital market, but its value must be based on the accuracy of the securities analysts' earnings forecasts. At the same time, analysts are also users of public market information. In order to ensure a more accurate forecast, it is bound to conduct comprehensive information collection. This information generally includes public information disclosed by listed companies in accordance with relevant laws and regulations or part of the private information directly obtained from the executives of listed companies. To a considerable extent, the above information will affect the accuracy of analyst forecasts.

To a certain extent, analysts are highly dependent on the public information of listed companies when making earnings forecasts. Company information disclosure will affect the accuracy of analysts' earnings forecasts (Beaver, 2002; Fang Junxiong, 2007). In order to improve the reliability of accounting information, improve the efficiency of internal corporate governance, and improve the quality of information (Wu Zhenwen, Zheng Pengxia, 2016), companies often restrict the behavior of managers through salary incentive, thereby reducing the analyst's earnings forecast errors. So, what is the relationship between the two different mechanisms of corporate information disclosure and executive compensation incentive influencing the accuracy of earnings forecasting? How does the incentive effect of executive compensation play? The existing empirical research in the theoretical circle does not give a clear answer.

Based on this, based on the panel data of CSI A-share non-financial listed companies from 2011 to 2018, this paper empirically tests the mechanism of the impact of corporate information disclosure on analyst errors and the moderating role of executive compensation incentive. This paper further considers the impact of internal pay gaps, and whether the incentive effect of executive compensation will change under different internal pay gaps of executives. The research contributions are as follows: (1) For the first time, we systematically comb the relationship between executive compensation incentive, company information disclosure and analysts' earnings forecast, and provides useful ideas for understanding the incentive effect of executive compensation; (2) This paper further studies whether there is a difference in the impact of executive compensation incentive on the accuracy of analysts' earnings forecasts under the internal salary gaps of different executives, which provides strong evidence for the company to determine the salary incentive mechanism reasonably.

The paper is divided into six sections. Research hypotheses are discussed in the second section. The third and fourth sections describe the combined states and models. In the fifth section, we provide descriptive statistics and illustrate our econometric findings. The sixth section concludes.

## **2 Research Hypothesis**

### **2.1 Company information disclosure and analysts' earnings forecast**

The accuracy of the securities analysts' earnings forecast is an important manifestation of the value of the analysts' research report. The public information is an important source of information for securities analysts (Barron et al., 2013). The more detailed information is disclosed by listed companies, the higher the quality predicted by analysts, the smaller the errors in the analyst's use of publicly disclosed information for earnings forecasts (Fang Junxiong, Hong Jianqiu, 2007). Highly transparent information will attract more analysts' attention and enrich research report of earnings forecast, and the number of analyst tracking is directly proportional to the analyst's overall earnings forecast quality (Feng Xunan and Li Xinyu, 2012). At the same time, the company's earnings management behavior will reduce the quality of accounting information, accounting information quality will have a significant impact on analysts' earnings forecasts (Bai Xiaoyu, 2009; Wang Xiaoning, 2015), the lower the quality of accounting information of listed companies, The prediction errors is also larger (Zhang Wen, 2015). In addition, if the internal governance of listed companies is more effective, they are more likely to disclose more high-quality information to reduce the follow-up of analysts and the cost of gathering and processing information, thus reducing the analysts' forecast errors (Fan and Wong, 2002).

Based on the above analysis, we hypothesize that:

**H1: The degree of company information disclosure is negatively correlated with the analyst's forecast errors.**

## **2.2 The moderating effect of executive compensation incentives**

The principal-agent theory holds that the salary incentive mechanism can effectively alleviate the conflict of interests between shareholders and executives, and the interests of managers and shareholders tend to be consistent. Salary incentive can reduce the free-riding phenomenon of company managers, reduce agency costs and the cost of monitoring the client, thus reducing the errors in analysts' earnings forecasts. The "championship theory" believes that the internal compensation of the company's executives has a competitive mechanism similar to that of the tournament. Through the salary incentive, the enthusiasm of the managers can be fully mobilized to some extent (Bergstresser and Philippon, 2006). First of all, salary incentive can play a certain role in restricting the behavior of managers, alleviating some agency problems and reducing the agency costs under the separation of powers. Secondly, salary incentive can reduce managers' adverse selection and moral hazard, reduce management's fraud motives, help analysts better predict the earnings level of listed companies, and reduce the cost of analyst tracking and processing information, thus effectively reducing the analyst's earnings forecast errors.

Based on the above analysis, we hypothesize that:

**H2: Executive compensation incentive are negatively correlated with analyst errors when other**

**conditions are constant.**

The effective compensation contract system helps to alleviate the principal-agent problem, promotes the interests of the agent and the client, and can guide the executives to make decisions that are beneficial to shareholders and beneficial to the development of the enterprise, ultimately will benefit the improvement of accounting information quality (Wang Shengnian, 2015). Management compensation incentive reduce the opportunistic behavior of managers and can effectively improve the quality of information disclosure of listed companies (Xu Xin, 2016), thereby reducing the analysts' earnings forecast error.

Based on the above analysis, we hypothesize that:

**H3: When other conditions remain unchanged, executive compensation incentive have a positive moderating effect on the relationship between corporation information disclosure and analyst forecast errors.**

### **3 Research Design**

#### **3.1 Sample selection and data source**

We take Shanghai and Shenzhen A-share listed companies as the research object. The data mainly comes from Wind Information Financial Terminal System and CSMAR Database. In addition, this paper also takes the following treatments on the data: (1) Excluding financial and insurance listed companies; 2) Excluding ST and \*ST listed companies with abnormal financial conditions and listed companies with missing financial data; (3) To avoid extreme value impact, all consecutive variables below 1% and above 99% quantile Winsorize processing. In the end, there were a total of 11,864 research samples from 2532 listed companies in 2011-2018. All statistical and regression analyses were done with stata14.0.

#### **3.2 Variable measurement**

##### **3.2.1 The dependent variable.**

Analyst earnings forecast errors (*Errors*). The errors of the analyst's forecast of the company's earnings indicator from the true value of the year. The larger the value, the greater the analyst's earnings forecast errors. The indicators of analyst's earnings forecast errors can be divided into two categories: absolute earnings error and relative surplus error rate. This paper draws on the research methods of Tucker and Zarowin (2006) and Zhang Qiaoliang (2017), using the relative surplus error rate. The absolute value of the difference between the predicted and actual value of the earnings per share of the listed company for the current year is divided by the actual earnings per share of the

company for the year.

$$Bias = \frac{|feps - eps|}{eps} \quad (1)$$

Where *feps* is the analyst's predicted earnings per share of listed companies, and *eps* is the real earnings per share of listed companies.

### 3.2.1 Independent Variables.

(1) Company Information Disclosure (*DA*). Regarding the measurement of company information disclosure, most of the existing literatures at home and abroad are measured from four aspects: constructing information disclosure indicators, information disclosure evaluation system issued by authoritative organizations, financial restatement, and earnings management. When an analyst makes a forecast, it relies heavily on the accounting information disclosed by the company. Since the company's earnings information is one of the most important information in the company's information disclosure, the company's executives often manipulate the information for opportunistic motivation. Therefore, this paper draws on the research method of Liu Qiliang et al. (2013), using earnings management as a reverse substitute indicator for corporate information disclosure. Combining the relevant research results (Jiang Fuxiu et al., 2015), the discretionary accruals is used as the measure of earnings management. The higher the discretionary accruals, the higher the degree of earnings management of enterprises. The Jones model measures the measurable accruals and takes the absolute value of the measured steerable accruals as earnings management. The specific calculation process is as follows:

$$NDA = \alpha_1 * \frac{1}{A} + \alpha_2 * \frac{\Delta Rev}{A} + \alpha_3 * \frac{PPE}{A} \quad (2)$$

$$TA = \beta_1 * \frac{1}{A} + \beta_2 * \frac{\Delta Rev - \Delta Rec}{A} + \beta_3 * \frac{PPE}{A} + \varepsilon \quad (3)$$

$$DA = TA - NDA \quad (4)$$

Where *NDA* is non-discretionary accruals, *TA* is the total accrued profit of the listed company; *A* is the total assets of the listed company,  $\Delta Rec$  is the change of accounts receivable of the listed company, *PPE* is the original value of fixed assets,  $\Delta Rev$  is the change of sales profit of listed company, *DA* is the stellar surplus, the smaller the absolute value of *DA*, the lower the company's earnings management and the higher the level of information disclosure.

(2) Executive compensation incentive (*Lnsal*). Salary incentive for listed companies include monetary compensation and non-monetary compensation incentive, monetary compensation such as

annual salary rewards, non-monetary compensation such as stock options, etc., due to current listed company executives non-monetary the disclosure of sexual remuneration is not perfect. The executive remuneration studied in this paper only involves the monetary compensation publicly disclosed in the annual report of the listed company. Referring to Chen Zhen (2006), Zhang Zhengtang (2008) for the classification of executives, this paper selects the natural logarithm of the top three executives to indicate the degree of executive compensation.

(3) Control variables. With reference to the research on the influencing factors of securities analysts' predictions (Feng Xunan and Li Xinyu, 2012; Xing Liquan and Chen Hanwen, 2014), this paper also controls the following variables, the definition of variables and related descriptions are shown in Table 1.

**Table 1 Variable Measurement**

Variable	Variable name	Variable symbol	Variable Measurement
Dependent variable	Analysts' earnings forecast error	<i>Errors</i>	Earnings per share - actual value per share   / actual value per share.
Independent variables	Company information disclosure	<i>DA</i>	The absolute value of the manipulated profit, calculated by the formula 1, 2, 3
	Executive compensation incentive	<i>Lnsal</i>	The natural logarithm of the top three salary sums of company executives
	Financial leverage	<i>Lev</i>	Total liabilities at the end of the period / total assets at the end of the period
	Profitability	<i>Roa</i>	Net profit / total assets at the end of the period
Control variables	Company Size	<i>Size</i>	The natural logarithm of the company's total assets
	cash flow	<i>Cfo</i>	Natural logarithm of net cash flow from operating activities
	Equity		
	Equity concentration	<i>Top10</i>	Proportion of the top ten shareholders of listed companies
	concentration Number of analysts	<i>Anum</i>	The number of analysts who tracked the company in the year plus 1 to take the natural logarithm
	Internal control quality	<i>DIB</i>	The number of analysts who tracked the company in the year plus 1 to take the natural logarithm

Annual dummy variable	YEAR	Belong to this year, take 1; otherwise take 0
Industry dummy variable	IND	Take 1 in the industry, otherwise take 0

#### 4 Model Construction

In order to verify the research hypothesis proposed in this paper, the following models were constructed:

$$\begin{aligned}
 Errors_{it} = & \alpha_0 + \alpha_1 DA_{it} + \alpha_2 Lev_{it} + \alpha_3 Roa_{it} + \alpha_4 Size_{it} + \alpha_5 Top10_{it} + \alpha_6 Anum_{it} + \alpha_7 Cfo_{it} \\
 & + \alpha_8 DIB_{it} \sum YEAR + \sum IND + \varepsilon
 \end{aligned}$$

( Model 1 )

$$\begin{aligned}
 Errors_{it} = & \beta_0 + \beta_1 Lnsal_{it} + \beta_2 Lev_{it} + \beta_3 Roa_{it} + \beta_4 Size_{it} + \beta_5 Top10_{it} + \beta_6 Anum_{it} + \beta_7 \\
 & + DIB_{it} + \sum YEAR + \sum IND + \varepsilon
 \end{aligned}$$

( Model 2 )

$$\begin{aligned}
 Errors_{it} = & \delta_0 + \delta_1 DA_{it} + \delta_2 Lnsal_{it} + \delta_3 DA_{it} Lnsal_{it} + \delta_4 Lev_{it} + \delta_5 Roa_{it} + \delta_6 Size_{it} + \delta_7 Top10_{it} \\
 & + \delta_8 Anum_{it} + \delta_9 Cfo_{it} + \delta_{10} DIB_{it} + \sum YEAR + \sum IND + \varepsilon
 \end{aligned}$$

( Model 3 )

Where  $\alpha_1$  is the key parameter to verify hypothesis 1. If  $\alpha_1$  is significantly greater than 0, then the company information disclosure is negatively correlated with the analyst's earnings forecast errors; if  $\beta_1$  is significantly less than 0, then the executive compensation incentive is negatively correlated with the analyst's earnings forecast errors; if  $\delta_3$  is significantly greater than 0, then the executive compensation incentive Negative correlation between corporate information disclosure and analyst earnings forecast errors has been promoted.

#### 5 Results and Discussion

##### 5.1 Descriptive statistics

Table 2 is a descriptive statistic for the variables. The results show that the average value of

analyst's earnings forecast errors is 0.954, the maximum value is 13.44, and the minimum value is 0.00216. This indicates that there is a certain errors in the analyst's earnings forecast; the average value of company information disclosure (*DA*) is 0.0606, and the maximum value is 0.299, the minimum value is 0, indicating that the degree of information disclosure of listed companies is quite different; the average value of executive compensation incentive (*Lnsal*) is 14.27, the maximum value is as high as 17.41, and the minimum value is only 10.31, indicating that there is a higher incentive for listed companies. Big gap.

**Table 2 Summary Statistics for the Variables**

Variable	N	Mean	Std. Dev.	Min	Max
<i>Errors</i>	11,864	0.954	1.903	0.00216	13.44
<i>DA</i>	11,864	0.0606	0.0612	0	0.299
<i>Lnsal</i>	11,864	14.27	0.661	10.31	17.41
<i>Lev</i>	11,864	0.429	0.203	0.0518	0.860
<i>Roa</i>	11,864	0.0581	0.0484	-0.0866	0.219
<i>Size</i>	11,864	22.23	1.221	20.05	25.97
<i>Top10</i>	11,864	57.81	14.83	22.96	89.66
<i>Anum</i>	11,864	17.73	16.13	1	71
<i>Cfo</i>	11,864	0.0430	0.0678	-0.151	0.234
<i>DIB</i>	11,864	6.495	0.109	5.999	6.743

According to the correlation analysis results, the correlation coefficient between any two variables is less than 0.5, and there is no multicollinearity problem between the variables. In addition, the correlation coefficient between the explained variable, the explanatory variable and the control variable basically passed the significance test, indicating that the variable selection is reasonable and suitable for further regression analysis. Due to space limitations, the results of the correlation analysis are not listed.

## 5.2 Regression analysis

The regression results are shown in Table 3.

From the results in the first column, the coefficient of the company's information disclosure (*DA*) is 1.379, at a confidence level of 1%, indicating that as the degree of earnings management increases, the degree of disclosure of company information will decrease, the errors of analysts' earnings forecast

will increase, and H1 will be verified.

The second column shows that the regression coefficient for executive compensation incentive (*Lnsal*) is -0.0281, at a confidence level of 1%. H2 was validated, indicating that the company's executive compensation incentive can effectively improve the company's accounting information quality and reduce analysts' forecast errors.

After introducing the interaction between company information disclosure and executive compensation incentive, the regression coefficient of the interaction term is 0.239, at a confidence level of 5%. It indicates that the executive compensation incentive plays a positive role in the relationship between the company's information disclosure and the analyst's forecast errors, which is consistent with H3.

**Table 3 Results of Regression Analysis**

Variable	(1)	(2)	(3)
<i>DA</i>	1.379*** (3.95)	-	1.361*** (3.94)

#### 5.4 Robust checks

Because the different measurement methods of variables may affect the results, in order to improve the credibility of the research conclusions, this paper carries out the following robustness test by replacing the analyst errors and the substitution variables of company information disclosure. The robust test results are shown in Table 4:

##### (1) Analysts' forecast errors

Referring to the practices of Fang and Yasuda (2009) and Shi Xianwang (2015), the analysts' forecast errors is measured by:

$$Errors' = \frac{|feps-eps|}{price} \quad (4)$$

Where  $|feps-eps|$  is the absolute value of the difference between the earnings per share of the

listed company and the real earnings per share of the listed company, except for the closing price of the company's stock at the end of the year, the larger the indicator, indicating that analysts' forecasts errors are greater.

(2) Executive compensation incentive

Considering the lag characteristics of executive compensation, refer to Guo Xuemeng and Liang Peng (2019) to introduce the lag one term (*LLnsal*) of executive compensation incentive, and replace the original variables to re-execute the model.

Except that the regression results of some control variables are not significant, the significance of other variables is generally consistent with the previous regression results, which indicates that the test results still support the previous assumptions, indicating that the results are robust.

**Table 4 Robustness Test Result**

Variable	<i>Errors<sup>t</sup></i>			<i>LLnsal</i>

### 5.5 Further research

According to the Tournament theory, salary incentive can promote the convergence of interests between shareholders and executives, but at the same time, the study based on the theory of fairness and behavior also believes that as the level of salary incentive rises, the internal compensation gap of executives increases, and the pay gap will play a counter-incentive role. Although salary incentive is an important way to resolve agency conflicts, with the increase of salary incentive, the issue of fairness among different levels of executives has also attracted people's attention. At this time, the executives' compensation incentive will also change. There are hierarchical differences between executives. When executives at lower levels feel a large pay gap with high-level executives, this will result in lower-level executives uniting and using earnings controls to increase their compensation. This in turn increases profit manipulation (Kothari, 2005). The internal pay gap of executives has led to executives' earnings operations (Connelly, 2013), and executives moderate accounting earnings in order to obtain more bonuses, thereby undermining the quality of accounting information (Bergstresser and Philippon, 2006). Huang Liangjie (2010) also pointed out that most enterprises may use the method of earnings management to manipulate profits in order to maximize their own interests due to imperfect incentive and less strict supervision. Therefore, within a certain range, with the increase of executive compensation incentive level, the salary gap is gradually widened, and the salary gap will induce executives to implement earnings management behavior, thus reducing the accuracy of analyst forecasts (Li Yuxia, 2017). This paper considers that the role of executive compensation incentive will change as the internal compensation gap of executives increases. The internal salary gap of executives is introduced in model (3). According to the internal salary gap of senior executives, the samples are divided into two groups to further test the moderating effect of executive compensation incentive under the influence of different internal salary gaps. Will it change?

Drawing on the research of Chen Zhen and Zhang Ming (2004), the executives are divided into core executives and non-core executives. The top three in the salary level ranking are considered to be core executives, except for the top three, other executives are considered to be non-core executives.

The formula of the internal salary gap of executives is as follows:

$$LnGAP = Ln\left(\frac{\text{total top three executives compensation}}{3} - \frac{\text{other executive compensation totals}}{\text{directors, supervisors and senior executives}-3}\right) \quad (4)$$

**Table 5 Grouping Result**

Variable	<i>LnGAP</i> <12.8	<i>LnGAP</i> ≥12.8
<i>DA</i>	0.883**	0.184**
<i>Lnsal</i>	(1.85) -0.0794***	(0.47) -0.0420
<i>DA_Lnsal</i>	(4.12) 0.573**	(0.87) -0.128
<i>Lev</i>	(2.20) 0.203	(0.26) -0.0752
<i>Roa</i>	(1.20) -9.944***	(0.52) -9.158***
<i>Size</i>	(11.80) -0.133***	(15.04) -0.0439
<i>Top10</i>	(4.41) -0.00578***	(1.71) -0.000360
<i>Anum</i>	(2.20) 0.00179	(0.22) -0.000686
<i>Cfo</i>	(0.05) -1.070*	(0.42) -0.336
<i>DIB</i>	(2.51) -1.900***	(0.82) -1.868***
CONSTANT	(7.52) -1.070*	(8.40) 15.27***
Observations	(0.70) 5932	(0.84) 5932
R <sup>2</sup>	0.90	0.89

Note: (1) The internal compensation gap of executives is based on the median 12.8 of the internal compensation gap sample of executives; (2) t statistics in parentheses, \* p<0.05, \*\* p<0.01, \*\*\* p<0.001

From the test results, it can be seen that under the low-level internal compensation gap level, the regression coefficient of the interaction between company information disclosure and executive compensation incentive is 0.573, which is significant at the 5% confidence level, indicating that under

the low-level salary gap level, with the increase of executive compensation incentive, the speculative behavior of executives is reduced, the information quality of listed companies is improved, and the errors of analysts' earnings forecasts is smaller. The executive compensation incentive promotes the negative correlation between the analysts' forecast errors and company information disclosure.; while at the high internal pay gap level, this promotion is not significant, probably because the increase in the internal compensation gap of executives has led to speculation by some executives. Executives of low pay improve their individual performance through profit manipulation, which damages the quality of accounting information. The incentive effect of executive compensation has offset the speculative motives of executives as internal compensation gap increases.

## **6 Conclusions**

### **6.1 Conclusion**

This paper studies the impact of two different mechanisms of corporate information disclosure and executive compensation incentive on the analyst's earnings forecast errors. On this basis, it also tests the incentive effect of executive compensation under different internal pay gaps. The study found that: (1) by increasing the degree of company information disclosure can help analysts reduce their earnings forecast errors. (2) The executive compensation incentive mechanism of listed companies can effectively improve the information quality of the company and promote the negative correlation between the company's information disclosure and the analyst's earnings forecast errors. (3) This paper introduces the internal salary gap of executives for further research. As the internal salary gap of executives increases, the incentive effect of compensation will also have a negative effect, which will have a negative impact on the accuracy of analyst forecasts.

### **6.2 Suggestion**

From a business perspective, first, listed companies should continuously improve the company's information disclosure and improve the quality of accounting information to provide market investors with more effective financial information to help them make more efficient investment decisions. Second, listed companies can enhance management performance, constrain executives' speculation, improve the company's accounting information disclosure level, and help analysts make more accurate earnings forecasts through compensation incentive. Third, the salary incentive mechanism of executives only helps analysts' predictions within a certain scope. Therefore, the company should design a moderate salary incentive system to control the internal compensation gap of the executives at a reasonable level, which helps to maintain teamwork and reduce self-interested behavior of managers.

From a market perspective, from the perspective of internal corporate governance, that is, to improve the level of corporate information disclosure and executive compensation incentive to enhance the quality of analysts' forecast is necessary. In addition, the market's focus on the average executive compensation incentive level in the industry also helps to restrict the unreasonable and unfair executive compensation incentive system of listed companies, improve the accuracy of analyst forecasts, and optimize market allocation efficiency.

### **6.3 Limitations and prospects**

In the analysis of this paper, there may be some shortcomings: first, the influence factors of analysts' earnings prediction error are complex and numerous. Although this paper has tried to consider them, some factors are hard to consider. Second, this paper studied Chinese analyst earnings forecasts from overall situation, in the process of the measure of the degree of earnings management, considering the industry factors, but due to the limitation of analysts predict sample size without further refine the classification of different industries.

With the participation of institutional investors in China, the securities market will be further improved, and the analyst industry will be further improved. In the future research, we can consider the relationship between institutional investor governance and analyst earnings forecast. Whether the governance of listed companies will enhance the accuracy of analysts' earnings forecasts, and at the same time, compare the analyst's own factors and company-level factors to compare which one has a greater overall impact on earnings forecasts.

# **Media attention to the Impact of Earnings Management on Listed Companies**

Ji Yayuan

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 734412306@qq.com)

**Abstract:** In this paper, the empirical research method is used, and the media attention data of DATAGO database is used as the proxy variable. From the two perspectives of accrued earnings management and real earnings management, the supervision effect of media attention is studied, and the regression model is established. When the company adopts different earnings management, the media is concerned whether there is a difference in inhibition. It is concluded that a large amount of media attention has led the management of listed companies to adopt accrued earnings management to a certain extent, but at the same time, the improvement of media attention can effectively curb the real earnings management behavior of listed companies, reflecting the governance function of media attention.

**Key words:** Media attention; Accrued earnings management; Real earnings management; Corporate Governance

## **1 Introduction**

In the 21st century, with the rapid development of the Internet and the continuous improvement of information technology, Media attention, as an external governance mechanism, is increasingly being used as a control variable in accounting and economic research. At present, the research on earnings management at home and abroad is mainly based on the traditional corporate governance perspective, such as the supervision of earnings management from the perspective of institutional environment, and the perspective of other types of stakeholders about earnings management governance. A lot of research has been done in the literature and fruitful results have been achieved. As for media attention, Foreign scholars mainly focus on the role of media supervision in protecting shareholders' interests and affecting auditors' judgment. Domestic scholars focus on promoting government functions, preventing corruption, and regulating listing. In terms of corporate information disclosure, it is generally more concerned with the corporate governance role of the media. This paper intends to study the accrued earnings management and real earnings management behavior of Chinese listed companies from the perspective of corporate governance effects of media attention, in order to enrich the research content and improve the quality of corporate earnings. The following arrangements are as follows: The second section is the theoretical analysis and research hypothesis, the third section is the research design, the empirical analysis is in the fourth section, and finally the full text is summarized.

## 2 Theoretical Analysis and Hypotheses

As the medium of information transmission, the media has become one of the main channels for the public to obtain relevant information. Earnings management is the means of accounting or non-accounting to achieve the maximization of self-interest to achieve the control and adjustment of accounting income, including the management of accruals and the construction of real trading activities, and the timing of controlling related activities of enterprises. From the perspective of cost-benefit, the media exposure of listed companies' earnings management problems can bring relatively rich benefits, and the marginal effect of such supervision behavior is significantly positive, which makes the media have the motive to supervise the listed companies' earnings management behavior.

On the one hand, corporate executives implement earnings management behavior based on compensation motives, capital market motives, and regulatory motives. On the other hand, the emergence of principal-agent relationship separates the ownership and control of the enterprise, and the manager objectively has the tendency to obtain personal benefits through the means of earnings management. The media's attention to the influence of the capital market will also affect the manager's earnings management strategy. The media attention makes the enterprise's accrued project earnings management easier to find, which means that the company is more likely to be subject to regulatory penalties, and adopt a real activity earnings management based on concealment.

As early as 2000, Zingales (Zingales,2008) pointed out that we should pay attention to the role of the media in corporate governance. Chen Kejing (Chen Kejing,2017) proposed that the substitution role of media supervision and legal governance is very beneficial for managing the earnings management of listed companies during the economic transformation of China. Li Yanxi (Li Yanxi ,2018) proposed that due to the company's emphasis on reputation and long-term interests, a large number of media attention and reports will have a certain inhibitory effect on the implementation of real earnings management activities. Wang Lijuan (Wang Lijuan ,2018) proposed that media attention and internal control have supervisory effects on earnings management.

However, some studies have shown that when the company's operating performance cannot be changed in the short term, the management tends to adopt various earnings management methods to achieve market expectations under the huge market pressure to avoid a negative surplus. Ying Qianwei, (Ying Qianwei ,2017) proposed that the market pressure effect of media attention exacerbated the earnings management of enterprises more significantly than the mainstream supervision effect. Chen Shen (Chen Shen,2016) found that market pressure effects promoted the implementation of real earnings management by corporate executives. Ma Zhuang(Ma Zhuang,2018)verified the dominant effect of market pressure on media attention.The use of accrued earnings management means that the company can establish a good image in a short period of time, which can not only promote good stock price information to the public, but also do not harm to the long-term interests of the company. At this time, the management is motivated to meet the market expectations, career promotion and salary incentives to choose accrued earnings management to modify performance and improve image. The media's attention makes listed companies pay more attention to their long-term development and long-term interests. Real earnings management activities will have serious economic consequences for the company in the long run, at the expense of the company's normal business activities. Enterprises will not choose real earnings management to influence normal production and operation activities.

The competitive hypotheses H1a, H1b, H2a and H2b were proposed for the above analysis.

**H1a: the increase in media attention can effectively inhibit the accrued earnings management of listed companies.**

**H1b: the increase of media attention prompts the management of listed companies to adopt accrual earnings management.**

**H2a: media attention fails to effectively identify hidden real earnings management behaviors;**

**H2b: media attention can effectively inhibit the real earnings management behavior of listed companies.**

### **3 Study Design**

#### **3.1 Sample selection and data sources**

This paper selects the data of Shanghai and Shenzhen A-share listed companies from 2013 to 2017, and empirically tests the relationship between media attention and the accrued profits of listed companies and actual earnings management. Corporate governance data comes from the CSMAR database, and media attention data comes from the DATAGO database. Based on the research needs, this paper conducted a preliminary screening of the sample: excluding financial insurance, ST and \* ST, and deleting companies that lack relevant data. After the above screening procedure, the paper finally obtained a total of 9,848 sample observations for a period of 5 years. In addition, in order to reduce the impact of outliers on the conclusions of the paper, 1% winsorize processing is performed on all continuous variables.

#### **3.2 Measurement of variables**

##### **3.2.1 The dependent variable**

In this paper, the degree of earnings management is measured by the modified Jones model residuals calculated by year and industry. Specifically, first of all, this article use net income minus operating cash flows to calculate the total accrued, second, to calculate the total accrued as explanatory variables, using the modified Jones model is divided by year and industry return estimated coefficients obtained, and the use of the estimated coefficients obtained estimate non maneuvering accrued, then, the total accrued minus the non-maneuvering accrued is the steerability accrued DA.

In view of the lack of research on real activity earnings management by domestic scholars, this paper USES the research methods of foreign scholars Roychowdhury (Roychowdhury,2006)to measure sales control by the net cash flow of abnormal operations (EM\_CFO), measure discretionary cost control by EM\_DISEXP, and measure production control by abnormal product cost (EM\_PROD). The net cash flow of abnormal business activities, abnormal discretionary expenses and abnormal product costs are calculated from the actual value of the year minus the estimated normal value. Using the Roychowdhury method, EM\_PROXY is used to measure the level of real activity earnings management ( $EM\_PROXY=EM\_PROD+(-1) *EM\_CFO+(-1) *EM\_DISEXP$ ).

##### **3.2.2 The independent variables**

Media attention existing research basic use of such as ting-ting zhang (ting-ting zhang,2018),Chen Kejing (Chen Kejing,2017), using manual sorting important newspapers full-text database of CNKI China and the financial authority of the country's eight major newspaper reports for measurement basis, there are also some scholars such as Li Yanxi (Li Yanxi ,2016) using baidu news website news to search contains samples was reported the company's annual quantity measured Media attention, but the two ways is manual sorting so there may be noise. The quantitative public opinion database of newspapers

and periodicals is a mature data platform designed by overseas professionals. It makes the analysis result storage into an easy-to-use and convenient field, which is intended to help professionals and scholars in the financial field to carry out high-quality and convenient financial practical work quickly with the result. The data of this database is in accordance with strict academic standards and has timeliness of news itself. Therefore, this paper measures media attention based on the number of reports about listed companies in the quantitative public opinion database of newspaper news.

### 3.2.3 Control variables

In this paper, a series of control variables that will have an impact on enterprise accrual and real earnings management are added, including Size, profitability, debt paying ability, Indep, First and Big4. (Li Ming, 2018) At the same time, in order to reduce the impact of year and industry on the empirical results, year and industry dummy variables were added into the model. The specific variable definitions and calculation methods are shown in table 1.

**Table 1 Variable Definition and Description**

Variable name	variable symbol	variable definition
Accrued earnings management	DA	revised Jones measurement model measurement
Real activity earnings management	REM	real earnings management comprehensive level
Media attention	Media	Ln (1+ Number of news reports)
scale of company	Size	Ln (Total assets)
profitability	Roe	Net assets/equity balance
Debt paying ability	Lev	Total liabilities/total assets
Ratio of independent directors	Indep	Number of independent directors/total directors
The shareholding ratio of the largest shareholder	First	The shareholding ratio of the largest shareholder
Type of accounting firm	Big4	Dummy variable, audit of the four major accounting firms is 1, otherwise it is 0
enterprise property	Gov	Dummy variable, state-owned enterprise is 1, otherwise it is 0
Industry	Ind	Dummy variables to control the impact of different industries
The annual	Year	Dummy variables to control the effects of different years

### 3.3 Model building

To test the media in China's capital market play of the role of information transmission and constraints, this paper constructs the following two regression model, to test the media outside the legal system of factors on the earnings management of listed company governance. Model (1) is used to test the research hypothesis H1a and H1b, and investigate the influence of media attention on the earnings

management of accruals of listed companies; (Zhu Heping,2019)model (2) is used to test the research hypothesis H2a and H2b, and investigate the influence of media attention on the earnings management of real activities of listed companies. In addition, this paper controls for some other factors that may affect earnings management by referring to existing studies. The specific model is shown as follows:

$$DA = \beta_0 + \beta_1Media + \beta_2Size + \beta_3Roe + \beta_4Lev + \beta_5Indep + \beta_6First + \beta_7Big4 + \beta_8Gov + \beta_9\Sigma Ind + \beta_{10}\Sigma Year \quad (1)$$

$$REM = \beta_0 + \beta_1Media + \beta_2Size + \beta_3Roe + \beta_4Lev + \beta_5Indep + \beta_6First + \beta_7Big4 + \beta_8Gov + \beta_9\Sigma Ind + \beta_{10}\Sigma Year + \varepsilon \quad (2)$$

## 4 Empirical Test and Analysis

### 4.1 Descriptive statistics of variables

Table 2 reports the descriptive statistics of variables in this paper. The mean, median, maximum and minimum values of variables DA and REM are significantly different, showing a certain degree of difference and at the same time indicating that different enterprises have different degrees of accrued earnings management and real earnings management. The average value of media is 4.751, indicating that each listed company has been reported by media 4.7 times on average, and there are differences between the maximum value and the minimum value, indicating that different media of enterprises also have some differences in their reports and attention.

**Table 2 Descriptive Statistics for Variables**

	Mean	Median	Max	Min	Sd	N
DA	0.006	0.003	0.530	-0.560	0.095	988
REM	0.177	0.111	0.262	0.000	0.262	9848

### 4.2 Variable correlation test

In this paper, the multicollinearity test was carried out on the variables involved in the study. The maximum variance inflation factor (VIF) of each variable was 1.6, which was far less than 10, so the regression equation did not have multicollinearity. Meanwhile, Pearson and Spearman correlation tests were conducted on all variables in this paper. Table 3 lists the correlation coefficient matrix of variables, from which it can be seen that the coefficients of DA and REM are significantly positively correlated with 0.010, which to some extent indicates that the sample companies will alternately use real activity and accrual project earnings management. Media has a significant positive correlation with Lev, First, Big4 and Gov, which indicates that the Media are more likely to pay attention to with strong solvency,

high shareholding ratio of the largest shareholder, high audit quality and state-owned companies.

**Table 3 Variable Correlation Coefficient Matrix**

Table 4 of the sample reports the regression results of the relationship between Media attention and accrual and real activity earnings management. In the regression results of table 4, the regression coefficient of DA and Media is 0.015, which is significantly positive correlation at 1% level, indicating that accrual item earnings management is positively correlated with the total number of Media reports. The above empirical results show that: the higher the media attention, the higher the degree of earnings management of accruals of listed companies, which supports H1b hypothesis in this paper. The regression coefficient between Media and REM is -0.017, which is significantly negatively correlated at the 1% level. Media attention is negatively correlated with the real earnings management behavior of listed companies, that is, the higher Media attention is, the lower the real earnings management degree of listed companies is, and the stronger the supervision and governance effect of Media is. This result supports the hypothesis H2b in this paper. Lev, the control variable, is significantly positively correlated with DA and REM, indicating that companies with high debt ratio may adopt both accrual and real earnings management methods. In addition, the coefficients of Gov and DA are both significantly negative correlated at the level of 1%, which preliminarily indicates that state-owned companies seldom adopt accrual earnings management. The positive correlation with REM at the level of 1% indicates that state-owned companies are more likely to adopt real activity manipulation earnings. The results show that there are differences between accrual and true earnings management in companies with different property rights.

#### 4.4 Robustness test

With the study of scholars in the past, this paper uses the CNKI “Chinese important newspaper full-text database” to pay attention to the media’s index measurement. The robustness test is performed by using the measured index of interest of the changed media. Repeating all of the above studies in the robustness test showed that the coefficient of DA was significantly positive at the 1% statistical level, while the REM coefficient was significantly negative at the 1% statistical level, indicating its robustness.

## 5 Conclusion

In this paper, a-share listed companies in Shanghai and Shenzhen from 2013 to 2017 were selected as the research samples to test the supervision and governance effect of media from the perspective of accrual and real earnings management, as well as the difference in the governance effect of media in

state-owned and non-state-owned companies. The conclusions of this paper are as follows : (1) a large amount of media attention makes the management face great market pressure, and limited by the cost of media reports, listed companies will adopt accrual earnings management to some extent to "beautify the image"; On the other hand, the media's attention urges the company to pay more attention to external reputation and long-term interests, motivates the company to improve its operation and management level, and can effectively inhibit the real earnings management behavior of listed companies. (2) under the supervision and governance mechanism of the media, non-state-owned companies adopt accrual earnings management more frequently than state-owned companies. (Han Dong, 2015)

This study not only provides empirical evidence for the effect of corporate governance brought by media attention, but also enriches and expands the research on the accrual and real earnings management of listed companies. After controlling the endogenous influence, the media's attention can effectively restrain the real earnings management behavior of listed companies, which is of great significance for countries in transition to give full play to the normative role of media in the capital market. The state should strengthen the protection of the freedom of the press at the policy and legal levels, improve the working environment of media and give sufficient legal protection, and ensure the role of the media as a supervisor in legislation when necessary.

**Abstract:** Using a sample of Chinese firms over 2010-2015 and Difference-in-Difference model, we examine the influence of replacing the business tax with the value-added tax reform on service industry firms' cost stickiness. We find that replacing the business tax with the value-added tax reform helps to decrease the degree of cost stickiness significantly. Moreover, the above effect is more significant in firms with more capital investment. A rich set of tests show that the baseline results are robust to omitted variables, sample bias, and endogeneity concerns. Further analysis shows that the degree of cost stickiness reduction changes from weak to stable as years go on after the tax reform implementation. With the unique background of China, we follow the theoretical framework of micro firm behavior affected by the macro policy and provide new empirical support.

**Key words:** Business Tax (BT); Value-Added Tax (VAT); Service Industry; Cost Stickiness

## 1 Introduction

Industrialization and urbanization continue to promote the gradual adjustment of China's industrial structure; the service industry accounts for an increasing proportion of the entire economy. Especially after Chinese government plan "joining primary, secondary and tertiary industries to boost economic growth" implementation, service industry has developed rapidly, which inputs both specialized human capital and intellectual capital into the industrial production process (Xi et al., 2015). They also effectively drive the transformation, upgrade traditional industries, improve the level of industrial service, and promote the growth of the manufacturing industry. Therefore, the service industry is hailed as the "adhesive" to promote economic growth (Riddle, 1986). As an essential way to promote the development of the service sector, the replacing business tax with value-added tax reform wholly implemented in all industries on May 1, 2016, which induces the attention of researchers. Most of the literatures on the effectiveness of the tax reform focus on changes in the tax burden of firms and its short-term performance (Jiang, 2011; Pan, 2013; Liu and Wang, 2014; Wei and Xia, 2015; Zhao, 2015; Tong et al., 2015; Guo and Liu, 2015). However, as macro tax reform, replacing

business tax with value-added tax not only targets to reduce the tax burden of the service enterprise, but also brings some economic consequences to the investment and operation activities of service firms. Cost stickiness is a vital cost behavior, which measures the degree of suboptimal cost reduction in response to a declining activity. Once the market demand declines, the activity declines. If the high-cost level is challenging to slash in the same degree with activity reduction, the shareholders' interests will suffer huge losses. Therefore, cost stickiness is a fundamental cost behavior and influenced by the macro environment.

The target of replacing the BT with the VAT reform is to reduce the tax burden actual payment by enterprises in the circulation field. It is also intended to encourage enterprises to change the business model, increase capital investment, and improve production efficiency through tax incentives. As to obtain the dominant right of market pricing, the competitive advantage in the industrial value chain reflects the effectiveness of its system. Therefore, building the theoretical framework of how replacing the BT with the VAT influences on firm cost stickiness is essential for exploring the effectiveness of the policy. We find that China's replacing the BT with the VAT reform helps to decrease the degree of cost stickiness significantly. Moreover, the above effect is more significant in firms with more capital investment. Further analysis shows that the degree of cost stickiness reduction changes from weak to strong year as the years go on.

Our research contributes to cost stickiness literature by showing the relation between replacing the BT with the VAT reform and firm cost stickiness, which is important for firm behavior and government tax reform decisions. First, we expand the researches on the effectiveness of replacing the BT with the VAT reform. The previous literature mainly focuses on the perspective of the business tax burden and short-term performance. We start our research from the perspective of firm risk and explore the consequences of replacing the BT with the VAT reform. Moreover, it provides new theoretical support and empirical evidence for the comprehensive implementation of the tax reform of China.

Second, the majority of previous studies only discuss the causes and factors of cost stickiness from the perspective of adjustment cost, executive decision, and agency problem. We take the macro tax reform as the background and research the effects of tax reform on the service industry firms' cost stickiness. Thus, we expand the literature of cost stickiness, enrich the literature of macro policy affecting micro-enterprise investment and business behavior, and shed light on the influence of macro policy on micro-enterprise risk.

The remainder of the paper proceeds as follows. Section 2 reviews the literature and develops our theoretical analysis and research hypothesis. Section 3 discusses our sample, data, and research design. Section 4 presents the analysis of empirical results. We conclude in Section 5.

## **2 Literature and Hypothesis**

Since Anderson et al. (Anderson et al., 2003) first find that cost has stickiness

characteristics, the cost stickiness problem has been widely concerned. Later literature broadens the scope of the cost gradually from the general cost to the total operating costs, general costs, and operating costs. Considering the high cost in business activities, many industries design long-term contracts to reduce the adjusting cost, such as information technology, research & design industry, and other industries. As an intermediate section in the industrial chain, service industry firms embed in the upper, middle and downstream manufacturing process, with a large amount of capital and human capital input (Sheng and Lu, 2013). Therefore, most service industry firms (e.g., construction industry, real estate industry, information technology industry) have cost stickiness phenomenon (Calleja et al., 2006; Sun and Liu, 2004; Liu, 2006; Kong et al., 2007; Liu and Wang, 2009). Since 2012, replacing the BT with VAT reform implements in the transportation and modern service industry, which divides into batches and regions in the whole of China. Replacing the BT with VAT reform is conducive to ease the tax burden generated by the imbalance economic structure and solve the problem of coexistence of the BT and the VAT, which will result in the cost stickiness reduction.

On the one hand, after the implementation of replacing the BT with the VAT reform, the firms only need to pay the value-added tax generated by the production and operation activities, which effectively solves the problem of coexistence of BT and VAT. Therefore, replacing BT with VAT reform helps to increase the firm value, bring higher profit margins. On the other hand, replacing the BT with the VAT reform has promoted the development of high-end service industries, such as design, logistics, and marketing. As a macro tax reform, the reform of replacing the BT with the VAT changes tax burden in the service industry. It breaks the original balance of benefit distribution between upstream and downstream firms. The adjustment of the tax system helps to form a new benefit distribution structure, which boosts the service industry firm development genuinely. Scientific research and other productive services firms intend to input more R&D, which will improve operational efficiency and reduce costs. At the same time, replacing the BT with the VAT reform helps to prompt manufacturing firms outsourcing the first independent, productive services business (Chen and Wang, 2016). Therefore, service firms will develop rapidly under the manufacture firms' increasing demand. Therefore, replacing BT with VAT reform is conducive to reduce the service firms' tax burden, which helps to improve operational efficiency and promote a significant reduction in cost stickiness. Therefore, the above theory develops our first hypothesis:

Hypothesis 1: The degree of cost stickiness of the service firms under the VAT policy is lower than under the BT policy.

The cost of purchasing inventory and fixed assets in service firms will be lower under the value-added tax system. Nie et al. (2009) find that the VAT tax system significantly encourages firms to invest in fixed assets, then increase the capital-labor ratio and production efficiency. Purchase more fixed assets will help them to receive more deducted cash flow (Wan et al., 2012) and also promote the production efficiency of enterprises (Yu and Jiang, 2014; Zhao, 2015). Therefore, after replacing BT with VAT reform implement, the chain of value-added tax has been profoundly improved, and firms' activities of equipment renewal will be accelerated. That means, the service industry firms have more capital expenditures, the more

deductible cash flow will receive. Along with improved operational efficiency and asset utilization capacity, firms' cost stickiness will alleviate greatly. Therefore, the above theory develops our second hypothesis:

Hypothesis 2: The reduction degree of cost stickiness is lower in the service firms with more capital expenditures under the VAT policy is lower than under the BT policy.

### 3 Model Specification

Following the launch of China's replacing the BT with the VAT reform, the promotion of the reform in transportation and modern service industry carried out in three batches. On January 1, 2012, the reform of replacing the BT with the VAT implement in Shanghai. After August 1, 2012, Beijing, Tianjin, Jiangsu Province, Anhui Province, Zhejiang province (including Ningbo), Fujian province (including Xiamen), Hubei Province, Guangdong province (including Shenzhen) joined the tax reform areas. The reform of replacing the BT with the VAT implemented nationwide in China's transportation and modern service industries since August 1, 2013. Considering the process, we build the multi-period DID model to start the empirical tests.

Following Anderson et al. (2013), we build our basic model (1). Then we extend the basic model by including the tax reform variable (*After*) and form model (2). Further, we add the capital expenditure variable (*Capex*) to model (2), then we get the model (3).

$$\begin{aligned} \Delta \ln cost_{i,t} = & \beta_0 + \beta_1 \Delta \ln sale_{i,t} + \beta_2 D * \Delta \ln sale_{i,t} + \beta_3 D * \Delta \ln sale_{i,t} * SD_{i,t} + \beta_4 D * \Delta \ln sale_{i,t} * Marketpower_{i,t} \\ & + \beta_5 D * \Delta \ln sale_{i,t} * Aintensity_{i,t} + \beta_6 D * \Delta \ln sale_{i,t} * Eintensity_{i,t} + \beta_7 D * \Delta \ln sale_{i,t} * GDP_t \\ & + \beta_8 SD_{i,t} + \beta_9 Marketpower_{i,t} + \beta_{10} Aintensity_{i,t} + \beta_{11} Eintensity_{i,t} + \beta_{12} GDP_t + \sum Year \\ & + \sum Industry + \varepsilon_{i,t} \end{aligned} \quad (1)$$

$$\begin{aligned} \Delta \ln cost_{i,t} = & \beta_0 + \beta_1 \Delta \ln sale_{i,t} + \beta_2 D * \Delta \ln sale_{i,t} + \beta_3 D * \Delta \ln sale_{i,t} * After + \beta_4 D * \Delta \ln sale_{i,t} * SD_{i,t} \\ & + \beta_5 D * \Delta \ln sale_{i,t} * Marketpower_{i,t} + \beta_6 D * \Delta \ln sale_{i,t} * Aintensity_{i,t} + \beta_7 D * \Delta \ln sale_{i,t} * Eintensity_{i,t} \\ & + \beta_8 D * \Delta \ln sale_{i,t} * GDP_t + \beta_{10} SD_{i,t} + \beta_{11} Marketpower_{i,t} + \beta_{12} Aintensity_{i,t} + \beta_{13} Eintensity_{i,t} + \beta_{14} GDP_t \\ & + \sum Year + \sum Industry + \varepsilon_{i,t} \end{aligned} \quad (2)$$

$$\begin{aligned} \Delta \ln cost_{i,t} = & \beta_0 + \beta_1 \Delta \ln sale_{i,t} + \beta_2 D * \Delta \ln sale_{i,t} + \beta_3 D * \Delta \ln sale_{i,t} * After + \beta_4 D * \Delta \ln sale_{i,t} * After * Capexp_{i,t} \\ & + \beta_5 D * \Delta \ln sale_{i,t} * SD_{i,t} + \beta_6 D * \Delta \ln sale_{i,t} * Marketpower_{i,t} + \beta_7 D * \Delta \ln sale_{i,t} * Aintensity_{i,t} \\ & + \beta_8 D * \Delta \ln sale_{i,t} * Eintensity_{i,t} + \beta_{10} D * \Delta \ln sale_{i,t} * GDP_t + \beta_{11} SD_{i,t} + \beta_{12} Marketpower_{i,t} \\ & + \beta_{13} Aintensity_{i,t} + \beta_{14} Eintensity_{i,t} + \beta_{15} GDP_t + \sum Year + \sum Industry + \varepsilon_{i,t} \end{aligned} \quad (3)$$

$$\Delta \ln cost_{i,t} = \ln(cost_{i,t} / cost_{i,t-1}) \quad (4)$$

$$\Delta \ln sale_{i,t} = \ln(sale_{i,t} / sale_{i,t-1}) \quad (5)$$

Where variable  $\Delta \ln cost_{i,t}$  is the change value of cost, which is measured by the ratio of the logarithm of operating cost in year  $t$  divided by that of in year  $t-1$ . Variable  $\Delta \ln sale_{i,t}$  the change value of the sale, which is measured by the ratio of the logarithm of the operating sale in year  $t$  divided by that of in year  $t-1$ . The base model (1) reflects the matching ability between sale and cost.  $Dis$  is a dummy variable, which is equal to 1 if the sale of firm increases and 0 otherwise. The coefficient of  $\beta_1$  suggests the degree of the cost increases when the sale increases by 1%. The sum of coefficient  $\beta_1$  and  $\beta_2$  suggests the degree of the cost decreases when the sale decreases by 1%. If  $\beta_2$  is significantly negative, it suggests that the cost reduction degree is lower than the cost increasing degree when sale changes. That means the cost is sticky.

Based on existing research (Sun and Liu, 2004; Liu and Liu, 2014; Xie and Hui, 2014; Liang et al, 2015, 2016; Jiang et al., 2015), continuous decline in sale ( $SD$ ), pricing power ( $Marketpower$ ), human capital intensity ( $Aintensity$ ) and macroeconomic growth ( $GDP$ ) are the essential variables influencing cost stickiness. Thus, we include the above control variables in the models.

**Table 1 Variable Description**

Variables Symbol	Variables Name	Explanations
$\Delta \ln sale$	Sale change	the logarithm of the ratio of sale revenue of year $t$ to that of year $t-1$ , which is calculated using the model (5).
$\Delta \ln cost$	Cost change	the logarithm of the ratio of sale revenue of year $t$ to that of year $t-1$ , which is calculated using the model (4).
$After$	reform variable	The year and after the reform takes 1, otherwise take 0.
$Capex$	Capital expenditure	Cash paid from operating leases plus cash paid for the purchase, and construction of fixed assets, intangible assets, and other long-term assets, then deduct net cash recovered from the disposal of fixed assets, intangible assets and other long-term assets
$D$	Sale declining dummy	The dummy variable, it is equal to 1 if the company's operating sale in the current year decreased compared to the previous year's operating sale, and otherwise 0.
$SD$	Successive sale decline	The dummy variable, it is equal to 1 if the company's operating sale for the second consecutive year, and otherwise 0.
$Marketpower$	Pricing power	The ratio of earnings before interest and taxes to the operating sale

<i>Aintensity</i>	Asset intensity	The ratio of total assets at the end of the year to the operating sale of the year
<i>Eintensity</i>	Human capital density	The ratio of the number of employees at the end of the year to the operating sale of the year (million)
<i>GDP</i>	Macroeconomic growth rate	The ratio of <i>GDP</i> in year t minus <i>GDP</i> in year t-1, divided by <i>GDP</i> in year t-1.

We present an explanation for key variables. Data are received or calculated from the China Stock Market & Accounting Research (CSMAR) database for the period through 2010 to 2015. We exclude ST firms and listed firms whose industry have changed during the sample period.

## 4 Empirical Results

### 4.1 Descriptive statistics and correlation analysis

Table 2 provides descriptive statistics of variables. Our sample includes 2479 observations. The mean value of  $\Delta Incost$  is 0.155, and the mean value of  $\Delta Insale$  is 0.1439. The proportion of *D* is 26.7%, and *SD* is 12.8% in the sample. Besides, other variables' descriptive statistics (e.g., *Marketpower*, *Aintensity*, *Eintensity*, and *GDP*) reported in Table 2. Table 3 is the correlation analysis, which shows that the data have no multicollinearity problem.

**Table 2 Descriptive Statistics**

Variable	N	mean	sd	p50	p25	p75
<i>ΔIncost</i>	2479	0.1550	0.4232	0.1367	-0.0060	0.3047
<i>ΔInsale</i>	2479	0.1439	0.3837	0.1276	0.0003	0.2835

#### 4.2 Main regression analysis

Table 4 reports the regression results of verifying the impact of replacing BT with VAT tax reform on the cost stickiness of Chinese service firms. Model(1) shows whether the service industry has cost stickiness. The result indicates that the regression coefficient of variable  $D * \Delta Insale_{i,t}$  is -0.304 (t=-3.60), indicating that the service industry has cost stickiness. Meanwhile, the control variable regression results show that the variable  $SD$ ,  $Market\ power$ ,  $Intensity$ , and  $GDP$  are significantly positive (0.346, t=3.40; 0.084, t=3.72; 0.067, t=3.63; 0.358, t=2.63), indicating when the sale of listed service firms continues to decline, the degree of cost stickiness reduces. While with the pricing power and human capital intensity increase, the degree of cost stickiness reduces. During the economic upswing, the cost stickiness of service companies significantly alleviate.

Model(2) indicates the impact of replacing the BT with the VAT reform on cost stickiness. The result shows that the coefficient of the variable  $D * Insale_{i,t} * After$  is 0.271 (t=1.78), indicating that the service industry cost stickiness is significantly alleviated after the implementation of the tax reform, providing support our hypothesis 1. In Model (3), the coefficient of  $D * Insale_{i,t} * After * Capex$  is 1.012 (t=2.46), which indicates the reduction degree of cost stickiness is lower in the service firms with more capital expenditures under the VAT policy is lower than under the BT policy., providing support our hypothesis 2. The control variable regression results are almost similar to the Model(2).

**Table 4 Replacing the BT with the VAT reform and Cost Stickiness**

### 4.3 Endogeneity concern

To enhance the effectiveness of the previous empirical results, we use the placebo test method to identify the influence of the tax reform on the cost stickiness of service companies. Specially, we change the year of replacing the BT with the VAT reform. If the coefficient of variable  $D^* \text{Insale}_{i,t}^* \text{After}$  is significantly positive, it means that the implementation of the tax reform is not the essential reason inducing firms to reduce cost stickiness. Table 5 shows the test results. When the tax reform is lag and forward one year, the coefficients of variable  $D^* \text{Insale}_{i,t}^* \text{After}$  are -0.275 and -0.553 ( $t = -1.36, -2.04$ ) respectively, which support our assumption.

**Table 5 Replacing the BT with the VAT Reform and Cost Stickiness**

#### 4.4 Robustness tests

##### 4.4.1 Excluding the eastern regions from samples

From the perspective of firm risk, the cost stickiness reflects the mismatch between sale and cost, which may be affected by the firm development degree. The service industry in the eastern region has a higher level of development and lower risk-taking level than the central and western regions; then we exclude the sample of the eastern region in the robustness test.

Table 6 shows the test results. Model (1) shows whether the service industry has cost stickiness. The result indicates that the regression coefficient of variable  $D^* \Delta \ln \text{sale}_{i,t}$  is -0.673 (*t*=-5.64), indicating that the service industry has cost stickiness. The coefficient of  $D^* \ln \text{sale}_{i,t} * \text{After}$  of Model (2) is 0.588 (*t*=3.88), which indicates that the service industry cost stickiness significantly weakens after the implementation of replacing the BT with the VAT reform. The coefficient of variable  $D^* \ln \text{sale}_{i,t} * \text{After} * \text{Capex}$  of Model (3) in Table 6 is 0.819 (*t*=1.70), which indicates that the effect is more significant in the service firms with more massive capital investment. These results support the previous empirical results.

**Table 6 Replacing the BT with the VAT Reform and Cost Stickiness**

#### 4.4.2 Excluding the first and last batches firms in the tax reform

The promotion of the reform in China's transportation and modern service industry carried out in three batches; some companies may know the tax reform in advance from the relevant government departments, then they may have expected response beforehand. Meanwhile, after the last batch firms join the tax reform, there are fewer samples in the control group. To concern these sample bias problems, we exclude the first and last batch samples in the robustness test.

Table 7 shows the test results. Model (1) shows whether the service industry has cost stickiness. The result indicates that the regression coefficient of variable  $D * \Delta \ln sale_{i,t}$  is -6.872 (t=-2.31), indicating that the service industry has cost stickiness. The coefficient of variable  $D * \ln sale_{i,t} * After$  of Model (2) is 0.370 (t=2.00), which indicates that cost stickiness significantly weakens after the implementation of the tax reform. The coefficient of  $D * \ln sale_{i,t} * After * Capex$  in Model (3) is 4.503 (t=2.46). These results support our assumption.

#### 4.5 Further analysis

As a macro tax policy, the reform of replacing the BT with the VAT has a time effect. Thus, we test the time effect in different periods. Table 8 shows the test results. The coefficients of variable  $D^* \ln sale_{i,t}$  in the different periods (e.g., one year, two years, three years) are -0.304, 0.072, and 0.204 (t=-3.60, 0.92, 4.15), indicating that the degree of cost stickiness reduction changes from weak to steady as years go on after replacing BT with VAT policy implementation.

**Table 8 Replacing the BT with the VAT Reform and Cost Stickiness**

## 5 Conclusion

Using a sample of Chinese firms over 2010-2015 and Difference-in-Difference model, we examine the influence of replacing the BT with the VAT reform on service industry firms' cost stickiness. We find that replacing the BT with the VAT reform helps to decrease the degree of cost stickiness significantly. Moreover, the above effect is more significant in firms with more capital investment. A rich set of tests show that the baseline results are robust to omitted variables, sample bias, and endogeneity concerns. Further, we find that the degree of cost stickiness reduction changes from weak to steady as years go on after replacing the BT with the VAT reform implementation. With the unique background of China, this paper provides empirical evidence for the economic consequences of the tax reform from the perspective of enterprise risk, expands the researches on the effectiveness of the replacing the BT with the VAT reform, and enriches the researches of micro firm behavior affected by the macro policy.

(E-mail: xsy189@vip.163.com, xinjie\_Li@hotmail.com, 1353289584@qq.com)

**Abstract:** The traditional financial quality evaluation system mainly includes indicators such as asset quality, capital structure, profit quality, and cash flow quality. However, the traditional system neglects the specific analysis of internal operation activities, investment activities and financing activities. Investment activities are important activities for enterprises to achieve their development strategies. Their quality directly affects their ability to sustain growth. The article breaks through the traditional evaluation model and constructs the framework of investment activity quality evaluation from three aspects: consistency with the development strategy of the enterprise, risk of investment activities and efficiency of investment assets. On this basis, the article combined the data of investment activities of Qingdao Haier 2013-2017, detailed analysis and evaluation of the quality of its investment activities with Gree Electric and Midea Group. It is concluded that Qingdao Haier's investment activities are basically consistent with its differentiated development strategy. Haier also faces less risk of tight demand. What's more, the overall quality of external investment of Haier is high.

**Key words:** Financial quality; Investment activities; Corporate strategy; Investment risk; Investment efficiency

### **1 Introduction**

Investment activities are important activities for companies to achieve their development strategies. The academic community has many research and analysis methods for financial quality, such as factor analysis, DuPont analysis, and EVA analysis. Especially in the classic analysis of financial analysis, many companies are still using DuPont analysis in the actual financial quality management of enterprises.

Domestic scholars have studied a lot of financial quality. The typical ones are: Zhang Xinmin believes that financial quality is the quality of the company's financial status in accordance with the carrying amount of operations or distribution. (Zhang Xinmin, 2000) Qian Aimin believes that financial quality refers to the quality of the financial consequences of the company's use of financial resources to engage in business activities. (Qian Aimin, 2008) Li

Fengtuan conducted a financial evaluation of investment activities from the perspective of corporate social responsibility. (Li Fengtuan, 2010) Yuan Chunsheng analyzed the financial quality of coal listed companies from the perspective of investors. (Yuan Chunsheng, 2015)

Foreign scholars also have relevant research on financial quality: Charles Gibusen analyzes the company's solvency, profitability and asset liquidity based on the company's balance sheets and profit and loss statements. (Charles Gibusen, 1997) J. David Cummins involved the concept of financial quality in the research of the insurance market, but did not elaborate. (J. David Cummins, 1997) The DuPont analysis method was first developed by DuPont. This method is based on the return of shareholders' equity. It is divided into several financial indicators. By analyzing the changes in indicators, we evaluate the financial quality of the company.

In summary, domestic and foreign scholars have carried out a lot of research on the overall financial quality of enterprises. But there are few analysis and evaluation of the quality of investment activities. Especially the literature for comprehensive analysis is very rare.

This paper combines qualitative and quantitative analysis. Firstly, we describe the investment activities and their quality connotations. And then we construct the framework of investment activity evaluation. Finally, according to the investment activity data and relevant information released by Qingdao Haier Company, we carry out detailed analysis to achieve the evaluation of the quality of corporate investment activities.

## **2 Data and Methods**

### **2.1 Data Sources**

This paper mainly takes the investment activities of Qingdao Haier Company as the research object. In the meanwhile, we also compare and analyze the object with the ones of Gree Electric and Midea Group. The data in the article are from annual reports released in CNINFO Network, CSMAR Database, Wind Information and official websites of Haier, Midea and Gree. CNINFO Network is a listed company information disclosure website designated by the China Securities Regulatory Commission.

### **2.2 Research methods**

This paper mainly uses two methods: literature research method and case analysis method. The literature research method is a research method that enlightens the text by combing the relevant literatures of domestic areas and overseas, summarizing the experience of related problems with the research objects, and drawing on the research results. The literature is mainly from the relevant journals of China National Knowledge Infrastructure Network. The case analysis method is based on the literature research method, in order to further elaborate and verify the viewpoint of the article, which combined with specific enterprise examples for detailed analysis. This paper takes Haier as the object of case study. On the base of that, we conduct a comprehensive and objective analysis of the strategic, safety and efficiency of its

investment activities.

### **3 The Connotation of Enterprise Investment Activities and Quality**

The most classic writing in the field of domestic financial quality research is the book "Theory of Financial Analysis of Enterprise Financial Status" by Professor Zhang Xinmin. Professor Zhang believes that the financial quality, that is, "the financial status of the enterprise which operates according to the book value or the quality of the distribution." Professor Zhang divided the financial quality analysis theory into financial status quality, asset quality, capital structure quality, profit quality, cash flow quality and financial information quality. (Zhang Xinmin, 2000) Other scholars and experts also conducted a multi-angle analysis of financial quality. However, the quality evaluation and analysis of operation activities, investment activities and financing activities from the perspective of financial activities are relatively small. In view of this, we take financial activities as the starting point to evaluate and analyze the financial quality of corporate investment activities.

The investment activity of an enterprise is the process by which the enterprise uses its own funds. Investment refers not only to the injection of funds to external companies or the purchase of financial products, but also to the use of funds by the company itself. (Li Xiaojing, 2006) According to the use of corporate funds, we can divide investment into two types: internal investment and foreign investment:

(1) Internal investment is the fact that the enterprise invests the funds into the enterprise itself, which can be the capital investment for maintaining daily operations, such as the purchase of raw materials, the consumption of water, electricity and other resources in the normal production process, etc. Of course, it can also be the investment for the company to expand the scale of production, such as the purchase of machinery and equipment, the expansion of new plants, recruitment and so on. Any use of the company's own funds for itself can be classified as internal investment.

(2) Foreign investment by enterprises is not part of internal investment. For example, enterprises use its funds to purchase financial derivatives shall be classified into foreign investment. There are two main purposes for foreign investment: the first is that the company invests its idle cash or cash equivalents into the financial market to obtain income. The most typical example is the transactional financial assets of the enterprise. The second one is the investment for generating controls and exerting significant influence on other enterprises. For this kind of investment, enterprises are not only for the purpose of obtaining income, but also for the strategic purposes of expanding market size and entering into new markets. The most typical subject is the long-term equity investment.

The evaluation of the quality of investment activities refers to the evaluation of strategy, safety and efficiency of the internal and external investment activities of enterprises.

## **4 The Framework of Investment Activity Quality Evaluation**

The quality evaluation of corporate investment activities can be carried out from many angles. This paper refers to the research results of other scholars and combines our own thinking. We construct the quality evaluation framework from three aspects: the consistency of investment activities with corporate development strategies, risk assessment and efficiency of investment assets.

### **4.1 Consistency evaluation with corporate development strategy**

From the investment activities of enterprises, we can see the main development direction of the company. When assessing the financial quality of an enterprise's investment activities, it is necessary to combine the development strategy formulated by the enterprise. It is significant to define whether the actual investment activity of the enterprise matches its development direction and strategy. (Zhang Tingting, 2017) For example, some manufacturing companies adopt a backward integration strategy. This kind of enterprise often acquires and merges many upstream enterprises to achieve control purposes. Such enterprises often hold a large amount of long-term equity investment. Some enterprises adopt differentiated strategies, so a large number of technological research and development projects will be involved to increase market entry costs and form technical barriers. (Wang Huacheng, 2013) Such enterprises need to pay attention to their annual R&D investment.

To evaluate relevancy, firstly, we need to determine the development strategy of the company. Then we conduct a practical analysis of the investment activities through the financial reports issued by the company. This process helps us to determine whether it conforms to the development strategy proposed by the enterprise. For example, we can test and verify the long-term equity investment of the company to find out if the investment is in line with the direction of the company. Also, we can analyze the annual R&D investment ratio and the growth rate of intangible assets. This process helps to determine whether it is consistent with the innovation strategy or differentiation strategy proposed by the company.

### **4.2 Risk assessment of investment activities**

Risk generally refers to fluctuations and uncertainties in the expected return on investment. The risk of investment activities is mainly the uncertainty of future earnings, including systemic and non-systematic risks (Table 1). From the risk of an investment, we can find out whether the executives of the company are risk-averse. We generally believe that the longer the investment, the greater the risk. Of course, the expected return will be greater simultaneously. (Xu Shiyang, 2016) When we measure the quality of investment activities from the perspective of security, we tend to hope the risk as small as possible since the cognition that smaller risk means a safer investment quality usually. Of course, security is always inversely proportional to the benefits.

**Table 1 Risk Types of Investment Activities**

Risk types	Contents
System risk (inevitable risk)	Mainly from the overall market factors. Such as changes in market benchmark interest rates, adjustment of import and export tariff policies, changes in commodity prices, and so on.
Non-systematic risk (Dispersible avoidable risks)	Mainly from specific industry or business factors. For example, changes in market demand, development and application of new technologies, etc.

From the perspective of financial statements of the company itself, it is often difficult to measure the investment risk of the company with quantitative indicators. By analyzing the system risks, such as market interest rates and commodity prices, still we can measure the inevitable risks faced by the company. In addition, we can evaluate the non-systematic risk by qualitatively analyzing through research on product development cycles, application of new technologies, high-level corporate mobilization, and special issues. (Wang Cuichun, 2008) Through the all above qualitative analysis, a solution to reduce the overall risk will be proposed.

#### 4.3 Efficiency evaluation of investment assets

**Table 2 Analysis of Investment Asset Efficiency Evaluation Indicators**

Index	Formula	Implication
Fixed asset profit margin	Total profit / average value of fixed assets	The efficiency of the return on the investment of fixed assets by the enterprise, the higher the value, the better.
Intangible asset profit margin	Total profit / average of intangible assets	The return efficiency of an enterprise investing in intangible assets (research and development patents, etc.), the higher the value, the better.
External investment efficiency	Cash received from investment income received by investment/cash investment	This value measures the ratio of the actual investment income of the enterprise to the investment expenditure from the cash basis. The higher the value, the better.

The most intuitive way to assess the effectiveness of an investment activity is to calculate how much an investment asset can bring to the business. Before making a decision, we often calculate the expected return on investment and market interest rates for comparison. (Shu Xingguo, 2010) At the end of the investment, the actual rate of return is calculated to measure

the actual quality and efficiency of the investment. When the actual rate of return is equal to or higher than the expected rate of return, we believe the investment is successful. (Miao Runsheng, 2007) If the expected goal is failed to achieve, the efficiency of the relevant investment is considered to be low. The investment asset efficiency evaluation indicators usually include indicators such as fixed asset profit rate, intangible asset profit rate and foreign investment efficiency. Please refer to Table 2 for details.

## 5 Quality Evaluation and Analysis of Haier Investment Activities

### 5.1 Evaluation and analysis of haier investment activities and enterprise development strategy

The net cash flow of Qingdao Haier's investment activities in 2017 was -56.2 billion Yuan. In 2016, this value equals to -396 billion Yuan, nearly three times lower than the -103 billion yuan in 2015. Compared with Midea and Gree, the net cash value of its investment activities is at its lowest level. This shows that Haier's investment in 2016 has greatly increased and far surpassed its peers, but can its performance be consistent with its development strategy?

"Collaborative operations with user-centered global multi-brand" is Haier's development strategy in recent years. By overviewing the annual reports of Haier in recent years, we can find out its multi-brand collaborative combat differentiation strategy ubiquitously. For example, Haier spent \$5.6 billion in 2016 to acquire GEA, a GE appliance division. In late 2015, it invested 9.8 to acquire British cold chain LabTech. In 2014, it launched a personal and commercial decoration solution. In early 2013, it invested 130 million US dollars to acquire Japanese Sanyo appliances department. At present, Haier has owned many high-end and differentiated brands such as Japan AQUA, Australia Fisher Paykel, Casarte, US General Electric Appliances and British Labtech through mergers and acquisitions, which have enabled Haier to increase its market share in different consumer groups. Secondly, Haier invested in the financial company established by the group company in 2016, making Haier's capital

operation more efficient and convenient.

From these, we have evidences to believe that Haier's investment activities are basically consistent with its differentiated development strategy. The investment principle of Haier is “collaborative operations with user-centered global multi-brand”. Haier's annual expansion of investment activities will help the company's rapid development in overseas markets which will increase its profitability and efficiency.

## 5.2 Risk evaluation and analysis of Haier investment activities

The risk of investment activities mainly refers to the uncertainty of the future earnings of the investment. Since Haier is currently guided by the M&A strategy and differentiated strategy, it is currently in a period of rapid expansion. At present, Haier has invested in a large number of home appliance start-ups in China and acquired large overseas high-quality assets. Haier's current investment activity risks are mainly divided into two categories: the first category is systemic risk and the second category is non-systematic risk.

(1) Exchange rate risk. Since most of Haier's investment projects are overseas home appliance companies, 50% of the production plants are set up in China. Haier's overseas branches are denominated in US dollars. In the same time, domestic manufacturing companies use RMB to calculate costs. Exchange rate fluctuations will inevitably affect manufacturing

Figure 2 Spot Exchange Rate

costs. (Shanghai National Accounting Institute, 2012) Financial expenses-exchange loss-makes Haier has to pay attention to exchange rate risks. It has a significant impact on home appliance exports.

According to Wind Information, from late May to early September 2017, the exchange rate of RMB against the US dollar showed a rapid appreciation trend. In early September, it rose to a peak of 6.46. This exchange rate appreciated by 7.74% compared to the beginning of 2017. The appreciation of the RMB will not only curb the total export value of home appliance exporters like Haier, but also increase the exchange losses caused by exchange rate fluctuations.

In 2016-2017, Qingdao Haier's exchange loss reached RMB 179 million, accounting for nearly 25% of the financial expenses. In particular, after Haier's acquisition of General Electric Appliances, GEA's individual assets accounted for 50% of its total assets. The risk of

Figure 5 Haier's GEA Market Share in the U.S.

fluctuations may cause more exchange losses.

(2) Tariffs and policy risks. The Sino-US trade war recently will definitely impact the free trade beneficiaries, including the home appliance industry. In 2017, the United States imposed anti-dumping duties on washing machines (mainly LG and Samsung products) produced in Japan and South Korea. Then these companies relocated their manufacturing plants to China, making domestic appliance exporters facing the same policy risks.

US home appliance imports are heavily dependent on China. China's exports of home appliances account for nearly 50% of the total imports of the US home appliance industry. GEA held by Haier currently accounts for 19% of the US market share. Excessive import tariffs will increase the retail price of home appliances which curbs domestic consumption, thus affecting Haier's exports. In 2018-2019, Haier will face greater tariff and policy risks and directly affect the investment income of its overseas assets.

(3) Industry risk. Since 2015, consumption upgrades and product upgrades have driven demand for home appliances in Mainland China. At the same time, the boom in the real estate market from 2016 to 2017 has also stimulated the growth in demand for home appliances. In the long run, there is still room for improvement in the home appliance market. In the domestic market, with the acceleration of the consumer consumption upgrade process, consumers have provided a huge market for Haier's brand recognition. The prospect of the home appliance industry in Haier is relatively optimistic. The total demand for the industry continues to rise. In the meanwhile, the risk of tightening is small.

### 5.3 Evaluation and analysis of the efficiency of haier investment activities

Figure 7 Comparison of Fixed Assets of Three Assets

#### (1) Fixed asset profit margin

From 2013 to 2017, Haier's fixed asset profit margin showed a downward trend year by year. In 2017 it rebounded slightly. On the other hand, the fixed assets profit rates of Midea and Gree, are at a high level. Also the fluctuations of competitors are smaller compared with Haier. This aspect shows that Haier's long-term asset investment activities in recent years have been frequently decreasing. In the meanwhile, the scale has been growing rapidly. On the other hand, Haier also shows that its profitability of long-term asset investment is much lower than the industry leaders.

Figure 5 Comparison of Profit Rate of Intangible Assets

#### (2) Profit rate of intangible assets

The profit rate of Haier's intangible assets has also been declining in recent years, especially in 2016, it fell to 1.3 level, and rebounded slightly in 2017. Compared with Gree and Midea, Haier's downward trend was too fast. In 2016, the lowest profit margin of Haier's intangible assets was mainly due to the rapid accumulation of intangible assets. It is caused by the patent technology formed by R&D expenditure in the year 2016-2017. However, the market has not yet responded effectively.

Figure 6 Comparison of foreign investment efficiency

### (3) Foreign investment efficiency

From the perspective of foreign investment efficiency, Haier's foreign investment efficiency has been in a slight downward trend since 2014. In 2017 it ended at its lowest point. Compared with competitors, Gree led Haier in 2013 and 2014. However, Haier's foreign investment efficiency was higher than Gree Electric after 2015. It is reflected that Haier's foreign investment is at a relatively high level in the industry.

### (4) Other project analysis

During the reporting period in 2016-2017, Haier held Bailian (600827.SH), Bank of Communications (601328.SH), Neusoft Carrier (300183.SZ), foreign exchange forward contracts and other financial assets totaling 23.03 million Yuan. During the reporting period of 2016-2017, the investment loss was approximately 8.85 million Yuan. The fair value of the cumulative appreciation is 80.27 million Yuan which was mainly contributed by foreign exchange forward contract.

Haier's investment income in 2016-2017 reached at 1.62 billion yuan. Since Haier has no long-term debt investment, it can be considered that most of the investment income is derived from the long-term equity investment. The amount of dividends receivable on the balance sheet was 106 million Yuan. The cash items received from the investment income in the cash flow statement amounted to 130 million Yuan. The excess part was the investment income receivable in the previous year. This shows that Haier's foreign investment income quality is relatively high.

## 6 Conclusion

Based on the above analysis, we can see that Haier's investment activities are of high quality. Its investment activities are matched with development strategies. However, Haier needs to pay attention to the improvement of systemic risks such as exchange rate and tariff policies in the future. Haier needs to take corresponding measures to diversify investment risks. In addition, Haier's return on investment is at a relatively high level in the industry, but large gap with its competitors such as Midea and Gree is indispensable. There is still room for improvement when we refer to Haier.

According to the evaluation of Haier's investment quality, we put forward the following two countermeasures. We hope that our study will be beneficial to the enterprise construction. Firstly, Haier needs to strengthen brand building. Haier's R&D investment has increased continuously in recent years. As a result, a large number of foreign brands have been acquired. However, the brands bought outside are not proportional to the profit in the statement. Haier already has a good brands package and technology foundation. Haier should further strengthen the construction of high-level brands, enhance consumer brand recognition, and strengthen the domestic market. The second is to strengthen the risk dispersion of investment activities. After Haier acquired GEA, its individual assets accounted for 50% of the total assets, which further improved Haier's investment risk. Haier should strengthen its management of investment activities. We believe all these tips will benefit the company.

# Comprehensive Financial Evaluation of Listed Biomedical Companies Based on Factor Analysis and Cluster Analysis

Huang Ziyu

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 1911711661@qq.com)

**Abstract:** This paper will study the financial status of 88 listed companies in the biomedical industry in 2019. Factor analysis will be used to extract three public factors reflecting the capability of three aspects from 10 indicators, and the companies will be ranked by calculating the score of each factor and the total score. According to the extracted three factors, cluster analysis is carried out on the companies, and 88 companies are divided into strength companies, ordinary companies and problem companies by means of multiple comparison of means, which provided certain basis for the business decisions of the company operators and the investment decisions of the investors. Finally, the paper puts forward countermeasures and suggestions to improve the business performance of listed companies in the biomedical industry, pointing out the direction for the improvement of performance and better development of biomedical enterprises.

**Key words:** Factor analysis; Cluster analysis; Financial status; Biological medicine companies

## 1 Introduction

In China, the biomedical industry is regarded as a sunrise industry with a rapid development momentum. With the rapid and stable growth of new product R&D expenditure, the production and marketing scale of new products of large and medium-sized enterprises in the bio-pharmaceutical industry in China showed a rapid growth trend from 2000 to 2015, but there is still a certain gap between China and developed countries. A few developed countries hold an absolute proportion in the global biomedical market and are in the leading position in the industry. Therefore, it is of long-term significance for the construction of biomedical enterprises to evaluate the financial performance of listed companies in China's biomedical industry, carefully analyze the financial status of enterprises in the industry, and then put forward suggestions for the biomedical industry. In this paper, factor analysis and cluster analysis in SPSS are carried out on the financial capacity of listed companies in the biomedical industry in 2018, and 88 companies are divided into three categories by means of multiple mean comparison, so as to provide certain basis for the company operators to make business decisions and investors to make investment decisions.

Dupont analysis is a financial ratio index analysis model created by DuPont company in the United States. It takes the return on equity as the comprehensive index and the return on total assets as the evaluation core. It is a method to comprehensively analyze and evaluate a company's financial status and profitability according to the relation and hierarchical relationship between financial ratios. Dupont analysis can analyze the profitability, operating capacity and solvency of enterprises. (Chen Yingying, 2015) Erik Hofmann and Kerstin Lampe used the detailed balance sheet analysis of

contingency theory, supplemented by correlation analysis, to provide information about the internal and internal financial structure, similarity and difference of LSP clusters. (Erik Hofmann, Kerstin Lampe,2013)

At present, there is not much research literature on the performance evaluation of biomedical industry in the theoretical circle, and there is even less literature on the evaluation by factor analysis. Chen Hongming and Xu Si conducted a comprehensive evaluation and research on the financial competitiveness of 50 listed biomedical companies by using the method of factor analysis, and proposed to increase the input-output and growth potential to improve the financial competitiveness, pointing out the development direction for bio-pharmaceutical companies. (HongMing and Xu Si ,2012)Yuan Kanglai and Liu Siwei evaluated the financial quality of listed companies in Hunan biomedical products from four perspectives, namely, operating quality, financing quality, investment quality and profit distribution quality, using methods such as index analysis and change comparative analysis, and concluded that the overall financial quality of listed companies in Hunan biomedical products was good. (Yuan Kanglai and Liu Siwei 2013)Liang Mengxue took listed biomedical companies in Hebei and its surrounding provinces as an example, constructed the financial comprehensive evaluation system of the industry through the dimensionality reduction thought of factor analysis, made evaluation and drew conclusions and Suggestions.(Liang Mengxue,2017) Zhang Min selected 40 listed biomedical companies as research samples and drew the conclusion of empirical study on the financial competitiveness of thesample companies after analysis. Finally, she found the existing problems in the financial competitiveness of biomedical companies at the current stage and put forward corresponding solutions and suggestions. (Zhang Min,2016)

## 2 Data and Methodology

According to the definition of the biomedical industry, this paper selects 88 a-share listed biomedical companies in Shanghai and Shenzhen and the data are all from CSMAR database. In order to comprehensively analyze the financial situation of the industry, \*ST companies are retained and the companies with missing financial data are excluded. A variety of financial indicators of the biomedical industry in 2018 are comprehensively selected,using factor analysis and cluster analysis to conduct research on its financial performance.

Considering the characteristics of the development of the biomedical industry and combining with the relevant theories of financial ability, this paper selects the ten variables including current asset ratio, cash ratio, accounts receivable ratio, rate of return on assets, return on equity, net operating rate, cost return rate, accounts receivable turnover, inventory turnover and fixed asset turnover.(Shimin, Wang Zeping,2010)

## 3 Results

### 3.1 Factor analysis

**Table 1 KMO and Bartlett's Test**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.634
Approx. Chi-Square		661.941
Bartlett's Test of Sphericity	df	45
	Sig.	0.000

The closer the KMO value is to 1, the stronger the correlation between variables and the more suitable the original variables are for factor analysis. Bartlett is used to test whether the correlation matrix is the unit matrix, that is, to test whether each variable is independent. In factor analysis, if the null hypothesis is rejected, it means that factor analysis can be conducted. If the null hypothesis is not rejected, it means that these variables may independently provide some information, which is not suitable for factor analysis.

Through KMO and Bartlett spherical tests on the data, the results are shown in Table 1, and KMO value =0.634 and p value =0.000<0.05. It can be seen that the original data is suitable for factor analysis.

**Table 2 Total Variance Explained**

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings	
	Total	% of Variance	Cumulative %	Total	% of Variance
1	3.635	36.347	36.347	3.635	36.347
2	2.374	23.745	60.092	2.374	23.745
3	1.439	14.393	74.485	1.439	14.393
4	0.965	9.652	84.137		
5	0.653	6.527	90.664		
6	0.335	3.348	94.011		
7	0.273	2.727	96.739		
8	0.221	2.207	98.945		
9	0.078	0.779	99.725		
10	0.028	0.275	100.000		

In order to eliminate the impact of dimensionality, the original data are first standardized, and factor analysis is conducted on the standardized data using SPSS, and the total explained variance is shown in Table 2. Three common factors are extracted according to ten factors, and the cumulative variance contribution rate is up to 74.485%, that is, the information reflected by these three factors accounts for 74.485% of the total information, which can describe the financial situation of listed biomedical companies more accurately

**Table 3 Rotated Component Matrix**

	Component		
	1	2	3
Current asset ratio	0.095	0.804	0.252
Cash ratio	0.017	0.687	0.241
Accounts receivable ratio	0.149	0.779	-0.458

Rate of return on assets	0.949	0.144	0.010
Return on equity	0.928	0.197	0.020
Net operating interest rate	0.869	-0.120	0.060
Rate of return on cost	0.962	0.002	0.053
Accounts receivable turnover	0.097	-0.151	0.824
Inventory turnover	0.006	-0.070	0.659
Turnover of fixed assets	-0.007	0.152	0.815

In this paper, the maximum variance method is adopted to rotate the load matrix, and the rotating component matrix is obtained as shown in Table 3. It can be seen that factor 1 is highly correlated with the rate of return on assets, the rate of return on net assets, the rate of return on component expenses and the rate of return on net assets, reflecting the profitability of enterprises. Factor 2 is highly correlated with current assets ratio, accounts receivable ratio and cash ratio, reflecting the solvency of enterprises. Factor 3 is highly correlated with accounts receivable turnover, inventory turnover and fixed assets turnover, reflecting the operating capacity of enterprises, which exactly confirms the three representative indicators reflecting the financial capacity of enterprises.

**Table 4 Component Score Coefficient Matrix**

	Component		
	1	2	3
Current asset ratio	0.019	0.327	0.183
Cash ratio	0.032	0.477	0.108
Accounts receivable ratio	0.024	0.302	-0.309
Rate of return on assets	0.272	0.014	-0.026
Return on equity	0.263	0.037	-0.017
Net operating interest rate	0.259	-0.089	0.007
Rate of return on cost	0.281	-0.044	0.001
Accounts receivable turnover	0.005	-0.053	0.563
Inventory turnover	-0.027	-0.038	0.266
Turnover of fixed assets	-0.046	0.118	0.334

According to the factor score coefficient matrix in Table 4, the factor score function can be obtained as follows:

$$F_1 = 0.019X_1 + 0.032X_2 + 0.024X_3 + 0.272X_4 + 0.263X_5 + 0.259X_6 + 0.281X_7 + 0.005X_8 - 0.027X_9 - 0.046X_{10}$$

$$F_2=0.327X_1+0.477X_2+0.302X_3+0.014X_4+0.037X_5-0.089X_6-0.044X_7-0.053X_8-0.038X_9+0.118X_{10}$$

$$F_3=0.183X_1+0.108X_2-0.309X_3-0.026X_4-0.017X_5+0.007X_6+0.001X_7+0.563X_8+0.266X_9+0.334X_{10}$$

Based on the results of factor analysis in Table 4, profit-seeking ability factor, debt paying ability factor and operation ability factor score values as the independent variable, with explanation as dependent variable, build multivariate linear regression model, the formula is:

$$Y= (0.36347F_1+0.23745F_2+0.14393F_3) /0.74485$$

**Table 5 Score and Ranking of Biomedical Enterprises**

Enterprise Name	F1	F2	F3	Y	Ranking	Euclidean distance
Nanjing Medicine	-0.30017	4.28171	-0.64099	1.095	1	3.544
Baiyun Mountain	0.21973	1.72522	1.01892	0.854	2	0.663
Renhe Medicine	0.54091	0.39571	2.2394	0.823	3	1.613
Yunnan Baiyao	0.50706	0.83305	1.5563	0.814	4	0.848
Ma Yinglong	-0.03107	0.76556	2.97086	0.803	5	2.157
Qian Jin Medicine	0.26688	0.67696	2.29124	0.789	6	1.512
Ji Chuan Medicine	1.53695	0.3054	-0.45	0.76	7	1.581
De Zhan Health	1.07784	0.98151	-0.42887	0.756	8	1.594
Heng Rui Medicine	1.06259	0.62054	0.1306	0.742	9	1.269
East China Medicine	0.65848	1.50665	-0.3659	0.731	10	1.386
Jilin Aodong	0.34135	-1.50663	-0.60968	-0.432	78	1.185
North China Medicine	-0.11259	-1.00572	-0.29238	-0.432	79	0.664
Sheng Ji tang	0.04407	-0.83175	-1.25451	-0.486	80	1.061
Qian jiang Biochemical	-0.65475	-0.75393	0.15696	-0.53	81	0.972
Ren Fu Medicine	-0.78158	-0.15118	-0.88513	-0.601	82	1.105
Hai Zheng Medicine	-0.33771	-1.20901	-0.3497	-0.618	83	0.946
Jiangsu Wuzhong	-0.85368	-0.56267	-0.28077	-0.65	84	0.993
Bai Yi Medicine	-1.2114	-0.48496	0.42538	-0.664	85	1.52
*ST Biological	-1.6795	-0.65447	0.31285	-0.968	86	1.921
Jiaoda Angli	-4.55518	-0.79393	-0.02916	-2.482	87	0.923
*ST Baihua	-6.07603	-0.0882	-0.80238	-3.148	88	0.923

Factor analysis scores were summarized, and 88 enterprises are ranked according to their scores, as shown in Table 5. Due to space constraints, this article lists the top 10 and bottom 10 companies.

(1) Comprehensive analysis: From the comprehensive score, there are 43 companies with a positive score and 45 companies with a negative score. Nanjing Medicine is the only company with a score greater than 1 and 18 companies with a score greater than 0.5, indicating that the overall financial level of China's biomedical industry is relatively good. From the perspective of individual enterprises, Nanjing Medicine, Baiyun Mountain, Renhe Medicine and other listed companies have a high total score and significant financial level, while \*ST biology, Jiaoda Angli only and \*ST Baihua and other enterprises have a total score significantly lower than the average level. Sort by composite scores, the top five with Nanjing Medicine, Baiyun Mountain, Renhe Medicine Yunnan Baiyao and Ma Yinglong has good performance, because they are the most common factor depends on top. It shows the company's financial performance is the result of comprehensive factors, and not just rely on one thing.

(2) Single factor analysis: In general, among the three factors, the first factor, namely the solvency factor, has obvious differences. Under the premise of standardization, there is still the level of minimum value -6.07602 and maximum value 1.780339. The profit level also has the big difference, in comparison, the operating ability difference is small; Secondly, among the 88 companies, most of them have significant differences in solvency, profitability and operating capacity. For example, Nanjing Medicine scores as high as 4.28171 in F2 solvency factor, while Jilin Aodong scores as low as -1.50663. In addition to the three consecutive years of lossmaking enterprises with the \*ST logo, there are also some enterprises showing varying degrees of losses, such as the operating net interest rate of Qidi Guhan is -20.548% and Ren Fu Medicine is 12.7024%. It can be seen that some enterprises like them fail to make profits in 2019, which also indicates that these enterprises need to update their financial strategies.

**Table 6 Descriptive Statistics**

	Minimum	Maximum	Mean	Std. Deviation	Variance
F1	-6.07602	1.780339	0.000000	1.00000	1.000
F2	-2.71060	4.281701	0.000000	1.00000	1.000
F3	-1.95239	2.970864	0.000000	1.00000	1.000
Y	-3.14812	1.094626	0.000000	0.614074	0.377

Through the description statistics analysis Table 6, biological medicine between solvency and profitability of listed companies is larger. Operating capacity difference is small and the total score difference is also bigger. The overall differentiation phenomenon is serious as well.

### 3.2 Cluster analysis

#### 3.2.1 Cluster analysis and results

**Table 7 Cluster Analysis**

Category	Number	The Name of the Company
		Yunnan Baiyao , Ren He Medicine, Bei Da Medicine, Tai He Health, De Zhan Health, Shanda Huate, Jinlin Medicine, East China Medicine, China Medicine, Tong Ren Tang,

one	23	Tong Ji Tang, He Rui Medicine, Zhong Xin Medicine, Baiyun Mountain, Health Yuan, Qian Jin Medicine , Nanjing Medicine , First Medicine Ma Yinglong, Jiu Zhou Tong, Guo Nong Technology, Lizhu Group, Qidi Guhan  Feng Yuan Medicine, Zhen Xing Biochemical, Dong'e donkey hide gelatin, *ST Biochemical, Zhongyuan Xiehe, Sihuan Biochemical, Wanze Group, Haihan Medicine, Dongbei Medicine , Haixin Group, Jilin Aodong, Changchun Gaoxin, Zhejiang Zhenyuan, Berry Gene, Guang Yuyuan, Pulo Medicine ,Xinhua Medicine, Tonghua Jinma, Jingfeng Medicine, Lukang Medicine, Zhongguancun, Guangji Medicine ,Jiu Zhi Tang, Huarun Sanjiu, Qianjiang Biochemical, Wandong Medicine, Huarun Shuanghe, Renfu Medicine ,Jinhua Group, Jianmin Group, Taiji Rroup, Fuxing Group, Jiangsu Wuzhong ,Tibetan Medicine , North China Medicine, Zhejiang Medicine, Tailong Medicine,  Haizheng Medicine, Hayao Group, Kaikai Company, Lingrui Medicine, Yabao Medicine, Modern Medicine, Furen Medicine, Kunyao Group, Tianyao Rroup, Lianhuan Medicine, Guofa Group, Tonghua Dongbao, Kangmei Medicine, Huahai Medicine , Shandong Yaopi, Tian Shili, Lanhai Investment , Kangyuan Medicine, Jichuan Medicine, Kang Enbei, Tianmu Medicine, Yibai Medicine, Shenqi Medicine, Fudan Medicine, Xinhua Medical
two	63	
three	2	Jiaoda Angli, *ST Baihua

Clustering is a process of classifying data into different classes or clusters, so objects in the same cluster have great similarity, while objects in different clusters have great heterogeneity. In this paper, k-means Cluster clustering method is adopted to classify the business performance level of listed companies in the biomedical industry through cluster analysis on the basis of factor analysis, so as to observe their performance distribution more intuitively. The results of cluster analysis are shown in Table 7.

Category 1 companies have the best business performance, with 23 companies accounting for 26.14% of the total sample, indicating that there are many high-quality companies in the biomedical industry in China. The second-class companies have medium and lower business performance levels, accounting for nearly three-quarters of the total samples. The characteristics of such companies are that their overall performance is generally lower, with their own advantages, but also some problems. There are only two companies in the three categories, with poor business performance, unsatisfactory factor scores and comprehensive score. For these companies, they are under great pressure to make a breakthrough in financial performance.

### 3.2.2 Multiple mean comparison

Table 8 shows the types of the importance of each factor can be seen that the first kind of solvency factor and profitability factor value, namely the three types of first class in the debt paying ability factor and profitability factor represents a significant advantage.

Power Companies: The first kind of companies, including Yunnan Baiyao and Ren He Medicine, etc., their solvency factor and profitability factor are seriously, namely the company solvency and profitability are strong, their composite scores were in the top several, the company has powerful strength, therefore, the first kind of companies can be said for the power companies, investors to invest in the company can get better returns.

Ordinary Companies: The second category of companies, including Feng Yuan Medicine, Zhen Xing Biochemical, and the revitalization of their solvency factor, profit ability factor and operation ability factor, the importance of general, namely, the company's solvency, profitability, operation ability is very general, they also ranked in the lowest scores, therefore, the second type of company can be said for the ordinary companies. This should attract the attention of corporate managers, and investors need to be cautious.

Problem Companies The third category of companies only have Jiaoda Angli and \*ST Baihua, they do not pay much attention to the three types of factors, their comprehensive score ranking in the last few, it can be said that the third type of companies as problem companies. Such companies shall create attaches great importance to the company managers. (You Yi, Liu Wanlu,2014)

**Table 8 The Importance of Each Factor for Each Category**

	The first kind	The second kind	The third kind
Profitability factor	2.12566	0.12287	-5.31561
Solvency factor	1.09245	-0.38483	-0.44106
Operating capacity factor	0.84472	-0.29519	-0.41577

## 4 Conclusion

Through factor analysis and cluster analysis, it is found that the overall financial performance of listed bio-pharmaceutical companies in China is average, but the gap between enterprises is large, and some enterprises have insufficient financial capacity.

In order to maintain the good momentum of development, biological medicine industry should take measures from the following several aspects: (1) Different companies in terms of profitability, operation ability, debt paying ability each are not identical. Decision-makers can make decisions according to their different focuses on the company, and can find out the company's relative competitive advantages according to the analysis results, learn from each other, give play to the advantages of the company, and improve the competitiveness of the company.(Xu Guoxiang, Tan Xiangqiu,2000)(2) Enterprise managers should always pay attention to summarize and analyze the financial situation and operating results of enterprises, so as to timely find and solve problems. Nowadays, only by constantly transforming and upgrading, actively seeking innovation, and developing suitable products according to its own actual situation, can an enterprise be invincible in the competition. (Zhang Fengshun, Cui Gang,2010)

In this paper, factor analysis and cluster analysis are used to comprehensively evaluate the business performance of listed biomedical companies, and the evaluation results are obtained. The evaluation indexes have good objectivity, and many indexes are integrated into a few basically unrelated comprehensive factors, so as to achieve the purpose of reducing dimension and reducing the superposition of information among evaluation indexes. If the financial statement data of multiple time periods are selected for comprehensive research and analysis by factor analysis method, the operation situation of listed biomedical companies can be judged more clearly, which is more conducive to the scientific decision-making of decision makers. (Ma Shuzhong, Chen li, Zhang Hongsheng,2008)

## **Empirical Research on Corporate Social Responsibility and Tax Radical: Independent Directors as Adjustment Variables**

Li Zhouliang, Yu Shuang, Zhou Guoqiang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 269519708@qq.com, 2414819414@qq.com, gzhouq@whut.edu.cn)

**Abstract:** This paper takes China's 2012-2018 A-share listed companies in Shanghai and Shenzhen Stock exchange as a research sample, using regression analysis to find out: (1) The higher the degree of fulfilling social responsibility, the more enterprises tend to reduce tax radical; (2) Independent directors have a regulatory effect on the relationship between corporate social responsibility and tax radical. The conclusions of the study reminded Chinese enterprises to strengthen the implementation of social responsibility and the construction of independent directors to control corporate tax risks.

**Key words:** Corporate social responsibility; Independent director; Tax radical; Regulation

### **1 Introduction**

In order to obtain more retained resources, enterprises will adopt tax radical, and corporate tax radical will risk tax violations if they are not controlled. How to adjust its tax radical and avoid breaking the boundaries of illegality has become a risk issue, enterprises cannot ignore. Researchers at home and abroad have conducted in-depth analysis. On the one hand, some scholars believe that corporate social responsibility can significantly affect tax radical (Hancock,2005). If a company adopts tax radical and does not pay due taxes, which has a negative impact on society, then tax radicals against its social responsibility (Zhai,2012). The government's corporate income tax is mainly used for the construction of public facilities. If the enterprise does not pay the due tax if it adopts tax radical, it will hinder the government's public construction funding sources and cause bad social influence, so tax radical of the company is against its social responsibility(William, 2007).Corporate social responsibility requires companies to consider the impact on social interests when making business decisions, including the impact of tax radical decision-making on social interests (Avi-Yonah, 2008).Foreign scholar uses the KDJ index to measure corporate social responsibility performance, and uses unrecognized tax radical as a proxy for tax radical, and finds that companies with good social responsibilities have lower tax radical(Watson, 2011).Tax radical are intangible assets that reduce the company's reputation, so companies will reduce their tax radical to maintain the ultimate corporate value(Manon, 2015).On the other hand, some scholars believe that independent directors can significantly influence tax radical (Richardson, 2013), Minnick et al first proposed that the company's tax radical may be affected by independent directors. They found that company supervision (including independent directors) has no significant impact on the company's book tax, but company supervision will determine the company's tax policy(Minnick et al, 2010).If the proportion of independent directors on the board increases, the tax radical for companies will decrease(Lanis, 2011),and independent directors also have an impact on the implementation of corporate social responsibility (Jamali,2008). Domestic scholar believes that in corporate governance, companies have an incentive to improve the sense of ethics, openness and responsibility of their business operations, and company decisions should take into account the interests of various stakeholders inside and outside the company, including employees, customers, suppliers,

Community, society and environment(Huang, 2010). Their findings suggest that corporate governance (including independent directors and property rights) has a significant positive impact on corporate social responsibility performance. Then will independent directors have a regulatory effect on the relationship between corporate social responsibility and corporate tax radical? There are still few scholars concerned about this point. Based on this, this paper takes China's 2012-2018 A-share listed companies in Shanghai and Shenzhen as a research sample, and empirically analyzes the role of independent directors in regulating the relationship between corporate social responsibility and corporate tax radical.

## **2 Theoretical Analysis and Research Hypothesis**

### **2.1 The impact of corporate social responsibility on tax radical**

When management makes aggressive tax decisions, it often considers the impact of social concerns, such as corporate social responsibility performance and corporate social reputation. Foreign scholars have conducted data surveys through questionnaires, they found that most managers consider the risk of corporate reputational loss when planning taxation (Graham, 2012). In order to reduce the overall risk of the company and increase the trust of stakeholders to maintain a good corporate reputation, the company will reduce the losses caused by negative events (such as tax radical) (Yang, 2015). At the same time, one of the ways to maintain corporate reputation is the fulfillment of corporate social responsibility, so corporate social responsibility will also affect tax radical (Hancock, 2005). From the perspective of social contract, domestic scholars have found that corporate social responsibility performance is significantly negatively correlated with tax radical. The more companies with higher social responsibility, the more concerned about the impact of corporate activities on society and the environment, the more likely their management is to consciously reduce tax radical (Zhai,2012). As a corporate culture always measures standards, if the corporate social responsibility performance is lax, it will damage the reputation of the company, and it's likely to increase the tax radical of the company (Fan, 2014). Some scholars have found that companies with higher social responsibility have lower tax radical, moreover, they report the willingness to disclose the negative impact of social responsibility on tax a radical (An, 2017). Therefore, this paper presents the first hypothesis.

Hypothesis 1: The better the performance of corporate social responsibility, the lower the corporate tax radical.

### **2.2 The role of independent directors in regulating corporate social responsibility and tax radical relationship**

Independent directors often have a wealth of knowledge, they can provide professional advice for management decisions, improve the quality of strategic decisions (Anderson, 2004; Dahya, 2005). Independent board of directors helps managers to weigh the importance of stakeholder rights or corporate performance and shareholder rights. Therefore, the role of independent directors in regulating corporate social responsibility and tax radical is likely to exist. This paper argues that the direction of this regulation is influenced by the independence of independent directors. Companies with more independent directors pay more attention to social performance in addition to financial performance (Ibrahim, 2003; Duhigg, 2012), Will support managers to reduce tax radical and enhance the negative impact of corporate social responsibility on tax radical. On the contrary, it will put the interests of shareholders in the first place, and oppose the excessive reduction of tax radical by managers, and weaken the negative impact of corporate social responsibility on tax radical. Therefore, this paper proposes a second hypothesis.

Hypothesis 2: The greater the proportion of independent directors to the total number of board members, the greater the degree of corporate social responsibility to curb tax radical.

### 3 Research Design

#### 3.1 Sample selection and data source

This paper selects A-share listed companies in Shanghai and Shenzhen stock markets from 2012-2018 as research samples. The corporate social responsibility index data comes from RKS, and the rest of the financial indicators are from the CSMAR database. And the following screening: (1) Excluding ST and \*ST companies; (2) Excluding gross profit and income tax expenses less than 0; (3) Excluding samples with missing financial data; (4) Excluding multiple nominal income tax rates sample. Through screening, this paper obtained 2835 samples. In order to prevent the influence of outliers on the results, we performed a tailing treatment of less than 1% and more than 99% of the continuous variables in the model.

#### 3.2 Variable design

Tax radical and progress. This article uses the term “tax radical” to represent the degree of tax radical (Jin, 2015; An, 2017). Calculate tax radical based on the fixed effect residuals method (*TAGG*) based on accounting tax differences. Accounting tax differences  $BT D_{i,t} = \alpha TA_{i,t} + \mu_i + \varepsilon_{i,t}$ , tax radical  $TAGG_{i,t} = \mu_i + \varepsilon_{i,t}$ . Among them, *BT D* is the accounting tax difference = total profit before tax - income tax expense / actual applicable tax rate, *TA* is the accrued item equals net profit - net cash flow generated by operating activities.  $\mu_i$  is the part of the accounting tax difference that does not change with time.  $\varepsilon_{i,t}$  is the characteristic part of the accounting tax difference.

Performance of social responsibility. This article uses the RKS Corporate Social Responsibility Score to measure corporate social responsibility performance.

Regulatory variables - the proportion of independent directors.

Control variables. This paper controls the company's size, asset-liability ratio, inventory intensity, capital intensity, growth capacity, shareholding ratio of the largest shareholder, annual, industry and other variables.

**Table 1 Variable Design**

Variable type	Variable meaning	Variable meaning	Variable description
Explanatory variables	Tax radical	<i>TAGG</i>	Accounting-tax differences that deduct the impact of accrued profits
Explained variable	Social responsibility performance	<i>CSR</i>	China's listed company social responsibility score issued by RKS
Moderator	Percentage of independent directors	<i>OUTDIRP</i>	Number of independent directors / total number of board members
Control variable	Business scale	<i>SIZE</i>	Natural logarithm of total assets
	Assets and	<i>LEV</i>	Total liabilities / total assets

	liabilities		
	Inventory weight	<i>INVENT</i>	Ending balance of inventory / total assets at the beginning of the period
	Fixed assets	<i>PPE</i>	Ending balance of fixed assets / total assets at the beginning of the period
	Intangible assets	<i>INTA</i>	Ending balance of intangible assets / total assets at the beginning of the period
	Growth ability	<i>MB</i>	Market value / total assets
	Equity concentration	<i>TOP1</i>	The shareholding ratio of the largest shareholder
	Annual dummy variable	<i>TEAR</i>	Take 1 when the variable data belongs to the year k, otherwise 0
	Industry dummy variable	<i>IND</i>	Take 1 when the company belongs to industry j, otherwise 0

### 3.3 Model design

In order to verify the impact of corporate social responsibility on tax radical in hypothesis 1, this paper constructs a regression model (1):

$$TAGG_{i,t} = \alpha_0 + \alpha_1 CSR_{i,t} + \alpha_2 SIZE_{i,t} + \alpha_3 LEV_{i,t} + \alpha_4 INVENT_{i,t} + \alpha_5 PPE_{i,t} + \alpha_6 INTA_{i,t} + \alpha_7 MB_{i,t} + \alpha_8 TOP1_{i,t} + \alpha_9 YEAR_{i,t} + \alpha_{10} IND_{i,t} + \varepsilon_{i,t} \quad (1)$$

In order to verify the role of independent directors in the hypothesis 2 on the adjustment of corporate social responsibility and tax radical relationship, this paper builds a model (2):

$$TAGG_{i,t} = \beta_0 + \beta_1 CSR_{i,t} + \beta_2 OUTDIR_{i,t} + \beta_3 CSR_{i,t} * OUTDIR_{i,t} + \beta_4 SIZE_{i,t} + \beta_5 LEV_{i,t} + \beta_6 INVENT_{i,t} + \beta_7 PPE_{i,t} + \beta_8 INTA_{i,t} + \beta_9 MB_{i,t} + \beta_{10} TOP1_{i,t} + \beta_{11} YEAR_{i,t} + \beta_{12} IND_{i,t} + \theta_{i,t} \quad (2)$$

Where i and t respectively represent the enterprise and year to which the variable data belongs,  $\alpha_0$  and  $\beta_0$  represent constant terms,  $\alpha_1 \sim \alpha_{10}$  are regression coefficients of variables in model (1), and  $\beta_1 \sim \beta_{12}$  are the regression coefficient of each variable in model (2),  $\varepsilon$  and  $\theta$  are random disturbance terms.

## 4 Empirical Analysis

### 4.1 Descriptive statistics

As can be seen from Table 2, the average of the tax radical is close to zero, and the median is negative, indicating that the accounting-tax differences caused by tax radical in some companies are negative, that is, the tax radical of more than half of the enterprises are lower. Moreover, the standard deviation of the tax radical is 0.0197, indicating that the tax radical vary widely between companies.

**Table 2 Sample Descriptive Statistics**

Variable	Maximum	Minimum	Mean	Standard deviation	median
<i>BTD</i>	0.0789	-0.0610	0.0016	0.0180	0.0007
<i>TAGG</i>	0.0751	-0.0605	0.0001	0.0197	-0.0009
<i>CSR</i>	80.4769	19.5890	40.4900	13.4250	37.1800
<i>OUTDIR</i>	0.5695	0.3070	0.3690	0.0539	0.3590
<i>SIZE</i>	29.4187	20.3180	23.3100	1.8480	23.0280

<i>INVENT</i>	0.9693	0.0000	0.1900	0.2170	0.1280
<i>PPE</i>	0.8300	0.0019	0.2390	0.2090	0.1890
<i>INTAN</i>	0.5490	0.0000	0.0520	0.0794	0.0284
<i>MB</i>	0.0088	0.0001	0.0015	0.0014	0.0009
<i>TOPI</i>	0.7890	0.0790	0.3765	0.1610	0.3580

#### 4.2 Regression analysis

First, a regression analysis of the relationship between corporate social responsibility and tax radical is carried out to verify hypothesis 1. Then the regression analysis of the independent director's adjustment role is carried out to verify hypothesis 2.

The regression results of model (1) show that social responsibility performance and tax radical are negatively correlated and significant at 1%, that is, corporate social responsibility will curb tax radical. Enterprise size, asset-liability ratio, inventory proportion, fixed assets ratio, and intangible assets were significantly negatively correlated with tax radical. Growth capacity and tax radical were significantly positive. Relatedly, equity concentration is also negatively correlated with tax radical but the results are not significant. Therefore, this article accepts hypothesis 1.

The regression results of model (2) show that the product of social responsibility performance and independent directors ( $CSR*OUTDIR$ ) is significantly positively correlated with the tax radical at 5%, with a correlation coefficient of 0.001. When the proportion of independent directors is greater, the suppression of corporate social responsibility on tax radical is weakened. In this paper, the larger the proportion of independent directors predicted in hypothesis 2, the greater the suppression of corporate social responsibility on tax radical. Therefore, the empirical result rejects hypothesis 2.

**Table 3 Regression Results**

Variable	TAGG			
	Model (1)		Model (2)	
	Regression coefficients	Z test value	Regression coefficients	Z test value
<i>OUTDIRP</i>			-0.000219***	-5.08

Adj-R <sup>2</sup>	0.3165		0.3174	
F value	36.6430		34.1490	
		Wald chi2 = 95.87 Prob > chi2 = 0.0000		

Note: \*\*\*, \*\*, and \* indicate significant levels at 1%, 5%, and 10%, respectively.

### 4.3 Robustness test

In order to enhance the reliability of the research conclusions, this paper uses *BTD* as the substitute variable of *TAGG* to measure the corporate tax radical, and conducts regression analysis again to enhance the robustness of the empirical results. The regression results of *BTD* are consistent with the regression results of *TAGG*, and support again hypothesis 1 and reject hypothesis 2.

## 5 Conclusion

The research results show that the performance of corporate social responsibility is negatively

correlated with the tax radical. The greater the proportion of independent directors, the less the degree of suppression of corporate social responsibility on tax radical, and the industry with good corporate social responsibility can effectively curb tax radical. Based on this, this paper proposes from the enterprise level and the government level respectively: enterprises should include corporate tax radical behaviors as social responsibility evaluation indicators and strengthen the construction of independent directors; the government should strengthen tax radical review and improve the performance of enterprises with low social responsibility. Independent director system to improve the independence of independent directors.

Through the analysis of relevant theories, this paper tentatively studies the relationship between corporate social responsibility, independent directors and tax radical. This paper still has some shortcomings. Independent directors are only a part of corporate governance. This article only focuses on independent directors. Whether the other corporate governance variables have a similar role in regulating the social responsibility and tax radical, future research can be cut into other parts of corporate governance to study the role of corporate governance in regulating the social responsibility and tax radical of independent directors.

## Research on Information Disclosure Behavior of Listed Companies: Taking \*ST Olefin Carbon as An Example

Zhu Hanlin, Wan Youqing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 295094403@qq.com, w13308641188@126.com)

**Abstract:** This paper uses the methods of statistical analysis and case analysis to conduct statistical analysis of the administrative penalty decision issued by the China Securities Regulatory Commission from 2013 to 2017. It is considered that the disclosure of information violations by listed companies in China is divided into three types: information disclosure is incomplete, unreal, and not timely, of which incomplete disclosure is the most commonly used method of disclosure of information by listed companies. Taking silver-based carbon new material group Co., Ltd. as an example, this paper deeply studies the disclosure of accounting information violations of listed companies, and then carefully analyzes the root causes of the company's violations. The main reasons for the disclosure of information violations of listed companies are as follows: Avoid ST and illegal profit, illegal cost is too low, the company's board of directors and the board of supervisors dereliction of duty, the company's internal governance structure is not perfect and internal control is not perfect, the external agency supervision is insufficient, the intermediary agency's responsibilities are lacking, and then proposed to curb the violation of the securities market Disclosure of behaviors that frequently occur in this behavior.

**Key words:** Information Disclosure; Violations; Listed Companies; \*ST Olefin Carbon

### 1 Introduction

The accounting information disclosure of listed companies affects the decision-making power and judgment of investors, and is an important basis for the supervision and management of the state regulatory authorities. Only the correct disclosure of accounting information can reflect the company's real operating conditions, and get effective market feedback to form a good trading environment for the securities market. If a listed company has a violation of information disclosure, it will lead to confusion in the market order, and will also infringe on the rights of the company's stakeholders, which will adversely affect the sound development of the entire securities market.

In China's securities market, incidents of disclosure of accounting information violations have occurred from time to time. Listed companies such as Zhangzidao, Wuliangye, Beidahuang and Zixin Pharmaceuticals have serious disclosures of accounting information violations. These violations not only infringe on the interests of investors, but also cause investors to lose confidence in the securities market, which is not conducive to establishing a good image of listed companies in China, and seriously hindering the healthy and sustainable development of China's securities market. How to ensure the standardization of accounting information disclosure behavior of listed companies and solve the quality and quantity problems of accounting information disclosure will have important significance for the majority of stakeholders and have a positive effect on promoting the sound development of China's securities market.

This paper analyzes the administrative penalty decision issued by China Securities Regulatory

Commission from 2013 to 2017, and selects Silver-Based Carbon New Materials Group Co., Ltd. (hereinafter referred to as \*ST Olefin Carbon) as a case to study the accounting of the listed company. Information disclosure violations, analysis of the causes of the company's violations, proposed governance measures relative to the company, and more effective ways to prevent accounting fraud and financial fraud relative to the entire financial market. This can be used as a reference for peers, enabling relevant departments to play a more effective regulatory role, protect the rights of stakeholders, and contribute to the healthy development of China's securities market.

## 2 Literature Review

By combing the research status and research characteristics of information disclosure violations of listed companies in China, through analysis, it is found that the status, types, causes and opinions of information disclosure violations are the main direction of scholars' research.

Many scholars have explored the status and types of violations of listed companies.

Lu Yating (2014) and Sun Hongmei, Jiang Na and Yan Lei (2011) all selected certain samples to statistically analyze the multiple levels of individuals and groups of corporate listed companies in China, and reached a consensus conclusion and proposed relevant measures: violations of listed companies in China The information disclosure violations in the behavior accounted for the highest proportion, the main problem is the incomplete disclosure of major issues. Listed companies should strengthen legal system construction, increase penalties, broaden financing channels, strengthen internal control and internal audit, and strengthen research on auditing methods and auditing methods.(Lu Yating, 2014; Sun Hongmei, Jiang Na, Yan Lei, 2011)

Wang Ruixue and Qiao Ruihong (2015) selected 352 listed companies from 2006 to 2012 as samples to statistically analyze the causes, types and means of management fraud of listed companies, and concluded that listed companies obviously prefer information disclosure violations, among which the most frequent violations occur. It is postponed disclosure and major omissions. (Wang Ruixue, Qiao Ruihong, 2015)

Many scholars have explored the reasons for the disclosure of information violations by listed companies.

Song Chuan and Lai Yiran (2012), Feng Wenli (2015), Yi Yi (2018), Zhang Yue and Wu Qifu (2018) all believe that the main reason for the disclosure of information violations by listed companies is the lack of strict supervision by external regulators. Too small. Among them, Song Chuan and Lai Yiran (2012) and Zhang Yue and Wu Qifu (2018) selected listed companies for a certain period of time as the research object for empirical research, and found that the supervision of the CSRC increased the level of R&D information disclosure.(Song Chuan, Lai Yiran, 2012;Feng Wenli, 2015;Yi Yi,2018; Zhang Yue, Wu Qifu, 2018)

Yan Huahong and Bao Nan (2015) and Xu Xiang (2015) conducted case studies to analyze the disclosure of information violations by listed companies. Yan Huahong and Bao Nan (2015) analyzed the case of Wuliangye financial fraud. The game analysis results and data backwashing results confirmed that the fundamental reason for the low quality of information is that the corporate governance is imperfect and fails to suppress the speculative motives of the operators. Xu Xiang (2015) analyzed the case of \*ST Boyuan and proposed corresponding measures and suggestions for violations. He believes that improvements should be made in three aspects: regulatory agencies, internal operations and intermediaries. (Yan Huahong and Bao Nan, 2015; Xu Xiang, 2015)

Wu Guoping and Ma Shi (2010) selected companies that were punished by the Securities and Futures Commission as research objects, and selected some companies that regulate disclosure to compare the two. They found that financial pressures are highly correlated with accounting information violations. The greater the financial pressure on listed companies, the greater the probability of information breaches. (Wu Guoping, Ma Shi, 2010)

Fang Hongxing et al. (2009) believe that larger listed companies will generate higher agency costs and are more willing to disclose true and complete accounting information. (Fang Hongxing, Sun Wei, Jin Yunyun, 2009)

Based on the research of the literature, this paper summarizes the status quo, influencing factors and improvement measures of the accounting information violation behavior of listed companies. Domestic and foreign scholars mainly analyze the violations from the aspects of financial status, internal structure and external supervision. This paper makes use of the research results of predecessors to conduct statistical analysis on the administrative penalty decision issued by China Securities Regulatory Commission from 2013 to 2017, and analyzes the status quo of listed companies' illegal disclosure of accounting information behavior, and discusses its causes and harms. Propose corresponding governance measures.

### 3 The Statistical Analysis of Information Disclosure Violations of Listed Companies

#### 3.1 The overall distribution of information disclosure violations of listed companies

This paper analyzes and studies 522 administrative penalties published publicly on the official website of China Securities Regulatory Commission from 2013 to 2017, excluding penalties that are not related to information disclosure violations, as well as accounting firms, law firms, securities companies, and asset valuation companies. Penalties for a series of intermediaries and senior executives of listed companies, media organizations, and 106 listed companies were selected as data samples for research.

**Table 1 Classification Statistics of Punishment Objects**

Punishment Object	Sample listed company	Accounting firm	Law office	Securities company	Asset valuation company	Media	Executive	Other
Statistics	106	21	2	12	6	5	300	60

Source: According to the official penalty website of the China Securities Regulatory Commission

After counting the number of listed companies that violated the disclosure of accounting information in 2013-2017, it was found that the number of companies from 2013 to 2015 showed an upward trend year by year, and declined in 2016, and rebounded again in 2017. To a certain extent, this shows that the work of China's regulatory agencies has certain effectiveness, but the regulatory effect is not enough, and it is impossible to completely suppress the listed company's illegal disclosure of

information. The specific situation is shown in Figure 1.

**Figure 1 Annual Distribution of Information Violation Disclosure Behavior**

Source: According to the official penalty website of the China Securities Regulatory Commission

After statistical analysis of the sample companies selected, 106 listed companies reported a total of 160 violations, and the frequency of violations was 150.94%. The specific results are shown in Table 2. It shows that each sample listed company has at least 1.5 information disclosure violations, which reflects the universality of violations of information disclosure in listed companies.

**Table 2 Statistics on the Number of Disclosures of Sample Company Information Violations**

Number of sample companies	Number of occurrences	Frequency occurring in the sample (%)
106	160	150.94

Source: According to the official penalty website of the China Securities Regulatory Commission

**3.2 Classification and statistics of information disclosure violations of listed companies**

This article divides information disclosure violations into three types: information disclosure is incomplete, information disclosure is not true, and information disclosure is not timely. This paper further analyzes the types of specific information violation disclosure behaviors of 106 sample listed companies. See Table 3 for details.

**Table 3 Classification of Information Violation Disclosure**

Type of violation disclosure	Number of occurrences	% of violations
incomplete	87	54.38
unreal	55	34.37
not timely	18	11.25
total	160	100

Source: According to the official penalty website of the China Securities Regulatory Commission

**Figure 2 Classification of Information Violation Disclosure**

Source: According to the official penalty website of the China Securities Regulatory Commission

According to the statistical analysis in Table 3 and Figure 2, 106 sample companies have disclosed 160 information violations and 87 incomplete information disclosures. The frequency of violations in the disclosure is 54.38%, more than half. The infrequent disclosure behavior of listed companies has the highest frequency, indicating that this method is the most commonly used method for information disclosure in violation of regulations. The reason may be that if a listed company has a major violation, it is easy to be discovered by the CSRC and severely punished. The integrity of the disclosure information is difficult to identify. The company is not easy to find in this way, and can mislead investors to make wrong decisions and obtain illegitimate interests.

According to the announcement of the administrative punishment of the CSRC, the information disclosure behavior of listed companies was further analyzed. The analysis results are shown in Table 4.

**Table 4 Statistics of Incomplete Disclosure Types**

Incomplete disclosure type	Number of occurrences	% of incomplete disclosure	% of violations
Related party transaction	24	27.59	15.00
Shareholding change	28	32.18	17.50
Major lawsuit	5	5.75	3.13
External guarantees, investments, and borrowings	8	9.20	5.00
Fund investment, occupation, use	4	4.60	2.50
Important contract, agreement	6	6.90	3.75
The actual controller	3	3.45	1.88
Other	9	10.34	5.63
Total	87	100	54.38

Source: According to the official penalty website of the China Securities Regulatory Commission

**Figure 3 Non-integrity Disclosure Type Statistics**

Source: According to the official penalty website of the China Securities Regulatory Commission

From the analysis of the statistics in Table 4 and Figure 3, there are 82 incomplete behaviors in 97 companies, and the incomplete disclosure of shareholdings occurs most frequently. It shows that the listed company failed to accurately and completely disclose the shareholdings, share transfers and holdings. There are also many occurrences of incomplete relationships between related relationships and related party transactions. Explain that the company lacks comprehensiveness and completeness in the disclosure of related transactions that can affect financial results and operating conditions.

## **4Case Analysis of \*ST Olefin Carbon Information Violation Disclosure Behavior**

### **4.1 Basic situation of \*ST olefin carbon**

Silver-Based Carbon New Materials Group Co., Ltd. (hereinafter referred to as \*ST-olefin) was established in 1989 and listed on the Shenzhen Stock Exchange in 1993 (000511). It is the first listed company in the Northeast of Shenzhen Exchange. Its main business includes the development, processing and sales of olefinic carbon new materials such as graphene carbon, rare earth activated carbon and refractory carbon.

The company's development process is as follows:

In 2000, the company entered the real estate market and became one of the largest real estate developers in the Northeast. In 2013, the company entered the graphene and advanced carbon industry and was committed to creating a service platform for graphene industrialization. In 2016, the company entered the new energy automobile industry, promoted the replacement of traditional fuel vehicles by new energy vehicles, and implemented the policy of fully developing the new energy automobile

industry chain with power batteries as the mainstay, supplemented by motor electronic control.

When the violation occurred	Event
May 4, 2016	The audit institution issued an audit report that could not express opinions on the 2015 annual report, and the Shenzhen Stock Exchange ordered it to implement the “delisting risk warning” from now on.
July 19, 2016	The CSRC issued a warning letter stating that *ST olefin carbon concealed the behavior of major information disclosure matters and ordered it to implement rectification.
October 13, 2016	The CSRC filed a case to investigate its information disclosure violations.
February 15, 2017	The Shenzhen Stock Exchange issued the "Decision on Public Reprimands for the Company and Related Parties", because its annual report disclosed errors and corrections for two consecutive years of losses and concealed external guarantees to publicly condemn the company and related responsible personnel.
June 16, 2017	The CSRC issued the "Administrative Punishment and Advance Notice for Market Prohibition". As a result of failing to disclose major events in 2015, the financial data of the annual report was falsely given a warning, a fine of 600,000 yuan, and warning and fines of other responsible personnel.
July 6, 2017	As the company lost 271 million yuan, 17.41 million yuan, 474 million yuan in the three years from 2014 to 2016, it will be suspended from now.
September 9, 2017	Received the “Notice of Administrative Punishment Prior Notice” from the Securities Regulatory Bureau, because it did not disclose the 2016 annual report and the first quarterly report in 2017 within the statutory time limit, it was ordered to correct the company, give a warning and impose a fine of 400,000, and give it to the responsible person. Warning and fine.
October 11, 2017	The Shenzhen Stock Exchange issued the "Decision on Disciplinary Action against Companies and Related Parties", pointing out the eight violations of the company.  The CSRC issued the "Administrative Punishment Decision", because the company failed to disclose major events in 2015 and the financial data of the annual report was falsely

\*ST Olefin Carbon group owns Jiangsu Yinjiene Carbon Energy Technology Co., Ltd., Shenzhen Yinjiene Carbon Energy Technology Co., Ltd., Panjin Yinjiene Carbon New Energy Technology Co., Ltd., Shenyang Yinji Real Estate Co., Ltd., Haicheng Magnesium Trading Co., Ltd. Beijing Yinxin Investment Co., Ltd. and Beijing Ethylene Graphene Technology Research Institute Co., Ltd. It will form a three-dimensional business development pattern with two strategic emerging industries – new materials and new energy vehicles as the core and real estate as the supplement.

\* ST olefin carbon corporate governance structure is as follows: the board of directors consists of a chairman, three directors, three independent directors of the decision-making body. The board of supervisors is responsible for supervising the board of directors and senior management of the company, consisting of one supervisor and two supervisors. The senior management is responsible for the day-to-day operations of the company and consists of a president, two vice presidents and directors of various departments.

#### 4.2 \* ST Olefin Carbon Information Violation Disclosure Case Review

Table 5 \* ST Olefin Carbon Information Violation Disclosure Case Review

December 19, 2017	given a warning, a fine of 600,000-yuan, warning and fine related person in charge, taken against the two principal responsible persons Market ban measures.
-------------------	--

Source: According to the official penalty website of the China Securities Regulatory Commission

### 4.3 \*ST Olefin Carbon Information Disclosure Problem Analysis

This paper analyzes in detail the specific violations of \*ST olefinic carbon from three aspects: incomplete, untrue, and untimely information disclosure.

#### 4.3.1 Information disclosure is incomplete.

In terms of incomplete disclosure of information, the company has a series of information disclosure violations, such as incomplete disclosure of related party transactions, undisclosed foreign investment and major external borrowings, and undisclosed asset impairment.

The disclosure of related party transactions is incomplete. In 2016, Ningbo Hangzhou Bay New District Carbon-based New Materials Co., Ltd., a wholly-owned subsidiary of ST-Alken Carbon, purchased about 300 million yuan of electrolytic copper from related party Xiangyi Tonglian Supply Chain Co., Ltd. The "Stock Listing Rules of Shenzhen Stock Exchange" stipulates that listed companies shall promptly disclose transactions with related parties (transaction amount is more than 3 million yuan, and account for more than 0.5% of the latest audited net assets of listed companies). The transaction amount is far more than 3 million yuan, and accounted for 22.85% of the company's audited net assets at the end of 2015. It can be seen that the above matters have constituted connected transactions. However, \*ST olefin carbon did not disclose any information about this related transaction, which is an incomplete disclosure of information.

Major foreign investment and external borrowings were not disclosed. \*ST Olefin Carbon and Tianjin Yinrui Wantong Asset Management Co., Ltd. and Hengrong Co., Ltd. signed the "Xihua Carbon Exchange Financing Leasing Co., Ltd." contract on November 10, 2015, and the contract stipulated the establishment of Xihua Carbon Exchange Financing Leasing Co., Ltd. the company. The contract stipulates that \*ST olefin carbon will be paid a total of 180 million yuan.

Beijing Yinxin Investment Co., Ltd. (\*ST olefin carbon holding subsidiary) signed the "Loan Agreement" with Panjin Zhongyue Optoelectronics Technology Co., Ltd. on April 26, 2016, which agreed that Beijing Yinxin will lend to China on the date of signing the agreement. Photoelectricity of 385 million-yuan, loan interest of 4 million yuan, the term is not more than 30 days. On the same day, the three companies also signed a "guarantee contract", and the contract stipulated that Zhongyue Investment shall be jointly and severally liable for the above-mentioned loans.

The Shenzhen Stock Exchange Listing Rules stipulate that listed companies should disclose that the transaction amount (including debts and expenses) accounts for more than 10% of the latest audited net assets of the listed company, and the absolute amount exceeds 10 million yuan. Among them, "transactions" include foreign investment and creditor's rights. The Measures for the Administration of Information Disclosure of Listed Companies stipulates that when a listed company has a major investment behavior and enters into an important contract, which may have an important impact on the company's assets, liabilities, equity and operating results, it shall promptly perform the information disclosure obligations of major events. The transaction amount of the above two events far exceeded the prescribed amount, and the first item accounted for 12.9% of the net assets audited by \*ST olefin 2014, and the second item accounted for 27.5% of the net audited assets of \*ST olefin 2014. \*ST olefin carbon

concealing these two major issues is an incomplete disclosure.

Undisclosed asset impairment provision. \*ST-Alcohol's 2016 asset impairment losses amounted to approximately RMB 400 million, accounting for 2252% of the net profit attributable to owners of the parent company in 2015. The Measures for the Administration of Information Disclosure of Listed Companies stipulates that when a listed company has significant losses and major losses, it shall promptly perform its information disclosure obligations. \*ST Olefin Carbon did not disclose the matter and was incompletely disclosed.

#### 4.3.2 Information disclosure is not true.

In terms of the untrue disclosure of information, the company has a series of information disclosure violations such as false predictions of performance and false financial report data (such as false assets, liabilities, expenses, profits).

There are significant differences in performance forecasts. \*ST Olefin Carbon released the 2016 annual results forecast on January 26, 2017. The announcement pointed out that the net profit attributable to shareholders of listed companies in 2016 was 450 million yuan to 520 million yuan. However, the amount disclosed in the 2016 annual report disclosed by the company was negative 474 million yuan. There is a significant difference between the company's disclosed performance forecast and the performance in the periodic report, and the relevant amendment announcement has not been disclosed.

Financial data is false. \*ST Olefin Carbon did not account for financing service fees, capital borrowing fees, loan interest and employee salary performance in the 2015 annual report. The above-mentioned several expenses were reported as "other receivables" and were not included in the current profit and loss. As a result, the 2015 consolidated financial statements accounted for a total of 17.95 million yuan of assets, a liability of 1.72 million yuan; a consolidated income statement of less than 19.76 million yuan, a net profit of 19.76 million yuan, accounting for 868% of 2015 net profit, affecting The company's net profit for the year of 2015 was -24 million yuan, and the undistributed profit was -68.84 million yuan. The error rates were 138% and -165% respectively.

Article 63 of the Securities Law stipulates that the information that the issuer and the listed company must disclose in a true, accurate and complete manner shall not contain false records, misleading statements or major omissions. \*ST Olefin carbon is not accounted for in accordance with accounting standards, and the disclosure of false financial information is untrue.

#### 4.3.3 Information disclosure is not timely.

In terms of the timely disclosure of information, the company has not disclosed the annual report and foreign investment matters in a timely manner.

The annual report was not disclosed in time. \*ST Olefin Carbon disclosed the 2016 annual report and other related announcements on June 24, 2017, but in fact the company held the board of directors and the board of supervisors on June 15, 2017 to review the 2016 annual report and other related proposals. Article 67 of the Securities Law stipulates that when an investor has not been informed of a major event that may have a significant impact on the stock trading price of a listed company, the listed company shall immediately submit and announce an interim report stating the cause and current status of the incident. Possible legal consequences. \*ST Olefin Carbon did not disclose the 2016 annual report in time, and the information disclosure was not timely.

Foreign investment matters were not disclosed in a timely manner. \*ST Olefin Carbon was

entrusted to Beijing Gold Trading Center Co., Ltd. on December 27, 2016 by entrusting its wholly-owned subsidiary Beijing Yinxin Investment Co., Ltd. to dispose of the assets and to purchase 450 million yuan of funds for the purchase of gold wealth management products. The wealth management principal accounted for 12% of the company's audited total assets in 2015. However, the board of directors did not consider the matter until December 29, 2016, and the payment date preceded the resolution of the board of directors. According to the relevant provisions of the Securities Law, \*ST olefin carbon is not timely in information disclosure.

#### **4.4 Analysis of the reasons for the violation of information disclosure of \*ST olefin carbon company**

According to the analysis results of the information disclosure violations of listed companies mentioned above, this paper uses the root cause analysis method and 5W2H analysis method to analyze the specific violations of \*ST olefin carbon in detail from three aspects: incomplete, untrue and untimely information disclosure.

##### **4.4.1 Avoid being ST and illegally profitable**

The 2015 annual report of Silver-Based Carbon New Materials Group Co., Ltd. provided false financial data, which led to the company's net profit increased by RMB 19,967,400 in 2015. If the company adds a deductible fee, the company's 2015 net profit will be negative. Moreover, the company not only operated losses in 2015, but also had a negative net profit on the 2014 annual report. Relevant regulations show that if a listed company has a poor operating condition or even an operating loss for two consecutive years, it will face the implementation of "ST", which indicates that the company has the risk of being delisted from the market. Therefore, this article considers this to be one of the reasons for the company to disclose information on violations. In this case, there are two main reasons for the company to disclose accounting information in violation of regulations: one is that the company will issue stocks to avoid the loss of shareholders, and avoid being suspended from the market; the other is that the company is going through the forgery because of the worsening business conditions and insufficient funds. Income to raise funds. According to relevant regulations, before the bank issues a loan, the bank needs to evaluate the solvency of the company through the company's financial statements and assess the financial status of the loan company. The company is in urgent need of capital turnover, but the real financial situation cannot meet the required standards, the company will conduct financial fraud in order to obtain bank loans. In another case, some listed companies disclose false information in order to attract more investors and earn more benefits.

##### **4.4.2 The illegal cost is too low**

On December 19, 2017, the CSRC issued an administrative penalty decision letter, analyzing the illegal behavior of the company and the person involved in the incident and its nature and the resulting harmful consequences. The following punishment decision was made: the company was given a warning and ordered to He was ordered to make corrections and fined 600,000 yuan. He also warned the direct responsible persons Fan Zhiming and Xiong Shuaihui, fined 300,000 yuan, warned the indirect responsible person Wang Daming, and fined 200,000 yuan. He warned the department manager and other members of the board of directors and the board of supervisors. And a fine of 50,000 yuan or 30,000 yuan will be imposed depending on the illegal circumstances. The company's financial fraud exceeded 100 million yuan, but it was guaranteed to be listed. After the final violation disclosure was exposed, it was only given a warning and fined several hundred thousand yuan. Compared with illegal interests, the illegal cost is too low, which is one of the reasons for the continuous disclosure of information violations in the securities market.

#### 4.4.3 Dereliction of duty of the company's board of directors and the board of supervisors

The professional level of the senior management staff of listed companies has a great influence on the quality of information disclosed. Regular and irregular training of company employees to improve their work ability and professional level is conducive to the development of healthy savings of the company's operations. Company executives may, under the temptation of huge profits, conduct unfair profit manipulation and damage the interests of investors.

The board of directors of a listed company shall be diligent and responsible for the illegal disclosure of company information. In this case, although Wang Daming (who was chairman of \*ST Ethylene) pointed out at the hearing that he did not participate in the actual operation of the company and did not receive remuneration, he was only a named director, but this could not be a reason for exemption. Other members of the company's board of directors, members of the board of supervisors, and senior management should also be diligent. At the hearing, the independent directors and supervisors of the company stated that they were not financial professionals, were not responsible for the company's financial work, and were unable to judge financial data. Authenticity, but this is not a reason for exemption. The independent directors and the board of supervisors of listed companies shall do a good job in supervision and management. The company's financial director Xiong Shuaihui said that he has no energy and time. This reason is even more absurd. The role of the chief financial officer is to ensure that the company conducts business activities, financial budget final accounts, profit distribution, fund use scheduling, financing plans, etc., and the chief financial officer should be the person directly responsible for the time of violation of the disclosure.

#### 4.4.4 The internal governance structure of the company is not perfect and the internal control system is not perfect.

The shareholders of a listed company have substantial ownership of the company, the company's operators and senior management personnel have the company's management rights, and the board of supervisors has the power to supervise and manage the operators. In the case, \*ST Olefin Carbon company has the problem of imperfect corporate governance structure. The senior management company controls the company and holds the real power. The chairman is just a name, the board lacks independence, and the independent director system is not perfect. Supervise and manage the role of senior management. Moreover, the company's internal control system is not perfect, which makes it unable to play its role, and cannot ensure that the company regulates operations and regulates the disclosure of accounting information.

#### 4.4.5 Insufficient supervision of external institutions

In this case, the company's violation disclosure information caused by the lack of external supervision has two main aspects: on the one hand, the relevant laws and regulations give the company a less serious punishment for violations. In the relevant laws and regulations promulgated by China, illegal companies and illegal personnel are not severely punished, failing to achieve the expected disciplinary effect, and cannot attract the attention of the company, so that the company's senior management and accounting personnel are bold in financial fraud. On the other hand, the company's senior management's own professional quality is insufficient, and the laws and regulations on accounting information disclosure are not well understood, and there is a chance of being lucky or even knowingly committing crimes. But in the final analysis, the company's pursuit of high-value interests exceeds the fear of legal punishment. The huge profits brought by illegal disclosure of information far exceeds the penalty for its punishment, which leads to violations of listed companies.

#### 4.4.6 Lack of responsibilities of intermediaries

In this case, the lack of responsibility of the CPA should not be ignored. As a professional auditing institution, the CPA should be able to take into account the possibility of the company's financial statements. The CPA firm should strictly control the auditing procedures and check the risk of non-compliance. In this case, the company inflated a profit of 100 million yuan a year. In order to continue to maintain its status as a listed company, in order to continue to earn profits, it has caused such serious consequences and infringed the interests of countless investors. In response to such a terrible violation of information disclosure incidents, the auditor issued an audit report that could not express opinions, and did not publish a report of reservations or negative opinions, which could not attract investors' attention. It can be considered that the accounting firm failed to perform its due diligence when conducting audit work on the company, so its opinions were invalid.

## **5 Related Recommendations and Measures**

### **5.1 Improve the company's internal control system**

One of the reasons for the disclosure of information violations by listed companies is the imperfect internal control system. The lack and inefficiency of the internal control system cannot play a corresponding role, and cannot guarantee the authenticity and integrity of the enterprise's standardized operation and disclosure of accounting information. For the company's internal control system to really play its role, it is necessary to establish a wind control system within the company, real-time monitoring of major issues, to prevent the occurrence of high-level violations.

A listed company shall establish a major risk early warning mechanism and a major event handling mechanism to conduct risk identification, analysis, and evaluation in production, sales, and finance joints, establish standardized procedures, clarify responsible personnel, and formulate contingency plans for possible risks. Ensure that the company's risks are effectively controlled when significant events occur. In addition, listed companies should do daily supervision to ensure that the management's daily behavior is within the controllable range, improve the management level of the management and the company's ability to prevent risks. Listed companies can introduce a good information communication system, enabling the company to timely and accurately understand the business status and executive behavior, and improve the efficiency of the company's internal control.

### **5.2 Strengthen the supervision of external institutions**

Strengthen government supervision. First of all, the CSRC should improve the information disclosure system and accounting standards of listed companies, and continually revise and improve existing laws and regulations in accordance with the changing new economic environment. Secondly, the CSRC should improve the working ability of law enforcement personnel in the process of law enforcement, and give specific punishment measures according to the characteristics of illegal behaviors. Moreover, the CSRC should openly and transparently punish the punishment process, the punishment basis, and the punishment results, and accept the inspections of the mass media and the masses.

Strengthen the supervision of certified public accountants. The role of the CPA is to test whether there is any violation of the listed company. If the CPA lacks independence, the false accounting disclosure will become more and more serious and will not be contained. First of all, it is necessary to strengthen the assessment of the professional competence of CPAs, and assess whether their firm is legal and compliant, and whether it has a sound internal control system. For emerging industries, staged intensive training should be conducted for CPAs. Secondly, the professional ethics of certified public accountants should be improved, and penalties should be increased for non-compliant CPAs. In this way,

it can have a deterrent effect on CPAs, ensure the independence of their practice, and ensure the standardization of information disclosure of listed companies.

### **5.3 Increase illegal costs**

The disclosure of information violations by listed companies has been repeatedly prohibited. One of the important reasons is that the illegal cost is too low. When the illegal cost is greater than the illegal interests, the information violation disclosure behavior can be effectively curbed. The CSRC should comprehensively strengthen penalties for illegal listed companies from the aspects of law, administration, and public opinion, and increase illegal costs.

From the legal point of view, most of the penalties for the disclosure of information violations by listed companies are administrative penalties, which rarely involve criminal penalties and civil penalties, and the amount of penalties is small and does not have deterrence. Relevant departments should increase the amount of punishment, extend the market entry period, and strengthen penalties. In addition, we should constantly improve and supplement the penalties. For example, special securities courts and securities arbitration institutions can be set up; the limits of criminal penalties in China can be increased, the statutory sentence of free penalties should be increased; the civil liability should be improved, and the relevant provisions on civil liability should be formulated in the securities law.

From the perspective of public opinion, the illegal disclosure of information on listed companies is not enough for the listed companies to contain the violations, which has led some listed companies to repeatedly violate the law. Relevant departments can use the power of public opinion to curb violations. For example, establish an integrity file that records the credit history of all listed companies and their directors, senior managers and intermediaries. For listed companies that have violated the rules, they can restrict their market rights and relax their market rights to reputable companies. And the integrity record is made public, so that the company's individual behavior is expanded into market behavior, so that the influence of violations is extended to financing, sales and other links.

### **5.4 Improve the internal governance structure of the company**

For \*ST olefinic carbon, the company's behavior of information violation disclosure, one of the important reasons is that the separation of the three powers has not been achieved. The company should improve the corporate governance structure, clarify the division of responsibilities between the board of directors, senior management and the board of supervisors, and establish corresponding restraint and incentive mechanisms. The specific measures are as follows:

Establish a system of checks and balances on the rights of the three powers. First of all, the chairman and the manager should be separated. The board should assume the supervisory responsibility and supervise the manager's behavior while making business investment financing decisions. Secondly, the proportion of independent directors in the board of directors should be increased, their supervisory responsibilities and rights should be clarified, and the decision of management should be judged to be appropriate to prevent them from harming the interests of shareholders. Finally, it is necessary to play the supervisory role of the board of supervisors, improve the professional level of the board of supervisors, and supervise the management behavior of the company's management. In addition, the incentive and restraint mechanism for directors, operators and supervisors should be established, and their wages can be linked to the interests of shareholders, which can improve their supervisory motivation and improve the quality of accounting information disclosure.

Establish an internal audit system. A listed company should establish an internal audit system and establish a subordinate audit institution in the board of supervisors, which can effectively curb the role

of senior management in internal audit intervention to a certain extent. Internal audit institutions can understand the trends of senior management in a timely manner, and can prevent managers from covering up facts and illegally disclose accounting information. Moreover, internal audit institutions can regularly evaluate the management performance of senior management, which is beneficial to the board of directors to effectively evaluate their own governance and senior management.

## 6 Conclusion

This paper analyzes the administrative penalty decision issued by the China Securities Regulatory Commission from 2013 to 2017, selects certain valid samples, conducts overall analysis and classified statistics on the information disclosure violations of listed companies, and combines case analysis to draw the following conclusions. (1) Listed companies mainly have three types of information disclosure: incomplete, untrue, and untimely. Among them, the incomplete disclosure of listed companies is the most commonly used method for information disclosure. (2) The main reasons for the disclosure of information violations by listed companies are: avoiding ST and illegal profits, illegal cost is too low, the company's board of directors and the board of supervisors are derelict, the internal governance structure of the company is not perfect and the internal control system is imperfect, and the supervision of external institutions is insufficient. The responsibilities of the intermediary are missing. This conclusion has the following implications and significance: (1) Listed companies should pay attention to the consequences of information violation disclosure, improve the company's internal control system, and improve the company's internal governance structure. (2) The regulatory authorities should further strengthen the supervision of information disclosure of listed companies, increase the penalties for illegal listed companies and intermediaries, and improve and supplement the penalties. (3) Intermediaries should do their jobs to improve the professional ethics of CPAs and maintain a good order in the securities market.

# **A Study on Foreign Direct investment and Economic Growth in China: The Role of Human Capital Development**

Zhang Yuling, Wu Zihao, Brima Sesay

School of International Education, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: zhangyuling@whut.edu.cn, ryanng@whut.edu.cn, brimasesay30@gmail.com)

**Abstract:** Foreign Direct Investment is generally considered a vital source of economic growth for China, generating employment opportunities, capital investment, and business knowledge needed for economic growth. This paper investigates the relationship between FDI and economic growth of China for the period of 1990–2017 using time series data and by extension verify for the role of human capital development. The study used multiple regression (OLS) model and the results revealed that FDI alone bring less significant positive impact on growth performance in China. However, the simultaneous interaction of FDI with human capital development brings about a greater positive and significant impact on growth. This confirmed that high positive impact of FDI on growth is conditional on the level of human capital development. Consequently, the study recommends that government policy makers should design policies towards improving human capital.

**Key words:** Foreign direct investment; Economic growth; Human capital development; China

## **1 Introduction**

The notion of economic growth is fundamental to economists and policy makers because of its central role in economic development. Therefore, the key factors that propel economic growth have been an area of interest for a very long time to economists and policy makers because of their significant role towards development. Foreign direct investment (FDI) is the key element of the globalization and of the world economy. FDI is important as a driver of employment, technological progress, productivity improvements, and eventually economic growth. It plays the important roles of filling the development, foreign exchange, investment, and tax revenue gaps in developing countries. FDI plays a key role in the development of developing countries. One reason is that FDI helps in transferring advance technologies know-how and increases employment levels to the host countries. Economists believe that FDI through new technologies and high standard managements puts pressures on domestic firms while making the markets competitive. Furthermore, FDI brings significant and positive externalities to the developing economies such as labor managements, training opportunities and thus increases the standard of the production function. By technology transfer, it boosts the economies of the developing countries to stand there on feet by technology spill over. A hand full of researches has been conducted on FDI and economic growth. However, their findings differ from diverse methods used on their research, some of the researchers found that FDI has a positive outcome on economic growth while others found the reverse. These contradictory results were as a result of the differences in methodology employed, time frame, and case selection. This present research gears towards filling this gap by unearthing the effect FDI have on economic growth for China between 1990-2017 and by extension verify for the role of human capital development on FDI-growth relationship.

From the literatures, regarding the relationship between FDI and GDP, different scholars hold different opinions (Pollin, R., & Zhu, A., 2006). Erik Biørn (Erik Biørn, 2015) developed a panel model which indicates that there is a positive but insignificant relationship between the aggregate FDI and GDP. It especially improves the GDP growth of Asian countries. And the manufacturing FDI affects both manufacturing and service GDP growth positively where no negative spillover effects between them was found. According to the research by Parviz Asheghian (Parviz Asheghian, 2016), there is no causal relationship between FDI and GDP growth and it also does not affect other variables through the model that based on the postulation of de Mello. Shujie Yao (Shujie Yao, 2006) suggested that the FDI contributed to the GDP growth of China which might be useful for other developing and transitional economies to make policies.

Also, in the case of China, the impact of FDI may vary during different time periods. Fleisher and Zhao (Fleisher and Zhao, 2010) pointed out that from 1985 to 1994, China's FDI had a significant impact on economic growth and from 1995 to 2003, and promotion of FDI was no longer significant. This phenomenon is estimated to associate with encouragement and policy support for non-public enterprises (Fleisher & Zhao, 2010).

Turning to the relationship between FDI and human capital, empirical evidence provided by Noorbakhsh, Paloni and Youssef (2001) reveals the significant correlation between human capital and FDI, which means human capital, might be one of the important factors influencing capital inflows to developing countries. Miller & Upadhyay (2000) hold the view that the impact of human capital on TFP varies in countries with different incomes. The human capital of middle-income countries shows a positive correlation with total factor productivity whereas those of the high-income countries have negative influence. In addition, a recent study conducted by Li and Wang (2016) demonstrates that the influence of human capital on economic growth is carried out through multiple channels. And the basic human capital is mainly through the “factor-accumulation channel”, thus improving the TFP to affect economic growth.

The relationship between inflation rate and GDP growth has also been widely discussed by scholars. Robert Pollin (2006) pointed out that the inflation and economic growth is strongly correlated under the goal where macroeconomic policy tries to stimulate growth. Similarly, the study by Fountas, S., et. al. (2002) based on Japan indicates that high inflation is more likely to associate with lower output. In other words, low and stable inflation rate will probably improve the economic growth. Generally, Mohsin S. Khan (2001) indicates that threshold for developing and developed countries are respectively 1%-3% and 11%-12. There is a significant negative relationship between the inflation and economic growth when inflation is beyond the threshold.

## **2 Methodology**

The study uses primarily secondary data; that were retrieved from the online publication of World Development Indicators–China Database published by World Bank and the National Bureau of Statistics of China database. The study collected and analysis time series data over the period of 1990 to 2017 for the variables included in the model specification. The multiple regression analysis of the ordinary least square (OLS) is the estimation technique that is being employed in this study to determine the relationship.

## **3 Empirical Model Specification**

Following an endogenous growth framework, the study specifies a model that best captures the effect of foreign direct investment (FDI) on economic growth. Given the growing empirical evidences supporting the positive effect of FDI on economic growth (Erik Biørn (2015; Shujie Yao 2006) we

control for other factors considered as control variables that influence long run growth and generalize the specification of a growth equation that accounts for the effects of FDI on economic growth. Thus, in deriving our empirical model for estimating this relationship for China, we put forward that:

$$GDP = F (FDI, HK, INF) \tag{1}$$

Where GDP = real GDP growth

FDI = foreign direct investment inflow

HK = human capital development

INF = inflation

The econometric form of equation (1) can be specified as:

$$\ln GDP_t = \beta_0 + \beta_1 FDI_t + \beta_2 HK_t + \beta_3 INF_t + \varepsilon_t \tag{2}$$

In order to enrich the analysis, we test for the intervening role of human capital development with foreign direct investment. This was done to verify whether the effect of FDI on growth is dependent on the level of human capital development. If human capital development complements foreign direct investment, then we would expect a significant impact of their combined effect on growth. In view of this, the coefficient would capture the interactive effect between foreign direct investment and human capital development. The significance of interaction terms would imply that the marginal effect of foreign direct investment on economic growth depends on the level of human capital development. This was done by the aid of the following equation:

$$\ln GDP_t = \beta_0 + \beta_1 FDI_t + \beta_2 HK_t + \beta_3 (FDI_t * HK_t) + \beta_4 INF_t + \varepsilon_t \tag{3}$$

The a priori expected signs are that  $\beta_1, \beta_2,$  and  $\beta_3 > 0$  and  $\beta_4 < 0$ .  $\beta_0$  is the slope coefficient and  $\varepsilon_t$  is the error term. E-views version 10 was used to run the analysis.

#### 4 Results and Discussion

This sub-section discusses the results and findings from the study, it commences with an analysis of the summary statistics of the variables used in the study. The summary statistics reported in table 1, below indicates that on average real GDP growth stood at 9.53 percent. The ratio of foreign direct investment to GDP averaged around 3.47 percent; inflation averaged around 4.44% and human capital development stood at an average of 67.37. The inflation rate observed from the summary statistics demonstrates an indication of macroeconomic stability.

**Table 1 Summary Statistics and correlation results**

Variables	GDP	FDI	HK	INF
Mean	9.5373	3.4774	67.392	4.4451
Maximum	14.231	6.1868	95.100	24.256

Minimum	3.9071	0.9663	40.600	0.3478
Std. Dev	2.4830	1.3180	19.674	5.5144
<b>Correlation Matrix</b>				
GDP	1.0000	--	--	--
FDI	0.7091	1.0000	--	--
HK	0.1322	0.1163	1.0000	--
INF	-0.4307	-0.2771	-0.2243	1.0000

Unlike for inflation, the pair wise correlation matrix as reported in the lower segment of table 1 indicate positive relationship of all the independent variables with GDP growth, with human capital (HK) measured as secondary school enrollment in the summary statistics stood at (67.37), fairly strong. There is no presence of multicollnearity as the correlation among the explanatory variable are fairly low.

#### 4.1 Unit root test

Here we analyses the time-series properties of the variables of interest for the function (see table 2). The augmented Dickey-Fuller (ADF) test is used to determine the order of integration of data compiled for each variable. This is followed by an analysis of the co-integration results and short run dynamics. The diagnostics test results are then analyzed.

**Table 2 Unit Roots tests**

**Results of Unit Roots tests of the variables at their levels**

Variables	ADF Statistic	ADF Critical (5%)	P-Value
lnGDP	0.109708	-1.953858	0.7091
lnFDI	-0.559120	-1.953858	0.4655
lnHK	3.135998	-1.953858	0.9991
lnINF	-1.672829	-1.953858	0.0886

**Results of Unit Roots tests of the variables at their first differences**

lnGDP	-6.000748	-1.954414	0.0000
lnFDI	-3.390340	-1.954414	0.0015
lnHK	-4.263678	-1.954414	0.0001
lnINF	-5.791541	-1.954414	0.0000

The ADF unit root tests are performed under the null hypothesis that unit root exists against the alternative hypothesis that unit root does not exist. The ADF unit root test in tables 2 shows that all the variables are not stationary in level but stationary at first difference, implying that all the variables are

integrated of order one, denoted as I (1).

#### 4.2 Co-integration test results

Having found the series to confirm the existence of unit root and are stationary at first difference I (1), the next logical thing to do is to test for long-run equilibrium relationship between the dependent variable and the explanatory variables using the Johansen Co-integration test. These tests results are reported in table 3 below.

**Table 3 Co-integration Test Results**

Unrestricted Co-integration Rank Test (Trace)				
Vectors	Eigenvalue	Trace Statistics	0.05 Critical Value	Prob.**
$r = 0$	0.749410	93.20776	69.81889	0.0002
$r \leq 1$	0.652845	57.22540	47.85613	0.0052
$r \leq 2$	0.558768	29.71784	29.79707	0.0511
$r \leq 3$	0.197060	8.445067	15.49471	0.4191
Unrestricted Co-integration Rank Test (Maximum Eigenvalue)				
$r = 0$	0.749410	35.98236	33.87687	0.0276
$r \leq 1$	0.652845	27.50756	27.58434	0.0511
$r \leq 2$	0.558768	21.27277	22.13162	0.0578
$r \leq 3$	0.197060	5.706371	14.26460	0.6511

\* denotes rejection of the hypothesis at the 0.05 level

Table 3 shows that for the trace test, there are two co-integrating equation at the 5% level. It can be observed that the null hypothesis of none ( $r = 0$ ) and at most one ( $r \leq 1$ ) vectors, the trace statistics are less than their corresponding critical values and secondly their probabilities are above the threshold of 5%, which leads to the acceptance of the null hypothesis. For the second and third hypotheses of no co-integration respectively, the null hypotheses are rejected as the probability values are less than 5% and the critical values less than the trace statistic. The maximum eigenvalue test also confirms the existence of one co-integration equation as seen in table 3 above. The presence of co-integration implies that long run equilibrium relationship exists between the dependent variable and the explanatory variables. Hence the hypothesis that long-run equilibrium relationship between foreign direct investment and economic growth exists in China is supported.

#### 4.3 Result of the error correction model

The Johansen co-integration trace and maximum eigenvalue rank tests conducted confirms that there is unique co-integration equation in the model implying that there is long run equilibrium relationship between foreign direct investment and economic growth. Since this long run relationship has been confirmed, it thus allows for the estimation of an error correction model. The results of the ECM are presented in table 4.

**Table 4 Regression Output**

Variables	Model 1	Model 2
C	1.718309** (0.560975)	-0.331176** (0.118151)
DlnFDI	0.271610** (0.079576)	0.270073** (0.091190)
DlnHK	0.100556** (0.040840)	0.266156** (0.101348)
DlnINF	-0.068958* (0.039032)	-0.286494** (0.095240)
DlnFDI*HK		0.379944** (0.083750)
ECM(-1)	-0.643415** (0.143604)	-0.679900** (0.135746)
R-squared	0.622491	0.636642
Adjusted R-squared	0.530974	0.534448
F-statistic	10.00099	6.229724
Durbin-Watson stat	2.015094	2.096032

Note \*\*, and \* represents significant at the 5% and 10% levels respectively. The variables are expressed in log form and standard error-values are reported in parenthesis.

The result in table 4, shows that in model 1, FDI and human capital development have positive effect on real GDP growth and are statistically significant at the 5%, while inflation was found to have a negative effect on real GDP and significant at and 10% level. This indicates that high inflation raises the cost of production and reduces returns from investment and thus impact negatively on growth. Other things being equal, after adjustment for the degrees of freedom, the result suggest that about 62.2% of the variation in real GDP is explained by variation in the independent variables. The coefficient of the error correction term E (-1) is - 0.643415as measure of the speed of adjustment which is negative and statistically significant, this implies that for any drift away from the long run equilibrium in previous years, convergence to the equilibrium is corrected by 64.3%. That is approximately 64% of the error is corrected every year in the event of shocks in the system. Similar interpretation holds for model 2.

Interestingly, the combination of foreign direct investment with human capital development generates robust and positive effects on growth (0.379944). This simply implies that human capital development is

connected to the effectiveness of foreign direct investment on growth in China. Practically, the result confirms that in the absence of human capital development, foreign direct investment alone would have less (0.271610) significant positive impact on growth. In effect, improving the human capital development is important for growth. By these results, human capital development and foreign direct investment are complementary in the growth process of China.

## 5 Conclusion

The study analyzes the effect of foreign direct investment (FDI) on the economic growth of China over the period 1990-2017. The study applied correlation and multiple regression analysis to determine the impact of FDI on the economic growth of China. The results of the study expose that FDI has a positive impact on the economic growth of China. Correlation analysis also suggests that FDI and GDP are positively related to each other and inflation rate is negatively related to GDP growth. The results revealed that FDI alone bring less significant positive impact on growth performance in China. However, the simultaneous interaction of FDI with human capital development brings about a greater positive and significant impact on growth. This confirmed that high positive impact of FDI on growth is conditional on the level of human capital development. Consequently, the study recommends that government policy makers should design policies towards improving human capital.

# **Empirical Research on Financial Capability of Listed Companies in Northwest Five Provinces in China Under the Background of “One Belt and One Road” Strategy**

Song Tianqi, Liang Shanshan

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 3043916958@qq.com, 1548814274@qq.com)

**Abstract:** Owing to unique physiographic condition of northwest five provinces in China, the “one belt and one road” strategy offers more important policy support and brings unprecedented development opportunity for northwest five provinces in China. This paper adopts principal component analysis (PCA) and takes SPSS as analysis tool to conduct empirical research on the financial capability of listed companies in northwest five provinces under the background of “one belt and one road” strategy, propose 8 indicators in total representing four perspectives of debt paying ability, profitability, operation capacity and development ability, know the current situation of unbalanced economic development in northwest five provinces in China and put forward reasonable suggestions to shorten economic development gap, including giving play to regional advantages and accelerating economic integration; making positive response to the “one belt and one road” strategy and realizing internal-external balanced development; enlarging investment in northwest five provinces in China.

**Key words:** One belt and one road; Northwest five provinces; Financial capability; Empirical research

## **1 Introduction**

In September and October of 2013, the state president Xi Jinping respectively put forward the cooperation initiatives of “building a Silk Road Economic Belt” and “a 21st century Maritime Silk Road”, which aimed at strengthening relationship with economic partners along the ancient silk road. The “one belt and one road” strategic development lines include the northern line, the middle line, the southern line and the central line, wherein, the middle line and the central line all involve the northwest five provinces in China. The “one belt and one road” strategy provides great opportunity for economic development of Shanxi, Gansu, Qinghai, Ningxia and Xinjiang (Liu Gang, 2016). For a long time, the northwest district, as the gate of northwest China, has abundant resources and large territory, while the slow economic development of surrounding countries causes the economies of northwest five provinces to be depressed, Therefore, the northwest district has always been the key resource transportation and poverty alleviation region (Wang Yimiao, 2018). The northwest five provinces in China are prime areas of the “Silk Road Economic Belt”, however, the economic levels of which are uneven. The imbalance of regional economic development in developing countries has always been the core problem of regional economic research, and the location theory has important value to consider spatial factors for the first time in economic analysis. Since the 1980s, the study of regional economic space has entered a new stage of economic spatial structure in the new economic geography represented by scholars such as Krugman, Venables and Fujita. Overviews of domestic research, domestic scholars have also conducted in-depth research on regional economy. In the aspect of theoretical research, the “point-axis” theory of Lu Dadao has laid the theoretical foundation for the development of modern regional space in China.

China's main theories include Lu Yulin's "dual-core" development model, Chen Xiuying's five basic elements of optimization combination, Cheng Biding's the space structure of the three-time transformation theory (Hao Wufeng, 2017). In empirical research, Chinese scholars mainly focus on urban clusters, economic zones and provincial areas, such as the Yangtze River Delta, the Pearl River Delta, Jiangsu, Xinjiang and other regions. In summary, it can be divided into the following kinds of research: economic space evolution and pattern research, economic space linkage research, economic space reconstruction and optimization research.

From the existing literature, there are still some shortcomings in the study of regional economy: (1) the lack of economic research in the five northwest provinces. With the continuous development of globalization and economic integration, the economic structure of the five northwest provinces has changed greatly compared with the past, but there are few literatures in China to study it. (2) Lack of reliability indicators for evaluating regional economies. According to this situation, under the background of "Belt and Road", taking the financial capacity of listed companies in the five northwest provinces as the research object, and as a measure of the economy of the five northwest provinces, reveal the current situation of regional economic development imbalance in the five northwest provinces, and put forward innovative ideas to narrow the regional development imbalance gap (Ma Wei, Cao Xiaoshu, Li Tao, Gao Xingchuan, 2019). The main contributions of this paper are: (1) to make up for the five northwest provinces of the current economic situation research gap under the "Belt and Road" background, and provide a more reliable study for the evaluation of the economic situation of the five northwest provinces. (2) Through sub-regions, sub-sectors and sub-categories, accurately selecting data, provide a more systematic examination of the "Belt and Road" policy on the economy of the five northwest provinces in China.

## **2 Empirical Research Design**

### **2.1 Sample selection and data source**

This paper selects financial data of 50 listed companies in northwest five provinces in China from 2016 to 2018 as samples. Wherein, 10 listed companies with top 10 average market value in each province are respectively selected. In addition, the related data all source from CSMAR database, while all data processing and statistical analysis are all be completed through Excel 2016 and SPSS 25. Meanwhile, the listed companies existing with major debt restructuring items, incomplete information disclosure or abnormal financial information from 2016 to 2018 are eliminated (Xu Xiaoli, Chen Peipei, 2018). Otherwise, select the companies with weak comprehensive strengthen, and so on in a similar fashion.

### **2.2 Indicator selection**

The selected indicators must be representative, correct and comparable. Based on comprehensive consideration of the economic development characteristics of various regions and combined with the related theories of financial capability (Huang Yangshuo, Wang Yufeng, 2016), this paper firstly selects four first-level indicators: debt paying ability, profitability, operation capacity and development ability. Each first-level indicator includes two second-level indicators, 8 indicators in total. The debt paying ability indicators include liquidity ratio and cash ratio; the operation capacity indicators include turnover of account receivable and current asset turnover; the profitability indicators include return on total assets and return on business; the development ability indicators include total assets growth rate and net profit growth rate. These indicators can comprehensively present the current economic development level of northwest five provinces in China.

**Table 1 Economic Development Research Index System of Five Provinces in Northwest China**

Primary index (Financial Ability )	Secondary index
Repayment capacity	Current ratio (%)
	Cash ratio (%)
Operating capacity	Accounts receivable turnover (%)
	Current assets turnover (%)
Profitability	Return on total assets (%)
	Net operating interest rate (%)
Development capacity	Growth rate of total assets (%)
	Net profit growth rate (%)

### 2.3 Model establishment

By studying the internal structure of the original multiple variables, principal component analysis (PCA) reduces the original data information to several comprehensive variables on the basis of covering the original data information as much as possible. It plays the role of reducing and simplifying problems and can obtain more scientific and effective data information. PCA can overcome incompleteness of a single variable, that is, it cannot reflect the real situation of enterprise's financial ability truthfully, and this can make complex problems simple and scientific.

### 3 Empirical Result and Analytical Investigation

Standardize the 8 representative variables of listed companies in northwest five provinces in China, conduct PCA analysis, establish the principal component regression equation and calculate the final principal component scores of various enterprises. Wherein, the principal component results are as follows:

**Table 2 KMO and Bartlett's Test**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.535
	Approx. Chi-Square	85.829
Bartlett's Test of Sphericity	df	28
	Sig.	.000

KMO and Bartlett are used to preliminarily test whether the selected data are suitable to PCA, wherein, KMO test coefficient >0.5 while Bartlett significance testing P value <0.05, therefore, they can be used for PCA.

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	The Proportion of Variance%	Cumulative %	Total	The Proportion of Variance%	Cumulative %	Total	The Proportion of Variance%	Cumulative %
1	2.127	26.588	26.588	2.127	26.588	26.588	1.991	24.888	24.888
2	1.540	19.255	45.844	1.540	19.255	45.844	1.539	19.235	44.123
3	1.272	15.903	61.747	1.272	15.903	61.747	1.261	15.761	59.884
4	1.076	13.446	75.193						
5	.790	9.881	85.074						
6	.682	8.528	93.602						
7	.309	3.860	97.462						
8	.203	2.538	100.000						

**Table 3 Total Variance Explained**

Extraction Method: Principal Component Analysis.

It can be seen from explained total variance that three principal components meet with the situation that the characteristic roots > 1, and the accumulative explained total variance reaches to 59.884%, which shows that the three principal components can better reflect most information covered by original indicators. Therefore, make the three principal components to be *F1*, *F2* and *F3* respectively, which can effectively replace the financial levels of 50 listed companies in the northwest five provinces in China. Meanwhile, the linear regression function for average comprehensive financial capacity of northwest five provinces from 2016 to 2018 can be obtained. In addition, the results of the three principal components can be clearly and intuitively presented in the three-dimensional diagram.

**Table 4 Rotated Component Matrix<sup>a</sup>**

	Component		
	1	2	3
Net operating interest rate	-.125	.085	.073
Growth rate of total assets	.150	-.917	-.061
Current ratio	.926	.053	-.026
Return on total assets	.406	.818	-.052
Current assets turnover	-.243	.120	.227

Net profit growth rate	.058	-.037	-.758
Accounts receivable turnover	.029	-.018	.789
Cash ratio	.931	.050	-.007

Figure 1 Component Plot in Rotated Space

Rely on the above three principal components to establish initial component loading matrix and realize maximum rotation of variance to get the rotation component matrix (see form 4), and then the explanatory powers and represented variables of the three principal components can be obtained based on variable proportion. wherein, the first principal component is mainly composed of liquidity ratio (92.6%), cash ratio (93.1%), total assets growth rate (15.0%) and net profit growth rate (5.8%), which can effectively represent the debt paying ability and development ability of listed companies; the second principal component mainly consists of return on total assets (81.8%) and return on business (8.5%), which can effectively represent the profitability of listed companies; the third principal component mainly consists of turnover of account receivable (78.9%) and current asset turnover (22.7%), which can effectively represent the operation capacity of listed companies.

The three-dimensional rotation diagram can effectively verify the result of the above rotation component matrix. The first principal component represents the following variables: liquidity ratio, cash ratio, total assets growth rate and net profit growth rate; the second principal component represents the following variables: return on total assets and return on business; the third principal component represents the following variables: turnover of account receivable and current asset turnover. Meanwhile, the conclusion can be obtained that partial variables have close relationship and fit highly with each other in the three-dimensional rotation diagram, such as cash ratio, liquidity ratio, net profit growth rate, turnover of account receivable and current asset turnover.

**Table 5 Component Score Coefficient Matrix**

	Component		
	1	2	3
Net operating interest rate	.102	.083	.136
Growth rate of total assets	.156	-.622	-.010
Current ratio	.472	-.043	.039
Return on total assets	.140	.510	-.058
Current assets turnover	-.096	.078	.094
Net profit growth rate	-.017	.003	-.599
Accounts receivable turnover	.062	-.044	.649
Cash ratio	.479	-.047	.048

Based on component score coefficient matrix, set the variables in the form 4 to be  $X_1, X_2, \dots, X_8$  respectively, and the three principal components are  $F_1, F_2$  and  $F_3$  respectively. And the score expressions of the principal components can be obtained:

$$F_1 = 0.472 X_1 + 0.062 X_2 - 0.102 X_3 - 0.096 X_4 + 0.156 X_5 + 0.140 X_6 - 0.017 X_7 + 0.479 X_8$$

$$F_2 = -0.043 X_1 - 0.044 X_2 + 0.083 X_3 + 0.078 X_4 - 0.622 X_5 + 0.510 X_6 + 0.003 X_7 - 0.047 X_8$$

$$F_3 = 0.039 X_1 + 0.649 X_2 + 0.136 X_3 + 0.094 X_4 - 0.010 X_5 - 0.058 X_6 - 0.599 X_7 + 0.048 X_8$$

Based on the regression equation, the comprehensive score of financial capability of listed companies in northwest five provinces can be seen in the following form 6. Take the characteristic value proportion of each principal component accounting for total characteristic value as weights and adopt regression analysis to establish the principal component score regression equation:

$$Y = 26.588\%F_1 + 19.255\%F_2 + 15.903\%F_3$$

#### 4 Comprehensive Score Evaluation of Financial Ability of Five Provinces in Northwest China

From a single principal component analysis (see Table 7, Figure 2), *F1*, *F2*, *F3* are relatively balanced in the degree of generation of regional financial capacity, the gap is not significant. As shown in Table 11, the correlation between *F1* and Ningxia's comprehensive score is close to 1, the highest among the five provinces, while the correlation between *F1* and Xinjiang's comprehensive score is only 0.514, the lowest among the five provinces. Compared with other industries, Ningxia's short-term solvency and development ability in garment manufacturing and transportation industry are stronger, while Xinjiang's short-term solvency in medicine industry is more prominent. From the perspective of profitability *F2*, its specific indicators mainly include net interest rate of total assets and net operating interest rate. The ranking of profitability of the five provinces from high to low is Shanxi, Ningxia, Gansu, Xinjiang and Qinghai. Operating capability *F3* has the highest correlation with regional financial capability in the three principal components, but it has the lowest representation of regional financial capability, which is only 15.903%.

**Table 7 Correlations**

	<i>F1</i>	<i>F2</i>	<i>F3</i>	
Y-Shanxi	Person Correlation	0.460	0.675	0.942**
	Sig.(2-tailed)	0.181	0.032	0
Y-Gansu	Person Correlation	.923**	.727*	.998**

	Sig.(2-tailed)	.000	.000	.000

Figure 2 Average Score of Each Principal Component

According to the comprehensive situation analysis (see figure 3), the average comprehensive scores of the five northwest provinces are lower, followed by Shanxi, Gansu, Xinjiang, Qinghai and Ningxia. Compared with the single related component mentioned above, it can be seen that the correlation between the principal components of Ningxia and financial ability is significant, but the overall economic level of Ningxia is relatively backward, reflecting to a certain extent that the regional superior industries of Ningxia are not outstanding, the overall economic industry integration is poor, and there is a big gap in the economic level within the region itself. If the economic level wants to catch up with the eastern provinces, it still needs long-term unremitting efforts. Gansu, Qinghai and Xinjiang are in the middle level of financial capacity of the five northwest provinces. Their economic development is relatively stable, but the imbalance of industrial development within the region can't be ignored. The comprehensive score of Shanxi Province is higher than that of the other four provinces, which shows that the overall economic strength of Shanxi Province is prosperous and prosperous, the development of the industry is in step, and if the internal financial capacity is improved, its economic development level will reach a new height.

### Financial Capacity

Figure 3 Financial Capacity

## **5 Policy Suggestions**

### **5.1 Give play to regional advantage and accelerate economic integration**

The unique geographic positions of northwest five provinces in China form different economic development characteristics, therefore, if the five provinces want to continue to give full play to regional advantages, they need to realize self-development, pay more attention to economic integration with surrounding provinces and seek for common economic profits and supplementation thus to accelerate their economic development(Lv Jingye, Ding Zhouxiang, Li Penglin, 2018). Wherein, Shanxi province should give play to its hub role to connect the economies of the northwest district and the middle areas and guide common economic development; The Xinjiang Uygur Autonomous Region should give play to its resource advantage, introduce some energy-based manufacturing industries, develop and utilize clean energies and new energies positively; Gansu, Qinghai and Ningxia should introduce labor force and technology positively, strengthen integration of technology, talent and industry, and consolidate their economic foundations(Jiang Anyin, Liu Xiaowei, 2017).

### **5.2 Carry out the national strategy of “Silk Road Economic Belt” and realize internal and external balanced development**

The northwest five provinces in China should grasp the opportunity of silk road to carry out national strategy positively, strengthen cooperation with the countries along the “Silk Road Economic Belt” in emerging industries thus to attract them to make investment and give financial resource support, moderate the problem of financing difficulty(Shen Minghui, 2019). Meanwhile, Shanxi, Sinkiang, Gansu, Qinghai and Ningxia should combine with their development characteristics to further optimize product export structure, enhance additional value of product export, persist in low-carbon economy, green economy and northeast five provinces, reduce resource consumption for economic development, realize benign circulation of economy and environment, and realize internal and external balanced development.

### **5.3 Enlarge investment and perfect technical innovation**

Compared with the eastern region, the northwest five provinces are weak in the economy, they should enhance their economic development levels through technical innovation. The government departments should strengthen financial support for technical innovation and give play to guidance role positively. On the one hand, the government departments can establish special policy-based financial institutions to provide targeted service for technical innovation, offer financial support to attract other financial institutions and give play to lever effect of financial policy. On the other hand, they should perfect the talent selection and information sharing mechanism for the northwest five provinces in China and establish idea bank(Lu Shanbing, 2018) in order to realize information sharing between governments and enterprises, realize mutual learning and reference in technical innovation, provide powerful support for the innovation work, and finally realize win-win.

## **6 Conclusion**

This paper adopts PCA to conduct empirical research on the economic development of the northwest five provinces in China under the background of “one belt and one road”, and verify the current situation of imbalanced economic development in the northwest region more scientifically, manifests the stability and total financial capacity of principal components is largely different in different areas. Wherein, Shanxi and Sinkiang have stronger financial capability while Qinghai, Ningxia and Gansu are weaker, which shows that the economic development of the northwest five provinces is commonly driven by Shanxi and Sinkiang, meanwhile, the economic development levels of other three

regions have large development space. Generally, with the international attention to the strategy of “one belt and one road” china will intensify efforts to play regional advantages fully, speed up the economic integration, implement the national development strategy, investment, science and technology innovation, these measures can effectively shorten economic gap of northwest five provinces in China effectively narrow and the level of regional economic development is moving towards new peaks in the future. Then it may drive the development of Chinese economy.

## **A Study on the Influencing Factors of Financial Leverage: Taking Real Estate Industry as a Sample**

Shen Jialu

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: shenjialu1120@126.com)

**Abstract:** Real estate, as is acknowledged, is an important industry in the deleveraging task. On the basis of domestic scholars' research, this paper chooses more significant financial indicators for regression analysis. It finds out that profitability (ROA) is negatively correlated with financial leverage. Return on net assets (ROE) explains that financial leverage is significantly positively correlated, while inventory turnover is not significantly negatively correlated. This paper tries to explain the variable of financial leverage in order to provide effective suggestions for the real estate industry to de-leverage.

**Key words:** Real estate; Financial leverage; Regression analysis; Deleverage

### **1 Introduction**

In the supply-side reform, General Secretary Xi Jinping has repeatedly emphasized 'capacity reduction, de-stocking, deleveraging, improving underdeveloped areas', in which deleveraging refers to reducing long-term financial risks and systematization. The appropriate use of leverage effect can expand the scale of enterprise capital operation, and is conducive to the development of enterprises. However, the high financial leverage of real estate will make the debt growth rate too fast, increase the financial risk of enterprises, and even eventually lead to the rupture of the capital chain of enterprises. Real estate industry is a pillar industry related to the people's livelihood of the country, and most of them belong to high asset-liability ratio enterprises. In recent years, the continuous rise of real estate prices makes the task of de-leveraging imminent.

Looking back on the past, the earliest research on financial leverage was the famous MM theory put forward by foreign scholars Modiglian and Miller, that is, the EBIT level remains invisible now and in the future. The liabilities of companies and individuals are risk-free, so the interest rate on liabilities is risk-free. In the 1990s, many scholars made various explorations on the influencing factors of financial leverage, such as Brailsford T J, Oliver B R and other scholars think that the stronger the profitability of enterprises, the higher the asset-liability ratio. (Brailsford T J, Oliver B R, Pua S L H, 2002) Kurshev A and Strebulaev I A believe that the size of the company is negatively related to the level of financial leverage. Through empirical analysis, Raghuram Rajan and Luigi Zingale conclude that there is a significant negative correlation between profitability and financial leverage, and it is the same as the growth trend of corporate size. Graham Hall and Patrick Hutchinson classify the types of debt. They think that short-term liabilities are negatively correlated with profitability, while long-term liabilities are not significantly correlated.

At the current stage, some domestic scholars have different opinions on deleveraging. Yin

Jianfeng proposed the way of debt-to-equity swap to improve the financing structure of enterprises and improve the efficiency of asset utilization. (Yin Jianfeng, 2016) Li Wenqin pointed out that financial leverage can enhance the investment efficiency of the real estate industry to a certain extent, and has a positive effect. (Li Wenqin, 2015) Gou Wenjun and other scholars proposed to vigorously develop equity financing based on the CA model, in order to improve the sustained and stable effect of China's financial system. (Gou Wenjun, 2016) Zhao Shuaiyin made an empirical study on the overall level of financial leverage, positive and negative effects and influencing factors of real estate listed companies. He believed that financial leverage decreased with the increase of profitability of enterprises, and increased with the growth and scale of enterprises. (Zhao Shuaiyin, 2012)

On the whole, there are more studies on the influencing factors of financial leverage of listed companies, less studies on a specific industry, more qualitative analysis and less quantitative analysis. In this paper, SPSS software is used for regression analysis. It summarizes and analyses the changes of financial leverage effect level in the past three years, and calculates the significant variable coefficients that affect the financial leverage of the real estate industry.

## 2 Research Design

### 2.1 Sample selection principle

*In order to ensure the validity of the study, this paper takes the financial data of real estate listed companies in China from 2016 to 2018 as the initial research sample, and eliminates the abnormal samples of ST, PT listed companies and the lack of financial data during the study period. The financial indicators data of past years are all from the CSMAR database. After sample removal and data processing, the sample of real estate listed companies is 101. This paper will use these financial indicators of real estate listed companies as independent variables and use regression analysis method to explore the influencing factors of high leverage in the real estate industry.*

### 2.2 Measurement of variables

#### 2.2.1 Selection of dependent variables

In fact, both asset-liability ratio and financial leverage coefficient are used to measure financial risks. In this paper, the asset-liability ratio is used to replace the financial leverage coefficient. Its measurement formula is total liabilities/total assets, which is expressed by FL. The level of financial leverage and the performance of debt-paying indicators of real estate enterprises reflect the degree of security of the real estate enterprises' capital chain. Under the background of tightening financing policy in the future, the analysis of financial leverage level and debt-paying ability indicators seems particularly important.

#### 2.2.2 Selection of independent variables

(1) Retained earnings: The internal accumulation of earnings extracted or formed by an enterprise from the profits realized over the years, including surplus reserve and undistributed profits = surplus reserve plus undistributed profits) / total assets, expressed in RST.

(2) Corporate profitability: Net profit margin of total assets = net profit/average total assets, expressed in ROA, is an important indicator to measure the profitability of enterprises by utilizing the total equity of creditors and owners.

(3) Enterprise operating capacity: Inventory turnover ratio = cost of goods sold/average inventory balance, is a comprehensive index to measure the enterprise's sales capacity and inventory management level. Because the expenditure and capitalized interest of real estate enterprises in the process of land acquisition and development are all recorded in the "inventory" of current assets, real estate enterprises mainly measure the overall operating level of enterprises by current assets (inventory), which is expressed by ITR.

(4) Net Asset Return Rate: This index reflects the income level of shareholders' equity, which is used to measure the efficiency of the company's use of its own capital. The higher the index value, the higher the return of investment.

(5) Earnings per share: It is the net profit or the net loss of an enterprise that a common shareholder can enjoy for each share he holds, expressed in EPS.

### 2.2.3 Selection of control variables

In order to ensure the data discretization caused by enterprise scale factors, this paper tries to construct a multiple regression equation and add the growth rate of total assets (growth ability), turnover rate of current assets, turnover rate of accounts receivable, operating profit rate and other indicators to ensure the validity of the model.

Through consulting a large number of literatures on the influencing factors of financial leverage of real estate listed companies, it is found that most scholars in China use panel data and multiple linear regression equation to prove that financial leverage of real estate listed companies is affected by specific financial indicators. Li Yang (2015) used empirical analysis method to draw a conclusion that profitability is negatively correlated and operating capacity is positively correlated. Combining with the variables selected in the previous paper, the following model is constructed:

$$FL = a_0 + a_1 * ROA + a_2 * ROE + a_3 * EPS + a_4 * RST + a_5 * ITR$$

In the formula,  $a_0$  is constant term;  $a_1, a_2, a_3, a_4, a_5$  are coefficient of explanatory variables

## 3 Sample Data Analysis

### 3.1 Dependent variable description statistics

This paper extracts 101 listed companies' financial leverage data from 2016 to 2018 to describe the statistics. The results are as follows:

*Table 1 Descriptive Statistics of the Means of Indicators of Sample Companies from 2016 to 2018*

Data	Min(M)	Max(X)	average value (E)	standard deviation	skewness	kurtosis
Statistics	Statistics	Statistics	Statistics	Statistics	Statistics	Statistics
					Standard error	Standard error

2016financial leverage	101	.927166	2.498071	1.28380	.375987066	1.941	.319	3.320	.628
2017financial leverage	101	.945649	4.350005	1.32224	.598239028	3.658	.319	14.884	.628
2018financial leverage	101	.863927	2.723099	1.21306	.309624353	2.800	.319	10.420	.628
Asset-liability ratio	101	.118612	.940897	.66196652	.180441894	-.830	.240	.340	.476
Net interest rate on total assets	101	-.087765	.121395	.03004370	.031408629	.510	.240	2.902	.476
Inventory turnover	101	.008958	540.59752	6.9051078	54.0454950	9.829	.240	97.883	.476
Return on net assets	101	-.469744	.314412	.09198130	.097163654	-1.973	.240	11.571	.476
Earnings per share	101	-.917092	4.463413	.72393766	.841237932	1.959	.240	5.446	.476
Retained earnings per share	101	-.699398	8.491688	2.31612547	1.68063885	1.037	.240	1.052	.476
Effective N (in columns)	101								

According to Table 1, we can see that the average financial leverage index of A-share real estate listed companies in Shanghai and Shenzhen in 2017 is 3.1% higher than that in 2016. Although there is a slight upward trend, the financial leverage index in 2018 is 8.3% lower than that in 2017, and the financial leverage has dropped by 5.4% in three years. This shows that most real estate companies are now more inclined to "reduce financial leverage appropriately" to reduce financial risk under the domestic policy environment of de-leveraging and de-productivity. In fact, financial leverage is essentially a measure of risk allocation between creditors and debtors. The total amount of financial risk does not change with the change of financial leverage coefficient.

Moreover, it can be seen that the average value of ROA and ROE is less than 0.1, which indicates that the real estate industry is not optimistic. The difference between the maximum value and minimum value of asset-liability ratio and inventory turnover ratio is large, which indicates that the real estate industry has good and uneven debt-paying ability. It also proves that the level of financial

leverage in the industry is due to company size, financing strategy and other reasons. This leads to polarization.

### 3.2 Empirical analysis

SPSS software was used for regression analysis. In order to eliminate the difference of business and profit scale among different real estate listed companies, this paper adds control variables such as total asset growth rate, turnover rate of current assets and operating profit rate, in order to make the independent's explanatory effect on dependent variable more remarkable. The model summary results are as follows:

**Table 2 Model Summary**

Model	R	R square	Adjusted R Square	Errors in Standard Estimation	Change statistics					
					R side change	F change	df1	df2	Significant F change	Durbin-Watson(U)
1	.745 <sup>a</sup>	.555	.531	.123555945	.555	23.656	5	95	.000	
2	.752 <sup>b</sup>	.565	.522	.124758246	.010	.544	4	91	.703	1.970

a. Predictive variables: (Constant), Inventory Turnover Rate, Return on Net Assets (ROE), Retained Earnings per Share, Total Asset Net Profit Rate, Earnings per Share

b. Forecast variables: (constant), inventory turnover, return on net assets (ROE), retained earnings per share, net profit margin of total assets, earnings per share, turnover rate of accounts receivable, growth ability (growth rate of total assets), turnover rate of current assets, operating profit margin

The adjusted  $R > 0.6$  in the model summary shows that there is a clear linear relationship between dependent variables and independent variables, and the multivariate linear regression equation fits well. After adding control variables, the significance of regression equation  $F = 0.000 < 0.005$ . It can be considered that the regression equation has statistical significance.

**Table 3 Analysis of Variance**

ANOVA <sup>a</sup>						
Model		Sum of squares	variance	mean square	F	Saliency
1	regression	1.806	5	.361	23.656	.000 <sup>b</sup>
	residual	1.450	95	.015		
	Total	3.256	100			
2	regression	1.840	9	.204	13.132	.000 <sup>c</sup>
	residual	1.416	91	.016		
	Total	3.256	100			

a. Dependent variable: asset-liability ratio

b. Forecasting variables: (constant), inventory turnover, return on net assets (ROE), retained earnings per share, profitability (ROA-net profit margin of total assets), earnings per share

c. Forecast variables: (constant), inventory turnover, return on net assets (ROE), retained earnings per share, net profit margin of total assets, earnings per share, turnover rate of accounts receivable, growth ability (growth rate of total assets), turnover rate of current assets, operating profit margin

Table 3 is the variance analysis table of the regression model. The adjusted F value is 23.656, the regression square sum  $U = 1.806$ , the residual square sum  $Q = 1.450$ , the deviation square and  $S_{yy} = 3.256$ , and their corresponding degrees of freedom are 5, 95 and 100, respectively.

**Table 4 Regression Coefficient and Significance Test**

Model	Coefficient <sup>a</sup>			t	Saliency	
	Non-standardization coefficient		Standard coefficient			
	B	Standard error	Beta			
(constant)	.716	.025		29.000	.000	
1	Net profit margin of total assets	-6.152	.651	-1.071	-9.451	.000
	Retained earnings per share	-.019	.011	-.173	-1.648	.103
	Return on net assets	1.399	.258	.753	5.432	.000
	Earnings per share	.064	.028	.297	2.285	.025
	Inventory turnover	-7.502E-5	.000	-.022	-.326	.745

a. Dependent variable: asset-liability ratio

Table 4 shows the regression coefficients of the multivariate linear equation of financial leverage. The coefficient of constant term is  $\alpha_0=0.716$ ,  $\alpha_1=-6.152$ ,  $\alpha_3=1.399$ ,  $\alpha_4=0.064$ . After testing, the Retained Earnings per Share (RST) and Inventory Turnover Ratio (ITR) are greater than the standard value of elimination factor 0.1. Therefore, the above two dependent variables should be removed from the regression model. Therefore, the regression equation is:

$$FL=0.716-6.152ROA+1.399ROE+0.064EPS$$

Based on the results, it can be seen that total net asset profit margin (ROA) is negatively correlated with financial liability ratio, but net asset return (ROE) is positively correlated. EPS has little effect on financial leverage of real estate enterprises, while ITR and EPS are not negatively correlated.

*Table 5 Colinearity Diagnosis of Interpretation Variables*

Model	dimension	characteristic value	Condition index (constant)	Variance ratio				
				Inventory turnover	Net profit margin of total assets	Earnings per share	Return on net assets	
1	1	3.181	1.000	.03	.00	.02	.02	.01
	2	.992	1.790	.00	.36	.00	.01	.00
	3	.385	2.873	.04	.01	.20	.42	.01
	4	.361	2.967	.48	.02	.00	.12	.04
	5	.079	6.335	.06	.00	.38	.43	.93

a. Dependent variable: asset-liability ratio

In view of the large number of explanatory variables selected in this paper, collinearity diagnosis of each explanatory variable should be continued after regression analysis, and the results are shown in table 5. In the table, the condition index <10 and the variance ratio are all <0.5, indicating that there is no serious linear relationship between the variables, proving that the linear regression results are statistically significant.

### 3.3 Results and suggestions

#### 3.3.1 High Debt Ratio is the Restricting Conditions Affecting the Profit Level of Real Estate Enterprises

According to the results of regression analysis, the total asset net profit margin (ROA) of real estate listed companies is negatively correlated with the financial leverage level, indicating that the decline of the asset-liability ratio will improve the enterprise's total asset profit margin, thus increasing the wealth of shareholders. The regression coefficient of the profit rate of total assets as high as -6 indicates that the high leverage of the real estate industry has caused the negative effect of financial leverage, resulting in a significant decline in the profitability of the real estate industry. This is consistent with the research results of scholars. The loan interest rate of commercial Banks in China is affected by macro policies. Real estate enterprises should adjust the debt structure reasonably, broaden the financing channels, and increase the proportion of owners' equity in the total assets in the form of debt-for-equity swap, so as to reduce the financial leverage.

#### 3.3.2 Sound operational capability is an important basis for real estate enterprises to exert the positive effect of financial leverage.

It is well known that the inventory turnover rate (ITR) reflects the enterprise's operational capacity as a whole, and the turnover rate represents the measured value of the enterprise's interests. The higher the inventory turnover rate, the higher the interest rate under the same amount of funds. Regression analysis shows that there is no significant negative correlation between inventory turnover and financial leverage, indicating that the increase of inventory turnover can lead to the reduction of financial leverage in real estate enterprises. Influenced by the state's macro-control policy, the

property market has been unsalable in recent years, the inventory turnover rate of the real estate industry has declined, and the developers have difficulties in capital turnover. In view of this situation, real estate enterprises can obtain a large number of land resources through acquisitions, mergers and acquisitions, cooperation and other low-cost ways; they can also show their operational advantages through agent construction to help enterprises obtain funds.

### 3.3.3 The Increase of Net Asset Return Rate is an Effective Measure to Deleverage Real Estate Enterprises

In fact, the return on net assets is used to measure the efficiency of enterprises' use of their own capital, and also the efficiency of companies' use of shareholders' investment capital. The higher the return on net assets, the higher the return on investment. Through DuPont analysis, we can get three ways to improve the profit margin, leverage and turnover speed of funds. Today, the real estate industry requires financial stability, which requires real estate enterprises to improve the speed of capital turnover. Enterprise decision makers can delay the development of the way to make the cost of capital in a controllable range of conditions, thus guiding the return on net assets to a positive direction.

## 4 Conclusion

In this paper, the following conclusions are drawn through regression analysis of the relevant data of real estate listed companies from 2016 to 2018: real estate financial leverage is negatively correlated with total net asset profit margin, positively correlated with earnings per share and net asset profit margin, and not negatively correlated with inventory turnover rate. At present, the financial leverage of real estate listed companies is still at a high level, so it is necessary for enterprises to consider their own operating conditions, multi-channel financing, and optimize the capital structure. As the net profit margin of total assets is negatively correlated with financial leverage, the improvement of total asset profit margin is the most important thing for real estate enterprises to de-leverage in practice.

# **A Study on The Impact of Accounting Conservatism on Corporate Debt Financing Cost from the Perspective of Environmental Uncertainty**

Li Jiaying, Hong Hong

School of Management, Wuhan University of Technology, Wuhan P.R. China,430070

(E-mail: 807399929@qq.com, 420379607@qq.com)

**Abstract:** Taking the 1860 A-share listed companies in 2013-2017 as the research sample, this paper discusses the impact of accounting conservatism on the corporate debt financing cost under environmental uncertainty, and draws three research conclusions: 1. There is a significant negative correlation between accounting conservatism and corporate debt financing costs; 2. There is a significant positive relationship between environmental uncertainty and corporate debt financing costs; 3. Under the uncertainty environment, the effect of accounting conservatism on reducing corporate debt financing costs is more significant.

**Key words:** Uncertainty environment; Accounting conservatism; Debt financing costs; Accounting information quality

## **1 Introduction**

### **1.1 Accounting conservatism and debt financing costs**

As the “oldest and most influential principle in accounting measurement”, accounting conservatism has a long-term impact on accounting practice. Accounting conservatism is usually defined as the asymmetry of the recognition of gains and losses, as evidenced by the recognition of accelerated losses and the recognition of delayed returns. Therefore, accounting stability plays an important role in the development of enterprises and the prevention of risks.

Under what conditions does accounting conservatism improve corporate performance? One explanation proposed in the literature is that conservatism serves as a disciplining device that constrains managerial opportunism (Hsu, C.,2017). Especially, conservatism can lead to a lower cost of debt

(García,2016). The main reason for enterprises demand for accounting conservatism comes from the contract of debt and compensation, and that the debt contract is the most important reason for enterprises to choose a robust policy(The Watts,2003).From the perspective of M&A investment, It is proved that accounting conservatism helps managers make more favorable M&A investment decisions and improve corporate investment efficiency (Francis,2010).The principle of accounting conservatism is firstly used to alleviate the conflicts between corporate creditors and business owners on dividend policy and reduce the cost of debt financing (BalakrishnanK.,2016).Domestic research in related fields appeared after the US subprime mortgage crisis. Empirical research found that accounting information reduces the asymmetry of credit decision information and increases the chance ratio of making correct credit decisions (Zhang Guangyuan,2017). Accounting conservatism encourages companies to more easily obtain external debt financing and equity financing opportunities, reduce financing costs, and thus ease financing constraints (Zhang Yuemei,2017).

### **1.2 Environmental uncertainty and debt financing costs**

Environmental uncertainty is created by the perceived variability and complexity of external factors. Variability refers to the rate of change in factors such as customers, suppliers, and competitors. This affects the accuracy and quality of information available to decision-makers(Yu, C.L,2016).Perceived uncertainty in the external environment impacts managerial attitudes towards identifying competitors since in these situations external events and trends cannot be predicted(Milliken,1987).In terms of information asymmetry, corporate environmental uncertainty will exacerbate corporate information unequal issues. Uncertain business environment is stimulating corporate response processes, such as innovation activities, business strategy shifts and even management's earnings management behaviors, which have become important driving forces for information asymmetry, and thus the changes in trait risks have a role (Hua Fengtao,2016). It is concluded that due to the increase of environmental uncertainties, the capital cost of enterprises will increase. The more turbulent the environment, the higher the debt cost of the enterprise, and the relationship between the two is more obvious in private enterprises (Li Jianfeng,2016).It is also found that the lower the degree of environmental uncertainty, the more significant the negative relationship between the customer concentration and the cost of equity capital(Wang Yan,2016).Some research pays attention to how the debt costs faced by Chinese companies in a more complicated and volatile environment after 2008. The results show that the more turbulent the environment the higher the corporate debt cost, and the relationship between the two is more obvious in private enterprises (Zeng Yanxue,2014).

### **1.3 Summary of literature review**

Previous studies on environmental uncertainty have mostly focused on business operations (involving corporate performance and corporate strategy choices, market orientation, etc.), accounting

perspectives (earnings management, investment efficiency, financial flexibility, audit fees, audit opinions, etc.). However, there are few empirical studies on environmental uncertainty and debt cost, and few scholars have conducted in-depth research on the relationship between accounting conservatism and debt cost under environmental uncertainty. Therefore, this paper studies this aspect focus.

## **2 Theoretical Analysis and Research Hypothesis**

### **2.1 Accounting conservatism and debt financing costs**

The higher the degree of accounting conservatism of the enterprise, the more controllable the financial profit in the financial statements can be controlled. When the creditor knows that the enterprise has adopted a sufficiently sound accounting policy, it can make a reasonable judgment based on various financial information disclosed by the listed company. In the case of satisfying the interests of creditors, the credit risk of creditors can be reduced, and creditors are more willing to provide debt companies with lower loan interest rates, which in turn reduces the debt financing costs of the above companies. Therefore, the following assumptions are made:

Hypothesis 1: The higher the accounting stability of listed companies, the lower the cost of debt financing.

### **2.2 Environmental uncertainty and debt financing costs**

Accounting conservatism can reduce the information asymmetry between enterprises and creditors, and reduce the risk premium faced by creditors from the perspective of internal enterprises. The external environmental factors are largely beyond the control of enterprise managers, which leads to environmental uncertainty. There are mainly market, policy, culture and other factors, the increase of environmental uncertainty, the greater the volatility of corporate performance, the increased operational risks faced by enterprises, and the greater incentives for managers to undermine the interests of creditors in this situation. From the creditor's point of view, the debtor's bad debt risk increases, so it is necessary to compensate for the risk premium faced by raising the borrowing rate.

Hypothesis 2: Environmental uncertainty is significantly positively correlated with corporate debt financing costs.

Hypothesis 3: In the case of environmental uncertainty, the level of accounting conservatism has increased the role of reducing debt costs.

## **3 Data and Methodology**

### **3.1 Sample selection**

This paper takes 1860 companies in the A-share market of listed companies in China from 2007 to 2013 as the initial research object. When selecting samples, we need to consider the following factors: (1) Excluding 25 listed companies in the financial industry, because the financial industry listed companies have special business and the financial data; (2) Excluding "ST" or "\*ST" sample 65 listed companies. (3) Excluding the sample with the missing variable value during the study period and the sales income of 5 years due to the uncertainty of the computing environment, in addition, in order to eliminate the interference of extreme values, all variables in the text were subjected to winsorize tailing processing at the 1% level. The specific data of this study is from the Guotaian (CS-MAR) database, and the data is collated and analyzed using SPSS20.0

### 3.2 Selection and measurement of main research variables

#### 3.2.1 Measurement of environmental uncertainty

This section refers to the practice of Shen Huihui and Wu Liansheng (2012), excluding the stable growth of sales revenue, and measuring the environmental uncertainty by the coefficient of variation of sales income over the past five years after the industry median adjustment. This article uses the ordinary least squares (OLS) method to run the following model:

$$\text{Sale} = \beta_0 + \beta_1 \text{Year} + \varepsilon$$

Among them, Sale represents sales income, Year is an annual variable, and the number is from the current year. If it is the 5th year, then Year=1; if it is the 4th year, then Year=2; and so on, if it is the current year, In the first year, Year=5. The residual of the model is the abnormal income of the enterprise. The standard deviation of the abnormal income in the past 5 years is calculated, divided by the average of the sales income in the past 5 years, and the environmental uncertainty that has not been adjusted by the industry in the current year is obtained. For the current year, the environmental uncertainty of all companies in the same industry takes the median, and the industry environment is uncertain. Finally, the unadjusted environmental uncertainty index of each company is divided by the industry environmental uncertainty of the year.

#### 3.2.2 Measurement of accounting conservatism

This paper uses Basu's (1997) surplus-stock compensation measurement method to test the impact of product market competition on accounting robustness.

$$EPS_{i,t}/P_{i,t-1} = \beta_0 + \beta_1 DR_{i,t} + \beta_2 RET_{i,t} + \beta_3 RET_{i,t} \times DR_{i,t}$$

In the model,  $EPS_{i,t}$  is the accounting earnings per share of fiscal year  $i$  company  $t$ ;  $P_{i,t-1}$  is the stock price of  $i$  company at the beginning of the year;  $RET_{i,t}$  is the stock return of  $i$  company  $t$  year;  $DR_{i,t}$  As a dummy variable, take 1 when  $RET_{i,t} < 0$ , otherwise 0. In this model,  $\beta_2$  measures the

sensitivity of accounting earnings to good news. The larger the coefficient, the faster the earnings reflect good news.  $(\beta_2 + \beta_3)$  measures the sensitivity of accounting earnings to bad news. The larger, the surplus reflects the bad news faster than the good news, and the  $\beta_3$  measures the sensitivity of the accounting information to the bad news, which is the so-called robustness coefficient. If  $\beta_3 > 0$ , then there is robustness.

### 3.2.3 Measurement of debt financing costs

In this paper, combined with the financial data that the listed companies in China are used to disclose, the measurement method for debt financing cost is: debt financing cost = interest expense / (short-term borrowing + non-current liabilities due within one year + long-term borrowing ten Bond + long-term payables + other non-current liabilities)

## 3.3 Model design

### 3.3.1 Design of the impact of accounting conservatism on corporate debt financing costs

In order to test the relationship between accounting conservatism and corporate debt financing costs, this paper first examines the accounting conservatism and corporate debt financing costs as explanatory variables and explanatory variables, respectively.

$$DOC = \beta_0 + \beta_1 EPS/P + \beta_2 RET_{i,t} + \beta_3 SOE_{i,t} + \beta_4 SIZE_{i,t} + \beta_5 LEV_{i,t} + \beta_6 ROE + \beta_7 GROWTH + \beta_8 \sum year + \beta_9 \sum industry + \varepsilon \quad (1)$$

### 3.3.2 Model design of the impact of accounting conservatism on debt cost under environmental uncertainty

In order to test the impact of accounting conservatism on debt financing costs under environmental uncertainty, we designed the following model, adding the cross terms of  $EPS_{i,t}/P_{i,t-1}$  and EU:

$$DOC = \alpha_0 + \alpha_1 EPS_{i,t}/P_{i,t-1} + \alpha_2 EPS_{i,t}/P_{i,t-1} \times EU + \alpha_3 LEV + \alpha_4 SIZE + \alpha_5 ROE + \alpha_6 SOE + \alpha_7 GROWTH + \alpha_8 \sum year + \alpha_9 \sum industry + \varepsilon \quad (2)$$

According to Hypothesis 3, it can be expected that accounting conservatism is negatively correlated with debt financing costs,  $\alpha_1$  is negative; environmental uncertainty makes accounting conservatism more obvious, and the sign of  $\alpha_2$  can be expected to be negative.

## 4 Results

### 4.1 Descriptive statistics

From the sample observations, during the sample period, the surplus index (EPS/P) has a skewness of -1.262, which is left-biased, and the stock return rate (RET) has a skewness of 2.744, which is right-

biased. Therefore, on the whole, China's 2013-2017 Shenzhen Main Board listed company A-share market companies may have accounting conservatism. Table 1 shows the descriptive statistics of the main variables. It can be seen from Table 1 that the standard deviation of stock return rate (RET) is 0.28096, which is much larger than the standard deviation of the explanatory variable EPS/P 0.07321, which indicates that the stock market volatility is greater than the volatility of accounting earnings. The mean value of the dummy variable DR is 0.1463, which indicates that approximately 14.63% of the company's annual stock returns are negative. The average and median cost of corporate debt financing are 0.0622 and 0.0531, respectively, indicating that the debt financing costs of different enterprises are 6% on average, and the minimum debt cost is 0.0013, indicating that the debt cost of the sample is greater than 0 and the maximum is 0.4529. Different enterprise debt financing costs vary widely. The mean and median of the variable EU representing the environmental uncertainty are 0.4981 and 0.0000, respectively, and the standard deviation is close to the mean, which indicates that the difference in environmental uncertainty between different companies is obvious.

**Table 1 Descriptive Statistics of Variables**

Variables	Mean	Median	Standard deviation	Minimum	Maximum
EPS/P	0.01937	0.01841	0.07321	-0.99911	0.19718
RET	0.05824	0.04393	0.28096	-2.80509	3.61809
DR	0.1463	0	0.35407	0	1
EU	0.4981	0.0000	0.5001	0.00000	1.0000
SIZE	9.5811	9.5221	0.4773	8.6532	10.9666
LEV	0.48396	0.48649	0.31661	0.00675	3.98452
SOE	0.4075	0	0.4914	0	1
DOC	0.0622	0.0531	0.0578	0.0013	0.4529
GROWTH	0.5053	0.1243	2.69990	-0.6321	12.2131
ROE	0.0561	0.0609	0.1313	-0.7688	0.3534

## 4.2 Correlation analysis

We find that both the Pearson coefficient and the Spearman coefficient, there is a significant negative correlation between accounting robustness and debt cost at 1%, and environmental uncertainty is significantly positively correlated with debt cost at 1%. This is initially consistent with Hypothesis 1, Hypothesis 2. In terms of control variables, there is a significant negative correlation

between equity nature, return on equity, company size, growth rate of main business income, and debt size.

**Table 2 Correlation Test**

	DOC	EPS	EU	SOE	SIZE	LEV	GROWTH	ROE
DOC	1	-0.31***	0.51***	-0.16***	-0.13***	-0.06**	-0.02**	-0.02***
EPS	-0.12***	1	-0.26***	0.09***	0.03***	-0.18**	0.08**	0.44**
EU	0.04***	-0.20**	1	-0.23***	-0.18***	-0.05**	0.02**	-0.28***
SOE	0.002***	0.08***	-0.19**	1	0.26***	0.02**	-0.04**	0.02**
SIZE	-0.17**	0.22**	-0.54**	0.25*	1	-0.14**	-0.01*	0.08**
LEV	0.02**	-0.12***	-0.22**	0.24**	0.43**	1	0.02*	-0.01*
GROWTH	-0.08**	0.02**	0.05**	-0.05**	0.02**	0.05**	1	0.08**
ROE	-0.14**	0.31**	-0.20**	-0.01*	0.21**	-0.14**	0.08**	1

### 4.3 Multiple regression analysis

#### 4.3.1 Accounting conservatism and corporate debt financing costs

The regression coefficient of accounting conservatism is one 0.008, and it is significant at the level of 1%. It is a strong argument that the debt cost is significantly negatively correlated with accounting conservatism.

**Table 3 Regression Results of Accounting Conservatism on Corporate Debt Financing Costs**

Variables	Model 1 coefficient	T-Value
Constant	0.141***	6.53
EPS/P	-0.008***	-5.08
SOE	-0.004**	-2.01
SIZE	0.049***	8.58
LEV	0.093***	9.06
GROWTH	-0.001**	-1.44
ROE	-0.011	-1.34

Year/Industry	Control
R <sup>2</sup>	0.237
F	21.78***

#### 4.3.2 The impact of accounting conservatism on corporate debt financing costs under environmental uncertainty

After adding the balance item EU\*EPS/P, the model regression yields a coefficient of EU of 0.029, and is significantly positively correlated with the debt cost at 1%, assuming that 2 is proved. The coefficient of the balance item EU\*EPS/P is 0.010, which is significantly negatively correlated with the debt cost at the level of 1%, indicating that the governance effect of accounting information is more obvious after adding environmental uncertainties.

**Table 4 Regression Results of the Impact of Accounting Conservatism on Corporate Debt Financing Costs after Adding Environmental Uncertainty**

Variables	Model 2 coefficient	T-Value
Constant	0.130***	5.81
EPS/P	-0.003**	-1.82
EU	0.029***	3.24
EU*EPS/P	-0.010***	-3.37
SOE	-0.004***	-2.1
SIZE	0.048***	8.44
LEV	0.092***	9.03
GROWTH	-0.001**	-1.41
ROE	-0.011	-1.32
Year/Industry	Control	
R <sup>2</sup>	0.239	
F	21.78***	

#### 4.4 Robustness test

In order to enhance the reliability of the research conclusions, this paper will test the robustness of

the model by changing the way the enterprise debt cost is measured. In the robustness test section, the three detailed accounts of interest expense, handling fee and other financial expenses are used as the approximate value of the net financial expenses, divided by the average value of the total corporate debt as a measure of the cost of debt.

**Table 5 Results of the Robustness Test**

Variables	Replace corporate debt financing			
	Model 1 coefficient	T-Value	Model 2 coefficient	T-Value
Constant	0.133	6.23	0.127	5.73
EPS/P	-0.0008***	-5.08	-0.003**	-1.82
EU			0.019***	3.13

Year/Industry		Control		
R <sup>2</sup>	0.24		0.239	
F	21.78***		18.24***	

## 5 Conclusion

The increase in uncertainty outside the firm is caused by many uncontrollable factors. In the case of increased environmental uncertainty, the negative correlation between corporate accounting robustness and debt financing costs is more significant. In other words, creditors have a good governance effect in the process of risk assessment and interest rate determination, which can mitigate the impact of environmental uncertainty on corporate debt financing costs to some extent.

Based on the conclusions of this paper, we put forward the following suggestions: (1) Enterprises should pay attention to the principle of accounting conservatism and improve the quality of their financial information; (2) Enhance the ability of enterprises to adapt to the environment and enhance the flexibility of business strategy; (3) Investment People should always pay attention to external

information and strengthen the emphasis and recognition of corporate accounting robustness. At the same time, in the future measurement of environmental uncertainty, future scholars may consider integrating political, legal, economic, and cultural factors into environmental uncertainty indicators.

# A Study on Carbon Accounting Information Disclosure of Listed Companies in China's Steel Industry

Ma Huizhi, Tang Miao

School of Management, Chengdu University of Information Technology, Chengdu, P.R.China, 610103

(E-mail: 24507404@qq.com, 1363712983@qq.com)

**Abstract:** This paper conducts research on five steel listed companies, based on their annual financial reports, annual audit reports, social responsibility reports, and board reports. And this paper analyzes the current situation of carbon accounting information disclosure from four aspects of the carrier, form, content and quality. It was found that there were problems in the disclosure of carbon accounting information in the steel industry, such as imperfect laws and regulations, imperfect supervision mechanism, inadequate form and insufficient content, and lack of carbon accounting talents. To this end, it is necessary to improve laws and regulations related to carbon accounting information disclosure, improve the corresponding supervision mechanism, establish standards for carbon accounting information disclosure, and formulate carbon accounting professional talents training programs. Only by improving the standardization of carbon accounting information disclosure of listed companies in an all-round way can we promote the development of low-carbon environmental protection.

**Key words:** Carbon accounting; Carbon accounting information disclosure; Steel industry; Listed companies

## 1 Introduction

In 1987, the United Nations World Commission on Environment and Development, chaired by Norwegian Prime Minister Gro Harlem Brundtland, formally proposed the concept of sustainable development in "Our Common Future", which has attracted worldwide attention. With continuous development, it has gradually established that the core of sustainable development is to meet the needs of the present, without compromising the ability of future generations to meet their needs. At the same time, "corporate social responsibility" has become a topic we are paying more and more attention to. Even when Forbes ranks global enterprises, corporate social responsibility is also a very important criterion.

Foreign scholars' research on carbon accounting is earlier than China. Carbon Accounting was first proposed by Janek & Stewart, who argued that carbon accounting is a collective term for accounting issues such as carbon emissions, carbon trading and forensics (Janek Ratnatunga & Stewart Jones, 2008). Kolk and others pointed out that companies should not only disclose greenhouse gas emissions data, but also disclose information on climate change (AnsKolk, David Levy & Jonatan Pinkse, 2008). Jan Bebbington and Carlos believe that a company's carbon account needs a third-party independent assurance before trading in the carbon market (Jan Bebbington & Carlos Larringga-gonzalez, 2008). Michel Callon pointed out that carbon accounting mainly involves accounting treatment of

carbon emission allowances, risk accounting and reporting related to carbon emissions, uncertain accounting and reporting related to carbon emissions, and disclosure and management of carbon emissions information (Michel Callon, 2009). Carbon disclosures is said to assist corporations position themselves strategically in terms of the carbon risks and opportunities they may face (Jane Andrew & Corinne L.Cortese, 2010).

In terms of domestic research, Zhang Caiping and Xiao Xu proposed that the carbon accounting information disclosure framework should include carbon emission accounting, management measures and carbon auditing (Zhang Caiping & Xiao Xu, 2010). Chen Hua and others found that carbon information disclosure has characteristics such as scattered structure, large industry differences, and asymmetrical quantity and quality in China. They also suggested that the carbon disclosure content of Chinese enterprises should mainly include “carbon emissions”, “carbon emissions related risks, opportunities and coping strategies”, “low carbon measures and performance”, “enterprise carbon trading”, “carbon information auditing” and other information (Chen Hua, Wang Hai & Yan Jingxin, 2013). Zhang Lu believes that the content of carbon accounting information disclosure mainly includes low carbon performance information and carbon accounting information. She pointed out that the way of carbon accounting information disclosure is mainly: 1. Use financial statements, post-report notes, etc.; 2. Prepare a special low-carbon report in the form of a report (Zhang Lu, 2016). Zhao Zeming and Wu Mengyue analyzed the motivations of corporate carbon accounting information disclosure from the aspects of compulsory and voluntary (Zhao Zeming & Wu Mengyue, 2018).

The steel industry is one of the main sources of carbon emissions in China. In order to more accurately understand the development status of China's steel industry, this paper selects the steel industry as the research object, conducts research on the carbon accounting information disclosure status of selected samples, proposes improvement suggestions and measures for existing problems. Improving carbon accounting information disclosure can provide a theoretical basis for promoting environmental protection and ecological construction, and raise social awareness of carbon emissions and environmental protection.
