Positive serious transfer means the transfer path of SCR is from the initial node enterprise to the downstream one till to the consumers under the influence of risk catalyst. Thus the negative impact of a risk in one node enterprise will influence the whole supply chain. During the process of positive serious transfer of SCR, risks adhering to risk carrier transfer among node enterprises in proper order. Supposing a certain supply chain has some node enterprises, node enterprise is expressed as E, enterprise risk current is expressed as C, diffusion coefficient is expressed as D, diffusion current is expressed as J, and time of risk transfer is expressed as T, the first node enterprise is expressed as E1, risk current of the first node enterprise is expressed as C1, the diffusion coefficient of E1 diffusing the risk current to E2 is expressed as D12, transfer time of E1 diffusing the risk current to E2 is expressed as T12, transfer current f of E1 diffusing the risk current to E2 is expressed as J12. The positive serious transfer path of SCR is described just as Figure 1.

Major features of positive serious transfer path of SCR are explained as following:

① Single direction. Single direction is reflected by the single risk transfer path which is from the upstream enterprise to the downstream one. As risk transfers from upstream to downstream, the source of risk can be inspected easily along the value chain from downstream to upstream. ② Long latent period. Long latent period makes the fatalness of the disaster difficult to predict in a short time. On one hand, the risk source exists in a relative small space, so it hides. On the other hand, the risk current from a risk source isn't big at the beginning, which may lead to underestimation of the loss of the risk. These two factors together generate the high latency of risk. ③ Developing. Positive serious transfer of SCR transfers risk on time sequence. According to the measurement index, risk energy consists of L^E, L^F, L^S . During the process of risk transfer, risk energy enhances as risk passes through every node enterprise, for both the increasing extensional space and cost to save the prestige of the enterprise, once risk turns into disaster, loss becomes greater than before. ④ Concealment. High concealment leads to the weak anti-risk capability since risk can not be perceived easily at the beginning. When the risk becomes clear, it may have been transferred to the whole supply chain, which makes it more difficult to control. In positive serious transfer of SPSCRT, the enterprise itself may be the source of risk or the risk may originate from other resources. In different transfer stage, risk carrier and risk catalyst of one stage may be the same or different from those of the next one. Risk catalyst may push the risk forward and be a positive catalyst at some time, and it can also hinder or even cut off the risk, thus becoming a negative catalyst. Transfer time for every stage is different the same risk^[2].

Positive serious transfer of STPSCR is common in supply chain management and product quality risk typically belongs to the positive serious transfer. For instance, the event of melamine in milk of China in 2008 is a typical case.

2.2 Reverse serious transfer of STPSCR

Reverse serious transfer and positive serious transfer are very similar. The major difference is the change of risk transfer direction. Risk transfers from the upstream enterprise to the downstream one in positive serious transfer, but it transfers from the downstream enterprise to upstream one on time sequence in reverse serious transfer. Furthermore, reverse serious transfer is divided into two kinds, namely strict reverse and non-strict reverse serious transfer (Figure 2).

Figure 2 Reverse Serious Transfer of SCR

As is shown in figure 2, strict reverse serious transfer means risk transfers from downstream enterprise to upstream enterprise one by one just as the solid line expresses in figure 2. While non-strict reverse serious transfer means risk transfers from the downstream enterprise to non-direct upstream enterprise. Namely, risk transfers along the dashed line and then the solid line just as the dashed line expresses in figure 2.

Besides possessing the features of positive serious transfer of STPSCR, reverse serious transfer of STPSCR possesses another feature of great difficulty in checking the risk source. In the reverse serious transfer of STPSCR, risk transfers from downstream to upstream and the scope of downstream is larger than that of the upstream, so the risk source in reverse serious transfer of STPSCR exists in a larger scope than that of positive serious transfer of STPSCR, making the checking of the risk source a difficult work. Risk in the reverse serious transfer of STPSCR originates from two sources. It may originate from the supply chain system itself or it may originate from other sources. Meanwhile, the risk source of positive serious transfer of STPSCR might induce other risks. The induced risks may transfer along the path of the previous positive serious transfer of STPSCR, and they can also change the transfer direction from the previous positive serious transfer of STPSCR to reverse serious transfer of STPSCR. The occurrence of any accident in the supply chain might induce the collapse of the whole system due to its chain structure. Risk induced by market demand belongs to one type of reverse serious transfer of STPSCR. For example, high-tech mobile phone produced by Iridium Satellite Company of Motorola makes the company become a meteor through market test. Iridium Satellite Company places a higher expectation on the high-tech mobile phone than the demand of market, thus the little profit from the

poor sale of the phone leads to the bankruptcy of the company due to its high investment and operation cost.

2.3 Cross serious transfer of STPSCR

Risks in supply chain are complex and unstable. Different risks diffuse through the supply chain network. Cross serious transfer of STPSCR means that one risk transfers in the supply chain through both positive serious transfer of STPSCR and reverse serious transfer of STPSCR. Namely, one risk sometimes transfers by the way of positive serious transfer of STPSCR and by the way of reverse serious transfer of STPSCR sometimes else just as embodied in Figure 3.

Figure 3 Cross Serious Transfer of STPSCR

In Figure 3, solid line refers to positive serious transfer of STPSCR and dashed line refers to reverse serious transfer of STPSCR. Doubtlessly, cross serious transfer of STPSCR is much more complex than both the positive serious transfer of STPSCR and the reverse serious transfer of STPSCR. The reasons for the occurrence of cross serious transfer of STPSCR can be summarized as the following:

① When one risk transfers positively or reversely, it might induce the positive or reverse transfer of some other risks in another supply chain. For instance, the occurrence of financial crisis in a node enterprise of the supply chain may delay the payment time of goods for the upstream enterprise, on this occasion the financial risk transfers by the way of reverse transfer. When the upstream enterprise finds the delay paying of goods from the downstream enterprise, it may adopt some measurements to avoid the crisis by delaying supply. Thus the supply risk transfers by the way of positive serious transfer of STPSCR, though it is induced by the positively transferring financial risk.

② When different SCRs coexist, some risks transfer through positive serious way while some others transfer through reverse serious way. Although the types and transfer directions of the risks are complex, the transfer direction of any one risk is unchanged, transferring along a fixed direction. For instance, supply risk of a supply chain always transfers from upstream to downstream enterprise by the way of positive serious transfer of STPSCR while demand risks always transfer from downstream to upstream enterprise by the way of reverse serious transfer of STPSCR.

Major features of cross serious transfer of STPSCR are explained as the following:

① Diversity of risk sources and difficulty in inspecting them. Risk sources of cross serious transfer come from two types. One is original SCRs such as inventory risk, supply risk, demand risk, policy risk and institutional risk, etc. The other is secondary SCRs induced by original risks. For instance, in order to avoid product shortage, node enterprise may order a large demand to increase the inventory, which may produce Bullwhip effect. This is the case of inventory risk induced by demand risk. Because the sources of risks originate differently and co-transfer in the supply chain system, inspecting the risk sources of cross serious transfer of STPSCR is much more difficult than that of single transfer of STPSCR.

② Agglomeration. Agglomeration includes risk source agglomeration and effectiveness agglomeration. Risk source agglomeration means that original risks or secondary risks may form various types of risks in the supply chain system after a period of time. Effectiveness agglomeration means that larger risk current may be produced from cross serious transfer of STPSCR than from single direction transfer of STPSCR after all risk currents agglomerate in the supply system.

Cross serious transfer is a common form of risk transfer in supply chain system as supply chain is a virtual extension organization. The complex internal and external environment together with the network structure of supply chain makes the occurrence of supply chain risks universal and the interaction of different risks produce more intercurrent risks. When one node enterprise sends out risks, it may receive risks simultaneously, displaying the duality of the node enterprise. The bidirectionality of SCR transfer lies in two factors. When one node enterprise sends out risks to another node enterprise in a certain way, the other enterprise may transfer another risk to it in the same or different way. The effectiveness and path of cross serious transfer depend on not only the characteristic and current of

original risks but also the type of SCR and the factors that influence the formation of the type. Different types of risks have different influences on each other, and the reason lies in many factors, such as the characteristic and anti-risk capability of the enterprise, its risk preference, its capability of risk diffusion, etc.

3 Conclusions

Through judging TPSCR, risk source can be found. It is urgent to adopt some countermeasures to control the risks to avoid the crisis. Further study will focus on the radar transfer path of SCR and interactive transfer path of SCR.

Abstract: With the advent of knowledge economy and information society, knowledge management in the enterprise occupies a more and more important position. This article defines the concept of enterprise research and development knowledge, expounds the characteristics and basic process of the R&D knowledge management, and constructs the overall structure of the system and the core functions of the system.

Key words: Enterprise; R&D knowledge management platform; Structure; Function

1 Introduction

With the rapid development of economy and technology, the knowledge human society has grows explosively. For this reason, knowledge management in enterprise occupies a more and more important position. It's key for enterprise to improve competitive ability that quick grasping and reasonable using knowledge, saving and accumulating experience and proprietary technology enterprises have. Therefore, how to implement knowledge management is a hot research topic in academia and companies in recent years. The knowledge management system is undoubtedly one of the effective tools to implement knowledge management.

2 Enterprise R&D Knowledge and Its Characteristics

Corporate R&D knowledge refers to the enterprise internal knowledge which is closely related to the product R&D of technology, including the knowledge of research object, R&D process, R&D methods, common sense and basic theoretical knowledge and so on.

Its characteristic mainly reflects in these aspects: (1)wide sources, (2)complicated structure, (3)strong professionalism, (4)various expressions, (5)communication difficulties, (6)innovative and (7)inheritance and so on.

3 The Basic Process of R&D of Enterprise Knowledge Management

In recent years, many scholars[2-5] have learnt a lot about the connotation of knowledge management, and its basic flow. Compositing their points of view, this article will define the enterprise R&D knowledge management as a management process of identifying, sorting, transforming knowledge, to share, use and innovate knowledge, with corporate R&D knowledge as the core. There are five links in the management flow, namely, knowledge accumulation, knowledge sharing, knowledge reuse, knowledge innovation, and knowledge evaluation. As shown in figure 1.

4 The Structure Model of Application Layer System

Combined with the enterprise R&D knowledge structure, the basic process of R&D knowledge management and the basic functional requirements, the structure model of enterprise R&D knowledge management system and its core functions are set up, as shown in figure 2.

5 The Function of Storage Layer

Storage layer is responsible for the storage of all kinds of knowledge, inference rules and the current project of all kinds of information.

(1) Data base

Data base stores the classification results, meta-knowledge lists, the key attributes of meta-knowledge, the storage address of related multimedia documentation and mathematical model, the

* This paper is supported by the Guangxi scientific research and technology development projects (10123003-5, 1298027-5)

basic information and process information of research and development project. In the database all kinds of information through the key attributes establishes links with rule base and method base, and through the address information establishes links with multimedia libraries and D/a library.

Figure 1 the Basic Process of R&D of Enterprise Knowledge Management

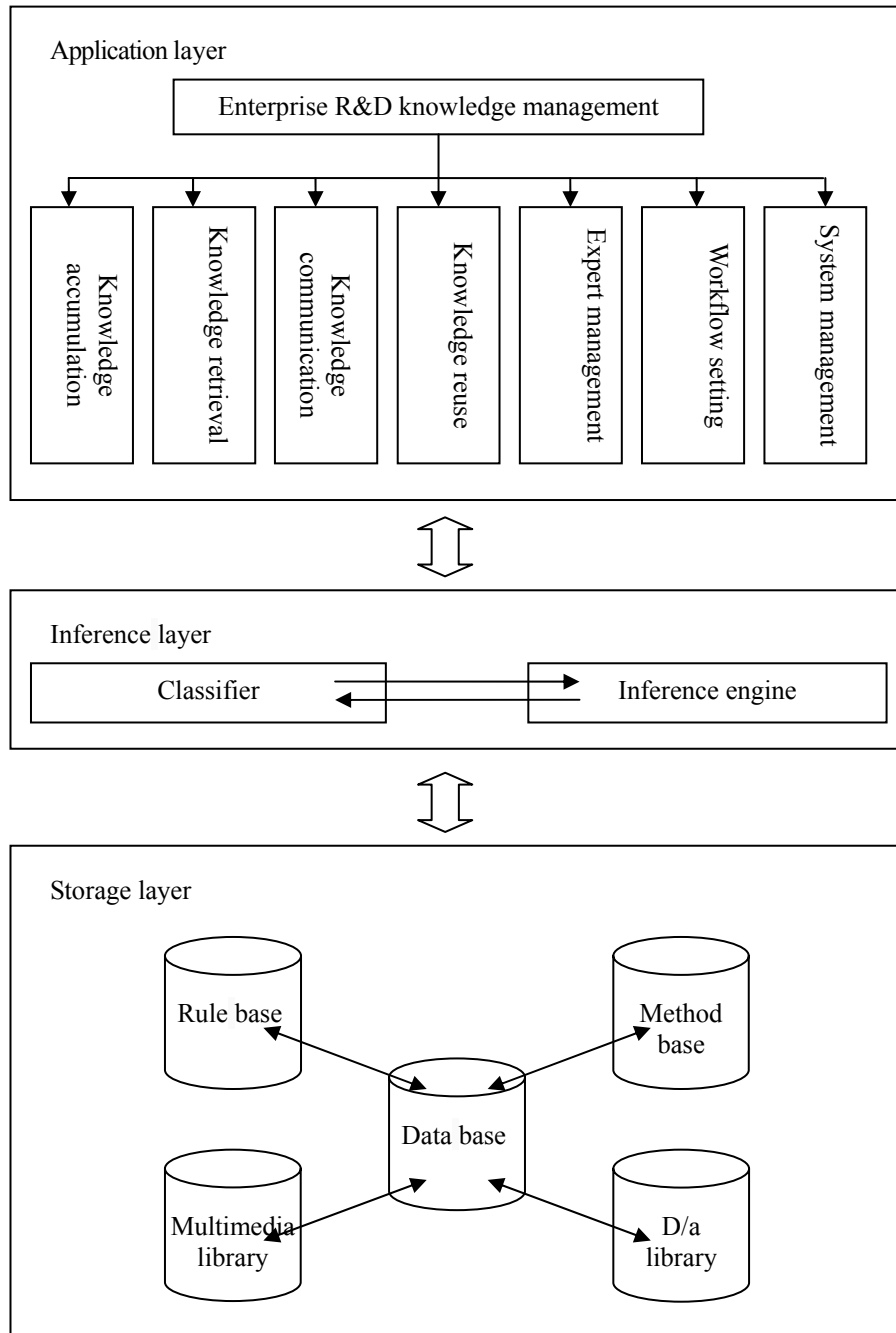

Figure 2 the Structure Model of Enterprise R&D Knowledge Management System

(2) Rule base

Rule base stores knowledge representation rules, knowledge classification rules and knowledge inference rule.

(3) Method base

Method base stores in the knowledge treatment of specific model and algorithm, such as Bayesian classification algorithm, knowledge evaluation algorithm, association rule algorithm and similarity matching algorithm [2], etc

(4) Multimedia library

Multimedia knowledge library stores knowledge of all kinds of document forms, such as design standards and specifications, design drawings, design specification documentation, project plans, meeting records, stage results view records, project information, test plans and results, problems and solutions, etc. Forms include text, pictures, PPT, electronic chart, animation, film, etc.

(5) D/a library

D/a library stores 2D drawings, 3D data model, the technical documentation and components performance simulation analysis data which are from other product aided design tools (such as CAD, UG).

6 The Function of Inference Layer

Inference layer mainly provides services for the application layer to realize the function of knowledge inference and mining. The classifier classifies the certainty or uncertainty problems of new knowledge. Common tools and methods are clustering analysis, rough set method, Bayesian classification, etc. Inference engine is responsible for the knowledge mining. Common tools and methods are association rules and sequential patterns found, etc. Summing up the research from Li Nong et al, the basic steps of knowledge mining are shown in figure 3.

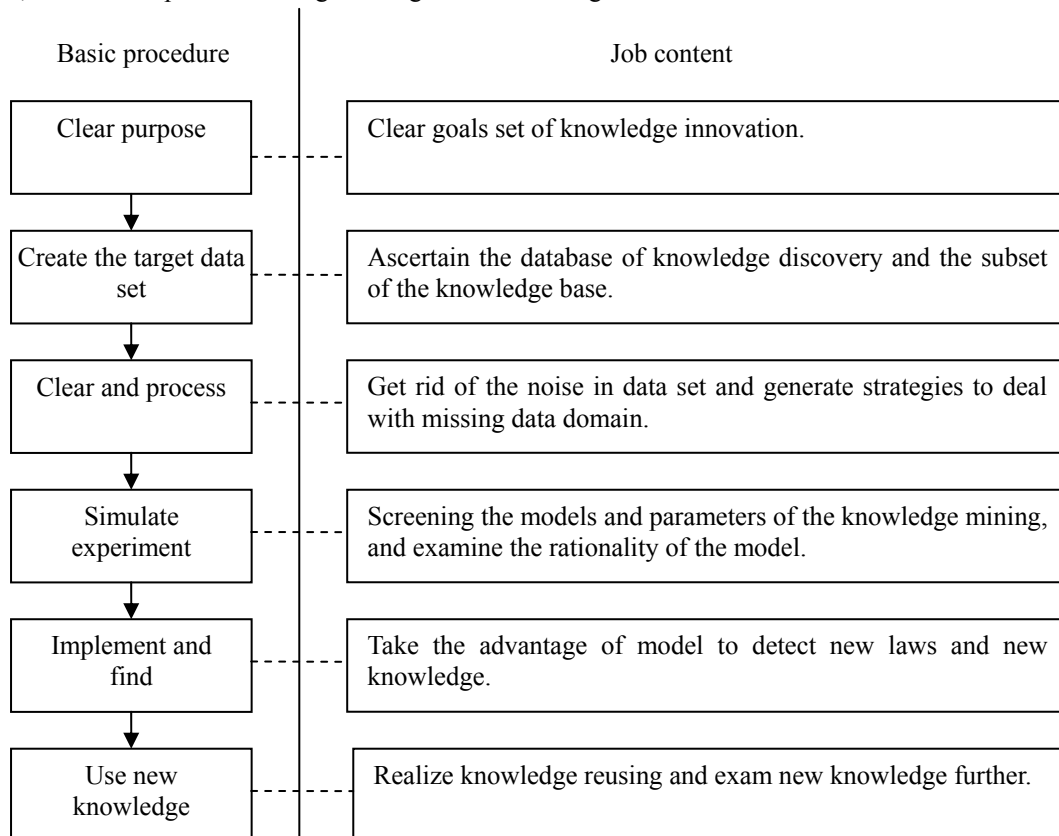

Figure 3 Basic Steps of Knowledge Mining

7 The Basic Function of the Application Layer

The application layer is mainly facing the user to provide the operating platform to, share

knowledge, and innovate for the knowledge management.

(1) Knowledge accumulation

Knowledge accumulation can be realized through external access and knowledge mining. External access refers to the employees summarize project has been completed from research technology, development experience and project management etc, and then store in the knowledge base after coding and audit. Knowledge mining refers to the knowledge in knowledge base, through classification, reasoning and other technical means to realize the process of knowledge discovery and innovation. The basic process includes knowledge matching, extraction, innovation, evaluation, storage, etc. Specific functions include knowledge edit, submit and review, warehousing, distribution, etc.

(2) Knowledge retrieval

Knowledge retrieval provides an efficient platform and tool for staffs to query and share enterprise R&D knowledge. Mainly includes the keyword searching, full-text retrieval, knowledge map and knowledge push, etc.

(3) Knowledge communication

Knowledge communication provides online real-time communication, discussion and collaborative design platform.

(4) Knowledge reuse

It assists enterprise employees to reuse existing knowledge in the knowledge base, shorten project development time, and improve the development efficiency. Mainly includes the template selection, parameter setting, program evaluation, knowledge reconstruction and other functions.

(5) Expert management

Manage the expert who has the right to evaluate knowledge or domain expert.

(6) Workflow setting

It is used to set the information such as name, responsible person in the process of knowledge review, knowledge release and so on, so as to guide, control and handling related tasks.

(7) System management

Includes personnel information management, setting operation permission, department information management, post information management, knowledge base backup and restore, etc.

8 Conclusion

Enterprise R&D knowledge management system is the important mean and effective tool to assist enterprise to accumulate knowledge, complete the R&D knowledge sharing, shorten the product development cycles, and reduce cost of product research and development. The author according to own working experience engaged in knowledge management in enterprise, knowledge management process as the main line, analyzed the type and management requirements of enterprise research and development knowledge, put forward the structure model of enterprise research and development knowledge management system, and achieved good application effects in local application. The implementation of knowledge management system to the enterprise has a certain reference value.

Research on Price Regulating Structure of Medical Expenditure on the Condition of Non-Separation of Hospital and Medicine Enterprises

Gu Xingong

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: guxg@hbstd.gov.cn)

Abstract: Based on motivation theory of economics, this paper analyzes the government's price regulating structure of medical expenditure. It is due to the government's inappropriateness in price regulation on the condition of information asymmetry between doctors and patients that doctor's effort level has been lower than suboptimal levels. That is, doctors are not only motiveless to upgrade their own qualities, but also motiveless to control patients' costs. Thus, the thesis designs a motivating mechanism to drive doctors to provide effective and efficient services on the condition of non-separation of hospital and medicine enterprises.

Key words: Non-separation of hospital and medicine enterprises; Price regulating structure; Motivation; Models

1 Introduction

There are many reasons for fast rise of medical costs. Some are reasonable while some are not^{[1][2]}^[3]. Presently, the policies controlling medical expenditure are focused on the prices of medicines. Due to the government's difficulty in knowing the producing costs of medicines, as well as inflated medicine prices resulting from the present medical system, the government should put their attention to reducing governmental regulations, deregulating retail rights of prescribed medicines and breaking up monopoly of state-owned hospitals.^{[4][5][6][7]}

Presently, the government's price regulation fails to control the rise of medical costs. Why? Li Pengfei^[8] and others were pioneers focusing on analyzing the governmental price regulation. They analyzed doctors' motivation and patients' welfare. According to them, when the medical service prices are controlled and the ceiling price is lower than the equilibrium price, if the regulators are unable to solve the problem of information asymmetry between doctors and patients, there will absolutely arise the phenomenon that hospitals will make profits from medicines. Therefore, they suggest deregulating medical service prices. Following their thoughts, the thesis tries probing into price regulating structure of medical expenditure.

2 Basic Hypotheses and Models

2.1 Basic hypotheses

Suppose there are a doctor (hospital) and a representative consumer (patient), the doctor provides medical services for the consumer to recover his health. The hypotheses are as follows:^[9]

(1) The value of medical service for the patient is S , then the doctor's cost function is:

$$C = \beta - e$$

Wherein, β is the efficiency parameter, e is the doctor (hospital)'s effort level.

(2) The amount of compensation of the patient for the doctor is the net money transfer payments of t . Let U represent the doctor (hospital)'s utility level, then:

$$U = t - \psi(e)$$

For the doctor (hospital), the utility acquired from regulation is at least the same as that he acquires when he stays away from the relationship. If the utility level of the doctor's outside opportunities is standardized as 0, then his individual rational constrain is $t - \psi(e) \geq 0$.

(3) Let $\lambda > 0$ represent the shadow cost of public money when regulating.

(4) The doctor's efforts fall into two respects: the efforts of their own techniques and experiences are e_1 ; the efforts of appropriate tests as well as medicines are e_2 .

(5) For the patient, the doctor's efforts in two respects are symmetric with the same random value $s^i = S \text{ or } \bar{S}$, wherein, $i=1,2$, \bar{s} represents high value meaning that the patient obtain effective

treatment while \bar{S} represents low value.

(6) The doctor's effort level is continual and supposes that $e_i \in [0,1]$. Within the above domain the probability of the doctor's efforts resulting in high value is $P_r(S^i = \bar{S} / e_i) = \pi(e_i) = e_i$ when $i=1, 2$.

(7) The negative utility of the doctor's efforts is further divided into $\psi_1(e_1)$ corresponding to e_1 and $\psi_2(e_2)$ corresponding to e_2 , and $\psi_i' > 0, \psi_i'' < 0, i=1,2$. To guarantee that the model has interior point solution, suppose the rice field condition holds, that is $\psi_i(0) = 0$ and $\lim_{e \rightarrow 1} \psi_i(e) = +\infty$.

(8) Similarly t – the monetary transfer payment of the patient for the doctor is divided into two respects: the diagnosis price P_1 and the medicine price P_2 when $t = P_1 + P_2$. The hospital's related costs are respectively c_1 and c_2 . While \bar{t} and \underline{t} respectively corresponds to treating results of different levels - \bar{S} and \underline{S} .

2.2 Theoretical model of medical expenditure rise and price regulation

2.2.1 Basic model of price regulators' social welfare

According to Hypotheses (1), (2) and (3), the net surplus of the patient and the doctor is as follows:

$$S - (1 + \lambda)(t + \beta - e)$$

For the utilitarian regulators of medicine prices, their ex post social welfare is:

$$S - (1 + \lambda)(t + \beta - e) + t - \psi(e) \\ = S - (1 + \lambda)[\beta - e + \psi(e)] - \lambda U$$

The social welfare of medical services equals to the patient's value minus $(1 + \lambda)$ times $[C + \psi(e)]$ - the total costs the doctor observes, and then minus λ times the doctor's rent on his opportunity utility. According to the above social welfare function, medicine price regulators are unwilling to leave any rents for doctors.

On the condition of perfect information, medicine price regulators know β and observe e , the regulators will solve the following formula:

$$\max_{\{U, e\}} \{S - (1 + \lambda)(S - (1 + \lambda)[\beta - e + \psi(e)] - \lambda U)\}$$

Wherein, constraint condition is $U \geq 0$, then the solution is:

$$\psi'(e) = 1 \text{ or } e = e^* \\ U = 0 \text{ or } t = \psi(e^*)$$

$\psi'(e)$ - the marginal negative utility of the doctor's efforts must equal to the marginal cost economy. Meanwhile, owing to the shadow cost, the doctor will not obtain price rents in fact.

2.2.2 Analysis on the doctor's efforts in two respects

Analysis on the optimal condition [10][11]

According to hypotheses (4), (5), (6) and (7), on the condition of e_1 – the doctor's effort of diagnosis, to maximize the sum of the doctor's and the patient's utility will result in:

$$\max_{\{e_1\}} \{V^{FB} = e_1 \bar{S} + (1 - e_1) \underline{S} - \psi(e_1)\}$$

To solve the first-order condition will end in:

$$\bar{S} - \underline{S} = \psi_1'(e_1^*)$$

According to hypotheses (4), (5), (6) and (7), on the condition of e_2 – the doctor's effort of medicine, to maximize the sum of the doctor's and the patient's utility will result in:

$$\bar{S} - \underline{S} = \psi_2'(e_2^*)$$

That is to say, on the optimal condition, the value difference the patient obtains exactly equals to the marginal cost of the doctor's efforts; in addition, the marginal costs of the doctor's efforts in two

respects are equal.

Analysis on the condition of the doctor's moral risk and limited liability ($\bar{t} > 0, \underline{t} = 0$)

In reality, there is information asymmetry between the doctor and the patient. The doctor's efforts are non-observable at all. Therefore, the moral risk is inevitable.

On the condition of e_1 – the doctor's effort of diagnosis, the doctor's expected return is as follows:

$$\max_{\{e_1\}} \{e_1 \bar{t} + (1 - e_1) \underline{t} - c_1 - \psi_1(e_1)\}$$

To solve the first-order condition will result in:

$$\bar{t} - \underline{t} = \psi_1'(e_1)$$

Similarly, on the condition of e_2 – the doctor's effort of medicine, to maximize the doctor's expected return will result in:

$$\bar{t} - \underline{t} = \psi_2'(e_2)$$

On the condition of e_1 – the doctor's effort of diagnosis, the patient's expected return is as follows:

$$\max_{\{e_1\}} \{e_1 (\bar{S} - \bar{t}) + (1 - e_1) (\underline{S} - \underline{t})\}$$

$$\text{s.t. } \bar{t} > 0, \underline{t} = 0$$

$$\bar{t} - \underline{t} = \psi_1'(e_1)$$

If suppose further $\psi''' > 0$, that is, the patient's objective function is strictly concave on e_1 , to solve the optimization problem leads to:

$$\bar{S} - \underline{S} = \psi_1'(e_1^{SB}) + e_1 \psi_1''(e_1^{SB})$$

Similarly, on the condition of e_2 – the doctor's effort of medicine, to maximize the patient's expected return will result in:

$$\bar{S} - \underline{S} = \psi_2'(e_2^{SB}) + e_2 \psi_2''(e_2^{SB})$$

According to the above analysis, on the condition of the doctor's moral risk and limited liability, the doctor will surely prefer the suboptimal efforts to the optimal.

2.2.3 Price regulating model on the condition of non-separation of hospital and medicine enterprises

Just as Arrow points out in his pioneering work of medical economics, the fundamental problem of medical market lies in information asymmetry between the doctor and the patient. The information asymmetry is consequent upon the fact that the doctor has professional knowledge which is why the medical consumption is characteristic of induced consumption; upon another fact that the patient is without the professional knowledge which results in his inability to examine the doctor's medical services (Arrow, 1963). Therefore, related hypotheses are revised as follows:

The patient, though he may notice whether he is cured or not, has no way to measure whether he obtained the lowest value, and consequently has no way to distinguish \bar{S} from \underline{S} , that is, to

distinguish \bar{t} from \underline{t} . What he can do is to pay $t = P_1 + P_2$. Owing to piece regulation and according to

the present regulating measures, we have $P_1 < c_1$, $P_2 > c_2$, and $P_2 = (1+r)c_2$, $r \leq 15\%$.

On the condition of e_1 – the doctor's effort of diagnosis, the doctor's objective function is as follows:

$$\max_{\{e_1\}} \{e_1 (P_1 - c_1) + (1 - e_1) \times 0 - \psi_1(e_1)\}$$

To solve the first-order condition will result in:

$$P_1 - c_1 = \psi_1'(e_1)$$

Similarly, on the condition of e_2 – the doctor's effort of medicine, to maximize the doctor's

expected return will result in:

$$P_2 - c_2 = \psi'_2(e_2)$$

On the condition of e_1 – the doctor’s effort of diagnosis, the patient’s objective function is as follows:

$$\begin{aligned} \max_{\{e_1\}} \{ & e_1(\bar{S} - P_1) + (1 - e_1)(\bar{S} - 0) \} \\ \text{s.t. } & P_1 - c_1 = \psi'_1(e_1) \end{aligned}$$

Because $P_1 < c_1$, then $P_1 \psi'_1(e_1) \leq 0$, wherein only e_1 agrees with $e_1 \leq 0$.

Similarly, on the condition of e_2 – the doctor’s effort of medicine, the patient’s objective function is as follows:

$$\begin{aligned} \max_{\{e_2\}} \{ & e_2(\bar{S} - P_2) + (1 - e_2)(\bar{S} - 0) \} \\ \text{s.t. } & P_2 - c_2 = \psi'_2(e_2) \end{aligned}$$

To solve the optimization problem leads to:

$$\bar{S} - \bar{S} - c_2 = \psi'_2(e_2^{SB2}) + e_2 \psi''_2(e_2^{SB2})$$

Because when $\psi''' > 0$, $P_1 < c_1$, $P_2 > c_2$, $\psi'_2(e_2^{SB2}) + e_2 \psi''_2(e_2^{SB2})$ is increasing function, then $e_2^{SB2} < e_2^{SB}$. Thus it may concluded that when $P_1 < c_1$, $P_2 > c_2$, then $e_1^{SB2} = 0 < e_1^{SB} < e_1^*$; $e_2^{SB2} < e_2^{SB} < e_2^*$.

On the condition of the present price regulation, the doctor is motiveless to improve his own techniques to provide basic medical services, and meanwhile he is motive to pay the least efforts to look for proper medicines.

To compare e_1 and e_2 , the optimal price design should agree with:

$$\frac{P_1 - c_1}{\psi'_1(e_1)} = \frac{P_2 - c_2}{\psi'_2(e_2)}$$

On the condition of the present price regulation, the above equation doesn’t work, because efforts in two respects are asymmetric. To make it work, P_1 must be raised to meet $P_1 > c_2$. That is, it is necessary to make reasonable price compensation for basic medical services to correct the present motivation distortion.

3 Motivating Mechanism of Price Regulation of Medical Expenditure

Are there a motivating mechanism on the condition of non-separation of hospital and medicine to drive doctors to provide effective and efficient services? Is it somewhat related to the doctor’s efforts, the prices charged as well as the market structure?

3.1 Hypotheses

(1) There are n homogenous doctors - i ($i = 1, 2, \dots, n$) in the market. Suppose one doctor represents one hospital; the doctor’s effort for one “diagnosis” is e_1 and his charge is E_1 ; his effort for one “treatment” is e_2 and his charge is E_2 ; $e_i > 0$, $E_i > 0$.

(2) When he comes to see the doctor, the patient doesn’t know he has serious illness or minor illness (or no illness). Suppose the probability he has serious illness is p and $p \in [0, 1]$, then the probability he has minor illness (no illness) is $1 - p$.

(3) When the patient has serious illness, the utility on his health is q_l ; when he has minor illness, the utility is q_h and $0 < q_l < q_h < 1$.

(4) After the doctor’s diagnosis and treatment, the patient’s health may be recovered, that is, his utility may come back to q_h .

(5) The doctor’s time and energy are limited, that is, his supplying capacity is limited. Let his limited energy be T , and then the patient number he can interview when he is conscientious is $\frac{T}{e_1 + p e_2}$.

3.2 The doctor's and the patient's utility as well as their strategic choice

The patient's initial utility function is: ^{[12][13]}

$$U_0 = pq_l + (1-p)q_h$$

When the doctor price on marginal cost and be conscientious, the patient's expected utility function is:

$$U = q_h - e_1 - pe_2$$

For the patient, only when $U > U_0$, it is efficient for him to choose diagnosis and necessary treatment, which means:

$$p(q_h - q_l) > e_1 + pe_2$$

The left of the equation is the exactly total benefits when he has serious illness and is cured; while, the right of the equation is the cost he pays. It may be calculated as follows:

$$\omega = \frac{p(q_h - q_l)}{e_1 + e_2}$$

Wherein, ω is the cost performance for cure of disease. Only when $\omega > 1$, it is efficient for the patient to choose diagnosis and necessary treatment.

The doctor's target is to choose his strategy to maximize his profits when his supplying capacity is constricted.

The game between the doctor and the patient is divided into 3 phases:

(1) The doctor's treatment strategy

The doctor's strategy to maximize his profits is affected by 2 conditions: comparison between his market share and attack ability; comparison between profit rates of "diagnosis" and "treatment", that is,

comparison between $\frac{E_1^i - e_1}{e_1}$ and $\frac{E_2^j - e_2}{e_2}$.

When $\eta_i > \frac{T}{e_1 + pe_2}$, that is, patient number exceeds the number the conscientious doctor may interview, the constriction on his supplying capacity is strong, and thus:

When $\frac{E_1^i - e_1}{e_1} = \frac{E_2^j - e_2}{e_2}$, it will make no beneficial difference when the doctor chooses to diagnose or treat and he will be conscientious.

When $\frac{E_1^i - e_1}{e_1} > \frac{E_2^j - e_2}{e_2}$, the doctor's benefit from diagnosis is greater than that from treatment, he will increase time on diagnosis and decrease time on treatment.

When $\frac{E_1^i - e_1}{e_1} < \frac{E_2^j - e_2}{e_2}$, the doctor will provide over-treatment for the patient.

When $\eta_i = \frac{T}{e_1 + pe_2}$, patient number equals to the number he may interview, the doctor will work at full capacity and thus:

When $\frac{E_1^i - e_1}{e_1} = \frac{E_2^j - e_2}{e_2}$, the doctor will be conscientious.

When $\frac{E_1^i - e_1}{e_1} > \frac{E_2^j - e_2}{e_2}$, the doctor will increase time on diagnosis and decrease time on treatment.

While, because patient number is limited in market, decrease of treatment will not result in increase of patient number and increase of benefits, the doctor will not decrease treatment and will be still conscientious.

When $\frac{E_1^i - e_1}{e_1} < \frac{E_2^j - e_2}{e_2}$, the doctor will provide over-treatment for the patient, that is, he will provide treatment for all patients diagnosed and finally the number he interviews will be smaller than

$$\frac{T}{e_1 + pe_2}$$

When $\eta_i < \frac{T}{e_1 + pe_2}$, if he is conscientious, he doesn't have enough patients but has spare time and energy, then:

If $E_2^i > 0$, the doctor is motivated to provide over-treatment;

Only when $E_2^i = 0$, over-treatment will not happen.

(2) Search for patients and the doctor's strategy to price

According to the above analysis, the doctor's pricing is closely related to market demand situation.

The patient number he may interview when conscientious is $\frac{T}{e_1 + pe_2}$. Suppose there are k doctors, they just meet medical demand in market.

When the doctor number is smaller than k , each doctor's service will fail to meet the demand, then $\eta_i > \frac{T}{e_1 + pe_2}$, and the doctor's optimal pricing will be $(e_1\omega, e_2\omega)$; when the doctor number is exactly k ,

each doctor will work at his full capacity, then $\eta_i = \frac{T}{e_1 + pe_2}$, and the doctor's optimal pricing will still be $(e_1\omega, e_2\omega)$; when the doctor number exceeds k , the doctor's service supply exceeds demand, his optimal pricing will be $(0, 0)$.

4 Conclusions and Suggestion

Two conclusions will be drawn from the above analysis:

(1) The present separately regulating structure of expenditure and price tends to distort behaviors of the doctor (hospitals) as agents.

(2) On the condition of non-separation of hospital and medicine, there is still a motivation mechanism in competing market to drive doctors to provide effective and efficient services.

The conclusions are significant for policies: if the price regulating structure were not changed, the problem would not be solved under the present medical system that medical expenditure has been unreasonably raising. The reasons are: the doctor is superior in grasping information and is possible to induce consumption while the distorted regulating structure turns the possibility into truth.

On the basis of above analysis, the following steps may be taken to reform present medicine price regulating structure:

To change the present distorted methods and prevent medical expenditure from unreasonable rise, it is irrational to regulate more severely; it is rational to deregulate or change regulating structure.

(1) To regulate on the basis of total costs. For example, introduce in system of paying on disease instead of on services.

(2) To raise the ceiling price of doctor's technical services to reform the distorted motivation structure.

(3) To deregulate, allow hospitals to set prices by themselves; meantime, encourage competition to increase market supply capacity.

(E-mail: zainiujang@moe.gov.my)

Abstract: The Ministry of Higher Education (MOHE) of Malaysia has launched its transformation initiative, called National Higher Education Strategic Plan (NHESP) that sets the foundation towards attaining merit and sustainability for the higher education system beyond 2020. One of the initiatives is for one Malaysian university to be in the top 50 of world ranking. Universiti Teknologi Malaysia (UTM) has decided to go for this challenge. To achieve this objective, UTM has to set a very clear and tangible target by setting challenging Key Performance Indicators (KPI). This paper summarizes the transformation initiatives that UTM undertook since 2009, the lesson learnt and good practices that other institutions of higher learning could adopt.

Key words: Value Creation; Transformation; Accelerated; Sustainability

1 Introduction

As a country, Malaysia is undergoing massive and accelerated transformation through national initiatives called Government Transformation Program and Economic Transformation Program (PEMANDU, 2013). Through Vision 2020, Malaysia inspires to be a fully developed nation by the year 2020 (EPU, 2013).

The Malaysian Ninth Plan on 31 March 2006 emphasizes the second phase of the government's effort to achieve Vision 2020. The Ministry of Higher Education (MOHE) of Malaysia has the main role of initiating the mission to raise the capacity for knowledge and innovation, as well as encouraging a first class mind set to the nation. The desired human capital should be knowledgeable, skillful and possess a superior personality.

In relation to these needs, the National Higher Education Strategic Plan (NHESP) was formulated in 2007 with the vision to transform higher education within the context of establishing Malaysia as an international hub of excellence for higher education (MOHE, 2013). This transformation is the foundation towards attaining merit and sustainability for the higher education system beyond 2020.

There are seven thrusts of NHESP that comprises of 33 initiatives, one of which is to aim for one of the Malaysian universities to be in the top 50 of world-renowned universities by 2020. Universiti Teknologi Malaysia (UTM) has decided to take up the challenge in 2009 when a new Vice Chancellor was appointed in UTM.

UTM knew very well that the good intention of the government would not come with huge allocation of resources and funding. Time is also not at UTM side. Harvard, for example, took 300 years and huge resources to become top ranked university in the world. With such constraints, UTM could not afford to adopt a normal conventional change strategy. Rather UTM has to be creative and innovative by employing very unconventional strategy, by capitalizing the current available minimum resources for maximum impact in a very short timeframe.

UTM is also very aware that the transformation journey is not going to be an easy ride. As such, UTM has to have a proper change management methodology to ensure the success of the noble effort. This paper summarizes the transformation journey, the lesson learnt and good practices that other institutions of higher learning could adopt.

2 Literature Review

Despite the importance of change management in organizations, unfortunately there is a high failure of change management initiatives. For instance, Kotter (1996) reports a failure rate of around 70 percent of all change programmes initiated and Zook and Allen (2001) find that only 88 percent of companies failed to execute their strategies on change. In addition, there is a high failure rate of 85

percent in public sector as well (Donlan, 2006).

There are several reasons contributed for the high failure rate in change management literature. Firstly, there is a fundamental lack of a valid framework of how to implement and manage organisational change (Kotter, 1996). Secondly, there is the lack of a formal strategy execution management process (Russell and Koch, 2009). Based on a survey of 143 organizations, they found that 75 percent of the respondents that were using a formal strategy execution management process were outperforming their peer group. Another reason is that change is often unpredictable. Therefore, change management tends to be reactive, discontinuous, ad hoc and often triggered by a situation of organizational crisis (De Wit and Meyer, 2005).

3 Change Management Framework

As stated above, one of the primary reasons for the high failure rate in change management initiative is the lack of a valid change management framework. As such, in order to reduce the risk of change management failure, UTM has adopted a framework that is based on a typical chemical process engineering model (Felder and Rousseau, 2005), as shown in Figure 1.

Figure 1 The Change Management Framework employed by UTM

3.1 Context

The context of the transformation of UTM is as stipulated by the Malaysian Government's Ninth Plan towards achieving the Vision 2020 and the National Higher Education Strategic Plan (NHESP) by the Ministry of Higher Education (MOHE) of Malaysia. There are seven thrusts of NHESP that comprises of 33 initiatives, one of which is to aim for one of the Malaysian universities to be in the top 50 of world-renowned universities by 2020. The newly appointed Vice Chancellor of Universiti Teknologi Malaysia (UTM) has decided to take up the challenge.

3.2 Input

With such a clear context and vision from the government, the new Vice Chancellor organized a series of strategic planning sessions with the senior management team of UTM to craft the input for the transformation of UTM from a local and undergraduate centric to an international and postgraduate focused university. The input for the transformation initiatives basically covers three aspects, namely strategy, structure and culture. To measure the outcomes of these inputs, Balance Score Card methodology and a set of Key Performance Indicators (KPI) are used.

3.2.1 Balance Score Card & Key Performance Indicator (KPI)

Balance Score Card (BSC) links the strategies to UTM's vision and mission. The BSC Strategy Map provides a macro-perspective of UTM future direction viewed from the four perspective: stakeholders, internal process, learning and growth, and financial management. Figure 2 shows the UTM Strategy Map (UTM,

Detail implementation of the BSC is translated into Key Performance Indicators (KPI). KPIs that will match the criteria of the current top 10 universities in the world by the year 2020 has been decided. The key common features of these top ranked universities are the emphasis in the numbers of publication (impact factors and citations), postgraduate and doctorate students, post doctorate fellows, Intellectual Properties, spin-off companies, and amount of research grants and endowment fund. Those KPIs are then staggered from 2008 (status quo) for the next 12 years until the year 2020 (Zaini, 2009).

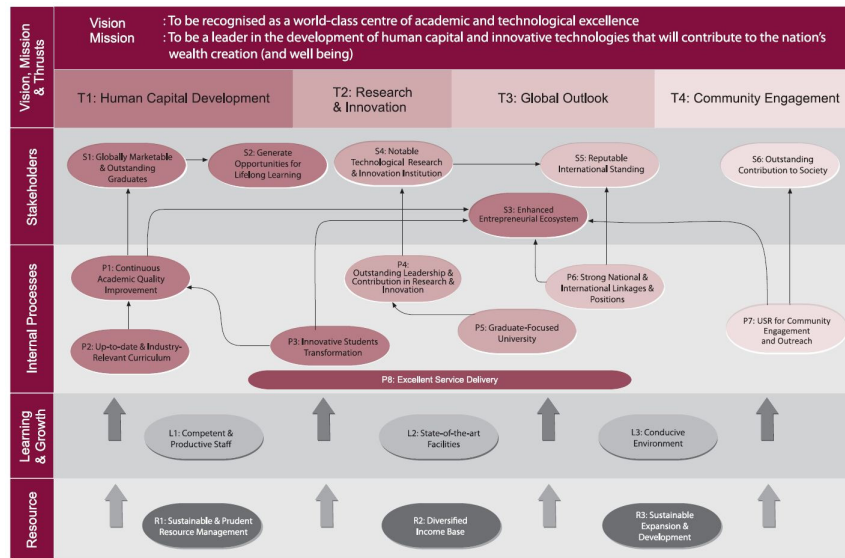

Figure 2 UTM BSC Strategic Map (UTM OCA, 2013)

Besides the tangible KPIs, there are other factors that influence the ranking, such as quality of networking with international partners, quality of student intakes, quality of our graduates and satisfaction of employers that employed our graduates.

3.2.2 Strategy

In order to achieve those KPIs, UTM employs the Blue Ocean Strategy (BOS) methodology to identify critical elements for transformation process. BOS helps in identifying strategic moves that could eliminate and reduce elements in UTM that were taken for granted before but do not add any significant values, as shown in Figure 3 (Zaini, 2012). By eliminating and reducing such elements, UTM has able to release huge amount of resources in terms of manpower, equipment, time and money. At the same time also, UTM has identified strategic moves that could raise and create certain elements that require minimal resources but give huge impact and value creations to UTM.

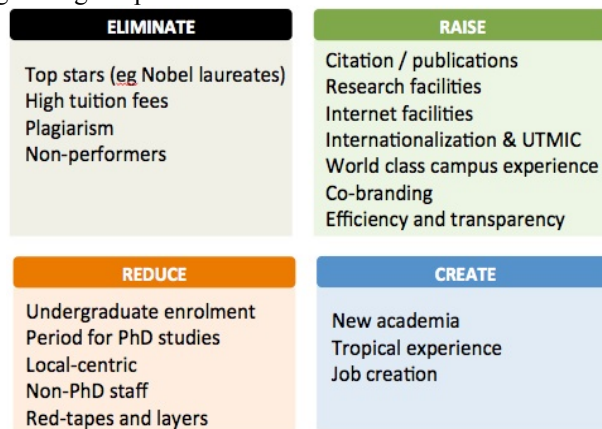

Figure 3 UTM Blue Ocean Strategy (Zaini, 2012)

To increase national and international reputation, networking with top ranked universities such as Harvard, MIT, Cambridge, Imperial College, Stanford, and others were initiated under smart partnership collaboration.

Realizing that government fund is quite limited, UTM has initiated UTM Endowment Fund and unlocking the values of UTM assets and human capital to provide enough funds to cover the expenses of the above initiatives.

3.2.3 Structure

To support the implementation of the above strategy, the administration structure of UTM has been reengineered. One of the main strategic moves is to increase the number of postgraduates from 25% in

2008 to 70% in 2020. Since the number of undergraduate is to be reduced, several faculties and departments were merged hence releasing some resources (academicians, administration staff and finance) that could be redeployed somewhere else. The reduction in the number of academic programs has reduced tremendously the resources and paper works that are required to comply with the national accreditation requirements.

Research Alliances that manages the team research themes in UTM were established under the Office of Deputy Vice Chancellor (Research & Innovation) to strengthen the postgraduate program, research and publication. The ten research themes are transport, water, biotechnology, manufacturing & material, sustainability, energy, nanotechnology, information and communication, construction and knowledge economy.

Academicians are allowed to become full time researchers and to fully supervise postgraduate students. The amount of research fund and graduate assistantships was increased. Monetary incentives were given to academicians who published papers in indexed and high impact journals and whose doctorate students graduated on time. The yearly assessment has been revised to include the number of publications and doctorate students. A publication unit is established to facilitate and guide academicians and postgraduate students on journal writing and publication skills. The number of post doctorate fellows is increased to strengthen research and publication activities in major research groups that have significant amount of research funding and doctorate students.

3.3.4 Culture

The organization structure and strategy should be supported with the right value and culture of the campus community. A wholesome culture will create an intellectual ecosystem that encourages high performance, integrity, healthy living, creativity and innovation. Consciously, UTM has decided to focus on developing and nurturing three aspects of culture, namely the Culture Knowledge & Learning and Healthy Living.

A fertile knowledge and learning culture in UTM symbolizes our understanding of the concept and appreciation of knowledge. Various activities and programs have been developed to instill the love of knowledge and learning, to encourage thinking, to share academic experience through publication and discourse, to encourage new research areas, to inculcate the reading culture, to encourage creativity, and to implement innovation.

The entire UTM community needs to take care of their health and optimize their strength. With a healthy body and sharper mind, it is thus easy for the staff of UTM to perform various major and challenging assignments in our endeavor to advance the institution and the nation.

3.3 Process

To ensure timely implementation of the strategies, the University has set-up a new unit called UTM Transformation & Risk Management Unit (TRM). The TRM office is the secretariat to conduct more specific planning programs and ongoing monitoring. The Director of TRM is appointed as a member in the University Management Committee reporting on the development of the transformation program on regular basis. The transformation program consists of 40 task forces and 184 projects that were administered under five programs, namely Synergy, Sunrise, Tropicana, Job Creation, and New Academia, as shown in Figure 4.

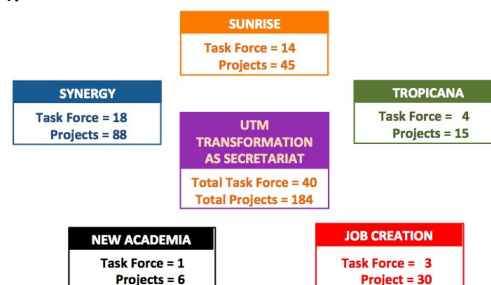

Figure 4 The Five Programs for UTM Transformation (Zaini, 2012)

The transformation projects are executed through project team whose members are representatives of various units in UTM to ensure multidisciplinary approach and enhancement of effective communication. To ensure high commitment of project team members, their contribution in the projects are included in the annual assessment exercises.

The TRM has employed a methodology to ensure smooth implementation of the various programs

and projects, called VACCINE (Value Creation Acceleration through Creativity and Innovation Experience) (Ahmad, 2010), as shown in Figure 5. VACCINE is about facilitating organization to harvest the enormous but largely untapped human capital inside the organization to create exceptional values. VACCINE focuses on the middle managers that have been identified as the future leaders to leverage massive cultural changes towards the creation of Innovation Culture in the organization. VACCINE starts with the harvesting of “pains” in the organization that are then blended with the vision of the Vice Chancellor to come up with transformation projects.

During the Assess Phase, the project teams need to conduct a thorough analysis on the project and to propose the need statement and resource requirement. Once the project is approved by the University Management Committee, the project will be implemented in three stages, namely piloting (Stage 1), consolidation (Stage 2) and enterprise-wide implementation (Stage 3). The preparation of project report is during the Final Phase.

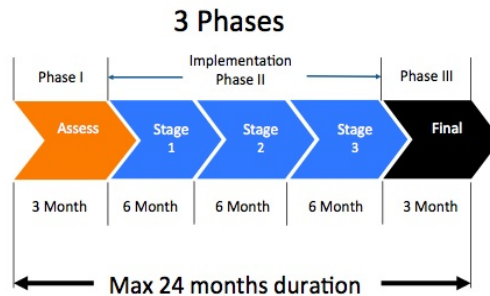

Figure 5 VACCINE Methodology (Ahmad, 2010)

3.4 Output

With a very clear KPI and concerted effort to realign and synergize all resources, UTM has exceeded almost all the critical KPIs that were set, as shown in Table 1. UTM SCOPUS publication, ISI impact factor and SCOPUS citation have increased (2008-2012) by 121%, 880% and 304%, respectively. Significant increases are registered for the number of postgraduate students (184%) and doctorate students (251%) for the duration from 2008-2012. Dramatic increased in the number of Intellectual Property (157%) and amount of endowment fund were also registered during 2008-2012.

Table 1 VKPI for UTM (Zaini, 2013)

Indicators	2008	2012 (target)	2012 (Actual)	2020 (target)
1 Staff with PhD	737	1300	1143	2100
2 SCOPUS journals	678	2500	1500	15,000
ISI impact factors	153	1200	1500	7000
SCOPUS citation	1372	5000	5552	50,000
3 Postgraduate (%)	25%	50%	53%	70%
Postgraduate no.	4,850	11,500	12,883	14,000
PhD students no.	1269	4000	4455	7000
4 Mean Intake CGPA	3.11	3.60	3.71	4.00
5 Research grant (RM m)	124	120	87	400
6 Intellectual property	1075	3000	2770	10,000
7 Spin-off companies	1	100	18	1000
8 Staff research load	30%	55%	55%	70%
9 Endowment (RM m)	0	50	50	500

The achievement of the KPIs has created motivation and inspiration within the internal eco-system in UTM and its stakeholders, hence providing the required momentum and stamina for UTM to reach the targeted destination of being in the top 50 universities in the world by 2020, as set by MOHE. MOHE in particular is very satisfied with the achievements of UTM despite giving only very minimal funding and resources. Since MOHE has seen the promising progression of UTM to achieve one of its main targets, MOHE has agreed to provide additional funding and support to UTM to accelerate further the transformation process in UTM. In fact MOHE has openly encouraged other universities in Malaysia to learn and emulate the strategy that was employed by UTM to transform itself to the current state. UTM also has been invited by numerous local and international universities and organizations to share its success story.

The biggest challenge to date is to change the mindset of UTM staff from status quo and complacency to a new mindset suitable to response to challenges in achieving the noble target. Hence, based on UTM experiences, it is suggested for universities who want to go for a similar journey should embark first with the mindset change initiative.

3.5 Feedback

Being prepared to improve weaknesses and limitations is a progressive and excellent work culture that needs to be nurtured. UTM practices transparent re-evaluation process with an open mind to gather feedbacks from stakeholders on how to enhance the effectiveness of the strategy, implementation methods, outcomes and expected impacts. Continuous feedbacks are gathered through regular formal scheduled meetings with the Board of Directors, senior management team, staff and the public. UTM also provides an online feedback portal, idea@utm.my for everyone to give ideas, suggestions or comments.

4 Conclusion

The transformation program of UTM has delivered its intended outcome. Almost all of the KPIs that were set in 2008 have outstandingly surpassed the targets in 2012. The proposed Change Management Framework that comprises the five important elements, namely the context, input, process, outcome and feedback has guided UTM in navigating the uncharted journey of change management to reach its intended destination on timely manner. The setting up of the UTM Transformation and Risk Management Division that oversees the implementation of the transformation strategies and its deployment of VACCINE process methodology has enabled UTM to reduce the risk of failure that normally happen in other change management initiatives.

Understanding the Impact of ‘Hard’ and ‘Soft’ elements of TQM in South-East European Firms

Shpend Imeri¹, Tauno Kekäle²

1 LEORON Professional Development Institute, Indigo Icon Tower JLT, Dubai, UAE.

2 Vaasa University of Applied Sciences (VAMK) Wolffintie 30, FIN-65200, Vaasa, Finland.

(E-mail: shpend_85@hotmail.com, tauno.kekale@puv.fi)

Abstract: The study emphasizes on the understanding of the impact of ‘hard’ and ‘soft’ elements of TQM in South-Eastern European (SEE) firms in Albania, Bulgaria, Bosnia-Herzegovina, Greece, Macedonia, Montenegro, Serbia and Romania. Thus, 350 questionnaires were collected out of 1000 from different industry sectors in order to have reliable statistical measurements of the ‘hard’ and ‘soft’ side of TQM. Hence, this study adopts an exploratory rather than a confirmatory research approach. This approach seeks not only to investigate firms’ awareness and perception to TQM but also explores to what extent are firms’ familiar with TQM tools techniques, and systems as well as TQM philosophies and principles. Therefore, it can be noted TQM in these SEE firms is neither resisted nor directly accepted, rather they tend to see it from a technical aspect, being familiar and understanding only the essential of its ‘hard’ elements and less the ‘soft’ elements.

Key words: TQM; ‘Hard’ elements; ‘Soft’ elements; South-Eastern Europe

1 Introduction

TQM originated early 1970s in Japan and has been further developed in USA and other Western European countries. Many authors now see it as having been superseded by Business Process Reengineering (BPR), where as others argue that TQM is still one of the most promising management approaches, and the underlying codes of the two are rather similar. During 1980s and 1990s TQM drifted to influence countries as well as regions and was seen as revolution in management methods and organizations recognized the need for a deeper focus, where TQM mainly spread to Europe. Its emergence generated enormous quantities of literature and journals that have been focusing on the analysis and principles of how TQM should be implemented in firms. According to Oakland (1989) TQM requires to gain ground continuously and become a way of life in many firms. Therefore, TQM cannot become a way of life by night or immediately. Time is the most important factor in order to align the proper TQM philosophies and concepts as well as tools, techniques and systems into firm’s culture (Goetsch and Davis, 2010).

Time, resources, experience are not the only imperative that TQM requires. Human resources are as much required for TQM in order to succeed; by this we mean specifically Top management and Middle management. Hence, it could be noted that firms understanding of TQM is focal point within a firm and spreading information around. As Morgan and Murgatroyd (1997) point out from their evidence that TQM understanding is sometimes limited in firms’. For this reason, TQM can be understood differently by managers and employees working within the firm. The issue that arises is that, how can TQM become “a way of everyday life” within a firm when managers and employees do not understand it totally? Hence, the purpose of this study is to explore firms understanding of TQM extent in wider approach such as the SEE region.

This research provides insights of a qualitative study that was conducted in the firms in South-East European Countries (Albania, Bulgaria, Bosnia-Herzegovina, Greece, Macedonia, Montenegro, Serbia and Romania). Basically, one hundred (100) interviews were conducted with top and middle managers from these firms. The rationale of using qualitative approach was in order to dig underneath the quantitative data, testing the meaning of TQM concept from firms’ top and middle managers and their view of linkages to wider individual and firm processes.

2 Theoretical View

According to Fotopoulos and Psomas (2008) gurus such as Juran’s quality of trilogy, Deming’s 14 points as well as plan, do, check, act cycle, Crosby’s quality management absolutes, Garvin’s dimensions of quality, Ishikawa’s cause and effect diagram, Feigenbaum’s steps of quality, Taguchi’s effort to turn firms into using statistical process control, and many other gurus respectively have represented the most vital elements of the TQM framework. There is no unique or specific model for

implementing TQM, since it is a network of interdependent elements consisting of tools, techniques, systems, philosophies and concepts. However, TQM implementation is nearly never 100 percent because some firms implement some elements, where as some implement other elements.

According to the Deming's (1986) phrase "in God we trust – others must use data analysis" it is clear that his point was emphasizing on management techniques, systems, tools that "hard" elements of TQM incorporates. Therefore, management tools and techniques are considered as mean collecting and displaying information in manner to provide a helpful objectives to the human in order to grasp thoughts and ideas that when are applied to physical processes, cause the processes to yield accurate results and better decision making (Goetsch and Davis, 2010). The TQM literature offers a wide range of tools, techniques, systems and methodologies. However, some of them are quite simple; where as some are more complex. The most common 'hard' elements of TQM detected in the TQM literature are (Table 2): statistical process control, ISO 9000 series, HACCP, kaizen approach, JIT, six sigma, EFQM, 5S's, scatter diagrams, benchmarking, quality function deployment, run charts and control charts, pareto analysis, matrix diagram, histograms and process charts, tree decision diagrams, critical path analysis and fishbone or Ishikawa diagram.

Table 1 The 'Hard' and 'Soft' TQM elements identified in the Total Quality Management Literature

Statistical Process Control	Total Employee Involvement
ISO 9000 series	Continuous Improvement
HACCP	Strategic Quality Planning
Kaizen Approach	Continuous Training
JIT	Teamwork
Six Sigma	Empowerment
EFQM	Customer Satisfaction
5S	Information & Analysis
Scatter Diagrams	Supplier Management
Benchmarking	Top-Management Commitment and Support
Quality Function Deployment	Democratic Management Style
Run Charts & Control Charts	Culture Change
Pareto Analysis	
Matrix Diagram	
Histograms & Process Charts	
Tree Decision Diagram	
Critical Path Analysis	
Fishbone or Ishikawa Diagram	

On the other hand, a number of 'soft' elements were introduced in order to increase the awareness of TQM philosophies and concepts for firms' overall improvement. 'Soft' TQM elements incorporate the following: total employee involvement, continues improvement, strategic quality planning, continues training, teamwork, empowerment, customer satisfaction, information and analysis, supplier management, top-management commitment and support, democratic management style, culture change.

A high number of firms around the world have adopted some elements of TQM and continually demonstrate significant benefits. Also it is noted that there is a high demand for improved measures of firms' performance in relation to TQM. Yet an interesting study conducted by Psychogios *et al.* (2009) on the impact of TQM on Middle Managers working in the Greek service industry provided some insights how they perceived TQM and its both elements, however this was done only for the service industry and in a particular country that did not fulfill the requirements of a region.

There are many studies on analyzing 'hard' and 'soft' elements of TQM, however, one can argue that they all have focused on statistical analysis such as the study of Fotopoulos and Psomas (2008) as well as Psychogios *et al.* (2009) that focused on constructing validity through confirmatory analysis. Yet, Talib *et al.* (2011) developed a study in order to priorities the practices of TQM through an Analytical Hierarchy Process (AHP) focusing on service industry. Therefore it is an interesting point to

research such kind of relationship in region which has not been explored yet and crosscheck similar studies such as that of Psychogios *et al.* (2009) for reliability and validity not only in the service industry or in a particular country rather than in region such as SEE where no light has been shade on TQM in qualitative method.

3 Methodology

The research was conducted in SEE region through questionnaire. Based on the above mentioned 'hard' and 'soft' TQM elements and the results from their familiarity and adoption, a questionnaire was designed and reviewed by quality management academics and professionals and tested through a pilot study. Initially, the present research was designed on the basis of received 350 questionnaires (respondents) out of 1000 that were sent to firms, visits, e-mail, fax and posted. This *survey method* has three interrelated advantages. The first is that through this method we aimed to come up with conclusions referring to firms in SEE region and the impact of TQM. The interest and familiarity of firms with the hard and soft side of TQM is another point that from the methodological perspective firms from different sectors answered the survey and that were mainly middle and top level manager. Therefore, the survey obtained a variety of responses that include different views on TQM; it was important and feasible for such as TQM issues to have access to this middle and high level managers.

4 Findings

As mentioned earlier, this study is interested to identify the impact and familiarity of the hard and 'soft' aspect of TQM. One way would be to explore the effect from each of these 'hard' and 'soft' aspects of TQM on individual attitudes. However, this would result to miss the whole picture of TQM we intend to explore. In other words, this study was interested to analyze the soft side and the hard side as a whole and not as separate entities. Thus, two types of measures of 'soft' and 'hard' TQM were developed. We start in this case with the 'soft' elements since it got lower

The first or the 'soft' side of TQM is based on philosophies and concepts and this is done through the summation of variables, which is formed by combining several individual variables into a single composite measure (Hair, *et al.*, 1998). Therefore in our case regarding the soft side of TQM, the sum of 10 TQM elements can form one single variable. There are two basic arguments for following this method. The first one is related to the theoretical notion that these concepts together compose what 'soft' TQM is all about explained in chapter three. Thus, by adding these concepts together we can represent the multiple aspect of 'soft' TQM in a single measure. The second argument is related to the statistical reliability of these concepts, which allow us to add these items together. More specifically, the diagnostic measure that has been used is *Cronbach's Alpha*, which is the most widely used to test of reliability coefficient and construct validity (Nunnally, 1979). The lower value of *Cronbach's Alpha* that is generally agreed is 0.7. However, this may decrease to 0.6 in exploratory research (Robinson *et al.*, 1991). Thus the ten identified items that compose the summated variables *Soft TQM* presented a moderate level of reliability with alpha coefficient over 0.6. This level of reliability is accepted since our research is an exploratory one.

However, one could claim that this is quite arbitrary approach since there is no confirmed theoretical basis that these ten concepts are parts of a single phenomenon. In respond to this criticism we have chosen to develop a second type measure of 'soft' TQM, which now includes most of the concepts described earlier. Once again the purpose was to explore the 'soft' side of TQM as a whole and not to use each item separately. In contrast, we can select those that they seem to represent most this complex concept. One basic method of achieving this is through the *Exploratory Factor Analysis* (EFA) (Lewis-Beck, 1994).

These analyses provide variables that seem to be the most representative of 'soft' TQM. According to the standard practices of EFA with rotation to an *orthogonal solution* by variemax method (Hair *et al.*, 1998) was used.

After the purification procedure the following factor structure emerged as shown in the table below. *Quality Driven Culture* as the first factor of 'soft' TQM concepts. *Management Commitment and Customer Satisfaction* was the second factor, whereas *Continues Improvement* the third one. The first factor is composed of the concepts of *training, teamwork, employee empowerment and quality culture*, the second factor is composed of *strategic quality, customer orientation & management commitment* and the third by the concepts of *continues improvement, scientific decision making & quality improvement*.

The table below shows that alpha coefficient for each emerged factor that confirms the statistical reliability of the three new variables. Thus, the measurements of the new variables can be obtained by a simple summation of the items included in each factor. From the three identified factors, one (Factor A – *Quality Driven Culture*) and second (Factor C - *Continues Improvement*) present regular levels of reliability with alpha coefficient values over 0.7. The other factor (Factor B – *Management Commitment and Customer Satisfaction*) presents also alpha factors greater than 0.7 but it are lower in comparison to other two factors. In addition, moderate and accepted level of reliability with coefficient alpha is between 0.6 and 0.7 (Nunnally, 1979; Churchill and Peter, 1984; Robinson *et al.*, 1991).

Table 2 Names of Emerging Factors and Included TQM’s ‘Soft’ Elements

Factors	TQM Philosophies & Concepts	Name of new variables	Alpha coefficient
A	1. <i>Training and education on the job is promoted by management</i> 2. <i>Teamwork is favored</i> 3. <i>Employees are empowered to get involved on decision concerning work</i> 4. <i>Quality Driven Culture</i>	Soft TQM 1 <u>Quality Driven Culture</u>	0.758
B	5. <i>Quality is strategically based</i> 6. <i>The organization is customer oriented</i> 7. <i>Top Management commitment and support</i> 8. <i>Continuous Improvement</i>	Soft TQM 2 <u>Management commitment and Customer Satisfaction</u> Soft TQM 3	0.704
C	9. <i>Scientific approach is used for decision making and problem solving</i> 10. <i>There is long term commitment towards quality improvement</i>	<u>Continues Improvement</u>	0.740

Based on the above test we notice that Soft TQM 1 or factor A gained higher alpha coefficient but also worthy to mentioned that it consisted of four items / principles of TQM that are closer and belong to *Quality Driven Culture* with alpha coefficient 0.785. The second factor that emerged in ‘soft’ side or with other words the second most familiar factor is *Continues Improvement*, with 0.740 alpha coefficients. Finally the lowest factor in this case gained *Management Commitment and Customer Satisfaction*, with 0.704.

The next step in our analysis is to examine how we can measure the ‘hard’ side of TQM. As mentioned this side consists of a variety of management practices that can be found in many Quality Management books, they are globally accepted as useful quality improvement techniques.

Again a purification procedure was needed for the ‘hard’ side in order to classify the emerged factors. The first factor that emerges from the ‘hard’ side is *Quality Systems. Lean Operations* and *Quality Planning & Control* emerged as the second and third factors. Now, the first factor is composed of *HACCP. ISO 9000 series* and *EFQM*. The second factor is composed of *Benchmarking, Kaizen Approach, Scatter Diagrams, Fishbone Diagram, Pareto Analysis, Just In Time, 5 S’s and Histograms & Process Charts*. Finally, the third factor is composed of *Statistical Process Control, Run & Control Charts, Six Sigma* and *Critical Path Analysis*.

Accordingly, from the tests shows in the table below, we can automatically notice that ‘hard’ side gained higher alpha scores compared to ‘soft’ side of TQM. Thus, the alpha coefficient for each emerged factor as said earlier confirms the statistical reliability of each variable. The summations of each factor provided the following reliability based on from the greater one from the three identified factors and that, first (Factor B – *Lean Operations*), second (Factor C – *Quality Planning & Control*) presented high level of reliability and validity as well, the cronbach’s alpha for both factors is higher than 0.9. The other factor (Factor C- *Quality Systems*) presents also reliable coefficient 0.8 which solid in this case.

Table 3 Names of Emerged Factors and Included TQM's 'Hard' Elements

Factors	TQM Tools, Techniques & Systems	Name of new variables	Alpha coefficient
A	1. HACCP 2. ISO 9000 series 3. EFQM	Hard TQM 1 <u>Quality Systems</u>	0.837
B	4. Benchmarking 5. Kaizen Approach 6. Scatter Diagrams 7. Fishbone Diagram 8. Pareto Analy 9. Just In Time 10. 5 S's 11. Histograms & Process Chart	Hard TQM 2 <u>Lean Operations</u>	0.945
C	12. Statistical Process Control 13. Run & Control Charts 14. Six Sigma 15. Critical Path Analysis 16. Quality Function Deployment	Hard TQM 3 <u>Quality Planning & Control</u>	0.909

Therefore, the results show that firms in SEE region general are familiar and in particular more with Hard TQM 2 or Factor B – *Lean Operations* tools with 0.945 alpha coefficient and then comes the Hard TQM 3 or Factor C- *Quality Planning & Control* with alpha coefficient 0.909. Finally in this test Hard TQM 1or Factor A – *Quality Systems* gained less alpha score 0.837 but this is also considered to higher than the normal scores.

5 Conclusion

To sum up, firms in SEE region are more familiar with 'hard' side than with the 'soft' side of TQM. This might also mean that firms in SEE region are not implementing and working on 'soft' side as much as they work on the 'hard' side. Nevertheless, the 'soft' side incorporates people and it is more difficult to manage, for this reason it is recommendation that SEE firm focus more toward the 'soft' side of TQM in the future.

Abstract: EndNote is a good reference management software, widely used over researcher, but not popular in the novelty work. The functions of EndNote in the Novelty work are introduced. EndNote has the comparative advantage relative to NoteExpress in the work of papers record searching report. This work also can promote the Novelty staff to keep up the advancement of modern technique. This work suggests that EndNote will play an increasingly important role in Sci-tech novelty search.

Key words: EndNote; Reference manager software; Sci-tech novelty search; Academic evaluation

1 Introduction

As powerful management software for bibliographic references, EndNote was developed by the U.S. Scientific Information Institute. By using Endnote, users can easily create their personal reference libraries, which are known as EndNote Libraries. In addition, users can not only classify the various references stored in their personal reference libraries, but also can edit the stored documents efficiently when necessary. Furthermore, the bibliographic fields can be modified following the requirements for distinct bibliographic styles and contents, and then the proper citations and bibliography can be inserted into word processing documents in hand^[1].

EndNote is widely used in scientific communities, mainly for managing bibliographic, writing scientific papers, and applying projects. Example, The applications of EndNote in bibliographic management and thesis writing were discussed in literature^[2]; EndNote can be used to improve the efficiency of editing work^[3].

When receiving a novelty subject, we need search a lot of literature relevant to the subject based on the technical points and novelty points, and then compare and analyze the literature. For the great amount of libraries and their literature, the outstanding talent of management literature is necessary. Reasonable management of literature can greatly improve the efficiency of the work of the sci-tech novelty, which gives novelty consultant more time to focus on filtering and comparing the relevant literature. Hence it indirectly improves the quality of science and technology novelty reports.

Even though the software of NoteExpress was applied to improve the efficiency of novelty search in literature, the authors failed to edit their own styles for the document requirements^[4]. In this paper, we produce a variety of output styles based on the Templates in EndNote. It is noted that the foreign literature databases only support the EndNote data output format, and therefore EndNote has the comparative advantage relative to NoteExpress in the foreign Novelty work.

When evaluating the personal academic level or applying the key disciplines, we need search the scholar's papers in ISI and Ei village databases, which only have the EndNote data output format. Hence EndNote has the comparative advantage relative to NoteExpress in the work of papers record searching report.

2 Using EndNote in Writing Novelty Report

We need to manage a large amount of literature during searching, analyzing literature, and writing report in the novelty. By Using EndNote, a great bibliographic management software, we can manage the literature efficiently and orderly.

2.1 Using EndNote in searching literature

Receiving a subject, a novelty consultant should communicate with clients about the content of subject, and then develop search strategies. The novelty consultant searches the related literature in the major databases, and pastes the related information of literature into word document manually, which

* This work was supported by the National Natural Science Foundation of China (Grant No. 61203032), the Natural Science Foundation of Hubei Province (Grant No. 2012FFB05007), and the Fundamental Research Funds for the Central Universities (Grant No. 2010-IV-014).

makes the information of the literature messy and disorderly.

By using EndNote, we can create the client database, store the literature in EndNote format, and import all literature into the client database, once for all. All foreign databases support EndNote format, which provides a great convenience for using the software in novelty.

The repetition rate of the retrieved documents is very high, during searching the literature in databases. For instance, the journals in VIP and CNKI overlap severely (about 43.795% for VIP and 86.956% for CNKI^[5]). This situation also occurs in the English databases, such as ISI and Ei village. Deleting the duplicated literature manually is tedious and time-consuming. On the other hand, by using the ‘automatic check the duplicate literature function’ of EndNote, We can remove the duplicated literature in the client library, once for all, which is easy and efficient.

2.2 Using EndNote in analyzing literature

In the novelty, the literature that we search includes journals, thesis, conference papers, scientific and technological achievements, patents and so on. By using EndNote, we can import all kinds of the literature into the client library, remove the duplicated literature, classify the literature by types, and sort the literature by time automatically and efficiently, once for all. During analyzing the literature, sometimes the abstracts of the literature do not contain enough information, that is, the abstracts can not adequately reflect the contents of the papers; in such a case, we should open and read the papers. By using the ‘link Library function’ of Endnote, we can open the electronic version of the papers directly, which can save a lot of time and manage the literature efficiently.

2.3 Using EndNote in writing novelty report

We should write the novelty report according to a certain format, right after analyzing the literature. Novelty report is rather different from journal article in that the literature related the novelty subject not only require a specific style, but also the abstracts of the literature. There is no specific style for novelty report in EndNote. Consequently, we need to fully understand the Templates language of EndNote, if we want to program and produce the desired literature output format.

For instance, we can program the format of novelty report’s attachment as follows. Click ‘Edit—Output Styles—Edit’, and then choose a style contained in EndNote that is similar to the required one. Then we program the styles of Journal Article, Conference Proceedings, Thesis, and Patent according to the requirements in EndNote Templates, respectively.

Because the novelty report’s attachment style requires the abstract of the literature, we should program ‘Layout’ in EndNote Templates as follows. We number each reference for [Bibliography Number] in ‘Start each reference with’ of EndNote Templates, and then write ‘Abstract’ at the end of references. The detailed results are shown in Figure 1, Figure 2 and Figure 3 respectively.

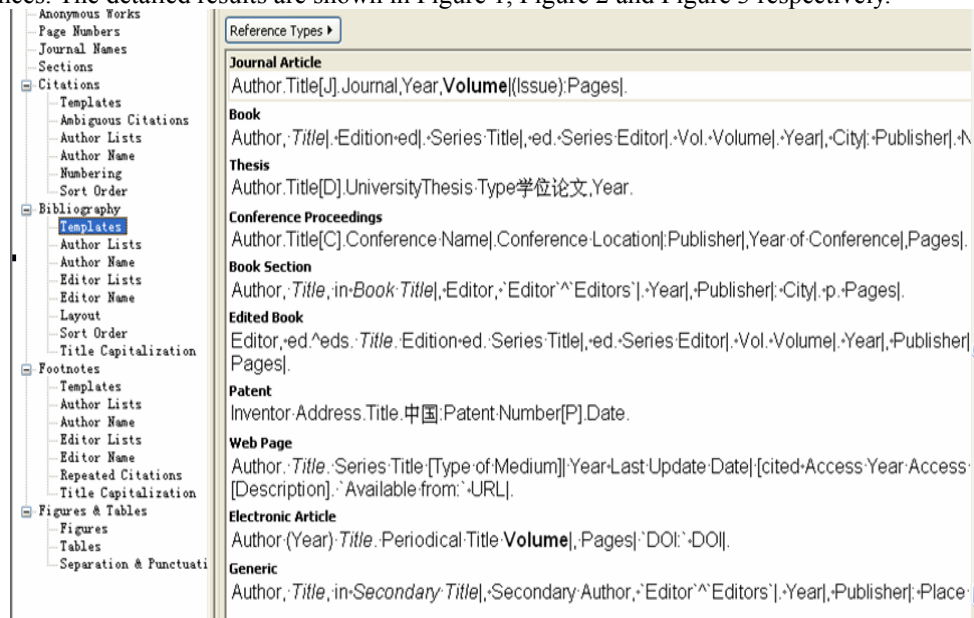

Figure 1 Novelty Report Accessories Output Style

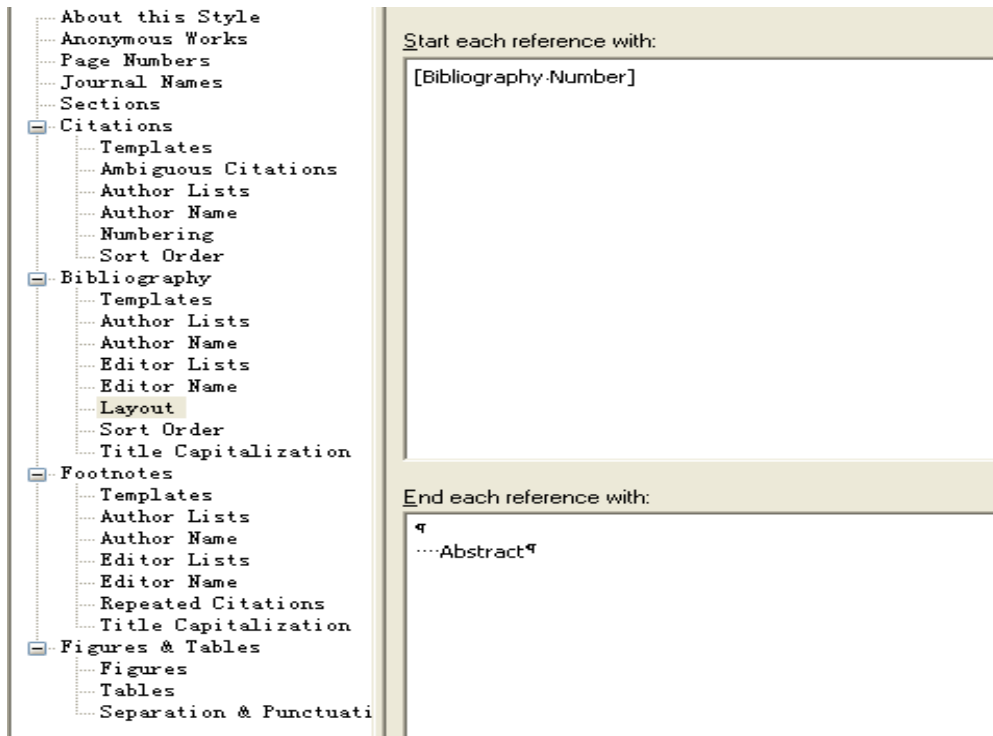

Figure 2 Novelty Report Accessories Output Layout

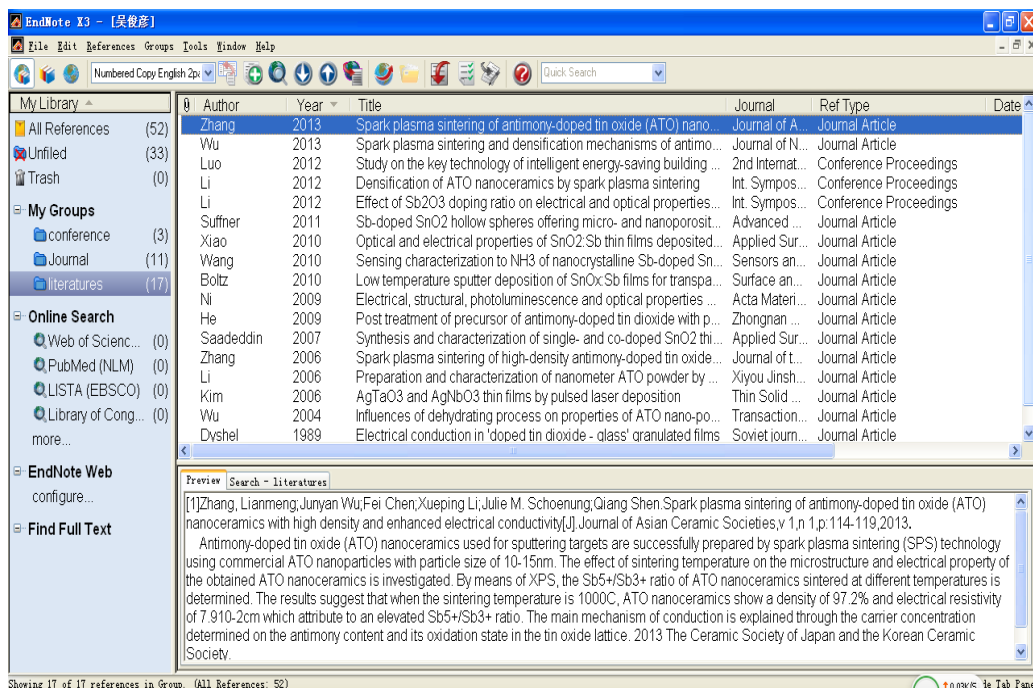

Figure 3 The Instance of Novelty Report Accessories Output

As long as mastering the language of EndNote Templates, we can program whatever output format you want. By using the above prepared output style, we can export the attachments in the written novelty report efficiently.

3 Using EndNote in Searching Scientific Papers

We need to retrieve the papers of scientists in ISI an Ei Village databases for talent introduction,

key disciplines declaration, talent scheme, and other supporting materials. By using EndNote, we can create a personal database, and classify the papers by retrieval type, such as SCIE, EI Village, and CPCI-S. And also we can classify the papers by the types (Journal article or conference papers), and the published time. The important one is that we can program the suitable output format for the papers. By using EndNote, we can improve the efficiency and quality for retrieving papers.

For instance, every year we should retrieve all papers of Wuhan University of technology, which are indexed by SCIE, EI Village, and CPCI-S, and then upload the papers into the library's website according to a certain format. There are about one thousand papers indexed by EI every year. If the papers in the above format are sorted out manually from the database, such work is tedious and time-consuming. On the contrary, by writing the Templates in EndNote according to the desired export format, searching the scientific papers is of great efficacy, which is shown in Figure 4.

 <文献类型>=Article
 <摘要>=Zirconium phosphate (ZrP2O7) bonded silicon nitride (Si3N4) porous ceramics were prepared using starch powder as the pore forming agent and pressureless sintering technique. The obtained results show that the porosity of the sintered starch processed 25 wt.% ZrP 2O7 bonded Si3N4 porous ceramics is 36-62.3%. All the samples exhibit surprisingly low linear shrinkage. The pores are formed by the continuous reaction of ZrP2O7 at 250 C and burnout of starch at 550 C, during which a large amount of pores with pore sizes of less than 0.5 m and 10 m are formed. 2011 Elsevier B.V. Figure 4 The Papers of Wuhan University of Technology Indexed By EI Village in 2011

4 Conclusions

When mastering the various functions of EndNote, we can eliminate a lot of manual steps, and improve the efficiency of the Novelty work and the scientific papers' retrieval. By using EndNote, we can write novelty reports and retrieve scientific papers indirectly, and consequently improve the quality of novelty reports and scientific papers' retrieval reports. This work suggests that EndNote will play an increasingly important role in Sci-tech novelty search.

Abstract: Innovation is the eternal theme of human beings as well as the fundamental way of enterprise development. To enhance the ability of independent innovation, enterprises must pay attention to the innovative talents incubation. In this paper, based on the concept and features of innovative talents, we analyze the current situation of innovative talents incubation of RG. Then point out the main problems existing in innovative talents incubation. At last, we put forward some countermeasures and suggestions about innovative talents incubation for the company.

Key words: Innovative talents; Talents incubation; RG Petro-Machinery (Group) Co. Ltd

1 Introduction

Innovative talents are the enterprise security of productive efficiency and economic benefit, directly related to the survival of enterprises. Innovative talents are the core and backbone for enterprise to innovate, directly related to the sustainable development of enterprises. Moreover, innovative talents are the solid foundation for the enterprise to develop, directly related to the competitiveness of enterprises. Only adapting to this changing trend and speeding up the cultivation of innovative talents, the enterprises can hold long-lasting competitive advantages.^[1] Although the innovative talent is very important, Chinese enterprises have not paid enough attention to it. At present, most of Chinese enterprises tend to recruit employees in the way of “Adverse demand”, aiming to reduce the cost of human resources. They think there is no need recruiting highly educated and high intellectual talent as long as the work can be done. Let alone the consciousness of innovative talents cultivation.^[2] This is one of the main reasons why Chinese enterprises’ competitiveness is not strong. Therefore, to change this situation and make full use of human resources, enterprises should take the innovative talents incubation as the development strategy and focus on the implementation of it. Here, this paper will take the RG for an example, and prove how enterprises should cultivate innovation talents from the perspective of practice.

2 Types and Characteristics of Innovative Talents

2.1 The concept and types of innovative talents

To understand the connotation of innovation talents comprehensively, we should learn it from three aspects: talent, innovation and creative thinking. Innovative talent is the one who have strong innovative consciousness and unique innovative thinking and strong ability to innovate. They are able to get innovative achievement and create value for the enterprise through their innovative labor.

Innovative talents include scientific and technological personnel engaged in R& D activities^[3], Compound talents who both have certain professional knowledge and international vision, managerial and administrative personnel engaged in the management work, as well as senior workers, technicians, senior technicians and other professional and technical and skilled talents who have specialized knowledge and the corresponding operation skills in the first post and can solve the practical problem.

2.2 Characteristics of enterprise innovative talents

First, the strong innovative consciousness. Generally speaking, innovative talents should have the strong sense of innovation and the courage to break conventional rules to make innovations. Innovation consciousness is the prerequisite of innovation^[4]. Only under the guidance of the innovation consciousness, can we have the strong motivation to innovate, and then set up the goal of innovation, make full use of creative potential^[5].

Second, the unique creative thinking. In the innovation process, innovative talents are able to create new thinking. Creative thinking is characterized with fluency, flexibility and rigorous logic. It can be either divergent or concentrated. For creative thinking, creativity and creative thinking is the core of the characteristics of innovative talents. The core of innovation is just the innovation ability and innovation spirit.

Third, the strong ability to innovate. Equipped with creative thinking only is not enough, creative talents should also have the ability to turn creative thinking into innovative achievement. Innovation ability is the basis of forming creative thinking^[6]. Besides, the enterprise innovative talents should also have the ability to gain knowledge and information, knowledge integration capability, the ability to find questions and practical ability, etc.

Fourth, the ability to create value for the enterprise. Compared to common innovative talents, Enterprise innovative talents are characterized with creating value for the enterprise. Traditional innovative talents focus more on theory innovation. But enterprise innovation talents pay more attention to find the actual utility of enterprise profit and put into production.

3 The Current Situation and Problems of RG Petro-Machinery (Group) Co. Ltd

3.1 Overview of RG Petro-Machinery (Group) Co. Ltd

RG is located in Wo Long District of Nan Yang City, He Nan Province. It's the oil drilling equipment manufacturing backbone enterprises of China, as well as a domestic base of major national technology and equipment. RG is high-tech enterprises of the State Torch Plan and the national mechanical brand top 500 enterprises, intellectual property advantage enterprises, patent application top 20 enterprises. Its comprehensive strength in the domestic same industry belongs to "top 10", having an important influence on the market both at home and abroad. The company has 16 production plants, including casting and forging, metal processing, assembly or so and 4 drilling equipment integrated test field. The company has perfect scientific research and development system, and has set up a technology research and development institutions in He Nan province oil drilling equipment engineering technology research center, a state-level enterprise technical centers, post-doctoral scientific research workstation matching and infrastructure. The company adheres to the customer-orient marketing idea. It has set up specialized agencies in each big oilfield nationwide. The company's products sell well in each big oilfield, and export to Britain, the United States, and Canada and other 30 countries or regions.

3.2 The current situation of innovative talents of RG Petro-Machinery (Group) Co. Ltd

3.2.1 The academic structure of RG

Staff education is an important index to measure the quality of innovative talents. In 2011, there were 950 people whose degrees are high school and the following degree personnel, accounting for 59% of the total number of employees, down 4.5% from 2007; 604 staffs are college and undergraduate, accounting for 37.7% of the total number, 5.6% more than in 2007; master degree or above (including Dr.) were 49, accounting for 3.3% of the total number, 21 more than the number 28 in 2007, increase rate is 75%.

3.2.2 The innovative talents structure of RG Petro-Machinery (Group) Co. Ltd

In 2011, RG had 885 innovative talents, accounting for 55% of the number of all employees, among which 164 personnel are science and technology personnel and accounted for 18.53% of innovative talents. The number of compound talents were 117, accounting for 13.22% of innovative talents. The number of managerial and administrative personnel were 128, accounting for innovative talents 14.46% of innovative talents. The number of professional technology and skilled personnel in first post are 476 people, accounting for 53.79% of innovative talents.

3.2.3 The title structure of innovative talents of RG

1) The title structure of professional technology and skilled personnel in first post

The professional technology and skilled personnel in first post refers to those who have special knowledge and corresponding operation skills in the front-line positions, and can solve the operation problem as well as key technology problem, including senior workers, technicians, and senior technicians or so. As shown in Table 1, in 2011, the company has 476 such kind of personnel, including 437 senior workers, 37 technicians and 2 senior technicians, accounting for 43.5% of all 1093 senior staffs. Senior workers accounted for 91.8%, technicians and senior technicians account for 7.8% and 0.4% respectively.

Table 1 The structure of professional technology and skilled personnel in first post in 2011 Unit :person,%

	Ordinary workers and below	Professional technology and skilled personnel				total
		Senior worker	technician	Senior technician	subtotal	
Number of personnel	617	437	37	2	476	1093
Proportion	56.5	91.8	7.8	0.4	43.5	100

2) The title structure of managerial and administrative personnel

Managerial and administrative personnel are part of executive staff, they are important to support the good operation of the company. As shown in Table 2, in 2011, RG has 128 managerial and administrative personnel, among which 109 personnel's title are junior or above, accounting for 85.2%. The number of managerial and administrative personnel who have middle or senior titles were 63, accounting for 49.1%.

Table 2 The Title Structure of Managerial and Administrative Personnel in 2011 Unit :Person,%

	managerial and administrative personnel				others	total
	junior	middle	senior	subtotal		
Number of personnel	46	33	30	109	19	128
Proportion (%)	42.2	30.27	27.53	85.2	14.8	100

3) The title Structure of science and technology talents (Engineers)

As shown in Table 3, the engineering and technical personnel of RG are mainly concentrated in the technology center. Among all the 164 employees, 153 belong to the science and technology talents, accounting for 93.4%. Senior engineers account for 18.9% of all engineering and technical personnel, engineers and assistant engineers account for 31.7% and 42.8%. respectively.

Table 3 The Title Structure of Science and Technology Talents in 2011 Unit :Person,%

	science and technology personnel				others	total
	junior	middle	senior	subtotal		
Number of personnel	70	52	31	153	11	164
Proportion (%)	42.8	31.7	18.9	93.4	6.6	100

3.2.4 The structure of high-level talents of RG Petro-Machinery (Group) Co. Ltd.

The company has 79 people with senior professional titles, 6 provincial-level academic technology leaders, and 3 experts who are in the National 863 project planning and enjoy the special allowance of the State Council. Compared with the company's 1093 employees, the proportion of high level talent is not big, but high-level talent in the team to play a leading role. They make the company become a guide-post leading enterprises of technology innovation, as well as an equipment manufacturing enterprises which have great technical strength and strong technical advantages.

3.2.5 The main problems of innovative talents incubation of RG Petro-Machinery (Group) Co. Ltd

1) The lack of awareness of the cultivation of innovative talents

The standardized production and work mode not only counts against the company daily business but also inhibits the innovation of enterprise talents. This is one of the main problems of innovative talent incubation of RG in the regulations of the company; more attention was paid to the standardization of production while the promotion of the cultivation of innovative talents was ignored.

2) The lack of innovative talents

Innovation is an inexhaustible motive force for enterprise development. RG only has 91 high-level personnel, accounting for 5% of the total number of 1603 employees. What's more, there are only 12 experts who are in the National 863 project planning and enjoy the special allowance of the State Council, just accounting for 0.7% of all the staffs. At the same time, the number of middle and above titles in the first operator, administrative management personnel and engineering and technical personnel, are less than half of the total number in these sectors.

3) The lack of training and incentive mechanism of innovative personnel

In the interview of RG, we know that neither the company's compensation system nor employees' occupation planning link to staffs' innovation ability except the sales department. The company did not take innovation as the company's corporate culture and give the appropriate spiritual and material incentives for innovation ability, which weakened the innovation enthusiasm to a certain extent.

4 The Countermeasures of Innovative Talents Incubation of RG Petro-Machinery (Group) Co. Ltd

4.1 Establish culture of innovation

The enterprise culture is the embodiment of corporate values and mission, enterprise culture

will gradually affect employee behavior and values. Excellent enterprise culture is the spiritual pillar of the modern enterprise. The establishments of the culture of innovation makes RG employees focus on innovation, the innovation of enterprise culture has the function of orientation, and cultural innovation will affect every department in the company, not only in the technology center and Engineering Department. Enterprise innovation culture makes the whole enterprise a great improvement, thus achieve a three-dimensional effect of innovation which integrates technological innovation, management innovation and organizational innovation.

4.2 Keep continuous talents innovation

The company should increase the number and proportion of innovative talents. On one hand, the company should pay attention to the cultivation of existing innovative talents, creating the atmosphere of "working for study, learning to work" of. On the other hand, we should also pay attention to the introduction of talents and exchange to outside. In this respect, the company can strengthen technology exchange with research institutes or universities to make up for the lack of knowledge, at the same time; it can also gain talents who have innovative quality and ability for the company.

4.3 Establish incentive mechanism for innovation

To enhance the staffs' enthusiasm to innovation, corresponding innovation incentive system must be established. Specifically speaking, the company should construct evaluation system and perfect appraisal system, then use evaluation index system to measure the company's creative thinking and creative achievements, at the same time, connect innovative achievement with the employees' salary and occupation planning, thus achieve the effect of motivating staffs eventually. What's more, the enterprise should create a good atmosphere of mutual learning, knowledge creation, developing information technology, innovating continuously.

5 Conclusions

The enterprise innovative talent is an eternal topic. With the continuous progress of science and updating of information, the society will make further demands on talents, enterprises are also facing challenge. Facing the lack of innovative talents, in order to allow enterprises to remain invincible in the competition and let the enterprise be long-term sustainable development, enterprises should pay attention to the cultivation of innovative talents, improve staffs' awareness of innovation, strengthen the self-learning and exchanges with universities and research institutes. At the same time, the company should establish and improve the incentive mechanism, keep staffs' innovation enthusiasm and motivation.

Informally Institutional Reform of Taxi Regulation

Ding Yunlong, Wang Wei

School of Management, Harbin Institute of Technology, Harbin, P.R.China, 150001

(E-mail: dingyunlong@hit.edu.cn, wei_w2000@163.com)

Abstract: There are many informal institutions of taxi regulation causing social welfare loss. The traditional view is that informal institution is a kind of cultural endowments which is essentially immutable or changes very slowly and then can not be created consciously by people. In this paper, the informal institutions of taxi regulation have been found that they are based on the formally regulatory institutions of taxi. This paper argues that the relationship between informal constraints causing social welfare loss and formally regulatory institution of taxi industry and the reform way of informal institution to maximize social welfare.

Key words: Informal institution; Taxi industry; Regulation; Reform

1 Introduction

According to the New Institutional Economics, the institutions provide people with the incentive, and then determine the result. Many scholars taking this view have carried on research on institutional innovation of taxi regulation including entry regulation, fare regulation and quality regulation. But it is a pity that the research scope of these literatures has been confined to formal institution and ignored informal institution which has a strong impact on the taxi market. In fact informal institution plays a so very important role that it can replace formal institution in a certain extent. As North said, "even in the most developed economy, the formal institutional arrangement is decided to choose a small part of the total constraints, people's life is influenced by informal institutional arrangement"(North, 1990). The reason why innovation of informal institution has been ignored is that many scholars consider informal institution as a part of the heritage that we call culture(ibid.: 36-40), in which formal rules have been embedded. So in their opinions, informal institution is essentially immutable or taking centuries to change (Williamson, 2000), so it is called as slow-moving rule while formal institutions as fast-moving rule (Roland, 2004). But the counterevidence have been found by a few researchers that some informal institutions can change faster than formal constraints such as the informal land tenancy rules in Philippines (Ruttan 2006). In Chinese rural area, there are some informal rules permits the private sector of the economy to exist before its reform and open-up which disappeared after collapse of planned economy (Chen 2000). This suggests that there may be both fast-moving informal institutions which would be influenced by informal rules(which we called as operation rules) and slow-moving informal institutions (what Ruttan calls cultural endowments) (Kingston and Caballero, 2009). The purpose of this paper is to discuss the relationship between informal constraints causing social welfare loss and formally regulatory institution of taxi industry and the reform way of informal institution to maximize social welfare. Several key questions are addressed: What are the informal institutions of taxi regulation? How do they cause social welfare loss? Whether they can be corrected through the formal institution reform?

2 The Informal Institution of Taxi Regulation

What is the informal institution? What is the difference between the formal institution and informal institution? The scholars generally recognized institution can be divided into two kinds: the formal institution and the informal institution, but due to the ambiguous concept of institution, so there is no clear definition of the formal and informal institution which has been given by anyone. The vast majority of informal institution is hard to be accurately described, although they are widespread and very important (Noth). According to Christopher Kingston and Gonzalo Caballero (2009), it is impossible to define the informal institution accurately, but most scholars convince that the difference between the formal institution and the informal institution is clear: the term "formal" is often taken to mean that the rules are made explicit or written down, particularly if they are enforced by the state, whereas informal rules are implicit and enforced endogenously by the members of the relevant group. As a matter of fact, there are three important informal rules in the taxi market.

2.1 The rule of discriminative access

The rule of discriminative access means that the government issued a taxi license to the special

people or organization. Most Chinese cities' taxi office does not give permission to the taxi drivers but to the taxi company. There are some literatures discussing the rule of access discrimination, but they regard the rule as a formal institution. This is a kind of wrong view because the rule of discriminative access is a violation of the law. Taxi license permission is from "management measures of the city taxi". According to this law, both the taxi drivers and the taxi company can take the taxi license. So the rule of discriminative access adopted by the taxi administration is illegal and invalid. In fact, there are few public documents about the rule of discriminative access which evolves spontaneously.

2.2 The rule of renting license

The rule of renting license is the so-called "daily rent" which is widely popular in most cities of our country. In this way, the taxi companies owning licenses don't actually engaged in a taxi business, but rent taxi licenses to the taxi drivers who pay the rent to the former daily. The taxi drivers are not the owners of taxi licenses, and they only can pay high rents on schedule to get into this business.

2.3 The rule of secondary rent-seeking

The entry regulation of taxi leads to taxi demand exceeding supply and the price raising that attracts many drivers without taxi licenses to entering into taxi market illegally. In order to avoid this kind of situation, the regulatory officers ought to punish the unauthorized cab. But in fact, the unauthorized cars exist widely in the taxi market in which the game between regulatory officers and the non-registered drivers have formed equilibrium. In this game, the unofficial drivers obtain illegal income, while the officers pursue rent-seeking. Any change of the equilibrium will lead to the loss of the players. After the first rent-seeking through the distribution of taxi licenses, this rent-seeking is called "secondary rent-seeking".

3 The Social Welfare Loss Caused by Informal Institution

3.1 Increasing the cost of taxi supply

Figure 1 The Loss of Social Welfare Causing by the Access Discrimination

As shown in the figure 1, with the absence of quantity control, the demand curve of taxi market is expressed as D and the supply curve expressed as S, the total social surplus expressed as triangle ABC. In this case, the rule of discriminative access will oblige the taxi drivers to join taxi companies. But the corporate supervision cost will be too high to suffer because of the dispersing, liquidity and privacy of taxi. So the taxi companies prefer to rent their taxi license than for the higher income. The reorganization of taxi companies can not improve taxi industrial income but increase administrative cost, which makes the supply curve S move up to S', and the total social surplus becomes a triangle AEF, quadrilateral BEFG for additional unnecessary management cost.

With the quantitative control, taxi supply is not decided by market but by the government, the supply curve is expressed as S_r which is perpendicular to the horizontal axis. At this time the total social surplus is expressed as quadrilateral AEHI, quadrilateral BEHG is additional management cost. This part of the additional costs is commonly known as "daily rent", which means a taxi driver need pay 200-300 Yuan to the taxi company everyday. Taking Shanghai as an example, according to the investigation of Zhu Jiaguo who is a member of the Shanghai political consultative conference (CPPCC), a Shanghai common taxi driver has to pay 380 Yuan everyday that occupy 50% his gross

trading income to the company as “daily rent”. That is to say, the taxi drivers have to work over half a day for no productiveness.

3.2 Reducing the quality of taxi service

As stated above, the rule of discriminative access causes the rule of renting license. Monopolizing the taxi licenses, the taxi companies have two kinds of choices: one is to operate independently; the other is to lease their licenses to the drivers. The main difference between the two options is who has the residual claim. In the independent operation, the residual claim belongs to the taxi companies which will gain the operating income, while the drivers are only employees who obtain salaries in accordance with the contract. In the license-rented case, the taxi companies will charge the rent of taxi licenses and pay no for managing companies, while the taxi drivers bear the cost of operating and acquire the relevant residual claim. If the taxi companies choose the first option, they will find their supervision cost be so high that the effective superintendence can be assured. Because the taxi companies can't effectively supervise their drivers, operating independently will greatly increase management cost and can not improve the driver labor's enthusiasm. As a result, their net profit declines. On the contrary, those companies choose renting taxi licenses will obtain higher profit because the taxi drivers would rather work for themselves. Therefore the rule of renting license becomes widely popular.

The rule of discriminative access forces the taxi drivers to join in the taxi business. But compared with before, the reorganization of taxi companies altered nothing except increasing additional unnecessary management cost. The quality of taxi service does not improve. On the contrary, it becomes worse. In order to pursue maximal advantages, the taxi companies Prefer to replace the existing taxi drivers with the farmers and migrant from low-income area because they would be more willing to accept higher rents than the existing taxi drivers. With acquisition of more experience, these previous farmer and low-income earners want to increase income. As a result, they will be replaced by new farmer and low-income earners. The continuous unstable state of taxi drivers results in descending of the taxi drivers' path finding ability, service skills and whole level of service of taxi industry.

3.3 Causing secondary rent-seeking

In taxi market, the rule of access regulation unbalances supply and demand, causes price to rise, leads to availability reduce, makes passengers wait longer. All of these have attracted a large number of profit-driven non-registered cars joined in transport and to a certain degree. As a matter of fact, it is actually a kind of spontaneous corrective actions by the taxi market. However, these illegal immigrants violate the law of access regulation, and cause the licensed operators' loss. Consequently, they were severely punished by law enforcement agencies. But the law enforcers find that they can benefit from the unofficial drivers through rent-seeking, if not all of the cabs without licenses forces to leave. For this purpose, the law-executors are not willing to kill the goose that lays the golden eggs. The illegal entrants realize that they can make a profit after pay the rents to the officers. And then, their game attains equilibrium. Therefore, the rule of secondary rent-seeking is actually a system of allocation of rents. In this system, the potential operators can pay bribes to break the law of taxi regulation. This means that the taxi supply increases. On the other hand, it also increases the supply cost of unlicensed cars, forces a few drivers to leave from the market so as to reduce the supply of taxi.

4 Innovations of the Informal Institutions

The core of these informal institutions is economic rent. Supply shortage resulting from quantitative restriction of taxi generates economic rent. The taxi regulators and the taxi companies' owners become rent-seekers. In the rent-seeking game the informal rules evolve spontaneously. So they are not cultural endowments but fast-moving rule, which will disappear if quantitative restriction of taxi is deregulated. The quantitative restriction of taxi has been criticized by many scholars due to reduced availability of taxi and inefficient correcting externalities. In their views, the main reason of traffic jam is not taxi but creasing private cars. Substitute for taxi is private car instead of a bus (Yang KaiZhogn and Chen LiangWen, 2008). So restricted the number of taxi and rising incomes will lead to sharp rise in the number of private cars. Therefore, deregulating taxi quantitative restriction will both cut congestion and create the informal rules causing social welfare.

5 Conclusion

As stated above, the informal institution in taxi market causes the loss of social welfare on the whole. Although in a certain extent the rule of secondary rent-seeking makes up for it, this problem is not solved far away. Furthermore, secondary rent-seeking which also caused the bribery and other

illegal behaviors wouldn't be the most constructive solution. These informal institutions including the rule of discriminative access, the rule of renting license and the rule of secondary rent-seeking which originates from the rule of quantitative restriction of taxi are not cultural endowments, but operation rules which could be changed fast, and they will vary if their base—the formal rules change. So as long as the elimination of quantitative control, these problems can be solved.

Research on Sports Resources Development and Management Countermeasures in Rural China

Ai Xiangnan

Department of physical education, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 75566568@qq.com)

Abstract: By applying literature review, questionnaire investigation, and mathematical statistics, this paper studied the current situation on the sports resources allocation and consumption market in rural China. The results showed that the sports resources were lacking in rural areas in China and there were region differences as well. On the other hand, the sports resources consumption market was highly potential there. In order to create better environment for the proper usage of rural sports resources, management countermeasures were put forward as taking advantage of existing resources; improving the rural sports consumption potentials; and exploiting more natural sports resources.

Key words: Rural areas; Sports market; Sports resources; Sports consumption; Management countermeasures

1 Introduction

Sustainable development of rural sports, culture and sports culture in rural areas, a new concept of development, in accordance with the requirements of the CPC Central Committee and State Council, the development of sport in rural areas should always adhere to scientific development. This requires to follow sustainable development of rural sports, culture and scientific development concept, which upholds the integrity of the development, sustainability, innovation and coordination principles.^[1] The State Council recently issued “National Fitness Program (2011-2015)”. The Program requires that local people’s governments at various levels shall bring the sports resources development in rural areas under the plan of building a well-off society in an all-round way and the construction of new socialist countryside, so as to gradually build a urban-rural integration public service system for national fitness, and improve public service ability of community sports in rural areas. The development and management of sports market in rural areas will not only promote national economy, but also enrich farmer’s spiritual life, thus further improve their quality of life, which also meet the goal of building a new socialist countryside.

2 Current Situations of Sports Resources in Rural China

2.1 The current situation of sports resources allocation in rural areas

In accordance with different existing forms of sports resources, we can divide sports resources into two categories, namely sports resources in physical form and sports resources in non-physical form. The former category includes sports products, sports natural resources, sports venues and facilities as well as sports funds, while sports information, sports technology, sports organization and sports events belong to the latter one.

Rural China is now facing a complex process that will transit from a traditional society into a modern one, although the rural economy has been greatly improved, with the fact that China has long put too little investment on sports in rural areas, that the sports investment system in these places is not rational. Therefore, if take a look at the allocation of sports resources in rural China, both physical and non-physical ones are in great need. according to “the fifth general survey of national stadiums”, the total number of stadiums in China is 850,000, among which 91.82% is located in cities and towns that account for 16.50% of national territorial area and 29.92% of population, only 8.18% located in the vast rural areas that account for 83.5% of national territorial area and nearly 70% of population. Although the rural areas have an overwhelming majority of the population, say close to 70%, the sports resources in these places just account for a small proportion^[2]. The sports instructors in rural areas are still in great shortage. Now in rural China, the lack of sports fitness organization and sports instructors is becoming a prominent problem, which cannot meet farmers’ growing demand for physical fitness. Moreover, there are very few channels to get sports information, and only the houses in the main streets have access to internet.

The different geographical conditions in rural China, the huge gap in economic development level, and the diversified needs of rural residents for sports are the main factors that determine the discrepancy of sports resources allocation in rural areas geographically, especially in the field of venues and facilities,

fund input and scientific guidance. Generally speaking, the rural areas adjacent to cities are richer in sports resources than remote areas, while the wealthy eastern areas richer than western areas.

2.2 The developing potential of sports resources in rural areas

2.2.1 The current situation of existing basic sports resources in rural areas

The sports resources in rural areas are in shortage, as for the problem of existing sports resources scarcity in rural areas, many local governments have paid attention to and begun to improve on this point. Take Laiwu City, Shandong Province for instance, under the main line of promoting the urban-rural integration in sports, the Laiwu Sports Bureau have continually extend the sports resources from city to countryside by carrying out the project of “bring facilities, organizations, activities and guidance of national fitness to the villages” (called “si jin cun” for short). In 2008, this city has invested over 20 million *yuan* in sports alone, bringing 230 basketball courts, 460 Ping-Pong tables and 1,500 fitness equipment for 230 villages, meanwhile, 1 community fitness center, 5 township recreation and sports centers were completed and put into use, more than 400,000 square meters of land were designed for sports use. The sports facilities in villages were greatly improved, creating idea conditions for farmers to take exercises^[3]. Another case in point is Xinjiang, Xinjiang is an agricultural district with most of the residents living in the remote rural areas. Launching an extensive exercise campaign in the countryside has played an important role in enhancing physical fitness, improving farmers’ health and enriching their cultural life. From 2006 to 2009, China and the province have set up 2500 sports venues with the fund from the non-profit foundation of sports lottery. During the 11th five-year plan, the new “project of sports fitness for farmers and herdsman” has planed to build 3,000 more sports venues. At the same time, more and more sports associations focused on the rural areas with throngs of sports instructors went to the village to give guidance of scientific exercise to farmers.

2.2.2 Develop the sports natural resources in rural areas in a rational way

The rural areas are boasted with abundant sports natural resources. The natural material elements have provided an important physical carrier for sports activities. Through the development and utilization of these resources, it can generate great economic benefits while achieving sustainable development among resources, environment and economy.

Sports tourism is a branch of tourist industry. China started late on this field, there is a huge business opportunity in the development of sports tourism resources and opening up of the market^[4].

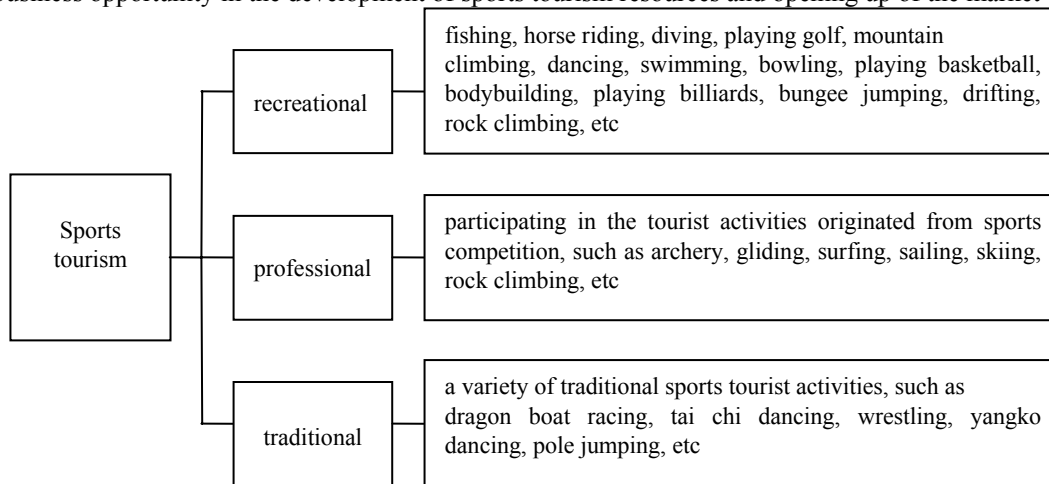

Figure 1 The Structure Chart of Sports Tourism

In recent years, city landscape sports come up to China quietly. Shanghai can be a good example: the National Beach Volleyball Tournament has held in Century Square, Nanjing Road, Shanghai; the Jin Mao Tower saw the organization of World Low-altitude Parachuting Competition; F1 China has held in Shanghai for 7 years in a row from 2004 to 2010. If bring the landscape sports from city to countryside with the use of extensive natural conditions there, such as extreme sports, motorcycle races and water sports which can be based on the rich natural resources, it will provide a new opportunity for the development of sports market in rural areas.

2.3 The current situation of sports consumption market in rural areas

2.3.1 The main form of sports consumption in rural areas

The rural population accounts for about 70% of the total population, theoretically analyzed, it can

be a large sports consumption group for the sports market in rural areas with huge consumer-market potential. Along with social progress, economic development, and the improvement of people’s living standards, there has been a fundamental change in rural lifestyle and consumption concept. Sports consumption has increased greatly compared with before, but the amount is less than 30% of the total amount and has not yet formed a certain scale.

Sports consumption refers to the personal consumption expenditure related to sports activities, it is an important and integral part in living consumption, belonging to development consumption and recreation consumption. This kind of consumption is based on the precondition that people’s material life condition can meet their basic living demand, and then the higher need stemmed from seeking individual development and recreation requires such an option. It is a new consumption type that forms under the subjective understanding to the functions of sports. In accordance with the different purposes and external manifestations of the sports consumption goods obtained from purchasing, the behaviors of sports consumers can be divided into material sports consumption, spectator sports consumption and participatory sports consumption^[5].

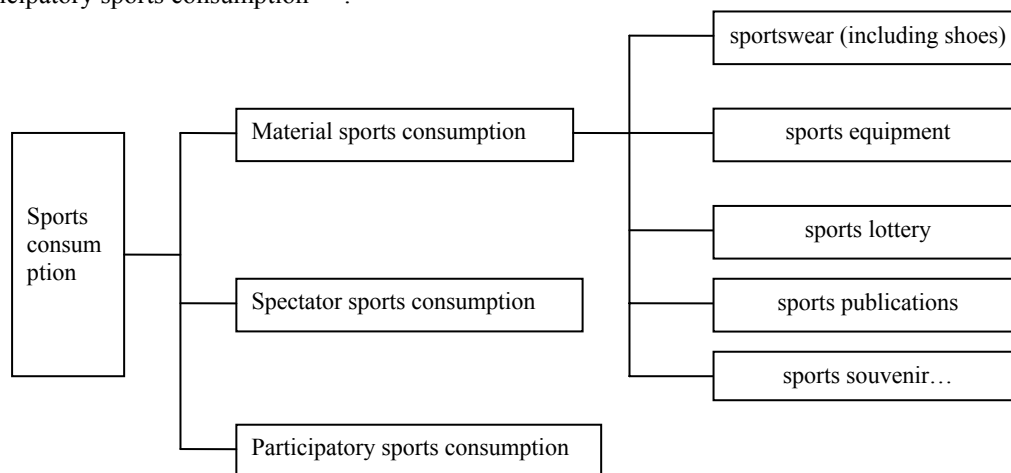

Figure 2 The Structure Chart of Sports Consumption

The material sports consumption refers to personal consumption for material consumption goods related to fitness activities, such as sports apparel, sports lottery, sports equipment, sports drink and sports magazines and newspapers. As can be seen from Table 1, the main consumption of farmers is centered in material sports consumption, including sports apparel, sports lottery, sports equipment and sports magazines and newspapers. Nowadays, sportswear is very popular among farmers which can meet their requirements for comfort and practicability.

The spectator sports consumption means to purchase sports tickets and watch sports matches or performance. From Table 1 we can see only a few farmers go to stadiums to watch games.

The participatory sports consumption refers to the consumption for physical exercises and corresponding services, such as the fee charged for attending martial arts, bodybuilding, qigong and fitness classes. As can be seen from Table 1, such consumption is also poorly ranked.

The statistical data of Table 1 is based on 1200 questionnaires on farmer's sports consumption pattern, the result is as follows:

Table 1 The Sports Consumption form of Chinese Farmers

Consumption patterns	Ranking	Number
sportswear	1	852
sports lottery	2	369
sports equipment	3	332
sports republications	4	216
sports-related classes	5	196
watching games	6	185
other	7	178

2.3.2 Factors affecting sports consumption in rural areas and the existing consumption potential

There are several main factors that affect sports consumption in rural areas:

First, the imbalance of economic development restricts the development of sports consumption in

rural areas. Farmer's income level is the most important factor affecting their consumption, among which permanent income matters most. Farmers in the regions with low income levels can hardly afford sports consumption, while those with higher and stable income intend to spend more in both material sports consumption and participatory sports consumption.

Second, the irrational sports resources allocation is another factor that affects the sports consumption in rural areas. The sports consumption can not exist without specific living environment, however, the sports market in these areas can be featured as single business, low grade, limited scale and fewer choices. The shortage of sports consumption goods and undeveloped sports consumption market restrict the development of sports consumption. The per capita income in the villages of Jiangsu and Zhejiang, southern Jiangsu, Guangdong and other coastal regions is much higher than that of cities, farmers in these areas have strong purchasing power, and as a culture, sports have already become one part of their life. However, the fact is that hardware facilities are mainly centered on more developed medium-and-large-sized cities, only 20% of them are built in rural areas. The sports consumption in various patterns is in great demand.

Third, farmers are unaware of the importance of sports. In many places, traditional morality and value still have an influence on their understanding to sports. With the idea that traditional manual work can replace physical exercises, farmers do not catch the real notion of sports consumption culture from the perspective of keeping fit, so they do not intend to participate in physical exercises, leading to the low level of sports consumption.

Fourth, farmers are scattered and hard to manage them..

2.3.3 The potential of sports consumption in rural areas

Material sports consumption is dominant in the sports consumption pattern in rural areas, but the potential of participatory sports consumption is huge. With the development of sports consumption market, participatory sports exercise and recreational consumption will become the major part, including bodybuilding, swimming, mountain-climbing, sports tourism, fishing, billiards and national traditional sports, so as to meet the farmers' requirements of keeping fit, amusing themselves and constantly improving their quality of life.

Today, more and more sports activities are held in rural China with many towns and villages have formed their own fitness groups. These activities include yangko dance, bodybuilding exercise (dance), tug of war, dragon and lion dances, winter swimming, basketball, gate ball, long-distance race and waist drum. Special competitions are launched among different villages. Some fitness organizations grasped this business opportunity and set up sports association training centers, driving farmers to spend more on sports consumption. The biggest farmers' sports competition is the National Farmers Games, which started from 1988. It is held every 4 years with more and more farmer know this event and participated in it. The Games are a driving force to sports development in rural area, which have greatly boosted the sports consumption.

3 The Sports Resources Development in Rural Areas and Management Countermeasures

The rural areas are blessed with a huge sports market, the development and management of this market is both the need of national economic construction and socialist ideological and ethical progress in rural China.

First, we should put more investment in sports infrastructure and work hard to develop sports natural resources in rural areas. As for the development of sports resources, we should strive to find out new ideas, new methods and new experiences to build sports market. The government should take responsibility for the basic construction of sports resources while mobilize and rely on the power of social groups, thus pushing the sports operators to extend the development and management of sports market from city to countryside.

Second, we should increase farmers' purchasing power in sports. The low purchasing power in sports in rural areas is jointly caused by a subjective reason and an objective reason. The former is related to farmers' awareness, and the latter to sports allocation. In this condition, we should pay attention to rural economic development; establish rural sports centers, strengthen the transmission of sports market information and improve farmer's sports consciousness;

Third, we should develop the sports cultural market in rural areas, and actively promote our national, traditional sports. The development and extension of rural sports cultural market can only rely on the support from local government. The government should adjust measures to local conditions,

develop traditional strong sports, use traditional sports to drive the progress of new ones, and ultimately make the sports cultural market in rural areas filled with scientific, civilized activities.

4 Conclusion

The attention paid to the issue of farmers and rural areas has made fundamental changes to rural lifestyle. Although China's rural sports market is still in the development stage—the scale has not yet formed, sports consumption consciousness still needs guidance, information is not well transmitted and laws and regulations are not so sound, the adjustment of farmers' demand structure and consumption structure brings good opportunities for rural sports market, and huge potential of rural sports resources creates conditions for the overall development of this market.

The Structure of Theoretical Framework about Strategic Management Audit*

Guan Yamei

College of accounting, Nanjing University of Finance and Economics, Nanjing, P.R.China 210023

(E-mail: guanyamei@sina.com)

Abstract: Strategic management audit is an upfront and novel field in audit which attracts numerous scholars' attention from the very beginning of its development. It is one of the ten major tendencies of internal audit to convert from operational management audit to strategic management audit. This paper reviewed the development and revolution of the theory of strategic management audit, analyzed the differences between strategic management audit and traditional internal management audit, and proposed constructive ideas for enhancing the theory frame and appraisal system.

Key words: Strategic management audit; Theoretical framework; Appraisal system

1 Introduction

Strategic management audit is a newly-developed field in audit, therefore, there is no strict definition yet. In 1956, Shockman proposed the concept of marketing audit, which is the origination of strategic management audit. Since 1960s, some developed countries vigorously carried out strategic management, in which internal audit is not only engaged in the evaluation of service efficiency and effectiveness, but also develops strategic audit to evaluate strategic management. Strategic audit is integral, overall, but high-risk, which requires internal audit to fully understand operational procedure, as well as the strategic management theory and practice of the company. More importantly, internal audit should be at the top of the management team to possess the authority of audit.

Since 1970s, management environment of enterprises became more and more complex, while scale turned bigger and bigger. Meanwhile, the government formulated strict law to protect investors and public interest, which dramatically expanded fiduciary duty of the executives. This transition produced enormous demand for strategic management audit by managers, investors, and other profit relevant, which boosted the development and revolution of strategic management. Therefore, Shockman believed that strategic audit should focus on proposing motion plan on the base of comprehensive, systematic, independent and routine investigation to improve strategic management of the audited enterprise. Ever since its orientation, strategic management audit has attracted attention of countries worldwide, it has already been applied in operations practice by enterprises.

Since 1980s, more and more research has been carried out on strategic management audit. However, Wheeler and Hunger pointed out that the practice of strategic management audit is far from fully developed. While audits lack the divergent thoughts, many companies still focus strategic management audit onto routine service and function, rather than the comprehensive audits from the aspect the company strategies. They also analyzed the characteristics and the vital roles of strategic management audit. Alfred Rappaport further analyzed in both theory and practice the feasibility of strategic management audit by independent audits. He believed that strategic management audit should be carried out by external independent audits who can help enhance the strategic surveillance function of the board of directors through strategic audit. While strategic audit could bring in profits for the enterprise on one hand, it also increases cost correspondingly. Therefore, the decision on whether or not to implement strategic audit should be based on overall evaluation of the cost and profit.

Since 1990s, even more scholars studied strategic management audit. In 1992, Neish and Jackson analyzed the roles of internal audit department in enterprise strategic management and necessary conditions to implement strategic management audit. In 1995, Gordon Donaldson published "A New Tool for Boards: The Strategic Audit" in Harvard Business Reviews. The article addressed that strategic management audit is a pivotal tool for company management, which could appraise overall development and operations of the company. The article also pointed out that strategic audit is composed of setting up operational standard, designing and maintaining database, setting up strategic audit committee, as well as coordinating with executives.

2 Differences Between Strategic Management Audit and Traditional Internal

* Project Funded by the Priority Academic Program Development of Jiangsu Higher Education Institutions (PAPD)

Audit

Strategic management audit is a special field in audit that has expanded the scope of internal audit, promoted internal audit to a higher level. Strategic management audit primarily focuses on the appraisal of enterprise operational strategies. It is a key part in enterprise strategy management, aiming to make sure that the enterprise strategies are effective, reasonable and economical, so as to help enterprises reach operational targets. Strategic management audit is an advanced phase of the development of internal audit

However, the practice of strategic management audit is quite different from that of traditional internal audit. The traditional internal audit focuses on transactions and account balance. It carries out risk appraisal with traditional audit procedure which requires accounting and audit knowledge correspondingly. However, audit personnel must understand company operation thoroughly, be familiar with company culture and interest conflicts, have strategic management theory knowledge and solid practice experience, as well as good communication skills and divergent thoughts to carry out strategic audit (Liao Hong, 2005). In addition, only when the enterprise has a good strategic management audit culture, audit personnel directly report to and are fully trusted by executives, can strategic management audit be smoothly carried out. Therefore, strategic management audit focuses primarily on the overall operations of the company.

Table 1 Comparison of Strategic Management Audit and Traditional Internal Audit

	Traditional Internal Audit	Strategic Management Audit
Basic Idea	Transactions, account balance	Overall strategies
Risk	Audit risk	Strategic risk
Specialty	Accounting, audit	Management, audit, accounting, system theory
Foci	Information collection	Company operations

3 Theory Frame Of Strategic Management Audit

3.1 Strategic management audit subject

The key to guarantee the effectiveness of audit is to maintain independence and authority of the audit subjects (Yu Yumiao and Huang Binghai, 2004). Strategic management audit should adopt a procedure guided by the board of directors (Mei Dan, 2004). This is determined by the special property structure of the companies in China. The majority companies are state owned, therefore, executive directors on board are representatives of the state, not the true property owner. Thus, it is hard for the audit committee composed by the board of directors to make optimum decisions on enterprise strategy. Therefore, an independent committee composed by representatives of minor shareholders is necessary for surveillance and appraisal of strategic proposal. In the audit system guided by the board of directors, some options to implement strategic management audit are: internal audit reporting directly to the board of directors, audit committee of the boards, and independent audits.

3.2 Strategic management audit object and content

The objects of strategic management audit committee or external registered accountants are all information and documents regarding enterprise strategy management, including, but not limited to financial information and documents (Yu Yumiao and Huang Binghai, 2004). Effective strategic audit requires the board of directors to not only set up the standard for strategies appraisal, but also control the sources of the information to produce the data. In particular, the content of strategic management audit includes:

3.2.1 Strategy setting basis and process

Inspection on whether the company strategies were based on comprehensive recognition and understanding of company goals, market, environment, competitors, as well as interior resources (Mei Dan, 2004). Strategic audit also assess whether strategic goals conform to national economical condition, reflect market demand, coordinate with environmental alteration tendency, and balance with adaptability of company interior resources.

3.2.2 Background and procedure of strategies setting

The enterprise strategies include growth strategy, profit strategy, centralism strategy, shift strategy, as well as withdrawal strategy. Audit to the growth strategy occurs at the developing stage of a company product or market, it inspects whether the company has an effective way to acquire market resources, to finance, and to cope with the intense competition. Audit to profit strategy applies at the mature stage of a

company product or market, it examines whether the company is shifting from market development and financing to market specialization and assets operation. Audit to the centralism strategy takes place at the mature and declining stages of the company product or market, it aims to investigate whether the company has started to decrease operation scale, to reduce investment, and to concentrate on the specialized market on which the company has competitive advantages. In a declining stage of a company product or market, audit to shifting strategy is meant to improve the operations of original strategies, or to adjust new strategies appropriate to current market.

3.2.3 Process of implementing enterprise strategies

First, audit to the implementation process is to inspect whether all divisions of a company have set up divisional strategies to achieve the overall enterprise strategic goals. Second, it examines whether the company has smooth mechanisms to communicate and coordinate internally, to pass information on strategies feedback to the board of directors in time. Third, it investigates whether the company has appropriate standard and procedure to appraise strategy operations, yearly target, financing strategy, and resources allocation to implement the enterprise strategies. Fourth, it also examines whether the company has detailed strategy implementation plan, organizational preparation, as well as controlling and reporting system.

3.2.4 Strategic Achievement

Strategy audit inspects whether the company growth strategy has increased the company market share, or enhanced company reputation and/or status in the industry and/or market; whether the profit strategy has increased the company resources and profit, realized profit maximization; whether the centralism strategy re-organized company operations scale and investment, to increase short-term revenue and long-term profit; whether shift strategy has turned around the declining company market share and profit; whether the withdrawal strategy has helped the company cautiously withdraw from the market and recoup the investment.

3.3 Functions of strategic management audit

The functions of strategic management audit are analysis, appraisal, and surveillance (Liao Hong, 2005). Appraisal and surveillance are basic functions of audit, which help companies set reasonable strategies and appraise the effectiveness of the strategy implementation, as well as fulfill fiduciary duty of executives. Analysis is also included in the functions of strategic management audit because of the pivotal roles of strategy analysis. It is a key part of strategic management audit, which is the precondition for accurate strategic appraisal and surveillance.

3.4 Discipline attribute of strategic management audit

Strategy management is at the highest level and the most important managerial activity in a company, therefore, strategic management audit should be attributed to management audit (Liao Hong, 2005). So far, most scholars agree with this. On the other hand, achievement audit is the advanced phase in audit development (Liao Hong, 2003), a branch of management audit. Since strategy management is the most important factor for enterprise operations and management achievement, strategic management audit could also be attributed to achievement audit.

3.5 Influential factors for implementing strategic management audit

Figure 2 Strategic Management Audit Theory Frame

First, organizational structure should be improved to enhance the construction of the independent system of trustees (Peng Zhengxin, 2003). The trustee's independence must be maintained through system arrangement. A reward mechanism should be institutionalized to avoid interference by management team.

Second, the members on the board of directors should be specialized, and clarified of each

individual's responsibility. A board of directors with various background and specialties should be constructed to set up appropriate enterprise strategies. Meanwhile, a strategic management audit committee under the board can help clarification of responsibility and participation of independent trustees. A minimum share amount should be met to be eligible for trustees, and shares of trustees should not be transferred while they are on the board.

4 Construction Of Strategic Management Audit Appraisal System

4.1 Financial performance is the core indicator in strategic management audit appraisal system

Strategy audit appraises the influence of company strategies on shareholder's investment, financial performance therefore is crucial for the evaluation. Meanwhile, since management team is more familiar with the company and the specialized market, they have the advantages over trustees to have more access to available performance information. A standard financial statement is easy to understand for everybody, it is therefore the critical tool for strategy management appraisal. In addition to traditional financial performance indicators, such as net income, net income verses assets ratio, sale growth, cash flow, net income verses investment ratio, other indicators should also be considered, including investment cash return ratio which is realized cash return divided by investment amount. This indicator focuses on cash flow instead of net income, which can be compared with return ratio of other company or market. With this indicator in the appraisal system, companies will pay more attention to cash flow. Yearly economy growth should be taken into consideration as well. It is revenue minus investment, dynamically describe economy growth by bringing in the investment term. Lastly, return ratio on account investment should be considered too, it is calculated as profit divided by investment. Both shareholders and trustees are familiar with this indicator, but its original data has to be adjusted to be able to compare with other companies, since it is influenced by accounting practice.

4.2 Customer is the leverage of strategic management audit appraisal system

The identification and evaluation of customer-related performance achievement should be closely coordinated with marketing strategies to really reflect customer-centered market. It should include customer satisfaction, market share, product delivery, product return, days of product warranty, customer retention, customer loyalty, and customer profitability to attract and obtain customers on target market to reach performance goals. A detailed appraisal system should be set up to evaluate departmental performance and find out areas for improvement.

4.3 Internal operations performance is the basis for strategic management audit appraisal system

The reason that operational performance is the basis for the appraisal system is that it indicates product manufacturing cycle period, product design level, process innovation capability, productivity, safety, and inventory etc, which all reflect the enterprise capability to create value and the impacts on financial performance, the basis of strategy management. In this process, the enterprise analyzes potential demand to develop new products and new customers to create value increase via innovation. The key appraisal standards for this process are the sale ratio of new product, sale ratio of patented product, the capability to release new product ahead of competitors, as well as how long it takes the company to develop the new product, etc.

5 Conclusions

In brief, a company must consider its own development phase, industry situation, as well as performance of main competitors to determine the standards of all measurements, and compare its performance with the standard to find out gap and the reasons. In addition to the appraisal standards cited above such as financial performance, customer, internal operation, learning and growth, a company should also take into consideration of internal monitoring system analytical standard, operational system analytical standard, as well as information system appraisal standard etc. This is a comprehensive appraisal system to realize profit maximization along the value chain by internal operation specialization and coordination, effective organizing manufacture and purchasing system, and producing and delivering the product based on market demand via specific channel.

A Study on the Relationship Between Organizational Ethical Climate and Employee's Anti-Ethical Behavior*

Ma Lu, Du Mingfei, Zhu Xin

Management School, Guangxi University of Science and Technology, Liuzhou, P. R. China, 545006
(E-mail: malu6655@163.com, du0703604007@163.com, 5266736@qq.com)

Abstract: The topic about the employee's anti-ethical behavior is now a hot theoretical discussion. Based on the existing research, this paper put forward organizational ethical climate and employee's anti-ethical behavior hypothesis. And by carrying out questionnaires to enterprises' employees, SPSS software is used to make system analysis to confirm that care guide, independent judgment guide and rule of law guide have negative influence on employee's anti-ethical behavior, utilitarian orientation a positive impact on employee's anti-ethical behavior, and the care guide organizational ethical climate the strongest impact, which provides a new angle of view and path to solve the problem of employee's anti-ethical behavior.

Key words: Organizational Ethical Climate; Employee's Anti-Ethical Behavior; Organizational Ethical Climate Types; Correction Analysis; Regression Analysis

1 Introduction

With the intensification of economic globalization and market competition, the value of the employees tends to be more diversified. Their interests and demands are more intensely affirmed. Traditional ethics moral concept starts to get serious challenge and impact. Scholars begin to pay attention to research of employee's anti-ethical behavior, and its influence factors as well. This paper attempt from the perspective of organizational ethical climate, discuss deeply of whether different types of organizational ethical climate have impact on employee's anti-ethical behavior, and whether the effect intensity is equal, thus to provide suggestion for organization to avoid employee's anti-ethical behavior.

2 Definition and Theoretical Assumptions

2.1 Employee's anti-ethical behavior

It had been found in the early last century. But people can't explain its nature systematically because of the fragmented research. Until the 1990s, scholars began to conduct further research on it. Gruys (1999) views the employee's absence or being late as employee's anti-ethical behavior^[1]. Spector & Fox (2005) argue that whether or not employees cause loss to others or organization is employee's anti-ethical behavior^[2]. Bordia et al (2008) analyze that employee's anti-ethical behavior not only causes loss to the organization itself, but will also have bad effect on organizational stakeholders^[3]. O'Boyle et al (2011) confirm that employee's anti-ethical behavior will change with the environment changing forms. The advanced information technology makes them more convenient, normal and subtle^[4].

Although research perspective of the ethical behavior is different, people agree that it is negative work behavior in essence. Based on the will of people, against organizations and other members of the legitimate rights and interests, is called employee's anti-ethical behavior.

2.2 Organizational ethical climate

The research of it not only helps predict employee's performance, and also provides a new path to solve the problem of employee's anti-ethical behavior. Victor and Cullen (1987) first put forward organizational ethical climate this concept. The staff perception in dealing with ethical behavior problems is referred to as organizational ethical climate^[5]. Cullen (2003) suggests that it is one of the dominant ethical behavior models within organization^[6]. Grojean (2004) argues that this concept exist misunderstanding. He claims to call it "about organizational ethical climate"^[7]. This study concludes that organizational ethical climate is specific performance of the dominant ethical climates within organization which is perceived and followed by staffs.

2.3 Organizational ethical climate types

Victor and Cullen (1988) accord to normative ethics and ethical value orientation analysis of the types of organizational ethical climate, thus theoretically derive the nine types of organizational ethical

* This paper is supported by the program of the National Natural Science Foundation of China (71162026) and the program of the Guangxi Soft Science of China (12252034).

climate, namely, self-interest, friendship, personal ethics, corporate interests, group interests, norms and procedures, efficient, social responsibility and the rule of law^[8]. Then on this basis, they research and develop organizational ethical climate questionnaire namely ECQ scale. Based on this scale, scholars conduct empirical research in different industries and parts of the world organization. The research results show the scale itself is stable, but ethical climate type concluded is extremely unstable. Only four types of organizational ethical climate are verified. They are care guide, independent judgment guide, the rule of law guide and utilitarian orientation.

2.4 Research hypothesis

The study find that present Chinese related research only from single perspective measure influence of organizational ethical climate on employee's anti-ethical behavior, and mostly stay in theoretical research level. The existing empirical study background is mainly foreign enterprises. In view of this, Chinese enterprises are used as research object. Care guide, independent judgment guide, rule of law guide and the utilitarian orientation these four widely verified stable organizational ethical climate types are selected to research effects on employee's anti-ethical behavior, to provide reference for enterprise's management ethics practice in China.

2.4.1 Care guide affects on employee's anti-ethical behavior

In care guide this ethical climate organization pays attention to every employee's vital interests, and shows care in the interactive process between departments and employee individuals. Ethical climate dominated by "cares" means "solidarity" between various departments, and also more mutual love between individuals. In this climate, employees in the pursuit of self-interest will also benefit groups. Employees facing the ethical dilemma choice will also be affected by the organization in the ethics of care, love climate. Okpara (2002) study finds that when the organizational ethical climate is care guide, employee's satisfaction on promotions, co-workers and supervisor is higher, employee's anti-ethical behavior reduced^[9]. Peterson (2002) research also confirms care guide is negatively related to employee's anti-ethical behavior^[10]. Based on above analysis, the following hypothesis is put forward:

H1: Care guide is negatively related to employee's anti-ethical behavior

2.4.2 Independent judgment guide affects on employee's anti-ethical behavior

Independent judgment guide fully respects and affirms employee's ability in judging things. Staff can make choices and free from the influence of ethics climate, which increases employee's ability to judge things and loyalty to organization. In this climate, staff respect and trust each other in decision-making, show strong self-discipline to reduce occurrence of reaching purpose through anti-ethical behavior. Wimbush (1997) indicated that the independent judgment of ethical climate is negatively related to the employee's ethical behavior^[11]. Taiwan scholar Zhang Renwei (2004) showed that under the independent judgment orientation, the anti-ethical behavior reduced while employees strictly follow the rules of ethics^[12]. Based on above analysis, the following hypothesis is put forward:

H2: Independent judgment guide is negatively related to employee's anti-ethical behavior

2.4.3 Rule of law guide affects on employee's anti-ethical behavior

In this rule of law guide climate, staffs follow the laws and rules, professional standards. Organization uses "laws, rules and systems" as the group ethical value orientation. Employees follow rules, and make their actions conform to norms. Trevino (1986) identifies that employee's moral cognition has influence on ethical behavior^[13]. Craig et al (2006) confirm that, under the rule of law climate, the moral cognition of staff is higher; their ethical behavior conforms to the organization of ethics^[14]. Based on the above analysis, the following hypothesis is put forward:

H3: Rule of law guide is negatively related to employee's anti-ethical behavior

2.4.4 Utilitarian orientation affects on employee's anti-ethical behavior

In utilitarian orientation employees pursue their own interests and individualism. If all staffs act according to "self-interest" principle, only caring about their self-interest regardless of overall interests, the binding for employees' anti-ethical behavior is almost zero. Sackett et al (2006) confirmed that binding for employee's anti-ethical behavior is the smallest in enterprises dominated by utilitarian orientation^[15]. Taiwan scholar Zhong Rongjun and Xiao Jinfen (2007) found that employee's anti-ethical behavior has the highest frequency in utilitarian orientation climate^[16]. Based on above analysis, the following hypothesis is put forward:

H4: Utilitarian orientation is positively related to employee's anti-ethical behavior

3 Empirical Analyses

3.1 Sample and data collection

The background of this investigation is Chinese enterprise situation. Based on Victor's ECQ scale and Stewart's employee's anti-ethical behavior scale, forecast questionnaire is designed^{[8][17]}. Before a thorough investigation, we chose on-the-job graduate student in a university in southwest China, got 50 effective questionnaires, analyzed and tested items according to the obtained data, deleted items not conforming to the measurement specification, modifying and improving the questionnaire thus to form the formal one. When official research started, we mainly chose objects from the private manufacturing enterprises in Guangxi, Henan and other 10 private manufacturing enterprises in China where employee's anti-ethical behavior is more prominent.

The formal questionnaire takes paper and Internet two forms. 250 questionnaires doled out, including 150 online, 219 recycled. Recovery rate 88%, effective questionnaire 190, effective rate 87%. Questionnaires recovery is between March and May 2013. This sample (N = 190) features are as follows: gender, male 43.7%, female 56.3%; Age, under the age of 25 (33.2%), 25 to 30 years old (53.7%), 31-40 accounted for 12.1%, over 40 accounted for 1.1%; Degree, high school or technical secondary school, and the following accounted for 6.8%, 43.2% college, bachelor degree or above accounted for 50.0%.

3.2 Statistical tools

This paper analyzes sample data with SPSS16.0.

3.3 Variable measurement

3.3.1 Organizational ethical climate measurement

Developed by Victor and Cullen ethical climate scale (ECQ) is recognized in academia, and its stability is verified in empirical study^[8]. Based on the ECQ scale, parts items is modified to conform to our country's enterprise. The organizational ethical climate scale with 13 items is formed.

3.3.2 Employee's anti-ethical behavior measurement

Stewart et al (2009) use the theory of projection, in the form of reference point shift, asking staff to point out anti-ethical behavior of colleagues, to reflect his anti-ethical behavior^[17]. Cole et al (2008) analyzed that colleagues' anti-ethical behavior can affect others^[18]. Combination of Stewart's scale formed 6 terms employee's anti-ethical behavior scale.

3.4 Empirical results analysis

3.4.1 Organizational ethical climate factor analysis

Organizational ethical climate perceived by employee with reference to Victor and Cullen care guide development ECQ scale, used five items measured, such as "Your company attaches great importance to all members' interests" etc^[8]. Organizational ethical climates perceived by employees such as independent judgment guide, rule of law guide and the utilitarian orientation with reference to Victor and Cullen ECQ scale, adopt 3 items, 2 items and 3 items on the measurements, such as "Your company staff has his standard to decide right or wrong", "Your company wants employees to comply with rules and regulations", "Your company staff have preferred their own interests" etc^[8]. The above questionnaires self-report by Likert 5 score. Upon examination, Chi - Square value is 604.847 ($p < 0.01$), KMO value is 0.681, inventory item load is over 0.5, the eigenvalue: 3.006, 2.098, 1.137 and 3.006, each table's interpretation of the cumulative contribution rate: 23.124%, 16.141%, 8.746% and 12.552%, which indicates that we adopt the organizational ethical climate scale conform to the requirements of the factor analysis test.

3.4.2 Employee's anti-ethical behavior factor analysis

Employee's anti-ethical behavior scale mainly refers to Stewart's scale, using 6 items to measure such as "Your colleagues in the company for overtime work and delay time" etc.^[17]. Upon examination, KMO value is 0.778, Chi - Square value is 347.078 ($p < 0.01$), inventory item load is over 0.5, eigenvalue is 3.021, the cumulative explain contribution rate reaches 50.347%, suggesting that employee's anti-ethical behavior scale meet factor analysis test requirements.

3.4.3 Correction analysis

Correlation analysis resulting from employee's anti-ethical behavior and ethical climate such as care guide, independent judgment guide, rule of law guide and utilitarian orientation shows that the coefficient correlation: 0.239 **, 0.208 **, 0.209 ** and 0.209 **, the significance level is less than 0.01, and also shows that employee's anti-ethical behavior and care guide, independent judgment guide and rule of law guide organizational ethical climate has significant negative correlation, and the utilitarian orientation has significantly positive correlation.

3.4.4 Regression analysis

Hierarchical regression analysis is used to delve into relationship between four types of organizational ethical climate and employees' anti-ethical behavior. Correlation of the empirical research shows that there is significant correlation between the two. Hierarchical regression model of employee's

anti-ethical behavior and four ethical climate types is built mainly to explore impact and impact strength of ethical climate against the anti-ethical behavior. It's shown in table.

Table 1 Hierarchical Linear Regression Analysis

Independent Variable	Adjust R Square	F	Standardized Coefficients	Co linearity	Statistics
			Beta	Tolerance	VIF
STEP 1:	- 0.002	0.872			
Gender			0.038	1.000	1.000
Age			0.053	0.979	1.021
Degree			0.016	0.979	1.026
Step 2:	0.162	6.219			
Care Guide			- 0.230**	0.975	1.026
Independent Judgment Guide			- 0.212**	0.989	1.101
Rule of Law Guide			- 0.209**	0.975	1.026
Utilitarian Orientation			0.205**	0.989	1.011

*P<0.05 **P<0.01 ***P<0.001

The regression proves there is linear regression relationship between two variables. The value of VIF less than 5 shows the model has no significant co-linearity problem. Based on regression coefficient, the impact strength of care guide is the highest.

4 Conclusions

4.1 Theoretical contribution

Through empirical analysis, we found care guide, independent judgment guide and rule of law guide ethical climate are negatively related to employee's anti-ethical behavior and confirmed the utilitarianism orientation ethical climate is positively associated with it. Through proved assumptions, research content of employee's anti-ethical behavior is enriched; understanding of management ethics study is more comprehensive.

4.2 Practical implications

Organization management ethical issues as attention of domestic managers are mostly macro institutional development. Practice proved above behavior deficiencies in the actual operation process. Construction and improvement of organizational ethical climate provides a new thought for managers to solve the ethical issues. Managers in the process of construction and improvement can start from the following aspects: First, managers create care guide, independent judgment guide and the rule of law guide these positive organizational ethical climates to let staff feel care and respect from organization, specifically, through economic means such as employee share out bonus, share holding, through lecture on management ethics, laws and regulations, through learning of laws and regulations and organization ethics. Second, managers should pay attention to avoid the utilitarian orientation of negative organizational ethical climate. Enterprises through a culture of teamwork encourage employees to help each other and bear its corresponding social responsibility, to make model for staff and let them feel enterprises are not purely for profit.

4.3 Research Prospect

Shortage lies in that the source of the sample is limited by regional research scope. Meanwhile, paper only explores its impact on employee's anti-ethical behavior from ethical climate this organizational level. Other levels or individual variables impacts are still needed further system research in the future.

An Empirical Analysis on the Coordination of Interest Allocation among Employee-Stockholder & Government in Japan

Wang Weiping Guan Huailiu
(Business School of Nantong University, Jiangsu China 226019)
(E-mail: wang.wp@ntu.edu.cn, ghl@ntu.edu.cn)

Abstract: In an attempt to investigate the coordination of interest allocation in the actual businesses this paper selected three parties of employee, shareholder and government as one of the simplest and most representative distribution systems and evaluated the coordination between their interest allocations. The measurement of coordination degrees revealed their relationships and possible effect. Based on the financial data of Japan's 66 listed companies in the past five years, the preliminary analysis on the coordination showed that the smaller the sales of company was, the lower the coordination of its interest allocation was; In contrast, companies with a larger sales had a relatively higher coordination of their interest allocations. The relationship between the coordination degree and the performance became more tightly with the rise of business scale. In the lower level of coordination of interest allocation, its correlation to its ROE was lower and in the higher level of coordination its correlation to its ROE was higher also. Especially in circumstance of large scale of business, regardless of which stakeholder dominated the distribution of benefits, the coordination and corporate performance had a significantly positive correlation.

Key Words: Coordination; Interest allocation; Stakeholder; Complex System

1 Introduction

How to distribute benefits among stakeholders has always been a core issue in handling stakeholder relations. In theory, most of researches are focused on how to reach more reasonable or effective results in an allocation of interests, and for this purpose various methods are introduced into such researches, among them the Shapley Value method^[1] and Nash Game^[2] are extensively used in the analysis of interest allocation among stakeholders who have formal contractual relationship, such as supply chain partners^[3], the strategic alliance and cooperators in R & D^{[4][5]}, and distribution channel of corporate incomes^{[6][7]}. However, little attention is paid to the real status of the internal distribution of benefits, especially to the coordination between distributions; almost no concern can be found about it.

Traditionally, the coordination methods are generally applied to larger composite system, such as the environment and energy development, education and economic growth^{[8][9]} etc. The previous studies on coordination of enterprise development are mainly confined to the strategy of the diversified businesses or allocation of interests between enterprises^{[10][11]}. So far, the coordination method has nearly not been used to analyze the systematic relationship between the actual distributions of corporate benefits, also very few researchers try to do so. In fact, the distribution of the corporate interests is a typical complex system, between its subsystems existing intricate relationships such as coordination, causal and overlay effects. In view of this, the paper tries to select employee, shareholder and government as one of the simplest complex system, based on a survey into the actual interest allocations in companies, and to discuss the relationship between their benefits. Its major purpose is to make an analysis on the coordination of allocating benefits among these three parties and its possible effect. This paper selects the financial data from 66 listed companies in five consecutive years as a sample, and then calculates the dominant economic interests distributed respectively to employee, shareholder and government, and by virtue of coordination degree model examine the coordination of the interests between the three parties, verifies if there is a correlation between business growth or performance and the coordination. Finally, it does a brief explanation and summary.

Here are several considerations for only selecting these three parties from the stakeholders involved in distribution of benefits. First, these three parties are crucial for companies, other may not be unimportant but their actual benefits are difficult to obtain based on the existing financial report; Second, if too many stakeholders involved in this paper, it will result in excessive data processes; Third, a complex system is usually composed of three elements, so this study has applicability to more stakeholders.

2 Samples & Data

In order to avoid the influences of such factors as industrial types, the business scale and cycle, and to increase the comparability, this study selected the listed companies in the same industry with similar sizes and at a mature stage, then taking their financial data in the same period as the samples. The selected 66 companies meet the following three criteria: in the category of manufacturing industries; medium-sized; in a relatively stable operating state. As a manufacturing company, any of the 66 companies has a certain amount of know-how capital, with the dependence on human resources in excess of dependence on natural resources, and thus they are likely more responsive to the coordination in their distribution of benefits.

Although “interest allocation statement in category of stakeholders” has been proposed by some scholars from the perspective of corporate social responsibility^[12], the disclosures of the existing corporate annual reports almost do not support this kind of specialized statement. Thus, the benefits involved in this study are mainly the dominant economic interests obtained through observation of existing financial reporting, which may reflect their vast majority of interests, where interests of the employees = wages + bonus + pension welfare fund; interests of shareholders = interim dividend + year-end dividend; government interests = corporate tax + resident tax + enterprise tax + tax relief or refund. Involving financial items mainly cover the debit balance sheet, income statement and dividend policy.

In a business, stakeholder’s interest obtained is reflected through its share of the total amount of benefits. Only their proportion is there a relative comparability between companies. Here the absolute amount of the above three benefits to be derived proportion of sales is taken as a measurement of how much interest one party of three to obtain, that is, the proportion of employees' interests(E%) = interests of employees / sales; proportion of shareholders interest(S%) = shareholders' interests / sales; proportion of government interests (G%) = government interest / sales.

All original data are collected from the Company's annual financial report in 2007-2011 announced by the FSA website EDINET. The original data are processed by using the following standardized method:

$$U_{ij} = \frac{X_{ij} - \min\{X_{ij}\}}{\max\{X_{ij}\} - \min\{X_{ij}\}} \quad i = 1 - n; j = 1, 2, 3 \quad (1)$$

The formula 1: X_{ij} is the proportion of the interests of stakeholder j of the sample company i. U_{ij} is the normalized value after the data conversion.

Table 1 Descriptive Statistical Results of Samples

Year	Stakeholder	N	Minimum	Maximum	Mean	Sd. Deviation
2007	E%	66	5.3375	63.8570	14.47552	8.570751
	S%	66	0.0000	73.4400	3.525084	9.436103
	G%	66	-0.8359	9.3282	2.7696	2.410086
	ROE%	66	-15.5983	20.8445	7.134224	5.92925
2008	E%	66	5.4440	43.4514	16.67777	7.727988
	S%	66	0.0000	55.0087	2.994043	7.085201
	G%	66	-3.8504	27.8913	2.0053	4.295932
	ROE%	66	-87.0206	14.8563	-7.14483	20.86153
2009	E%	66	5.7425	53.8996	18.96188	8.210471
	S%	66	0.0000	69.2093	2.752309	8.487429
	G%	66	-9.6063	9.5094	0.54374	2.74624
	ROE%	66	-33.3346	12.8764	-0.50774	9.80766
2010	E%	66	1.6730	39.4486	16.48803	6.318877
	S%	66	0.0000	65.8293	2.941568	8.102202
	G%	66	-6.4791	39.3314	1.7394	5.248988
	ROE%	66	-46.3078	16.2503	3.72088	8.606038
2011	E%	66	1.5745	33.7996	16.42051	6.161687
	S%	66	0.0000	69.0073	2.99017	8.399558
	G%	66	-3.1340	9.8015	1.7164	2.345141
	ROE%	66	-28.9253	22.1744	3.380306	8.21928

The above process, in the case of maintaining the data relationships, can further increase comparability in the dimensions and magnitude. Meanwhile, in accordance with the level of sales, 66 samples were divided into three groups, each consisting of 22 companies. Group 1 average annual sales <570000 million yen; 1,280,000 one million yen> Group 2 average annual sales > 570,000 million yen; Group 3 average annual sales > 1,280,000 million yen. Due to the too large amount of the original data, here is omitted. Its descriptive statistical results are as follows:

Seen from Tables 1, in the 5-year observation term, proportions of employee benefits accounted for among three parties showed a decreased trend, either in the highest value (63.8↘33.8) or in the lowest value (5.3↘1.5), but the average is basically stable, may be because the government revenue has played the role of "automatic stabilizers". In the recession year of economy, the reduction in taxes ensured the basic stability of the interests of employees assigned. At the same time, the share of government taxes showed a significant fluctuation, a year high after a year low, a huge difference for the companies. The average taxes proportion for the past five years has decreased significantly (2.7%↘1.7%). Probably affected by the financial crisis, the average ROE in 2008 is negative 7.14%. In comparison, the average of interests shareholders shared in the sales (Return on capital) is the smallest among three parties, but have very large diversification between the companies. But the interests of the shareholders is also relatively most stable, the average for the several years was stabilized at around 3%.

3 Assessment of Coordination of Interest Allocation

3.1 Weight calculation

Weight of distribution of each stakeholder is a quantitative expression of its relative importance in a complex system for interest allocation among all stakeholders; a measurement of the weight will affect the results and quality of the coordination evaluation. Under normal circumstances, the importance of the various distribution subsystem may not be the same, here is divided into two cases to consider.

Case 1, each subsystem of distribution to employees, shareholders and the government is treated equally, that is, their respective weights are 1/3 in the system integrated by the three subsystems.

Case 2, to calculate their respective weights by the method commonly used to determine weights. There are two kinds of methods, subjective weighting and objective weighting, the former are mainly determined by the experts' subjective judgments based on their experiences, including expert analysis method, the Analytic Hierarchy Process (AHP) etc. the latter according to the correlation between the indicators and the variation coefficient of the indicators, such as principal component analysis, factor analysis, correlation, entropy value method. Standard deviation coefficient weighting method based on statistical methods is used here to reduce subjective uncertainty. The steps are as follows:

(1)The average of the standard value of the proportion of each stakeholder interests

$$\bar{U}_j = \frac{1}{n} \sum_{i=1}^n U_{ij} \quad (j = 1, 2, 3) \quad (2)$$

(2)The standard deviation of the standard value of the proportion of each stakeholder interests

$$\sigma_j = \sqrt{\sum_{i=1}^n [U_{ij} - \bar{U}_j]^2} \quad (j = 1, 2, 3) \quad (3)$$

(3)The standard deviation coefficient of the standard value of the proportion of each stakeholder interests

$$V_j = \frac{\sigma_j}{\bar{U}_j} \quad (j = 1, 2, 3) \quad (4)$$

(4)The weight of the distribution system for each stakeholder

$$\bar{W}_j = \frac{V_j}{\sum_{j=1}^3 V_j} \quad (j = 1, 2, 3) \quad (5)$$

Where \bar{W}_j is the weight of Stakeholder j. n is the number of each group of samples, here n = 22 for these three groups. The weights represent the degree of variability of the sample data, which are derived from the benefits distributed to each stakeholder, reflecting the relative importance of the stakeholders in the comprehensive distribution system. A comparison can be made between the results of case 1 and case 2.

The weight calculated by the above steps as follows:

Table 2 The Every Year Weight of Employees (E),Shareholders (S) and the Government (G)

	2007	2008	2009	2010	2011
E weight	0.215866	0.135567	0.101588	0.093322	0.113432
S weight	0.593900	0.445984	0.468551	0.431630	0.576983
G weight	0.190234	0.418449	0.429861	0.475048	0.309585

3.2 Model for Assessment of Coordination

There are mainly four common coordination degree evaluation models [13]. Through the analysis of the applicability and merits and in compliance with the practical and simple principle, a coordination model is structured on the basis of membership function model. The coordination degree of a complex system is given as follows. Supposing the distribution system is composed of the employees' interests subsystem (H₁), the shareholder interests subsystem (H₂) and government interests subsystem (H₃), the actual level of the interest allocations for each subsystem is represented by E₁, E₂ and E₃ respectively, they are a function of their respective components, and the development level of the overall distribution system is represented by E*. Then a single system coordination degree of each subsystem H_j is defined as:

$$H_j \begin{cases} = \exp\left(\frac{dE_j}{dt} - \frac{dE^*}{dt}\right) & \frac{dE_j}{dt} < \frac{dE^*}{dt} \\ = 1 & \frac{dE_j}{dt} = \frac{dE^*}{dt} \\ = \exp\left(\frac{dE_j}{dt} - \frac{dE^*}{dt}\right) & \frac{dE_j}{dt} > \frac{dE^*}{dt} \end{cases} \quad j = 1, 2, 3 \quad (6)$$

In its calculation the development level of the various interest subsystems is represented respectively by its t-year average. That is, E₁ = \bar{U}_1 ; E₂ = \bar{U}_2 ; E₃ = \bar{U}_3 . The integrated system level is evaluated with subsystem weighted E* = $\sum_{j=1}^3 w_j E_j$. The coordination degree of the complex distribution system can be accomplished through the consolidation of subsystem coordination, by use of the geometric mean algorithm, namely:

$$H_s = \sqrt[3]{\prod_{j=1}^3 H_j} \quad (7)$$

In the formula (6) dE_j / dt represents the growth rate of interests of each subsystem inherent to the composite system, and as a whole dE^* / dt indicates the growth rate of interest of the composite system. $\frac{dE_j}{dt} > \frac{dE^*}{dt}$ indicating the subsystem E_j enhances at a greater speed than the overall speed of the system, that is, subsystem E_j grows too fast; $\frac{dE_j}{dt} = \frac{dE^*}{dt}$ indicating the speed of subsystem E_j development is equal to the speed of the overall system, and in the state of the coordinated development; $\frac{dE_j}{dt} < \frac{dE^*}{dt}$ indicating subsystem E_j advances slowly and its improvement is behind in the overall advancement of the composite system. As Formula (6) defined, H_j is a single system coordination degree of each subsystems of the composite system E_j, H_j ∈ [0,1], and only if $\frac{dE_j}{dt} = \frac{dE^*}{dt}$, H_j reaches a maximum. In general, H_j > 0.8 it is in coordination. H_j < 0.5 is regarded as uncoordinated [14].

According to the above formula, the distribution system is in a certain state of synergy with stakeholders at a different level of interest allocation. A definition and measurement of the state of synergy provides a prerequisite for our analysis of the interaction between interest allocation subsystems

and the possible effect of their coordination on CFP.

4 Results & Analysis

For the above three groups of sample data, respectively calculated by advantage of the above model, the results obtained are as follows:

Table 3 The Coordination Degree of Interest Allocations for Employees, Shareholders and the Government under the Same Weight of Each Subsystem

	Group 1				Group 2				Group 3			
	H1	H2	H3	Hs	H1	H2	H3	Hs	H1	H2	H3	Hs
2007												
2008	0.36368	0.71417	0.62200	0.54463	0.88089	0.96804	0.82499	0.88938	0.77705	0.94396	0.89776	0.87001
2009	0.50829	0.39727	0.10096	0.27318	0.90221	0.92460	0.76033	0.85919	0.99820	0.92235	0.92997	0.94957
2010	0.58359	0.65740	0.68874	0.64170	0.71086	0.84111	0.74888	0.76504	0.81418	0.77391	0.92273	0.83463
2011	0.74983	0.55171	0.36983	0.53484	0.94398	0.79522	0.80743	0.84629	0.89633	0.82876	0.68785	0.79946

The results can be seen in Table 3, in Group 1 the coordination of the interest allocation to employees increased year by year, and the coordination for shareholder interest allocation showed the overall downward trend over these several years, the coordination for government distribution of benefits fluctuated at some extent. In general, the distribution of benefits is not very harmonious, but basically stable. Meantime, in Group 1 coordination and performance was negatively correlated (see below), indicating that there exist leading roles in the distribution of benefits, despite the coordination was not high, a certain performance can be still maintained. Under the smaller market scale of Group 1, the coordination of the interest allocation does not make much sense for enterprises to improve their performance.

In Group 2, the degree of coordination has been improved with enlargement of the business scale. In Group 3, with a slight decline of the coordination the ROE of the companies has decreased slightly, but overall kept at a higher degree of coordination and rather stable. Further calculation shows that the coefficients between the integrated coordination Hs and the corresponding ROE of group 1, Group 2 and Group 3 were respectively -0.58855, -0.05237, 0.455087. In case of Group 3, the coordination was positively related to ROE instead of the negative correlation, the coordination of interest allocation is of more importance, with a result of that the effects of a particular stakeholder who alone play a leading role are weaken. In this specific case the role of the interest allocation for shareholders was relatively reduced, performance improvement was more dependent on the interest allocations for government and employee.

Table 4 The Coordination Degree of Interest Allocations for Employees, Shareholders and the Government under the Different Weight of Each Subsystem

	Group 1				Group 2				Group 3			
	H1	H2	H3	Hs	H1	H2	H3	Hs	H1	H2	H3	Hs
2007												
2008	0.37907	0.74439	0.59676	0.55221	0.78552	0.86323	0.9251	0.85605	0.78873	0.92998	0.88447	0.86569
2009	0.34908	0.27283	0.14701	0.24102	0.78014	0.79950	0.87930	0.81855	0.93968	0.86516	0.9914	0.93064
2010	0.48914	0.55101	0.82173	0.60503	0.59235	0.99069	0.89872	0.80794	0.79882	0.78879	0.90532	0.82935
2011	0.75944	0.55879	0.36515	0.53712	0.85369	0.71916	0.89283	0.81840	0.77984	0.72106	0.79059	0.76321

Through a further observation on Table 4 it can be found that in the case of resetting the weight by the statistic method, that is, weights of government and shareholder are heavier than employee, and simultaneously business being in a smaller market, the overall coordination of its interest distribution was not so high also (average about 0.5). An additional calculation shows that the correlation coefficients are respectively -0.51163, 0.517082, 0.495279 between the overall coordination Hs of Group 1, Group 2 and Group 3 and the corresponding ROEs. It implies that although the coordination has not much correlation to the performance at a small market size and there may be larger influences of other factors on performance (ROE), with the expansion of the market size, the coordination has greatly

improved, and the correlation of the coordination to performance was increased to 0.5. The coordination degrees of group 2, group 3 were higher and more stable than group 1. This shows that in the case of larger sales, compared with cases of equal weights, the change in stakeholder's weight has little impact on relation between coordination and performance. On the whole under circumstance of larger sales, relationships become quite close between the coordination of the interest allocation and corporate performance.

A further measurement shows that there is a significant difference between the annual average ROE of the 10 companies with the lowest annual average coordination and the 10 companies with the highest annual average coordination, as seen in Table 5. Thus it further illustrate that the coordination is closely related to performance.

Table 5 The 10 Companies with the Lowest Annual Average Coordination and the 10 Companies with the Highest Annual Average Coordination

5 Conclusion

With the growth of business, the system of benefits distribution evolves. The economic interests of a company available for distribution are linked to the growth of business, and change with the change of the system of benefits distribution. Conducted for the same industry in a similar environment and in a mature market environment, this study on the 66 company samples shows that the relationship between coordination and performance become more tightly with the rise of business scale. In smaller-scale businesses, the coordination of interest allocation is also lower; in larger-scale businesses, the coordination is also relatively higher. When the coordination is at the lower level, its relevance with the performance is not prominent; at a higher level of coordination, its correlation to performance is also increased. And large enough in size, no matter who dominate, roles of different stakeholders have been little distinguished, the harmony of interest allocation within a company has obviously positive significance on corporate performance.

Unfortunately, there are less of empirical studies in this area. The purpose of this paper is merely to examine if there is the coordinated relation (consistent relations) between interest allocations and potential effects of the coordination degree on corporate performance. Owing to the limited sample data,

lack of consideration on factors such as the industrial sectors, economic cycle, this study is still relatively preliminary. It is necessary for more depth studies to use the wider stakeholders and more samples.

Research on the Guarantee of Efficient Operation on Teaching System to Cultivate Excellent Talents in International Cooperation

Dai Fuxiang

Wuhan University of Technology Wuhan, P.R.China, 430070

(E-mail: DaiFuxiang@126.com)

Abstract: The international cooperative education in China began in 1990s. After over 20 years' development, the international cooperative education has become an important part of higher education and the development direction of teaching reform in China. How to efficiently operating teaching system has attracted more and more attention. This paper tries to discuss the guarantee of the efficient operation from the excellent talents of international cooperative education teaching system mechanism.

Key words: International cooperative program; Teaching system; Efficient operation; Guarantee

1 Introduction

With the gradually mature of cultivating system on excellent talents in international cooperation, its management has tended to internationalization, standardization, systematization and scientific direction. And the key to successful international cooperation project lies in the effective operation and improvement of teaching system. Whether the teaching system is efficient or being adapted and improved with the environment will not only affect the quality of teaching and teaching order, but also affect the stability and development of cooperation programs. It is definitely necessary to discuss and research on the operational mechanism of teaching system in order to promote the quality of teaching and the cultivation of internationalized excellent talents.

2 Analysis on Teaching System Construction in Cultivation Excellent Talents in Int'L Cooperation

The motion of the system is determined by its mechanism. "Teaching system operation mechanism" in cultivating excellent talents in int'l cooperation is referred to that, in the process of teaching, the teaching participants constantly summed up with its own characteristics, effective teaching management system and its internal elements interaction feedback. International cooperation of excellence talent training mechanism teaching system mainly includes two aspects.

The first is to establish the teaching management system based on the mode of cultivating excellent talents in international education cooperation. The operation mechanism of teaching system is based on teaching management system, which mainly includes the system of teaching objectives, the supervising system of teaching quality, the teaching reforming system, and various teaching management regulations, including management regulations on teachers, students, teaching facilities, teaching service, teaching incentive, teaching resources allocation, teaching supervision, teaching evaluation and so on. These systems are procedures and methods that the staff should follow. The teaching management systems are integrated to form the object mechanism, monitoring mechanism, incentive mechanism, restraint mechanism and effect evaluation mechanism in cultivating excellent talents in international cooperation education teaching system. Altogether, it makes the teaching system operate effectively. Teaching management system must be improved and perfected in the process of teaching to ensure the characteristics of cultivating excellent talents in international cooperation, to ensure sustained and stable development.

The second is the management of teaching process. The management of teaching process mainly refers to the mutual cooperation between the various links of the management system. Any failure of effective cooperation will have a negative effect on the system operation. It will ultimately affect the implementation of teaching effect. That is to say, interaction between each link of the teaching management system is the guarantee of achieving the objectives and effect, making effect on guaranteeing, promoting, giving feedback and controlling teaching system. Those came to a dynamic system. The system mainly includes two aspects: one is the coordination between the teaching departments; another is combined with teaching management, which is based on the cooperation in teaching departments. These aspects are independent of each other and mutual connection, mutual influence, and have a certain logical relationship. Clarifying the relationship between teaching and management will make the teaching system run effectively.

3 Analysis on Operational Mechanisms of Teaching System in Cultivating Excellent Talents in Int’L Cooperation

Analysis and research on operational mechanisms of teaching system in cultivating excellent talents in int’l cooperation will set a further goal and help clarify ideas so that the cooperation of division of labor can be achieved. Following is the fig. of “Operational mechanisms of teaching system in cultivating excellent talents in int’l cooperation”

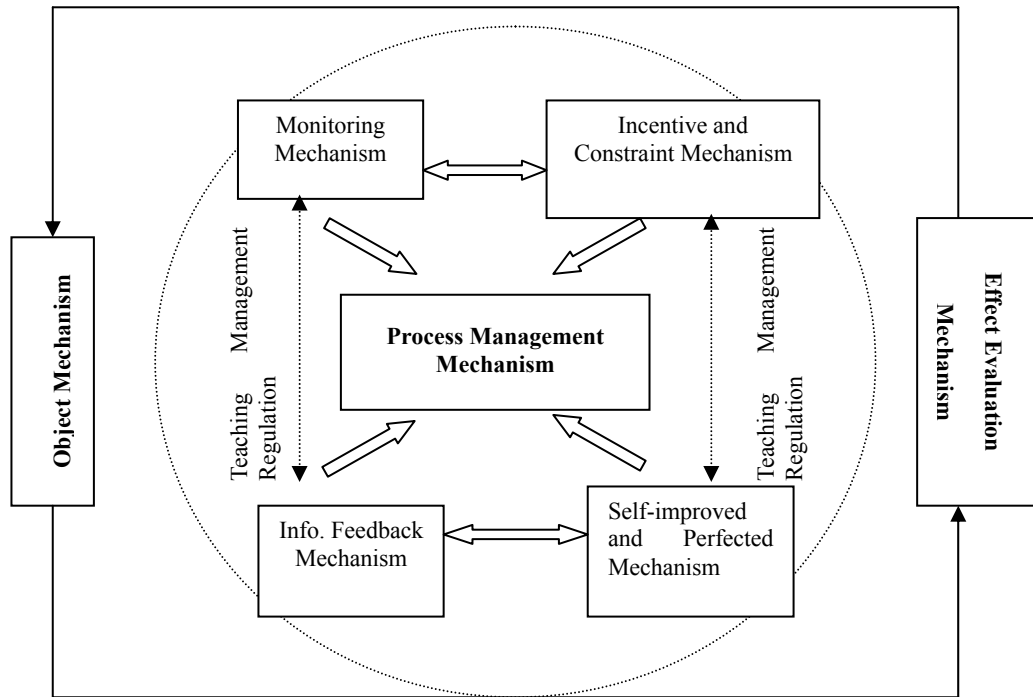

Figure 1 Teaching System Operational Mechanisms in Int’L Cooperative Education Programs

Object mechanism: the aim is to cultivate excellent internationalized talents in international cooperation education. Specifically, it is to cultivate abilities in knowledge application, innovation and internationalization. Object mechanism is to ensure the realization of the target of cultivating internationalized talent. It is set to fulfill the management indicator.

Process management mechanism: each department (project department, teaching affairs department, and instructors departments) is involved in the implementation of process management in international cooperative teaching. It contains the setting and assessing of international cooperative cultivation plan, teaching plan, disciplines arrangement, and practical teaching plan, supervising the implementation of teaching plan, employing teachers, and examining and evaluating students learning effect.

Monitoring mechanism: it is a necessary part in international cooperative teaching management system, aiming to ensure the teaching quality goal. The monitoring is composed of teaching information resource, teaching process, teaching conditions, teaching object, teaching staff and teaching administrative staff.

Incentive and constraint mechanism: the smooth running of teaching system of international cooperation is due to the cooperation among various departments. Only when combining teaching management, responsibility and interests together, can it form an effective dynamic effect so that the incentive and restraint will play its due role. Positive encouragement and negative punishment complement with each other to form the incentive and constraint mechanisms.

Information feedback mechanism: it is to collect, store sort and dispose relative information on international cooperation teaching in the management. This mechanism controls and gives feedback on teaching system and teaching management. It helps check whether the object mechanism is scientific and whether teaching process management is appropriate. It also guarantees the teaching effect.

Self improvement and perfect mechanism: self improvement and perfect mechanism is mainly to strengthen self correcting ability of international cooperation in teaching management through the information feedback mechanism, trying to optimize and improve the teaching system.

Effect evaluation mechanism: Evaluate the effect of international cooperation teaching management at any time to constantly improve the teaching management. Establishing a set of perfect teaching effect evaluation system is very necessary to evaluate the effect of teaching management.

4 The Guarantee of High Efficiency on Cultivating Excellent Talents in International Cooperative Education Teaching System.

The operating power of a system comes first from the inner side, including the policy goals, leadership attention, and clear division of responsibilities, the process detection and control. The second is the ability for continual improvement of the system and self development, self optimization, are fully reflected in the process of the establishment and operation of the system. The third is the surveillance audit of the third party on the operation of the system.

(1)The teaching system must have a clear goal. The teaching system management activities can be divided into the formulation of policies and objectives, responsibilities, establishing regulation system, implementation plan, control and improvement activities, among which policy and objectives composes of the purpose of the organization. All the management activities in teaching system are achieved on the principles and objectives. That is to say, the international cooperative education system's goal is the basis to ensure the normal teaching activities. The teaching policy and goal not only reveal the purpose and direction of cooperative education, but also is the power of management system operation and reforming. All teaching activities will be developed with the teaching goal. This can improved steadily the schooling level and teaching quality.

(2)Attention on identification and control of teaching process and the process elements. In order to make the effective operation on teaching system, teaching management process must be identified with interrelated teaching management, especially to make clear the relationship between process and elements, to facilitate on effective control and improvement on the teaching system operation. Identification of the process or elements, is in fact the analysis and confirmation of the various factors affecting the quality of teaching and the teaching environment, and ultimately achieves effective control of these factors.

(3)Attention on leader's role. In the current circumstance, The implementation and operation effect of teaching system in international cooperative education depends on its leaders' recognition and the role they played in application in a certain extent. Leaders should not only determine the direction of development, be responsible for the discipline construction, make development planning, but also allocate resources, divide duties, create harmonious working environment that the staff can fully participate in. Top administrators should not only carry out and implement the management system, but also focus on teaching effect, applying management review to understand the system operation situation, promote the system smoothly.

(4)Clarify the responsibility of the relevant duties. Clarification of working responsibility of each department and each post plays important role in command, control, coordinate activities, achieve the goal for the organization. Unclear responsibility will lead to chaotic teaching system, increase running resistance, or even result in failure of teaching system. Clear responsibilities and authority is benefit for a smooth transition for each link of the teaching system, so as to make the management more effective.

(5)Attention on the monitoring mechanism of teaching system. The establishment of a teaching system is not easy. It is even harder to make it run effectively, which requires all relevant teaching activities are under control: formulate standards of evaluation index and teaching quality criteria; strengthen supervision and inspection and information feedback mechanism; construct international cooperative education teaching quality monitoring mode; carry out regular self-examination and self-assessment to solve the problems and shortcomings in teaching activities. Self-examination and self-assessment is a driving force of teaching system. Self evaluation helps both administrators and staff understands teaching system running status, recognize system improvement opportunities and form self-improvement and perfect teaching system mechanism.

(6)Rigorous third party supervision mechanism. Effective operation of teaching system needs not only scientific regulations, rigorous third party supervision mechanism of continuous improvement and perfection of teaching system has played a very important role, makes the implementation of teaching

system a powerful safeguard, so that it enters to a virtuous cycle standard operation. Therefore, when facing all levels of supervision power, the international cooperative education teaching point should not make fraud, assault motion type, but transfer the pressure of market competition and supervision and inspection from the outside as a powerful driving force to promote teaching system operation, seize the opportunity to improve the shortage, to fulfill the teaching system of the vigor and vitality, to achieve the teaching goal.

(7) Guarantee the stability of high-quality teaching staff. The building of the contingent of teachers is an important guarantee for normal operation of the teaching and teaching quality improvement. In order to ensure the effect and quality of international cooperative education, cooperative education program should set a goal to build a high level teaching team, mainly in independent training and working improvement, to strengthen the cultivation of high-quality teachers, to improve the existing teaching team level.

(8) Perfect the relevant management regulation in teaching system. Economist Wu Jinglian once said ‘the idea is more important than the regulations, while the regulations are even more important than technology’. Cultivating excellent talents in international cooperative education should follow the internationalization of education idea, establish and perfect the system of teaching management, to ensure the effective operation of the implementation of teaching methods, teaching work and the development of teaching system. Regulation is the rules that certain procedures, organization members to abide by, including a variety of requirements, working methods and procedures, policies and regulations. Regulations are in the form of performance management manual and a variety of documents. Only fair, reasonable, scientific, perfect teaching management system can be the staff recognized, in order to ensure the effective operation of teaching system.

The Role Positioning and Countermeasures of Local Government Process Reengineering Based on Administrative System Reform*

Zhang Hao, Ding Yunlong

Management school, Harbin institute of technology, Harbin, P.R.China,150001

(E-mail: hao3answer@163.com, 30825379@qq.com)

Abstract: Government Process Reengineering (GPR), which is produced in the new public management movement in western countries, is a new government reform initiative. It is the combination of "reinventing government" thinking and business process reengineering. Building the government process system, which makes the public demand as the core, is the fundamental requirement to adapt to the current trends of government reform. Meanwhile, the meaning of GPR is not only limited to the simple business process optimization, also reflected the concept of government organizations upgrading and the changes of organizational structure and management mode. It fully enhances the efficiency of government administration through these innovative measures. In this paper, the author focuses on the four hot issues of the China government reform: e-government construction, the super-ministries construction, government performance management and the transformation of the government function. Then, the author discusses on the inter-relationship between above four aspects and the GPR. At last, from the theory and operational levels, fully exploited the demands from "the government process" which based on specific measures of the administrative system, the author positions the roles of GPR in our administrative system reform.

Key words: Government Process Reengineering; Administrative System Reform; Role Positioning; Countermeasures

1 Introduction

At present, China is facing the economic system transition, from the original plan economy to the market economic transformation gradually. As the traditional inertial impact, the transformation of political is far behind its economic development, which cannot meet the requirement of economic development. The disadvantage of government management is especially significant, of which the diffusion effects very rapidly, so, the social attention is gradually shift to the effectiveness of the administrative system reform from the local government service ability. There are some apparent problems on government's public service and administration ability, such as: information asymmetry, which caused by information that the government wants and the enterprise needs can't deliver timely between them. The high costs of government management, as many public service procedures are still stay in the original "face to face, hand to hand" way, so that there are so much waste of the time and space cost that both enterprise and government had to pay, which caused inefficiency. Discretion and black-box operation, which are the old problems in our traditional bureaucracy system reform, is because working processes are not fixed and standardized in our government, especially the processes directly extending to the enterprise, even that the positions and responsibilities of staffs are stable. No standardized processes takes a series of problems that the same enterprise may have different public service standard, where the unfair treatments happened.

These management problems are the main factors causing the low efficiency, and become the obstacles in China's economic and social development. Aimed at finding a model of GPR that meets our social environment, political background and economic conditions, our government, from central to local based on "service-oriented government" concept, takes a lot of attempts with "the government process" in GPR in our the current the new round of reform^[1]. Our objectives are maximizing the government's administrative efficiency within China's government at present management mode, Reform is a kind of trend, so the GPR is the reform operational measures but the purposes. Therefore, the current problem which the local government faced is that how we make GPR adapted to others reforms and meet the trend of the reform. In other words, what role that the GPR in the process of reform should play and what kind of affect it should achieve is the problem which managers should make clear above all.

* This paper is supported by Harbin government project, named the government process reengineering of Harbin government, FZB—HIT2009001)

2 The Government Process Reengineering: From Concept to the Operational-Level

2.1 The connotation of GPR

The definition of government process reengineering is no unified, but the researchers had reached a basic agreement. The operating process of GPR is the redesign or reschedule of the original administrative management process and government administrative procedures, based on the relations of all the interests and responsibilities. As a result, GPR replaced the old one process with a new one, or modified, merged and simplified the old ones. The purpose is that, firstly, to optimize administrative organizations or government operation system and operation mode.

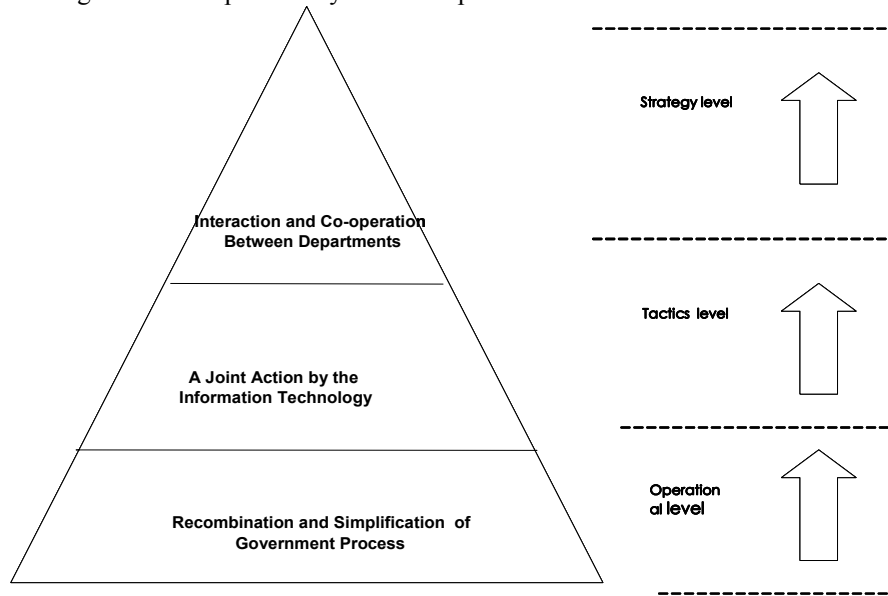

Figure 1 The Connotation of GPR

Secondly, the government should transform government function and improve the efficiency of the administrative management, performance and quality. Thirdly, the government should realize the maximization of social welfare. Taking the guiding ideology and tools as the perspectives, from satisfied the public service needs as the starting point. GPR is a process by which we can organize the public service in a certain way to form a complete service process, using the modern information technology and based on the system thought as the foundation^[2]. To create a service-oriented government is the important way to change the government management function and management mode via the GPR.

There are three levels to understand the meaning of GPR (The figure 1 follow). First, the operational level of GPR is visual simplified or restructuring the government management process. Second, extended upward to the tactical level is to use information technology to promote department linkage. Third, strategic level is to realize the interaction between government departments without boundaries.

2.2 The development Trend of GPR

Compared with "government reengineering" movement in western countries, the study of GPR in China is required to further strengthen, quoted a scholar's words, is "a burgeoning field". Recent studies focused on the theory system of GPR, such as the concepts, principles and significances of operating the GPR, meanwhile, the empirical research is seldom on how to solve specific administrative problem and organizational restructuring, the transformation of government functions, government management change and government services paradigm change through the GPR. From the research situation perspective, our government also took the GPR practically earlier than theory research. There are some forms of it in our e-government construction, the super-ministries reform and other countries major administrative system reform. Now, our study aim is to summarize the experience, then analysis the relationships among the GPR and e-government construction, administrative system reform, government performance evaluation, government transformation project, and so on. The research in this respect is more lack. In addition, the influence, which came with the GPR, of institutional, structural, management, and human resources, technology level are the hot issues in this field.

Overall, the GPR projects in China's government departments already had successful models, even

though not very popularization, but its development speeds up soon. Along with the development of China's public management and administrative system reform^[3], the GPR from the connectional level had concentrated the attentions of public society, and received common recognition; the current development is toward exploration experience.

3 The Position of GPR in the Administrative System Reform

The goal of Administrative system reform is to improve the administrative efficiency, and enhance the government service capability. The government process reengineering, as part of the reform, has connected and influenced the present reform measures in the long Reform process. Therefore, the government process reengineering which had service for reform, should coordinate with the ongoing reform measures, adapt to the already done measures, so as to promote administrative system reform smoothly and directly.

3.1 The links between the Government Process Reengineering and the E-government

E-government is part of the development and innovation of the traditional working mode^[4], because the changes of government affairs must cause the working procedure alterations, so, electronic government has a large interactions with the government process reengineering. On the one hand, the government process reengineering is a way to promote e-government to a certain extent; On the other hand, the electronic government affairs raise a claim for the government reengineering.

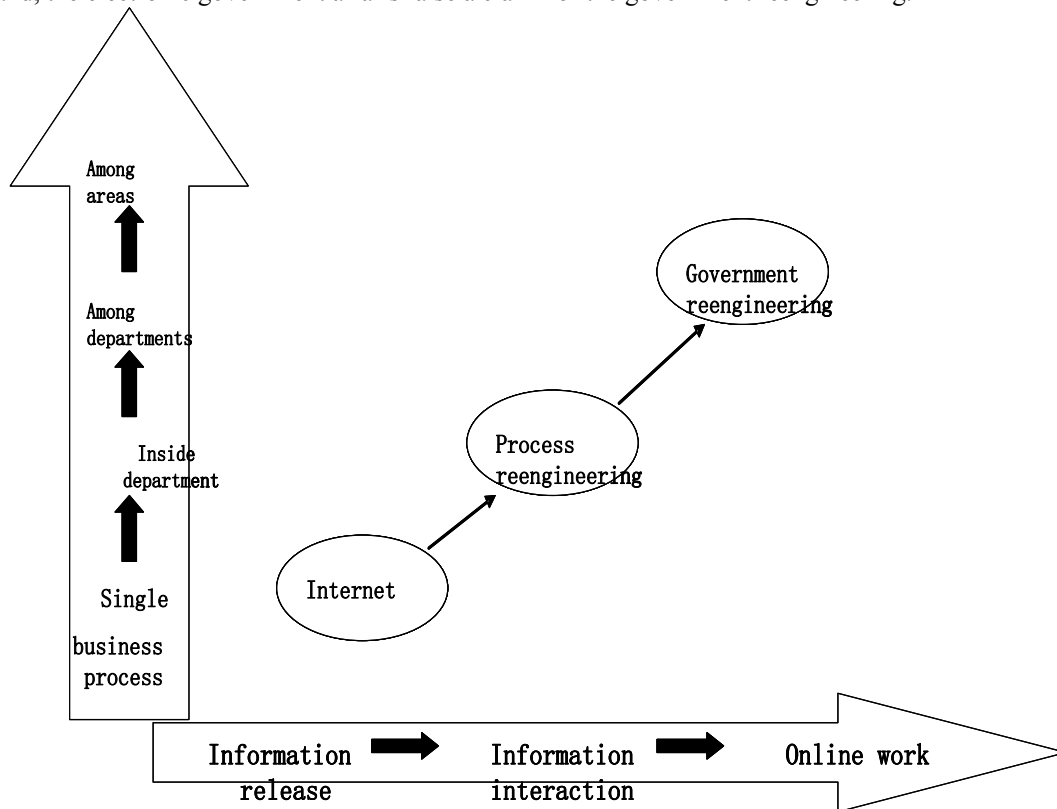

Figure 2 The of GPR and the Application of E-Government

The application of electronic government affairs should take the process reengineering as organizational guarantee. As the levels of electronic government affairs application is continuously improved, the requirements for process reengineering are also increasing after the section of information released^[5]. The electronic government pointed out clear direction for process reengineering, and put forward the requirements. Due to the administrative process reengineering also is to structure the government process form which is adapt to requirements of informationization development by the information technology, it should re-design and optimize the traditional organization structure mode, the mode of management, business process and the way of providing service, and take the integrity business process to replace fragmentation process split by any government department formerly based on information technology and from the system point^[6].

The e-government and process reengineering are interacted and influenced each other, as the government can optimize management function, save administrative cost and improve the efficiency of executing the government mission to promote public satisfaction, in this way, the electronic government is technical support for process reengineering. Moreover, the restructuring of government business process plays a meditative and promote role for e-government, as a result, the combination of both one has the significant practical meaning^[7].

3.2 The links between government process reengineering and "the Super-Ministries" of China

The seventeenth national congress of the communist party of China focused on reducing the administrative levels, reducing administrative costs, and strives to resolve the problem on overlapping organizations, cross responsibilities, and divided policies from various sources. In the new round of reform, the main point falls on "the super-ministries" construction, the essence of "the super-ministries" is that to reconstruct government authorities structure and establish the new government operation system and operation mechanism^[8], but not merge government agencies simply. "The super-ministries" gets departments which has the similar business and same function together so as to accomplish unified management by one department according to "decision-making, execution and supervision" coordination and mutual constraints of the principle. Aimed at avoid overlapping functions, many supervisors to one subordinate, it had to reduce the amount of department agencies so that to improve the administrative efficiency and reduce the administrative cost.

The value of government process reengineering is to constantly improve the ability of the government management to meet the social public increasing development needs, and maximize the public interests. The integration of the super-ministries directly related to the reconstruction of government process, which the institutional changes lead processes to a new level. It requires the goal of evolutes to flat-style and simplifies the process further through the reduction of administrative level. Along with the advancement of the super-ministries, government process reengineering is droved.

3.3 The links between government process reengineering and government performance management

The definition of government performance management is that evaluating actual performance and achievements of the government authorities as accurately as possible by the scientific methods, standards and procedures, so as to improve and enhance the government working efficiency^[9]. The government performance management is a series of activities that make the government's long-term and short-term goal, the strategy, and the assessing standards, so as to achieve the administrative agency operational management and evaluation.

It mainly includes four basic function activities: performance planning, performance implementation and management, performance evaluation and performance feedback and improvement. Specifically, the government performance management could be understood from the three aspects as follow, the micro level, the medium level, and the macroscopic level. It includes the identification of civil servants personnel performance and contribution; the assessment on management of every government departments and the government institutions; the performance evaluation of the whole government^[10]. Because the cognition of performance management and extension does not come to an agreement, and the definition of it is not clear, it could not establish a complete set of government performance evaluation index system and method. As the expression of the content, it is the one-sided will that the economic performance is equal as the government performance. So, it uses more qualitative evaluation than the quantitative index, such as "leader's attention", "satisfaction", and "standard level". These qualitative indexes are easy to be adjusted by the government department, which makes the assessment results hardly to be objective and fair enough, so it becomes formalization^[11].

The core issue of public sector process reengineering is to solve the government efficiency and performance, and its revolutionary significance takes continuously improvement of the executive ability and working efficiency to achieve the high quality and efficiency of public service finally through the practice.

3.4 The links between governments process reengineering and build a service-oriented government

The definition of service government is that a government which achieve the service functions and bear the responsibility of the service, refers to a "citizens as core-oriented, under the guidance of the concept of social standard, being built in the entire society under the framework of democratic order, according to citizens will legal procedures to set up, aimed at citizen services^[12]." The subjects of The service-oriented government service is all levels government, the object is a citizen, social organizations and society, the aim is to promote social benefit and stable development, the content is decided by the

public opinion, the mode is in the open and transparent way.

At present, because the government's decision is not divided with the executive function, the government departments may make the policy for local interests, so administrative performance evaluation is instead of maximizing internal interests, the chaos of management mode lead to government micro management and intervention overmuch, which fell into specific economic affairs in management's mire and hindered the transition of government function. The government process reengineering will re-settle the government internal function by integrating the business process which faced public demand^[13], re-design management pattern by improve the public service network system as the foundation, re-evaluate the administrative performance by the satisfaction degree of the enterprise and public. So as to realize the transmutations from traditionally consciousness of centralized management, controlled subordinate and regulation completely to scatter decision, serviced subordinate and sensitive feedback. A service-oriented government indicate he direction for the government process reengineering. With the construction of e-government, the traditional government process and operation mode no longer meet the needs of practical application under the concept guidance of "one-stop" service^[14], so it requires re-designing the government's public service mode. Service program reflect internal pattern of the government's public service activities, which is logical sequence of the activity. The quality and efficiency of public service directly comes from whether concise the public service program is or not. The government process reengineering and service program transformation are two part of one body, the latter is the core content of the former, meanwhile, the actual result of former expressed as the change of service program^[15].

4 Case Study of Government Process Reengineering of Harbin Bureau of Quality and Technical Supervision (HBQTC)

4.1 The status description

Harbin Bureau of Quality and Technical Supervision (HBQTC) as a municipal government agency, is responsible for the implementation of the laws and regulations of standardization, metrology, quality and safety supervision of special equipment, etc within the scope of the city. the main business and office system of HBQTC includes two categories, ten events for examination and approval matters, Six administrative licensing and one non-executive permission.

There are seven main responsibilities faced to the public, such as to carry out national and provincial quality and technical supervision guidelines, policies, laws and regulations; to take response for quality management in the region, to supervise The quality management of the region, to take response for the local management of standardization, to unify management of metrological work in the region; to integrate management of the region of boiler, pressure vessel, pressure piping, special equipment's safety supervision, to carry out and implement relevant laws and regulations; to organizes development and implement for quality and technical supervision in our region business plan.

The business relevance of HBQTC takes the proportion of 3% in the all 297 items of administrative services announced from 41 departments, which is closed to the main business and the public and the companies. HBQTC is an important position in the e-governmental network, on the vertical direction there are the National and Heilongjiang provincial Bureau of Quality and Technical Supervision on the top, and other units subordinate and inspection department under the district. Horizontally, HBQTC has a lot of businesses cooperation with other governmental departments, such as public security, business administration, bureau of health, consumer advocates etc.

4.2 The objectives description

The main goal of government process reengineering, is to optimize restructuring the original process, to achieve chartered process, to Pursue process reengineering under the rule of law, to achieve institutionalization and sequencing, behavior standardization, to give prominence to the humanistic care, to achieve process human, to pay attention to public services and products supply of indifference, quality standardization. Taking the view of the reengineering process, the objectives of HBQTC government process reengineering can be divided into short-term and long-term goals.

Short-term goal, which is also the microcosmic goal, is to solve the problem which the requirements of this unit each department in administrative activities, neither dereliction of duty, but not excessive, neither doing their duties, nor disorderly, not only emphasis on power, fails to perform the responsibility, but also only do their jobs when it make benefit and give up responsibilities as nothing happened.

Long-term goal is macro goal, which solves the problem of the government process reengineering

standardized the administrative behavior^[16], changing from the almighty government to limited government power. The administrative process reengineering of HBQTC emphasizes the government provide public products and service quality.

4.3 The implements of the project

The project team investigates on government functions, institutions and sections, responsibility and division of administrative authority, finds out the positions and relations of the functions, responsibilities and authority of operation offices, teams and institutions by tracking mining their government processes. On this basis, we conduct a comprehensive combing of decision-making, information transferring, supervision, assessment process and the law enforcement process thoroughly.

We take the government process reengineering from two aspects of demand, the enterprise and the public, then carding the process and making improvement according to the requirements. The design mainly divided into three steps:

The first step is to research and comb. Investigating on the administrative functions, powers operation and public demand then carried out the administrative power level, as a result of power sorting catalogs and function adjustment opinions, which are assessed by the expert argumentation.

The second step is to adjust function and reform the system. To formulate and organize the implementation of the government institution reform, to carry out the adjustment function; to issue administrative rights to county departments, ready to handover of the district, county (city) authority and cohesion; and to adjust the public finance system.

The third step is to carry out the execution process reengineering and perfect security mechanism. To optimize the administrative law enforcement procedures, and establish and perfect the safeguard mechanism, to take fully implementation of government performance evaluation, and establish administrative supervision network platform, exercise network supervision over administrative power operation.

Comparing the before and after, the main process improvement reflected in the following aspects:

First, the payment system was optimized. The original payment shall be handled directly by the window, and then turn to fiscal revenue system, now the applicant can choose the one step payment way, leaves out the window of doing business and save intermediate link.

Table 1 statistical Comparison Table of Process Optimization

	Applicant Actions	Transactor Actions	Interactive Process
Before	5	7	8
After	6	6	3

Second, the information acquisition way has some adjustment. The original of the applicant's information collection need to fill in manually and typed-in by the acceptance, as now we changed the process that the applicant directly entering the application information, which reduce the back and forth in the audit, make the information acquisition as one pace reaches the designated position.

Third, to reduce number of times of material between both sides and it reduce the energy input and improve process efficiency. On both sides of the interaction, process by eight times reduced to 3 times, as the figure of the arrow line between the two columns, fully illustrates that the handling process, both sides need to communicate the completeness of information, for people to do work is necessary to review, and some of them is not limited to face-to-face interaction, which can take a variety of forms such as network, telephone, SMS, make full use of technology to support the process.

Fourth, the applicant can accord the information public service guide, learn to deal with process, and can clear the progress of the process after a phone call or SMS notification. Form now on, they only need to carry documents, can be a successful get their card, reduces the time cost, and the business is no longer difficult.

Fifth, the increase of action times shows the more applicants to participate in the conduction of greater autonomy, improve the degree of public participation and transparency; the number of transactor action decreased, shows that higher efficiency of handling affairs.

5 The Countermeasures of Local GPR

5.1 To Reshape a Conception of Administrative Value as Initially, driving the changes of administration culture, to provide culture environment of GPR

The implementation of GPR, first to do is remodeling personal administrative value, then, taking

transformation of whole administrative culture. Based on the current situation of a service-oriented construction in government, the government should set up "the public interest is supreme", "hearty service", "full service" and "service is the productive forces" concept, by building the service center to the public. So, the government could make an "public demand" oriented service values^[17].

5.2 To take the government organizational reform as an opportunity, driving the transition of government function, providing the GPR a reasonable organizational framework

Structure transformation lead to change of process, it is also the other hand of driving the implementation of GPR. Therefore, the current government reform can reduce stress and resistance for the GPR; often it makes more the effect. Government organizations change to "flat type" from originally the "pyramid" of institutions, make the government network structure as longitudinal breakthrough and lateral coupling, and expand the management range, reduce the administrative levels, decentralize the authority appropriately, then change the traditional almighty government image. The transition of government function lead to government organization adjustment, by which this adjustment to integrate the government process: through the government reorganization merger, we can integrate process which scattered in different departments, and make it full and fluent^[18].

5.3 To take the performance evaluation as a safeguard, driving the government management innovation, providing system platform for government reengineering

The change of new government process requires new performance evaluation content to adapt to performance management of the new process, which drives the reform performance management. The new performance evaluation based on process as the center, is the improvement of performance evaluation system by which the traditional department functions evaluated. It will accurately convey the direction, responsibility and audit standard from the strategic decision-making level to each specific actions or tasks, focused on the interaction between people, procedures, and the performance, which make the process easier to observe, control and adjust. In this way, it not only makes the evaluation more scientific, equitably, persuasive, but also can reflect more broad vision as "flow as the core" new ideas and "horizontal integration"^[19], thus forming the healthy operation mechanism that government process improved itself.

5.4 To take the informatization Construction as the means, driving the government process change the way of thier work, to provide the technical support for GPR

Information construction is much closed to the government process reengineering, the informationization is trends of government management, which support the government process reengineering is the flow of support behind. At the same time, the results of government process reengineering are embedding the process into technology measures as far as possible, which are different from traditional written review form of "face to face, hand to hand", instead of simple "window type" or "one-stop" office form taking the online services office model, by which the public could receive government information and services via many channels¹⁴, so the government authority and all sectors of the community could communicate from each other, and the government also could provide various services public choice. Therefore, we must continue the GPR through government informationization, such as promoting departments' official online and wide-area network construction of government, regulating and innovating the administrative behavior and procedures; promoting the e-governmental network construction and unified data standard, practicing the resources integration to promote information sharing^[20].

6 Conclusion

To sum up, the government process reengineering thought is the references for Chinese administrative system and operation mode reform, but at the same time, we should understand that the government process reengineering thought itself is yet to be practiced and completed constantly. So, it makes us not only to reference the advanced thinking of sparkle, but also to base on the actual situation. After that, we could find the suitable the reform mode to promote the construction of service-oriented government in our country, combined with the improvement of the government work process. The government process reengineering is completely revolution in government operation pattern, also is the great measure of deepening the administrative system reform. It has the inherent consistency with other reform measures or reform ideas, therefore, only through the idea, organization, system and technology support, will we exert better government process reengineering performance, so to play a bigger role in the reform.

Policy Research on Human Resource Development of Disabled Persons in Our New Period

Ai Liang, Luo Dan

School of Politics and Administration, Wuhan University of Technology, Wuhan, P.R.China, 430063

(E-mail: ailiang08@163.com, luodanwhut@163.com)

Abstract: The disabled person is an important force that allow of no neglect in human resource development. Under the main idea of qualitative research, this thesis interprets and analyses Chinese government's policy on disabled persons' human resource development in the aspect of special-education, employment services and motivation system from the year of 2000 to 2012 by using the method of literature search and data collection. It has been found that problems exist in unfulfilled requirements of special-education for all disabled groups and the low utilization of training resource; single orientation of employment policy service and the lack of a policy system for employment training of people with disabilities, and so on. In view of the above problems, this thesis puts forward six proposals, including organizing cultivating and training for special-education teachers to meet the different types of disabilities and requirements; introducing an assessment system of special-education teachers' training effectiveness for the rights of the disabled; strengthening the maintenance and management of configuration related to the employment information network for the disabled; enhancing efforts to support disabled persons in their own businesses; developing periodic and standardized training of employment for the disabled; enabling more disabled people to benefit from the incentive scheme.

Key words: Disabled persons; Human resource development; Policy; Descriptive statistics

1 Introduction

With the development of modern economy and society, the utilization of human resource, as an economic development factor, is getting more and more attention from enterprises, even the government. As is known, there are objective differences in working capability and employment environment etc., between the disabled and the healthy people. This difference is one of the reasons which leads to the fact that the human resource of the disabled is not fully valued and optimized. However, most of the disabled just partly appears physiological function disorders, and the capability of undamaged parts of body can still be called human resource, which has been underdeveloped so far. According to the Second National Sample Survey on Disability in China, 82.96 million people or 6.34% of the country's population has a disability. There are researchers pointing out that based on the survey, of these disabled over 15-year-old, 27.42% has complete working capability, and 42.99% has partly working capability, which means the total number of the disabled can participate in the labor runs up to 70.41%. In recent years the employment rate of the disabled keeps rising in China, and the employment service for the disabled is enhanced. But at the same time, employment situation of the disabled is still severe: there are 8.58 million disabled people without job at their working age and with working capability, what's worse, the annual increase reaches 300 thousand; besides, most people with disabilities can only undertake simple manual work with low income and straitened living circumstances, which makes the low level of employment; the differences between regions, urban and rural areas and various types of disabilities can also result in the imbalance of employment of the disabled. The disabled people are disadvantageous in competitive employment, and they should not only be treated fairly, but also get special protection from the society. At present, the social environment has great adverse impacts on the disabled. Discrimination and prejudice of the disabled severely obstruct the equal rights in employment competition and the implementation of related laws and policies. As for the human resource development of the disabled, it needs the contribution from family, government and the enterprises, while the enterprise is the ultimate taker. We have set forth a series of related policies and methods dating back from the year of 2000 and basing on these, the writer makes a research on the disadvantages and improvements.

2 Analysis on the Policies of the Human Resource Development of the Disabled from 2000 to 2012

2.1 Summary of the policies of the human resource development of the disabled from 2000 to 2012

According to related government documents and information the author collected, it was found that,

since 2000, there was 62.9% human resources development policy in relevant disabled persons undertakings in our country, which fully shows the disabled persons development have received attention in human resources development. Detail statistics are shown in table 1:

Table 1 Total Number of Statistics of Each Policy

Subjects	Special education	Employment service	Incentive mechanism	Human resource development	Relevant policies on Disabled persons undertakings
Numbers	29	38	53	276	439

However, the 276 human resources development policy documents already issued and implemented for disabled people mostly focused on special education, employment services, incentive mechanism. Among these three aspects, the special education policy of human resource development accounted for 10%, the employment service policy accounted for 14% of the total, and the related policy of incentives accounted for 19%, which took nearly half of the total (Detail in Figure 1).

Figure 1 Proportion of Various Policies

The relevant policy of special education is mainly to solve the problems of special education schools' construction and management, special education talents cultivation and transportation, promotion of college admission for disabled candidates, etc. Employment service policies are mainly on disabled persons' current investigation and statistics of outstanding, the disabled persons' employment guidance and training, and encouragement and support for the disabled starting their own business. The relevant policies issued around incentive mechanism mainly include the selection and recognition of self-improvement disabled persons, disabled workers and demonstration areas of disabled undertakings, and enterprises which accept disabled persons.

2.2 Problems and analysis on the policy of disabled persons' human resource development from 2000-2012 in China.

2.2.1 Special Education

1) The special-education has not satisfied all the disabled.

Special education policies mainly focus on serving the visual disability, hearing disability and speech disability, for the physical disability, mental disability and mental disability groups, there are fewer supportive policies for special education. Few appropriate special education teaching training can meet the requirements of various disabled people. In the projects which the Disabled People's Federation of China cooperates with the Li Kashing Foundation, they concentrate on training a large number of graduates major in hearing and speech rehabilitation technology, language training teachers for deaf children, while the training of special-education teachers offering the special services for the visually impaired people and people with intellectual disabilities are not organized and conducted by the government.

2) Low training resource utilization.

The effective results of special-education teachers' training base on policies of stimulating the scale of various types of teaching, while not the satisfaction of the training for the disabled. How to increase the shortage of special-education resource has been paid more attention when making policies, rather than focusing on the quality evaluation and consideration of previous stage of special education training,

which ignores the different characteristics of the people. For example, after cultivation and settlements of a large number of language-training teachers for deaf children, there are no policies indicating the presence of underlying evaluation mechanisms for collecting and summarizing the training effect and the feedback opinions of the educated hearing disabled and speaking disabled, so the effectiveness of the policy which is based on local conditions for certain problems is weakened.

2.2.2 Employment services

1) Single orientation of employment policy service.

Most of these policies are made to help people with disabilities to get employed in the enterprise, ignoring the assistance given to the disabled entrepreneurs, which causes that most disabled people who have conditions to start an undertaking rather look for jobs than grasp the opportunity of being self-employed and even helping others.

2) The lack of a policy system for employment training of people with disabilities.

Vocational education is the key to improve employment opportunities for people with disabilities, and the appropriate vocational skills training carried out by CDPF is far from satisfaction catering to different types of disabilities, and at the same time relevant system instruction and work supervision are not offered for the local vocational skills training, some locational intermittent vocational skills trainings are unprofessional and out of the specifications, which is not only unable to obtain the desired effect, but also wastes the resources and frustrates the disabled.

2.2.3 Motivation system

The coverage of incentive policies is limited. There are seven categories of disability including hearing disability, visual disability, mental disability, intellectual disability, speaking disability, physical disability. And the disabled who have the ability to receive these honors concentrate on physical disabilities and visual disabilities, while the remaining parts are difficult to weigh the former whether in business or in employment. So the existing motivation system will not work entirely for stimulating the potential of disabled people's human resource unless some special recognition awards can be established for these five categories.

Without doubt, special education, employment service and motivation system are not the only contents of policies on human resource development of the disabled in China. In February 2009, the CDPF issued Circular of Establishing Leading Group and Office of Social Security System and Service System for the Disabled, this circular represents the beginning of social security system and service system for the disabled in China. Thereafter the CDPF organized a series of meetings to make the list of the leading members, work arrangements in provinces and cities, aiming at promoting the construction of the system. Then in May 2011, the CDPF issued the Guide to Formulating and Implement of Regulations for Employment of the Disabled. In 2007 the state council formulated and promulgated Regulations for Employment of the Disabled, which marked the disabled employment is on track of legislation, and formulating local regulations is an important signal of the progress made in the local governments' work of human resources development of the disabled.

3 Proposals to the Human Resources Development of the Disabled In New Period of China

3.1 Making training policies of special education teachers catering to different types of disabilities.

Considering the fact that the diversity and specific conditions of persons with disabilities are complex, it is essential to set up relevant targeted special-education teachers' training and programs. The targeted special education with high quality for the disabled children will certainly accelerate them to pursue a good career planning and development when entering manhood from childhood. So pay attention to the special education of persons with disabilities, meaning that ensure the quality of human resource development from the source. As the special education teacher training mechanism set for language training for deaf children with hearing disability has been relatively mature, the experience gained in this area can also be applied to other types of special education teachers' training. For there exists disabled people with visual impairment, physical disability, mental retardation, etc., special education teachers training mechanism and schedule for standardized training should also be established, to form a necessarily steady special-education teachers' training and mechanisms.

3.2 The policy of special education teacher training effect evaluation from disabled people's perspective

It's not enough to focus only on the training of special education teachers. The training effect appraisal and the feedback is also an important guarantee to improve the quality of teaching. As for the

teaching quality of ordinary teachers, the Ministry of Education has a mature evaluation mechanism. And this is a mechanism that can be used to reference. According to the evaluation of teaching quality of special education teachers, not only to improve the teaching ability of the teachers themselves, but also to ensure the quality of special education, which paved the way for the development of disabled human resources. The system of special education teacher training effect evaluation can choose special teaching schools as the test point, formulating a set of written examination standard. Among the important part is to collect and collate the feedback of education students, including the interview and survey of disabled students, the statistical analysis of disabled students' test scores and etc. After the pilot work in special education school achieved certain results, this mechanism can be promoted in other settings of special education services.

3.3 Improve the policy support for the self-employed of disabled people

Among all social roles, the government is the final undertaker of the human resources development of people with disabilities.¹ In making the policies to encourage the employment of disabled people, the key point is to consider the self-employed of disabled people, laying a convenient way for the self-employed of disabled people and offering them corresponding financial and policy support. When the disabled counsel the employment, the staff should have a brief idea of the basic skills of object who need employment demand. Persuade those disabled people who have special job skills to become self-employed and inspire them with the idea of "self-saving". At the same time, visit the successful self-employed disabled people and collect their information, invite them to give lectures to those disabled people who need employment, show them the spirit of entrepreneurship and motivate the advantage of disabled human resources. All these can encourage the disabled people to give play to their skills to "self-help" and "help others".

3.4 Working out policies to organize and conduct periodic and standardized training of employment for the disabled.

Vocational skills of people with disabilities play an important role in their employment. Choosing what kind of job and deciding their abilities and inabilities base on their vocational skills, so employment training for the disabled is a key point in human resources development. Local small-scale vocational training for the disabled has always existed, but the selection of trainers, curriculum and training effectiveness is not guaranteed standardly. The trained handicapped often express that these training not only wastes their time, but also does not teach them any practically skills. While in the view of government, this is also a waste of the government's human and material resources. Therefore, legitimately regulating the job training of people with disabilities is imperative. Firstly, the primary CDPF draw up a questionnaire to the disabled within the jurisdiction as the investigation object, mainly asking them what type of vocational skills training they need, and then arranging training and the length of time according to their free time. After delivering the unified report to the parent organization, the CDPF or provincial CDPF directs teachers and funding in the light of the reported situation, and if there is a demand for small-scale, the subordinate organization can make flexible arrangements on training content and time. Finally, a quarter or a year can be a cycle for the assessment of all trainings, the content of the assessment may include a trainee's return visit or employment situation, etc. All these assessment results provide the orientation of improvement for the next cycle of training.

3.5 Formulating efficient motivation system policy to stimulate the potential human resources of the disabled

Widen the range of the disabled under the motivation system including reward and commendation. And make different standards and types of motivation according to different kinds of disabilities. For example, the hearing disability have certain impairment, so we can commend those who overcome difficulties and make outstanding performances with strong mind. As for those who cannot make this because of objective realities, we can encourage them to optimize their features, and also set up rewards to commend those who have outstanding performances in art, sport and professional skills etc. The ways of motivation can be more various and can suit different kinds of disabilities to make them feel been cared about and become confident, to realize the potential of human resources of the disabled and to help those who have been developed or to be developed find the direction and increase the possibility for further development.

4 Conclusion

From 2000 to 2012, many policy documents on disabled persons' human resource were unveiled by

¹ Mao Ailin 2008

Chinese government, which made great progress in advancing the cause of disabled people and improves the quality of their living condition. However, there still existed some problems in the process of making and implementing this kind of policy. Thus, we must take feasible and exact response to solve the problems without hesitation. Only in this way can the large quantity of Chinese disabled persons' human resource be fully used. Moreover, it will promote the economic development and social progress in an all-around way.

Cross-Border Spillovers from Local Fiscal Expenditure: Evidence from Cities in the Yangtze River Delta *

Yin Desheng, Huang Wenqian

School of Finance and Statistics, East China Normal University, Shanghai, P.R.China, 200241

(E-mail: dsyin@finance.ecnu.edu.cn, huangwq@cnooc.com.cn)

Abstract: The adjacency of geographical space and that of economic space play an indispensable role in the fiscal expenditure of each city in the Yangtze River Delta, and this impact directly determines the progress and path of local government cooperation of this region. Based on 16 core cities in the Yangtze River Delta, this paper estimates the spatial externality of the expenditure of each city in capital construction projects and such livelihood projects as science, education, culture and hygiene and social welfare, so as to provide empirical evidence for each local government here to determine cooperation projects in capital construction and livelihood fields and their priority order, and thus achieving a breakthrough for local government cooperation and coordinated development in the integration progress of the Yangtze River Delta.

Key Words: Adjacency; Local Fiscal Expenditure; Regional Cooperation; Yangtze River Delta

1 Introduction

The spatial correlation of fiscal expenditure behaviors of neighboring areas is a research focus of the applied public economics. Zhao and Cai(2006),Baicker(2005),Revelli(2003),Case et al .(1993)have demonstrated the channels through which the fiscal expenditure of an area generates spatial externality on the fiscal expenditure behaviors of neighboring areas and corresponding results. The spatial relationship of local fiscal expenditure covers both circumstances of positive externality and negative externality. The inter-local tax competition is a typical embodiment of negative externality. Domestic researches on such an aspect were relatively centralized, and all emphasized that the tax competition among neighboring areas had various negative impacts on regional coordinated development (Li and Zhou, 2009; Shen and Fu, 2006;). On the other hand, the fiscal expenditure behaviors of neighboring areas also have demonstration effect and linkage effect, which constitute the positive externality of fiscal expenditure in space.

The Yangtze River Delta has the highest city denseness in China. According to the demarcation in “Yangtze River Delta Regional Planning”, 16 cities are defined as the core area including Shanghai, and Nanjing, Suzhou, Wuxi, Changzhou, Zhenjiang, Yangzhou, Taizhou and Nantong in Jiangsu Province, and Hangzhou, Ningbo, Huzhou, Jiaxing, Shaoxing, Zhoushan, Taizhou in Zhejiang Province. How to realize cooperation among local governments to achieve integrated development in the Yangtze River Delta is a major issue concerning whether such an area can take the lead in developing and realize coordinated development. This paper unveils the specific impact of such spatial factors as the adjacency of geographical location, proximity of economic scale, and similarity of urbanization level on the fiscal expenditure of each city, and provides a new perspective for the regional integration of the Yangtze River Delta, namely removing regional planning obstacles in the integration process by regional cooperation.

2 Data Processing

The research sample is the panel constituted by the data from the year of 2001 to 2008 concerning 16 core cities in the Yangtze River Delta, and then the paper tests the impact of several kinds of adjacency on the subdivision items of the fiscal expenditure of each city. Since the adjustment of classified subjects of fiscal expenditure, the data term of capital construction expenditure is 2001-2006. The explained variables are capital construction expenditure, expenditures of science, education, culture and hygiene and social welfare.

The explanatory variables include two categories. On the one hand, we take spatial adjacency or similarity as endogenous variable.

The first is weight matrix of geographical space. If city i is not adjacent to city j , $w_{ij} = 0$; if city i

* This paper is supported by the National Education Sciences Planning Ministry of Education Key Topics(No. EGA090375).

is adjacent to city j , $w_{ij} = 1/S_i$, where S_i refers to the number of cities that are adjacent to city i .

The second is weight matrix of economic space. According to the taxation scale and the similarity of urbanization level of 16 core cities, specifically speaking, taking per capita tax revenue and the proportion of built-up area to land area as proximity weights, the calculation method is as follows:

$w_{ij} = \frac{1}{|Z_i - Z_j| S_i}$, Where, $S_i = \sum_j \frac{1}{|Z_i - Z_j|}$, Z_i refers to per capita tax revenue of city i and proximity index of built-up area.

On the other hand, in order to reflect the impact of different economic characteristics of the areas on each fiscal expenditure item, we introduce a series of control variables.

(1) Use per capita GDP (PGDP) and tax revenue (TAX) to express economic scale. The per capita GDP determines the economic resources of an area available to be utilized; in areas with relatively high per capita GDP, the tax revenues and scales of fiscal expenditure are larger too.

(2) Use population density (PD) and built-up area (BA) to express city size. The population density is a conventional index to measure city size, while the built-up area is an important embodiment of urbanization level. The larger the built-up area of an area is, the larger public function borne by the government and the demand for public products and service are.

(3) Use the proportion of population over 65 years old (OLD), the proportion of population less than 15 years old (CHI) to represent population structure. The higher the proportion of population over 65 years old, the more the expenditures will be borne by the government in annuities and social welfare. The rise in the proportion of population less than 15 years old will increase governmental expenditures in fundamental education.

In this paper, the weight matrix W of economic space is calculated through MATLAB software, the built-up area comes from *China City Statistical Yearbook*, while other variables all come from *Yangtze River Delta & Pearl River Delta and Hongkong & Macao SAR Statistical Yearbook*. To reduce data heteroscedasticity, we have made smooth data processing in a way that natural logarithm is taken for other variables except for the proportion of population over 65 years old and that of population less than 15 years old.

3 Cross-Border Spillovers of Capital Construction Expenditure

We shall select SEM model when we apply spatial weight matrix of geographical proximity, and select SLM model when we apply spatial weight matrix of per capita tax and built-up area proximity. The estimation equations for SEM model and SLM model are respectively as follows:

$$\ln CC_i = \alpha_1 OLD_i + \alpha_2 \ln PD_i + \alpha_3 \ln BA_i + \alpha_4 CHI_i + \lambda(I_T \otimes W_j)\varepsilon_i + \mu_i \quad (1)$$

$$\ln CC_i = \alpha_1 OLD_i + \alpha_2 \ln PD_i + \alpha_3 \ln BA_i + \alpha_4 CHI_i + \rho(I_T \otimes W_j) \ln CC_i + \varepsilon_i + \mu_i \quad (2)$$

According to the estimation results of Table 1, the capital construction expenditure of the Yangtze River Delta has significant spatial positive externality, no matter SEM model based upon geographical proximity or SLM model based upon per capita tax and built-up area proximity, the spatial externality statistics λ and ρ are significant, and the coefficient is positive. The significance of λ coefficient means, the capital construction expenditure shows evident demonstration effect and linkage effect among different cities, whichever cities are prefecture-level cities affiliated to the same province or different provinces. The significance of ρ coefficient indicates that positive externality also exists between provincial-level areas in capital construction expenditure. From the perspective of other control variables, the aging degree and the population density are also significant factors affecting the capital construction expenditure of local governments. The pricking-up of aging degree and raising in population density will surely make the government increase public investment, such as investment in the construction of infrastructures in traffic, communication and electric power, as well as public welfare facilities in culture, education, hygiene and public service.

The generation of significant demonstration effect in capital construction expenditure in the Yangtze River Delta is not only because local government officials compete for promotion to imitate and even contend with capital expenditure for fear that their political reputation is affected, but because local governments are afraid that the economic resources flow into neighboring areas. The adjacency and high density of cities and towns in the Yangtze River Delta make the economic activities of such area have evident space continuity. For instance, the traffic network, especially the construction of “one-hour city economic circle” drives the development of the areas and increases the fiscal expenditure

of traffic infrastructure. Accordingly, water conservancy, communication, electric power and energy related with the traffic network also present significant linage effect. Since the Yangtze River Delta has evident spatial positive externality in capital construction expenditure, prior cooperation among local governments is basically defined as jointly advancing integration construction of cross-region major infrastructures and upgrading construction, share and interconnection level of such infrastructure as energy, water conservancy and information so as to enhance the support capability of regional development.

Table 1 The Estimation for the Spatial Externality of Capital Construction Expenditure of 16 Core Cities in the Yangtze River Delta

4 Cross-Border Spillovers of Livelihood Project Expenditure

The spatial model of education, science, culture, hygiene expenditures (ES), SEM model shall be applied under three spatial weight matrixes: geographical proximity, built-up area proximity and per capita tax proximity, and the estimation equation is as follows:

$$\ln ES_i = \alpha_1 \ln PGDP_i + \alpha_2 OLD_i + \alpha_3 \ln TAX_i + \alpha_4 \ln BA_i + \alpha_5 CHI_i + \alpha_6 \ln PD_i + \lambda(I_T \otimes W_j)\varepsilon_i + \mu_i \quad (3)$$

As for the spatial model of social welfare expenditure (SW), SEM model shall be applied under the spatial weight matrixes of geographical proximity and built-up area proximity, while SLM model shall be applied under per capital tax spatial weight matrix. The estimation equations of SEM and SLM models are respectively as follows:

$$\ln SW_i = \alpha_1 \ln PGDP_i + \alpha_2 OLD_i + \alpha_3 \ln TAX_i + \alpha_4 \ln BA_i + \alpha_5 CHI_i + \lambda(I_T \otimes W_j)\varepsilon_i + \mu_i \quad (4)$$

$$\ln SW_i = \alpha_1 \ln PGDP_i + \alpha_2 OLD_i + \alpha_3 \ln TAX_i + \alpha_4 \ln BA_i + \alpha_5 CHI_i + \rho(I_T \otimes W_j) \ln SW_i + \varepsilon_i + \mu_i \quad (5)$$

According to the estimation results of Table 2, both spatial error regression coefficient λ and spatial lag regression coefficient ρ have passed 99% significant test, and the regression coefficient is positive. This shows each city in the Yangtze River Delta has evident positive externality in the expenditures of education, science, culture, hygiene and social welfare.

From the perspective of other control variables, such factors as per capita GDP, tax revenue and urbanization level have significant positive impact on the livelihood project expenditure of the Yangtze River Delta. The per capita GDP and tax revenue represent the economic scale of an area. The more economic resources an area can utilize, the stronger the payment ability of the area for such livelihood projects as education, science, culture, hygiene, and social welfare. Besides, these livelihood project expenditures will increase along with the improvement of urbanization level. That is because the larger the built-up area is, the more public functions and public products and services the government has to bear and provide.

Table 2 The Estimation for the Spatial Externality of Livelihood Project Expenditure of 16 Core Cities in the Yangtze River Delta

According to Table 2, the impact of population structure on the livelihood project expenditure of each city in the Yangtze River Delta is generally insignificant. Theoretically speaking, the higher the aging degree of an area is, the larger the medical health and social welfare expenditures of the government will be. However, this impact relationship is not evident among the cities in the Yangtze River Delta. This might be related to health & medical treatment restructuring. The market-oriented reform of China's health & medical treatment system causes the government to transfer its partial liabilities for the elders and health & medical treatment to the market. Also, the higher the degree of child support is, the larger the fundamental education expenditure of the government will be, but this kind of relationship is insignificantly shown in the Yangtze River Delta. The primary reason may lie that the fundamental education facilities expenditure is within the scope of capital construction expenditure. Further the Yangtze River Delta witnesses an increase in immigrated children in the accelerated process of urbanization, reform lagging in registered permanent residence system, however, makes the government still make budget according to the number of children of local registered permanent residences, thus the personnel expenditure for fundamental education and other expenditures of the government fail to increase along with the actual increased proportion of children population.

According to empirical test for the spatial weight matrix of geographical proximity, built-up area proximity and per capita tax proximity, the Yangtze River Delta has evident positive externality in livelihood project expenditure. This conclusion certifies it is feasible to advance in this area the equalization of such basic public services as compulsory education, public health, public culture and social security so as to promote coordinated economic and social development. Considering the problem that the population structure does not have evident impact on livelihood project expenditure, local government shall strengthen cooperation and coordination in fundamental education of the children of immigrated population, medical health security of the aged population, aging population social security integration.

5 Conclusions

This paper takes 16 core cities in the Yangtze River Delta as a sample and defines such spatial adjacency factors as geographical spatial factors represented by geographical proximity and economic spatial factors represented by per capita tax revenue, built-up area similarity. We estimates the spatial external effect of each city in terms of capital construction project expenditure, the expenditure of

education, science, culture and hygiene and the expenditure of social welfare. Then from the perspective of cooperative governance of local governments, approach and breakthrough for regional cooperation of the Yangtze River Delta are put forward to overcome integrated development obstacles caused by administrative divisions and local interests.

The Yangtze River Delta has significant space positive externality in capital construction expenditure. This means the prior cooperation of local governments in the area is to advance the integrated construction of cross-region major infrastructure, to upgrade establishment, share and intercommunication level of such infrastructures as energy, water conservancy and information, so as to enhance the support capability of regional development and to lay foundation for the cooperation and coordinated development of other fields, especially livelihood field. How shall each local government in the Yangtze River Delta to cooperate in the problem of livelihood? The empirical results of this paper certifies the feasibility of advancing the equalization in such basic public services as compulsory education, public health, public culture and social security in this area to promote coordinated economic and social development. Besides, considering the impact of change in population structure on livelihood project expenditure, it finds out the breakthrough of each local government in livelihood field cooperation and coordinated development, namely, to take the lead in realizing the cooperation in the fundamental education of the children of immigrant population, medical health security of aged population and aging population social security integration.

(E-mail: 21780582@qq.com)

Abstract: College students' innovative undertaking has an important role in resolving the employment problems of college students. Based on the relevant research results, this paper puts forward the main influence factors of college students' innovative undertaking, depth analysis of the main problems of college students venture, on this basis, put forward the countermeasures to the success of college students' innovative undertaking from four dimensions which are college students themselves, society, policies, colleges, has a certain theoretical and practical significance.

Key words: College student; Entrepreneurship; Influencing factors; Countermeasures; Fishbone Diagram

1 Introduction

Due to the continuing of the European debt crisis and the American debt crisis, the increase of global economy continues to slow, the demand for employment posts significantly reduced in 2013. Since the enrollment expansion of colleges and the implementation of education industrialization policy, the increase in the number of college students is far beyond talent growth needed for economic growth, the national fresh college graduates scale up to 7000,000 in 2013, the employment situation is not optimistic. The entrepreneurship can not only solve the employment problem of college students, but also provides more jobs for the society. Therefore, study on the influence of college students' innovative undertaking has a very important practical significance.

In recent years, scholars have carried out corresponding research to the college students' innovative undertaking. Abroad, Miller and Friesen (1997) pointed out that in the entrepreneurial process, the government should actively encourage students to play their own advantages, tap the market opportunities and do entrepreneurship for survivability. In domestic, Lei Lin and Jiang Yongheng put forward the influencing factors of college students entrepreneurship mainly include: student's personal ability and quality, family, college, society and friends. Lin Jie (2002) deeply analyzed the bottleneck of our country's college Students' innovative undertaking, including five big problems, which are focusing too much on the line, lacking of market awareness, lacking of business management experience, lacking of scientific and technological content of the project and it is difficult to attract venture capital.

Therefore, based on the relevant research results from domestic and foreign scholars, this paper summarizes the main factors influencing the success of college students entrepreneurship, and researching the problems and countermeasures of college students' entrepreneurship from the perspective of the factors has certain theoretical and practical significance.

2 The Influencing Factors of College Students' Entrepreneurship

2.1 Self factors

College students' own factors include students' ability and quality. The ability of students refers to the possibility to complete a specific job, including: the ability of seizing the opportunity which is the ability to discovery and capture market opportunities, learning ability which is the ability to accept new knowledge and new things, including the acceptance rate and degree, leadership and cooperation ability which is the ability to efficiently integrate various resources, the ability to maintain good cooperation with members of the founding team and entrepreneurial resource holders, and so on. Literacy refers to the components of college students' personality that is relatively fixed, not easy to change, including: degree of confidence (the degree of believing oneself can win in the fierce challenges and competition), the sense of responsibility, the sense of values, and so on.

2.2 Social factors

Influence of social factors on college students' entrepreneurship is mainly reflected in: social perceptions and attitudes of college students' entrepreneurship also has an important impact on it. From a psychological point of view, there exists a psychological phenomenon of "herd" in the college students.

In the process of individual socialization, givers of socialization use a variety of strong stimulus to make students gradually acquire the desired behavior, attitudes, or habit of the educators. Therefore, a good enterprise atmosphere in society and a wide range of entrepreneurial activities will also affect college students' entrepreneurship.

2.3 Government factors

The government environment is that the government provides legal, policy environment for college students. Because the number of college students in our country is numerous, it is not practical only depend on the input from the State or colleges just like in South Korea. Thus, whether the State can formulate appropriate policies to attract social capital into the assistance system for college students' entrepreneurship is one of the important factors.

2.4 College factors

College's environment: the impacts of this environment can be divided into direct and indirect impacts. The direct impact refers to the infuse of a variety of policies and regulations from colleges entrepreneurship. Specifically, it refers to not only whether colleges provide the necessary time and space for college students in entrepreneurial activities, but also colleges have the appropriate support and service system. The indirect effect is whether innovative education and individualized education will be included in the reform of higher education system.

3 Problem Analysis of the College Students' Entrepreneurship

There still exist many defects and shortcomings in the college students' entrepreneurship in our country, which are reflected in many aspects: self-quality, social environment, policy and colleges etc., and these aspects are mutual influenced and interacted.

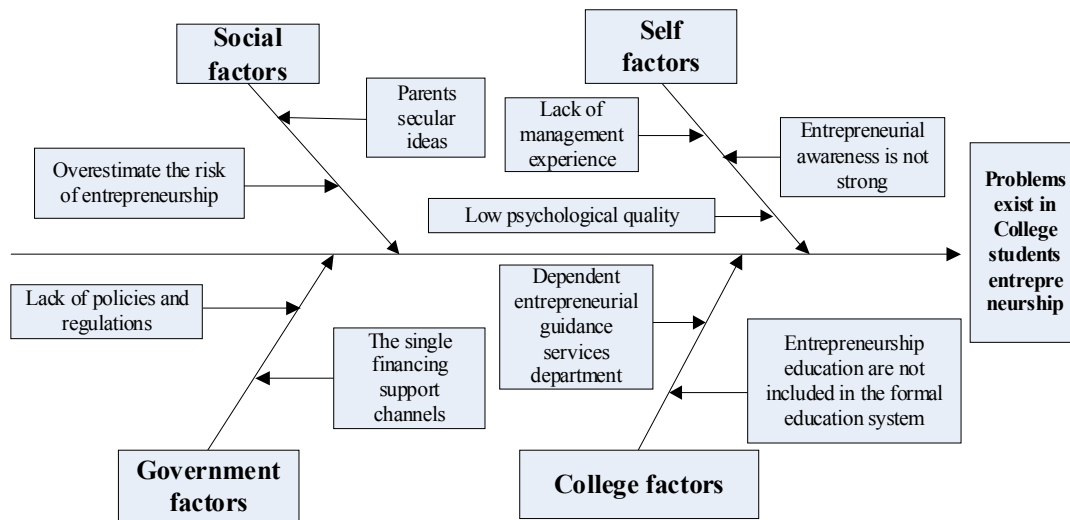

Figure 1 Analysis of College Students' Entrepreneurship

3.1 Own problems

Their own problems in the process of students' entrepreneurship are mainly embodied in entrepreneurship awareness is not strong, lacking of management experience, as well as lower psychological quality. First of all, the formation of entrepreneurial consciousness of college students entrepreneurs stays on the stage of been affected by family entrepreneur culture. And the awareness of grasping the entrepreneurship opportunities, leading to the entrepreneurship awareness is not strong. Secondly, due to the limitation of their own knowledge, Some college students only has the technical knowledge, and know little about enterprises Operation and management. When the business cannot transfers from the technical staff to the management and operating personnel after its establishment, it will makes great obstacles for the survival and development of enterprises. However, after 80, 90, the college students' psychological quality is relatively low, and cannot cope well with setbacks and pressure.

3.2 Social issues

The entrepreneurial culture of the whole society is not strong. Because of the doctrine of the mean

thought deeply rooted in traditional culture, public of China overestimate the risk of entrepreneurship and innovation, do not advocate adventure, holding reservations for entrepreneurs and do not be proud of entrepreneurship, especially the secular concept and package style of parents, which greatly kill the brave spirit of the students. Additionally, public opinion in China generally think that college students belong to the elite, and should be "tight" in society. Entrepreneurship tends to be a desperate option after graduation. All these put pressure and burden on students' entrepreneurs, hindering college students' entrepreneurship.

3.3 Government issues

Delayed development of relevant policies, laws and regulations are related to entrepreneurship. At present, the Policies and Regulations, preferential measures promulgated nationally for entrepreneurship, which lacks a system of legislation specifically for graduate entrepreneurship. Without considering the particularity of university graduates to start a business, college students founded enterprise cannot enjoy equal legal rights and obligations to other enterprises, so the results and property rights are easy to be infringed. Thus reflect in institutions that specially provide financing for the college students' entrepreneurship are less, the single channel of policy assistance. Since these policies subject to various restrictions of conditions, the value of the policy discount do not works as expected.

3.4 College issues

Entrepreneurship education service system is not perfect. At present, China's colleges and universities entrepreneurship guidance service sector still belongs to the employment guidance department and do not independent. And in the actual operation process, the administrative functions are far more than its service function. And entrepreneurship education is not included in the formal education system, also lacking teachers of entrepreneurship education. Entrepreneurship guidance services lack a complete set of system, the mode of operation process, lacking of a comprehensive and detailed guidance on the whole process of university students' innovative undertaking, including the audit, market information, project feasibility and other aspects of the advisory services.

4 A Study on Measures of Successful Entrepreneurship of College Students

4.1 Measures base on the perspective of college students

Develop positive habit of study, and improve their entrepreneurial qualities in an all-round way. College students shall set up positive and modest mentality of study, and foster the concept of active study and lifelong study, master comprehensive knowledge needed in entrepreneurship, enrich their accumulation of entrepreneurial knowledge, convert their entrepreneurial knowledge to entrepreneurial skills required, and constantly reinforce and improve their entrepreneurial abilities.

Participate in entrepreneurial practices actively, and enrich their entrepreneurial experience. In addition to the course study, college students shall actively participate in the social practice related with entrepreneurship during college time, and enrich their entrepreneurial experience in after-class practice. For example, they could participate in entrepreneurial practice activities such as "National College Students Entrepreneurship Challenge", etc.

4.2 Measures based on social perspective

Give full play to the role of correct guidance of public opinion from news media, spread and explain relevant policies on entrepreneurship of college students, and collect opinions and suggestions on the entrepreneurship of college students through network, feedback to the relevant departments, response to the demands of college entrepreneurs in a timely manner, change the partial understanding of the public on entrepreneurship of college students, change the attitudes of the public, thus providing opinion support for entrepreneurship of college students.

4.3 Measures based on the perspective of the government

Integrate entrepreneurial policies, formulate laws and regulations for entrepreneurship of college students specifically. For example, to introduce a Law on the Entrepreneurship of College Students, unify relevant policies that support entrepreneurship of college students, so as to guide the entrepreneurship of college students from a macro perspective.

Set up a department specifically responsible for entrepreneurship of college students, coordinate related work of other departments. Entrepreneurship of college students involves different departments including Industry and Commerce Department and Taxation Department, etc., so a special department is required to take the responsibility of coordinating the work of all relevant departments, so as to implement relevant policies and improve service efficiency. For example, a National Entrepreneurship Foundation for College Students could be set up to provide funds for entrepreneurship, credit guarantees

and employment guidance services, etc., specifically coordinating the relationship between the enterprises established by college students and relevant government departments such as Industry and Commerce department and Taxation department, etc.

Improve the entrepreneurial service policies, and optimize entrepreneurial environment. The government shall pay enough attention to the entrepreneurship of college students, gradually enrich the entrepreneurial services, provide tracking services around the whole process of entrepreneurship, from the training before the entrepreneurship, promulgation of information on related industries and policy information, introduction of legal knowledge, to the registration on Industry and Commerce Department and Taxation Department when the business is started, issuing of business licensing, and the funds and site approval in follow-up enterprise development, and even to the whole-process entrepreneurial service during the business failures and bankruptcy liquidation, to make the entrepreneurial services more procedural, and facilitate the access and exit of entrepreneurship, thus saving the entrepreneurial resources .

4.4 Measures based on the perspective of the college

Strengthening the construction of career guidance services, to improve their service level. Set up a special career guidance services to enrich the content of career guidance service. Open the campus market properly for college students as their entrepreneurship lab. Establish college students' entrepreneurial guidance teachers, colleges and universities can organize rich entrepreneurial theory knowledge and experience of teachers, forming a teaching entrepreneurship team, which offers targeted guidance to college students' entrepreneurship program. Colleges set up college students venture fund. Colleges can dial certain number of venture capital each year or absorb social sponsorship. At the same time, to establish strict management mechanism of the funds and control the use of funds. Select high-quality entrepreneurial projects to ensure that the college students' entrepreneurial success and smooth recovery in investment funds.

Improve the entrepreneurial education and training system. Entrepreneurship education should be included effectively into the professional and cultural education system, formulating detail teaching plan, strengthening the curriculum system reform. Meantime, increase the proportion of optional courses about entrepreneurship to stimulate students' interest in learning and strengthen the construction of teachers. On the construction of teaching force can take two routes that are Go out and introduce in. Extract professional teachers with rich theoretical knowledge and employment guidance teacher to learn in the enterprises, encourage them to actively participate in the practice of social entrepreneurship, study of entrepreneurship theory and cases to improve their teaching level. It is better for colleges to open an easy access for outstanding entrepreneurs, introduce a batch of outstanding entrepreneurs with rich experience as part-time teachers in colleges, to enrich the entrepreneurship education teachers' team. At the same time, colleges should put some policy inclination to the teaching appraisal, title evaluation, budget, etc.. Establish quality tracking system to entrepreneurship education. They should do real-time tracking and feedback of teaching process and problems in the process of students' entrepreneurship, establishing graduates and ungraduated entrepreneurship database, analysis and optimization problems, improve the quality of entrepreneurship education.

5 Conclusion

Entrepreneurship can not only solve the employment problem of college students, but also provide more jobs for the society. In this paper, we summed up the main impact factors of entrepreneurship of college students in China, based on the results of former research. There are four aspects, the students themselves, society, government and colleges. At present, there are still some problems in entrepreneurship of college students ,students their own problems and quality are not competent, social entrepreneurial culture is not strong, the development of relevant government policies, laws and regulations lag behind, service system of entrepreneurship education in Colleges is not perfect etc.. To solve these problems and promote the success of college students' entrepreneurship, we should take measures from four targeted aspects, promote college students' entrepreneurial ability and enrich their experience; give full play to the role of the news media in correctly guiding public opinion to create a good cultural atmosphere; formulate specifically policy for college students' entrepreneurship, improve business service policy, optimize business environment; enhance the construction of career guidance service, improve business service level, improve entrepreneurial education and training system etc.

Credit Risk Assessment of Commercial Bank of Ethiopia with Special Emphasis to the Prioritized Sectors

Eskinder Asfaw Bantiwalu
Wuhan University of Technology
School of Management and Science Wuhan, P.R. China, 430070
(E-mail: eskinderasfawb@gmail.com)

Abstract: Commercial Bank of Ethiopia (CBE) has put Agriculture, Manufacturing and Export as a major priority sector to improve the country's economy. Survey has conducted among crucial members of the Bank to understand the high risk sector among three. As evidenced from the survey agriculture is the most risky sector than manufacturing and export. The main reason is because of unavailability of insurance companies sharing the burden of the risk. Manufacturing is second risky sector; it is because most of less availability of imported raw materials. The survey showed that the Bank has a lack of experts in all sectors to analyze the credit request. Export is a less risky especially if it can be proved the legality of the sales contract.

Key words: Commercial Bank of Ethiopia; Credit Risk Assessment; Growth and Transformation Plan; Priority Sectors

1 Introduction

The banking industry has a long history and has had an important influence on the economic development of the country. Financial results for the 2012 fiscal year show an industry enjoying high growth, high profits, and high dividends. Even in the midst of a challenging environment, all key areas of banking operations—collecting deposits, providing loans, and foreign exchange dealing—showed growth of more than 20 percent. Profits were up 45 percent and shareholders (at banks open for more than a year) received an average return of 27 percent on their investments. Although sharing strong growth, there are of course notable variations among banks in terms of their aggregate size, relative profitability, revenue sources, customer focus, loan concentration, and operational efficiency.

The Commercial Bank of Ethiopia (CBE) has been one of the movers of the Ethiopian economy for the past 70 years. No other strong bank existed in the country when CBE was officially launched in 1942. CBE was a pioneer in the introduction of modern banking services in the country. In the long years of its market existence, CBE has attained the following:

- Ensured sustainable profitability with strong support to the country's economic growth.
- Expanded its branch network covering large geographical areas.
- Employed more than 15,000 staffs.
- Substantially increased its customer base and capital size.
- Become one of the top African banks in terms of assets and capital size.

Building upon these achievements, CBE has massively engaged in transformational activities with the vision of becoming a world-class commercial bank. Business Process Reengineering (BPR) has been chosen as a management tool to support this change initiative. Currently, CBE takes the lion's share of the commercial banking market of the country in terms of credit, deposit, customer base and branch network.

2 Statement of the Problem

Almost all banks established in Ethiopia are involved in providing credit for their customers. CBE is among the banks established in the country that are actively involved in providing credit for their customers. Bank risk is inherent by its nature and the same is true for credit as well. Basically, to recollect the principal and its interest that is lend to customer is the major risk of credit for the bank. CBE has been delivering wide range of credit products for its various customers. Currently the credit policy of the bank is giving a priority for three major economic sectors, namely, the agriculture, manufacturing and export. These sectors by their nature require huge amount of capital for a single project and they are inter-related by nature. This means if agriculture is not successful both industry and export will fall. In the year 2007/2008 87.4% of export earning comes from agricultural products his shows that Ethiopian exports are highly depends on agriculture (Muday, 2010).

These sectors have immense access for large amount of loan from the bank. Such a credit makes

the bank vulnerable for high risks. These caused due to the increasing amount of the credit delivered that will increase the risk of the bank. However, the bank is still providing a large amount of credit for these sectors even if it has a risk of non-collectability. Therefore, in this research an attempt is made to assess the credit risk associated with the priority sectors.

3 Credit

Credit is the use or possession of goods or services without immediate payment. It enables a producer to bridge the gap between the production and sale of goods. Virtually all exchange in manufacturing, industry and service is conducted in credit.

3.1 Risk Management (RM)

Risk management is a central part of any organization's strategic management; it is the process whereby organizations methodically address the risks attaching to their activities with the goal of achieving sustained benefit within each activity and across the portfolio of all activities (IRM, 2002).

Looking at the process below, it shows that before risk can be managed, it must be identified. Once the risk is identified, action will be taken to measure its intensity or to evaluate the outcome of the risk, an assessment of the consequences is being done, control measures are then put in place to avoid or reduce its intensity and after that good monitoring is being done to see whether the expected outcomes are as desired.

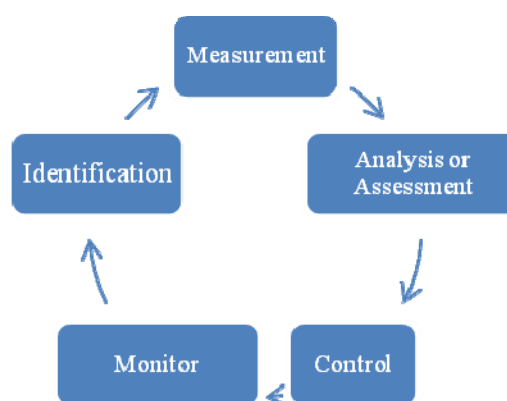

Figure 1 Risk Management Process

3.2 Credit Risk

Credit risk is the most obvious risk of a bank resulted from the nature of its activity. In terms of potential losses, it's typically the largest type of risk (COLQUITT, 2007). The default of a small number of customers may result in a very large loss of the bank because of the amount of loan given for a single project is high. Credit risk is typically represented by means of three factors: default risk, loss risk and exposure risk.

Default Risk is a payment delay of at least three months, in the case of The Loss Risk; it determines the loss as a fraction of the exposure in the case of default and finally the Exposure Risk is a risk that may not be known beforehand at the time of default.

3.3 Credit Risk Assessment

Generally, credit risk assessment is an evaluation of the potential that a borrower or counterparty will fail to meet its obligation in accordance with agreed terms. This considers credit risk is inherent to the entire portfolios as well as the risk in individual credits or transactions, and is typically performed by credit risk specialists.

3.4 Concentration Risk

The term concentration risk in the context of banking generally denotes the risk arising from uneven distribution of counterparties in credit or any other business relationships or from a concentration in business sectors or geographical regions which is capable of generating losses large enough to jeopardize an institution's solvency (Detsche Bundesbank, 2006). In many cases, a concentration in individual economic sectors or certain groups of borrowers also emerged. This resulted in large loan losses, leading to numerous bank insolvencies and in some countries to banking crisis.

4 Priority Sectors in Ethiopia

Since 2010 Ethiopian government has designed a five years Growth and Transformation Plan (GTP), it specifically put Agriculture, Manufacturing and Export are the main economic strategic organs, which require a series attention to realize the goal. In accordance with this massive strategy the Commercial Bank of Ethiopia made available different credit products and widen up its portfolios that able to move forward the country's economy

4.1 Agricultural Loan

Agriculture is one of the priority sector set by CBE. Different loans related to this sector are available to farmers; they may apply for loans to buy inputs for cultivation of food grains as well as horticulture, aquaculture, animal husbandry, floriculture and sericulture businesses. There are also special loans to finance the purchase of agricultural machineries such as tractors, harvesters and trucks. Construction of biogas plants and irrigation system as well as the purchase of agricultural land may also be financed through special types of agricultural finance.

Financing agricultural businesses has its own peculiar characteristics that distinguish the sector from others. Among others one of the major peculiarities is its requirement of long gestation period. As a matter of fact most agricultural productions commonly stretch over long periods of time. As a result, farmers are expected to anticipate expenses that they will only be able to get back after their product is marketed. In such situation farmers are challenged by potential cash flow problems to cover their expenses.

Due to these features, agricultural loan/ financing is prone for various type of risks. An agricultural risk is associated with negative outcomes. The source of risk in agriculture are numerous and diverse. The markets for agricultural inputs and outputs have a direct incidence on farming risk, particularly through prices. A diversity of hazards related to weather, pests and diseases or personal circumstances determine production in ways that are outside the control of the farmer (OECD, 2009)

4.2 Manufacturing Loan

A lender for a manufacturing loan includes a bank, private lender or government agency. A business looking to take out a manufacturing loan should work with a lender who is experienced in providing these types of loans. The interest rates on manufacturing depend on credit worthiness of the loan borrower. A borrower with a good credit score will be able to receive a loan with favorable loan interest rate. The length of manufacturing loan can be short or long term. The loans length is determined by the needs of the business who borrows the loan from a lender. The loan length can be as short as 12 months or as long as 30 years (Scharmok, 2010).

Mostly manufacturing loans tends to be either medium or long term loans. Such loans usually used to purchase an asset that is expected to generate future cash flow and contribute towards the repayment of the loan. The asset being financed by the facility, such as plant or equipment are usually expected to produce other assets, which converts to cash through completion of manufacturing process and sale, will generate sufficient funds to repay the loan. (Fight, 2004)

4.3 Export Loan

Access to working capital is one of the most important components of the export transaction, providing a means for companies to process and acquire goods and services to fill purchase orders, to ship and extend credit to their buyers. To cover their working capital need, exporters mainly use working capital loan programs which are normally associated with pre-shipment financing. Pre-shipment is a loan extended for purchase of raw materials, processing and converting them in to finished goods, warehousing, packing and transporting the goods until the time of shipment. Mostly there are three types pre-shipment export financing. These are pre-shipment export credit, revolving export credit and advance on export bill (Mekbib, 2008).

In financing trade transaction, financial institutions are confronted by at least three types of risks or perception of risks associated with the pre and post shipment export financing: Nonpayment risk or buyer risk, nonperformance risk or supplier risk and third party risk.

To sum up, providing loan to the above mentioned sectors, namely agricultural, manufacturing and export have potential risk. In order to minimize these risks these are various types of credit risk management methods. Among others, three of the traditional approach identified by Anthony and Linda (2002) are Credit Scoring, International Ratings Based and Expert System

5 Analysis

In order to assess the credit risk of CBE, a total of 60 sample respondents were identified to fill the

entire questionnaire. These respondents were selected from three different departments of the bank namely relationships managers, credit analyst and risk managers. From the first two departments, relationship managers and credit analysts a total of 50 respondents were selected 25 respondents from each and the remaining 10 were selected from risk managers.

Table 1 Demographic Characteristics of the Sample

Position	Number of Respondents	%
Relationship Manager	25	41.66
Credit Analyst	25	41.66
Risk Manager	10	16.66
Total	60	100

Source: Own Survey Conducted in 2012

Following the description of the demographic characteristics of the sample, the analyst will proceed to forward results that could help the study to achieve its objectives. The result of the survey questionnaire is presented in three thematic areas below.

5.1 Loan for Prioritize Sector

One of the objectives of this study is to assess the potential and actual challenges that the bank is facing due to prioritizing some sectors for loan disbursement. In order to achieve this objective, four questions are forwarded to the respondents to assess their opinion. The results are presented in table 2 below. As the result of the survey revealed 85.7% of the respondents support the claim that states the bank has qualified personnel’s that are involved in processing the loan. On the other hand the remaining respondents, 14.2% has no opinion on the claim, this could reflect that, though the bank has qualified professionals to process the loan disbursement, there is still some gaps in the area.

The second perceived challenge for the banks is related with mechanisms of credit risk assessment. Accordingly, the idea that states the bank has proper mechanisms to assess the credit risk, has got a wide range of support from the respondents. Out of the total respondents, 91.4% showed their agreement with this claim. On the other hand 5.6% of the respondents expressed their disagreement. The remaining 2.8% of the respondents reflect their response as no opinion.

Table 2 The Actual and Potential Challenge of Prioritized Sectors

N 1	Inquiries to respondents	Response of Officials/experts in %		
		Agree	Disagree	No opinion
	The bank has equipped with qualified personnel’s in each sector to process the loan	85.71	-	14.28
2	The bank has proper mechanism to assess credit risk	91.43	5.71	2.86
3	The prioritization of the loan increases the credit risk	85.71	14.28	-
4	The bank has a proper customer credit rating system	91.43	8.57	-

Source: Own Survey Conducted in 2012

The third potentially perceived challenge is related with prioritizations of some sectors. In relation to this, the claim that states the banks’ prioritization of the three sectors causes’ credit risk on the bank is supported by 85.7% of the respondents. The remaining respondents, 14.2% of them disagree with this claim. From this it is evident that prioritization of the sectors is increasing the credit risk of the bank.

The last perceived challenge is related with the credit risk rating system of the bank, in line with this, the bank is argued that it has an appropriate credit risk rating system. Out of the total respondents, 91.4% of the respondents showed their agreement while, 8.5% of them disagree with this idea.

5.2 Sectors with High Rate of Credit Risk

As it is evident from the data in Table 3, agricultural loans are highly considered as risky. Accordingly 94.2% of the experts support this claim while 5.7% of them argue for the export sector as risky.

Conversely, the document reviewed on the issue revealed a different result that states manufacturing loans are more risky than agriculture and export. The detail of the result from the

document review will be dealt later on. Here however, it is important to note the discrepancy between the results obtained from opinion survey analysis on the sector with a higher credit risk.

Table 3 Sector with High Rate of Credit Risk

Indicate the sector with high rate of credit risk	Agriculture	Manufacturing	Export
		94.28	-

Source: Own Survey Conducted in 2012

5.3 Risk Associated with Agriculture Loan

In this sub section risk associated with disbursement of loan for agricultural projects is presented and analyzed. To do so, two interrelated questions are selected for the discussion.

Table 4 Risk Associated with Agricultural Loan

N	Inquires	Response of the officials in %		
		Agree	Disagree	No Opinion
1	Agricultural product has appropriate insurance coverage	5.71	91.43	2.86
2	Most agricultural loans are given for large scale and mechanized farms	82.86	17.14	----

Source: Own Survey Conducted in 2012

The first perceived cause of credit risk for agricultural projects is related with insurance. Accordingly, the claim that states the existence of appropriate insurance coverage for these projects is hugely rejected by the experts. Out of the total respondents, 91.4% of them disagree with the existence of appropriate insurance for agricultural projects. On the other hand, 5.7% of the experts favor the claim while 2.8% of the remained silent on the issue. From this, it is observable that the lack of insurance coverage for agricultural projects increased the possibility of credit risk. Secondly, the size and nature of agricultural projects are considered as another cause of credit risk. In line with this, it is argued that most agricultural loans that have an access for loan is mainly characterized by large scale and mechanized farms. Out of the total respondents, 82.8% of them showed their support for this argument. On the other hand the remaining 17.1% of the expert refuse the argument. This shows that most of agricultural loans are given for large and mechanized farms than small and subsistent. As a result, the failure of single mechanized farming project has a huge credit risk on the bank.

5.4 Risk Associated with Manufacturing and Pre-shipment/Export Loan

In this subsection, the credit risk related with the other prioritized sectors that the bank provides loan, namely; manufacturing and the export sector is presented and analyzed.

Table 5 Risk Associated with Export

N	Inquires	Response of the officials in %		
		Agree	Disagree	No Opinion
1	The legality of sales contract presented for pre-shipment loan is checked by bank	85.71	14.47	---
2	LC is open in CBE for all sales contact that pre-shipment loan is given	80.00	14.28	5.72
3	There is shortage of raw material for manufacturing	57.14	28.57	14.29

Source: Own survey Conducted in 2012

Concerning the credit risk of the export sector is related with the legality of sales contact. Accordingly it is argued that the bank has a mechanism to check the legality of all sales contract presented for export loan. For this claim, as it is presented in the above table 85.7% of the respondents expressed their agreement while 14.2% of the experts disagree with this claim. This result showed even though the bank has mechanisms to check the legality of the pre-shipment contracts for loan, there is still some gaps that could increase the responsibility credit risk for the export loan.

The second credit risk related with the export sector is the issue of letter of credit (LC). In line with this, is argued that for all sales contact the pre-shipment loan is given LC is open in CBE. Accordingly,

80% of the experts showed their agreement with this claim. On the other hand, 14.2% of them disagree and the remaining 5.7% of the respondents opt to be silent. Though most of the experts agree on the opening of LC in CBE for all contracts that obtained pre-shipment loans; there is still some variations on this issue that may generate the credit risk in the sector.

The last perceived challenge is related with manufacturing sector and in raw materials. In line with this it is claimed that providing loan for manufacturing is risky due to shortage of raw materials. In view of that 57.1% of the respondent showed their agreement while 28.5% refuse the claim. On the other hand 14.2% of the experts are said they do not have opinion on the issue. Unlike the above arguments, there is a huge variation among the experts on this claim. This reflects the shortage of raw materials for manufacturing projects is among the major causes of credit risk in the sector.

6 Conclusion

The total loan dispersed by the CBE has been increasing from time to time. In the same manner, the amount of loan for prioritized sectors also increased overtime. In recent years the bank has been involved in providing large amount of loan for three major sectors namely agriculture, manufacturing and export. Among these sectors, the share of agricultural loan increases remarkably. The trend analysis of total loan disbursement, the share of prioritized sectors and the issue of NPL in the one hand and the data obtained from the survey in the other hand, came up with different results. The trend analysis revealed that the manufacturing is too much risky than the other two. Conversely the opinion survey confirms that agricultural loan is more risky than any other sector. This shows the existence of inconsistency of the results obtained from the two sources. The bank has been facing various challenges due to prioritizing the sectors for loan disbursement. The major challenges includes lack of skilled and well experienced staffs in each prioritized sectors, lack of clear policy and procedure for agricultural loan at the time of prioritization, absence of insurance for agricultural loan and the legibility of contract for pre-shipment loan are the major challenges.

Statistical Analysis of Academic Studies on Innovation and Management in the Last Decade in China

She Yilin, Zhang Quanle, Wu Zhenghao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wujh63@sina.com, zql680224@sina.com, 929967573@qq.com)

Abstract: Academic research papers related to innovation management which included in “CNKI Chinese Academic Journal” in the last decade are analyzed statistically. Those studies are compared with the main topics of the International Conference on Innovation and Management (ICIM). We have found that ICIM conference themes are closely related to innovation management level and research disciplines. It leads and improves the development of innovation and management science research in China. Finally, some suggestions are presented for accelerating the advancement of the ICIM.

Key words: Innovation; Management; Academic Studies; Statistics; Analysis

1 Introduction

Through centuries' development, management has formed a huge knowledge accumulation. To draw effective innovation management experience and reference from management knowledge, according to the development tendency of the world and combining culture and social background of China, researchers of management science have conducted the ongoing studies on innovation and management. Especially over the past decade, those researchers have published papers extensively on the themes of innovation and management research, and have held many domestic and international academic conferences with above themes. What is the role of the conference on innovation and management playing in the development of management studies? To identify the relationship of above mentioned problem, we have fulfilled step by step. Firstly, the innovation and management research paper of China in the last decade are analyzed statistically. Secondly, the comparison between those papers and the main topics of ICIM are investigated thoroughly. Finally, the intrinsic links are revealed consequently.

2 The Analysis of the Age Distribution Distributions of Research Papers

China Academic Journal Full-text Database--china National Knowledge Infrastructure (CNKI) which is known as the largest and most complete collection, the most widely used database has been adopted as the studied data source. In CNKI, “Innovation management” is chosen as the search keywords. To fairly assess the affect of ICIM conference on innovation and management of academic in China, it limits the scope journal 8685 articles cited by CNKI from 2003 to 2012 and does not include conference papers and graduate thesis, etc. The age distribution data is shown in Table 1.

Table 1 Distribution Data about Innovation Management from 2003 to 2012

2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	Total
381	395	438	569	718	810	1094	1165	1421	1694	8685
4.4%	4.5%	5.0%	6.6%	8.3%	9.3%	12.6%	13.4%	16.4%	19.5%	100.0%

The number of research papers is 381 (4.4%) in 2003 up to 1694 (19.5%) in 2012. The overall number of papers showed an increasing trend, as shown in Figure 1.

ICIM is the international conference on innovation and management which organized in 2004 for the first time and consecutively held the ninth in 2012. ICIM always adheres to the “innovation” and “management” as the theme. The scholars put forward insights on innovation for business, industry and government and hold academic communication related to the field of management science and engineering, technical and economic, accounting, business administration, marketing, logistics and supply chain managerial, E-commerce, knowledge management, human resource management, etc. As shown in Figure 1, from 2003 to 2005 the number of papers grows moderately, but there was a sharp increase in 2006. It shows that after two sessions the influence of ICIM reflected gradually. With further analysis, it can be found that the main topics of Third ICIM added the Synthetic content which gives greater communication space to researchers on innovation and management. This is also one of the

factors that the number of papers increases evidently. And every other session have retained the “Synthetic” issues, reserved the expansion space of the field of innovation and management and played a positive role in promoting the number of papers. There is also a large growth in 2009. It has been searched twice with the theme of “Technical innovation”, “System innovation”, “financial management” and “finance”, obtain the data as shown in Table 2. Compared with the data in 2008 and 2009, it can be found that the similar research papers grow exponentially. Particularly, the number of papers on financial innovation is 6 in 2008 to 59 in 2009; the growth rate reached 883%.

Figure 1 Distribution Data about Innovation Management from 2003 to 2012

With depth analysis of the financial situation at that time, the global financial crisis in 2008, huge losses of financial institutions, government funding scales expansion. For many countries, the government has faced huge pressure. The countries which are not powerful in Eastern Europe and Asia faced national bankruptcy crisis. At the same time the voice of reforming the international monetary system and international financial systems are rising. In this context, “financial innovation” and other topics in ICIM is corresponding to the current major domestic and international economic situation. Then it can be inferred that the topic in ICIM is closely to the hot issues of international affairs. There is also a large growth in 2011. Compare with the conference theme in ICIM in 2011, 2010 and 2009, it can be found that the conference theme has changed significantly. Although two topics have been decreased, but “Industry-study-research”, “Open innovation”, “Technical innovation” and other new conference theme have been added. It has been searched twice with the theme of “Open innovation”, “Technical and economic” and “Industry-study-research”, the obtained data is listed in Table 2. It shows that in the newly added three research areas the number of papers has a more substantial increase in 2011 than that in 2010. It fully shows that, the adjustment of ICIM conference theme has been a positive response from the community, and also confirms that the ICIM conference plays the key role in this study domain.

Table 2 Main Topic Papers in from 2008 to 2011

	2008	2009	Growth Rate		2010	2011	Growth Rate
Technical Innovation	81	166	105%	Open Innovation	32	50	56%
System Innovation	12	63	425%	Technical and Economic	18	32	78%
Financial management	10	23	130%	Industry-study-research cooperation	2	7	250%
Finance Innovation	6	59	883%				

3 Statistical Analyses about Support Fund

To encourage scholars to engage in various high-level basic research work, the government departments at all levels in China have established a variety of research funds, in which the National Natural Science Foundation and the National Social Science Fund is the representation of highest level. Thus, the paper which received a special fund to support is considered to be a high quality research. We have research the association between the quality or the quantity of the innovation management papers and the ICIM conference. Therefore, we analysis the themes of the consecutive ninth ICIM in order to find whether it in accordance with the frequency statistics or not (due to the first conference has no subject classification, so it is not included in the statistics), as shown in Table 3. In our analysis, each topic indicates with the code “NO.n; n =1, 2…16”. Within the chart, the top five are “Product

innovation ,technical innovation and industrial innovation”, “Regional innovation”, “Organizational innovation, system innovation and management innovation”, “The technical economy and the policy of science and technology innovation" and "Intellectual property and knowledge management” and each conference is basically used as those themes. It has been searched twice with the themes and the obtained data is shown in Table 3.

Table 3 Frequency of ICIM Topic, Statistical for Five Kinds of Papers were Supported by the Fund

Topic	Code	Rate of Recurrence	Fund		Natural Science Fund		Social Science Fund	
			Fund	Proportion	Fund	Proportion	Fund	Proportion
Technical innovation, product innovation and industrial Innovation	NO.1	9	247	46.25%	95	48.47%	33	37.50%
Regional innovation	NO.2	9	6	1.12%	1	0.51%	2	2.27%
Organizational innovation, system innovation and management innovation	NO.3	9	116	21.72%	38	19.39%	18	20.45%
The technical economy and the policy of science and technology innovation	NO.4	8	2	0.37%	1	0.51%		0.00%
Intellectual property and knowledge management	NO.5	8	48	8.99%	14	7.14%	12	13.64%
financial management and finance innovation	NO.6	5						
Marketing Innovation	NO.7	5						
Production, logistics and supply chain managerial	NO.8	5						
E-commerce, e-government and information managerial	NO.9	5						
Human resource management and its innovation	NO.10	5						
Industry-study-research cooperation and strategic alliance	NO.11	4						
Open innovation and distribution innovation	NO.12	4						
Production and operation innovation and application of IT Technology	NO.13	4						
Competitive Advantage and Corporate Competitiveness	NO.14	1						
Independent College (Private University) innovation and management	NO.15	1						
Risk Analysis and Risk Management	NO.16	1						
Total				78.46%		76.02%		73.86%

Figure 2 Frequency of ICIM Topic, Five Kinds of Papers were All Kinds of Fund Support Ratio

The data shows that support fund based on the conference themes have reached to 78.46%, as shown in Figure 2. And the support of National Natural Science Foundation of China has reached to 76.02%, the National Social Science Fund support is 73.86%, as shown in Figure 3. Thus, the previous ICIM conferences with the purpose to organize high-level international conference stick with the forefront of innovation management themes. As can be seen from another angle, the ICIM has made unremitting efforts to improve the quality of innovation management papers.

Figure 3 Five Kinds of Papers were Natural Science Fund and Social Science Fund Support Ratio

4 Statistical Analyses about Research Level and Discipline Distribution of Papers

We sorted the discipline distribution of the innovation management theses, as shown in Table 4. While it has been associated with the ICIM conference themes and the top five of research levels, is shown in Figure 4. The second one is the industry guidance. “Financial management and finance innovation”, “Marketing Innovation”, “Production, logistics and supply chain managerial”, “E-commerce” and “Human resource” etc. have always been the themes of ICIM. The third one is the policy research, in addition to no elaborate classification in the first conference, the “Science and Technology Policy” is the reserved topic theme from the second ICIM, and this can prove that the ICIM conference attach importance to research. Each conference has “Technical innovation” in addition to the seventh one. “Independent College (Private University) innovation and management” is one of the main themes in the seventh conference and this is the first time to discuss vocational guidance. It should be noted that, the top of the ranking is basic research; it is not the keyword in the conference. In addition to the seventh conference which emphasizes research results into productive, others are part of basic research. With foregoing analysis, the Conclusion is that the ICIM conference is closely related to the scholars on the domain of innovation management.

Table 4 Research Level and Discipline Distribution

Rank	Research Level	Number of Papers	Proportion (%)	Discipline Distribution	Number of Papers	Proportion (%)
1	Basic Research	2304	26.53	Enterprise economy	1880	21.65
2	Industry guidance	2091	24.08	Industrial economy	1375	15.83
3	Policy Research	736	8.47	Higher Education	772	8.89
4	Engineering and Technology	492	5.66	Macroeconomic Management and Sustainable Development	555	6.39
5	Vocational guidance	211	2.43	Information and Library Digital Library	391	4.50
6	Industry technical guidance	209	2.41	Agricultural Economics	383	4.41
7	Higher Education	111	1.28	Power Industry	233	2.68
8	Basic and applied basic research	107	1.23	Research on Medicine and health policies and laws and regulations	227	2.61
9	Policy Research	48	0.55	Architecture and Engineering	199	2.29
10	Economic Information	44	0.51	Mining Engineering	198	2.28
11	Basic education and secondary occupation education	16	0.18	Finance	194	2.23
12	Standard and quality control	11	0.13	vocational education	189	2.18

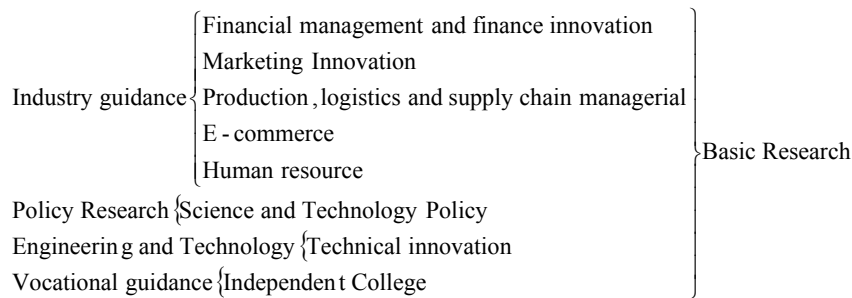

Figure 4 ICIM Conference Topic and Research Level Association Graph

Figure 5 ICIM Conference Topic and Research Discipline Association Graph

The disciplines about innovation management are also sorted, as shown in Table 4. At the same time, the theme also process appropriately, as shown in Figure 5. Enterprise economy: At the first conference “business and talent innovation” is conduct as the topic theme. What is more, “Industry-study-research cooperation and strategic alliance” is also a theme that relates research institutions to enterprise products. Industrial economy: “Environmental innovation and sustainable development” appeared at the second, ninth, tenth conference as a main theme. Macroeconomic Management and Sustainable Development: After the seventh conference “Environmental innovation and sustainable development” appeared as a main theme. But the conference does not include the third one “Higher Education”, the fifth one “Information and Library Digital Library”.

It can be concluded that in the coming ICIM, it is sane to focus on above themes appropriately.

5 Statistical Analyses about Research Institutions of Papers

The research institutions which have published more than 20 papers about innovation management can be seen in Table 5.

Table 5 Research Institutions Which Have Published More Than 20 Papers about Innovation Management

Ranking	Organization	The number of thesis	Proportion (%)
1	Zhejiang University	102	0.62
2	Tsinghua University	38	0.23
3	Wuhan University Of Technology	36	0.22
4	Sichuan University	33	0.20
5	Wuhan University	32	0.20
6	Tianjin University	29	0.18
7	Central South University	29	0.18
8	Renmin University of China	28	0.17
9	Shanghai Jiao Tong University	26	0.16
10	Nanjing University	26	0.16
11	South China University of Technology	26	0.16
12	Harbin Engineering University	24	0.15
13	Nanjing University of Aeronautics and Astronautics	22	0.13
14	Harbin Institute of Technology	22	0.13
15	Dalian University of Technology	20	0.12
Total		493	5.68

Within the 8685 papers, the number of papers which the top 15 research institutions have published is only 5.68% in the total number of papers. It shows that the institutions are rather decentralized. From another perspective, the ICIM has powerful influence on the research institutions of China. Zhejiang University, Tsinghua University, Wuhan University of Technology and other 15 universities is the main research institutions on innovation management. Compared with other research institutions, they have showed strong academic ability and play a important role. Especially Wuhan University of Technology which ranked third beats many top universities in China. It is related with the WHUT all year round as the ICIM of the host of the conference. In turn, it can be observed that by organizing the ICIM the management subject of the university has enhance the visibility and academic status further. In addition to the traditional academic institutions such as the universities, research institute, many companies and institutions are beginning to join in the team. It shows that the discussion on innovation and management is not only limited in academia. It has aroused repercussions, and has been used depth into practical activities about innovation management. Seen from the other side, the social has given a positive response to various activities (including conferences) about innovation management.

6 Conclusions

Through the statistically analysis of thesis about innovation management which included in “CNKI Chinese Academic Journal” during 2003 and 2012, and compared with the main issues of the ICIM, We found that ICIM conference plays a very important role in innovation and the development of management science research in China, and ICIM always adhere to use the forefront conference theme, and improve the quality of papers about innovation management. In the coming ICIM, the organizers can take the subject relating to “Higher Education” and “Information and Library Digital Library” into the main theme for further discussion.

Operation Performance Analysis of Enterprise Complex System from the View of Synergy

Xu Jun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: weedxj@163.com)

Abstract: Enterprise performance has always been a major concern of the people engaged in management, the passage Performancism Ruined Sony caused academic reflection on enterprise performance. Based on the complex scientific management analyze the characteristics of the enterprise complex systems, combined with synergetic theory studies show that enterprise self-organization model is the main order parameter, is the slow variables which decide the enterprise performance; the integration mode of enterprise systems to resource, advantage resources are the parameters second to the main parameters, also the key factors influenced the enterprise performance; the way to improve enterprise performance according to the main and second order parameter analysis.

Key words: Enterprise performance; Complex scientific management; Synergetic; Slow variables

1 Introduction

Faced with the same market, why do some enterprises achieve success and make high profits, while some remain bad even bankruptcy. The enterprise is a complex system, which operation performance is decided by both the system's internal factors and its function with the external environment. Faced with complex, changeable and intensely competitive external environment, managers are keen to improve enterprise performance, put forward related management concepts, such as the core competitiveness, the learning organization, business process reorganization, disruptive innovation, blue ocean strategy and so on, which provides direction for organization changing, most of these management concepts reflect the characteristics of simple, operational, appeared novelty, committed results, halo effect, and easy to segment, which summarized by Miller & Hartwick institute, become a management fashion admired by managers for a time. But many studies have shown that the management style in the enterprise application has many failed cases, its reason mainly lies in the management style is based on reductionism^[1], but in a way explains the enterprise in need of improvement, or just provides a solution to better enterprise performance than the status quo. The enterprise management is a complex systematic operation process, including enterprise resources, management mode and enterprise external environment, enterprise performance tend to have many solutions. For enterprises complex systems, the view of complex scientific management was needed during thinking and solving.

2 The Enterprise Complex System Characteristics from the Perspective of Complex Scientific Management

The Santa Fe institute in new Mexico (SFI) led the complex scientific research founded in 1984, which specialized in the research of complex scientific research, changed the views of people towards social and economic system, the first director George Cowan pointed out, when people look for solutions to the problems which were idealized in different levels, they have deviated from the real world more or less, and confined to the point of searching a solution, while the real world requires people to adopt integrated methods to deal with the reality problems^[2], Applied complex science to management field, which created a new management thought, i.e. complex scientific management. The complex scientific management based on system thinking mode to analyze the complex systems socially, including enterprise organization management system.

The complex scientific management believe that the socially complex system is a complex system interfered by people with the ability to think^[3], its theoretical point is the concept of system, based on systematic thinking model to analyze management issues, dealing with management issues with the integrated theory, emphasizing the system dynamic changes from disorder to order through the integration of resources and elements within the system and system interaction between the internal and external environment. Based on this theory, reconsider the complex system of enterprises whose main characteristics are as follows:

2.1 Enterprise complex system with nonlinear

The research object of the Complex scientific management is the social complex system, which was featured with nonlinear. When analyze the cause of success or failure of enterprise management, nonlinear determines that we cannot revert the results simply to the reasons, because the results and reasons are not a linear relationship. Nonlinear complex system has become a successful way to solve the problem. Nonlinear doesn't just mean circular causality. Because the circular causality seems to be linear, this kind of observation is repeated. Complex systems have a certain macroscopic phenomena by nonlinear interaction of micro-elements of the system, from the macro-elements characteristics, which is difficult to find the reunification, to the height of the complex nonlinear systems, overall behavior of the system is not simply linked to some of the behavior, but through the consolidation of the results reflect the overall system behavior. Current management based on reductionism which provides direction for companies to increase enterprise performance and implement revolution, thus it cannot really solving the problems within the enterprises.

2.2 Enterprise complex systems have the ability to predict

The complex systems are featured with self-organization, adaptive and dynamic nature^[3]. In nonlinear complex systems, the complexity doesn't just mean nonlinear, but a lot of elements with freedom in different levels, which are the enterprise resources. The act of individual elements in a complex system with different degrees of freedom cannot only be foreseen, but also be traced, while these separate elements can spontaneously form stable structure under the interaction among them, this is the complex self-organization, self-adaptive system constituted by intelligence. The most essential characteristic of the complex system is its part has some intelligence, namely knowledge about its environment, according to the target to take action, and this system has the ability to predict. Enterprise organization system is dynamic, it is in constant development, and the system itself can predict the future development. The enterprise, in the process of development, in the face of changing circumstances whether can keep on learning by prediction, restructure and improve its operation models to some extent determines the enterprise's performance.

2.3 The enterprise systems are a complicated nonlinear feedback network

Nonlinear system and linear system are completely different, and all the people involved in the systems are nonlinear feedback network, enterprise system is not exceptional. Meanwhile the complex systems with positive feedback and negative feedback, this makes the results finally produced by the system unpredictability. but there is one thing for sure, the negative feedback loop in the system will make the system stable, while the positive feedback loop by magnifying the interactions between independent intelligences make the system development unpredictable. During the enterprise operation process, the positive and negative feedback loops work on the organization system, the two forces result in the enterprise's business performance.

1.4 The enterprise complex system with initial value and path dependence

The enterprise system's initial state is different, which decided the enterprise to improve business performance by employing different strategies; the enterprise resource's interaction pattern is different, which decided the enterprise system evolution process is different, resulting in different enterprise performance.

Based on the perspective of complex scientific management, the analysis of the characteristics of the complex system shows that the enterprise performance, the initial status of the system, and the evolution process of enterprise resource system, related components, has the path dependence.

3 The Models of Enterprise Complex Systems' Evolution

The evolution of enterprise systems in the face of environmental change decided the enterprise performance. For complex system, the system as a whole is greater than the sum of the parts, when some components constitute a system, the system will appear the natures that its individual components without. Thus complex scientific believe that system is a function of its components^[4], which form the basis of the evolution model of complex scientific management analysis system.

The enterprise system evolution is along with the process of self-organization and enterprise resource integration. Resources integration is the reverse thinking, that is, starting from the target, what resources are needed, which resources, integrating them to create new resources^[3]; while self-organization model is positive, according to the complex system's unique predict ability to achieve the system's self-drive and self-organization.

The evolution model of enterprise system can be expressed

$$D_t(R) = O_t(S_t, R_1, R_2, \dots, R_n) + I_t(S_t, R_1, R_2, \dots, R_n)$$

$$I(R) = I_t(S_t, R_1, R_2, \dots, R_n)$$

which means resource integration mode; the resources are integrated by enterprise operation mode, thus It means the operation pattern at the time of t , which is relevant to S_t and R_n .

$O(R) = O_t(S_t, R_1, R_2, \dots, R_n)$ said the enterprise's self-organizing mode at the moment t ; which is related to both the system state S_t and system component R_n of the moment.

$S_t, R_1, R_2, \dots, R_n$ mean the various resources within the new resource outlook of complex scientific management.

Status variable S_t , which indicates the state before system integration, determined by $D_{t-1}(R)$;

The evolution of enterprise $D_t(R)$ was determined by integration mode It and self-organizing mode O_t , this both interactions urge the enterprise evolve from S_{t-1} to S_t , the evolution result reflect the enterprise performance.

4 Operation Performance Factors Analysis of Enterprise Complex System on Synergetic

The evolution process of enterprise in the face of environmental change decided the enterprise performance; what decided the evolution process of the enterprise? Complex economic systems rely on supply and demand laws of market economy, the laws of the market economy are the main parameters of economic system running. As for enterprise complicated systems, and what is the corresponding parameter to the market economy rule in economic system? What determines the evolution process of the enterprise, thus then determines the corporate operating performance.

4.1 The main parameter and second parameter which were decided the enterprise operation performance

The synergetic which was founded by Hawking in the late 1970s is a sub-branch of modern self-organizing theory, it mainly research system from disorder to orderly mechanism between their systems. The synergetic provides a heuristic framework for constructing natural sciences and humanities of nonlinear complicated system model^[5]. Enterprise is a complex nonlinear system, in the edge of chaos and order, the essence of enterprise management is the enterprise through the organization between various elements and the effect between the elements and the environment, realize transformation from disorderly to orderly, finally realize the management goal.

Analyzing the determinants of enterprise evolution by using synergetic, the system is expressed by a number of state variables, and the evolution of the system i.e., the change of state is expressed by a set of differential equations:

$$D_t(R) = O_t(S_t, R_1, R_2, \dots, R_n) + I_t(S_t, R_1, R_2, \dots, R_n)$$

$$dD/dt = dI/dt + dO/dt = (\partial I / \partial S) (dS/dt) + (\partial I / \partial R_i) (dR_i/dt) + (\partial O / \partial S) (dS/dt) + (\partial O / \partial R_i) (dR_i/dt)$$

Among them, $dy/dx, \partial y / \partial x$ represent variable rate of variant y to X .

dD/dt system evolution agenda represents the evolution of enterprise systems is determined by the variable rates on the right side of the equation.

The system variables were divided into two major categories of slow and fast variables by synergetic principle. The quick variables change fast over time, the number of them is huge, but plays a minor role in the system evolution; Slow variables, also called order parameter, which changes over time slowly, the number is less, but it controls the system's evolution; The nature of the complex system will be determined by the order parameter or slow variables.

For enterprise systems, various resource elements R_i , the initial status of the enterprise S , enterprise operation mode It , recover mode O_t and so on, decide the enterprise's operation performance, but the change is slow to other influential factors of slow variable is the enterprise resources integration pattern IT and the self-organizing mode of the enterprise system O_t . In the system deepening agenda, the dD/dt is mainly determined by the four slow variants $\partial I / \partial S, \partial I / \partial R_i, \partial O / \partial S, \partial O / \partial R_i$, in the four variants, the rate of the self-organizing pattern to the resources $\partial O / \partial R_i$ change slowly over time, is the main

enterprise system parameters; Enterprise to resources integration mode $\partial I / \partial R_i$ slowly change over time, is the second system parameters. Multiple parameters have order, among the other changes faster parameters, the variant dR_i/dt change is relatively slow, enterprises need a certain amount of time to tap resources, therefore the system resources is an important parameter, which need longer time to foster or acquire enterprise advantage resources, change is slow, is give priority to order; Other resources are relatively inferior, the order parameter around main parameters to look for its to its way to realize enterprise performance.

4.2 The implementation of the main parameter and second parameter in the enterprise complex system

From the above analysis, the self-organization of enterprise system to the function mode of the resources is the main parameter, is the main determining factor of the enterprises performance; Enterprise system of resource integration model is the second order parameters, the advantage of system resource is the order of the order parameter, is the key to affect enterprise performance factors in enterprise management, through the design of certain mechanism to formulate some rules (consolidation pattern) oriented enterprise main body behavior, enterprise main body through the mutual influence and mutual relationship between the employee (self-organizing mode) to perform the rules. These smart bodies compose a complex self-organizing, adaptive system, through the external environment prediction and adaptation, showing more complex than a single member of the intelligence, language, behavior and other characteristics. Based on the characteristics of complex systems managers should design integration mode and self- organization mode to allows them naturally produce creativity and high efficiency, rather than to impose their own solution on them.

The design of Mechanism and rules are provided for the enterprise resources integration model, and under this guidance, enterprise systems produced self-organization, thus the primary order parameter and order parameter of enterprise systems are basically determined. In this enterprise system, employees will release enormous energy and enthusiasm, and the company's operating performance will be increased.

In addition to the innovation of resources integration mode, design healthy self - organizing mode of enterprise mechanism for enterprise, businesses cannot afford to ignore the order parameters of resources, actively explore and cultivate superior resources, improve enterprise performance constantly.

5 Conclusion

When people look for solutions to the problems which were idealized in different levels, they have deviated from the real world more or less, and confined to the point of searching a solution, while the real world requires people to adopt integrated methods to deal with the reality problems. complex scientific management from the whole to think the enterprise complex system, combined with synergetic theory analyzes the slow and fast variables, gain the key variants: enterprise self-organizing mode, resource integration mode and superior resources, which determined the performance of the enterprises, through the design of enterprise operating mechanism oriented enterprise integration patterns and the self-organizing mode, and actively expand the superior resources, make other enterprise system parameters around the three main parameters to find the ways of the realization of the enterprise performance, provides the direction for improving organizational performance and implementation of organizational change for the enterprise.

Expert Counseling Model Based on Life Cycle Theory

Zhu Hanxiong, Xu Yahe

Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: zhuhx@whut.edu.cn, xyhyzp@qq.com)

Abstract: Currently, as the dominant force in national investment in science and technology, the national science and technology plan is important in building an innovation-oriented country. Expert advice and opinions in our technology programs play an important role in decision-making and management. This paper proposes life-cycle expert counseling model by grafting life science theory after defining connotation and denotation features of expert counseling. Based on this model, it has carried on expert consulting system organizational structure and operation process innovation, and the theoretical support is also provided for government technological program and decision-making.

Key Words: Expert counseling; Life-cycle expert counseling model; Expert counseling management innovation; Decision-making.

1 Introduction

Expert counseling has displayed an important role in the formulation and management process of China's scientific and technological plans, including initiating a project appraisal, project approval, appraisal reward and other aspects of the project. Each link is with the participation of experts. Expert recommendations and advice in these planning decisions and management has become one of the most critical factors. Presently, the number of experts to support national 973 project has reached more than 6,000 people, the scale of 863 plan database is close to 20,000 people, and the expert database in Office of the National Science and Technology Awards has more than 30,000 people (Xu Guanhua, 2007). After years of development and practice, expert counseling has been employed in China's three major scientific and technological plans, namely, National High-tech Research and Development Program (863 Program), National Key Basic Research Development Program (973 Program), and National Science and Technology Support Program, which has helped to accumulate practical experience, achieve good results and display scientific style and democratization in the government decision-making. It is worth mentioning that National 973 Program always adheres to the combination of expert advice and policy management mechanism, establishes expert consultant team and domain expert advisory group, thus give full play to experts in strategic research, in formulation of guidelines, in project evaluation and in assessment process management.

2 Research Status at Home and Abroad

As an important part of counseling system in modern decision making system, the expert consulting system is an important measure "to implement a verification system and decision-making responsibility to prevent arbitrary decision-making." The function of government policy decision expert counseling mainly manifests in: (1) providing ministrant, independent and diverse service for government policy decision-making. (2) providing the dual function of investigation and study, information analysis and project design as well as expression of public opinion for the government policy decision-making (Fu Xiaosui, 1995). (3) supporting role in decision-making, democratic political advocacy role, role in promoting economic and social development and promotion role in scientific and technical knowledge.

According to UNESCO, Science and technology policy is an important system and implementation of policy initiatives for the Government to foster effective development of science and technology and enhance overall national strength. This definition is only related to the field of science and technology, equivalent to what Brooks said, "not the policy for Science, namely" management and support of national science and technology policies, as well as for selection and evaluation of specific science program" (Brooks H. The scientific adviser[A]. Robert Gilpin, Christopher Wright. Scientists and National Policy—Making[c]. New York: Columbia University Press, 1964. 73—96), and (OECD, 1963 Classification, Xing Huaibin, Su Jun. Theoretical Progress of Analysis for Public Scientific and Technological Progress: Comments and Comparisons[J]. Public Management Journal, 2005. 2(4): 42—51). In the actual government policy decision process, policy-maker's demand to the science and technology expertise is not only limited to "for the policy of science" scope, but more widespread,

especially for policies related to environment, food and medical care. Therefore, Brooks describes this phenomenon of science and technology of massive intervention in political affairs as "Science in Policy, including " politics, policy, international relations in nature but have to rely on Science and technology" (Chen Guang, Wen Ke, Mou Zhiping. Role Transition of Experts in Sci-tech Counseling[J].Studies in Science of Science,2008.26(2):385-386).

Therefore, formulation of science and technology programs requires both an experienced expert counseling for their professional knowledge, practical experience and innovation in science and technology forecasting and strategic decision-making advice; it also needs to solicit opinions from the public, businesses and government agencies in order to meet their technology development needs. In addition, it requires the participation of technology managers at different levels in order to develop the country's science and technology development strategy, plans and programs in accordance with science and technology management system and research funding (Qiao Dongmei, Yang Jian, Li Zhengfeng. Knowledge acquisition, analysis and assessment of Expert Counseling System for Internet Scientific and Technological Planning[J]. Scientific Progress and Countermeasures,2007. 24(7)). To sum up, although sci-tech programs promoted by government mainly involve experts in sci-tech fields, their scope tends to be much wider.

3 Definition and Features of Expert Counseling

Expert counseling means that experts engage into the management of specific organizations and help the organizations to improve science, democracy and effectiveness of management with their professional knowledge or special skills. As for the government expert counseling, it means government seeks knowledge and technological help through certain procedures to improve scientific, democratic and legal levels of management in their public management, especially in decision making. Compared with the enterprise expert counseling, the government expert counseling is different in many aspects, such as behavioral intentions, personnel requirements, consultative approach, consulting and supervisory body .

Firstly, government expert counseling involves three bodies, namely, government, experts and the public, while the enterprise expert counseling only involves activities between companies and experts. Consultation of governmental experts aims at prevention and correction of Government and citizens' interests and "ignorance", and maintain balance between public interest and private interest with specialized knowledge and skills and a high degree of rationality. Beneficiary parties between government's expert counseling and companies' expert counseling are different. The former benefits society and individuals that make up the society, but the latter benefits companies as the market body. From this perspective, the success or failure of government expert counseling relates to the interests of the whole society.

Secondly, different types of experts are needed due to different purposes between government expert counseling and enterprise expert counseling. Companies which focus on profits demand more economists, business management experts and technological experts, while aiming at improvement of decision making levels and realizations of a scientific, democratic and legal decision making, government needs to consult not only economic and technical experts, management consulting experts, legal experts, planning experts, psychologists but also multidisciplinary experts in the field of sociology, and this is determined by the complexity and variability of social affairs. Thirdly, government expert counseling is realized mostly by entrust, which means experts provide their counseling advice for professional mission and social responsibility, and the Government will pay experts only in the case of major project tender or a few paid commission, This is totally different from the contract between the enterprise and expert. Enterprise expert counseling is a civil act, governed by private law while government expert counseling is subject to private law and public law. Therefore, procedures for government expert counseling have strict limits and subject to supervision from the society.

4 Life Cycle Expert Counseling Model

Life cycle counseling model means dividing life cycle of sci-tech plans or programs into several processes, and involving expert counseling management into each controlling points and key decisive points separately, thus realizing objectives of the whole program and acquiring corresponding social and economic returns. A complete expert counseling system must include five stages of life cycle, namely, issuance of program guidelines, program approval, implementation, completion and evaluation, and outcome transfer.

Life cycle expert counseling model not only requires a complete and scientific counseling to the content of each stage of the program, but demands the management between stages of “interface”, enabling a successful transfer of result from the last stage to the next stage and a proper time to start counseling work within the last stage.

5 Management Innovation Based on Life Cycle Expert Counseling

5.1 Flat type Expert Counseling Organization Structure Based on Internet

Flat type expert counseling organization structure based on network information technology combines the development of existing internet information technologies, and introduces network technology into the organization structure of expert counseling system, breaking the current binary system of hierarchical structure and flat structure and combining these two structures together, thus enabling these two structures to develop its own strengths and complement each other as well. At the same time, introduction of internet information technologies could break the geographical limitation of expert counseling, expand the professional range and import decision making and suggestions from the foreign experts, thus improving the counseling quality and efficiency and decrease the counseling cost a lot.

International counseling experts and experts from various institutes in the WAN organization structure make up the WAN experts. Top counseling experts and counseling experts from the professional fields make up LAN experts through LAN channel. At last, via the connection of internet, WAN experts and LAN experts form a complete organization structure of flat expert counseling system network based on internet.(Seen from Chart 1

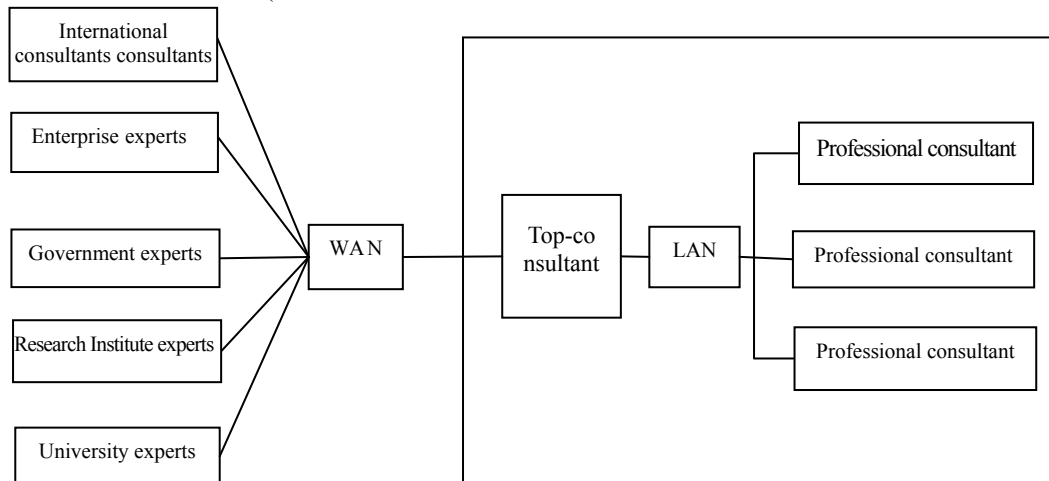

Figure 1 Organization Structure of Flat Expert Counseling Based on Internet

Advantages of organization structure of flat expert counseling system network based on internet are as follows. Firstly, a wide range of experts means abundant knowledge to pool mind together. An integration of existing expert database through internet technologies can break the geographical boundaries and collect good ideas and suggestions from experts coming from different institutes. What’s more, counseling work information of sci-tech programs proposed by overseas advanced experts can be introduced, which brings new ideas. Secondly, high counseling efficiency and low counseling cost. Secondly, counseling experts communicating through network information technologies helps them express their opinions equally. Thanks to the information platform, suggestions and ideas of counseling experts can be reflected, which avoids frequent conferences, discussions and experts’ taking turns speaking, thus reducing the difficulty of coordinating advisory experts, saving a lot of time and improving counseling efficiency. At the same time, network technologies also avoid the excessive use of paper documents, expert travel expenses, thus reducing research cost and consulting costs .Thirdly, organization shortcomings can be weakened. An increasingly mature network technology weaken the flat-like organization structure as it helps to shoulder management responsibilities of top counseling experts, so that they can devote energy to guiding and managing work. Meanwhile, it enables top-level consulting experts to understand the progress of the consultation work from a global perspective,

understanding each advisory expert performance and evaluating consultant work impartially. Fourthly, it harbors higher degree of confidentiality and security. WAN experts enjoy larger openness, but they are less-privileged. Although experts submit their counseling suggestions through the internet, they don't have access to other experts' files. While entering the stage of approval and evaluation of scientific research program, WAN will be narrowed to LAN, therefore, a higher degree of confidentiality and security is established. Fifthly, expert database are managed in a dynamic manner. Network technologies help to build a complete, scientific and dynamic expert database system. Based on up-to-date information, expert database can update the application and recommendation information of experts and add new information of evaluation experts accordingly without delay; At the same time, information of experts, including transfer, retirement and death, can be updated as well. Sixthly, unfair assessment influenced by factors such as social connections, and celebrity can be avoided. Network technologies requires the expert's participation of evaluation work in their individual names, and shields the applicant names and their working institutes, enabling a full display of anonymous system and ensuring the fairness, objectivity and accuracy of evaluation work by experts. Seventhly, counseling experts are engaged into full process of counseling and management of scientific research programs. Owing to the convenience and cross-regional nature of network, counseling experts can provide timely counseling to the program at whatever stages as counseling experts can play their respective roles at different stages and for different purposes. In this way, a life cycle expert counseling function is realized.

A flat-like expert counseling system network based on internet combines network information technologies and experts counseling system, which fully develop their respective roles. It provides a new idea for the development of China's sci-tech plan management, and a new model for the counseling and management work of scientific research program.

5.2 Operational Process of Expert Counseling Model Based on Life Cycle

Life cycle expert counseling model are useful in every stage of scientific research program, for example, when the requirements for technological support of a scientific research program are produced, just as a seed takes root in the soil, experts will provide intelligence support to help it transfer into a plan in the program guidelines. After program selection by counseling experts, the program will receive guidance from experts including intermediate stage inspection and annual review to help it develop healthily. While entering the middle stage of the program, counseling experts working for professional fields will deliver a final evaluation to the program led by top counseling experts. Similar to the evaluation of material quality of good wood that has already taken shape, they determine whether it has realized the transformation of scientific and technological achievements eventually. After evaluation, counseling experts from different areas will be selected from the database to provide a complete set of advisory service to the sci-tech transfer. With life-cycle expert advisory model in conjunction with project life-cycle, it forms a "tree" shape operation pattern, shown in chart 2.

5.2.1 A Tree Shape Operational System Structure Based on Life Cycle Expert Counseling Model

"Root": Operation pattern "root" refers to the pan-expert links network. The pan-expert is not necessarily consultancy expert, but certainly is in the expert of profession. They disperse in the world in various trades and occupations. Similar to a giant library, they are the soil for all scientific research item breeding. Network information connects these experts together, providing intellectual "nutrients" for scientific research project life-cycle and life cycle expert counseling system, and ceaseless driving force and solid foundation for scientific cause. "Trunk": Trunk of the operational model is the specific organization of the life cycle experts counseling model. The bottom part of the stem is representative of pan-expert groups selected in various ways. Experts in the database have more definite goals and responsibilities. They are candidates of counseling experts, providing daily consultations to expert counseling system. Other parts of the stem are WAN experts connected by WAN and LAN experts connected by LAN, as well as the affiliated hardware facilities. WAN experts will provide professional counseling work at the initial and late stage of the scientific research program, while LAN experts evaluating on the scientific research program within the LAN at the key evaluation stage. "Stem": Stem in the operational model represents five stages of the life cycle in the scientific research program. Different experts play different counseling roles at different stages. "Branch": Branch of the operational model means specific counseling work assigned to counseling experts in each stage.

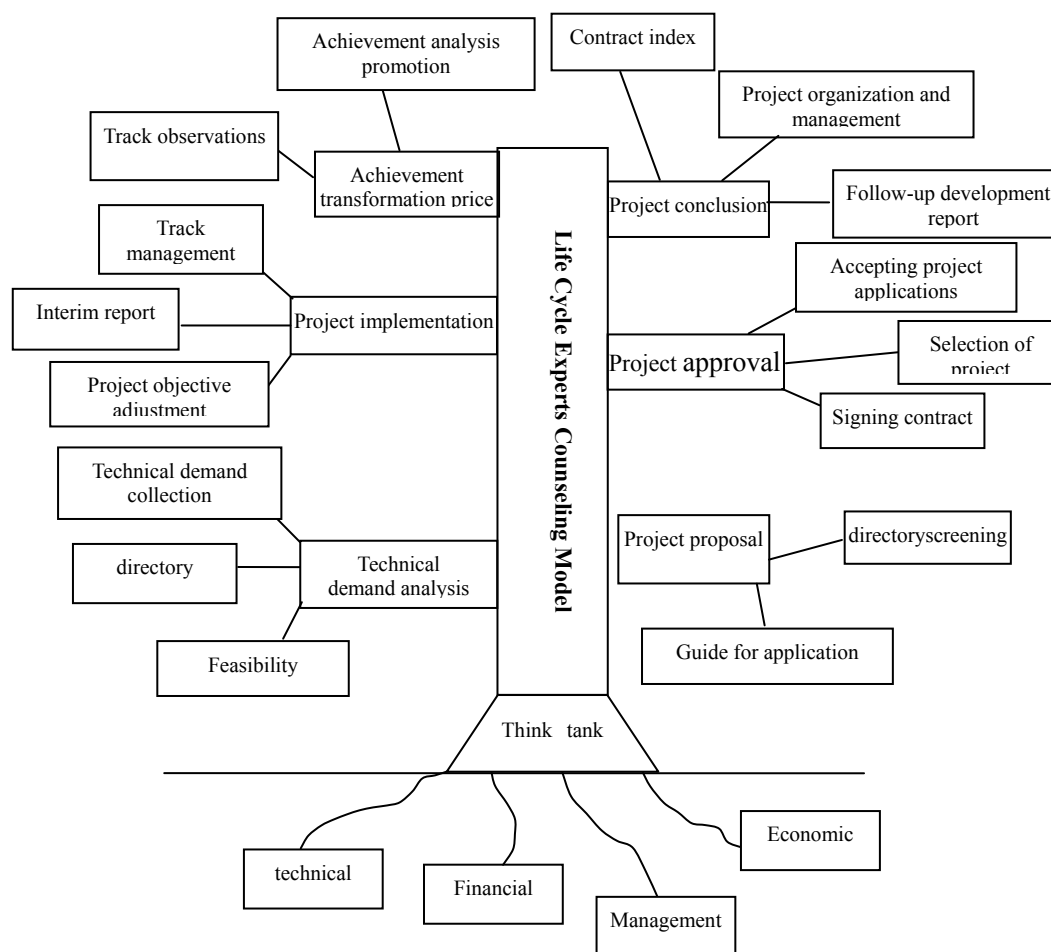

Figure 2 Tree Shape Operational Chart of Life Cycle Experts Counseling Model

5.2.2 Tree Shape Operational Route Based on the Life Cycle Experts Counseling Model

During the tree shape operational process of the life cycle experts counseling model, different stages of the life cycle have different operational routes. “Series” type: “Series” type refers to a type in which all consultancy experts in the same consultation link in a work flow use similar network condition to carry on consultancy work. “Parallel” type: “parallel” type is defined in a different part of the same consultation workflow counseling Experts use different network conditions to carry out consultancy work in parallel mode. “Hybrid”: “hybrid” refers to a participatory work model with different advisory links in different processes in which experts use different network conditions with several links doing consultancy work alternately across.

Mode of the State-Subsidized Student Loan System in China

Shang Dan

School of Humanities and Law, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: sd1220@sohu.com)

Abstract: For three decades of reform and opening up, the educational aid system in China has presented great changes with social revolution. To decrease the economic burden of students in Chinese higher education, the system of State-subsidized student loan (SSSL) was constructed in 1999. For some misunderstanding exist in the SSSL system which is predominantly provided by government by a subsidized policy, this article focuses on the purpose, coverage and characteristics of the SSSL (2004) in China. It is concluded that the SSSL (2004) system is basically on commercial mode by comparison with the policy loan. Therefore, methods induced by the commercial mode are more suitable in solving the problems in the process of SSSL.

Key words: Higher education; State-Subsidized Student Loan system; Commercial mode

1 Introduction

Since the establishment of P.R. China, the higher education was free of charge for students, in which the expense was completely supported by government. Until 1988, the government starts to charge a small fee (200 RMB) for higher education for the tuition of 200 RMB is only symbolic. However, it is a beneficial attempt that the higher education is not the free-lunch any more for students passed examination in some extent. After eight years since then, the tuition of the reformed higher education was gradually increased by 2,000 RMB. But it was just beginning; the tuition of higher education entered into channels of the moderate ascending for some reasons, such as the principle of apportionment expenses of higher education, the economic inflation. Recently, the average tuition in China rose to 5000 RMB, and the dormitory expense cost 1,000 to 1,200 RMB besides subsistence expenses. Therefore, the financial support of one student has to get at least 10,000 RMB from their families by each year. It has become a heavy burden for student families because per caput gross of China was 2000 RMB, and it is the huge challenge for pursuit of freedom and democracy^[1].

At the same time, the popularizing rate and enrollment rate in higher education was also enlarged with the increases of the absolute quantity of student passed examination. More and more children, who are coming from poor families, try to receive advanced education and deeply believe in the conviction that knowledge can change their fate^[2]. Of course, the value of social fairness has spread and embodied in education, including two basic fields in the equality of educational right and opportunity. According to the statistical data of the Education Ministry the total amount of full-time undergraduates in 2008 is 21.03 million. Within it, the students in the financial difficulty are about 473.96 million accounting for 22.53% of the total. Especially students in the extreme financial difficulty are about 158.32 million, accounting for 7.53% of the total. It is not easy for the poverty families to charge this tuition, especially for the multi-child-families, the low-income family struggling for surviving, and the rural families after the natural disaster. So the contradiction between the tuition of higher education and the low income becomes a potential threatening to the equality of educational opportunity and social fairness.

Chinese government provides five kinds of subsidy strategies: scholarships, maintenance grant, apart-time jobs while studying, deductions or exemptions of tuition, and State-Subsidized Student Loan (SSSL). Among these, SSSL is most available to almost students in poverty. The major reason is that eligible students can apply for the loan without monetary limitation. Another reason is that the tuition and dormitory fee are the main component of higher educational expenditure, which is mainly supported by SSSL. Therefore, SSSL might probably eliminate the contradiction between the tuition of higher education and low income.

As we all know, SSSL is multi-win mode: 1)for the poverty recipients of higher education, SSSL help students to avoid the burden of increased tuition; 2)for the higher colleges, SSSL can solve the problem of poor students tuition barriers; 3) for the state, SSSL are able to relieve pressures on national budgets by facilitating greater cost of enrolment expansion; 4) for the society, harmony aim can be achieved in the equality of educational opportunity and social fairness.

2 Enforcement and Reform on SSSL

After the regulations on SSSL management were suspended by a joint mandate of the Central Bank, Ministry of Education and Ministry of Finance of China, the mainland attempt on SSSL was carried out in eight cities in 1999. This is the beginning of popularization on SSSL mode. At that time, SSSL was carried out by the Industrial and Commercial Bank of China, the interest burden of loan during SSSL borrowers' schooldays was undertaken by government and the repayment period cannot exceed four years after graduation.

In 2000, the supplementary suggestions of the regulations on SSSL management were announced by a joint mandate of the Central Bank, Ministry of Education and Ministry of Finance in China. After one year, it was decided that the only one bank performed SSSL business extended to four banks -- the Bank of China, The Agricultural Bank of China, China Construction Bank and Industrial and Commercial Bank of China; the SSSL applicants expanded to undergraduates and postgraduates; the college served as introducer and one teacher at Student Affairs Office regarded as witness. At the same time, the regulation was definite that SSSL applicants could not tender Property guarantee. That is to say, SSSL is certificated as unsecured and consumer credit loan, which is supported by government policy.

In 2004, the further improvement of the regulations on SSSL management (for short "SSSL (2004)") was declaimed by the Central Bank, Ministry of Education and Finance of China. The banks with permitting qualification on SSSL business are endowed with the winner in a public bidding, and the actual successful bidder is the bank of China. That means the bank of China obtains the only qualification on SSSL business. A system of SSSL compensation by government is built on for volunteers working at the outlying poverty-stricken regions. And then a risk compensation system is developed. The risk compensation fund is offered by government and colleges that the student borrowers belong to and the distribution of the risk ratio is equal. To some extent in SSSL (2004), the government takes count about the balance mechanism among various interests: the repayment burden of borrowers, the compensation of debt, and risk of commercial bank.

3 The State-Subsidized Student Loan (2004)

The present SSSL system is consequence of the latest reform in 2004. Therefore, the further study SSSL (2004) is necessary.

3.1 Purpose

SSSL keeps invariant in some extent, and the purpose of SSSL (2004) is to help the poor students pay the tuition and dormitory expenses. The financial instruments are analyses to support the development of higher education and safeguards equity on education right.

3.2 Coverage

Considering SSSL performed as a kind of methods in supporting the poor students in higher education, the eligible SSSL applicants are students in general colleges who have difficulties on paying the tuition and dormitory expenses. The coverage of applicants in SSSL (2004) has enlarged to students in higher vocational colleges, postgraduate students and some second degree students. The coverage of SSSL applicants becomes more extensive.

3.3 Operations of SSSL system in China

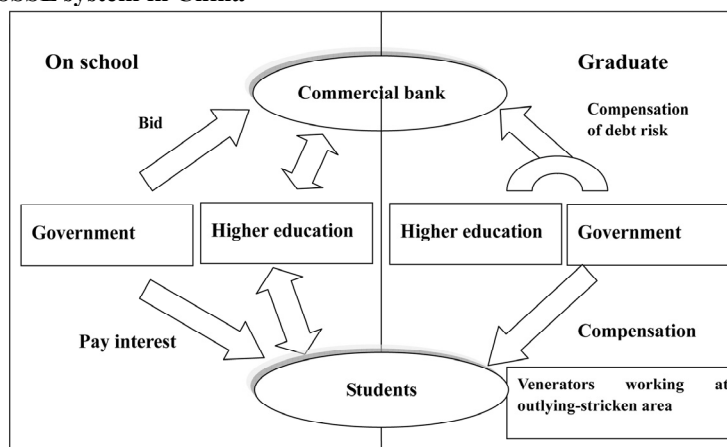

Figure 1 The Process of State-Subsidized Student Loan (2004)

3.3.1 On school (see the Figure1)

Commercial bank: lending money to poor students. The legal status of commercial bank is regarded as a lender, which provides money to students. The limitation of loans is determined by the tuition and dormitory expenses of applicant and the total of loan cannot exceed 6,000 RMB per year.

Students: the eligible applicants are students in higher education who passed the entrance exams but cannot afford the tuition and dormitory expenses. In China, applicants must provide a certification which is signed by the civil administration department above county, to insure the poverty degree of students. Besides certification, application materials also conclude the copies of students card (or enrollment note), students and their parents' Identification Cards. The application from senior class has to provide score sheet with latest one year for the qualified applicants must have no failed courses.

Higher schools: SSSL application can not submit directly from students to commercial bank, but is submitted from higher education. The higher education set up a specialized department in subsidization, named as the center of higher school students' financial aid (CSFA). After collected all application materials in time, CSFA submits these to commercial bank altogether. Compared with large scale of applicants, SSSL is credit of small amount loan. Because the amount of applications is larger, CSFA collect and check up at first before putting together to commercial bank. Although the debtor-creditor relationship is between the commercial bank and the students, the contract both parties are connected indirectly with the higher education that it is a distinctive difference from the commercial loans. The SSSL (2004) has manifested that the higher education serves as introducer between debtor and creditor, such as application submitter, the contract first reviewer, the loan usage supervisor and so on.

Government: The bank with permitting qualification on SSSL business is chosen by government through a public bidding; the interest of SSSL on the borrower in school is paid by finance ministry.

The first step: the government endows a commercial bank with the qualification on SSSL business by public bidding.

The second step: The eligible applicants submit their applications to commercial bank through the higher school of the applicants. Before the application profile sent to the commercial bank, the higher schools have to gather and sort out of materials according to the demands of commercial bank.

The third step: After received the applicable materials, commercial bank approval the contracts. By those approval contracts, the commercial bank carries out obligations on lending. And this course of lending is also through the colleges which applicants belong to for supervising the usage on this loan.

3.3.2 Graduation (see the right side of Figure 1)

Students: after graduation, higher education has no longer performed as medium between the debtor and creditor. Students repay the principal and interest by themselves and the repayment has followed the regulations as follows: students have repaid the interest after graduate immediately and have right to choose any date in two years after graduation as the beginning of repayment. The repayment has four years limitation from the starting day of repayment that students have chosen.

Commercial bank: bank has right to take back the loan principal and interests, and the interest rate is floating according commercial bank rate.

Higher schools: before graduation, higher schools have obligation in collection the student borrower information, which contain the employment intention, working site, kinds of communicative way and other information related to repayment. After graduation, higher schools assist the commercial bank to connect the borrowers who was delay of performance or non-performance on repayment. These tasks could be classified into information collection. Besides these, higher schools have to undertake the half of risk fund.

Government: government undertakes the other half of risk fund and compensates the volunteers working at outlying poverty-stricken regions. The former is in favor of commercial bank's benefit, because that SSSL is put into credit loans without property guarantee and the risk of taking back the loan principal and interests is high. The later is to courage students to devote into the development of outlying poverty-stricken regions. Compensation have two mainly reasons. Firstly, the jobs in the outlying poverty-stricken regions have lower salary whereas SSSL repayments maybe become financial burden on volunteers. Secondly, working in the outlying poverty-stricken area is also responded the call of nation to devoting to the development and improvement of people's lives in the outlying poverty-stricken regions.

4 Discussions of the SSSL mode: Commercial loan or Policy Loan?

In China, besides the Central Bank, People's Bank of China, there are two kinds of banks: commercial bank and policy bank. These two kinds have their own business. In the aspect of credit

business, the commercial bank mainly develops commercial loan and the policy bank mainly operates policy loan. These two kinds of loan have their own characters as follows (Table 1):

Regarding to these two kinds of loans, there are mainly three kinds of opinions on SSSL in China. The first opinion thought SSSL belonged to policy loan, for the aim of the SSSL is to relieve the financial difficulties on children in poverty families. That aim can be regarded as administrative remedy or governmental functions^[3]. The second one believes that the SSSL is commercial loan, for the lender is commercial bank and the operation was according to commercial loan mode^[4]. The third one insists on an alternative opinion that is the SSSL has characters of both policy loan and commercial loan^[5].

Table 1 Comparison the Commercial Loan with Policy Loan

Comparison	Policy loan	Commercial loan
Lender	policy banks	commercial banks
The role of state	subside; administrative interference; take on the bad debt risk	encourage competition
The service object	weak industry and vulnerable groups which are Out of sight of commercial bank	the well or stable-income ;the large and medium-size enterprises
Capital source	financial budget; government policy support.	market distribution
Interest rate policy	preferential interest rate	market interest rate
Risk control	administrative management.; ignore the risk	credit rating; financial reports; mortgage lending
Characters	government's involvement; financial method	pursuit the maximum return on the minimum risk
Problems	lack of the risk consciousness; rent-seeking; obvious against the market	transaction cost are high; information asymmetry; take no consideration of weak industry and vulnerable group

The third opinion does not fully reveal the nature of the SSSL because SSSL is only intermediate form and the essence is obscure. However, the nature of SSSL should be direct and certain.

Between the former two opinions, the author holds that the essence of SSSL is commercial loan. Firstly, the lender is commercial bank, which have the final right of interpretation on the SSSL applications and has veto power independently. Secondly, the interest rate of SSSL keeps consistent with commercial interest rate without any favorable policy. Although the interest on loan is paid by government, interest rate level has no discrimination with commercial interest rate. Thirdly, the risk of SSSL is undertaken by commercial bank mainly. The risk fund sets up just for this function. Fourthly, the operation of payment and delay of performance or non-performance are also the same as the commercial loan. The last, the commercial bank and student borrower are the volunteer for SSSL, in which they all have complete autonomy, and the relationship between them is civilized subjective on debtor-creditor. All these characteristics are not compatible with the policy loan.

5 Conclusions

SSSL is a kind of loans by commercial bank. That is saying that commercial banks lend money to students and the students on debt repay the money to commercial bank with repayment period. On the other hand, SSSL is subsidization from government. The government suggests that the commercial bank lend money to poor students without security. SSSL is the credit and unsecured loans for poor students by commercial bank. In a word, the State-Subsidized Student Loan system in China is in commercial mode.

The Reform of US Financial Supervision after Sub-Prime Crisis and Its Implications to Chinese Financial Supervision

Huang Zihua

School of international education, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: roger.smith.huang@gmail.com)

Abstract: The financial crisis led by the sub-prime crisis has heavily hits the global economy and makes many countries carefully examine their own financial supervisory systems. Strengthen financial supervision becomes a necessary issue. This paper first talks about the profound reasons of the financial crisis. After that, this paper discusses the reform of US financial regulators after the financial crisis; regard it as a example, trying to figure out what we can learn from it to improve Chinese current financial supervision under the circumstance of current Chinese financial field. Finally, this paper draws this conclusion that it is essential and urgent to clearly define the rights authorized by laws.

Key words: Sub-prime crisis; Financial regulation; Institution reform; Risk management

1 Introduction

There is no denying that it is a globalized economy ear today. The sub-prime crisis starts in US led to a sweeping horrible financial crisis all over the world. As a matter of fact, US may has the most advanced and efficient financial regulation in the world. Therefore, why it fall to prevent the crisis from happening become a question that often asked. One of the main reason of this terrifying financial crisis is the lack of government financial regulation. Enhance the regulation of government on financial and give more power to the government is becoming a regular method for governments in this post-crisis period.

2 A Brief Analysis of Sub-prime Crisis

First of all, what is the sub-prime crisis is crucial. In US mortgage market, sub-prime and prime are two different standards that represent the credit rating of the borrower. Therefore, loans that are offered to borrowers with bad credit record and no stable income by the banks are called sub-prime mortgages. Those loans are usually with great default risk due to the low credit rating and poor ability to pay off the debts of borrowers. But, the interest rate of sub-prime mortgage is usually 2-3% higher compared with normal loans. Thus, the sub-prime mortgage is very attractive business section for banks. Also, its high revenue comes with accordingly high default risk.

It needs to be emphasized that this sub-prime crisis is not caused by one single reason. So many elements combined together then triggered the crisis. In another word, these crises occur due to several different reasons integrated. Several main reasons will be discussed in this paper.

The first main reason should be the burst of the real estate. By reviewing what happened before, we are able to be aware that the real estate bubble burst of the seeds has been planted as early as 10 years ago. At the beginning of 2001, the Internet bubble in United States burst, stock prices fell sharply, plus the 9.11 terrorist attacks, United States economy was in the edge of recession's. In order to stimulate economic development, then-Federal Reserve Chairman Alan Greenspan, taking cuts in a row. From January 3, 2001, to June 25, 2003, the Fed cut rates 13 times in a row, the federal funds rate had declined from 6.5% to 1%. While greatly stimulated the real estate industry, and drove the United States economic development. But it also caused the 'false prosperity' in United States domestic real estate field, which forming the foam. Burst of this bubble started in 2004, from June 2004 to June 2006, the federal funds rate from 1% rose to six, almost back to levels seen the interest rates cut 13 times before. Gradually increasing interest rates to mortgage holders increased the bubble of the repayment burden. Therefore, real estate boom began its recession, the dramatic decline of investment housing demand occurred. In 2006, the new building real estate area fell to 40%. In 2007 the overall home prices in the second quarter its largest decline since 1987. In February 2008, 8.8 million households in the United States were facing unaffordable mortgage. The total amount of mortgage loans in negative equity was up to \$ 2.6 trillion.

The second reason is that banks and other financial institutions are becoming too utilitarian, ignoring the risk of default and operating against basic mortgage loan regulation and rules. Major banks in United States becomes too greedy in getting more revenue. They are stimulated by high profits in sub-prime mortgages. Loan credit approval procedure has been simplified, and credit information lenders don't have strict audit. A large number of unqualified borrowers received sub-prime loans.

Statistics show that the share of sub-prime US home loans rising from less than 5% in 2001 to 23.6% in 2007. At the same time, the absolute amount up to \$ 1.89 trillion in sub-prime loans.

The third reason is a serious dereliction of financial regulators and credit rating agencies. First turning point, is the excessive free of securitization led to a widespread proliferation of financial risks. During the booming period in the real estate industry, financial institutions are holding a large amount of housing loans. In order to increase the rate of capital operation, boost their profits, investment banking industry developed a kind of financial derivative called Collateralized Debt Obligation also known as CDO. Before the bonds put to the market, it requires credit rating agencies to evaluate its quality. Major international credit-rating agencies like Moody's, S&P's and Fitch give the highest credit rating AAA to many actually junk bonds that packed into premium bonds after they received a lot of commissions from investment banks. In this way, investors in every work fields from all over the world have purchased a large number of these junk bonds, resulting in the rapid global spread of the crisis in the future. In this case, once borrowers are unable to repay their mortgages, all institutions and persons involved in this very CDO funds chain will receive one after another severe shock, causing very serious consequences. One example of it is that thousands of people in US got their house taken by the bank due to their lack of money to pay off the mortgage.

Led by the Federal Reserve, the financial regulators of the United States became serious misconduct. United States Government is serve lack of regulation on expansion of sub-prime loans, derivative spread that led investment banking almost totally separate from financial regulation. Those investment banks are able to conduct massive promotion of financial derivatives, and concealing its hidden risk. Moreover, credit-rating agencies do not have any responsibility for their ratings due to the lack of law regulation. Then-Federal Reserve Chairman Alan Greenspan said at a Congress hearing on October 28, 2005: "Fed till 2005 years don not know the exactly scale of the sub-prime lending market in the US." But he also acknowledged that themselves against the practices of derivatives regulation errors. When Alan Greenspan as Chairman of Federal Reserve, he is committed to building a minimum level of government regulation in the second market and even in the whole financial system.

3 The Defect of United States Financial Regulatory System and Its Reform

In November 1999, the United States passed the "Financial Services Modernization Act" put the implementation of the 66-year-old "Glass-Steagall Act" to an end. Restrictions that banking, securities, insurance companies are regulated to separate their business was completed abolished. US financial regulation Institutions finished its functional change from single supervision to "multitasking supervision". United States Federal Reserve is designated as the primary supervisor, the executive regulation of entire financial holding companies, as well as by business line provides the specific person. In the United States under the federal system, laws not only give the Federal Government regulatory functions also authorized the State Government to exercise regulatory duties. The graph below indicates a brief structure of the early US financial regulation.

3.1 Before reform United States financial regulatory system deficiencies:

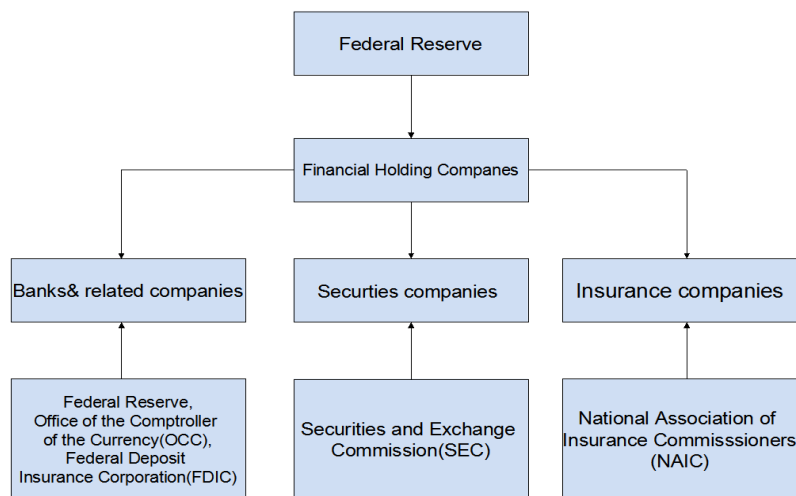

Figure 1 Early US Financial Regulation Structure

(1) Overlapping Regulation

Taking supervision by a number of regulatory regulators is common to United States financial institutions. Multi-head control refers to United States financial regulatory system operate the business separate supervision. In practice, however, the whole financial industry has entered the stage of mixed business field operation; there is an inextricable link between financial products. In this case, there is a clear overlap between different supervisions.

Taking the Citibank as an example, it has to be supervised by a numbers of regulators: The Office of the Comptroller of the Currency(OCC), the Federal Deposit Insurance Corporation(FDIC), Federal Reserve Bank, savings institutions supervision Department, the Securities and Exchange Commission(SEC), and other local regulators by the 50 States. There is a crossover between these institutions and the phenomenon of regulatory overlap. There is no single financial regulator with the necessary authority and information to monitor systemic risk in the market. Between existing financial regulators, they are lack of the necessary coordination mechanisms when dealing with major issues threatened the stability of the financial markets. Due to the different regulatory goals and purposes, regulators of financial institutions to the new standard, submission of information formats and procedures, internal risk control, capital adequacy standards, qualifying for senior managers, financial institutions mergers and acquisitions and so on, there are always different provisions. Large financial groups on the preparation and submission of the annual report per year will have to spend at least 2 months time. Financial institutions are also often the same thing, in the same sector or subsidiaries continuously taking on-site inspections of different regulators.

(2) Regulation omission

In 1998 the Long Term Capital Management (LTCM) suddenly on the brink of insolvency. On such a large scale, such company that deeply participated in Forex market, futures markets, monetary market, securities markets and financial institutions. Surprisingly, there is not one agency claimed that it had implemented regulations. In this LTCM event, many banks operated with the LTCM company. They invest without understanding the details of the case, giving large amounts of loans to it in high risk investments business. Eventually it was revealed the seriousness of the problem until the Federal Reserve investigated. It reflected that financial regulators facing varieties of challenges when fulfilling their supervisory duties, financial regulators need to be constantly innovative and vigilant to identify and respond to potential threats to the financial system risk. As a matter of fact, LTCM was one of the thousands of unregulated hedge funds. Also, we know that in the early 1990 of the 20th century, the United States major commercial banks and securities companies have established derivative products, and vigorously expand structured products business. These structured products is not the traditional options, futures or swaps, but a sort of complex amalgam of derivative products with varieties of basic products. More than 10 years passed, while structured products has become an important source of income for financial institutions, since none of the regulators claim that they have supervisory responsibility for these products, risks revealing and investor protection. Disperse will easily lead to regulatory gaps in the regulatory powers.

3.2 The reform of United States financial regulatory system after the crisis

In March 2008, the United States Treasury Secretary Paulson referred to the Congress the 'Blueprint for Modern Financial Regulatory Reform', which formally starts the new round of financial supervision system reform of United States. The blueprint is divided into three parts: the short, medium, and long-term. The ultimate goal is to establish development status to be goal-oriented and adapted to the financial regulatory system.

Its short-term aim is to strengthen regulatory cooperation and to address the current United States regulation of housing mortgage market lack. Achieved target of main way including three points: (1) Enhanced President financial working group on financial regulatory institutions of coordination role, to strengthening regulatory sector cooperation and information communication. (2) Strengthening Fed in ensuring market liquidity aspects of responsibility, and gradually strengthening Fed in integrated regulatory aspects of functions. (3) Established a Federal mortgage Committee appointed by President, which is responsible for assessment, evaluation and report mortgage financial business progress and license issued situation of each State.

Medium-term objective is to address the reform of United States regulatory duplication in financial regulation, increasing the effectiveness of supervision. Achieved targets include five points: (1) Plans to put original State Bank regulatory functions into federal regulatory system. (2) Recommends the Fed to building a efficient of modern paid settlement system, and established paid settlement system regulatory framework. (3) Recommends the Treasury constructs a national insurance office that provides effective,

unified regulatory rules and framework to all insurance companies. (4) Proposes to merge the Securities and Exchange Commission (SEC) and the Commodity futures trading Commission (CFTC) in order to provide a unified regulation of futures and securities industries.

Long-term goal of the reform is to establish optimal regulatory system to increase United States competitiveness of the financial industry. Means to achieve goals including four main points: (1) Build the optimal regulatory framework. This framework has three pillars: financial market stability regulation, prudential financial regulation and business conduct regulation. (2) To the fed as the Center, building a super regulatory agency responsible for financial stability as a whole. This new institution has the right to implementing the necessary regulatory to all financial Agencies. It is responsible for monitoring systemic risk in the entire financial markets. (3) The blueprint recommends building a prudential financial regulator, responsible for the regulation of access to Government-guaranteed financial institutions, and is responsible for the supervision of financial holding companies. (4) Building a business conduct regulator of financial institutions. To implement appropriate regulatory on financial institutions such as access into the financial sector, selling their products and so on. In order to reach balance between controlling financial risks and encourage innovation.

On this basis, on June 17, 2009, president Obama announced the reform programme as “Financial Regulatory Reform: A New Foundation:Rebuilding Financial Supervision and Regulation” at the White House. This 88-page programme indicated the largest reform of financial regulation in United States since the great depression.

4 Enlightenment on the Reform of Financial Supervision in China

4.1 Laws and rules are the priority to regulators

As can be learned from the reform of US financial regulation system, in order to reduce the moral hazard in financial institutions, we must build a sound market discipline mechanisms, strengthen market supervision.

On June 28, 2004, China Banking Regulatory Commission(CBRC), China Securities Regulatory Commission(CSRC) and China Insurance Regulatory Commission(CIRC) officially announced the three financial regulators financial regulation Division memorandum (will be called ‘Memorandum’ in further parts). In the form of system gave the joint meeting of the regulatory system: positive coordination, avoid duplication of regulatory vacuum and regulatory mandates. Thus, the joint meeting of the regulatory system was finalized in the form of the ‘Memorandum’, it is not a law, does not have the constraints of three capabilities. Selective persistence of law enforcement in the area of financial regulation in China, for ineffective the ‘Memorandum’, its just as likely to be selective implementation of even a virtual reset scheduled convening of a joint meeting of the monitoring on a quarterly, but had missed 18 months. Therefore, administrative regulations are necessary for the clearly effectiveness of the ‘Memorandum’.

4.2 Joint regulatory Conference and the perfection of the memorandum

Joint regulatory conference system under the ‘Memorandum’ was flawed: (1) From the view of participating, the third level sector differences was not established to address the meeting mechanism, differences only reported to the State Council to make the final decision while the joint meeting does not have the decision-making functions of the dispute. (2) On the supervision of financial groups by, the provisions of the memorandum on the financial holding company of the group based on the nature of their principal business, vested in the appropriate regulatory bodies, the relevant body, the business regulation of the financial holding company, implemented according to the nature of the business-industry regulation. But this Division is not reasonable, financial holding company may itself only to the subsidiaries of the group administration do not carry on specific business, while there was no clear division of primary and secondary business in accordance with the criteria, divided by which body of primary and secondary business and major business change and how to deal with such details. (3) The joint meeting of the People's Bank of China to participate as an observer only, neither the rights nor the right to vote and the right of veto. As “maintaining financial stability” was excluded from the joint meeting of the Central Bank, which amounts to a fragmented financial regulation and financial supervision of contact. (4) Joint Conference by the three party set up "joint secretariat" was not a unified standing body. Creation of a unified standing body point is assigned to the permanent establishment is situated in the most important regulator ‘primary facilitator’ status, a clear ‘primary facilitator’ in favor of links related to regulatory forum and the consensus further implementation.

Hence, it is needed to establish a clear legal permission, the entity organization coordinating bodies.

Most suitable for this by the people's Bank of China. primarily for the following reasons: (1) From the historical point of view, the people's Bank of China used to be the only Chinese financial regulators, the three regulatory powers are stripped from people's Bank of China for global financial regulation to seize a significant advantage. (2) From the perspective of supervision fee on sources, the rules of the independent system of financial budget, does not charge a supervision fee, from the impact of sectoral interests. (3) From the efficiency point of view, the People's Bank of China is responsible for setting monetary policy. Monetary policy can not run without good financial information that is complete, timely collection. Therefore for information gathering the most effects agency will be the People's Bank of China. For practical considerations, branches of People's Bank of China are all over the country. Therefore, the People's Bank of China the most appropriate for the information platform. (4) From the level of law, 'maintaining financial stability' is the statutory duty of the Act provides the rules of the People's Bank of China. In 2008, for the functions of the People's Bank of China under the State Council, People's Bank of China 'charge in conjunction with the financial regulators to make regulation of financial holding companies, cross-financing business standards, norms.

5 Conclusions

First of all, the US sub-prime crisis and the following world wild financial crisis has profound influence to every country. Due to the globalized world today, there is no single country that is able to be absolutely isolated from other countries. Once another crisis occurred, we will suffer the damage and lost together. Therefore, the regulatory system in every country should be vigilant from now on in order to detect and prevent the next financial crisis in the future.

Second ,taking the reform of US financial regulation system as a example, we are able to learn that the clear and proper legislation in financial regulation is the priority and very foundation of a efficient, powerful, economic financial supervision system. Also the branches and their layout of the supervision system are equally important. To prevent inefficient supervision, resources wasted, corruption and bureaucrats from happening. In order to reach these goals, the responsible link system should be done. By doing so, when accidents or crisis occur, those who should be responsible will not be away from the punishment of laws. The justice should and will be done in the field of finance.

Third, there is no denying that no body knows what the future is. So what we should do is to build a proper system to prevent the disaster from happening. In the worst case scenario, once the crisis happens, we are able to find out as soon as possible. Thenwe should try to minimize the damage and lost relay on this supervision we built. The world is changing every day, so we should update the system everyday to adapt the changing circumstance in the world.

Marketing Mix and Adaptation Strategy of Commercial Banks in a Fragile Economy: A Case Study on the Congo D.R.

Mbayo Kabango Christian

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: cmbayo2201@gmail.com)

Abstract: This paper intends to analyze marketing strategies of commercial banks operating in a sub-Saharan economy such as the Democratic Republic of the Congo. Therefore, by focusing especially on the manner they develop their marketing mix, it will find out if adaptation as a strategy in international marketing has been utilized within the Congolese market. It is assumed that accordingly to the last 32 years of a disastrous political and economic management of this country, the ongoing efforts to restore a good business climate and to minimize the risks on any investment such as banks, the Congo seems to be a perfect case study for a discussion about the adaptation strategy. To apprehend and understand the motives and the canals through which the strategic marketing adaptation has been operated, the environmental analysis using the PEST, the SWOT models and the 4Ps analysis have been used and are sustained by a survey and data collected on 21 banks which were running normally their businesses within the period going from 2001 to 2010.

Key words: Congolese banking system; Marketing mix, Stability; Adaptation

1 Introduction

After several years of economic recession and degradation of the social and political environment, the Democratic Republic of the Congo from the year 2000 began to renew with positive growth trend in the macroeconomic sector whilst some efforts were also made to improve the political environment.

Meanwhile, a critical lecture of the evolution of the global situation of the country shows that the renewal with positive macroeconomic indicators cycle like a positive GDP growth trend or the management of political contradictions doesn't effectively mean becoming stable.

Indeed, stability is a vague concept that lacks a clear understanding as stated by Leon Hurwitz (1972), Emily Paddon and Guillaume Lacaille (2011). Stephen Guest (2008) citing John Rawls noted that in general, stability implies solidity- as in difficult to be swayed- and a dependable continuity. It may also imply relative lack of conflict and harmony. Whence, about Congo's stability, several reports of international organizations such as Refugee Studies Center (2011) stated that the country was coping with a positive propensity of falling under a peaceless state because of the effectiveness of the threats coming mainly from the political situation.

Nevertheless, this renewal with positive economic and political trends, reinforced by the government's desire of improving the business climate, has strengthened investors' wills to direct and locate new investments within the Congo. Banks number grew quickly in the last ten years in this extroverted economic system strongly dollarized, with a national budget supported almost at 50% by international partners, a population counting small incomes almost dollars 180 as minimum wage and low purchasing power.

By assuming that in an unstable or fragile economic and political environment, investors' first move will be to reduce the risk taking, it can be pretended that their actions should be to use prudential measures and to develop product that match with the market.

Through these kinds of flexible strategies, banks may then be prospectors, defenders, analyzers or reactors accordingly to Miles and Snow's classification. (Miles and Snow, 1978) and then, they may be using any other strategy such as differentiation, cost-leadership, segmentation or diversification. How and why strategies have been developed through marketing mix is the focal issue to which the paper is going to answer.

2 Theoretical Views on Adaptation Strategy by the Marketing Mix Canals

As stated by Ai Jun Hou (2001) by citing Bradley (1995), adaptation is related completely, when concerning a marketing mix, to a "localized" marketing strategy. This strategy often used when an enterprise decides to go international stands on the how to adjust marketing mix and marketing strategies to fit the characteristics of targeted market.

The adaptation approach of entering a market can be applied not only on marketing, but also on other

domain of business management such as logistics, operations, organizational behavior, accounting, finances, human resources and etc. This will specifically depend on the market structure, the economic landscape, the political influence, the cultural values, the customers' needs, the human capital and abilities, the religious beliefs, factor endowment, laws and regulations.

However, throughout the marketing mix canal, adaptation strategy will be related to the product, the pricing, the distribution channel and the communication depending on the firms both internal and external environment. So, adapting his business is merely referring to the choice of flexibility rather than rigidity in accordance to the environmental forces.

The environmental view remains extremely important because of the risk that firms have to cope with. In this case of the Congolese banking industry, these risks are financial, economic/systematic (Santomero, 1996) and market risk. Conforming to the Congolese reality, the political risks affect more directly than the other risks. Financial risks that Congolese banks avoid are the credit/loan portfolio risk (customers' insolvency), interest rate risk, liquidity risk (related to provision), and transactional/operational risk.

The systematic/economic risks concern at the first level the monetary risks which are related to inflation, depreciation, foreign exchange rate. At the second step, it concerns more the general productive activities. A decline (depression or recession) in the economic activities will directly affect the banking position and may also be linked to profitability risk and liquidity risk. The market risks may be more relative to customers' perception and competitors' behaviors (anticipation/flexibility).

As stated by Santamero, there are risks that can be absorbed totally or partially, as there are other risks which cannot be avoided. Market risks and financial risks may at some level being avoided or partially absorbed, depends on how the banks set their compliance system and specifically use their R&D department. While the economic risks are so external that they impose themselves to the firms and their effects can be diminished but there is no way to avoid them.

These risks (economic, financial, and marketing) can be amortized or avoided through the marketing mix whenever banks decide to be customer-oriented in setting the product, pricing, places and the promotion. Each canal of the 4P's is referring to specific aggregated values that have to be counted in the analysis as standards of evaluation.

3 Methodology

According to the strategic relationship between strategies, marketing mix and the environment the PEST, SWOT and 4P's analysis are required for a good comprehension of the context in which banks developed their businesses. A ground research focused more on direct observation, interview and collection of document. To have a better view on the field reality a benchmarking on twenty-one banks and a statistical treatment of data collected is used to present the strategic landscape.

3.1 Environmental approaches: PEST and SWOT analysis

3.1.1 PEST analysis : understanding the general environment

At the first glance, it is important to note that the Congo is a sub-Saharan African country located in the central African region and neighbored by nine countries. This country bigger as the Western Europe region passed through terrible events that marked negatively the evolution of the economy.

Looking at a political-legal-security environment, it seems that this country went through difficult period. From its independence day to date, the political history of this state has been strewn with several terrible events which moved the country to the queue of the rank of safe African country. Some events such as nationalization of private enterprises in the earlier 1970s, putsches (1965 and 1997), political legitimacy contestations, riots and pillaging in 1991 and 1993, provinces secessions around the year 1960s (Katanga and Kasai secessions), multiple and continuous wars (1998-2004), a permanent rebellion in the eastern of the country and a politicized institutions.

However, it is necessary to remark that in a global vision of the situation, the country is relatively politically stable, even if this stability is threatened by some selfish politicians 'desire of getting in power.

A report released by Alfie Ulloa, Felipe Katz and Nicole Kekeh (2009) noticed by cons that the political instability as a security issue was not the first constrain for the country development.

From the recent decade, considerable efforts to build trust and new values on national institutions are still on process; also a lot of law measures and counter measures have been taken to provide the country with a solid legal framework for a sustainable development.

Even though major consideration may be generally given to the political and legal aspects, the stability of a country cannot be evaluated on this unique criterion. The economic and social aspects must

necessarily be added to the analysis. The debate does not stand indeed on the preponderance of one factor on the others, but on the global understanding of what is showing up as a global evidence of a national reality.

In the economic framework, a lot of decisions have been made to reinforce the stability of the macroeconomic framework by mastering the general price inflation through a permanent control of the price of the national currency, an improvement of the investment code as a stimulus to the private investments, the fiscal policy, a supervision of the financial intermediaries, a control of the government channel of expenditures and the creation of new partnership with international financial institutions and other financial partners such as the People Republic of China for the funding of development's projects.

In general, macroeconomic indicators show from the year 2000 even a bit earlier from year 1998 a positive trend. From 329% in 2001 to 22% in 2010 the inflation, consumer price index has considerably been mastered. The Gross domestic product trend moved from -6.9% in 2000 to 7.2% in 2010. A positive interest of foreign investors may be underlined because of the continuous growth of FDI such as from USD 80 million in 2001 the total foreign direct investment index reaches the level of USD 2,939.3 million in 2010. The export and import sector presents a contrasted situation strewn with fluctuation in such manner that for instance exports of goods and services varied from 60% in 2007 to 38% in 2010 with an average of 27%; while import of goods and services was about 77% in 2007 and 40% in 2010 with a trend averaged out at 29%.

The big deal with the economic environment is in the microeconomic side. This country is still counted as a poor and under developed country in term of GNI per capita which is US\$ 190, poverty head count ratio at the poverty line almost 73%, household consumption growth level remains very low, human development index equals 0.286 (the lowest level), existence of basic facilities and infrastructures and an unemployment rate over 75% (OECD, 2012) which means that 2,981,250 over 3,975,000 active inhabitants are jobless.

The strong dollarization of the economy due to the use of free circulation of foreign currency within this economy has seriously deteriorated the preference for and the value of the national currency, the Congolese Franc (CDF). Bad money drives out good one, say economists. In other words, monetary issues remain important for the development and the stability of this economy.

Another serious problem of is the existence of underground economy due to higher tax rate, relative hard condition of opening a formal enterprise according to the doing business report and a lack of sufficient funding for start-up business. The financial stability since the last decade depends on the policy of the central bank to control the overflow of dollars and to stimulate the banking of the economic system for higher flow of transaction. Another specific argument that goes against an easy implantation of banks is the saddest history of bankruptcy of several banks and the earlier existence of financial scams.

The social and technological environment of this country is at some level directly affected by the political and economic realities. A country with almost 70 million of inhabitants, the Congo presents itself as one of the giant country in Africa. This population, great potential for sustainable development, is most composed by youth in such as proportion: 53% are aged between 15 and 64, while 44% represents young people less than 14 years old and only 2.6% are above 65 years old.

Two other problems may be highlighted from the demographic approach; these are the psychological stress due to economic and political phenomenon, and the lack of added value on the human capital and knowledge on technology. The access to technology is still be improving with the growth of new foreign investment in all sectors.

3.1.2 SWOT analysis of the Congolese banking industry

The Congolese banking industry is an important part of the financial sector which composed with 21 operating banks belonging each of them to international management strategic channel of different financial corporation.

The history of the Congolese banking industry began in 1909 with the authorization of creating indigenous cooperatives and colonial banks with the prior purpose of doing an intermediation of the mining products and rubber's trade. From that period to date, those institutions are from multiple nationalities Belgian, American, Indian, Spanish, Pakistan, Russian, French, German, South African, Nigerian and others. Almost, 86 % of the banks funds origins are foreign direct investments.

Figure 1 Repartition of Band Creation by Period

Table 1 SWOT Analysis Summary

Strengths	Weaknesses
Existing demand relative economic stability Willing of the government to reinforce the system Existence of investment sector with high of return on investment.	Low diversification High costs (Slight legal system Low coverage Concentration of activities Lack of rigorous supervision and coordinated actions with other structure of the financial sector: insurance, installment purchase. Low quality of information Lack of an efficient risk central
Opportunities	Threats
Development of a particular system innovative diversification Segmentation and specialization of institutions	Political instability None clear delimitation of laws about activities of bank and microfinance NGO and informal structure

3.2 The 4P’s analysis method

It is merely about to utilize the 4P’s marketing mix strategic analysis in a scope that it may become a technical approach for studying and understanding behaviors, objectives, motives and decisions that organizations are developing within the market.

4 Banks Adaptation Strategy: Data Analysis and Results

As said above the survey stands on the manner that marketing mix of Congolese banks is settled according to this country’s environment and the feasible risks to minimize. Each canal of the marketing mix will be globally analyzed according to visible attributes which may probably affect the positioning of banks. The use of 4P’s canal is by then more preferable for this study about adaptation (internationalization) than the 7P’s channel that may be certainly affected by standardization for certain canal such as People, Physical evidence and process.

4.1 Product adapted strategy

As identified during the investigation, the Congolese banking industry propose a product mix of 4 product lines (accounts, credit, cards and services), 13 product lines length (4 kinds of accounts, 4 models of credit, 2 types of cards, 3 sorts of services), 18 product depth representing the 18 active banks operating until year 2010. In total almost 104 products have been recorded within the product width. The four accounts product lengths are current account, saving account, time deposit account and special accounts.

Figure 2 Rate of Product Usage

4.1.1 Special accounts

Special accounts are the symbolism of a strong need of adaptation presented by banks. Only 50% of active banks were developing specific account until year 2010. These accounts are considered as specific firstly because of their target market (religious group as Muslim, student, adolescent, traders such as woman performing the sale shoplifting, employees of enterprises contracting a bank) and the brand which is generally in local language. E.g. account elikya from the lingala language which simply means account hope.

4.1.2 Saving accounts

About the saving account, the adaptation dwells in the fact that bankers set these account in both Congolese currency (CDF), Euro and in US dollar for them to avoid the monetary risk of the money inflation.

Banks promote dollar and Euro as a stable currency. They also propose for certain banks the opportunity of withdrawing money from the saving account to permit by then customers to face undesired situation. The proportion for saving account is like 67% of banks develop this product. Competition within the market affected the interest rate on saving account by increasing it from almost 1% per year in average during the year 2002 to an average of 2 or 3 % per year in 2010 for saving in foreign currency. Savings in CDF are averaging an interest rate of 10% per year as demanded by the central bank for the stimulation of saving and the stabilization in the national currency.

4.1.3 Credit line

Concerning the credit product line, this banking industry proposes four types of credit offer that are consumer loans, investment loans and real estate credit. The important part of this sixteen credit product line depth is presented as cash facilities or banks overdrafts strongly guaranteed at a minimum of 100% by customers. Employer guarantee, mortgage or term deposit are the most desired guarantee required by bankers.

Obviously, banks are strictly protecting their engagement to avoid risk portfolio and the risk of liquidity. According to the economic risks credit are evaluated in dollar and project funding are not too much used. Most repayment period are delimited on two years. Credits are short-termed because of the economic uncertainty on the future. Technically, Start-ups, small enterprises and microenterprises are not well positioned to get loans because of the strong prudential regulation established by banks. Furthermore, banks are fixing a high debtor interest rate on credit at least the double of what they propose for a term deposit accounts. They are obviously low risk-takers.

Statistics on bank card offers shows that for both international and local card of almost 38% banks in average propose cards. This is because of the level of the technology interest and the level of the population income. Congolese consumers are adverse to additional charges, but also the culture and infrastructures (condition) for using banks cards are not developed. Furthermore, only 44% of banks offer ATM, even though not all of them are functional because of the weakness of the energy supply.

Figure 3 Product Width

4.2 Place / Distribution channel

The investigation counted out almost 216 banks agencies disseminated through the national territory with a critical concentration in certain towns.

There are cities or regions of the country which are containing the largest number of banks represented in the Congolese banking market. The deployment of agencies is following two very simple logics those are profit and dynamics. In banks vision of profitability, agencies are installed at the hot spot of Congolese economic activity. Focal points which can be summarized in two areas of activity which are the Eastern Zone and Western Zone.

The eastern region is dominated by the productive activity such as mining (copper, gold, cobalt, coltan and etc) while the western region is more depending on the administrative, services and trade

(traders, oil and port).

Despite of this reality, there are not too many banks which are represented everywhere, two of the reason being the cost in terms of implementing agencies and the existence of infrastructures. Such cost may be installation fees, taxes, equipment and so on. Almost, 79% of the banks visibility is concentrated in 3 provinces which are Kinshasa, Katanga, Bs-Congo. Provinces like North and South Kivus, Maniema in spite of their mining endowment have not a lot of branches because of problems related to security and lack of infrastructures.

4.3 Pricing adapted strategy

The prices analysis of product is certainly not exhaustive, but it will certainly present an overview of the banking industry. In pricing, it is taken the minimum deposit, fees required to account, the cost of withdrawal, the closure costs, the repayment rate of credits, the price of cards, the transfer fees and other charges for both individuals than for corporations.

The pricing strategy was really differentiated in function of product in such way that is a quiet difficult to identify one strategy for the entire industry. However, it has been really noticed a weave of cutting price down especially for accounts in term of reducing charges on the deposit of customers. Other products such as cards have almost the same standard in pricing; they are depending on the contract banks signed with international suppliers like MasterCard and Visa. So, two strategies may be highlighted in this case. When they are market-oriented strategy, they often do penetration strategy at the first stage and discrimination pricing at the diversification. But, they do also cost-based for such product as card, transfer and credit.

4.4 Promotion strategy

As communication channel, banks in Congo often use three types of features which are direct marketing, public relationship and advertising. Targeting primarily enterprises, banks focus principally on direct marketing through their sales forces. This practices permit to propose concrete offers, to have firm agreement and by then gaining individual customers.

By doing corporate, they ensure to their business a good retail option with low risk-taking. Public relationship is also used to accompany their customer through their social project; it is certainly a way for them to build a good image and so to minimize the market risk related to the customer perception.

4.5 Model summary

This may be seen as simple model presenting the relationship between environmental problems, the risks implied from them and the strategic adaptation approach organized by those commercial banks through their marketing mix

Thus, by differentiating themselves through their product, cost, price, distribution and communicational channels to achieve the goals of good customer satisfaction, good market penetration and the improvement of their business activities.

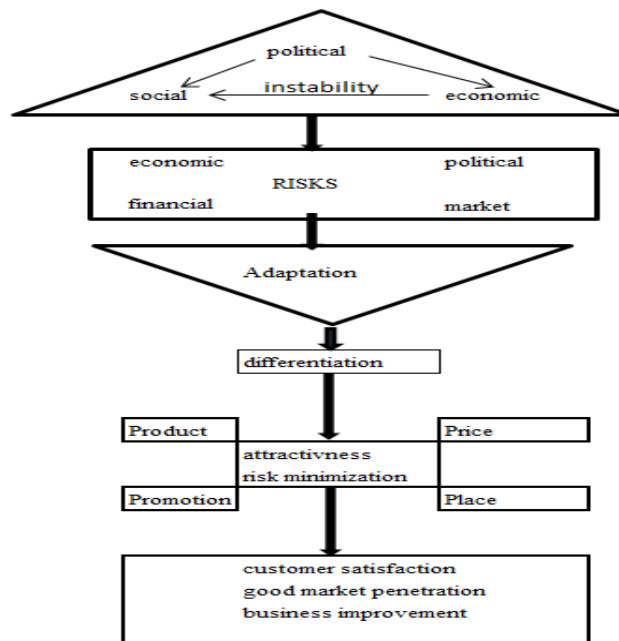

Figure 4 Relationship Environmental Risks-Adaptation-Marketing Mix Strategies**5 Conclusion**

Strategy issues for the development of the banking industry are truthfully essential for the Congo which wants to have a strong financial system. Strengthening the financial system does not only involve the increase in the number of financial institutions which operate within the country; but at a larger scale, the development of products and services that meet the diverse needs of consumers. It is also about servicing this system by strengthening auxiliary structures and building a confident interaction between stakeholders by shaping well the organization of financial intermediaries.

Effectively, the adaptation strategy through the marketing mix has been executed by those international financial firms installed within the Congolese market. The design of their product explains a lot about the nature of the strategic view they developed. In a point of view, about innovating through the 4P's channel, the R&D development became a critical element. It had certainly cost less to banks to minimize the risks by activating efficiently their R&D department.

Daniel Hoewer, Tobias Schmidt and Wolfgang Sofka (2011) stated that the major input in this innovation process is unique knowledge generated by investments in research and development (R&D). They strengthened their argumentation by citing Grant (1996) and Schumpeter (1942) whose summarized ideas are the continuous generation of innovative products, processes and services is widely considered to be the primary key to the competitiveness and growth of firms and of entire economies.

Some innovative ideas such as constructing internal financial market within banks in such a way that banks may just intermediate their customers to enable them to buy stocks or options. In accordance to the need of customers, such credit line based on tangible goods may also be developed to limit amount of cash that banks provide to clients. This will surely increase a B2B or a B2C relationship through banking institutions.

Selection and Evaluation of the Tenant Enterprises for Industrial Base on FAHP

Wang Jing, Zhong Mingxia

School of Management, Wuhan University of Science and Technology, Wuhan, P.R.China, 430081

(E-mail:wangj0311@126.com, 355059176@qq.com)

Abstract: From the enterprise industrial base perspective, this paper analyzes an evaluation index system model of the tenant enterprises, to evaluate and analyze two selected enterprises by using expert scoring method. Considering the complexity for constructing the industrial base, it uses Fuzzy Analytic Hierarchy Process (FAHP) to determine appropriate weights and analyze them according to these various indicators. Finally it picks out the excellent enterprise which is the most suitable to construct the industrial base.

Key words: Industrial base; Tenant enterprises; FAHP; Index model

1 Introduction

At present, the academic world has paid close attention to the study on industrial base. In fact, a number of industrial bases have been established, while some are being built. Industry base is to focus on specific industry, to make enterprises and institutions together according to the industrial chain or product category, in order to form the enterprise cluster zone with relative concentration layout, matched environment, and the important status in the international or domestic. Aiming at enterprise D1 and enterprise D2, this paper is to analyze how to evaluate and choose tenant enterprises of industrial base which based on FAHP.

2 Constructing and Analyzing the Index System of the Tenant Enterprises

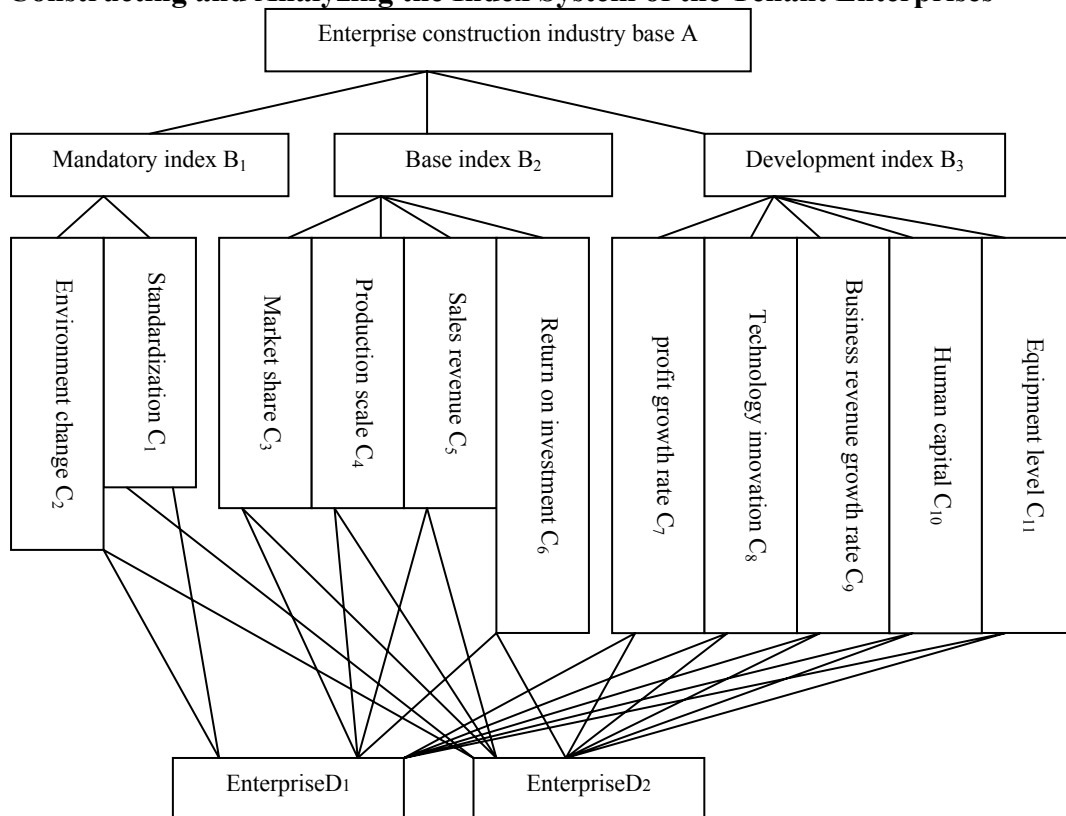

Figure 1 The Tenant Enterprises' Evaluation Index System Model

In order to construct a better industry base, and make full use of the comprehensive benefits of

industry base, it needs qualitative and quantitative research. The conditions of forming industrial base include a long value chain of the industry, the resources and marketing conditions that meet industrial development, technological innovation, and cultural environment and so on. This study is to construct a set of quantitative analysis index system, including mandatory index, basic index, and development index^[1].

The first indicator is the mandatory indicator. As an existing prerequisite, the industrial base construction has a ticket veto position. It mainly meets various environmental indicators and the standardization indicators. Standardized index is mainly based on ISO9000 and ISO14000 certification for evaluation. Environmental indexes like pollutants of exhaust quantity, resource utilization rate and secondary utilization rate, can refer to the industrial standard files.

The second is the basic indicator, such as the marketing share, production scale, sales revenue, returns on investment rate, etc. Basic indicator reflects the enterprise's initial condition. These indicators need to meet the funds of enterprise industrial base construction, and ensure the normally operation of the tenant enterprise at the same time.

The third is the development index. Human capital (engineering and technical personnel proportion, per capita salary, training expenses proportion), technology innovation (research and development funds rate, research personnel rate, new product sales rate, own the patents), equipment level (equipment new degree coefficient), the main business revenue growth rate, net profit growth and so on. These indicators are used to evaluate whether the industry base have a promising future^[2].

According to the above indicators, this study is to build the tenant enterprise' evaluation index system for the industry base, which is shown in Figure 1.

This paper uses FAHP to establish the level of decision-making problem. The related model can generally be divided into three levels, target layer, criterion layer and scheme layer. The first floor is the target layer, enterprise construction industrial base (A), which is objective or ideal result of the decision maker. The second floor is criterion layer, including mandatory index, basic index, development index, which sets out the main evaluation indicator systems of the tenant enterprises. The third floor is sub-criterion layer, including all the indicators involved in the intermediate links to achieve the goal, such as environment change (C₂), standardization (C₁), market share (C₃), sales revenue (C₅), return on investment (C₆), profit growth rate (C₇), technology innovation (C₈), business revenue growth rate (C₉), human capital (C₁₀), equipment level (C₁₁). The fourth floor is scheme layer, including enterprise D₁ and enterprise D₂, all the elements of the layer can contribute to achieve the target selection of various measures, decision or plan. According to the relationship among the target layer, criterion layer and scheme layer, it can get the tenant enterprise' hierarchical system as shown in Figure 1^[3].

3 Using Fuzzy Analytic Hierarchy Process to Evaluate the Tenant Enterprises

Fuzzy analysis method was set up by introducing the idea of fuzzy mathematics to Analytic Hierarchy Process (AHP). On the condition of difficulty to assess a situation, a big system is decomposed into smaller systems, and smaller system is decomposed into the smallest factor, then the minimum factor weight is determined, finally the importance of the whole system is deduced. The study will use FAHP to analyze the tenant enterprises of the industrial base quantificationally. Firstly, it selected 10 experts, used expert scoring with a 10-point scale, and then constructed judgment matrix, calculated the corresponding weights. Finally, it made a reasonable assessment for the two enterprises D^[4].

In order to determine the comprehensive weight of the tenant enterprises' index system, the group will adopt brainstorming method (Delphi) collecting expert opinions, and nominate the relative importance of the tenant enterprises' each index. In order to guarantee real objectivity of evaluation results, experts at home and abroad should thoroughly research the chosen field to deal with various enterprises. Various specific indicators of the tenant enterprises include environment change (C₂), standardization (C₁), market share (C₃), sales revenue (C₅), return on investment (C₆) and so on. The study will respectively determine its weight, and weight the sum to 1. Experts will make the index divide into 10 levels, compared with the each two elements to determine the relative importance and give quantitative values for each grade, then use the 0.1~0.9 to score, each level corresponds to a score. Finally each index weight should multiply with the corresponding level, and then to find out the index score.

The study will make expert members use the 0.1~0.9 scale method to quantify the relative importance of the tenant enterprise' each index, according to the established evaluation index system,

which is shown in Table 1. Then it will use AHP to determine the weight of each index. Finally it will construct the judgment matrix, and use MATLAB software to calculate the judgment matrix^[5].

Table 1 0.1~0.9 Scale

Scale	Definition	Explanation
0.5	Equally important	Compared the two elements, equally important
0.6	Slightly important	Compared the two elements, one element is slightly more important the other one
0.7	Obviously important	Compared the two elements, one element is obviously more important than the other one
0.8	More important	Compared the two elements, one element is much more important than the other one
0.9	Extremely important	Compared the two elements, one element is extremely more important than the other one
0.1,0.2,0.3,0.4	Converse comparison	If two elements compared, get r_{ij} , by compared to get judgment get $r_{ji}=1-r_{ij}$.

$$R = \begin{bmatrix} r_{11} & r_{12} & \dots & r_{1n} \\ r_{21} & r_{22} & \dots & r_{2n} \\ \dots & \dots & \dots & \dots \\ r_{n1} & r_{n2} & \dots & r_{nn} \end{bmatrix}$$

When R meet the properties:

- (1) $r_{ii} = 0.5, i=1,2,3,\dots,n;$
- (2) $r_{ij} = 1-r_{ji}, i, j=1,2,\dots,n;$
- (3) $r_{ij} = r_{ik} - r_{kj}, i, j, k=1,2,3,\dots,n$

Namely, R is fuzzy consistent matrix. Therefore, if the tenant enterprises' indicators meet the conditions of fuzzy consistent matrix, it can use AHP to determine the index weight.

4 Using FAHP to Choose the Tenant Enterprise of the Industrial Base Construction

The tenant enterprises' evaluation and selection is a complex problem of multicriteria decision. According to the relevant data of the enterprise, the study uses the data from expert scoring method to construct the corresponding fuzzy judgment matrix, and then establishes the evaluation index weight, finally selects a suitable enterprise for industrial base construction by using FAHP.

Based on FAHP evaluation theory, at first, the study establishes a fuzzy judgment matrix from the target layer to the criterion layer, then calculate the weight as follows.

$$A = \begin{bmatrix} 1 & 5 & 3 \\ 1/5 & 1 & 1/3 \\ 1/3 & 3 & 1 \end{bmatrix} \quad B_1 = \begin{bmatrix} 1 & 2 \\ 1/2 & 1 \end{bmatrix} \quad B_2 = \begin{bmatrix} 1 & 3 & 2 & 9 \\ 1/3 & 1 & 5 & 4 \\ 1/2 & 1/5 & 1 & 3 \\ 1/9 & 1/4 & 1/3 & 1 \end{bmatrix} \quad B_3 = \begin{bmatrix} 1 & 1/3 & 1/7 & 1/5 & 1/6 \\ 3 & 1 & 1/4 & 1/2 & 1/2 \\ 7 & 4 & 1 & 7 & 5 \\ 5 & 2 & 1/7 & 1 & 1/5 \\ 6 & 2 & 1/5 & 5 & 1 \end{bmatrix}$$

$$W_A = (0.637, 0.105, 0.258); \quad W_{B_1} = (0.667, 0.333); \quad W_{B_2} = (0.505, 0.299, 0.138, 0.058);$$

$$W_{B_3} = (0.037, 0.097, 0.537, 0.105, 0.223)$$

It is to use MATLAB software to weight B-C's weight, such as Table 2.

Table 2 B – C's Combination Weight

	B ₁	B ₂	B ₃	Combination weight
	0.637	0.105	0.258	
C ₁	0.667	0	0	0.425
C ₂	0.333	0	0	0.212
C ₃	0	0.505	0	0.053

C ₄	0	0.299	0	0.031
C ₅	0	0.138	0	0.014
C ₆	0	0.058	0	0.006
C ₇	0	0	0.037	0.010
C ₈	0.097	0	0	0.025
C ₉	0	0	0.537	0.139
C ₁₀	0	0	0.105	0.027
C ₁₁	0	0	0.223	0.058

$$U_j = (0.425, 0.212, 0.053, 0.031, 0.014, 0.006, 0.010, 0.025, 0.139, 0.027, 0.058)$$

Then, to establish fuzzy judgment matrix from criterion layer to layer scheme, and to calculate weight;

$$C_1 = \begin{bmatrix} 1 & 2 \\ 1/2 & 1 \end{bmatrix} \quad C_2 = \begin{bmatrix} 1 & 3 \\ 1/3 & 1 \end{bmatrix} \quad C_3 = \begin{bmatrix} 1 & 5 \\ 1/5 & 1 \end{bmatrix} \quad C_4 = \begin{bmatrix} 1 & 1/7 \\ 7 & 1 \end{bmatrix} \quad C_5 = \begin{bmatrix} 1 & 1/9 \\ 9 & 1 \end{bmatrix}$$

$$C_6 = \begin{bmatrix} 1 & 1/7 \\ 7 & 1 \end{bmatrix} \quad C_7 = \begin{bmatrix} 1 & 1/5 \\ 5 & 1 \end{bmatrix} \quad C_8 = \begin{bmatrix} 1 & 3 \\ 1/3 & 1 \end{bmatrix} \quad C_9 = \begin{bmatrix} 1 & 1/5 \\ 5 & 1 \end{bmatrix} \quad C_{10} = \begin{bmatrix} 1 & 1/4 \\ 4 & 1 \end{bmatrix} \quad C_{11} = \begin{bmatrix} 1 & 7 \\ 1/7 & 1 \end{bmatrix}$$

$$w_{C_1} = (0.667, 0.333); \quad w_{C_2} = (0.75, 0.25); \quad w_{C_3} = (0.833, 0.167); \quad w_{C_4} = (0.125, 0.875);$$

$$w_{C_5} = (0.1, 0.9); \quad w_{C_6} = (0.125, 0.875); \quad w_{C_7} = (0.167, 0.833); \quad w_{C_8} = (0.75, 0.25);$$

$$w_{C_9} = (0.333, 0.667); \quad w_{C_{10}} = (0.2, 0.8); \quad w_{C_{11}} = (0.875, 0.125)$$

It uses the MATLAB software to get decision weighted weight, which is shown in Table 3.

Table 3 Target Decision Weight

	C ₁	C ₂	C ₃	C ₄	C ₅	C ₆	C ₇	C ₈	C ₉	C ₁₀	C ₁₁	Combination weight
	0.425	0.212	0.053	0.031	0.014	0.006	0.010	0.025	0.139	0.03	0.058	
D ₁	0.667	0.75	0.833	0.125	0.1	0.125	0.167	0.75	0.333	0.2	0.875	0.616
D ₂	0.333	0.25	0.167	0.875	0.9	0.875	0.833	0.25	0.667	0.8	0.125	0.384

C-D's combination weight $U_2 = (0.616, 0.384)$

5 Results

From comprehensive evaluation of the target decision, this paper compares the overall weight of enterprise D₁ and enterprise D₂, then the result is $W_{D_1} = 0.616 > W_{D_2} = 0.384$. Meanwhile, according to the mandatory index, basic index, development index of the tenant enterprise, and all the subordinate indicators, including environment change (C₂), standardization(C₁), market share(C₃), sales revenue (C₅), return on investment (C₆), profit growth rate (C₇), technology innovation (C₈), business revenue growth rate(C₉), human capital(C₁₀), equipment level (C₁₁), the results show that enterprise D₁ is more suitable for construction industrial base and it is also good choice .

6 Conclusions

This paper used FAHP to make the corresponding evaluation of the two enterprises by the expert scoring method and finally determined the corresponding comprehensive index weights of the tenant enterprises. Thus it chose the suitable enterprise to build the industrial base. What need to be pointed out is that FAHP still exists a degree of subjective assumption. The evaluation index system constructed in this study is not very comprehensive and remains to be further researched by other experts.

Abstract: It's a practical and feasible method to develop undergraduate's technology innovation awareness that constructing undergraduate technology innovation base, which can help undergraduate overcome disadvantages such low technology innovation maturity or insufficient internal driving force, provide a platform for students exchanging and discussing originality. Combined with the experience of Mechanical and Electronic Innovation Base in Wuhan University of Technology, the paper analyses the characteristics of undergraduate technology innovation and the significance of undergraduate technology innovation base construction, take undergraduate autonomous management as the starting point to explore the new method of undergraduate technology innovation base construction, in order to offer beneficial reference to undergraduate technology innovation system construction.

Key words: Undergraduate; Technology innovation; Innovation base; Construction

1 Introduction

The eighteenth National Congress of the CPC pointed out that technological innovation is the strategic support to improve social productivity and comprehensive national strength, which must be in the core position of national development. Training and bringing up innovative talents, especially innovative engineering talents, is the key of building innovative country, carrying out the strategy of revitalizing the nation through technology and education, and the strategy of strengthening the Country through Talents. At the same time, it puts forward new and higher request for university building undergraduate technology innovation system (Cheng Guangxu, 2011). Construction of university technology innovation base, providing a innovation communication and exercise platform for undergraduate, is one of the most important steps in constructing undergraduate technology innovation system.

Combined with the experience of Mechanical and Electronic Innovation Base (MEIB) in Wuhan University of Technology (WHUT), the paper analyses the characteristics of undergraduate technology innovation and the significance of undergraduate technology innovation base construction, take undergraduate autonomous management as the starting point to explore the new method of undergraduate technology innovation base construction, in order to offer beneficial reference to undergraduate technology innovation system construction.

2 The Characteristics of Undergraduate Technology Innovation

Because undergraduate have scanty experience of life, professional knowledge and personal mental has not yet mature, undergraduate technology innovation has significant characteristics relative to the social technology professionals.

2.1 Coming from the actual life

Undergraduate technology innovation often focus on university grade two and grade three, when they have learned the basic knowledge of the subject system, had considerable understanding about technology innovation, but for the forefront grasp ability is poor, the breadth and depth of social practice await to accumulate, so undergraduate usually use their professional knowledge for technology innovation from the reality of life. The theme of the 6th National Undergraduate Mechanical Innovation Design Competition is “phantom· dream classroom”, which require the content of innovation is “design and manufacture of classroom using equipment and materials”, in order to lead undergraduate carrying out technology innovation activities from the reality of life.

2.2 Active thinking

Undergraduate have mastered extensive basis knowledge and systematic professional knowledge through the systematic professional learning at the university, which is the basis of the open thinking and broad mind (Zheng Yongting, Gao Guoxi, etc, 2010). Compared with adults, undergraduate,

because of age small, wet behind the ears, show curiosity and novelty to surrounding things, and thinking is more active, technology innovation topic tend to design novel, the logic is clever.

2.3 Low Maturity

Undergraduate have active thinking in technology innovation, at the same time means that undergraduate technology innovation is often ridiculous thoughts, couldn't consider the reality of technical conditions. Undergraduate's professional level is at the fledgling stage, and technology innovation belongs to the extracurricular activities, so even if a good idea, many key techniques are difficult to overcome in a short period of time. Then the cycle of innovation projects generally within a year or so, therefore, a lot of technology innovation projects tend to ignore many objective conditions for finishing the project, far less than the level of utility, having low maturity. Taking undergraduate highest technology innovation competition "Challenge Cup" for example, the proportion of the projects which can reach the level of maturity and signed a contract with the enterprises is less than 10% in total number (Ding Sanqing, Wang Xipeng, 2009). If considering the area out of project, "challenge cup" competition project technical conversion rate is far lower than 1%, even less than 1 %.

2.4 Insufficient internal driving force

The rapid development of undergraduate technology innovation benefit from all kinds of technology innovation competition, and technology innovation competition provides project support funds and works display platform for undergraduate technology innovation. However, there will be others points, part of a high standard competition even become the symbol of the strength and the level of university education. Many colleges and universities reward the award-winning students "excused from examination to higher school" or bonuses to encourage students to get good grades in technology innovation competition. Therefore, technology innovation competition has more and more serious utilitarian color. More and more undergraduate involved in the scientific and technological innovation, and tend to incentives as the ultimate goal, but ignore the meaning of scientific and technological innovation itself, leading to the enthusiasm of innovation is just in order to the extrinsic incentives, the internal driving force is insufficient.

3 The Function and Meaning of Undergraduate Technology Innovation Base

Undergraduate technology innovation base is a communicating and developing platform for undergraduate technology innovation, as well as a platform of undergraduate' self management and exercise. With MEIB as an example, the undergraduate technology innovation base is generally responsible for the following work: undergraduate technology innovation promotion and training; organization and declaration of technology innovation competition; cultivation of undergraduate technology innovation talents and management cadres.

3.1 Construction of undergraduate technology innovation base is in favor of strengthening undergraduate's innovation consciousness

The basic starting point of undergraduate technology innovation activity is to enhance students' innovative consciousness, so that the students can grasp problem analysis and solving ability. The priority of undergraduate technology innovation base construction is to promote undergraduate extracurricular innovation, enhance their innovation consciousness. Undergraduate technology innovation base can provide students creative exchange and discussion platform, to guide students in learning life always have good ideas and put into practice. The process of creative communication and discussion means the more prone to gather effect and produce more creative and more scientific ideas, so as to promote undergraduate extracurricular innovation atmosphere, overcoming creative low maturity and insufficient internal driving force.

3.2 Construction of undergraduate technology innovation base is in favor of improving the students' comprehensive quality

Undergraduate technology innovation activities can not only strengthen them the consciousness of innovation, but also access to scientific research methods, exercise manipulative ability, enhance the unity cooperation spirit, and improve personal comprehensive quality. Universities' all work are around "education", students in the classroom is the easiest way to improve intelligence and knowledge, in the technology innovation activities is personal comprehensive quality and ability of knowledge, and these two is students into the society must have the ability in the future. Construction of undergraduate technology innovation base will also be able to provide display personal ability platform for the students with technology management ability, they can continue to exercise and improve themselves and enhance individual core competencies through organizing technology innovation activities and participating in

technological innovation projects.

3.3 Construction of undergraduate technology innovation base is in favor of construction of study style

Undergraduate technology innovation activity in the final analysis is a process that the students convert their mastery of the knowledge to practical problem solving skills or tools based on real life observation. Students who want to a breakthrough in technology innovation activities, should study hard in the classroom, master more knowledge, and improve their learning ability and breadth of knowledge. When more and more students devote their energy to technology innovation, under the interweavement, the time they spend on the Internet, shopping and leisure will be reduced. Gradually, major learning and technology innovation will form a virtuous cycle, and then school style of study will be constructed well.

4 The Method of Technology Innovation Base Construction

MEIB in WHUT founded in 2011, is responsible for various innovation competition preparation, declaration and the instruction work, which is the innovation platform of students' self management and improvement. Since MEIB inception, it constantly explores new ways and method to construct innovation base, accumulates a wealth of experience.

4.1 Perfecting base management team

Perfecting the management team in undergraduate technology innovation base, is to abandon the past management pattern of teacher guidance, students follow, form the management methods that students autonomous management, teacher providing guarantees. The managers in undergraduate technology innovation base are also innovation talents. They belong to different innovation teams, and are divided into affair group, propaganda group and technology group according to the ability, these groups work around the function of MEIB.

Affair group is mainly responsible for base daily transaction processing, such as activity site management, funds management, project management, members of the base management, and other matters; Propaganda group is mainly responsible for base activities publicity and display, such as activity early announcement and publicity, prometaphase of announcement and publicity, game late results publicity and display, base website construction and maintenance management, etc.; Technology group is mainly responsible for the team project technical problems, focusing on studying and learning new knowledge, difficult disambiguation, keep communication with teachers in time, promote good projects.

4.2 Building technology innovation team

Technology innovation activities in general are divided into project driving type, member driving type and team driving type. Project driving type as the name suggests is project dominated, almighty on sucker, which can improve students' competitive consciousness and enthusiasm. But, the type requires much to undergraduate psychological quality so as to be quite unfavorable to the cultivation of for all students. And when after the completion of the project, the staff is dissolved, which is not conducive to innovation. Member driving type is a small team formed by main innovation members, but because students strong liquidity and low technical level, the type is difficult to effective application in undergraduate technology innovation activities.

Team driving type is an undergraduate self-management innovation team which makes major competitions or projects as the carrier, improving learning practice ability as the core. Technology innovation team consists of one or more professional guidance teacher, including a dozen or dozens of students of different grades. Knowledge, information, technology can be shared in technology innovation team, and the member can flow between different teams. The type can overcome the shortage of the above two types, and can ensure the team dynamic and the enthusiasm of students.

4.3 Promoting technology innovation activities

In order to popularize technology innovation knowledge in undergraduates and enhance their innovation consciousness, undergraduate technology innovation base could not confined technology innovation activities to inside, on the contrary, the base should organize a series of technology innovation activities: to attract more students to join the technology innovation team, MEIB carries out the innovation team recruitment at regular intervals, which are innovation team self management. To increase the members' professional technical ability and innovation consciousness, MEIB carries out innovation lectures to members and school students at regular intervals. The lectures invite the teachers with rich experience, the students performed very well in the national competition, technical talents in

social to carry out different themes. In order to improve the innovation level of the project, check the progress of innovation projects, MEIB regularly invited experienced renowned teachers and graduate students as juries to carry out simulation reply, and the reply open to all students, encouraging students view the scene.

5 MEIB Construction Results

So far, MEIB has invited the well-known professor as the core teachers to set up four innovation team; has carried out 11 innovation team recruitments, 7 innovation lectures, and more than 20 innovation simulation replies, attracted more than 2000 students to attend. Taking innovation as a unit, MEIB has collected 194 university independent innovation fund declarations, 19 school innovation cup declarations, 43 national college students' innovative entrepreneurial training program declarations, 108 national college students' mechanical products digital competition declarations, 108 energy conservation and emission reduction competition declarations, and 42 mechanical innovation design contest declarations. MEIB has got 54 university projects and 8 national projects, won 8 provincial awards and 6 national awards, and 602 students attended in total. MEIB has become an influential students' technology society in WHUT, accumulated rich experience in undergraduate technology innovation base, enhanced undergraduates' innovation consciousness within the scope of the whole university, and promoted undergraduate technology innovation atmosphere of the university.

6 Conclusions

Innovation is the soul of a nation, is the driving force for the prosperity of a country. Colleges and universities bear the task of training innovative talents for the great rejuvenation of the Chinese, need to establish and improve undergraduate technology innovation system. Construction of undergraduate technology innovation base is the practical and feasible method to train undergraduate technology innovation awareness, which can provide a creative platform for exchange and discussion. Taking undergraduates autonomous management as the starting point, constructing and managing undergraduate technology innovation base, is favor of improving the comprehensive quality of students and producing more innovation talents for the country, and provide a steady stream of the great cause of rejuvenation of the Chinese nation.

Mental Health Service System Innovation in University: Application of Case Management

Li Qian

Mental Health Education Center, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: liqian@whut.edu.cn)

Abstract: The article mainly made research on mental health service system innovation in university in China. It claimed that improving university mental health education service overall efficacy in China was urgent. An innovation was needed in order to bring better care to the clients, and to improve cost-effectiveness as well. The article suggested applying case management to renew the standard procedures, to make a clear classification to practitioner, and to provide characteristic support to the university students in China. The conclusion of this article was the application of case management in university mental health service system in China would be a worthy and good try.

Key words: Case management; Mental health; Service system; university

1 Introduction

Mental health service in university in China started in the 1980s, developing in the last 3 decades, which met the demands of the fast developing society. Researchers in China made a lot of researches from different aspects, including service content, organizing structure, practitioner, running model, etc. XU Dazhen & XU Guangxin (2007)¹ claimed that university mental health service system must be multiple subjects fundamental, using all possible resources. System context, practitioner cultivation, organization management, curriculum developing, organization reform and staff training were the most important columns. The innovation to the system was aimed to adapt to Chinese local condition on multiple levels. SHI Wenshan & CHEN Jialin (2004)² made research from modern management point of view. They believed university mental health service system should be made up with 3 levels, which were university, grade and class. LIU Keshan (2006)³ observed many universities, and he suggested that the service organization should be established on each 3 levels. ZHANG Dajun (2004)⁴ claimed the purpose of mental health service in university should be cultivate students. It should abide by two principles, which were positively adaptation and actively development. He asserted using simple education approaches to help students, such as invisible influencing, selected training and counseling, meanwhile fully using the power from individual, university, family and community. ZHANG Dajun (2008)⁵ also suggested to establish observation network and responsive system in 3 levels.

The mental health service system was founded earlier in the USA than in China. The system combined resources and power from university, family and the whole society, in which, facilities established by university and community were the core part, and professional service and association were good assistants. Haight, Black, & Sheridan (2010)⁶ illustrated the aim of university service was to meet the help-seeking intention of college students. The service was made of 2 parts, which were psychological counseling and mental health service. The main function of psychological counseling included counseling, coordinating, consulting, appraising and referral. And the functions of mental health service were assessment, consultation, intervention and prevention. Its main clients were students. Sometimes if needed, parents and teachers were involved too.

2 Current Problems in Mental Health Service

2.1 Mental Problems & Mental Illnesses

According to a survey made by Beijing health bureau in 16 universities in Beijing, the ratio of suspended and termination due to mental problems were 37.9% and 64.4%. Mental illnesses had become a main reason for leaving school⁷. A great number of students returned to university from mental hospital needed a long recovery period. They would meet more difficulties and pressure than normal students on environment adaption and interpersonal relationship. Nowadays, in many universities, counseling, crisis prevention and intervention were used to reduce self-injury and suicide. Students in recovery phase seldom received help and support from community. Reports also showed some suicide cases in university occurred during the recovery period, which suggested it might be a weak point in the whole service system.

2.2 Participator's Identification

Counseling was one of the main functions of mental health service, which required professional study and training for a long time. During the session, counselor must abide by ethical requirement, maintaining confidentiality and avoiding dual positioning. In the USA, it usually had 2 teams in mental health service facilities, which were professional team and support team⁸. The professional team was in charge of counseling, made up with people who passed the qualification examination, or had doctoral degree in counseling psychology, clinical psychology or psychiatry. The support team was in charge of reception and background service, made up with people who had been trained on psychological counseling basics. The 2 teams guaranteed service outcome, and made sure that ethical principles could be implemented.

In china, the professional level of the practitioner were raising up. New blood continuously took part in this meaningful career. They usually worked in mental health education center in universities, not only provided psychological counseling, but also gave lessons to students and helped to organized activities, intervened crisis, and dealt with administrative work and etc. The blurry identification often trapped them into dual positioning, made them hard to keep privacy, and finally took damage to the effect of counseling.

2.3 Unsystematically Intervention

University students were still growing physically and mentally. Their mental problems and illnesses were often triggered by various factors. When dealt with them, both individual strength and social environment should be highly considered. Counselors should assess the individual problem in university and social networking atmosphere. Some of the participators in China only evaluated problems individually, which might weak the counseling effect when students faced the actual difficulties.

2.4 Inaccurate Positioning

The basic obligations of mental health service in China were education and administration, with a strong color of compulsory, which was far away from the mental health service's motto of equal and love. Meanwhile, students' self-awareness grew stronger and stronger day by day, moralistic preach and administrative supervision could no longer meet the requirement of college students. The efficacy and constancy of the old service mode was not satisfied neither.

3 Applicability of Case Management in Mental Health Service

3.1 What is case management?

The case management method was a technique and social work approach, which was first introduced in social welfare aiding. It met the multiply welfare needs of the public, and help to promote the service cost-effectiveness, which had been used wildly in hospital, recovery center, and community in abroad.

According to the definition made by American Case Management Association, case management was a collaborative program, which including assessment, planning, implement, collaborating, administration and evaluation to the selected treatment and service. By organizing and using all related resources, the treatment and service aimed in meeting the requirement of individual health needs, improving service quality and creating a cost-effecting healthy caring outcome⁹.

Case management emphasized community caring. It encouraged long-term nursing based on community, asked for a systematically solution with multiple approaches and continuously service. The purpose of case management was to reorganized social resource, to ensure providing professional, continuously and individualized caring to high risk clients, promoting their self-independence and controlling cost¹⁰.

All case management activities were carried out by case managers. They provided long-term and direct help to the clients. Generally speaking, there were 3 patterns of case management, which were comprehensive mode, agent mode and mixed mode. The comprehensive mode meant to provide clients all clinical and support service. The agent mode meant to help clients to seek the service they needed, but with less direct help. And, the mixed mode meant to provide both direct and indirect help to the clients. Patterns selection mainly depended on the level of illness and the size of service facility¹¹.

3.2 Applicability of case management in university mental health service

Broadly speaking, a university could be regarded as a community. Students suffering from mental illnesses or mental problems finished their treatment in hospital and would finally come back to the community. Applying case management to students suffered from severe mental illnesses could be a better way of caring, which asked for a nursing during the whole phases from treatment to recovery. It putted all medical and educational resources in and out the campus, to help students to finish their study

and help to restore their social ability. It might also avoid suicide and self-injurious behavior, and reduce suspended ratio due to mental illness.

There were 2 benefits of applying case management. First, it could clearly identify the counselor's role in university. The counselors were only a team member but not the leader. They just needed to focus on counseling and left administrative work behind to the case managers. This might also avoid dual positioning, and help to build mutual trust between the counselor and client more quickly and easier. Secondly, case management was a systematic solution. It was not only used to gather resource, meet students' requirement, but also helped the students fully developed in the future.

4 Application of Case Management in Mental Health Service

4.1 Service object

The main purpose of applying case management in university was to promote the quality of psychological counseling and therapy, maintain healthy mental status of the students. Fully applying is suggested, but, considering the actual condition in China, the major recipients should be the students with severe mental illness or complex mental problem. With the experience growing and fund increasing, the service objects could be larger in the future.

4.2 Positioning of case manager

In the process of case management, the case manager was in charge of analyzing client's physical and psychological status, assessing client's problems and needs, recognizing and coordinating resources, and deciding the service program and nursing level. The positioning of case manager asked for he/she should have a wide range of knowledge and skill. A good case manager should be acquainted with evaluating problems, running sequence of the related facilities in the community, mastering communication skills with people, to serve the clients well. The best choice of case manager in mental health service organization in university in China should be the full-time staff in mental health education center or the students' tutor who had received basic training on psychology.

4.3 Working pattern

According to the situation in China, the agent mode is recommended to put in use in mental health service facility in university. Case managers were in charge of coordinating resources, helping the students to seek for professional support, observing and evaluating the whole process.

4.4 Working process

The case management of mental health service in university included 7 stages: 1) cases classification and selection; 2) case manager-client relationship establishment; 3) preliminary assessment; 4) service plan-making; 5) resources coordinating & program implementation; 6) process observation & quality evaluation; 7) case closed¹². The whole working process was shown in Figure 1.

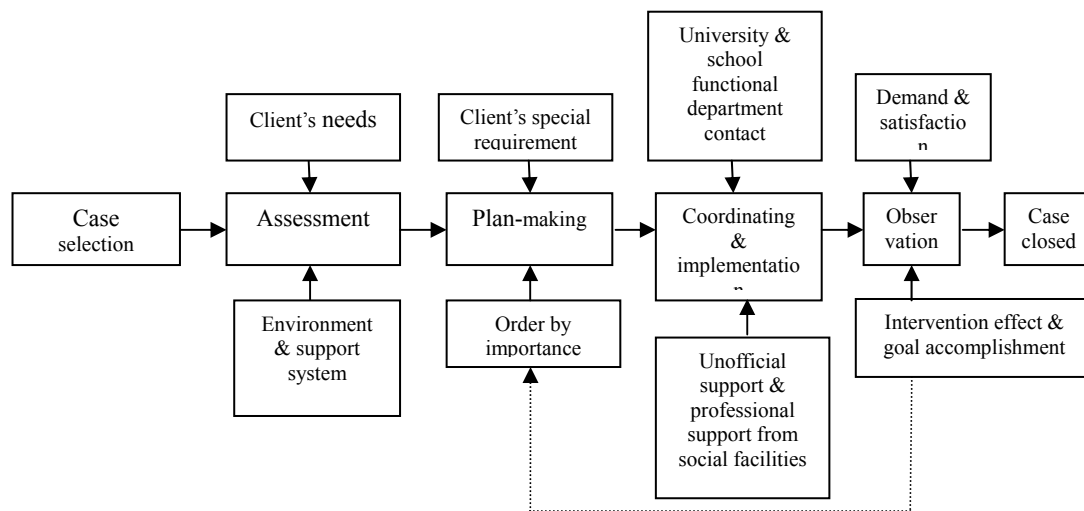

Figure 1 Working Process

4.5 Issues & recommendations

In each process of case management, the issues hereafter should be noticed.

- 1) The cases classification and selection phase. Case manager should filtrate out server cases and

deal with them first. All students suffered from mental illness should apply case management immediately. Some students with complex problems or needed to help with multiply service should apply case management if possible.

2) The relationship establishment phase. The case manager should fully understand the student first. Sometimes, the client's classmates, roommates, tutors, teachers, and family should be involved too. This phase was a key process that establishing a strong connection and deep trust between the case manager and the client. Case manager should understand the importance sufficiently.

3) The preliminary assessment phase. There were 3 questions to be confirmed:

a. What's the problem?

b. What do they need to self-help in their own opinion?

c. What's the obstacle to getting help?

Case manager should confirm the questions before making plan. The possibility of self-help, the resource already had and still needed should be considered. The assessment should be all-around and individually, from inner strength to exterior support.

4) Service plan-making phase. A good case management service plan should include treatment plan, recovery plan and long-term caring plan. A student's participated plan-making was highly recommended, which would help to amplify the power of self-determination, self-selection, self-help and self-actualization.

5) Program implementation phase. This was not only the process of carrying out but also the process of coordinating, intervening and preventing. Case manager played multiply roles, such as coordinator, organizer, promoter, and provide service and resource from in and out the campus.

6) Observation & evaluation phase. Case manager should make sure that the student, the case management team, the help and support provider communicated with each other well. Case managers also had the responsibility to track on program running. Evaluation was a real-time work, which included the set out goal evaluating and the system function monitoring. In university, the result and effectiveness evaluation was the most important part. Generally, it would include student's requirement, satisfaction, goal achievement, service quality, and cost-effectiveness.

7) Case closed phase. When the result of evaluation showed all set out goal had achieved, case manager could discuss with the students whether to close the case or not. After a case closed, case manager should still track on the case for a period time for assurance. Some of the students suffered from server mental disease should never stop tracking on, until left the university.

5 Conclusion

In the late 20th century and the early 21st century, service mode reform spirit raised up in the USA, which asked for changing mental health education into a wild and integrated case management service, by using all social resource to serve the suffering students¹³. Nowadays, university in China asked for a method to guarantee that the most ill students could finish their study, while saving work spend on mental health service as well. In the actual situation, short on man and work fund were quite common in many mental health education center. To apply case management in mental health service in university would be a nice try and solution. It could enlarge the practitioner from only the counselor to all related stuff, and also provide long-term nursing to the service receivers and emergency clients. It would benefit both the university and the students, worthy to be applied and amplified.

Institutional Innovation: Path Selection for Increasing Soft Power of Culture of Clean Governance*

Li Xiaoqin

Chongqing Technology and Business University, chongqing, P.R.China, 400067

(E-mail:xiaoqingli@ctbu.edu.cn)

Abstract: Today in China, culture of clean governance and the health of Chinese political system are closely linked to each other. As culture of clean governance and political system complement each other, the innovation of the political system can be the key to develop the soft power of culture of clean governance. This paper begins with the obstacles in developing culture of clean governance, followed by discussion of the lack of culture of clean governance in the period of China's social transformation. Then, four paths to strengthen soft power of culture of clean governance are introduced: 1) Innovation in the field of ideology can lead the improvement of culture of clean governance. 2) Eliminate the influence of past institutional change, get rid of path dependence. 3) Establish effective system incentives to positively encourage culture of clean governance. 4) Citizens' participate in institutional innovation is the foundation for improving soft power of culture of clean governance.

Key Words: Culture of clean governance; Soft power; Innovation of political system

1 Introduction

Culture of clean governance consists of culture tradition and culture patterns. In other words, culture of clean governance relies on political impartiality and integrity which is encouraged in Chinese culture and enforced by the legal system. Corruption is a global problem and all countries are facing anti-corruption issues. Promote culture of clean governance is the basis of anti-corruption campaign. In 2010, the Commission for Discipline Inspection of the Central Committee of the CPC along with other six ministries and commissions released Views of Strengthen Promotion of Culture of Clean Governance. It pointed out that promote culture of clean governance is a fundamental and strategic step and of the anti-corruption campaign. The document states that "Promotion of culture of clean governance is a very important part of our advanced socialist culture. It takes advocate honesty and disdain corruption as values and integrates our vision, action and social trends. It reflects people's awareness of clean politics and clean society, basic concepts and spiritual pursuit."

The concept of soft power was developed by Joseph Nye of Harvard University a 1990 book, *Bound to Lead: The Changing Nature of American Power*. He defined soft power as the ability to attract and co-opt rather than coerce, use force or give money as a means of persuasion^[1]. This theory has been widespread since its birth, and attracted attention and great interest from various governments and academia. In recent years, as an important part of soft power, the cultural soft power has gradually been accepted by Chinese academia and government, and influenced national decision-making. Culture of clean governance is an important part of cultural soft power, "If we cannot give life to the culture of clean governance value system, we will get nothing."^[2] Therefore, culture of clean governance and the health of Chinese political system are closely linked to each other; the innovation of the political system can be the key to develop the soft power of culture of clean governance.

2 Obstacles in Improving Soft Power of Culture of Clean Governance

2.1 Old political culture has strong impact on improving soft power of culture of clean governance

Culture of clean governance is part of political culture, feudal political culture still exists in today's Chinese society. For example, rule by man not law, privilege, official-oriented, hierarchy, nepotism and so on. Such feudal political culture still has a big influence on some officials. The outworn feudal soil for corruption, to improve soft power of culture of clean governance the feudal concepts must be eradicated.

Clan is the basic social structure of Chinese feudal society. The so-called patriarchal system takes hereditary as a legal way of power succession, thus the ruling of the country becomes similar to a clan chief rules his clan. Deng Xiaoping indicates in his *Selected works of Deng Xiaoping (Volume II)*, "Even

* Fund Project: Empirical Study on Enhancing Soft Power of Clean governance Culture in Chongqing, Sponsored by Chongqing Social Science Fund(Project No.2009ZD05)

now, the abominable practice of appointing people through favoritism and factionalism continues unchecked in some regions, departments and units.” This shows some cadres have deep-rooted concept of rule of man.

Lasts for thousands years, the Chinese political culture, “subject personality” has deeply influenced people in their characters. This requires people to fulfill their obligations but not encourage them to claim rights, rights and obligations are very unequal. If people claim their right, such action can be considered as “rebel” and is very immoral in Chinese culture. This distorted sense of entitlement hinders the progress of democracy in China, thus makes it hard to foster culture of clean governance in Chinese feudal society. Long-time feudal rule almost makes people lose their sense of entitlement. In such profound feudal culture, it is almost impossible to find value and theoretical support for culture of clean governance. To improve soft power of clean governance, we must eradicate feudalism culture and cannot allow unrestricted power exceed democratic political system. Power should be put into the cage of democratic political system.

2.2 The Openness and Operability of current system need to be further improved

Establish and improve the culture of clean governance system can accelerate culture of clean government promotion. For example, develop implementation plans, performance evaluation system and long-term planning can lay the foundation for a routinized and long term culture of clean governance campaign. However, the overall condition of current system is very imperfect. First, the main reason is the lack of a national level strategy. Although local institutions can develop targeted culture of clean governance promotion plan according to local conditions, from the perspective of guiding ideology and unified objective we need a national level strategy. Second, since there is lag in the result of culture of clean government campaign, it is hard to evaluate in a short time. We should not judge whether culture of clean government campaign is effective just from the superficialities, but should continuously test it in long-term practice. Thus it is very necessary to formulate a scientific and objective evaluation mechanism for culture of clean governance^[3]. Additionally, culture of clean governance campaign needs innovation and improvement during the implementation. This will require development of appropriate incentives for innovation and optimization mechanisms thus to ensure good result for improving soft power of culture of clean governance.

2.3 Other Non-institutional Factors

First factor which affects culture of clean governance is the lack of innovation concept and understanding of soft power. These factors are the cause of formalism in culture of clean governance campaign. Some people do not believe and do not support the campaign, take negative attitude and acquiesce corruption, some even involved in corruption. “Money first”, “Personal interest first”, it seems such kind of values have become the beliefs of some people. Corruption is not condemned but be treated as a sign of “capable”. Some people envy the outcome of corruption and follow this unhealthy tendency. In contrast, people abide by the principles and honest are often seen as “non-mainstream” who is against the trend. This creates public opinion which is not good for fighting corruption. It can be said that the society and public are not all firmly against corruption.

Second, culture and value recognition need to be improved. Because China is a multi-ethnic country, every ethnic group has strong and unique culture tradition. Also different ethnic group has different lifestyle, ideology and cultural traditions, which make their interests, needs and capability different, thus inevitably create different values among different ethnic groups. It is normal that every ethnic group may have different views on culture of clean governance. To promote culture of clean governance, we must consider the influence of culture diversity. Despite there are different voices, some common values like honesty and integrity can play important roles in improving soft power of culture of clean governance. Additionally, in this information age, the promotion of culture of clean governance hasn't found a way to fully take advantage of information technologies. The fast-developing internet provides a new platform to improve the soft power of culture of clean governance, especially the emerging social network which can greatly expand the space of promotion. Currently, the online culture of clean governance campaign is not professional enough; there is still much space for development.

3 The Institutional Innovation Paths for Improving Soft Power of Culture of Clean Governance

3.1 Foster innovative ideas, lead the institutional innovation for improving soft power of culture of clean governance

Innovation in the field of ideology can lead the improvement of culture of clean governance.

First of all, socialist core value system should be used to guide culture of clean governance value recognition and the modern transformation of culture of clean governance transformation. Value recognition is the core value of soft power and the most direct manifestation of culture of clean governance. It influences national public management, mode of production, system establishment, the public's value judgments and behavior.

Under the condition of market economy, the traditional values, spiritual concepts of the public receives selection of the modern society and should be keeping pace with the times. Socialist core value system is not only public's spiritual sustenance and relegation of culture of clean governance, but also the backbone in the process of China's social modernization. From the "National Integrity System" developed by Transparency International, we can clearly see that social value and public awareness are the foundation of National Integrity System. If a country has a strong awareness of integrity, it can strongly support the country's development, that's how soft power of culture of clean governance works; if a country has a complete system of national integrity system, the system can conversely promote the development of culture of clean governance. China's Sixth Plenary Session of the 17th CPC Congress report indicates: "Adhere to the socialist advanced culture, vigorously promote the culture of clean government, take efforts to cultivate integrity values, actively build a positive social environment."

3.2 Eliminate the influence of past institutional change, get rid of path dependence

American economist Douglass Cecil North developed a very important concept from economic perspective: path dependence. He stressed that a country's process of institutional change is susceptible to traditional culture and historical factors.^[4] Although he analyzed a country's attitude towards traditional culture, but also pointed out historical factors' constraint and impact on modern system reform. Path dependence theory explains once the system develops along a certain path and inertia is formed, it will be difficult to replace it with other system or even more preferable system, even get into a vicious circle. Old regime and historical factor have relatively great impact on China's culture of clean governance. Since the Reform and Opening up, economic development is always the first priority of China, the lag in cultural development is restricting the development of economy. The fact of non-balanced development has illustrated that compulsory institutional change have led to the "lock-in" (Douglass North) of culture of clean governance campaign, and this status cannot be neglected.

The promotion of culture of clean governance has been restricted by historical conditions for a long time. In the condition that there is not much institutional demand, the system has long been locked, thus formed dependency and inertia on institutional change. This status, reflected to culture of clean governance, is also very clear. To improve the soft power of culture of clean governance, we cannot only rely on policy guidance and institutional changes to unlock "lock-in" system. We need to introduce external variables, for example new systems new technologies, new models to eliminate the inertia in institutional change and carry forward internal force to develop culture of clean governance. There have been examples of culture of clean governance squares, culture of clean governance comics, culture of clean governance advertisements, culture of clean governance calendars, culture of clean governance mobile news, etc. In 2010, Supervision of the Central Commission for Discipline Inspection named 50 national anti-corruption education bases which expanded the space for culture of clean governance campaign. These various culture of clean governance carriers played importance roles in spreading culture of clean governance value and improving soft power of culture of clean governance, and there is more potential to be discovered.

3.3 Establish effective system incentives to positively encourage culture of clean governance

Any action of human beings must have a motivation, and then the motivation decides action. Incentives is a complete set of rules and regulations, it uses basic ways such like promote, encourage, inhibit, oppose, reward and punishment to realize organizational goals. North believes whether formal and informal institutions can play roles depends on the establishment of effective institutional mechanisms for implementation. And whether effective institutional mechanisms for implementation can realize the organizational goals depends on the satisfaction of people's interests. Establishment of effective institutional mechanisms is the power source of improving soft power of culture of clean governance. Incentive theory indicates that incentives should have dual function of constraints and incentives. On one hand, there should be reverse incentive like limitations, restrictions, oppose and penalties, eliminate hindering factors in improving soft power of culture of clean governance, establish a mandatory or normative incentives. This is an important task to enhance institutional innovation of culture of clean governance; it can transform the passive demand of culture of clean governance development into active demand. For instance, there should be effective reverse incentive to hold back patriarchal ideology like old customs, personal dictatorship, official-oriented thought, subject personality,

appointing people through favoritism and factionalism and so on. On the other hand, we should satisfy people's interests to add positive energy to enhance soft power of culture of clean governance. Power restriction, better social and moral status, harmonious and healthy relationships, cultural and environmental improvement are all examples of positive energy, all of these can encourage the society to sustainably take initiative in improvement of soft power of culture of clean governance. For example, Jiangxi Province uses its rich "Red Resource" to launch culture of clean governance education project. Lots of cultures of clean governance campaigns are organized, public service ads are widely displayed and public opinion guidance mechanism is completed. More than a thousand printed ads, television ads and comic ads for culture of clean governance are created; outstanding works are selected to broadcast in main news media in the province. Among them, *Jinggang Bamboo* and *Taomu Tuiyu* are acclaimed; meanwhile contribute to the "Red Tourism" and local economy. Therefore, to realize the dual function of incentives, we need the combined effect of law, policy, rules and regulations and code of conduct.

3.4 Citizens' participate in institutional innovation is the foundation for improving soft power of culture of clean governance

This is to use legal means to protect the rights of citizen participation, clearly define citizen participation in the content, manner in fostering culture of clean governance, so that the process of citizen participation can have procedures, and fix legal form of the procedures, make the citizen participation legal basis routinized and institutionalized. Deng Xiaoping always attached importance to the system of citizen participation construction, he pointed out: "System is the deciding factor." "Good system cannot make bad people run amok, but bad system can make good people unable to do good, or even go to the opposite."^[5] Therefore, a sound system is an important guarantee of citizen participation. Also, we should broaden the channels for citizen participation to achieve diversity in both participants and participation ways. Further fulfill the role of non-governmental organizations, non-profit organizations, the third sector, community in fostering culture of clean governance. These groups and civic organizations are closely related to citizens, they should play the role of coordinating, integrating citizen interests and demands in the expression processes of public policies. NGOs can effectively prevent political corruption. First, it enables citizens' individual survival and development less dependent on government, thereby reducing opportunity for the government to get excuses to increase the power and escape supervision. The higher level of public self-management and self-service are, the less reason and opportunity for government to go corruption. Countries with higher corruption index, such as Canada and the United States, all have mature non-governmental organizations which are independent well functioning. Secondly, non-governmental organizations have organization system which is "non-hierarchical, decentralized network-style"^[6], reflect the free will of individuals in work, also train its members of the spirit of liberty. Non-governmental organizations are large schools of free education for citizens in practice. Again, non-profit, non-governmental organizations set role models for the whole society to be indifferent to fame and fortune; its members' dedication not only provides the country with a large number of honest people, but also helps to prevent excessive pursuit of money.

4 Conclusion

The culture of clean governance is belong to a part of political culture, its progress facing the resistance come from old system and the opportunity in the future. We want to play the role of anti-corruption and clean-governance in real world, we need to make progress in the culture of clean governance through creating systems. The institutional innovation may provide system power and guarantee for the advanced culture, it also can provide effective pathways to eliminate old systems.

Institutional innovation is a systematic project, the implementation must be gradually and spirally raised. It can not only help to initiate improvement of soft power of culture of clean governance, but more importantly ensure the healthy development of culture of clean governance. To realize the institutional innovation, we should set up creation notion, reduce the inertia of system changing and establish the mechanism of system encouragement. For this reason, we should combine the actual condition of social democratic political development and emerging issues in anti-corruption, carry on in-depth culture of clean governance study, turn the experience into theoretical results through special carrier. Thus, to promote the construction of soft power of clean governance culture, in addition to persist people-oriented and institutional innovation, we should have other innovation carriers or forms, such as encouraging the combination of clean governance culture with history culture, nationality culture, art culture and tourism culture. Our final propose is to realize the ideal goal of using soft power of culture of clean government to continuously promote clean government building.

A Rustic Opinion on The Quality of Scientific and Technical Periodicals in China

Luo Yixin

Hunan Science and Technology Economy Trade Vocation College, Hengyang, P.R.China, 421009
(E-mail: luoguiyuan@sina.com)

Abstract: This paper defines several problems on the status quo of China's scientific and technological periodicals by using the principles of management and statistical analysis approach, and objectively analyzes the root cause. These problems include weak influence, low credibility, high page charges, low quality of reviewed papers and long publishing cycle. It proposes an ideal model to improve the quality of China's scientific and technological periodicals in terms of editors' quality, budget, and other aspects, and draws a scientific conclusion that the quality of China's scientific and technological periodicals can be improved only by means of well construction of China Periodicals Phalanx, regular quality examination on scientific and technological periodicals, supervising and urging the implementation of ISO9000 standard series, and intensifying cultivation of editors for scientific and technological periodicals.

Key words: Scientific and technical periodicals; Quality; Opinion

1 Introduction

Through the unremitting struggle by several generations, there has been the rapid growth of scientific and technical journals in China. According to the incomplete statistics, nowadays 8135 sorts of periodicals have been published in the whole country, of which the former make up nearly one third. However, unfortunately, they don't come up to all expectations. In the writer's view, the mathematical model for their quality may be denoted in the formula $Q_k=f(X,U,W)$, in which X stands for the contributions; U the quality of editorial staffs and W the funding for journal publication.

As a scientific worker as well as a long-standing author and reader of scientific and technical journals, here I'd like to express some of my imperfect opinions about the three above factors effective to their quality in hopes of inducing others to come forward with valuable contributions.

2 Present Situations and Problem

Currently scientific and technical journals in China are generally low in level mainly due to the widespread lack of high-standard contributions. Generally speaking, high-standard manuscripts concern not only the degree, the title of the technical post and the subject of research of authors, but the conditions of the units employing those authors. Naturally, those with high degrees and high titles of technical posts normally can win over the important subjects concerning high-tech. Thus, the major undertakers of Natural Science Foundation of China and national level tackle key problems in science and technology own such high degrees and titles. Besides, there is the policy on the encouragement of writing high-standard academic papers in some units. Truly, a scientific and technical journal needs a large relatively stable group of authors with high levels in order to achieve a higher level. But it is just this point that many of our journals are lacking in. Through analysis, the author concludes a few causes for this respect as follows:

(1) The smaller impact of periodicals. Presently the optimum and vicious circles are increasingly severe in the case of absorbing contributions. The high-standard papers are heavily backlogging when they are to be published by such including sources as SCI and EI while they are hardly available for ordinary journals. It is certain that these days the benevolent see benevolence and the wise see wisdom in the right view of SCI and EI. I extremely agree with the opinion of Paper^[1] that they can be neither ignored nor abused since after all, they are the vital basis of indicating how much attention papers can receive. Accordingly, it is somewhat justified that so far numerous units have been adopting them as the important index for measuring the level of science and technology. What's more, a fairly large number of academic papers of China have been issued overseas, which is highly related with their opportunity to be included in SCI and EI. At the moment the greater impact the periodical makes, the more manuscripts it will obtain; and vice versa. For instance, it's evident that some academic journals of colleges and universities are of poor quality which receives far less incoming manuscripts than those needed for issue^{[2]-[4]}.

(2) The bad credibility of periodicals. Some of the periodicals in China are so short of strict regulations and systems such as no reply after receiving manuscripts, no information of including manuscripts for issue or not, unpunctual publication as scheduled and breaking promises to writers that they gradually lose a multitude of writers^[5].

(3) The too high publishing fees. Nowadays the majority of scientific and technical journals in China charge the printed page a definite sum of fees, some of which are even surprisingly high. Take the author with a scientific and technical paper issued once in a famous journal. Unexpectedly, six pages were charged RMB 2400 Yuan as publishing fees. Such high fees don't matter to those writers who can apply for the reimbursement in their own units, whereas they are probably intolerable to those who can't. As a result, the good articles of the latter are likely to be contributed to the periodicals overseas which never charge them this kind of fees.

(4) The poor quality of copy editing. As analyzed in Paper ^[1], many editors in science and technology in China fail to select competent experts for copy editing, so that quite a number of experts' opinions don't accord with facts, which consequently causes many of distinguished papers out of the manuscripts rejected in China to flood overseas for issue. For example, one of the author's colleagues, who had contributed two high-standard papers to a second-class technical journal in China, only to be rejected twice for lack of new ideas, went so angry as to send them both to a well-known international journal in the USA with the result of both of them hitting the target with high estimation.

(5) The pages of journals infested with ads. Supposedly, academic journals, especially those in science and technology, oughtn't to publish any ads for making profits. Nevertheless, a lot of journals in our nation go out of their way to absorb such ads to obtain subsidies for publishing funding. Actually, this objective in mind makes sense but part of the practice concerned is to be deliberated. For instance, thumbing through a relatively renowned academic journal in science and technology at hand, the author found the ads making up almost one third of the pages in the journal, which made it inconvenient to look up the papers inside. In accordance with the preliminary statistics in the reading-room for journals in science and technology in our college, there are X sorts of journals containing X ads, including X sorts with more than X pages of ads making up X %.

(6) The quality of editors. One aspect of improving periodicals in quality is good contributions, while the other important one is the quality of editors of periodicals. Better periodicals in our nation are allocated with a definite quantity of outstanding editors. The relationship between editors and manuscripts is just similar to that between clever women and food material—even best chefs are unable to cook decent delicacies with no good material; nevertheless, good material may hardly make tasty meals with any good chefs. Theoretically speaking, it is hard to become a really qualified editor. Therefore, great editors in science and technology are required to have good writing skills, know or even know well the knowledge of science and technology related with their professions and get familiar with national standards and editing knowledge as well as possess necessary fine personality and virtues. Accordingly, a respectable and admirable editor tends to bring vigor and benefit to a periodical. Regrettably, the current editing staffs in our nation are extremely irregular, concretely shown in a definite quantity of staffs unqualified, some of them with low academic degrees or with no writing skills and others incompetent for their jobs or even with questionable personality and virtues^{[6]-[7]}.

(7) Funding for publishing journals. It is impossible for a journal in science and technology to be published merely based on high-quality manuscripts with no adequate funding because the normal funding is absolutely not small for the editorial staff of this journal. As a result, given the reason of the funding, good editors might quit for the too low treatment or good writers could gradually disappear for the too high publishing fees; on the other hand supposing too many ads were printed in the journal to compensate the inadequate funding, there would be the loss of the large bulk of readers^[8].

3 Suggestions

Just owing to the adequate funding, many foreign periodicals can neither print ads nor charge publishing fees.

Now that China has joined in the WTO, a journal in science and technology will be involved in the competition worldwide just like any other products. In order to swiftly enhance the quality of this kind of journals in China, here the author makes the following suggestions in the light of the problems above:

(1) China's Journals of "Journal Phalanx" must be managed well. 10—20 sorts of international famous-brand journals shall be established as soon as possible to carry out "the Strategy of Quality Products". In the list of China's Journals of "Journal Phalanx" declared by Ministry of Science and

technology of PRC on Sept. 10, 2001 were included 716 kinds of journals in science and technology. Certainly, China must allocate the special funds to provide those journals with the key support. For another, it is indispensable to introduce the competition system and set up the relative index system to make regular inspection with the rigid implementation of the system of the best surviving and the worst dismissed. Moreover, the fair and square and open principle ought to be insisted on in choosing those journals through public appraisal. Currently some of the periodicals included in the Phalanx are greatly out of expectation indeed which have made the unworthy impression of the journal.

(2) The publicity of SCI and EI is to be decreased appropriately. For instance, it is advisable to reduce their weight in establishing the index system of evaluating the level of the scientific and technical research of such research institutions and colleges and universities.

(3) The Editing College of China should be founded or the Editing Department in national key universities with comparatively more mature conditions to inclusively train qualified editors, particularly those of journals in science and technology.

(4) The regular inspection shall be conducted to journals in science and technology. If inspected unqualified, they ought to be given the punishment like warning, imposing fines and even stopping publication in line with the seriousness of their situations.

(5) Journals in science and technology are to be supervised and urged both to carry out and implement ISO9000 and to apply for the ISO9001 Quality System Certification positively so as to firmly improve the quality of those Journals.

A Critical Analysis of Two Motivation Theories and Their Application

Huang Yang

Business School, University of Hull, UK
(Email: Y.Huang@2011.hull.ac.uk)

Abstract: This article describes, compares and contrasts one content theory (Herzberg's two factor theory) and one process theory (equity theory) and believes though the two theories are based on different ideas of motivation, they still have links inside. The article also looks into the application of the two theories in the business world and evaluates their appropriateness for the current business environment through a few representative examples. Based on the study, some useful suggestions are given to help the business to develop a good condition and culture atmosphere for the workers in order to give them a positive attitude, motivate them and makes the company the biggest beneficiary.

Key Words: Motivation; Herzberg's two factor theory; Equity theory; Business environment; Company culture.

1 Introduction

The main purpose of the study is to give a critical analysis of Herzberg's two factor theory and the equity theory and evaluate their appropriateness for current business environment.

Motivation plays a critical role in achieving goals and business objectives and is equally as important for companies that work in a team-based environment or in a workplace comprised of workers who work independently. Trying to understand this complicated and at times contradictory combination of hopes, desires, dreams, past experiences, outside influences, societal pressures, and innate tendencies that we are better to start with motivation theories.

There are many theories of motivation. But there are only two types of motivation theories, content theories and process theories. For content theory, many scholars did their researches on Herzberg's two factor theory. They mainly focus on motivator factors and the relationship between motivation and job satisfaction. For process theory, most scholars examined the equity theory. For recent years, the main focus of researchers moved towards employees and their their motivation factors. Which means most researchers only considered the definition of motivation theory. And only very few people made comparison between the two types of motivation theories and find their links with today's business environment.

In order to attain these goals the plan given here is followed: firstly, a general definition of motivation is given; secondly, definitions on Herzberg's two factor and the equity theories are given, and finally a comparison of the two theories and their application in the current business environment.

2 Motivation

There are lots of definitions of motivation. According to the Oxford English Dictionary, motivation can be defined as "The action or an act of motivating something or someone." Meanwhile, motivation can be considered as "the cognitive decision-making process through which goal-directed behaviour is initiated, energized, directed and maintained" (David and Andrzej, 2010). Robbins (2003) believed that motivation is a process that explains an individual's intensity, direction and persistence of effort towards attending a goal (Robbins, 2003). The lack of motivation or low motivation can lead to counter-productivity behaviours, tardiness for work, absenteeism and many more. Motivation theories are the core theories in organizational behaviour used to deal with the relationships between needs, motivation and behaviour.

There are two types of motivation theories: content theories and process theories. Content theories are "based on drives and needs"(David and Andrzej, 2010). They suggest that people have same needs and explain the factors that motivate them. Process theories, however, mainly focus on figuring out why individuals make different decisions and how their motivations shape when facing changes in offering labour, requirement, payment and reward. So basically, content theories assume that people have the similar set of needs and are to be motivated following the same kind of patterns, whereas process theories concentrate more on the differences between individuals and believe that different measures should be used to motivate various people.

3 Two Factor Theory

A representative example of the content theory is Herzberg's two factor theory. Herzberg, an American psychologist states in his theory that there are certain factors in the work place that may cause job satisfaction (motivator factors) while a separate set of factors can prevent dissatisfaction but cannot increase satisfaction (hygiene factors), which means that "job satisfaction and job dissatisfaction act independently of each other"(Herzberg et al., 1959).

Herzberg analyzed the job attitudes of 200 engineers and accountants, who were asked to tell their feelings about their working conditions and their attitudes towards their jobs. From this test, Herzberg set up the two factors, one is motivator factors, which includes responsibility, advancement, gaining recognition, sense of personal achievement and challenge. These motivators are the primary causes of job satisfaction and positive job attitudes, "because they satisfy the worker's need for self-actualization" (Maslow, 1954). The other is the hygiene factors, which involves salary, security, working conditions, company policy, quality of supervision and more. "It is the motivators that cause satisfaction and have the potential to motivate employees to higher levels of performance because they provide opportunities for satisfaction." (Wilson, 1995)

Though Herzberg's theory has been believed and accepted by most of the managers and researchers around the world, there are still some criticisms to his theory. One is related to his research method saying that Herzberg only used accountants and engineers as his respondents, so there would be a bias in the his research. People in different condition may have different responses to changes. According to a study by Ewan, hygiene factors sometimes can act as satisfiers while motivators sometimes cause both satisfaction and dissatisfaction. For example, poor people may think that a raise in salary (hygiene factor) is more motivating than gaining recognition (motivator factor). So there are limitations to the theory. Secondly, are the people been interviewed telling what they really think? As Vroom and Maier (1961) pointed out that on the one hand, people may be more likely to perceive the causes of satisfaction within themselves and therefore describe experiences invoking their own achievement-that is to say they recognize the advancement in their job. On the other hand, dissatisfaction is not caused by personal inadequacies, but rather by factors in the work environment.

4 Equity Theory

Equity theory is a good example of the process theory. As we all know that inequality is a pervasive fact of our present world and therefore all of us live in unequal societies in this unequal world (John et al., 2009). Based on this fact, process theory of motivation which "argues that perception of unfairness leads to tension, which motivates the individual to resolve that unfairness" (David and Andrzej, 2010) has its sound footing. J Stancy Adams has the most impact on this theory. His most representative two questions are: "What do people think is fair and equitable, and how do they respond when they feel that they are getting far less than they deserve?"(Walster et al., 1978) As we can see, equity theory is more based on individual's own perceptions of what they think is fair or unfair. The core point of equity theory is simple, "the more intense perceived inequity, the higher the tension, and the stronger the motivation to act."(David and Andrej, 2010). There is a famous contribution-reward ratio used to calculate inequity, it is calculated by comparing "my" rewards (pay, recognition) and contributions (time, effort, ideas) to "your" rewards and contributions. When people have perceived inequity, they would act to resolve it until equity is restored.

Why is the equity theory so important in the process theories? The answer is simply: it illustrates that every single person holds different ideas on equity and should have his own perception of motivation, two individuals compared to each other might not feel so equal even their states are similar or even the same in others' eyes, because what fairness is might be different in their eyes. It's also because of this difference, people argue that equity theory has an obvious problem, as David (2010) pointed out that different people think differently when calculating fairness. And also, "There are individual differences in tolerance levels, and not everyone will respond in the same way to a particular level of inequity. The extent to which you believe that there is a valid explanation for inequity will also moderate your response."(David and Andrzej, 2010)

5 The Argument

One might say that these two theories are completely different and have nothing in common, but actually they are linked to each other in some ways. To put them into practice, imagine that you are the manager of a company and you are trying to use these theories in order to improve your working life. To motivate your workers in an effective way, you should make a use of both the content theories and

process theories but not just one. For example, when you get the idea of the two factor theory, you may think that as a manager, to motivate your workers, you should firstly provide them a good job security, a clear job description, a nice working condition and maybe a reasonable salary. And then you consider about their advancement, gaining recognition, sense of personal achievement and give them some challenges. However, some problems might occur when you take the equity theory into consideration, when you put your worker under good hygiene factors, they start to compare with each other, because everyone has his own contribution-reward ratio, they may discover that for example someone who is not working that hard has got a pay rise but they don't, then they sense inequity. So now we can clearly see the difference of these two theories. The two factor theory suggest that all people have the same set of needs and can be motivated in the same way, but equity theory tells us that individuals are different and should be treated using different measures. Another difference is, according to Herzberg, when people move from hygiene factors to motivator factors they are unconscious and everything happens naturally. However, equity theory is not, with the pattern: perception of inequity--experience of tension--motivation to resolve--action to resolve--equity restored. We can clearly see that though this process, it's what we think motivates us, therefore individual's consciousness takes an important part.

6 The Current Business Environment

Many researchers argue that these theories don't fit with the current business environment anymore. I agree that with the development of the society, the enhancement of the level of productive forces and the improvement of technology, the content and structure of physical needs and mental needs are changing constantly, so that hygiene factors and motivator factors may not seem so convincing as before. But I believe there are still something we can absorb from the theory. As we know, even with the most advanced technology and equipment, the most complete material information, without accurate and all-round enforcement of the people, everything would be meaningless. So Firms and enterprises should no longer see "profit maximization" as their only goal, they should consider more about their workers' needs. Considering about the two theories mentioned above, hygiene factors are clear and basic, what firms should be seeking is a way to provide their worker both motivator factors and a new look on equity and inequity. Therefore I believe company culture are more and more becoming the key point of company development.

Company culture is a kind of cultural concept and value which is developed inside the company and is of unique feature. It's the spiritual support of a company. We can take a example from a well-known company-the IBM. IBM designed the new Corporate Trust and Compliance Web site in February 2009, it is a web site that allows the workers to speak out their concerns, such as working conditions, payment or employee misconduct. The idea is to foster a culture of trust and personal responsibility throughout the company. Trust refers to the extent to which we are willing to ascribe good intentions to and have confidence in words and actions of other people(Cook and Wall, 1980). By developing this culture of trust, workers' changed their attitudes towards equity in job and thereby develop personal responsibility, IBM successfully provided the workers a motivator factor which greatly strengthened the workers sense of the masters of the company and therefore enhanced their enthusiasm for the job hugely. Another good case in point comes from Wuhan University of Technology, China. Alongside with a competitive package of salary and bonus for the staff, the university set up a QQ (a popular internet chatting software) group for its staff to exchange their ideas and feelings about their work and life. This measure motivates the staff and offers them a sense of being the master of the university. Through the QQ group, many good ideas and suggestions as well as complaints are put forward which help the administrative sections to take due measures to better the working environment and which in the end benefits the university as a whole. A good company culture should be able to motivate employees as a motivator factor, what's more important, a good company culture can be a factor to shape employees' views on equity and inequity which can give them a positive attitude, motivate them and thereby the company becomes the biggest beneficiary. So the two theories are still helpful with the current business environment, with the idea of company culture motivation being the best example.

7 Conclusion

To the question given, the main differences between Herzberg's two factor theory and equity theory is that Herzberg' theory, as a content theory, assumes that individuals has the same set of needs and can be motivated in the same pattern, whereas equity theory suggests that individuals have their own

perception over fairness and therefore they motivate themselves through different methods. Considering the current business environment, it is the managers' job to develop a good condition and culture atmosphere for the workers, and managers should make good use of both the content theories and process theories but not just one, because "There is, however, no single reliable theory or set of ideas on motivation that can be used as a solution by managers to the problem of motivation." (Wilson, 2010)

A Discussion on the Dynamic Mechanism of the Management Innovation of Pale-biotic Fossil

Han Gang, Liu Xueling, Han Lizhuo, Pan Ling, Guo Zhichuen
Paleontology Center, Bohai University, Jinzhou, .R.China,121013
(E-mail: hg0805@126.com, lx15909@126.com, Lpigg0113@qq.com, 407700252@qq.com,
ljgsl2008@163.com, 867319583@qq.com)

Abstract: This paper discusses the importance of the management innovation of pale-biotic fossils by using the theory and method of the management innovation, thinks that the dynamics of the innovation is the main causes of the occurrence and continuity of the innovation actions, has established the driving source model of the management innovation of pale-biotic fossils, discussed the contents and establishment tactics of the dynamic mechanism of management innovation of pale-biotic fossils, come to conclusion that the real essential driving effect of the management innovation of pale-biotic fossils is the internal dynamic factors, but the external dynamic factors is the external source, resources or opportunities of the management innovation of pale-biotic fossils.

Key words: Management innovation; Dynamic mechanism; Pale-biotic fossil

1 Introduction

The mechanism of the management innovation of pale-biotic fossil is that continuously seek the internal function and operating mode of the innovation under the guiding of the idea of the management innovation of pale-biotic fossil. At present, the capacity of the management innovation of pale-biotic fossil is very weak in our country, the key is owing to the administration departments at all levels don't establish real effective mechanism of the management innovation.

The dynamic mechanism of the management innovation of pale-biotic fossil is dynamic source and effect mode of the management innovation of pale-biotic fossil, is also the mechanism which can drive to achieve the conformity of the resources and high-efficiency operation of the management innovation of pale-biotic fossil and then achieve desired goal. In the activity of the management innovation of pale-biotic fossil, the motive force of the innovation is main cause that the innovation action happens and continues.

2 The Importance of the Management Innovation of Pale-Biotic Fossils

The fossil resources of our country can be said to be the world first-class, the research results of Chinese paleontologists have also enjoyed a high reputation in the world. But it is regretful that the status quo of Chinese fossil protection is still very worrying, main conditions are: the lack of long-term plan, imperfect laws and regulations, the government management is not in place, the protection consciousness of the public is not strong, the relationship between economic development and the protection of the resources is handled improperly etc. In the face of threats from all sides, the most urgent problem Chinese fossils are faced with just is the management innovation.

2.1 The objective request and inevitable trend to promote scientific research and reasonable utilization of pale-biotic fossils

At present, the solution of many important paleontological theories and major geological problems in the world are dependent on the discovery and research of Chinese paleontological data. Only the better protection of the fossil resources and the better management of the fossil resources can provide new, strange, special valuable specimens for scientific research departments to promote scientific research and reasonable utilization.

2.2 To improve the management level of pale-biotic fossils requires the management innovation

By the management innovation of pale-biotic fossils, renew the management concepts, constantly improve the laws and regulations, regulations, improve the organizational structure, innovate the management system, adopt the new management modes and methods, establish the management mechanism beyond the departmental interests, promote the superiority of the natural resource changes into market superiority and economic superiority, constantly improve the level of the management of pale-biotic fossils.

2.3 The best way to promote the comprehensive development of regional economy by taking the

superiority of the resources

The establishment of the protected areas, scientific research bases, museums, geological parks, markets of the pale-biotic fossils can attract many people to visit, appreciate, collect, exchange, make them become the windows of the area, promote the development of the environmental protection, hotel, retail, catering, tourism, transportation, finance and insurance, construction, real estate and other industries.

3 The Content of Dynamic Mechanism of the Management Innovation of Pale-Biotic Fossil

The management innovation of pale-biotic fossil is carried forward by four dynamic mechanisms i.e. the mechanism driven by internal interest, one pulled by the market, one pushed by the science and technology and one encouraged by the policy. But real and substantive driving effect on the management innovation of pale-biotic fossil is the essential factor of internal motive force, external dynamic source is better to say it is external favorable circumstances and conditions than to say it is dynamic factor. Sum up above-mentioned viewpoints, this paper has established the model of driving source of the management innovation of pale-biotic fossil (as Figure.1)

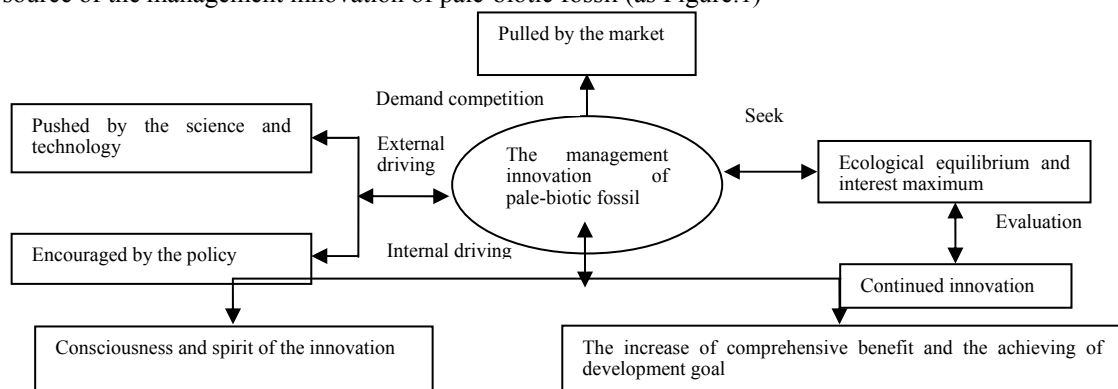

Figure 1 The model of driving source of the management innovation of pale-biotic fossil

The bidirectional arrows are used for connections between all layers or dynamic factors of the same layer, this expresses the motive force of the management innovation of pale-biotic fossil is as an organic whole system, is full of bidirectional mutual effect and close relation between the essential factors, the layers.

3.1 The mechanism driven by internal interest

The driving of the internal interest of the management innovation of pale-biotic fossil stems from seeking the continuous increase and continued development of the comprehensive benefit of the economy, ecology and society, “just because the innovation can give a special increase and temporary monopoly interest requital to successful innovator”^[1], so it encourages the management innovation, generally speaking, the level of the management innovation is higher, the comprehensive benefit is more remarkable. The main body of the management innovation of pale-biotic fossil consists of the government, the comprehensive body of the natural protection area of the pale-biotic fossil (including the state geological park and the state pale-biotic fossil museum) and the public; they have different positions in the course of the pale-biotic fossil management, their corresponding powers, jurisdictions, responsibilities and interests have more difference. The management innovation of pale-biotic fossil is just to break original structure of the power, jurisdiction, responsibility and interest, and then establishes new interest structure according to the requirement of the environmental change. The innovating consciousness and the innovating spirit of the main body of the management innovation of pale-biotic fossil are most important essential factors at the core. The innovating consciousness is a deep understanding of importance and necessity of the management innovation of pale-biotic fossil, is also a strong consciousness to seek and catch new opportunity of the management innovation and to take continuous innovation road under background condition of the times that the mankind seek continued and coordinative development of economy, ecological environment and society. The innovation spirit “which effect on the management innovation, can put it in a nutshell, it is the power of psychology. The innovation is not only a driving of interest, but also a driving of psychology, one of the demands of

higher level of the people. That the main body of the innovation seeks the sense of achievement, the personal value; the sense of responsibility etc. often excites the motive force of the innovation”^[2]. All the administrative department of the government, the comprehensive body of the natural protection area of the pale-biotic fossil and the public hope to make clear the ability and value of the leader or person by successful innovation, so that gain the sense of achievement and the satisfaction of psychology. The management innovation of pale-biotic fossil should also involve that goal of the continuous increase and continued development of the comprehensive benefit is approved by the main body of the innovation. Above-mentioned the driving factors of the internal interest and their mutual effect form a strong and lasting power of the management innovation of pale-biotic fossil.

3.2 The mechanism pulled by the market

The pulling of the market is the innovation caused by the influence of the market demand and the market competition. The market demand is first external force to pull the management innovation. Because the value that the management of pale-biotic fossil exists lies in the satisfying the demands of scientific research, scientific popularization, rational use and market; when the demand of the market changes, the manager will be forced to take the management innovation around the demand of the market for the sake of existence. The market competition is main pressure on the management innovation of pale-biotic fossil, because the market competition is essential characteristics of market economy, objective existence, increasingly presents the trend that the main body has multielement, the means has variety, the level is depth with the developing of the economy, the progress of the science and technology, the changing of the market management mode. On this condition, must continuously take the management innovation of pale-biotic fossil, “adopt the conformity mode and way of the resources that the efficiency is better and the benefit is better than one of the opponent of the competition, can hold the superiority and be not eliminated by the opponent of the competition in the market competition. If it can not create the opponent of the competitive superiority which is different from one of the opponent of the competition, then the final result to wait for it can only be eliminated by the market”^[3].

3.3 The mechanism pushed by the science and technology

The pushing force of the management innovation of pale-biotic fossil stems from rapid development of the science and technology and close relation of the science and technology with the economy day by day, thus it promotes the management of pale-biotic fossil continuously adopts advanced science and technology to make applicable innovation. The science and technology as basic and developing knowledge foundation are another decisive force to pull the management innovation of pale-biotic fossil. On the one hand the technological progress provides necessary material and technological conditions for the management innovation of pale-biotic fossil; for example, variable vacuum scanning electron microscope is applicable to observing the component image of the specimen of the pale-biotic fossil and quantitative analysis of the component part of one; the arranging of the monitoring equipment in an important producing area of the fossils has been forcefully controlling the events of steeling and excavating the fossils. On the other hand the development of the science and technology causes the change of the market demands, for example the state geological park and the pale-biotic fossil museum etc. adopt a great quantity of acoustic, optical, electric, bionic and simulative technologies, these technologies not only strengthen mutual movement sense of the spectators, appeal the spectators, but also produce considerable benefit. This shows, the management innovation of pale-biotic fossil is a result of common effect of the market demand and the science and technology, the market demand decides the direction of the management innovation of pale-biotic fossil and the benefit of the innovation, the science and technology decide successful possibility and cost of the management innovation of pale-biotic fossil. If there is the market demand but is not the guarantee of the science and technology, it is very difficult to achieve the management innovation of pale-biotic fossil.

3.4 The mechanism encouraged by the policy

The encouragement of the management innovation of pale-biotic fossil mainly stems from the policy adopted by the government for encouraging the innovation. The executive meetings of the State Council hosted by Premier of State Council Wen Jiabao had discussed and approved in principle<On Accelerating the Development of Tourist Trade> on November 25, 2009, this document had officially issued on December 1, 2009.

According to investigation, the pale-biotic fossil resources of our country are basically located in poor mountain areas, as a result of restriction of the historical and geographical as well as other conditions, these areas “are not flourishing, are short of development” very seriously. The deciding of this problem i.e. let the poor mountain areas be lifted out of poverty is a long-term and arduous political task in the construction of new socialist rural areas. In new period, the tourist trade becomes a strategic

industry. In this social background, the ecological superiority, the superiority of the national culture, the superiority of the resources are presenting day by day, these superiorities bring new dawn to pass that the poor mountain areas be lifted out of poverty. The developing of the tourist trade has the function to promote the rejuvenating of local culture and the flourishing of national culture, has also special effect to perfect the housing conditions of local people, to stimulate the tourist economy, to provide the employment posts, to increase the income of the residents. If there are only the mechanism driven by internal interest, one pulled by the market, one pushed by the science and technology, but there is not correct and effective encouraging policy of the government, even if the market is very good, the science and technology are very advanced, can not promote initiative innovating of the main body of the innovation. So for the main body of the innovation to take the ecological equilibrium as foundation, above-mentioned four dynamic mechanisms of the management innovation can finally sum up seeking the continuous increase and continued development of the comprehensive benefit.

4 The Establishment of Dynamic Mechanism of the Management Innovation of Pale-Biotic Fossil

According to above-mentioned analysis, think the establishing of the dynamic mechanism of the management innovation of pale-biotic fossil must start from following respects:

4.1 Strengthen the training of the innovating consciousness and spirit of the main body of the management innovation of pale-biotic fossil

The management innovation of pale-biotic fossil is a new question, the innovating consciousness and spirit of the main body of the management innovation of pale-biotic fossil is the key to decide the success or the failure of the management innovation of pale-biotic fossil. The rich and unique pale-biotic fossil resources of our country provides new opportunity for economic development of the area, the seizing the opportunity to advance that the paleontological cause is continuously growing in strength is common aspiration of each main body of the management innovation, for the sake of the achieving of this aspiration, must train strong innovating consciousness and innovating spirit. First must get a clear understanding of the effect and meaning of the development of the paleontological cause; next get a clear understanding of the influence and effect of the main body of the pale-biotic fossil innovation in the course of the management innovation; third must hard study and be brave in practice, so that gain more modern profound professional knowledge, have a strong knowledge foundation and a wide field of vision, train the ability of knowledge conformity, grasp the theory, methods, measures and ways etc. of the management innovation of pale-biotic fossil.

4.2 Continuously improve the quality of the managers

The cultural level and the management level of the managers of the pale-biotic fossils is lower, the management level of the managers is more backward than ones of other industries. This has certain relation with the particularity of the management of the pale-biotic fossils, for the sake of satisfying the requirement of the paleontological cause, must raise the level of the management. Especially strengthen the consciousness of the qualified personnel, put the qualified personnel who have information technology and conformity ability of the management, enforce the law and have a good grasp of the law, implement the policy according to law, strictly act according to the regulations of the law, have very strong professional knowledge quality in the important positions. And let them more participate in the policy decision of the management, stimulate their work zeal, and increase the satisfaction of the qualified personnel doing everything possible. Establish the management ranks to take the personnel in a specific field as the core, to take professional personnel to enforce the law as main body.

4.3 Create the cultural atmosphere to encourage the management innovation

The culture, it is invisible, is also true, the people run into it in the practical life in all matters and all respects. Many useful things in historical culture are needed to be carried energetically forward. When we investigate the birthplace of Hushi Guizhou dragon of Luyin Village of Dingxiao Town of Xingyi County of Guizhou Province, we had seen that since Xianfeng five years of Qing Dynasty (that was 155years ago), the for the sake of protecting the geomancy, protecting dragon mountain and dragon vein, villagers of The Bouyei nationality had established the stele with the regulations of the village and convention of the public, the blasting up mountain and the mining stones is forbidden, so the innovation of cultural atmosphere is the soul^[4]. Be sure to make the significance of the management innovation of pale-biotic fossil clear to people as many as possible, train the consciousness that the whole citizens consciously protect the pale-biotic fossils, bring the enthusiasm of each person of the main body of the management innovation into full condensation to become prolonged tremendous force, form a

atmosphere to dare to challenge all outmoded convention and bad customs (those living on a mountain live off the mountain etc.) in the whole society, initiate to take good care of environment, bring up the life on the earth with loving care, cherish the pale-biotic fossils which are irreplaceable resources, let more people accept the result of the management innovation, form powerful driving force of the management innovation, so that successfully attain the goal of the management innovation of pale-biotic fossil.

4.4 Perfect the laws and systems step by step

The market demand and the market competition are basic external source, driving factor or opportunity of the management innovation of pale-biotic fossil. The science and technology are both basic resource factor and opportunity of the management innovation of pale-biotic fossil and driving force of the management innovation of pale-biotic fossil. The perfecting of relevant laws and systems step by step produces powerful driving to the management innovation of pale-biotic fossil. With the developing of the economy and culture of our country and the improving of legislative technology, great advances have been made in the legislation field of the pale-biotic fossil resources; have basically formed the system of laws and regulations to take <The fossil protection ordinance> as the foundation and the mutual coordination of all management ways (including local ones). But must conscientiously examine uncoordinated factors of all components of the system of laws and regulations in combination with the practice, continuously perfect of the system of laws and regulations; examine mutual coordination of relevant laws and regulations as well as the factors in conflict with that our country had joined the international convention organization, revise in time; must also draw up the management ways for the plan and construction of the museum and the natural protection area, the laws and regulations for the protection of ecological environment and other fields as quickly as possible, including unofficial systems for the ideology and sense.

5 Conclusion

Thus it can be seen that the real essential driving effect of the management innovation of pale-biotic fossils is the internal dynamic factors, in the same way as the driving essential factors of internal interest, there are also inseparable mutual effect and relation between the external dynamic essential factors of the management innovation of pale-biotic fossil, these are also external source, resources or opportunity of the management innovation of pale-biotic fossil.

Innovations in Public Transportation Privatization in China and Its Reflection

Zhao Ying

School of Marxism Xiamen University, Xiamen, P.R. China, 361005

(E-mail: yingzi@xmu.edu.cn)

Abstract: In this paper, case study methods are applied to discuss the Chinese bus service system innovation and privatization reforms. The frustrations in privatization reform are due to Chinese public transportation system which should be partly privatized, rather than fully privatized including government functions, because government plays an important role in undertaking reforms. The failure in Privatization of public transport services does not mean the failure of market mechanism. It is not worth returning to state-owned economies in order to avoid privatization. Lessons should be drawn from failures to try new things, to find a suitable partial market-oriented way to reforms.

Key words: Bus service systems; Privatization; Innovation; Reflection

1 Introduction

In the 1990s, influenced by the rising Western market-oriented reform in public services, Chinese bus services have begun to try privatization reforms. With the continuous development and deepening of reforms, some problems which seriously endanger the public interest gradually exposed. With the privatization of bus services failed in several places, such as, in Lanxi, reforms in privatization of public transport services have fallen like domino. Doubts and denial of market-oriented reforms have increasingly become the mainstream of public opinion. Cheap bus in Beijing and welfare reform in Shanghai have shown that city bus service reform has returned to emphasize more on public welfare. It is necessary to reflect and learn lessons from the failures in privatization reforms of bus services. With the backgrounds that market mechanism is unfavorable and state-owned system returned back to people's sight, this paper will discuss the bus service reform.

2 Status Quo

Privatization can be defined as civil institutions to rely on more, less reliance on government to meet the demand of the public.(Savas,1987)The Chinese scholars primarily discuss whether privatization reform should be introduced in the public transport service. For example, Hong Sheng and Yushi Mao believe that the market mechanism should be introduced in the public transport even though it has natural monopoly nature. The privatized service has efficiency advantage. The market reform can enhance the entire service level. This is the mainstream idea. In the mainstream of supporting privatization, Scholars discuss bus privatization reform mainly from the legal, regulatory and other perspectives. According to Xu Jun, government regulation can guarantee the public benefits and welfare provided by bus services. It can ensure the effective supply of public transport, and also promote the public transport enterprises to compete actively and fairly, thus, to improve operational efficiency. Some scholars also analyzed the reform risk and difficulties in bus services from privatization. Western scholars always analyze the privatization of public service from historical, technological and legislative perspectives. Savas is a pioneer in the privatization experiment; From 1969 he began to explore the issue of privatization of public goods. He believes that the implementation of the privatization programs of public and private sector cooperation is an effective approach to achieve sufficient supply of public goods. In his "Privatization and public-private partnership", from the perspective of the background, theories and applications of privatization, he demonstrated that privatization is the best way to improve the government's regulation. A profound analysis of the problems in privatization movement and its practical and effective solutions are also discussed.(Savas,1999)

3 Applications of Innovations in Chinese Bus Service System Privatization Reforms

Apart from European and American countries, before the Chinese economic reform, the bus service has always been monopolized by the public sector. Public sector monopoly bus service is not the same as the West whose monopoly is because of the rise of private cars or by the impact of natural monopoly theory, but a reasonable application of planned economy in the transport sector. Until the 1990s, with the

emergence of self-CMB, bus service began to break the monopoly, and attempted to undertake privatization reforms. As a slogan, bus service privatization reform once voiced everywhere, called to break the "last brick of planned economy."

3.1 Bus service system reform and innovation

In 2001, it is encouraged nationally that private capital should enter the public service sector. As a county-level city, Lanxi City, in order to make effective use of some state-owned funds for the restructuring of loss-making enterprises and to offer jobs to more than 1,000 employees, Lanxi City bus company has naturally become the first one to start the bus industry restructuring, the auction process in the National Automotive Systems. April 20, 2001, Department of Transportation leadership team of Lanxi City decided to conduct an auction to sell Lanxi Bus Company as a whole in accordance with the corporate restructuring principles "two thorough, two implementations," i.e. state-owned assets completely quit, complete replacement of worker identity and implementation of business entity management, the registered capital prepared. It is Finally, after 69 bids, with the "national bus industry first auction gavel" sounded, Lanxi City bus company changed its name to Changda bus company, as the first Chinese private bus company. The director of the old company Zhichang Ge paid 14,688,000 CNY and became the owners of the company and had 20 years rights to operate the 12 routes. The new founded Lanxi City Changda Public Transport Service limited became the 1st privatized public transport service company.

3.2 Problems and contradictions in reforms

3.2.1 Conflicts with Changfeng Automotive Company

Since the rapid expansion of Lanxi City, the original bus lines must be extended, these extensions or adding a new line damaged the interests of Changfeng Automotive company. From January 17, 2002 Changda Bus Company and Changfeng Automotive company began a five-year dispute. During the five years, the two companies disputed frequently and fought for customers continuously, which seriously affected the development of public transport services and the public travels.

3.2.2 Intensifying conflicts between Shareholders of the Company

In the proposed privatization reforms, Lanxi private enterprises generally lack of funds, very few people have the ability to bid. Zhu Gezhi Chang used "tractor" approach to raise funds to bid. After successful bid, Zhu Ge Zhichang and other 14 small shareholders have jointly set up a joint-stock Changda bus company, and these shareholders also contracted a number of lines. When the bus company reform encountered problems, interests of shareholders have been damaged, dispute of economic interest escalating the conflict, which affects the bus company's operation and development of privatization reform.

3.2.3 Government questioned the bus company's ability

There is a conflict between the public interests in bus service and private interests in bus enterprise. Public benefits is the basic attributes of public transportation which cannot shirk responsibility of ensuring public's travels. It means that the bus lines have to be guaranteed no matter with profit or loss. Private bus services has the nature of satisfying its personal interests first and to maximize the profit. Therefore, when social and economic conflict occurred, private company would choose to stop or reduce new lines when its not profitable. When this happens, the government began to doubt whether the private bus companies can be competent in running business with the public nature like bus services.

3.2.4 Private bus companies dissatisfied with the government

When the bus service reform encountered difficulties, the Government did not give timely help and support. First, government subsidies were not fully in place. Transportation concession for the elderly, the disabled and soldiers should have been subsidized by the government, but the government did not transfer the welfare spending fully after the reform to private bus services company, which led the company faced financial difficulties. Second, the government does not regulate the market. After the establishment, Changda bus company developed rapidly, the need to develop new routes and business scope was pressing. Government did not plan or regulate the entire bus service sector, resulting in Changda bus companies and Changfeng companies disputed frequently, leading to market disorder, which made the bus company's management and operation facing difficulties.

3.3 Results of reform

With no government funding, policy support, Changda Company has been losing money after the reform. With the pressure of rising oil prices, the government was getting more and more worried about Changda Bus Company and decided to buy back the company. On September 15, 2006, Lanxi City decided to repurchase Changda Bus Company. On January 5, 2007, Lanxi city government repurchased the bus company with 18 million CNY which marks an end of the privatization reform in the past 5 years.

4 Reflection on Privatization Reform of Bus Service Systems

After the failure of the privatization of Lanxi transit service system, transit service privatization reforms happened elsewhere have also failed, which makes people began to doubt that the direction of the market is wrong. Then in the service sector, the state-owned power began to appear which is regarded as an inverse trend to what's actual happening in the global market. Since 2006, followed by the non-profitization of Beijing public transit service, many other transit services have been turned to state-owned status. From privatization reform, to failure, and then back to state-owned, it seems that the academia and government have reached a conclusion that the public nature of the transit service should not have market-oriented reforms. State-owned status guarantees its public nature. It seems to be too early to derive the conclusion that the failure of bus service privatization reform is equivalent to that the private power cannot play any role in the public service sector. We should analyze the reasons for failure of the reform, learn lessons, and search for the right path of reform.

4.1 Reasons of privatization reform failure

4.1.1 The reason of reform paved the stone for the failure

Experts believe that the government who wants to throw the burdens away did not pay enough attention on governing the performance of the public transport service, which led to the failure in future. Lanxi Bus Company had good economic returns before the reform. Simply because of the majority-owned subsidiary transportation systems, the entire enterprises are collectively at a loss. In order to make full use of the state-owned funds and settle the employment issues of more than 1000 people, the reform was started. The aim of the reform in Lanxi is more about the financial burden of the government, which means the transit service itself is a trouble and the reform is not in the correct form at the very beginning and the government forgot its governing role and responsibility.

4.1.2 Comprehensive private reform

Lanxi bus service reform is not just to go the road of privatization, but also in a role of fully privatization. Such “sudden change” reform usually cannot succeed. The Lanxi City Department of Transportation sold the whole bus company in auction and tried to implement a comprehensive private reform. In a competitive market, the private bus companies are usually more efficient than government institutions, but the market mechanism is not a panacea. Since the bus service is a kind of public service, the public interest must be taken into account and efficiency and quality must be considered. However, in front of the interests of private companies, such important factors are usually neglected.

4.1.3 Government subsidies are not in place

According to the State Council “Prioritizing the development of urban public transport service”, the bus company should be subsidized by the government because it offers social welfare to the public. (Yu Hui, Qin Hong, 2005) However, the reform in Lanxi was just about throwing off a burden from the view of the government and government did not offer any subsidies in the process of reform. Though the bus service itself can generate some profit, but in order to consider the social welfare, it will have little profit or even non-profit. Enterprises should pursue profit. They can only break-even by reducing wages, increasing ticket prices and operating efficiency. Ultimately, it may lead to disorder and conflicts.

4.1.4 Lack of government regulation

A good regulatory framework is always needed in the process of reform. As a kind of public service, bus service must be regulated by the government to ensure its public properties. The privatization of bus service does not mean that the government can abandon regulation and governing. Government should redefine the functions of supervision, specify the exit of management functions, and strengthen supervision. If the Government could strengthen the supervision of the reform initially, it would not lead to bus services market disorder and vicious competition among operators. Private bus service companies can only operate effectively and efficiently when the regulation is in place.

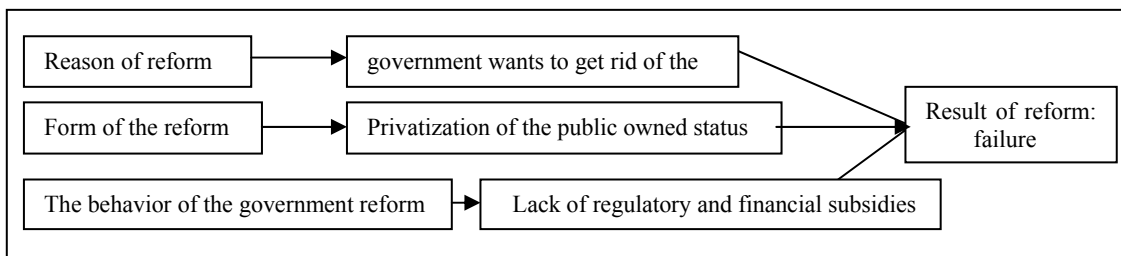

Figure 1 Analyzing the Reasons of Failure of Privatization of Public Transport Service

In sum, the initial causes and motivations of privatization are not correct, which lead to a series of reactions and privatization has become a failure. Only analyzing from the reason and form of reform and the responsibility of government can help the stakeholders to find the right approach to reform and succeed in the reform.

4.2 Lessons learned from the reform

4.2.1 A way of limited market-oriented privatization

Practice has proved that we cannot have bus service 100% privatized but we should follow a limited market-oriented privatization. Western market is the product of its specific historical conditions, and it is built on highly developed of civil society. China's national conditions determine that the bus service can determine that the privatization of bus service is limited to the mechanism of the service, not the overall transportation market. And in affirming the effectiveness of market-orientation, we also see that the market is a double-edged sword. Market is an effective measure to improve public transport services, but we cannot fully rely on market to solve all the problems.

4.2.2 Government is the key to the success of reform

Bus services in the market-oriented reforms, the government is the key to the success of reform. Comparing with developed countries, the market-oriented reforms of China transit service is more focused on government functions in the market. The privatization reform of transit service is based on the fact that government has financial constraints. The reform is a way to get rid of the financial burden. Government exists because it is in charge of public goods and services. Although private companies may have better efficiently than the government, but it cannot fully consider public interests in front of private interests. Therefore, government must play a functional role to ensure the public welfare.

4.2.3 Failure of privatization does not mean the failure of the market

Because of lack of theoretical understanding and guidance in the reform, we have encountered some setbacks. Some people began to suspect that the role of the market, resulting in an argument that the market-oriented reforms have failed. Cheap bus in Beijing and Shanghai city emphasized the return of state-owned transit service. Market-oriented reforms and repeated setbacks make people more skeptical about the direction of market-oriented reforms. Denying transit service market reform is increasingly becoming the mainstream of public opinion. Here we must recognize that the failure of privatization does not mean the failure of the market. Privatization is a specific form of the market reform. The failure of privatization can only prove that this model is not suitable for market-oriented mechanism but cannot prove other market-oriented models will fail.

4.2.4 Path selection of bus service market reform

In addition to the bus service innovation in Lanxi, Shenzhen and Changshu bus service also carried out market-oriented reforms. The two cities did not simply choose between government and market, but take public-private partnership approach. The underlying rationale of public-private partnership mechanisms is that the government and the market can make full use of the unique advantages of themselves and achieve complementary advantages. Public-private cooperation or privatization is both market-oriented reform models. The different is that the public-private cooperation is a limited market-oriented approach. In such a mechanism, private bus transit service becomes a long-term producer. It gives up part of autonomy in exchange for political influence, or other hidden benefits while the government becomes regulators and plays planning, monitoring functions. Bus service public-private partnership is a win-win mechanism which can take the unique advantages of all parties and its ultimate performance can exceed any party acting alone.

5 Conclusion

Though we have faced the failure of privatization of transit service in some places, we cannot simply decline the trend of using market power to operate bus service more efficiently. State-owned service still cannot solve the efficiency issue and the financial burden. We must find an innovative approach and have the courage to improve the public transit service.

The Innovation of Regulation of Food Safety Management and System Innovation: The System of Public Participation*

Wang Li

School of Grammar, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: axiaopei@sina.com)

Abstract: In recent years, food safety accidents arise endlessly in China and food safety problems become the most concern of the topics. Safeguarding food safety is involved with national economy and people's livelihood, international image, the Chinese economy's healthy, continuing, and steady development, and social stability. Frequent accidents reflect that the legal system of food safety supervision in our country is still not perfect, the supervision idea is relatively backward, and the supervision system needs to be innovative. Through fact method, probing into the cause of the food safety regulatory weakness, this paper puts forward to establish people-oriented scientific outlook on development and the concept of public participation in social governance, and through the perfect achievements appraisal mechanism, food supervision accountability and oversight daily public participation system to implement the system of public participation, hope to help to solve this problem.

Key words: Food safety; Food regulators accountability system; Food regulatory system of public participation

1 Introduction

Food safety regulatory system innovation—the public participation system, is the key factor to solve the problem of food safety. But for this question, the domestic scholar's research is still in the primary stage, related works is limited. Ceng Na in 2011 on the constitution and administrative law review published research on the public participation in the food safety risk assessment, puts forward the system of public participation should be part of a food safety risk assessment. Wang yue in 2012 in his master's thesis “the analysis the public participation mechanism in the food safety regulation in China” is discussed in detail the concept of public participation system, the necessity, existing problems and improvement Suggestions. All in all, food safety regulation system of public participation is still in its infancy, less attention of scholars, the discussion on theory is not mature and perfect, can't meet the needs of the current social situation of food safety.

The United States food safety public participation has successful experience for reference. The federal “administrative procedural law” made the provisions of public participation and transparency. The us food and drug administration regulations formulated process is in open and transparent way, encourage the relevant enterprises, consumers and other stakeholders involved in regulations formulate and publish the whole process. When issued new regulations and revising the existing laws and regulations, government agencies, usually by issuing “proposed regulations formulated notice” for the public to provide a discussion and comments in advance. It lists the problems, the government suggested solutions as well as the public, please answer a choice problem. Government agencies and then using the information gathered from the public to decide whether to continue and how to develop laws and regulations. All of the important public evaluation must be stated in the final regulations.

2 The Concept of Food Regulatory System of Public Participation

Food safety public participation system, refers to the public as a main body involved in the food safety supervision and management, the realization of social public management rights and the right of supervision of government, improve the efficiency of government food safety regulation, protection of life and health of the public and economic order of the benign operation. Here refers to participate in, not only refers to the public in some administrative areas, limited participation, passive participation in the administrative procedures, but to the public in the administrative decision, administrative enforcement, administrative supervision and administration in the process of full participation, active participation, it is also the process of positive interaction between administrative organs and public.

3 The Necessity of the Implementation of Food Safety Public Participation System

* This paper is supported by “the Fundamental Research funds for the Central Universities

3.1 Public participation is helpful to eliminate local protectionism

Along with the rapid development of China's economy, people's material and cultural level has been greatly improved, but food safety problems are highlighted in the explosive way in recent years, such as lean meat powder, illegal cooking oil, poisonous milk powder, DiaoBaiKuai cadmium rice, rice, plasticizer, etc. Food safety problems the serious damage to people's life and health, disrupt social economic order, damage the government's credibility, harm the social harmony and stability, damaged the reputation of made in China and the country's image. Many facts show that behind every major food safety crime, there is more or less regulatory oversight dereliction of duty, malfeasance, and local protectionism is one of the important reasons for the regulation of dereliction of duty, malfeasance. Food regulation of local protectionism is refers to the food safety regulators in order to protect the local local economic interests and achievements, to perform the regulatory functions dereliction of duty, malfeasance, leads to low efficiency, inefficient, and even negative regulatory behavior efficiency, cannot make up for market defect and attain the goal of regulatory behavior and the floorboard of the phenomenon. That local protectionism is to protect the illegal enterprise operated, wanton, law-abiding enterprises was cheated, follow, lead to violations of the law and hurt consumer interests and the long-term economic development, damaged the government's credibility and image.

People used to think that the government food regulation organizations take public interests improvement as basic goal, but the reality is often not the case. The government is not only responsible for social and public health, but also responsible for the economic development. Government responsibility clashed in the field of food safety problems is to adhere to safeguard people's health, persisted in GDP is the highest. From a long-term and fundamental view, is not a contradiction between them, the rapid development of economy is for people to live and work in peace and contentment, guarantee people life and health is also to live and work in peace and contentment. But from local and stages, two exists not only conflict, and conflict is intense, seeking rapid growth of GDP is still some government officials and even the entire government system of "consensus", for example. Sanlu milk powder incident, the local government after know the truth, had dragged on for a month to report the state organs at higher levels, and sanlu group should apply "the control and coordination", strengthen the media to review progress made a lot of resistance. As a responsible government departments, the human life in the big problem, not only don't take measures to prevent the harm of further expanding rapidly, rather ill, indulge. Reason is clear, sanlu is Shijiazhuang city leading enterprise, profit tax, sanlu collapsed, the economic development of Shijiazhuang city will be hit hard, followed by a "domino effect", local governments face shame, official's limited promotion. As for the victims of infants and young children, are not considered. Enterprises and local government in certain degree formed the interests of the community, in fact, both for local governments to provide the rolling financial income and the huge jobs, and provides a promotion, the rich, the promotion, both a glorious all glory, broken. Try to ask the government for the enterprise how to form effective supervision? As long as no liability by outside, some local government departments to enterprise's illegal behavior is bound to it.

3.2 The public participation system is conducive to improve accountability by the regulatory authorities

In recent years, each major food safety accidents have been accompanied by massive accountability "storm", but food regulatory dereliction of duty, malfeasance phenomenon common occurrence, still visible accountability didn't play their effectiveness. Consubstantiality accountability is the accountability system design model in our country, this kind of accountability mode leads to the following questions:

One is the consubstantiality accountability subject set up single, the lack of checks and balances. Within the current accountability system mainly is the administrative system of accountability from top to bottom, to high-level leaders often lack of effective accountability system. Leadership is a responsibility, or to evade responsibility, it all depends on the personal leadership consciousness and accomplishment. The smaller is the greater the power, responsibility, and power is smaller, the greater the responsibility, a "scapegoat", even be pitied;

Second, accountability range is relatively narrow, start at random. Consubstantiality accountability is easy to form the content of the accountability, the narrow scope of accountability only lock in major accident, the media exposure has significant social impact, instructions, etc. Such as the 2004 tainted milk powder incident "big head doll", because of the wide media coverage, to the attention of the leadership, Anhui Fuyang city mayor, vice mayor of two and four deputy director is accountability, those responsible have 47 people were detained. Events, while concentrated outbreak in Anhui Fuyang, in Inner Mongolia, Hainan, Shaanxi, Gansu, Guangdong, Shanxi, Sichuan, Chongqing, Heilongjiang

provinces have similar event to occur, due to insufficient media exposure, the impact is not big, accountability is not in place. Passive because accountability, there is no normalized, a large number of useless “agent officer” of “lazy” (don’t perform their duties, the administrative nonfeasance) could not be accountability. In our country has been under the premise of corresponding standards of using food additives, 2005, 2006, 2006, Japan, Korea, Hong Kong SAR have detect malachite green in aquatic products in China exceeds bid, detection of dereliction of duty for such supervision, accountability, failed to put in place.

The third is weaker, superficial formal accountability efforts. Consubstantiality accountability, in the same administrative system internal relations between higher and lower complex and closely related interests, stakes, personal emotional factors such as affected, to a certain extent, there is a brief, intended to protect and avoid trouble phenomenon, to resign, the organization process, an administrative sanction to circumvent the law responsibility and the accountability efforts to weaken, the limelight after, can stage a comeback again.

Four principal officials back anomie. Quick comeback officials quickly, return procedure black-box, not to solicit public opinion, regardless of the feelings, little less than a year, more than four to five years. For example, because of the “sanlu incident” in the accountability of officials, deputy director general of quality supervision, inspection and quarantine of food production and supervision the original BaoJunKai have moved as early as in 2008 in anhui province as the entry and exit inspection and quarantine bureau chief. Hebei province agriculture department of the original director of liu daqun back in November 2008 after the xingtai vice secretary of municipal party committee, and in January 2009, was elected mayor of xingtai. The two officials because of accountability and didn’t even have time to “step down” over a year. On September 22, 2008, quality supervision, inspection and quarantine bureau chief li changjiang, resigned. On December 24, 2009, quality supervision, inspection and quarantine bureau chief li changjiang to “against pornography and illegal publications office full-time deputy team leader” of the country’s identity to visit jiangsu. At the beginning of 2010, li changjiang to the CPPCC national committee. On March 2, 2010 three session of the 11th CPPCC press conference spokesman zhao qizheng in the reporter’s question, is this reply: “Mr Li can use his experience in the work in the middle of the Chinese people’s political consultative conference and the suggestion, in our political consultation, democratic supervision, that can make a corresponding contribution to participate so eighth appointed him as the 11th Chinese people’s political consultative conference (CPPCC) standing committee, deputy director of the preparatory committee of Hong Kong and Macao this after discussion, we were agreed to.” because “everyone” agreed, no problem, as to common people agree with, it doesn’t matter. Inside the consubstantiality accountability model, the same system between higher and lower level, flat between “mutual understanding and agreed” easily. Return black-box operation, public transparent, the public is the last one to know. So these examples guide give to other officials, work is bad it doesn’t matter, like li changjiang, head of the first severe food safety accident, between gears, executives still can give the, retire. Return the consubstantiality accountability mode problem officials high proportion, mystification, rapid, high, make accountability can be evaded. This is the key of the accountability system has failed to deter the reason.

3.3 public participation system is the intrinsic demand of democratic politics

“According to the nature of the pure sense of the power, power should be all the members share a common exercise together, and can truly reflect the interests of the members of the community of common will and common political power”^[1] “the only real bottom-up granted power, only to express people’s will to power, only some expressed the basic consensus based power, legitimate power is”^[2]. Under the democratic politics, countries all power comes from the people, the government through the licensing for the power of the state and public affairs management. The constitution “all power in the People’s Republic of China belongs to the people.... The people in accordance with the law, through various means and methods, management of state affairs, manage economic and construction, and management of social affairs.

4 Set Up a Sound Food Regulatory System of Public Participation

4.1 Public participation food regulatory management idea innovation

The innovation of management system, is rooted in management innovation. Correct management concept is the premise and basis for the implementation of institutional innovation and. Only the change of social management concept, to promote the system innovation. Deep understanding to the core concept of management innovation, value orientation and management innovation to deepen to the level

of value from the system level, from the behavior level, deepen to the mentality level from surface reform deepening to substantive reforms, to form the understanding of public management consciousness and action consciousness.

4.1.1 Rectifies the subject status of the public participation in food regulation.

Public participation in social management should not stay in form, slogans, should not stay in the report, also be for advice and other ancillary work, but to establish the public participate in the host status of food regulation, on the concept and institutional arrangement reveals the public host status, restore the true nature of people's sovereignty. However, in terms of specific implementation mechanism, the government and the public relations is often embodied in the government management and control of citizens, the people are masters of the country is more of an abstract meaning or the embodiment of the basic system. To reverse this situation, must from the political height to recognize the legitimacy of the public participation in social management, the necessity, break "ranking of officials, to establish the idea of" people-oriented ". In addition to adhere to "the power used for the people, the feelings and plans for the people for the people", also should be deep understanding to the rights granted by the people, "the power used by the people". Government must give up the feudal patriarchal management pattern of top-down, unify the whole country, and government officials also have to give up high above the "sky'm" superiority "for the people in charge", real returns to the original position of "public servant". Government and officials must build up the idea of government and public cooperation work, building a new partnership between the government and the public, truly implement the eighteenth big report put forward the function science, structural optimization, integrity efficient "construction, people's satisfaction of service oriented government".

4.1.2 Adhere to the people-centered economic development appraisal mantra effect.

Change everything with economic construction as the center of the guiding ideology, adhere to the people-oriented. The protection of the economic development is prosperous, but if the thread of the deviation from the people-oriented, will do more harm than good. The development of the famous American economist Michael p. Joe dareau says: "we must regard development as involved in social structure, people's attitude and state institutions as well as to accelerate economic growth, reduce inequalities and the eradication of absolute poverty and so on many aspects of major changes. The process of development, from the essentially speaking, must represent all scope changes." [3] the people's livelihood problem is the state. At present, food safety has become the biggest livelihood issues today. Food safety has become a people care about most, the one of the most direct and most realistic interests problem. Shun public opinion over the people, social harmonious stability. Without the food safety, there is no public health, there would be no economic development and social harmony and stability. The ruling party and the central government must be attach importance to this problem from the height of the political. The basic function of the government performance management, score is the target of to clear, accurate and can distinguish them accordingly, the effective assessment between government departments and levels of government, the guide of government organs at all levels and departments to set up correct achievements view and development view. Assessment of the current government cadres index focuses on the local economic development, which leads the government officials in order to obtain maximum performance, the expense of other interests, blind development of the economy. For investment promotion and capital introduction, some officials to give up the bottom line, just do well relationship and business, to form community of interests. This is the root cause of local protectionism.

4.2 Innovation public participation food regulation of concrete system

Although some administrative areas in the recent ten years in the public participation has made some achievements, but because of the lack of legal provisions and system guarantee, at present most of the public participation depends on the governing level and orientation of the government. Public participation in administrative accountability legalization, institutionalization is the premise and guarantee. Although for public participation in administrative accountability in our constitution provides the system guarantee of the fundamental, specific legal system is not perfect, but must use laws and regulations make clear a regulation on public participation in accountability.

4.2.1 Establish a public evaluation institution

The traditional government performance evaluation is primarily a top-down assessment system. Within a closed system of operation, easy to cause a few officials only on, not only only, leads to higher satisfaction and the masses are not satisfied, the so-called "self-evaluation every, the crowd said no"; Easily lead to official one-sided pursuit of a few assessment indicators, many statistics contains water, produce "digital officer, GuanChu number". Within the government system appraisal, be helpful for

self-examination, through interaction to promote the social recognition of evaluation result, improve the scientific nature, credibility of the government performance appraisal evaluation. Evaluation mechanism must be geared to the needs of the public, by the public for government performance to make a scientific and fair evaluation. Performance evaluation of the performance management organization agencies, according to the performance evaluation content, CePingBiao design service object and the social public questionnaire. Assessment standard, assessment content, assessment results will be open in the government website, and in the major media widely publicized. During the appraisal, any citizen (except herself) all can access to the Internet, every citizen participation will get message feedback and explanatory. Consumer organizations, institutions of higher learning, scientific research institutions, civic organizations, etc. Can also be authorized or entrusted by the government, independent of government and its departments performance evaluation.

4.2.2 Establish a sound food regulators supervision accountability system

In the form of legal norms to determine its content and form of citizen participation, the public has the right to participate in the accountability process each link, including accountability starts, investigation, treatment, be accountable officials argue, is principal officials back program, and clearly define the rights of citizens in each link, such as the right to know, the right to express, the resolution power, supervision, and to the hearing, the right to relief rights, ensure the legal effect of the public participation. In starting the program, for example, meeting the standards, the public that can be filed, without having to depend on the leadership instructions and social impact, such as in cadmium rice incident, officials have not been investigated regulatory responsibilities, at this point, the public can be according to certain procedure, start the accountability system; Comeback in investigation, handling and application, the public participation can reduce the internal administrative system of "bureaucrats shield one another", in the return procedures, the public have been dispose all principal officials during the period of performance evaluation right back and was principal officials and promotion decisions.

4.2.3 Establish and perfect the food regulatory system of public participation

Restraint food regulation of local protectionism, in addition to the shift from the source to blindly taking economic construction as the center, perfect food supervision accountability for curing, also needs to strengthen the beforehand prevention, improve the food regulatory system of public participation is the best route. Has a long food regulation of local protectionism, big economic community of the collapse of the overnight, must in the process of food regulation in the public supervision and checks and balances of power.

Public participation in food regulation legalization and institutionalization. Citizens have the right to participate in every link of food regulation, the first is legislation, each about food safety legislation, all should widely absorb the public participation, through to the society regularly release planning legislation, legislative matters for the social public opinion. Argument to establish and improve the legislation, the hearing, the evaluation mechanism, give full play to the role of the panel discussion, feasibility study meeting, hearing symposium, extensively solicit the public especially the grassroots opinion and the suggestion, set up a sound public opinion feedback mechanism, actively response to social concerns, strengthen the public participation in legislative work of the actual effect, truly "from the crowd, to the crowd to" the mass line. In terms of hearings, resolutely put an end to "fake hearing", namely, policy makers have already decided to exercise some decision, most is in the case of the irrelevant to do some modify and perfect. Other public participation in the field of advanced experience for reference. Such as. In February 1994, the xi 'an people's congress passed "about sales, fireworks regulations, the rules forbid setting off firecrackers in xi 'an city. In October 2003, xi 'an city National People's Congress law committee held a hearing to listen to the amendments to the law. At the same time, the xi 'an people's congress to issue copies questionnaire, were back more than 8000 copies, of which banned the sale of accounts for more than seventy percent. Soon, the xi 'an people's congress (NPC) issued by the modification of the provisions of the notice, finally respect the questionnaire reflects public opinion, also adopted the opinions of the participants in the hearing. 13 in law enforcement link, the public can according to the popular will start the enforcement procedures, such as sampling observation at the food and drug administration in May 2013, guangzhou investigate cadmium rice ", "hubei province adjacent to hunan, also have a lot of hunan rice on the market, but due to various reasons not as a regulatory authority, the public is able to start sampling law enforcement procedures; At the scene of the enforcement of the law, take public representatives, law enforcement, and law enforcement officials with the exercise of the executive, the practice of social management and public brought to authority to supervise. In addition, a sound system of public complaints system, criticism, Suggestions, feedback system, reward system, security system and relief system, etc. In institutions

should have clear statutory time limit and the provisions of the steps are set out in the relief system of public participation or for refusing to infringe upon the public right of supervision and punishment measures.

5 Conclusion

Food regulation of local protectionism lead to regulatory inefficiency, low efficiency and even negative efficiency. The problem is not solved, the current situation will not change frequent food safety problems, the resulting profound social problems will aggravate the existing social contradictions, once the government credibility fell below the bottom line, is bound to encounter more difficult crisis, a harmonious society will become empty talk. Single from the aspects of legal system and improve the solution to this problem is not enough, must rise to the height of political attention to the final solution.

Abstract: Teaching strategy is particularly challenging because it involves developing the ability to think strategically. Yet, many material on strategy present it in a procedural manner that involves a number of steps. At the heart of strategic thinking is creativity. This paper proposes that instructors can rely on using *cognitive metaphors* to help stimulate thinking and questioning about strategizing. Specifically, we propose that sports can be used as *cognitive metaphors* to help students think deeper about competitive issues faced by businesses. We propose some guidelines on the metaphorical use of sports in teaching strategy

Key word: Cognitive metaphor; Strategy; Creativity

1 Introduction

Teaching strategy can be challenging. At the heart of teaching strategy is developing students' develop strategic thinking skills. Yet, the available teaching material on the subject do not usually help develop such a skill. Some are too procedural in that strategy is presented as a sequent of steps to be followed. As a result, there is the risk that strategizing may end up being understood more as a bureaucratic process. Strategy becomes more like "strategic programming" (Mintzberg, 1994).

Early thinking in the field of strategy was largely influenced by the "planning model" which depicts strategizing as a formal, highly ordered, mechanistic and linear process (Mintzberg, 1978). This implies that the process of formulating a strategy is rational and logical process with the implementation proceeding in an orderly manner, akin to steering a airplane. This outlook continues to prevail in some discussions about strategy. Bessire and Baker (2004) point out that this understanding of strategy can be seen in discussions the Balanced Scorecard. Indeed, anecdotal evidence suggests that some organizations continue to operate in this manner with an elaborate strategy formulation process that results in a thick strategy documents that spells out in considerable detail the key performance indicators and detailed action plans.

The way strategy is presented and taught in many textbooks perpetuates this outlook. Many books still depicts strategizing as consisting of discrete steps to be implemented with the use of a plethora of analytical tools. To a certain extent, the presentation of strategy formulation and implementation in this manner do help to make the process easier to understand. It helps authors and instructors explain the main component in strategy formulation and implementation. However, in doing so, it risks oversimplifying the dynamic and fast changing reality that organizations face. Companies competing in a high velocity environment have to deal with a high degree of uncertainty and constant change. New challenges and opportunities emerge at a fast rate and it is not possible to develop elaborate plans with a high degree of certainty. Instead of detailed analysis and elaborate actions plans, these companies have to create success by seizing "fleeting opportunities" (Eisenhardt and Sull, 2001). Mumford et al. (2007) argue that in such a situation, strategizing should focus more on creating a sound base plan instead of a detailed plan. This helps build in flexibility while maintaining constancy of purpose. Eisenhardt and Sull (2001) propose that organizations competing in high velocity environments should rely on a more flexible approach to strategic planning. Instead of developing detailed routine to execute their strategy, these organizations rely on a set of simple rules that serve as the premise that defines their decisions and actions.

To be fair, more books are paying attention to the dynamic and sometime fluid nature of strategizing. We propose here that the use of metaphors can be one way of explaining the nature of strategy and how it is formulated and implemented. Metaphors can be used to describe the different conceptualizations and descriptions of strategy. We offer the use of metaphor as a way to instill more

creativity and use of imagination in the way strategy is described, communicated and taught. The use of metaphors will complement and enrich other approaches in teaching strategy.

2 Definition of Metaphor

Metaphors are mental constructions of our imagination (Von Ghyczy, 2003). A metaphor joins two terms normally regarded as belonging to different classes of experiences (Foss, 2009). These two terms or the two parts of metaphor are called the tenor and vehicle. The tenor is the topic or subjects that being explained. The vehicle is the mechanism or lens through which the topic is viewed.

Metaphor is seen as a major means for constituting reality. We do not perceive reality and then interpret or give it meaning. Rather, we experience reality through the language by which we describe it; description is the reality we experience (Foss, 2007). Metaphors contain implicit assumptions, points of view, and evaluations. They serve as vehicles that help us organize attitudes towards the tenor they describe and provide motives for acting in certain way. The choice of different metaphor to describe a tenor, enables us to view and experience the subject differently. The metaphors we select help us filter and organize our perception and experiences. They are important because the choice of a metaphor means choosing its rules, along with the roles and scripts that are embodied in those rules (Elgin, 1997).

Metaphor is not just a matter of language and using metaphor cannot just be approached from a linguistic perspective. Using metaphor also demands a social approach (Steen, 2011). A metaphor helps the speaker move his audience, to make his argument memorable, and to enhance his prestige in the eyes of his listeners. The use of metaphor enhances the credibility of a speaker, for this reason we might expect the usage could increase audience respect for the speaker (Bowers & Osborn, 1966). The use of metaphors can also help capture change. Anzaldua (1983) is a proponent of the use of metaphors to evoke individual and social change. She argues that shifting metaphor means changing perspectives and that metaphors help make new connections and seeing in new ways, for both the creator of and the audience for the metaphor

Von Ghyczy (2003) proposes that metaphors can be categorized into *rhetorical metaphors* and *cognitive metaphors*. He defines *rhetorical metaphors* as metaphors that are used to compress an idea for ease of communication and aids in making an idea, event or concept more apparent. A *rhetorical metaphor* describes a phenomenon but does little else. An example would be describing speculative price increase as a “bubble”. It indicates that price may soon collapse, akin to the bubble coming to the point where it is about to burst. However, such a metaphor does little to describe what causes the “bubble” effect. *Cognitive metaphors* on the other hand, conveys information quickly and can serve to stimulate learning and discovery. It is efficient in communicating a meaning but it also contains a certain ambiguity and stimulates curiosity and more information search. Von Ghyczy (2003) argue that whereas *rhetorical metaphors* are familiar symbols or events that are used to explain something less familiar to the audience, *cognitive metaphors* is used to stimulate the audience to think creatively about something they think they already understand. The purpose is to get the audience to use the metaphor to explore alternative interpretations of a phenomenon.

Metaphors are by nature imprecise and depicts certain aspects that the communicator is trying to highlight (Tsoukas, 1993). Deeper understanding of the phenomenon of interest can be achieved by seeking a deeper understanding of the metaphor. Tsoukas (1993) argues that the communicator should use multiple metaphors as vehicles to generate a rich understanding of a tenor. The use of multiple *cognitive metaphors* help to liberate insight and generate alternative conceptions.

3 Strategy and Metaphor

The use of metaphor in the business is fairly common. For instance, warfare metaphors are often used as vehicles to describe competition in business (Von Ghyczy, 2003). Kaplan and Norton (1996: 29) use the metaphor of “piloting” to describe the role of key performance indicators in steering an organization towards its objectives. Burns and Stalker describe organizations using the mechanistic-organic metaphor to describe flexibility and rigidity (Lussier, 2012: 43). These metaphors help depict and explain certain aspects of business strategy.

However, many of these metaphors are *rhetorical metaphors* that are used to provide a simple and concise descriptions of various aspects of business strategy. While these *metaphors* serve their purpose, they are what is considered by linguists as “dead metaphors” (Von Ghyczy, 2003). They describe a phenomenon but do not stimulate further thinking and deliberation.

As Mintzberg (1994) points out, strategizing is first and foremost about creativity. It involves the use of intuition and the synthesis of ideas. Creative people rely on exploration of alternative ideas when

encountering ambiguity (Mumford et al. 2003). They are able to engage in critical thinking and divergent thinking (Mumford et al. 2007). Hunter et al. (2012) propose that creative thinking also requires analogical ability and associational ability. Analogical ability is about the ability to use similarities between earlier encountered problems and new problems and utilize the ideas and solutions used in the former for the dealing with the latter. Associational ability is basically the ability to connect ideas that would otherwise remain separated in generating something new. These abilities are crucial in enabling strategist to overcome the tendency to succumb to vertical thinking, help them create short cuts in problem solving and enable them to synthesize new products and approaches to exploit opportunities.

It is in this regard that we argue that developing strategic thinking skills would be aided with the use of *cognitive metaphors*. The key to teaching strategy and developing strategic thinking skills is developing the willingness to consider alternative ideas and interpretations, explore beyond the obvious, examine an issue from the different angles and see connection between ideas and possibilities. We propose that the use of sports as a *cognitive metaphors* in teaching strategy has the ability to help stimulate the students' imagination and thinking about strategy.

4 Sports Metaphor and Strategic Thinking Skill

Sport metaphors are useful for teaching a difficult concept by paralleling that concept with something the reader is familiar with and excited about. Sports metaphor should be able to help to clarify some of the basic concepts related to strategic planning (Wilsey, 2011). Team sports can be used as a metaphor for corporate organizations. The owner of the team, like shareholders in a corporation, do not play the game. Instead, players act on behalf of the owners, much like employees working as agents of shareholder. In this agency relationship, it is critical that all the employees in the organization understand and align their actions with the organization's mission, vision and strategy. The players, like employees in a corporation, must be able to make their own decision and take action on behalf of the owners. Like business, sports are competitive activities. Success depends on the ability to understand one's abilities, the environment and opponents' behaviours.

Many instructors would have used metaphors to explain a point in their strategy class. Most of the time metaphors are used mainly as a heuristic tool. They are often used briefly and occasionally as *rhetorical metaphors*. *Cognitive metaphors* extend the use of metaphors beyond this and can instead help stimulate discussion. The use of sports as *cognitive metaphors* in teaching strategy and strategic thinking has the potential to develop the thinking skills and abilities needed to be an effective strategist. Each type of sports is governed by a set of rules, logic and winning formula. However, the different types of sports differ considerably. Even though the aim of every player is to win, the key success factor and capabilities needed to win is unique to each sport. In fact, the key success factors differ across different matches in a particular sport. For instance, badminton and tennis are similar in that both use rackets, are played on courts and the players are separated by a net. However, the skills needed to excel in these two sports differ considerably. The similarity between badminton and tennis is the importance of hand-eye coordination and the ability to mislead the opponent when making a stroke so as to have him run in a different direction from where the player intends to send the ball or shuttlecock. However, badminton requires the ability to use wrist in maneuvering the racket to hit the shuttlecock to the desired direction. Tennis, on the other hand, requires arm strength without the use of the wrist. This example shows how sports metaphor can be used as a vehicle to help students develop analogical abilities in assessing the difference and similarities between situations.

The potential to use sports as a *cognitive metaphor* is due to the fact that most students have a certain degree of familiarity with the main sports but do not necessarily have a deep understanding of the key factors that will determine how to win a match. Thus, while the use of sports as a *cognitive metaphor* provides something most of us can relate to, a deeper understanding of the different key success factor requires that we explore deeper the dynamics of a sport. Performing this will help sharpen the students' critical thinking as well as divergent thinking.

Sports can be used as a *cognitive metaphors* in three basic ways. First, is to use different sports for comparison and stimulate a discussion on similarities and differences as well as about key factors for success. An example is a comparison between American football and soccer. Soccer is played in two halves lasting 45 minutes each whereas American football has many pauses and are played in four quarters of 15 minutes each. And soccer players use their feet whereas American football is played with both hands and feet. American football is more choreographed with teams relying on well developed playbooks to plan their moves. Teams practice these moves repeatedly to ensure their smooth execution

during matches. Soccer on the other hand, is less structured and choreographed. Teams decide on basic issues such as their formation, which opponent player to be marked, pace of their game but players have considerable flexibility and autonomy in how they play the game and how they conduct an attack. The more choreographed nature of American football makes the team behave more like mechanistic organizations compared to soccer. On the hand, the greater flexibility that players have in deciding on their moves in soccer makes the sport resembles organic systems. Students can then be steered to think about the different key factors for success in the competition in the fast food industry compared to management consultancy.

The second approach is to use a match in a particular sport to discuss why the winning team won and their relative advantage over their opponents. An example is a comparison of the match between Spain and the Netherlands during the 2010 World Cup finals. Both teams have a strong reputation. Recognizing that their opponent have some very capable players, the Spanish team relied of good passes between their players to gain control over the tempo and progress of the game. And to ensure higher scoring chances, the Spanish avoided long range shots. The Dutch, on the other hand, relied on long range shots that did not succeed in getting into the goal. The Spanish were also skillful in exploiting weaknesses in the Dutch defense by making attacks from the sides, drawing out the less agile Dutch defenders, and then making a pass to the centre for the final kill (Farah, 2010a). The use of this historic match as a metaphor enables students to discuss the dynamics of the game and develop their ability to dissect the key success factors and relative advantage in the strategy and tactics used by the teams. For instance, students can be encouraged to identify the relative advantage Spain had over the Dutch in deploying its strategy. Lessons can be drawn on the importance of good execution, adaptiveness and the ability to exploit opponent's weaknesses. Here also, students can then be asked to compare Apple with Samsung in the way they compete in the smartphone market.

The third approach is to use the top teams as comparisons and to get students to explore and identify what makes these teams consistently outperform other teams. A discussion along this line will not only help students identify key factors for success and relative advantage, it can also get them to identify how each team configure its resources and help them identify rare and tacit capabilities that the top teams have. For instance, the Brazilian national team, is probably the strongest team in the world, being the only team to have won the World Cup five times. Their success is attributed to a number of strengths (Farah, 2010b). This includes highly skilled player, defenders with good tackling skills and good passing technique. Their midfielders are very good at dribbling and quickly push the ball to the strikers for the final kill. And their strikers are known for being creative and attack minded. Here students can be encouraged to examine how seamless execution that exploited the individual strengths of Brazilian players is crucial. They can use this understanding to compare soundly executed and poorly executed strategies. For instance, in the discount airline segment, why does Southwest Airline continue to thrive whereas People Express collapsed? Why was it that the Hong Kong based discount airline Hong Kong Oasis Airline failed (Stanley, 2008)? How can the insights from the Brazilian team be used to understand how Southwest configure its resources to support its competitive approach?

In each of the three possibilities mentioned above, the answers are not obvious and will require considerable debate among students. This provides the opportunity for each student to offer his analysis and arguments to support his views. The use of sports as *cognitive metaphors* also goes beyond simple descriptions offered by *rhetorical metaphors*. Students can examine a phenomenon from various angles. In terms of teaching strategy, it enables instructors to not only describe which teams are superior compared to their rivals but also how these teams develop their strengths. In other words, instructors can use *cognitive metaphors* to generate insights from an Industrial Organization perspective as well as a Resource Based View of competitive strategy. Thus, *cognitive metaphors* can serve as an integrative tool that help students link various theoretical perspectives in strategy.

Zhou & Heineken (2009) argue that the use of metaphors to conceptualize a theoretical construct or communicate new knowledge in an academic setting requires that the metaphor is carefully selected and presented in appropriate contexts so as to ensure that the students can easily derive the intended metaphorical meaning. We propose some specific steps that instructors can take in using metaphors to teach strategy includes:

(1)Instructors need to choose a sport that are more commonly known to most students. In most countries it is easier to use soccer or tennis as metaphors than lacrosse or Gaelic football. This will enable them to examine these sports. Their understanding doesn't have to be thorough or complete. The basic idea is to use the lack of complete understanding to stimulate sense making in the discussion.

(2)Students should be encouraged to do some background reading to familiarize themselves the different types of sports and games. Instructors can also get students to watch a match to gain more

understanding of the dynamics of game. It is not necessary that everyone has the same interpretation of the match. The ensuing discussion should be an opportunity to share their insights.

(3) Instructors need to rely on the use of questioning to stimulate debate and discussion about the metaphor and how the insights from a particular sport or match can be used in business situations. They need to resist the temptation to lecture and feed answers to students. Questioning should be used to help students explore ideas, alternative explanations and see parallels in between metaphors and business situations.

5 Conclusion

The use of *cognitive metaphors* in teaching strategy is meant to complement other methods. It can help make class discussions more alive. Sports, because of its competitive nature, can help students examine problems with the context of rivalry that businesses usually encounter. We believe this help make the discussion more lively and insightful to students.

Abstract: This article presents a case study of two companies operating in the Brazilian market; one in the electrical energy sector, and the other in the pharmaceutical sector, both of which appeared on the list of 150 Best Companies to Work for in Brazil in 2012, and have stated that they consider retaining talents to be essential to their Human Resources strategies. These companies identified the professionals they considered to be talents, through the application of a questionnaire to the employees, with 51 statements, the results of which were used to analyze the link between retention factors and intention to remain in the company. Together with the application of the multiple regression technique for associations between the variables, the retention factors, measured by means of the employees' perceptions, were qualitatively linked to the practices of talent retention adopted by the companies. Among the results, it is highlighted that the retention factors explained 86% in company A, and 83% in company B, of the variation in the variable "intention to remain in the company." It was observed that the talents are determined by the management model of each company, and that the employees who were considered talents based on their current performance, together with those with potential to be considered talents in the future, represent 20% of the company's staff. Based on the results, we believe that before implementing a talent retention strategy, companies need to understand the influence of the macroeconomic scenario on the job market; the social influences that impact on employees' career expectations; and the individual personalities of the talents.

Key words: Retention; Strategy; Talent

1 Introduction

The resource-based view of the firm (RBV), a term coined by Edith Penrose (1959), provides support for understanding the present-day search to retain talents in companies, which are increasingly finding it necessary to maintain talented people, capable of occupying strategic positions in the organizational hierarchy (Holtom, Mitchell, Lee, & Eberly, 2008). It can be assumed that the mobilization and retention capacity of these companies can guarantee sustainable competitive advantage for companies.

In the literature on talent management, it is difficult to find definitions, concepts and processes that assist in the creation and adoption of effective practices in companies seeking to manage their talents. Authors like Lewis and Heckman (2006), Huang and Tansley (2012) mention the lack of integration between talent management and strategic management, both in the area of Human Resources and in the company as a whole.

According to Lewis and Heckman (2006) this is a major problem that needs to be resolved for the proper planning and management of employees, and various articles have described talent management as a new way of thinking within Human Resources management. One of the main challenges for the theoretical and practical advancement of talent management is the need for a theory, or principles that can provide guidance on the group of talented people the company should look for, and the areas its retention strategies should focus on.

According to Allen, Bryant and Vardaman (2010), research into the effects of the industry, the competitive and organizational environment, as well as the national culture, would be of great value for understanding talent retention in different work contexts.

In a scenario where the importance of managing and retaining the skills of employees that are valuable to the company is increasing (Wright & Snell, 1991), the question that remains is how Human Resources management can provide a working environment that will encourage employees to remain in the company (Allen et al., 2010; Holtom et al., 2008)

For 57% of Brazilian employers, the current difficulties in filling job positions are related to the candidates' lack of qualification. To resolve the challenge of this deficiency in the workforce, the main initiative of companies has been to apply training and development actions for their staff (Manpower, 2011).

Brazilian human resources professionals, when questioned about the challenges and trends for this area over the coming years, generally mention talent management as an underlying concern (Barreto, Silva, Fischer, Dutra, Veloso, & Amorim, W., 2010). According to these authors, HR professionals mention, among these challenges, the need to stimulate young professionals, and the imminence of loss of professionals' knowledge when they retire, among other factors related to the use and retention of valuable people for the company.

This article, which seeks to understand the search to retain these professionals and ensure they remain in the companies, begins by discussing the approaches adopted in the talent management, and the challenges involved in retaining them. It then presents the conceptual model that formed the basis of the analyses, and finally, a discussion of the results in regard to talent retention strategies.

2 Theoretical Framework: Streams of Thought in Talent Management

According to Collings and Mellahi (2009), there are four main streams of thought in relation to the concept of talent management. According to the authors, in the first stream of thought, talent management is described in the literature, and in the business world, as a new label for the area of Human Resources management, since in this line of reasoning, managing talents means ensuring that these individuals carry out their actions with greater efficiency.

The second stream of thought found in the literature focuses on "pockets of talents," and defines the process of talent management as being practically the same as that of personnel management. The objective here is to plan for future needs (leadership, or in general) for which it is necessary to map the professionals, considering their present and future needs. This stream of thought reinforces well known practices of succession management, and also of forecasting demands versus actual offer, the costs involved, growth of the company, and mergers and acquisitions, for example (Lewis & Heckman, 2006). Therefore, the contribution of this approach in the literature does not show the strategic role of talent management for the company (Collings & Mellahi, 2009).

The third stream of thought defines the idea that all the functions within the company should be filled by professionals with high performance and potential, and affirms that the talent management should concentrate on managing these professionals. While this approach appears not to favor the employees with average or low performance, Collings and Mellahi (2009) recognize limitations to this reasoning, and argue that it is neither desirable nor appropriate to fill all the positions of the company with talents.

Huselid, Beatty and Becker (2005) add that few employees work in positions considered strategic: approximately 20% of the entire staff. Thus, it is only to these positions that talent retention would apply. Accordingly, if the talent management system is applied in the same way to all the employees of a company, it becomes difficult to differentiate talent management from traditional Human Resources management. Following this reasoning, the fourth stream of thought in talent management relates to the identification of key positions, which have the potential to impact on the competitive advantage of the company. In this case, the talent management strategy involves activities and processes aimed at systematically identifying strategic positions that contribute to the company's competitive advantage.

With this in mind, research on turnover and retention has been replacing a focus on understanding "why people leave" with a focus on "why they stay" in companies (Holtom et al., 2008). Our study considers this trend, and puts the focus back on professionals who are more highly appreciated by companies, and who, according to the reasoning developed here, are called "talents."

2.1 Challenges to talent retention

Talent retention strategies should adapt to the assessment of how critical the employees' competencies are for the company; the employees, in turn, depend on the organizational competencies, and vary from one company to another (Ortlieb & Sieben, 2012). We can therefore assume that the definition of a talented employee will also vary from one company to another.

However, one thing that all companies have in common is the existence of direct costs arising from loss of talents, due to interruptions in the work, generating a loss of knowledge associated with these employees. However, even if a company makes substantial investments in talent retention, a portion of these employees may still leave the company voluntarily (Trevor, 2001; Allen et al., 2010). These are

factors over which the company has little or no control, such as health issues, or questions of double career. These authors also suggest that the start of the process of leaving the company is generally initiated by some shock or event that prompts someone to consider leaving their current job.

2.2 Strategies for talent retention

Ortlieb and Sieben (2012) developed a taxonomy of five talent retention strategies associated with the level of criticality of the employees' competencies. In this study, the criticality of the competencies was defined by the human resources managers of the companies analyzed. Thus, two taxonomies emerge: 1) competencies associated with internal knowledge of the company (technical skills, leadership, or knowledge of aspects of the product or process); 2) competencies associated with external knowledge (of the consumer market, and negotiation with other stakeholders). The retention strategies are mentioned below:

Incentives (monetary and non-monetary): salary increases and variable remuneration, responsibilities and career opportunities.

Norms and values: involvement with the company's objectives, and a sense of belonging.

Coercion: job regulation contracts, with penalties for leaving the company.

Recruitment of new professionals: recruitment of new professionals and managers (internal or external).

Knowledge management: obtaining know-how through manuals and guides, use of information technology or specialized systems, and exchange of experiences.

Regardless of the competencies involved, in the study of Ortlieb and Sieben (2012), the retention strategy based on norms and values was considered the most effective one, followed by a strategy based on incentives, and then on recruitment of new professionals. Knowledge management was in fourth place, and coercion was the least frequently adopted strategy.

We therefore consider that in a model that seeks to involve people in the goals and values of the company, there is an influence of perception on the human resources management practices to retain employees, according to the reasoning of Yamamoto (2012). We therefore link the retention strategies (Ortlieb & Sieben, 2012) with the factors that prompt employees to remain in the company (Hausknecht et al., 2009) and, as shown in Table 1, we present the structure that will be used in this article to analyze the results.

Table 1 Relationship Between Retention Strategies and Talent Retention Factor

Retention strategy of the company	Retention factor, according to employees' perceptions
Incentives	Extrinsic rewards Flexible work arrangements
Norms and values	Organizational prestige Organizational commitment Job satisfaction Organizational justice
Coercion	Lack of alternatives Investment Nonwork influences Location
Recruitment of new professionals	Advancement opportunities
Knowledge management	Constituent attachments

Source: Elaborated by the authors

In the description of the retention strategies, there is no consideration of external factors, which are unexpected and are not related to the job (Allen et al., 2010). Therefore, in the coercion strategy, besides considering the formal contractual aspects for staying in the company, we also considered the informal influences that are not under the company's control, such as family situations, employees' propensity to invest in their career in a company, job alternatives in the job market, and the ease with which the employee can travel from their home to their job.

The incentive strategies were linked to the extrinsic rewards, and to the employees' desire for flexible work arrangements. In norms and values, we considered prestige, commitment to the company, and job satisfaction. And in knowledge management, we considered the constituent attachments between colleagues, leaders and clients of the company, from a perspective of turning tacit knowledge into explicit knowledge (Nonaka & Takeuchi, 1997).

In short, based on the above reasoning, we present the objective of this study, which is to link the

talent retention strategies of two companies, operating in different business contexts, to the employees' intention to stay in the companies.

3 Methodological Procedures

The case study is a research strategy that seeks to understand a particular dynamic in unique configurations. More than one case can be analyzed, in a so-called multicase study, or a single case, with more than one level of analysis. Case studies can fulfill various objectives, which may be either descriptive, or to test or generate some theory (Eisenhardt, 1989).

Therefore, this research can be classified as a multicase study (two companies), with more than one level of analysis (employees and the area of Human Resources management).

Yin (1995) states that when carrying out a case study, it is necessary to establish a protocol, which besides presenting the common content of a collection tool, establishes the procedure and rules to be followed during its use. Once the protocol is defined, the research is initiated, based on the following variables: strategies for talent retention, perception of talent retention factors, and intention to stay in the company.

The case study was carried out using both qualitative and quantitative methods, i.e. adopting the multi-method of data triangulation (Eisenhardt, 1989; Yin, 1995). Following the research protocol, the stages described below were followed.

The first stage of the study involved the selection of the companies, which represent the units of analysis of the case study. This selection was based on document analysis of descriptive reports of human resources management strategies and practices.

These reports were prepared by the people responsible for the areas of human resources of the two companies operating in different sectors: one in the electrical energy sector, and the other in the pharmaceutical sector, which were included in the list of the 150 Best Companies to Work for in Brazil in 2012. These two companies were selected by the researchers because they had stated, in the above-mentioned reports, that they considered talent retention to be essential for their Human Resources management strategies. Also in this stage, the descriptions were selected, of Human Resources practices adopted by these two companies that could be linked to the talent retention strategies described by Ortlieb and Sieben (2012).

The choice of this database for the selection of the units of analysis was based on the fact that this group of companies contain information on major companies operating in Brazil, and which can be considered references in Human Resources Management.

It is important to mention that the initial requirement to take part in this survey, which involved 500 companies, was that it must have 100 employees, a criterion that ruled out a number of smaller companies that may have similar practices to those presented.

The second stage of the study consisted of asking the two selected companies to indicate which employees they considered talents. After this indication, the third stage consisted of the application of a questionnaire to these employees, with responses on a 5-point Likert scale to measure "perception of retention factors" and "intention to remain in the company." The 51 statements (Appendix 1) were elaborated based on the categories identified by Hausknecht et al. (2009), and were used to analyze the relationship between the retention factors (independent variables) and intention to remain, among the people considered to be talents by the company (dependent variable).

The interpretation of the results followed the recommendations of Miles and Huberman (1994), which guide the researcher in the identification and comparison of standards, and is presented below.

4 Analysis and Discussion of the Results

In the analysis of the cases presented here, to preserve their identities, we have called the company in the electrical energy sector company A, and the one in the pharmaceutical sector company B. First, we present the challenges to talent retention, which were described by Human Resources professionals of the companies, in the reports indicated in the first stage of this study. This is followed by the statistical validity of the measuring model used, and finally, the retention strategies adopted by the companies, and their results in terms of the intention of talents to stay with the company.

4.1 Measurement model

According to the employees' perceptions, lower mean values were found for coercion strategy: lack of alternatives (2.49), nonwork influences (2.77), investment (3.30), and location (3.96). The highest mean values were found for the strategy knowledge management: constituent attachments (4.48); and

for the strategy norms and values: organizational prestige (4.10), job satisfaction (4.16), organizational commitment (3.57) and organizational justice (3.19). The Cronbach's Alpha reliability indices were satisfactory; only the factor flexible work arrangements (0.60) did not reach the reference value of 0.7.

We conducted a confirmatory factorial analysis (CFA), applying the estimate of maximum likelihood to the Analysis of Moment Structures software (AMOS) v. 18. The main absolute fit index of the model is the chi-squared (χ^2). Other commonly used absolute fit indices are the Goodness of Fit Index (GFI), an index that is less sensitive to sample size, whose reference value is 0.9, and the Root Mean Square Error of Approximation (RMSEA), a measurement that seeks to correct the trend of the chi-squared index by rejecting models with large samples or a high number of observed variables, with a reference value of 0.08 (Hair, Black, Babin, Anderson, & Tatham, 2009).

Although the chi-squared statistic presented a significance value, when considered on the degrees of freedom ($\chi^2/df = 1,77$), it attests to the quality of the model, with values below 3 being considered good (Hair Jr. et al., 2009; Kline, 1998).

The other indices also show that the adjustment of the measuring model obtained satisfactory fit to the data $\chi^2(1314, N = 141) = 742, p < 0.01, \chi^2/df = 1.77, GFI = 0.90, RMSEA = 0.07$.

The standard factor loading of forty-three statements used in the measurement model were between 0.5 and 0.93, all significant ($p < .01$). The results demonstrate the fit of the statements to the constructs that the researchers sought to measure. However, eight statements presented loads lower than 0.5, and were therefore excluded from the model (Hair et al., 2009).

Below, the retention strategies adopted by the two companies studied here, and the relationship between these strategies and employees' intention to remain, are described.

4.2 Strategy of Incentives

Although practices of job flexibility, with home-office and flexible working hours, were mentioned, in both companies the adoption of flexible work arrangements was not a statically significant factor in influencing the talents' desire to remain (Company A: $\beta = -0.10, p > 0.01$ / Company B: $\beta = -0.21, p > 0.01$).

Company A seeks to attract and retain professionals through the adoption of best practices in the market, remunerating the employee by the market average, which is checked periodically by salary surveys. The remuneration consists of a fixed part and a variable part. The fixed part consist of the funds of a habitual nature, and the variable part is performance-based, whether through the performance bonus, or parcels allocated by the profit sharing program, based on Profits and Results.

Meanwhile, Company B has limitations in relation to the promotion of speed of career and salary practices aligned with companies in the same sector and of a similar size. The question of salary, particularly when compared with the large pharmaceutical companies, is described as the main motive for employees leaving the company.

4.3 Recruitment strategy

In Company A, talents are included in a succession plan, and their development is monitored in the talent management program. The performance matrix is the main factor that guides the actions of development, recognition and retention. The employees are assessed once a year, based on their competencies and goals, and depending on their position, specific actions are analyzed and implemented for each group.

The selection processes of Company B, meanwhile, seek to identify candidates whose professional expectations are aligned with the value proposal of the company, analyzing, in particular, their priorities in relation to salary, job position and quality of life. Another of the actions adopted is the use of indication of new employees by employees of the current staff, to fill vacant positions. In both companies, no significant relationships were found between the advancement opportunities (Company A: $\beta = -0.15, p > 0.01$ / Company B: $\beta = 0.17, p > 0.01$), through its programs for recruitment of new professionals, and talents' intention to remain in the company.

4.4 Strategy of norms and values

New recruits in Company A go through an induction period, and are received by a host. This corporate training path consists of three stages. First, the employee is received by a work colleague, who introduces him to the other members of the team, shows him around the workplace, and accompanies him during the first few days. In this stage, the new employee is also informed of the company's benefits. The new recruit then learns a bit more about the history of the company, the communication channels, his rights and duties, Human Resources policies and management programs, the strategic guidelines, and the certification processes, among other things.

4.5 Strategies to mitigate coercion

In both Company A and Company B mechanisms of formal coercion, such as minimum-term contracts, were not mentioned as talent retention methods. The external factors of coercion and continuance of the employee in the company are considered, and the company seeks to mitigate them. The working environment is used to improve the employees' quality of life. In both companies, the quality of life programs are based on the pillars of physical, emotional, social, environmental, and spiritual well-being, as well as security, and financial health.

4.6 Knowledge management strategy

Little information was found on strategies and practices of knowledge management of talents. Likewise, only one mentoring program for young executives was mentioned in Company A. A structured program for specialist professionals with high expertise was also mentioned. In it, the key knowledge of the company is mapped, and professionals responsible for disseminating knowledge are identified. Based on this, the tutoring process of older to younger is begun, taking advantage of the experience of one and the youth of the other, to translate and retain the knowledge within the company.

Company B presents a more critical situation, because when it loses professionals, particularly at management level, it offers, where possible, funds or better salary proposals than those it offered to the previous occupant of the position to be filled, in a bid to attract highly qualified people. Management of the total payroll is used as a means of managing knowledge.

5 Theoretical Implications

Based on the findings of this study, we hope to contribute to understanding of the relationship between the company and its employees, particularly those wishing to remain in their current jobs. The retention factors explain 86% in Company A, and 83% in Company B, of the variation in the variable "intention to remain in the company." It is noted that there is a need to contextualize both the times the company is going through in the dispute for qualified professionals in the job market, and its sectoral and internal context (Allen et al., 2010).

We hope that the Brazilian scenario will contribute to demonstrating strategies for talent retention in two companies facing the same challenge in different ways. For this reason, the concept of competencies (Barney, 1996), derived from the resource-based view of the firm (Penrose, 1959), offers support for a detailed analysis between companies, particularly in relation to the key positions, which should be filled by individuals with certain profiles and competencies.

It was observed, in the analyses, that the talents are identified by the management model of each company (Ortlieb and Sieben, 2012). Although the talent management is different in each of the two companies studied, we could see that the employees who are considered talents for their current performance, together with those with potential to be considered talents in the future, represent 20% of the total employees.

The remuneration was deliberately considered as a factor of balance in the retention strategy in Company A, and the same could be said of Company B in terms of the involvement of the employees, with their objectives and values.

The proposal of this study to consider coercion caused by external, non-contractual influences, such as financial and family commitments, proved to be valid because employees who stay merely out of a sense of obligation tend not to be as physically, psychologically or socially healthy to carry out their jobs or add value to the company (Allen et al., 2010). Thus, neither of the two companies used coercion by means of contracts as their main retention strategy, on the contrary, they sought to mitigate the employees' sense of obligation to remain in the company arising from nonwork influences, through their quality of life programs. It is, then, the responsibility of talent management to interfere only in factors related to the working environment.

However, one factor that deserves attention is the profile of the employee who invests much of his time in his career in a company. Thus, some people are easier to retain, because they have a more conservative profile than others, who are more averse to dedicating their career to a single company (Hausknecht et al., 2009).

6 Practical Implications

We believe that companies, rather than creating a talent retention strategy, need to understand certain factors: the influence of the macroeconomic scenario on the job market; the social influences that generate an impact on the career expectations of the employees in relation to companies, and the personalities of the talents.

The success of the talent retention strategies is generally measured by organizational turnover (Holtom et al., 2008). We believe this indicator is too delayed, implying a reactive attitude on the part of the company. Measuring intention to remain is an indicator that other observable behaviors, such as absenteeism, precede the employee's departure. In other words, the company needs to take a proactive stance, before the talent leaves.

As a suggestion for the companies, the use of talent recognition management is recommended. Stimulating the sharing and explanation of knowledge of these professionals about the company and clients, through cooperative relationships, can help shift of focus of from retaining the individual to retaining their skills.

7 Limitations and Suggestions for Future Studies

There are limitations in relation to the number of people who responded to this survey. On the other hand, considering that talent management is considered strategic in the companies, few of them agreed to take part in the survey, enabling the application of questionnaires to their talents. The difficulty of many of the companies in defining who their talents are meant that some companies that wanted to participate in the process were not able to do so. We therefore opted for a convenience sample.

For future studies, we suggest consolidating detailed talent management and retention models for different organizational contexts. It is also important to determine whether talent retention involves discriminatory behaviors and lower added value for the company.

Analysis on the Critical Factors of Leading Figures' Impacts on the Performance of Enterprise Innovation Teams*

Dou Han¹, Chen Yun², Zhong Qian³

1, 2, 3 School of Management, Wuhan University of Technology, Wuhan, Hubei, P.R.China, 430070
(Email: douhan416@163.com, chenyun135@126.com)

Abstract: The enterprise innovation team plays an important role in building an innovative country. The leading figures with professional knowledge and skills, high level of management ability and good personality are the core resources of the enterprise innovation team, and they can lead to higher efficiency of the innovation team work. This study aims at analyzing the factors of the leading figures that make influence on enterprise innovation team performance, and finding out the critical factors, in order to provide a reference for enterprises to select leading figures, to allocate human resources more effectively, and to improve the overall performance of the innovation team.

Key words: Critical factors; Leading figures; Performance; Enterprise innovation teams

1 Introduction

With the rapid development of information technology, the importance of innovation in science and technology research and technology competition is becoming more and more highlighted, building an innovative country has become the common sense of the most countries throughout the world. Our country has put forward the guidelines of building an innovative country on the basis of independent innovation, key span, support the development and lead the future. Independent innovation capacity has become the inner engine for a country's long-term development, and the power source of scientific and technological progress. Moreover, the enterprise innovation team is the important part of an innovative country, and the core of the implementation of independent innovation. Therefore, the development of enterprise innovation team is one of the important reflections of the development degree of an innovative country. The leading figures with professional knowledge and skills, high level of management ability and good personality are the core resources of the enterprise innovation team, and they can lead to higher efficiency of the innovation team. This study aims at analyzing the factors of the leading figures that make influence on enterprise innovation team performance, and finding out the critical factors, in order to provide a reference for enterprises to select leading figures, to allocate human resources more effectively, and to improve the overall performance of the innovation team.

2 Literature Review

In the early studies about the personality characteristics of science and technology leaders and the functions of team leader, Ama (1998) argues that science and technology leaders should have pioneering spirit and outstanding intelligence level, they are irreplaceable technology experts, and they can help team members to build confidence to reach success through personal influence and ability^[1]. Since the 21st century, Deschamps has divided the innovation leaders into the front leader of technology or product innovation, the back leader through industrialization and market implementation^[2]. Wang Dong(2006) pointed out that leader is the key to the formation and development of enterprise innovation team, in enterprise innovation team, the leader is not only the source of core technology, the core resource of the team, but also the important part of the human capital of the team^[3]. Thus, it shows that leader plays an important role in enterprise innovation team. At the same time, a large number of empirical studies have shown that the team leader has significant correlation with team performance, team leadership is one of the key factors that affect the team performance^[4]. Yang Chen (2008) has analyzed the connotation of innovation team in details, and explained that the operation pattern of a task innovative team is that the leader integrates strategically all innovation units in the whole system^[5]. So the leaders' influence on the performance of enterprise innovation team can not be ignored. Wu Jie, basing on the established hierarchy model of the performance evaluation of science and technology innovation team and its evaluation index system, using AHP analysis method, analyzed the hierarchy and draw a scientific and quantitative model of innovation team performance^[6], and the result showed that the team innovation ability and the teamwork are significantly affected by the innovative enterprise

* This paper is supported by Wuhan Science and Technology Project(201271031387)

leader. The leadership process of innovation team and the mental models of leader fundamentally affect the team’s cognitive process. One of the responsibilities of the team leader is to train the team members to understand the environment, goal and task of the team and to communicate with team members about the mental models of the team^[7].

3 Leading Figures’ Characteristics and the Performance of Enterprise Innovation Team

3.1 The definition and characteristics of leading figures

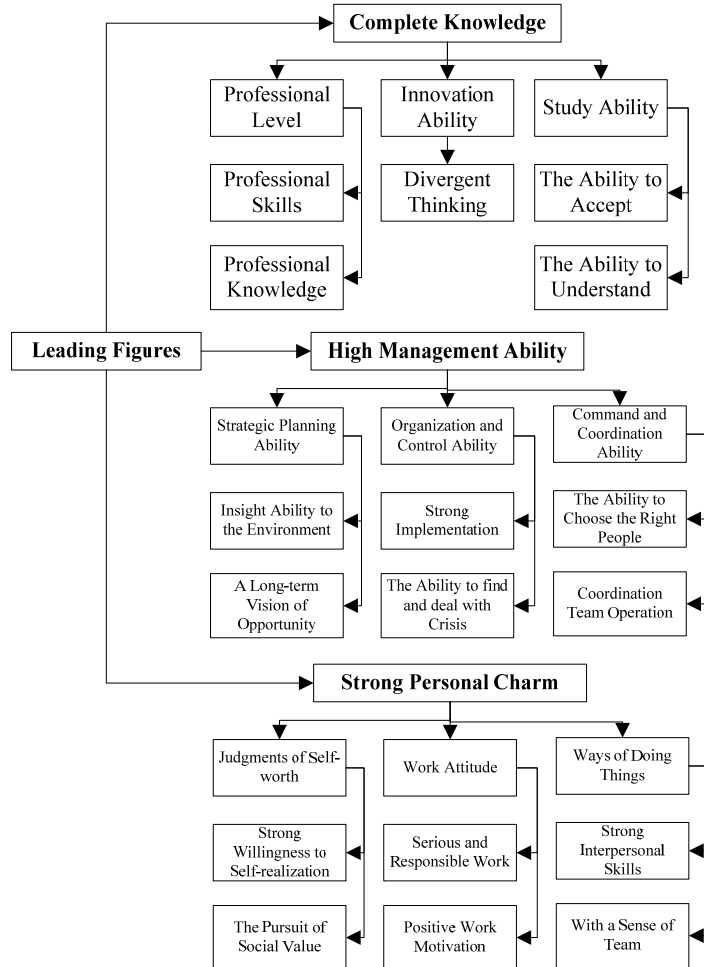

Figure 1 Enterprise Leading Abilities

About the definition of the leading figures, academia has not yet made a unified accurate explanation. Li Chunsen, talent research association of Shanghai, said that, leading figures, as the name implies, they are not only talent, but also equipped with lofty value pursuit, outstanding scientific literacy, excellent leadership, unique personality charm, tenacious perseverance, strong team cohesion, and extensive social influence. Chinese scholars Cai Xiuping(2007) argues that “science and technology figures” are those who, in the vast field of natural science, social science and technology-based enterprise operation and management, including the front of basic research, applied research, technology development and market exploitation, play a big role in academic technology leadership and team core, prompt the scientific to be turned into practical technological productivity, integrate and optimize social resources, explore and create value source, lead the trend of the times through continuous innovation, thus making an outstanding contribution to the development of economic and social people^[8]. Wang Dong(2007) argues that “leader” is the leader of the team, is responsible for providing guidance for the team and set long-term goals for the team, deal with the relationship with other departments within the organization on behalf of the team at the appropriate time^[9]. Lv Biao (2008) points out that “figures” are those who make a significant contribution in specific areas, promote or lead the development of specific

areas of the famous statesman, thinker, scientist, inventor, engineering and technical experts, etc^[10]. Combining with the understanding of these concepts, this article defines the meaning of “leader” as formal authority leading personnel in the enterprise, with professional technology and knowledge advantage, with management ability of organizing enterprise, with personality charm of leading a team.

It is generally believed that enterprise leader's quality can be divided into political quality, ideological quality, moral quality, cultural quality, professional quality, physical quality and psychological quality, leadership and management ability, etc. Spencer (2007) puts forward the iceberg model which points out that the characteristics of the enterprise leaders can be divided into dominant competence(knowledge skills and invisible competence), such as social role, self-concept, trait and motivation. At the same time, he puts forward the onion model, which argues the characteristics of the leader can be divided into core layer(trait and motivation), middle layer(self concept, attitude and values), Surface(skills)^[11]. These divided methods show that the formation of enterprise leaders, in addition to the external professional knowledge skills, more intrinsic characters are self-value judgment, value choice and value expectations. Thus, this paper argues that the enterprise leaders should have the following characteristics

3.2 The dimensions of measuring the performance of enterprise innovation team

Leader can exert important influence on the performance of enterprise innovation team, at the same time, and the dimension of measuring the performance of enterprise innovation team also affects leading figures to play a role. The measure of the performance of enterprise innovation team is one of the important factors involved in this paper. Zhang Chunxia(2001) argues, team performance includes two aspects, namely the individual level and team level, and each level is divided into two dimensions: namely the behavior dimension and the result dimension^[12]. Xu Fang(2003) argue that team performance is a system process, which is closely related to the individual performance and organizational performance^[13]. Wang Yanjie(2009) put forward a five dimensions measure of the performance of university innovation team, namely independent resource investment ability, the productive capacity, social influence, internal radiation ability, sustainable development ability^[14]. Lan Yujie(2001) took example and developed the performance measurement scale built up by Lovelace's and others, mainly from three aspects, namely, working achievement of innovation team, innovation team's influence on its members, and working process of innovation team, to measure the performance of innovation team^[15]. Combining the existing research with the particularity of innovation team, according to the standard of KPI index, this paper argues that the dimensions of measuring the performance of enterprise innovation team should include the following aspects: the economic benefits of enterprise innovation team(the contribution to the profitability), the operating benefits of innovation team(the impact on market share, company's internal management cost and operation expenses for the team itself), and organizational benefits of innovation team(the impact on corporate image, self-development and satisfaction).

4 Analysis on the Factors of the Leading Figures' Impacts on the Performance of Enterprise Innovation Team

The characteristics of the leader have overlapped and important influence on enterprise innovation team performance, as shown in Figure 2.

Leading figures of the professional level, innovation ability, learning ability and strategic planning ability, has impact on the economic benefits of enterprise innovation team. Leader is the core technology of enterprise innovation team. Leaders themselves who have comprehensive knowledge and professional skills can guide the knowledge progress of innovation team members, leader's innovation ability and learning ability can lead to technical exploration and innovation, conformability with international advanced technology, thus enhancing the production capacity of enterprises, reducing the production cost of enterprises, improving the profitability of enterprises, enlarging the advantage for enterprises to participate in market competition.

Leading figures of the innovation ability, strategic planning ability, organizational and control ability, command and coordination ability, self-value judgment, work attitude will influence the operating benefits of enterprise innovation team. Team leader is the development planner of enterprise innovation. The operating ability of the team itself will get fully embodied in its development process. Leaders having forward vision and sharp insight, can analyze the macro and micro environment, set the development direction and goal of innovation teams. Leading figures is the commander of enterprise innovation team, whose powerful executive ability and crisis-handling ability can guarantee innovation

team to operate efficiently and orderly, can reduce the cost of team operation and enterprise management. Leader is the coordinator of innovation teams, through the selection and training of enterprise management, reasonable distribution and incentive, they can improve team members' working enthusiasm and working efficiency.

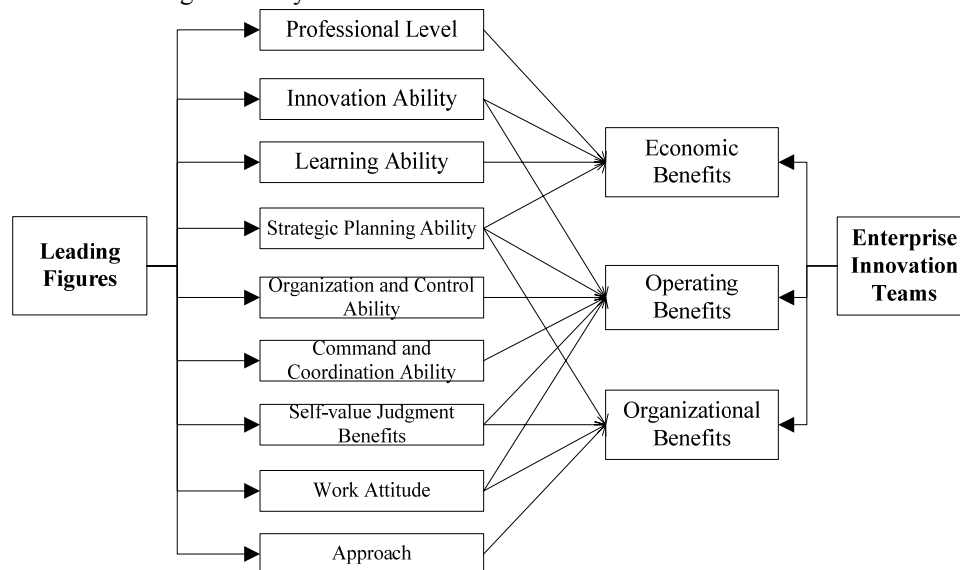

Figure 2 The Features of Leading Figures Associated with the Performance Evaluation of Enterprise Innovation Team

Leading figures of the strategic planning, self-value judgment, work attitude and approach will affect the organization benefits of enterprise innovation team. Leader is the motivator and promoters in the development of enterprise innovation team. Leading figures with strong self-fulfilling will focus more on work. At the same time, leading figures with a strong sense of social responsibility will prompt innovation team to undertake social responsibility actively, which play a big role in improving the entire social image of enterprise innovation team, and they can also improve the social reputation and credibility of innovation team. The character and charm of leading figures make them able to condense the power of the team members, encourage innovation team members to form a common vision and be confident to face difficulties and the future, in turn, can enhance the overall image of the innovation team can be improved, more public satisfaction can also be attained in external speech.

Judging the key factors of leading figures impacts on the performance of enterprise innovation team, we need to study the effect of every factors, especially the influence range and extent on the innovation team performance. At the same time, we should also take it into consideration that the different nature of the enterprise innovation team is affected by leading figures to different degree. The existing enterprise innovation team can be divided into scientific research science innovation team and non-technical research innovation team. There is a big difference in both work object, work goal, work task. But the two types of enterprise innovation team both need common development goals and team members who have work enthusiasm and cooperation consciousness. Leading figures of the charm is the spiritual power, which affects the development of enterprise innovation team, therefore, leaders of personal charm have affected the performance of the two types of enterprise innovation team. Therefore, through the study on the differences of two types of innovation team, the key factors' influence on the performance of innovation team can be concluded.

In the scientific research innovation team, the main task of innovation team is researching and developing new products and new technology. Leading figures of professional ability affects all the aspects, including new technology research, development in creative production, project planning, project evaluation, research, product testing and manufacturing. Creative novelty, height of conception, the feasibility and the success and development prospect are basically decided by the professional ability, so in the research and development of enterprise innovation team of science and technology, leading figures of the professional ability is the key factor that influences the performance of innovation team.

In non-R&D innovation team, the team's main job is the routine products, the task and the objective of the job is to sell the products well in market. In this kind of enterprise innovation team, the

rationality of the development strategy, the execution degree of development plan, the correctness of the executive direction, the handling of emergencies, the synergy degree of team members, the matching degree of team members and post are important factors that affect team work, and the orderly operation of these programs are affected by the leading figures of the management ability, management ability, which, to a great extent, plays a decisive role in the above factors. As a result, leading figures of management ability is the key factor for the performance of no-technical research and development of enterprise innovation team.

5 Conclusion

In the enterprise innovation team, performance affects the development of the team, and influences the development of enterprises as well. The leaders of innovation team performance play a key role. The conclusion of the study is that in the scientific research innovation team, the leader of the professional knowledge is the key factor that influences the performance of the innovation team; In non-technical research innovation team, leading figures of the management capability is the key factor that influences the performance of innovation team. So a reference basis of selection process for the enterprise leaders or leaders has been provided. When making the choice of the leading figures, the leader should examine the alternatives according to the nature of the enterprise innovation team, and with emphasis to achieve the mutual promotion and coordinate development of enterprise innovation team.

An Empirical Study on Capital Allocation Efficiency of Listed Companies in Hubei Province of China*

Huang Xiaobo, Hu Shiyu

School of Business, Hubei University, Wuhan, P.R.China, 430062

(E-mail: hdkjhx@hubu.edu.cn, 514770058@qq.com)

Abstract: Enterprise is the micro base of national economy, whose changes in capital allocation efficiency can reflect the changes of market which play a important role in resource allocation, The development and growth of listed companies in Hubei province depend on both the amount of capital accumulation and the efficiency of capital allocation. A lot of domestic and foreign experts and scholars has focused on the research of capital allocation efficiency, and has proposed a variety of ways to measure the efficiency of capital allocation. The paper makes an empirical study on the efficiency of capital allocation for 1995-2009 listed companies in Hubei province, China with a new method measuring the efficiency of capital allocation. It shows that net fixed assets (investment) and total profit (profit amount) is significantly empirically relative, and the increase in total profit leads to the increase in investment, and the leading effect of profit on investment becomes growing, the efficiency of capital allocation becomes higher.

Key words: Listed companies; Investment elasticity coefficient; Capital allocation efficiency; Empirical study

1 Introduction

Capital is the scarcest resource of listed companies in Hubei Province. The development and growth of listed companies in Hubei province depend on both the amount of capital accumulation and the efficiency of capital allocation. At a micro level, the development of capital allocation efficiency means that those companies who has high rate of return on capital and strong profitability can attract more investment, on the contrary, the investment for those companies who has low rate of return on capital and weak profitability may decrease.

In 2000, Jeffrey Wurgler put forward a method to measure the efficiency of capital allocation directly. The method measured the efficiency of capital allocation by using the sensitivity of capital on profit (investment elasticity coefficient). In recent years, some experts and scholars of china draw lessons from Jeffrey Wurgler's way of thinking. Most of them, like Jeffrey Wurgler, focus on country-level, regional-level and industry-level studies, but little study focused on the enterprise level.

Enterprise is the microcosmic base of national economy, and listed companies in Hubei province are the micro basis of Hubei economic development. it is great important for the development of listed companies in Hubei Provence(China) to enhance the efficiency of capital allocation The variety of capital allocation efficiency of companies can also reflect the market changes which play a role in the resource allocation to some extent, so as to reflect the economic marketization process. (Fang Junxiong, 2006) Therefore, the paper tries to do a empirical study on the efficiency of capital allocation and its changes with all listed companies in Hubei Province as a sample (according to the registered address).

2 Literature Review

Under the condition of market economy, the market plays a basic role in the allocation of resources. The capital allocation efficiency can reflect the perfect degree of the capital market and how the big role capital markets can play in the allocation of resources. Therefore, the domestic and foreign experts pay more attention to the empirical research on capital allocation efficiency, and put forward a variety of ways to measure the capital allocation efficiency .

First step is to measure the efficiency of capital allocation by using capital mobility. Financial liberalization and internationalization of financial markets can make capital free flowing among enterprises, industries, Regions, and even countries, it also can enable the investors to allocate capital throughout the world and spread risks, so as to improve the capital allocation efficiency. Those studies

* This paper is supported by 2009 Wuhan social science funding project: Research on the Development of Regional Capital Market and the Financing Efficiency of Listed Companies in Wuhan City Circle.

such as Ross L. and Sara Z. (1998), Almeida H. and Wolfenzon D. (2005) have supported the conclusion.

Second, to measure the capital allocation efficiency by using Tobin Q or variance of Tobin Q. Tobin Q is the ratio of the sum of stock market value and debt market value with the replacement cost of company assets, and reflects that 1 Yuan worth of asset represents the present value of future cash flows. If Tobin Q is greater than 1, the present value of future cash flows represented by 1 Yuan of investment is greater than 1. therefore, the company are incentive to issue stocks and to expand its investment, which may lead to a decline in the marginal return on capital. In a perfect market, Tobin Q should be equal to 1. So it can reflect the capital allocation efficiency by using Tobin Q or variance of Tobin Q. both Abdul A. (2005) and Fan Xuejun (2008) used the method.

Third, to measure the capital allocation efficiency by using marginal capital output or variance of marginal capital output. if, K-capital stock, ΔK - capital incremental, Y- annual output, ΔY -total output increment, then the incremental capital output ratio (ICOR) is equal to $\Delta Y/\Delta K$. It shows that the increase of output is brought by a unit of capital increment, capital allocation efficiency will happen when the ICOR has improved. Moreover, capital flows across industries with different efficiency will cause the convergence on the incremental capital-output ratio (ICOR) in various Sectors, therefore, the variance of incremental capital-output ratio (ICOR) from industries can reflect the capital allocation efficiency. Zhang Jun (2002)、Shen Neng 、Liu Fengchao (2006) used this method. Similar to the method, Liu Ganzhou (2003) used the first-order conditions of output maximization to judge whether the configuration of capital in various industrial sectors is at its best. That is to say, the marginal output of capital are equal when capital allocation efficiency is in the optimal state.

Forth, to measure the capital allocation efficiency by using the investment elasticity coefficient, which is put forward in 2000 by Jeffrey Wurgler (2000). Many experts and scholars in China learn from the method to study capital allocation efficiency of China's industries or regions. For example, Feng Yuming (2003); Shang Wei and Zhao Xin (2004); Han Liyan, Wang Zhebing (2005); Zhang Kuiwei and Xu ke (2006); Zeng Wuyi and Zhao Nan (2007); PuYanPing and Wang Weiqun (2008); Xia Tian (2008); Yu Ying (2008); Sun Wenbo (2009); Han yu and Hua Xiaoan (2009), etc.

In the above four methods, the investment elasticity coefficient, which Jeffrey Wurgler put forward in 2000, is more suitable to measure the capital allocation efficiency of Listed Corporation. however, if directly use the econometric model adopted by Jeffrey Wurgler, there are some problems.

The econometric model put forward by Jeffrey Wurgler in 2000 is as the following.

$$\ln \frac{I_{i,t}}{I_{i,t-1}} = \alpha + \eta \ln \frac{V_{i,t}}{V_{i,t-1}} + \varepsilon_{i,t} \quad (1)$$

This is a double log-linear regression model. In this model, I-net value of fixed assets, V-added value; I-industry, t-year. Obviously, η is the elasticity of I to V, namely the 1% growth of V leads to the growth rate of I, which can be used to measure the capital allocation efficiency.

If directly using this model to study the capital allocation efficiency of listed company, there are some problems. first, V can be expressed by the total profit, net profit or the net cash flow of the firm for a year, But some of the company's annual net profits or the total net profit, cash flow may be negative, the ratio of V in adjacent two years may also be negative, then its natural logarithm is meaningless. Second, due to the new listing, delisting or mergers and acquisitions, the number of listed companies in different years is not the same, the comparability of I and V in different years is not strong. Third, listed companies in Hubei Province is not much, a total of 70 can be found in the Shanghai stock exchange and Shenzhen stock exchange by the end of 2009, and there are a number of annual report in 2009 cannot be checked on the Shanghai stock exchange and Shenzhen stock exchange. the annual samples may be too small to affect the quality of the regression analysis.

3 Research Design

3.1 Econometric model

This paper uses the econometric model to study the capital allocation efficiency of listed companies in Hubei province, China.

$$Y_{i,t} = \beta_0 + \beta_1 X_{i,t} + \varepsilon_{i,t} \quad (2)$$

In the formula, Y-company's net fixed assets (investment), X-total profit of the firm (profit), i-Company, t-year. Obviously, β_1 expresses the relationship between investment and profit, and means

the investment which are caused by 1 Yuan of profits. As β_1 grow larger, the investment caused by 1 Yuan of profits becomes greater. for a company, the more profitability it has, the more investment it can attract. so the capital allocation efficiency is higher.

3.2 The research objects and sample data generation

With all compaies in Hubei province listed on the Shanghai stock exchange and the Shenzhen stock exchange from 1995 to 2009 as the research object, to select the sample data by using the CSMAR database: First, “portfolio selection” in Shanghai A shares and the Shenzhen A shares; Second, to choose the Hubei province in the “area selection”; Third, To query and derive the annual net value of fixed assets in each company in the balance sheet of " listing company's financial reporting database" in the CSMAR; and to query and derive the annual “total profit” in each company in the income statement.

4 Statistical Analysis

First of all, to analyze all the sample data from 1995 to 2009, to inspect the total capital allocation efficiency; Then, all sample data are divided into three sections, namely 1995-1999, 2000-2004, 2005-2009, to explore the changes of capital allocation efficiency by respective statistical analysis .Using SPSS11.5 for descriptive statistics, correlation and regression analysis, the results are as the followings.

4.1 The results of all sample analysis

The results of all sample analysis are shown in table 1, table 2, and table 3

Table 1 Descriptive Statistical Analysis of All Sample Data

period	sample number	Net value of fixed assets (Billion Yuan)				Total profit (Billion Yuan)			
		Min.	Max.	Mean.	Std.Error	Min.	Max.	Mean.	Std.Error
1995-2009	737	0.00	442.60	9.22	28.86	-9.86	94.07	1.27	5.90

Table 2 Correlation Coefficient of All Sample Variables and Its Significance

period	correlation coefficient of net value of fixed assets and total profit and its significance	
	Correlation coefficient	Sig.
1995-2009	0.754**	0.000

**： The correlation coefficient is significant at the 0.01 level (two-tailed test)

Table 3 Results for Regression Analysis

period	project	coefficient	Std.Error	t	Sig.
1995-2009	B ₀	4.538	0.715	6.349	0.000

	Sig. of F	0.000			

5 Conclusions

First, All the sample statistical analyses show that the correlation coefficient of net value of fixed assets and total profit are 0.754, which are significant at 0.01 level. The results mean a higher degree between net value of fixed assets and total profits. The regression coefficient of B₁ is 3.686, which is significant at 0.00 levels. It shows that the investment brought by 1 Yuan of profits is 3.686, the efficiency of capital allocation is higher.

Second, the statistical analyses of segmented sample show that, the correlation coefficient of net value of fixed assets and total profits are respectively 0.712, 0.843, 0.747 from 1995 to 1999、from 2000 to 2004 ,and from 2005 to 2009,these are significant at the 0.01 level. It expresses there are significant empirical correlation between net value of fixed assets and total profits, the correlation degree from 2000 to 2004 is the highest, it is followed by the correlation degree from 2005 to 2009, and the correlation degree from 1995 to 1999 is the minimum; the regression coefficient of B₁ are respectively 2.576, 3.027, 3.736 from 1995 to 1999,from 2000 to 2004,and from 2004 to 2009, all are empirical and significant at the 0.00 level, and gradually increase. it indicates that the increase in total profit leads

to the increase in investment, and the leading effect of profit on investment becomes growing, the efficiency of capital allocation becomes higher.

Research on Evaluation of Customer Knowledge Management Competence

Wu Jing

Wuhan Vocational College of Software and Engineering, Wuhan, P.R.China, 430205
(E-mail: freebee1018@126.com)

Abstract: Customer knowledge management, the integration of customer relationship management and knowledge management, arouses modern enterprise's attention increasingly. This paper aims at assessment of enterprise customer's knowledge competence and devises hierarchically the customer knowledge management competence evaluation system including working procedure index, enterprise customer index, learning & growing up index as well as the sales performance index by taking the reference of balanced scorecard, constructing the comprehensive evaluation model of customer knowledge management competence by applying the AHP

Key word: AHP; Customer knowledge management competence; Index system; Evaluation model

As the composed part of Customer Relation Management (CRM), Customer Knowledge Management can not only improve customer service quality but also promote the enterprise's sustainable development in order to enhance the enterprise's adapting ability of external market environment better. The level of customer knowledge management is embodied by the ability of customer knowledge management competence^[1]. Hence in this circumstance of hyper competition, the practical way of raising the competitiveness of enterprise and constructing the enterprise's competition advantage depend on analyzing the composition of enterprise's customer knowledge management, establishing the assessment model while taking the evaluation.

1 AHP and Customer Knowledge Management Competence

Analytic Hierarchy Process (AHP) was initially proposed by celebrated American operational researcher T.L. Saaty^[2]. It is the effective measure of decision-making and comprehensive evaluation dealing with multiple targets, factors and layers. The basic principle is to organizing the various factors in the complicated problem by dividing the orderly layers of mutual connections. Then the quantitative quota is given by judging the relative importance of each layer with the following step of defining the weight-important sequence of all the factors by using the mathematic measure. Consequently, the problem will be solved by arranging and analyzing the results. Commonly, it consists of 5 phases: constructing the layer structure model, forming the judge matrix; single hierarchical arrangement and coherence test; the ultimate layer arrangement; the coherence test of ultimate layer arrangement.

Customer's knowledge management competence is Customer knowledge management oriented applying by enterprise. Allocating, developing and integrating the resources inside and outside the enterprise as well as utilizing, analyzing and managing customer's information for satisfying the unique demands actively in order to integrate the competitive advantage knowledge and skill by setting up, developing and enhancing the customer relationship. It is the form of enterprise ability constituted by various sub-abilities.

2 The System Funding of Customer Knowledge Management Competence Index Test

Robert Kaplan from Harford Business School and Chief of Nolan Norton Institute David Norton proposed the method of organization performance management - Balance Score Card (BSC), which viewed the organization performance from 4 aspects: learning & growing up, operation flow, customers and finance. They consider the benefit can be brought only by the enhancement of sales, decrease of operational cost and the improvement of assets turnover rate^[3]. Taking the reference of BSC, this paper regards the operation flow, customer, learning and growing, sales performance as the 4 indexes for the judgment of enterprise's customer knowledge management competence.

2.1 Index of operation flow

Customer knowledge management activity includes the acquisition, sharing applying and innovation of customer knowledge. In such circumstance, the operation flow index is comprised of customer knowledge acquisition ability, effectiveness of customer knowledge sharing mechanism,

applying ability of customer knowledge, level of customer knowledge innovation ability. The customer knowledge acquisition ability requires the enterprise possesses the basic diathesis of customer knowledge acquisition. Such diathesis embodies the level of operation, management and technology as well as the strength of capital and human resource^[4]. The coverage rate of customer knowledge and the reaction ability of customer change are two major aspects for measuring the effectiveness of customer knowledge sharing mechanism.

There are 2 indexes for reflecting the applying ability of customer knowledge: the first one is the identification of gold customers. 80% of the profit is created by 20% of the customers. Such 20% of customers are called gold customers whom we should take special attention and preferential terms. The second aspect is the knowingness ability of customer's purchasing motivation. Only we acknowledge customers' demands and motivation so that the customers purchasing behaviors can be predicted and guided precisely. The level of customer innovation ability can mainly be reflected by 2 aspects of developing force of new products and custom-oriented product force.

2.2 Enterprise customer index

Enterprise customer index is reflected on the 4 aspects of diversification, Timeliness, effectiveness and dealing with the customer's complaints in the communication between enterprise and customers. The communication would be more convenient if there were more ways of communication between enterprise and customers. The aspect of timeliness embodies 2 factors of customer abandon rate and the length of waiting during the communication. The diversification and timeliness of communication is the base for customer maintenance. The effectiveness of communication reflects the quality of customer relationship. The reflection of it is through the length of time when answering customer's question and the friendliness, acuteness and knowledge of enterprise's personnel communicating with customers. The ability of dealing with customer's complaints refers to speed and effectiveness of handling complaints, which is the average time of resolving customers' complaints and the satisfaction degree of customers to such resolving scheme in other words.

2.3 Index of learning and growing up

The index of learning and growing up comprises the supportive force of organizational environment, the sustainable force of human capital, the level of informative technology and degree of importance from the senior leaders. Only when the organization possesses the strong force of adapting environment the favorable supporting of providing customer knowledge management could be formed from the organizational level. The supportiveness of human capital embodies on the aspects of knowledge employee ratio, the time and effectiveness of personnel training.

Taking the advantage of advanced information technology will facilitate the effective management of enterprise's customer knowledge and building up the system of knowledge management, enhancing enterprise's innovation ability. Customer knowledge management is a prominent reform of enterprise's management needing the support and facilitation of senior leaders for deploying the work smoothly. All these need the enforcement of awareness degree of the customer knowledge management from senior leaders as well as the promotion rate of implementation of customer knowledge management in order to make it practicable.

2.4. Sales performance index

There are 4 aspects reflecting the sales performance index. They are namely the customer acquisition rate, customer satisfactory rate, cross sale volume and sales growth rate. Customer acquisition rate refers to the rate that the enterprise obtains the target customers. Customer satisfactory rate is related to the products and service value provided by the enterprise. If the value of product and service provided by the enterprise exceeds the cost or the price paid by customers, it will raise the customer's rate of satisfaction and loyalty^[5]. Cross sale volume reflects the relation quality between enterprise and customers, which depends on the communicative ability between them as well as the ability of customer value creation and transferring. Such ability is one of the factors greatly influencing if customer's will do the cross sales in the future. Sales growth rate is the total ratio of this year's sale growth volume to the last year's sales revenue volume. It reflects the circumstance of increasing and decreasing of enterprise sales revenue and it is one important index of enterprise's growth and developing ability.

3 Model of Customer Knowledge Management Competence Test

3.1 Establishing the hierarchical structure model

Based on the index of customer knowledge management competence mentioned above, the

customer knowledge management competence test model is constructed according to AHP. (Figure 1). Such model is divided into 3 layers: the first one is target layer A, the second one is principle layer B, thirdly, the index layer. First level indicator is $X = (X_1, X_2, X_3, X_4)$. Second level indicator: $X_1 = (X_{11}, X_{12}, X_{13}, X_{14})$; $X_2 = (X_{21}, X_{22}, X_{23}, X_{24})$; $X_3 = (X_{31}, X_{32}, X_{33}, X_{34})$; $X_4 = (X_{41}, X_{42}, X_{43}, X_{44})$

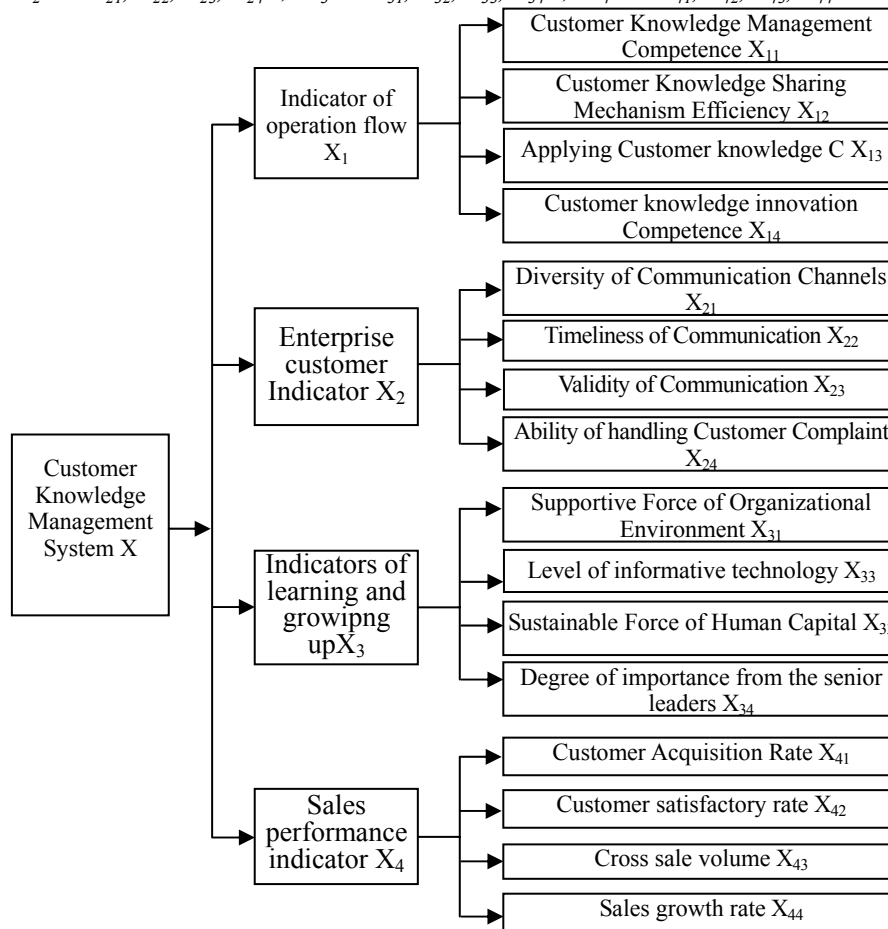

Figure 1 The Test System of Customer Knowledge Management Competence

3.2 Construction of judging matrix

This model adopts 1-9 rating scale method. The judging matrix is written by assessment specialists group. 1-9 rating scale method is shown in table-1

Table 1 Scale Table

Scale	Denotation
1	Comparing 2 factors, X_i is as important as X_j
3	Comparing 2 factors, X_i is slightly more important than X_j
5	Comparing 2 factors, X_i is prominently more important than X_j
7	Comparing 2 factors, X_i is especially more important than X_j
9	Comparing 2 factors, X_i is extremely more important than X_j
2, 4, 6, 8	The mid-value of 2 proximate judgment above

Carry on geometric mean procedure the paired comparison results which are according to indicator of operation flow, indicator of learning and growing up, enterprise customer indicator and sales performance indicator of each specialist. Then constructing the judging matrix A.

$$A = \begin{pmatrix} b_{11} & b_{12} & \dots & b_{14} \\ b_{21} & b_{22} & \dots & b_{24} \\ & & & \dots \\ b_{41} & b_{42} & \dots & b_{44} \end{pmatrix}$$

In same manner, construct 4 judgment matrixes on the principal of $C_i (i=1,2 \dots,4)$ corresponding to the indexes of third level.

3.3 Seeking characteristic value and Characteristic vector of matrix

In this paper, the Characteristic vector is sought by root method. The basic steps are as follow: firstly calculate the product M_i of the elements b_{ij} in each line of B : $M_i = \prod_{j=1}^s b_{ij}$, then calculate β ,

the root of n of M_i : $\beta_i = \sqrt[n]{M_i}$; Finally, carry on the normalization processing of vector $\beta=(\beta_1, \beta_2, \dots, \beta_n)$, command W_i vector $W=(W_1, W_2, \dots, W_n)$ which is Characteristic vector, the max characteristic root is $\lambda_{max} = \sum W_j \cdot b_{ij} / W_i$.

3.4 hierarchical arrangement and coherence test

Single hierarchical arrangement is seeking the characteristic value of judgment matrix A. Seeking characteristic vector W which is corresponded with max characteristic root λ_{max} . After the process of normalization, the result is considered as the importance ranking weights to certain factors of upper level. Total hierarchical arrangement is to calculate the arrangement weights of same level's factors' relative importance to the final task. The calculation method is to carry on the weight of certain index (the third level) and multiply the weight of target in such aspect.

When the judgment matrix totally satisfies the following 3 terms: $b_{ii}=1$, $b_{ij}=1/b_{ji}$, and $b_{ij}=b_{ik}/b_{jk}$. We consider the judgment matrix takes on the complete coherence. At this point, the max characteristic root is only the λ_{max} , and the rest of characteristic roots are 0. Generally $b_{ii}=1$, $b_{ij}=1/b_{ji}$ is easy to prove. However, $b_{ij}=b_{ik}/b_{jk}$ is not easy to satisfy, and this requires the coherence test of judging matrix, the indicator is :

$$C \cdot I = (\lambda_{max} - n) / (n - 1) \tag{1}$$

$$C \cdot R = C \cdot I / R \cdot I \tag{2}$$

And the value of R I can be found according to Table 2

Table 2 R.I Value

N	1	2	3	4	5	6	7	8	9	10
R-I	0.00	0.00	0.58	0.89	1.12	1.24	1.36	1.41	1.45	1.49

The test principle When $C \cdot R < 0.1$, it is considered the judging matrix meets the demand of coherence, the arrangement is valid. When $C \cdot R \geq 0.1$, it is considered the judging matrix does not meet the demand of coherence and it requires adjustment of judging matrix until $C \cdot R < 0.1$ which means new weight table is obtained.

3.5 The Quantization of Customer knowledge management evaluating indicator

Part of the qualitative indicator needs quantitative transformation in the evaluating indicators. However, there are no unified norms of quantization coefficient and it is ascertained according to the particular situation. This paper adopts the method of semantic difference membership valuation method. The quantized indicators are fixed from scale one to scale five as shown in the table 3. Each scale has the explicit and concrete requirement as well as establishing the relationship of each scale and degree of membership.

Table 3 The Evaluation of Qualitative Indicators

qualitative indicators	Better	Good	Average	Bad	Worse
Evaluation	1	0.8	0.6	0.4	0.2

Finally, calculate the scores of customer knowledge management. Suppose the weight of C is W_i with regard to C_i , the weight of C_i is W_j' with regard of C_{ij} , the evaluation of indicators is V_{ij} , the

score of customer knowledge management competence sub item is $V_i = \sum V_{ij} \times W_j$, thus, the total scores of w customer knowledge management is $V = \sum V_i \times W_i$

4 Conclusion

This paper takes the view of customer knowledge management definition and establishing the system of customer knowledge management competence test index according to 4 aspects of operation flow, customer, learning & growing up, sales performance and designing the testing model of customer knowledge management competence by applying AHP. However, the customer knowledge management is a complicated procedure and whether the test of customer knowledge management competence only comprises the indicators above still needs the practical testing. Thus, the issues on the system of customer knowledge management competence and designation of test model as well as the related problems are still deserved for further research and exploration.

Barriers and Countermeasures of Information Sharing in Emergency Management*

Zhang Ping, Luo Wei, Su Min

College of Science, Naval University of Engineering, Wuhan, P.R. China, 430033
(E-mail: 1512770624@qq.com, luowei459443229@qq.com, fthyes@sina.com)

Abstract: While information is probably one of the hardest things to share in a coalition environment, there are still strong incentives to share information. Some obstacles to full information sharing lie in the lack of information sharing environment, of common structure and technology accessible and of supervision channel as well. Besides, participants in emergency management have to rely on advocating sharing culture and motivating the willingness to optimize multinational information sharing. And positive procedures are supposed to be setting up rules, creating a shared database and implement training, which facilitate effective sharing. Measures for the long-term success should also be taken into consideration.

Key words: Information sharing; Obstacle; Collaboration; Countermeasures

1 Introduction

Sharing of information becomes increasingly important for most military operation-other-than-war (MOOTW) successes. Governments and military authorities require timely and accurate information to deal effectively with most of the security threats they are facing today. A widely acceptable mechanism for obtaining such information is to share with other countries. After “9/11”, the Department of Defense (DoD) of the United States issues The DoD Information Sharing Strategy (DoDISS, 2007), aiming at establishing the vision and goals for information sharing and requires “innovations to enhance information sharing across the Department and with external partners”.^[1] From then on researches on the information sharing have been done from different dimensions such as the key barrier to intelligence sharing, information sharing in emergency response, as well as the assessment on the effectiveness of intelligence information sharing (Walsh, 2006; Babajide Osatuyi, 2011; Freedman, 2012). Prior studies that investigated information sharing report that information sharing, “including the two-way flow of information and analysis, and cooperation between law enforcement and intelligence entities, remains problematic”,^[2] and that there is a need for an understanding of the environmental factors that shape the information sharing behavior (Hansen & Kalervo, 2005). In many cases, technological, cultural and political challenges exist, all contributing to the less-than-perfect nature of the existing information sharing framework.

This paper aims to identify potential obstacles to information sharing and to study the possible contributing factors to information sharing failure. And it also explores the measures leading to successful information sharing and the solutions to leverage existing intelligence operations that can promote a favorable intelligence sharing environment.

2 Incentives to Share Information

In DoDISS (2007), information sharing is defined as, “making the information available to participants (people, process or system)”. Information sharing occurs when “the sender communicates information in its possession to the receiver”, which covers the cultural, managerial, and technical behaviors.^[3] Although information is one of the hardest things to share in a coalition environment, the tendency to get rid of masking information is transformed. And there are contributing three factors having created stronger incentives to share information.

Firstly an information-rich environment today with so much technology available facilitates the sharing of kinds of information. Electronic tools, the Internet resources, for instance, ensure daily exchanging and updating of communications. Sharing kinds of information in different fields is of great importance and becomes unavoidably a trend in both people’s daily life and business or military areas as well.

Secondly, some extreme events or emergencies, such as might be precipitated by natural disasters, present a strong need for effective information sharing. Managing such global emergencies requires people’s working together across diverse fields in response to the extreme situation. Information sharing

* This paper is supported by Military Science Fund for Postgraduates (2011JY001-019)

strategies at a managerial level by analyzing reports of nature disasters such as an earthquake is what many countries are advocating. Managing these emergencies creates the need for collaboration in information so as to deal with the situation. In many cases, information in the after-action assessment is reported publicly.

Thirdly, the painful lesson learned from 9/11 that information related to the attack was not shared across the intelligence community,^[4] urges the United States to reform its intelligence policy with much focus on the sharing of information. A set of governmental documents such as DoD Information Sharing Strategy (2007), Intelligence Community Information Sharing Strategy (2008), National Strategy for Information Sharing and Safeguarding (2012) have been issued to reinforce intelligence sharing, which leads to a great demand for improvement in the capability and value of the existing information support structures even in the whole world. Other countries in the world make consequent efforts to adjust their practice to meet the new needs for information sharing.

3 Obstacles to Information Sharing

True information sharing is believed to ensure all participants have access to any information they need. Studies, however, report that there are still difficulties in the effective information sharing and failures in sharing information usually occur in the collaboration cycle.

Take the earthquake in Haiti in 2010 for example, the situation report from Haiti indicated that communication and coordination among agencies of the United Nations World Food Program (WFP), the International Organization for Migration (IOM), the International Federation of Red Cross (IFRC), the United Nations Development Project (UNDP), and the World Health Organization (WHO), suffered possibly as a result of lack of structure and familiarity with a common set of rules of engagement.^[5] From the report on this emergency event, the organizations cooperated disorderly, which resulted in the resistance to information sharing. Sometimes the same information is reported by different sections, which resulted from the lack of collaborative response. In some context, “cultural, bureaucratic, and technological barriers to the sharing of information among agencies”^[6] contribute greatly to the less-than-perfect cooperation.

Obstacles to information sharing fall into the following categories.

3.1 Lack of information sharing environment

Information sharing processes are considered to have great impacts on group work especially when an emergency occurs. Participants, however, seem to have a nature tendency to mask his capabilities, which is the key barrier to effective sharing. It is reported that member states in the European Union have little trust in each other to share completely.^[3] If they don't tackle the problem of mistrust, participants will find themselves put into a dilemma. When taking part in the operation, different organizations are expected to carry out the responding duties, rather than different activities without collaboration which likely brings about the information sharing failures.

3.2 Lack of a common structure

Movements to closer cooperation demand for a working coding scheme can facilitate the information sharing in sorts of operation efforts. The fact is that the system and procedure for the participants to share the relevant information still remain problematic. There appears no formal structure, identifying the information shared during the response efforts. Additionally, each country has established its own organizations for operations and there are differences in national doctrines and regulations, which also leads to the resistance to the sharing of information in the global commitment to emergency response. In some cases, the extent to which departments are willing to share information with partners is unclear. For example, in Haiti earthquake relief, inconsistencies are noticed to be prevalent in the form of information delivery. (Babajide Osatuyi, 2011) And access to any given information only open to some participants can also be expected to hamper sharing information

3.3 Lack of accessible technology

It is stated in DoDISS(2007) that improving information sharing constitutes a cornerstone of American national priorities, which makes it clear that efforts to address the threats posed by terrorism have led to a reconsideration of how anti-terrorism information can be shared. In the assessment of the effectiveness of post-9/11 intelligence information sharing, the obstacles to information sharing are attributed to such factors as turf battles, organizational culture and technology and knowledge management (Freedman, 2010). Less effective information mobility in some cases result from less perfect management and processing the information. What's more, there is no “metadata tagging standards established to investigate and index the information needed”^[7]. Multiple data bases usually

require a more complex management system so as to fulfill technical information sharing.

3.4 Lack of supervision channel

Organizations that worked together without monitoring system are not able to make response quickly to the emergency because much information from many different sources should be acquired and analyzed. Processes and procedures of current technology can't meet the demand for multinational information. Situational operation depends much on a comprehensive supervision framework that is critical to improve the capability for information sharing. Without highly developed monitoring technology support, effectiveness of information sharing will not be achieved.

4 Steps to Effective Information Sharing

As complex information source is, agencies have to rely on systematic steps to optimize multinational information sharing, which covers environment advocating and willingness motivating. And positive procedures should also be involved.

4.1 Challenging new environment

Since The 9/11 Commission Report calls for the creation of an information sharing environment (ISE) to facilitate the sharing of terrorism information among all appropriate federal, state, local, tribal, and private sector entities ^[4], promoting a broader information sharing culture among people and organizations becomes a heated issue. High trust is encouraged so as for international agencies obtain freely the information in a reliable manner. The Office of the Director of National Intelligence of America calls for transition from its historic culture of "need to know" to one of a "responsibility to provide". This new policy should assist in removing "cultural barriers and create incentives to encourage collaboration that is so critical to counterterrorism efforts."^[4]

The willingness to share is another essential factor that should be taken into consideration. Each participant has strong sense to take part in collecting information and its delivery. The intention of extensive coordination may compensate for the effect of the lack of information. Sharing as open as possible can get rid of mistrust that is thought as the key barrier to deep sharing of information. Effective information sharing requires all participants hold a strong degree of trust in each other.

4.2 Information sharing strategies

In addition to willingness to share, several critical missions pertaining to information sharing include: ".....ensure maximum availability of and access to intelligence information within the Intelligence Community, establish objectives and priorities for collection, analysis, production, and dissemination of national intelligence, and ensure the most accurate analysis of intelligence is derived from all sources to support national security needs".¹ And specific changes include the following adjustments to ensure the sharing of information:

4.2.1 Set up rules

Rules are helpful in achieving multinational shared awareness and providing guidance for effective information sharing. Proper levels of rules will enhance the cooperation and coordination among the participants. In some cases, when there exists no agreement, then platform for participants to meet and to discuss regularly matters of common concern has much priority. Requirements for processes, standards, and technologies can be established in the development and integration of policies. Providing an organizing framework to guide collective efforts will be meet needs for information sharing.

4.2.2 Create a shared database

While information sharing cannot be relegated to only an issue of technical information sharing aspects, the technology issues related to information sharing cannot be overlooked,² establishing a particular structure to foster sharing and easy comprehension among agencies becomes urgent. In any operation, standardized operating procedures would allow sharing and releasing of information early in the process. A common vision to facilitate the development of standards, policies, and collaborative processes is one of the top priorities. With standardization network, technical mechanisms such as setting up institutions, establishing website, and issuing policy, budget, process, and technology relating to information sharing can facilitate or improve exchange information.

4.2.3 Training

¹ See: Office of the Director of National Intelligence, "About the ODNI". <http://www.dni.gov/who.htm> (accessed December 28, 2009).

² See: Office of the Director of National Intelligence, "About the ODNI". <http://www.dni.gov/who.htm> (accessed December 28, 2009).

Any difficulty from sophistication in technology and automation will lead to ineffectiveness in information sharing. The purpose to carry out personnel training among participants is to develop their ability to achieve true advancements in information sharing. People work there should have the capability to use the classification levels, reliability system, information procedures and especially in multilevel security system, which should provide incentives for sharing and restore a better balance between security and shared knowledge. As a matter of fact, personnel's technical capability will result in a need for facilitating information sharing.

4.3 Measures for the long-term success

Since The Intelligence Reform and Terrorism Prevention Act (IRTPA) of 2004 that makes the principle of 'responsibility to provide' take its shape, a number of reforms have strengthened information sharing capabilities. Efforts in the long run should be made to foster cooperation in information providing and analyzing. And a high degree of supervision of coordinating and interacting in information sharing is needed.

4.3.1 Collaboration based on net-worked systems

To improve information sharing, cooperation is a relatively new trend. In most cases, information sharing is characterized by complexities and dynamism, especially in extreme events or emergencies, which creates the need for collaboration transcending traditional boundaries. With the initiatives to provide, many efforts will be made to accelerate and improve the ability to exchange resources, maximize functions of the mechanism, and establish and employ the common database. Net-worked systems relegate the complexity of information sharing, allowing the degree to share to the full play. In other words, coordinate with standardized procedures can support the information sharing requirements at any levels. Sometimes the common policy and regulations should also be taken into consideration for different organizations work together.

4.3.2 Supervision to enhance sharing information

Different teams or agencies from several backgrounds usually develop their own approaches to manage a response effort in an operation. That needn't mean an environment without supervision. It does mean supervision under some new committees or organizations that ensures effective collaboration. For example, a standardized exchange system with common control may be extraordinarily helpful to avoid failure to share information. Monitoring timely can prevent working against full sharing. For sharing purpose, a give-and-take relation is required between the new committee and its partner member, where facilitating sharing is the top priority. A high degree of interaction may ensure the information product available. In other words, the committee takes the responsibility to provide policy, process and technology issues to guide information sharing, and the participants members have the duty to carry out the contact and its procedures.

5 Conclusion

Much has been achieved in creating the coordinating environment, which makes information sharing the future trend. But it needs to be kept in mind that different levels of mistrust still exists and the degree to share is not yet satisfactory. Sharing is not becoming dependent on the participants' information sources nor being forsaken. As the American intelligence communities expect, full information sharing has a long way to go.

A Research on the Operating Mechanism of the Management Innovation of Pale-biotic Fossil

Liu Xueling, Han Gang, Han Lizhuo, Pan Ling, Guo Zhichuen
Paleontology Center, Bohai University, Jinzhou, P.R.China, 121013;
(E-mail: lx15909@126.com, hg0805@126.com, Lpigg0113@qq.com, 407700252@qq.com,
ljgs12008@163.com, 867319583@qq.com)

Abstract: This paper has analyzed the connotation and the influencing factors of the operating mechanism of the management innovation of pale-biotic fossil from the point of view of system theory, thinks that the management innovation of pale-biotic fossil must have the internal operating mechanism and the external operating mechanism in conformation with the two aspects i.e. internal and external driving forces; has tentatively established the operating mechanism of the management innovation of pale-biotic fossil; come to conclusion that the operating mechanism of the management innovation of pale-biotic fossil is the foundation that the activities of the management innovation of pale-biotic fossil can continuously operate with high quality and high efficiency in the right decision.

Key words: Management innovation; Operating mechanism; Pale-biotic fossil

1 Introduction

The fossils is an irreplaceable resource, the scientific value and economic value of this resource determine that it needs not only the protection and utilization and also the management innovation, the innovation is in the core position of the management of pale-biotic fossil. The mutual relationship and mutual influence between all levels of government, relevant departments and the public form a whole of the protection, utilization and management innovation, which shares out the work and help one another,. But because the system and mechanism are not reasonable, the protection, utilization and management innovation of pale-biotic fossils don't adapt to the requirements of local economic and social development, it seriously restricts the development of the protection, utilization and management innovation of pale-biotic fossils, so it is very necessary to research the operating mechanism of the management innovation of pale-biotic fossil from the point of view of system theory.

2 The Connotation of the Operating Mechanism of the Management Innovation of Pale-Biotic Fossil

The word “mechanism” was taken from the Greek; its original intention is the structure and operating principle of the machine^[1]. The mechanism is system plus way or the systematized way. The mechanism of the management innovation of pale-biotic fossil is that continuously seek the internal function and operating mode of the innovation under the guiding of the idea of the management innovation of pale-biotic fossil.

The operating mechanism of the management innovation of pale-biotic fossil refers to the management of pale-biotic fossils operates the restricted relations and functions of the mutual relationship and effect between all the component elements, Its role is to coordinate the various component elements to run regularly according to a certain way and to play the whole function in the process of the management innovation of pale-biotic fossil, it is the most complex mechanism in the mechanism of the management innovation of pale-biotic fossil, covers the whole process of the protection, management, scientific research, popularization of scientific knowledge and rational use of the pale-biotic fossils, plays a crucial role to promote the process of management innovation of pale-biotic fossil.

So, the operating mechanism of the management innovation of pale-biotic fossil is the relationship and operation in the specified innovation process, rather than isolated elements. The functions the operating mechanism of the management innovation of pale-biotic fossil mainly focus on coordination of the elements the whole process of the management innovation of pale-biotic fossil, ensure that the management innovation of pale-biotic fossil is carried out smoothly and comprehensive benefits are increased continuously, the management innovation of pale-biotic fossil is achieved by playing the role of each function contained inside the operating mechanism.

The activity of the management innovation of pale-biotic fossil is a complex process, intertwined with a various powers in it; its behavior is a result of joint action driven by the external power and

internal interests. So, the management innovation of pale-biotic fossil must have both internal operating mechanism and the external operating mechanism which are compatible with the two aspects of internal and external driving forces. The internal operating mechanism mainly includes the mechanism of scientific management, the mechanism of talent management and the mechanism of fund investment; the external operating mechanism mainly includes the government mechanism, market mechanism and social mechanism. Only establish and promote the organic combination of the two mechanisms, can give full play to the two mechanisms, can also make the management of pale-biotic fossil really has innovative behavior, and then can improve the level of the management innovation of pale-biotic fossil.

3 The Factors to Influence on Management Innovation of Pale-Biotic Fossil

3.1 The replacement of the protection of the resources and the long-term interests by economic benefit

Find according to investigations that the pale-biotic fossil resources of our country are basically located in poor mountain areas, the economic development of these areas are more backward, on the one hand the government and masses of the locality have very strong desire to be lifted out of poverty and to develop the economy; on the other hand because the basic conditions of the locality are poorer, the information is not quick access, thus the economic development strongly depends on the resources, the life and production of the masses maintain close link with natural resources, and then because of being driven by the interest, so illegal stealing and excavating, reselling at a profit and smuggling the fossils frequently happen. Many governments excessively construct the highway in the protection area in the name of the developing of the tourist trade, and so on and so forth. The pale-biotic fossil resources are seriously damaged, thus the specialists loudly appeal to the public: "If the departments concerned don't quickly adopt scientific and effective ways to deal with this situation, the pale-biotic fossil resources of the state will certainly sustain irretrievable serious losses in 5 to 10 years". If it goes on like this, not only the environment and resources are damaged, the existence of the animals and plants is threatened, but also the existence of the mankind as one member of natural world is greatly threatened! The protection of resources and long-term interests are replaced by immediate economic interests, the relationship between the protection and development use is not handled well.

3.2 The laws and regulations are being perfected progressively but have still shortcomings

"The Stipulations of the Protection of the Pale-biotic Fossils" issued by the state and had been officially put into effect on January 1, 2011. In addition, Liaoning, Yunnan, Shandong and other provinces had also issued the stipulations of the management of the pale-biotic fossils.

The above-mentioned laws and regulations provide the guarantee of the laws for strengthening the protection and the management of the pale-biotic fossil resources, take great promoting effect on social benefit, economic benefit and ecological benefit of the pale-biotic fossil resources. But Facing reality, we must recognize, the legislation of our country on the protection, management and sustainable development of the pale-biotic fossils resources is not far enough.

3.3 The plan of pale-biotic fossil resources lags behind

The main objective of the development plan of the pale-biotic fossil resources is the achieving of continued development of the resources, so ensure that not only can gain the economic benefit and but also do not damage the resources during the development and use of the pale-biotic fossil resources, simultaneously can achieve the social benefit and environmental benefit, this is important content of the development plan of the pale-biotic fossil resources. The clause 7 of "The Management Way of the Pale-biotic Fossils" issued by the Ministry of Land and Resources clearly stipulates: all parts of the country must work out the plan of the pale-biotic fossil protection of the administrative area according to the plan of the pale-biotic fossil protection of the country. So at present the task is very pressing that work out the development plan of the pale-biotic fossil resources that plan takes the pale-biotic fossil resources of the region as the foundation in coordination with the interests of economic, social and environmental benefits and in unitization with the strategy of the plan of national economy and social development.

4 The Establishment of the Operating Mechanism of the Management Innovation of Pale-Biotic Fossil

The above analysis shows that in China because it has not yet formed the scientific and perfect operating mechanism of the management innovation in consistent with the management of pale-biotic fossils, overall innovation ability is relatively weak, so, should process the relationship between

short-term development and long-term development well according to the science, not only fully play the basic role of the market mechanism on the allocation of the resources, but also give full play to the guiding role of the specialists and foundation. Specifically say, in China the operating mechanism of the management innovation of pale-biotic fossil is the foundation that the activity of the management innovation of pale-biotic fossil can continuously operates by high-quality and high-efficiency under the correct policy decision, mainly includes the mechanism of the comprehensive body of natural protection area, the mechanism of the government, market mechanism, social mechanism and other contents (as Figure 1)

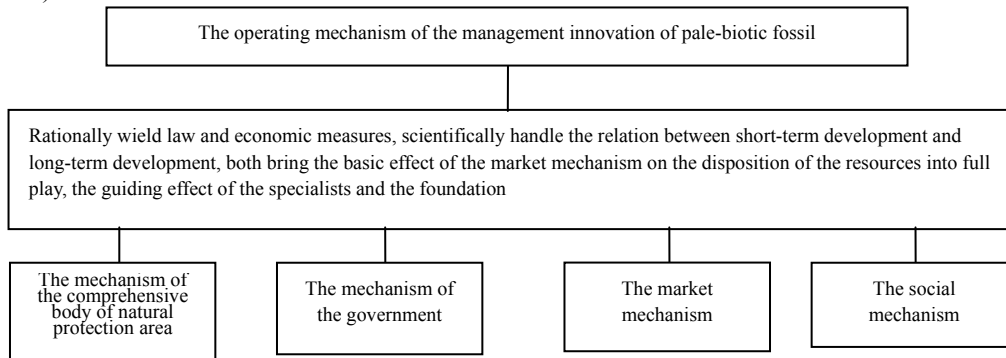

Figure 1 The Operating Mechanism of the Management Innovation of Pale-Biotic Fossil

4.1 The mechanism of the comprehensive body of natural protection area of pale-biotic fossil

China attaches great importance to the construction of the natural protection area to take important producing area of the pale-biotic fossils as protected object, had constructed 32 natural protection areas, 23 state geological parks, over 100 state paleontology museums in relation to the pale-biotic fossil trace. But present laws and regulations of the pale-biotic fossil protection are not enough perfect, the protection work is short of fund and qualified personnel, has not quick access to information, these hinder the activity of the management innovation of the comprehensive body of the natural protection area of pale-biotic fossil. In fact above-mentioned factors are also a problem of the mechanism. So, should make great efforts to perfect internal and external mechanism of the comprehensive body of the natural protection area of pale-biotic fossil, advance the action of the management innovation of the comprehensive body of the natural protection area of pale-biotic fossil.

4.1.1 The mechanism of scientific management

The theory of scientific management is a very clear comprehensive concept. It is not only a thought, a sense, but also the operating rules. So the comprehensive body of the natural protection area of pale-biotic fossil must take the idea of the management innovation of pale-biotic fossil as the guide, probe a set of scientific and high-efficiency management mechanism, strengthen the management of the resources, the management of the scientific research, the management of the scientific popularization and the management of the sale etc. of the comprehensive body of the natural protection area of pale-biotic fossil, strengthen the management to integrate knowledge and information as the focal point, promote the management innovation of the comprehensive body of the natural protection area of pale-biotic fossil to develop towards information, network and modernization. For example, for the sake of raising the level of policy decision, the management of policy decision of construction project of geological park first must invest research the geological parks of each level at home and abroad; next invite the specialists to evaluate, sum up the constructing characteristics which can be studied and adopted, work out overall plan, and then choose a optimum design of the plan by bids and other modes; strictly supervise according to relevant standards during construction, ensure the quality and level of the project; pay attention to close combination of all links including scientific characteristics, characteristics of scientific popularization, admirable characteristics, characteristics of mutual movement, finally achieve the continuous increase and continued development of the comprehensive benefit of the economy, ecology and society.

4.1.2 The mechanism of qualified personnel management

The competition of the market is a competition of qualified personnel management in a sense. The human resources are the most precious resources in the developing of the comprehensive body of the natural protection area of pale-biotic fossil. At present, the great majority of the natural protection area

and the geological park of pale-biotic fossil are located in remote mountain area, the income is lower, encouragement policy is not very effective, and the importing of the qualified personnel is difficult, the force of the qualified personnel ranks is weak, so should enthusiastically create the conditions, positively adopt powerful measures, establish a management ranks to take fixed professional personnel as core, the specialists of all subjects and the personnel of enforcing the law as the main body as quickly as possible.

The mechanism of qualified personnel management of the comprehensive body of the natural protection area of pale-biotic fossil mainly includes the training of qualified personnel, importing of qualified personnel, use of qualified personnel, encouragement of qualified personnel, guarantee of qualified personnel, movement of qualified personnel, disposition of qualified personnel etc., its core is the encouragement mechanism and competition mechanism of the qualified personnel.

4.1.3 The mechanism of fund investment

The natural protection areas and geological parks etc. of pale-biotic fossil of our country are basically located in remote mountain area, sometimes their wages are difficult, so the establishing of the operating mechanism of the management innovation gives a new problem to the government, the government must change the mechanism of financial investment to the comprehensive body of the natural protection area of pale-biotic fossil, first can use concentrative coordination type innovative of investment management system for reference, its core content is "policy of overall coordination, resources of overall disposition, budget of unified management", this concentrative system gives stress to the top design, unified plan, has been adopted by many countries in the world. Next the government should carry out the innovation of investment mechanism by using commercial and financial operating mode; use market means^[100]. Third establish long-term effective investment mechanism as quickly as possible, achieve a good circulatory way of self accumulation and continued development.

Thus it can be seen, today our country should make great efforts forming multi-unit and overall investment mechanism of the funds, fully use various financing measures, ensure the demand of the fund of investment management. This is forming the investment mechanism of the management innovation to take the financial support of the state as guide, financial loan as support, local financial investment as main body, social investment (contributed by non profit organization, social group, resident individuals and enterprises as well as from overseas) and foreign investment as supplement, provide the guarantee of fund for the management innovation of pale-biotic fossil.

4.2 The mechanism of the government

The government plays its leading role in the activity of the management innovation of pale-biotic fossil, the government should make rational use of economic means, full use of law means, continuously perfect and encourage the operating mechanism of the activity of the management innovation of pale-biotic fossil, integrate the strong points of various qualified personnel at home and abroad, arouse the enthusiasm of all sides by every means, make great efforts to create a good economic and social environment for the management innovation of pale-biotic fossil, strengthen the actual strength of the whole of the management innovation of pale-biotic fossil.

4.2.1 The mechanism of the training of qualified personnel

The qualified personnel are key and basic factors for gaining the practical results of the management innovation of pale-biotic fossil. So the government should take measures to strengthen the controlling of the qualified personnel resources, take the finding and training of outstanding qualified personnel especially young qualified personnel as important strategic measures of the developing of paleontology cause, form the mechanism which is advantageous for merging the good points of various personnel, arousing the enthusiasm that the personnel of all sides are engaged in creative work, promoting that the composite qualified personnel flow from scientific research institutions, colleges and universities to basic units of the management of pale-biotic fossil, this is important guarantee of the developing of the pale-biotic fossil cause, ecological equilibrium, social progress.

4.2.2 The mechanism of legal guarantee

Doubtless, the law should and can bring its special effect into full play, make basically innovate incorrect sense of the people on environmental resources, cultivate correct attitude towards the pale-biotic fossil resources in the whole society, and establish the harmonious relation take ecological equilibrium as foundation.

In the activity of the management innovation of pale-biotic fossil that it takes the government as leading and main body formed by multi units participate in, can produce the contradiction and conflict of interests of different natures, this is needed that the government establishes perfect mechanism of

legal guarantee by working out the laws, regulations, rules and policies etc., correctly standardizes, guides and supervise the actions of all main bodies.

4.2.3 The mechanism of fund investment

Under the influence of the factors of many sides, the natural protection area and geological park of pale-biotic fossil cannot become the main body of the management innovation and protected investment, the investment of the government still takes a considerable proportion, so the government should strengthen the investment strength in the management innovation by financial and tax policies etc., perfect the investment mechanism of the funds as quickly as possible, strengthen the support of funds in the management innovation of pale-biotic fossil.

4.3 The market mechanism

The activity of the management innovation of pale-biotic fossil must be carried out around the change of the market demand; the market demand and the market competition are internal motive force, the innovation of the market mechanism is a complicated work system, its core stresses to take the market as the guide, the management innovation of pale-biotic fossil must be brought into operating process of the market, so that create and achieve the maximum of comprehensive benefit of the management innovation of pale-biotic fossil. So the management innovation of pale-biotic fossil must persist in taking the market as the guide, perfect the market mechanism step by step, probe the change of the market, pursue the development of the market, accurately grasp the demand of the market, establish and perfect the operation mechanism.

4.3.1 The mechanism pulled by the demand

The demand of the market is the power source of the management innovation of pale-biotic fossil, make the demand pull the management innovation of pale-biotic fossil; let the demand provide the market, so that regulate and control the process of the management innovation of the natural protection area of pale-biotic fossil. When gain the demand of the market, must be in combination with the developing state, analyze the situation and the demand of the market in view of the direction of the development, and then according to one's resources and capacity, continuously gain the superiority of the market competition, establish the management mode to be suited to one's development, impel the forming and formulating of the market strategy, promote continuously raising the capacity of the management innovation of pale-biotic fossil, achieve the goal to gain good achievement and result.

4.3.2 The mechanism of the market competition

In the market competition which is a sharp day by day, on condition that the demand of the market continuously changes, the successful key of the management innovation of pale-biotic fossil is the quick reaction mechanism to the market change, quick reaction requires high sensitivity of the manager to the market change, according to feedback information of the demand of the market, the manager should decide and regulate coming development direction, strengthen the competitive capacity of the market. If an innovation can not take quick reaction to market opportunity, a greater innovation can only look at market helplessly. Today, the man who won success nobody is not the first to run. For example, successful operation of Yunnan "World Dinosaur Valley" is just a very good example.

4.4 The social mechanism

The management innovation of pale-biotic fossil is huge system engineering, a system process that many elements participate in, the comprehensive body of the natural protection area of the pale-biotic fossil is main body in the activity of innovation, the government is the leader, the scientific research organization and the protection foundation as well as other essential factors play the indispensable role. So must actively create the condition, establish the cooperation mechanism of scientific research and service mechanism of the protection foundation etc., perfect social mechanism of the management innovation of pale-biotic fossil, provide good social environment for the management innovation of pale-biotic fossil.

4.4.1 The mechanism of production-teaching-research cooperation

The comprehensive body of the natural protection area of the pale-biotic fossil (the producing area of the pale-biotic fossils), the scientific research organization and the institutions of higher learning are key essential factors. At the present stage, the comprehensive body of the natural protection area of the pale-biotic fossil has not the scientific research force, the scientific research force of the scientific research organization and the institutions of higher learning are stronger, the disconnected phenomenon of the production-teaching-research is more serious, on the one hand the scientific and technological results are changed difficultly, on the other hand the demands of economic development of the locality are satisfied difficultly. So must establish grand union, large-scale cooperation and big innovation with "zero distance" among multi-unit main bodies i.e. the comprehensive body of the natural protection area

of the pale-biotic fossil, the scientific research organization and the institutions of higher learning, establish the mechanism of production-teaching-research cooperation at higher level. The innovation of production-teaching-research cooperation focuses on integrating scientific and technological essential resources at home and abroad. Achieve a good circle among three essential factors by bilateral or multilateral cooperation that the advantage is complementary, it gives full play to your strengths and to make up for your weaknesses, is mutually beneficial win-win, continuous and stable in importing famous research organizations, outstanding personnel and practical talents at home and abroad.

4.4.2 The mechanism of public cooperation

The Chinese Fossil Protection Foundation was founded in Beijing on April 10, 2008. The Foundation has opened up the form that “the ancient biological culture sets up the stage, the public interest starts before the others, the enterprise pushes”, innovated a new public mechanism to promote international cultural exchange in the paleontology, drive the cooperation and use of the resources.

5 Conclusions

The operating mechanism of the management innovation of pale-biotic fossil is the foundation that the activities of the management innovation of pale-biotic fossil can continuously operate with high quality and high efficiency in the right decision. Only truly establish main body position of the comprehensive body of natural protection area of the pale-biotic fossil in the management innovation activity and accurately grasp the positioning of government functions, can promote the participation and effective combination of the diverse capital, production-study-research and foundation in the activities of the management innovation of pale-biotic fossil.

On the Institutional Innovation of Resettlement Compensation of Water Conservancy and Hydropower Projects in China

Luo Yongneng

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: akangbo @126.com)

Abstract: The large-scale construction of water conservancy and hydropower projects brings huge social and economic benefits, and thus, the social development is promoted; however, with huge amount of land expropriated, involuntary resettlement has become a bigger issue of concern. The resettlement compensation system of water conservancy and hydropower projects in the New China has undergone three stages in history: the stage of land acquisition approach, the stage of land acquisition regulations and the stage of land management law. After a thorough research of the current resettlement compensation system of water conservancy and hydropower projects in China, this essay initiates several new methods to the innovation of resettlement compensation system in China on the basis of long-term resettlement compensation mechanism of land acquisition in the Guizhou section of Longtan Hydropower Station.

Key words: Water conservancy and hydropower projects; Resettlers; Compensation system; Innovation

1 Introduction

China is rich in water resources, with total water resource amounting to 2,800 billion m³. However, due to China's large population, per capita water resource only stands at 2300 m³, just 1/4 of world average level. Besides, the spatial and temporal distribution of water resources is extremely uneven, which makes China a country with frequent floods and droughts. In order to meet the social needs of survival and development, China has built water conservancy and hydropower projects of all sizes, which have produced great economic and social benefits in terms of flood control, irrigation, water supply, power generation and comprehensive utilization, etc., and guaranteed a sustained, steady and rapid development of national economy.

On the one hand, the large-scale construction of water projects produces huge social and economic benefits, and promotes social development; on the other hand, with a lot of land expropriated, involuntary resettlement has become a bigger issue of concern. According to statistics, after 1949, the total number of project-induced involuntary resettlers is more than 40 million by now. They have made a great contribution for the national economic construction, and the state has developed a series of policies and measures on involuntary resettlement compensation. Especially from the mid-1980s, China has proposed the policy of development resettlement and has been embarking on a virtuous cycle path concerning resettlement. These policies can bring benefits to involuntary resettlers in the short term to some extent, but in the long run will have far reaching adverse effects on the development of their descendants due to the loss of land on which they depend and chance of sustainable development, which is especially true to those who do not benefit from project construction; and even worse, some involuntary resettlers find it is hard to get rid of poverty. Therefore, it has become an important topic facing us to further reform and improve the resettlement compensation system to ensure that resettlers can share the benefits and achievements in construction so as to ensure a sustainable and coordinated development of local economy, and to reach the goals of an overall and well-off harmonious society.

In order to study the resettlement compensation system of water conservancy and hydropower projects in China, the resettlement compensation practice in Guizhou section of Longtan Hydropower Station is taken as an example for analysis, and innovative ideas are proposed.

2 Historical Evolution of Resettlement Compensation System of Water Conservancy and Hydropower Projects in China

The historical evolution of resettlement compensation system of water conservancy and hydropower projects in China has undergone three stages.

2.1 Stage I: land acquisition approach (1953-1981)

In 1953, China enacted the *Approaches on National Construction Land Acquisition*, the first land requisition compensation act, aiming at compensating individual-owned or collective-owned house and land. The compensation standard is generally based on the total land output value of the three to five

years preceding land acquisition. In actual operation, the compensation standard of reservoir flooded farmland is generally 3 times of annual land output value per mu. Due to the narrow scope of economic compensation and low compensation standards, the compensation fees are extremely low, with average financial compensation amounting around 100-300 RMB yuan. In 1953, the act was revised and the compensation standard was set to 2 to 4 times the average annual land output value of the three years preceding land acquisition. In 1958, the State Council revised it again and the compensation standard was set as before. After 1958, China undergone, in succession, several political turmoil, i.e. "the Great Leap Forward", "the Cultural Revolution", and resettlement in the construction of water conservancy and hydropower projects was greatly disturbed. Such erroneous tendencies as "construction first, resettlement second", "relocation first, resettlement second" and "production first, livelihood second" were very common, and due to low compensation standards and narrow compensation range, each rural resettler can only get 300 to 500 RMB yuan in compensation on average in 1960s and 600 to 1200 yuan in 1970s. Besides, the way of relocation and resettlement was simple and rough, which left many problems, and consequently, a considerable number of resettlers were put into long-term poverty.

2.2 Stage II: land acquisition regulation (1982-1985)

In 1982, the State Council promulgated the *Regulations Concerning Land Requisition for State Construction*, and abolished *Approaches on National Construction Land Acquisition*, setting the compensation standard at 3 to 6 times of the average annual land output value of the three years before acquisition. On June 19, 1981, the Ministry of Finance and Ministry of Power Industry jointly issued *The Notice on Extracting Reservoir Maintenance Fund from the Cost of Power Generation*, deciding that hydroelectric power stations directly under management of the Ministry of Power Industry should extract one thousandth of one yuan from per kilowatt hour to finance a reservoir maintenance fund aiming at providing subsidies for resettlers. On August 24, 1985, it was decided in *The Meeting Minutes of Central Financial Work Leading Group Office No. 22* that From January 1, 1986, found-raising for supporting resettlers would be addressed by extracting fees from benefits of reservoirs or income of power generation of hydropower stations. After *Land Regulations*, *Land Administration Law* and other laws and regulations were promulgated, maintenance fund and construction fund of hydropower station or reservoir were established, and these efforts played an important role in addressing resettlers' difficulties with extended scope and higher Standard in compensation. However, it still could not guarantee the basic production and living needs of resettlers, and they still had huge difficulties in production and living, and groups of poor resettlers became factors of social instability.

2.3 Stage III: land administration law (1986 - present)

In 1986, the National People's Congress enacted the *Land Administration Law of the People's Republic of China* (hereinafter referred to as the *Land Administration Law*), and abolished *Regulations Concerning Land Requisition for State Construction*. The land compensation fees was set at 3-6 times the average output value of the three years preceding land acquisition, the resettlement fees cannot exceed 10 times, and the total amount shall not exceed 30 times. In 1998 and 2004, the law was revised twice, and the compensation fees was increased to 6-10 times, the resettlement fees cannot exceed 15 times, and the total amount shall not exceed 30 times. On September 1, 2006, the newly revised *Regulations on Land Requisition Compensation and Resettlement of Large and Medium-sized Water Conservancy and Hydropower Projects* (hereinafter referred to as *Regulations*) was formally put into practice, and the compensation and land acquisition in resettlement is 16 times the average output value of the three years preceding the requisition of the cultivated land. The initiation of these policies and regulations indicates that resettlement work of water projects in China has achieved a historic leap, which is a milestone in safeguarding and realizing the interests of the reservoir resettlers, reflecting the full range protection of reservoir resettlers' rights.

It can be inferred from the above analysis that though involuntary resettlement compensation system in China undergone three stages, but in general, it can be divided into two stages, with the first two stages defined as the regulatory management stage, and the third stage, the legal management stage. In the first two stages, there were no resettlement subsidies. Only after the *Land Administration Law* was enacted, the resettlement subsidies came into being and compensation standards gradually increased.

3 The Status-Quo of Water Conservancy and Hydropower Project Resettlement Compensation System in China

3.1 Research status-quo

In theoretical circles, the studies on resettlement compensation system are abundant, but it has not yet formed a complete theoretical system. Wang Junhai thinks that under the existing compensation mechanism the acquired land is compensated only according to its agricultural value, but its future use and value is not compensated (Wang Junhai, 2005). From Chen Guiyang's view, the reason lying behind the current unsatisfactory resettlement model is that the land-owners get one-time land requisition compensation fees in accordance with national accredited standards; however, with such compensation fees resettlers cannot regain their basic means of production, and thus, he proposes that a long-term compensation is helpful to the resettlers and social stability in the reservoir area (Chen Guiyang, 2005). Peng Weijie put forward the model of benefit-sharing compensation after an analysis of the amount of compensation of in the resettlement of the Changzhou Reservoir in Guangxi, China, and initiated a bonus calculation model (Peng Weijie, 2006). Wen Liangyou summarized the compensation and resettlement experience of small-sized power stations, and analyzed the feasibility, necessity and problems which may arise of long-term compensation in resettlement (Wen Liangyou, 2006). Jia hua thought that the long-term compensation system of land requisition can help resettlers maintain their original living standards and is of important practical significance to safeguard their legitimate rights and interests (Jia Hua, 2006). Duan Yuefang pointed out that the investment-oriented compensation and resettlement mode provides a way to solve resettlers' problems of long-term stability and prosperity (Duan Yuefang, 2009). Michael M. Cernea proposed the IRR model, i.e. impoverishment risks and reconstruction model for resettling displaced populations, and pointed out that after resettlement the relocated people may face economic, social and cultural risks and fall into poverty; and thus, a relevant reconstruction strategy should be set up to get rid of risks.

3.2 Current compensation systems

In order to provide a legal basis and ensure a smooth progress in resettlement compensation, in 1991, China promulgated the regulation of *Regulations on Land Requisition Compensation and Resettlement of Large and Medium-sized Water Conservancy and Hydropower Projects Construction*. The basic policies consist of compensating in the earlier stage and follow-up support in the later stage. The compensation and subsidy for reservoir resettlement is based on a full investigation of physical indicators submerged; and according to the principles of "original scale, original standards, restoring the original function", the specific compensation standards for losses is decided, and the total investment of compensation is included in the project cost budget. In 1993, China formulated a specific guidance *Regulations on Three Gorges Project Resettlement* for the Three Gorges Project resettlement. It provides that the investment calculated according to the three-original-principle can be classified in resettlement investment after approval; and the investment arising from expanding reconstruction scale or upgraded standards need to be solved by relative units themselves.

3.2.1 Basic principles in resettlement compensation

The following principles should be followed in the land requisition compensation and resettlement of water conservancy and hydropower projects construction. (1) The relationships between the nation, collective organizations and individuals should be handled appropriately, and the development in reservoir areas and resettlement areas should comply with national overall arrangement. (2) The resettlement should be combined with reservoir construction, resource exploitation, water conservation, and local economic development, so as to ensure that resettlers' living standards reach or exceed their original level. (3) The resettlement should be adapted to local conditions, overall planning, rational using of resources in the reservoir area, and in-place resettlement to sites above the inundation line, and in case of without the condition for in-place resettlement to sites above the inundation line, other forms of resettlement such as the utilization of deserted beach, land transfers, and relocation etc. can be taken with full observe of national laws and regulations.

3.2.2 Compensation standards

As to land requisition compensation standards of water conservancy and hydropower projects, it is clear in *Regulations*, i.e. the land requisition compensation fees in large water conservancy and hydropower projects construction consists of land requisition compensation and resettlement subsidies. Land acquisition compensation fees for the cultivated land is 3 to 4 times the average output value of the three years preceding the requisition of cultivated land, and the subsidies for each among the agricultural population is 2 to 3 times the average output value of the three years preceding the requisition of cultivated land. In large-scale project construction of flood controlling, irrigation and drainage etc. the land requisition compensation fees can be less than the standard above, and specific standards should be decided jointly by the department of water resources with relevant ones. Compensation and resettlement subsidy standards of other land requisition shall be decided by the related provinces, autonomous

regions and municipalities with reference to the cultivated land requisitioned. In accordance with the above standard, if the resettlement remains cannot go well, resettlement compensation fees can be increased appropriately.

3.2.3 Follow-up support

Reservoir follow-up support policies was decided in the *Regulations*, and based on these policies, the state established a reservoir construction fund for large and medium-sized water conservancy and hydropower projects for reservoir maintenance and supporting resettlers' production. The regulation of extraction, management and usage of the fund of newly-built water conservancy and hydropower projects should be jointly prescribed by related departments. In March 1996, the State Council and its related departments jointly issued the notification of *Notification on the establishment of hydropower and Reservoir Follow-up Support Fund*. The notification has made corresponding provisions on the extracting principles, source of funds, extracting standards and methods, usage of funds etc. In April 2007, the Ministry of Finance issued a nationwide unified reservoir fund collection and management regulation.

The above-mentioned compensation systems and regulations seem reasonable in a particular historical context, because they ensured that the construction run in an orderly way, and resettlers can also get some compensation. But in the long run, particularly in the context of building a moderately prosperous society and a harmonious society, there are still some shortcomings and deficiencies in them.

3.3 Deficiencies of resettlement compensation system of water conservancy and hydropower projects

3.3.1 Path dependence in the resettlement system

From 1953 till now, the standards of resettlement compensation fees in land requisition in China is always based on the average annual output value. Once this institutional mechanism embarked on a path, its established direction will get self-reinforcing in the future development.

3.3.2 Ignorance of the wide participation of resettlers in policy-making

In current policy-making, resettlers' wide participation is neglected.

3.3.3 Distortion of land-lost farmers' substantial property rights by institutional arrangements in resettlement compensation

Due to the limitation to land property rights system and farmland ownership transfer system, farmers' substantial property rights are often distorted. Although *Rural Land Contract Law* provides farmers in the 30-year land contract period with the right of use, management, usufruct, handling gains and ownership-transfer right, but in current laws in China, rural land is collectively-owned, which results in "property incompleteness" of substantial property rights of farmland. In land requisition compensation practice, the rural collective economic organizations catches attentions first, followed by the relation between farmers and their organizations, which results in farmers' inability to realize their rights in land requisition.

3.3.4 Ignorance of resettlers' intangible losses.

The current resettlement compensation system in China is still limited to resettlers' direct physical losses, and their indirect intangible losses are not included. Duan Yuefang argues that resettlers' intangible losses mainly includes the dysfunction of their original labor skills, traditional non-market income loss and loss of job opportunities, as well as resettlers' original social network being damaged and advantageous traffic and market conditions disappeared.

4 Practice of Resettlement Compensation System Innovation of Water Conservancy and Hydropower Projects in China

Longtan Hydropower Station is one of the important power base projects in the national strategy of "West Power to East", its designed capacity is 4.2 million kW, and its actual capacity is 4.9 million kW. Under its 375 m normal inundation line, nearly 50,000 resettlers in Guizhou section of the reservoir are involved, with a flooding area of 48,000 mu of arable land, among which nearly 15,000 mu are garden plot. In Guizhou section of Longtan reservoir, resettlement work was delayed by more than six years because of the deficiency of arable land available. Due to the outstanding problems in resettlers' production cannot be solved Guizhou took a new measure, the long-term yearly compensation mechanism of flooded land, to address these problems. In December 2009, Guizhou Provincial People's Government approved the long-term compensation program, and in January 2010, the program was officially launched. Through efforts of more than 8 months, up to August 31, 2010, there were 23,413 mu flooded farmland included in the long-term compensation program in Guizhou section of Longtan

reservoir, and the per capita arable land included in the long-term compensation program was close 0.5 mu, which, equally speaking, shows the per capita arable land was restored to approximately 1.3 mu. This new mechanism provided more than 40,000 rural resettlers with long-term means of livelihood.

4.1 Object and scope of long-term compensation

There are three types of objects for long-term compensation. The first group is resettlers who in their original resettlement plan would obtain a certain amount of cultivated land, but get no cultivated land or the cultivated land obtained cannot reach their previous level after relocation; the second group is resettlers whose original plan was to take part in non-agricultural industries but failed, and are willing to return land compensation fees and subsidies; the third group is farmers whose houses are above the reservoir inundation line, but farmland is inundated. The scope of the program is paddy fields and dry land flooded by the inundation line, i.e. the altitude of 375 meter. Usually, the compensation standards of suburban garden plot, vegetable rice field, sugarcane field, dry vegetables land, orchard, etc. are higher than paddy fields and dry land. If they are evolved from paddy fields and dry land, they shall be brought into long-term compensation corresponding to the class of paddy fields and dry land compensation standards, and compared with paddy fields and dry land, the part of their higher value will be cashed to the rural collective economic organizations or statutory contractors one time. Land requisition in towns and cities or for the reconstruction of specific programs are not included in the program.

4.2. Long-term compensation standards

The standard in the long-term compensation program in Guizhou section of Longtan reservoir is 1247.50 RMB yuan for paddy field per Mu per year (with value equivalent to 650 kilograms of rice at 2010), and 850.50 RMB yuan for dry land per Mu per year (with value equivalent to 440 kilograms of rice at 2010). Power station owners pay that in the form of cash, the compensation is executed by the resettlement department at county level, and the local banking institutions are commissioned to handle the cash to each relocated family. The cash is set to be transferred to resettlers on April and October each year, the annual harvest period in agriculture. The standard of combination of land acquisition will be adjusted according to paddy price. After 2010, according to the local paddy rice price index announced by provincial statistics department, the provincial resettlement department will negotiate with the power station owners once every three years. Therefore, the standard of long-term compensation adequately reflects changes in price index as well as agricultural subsidies, agricultural science and technology progress and other factors, and thus, it is in resettlers' interests compared with one time compensation.

Table 1 Present Value of Long-Term Compensation Fees of 1 Mu Paddy Field in Guizhou Section of Longtan Power Station (Annual Output Value in 2007:1247.5 RMB Yuan)

Fixed number of years	Present value according to rural consumer price and average interest rate(RMB yuan)	Fixed number of years	Present value according to rural consumer price and average interest rate(RMB yuan)
5	5663.1	30	22134.06
10	10316.06	35	23941.82
15	14143.24	40	25427.12
20	17342.85	45	26648.82
25	19971.74	50	27670.15

Annotation: The result shows that the total present value of 1 Mu paddy field in 50years in long-term compensation (27670.15 RMB Yuan) is 1.39 times the value of one-time compensation (19960 RMB Yuan). Long-term compensation of land acquisition is in the interest of resettlers.

4.3 Time limit for long-term compensation corresponding to the period of the power station in function

In 2007, the first generating unit of Longtan Hydropower Station started to generate electricity, so it is the starting point of compensation on January 1, 2007. As long as the power station exists, the compensation will be implemented yearly, until the station closed. It broke through the existing statutory compensation standard of land requisition, i.e. 16 times the annual output value of the three years preceding land requisition, and extends the standard to N times. Generally the life cycle of a power station is 50 years or more, and if then the power station is scrapped, the method of reclamation can be taken to resume production and rehabilitation funds and other problems of farmers during rehabilitation time can be solved in accordance with national and the relevant provisions of Guizhou Province.

4.4 Related safeguard measures

First, the station owner pre-fetches compensation fees for two years as long-term compensation risk fund to bank designated account by station owners and provincial resettlement authorities for rainy days when finance problems appears due to poor hydropower generation benefits, corporate restructuring, juridical person change, etc. Second, the annual cost of carrying out the program, 3% of the total amount of compensation, should be reasonable and listed separately. Third, in the reform of local government bodies, resettlement agencies at county level should be further strengthened to enhance their capability in work, so as to guarantee that long-term compensation has a long-term, normal, special handling mechanism. Moreover, there is need to manage resettlers' files well and provide them with fine service, and make sure that "the water is drained to the field", and "the program not be abolished in one hundred years".

The establishment and implementation of long-term compensation mechanism in Guizhou section of Longtan Hydropower Station has yielded good results. The practice shows that the compensation method from one-time to dynamic changes yearly has effectively resolved the historic difficult problem of reservoir resettlement in Guizhou, and realized triple-win situation of the resettlers, power station owners and the government.

5 Path of System Innovation of Water Conservancy and Hydropower Projects Resettlement Compensation in China

5.1 Reforming cultivated land transfer system and the resettlement compensation system in accordance with principles of market economy

At present, China should establish and improve the ownership-transfer market of the farmland to reform the unidirectional compensation mechanism of land requisition in which the compensation fees is based on annual crop output value, ensure that compensation fees should in line with the real value of the land with full consideration of land gains and social security value, and list the fees into its investment cost. In addition, China should realize marketization of resettlement compensation system and compensation mode, and fundamentally overcome the phenomena of artificially lowering resettlement compensation standards and damaging the legitimate rights and interests of resettlers, to ensure resettlers to return to normal production and living conditions as soon as possible.

5.2 Improving and standardizing procedures in resettlement compensation policy-making

Open, transparent and normative means such as expert consultation, public hearings etc. should be taken in resettlement policy-making to promote a democratic and scientific decision-making process. Moreover, the social assessment method should be introduced, and compensation in resettlement should be decided in accordance with market prices of farmland with full consideration of their location, purpose, quality, size and other factors.

5.3 Flexible means of resettlement compensation based on local conditions

Various flexible means such as monetary compensation, property replacement (land, houses, enterprises and other replacement), equity dividends, production resettlement, urbanization jobs resettlement, social insurance pension resettlement, vocational training, education self-resettlement, and other ways can be taken in resettlement.

5.4 Exploring and promoting the long-term resettlement compensation mechanism

By reforming of rural resettlement from the one-time compensation of land requisition compensation to long-term compensation mechanism based on the annual output value of farmland, it can not only reduce one-time investment of water conservancy and hydropower project construction, but also allow rural resettlers to share benefits and achievements of reform and development to a certain degree.

5.5 Establishing development fund and improving the social security system for the settlements

Government need to establish resettlement development funds for infrastructure construction in resettlement areas, and the supporting fund for creating new employment opportunities, providing interest subsidies for resettlers to develop their own businesses and loan interest discount. Also, a basic social security system consists of medical care, unemployment insurance, pension, etc., should be established to safeguard resettlers' legitimate rights and interests of all kinds, and promote the building of a harmonious society in resettlement areas.

5.6 Speeding up the legislation of resettlement law

There is need to strengthen the "top-level design" and accelerate legislation in this field to guarantee the innovation of resettlement compensation system. It should establish specialized laws on

involuntary resettlement and water conservancy and hydropower project resettlement. The law should focus on the principles of involuntary resettlement, regulatory agencies, the standard of financial compensation and resettlement ways, resettlers' rights and obligations, social involvement, participation of resettlers, resettlement follow-up support policies and legal liability, etc.

6 Conclusions

As construction of China water conservancy and hydropower projects came into being, the resettlement compensation system of that was formed at the same time. From 1949 to present, the resettlement compensation system of water conservancy and hydropower projects in China has undergone three stages in history: the stage of land acquisition approach, the stage of land acquisition regulations and the stage of land management law. New resettlement compensation system should be based on economic and social development and the increasingly diverse needs of resettlers. By discussing the existing resettlement compensation system of water conservancy and hydropower, this paper identifies system deficiencies which need to be improved. Given the wealth of content of resettlement compensation system, this paper selects the long-term compensation resettlement mechanism in Guizhou section of Longtan reservoir as a node for basic description, and then explores the innovation paths of China water conservancy and hydropower engineering resettlement compensation system.

An Innovative Thinking on the Concepts of *Ex-Ante* Value, *Ex-Post* Value and the Realized Value (Price)

Mohammad Ali Tareq

Senior Lecturer, Malaysia-Japan International Institute of Technology (MJIT),

Universiti Teknologi Malaysia (UTM)

(E-mail: tareq@ic.utm.my, tareq@cantab.net)

Abstract: Researchers have been considering the realized value as the ex-post realization of the ex-ante value. They have argued that the realized values have failed to estimate the expected value in asset-pricing models. We provide a new definition of the ex-post measurement and we show that considering realized value as the ex-post realization of the ex-ante value is misleading and this has led to the failure in estimating the expected value.

Key words: Ex-post; Ex-ante; Realized value; Expected value

1 Introduction

In theory, researchers can establish risk-return relationship; empirically, the unobservable nature of the *ex-ante* expected return hinders the estimation of the relationship between the risk and return. In general, it is believed that investors know their expected value and the variance-covariance matrix, and based on these, they form the price of an asset in the market. Thus in the text books, researchers have been using realized returns assuming that realized returns are normally distributed with mean μ_i and a variance of σ_i^2 ; $R_{it} \sim N(\mu_i, \sigma_i^2)$, and over the sample period, the average of these realized returns will match the *ex-ante* expected return. This implicit belief has led the researchers to assume realized returns as a sample of returns in estimating the expected return, i.e., they consider realized value as the ex-post realization of the ex-ante expectations.

We argue that this belief on the convergence of realized return on *ex-post* return is misleading. The disparity between *ex-post* realization and *ex-ante* prediction is well addressed by Sharpe (1978); and Campello *et al.* (2008) also believe that the distribution of expected returns does differ from the distribution of realized (*ex-post*) returns. Elton (1999) concluded that the realized (*ex-post*) return is a poor proxy for the expected return because of its deficiency in reflecting the nature of *ex-ante* expectations. None of the researchers have identified the reason behind this disparity between these two values, however. From the point of view of asset-pricing model, we introduce new definition of the *ex-post* value and show clear distinction between the realized value (price) and the *ex-post* value, and in turn, it proves that realized price cannot be the *ex-post* realization of the *ex-ante* values. *How the ex-post value and the realized value differ from each other?*

2 The Ex-Ante Return, Ex-post Return and the Realized Returns

The main focus of the asset-pricing model is to explain the risk-return relationship. Theoretically, we can establish risk-return relationship (for example, CAPM). However, unobservable nature of the ex-ante expected return hinders estimating the empirical risk-return relationship. As a result, in empirical analysis, most of the researchers consider realized return as the ex-post realization of the (ex-ante) return, i.e., they assume realized return as a sample of return. For example, they assume that (ex-ante) return¹ are normally distributed with mean μ_i and variance of, $\tilde{R}_{i,t} \sim N(\mu_i, \sigma_i^2)$. They have used the average realized return and sample variance as estimators of the ex-ante expected return and the ex-ante variance. Nevertheless results of the empirical analysis were almost inconclusive.

Some researchers intuitively believe that the realized return cannot be the ex-post realization of the (ex-ante) return and consequently empirical estimation differs from the ex-ante expectation. In this section we depict the inability of the realized return as the ex-post realization of the ex-ante and present that ex-post value is different from the realized value. We portray our argument from the pricing point

¹ In general, expected return has been considered as the 'ex-ante return' by the researchers. As we have discussed later in the paper that the *ex-ante* literally means the random future values. If we define *ex-ante* return as the expected return, we are disregarding the randomness of the future values. Therefore, we have defied the returns as '(ex-ante) returns' in this paper instead of the 'expected returns' as has been considered by the other researchers.

of view and in doing so we show that the information set in the price is different from the information set in the ex-post value. Our argument is based on the following simplified assumptions:

(i) In an one-period setting, price is the discounted value of the next period's expected price,

$p_{i,t} = \frac{E(\tilde{p}_{i,t+1})}{d_i}$ where $d_i > 1$. In addition, we assume that $E(\tilde{p}_{i,t+1})$ incorporates all future information available at t .

(ii) The state of future economy changes with time.

Assumption (i) states that for any risky asset the investors are assumed to expect positive payoffs in future and can be considered as one of the basic assumptions in valuation. Assumption (ii) can be considered as the base of our argument. Most of the researchers assume a steady state of the economy where there is no change in the fundamental economic variables. Rather they consider any change in the information set (surprises) as a change in variables other than the fundamentals. And for a sample, these surprises are expected to be cancelled out. We assume that any change in the economy is a result of the changes in the economic variables, both fundamentals as well as firm specific ones. This may lead us to assume that investors' forecasts about the asset's expected price would increase (decrease) with forecasted positive (negative) changes in the economic variables. Besides, researchers have been using the realized return in empirical tests, and in reality the economy is changing also. Thus our second assumption is much closer to the reality.

Most of the researchers have been using realized return in establishing the empirical risk-return relationship; we introduce 2 scenarios and argue on the inability of the realized return to explain the risk-return relationship. As we proceed, we discussed on the different information sets in the asset-pricing, and gradually, we present the difference between the realized value and the ex-post value. We conclude that realized return cannot be a sample of return.

An example:

We begin with a simple example for better understanding of our argument. We show that when the assumptions (i) and (ii) hold, average realized returns cannot estimate the expected return. Investor's expected price would rise (fall) with the favorable (unfavorable) future economic forecasts. We start our argument with a series of unfavorable future economy in scenario 1. Under one-period model settings, we assume that price in every period is formed based on the expected price of the next period. Let us assume the expected prices for $(t+1)$ to $(t+4)$ at $t, (t+1), (t+2)$ and $(t+3)$ are 105, 95, 89 and 83 respectively. If we assume 5% expected return¹ for the investors, we would get the price for t to $(t+3)$ as $(105/1.05)$, $(95/1.05)$, $(89/1.05)$ and $(83/1.05)$ respectively. For this series the average realized return would be negative. Note that our expected return is 5% in scenario 1. The sample average realized return for these types of series cannot estimate the expected return of 5%. Why average realized return fails to estimate the expected return?

Scenario 1 Realized return and the risk-return relationship in downward Market

This table forecasts the future values from $(t+1)$ to $(t+4)$ in a down-ward market.

The expected return (cost of capital) is 5% (i.e., discount rate, $d_t=1.05$). For simplicity of the argument we assume expected return as constant.

	t	$t+1$	$t+2$	$t+3$	$t+4$
$E(\tilde{p}_{t+\tau})$		105	95	89	83
$p_{t+\tau}$	105/1.05	95/1.05	85/1.05	83/1.05	...
$r_{t+\tau+1} = \frac{p_{t+\tau+1}}{p_{t+\tau}}$		0.905	0.937	0.933	...

¹ Although the expected rate of return (the discount rate) might change with the changes in the economic forecasts, for simplicity, we consider constant discount rate in this paper. Note that, the argument of this paper can support a model with changing discount rate scenario also.

For $(t+1)$ in scenario 1, researchers would consider $(95/1.05)$ as the *ex-post* realization of *ex-ante* price for t , i.e., $(95/1.05)$ is treated as a realized value of the *ex-ante* distribution of future price of $p_{i,t+1}$ for $(t+1)$ at t . Can $(95/1.05)$ at $(t+1)$ be a *ex-post* value of the future price of $(t+1)$ for t ?

The price at $(t+1)$ is the discounted expected price of $(t+2)$. In this example, the price $(95/1.05)$ at $(t+1)$ is derived from the information on the future price for $(t+2)$ which is available at $(t+1)$. In general, the *ex-post* value at $(t+1)$ is the observed value from the information on t to $(t+1)$. $(95/1.05)$ cannot be the *ex-post* value at $(t+1)$ as this value is derived from the information of $(t+2)$ instead of the information set of t to $(t+1)$. Under assumption (ii), the expected price of $(t+2)$, $E(\tilde{p}_{i,t+2})$, has no relation to the distribution of $\tilde{p}_{i,t+1}$ at $(t+1)$. So the realized return can neither be the *ex-post* return nor the sample of return.

In scenario 2, with favorable economic forecasts, the expected values increase from 105 in $(t+1)$ to 150 in $(t+3)$. We can consider scenario 2 as an illustration of the Japanese bubble during 1985-90. With this increase, the prices also increase from 100 at t to 143 in $(t+3)$. The average realized return for this type of upward series will be much greater than the expected return of the asset (5% in this case). Besides, as we have argued before, $(120/1.05)$ cannot be considered as the *ex-post* value at $(t+1)$ because $(120/1.05)$ is derived from the information set on the expected price of $(t+2)$ available at $(t+1)$.

Scenario 2 Realized return and the risk-return relationship in upward Market

This table forecasts the future values from $(t+1)$ to $(t+4)$ in an up-ward market. The expected return (cost of capital) is 5% (i.e., discount rate, $d_t=1.05$). For simplicity of the argument we assume expected return as constant.

	t	$t+1$	$t+2$	$t+3$	$t+4$
$E(\tilde{p}_{i,t+\tau})$		105	120	135	150
$p_{i,t+\tau}$	105/1.05	95/1.05	89/1.05	83/1.05	...
$r_{t+\tau+1} = \frac{p_{t+\tau+1}}{p_{t+\tau}}$		1.143	1.125	1.111	...

None of the researchers have argued on the information sets in the price as well as in the *ex-post* return. In this section, with simple illustrative examples under assumption (i) and (ii), we have shown that the information sets in price and in *ex-post* return are different, and price cannot be considered as the *ex-post* realization of the *ex-ante* expectation.

2 Realized return and the ex-post return

In this section, we provide a general discussion on the difference between realized return and *ex-post* return. We have divided information at t into two parts for better understanding, and we define information as:

$$\phi_t = \phi_t^{H_t} + \phi_t^{F_{t+1}} \tag{1}$$

where, ϕ_t is the total information set available at t , $\phi_t^{H_t}$ is the past information set on $(t-1)$ to t available at t , and $\phi_t^{F_{t+1}}$ is the future information set on $(t+1)$ that is incorporated at t . Past information set is assumed to be comprised of the results of the operating activities between $(t-1)$ to t . In contrast, the economic information as well as the firm's future policies is incorporated in the future information set. Under assumption (i), price p_{it} is the discounted value of $E(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$. Similarly, price $p_{i,t+1}$, is the discounted value of $E(\tilde{p}_{i,t+2} | \phi_{t+1}^{F_{t+2}})$. At $(t+1)$, $p_{i,t+1}$ does not incorporate

past information set $\phi_t^{H_t}$; it is derived from the future information set of $\phi_{t+1}^{H_{t+2}}$. The figure 1 explains the difference between information sets in price and the *ex-post* value.

Figure 1 Price and *ex-post* value

In the following discussion, we provide further explanation to confirm that the realized return cannot be the *ex-post* return. We define (*ex-ante*) return at time t , $\tilde{r}_{i,t+1}$ as,

$$\tilde{r}_{i,t+1} = \frac{\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}}}{p_{i,t} | \phi_t^{F_{t+1}}} \tag{2}$$

and, the realized return, $r_{i,t+1}$, is defined as,

$$r_{i,t+1} = \frac{p_{i,t+1} | \phi_{t+1}^{F_{t+2}}}{p_{i,t} | \phi_t^{F_{t+1}}} \tag{3}$$

The researchers consider $(p_{i,t+1} | \phi_{t+1}^{F_{t+2}})$ as the *ex-post* realization of $(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$, i.e.; they have been assuming $(p_{i,t+1} | \phi_{t+1}^{F_{t+2}})$ as the sample of the distribution of future random price of $(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$. The return at t in equation (4.2) incorporates the information about the time period $(t+1)$, available at t . In equation (3), $(p_{i,t+1} | \phi_{t+1}^{F_{t+2}})$ has no relation with $(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$ under assumption (ii), however. Instead, $(p_{i,t+1} | \phi_{t+1}^{F_{t+2}})$ is the discounted expected value of $(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$. The realized return of $(t+1)$ in equation (3), includes information about periods $(t+1)$ and $(t+2)$ for $(p_{i,t} | \phi_t^{F_{t+1}})$ and $(p_{i,t+1} | \phi_{t+1}^{F_{t+2}})$ respectively. The information sets in $\tilde{r}_{i,t+1}$ and $r_{i,t+1}$ are different. These two values are derived from different information sets of different time periods. As a result realized return can neither be *ex-post* return nor a sample of return.

3 Alternative Definition of *ex-post* Value

In section 3, we have shown that the present believe on the *ex-post* return is misleading. How can we measure the *ex-post* return? At t , we consider, the *ex-ante* prediction follows²,

¹ Past information, for example as cited by Elton (1999), high earnings announcements of MacDonald, has little or no role in forming future expectation of the investors. *Does high earnings announcement really lead to higher future price?* In TSE, the annual earnings for Nintendo was the highest in March of 2009 at JPY 279 billion (approx); the price dropped from JPY 71,900 in 2007:10 to JPY 23,180 in 2009:10 following the earnings information, however. If positive (negative) past information has an impact on the following price, the price would have increased (decreased) following the information. The drift in Nintendo's price, even with the highest earnings information, can be an example of the absence of the effect of past information on the price.

² Readers might question that: How the investors will forecast the future when the future looks gloomy and next period's expected value is thought to be negative? that is, when $\tilde{x}_{i,t+1} | \phi_t^{F_{t+1}} < 0$, how the investors will make their future forecasts?

$$\tilde{p}_{i,t+1} = (p_{i,t} | \phi_t^{F_{t+1}}) + (\tilde{x}_{i,t+1} | \phi_t^{F_{t+1}}) \tag{4}$$

where, $(\tilde{x}_{i,t+1} | \phi_t^{F_{t+1}})$ is random operating value for t to $(t+1)$ based on available information set $\phi_t^{F_{t+1}}$ at t . We assume earnings, $\tilde{x}_{i,t+1}$, as the random operational outcome from t to $(t+1)$ realized at $(t+1)$. We observe earnings for t to $(t+1)$, i.e.; $(x_{i,t+1}^* | \phi_{t+1}^{H_{t+1}})$. Thus, we define the *ex-post* value at $(t+1)$, $(v_{i,t+1}^* | \phi_{t+1}^{H_{t+1}})$ as,

$$v_{i,t+1}^* = (p_{i,t} | \phi_t^{F_{t+1}}) + (x_{i,t+1}^* | \phi_{t+1}^{H_{t+1}}) \tag{5}$$

where, $x_{i,t+1}^*$ is the observed earnings at $(t+1)$. The value in equation (5) is the realized value of *ex-ante* random price of $(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$ for $(t+1)$ made at t . The realized price, $p_{i,t+1}$, is not the *ex-post* realization of $(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$; whereas, $x_{i,t+1}^*$ is the observed earnings for t to $(t+1)$ at $(t+1)$. The *ex-post* return, $r_{i,t+1}^*$, can be written as:

$$r_{i,t+1}^* = \frac{v_{i,t+1}^* | \phi_{t+1}^{H_{t+1}}}{(p_{i,t} | \phi_t^{F_{t+1}})} \tag{6}$$

As a concluding remark of section 4, the *ex-ante* value at t is the expected value of $E(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$ for $(t+1)$. $E(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$ is discounted to derive $p_{i,t}$ at t . The *ex-post* value at $(t+1)$ is the realized (observed) value of timer's anticipation of $(\tilde{p}_{i,t+1} | \phi_t^{F_{t+1}})$ that we would observe as we move to $(t+1)$. In contrast, price $p_{i,t+1}$ is derived from $E(\tilde{p}_{i,t+2} | \phi_{t+1}^{F_{t+2}})$ at $(t+1)$. In section 3 we have argued that the information sets in these values are different. At $(t+1)$, price $p_{i,t+1}$ incorporates the information set $\phi_{t+1}^{F_{t+2}}$ on $(t+2)$, whereas the *ex-post* value at $(t+1)$, $v_{i,t+1}^* | \phi_{t+1}^{H_{t+1}}$, is observed from the operational activities of t for $(t+1)$.

4 A Numerical Example on the Ex-Ante Return, Ex-Post Return and the Realized Return

The Latin word ‘*ex-ante*’ means ‘beforehand’. In models where there is uncertainty, that is resolved during the course of events, the *ex-ante* values are those that are calculated in advance of the resolution of uncertainty. In finance, for example, *ex-ante* is the future random values. As a numerical example, let $E_t(\tilde{p}_{i,t+1})$ and R_i be \$110 and 10% respectively. The price at t , $p_{i,t}$, would be \$100. Now, as we move to $(t+1)$, the price $p_{i,t+1}$ will be the discounted expected value of $(t+2)$, i.e., $E_{t+1}(\tilde{p}_{i,t+2})$. If for some reasons, at $(t+1)$ the investors predict a macro-economic downturn in $(t+2)$. At $(t+1)$ investors predict $E_{t+1}(\tilde{p}_{i,t+2})$ to be \$99.¹ Thus the price at $(t+1)$, $p_{i,t+1}$, will be \$90. This downward movement

Following equation (4.4), when $\tilde{x}_{i,t+1} | \phi_t^{F_{t+1}} < 0$, investors will consider another variable $(\tilde{\theta}_{i,t+1} | \phi_t^{F_{t+2}})$ which includes the information on the periods $(t+2)$ onwards.

$$\tilde{p}_{i,t+1} = (p_{i,t} | \phi_t^{F_{t+1}}) - (\tilde{x}_{i,t+1} | \phi_t^{F_{t+1}}) + (\tilde{\theta}_{i,t+1} | \phi_t^{F_{t+2}})$$

The idea behind this is that, even though the next period's values are negative, the following periods information makes the forecasts positive in the sense that:

$$-(\tilde{x}_{i,t+1} | \phi_t^{F_{t+1}}) + (\tilde{\theta}_{i,t+1} | \phi_t^{F_{t+2}}) > 0$$

In the later section we conduct an empirical test on the *ex-post* measure of the above relationship. And we have provided proof supporting our assumption.

¹ For simplicity, we have assumed that the variance-covariance matrix for the investor is constant and any change in the macro-economic variable will be reflected in the changing expected value.

of the price is the result of the unfavourable forecast of $E_{t+1}(\tilde{p}_{i,t+2} | \phi_{t+2})$. Under these circumstances, the *ex-ante* returns for both t and $(t+1)$ are 10% whereas the realized return at $(t+1)$ is -10%. The price \$90 at $(t+1)$ is not observed from $\tilde{p}_{i,t+1}$, rather $p_{i,t+1}$ is the discounted value of $E_{t+1}(\tilde{p}_{i,t+2})$. Thus, realized value (or the price) cannot be the sample of the *ex-ante* expectations. *Can realized return be the ex-post realization of the ex-ante expectations?*

Continuing with the numerical example, let the operating earnings for t to $(t+1)$, i.e.; $x_{i,t+1}^*$, be \$8. Thus the *ex-post* value $v_{i,t+1}^*$ becomes \$108 and the *ex-post* earnings is 8%. The realized return at $(t+1)$ is -10% whereas the *ex-post* return is 8%. *How rational will substituting 8% with -10% be?* In other words, we cannot substitute the *ex-post* return of 8% with the realized return of -10%. The *ex-post* earnings is positive whereas the realized earnings is negative. The realized return cannot be the *ex-post* realization of the *ex-ante* returns.

In the empirical tests of CAPM, researchers are assuming that the realized return, $r_{i,t+1}$, is a sample of return \tilde{r}_i , and the average of the realized return, \tilde{r}_i , will be the best estimate of the expected return, $E(\tilde{r}_i)$. We have argued in this section that, the realized return cannot be a sample of return. We believe, the intuition that realized return as the *ex-post* realization of the return is misleading. Redefining the *ex-post* value will portrayed the distinction between the *ex-post* value and the realized value. When the realized value is not the *ex-post* realization of the *ex-ante* value, it concludes that realized return is not the sample of return.

The term *ex-post* literally means “after the fact”. For any *ex-ante* value, the *ex-post* value will be observed as we moved to that particular period and when all the uncertainty has been resolved. For example in figure 6.2, at t , the future value of asset i for $(t+1)$ can be considered as the *ex-ante* value, i.e.; $\tilde{p}_{i,t+1}$ would be the *ex-ante* value for t . In contrast, the *ex-post* value is the observed value at $(t+1)$ from, and this value is the result of operations from t to $(t+1)$. In other words, the *ex-post* value can be defined as the observed value of $\tilde{p}_{i,t+1}$, forecasted at t , that is realized at $(t+1)$. However, the realized price at $(t+1)$, $p_{i,t+1}$, is the discounted future value of $(t+2)$. Although we get two values at $(t+1)$, the *ex-post* value and the realized price, these values are different as they are derived from different time periods.

Figure 2 Derivation of Prices and *ex-post* value

We defined $x_{i,t+1}^*$ as the *ex-post* earnings of the distribution of random values of $\tilde{p}_{i,t+1}$ in $(t+1)$, which is observed as we move to $(t+1)$. The researchers believe that the *ex-post* average return provides a good estimate of the *ex-ante* expected return. As the *ex-ante* expectation is unobservable, empirical tests of CAPM assumes that the probability distribution generating the *ex-post* outcomes is stationary

over time and realized return could be substituted as the sample of *ex-post* realization of the *ex-ante* expectations. *Are both of these values, the ex-post and the realized value (price), generated from the same distribution of future values? Are both $v_{i,t+1}^*$ and $p_{i,t+1}$ derived values of the distribution of $\tilde{p}_{i,t+1}$?* Figure 2 clearly explains that these values are not the same. Instead, these values provide different information to the researchers. Although these two values rarely coincide, none of the values can be treated as substituting the other value.

5 Conclusion

In this paper, we focused on the belief of considering realized return as a sample of return. Under assumptions (i) and (ii), we have shown that realized return cannot be the *ex-post* realization of the *ex-ante* expectation.

The researchers can establish the risk-return relationship in theory. The unobservable nature of the expected return has led the empirical researchers to use realized return as a sample of return. And the measurement of the empirical risk-return relationship has been inconclusive and controversial. As a result, a number of researchers have introduced new models to measure the empirical risk-return relationship.

For example, Fama and French (1992) have introduced the 3-factor model in an attempt to explain the empirical risk-return relationship. Their model gained popularity as they focused on forming an empirical model that would fit the realized return data. The model is used to explain the *ex-ante* risk-return relationship from the realized return data. We have shown that realized return can neither be the *ex-post* return nor the sample of return. What economic implication does the realized return data contain?

This thesis is the first one to explicitly define the *ex-post* value, and we have shown that realized value and the *ex-post* value are different because of the differences in the information sets. We conclude that realized return cannot be the *ex-post* realization of the (*ex-ante*) return, i.e., realized return cannot be a sample of return.

A Study on Purchase of Service Contracting and Community Care for the Disabled

An Zhimin

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: anzhiming001@163.com)

Abstract: The stability of the disabled is conducive to the social stability and the extension of national governance. This article starts from the living status of the disabled in China, introduces the concept of “community care for the disabled”, and compares the role orientation between government and social organization in the community care for the disabled. The conclusion is that in the current stage, the affairs of the disabled should be dominated by the government, and supplemented by social organizations, in government purchase of contracting service to promote the development of the affairs for the disabled.

Key words: POSC; The disabled; Community care

1 Introduction

The disabled refer to the people who are deprived of or abnormal in a certain organism or function of psychology, physiology and body structure, or those who are totally or partly unable to be engaged in certain activities in a normal way. The disability includes vision disability, hearing disability, speech handicap, physical disability, intelligence disability, mental disability, multiple disability and other disabilities. According to the total population of the sixth population census, and the second nationwide sampling survey of the disabled, as well as the percentage of the disabled in the total population and the proportion of all kinds of disability in the total number of the disabled, it can be calculated that until the end of 2010, the total number of the disabled in China was 85.02 million. The population of all kinds of disability was respectively: vision disability 12.63 million, hearing disability 20.54 million, speech handicap 1.3 million, physical disability 24.72 million, intelligence disability 5.68 million, intelligence disability 6.29 million, and multiple disability 13.86 million. The population of all levels of disability was respectively: severe disability 25.18 million, and moderate disability 59.84 million. Apparently, the disabled is a large group of the complicated structure. Because of their vulnerability, and lack of the social fairness and justice, the disabled are deprived of the due protection of civil rights and personal dignity.

In addition, the disabled cannot be ignored in the human evolution and the social development. The disability has two categories of primordial disability and posterior disability. The former refers to the congenital disability caused by heredity. The latter refers to the disability caused by “irresistible forces” in social activities (such as the disability caused by aging). These two kinds can be alleviated or cured by the professional rehabilitation. However, because of the scarcity of public resources and the unbalanced regional distribution, a majority of the disabled miss the opportunity of receiving the professional rehabilitation and have the lifelong trouble with the increasing opportunity cost. In the daily life, the disabled are treated unfairly and suffer from the social discrimination in the medical treatment, employment and education. In a transformational society, they are excluded from the system for their disability, and turn out to be an underprivileged group. It will be the duty of the family with the disabled, of the society and of the government to improve their living condition and alleviate their pressure and pain.

2 Introduction to Community Care for the Disabled

How to improve the living condition of the disabled The inertial answer will be family care. Undoubtedly, as the social basis and the structural pattern of mutual assistance of human survival, reproduction and development, family is the ultimate guarantee for its members. As a result, in the traditional family-oriented structure, the family assumes the major responsibility of taking care of the disabled. The society and even the country only play marginal roles in caring for them. However, since the beginning of the 1980s, the transformation of the family structure and the social economic structure and the changing ideology of social members keep striking the traditional family structure. The family care entails a high human and material cost. People’s pursuit of wealth and all kinds of temptations shake its foundation. There is an expanding mental gap between the disabled, especially the severely

disabled, and their family members. Usually, they feel anxious, lonely, and deprived. It is clear that either materially or mentally, the traditional family care is too vulnerable to catch up with the social development.

As the family care is going downhill, the institutional care is playing a more and more prominent role. The current welfare institutions include professional rehabilitation institutions, professional fostering service institutions and special educational institutions. They have many advantages. Firstly, their service is professional. Basically, the disabled can receive the professional life care and the medical treatment in welfare institutions. Moreover, the institutional care plays an important role in reducing the burden of the family, and alleviating the loneliness of the disabled, especially the senior disabled. However, the institutional care also has some drawbacks. Firstly, the institutional care breaches the traditional family ethics, and a majority of the disabled can not accept this caring mode. Secondly, there are too many institutions for the disabled, which are operating independently, with high caring cost and certain economic risks. Thirdly, the development of the institutional care, especially the welfare system is very slow. There is a gap between the limited number of institutions for the disabled and the expanding demand for service.

In order to make up the gap, the current mode must be discarded for a new one. As a result, the concept of the community care is introduced, which originates in the community care for the seniors in the west.^[1] The advantage of the community care for the disabled is that they can live at home, and receive a social service. It is family-oriented, based on the community and centers on the rehabilitation, education, fostering, culture leisure, rights protection, and disability prevention. It is mainly in the form of the door-to-door service and daily care in the community. In this way, the disabled receive the care at home and the necessary service from social institutions, such as the social worker organization and the disabled organization.

Until now, it is clear that the major way of the disabled service is the professional and organized community care. The discussion about the government and social organizations which are the major supporters of the community care can never be neglected.

3 Government, Social Organization and Community Care for the Disabled

The discussion about the relation between government and the society can never be separated from the theoretical paradigm of the state and the society. The relation between the state and society is a heated topic in the discussion of political theories. The power of the state and the society represents the level of democratization of a society. A powerful state means that the society is subordinated to the state or the political authority. Although it may not be able to provide freedom, it can establish a strong government to maintain the national stability and prosperity. A powerful society means that the state is subordinated to the society. The state (government) withdraws from the society, economy, culture and non-government activities. The core functions of the government are “economic regulation, market supervision, social management and public service”, in order to optimize government functions.^[3] China is in a period of transformation, and the establishment of a service-oriented government and of a development mode of “small government, big society” will be the trend of the civil society in the future. Among the new development modes, the social organization in the social system is selected to illuminate its relation with the community care for the disabled.

The family care burdens the family heavily and entails the support of humans and materials, which increases the opportunity cost. As a result, the family care is in an urgent need of the support from the society and the state.

3.1 Service-oriented government: new mode of national governance

In his discussion about the political order in the developing countries, Huntington points out that the Communist Party of China (CPC) can make use of its advantages to establish the political authority in order to maintain the political stability. Its ideology provides evidences to the validity of the government. Its party organizations provide the system of the power organ to win support and carry out policies.^[2] The stability of the political order is the prerequisite for the national development. The state (government) maintains its absolute control of the society by dynamic governance modes, which include hard strike, document politics, group politics and mass activities.^[4] Undoubtedly, these government modes make the most of the political authority of CPC to fully mobilize the social forces, in order to accomplish seemingly impossible “political missions” one after another with concerted efforts. In this process, the collectivity (here referring to the state) is enlarged, and individual differences are reduced. As a result, comparative fairness and justice are realized in the state.

However, with the social transformation and the major social and economic reforms, the previous dynamic governance modes can not adapt to the practical changes and development. The modes of the social mobilization also need to be transformed, or they will be discarded. State-owned businesses and collective enterprises start restructuring, or they will go bankrupt. Laid-off workers, urban proletarians and the disabled turn into social members from institutional members. The institutional welfare turns to the social and public welfare. Before the establishment of a welfare system in the state in a general sense, they are excluded from the social system. They are eager to be included in the system. However, because of the lack of knowledge and skills, they are reduced to grass-root classes in the society, of which the disabled are the most underprivileged. The lack of the social welfare system, the aggravation of the family burden and the discrimination in the society make them under great survival and mental stress. If the pressure is not released, its potential tension will accumulate, expand, and evolve to the dissatisfaction about the government and the society. They will even form a new social group. If the members are not mobilized to get involved in politics, they will rise to overthrow the existing political order of injustice and unfairness, which will threaten the governance of the authority. If the previous dynamic governance mode is observed, the temporary assistance and the imperfect social security policy will intensify the contradiction. The maintenance of the political order and stability entails the integration of their interests in order to achieve peace in competition.

The integration of their interests entails the establishment of a service-oriented government, the transformation of its governing idea, the people-oriented practice, and the gradually released control of the society, in order to make social forces integrated into the system of the public service, and to fully mobilize them to provide the security service to the disabled. For this, the country has made a great deal of valuable exploration, including the establishment of China Disabled Persons Federation in Beijing in 1988, the setting-up of nationwide disabled persons unions according to the setting pattern of the government, the promulgation of the Disabled Rights Protection Law of the People's Republic of China (PRC), and the nationwide sampling survey of the disabled in 1987 and 2006. The report of the Eighteenth Party Congress of the Communist Party of China (CPC) declared to establish a perfect social security and service system for the disabled, and to safeguard the rights and interests of the disabled. The Twelfth Five-year Plan pointed out that the establishment of a perfect social security and service system for the disabled will provide a stable institutional guarantee for their life and development. The state keeps upgrading the establishment of two systems for the disabled by the implementation of various laws and regulations. According to the requirements of establishing a social management pattern of the leadership of party committees, the responsibility of the government, the social coordination and the public participation, the state strengthens the construction of the social management law, system and ability, in order to do well the management and service of the disabled.

3.2 Social organization: important practitioner of community care for the disabled

The transformation of the state governance mode, the establishment of the service-oriented government, the released control of the society and the flooding emergence of policies favoring the society promote the persistent springing up of social organizations. The state needs to integrate interests of the disabled to set up nationwide Disabled Persons Union (DPU for short). However, in China they develop into an integrated variant (the government organization in the category of the nation, the mass organization in the category of the party, and NGOs in the category of the UN). Other social organizations of the service for the disabled also spring up, which included the social organizations, foundations and private non-enterprise organizations which register with the civil administration department. They can be divided into the organizations funded by the government, the social organizations established by enterprises and the grass-root non-enterprise organizations (private organizations). They gradually become the third department, apart from the government and the market.^[5] Owing to their commonweal, non-profit and voluntary, the social organizations can always gain more extensive social information and resources, and provide more professional and efficient social services.

Social organizations are based on the profession rehabilitation, the psychological comfort, the medical treatment and the educational service of the community for the disabled, in order to help them to overcome their mental block and to get integrated into the society in a short time. The core construction of the social organization is the service staff. That is to say, only the direct person-to-person contact and assistance can become the service. Its directness works in concert with the indirectness of the government management and decision-making. The government sectors are only the managers of the social service, rather than the direct executor. They will hire off-staff social workers to do the specific service. These organizations are official, into which the government funds can be quickly invested. Another organization is the mass-run enterprise which forms spontaneously in the society, such as the

private nursing institutions and specialized education institutions, which employ professional workers (such as social workers) from the society to provide the systematic and professional community care. They are diverse and called "Grass-root NGO". Their large amount and great diversity bring convenience to the daily care of the disabled.

Official and non-official social organizations constitute the community care system for the disabled, which work in concert with the state-run social welfare institutions and society-run welfare institutions explored by the state. They are both the reasonable modes. However, in a background of "Small Government, Large Society", state-run (public) welfare institutions should introduce the market competition mechanism, like the reform of the economic system, rather than compressing excessively the living space of society-run (civilian-run) welfare institutions. Only in this way, can the service quality and level be improved to promote the further development of the affairs of the disabled.

3.3 Organization dilemma: contradiction between service-oriented government and social organization

The current organization dilemma lies in the economic transformation of the state. The service for the disabled is expected to be pushed into the market. However, the national policy funds only go to the people included in the system. For the people excluded from the system, the social service entails the government's purchase of the service of social organizations. However, the purchase has not developed as a long-term mechanism. As a result, many social organizations are declining. The practical dilemma is the way of investing national funds into the society, the economization of administrative resources, the growth of the administrative efficiency and the mobilization of the social participation in the community care for the disabled.

In order to illuminate the dilemma, we take CDPF as an example. As has been mentioned, this organization is an NGO in the United Nations. However, in the government management system in China, it is a government management department. CDPF has three functions of representation, service and management: representing the common interests of the disabled, and safeguarding the legitimate interest of the disabled; unifying and educating the disabled, as well as serving them; performing the legitimate responsibilities, undertaking the tasks of the government commission, and managing and developing the affairs of the disabled. The contradiction results in the important role of CDPF in the affairs of the disabled. As an official organization, it integrates the duties of management and service. Apart from the management responsibility, the service responsibility should not be commissioned to an NGO. With the policy funds, the government-controlled social institutions imitate the organizations mode of the government system. They are so stable that they lack innovation. The members work with low efficiency because of the subtle heterogeneity. In addition, it is difficult for these institutions to prevail in the community to provide direct service to the disabled. As a result, the social organizations rendering direct service come into emergence to meet the expanding demand of the community care for the disabled. They are the organic joiners of the government-run social organization, which have been tested and proven effective in the community care for the senior abroad. As a result, China begins to introduce this mode of the community care. Many cities have explored it in practice over a long time, such as Shanghai and Shenzhen.

Social organizations play such important roles that they are highly valued by the state. However, their development is restricted by many factors, such as the lack of funds, imperfect social policies, and scarce professional talents. It is critical to solve this problem, to establish sound social security policies, and to maintain social justice and fairness. However, there is a long way to go before its realization. At present, we can only seek a way of rendering good service to the disabled in the short time, which means giving social organizations (especially the ones for the disabled) enough room for development, and making the funds go out of the system to benefit more people. Purchase of services contracting is an effective policy approach.

4 Purchase of Service Contracting: Only Road to Community Care for the Disabled

With the economic development and improvement of living standards in China, the public begins to require more effective and diverse public services. In order to meet the demand of development, the Chinese government puts forward the reform idea of the transformation of government functions. By the government purchasing service, the public service previously provided by the government is commissioned to the more efficient social organizations. Here, the Purchase of Service Contracting, (POSC for short) refers to the government's responsibility of serving the public, by funding all kinds of

qualified social service institutions through the government finance, in order to purchase all or part of the public services within the categories and quality defined by it, which is provided by contracting. It is a provision of purchasing service of “government funding, directional purchasing, contracting management, evaluation redemption”^[6] In essence, it is a mode of the public service of contracting commission, with the production and supply of private profit organizations or non-profit organizations. Namely, the service previously provided by the formally ordered linkage structure within the public sector is transferred outside the organization through the purchasing task executed in the mass taxing by the government.^[7]

Honestly, POSC originates in the west, because of the welfare state crisis including the crisis of western government finance, and the consequent government reform, public service marketization and privatization flooding and new public management proposals. However, it is alienated in China, because, influenced by administration and bureaucracy, the social service can only be provided directly by government sectors or developed by government-run social organizations (such as the subordinate social organizations of the CDPF) and neighborhood committees^[8], which has been discussed. Because of its drawbacks, it is not easy to realize the comprehensive service for the disabled in a new way, which can be traced from the classics of Marxism. Marx advocated the social revolution ignited by the working class, the overthrow of the governance of the ruling of bourgeoisie, and the establishment of a communist Utopia.^[9] However, as a part of the capitalist society, the working class is intrinsically affiliated to the bourgeoisie, and can accomplish the socialist revolution as a new social organization or social stratum differentiated from the social revolution (such as Bolshevik in Soviet Union, and CPC) rather than as an independent force. Similarly, as for the community care for the disabled, government-run social organizations can not be free from the restriction of the current system. The future trend is the transformation to POSC, and the emergence of newly established private social organizations.

The prerequisites for their emergence also lie in the transformation of government functions. The service-oriented government should contract more responsibility to the professional service institutions for the disabled, in order to maintain the reasonable operation of the institution, to establish a prefect public policy system and to strengthen POSC, the most important of which is the determination of the government, namely, whether the government and officials (management staff) at all levels can really serve the people and whether they are in line with the public to support the development of the affairs of the disabled in China. In addition, the market mechanism needs to be introduced to the policy of POSC, in order to engage more social organizations (NGOs for the disabled) in the service for the disabled. The discussion here focuses on the second point, that is to say, the discussion of the policy implementation of POSC in the community care for the disabled, of which the executors are mainly civil social organizations in the community. The operation is funded by POSC of the government.

4.1 Operation mechanism of POSC

As a new provision mode of the public service, POSC has the operation mechanism of policy making, government purchasing, contracting management and project evaluation.

Policy Making The government needs to make the social policy of POSC scientifically, which is in line with the macro and other related development planning of the government. The development of the POSC should be based on the needs of the public and the social and economic development, with the model of the gradual institutional reform.

Government Purchasing After making a plan of POSC, the government also needs to distribute and set specific applicable project implementation according to it. The government also needs to strengthen the training and guidance of social service organizations, in order to improve their professional ability and level. The public service purchased by the government should be quasi-public goods. From the experience, it is shown clearly that the financial resources and the management level of the government determine the quality and quantity of the service. There are four kinds of the government investment: wage system, payment for project, payment for labors, and mixed payment system.^[10]

Contracting Management It is the contracting management in a broad sense. Either by contracting, subsidy or voucher, on the one hand POSC renders diverse choices to the public service. On the other hand, it brings about new requirements and challenges to the management ability, especially the contracting management ability of the government. It is because in the operation of POSC, the government only changes the role of producers. However, as the arranger and provider, the government assumes the new management responsibility, rather than reducing its management responsibility. The regulation of the operation procedures of POSC, such as the service application (or bidding), approval

(or signing a contract), provision, evaluation and settlement, all need to be standardized.^[11]

Project Evaluation In the implementation of the project, the assessment and supervision is needed to be strengthened. The quality and effect of the social service project should be guaranteed to win the trust of the people. Moreover, in terms of the evaluation of techniques, the design of an evaluation method which can balance universality and specialty practically, in order to establish a disinterested social service evaluation acceptance index system, also needs to be constantly explored and perfected in practice.^[12]

4.2 Future development of POSC

As an “import”, POSC works in concert with the notion of the service-oriented government of “small government, and large society”, which is consistent with the rapid economy growth, as well as the need of a transformational civil society. A large number of the disabled people are in need of comprehensive cares. The state should establish perfect social security and service systems for the disabled. In terms of micro-society, the mode of the community care for the disabled can be adopted in order to set up charitable service organizations for the disabled, and to guide their healthy and ordered development by increasing the financial investment through POSC. Ultimately, the policies of the service-oriented government should be specifically implemented in the community, the family with the disabled, and the disabled themselves, in order to put into full play its expected function, to be people-oriented and to integrate the interest of the group, in order to maintain the political stability and peace of the state.

5 Conclusion

As a newly-emerged sector, POSC also has some problems, such as the insufficient power for the policy of the government purchasing, the lack of the local financial support or the low level of the economic development, the inadaptability of social organizations to the need of POSC and the grey zone in POSC.^[13] The key to the solution of these problems is the determination of the government, which should have the notion of benefiting the people and perfect all the social security systems, lead the development of social organizations properly, set up a professional talent team for the social service and pay more attention to social workers, transform the public concept about the disabled, safeguard their rights and freedom as citizens, care about their physical and mental health, and maintain the social justice and fairness.

As for the future research, the discussion about the institutional improvement of POSC is critical to its systemization and perfection, and the establishment of a long-term mechanism of the financial investment. In the discussion about social organizations, the government should take into consideration the ways of integrating, mobilizing and controlling them. For example, there is much room for the promotion of the party construction in social organizations.

Tourists' Attitude Towards Service Marketing Mixes: An Empirical Study on Cox's Bazar Sea Beach in Bangladesh

Mohammad Amzad Hossain Sarker, Sumayya Begum, Wang Aimin
School of Management, Wuhan University of Technology, P.R. China
(E-mail: emailtoamzad@yahoo.com, fsmayya@yahoo.com, wangam@vip.163.com)

Abstract: The core objective of this study is to know the tourists' attitude towards service marketing mixes. For that purpose data were collected by verified structured questionnaire from sample of 214. Sample respondents were divided into three groups. First group consists of 100 students, second group consists of 100 service holder and third group consists of 14 Businessmen. All of the students were taken from three different universities of Bangladesh. Service holder respondents were taken from different banks and company and the entire businessmen respondents taken from Dhaka and Comilla business centre. Target respondents were visited Cox's Bazar sea beach. Data were analyzed by using software SPSS-17 version by adopting the statistical techniques, correlation and regression. The findings of the study showed that six out of seven marketing mixes were positively related to tourists' attitude but service distribution system (Place) practiced by the authority is not satisfactory to the visitors'. Besides, some of the facilities and services did not meet tourists' expectation. Therefore, some recommendations have been given for policy makers for sustainable tourism development in Cox's Bazar.

Key words: Marketing mixes; Tourism; Tourists' attitude.

1 Introduction

Today in globalized world tourism industry is recognized as the single largest industry and this sector also become a major thrust area of economic and business activities in most of the countries. Travel is the basic trait in human nature. Millions of people are travelling each year from one part to another part of this world (Hasan, 1985). People now want to gather experiences about new places, new pleasure and know multi cultures through visiting destinations. As a destination Bangladesh is trying to develop bundle of tourism products-especially, Cox's bazar- world's largest unbroken sea beach. Cox's Bazar is about 150 km from Chittagong and is connected to the port city by bus, air and steamer services. It is a district town and is also the headquarters of the Cox's Bazar forest division. The town and surrounding places have many colorful pagodas and Buddhist temples and are inhabited by, among others, many tribal people who have their own distinct customs and traditions. This sea beach is the most attractive tourist resort of the country located on a low range of sand hills between the rivers Bakhali and the Bay of Bengal with a long open beach towards the sea. In addition to the long sea-beach with its silvery waves breaking at the foot of hills and sea-bathing, the attractions of Cox's Bazar include a drive along the beach, the view of the sun setting on the rolling sea-waves, the moonlit night, and the exciting interior of the bazar and its people.

2 Literature Review

A few number of researches conducted to know the tourists attitudes and perceptions towards marketing mixes of different tourist places in this world. As a developing country like Bangladesh we found few significant researches in this context. Hossain, Md. Afjal (2002) using five point scale examined foreign tourists' attitude towards marketing mix elements of the tourism industry in Bangladesh. He found that marketing mix elements of the tourism industry in Bangladesh relatively better to the foreign tourists. Hamidreza rastegar (2010) using five point likert scale assessed the attitude and perception of local residents toward tourism industry development in Iran. The samples were 320 local residents. The result shown that local people have positive attitude towards tourism development but they are not fully satisfied with tourism management in the area. Dr. Ayed Al Muala and Dr. Majed Al Qurneh (2012) shown the relationship between three key variables, namely marketing mix, satisfaction and loyalty in curative tourism industry in Jordan. Their study results were as follows: H1 has shown that product and place were significant on destination loyalty. While, price, personnel and process not significant on destination loyalty, and for H2 has shown that product, place, price, personnel and process significant impact on tourist satisfaction. In addition, H3 has shown that the tourist satisfaction mediates the relationship between Marketing Mix and loyalty. Hossain Sarker, Mohammad

Amzad; Wang Aimin; Begum, Sumayya (2012) examined the impact of marketing mix elements on tourists' satisfaction. Their findings shown that six out of seven marketing mix elements were positively related to tourists' satisfaction but price imposed by the authority is not satisfactory to the visitors'. Owomoyela S K, Ola, Olasunkanmi .S and iree Oyeniya K.O (2013) investigated the effect of marketing mix elements on consumer loyalty with special reference to Nigerian breweries Plc. They found that marketing mix elements have significant effect on consumer loyalty. Ljiljana Stanković and Suzana Đukić (2009) examined tourist destination management and found that innovative and well co-coordinated tourism products is exceedingly important for tourism regions. Kannan Srinivasan (2009) investigated that Kerala is one of the important destinations for the international tourists with its unique nature beauty with backwaters, mountains and beaches. Leo Huang, Kaung-Hwa Chen and Ying-Wei Wu (2009) identified the variety of marketing channel efficiencies for marketing activities and sets up an optimal marketing distribution mix for different wholesaler travel agencies. They found that Taiwan's wholesaler travel agencies adopt the retailer travel agency as their highest priority of channel selection, while travel agency websites hold it as their second priority. In other study, Douglas G. Pearce (2008) tried to develop a stronger conceptual basis for the study of tourism distribution by presenting a generalized model emphasizing the needs of tourists and the functions required to meet them. Musa and Adamu (2011) found that transportation is a significant determinant of tourism development. Other factors like recreational and social facilities and security also play positive role to develop this industry. Yu Wang (2006) examined some Chinese four- and five star hotels' training and development (T&D) practices from a Western human resource development (HRD) perspective and compares the results between the Chinese state ownership and Sino-foreign joint ventures using multiple case studies. Result shown that the western way of training and development may not necessarily lead to superior training effects in the Chinese context than those used by state-owned hotels. Kannan, Srinivasan (2009) the process in tourism includes, (a) trip planning and anticipation, (b) travel to the site/area, (c) recollection, (d) trip planning packages. The trip planning packages include, maps, attractions en route and on site, information regarding lodging, food, quality souvenirs and mementoes. In another study, Kannan, Srinivasan (2009) shown that in Tourism the physical evidence is basically depends on travel experience, stay, and comfort.

3 Methodology

3.1 Objectives

The main objective of this study is to know the tourists attitude towards service marketing mixes in case of Cox's Bazar. Other objectives are:

- (1) To explore the marketing mix which most significantly attracts visitors to visit Cox's Bazar.
- (2) To give some recommendations for policy makers for sustainable development.

3.2 Conceptual model and hypotheses

The model for this study is:

Figure 1 Conceptual Framework

The general form of the model was as follows:

$$TA = \alpha + \beta_1X_1 + \beta_2X_2+ \beta_3X_3+ \beta_4X_4+ \beta_5X_5+ \beta_6X_6+ \beta_6X_7+ e$$

Where, TA = Tourists' Attitude

X1 = Product

- X2 = Price
- X3 = Place
- X4 = Promotion
- X5 = People
- X6 = Process
- X7 = Physical Evidence

And α is constant and $\beta_1, \beta_2, \beta_3, \beta_4, \beta_5, \beta_6$ and β_7 are coefficient to estimate, and e is the error term.

3.3 Hypotheses

- H1: Tourists' attitude is positive towards Cox's bazar sea beach (Product).*
- H2: Tourists' attitude is positive towards s travel cost of visiting Cox's bazar sea beach (Price).*
- H3: Tourists' has positive attitude towards service distribution system at Cox's bazar sea beach (place).*
- H4: Tourists' attitude is positive towards promotion program to attract tourists' for visiting Cox's bazar sea beach (Promotion).*
- H5: Tourists' has positive attitude towards tourist service staff available at Cox's bazar sea beach (people).*
- H6: Service providing process at Cox's bazar sea beach and tourists' attitude are positively related to each other (Process).*
- H7: Tourists' attitude is positive towards the environments of Cox's bazar sea beach (Physical evidence).*

2 o by tourism and travel services

3.4 Sample size and sampling technique

To fulfill the objectives of this study, total 214 respondent (N= 214) were chosen by convenience sampling technique. The condition was that all of the respondents were visited Cox's Bazar sea beach. They were divided into three groups. First group consists of 100 students, second group consists of 100 service holder and third group consists of 14 Businessmen. All of the students were taken from Comilla University, Southeast University and Bangladesh Islami University. All of the service holder respondents were taken from different bank and company and the entire businessmen respondent taken from Dhaka and Comilla business centre.

3.5 Research instrument

The main methodology chosen for this study is the questionnaire survey method. The survey was conducted from October 2012 to January 2013. Primary data were obtained through a structured survey questionnaire. Total twenty four questions under the head of seven marketing mix elements (Product, Price, Place, Promotion, People, Process and Physical Evidence) and three questions for tourists' attitude are included in the survey questionnaire.

3.6 Measurement of dependent and independent variables

For the purpose of the study, respondents were asked to give tick marks on right side of different statements. Dependent and all of the independent variables were measured on five point Likert scale. The response scales for each statement in the survey questionnaire were as: 1= Strongly disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly agree.

4 Data Analysis

Data were analyzed by using software SPSS- 17 version. The following statistical techniques were applied to analyze the data:

- Cronbach's alpha (Reliability test table 1)
- Descriptive statistics and correlation (Table 2)
- Linear regression (Table 3)

Table 1 Reliability Test

3.1 Cronbach's alpha

By using Cronbach's alpha Internal reliability of the questionnaire was tested. According to Nunnally, J. (1978) Cronbach's α with larger α values (greater than 0.70) indicating higher internal consistency in the measured dimension and hence greater reliability. In our study the entire variables Cronbach's alpha is greater than 0.70 (Table- 1). So, it is clear that the questionnaire used in this study had strong internal reliability and it could be used with confidence for the application of next statistical analysis and interpretation.

3.2 Descriptive statistics and Correlation analysis

Table 2 represents descriptive statistics and correlation between each variable. If the mean scores of independent variables are observed then it we found that product has higher mean value 4.36 then the rest of the order is as follows: Price (3.89), Physical evidence (3.72), Promotion (3.57), People (3.53), Process (3.51) and Place (3.43). The mean score of the tourists' attitude is 4.07 means most of the tourists' attitude is positive. Range of correlation among variables is from .075 to .473. Therefore, all the variables are positively related to each other (Table 2).

3.3 Regression analysis

In order to know the affect of each independent variables on dependent variable and linear regression analysis was applied to test the hypothesis developed. Results of linear regression analysis are shown in Table 3.

3.3.1 Hypothesis 1 expresses that product quality has significant affect on tourists' attitude.

H₁: Tourists' attitude is positive towards Cox's bazar sea beach (Product).

47.3% variance in tourists' attitude is explained by product, which is evident by the value of R = 0.473, F = 60.947 at P = 0.000 explains the model's goodness of fit. The value of t = 7.807 is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H₁ is accepted.

3.3.2 Hypothesis 2 expresses that the total cost (price) has significant affect on tourists' attitude.

H₂: Tourists' attitude is positive towards travel cost of visiting Cox's bazar sea beach (Price).

30.1% variance in tourists' attitude is explained by price, which is evident by the value of R = 0.301, F = 21.110 at P = 0.000 explains the model's goodness of fit. The value of t = 4.595 is the evident

of significant relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H₂ is accepted.

3.3.3 Hypothesis 3 expresses that service distribution system (place) of Cox's bazar sea beach has significant affect on tourists' attitude.

H₃: Tourists' has positive attitude towards service distribution system at Cox's bazar sea beach (place).

7.5% variance in tourists' attitude is explained by place, which is evident by the value of $R = 0.075$, $F = 1.215$ at $P = 0.272$ explains the model's goodness of fit which has slight positive affect on tourists' attitude. The value of $t = 1.102$ is the evident of insignificant relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H₃ is not accepted.

3.3.4 Hypothesis 4 expresses that promotion strategies has significant affect on tourists' attitude.

H₄: Tourists' attitude is positive towards promotion program to attract tourists' for visiting Cox's bazar sea beach (Promotion).

16.5% variance in tourists' attitude is explained by promotion, which is evident by the value of $R = 0.165$, $F = 5.913$ at $P = 0.016$ explains the model's goodness of fit. The value of $t = 2.432$ is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H₄ is accepted.

3.3.5 Hypothesis 5 expresses that employees' cordial behavior has significant affect on tourists' attitude.

H₅: Tourists' has positive attitude towards tourist service staff available at Cox's bazar sea beach (people).

18.9% variance in tourists' attitude is explained by people, which is evident by the value of $R = 0.189$, $F = 7.869$ at $P = 0.005$ explains the model's goodness of fit. The value of $t = 2.805$ is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results we accept H₅.

3.3.6 Hypothesis 6 expresses that service delivery process has significant affect on tourists' attitude.

H₆: Service providing process at Cox's bazar sea beach and tourists' attitude are positively related to each other (Process).

26.3% variance in tourists' attitude is explained by process, which is evident by the value of $R = 0.263$, $F = 15.795$ at $P = 0.010$ explains the model's goodness of fit. The value of $t = 3.974$ is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H₆ is accepted.

3.3.7 Hypothesis 7 expresses that good travel experience, stay, and comfort has significant affect on tourists' attitude.

H₇: Tourists' attitude is positive towards the environments of Cox's bazar sea beach (Physical evidence).

21.9% variance in tourists' attitude is explained by physical evidence, which is evident by the value of $R = 0.219$, $F = 10.642$ at $P = 0.001$ explains the model's goodness of fit. The value of $t = 3.262$ is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results we accept H₇.

4 Discussion

If we analyzed the mean scores of the marketing mixes as independent variables we found that the lowest mean score is place (3.43). In our study we also found that the distribution system taken by the authority is not satisfactory by the tourists'. Therefore, place has no significant positive relationship with tourists' attitude. While, on the other hand, except place, remaining six elements, namely, product, price, promotion, people, process and physical evidence have significant relationships with tourists' attitude. The findings also prove that 'Product (sea beach)' has the most significant relationship with tourists' attitude. 'Price' is the second most significant element that this study reveals. The third most influencing variable is 'Physical evidence' which have significant relationship with tourists' attitude. The fourth most influencing variable is 'Promotion' which have significant relationship with tourists' attitude. The fifth most influencing variable is 'People' which have significant relationship with tourists' attitude. The last variable that has positive relationship with tourists' attitude is 'Process'. Finally, the mean score of the tourists' attitude is explained overall positive impression of the tourist's though the tourists' have dissatisfaction toward place.

5 Conclusion and Recommendations

5.1 Conclusion

As a developing country tourism industry can play important role to boost up the economy of Bangladesh. On the basis of our study we concluded that except place (distribution system) all of the variables have significant affect on tourists' attitude. Therefore, Bangladesh has lot of opportunities to gain profit by offering this sea beach to local and foreign tourists'.

5.2 Recommendations

In Bangladesh, most of the visitors' in different scenic spots are young boys and girls, especially students are visiting places during their vacations. Besides, they have lot of leisure time to visit tourist spot. Most visitors received information from other visitors who visited the tourist spot. Through advertisement in TV channel, newspaper, magazines and websites authority can marketing their attractions for increasing visitors' volume. Since, some service holder and Businessmen visited Cox's Bazar with their family, it may therefore adopt incentives for family members and offer special discount for students. The study concluded that some of the facilities and services did not meet visitor's expectation. Therefore the following recommendations for Cox's Bazar requiring improvement: (1) Authority should establish more hotels and motels for facing peak period demand. (2) They should establish sufficient toilet facilities at the sea. (3) Through police administration authority should ensure security of the visitors, especially at night. For that purpose special legal authorities should prevail in beach area for around the year. (4) There must be enough life guard people for rescue the visitors from sea and need to build net around the sea for visitors' protection. (5) Need to increase the facilities for changing dress and keep materials at the beach. As a result, conservative women and young girls can keep their privacy. (6) Need to arrange amusement like bar club, disco club etc. for tourists', especially foreign tourists'. (7) Need to proper training for the employees of the hotels and motels. (8) Entry and exit control mechanism should exist. (9) No shopping facilities to remain on the sea beach. (10) Make good environment around the beach, need to employed sufficient cleaners to clean dust in the beach area. (11) Authority should fix up the unique rent of hotels and motels around the year because most of tourists' have negative attitude toward price. They can also offer discounts for family visitors' and students. In offseason like summer they can offer discount price for attract more visitors'. (12) Government should take initiative to build railway direct communication from Dhaka to Cox's bazar and provide government bus service. (13) Local authority should take initiative to stop unplanned establishment in sea sight, like to build hotels, motels, private apartments etc. Because present situation tells us that these establishments destroy the beauties of beach and environment also.

In our study we also found that cost of the tourist (especially student) performed as a sensitive element toward their attitude and intention to revisit. So, price sensitivity for the cost of transportation, accommodation, quality food, coffee or tea, beverages and tour related cost can be determined as competitive factors for the tourist operators.

6 Limitations and Future Research

Despite the importance of the contribution of this study to know the tourists' attitude towards service marketing mixes and its valuable implication, it has some limitations. First limitation of this study is the use of self evaluation criteria of investigating the tourists' attitude, which may be biased. Second limitation is that sample size could be higher to make it more representative. Third limitation is some respondents have shown reluctant to give their opinion due to their time limitations. Fourth limitation is number of businessmen; it could be more representative if we took more businessmen as sample. Finally, it was expensive. Our budget was limited which actually made difficulties to craft the research successful in all respect.

In this research we only want to know the tourists' attitude towards service marketing mixes. But there are several potential research areas. For example; Tourists' psychological factors may impact on visiting or revisiting to Cox's Bazar and also their attitudes. Other study can be done with other influential factors like demographic, behavioral, and cultural. The results of this study were carried on by using the regression analysis. The relationship of the variables could be modified and can be done other advanced statistical techniques.

A DEA-based Efficiency Study of Service Industries in 19 Central Cities in China

Wu Lixia, Yun Jun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: yunjun@163.com, wlxligong@163.com)

Abstract: This paper uses the DEA approach (Data Envelopment Analysis) to construct the input-output model to analyze efficiency of service industries in 19 central cities of China in 2009. The results show that the input-output efficiency of these cities is not high, and also that the efficiency differences are significant. The trend shows higher efficiencies in southern and eastern cities than in middle and western areas. The input-output efficiency of Shenyang, Guangzhou, Xiamen, Shenzhen are relatively high. The input-output efficiency of Wuhan, Harbin, and Changchun are comparatively low. This paper suggests some measures to improve the input-output efficiency of modern service industry in central cities.

Key words: Modern Service Industry; Data Envelopment Analysis; Central Cities; Input-Output Efficiency

1 Introduction

Service is derived from the concept of the third industry. In 1957, Clark added the third industry (service industry) to national economic structure, which is divided into agriculture department, industry department, services department (including building industry), transportation industry, telecommunications industry, commerce industry, finance, professional services and personal services, etc. Scott^[1](1988) firstly proposed the concept of "service industry cluster". Riddle^[2] suggested that in the process of economic development, the role of service industry is even more important than its share in GDP. Ye Ying and Fan Bingquan^[3](2008) comprehensively analyzed the four development modes regional service industry, mainly including integrated mode, outsourcing mode, investment promotion mode, and houses' intensive mode. They showed the Baoshan district in Shanghai as an example to carry on empirical research. Liu Chong^[4](2005) discussed the theoretical connotation of modern service industry, presented the concept of relative dynamic. He thought that modern service industry is an industry body which upgrades after the extension of the third industry. Yang Cuilan^[5](2005) argued that modern service industry is mainly productive service, which provides various services to daily production, business activities, and government management. Gu Naihua^[6](2007) thought that modern service industries are those who have strong spillover effect and is a combined service sector which is beneficial to the promotion of overall economic competitiveness from the perspective of industry Relevancy. There are also some scholars who make evaluations of modern service industries. Authors such as Qu Chao^[7], Lu Ling^[8] evaluate the information service industry, travel services industry, and production services industry. They mainly evaluate the service industry development level and service industry competitiveness from the perspective of evaluation content.

This paper selects appropriate input and output indicators, uses DEA method to analyze the input-output efficiency of modern service industry of central cities in China.

2 Sample Selections

We selected China's service industry in 19 central cities as research sample. With rapid development of information technology and acceleration of economic globalization, large changes have taken place in the global industrial structure. Since the 1960s, the service industry has become a main impetus for economic growth. The global industrial structure is trending away from an industrial economy towards service economy (the proportion of service industry in the economy is now more than 60%). During the "Eleventh Five - Year" period, China's service industry has made rapid development, with steady economic growth and contribution to employment. In 2010, service industries added RMB 17.1 trillion to the GNP, an increase of 28.9 percent over 2005, and an annual growth rates 11.9 percent, higher than GDP growth rate. Value added from service sector increased from 40.5% of GDP in 2005 to 43% in 2010. Service industry employment increased from 31.3% in 2005 to 34.8% in 2010. The total amount of consumable retail increased from 6.7 trillion yuan in 2005 to 15.7 trillion in 2010, up 134.3 percent or 18.1 percent annually. The consumption market has entered a rapid development period. Beijing,

Shanghai, Guangzhou and other cities have become service dominated, and the growth rate of the modern service industry is the highest of all domestic industries. These central cities, as "leaders" of national economy, must show that the development of service industry conforms to the trend of economic development of global industry. Research and analysis of the input-output efficiency of modern service industry in central cities provides references for industrial adjustment and regional economical development plans, and promotes the balanced development of modern service industry in the central cities.

3 Data and Methodology

3.1 Method on DEA model

Data envelopment analysis (DEA) is a mathematical tool that uses available data to evaluate validity of decision making units (DMUs). It is a method of system analysis, developed by the famous American operations researchers A. Charnes, W.W. Cooper, et. al., and is based on "concept of opposite efficiency evaluation". The first DEA model was proposed by A.Charnes, W.W. Cooper, and E. Rhodes in 1978, called the C²R4, A model [9]. In 1988, Wei Quanling, a Chinese scholar, introduced DEA method into China [10], getting the attention of domestic scholars. Based on the axiom assumptions of convexity, cone, uselessness and minimum, it has the production possibility set:

$$T = \left\{ (X, Y) \mid \sum_{j=1}^n X_j \lambda_j \leq X, \sum_{j=1}^n Y_j \lambda_j \geq Y, \lambda_j \geq 0, j=1,2,\dots,n \right\} \quad (1)$$

We can make the following result: that is DEA model (M1):

$$\begin{aligned} & \min [\theta - \varepsilon (\sum_{i=1}^m S_i^- + \sum_{r=1}^s S_r^+)] \\ & \text{s.t.} \begin{cases} \sum_{j=1}^n x_{ij} \lambda_j + S_i^- = \theta x_{ij}, i=1,\dots,m \\ \sum_{j=1}^n y_{rj} \lambda_j - S_r^+ = y_{rj}, r=1,\dots,s \\ \theta, \lambda_j, S_i^-, S_r^+ \geq 0, j=1,\dots,n \end{cases} \end{aligned} \quad (2)$$

Where n is the number of DMUs and m and s are the numbers of input and output respectively; x_{ij} and y_{rj} denote the input i and the output r of the DMU _{j} respectively; S_r^+ and S_i^- are the slack variables, ε denotes Non-Archimedean infinitely small quantity. It is small enough in counting, such as it equals to 10^{-7} , this model is mainly used for the scale and the technical evaluation of the effectiveness of DMU. When the optimal solution is:

(a) $\theta^0=1, s^{-0}=0, s^{+0}=0$, then j is an effective decision making units (DMUs).

(b) $\theta^0 < 1$ or $s^{-0} \neq 0, s^{+0} \neq 0$, then j is an ineffective decision making units (DMUs).

(c) $\lambda_j^* (j=1,2,\dots,m)$ make the equation: $\sum_{j=1}^n \lambda_j^* = 1$ true, then DMU _{j} scale will remain the same. If there is

no λ_j^* to make the equation: $\sum_{j=1}^n \lambda_j^* = 1$ true, then $\sum_{j=1}^n \lambda_j^* < 1 \Leftrightarrow \text{DMU}_j$, It means that it is increasing benefit

of scale, if there is no λ_j^* to make the equation: $\sum_{j=1}^n \lambda_j^* = 1$ true, then $\sum_{j=1}^n \lambda_j^* < 1 \Leftrightarrow \text{DMU}_j$, it means that it is

decreasing benefit of scale.

This paper uses C²R model, which is the most effective DMUs constitute of effective production front sides. Its efficiency is defined as 1, while the DMU within the production front bound is will be void comparatively. The efficiency value is defined between 0 and 1, and assumes that returns to scale is constant.

DEA model which is met with constant returns to scale (CRS for short): when there is n DMU, m input factors (X), s output (Y), can be expressed as follows:

$$\begin{aligned}
 Max h_j &= \frac{\sum_{r=1}^s u_r y_{rj}}{\sum_{i=1}^m v_i x_{ij}} \\
 s.t \ h_j &= \frac{\sum_{r=1}^s u_r y_{rj}}{\sum_{i=1}^m v_i x_{ij}} \leq 1
 \end{aligned} \tag{3}$$

Where $u_r, v_i \geq 0$, u_r, v_i denote the weights of output r and the input i respectively, (3) expressed the relative efficiency of the DMU_{*j*} maximum. To solve the equation, it should be translated: unit j inputs is constant, its output is maximum, the expression is:

$$\begin{aligned}
 Max \ h_j &= \sum_{r=1}^s u_r y_{rj} \\
 s.t \ \begin{cases} \sum_{i=1}^m v_i x_{ij} = 1 \\ \sum_{r=1}^s u_r y_{rj} - \sum_{i=1}^m v_i x_{ij} \leq 0, u_r, v_i \geq 0 \end{cases}
 \end{aligned} \tag{4}$$

The first constraint conditions denotes the sum of inputs weights is 1, the second constraint conditions is to correspond to Equation (3). Convert the Equation (4) and the constraint conditions to its dual mode to make sure the converted dual mode have an unique solution, as follows:

$$\begin{aligned}
 Min \ \theta & \\
 s.t \ \sum_{j=1}^n \lambda_j y_{ij} &\leq x_{ij} \sum_{j=1}^n \lambda_j \quad \theta \geq 0, \lambda_j \geq 0
 \end{aligned} \tag{5}$$

Where θ denotes the relative efficiency of the DMU_{*j*}, λ_j is the weight of output r and input i . Using software Deap2.1, input the input, output data and the corresponding parameters to calculate the relative efficiency of each DMUs .

3.2 Data sources and empirical analysis

3.2.1 Data sources

The data source of the paper is: Statistical Yearbook 2011, which is published independently by 19 central cities in China and the province Statistical Yearbook 2011, and the NBS, China Statistical Yearbook 2011. This paper selects data of 2010. As input indicators, we selected a number of employees at the end of year and fixed assets investment in modern service industry of 19 center cities. Outputs included industrial added value of modern service industry, the proportion of industrial added value accounted for GDP, and the per capita value . The following tables shows these input/output values:

Table 1 Input-Output Indicators of Modern Service Industry In 19 Central Cities

DMU _{<i>j</i>}	Output y_{rj}			Input x_{ij}	
	Industrial added value of modern service industry (billion yuan)	Per capita output value of modern service industry(yuan)	The proportion of industrial added value accounted for GDP	Number of employees at the end of year(thousands people)	Fixed assets investment (billion yuan)
Beijing	1060.08	54052.62	75.1	7675	492.23

3.2.2 Calculation of DEA Efficiency

Using Deap2.1 software to calculate the DEA efficiency value of modern service industry of 19 central cities in China, as table 2 shows:

Table 2 Input-Output Efficiency of Modern Service Industry in Central Cites

EFFICIENCY SUMMARY:				
firm	crste	vrste	scale	
1	0.848	1.000	0.848	drs
2	0.993	1.000	0.993	drs
3	0.669	0.680	0.984	irs

mean	0.764	0.809	0.944	

Description: firm: represents 19 center cities, crste: technical efficiency, also called comprehensive efficiency, vrste: pure technical efficiency, scale: scale efficiency (drs: decreasing returns to scale; constant returns to scale; irs: increasing returns to scale). $crste = vrste * scale$.

4 Results

From the comprehensive efficiency in table 2, we can obtain the input-output comprehensive efficiency values of modern service industry in 19 center cities, as showed in table 3:

Table 3 Comprehensive Efficiency Values of Modern Service Industry and Rankings

cites	$\theta = crste = vrste * scale$	Rankings
Beijing	0.848	3
Shanghai	0.993	2
Tianjin	0.669	11
Chongqing	0.309	16
Shenyang	1.000	1
Changchun	0.664	12
Harbin	0.611	13
Jinan	0.873	4
Nanjing	0.760	7
Hangzhou	0.722	9
Guangzhou	1.000	1
Wuhan	0.688	10
Xian	0.549	14
Chengdu	0.517	15
Dalian	0.728	8
Qingdao	0.810	5
Ningbo	0.769	6
Xiamen	1.000	1
Shenzhen	1.000	1

According to ranking data of table 3, the following two conclusions can be made:

(1) Generally speaking, input-output efficiency of modern service industry of 19 Central City in China is not high, the cities vary considerably, but input-output efficiency of modern service industry in east and south areas are obviously higher than the middle and west areas. The cause lies in the fact that center cites in eastern and southern region ,located in the coastal areas, are in developed areas, the development and opening of these cities is earlier, closely following the development trend of the developed countries. Modern service industry in central city which are highly concentrated, exuding a strong radiation effect, can promote service industry development of the whole economic zone.

(2)In the table2, the efficiency values of modern service industry show that input-output efficiencies in Shenyang, Guangzhou, Xiamen, Shenzhen and other regions are most effective. Compared to these cites, central cites which input and output efficiency is high are: Beijing, Jinan, Shanghai, Nanjing, Qingdao, Ningbo. The relative efficiency value is between 0.75 and 0.99, and the reason is because that Shanghai is the financial center in China. It has a favorable geographical environment and human resources, highlighting the modern service industry cluster phenomenon. Jinan, Nanjing, Ningbo which are affected by proximity to Shanghai, at the same time, have developed strategic alliance in technology and talents. Ningbo city has been developing positively financial, shipping and other industries in recent years, to speed up the integration into construction trend of Shanghai international financial services center and international shipping service center, the proportion of service industry is significantly improved. Since awareness of developing modern service industry in middle and western regions is not clear and modern service industry investment is less. As a result, the input and output efficiency value of modern service industry in these central cites is lower.

5 Conclusion

On the whole, Modern service industry is an important symbol to measure modernization level, comprehensive competitiveness and sustainable development ability of a region. Hence, modern service industry in eastern and southern cites of China needs to keep pace with the international development, increase the talent and technology investment, and optimize industrial structure of modern service industry. The service industry needs to expand its regional economic range, drive the rapid development of modern service industry in surrounding cities. The development of modern service industry in west

center cities must be based on the local advantage industry as the foundation, adhering to the basic direction of "suit one's measures to local conditions". On this basis, they should continue to expand new areas, upgrade the development level of service industry to promote the development of the whole industry. They also should persevere in "cluster innovation" industrial policy to create a good environment for industrial in midwest cities, through close industry association, sharing resources, abundant social capital, and effective competition mechanisms. This will promote the formation and development of service industry cluster. The midwest should make full use of cooperative development network of the "Bohai bay", "Yangtze River Delta", "Pearl River Delta", to form an interactive development economic network of modern service industry in midwest.

Study on the Regional System Vulnerability Evaluation: Taking China's Hebei Province City Group as Example*

Feng Zhenhuan, Jia Shanshan, Wang Lina

School of Business, Tianjin University of Financial and Economics, Tianjin, P.R.China, 300222

(E-mail: fengzhenhuan@tjufe.edu.cn, fengzhenhuan@sohu.com)

Abstract: This paper presents an unprecedented survey of Brazilian firms mapping their eco-innovative patterns. This paper draws special attention to the group of firms that have achieved the stage of “eco-advantage”, in order to find out what drives radical innovation and what are the main characteristics of this group. The results show that the main innovation determinant influencing radical outcomes regards market-driven factors, specially the purpose of creating new market segments. Moreover, this result corroborates with theoretical observations suggesting that spurring green innovation can be seized as opportunities, instead of mere constraints to economic activity. These opportunities are both to fulfill the existing demands of consumers for environmentally friendly products (and services), as well as to emulate preferences while creating new market segments.

Key words: Eco-innovative patterns; Eco-advantage; Radical innovation; Market-driven factors; Market segments

Abstract: Vulnerability is the kind of degree to measure the relative levels, trends and possibilities for the sustainable development of regional system. It's the inherent attribute of the regional system manifested when encountered unfavorable internal and external disturbances, which is positively correlated with sensitivity, negatively correlated with the response-recovery ability. Entropy method and set pair analysis are used to evaluate and analyze the system vulnerability of eight cities in Hebei Province City Group of China in 2007 and 2010 during the 11th Five-Year Plan. The results show that the gap among the eight cities of Hebei Province is narrowing; their nature, economy and society are developing towards the direction of the stable and secure, and sustainable development ability and level is constantly strengthening. Among the eight cities, Cangzhou has always ranked top three, the vulnerability of Tangshan and Shijiazhuang improves significantly. Baoding is in middle level, Qinhuangdao, Chengde and Langfang step backward obviously; Zhangjiakou has always failed behind others on the list. The evaluation results also confirm the positive correlation between vulnerability and sensitivity, and the negative correlation between vulnerability and response-recovery capabilities. The influence of sensitivity on vulnerability is enhancing, and it is highly significant to change vulnerability by reducing sensitivity of the regional system at the present stage.

Key words: Vulnerability; Regional system; Entropy method; Set pair analysis method; China's Hebei Province City Group

1 Introduction

The vulnerability research was considered beginning from natural disaster research in the late 1960s, then the theory and methods of vulnerability are widely applied to the natural, cultural, social, economic and many other fields. Bibliometric analysis indicates that vulnerability research results have rapidly increased since the 1990s, and has become the frontier and hot issue in many different fields^[1-2]. Under the background of global change, vulnerability research is gradually developing into a sustainable research method^[3], and its application range is becoming wider and wider. For this reason, this paper evaluates the whole nature-economy-society sustainable development situation of the 8 cities in Hebei Province in Beijing-Tianjin-Hebei metropolis circle based on the theoretical paradigm of vulnerability.

2 The Vulnerability of the Regional System and Its Evaluation

2.1 Regional system

All the activities of human society are closely related to specific geographical space, the combination of human society activity and specific geographical space produces the regional system. According to the definition of Qian Xuesen, “the system is an organic whole with specific function, which composed of interacting and interdependent parts”^[4], the author defines regional system as a

* This paper is supported by China's National Social Science Fund Project (number: 11 BJL055).

complex system with a certain function of structure and can do some kinds of material, information, technology, personnel and energy exchange, which is composed of some functions, such as resource, environmental, social within the scope by interaction, mutual influence, mutual dependence and mutual restriction. Regional system not only has the characteristics of the complex system, such as complexity, openness, space structure, organization and dynamic evolution and so on, but also is an open complex giant system with a lot of variable, the mechanism of complex and uncertainty significant factors^[5].

2.2 Vulnerability of the regional system

As academic concept, vulnerability appears in many fields; therefore its meaning is continuously developing and changing, and gradually becomes a set concept^[6]. Referring to related research results, the authors think, vulnerability is the kind of degree to measure the relative levels, trends and possibilities for the sustainable development of regional system, and the inherent attribute of the regional system manifested when the system encountered unfavorable internal and external disturbances. During development process, if regional system is sensitive to internal and external disturbance, and lacks of response-recovery ability to the disturbance, then the stability mechanism of regional system will be destroyed, sustainable development will be affected by the negative effect; once this negative effect is cumulated to exceed a certain critical threshold, the regional system will shock, or even collapse. So vulnerability and sensitivity are positive correlation, vulnerability and response-recovery capability are negative correlation.

2.3 Evaluation on the vulnerability of region system

Evaluation on the vulnerability of region system is to discuss about the structure and function of a system itself, and to predict the potential impact of external stress on the system, as well as to evaluate the system's resistance to external stress and the ability for the system recover from adverse effects. The purpose of evaluation is to maintain the sustainable development of the system, reduce the negative impact of the external stress to the system and provide decision basis for the degradation system's comprehensive improvement^[7].

2.3.1 Establishment of index system

As mentioned before, vulnerability of regional system is related to sensitivity and response-recovery capabilities. Thus, under the hard constraint of data availability, the authors construct the evaluation index system for vulnerability evaluation as shown in table 1.

Table 1 Evaluation Index System for the Vulnerability of Regional System

Target layer	Subsystem	Criteria layer	Index layer
vulnerability of regional system	Natural subsystem	Sensibility	Emission intensity of industrial wastewater ($10^4t/km^2$)
			Emission intensity of industrial SO ₂ (t/km^2)
			Emission intensity of industrial soot (t/km^2)
			(Municipal district) Per capita annual water supply ($m^3/person$)
			Per capita arable resources ($mu/person$)
		Response-recovery capability	Standard-reaching rate of industrial wastewater discharge (%)
			Standard-reaching rate of industrial solid waste (%)
			Treatment rate of domestic sewage (%)
			Harmless treatment rate of domestic waste (%)
			(Municipal district) Green coverage rate of built up area (%)
	Economic subsystem	Sensibility	The ratio between added value of primary industry and GDP (%)
			Energy Intensity GDP (tons of standard coal/ten thousand RMB)
			The ratio between actual amount of foreign capital and GDP (%)
			GDP per capita (RMB)
		Response-recovery capability	Diversification index of industrial structure <i>H</i>
			The ratio between added value of tertiary industry and GDP (%)
			Density of investment in fixed assets ($ten\ thousand/km^2$)
			Growth rate of GDP
	Social subsystem	Sensibility	Population density ($people / km^2$)
			Natural growth rate of population(‰)
			Registered unemployment rate in town (%)

			Per capita consumption expenditure of urban residents (RMB)
			Per capita consumption expenditure of rural residents (RMB)
			Engel coefficient of urban residents (%)
		Response-recovery capability	Per capita disposable income of urban residents (RMB)
			Per capita net income of rural residents (RMB)
			The proportion of tertiary industry employment (%)
			The ratio between educational expenditure and fiscal expenditure (%)
			The ratio between fiscal expenditure and GDP (%)
			The number of hospital/health centers bed per ten thousand people (doctors/ten thousand people)
			The number of doctor per ten thousand people (doctors/ten thousand people)
			The number of internet users of per ten thousand people(users/ten thousand people)

In order to avoid human bias of subjective weighting method and to explore the self-law of regional system development much better, the authors use the Entropy Method to determine index weight. The essence of Entropy Method is to determine the weights according to the disorder (entropy value) of information contained in the indexes: the smaller the entropy value, the more useful information can be provided by indexes, then the greater the weight; on the other hand, the smaller the weight. Calculation steps of Entropy Method can be found in the literature [8], not repeat them.

2.3.2 Set Pair Analysis Method

With the application range is extended, the method of vulnerability evaluation has developed from the qualitative to the semi-quantitative and quantitative, such as the comprehensive index method, the method based on GIS technology, fuzzy matter-element evaluation method, and figure overlay method and so on. The authors try to use Set Pair Analysis Method to evaluate the vulnerability of regional system.

Set Pair Analysis (SPA), put forward by Zhao Keqin, is a quantitative method is suitable for uncertainty analysis of complex systems. Its basic idea is: considering set *A* and set *B*, which have certain relation, as a set pair *H*; under the background of problem *Q*, certainty is divided into two situation “identity” and “opposition” according to one characteristics of the set pair, and uncertainty is considered as “difference”; then connection degree can be established from “identity”, “difference” and “opposition” to analyze and solve problems. Suppose set pair *H* has *N* characteristics, among which *S* characteristics are identity for set *A* and set *B*, *P* characteristics are opposition, and the rest *F = N - S - P* characteristics are not opposite or identity, are uncertain. The connection degree μ of the two sets can be defined as [9]:

$$\mu(Q) = \frac{S}{N} + \frac{F}{N}i + \frac{P}{N}j = a + bi + cj \tag{1}$$

Among formula (1): *a*, *b*, *c* denote respectively identity degree, difference degree and opposition degree of set *A* and set *B* under the background of question *Q*, and satisfy *a + b + c = 1*; *i* is the markers sum coefficient of the difference degree, *i* ∈ [-1,1]; *j* is the markers sum coefficient of opposition degree, *j* ≡ -1. Thus, the relationship between set *A* and set *B* can be analyzed according to the connection degree determined by formula (1).

According to the basic idea of Set Pair Analysis, suppose that *Q* = (*Y, E, W, D*) represents the question of vulnerability evaluation, the vector *Y* = {*y*₁, *y*₂, ..., *y*_{*n*}} represents evaluation scheme, and *n* is the number of evaluation objects; Vector *E* = {*e*₁, *e*₂, ..., *e*_{*m*}} represents that each scheme has *m* evaluation indexes; Vector *W* = {*w*₁, *w*₂, ..., *w*_{*m*}} represents the indexes weight; Matrix *D* = (*d*_{*kp*})_{*m* × *n*} represents the evaluation index value of each scheme.

In order to compare the evaluation objects within the same space, the optimal and the worst evaluation index value among the evaluation schemes can be elected to compose the optimal solution set *U* = {*u*₁, *u*₂, ..., *u*_{*m*}} and the worst solution set *V* = {*v*₁, *v*₂, ..., *v*_{*m*}}. According to set {*v*_{*p*}, *u*_{*p*}}, identity degree *a*_{*kp*} and opposition degree *c*_{*kp*} of *d*_{*kp*} in numerical matrix *D* can be calculated as follows [10]:

When *d*_{*kp*} is a positive indicator:

$$\begin{cases} a_{kp} = \frac{d_{kp}}{u_p + v_p} \\ c_{kp} = \frac{u_p v_p}{d_{kp}(u_p + v_p)} \end{cases} \quad (2)$$

When d_{kp} is a negative indicator:

$$\begin{cases} a_{kp} = \frac{u_p v_p}{d_{kp}(u_p + v_p)} \\ c_{kp} = \frac{d_{kp}}{u_p + v_p} \end{cases} \quad (3)$$

Then, the connection degree μ of set $\{Y_k, U\}$ in interval $[V, U]$ can be represented as:

$$\begin{cases} \mu(S_k, U) = a_k + b_k i + c_k j \\ a_k = \sum w_p a_{kp} \\ c_k = \sum w_p c_{kp} \end{cases} \quad (4)$$

So, the relative closeness r_k between the scheme Y_k and optimal solution can be defined as:

$$r_k = \frac{a_k}{a_k + c_k} \quad (5)$$

The r_k in formula (5) actually reflects correlation degree between scheme Y_k and the optimal solution. The bigger value r_k , the closer between evaluation objects and the optimal scheme, and the results will be better.

When using Set Pair Analysis Method to evaluate vulnerability of region system, different evaluation objects' data, which are collected according to the evaluation index system shown in table 1, can be combined together to form the data set $\{Y_k\}$, then an object's relative closeness to the optimal solution will reflect its vulnerability degree. Therefore the evaluation objects' vulnerability relationship can be analyzed through comparing r_k . According to the same ideas, regional system's sensitivity and response-recovery ability can also be evaluated and analyzed.

3 Evaluation on the Vulnerability of China's Hebei Province City Group

3.1 Hebei Province City Group

According to the *Regional Development Plan for Beijing-Tianjin-Hebei Metropolis Circle*, that the China's National Development and Reform Commission is working on, China's Beijing-Tianjin-Hebei metropolis circle is the region, which centers on Beijing and Tianjin, also includes Shijiazhuang, Langfang, Baoding, Zhangjiakou, Tangshan, Qinhuangdao, Chengde and Cangzhou in Hebei Province. According to the dividing mode of "2 + 8", this area locates in the hinterland of the People's Republic of China, mountains and rivers are linked together, belongs to the Haihe River basin, and has the political center, cultural center of China and economic center in the north. This area belonged to Zhili Province during Ming Dynasty and Qing Dynasty. After the administrative division of Beijing-Tianjin-Hebei changing many times during the Republic of China to the People's Republic of China, the administrative subordination relations today formed. Developmental gap among China's Beijing, Tianjin and Hebei is visible, what kind of situation in 8 cities of Hebei Province is?

3.2 Results of vulnerability evaluation

According to the index system shown in table 1, the authors evaluate vulnerability of natural, economic and social overall development in 8 cities of Hebei Province during the 11th "Five-Year" Plan by using the Entropy Method and Set Pair Analysis Method. Due to the limitation of data availability, the authors finally chose 2007 and 2010 to evaluate. The relevant data are collected from *China City Statistical Yearbook*, *China Statistical Yearbook*, *Hebei Economic Statistical Yearbook* and *China Environment Statistical Yearbook*. The evaluation results are shown in table 2.

Table 2 Evaluation Results on the Vulnerability of Regional System in 8 cities of China's Hebei Province

city	2007			2010		
	Sensibility	Response-recovery capability	Vulnerability	Sensibility	Response-recovery capability	Vulnerability
Shijiazhuang	0.5277 ③	0.5244 ④	0.5004 ⑥	0.4228 ②	0.5980 ④	0.4084 ③

Tangshan	0.5262 ⑦	0.5157 ⑥	0.5040 ⑦	0.3846 ①	0.5958 ⑥	0.3943 ①
Qinhuangdao	0.5080 ⑤	0.5235 ⑤	0.4909 ④	0.4635 ⑦	0.5763 ⑧	0.4429 ⑧
Baoding	0.4968 ②	0.5016 ⑦	0.4972 ⑤	0.4486 ④	0.6206 ②	0.4115 ④
Zhangjiakou	0.5208 ⑥	0.4944 ⑧	0.5132 ⑧	0.4788 ⑧	0.6177 ③	0.4273 ⑦
Chengde	0.5014 ③	0.5328 ③	0.4778 ③	0.4598 ⑥	0.5950 ⑦	0.4261 ⑥
Cangzhou	0.4875 ①	0.5409 ②	0.4722 ①	0.4436 ③	0.6387 ①	0.3961 ②
Langfang	0.5031 ④	0.5527 ①	0.4764 ②	0.4541 ⑤	0.5976 ⑤	0.4251 ⑤

[Note] The serial number in the table is one city's rank about related evaluation value in 8 cities. In accordance with the principles regional system's sustainable development, the vulnerability and sensitivity rank from low to high, response-recovery capability rank from high to low.

3.3 The analysis of evaluation results

First of all, the vulnerability evaluation gap between the minimum and maximum is narrowing from 2007 to 2010. According to the basic principle of Set Pair Analysis Method, it means that the relative closeness of evaluation objects to the optimal value is becoming smaller. On the whole, it shows that nature-economy-society system of the 8 cities in Hebei Province of China is developing to the direction of the stable and coordinating, and the gap among the cities is narrowing.

Second, among the 8 cities in Hebei Province of China, Cangzhou has always ranked top three, it is better than the other cities; the vulnerability of Tangshan and Shijiazhuang improves significantly and their ranking are promoting; Baoding is in middle level, Zhangjiakou falls behind others on the list; Chengde and Langfang step backward obviously.

Third, the evaluation results confirm the correlation of the vulnerability, sensitivity and response-recovery capability. From the evaluation results in 2007, due to the low sensitivity and strong response-recovery ability in Cangzhou, Langfang and Chengde, they have low vulnerability. In contrast, sensitivity of Tangshan and Zhangjiakou is higher, response-recovery ability is weak, and therefore they have high vulnerability. Although Baoding's sensitivity is low, because its response-recovery ability is relatively weak, it has high vulnerability. Shijiazhuang's high sensitivity is due to its high vulnerability. From the evaluation results of 2010, the low vulnerability of Tangshan, Shijiazhuang and Cangzhou is due to low sensitivity, and high vulnerability of Zhangjiakou is caused by the high sensitivity. The high vulnerability of Qinhuangdao and Chengde is the double effects of high sensitivity and low response-recovery ability.

Fourth, the sensitivity's influence to vulnerability has the trend of aggrandizement. In 2007 only Shijiazhuang's high vulnerability is caused by high sensitivity; but in 2010, the change of sensitivity directly affects Shijiazhuang, Tangshan, Baoding and Zhangjiakou's vulnerability ranking. It shows that the sensitivity reduction of regional system has significant meaning to vulnerability changing.

4 Conclusions

Vulnerability is the kind of degree to measure the relative levels, trends and possibilities for the sustainable development of regional system. It's the inherent attribute of the regional system manifested when encountered unfavorable internal and external disturbances, which is positively correlated with sensitivity, negatively correlated with the response-recovery ability. This paper constructs the evaluation index system for the evaluation on region system's vulnerability from the aspects of sensitivity and response-recovery capability, uses Entropy Method and Set Pair Analysis to evaluate and analyze the vulnerability of 8 cities in Hebei Province of China, which belong to Beijing-Tianjin-Hebei metropolitan circle, in the years of 2007 and 2010 during the 11th Five-Year Plan. The results show:

(1) The gap among the 8 cities in Hebei Province is narrowing, their nature, economy and society are developing towards the direction of the stable and secure, and their sustainable development ability and level are constantly strengthening.

(2) Among the 8 cities, Cangzhou has always ranked top three, the vulnerability of Tangshan and Shijiazhuang improves significantly; Baoding is in middle level; Qinhuangdao, Chengde and Langfang step backward obviously; Zhangjiakou has always failed behind others on the list.

(3) The evaluation results also confirm the positive correlation between vulnerability and sensitivity, and the negative correlation between vulnerability and response and recovery capability.

(4) The influence of sensitivity on vulnerability is enhancing, it is highly significant to change vulnerability by reducing sensitivity of the regional system at the present stage.

Assessment on Wuhan's Industrial Sustainable Development Capacity under Ecological Environmental Constraints*

Pang Guoqiang, Wei Jianguo, Zhu Chun

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: pgq@ynxygf.com, weijg@whut.edu.cn, 676753537@qq.com)

Abstract: In recent years, the industry in Wuhan has grown with the characteristic of high resources consumption and pollutant emission, which leads to serious environment deterioration. Based on analyzing current condition of industrial environmental pollution in Wuhan, this paper makes a comparative study on the industrial sustainable development capacity among 15 sub-provincial cities in China under ecological environmental constraints by applying principal component analysis with SPSS software. According to the empirical study, Wuhan ranks the top 11 among these cities, which means that Wuhan doesn't perform well in promoting industrial sustainable development on the whole. Finally, the paper puts forward policy suggestions on promoting industrial sustainable development in Wuhan, the suggestions including to improve the regulation and technology of the "three wastes" such as industrial wastewater, waste gases and residues, to strengthen the urban greening, to impose tax for environmental protection, and to promote industrial transformation.

Key words: Industrial sustainable development; Ecological environment; Principal component analysis; Three wastes

1 Introduction

Since China's reform and opening-up to the world, Wuhan, a large industrial city in central China, has achieved rapid development in industry, while the problem of urban environmental pollution has been becoming worse and worse. Due to the long-term traditional extensive development model of high resources consumption and high pollutant emission in Wuhan, the ecological environmental bearing capacity is continually weakened, which then results in non-sustainable development of industry. The serious deterioration of the ecological environment has been a major impediment for Wuhan to step forward on the road of strong industrial city for the moment.

Currently, environmental constraints on industrial sustainable development have attracted numerous researchers' attention in China. Under the background that financial crisis highlights the importance of the real economy and the demand of the time for the industry re-feeding agriculture, Chen Shiyi (2009) analyzes the sustainable development of China's industry, which is characterized by high energy consumption and high carbon emissions^[1]. An Meimei and Gong Xinshu (2010) conducts systematic analysis on sustainable development of Xinjiang industry with multi-objective linear weighted function model by means of establishing an evaluation index system on industrial sustainable development ability under environmental and resource restriction, and they propose suggestions and countermeasures for the sustainable development of Xinjiang industry^[2]. Based on the predecessors' relevant researches, this paper designates Wuhan's industry as the study object, and aims at defining the actual level of its sustainable development capacity under ecological environmental constraints. To achieve the comprehensive performance ranking of industrial sustainable development capacity in Wuhan, this paper chooses 15 sub-provincial cities in China as horizontal comparison objects and sets four original evaluation indicators of ecological environment supportability to conduct positioning analysis on the 15 cities' industrial sustainable development capacities by applying SPSS software to analyze statistical data of the established indicators in 2010. The result of the study will be helpful to guide the practice of industry development in Wuhan.

2 The Current Condition of Industrial Environmental Pollution in Wuhan

Since the economic reform and opening-up to the world from the year of 1978 on, Wuhan has gradually formed four key industries, including steel, automobile and machinery equipment manufacturing, electronic information and petrochemical industries, which results in the high pollutant

* This paper is supported by The Humanities and Social Science Fund Project by Ministry of Education, PRC: Research on the Innovation Advantage Building of Industrial Cluster Based on the Theory of Network (12YJAZH131) .

emission and seriously pollutes the soil, water source and air. The time series trends of standardized volume of “three wastes” discharged from 2000 to 2010 in Wuhan are shown in the Figure 1, which show that the industrial waste water has declined year by year, but industrial waste gas emission presents an increasing tendency and industrial solid wastes have always been unstable among the eleven years. On the whole, Wuhan’s industry has achieved a certain effect on controlling pollutant discharge in the process of constant adjustment, but Wuhan is still facing high pressure of pollution abatement.

Figure 1 Trends of Total Volume of Industrial “Three Wastes” Discharged in Wuhan

Industrial sustainable development capacity refers to the regional ability to promote coordinated sustainable development of industry in accordance with its goals and requirements. For the moment, the ecological environment pollution has seriously weakened the industrial sustainable development capacity in Wuhan.

3 Positioning Analysis on Industrial Sustainable Development Capacity in Wuhan

3.1 Idea and tool of conducting positioning analysis

Since industrial sustainable development capacity varies among the cities, the development in these cities focuses and directions are different from each other under different abilities and stages of development. Based on its strengths and weaknesses, each city ought to take targeted measures and make corresponding strategies for industrial sustainable development according to its conditions of industry and environmental protection. The ranking of Wuhan’s industrial sustainable development capacity obtained in this paper will objectively reflect the city’s real situation of promoting industrial sustainable development, which has an important guiding significance in practice.

To make comparative study on industrial sustainable development capacities among the 15 cities from the perspective of ecological environment, it is necessary to set reasonable multiple evaluation indicators of ecological environment supportability to conduct a comprehensive analysis. According to the composing of urban industrial sustainable development capacity under ecological environmental restriction, this paper designs four indicators such as comprehensive utilization of industrial solid wastes, attainment rate of industrial waste water, rate of good atmospheric quality and urban green coverage rate, which can reflect urban industrial sustainable development capacity from four different angles—prevention and control level of environmental pollution by solid wastes, prevention level of environmental pollution by waste water, abatement level of air pollution and construction level of urban greening. The analysis expands upon these cities’ statistical data of the established indicators in 2010.

Taking the relatively large number of ecological environment sustainability evaluation indicators into consideration, principal component analysis method (Hervé Abdi, Lynne J. Williams, 2010) [3] is adopted here with the idea of dimensionality reduction to integrate many correlated indexes into less

uncorrelated indexes. In other words, this paper intends to represent the original four indicators as a set of new orthogonal variables called principal components on the premise of keeping the important information carried by them. By means of endowing the acquired principal components with rational weights, they can serve as the composite indicators to get each city's synthesis score value for the ranking with the principal components analysis synthesis estimate model.

3.2 Process of the positioning analysis

Firstly, statistical data of the four indicators are obtained from Statistical Yearbooks 2011 of the 15 cities. Then SPSS software is used here for the data standardization (Banimostafa A, Papadokonstantakis S, Hungerbühler K, 2012)^[4]. Next, the paper calculates the correlation coefficient matrix of indicators based on the standardized data by SPSS with the result shown in table 1. The standardized four indicators, including standardized comprehensive utilization of industrial solid wastes, standardized attainment rate of industrial waste water, standardized rate of good atmospheric quality and standardized urban green coverage rate, are respectively denoted by ZX1, ZX2, ZX3 and ZX4. It can be seen from Table 1 that the correlation coefficient between the rate of good atmospheric quality and urban green coverage rate is 0.681, which means that there is relatively large amount of overlapped information between the two indicators because of the strong correlation between them. Moreover, there are also certain correlations between other indicators in an indication that information carried by the four indicators overlap each other to different extents. Therefore, it is difficult to make a comprehensive evaluation on each city's performance according to these indicators. To simplify the process of positioning analysis, principal component analysis method is adopted here.

Table 1 Correlation Coefficient Matrix of Indicators

	ZX1	ZX2	ZX3	ZX4
ZX1	1.000	0.160	-0.108	0.307
ZX2	0.160	1.000	-0.211	-0.039
ZX3	-0.108	-0.211	1.000	0.681
ZX4	0.307	-0.039	0.681	1.000

Table 2 shows the variance contribution ratio of each component obtained by SPSS. Components are extracted as principal components according to the principle that the corresponding eigenvalues are greater than 1.

Table 2 Principal Component Extraction Table

Component	Initial Eigenvalues		
	Summation	Variance contribution ratio	Accumulative variance contribution ratio
1	1.738	43.452	43.452
2	1.256	31.395	74.847
3	0.801	20.031	94.878
4	0.205	5.122	100.000

The number of extracted principal components is denoted by m. It can be seen from the principal component extraction table that m is equal to 2 with the meaning of extracting two principal components. Since the accumulative variance contribution ratio of extracted principal components is 74.847% in an indication that they are able to explain most of the information carried by the original indicators, it is reasonable to replace the four original indicators with the two new ones. The next step is to calculate principal components load matrix by SPSS with the result shown in Table 3, which can reflect the correlation between each original indicator and principal component.

Table 3 Principal Components Load Matrix

Standardized indicator	Principal component 1	Principal component 2
ZX1	0.195	0.824
ZX2	-0.260	0.675
ZX3	0.891	-0.240
ZX4	0.916	0.250

The greater the absolute value of indicator's weight on one principal component is, the higher the correlation between them is. It can be seen from Table 3 that ZX1 and ZX2 have relatively greater loads on the second principal component in an indication that information carried by the two indicators is basically included in the second principal component, while ZX3 and ZX4 have relatively greater loads on the first principal component with a meaning that the first principal component can remain the main information carried by the two indicators.

The coefficients of original indicators in each principal component are achieved by means of dividing their weights on principal component by the square root of corresponding eigenvalue. And then, the two principal components' expressions can be shown as follows:

$$F_1 = 0.148ZX_1 - 0.197ZX_2 + 0.676ZX_3 + 0.695ZX_4 \tag{1}$$

$$F_2 = 0.735ZX_1 + 0.602ZX_2 - 0.214ZX_3 + 0.223ZX_4 \tag{2}$$

The percentage of eigenvalue corresponding to each principal component in total eigenvalues of the two acquired principal components is used as the weight of each principal component in the principal components analysis synthesis estimate model, which means the model is got according to the formula

$$F = \frac{\lambda_1}{\lambda_1 + \lambda_2} F_1 + \frac{\lambda_2}{\lambda_1 + \lambda_2} F_2, \text{ where, } \lambda_1 = 1.738, \lambda_2 = 1.256.$$

Then, principal component comprehensive model is as follows:

$$F = 0.5805F_1 + 0.4195F_2$$

The model can be used to calculate each city's synthesis score value. Then, the rank of industrial sustainable development capacities of the 15 cities can be got according to the value. The ranking result is shown in Table 4.

Table 4 Synthesis Score Value and Ranking of Each City

City	Principal component 1	Principal component 2	Synthesis score value	Ranking
Guangzhou	0.879	-1.260	-0.018	8
Shenyang	0.679	-0.095	0.354	6
Nanjing	-2.413	-2.062	-2.266	15
Wuhan	-1.719	1.553	-0.346	11
Chengdu	-0.470	1.763	0.467	4
Xian	-0.766	0.088	-0.408	12
Dalian	2.319	-0.524	1.126	2
Changchun	0.496	0.201	0.372	5
Ha Erbin	-0.851	-0.530	-0.716	14
Jinan	-1.225	1.353	-0.143	9
Qingdao	0.883	1.081	0.966	3
Hangzhou	-0.260	-0.121	-0.202	10
Ningbo	-0.177	-1.370	-0.677	13
Xiamen	0.486	-0.624	0.021	7
Shenzhen	2.138	0.547	1.471	1

3.3 Result of the positioning analysis

It can be seen from the empirical study that the top three cities in terms of industrial sustainable development capacity among the 15 sub-provincial cities in China are Shenzhen, Dalian and Qingdao in order, while the last three ones are Ningbo, Ha Erbin and Nanjing. Wuhan ranks the 11th among these cities. Wuhan's first principal component gets a score of -1.719 with rank of the 14th, and the second principal component gets a score of 1.553 with rank of the second. The different ranking results of the two principal components show that Wuhan has reached a high level of prevention and control of environmental pollution by solid wastes and waste water, while it still has a long way to go to abate air pollution and to improve urban greening compared with other cities. On the whole, the present condition of Wuhan's industry cannot meet the requirements of industrial sustainable development. Therefore, based on keeping the disposing level of industrial solid wastes and waste water, Wuhan ought to step up

its efforts in air pollution control and devote itself to the greening construction through learning from well-performed cities like Dalian and Shenzhen, which can contribute to the overall improvement of sustainable development capacity of Wuhan's industry.

4 Policy Suggestions

With the introduction of the concept of building a harmonious society and promoting sustainable development, environmental protection has been an important part for the industrial development pattern reform and rapidly sustainable development of national economy in China. China's former chairman Hu Jintao pointed out in the Report of 18th National Party Congress of China that the issue of unsustainable development with China's economy remains prominent and restrictions by resources and environment become increasingly tiger, which requests for the quick establishment of ecological civilization system in order to promote the new pattern of harmonious development between human and nature. For the moment, Wuhan's industry is in an important period of strategic opportunities for its target with the variety of domestic and international environment so that it is necessary to explore the countermeasures to realize Wuhan's industrial sustainable development under the new situation. According to above empirical analysis, this paper proposes some policy suggestions for the sustainable development of Wuhan's industry as follows.

1) The regulation force and technology for industrial "three wastes" treatment should be improved. In order to abate the industrial "three wastes", it is necessary to take the government-leading development strategy to promote the three transformations of industrial pollution control method, such as the transformations from terminal control to entire process control, from decentralized control to the combination of centralized control and decentralized control and from consistency control to the combination of quantity control and consistency control. In addition, the government ought to increase investment in the construction of environmental protection infrastructure and focus the investment on the treatment of water pollution, air pollution and waste materials. For example, the government should put emphasis on the technology development like resource recovery of urban industrial solid wastes, treatment of industrial high-concentrated wastewater, equipment of coal-fired flue gas desulphurization and high-efficiency catalysis and conversion of automobile exhaust.

2) It is urgent to improve urban greening for Wuhan. Urban greening has important ecological function, which can absorb harmful gas such as carbon dioxide, which is emitted by the burning of industrial fuel, and improve urban air quality. It can be seen from the empirical analysis that Wuhan's industry doesn't perform well in terms of urban greening, so Wuhan should devote itself to the greening construction to promote the industrial sustainable development. It is necessary for the government to strengthen relative management and invest enough funds in the urban greening, such as giving financial support in terms of fertilizer, equipments, protection of plants and so on. Moreover, the government needs to strengthen the related legislation on urban greening and encourage the citizens to join in the greening work.

3) It is useful to impose tax for environmental protection. It is suggested to levy taxes for destruction of environment by enterprises with high resources consumption and high pollutants emissions, such as carbon tax, waste disposal tax, surface water pollution tax and so on. On the one hand, imposing environmental protection tax can aggravate high-polluting enterprises' tax burden, which consequently can suppress their destruction and pollution to environment. On the other hand, the imposed taxes can be used as a special fund to support environmental protection. What's more, it is suggested to develop special environmental tax law to make environmental tax a powerful tool for the government to protect environment and to implement the strategy of sustainable development.

4) Wuhan's industry ought to promote industrial transformation. With the new round of technology change resulting from global financial crisis, Wuhan's industry is faced with greater pressure of transformation because of its high proportion of traditional industry and the lack of capacity for independent innovation. It is suggested that Wuhan's industry should stick to the principle of combining the improvement of its key industries with the development of new industries in the process of transformation. Wuhan's industry can enhance its competitiveness by means of improving the quality and widening the selection of its key industries' products with technology innovation. In addition, it should try to break through the technology restriction on industrial transformation and upgrading and

actively develop strategic emerging industries in the field of new materials, new energy resources, energy conservation and environment protection and so on.

5 Conclusions

Due to the long-term traditional extensive industrial development model with high resources consumption and high pollutants emissions, Wuhan is faced with a serious impediment in the process of developing into a strong industrial city with the sharp deterioration of the ecological environment for the moment. According to the result of principal component analysis, Wuhan takes the 11th place among the 15 sub-provincial cities in China, which means Wuhan doesn't perform well in terms of promoting industrial sustainable development on the whole. In particular, Wuhan has performed well in terms of prevention and control of environmental pollution by solid wastes and waste water, while it has a long way to go in abatement of air pollution and urban greening. In order to promote the sustainable development of Wuhan's industry, this paper has proposed some policy suggestions, including improving the regulation force and technology for industrial "three wastes" treatment, to strengthen the construction of urban greening, to impose tax for environmental protection and promoting industrial transformation. It is believed that Wuhan's industry must be able to realize the sustainable development by its efforts in promoting the harmony between human and nature.

Abstract: This paper explores the issue of inserting the theme of sustainability in the core of corporate business strategies, since this insertion is based not only in punctual improvements in production processes, certifications, awards or adaptations of products and services, but also in the effective thinking about the needs of human beings that this product or service is tending to. From several benchmarks, including a few market surveys, the paper highlights and compares data from 20 model companies featured on the 2011 *Guia Exame de Sustentabilidade* with the concept of the five corporate development stages, by Nidumolu, Prahalad and Rangaswami (2009) that support the discussion and strengthen the need to align products and services with strategies, in order to have sustainability in business. The conclusion is that few companies are in the most advanced stages and there is the need for greater corporate empowerment on the topic and for further research with similar topics.

Key words: Strategic alignment, Sustainable development; Sustainability in business; Corporate sustainability

1 Introduction

The sustainability topic can be seen everywhere: in television, newspapers, advertising, cartoons, movies, social networks, T-shirts, company brands, and many other places. In newspapers, one reads about environment catastrophes like Katrina or the earthquake in Haiti or the tsunami in Japan. TV news broadcast the slowness in global leader meetings, named with acronyms like COP or Rio+20, to emit less carbon to the atmosphere. In movies, there are extraterrestrial beings, such as in *Avatar* or *Star Trek*, defending the nature and base of their planet against insatiable, power-hungry men. In cartoons, there are several humanized animals, walking on two feet and talking, who try to selectively sort waste, something the “evolved” *Homo sapiens* cannot do. In social media and networks, many Twitter and Facebook posts feature animals suffering and social themes from around the world. It is also noticed that Brazilian banks are becoming greener, a considerable part of cosmetics companies are assessing their vendors, the automobile and logistics industry are considering the emission of CO₂, electric and electronic industries are developing recycling practices, ore and natural byproduct extracting companies are studying their legacy in regions – to sum up, several actions are being conducted aiming at a greater, common goal.

With this concept stamped every day on the news, there is the issue of the theme’s complexity and how companies include sustainability in their activities. In this line, the main purpose of this document is to conduct an analysis on the issue of including the sustainability in the strategy and business of Brazilian companies.

A considerable part of our feeling of powerlessness when facing financial dynamics comes from the fact that we simply do not have the instruments to know what the contribution of different activities to our well being is. The nearly hysterical appeal from the media for a few additional percent points in GDP growth acts on the generalized distress of unemployment and deviates our focus from the main goal, which is quality of life in the society, leaving people confused and uniformed. Poorly informed people, naturally, do not participate. (DOWBOR, 2008, p. 33)

The frantic pursuit of GDP growth by governments and of increased profit by companies leaves aside the real pursuit of activities and products for the well-being of people around the world. More than that – to achieve this utopian well-being for everyone, non-renewable resources are being consumed in an unplanned manner.

We have come to a critical point where the future of the spaceship named Earth, from its passengers to its crew, is no longer certain as it used to be. There are technical conditions to devastate the biosphere, rendering the human adventure impossible. This is the new radical way of being that makes all other issues relative in the sense of diminishing them and making them relative. The true question one must ponder is, therefore, how can the survival on Earth be guaranteed, with its ecosystems,

and how can the conditions of life and development of the species *Homo sapiens etdemens* (BOFF, 2001) be preserved.

Despite of all these arguments and demonstrations of the emerging need for a real change of culture and systemic and holistic thinking, and of the challenges and difficulties faced by the planet, most employees, managers, executives and board members in companies, according to Wilhelm (2009), continue to make the same remarks:

“I have to worry with the first bottom line” (according to the concept of triple bottom line, this would be the financial one).

“We cannot invest in this now!”

“It will cost more.”

“I don’t handle environmental issues.”

“I am waiting for each quarter’s productivity, and with everything that’s going on, climate issues are not priority.”

“Even if we do the best we can, there will still be gaps as far as environmentalists are concerned, so what do you want?”

But how can we change this reality, this model in force? Senge, Jaworski, Scharmer and Flower (2007) state that seeing in a new way starts when the usual way of thinking and perceiving is interrupted. They quote the cognition scientist Francisco Varela, who explains that, in order to develop this capacity, there must be “suspension, distancing from the usual flow (of thinking).” To Varela, suspension was the first basic “gesture” to enhance perception. Making a pause does not entail destroying or ignoring the mental templates we have of reality – that would be impossible, even if we tried. It does entail what the famous physicist David Bohm calls “hanging our assumptions in front of us.” Thus, we start identifying thoughts and mental models as products of our own mind. When we become aware of our thoughts, their influence on what we see diminishes. Making a pause allows us to “see our way of seeing.”

Before interrupting our usual way of thinking and perceiving, we must understand the existing mental models in the issues of sustainability, strategy, trend and reality, and then start thinking about the future.

In the future, the unlikely happens instead of what is likely. Can our immaturity be overcome? It is possible, yet unlikely. However, major movements start small. Christianity and Islamism, for example, started with a prophet, and both have become gigantic phenomena. This shows that we must wait for the unlikely. Young people come to me saying they have no cause to fight for, like we did when I was young. I say to them: yes, you do have, the most gigantic cause: your destiny. We need to consider the future with the possibility of hope. (MORIN, 2008)

The WBCSD – World Business Council for Sustainable Development, represented in Brazil by CEBDS – Conselho Empresarial Brasileiro para o Desenvolvimento Sustentável (or Brazilian Business Council for Sustainable Development), through its document *Vision 2050*, aims at viewing the possibilities for the future of the planet with companies. The document addresses three questions: How would a sustainable world be? How can we make it happen? What role can companies perform to ensure quicker progress toward this world?

For this thinking, it is crucial to know the main concepts, ideas and examples on the topic of sustainability, sustainable development and its direct relationship with companies, as well as the main concepts on sustainable products and services, and what must be the core of every company, the reason for existence of an organization that aims at profitability as the reason for its pursuit.

2 Data and Methodology

2.1 Method

For this research, we used vast theoretical bibliographic references, due to the need of understanding the existing relationship between corporate strategies, the theme of sustainability, and sustainable development.

2.1.1 Discussion on the Method

The investigation explored corporate strategy themes, articulated by definitions, strategies, strategic planning and typologies. Thus, we understand that it is possible to gain more clarity in the alignment of fundamental theoretical concepts of strategy, the base of a company concerning sustainability issues, an urgent topic on present times.

To measure sustainability issues against corporate strategies, a qualitative analysis was conducted based on the 2011 *Guia Exame de Sustentabilidade* (Exame magazine’s Sustainability Guide). This

analysis was based on the Guide's data when compared with the five corporate evolution stages model, by Nidumolu, Prahalad and Rangaswami (2009).

Guia Exame de Sustentabilidade is an annual publication by Grupo Abril, highlighting companies that are benchmarks in social corporate responsibility – it is the biggest and most respected inquiry on the topic conducted in Brazil, now on its 12th edition. Any companies, whether state-owned or private, open or closed-capital, major, medium and small, can participate in it. The Sustainability Studies Center from Fundação Getúlio Vargas (GVCes), an institution considered the benchmark in this topic in Brazil, prepares the questionnaire and is responsible for the analysis of information. The questionnaire is divided into four parts, with an approximate total of 140 questions. The first part addresses issues on commitment, transparency and corporate governance. The other parts address the economic-financial, social and environmental dimensions. After being completed, the answers are analyzed statistically, in order to exclude companies with the worst performances in any dimension in the questionnaire. Based on this analysis, a group of nearly 40 companies is selected and submitted to the decision by a deliberative council – comprised of experts – that selects the 20 model companies. In the case of these model companies, there is no ranking, and they are featured in the publication in alphabetical order. In 2011, 158 companies that answered to all questions participated on the survey.

A thorough bibliographic research was conducted to select, understand and analyze data and secondary information, originated from existing market surveys on the topic, stressing the relevance and urgency of this discussion, aiming at presenting the theme by interconnecting the concepts of sustainability with business strategies from the companies selected by this prestigious Brazilian annual business publication.

The research suggests that, when one wants to head towards product and service sustainability, there must be strong alignment with corporate strategies. Reviewing product and service cycles not linked to business strategies can generate costs much higher than the ones forecasted by business managers and investors.

2.1.2 Main sustainability concepts

Issues on the non-sustainability of life and, consequently, business have been discussed more frequently over the past decade. Several meetings have occurred aiming at more awareness between nations and partners to reduce the high negative impacts from several industrialized countries that have severe repercussions for the planet, generating catastrophes of environmental, social, economic, cultural, organizational, psychological, human natures, among others.

The term 'sustainability' was the center of discussions during the Earth Summit (United Nations Conference on Environment and Development), held in Rio de Janeiro in 1992. Sustainability was initially defined by the Brundtland Commission in 1987, as "a development that meets the needs of current generations without compromising the ability of future generations to meet their own needs" (or, according to a recent variation, "allowing future generations to do the same").

The 178 nations gathered in 1992 for the Earth Summit listed the main phases towards sustainable development on a founding document, which forms a kind of common program for the 21st century: Agenda 21. In June 2012, Rio+20 was a conference held in Rio de Janeiro with the purpose of discussion again the environment, green economy, eradication of poverty and international governance for sustainable development. However, one of the concerns was that the event was a mere balance, because it had no deliberative character, not representing considerable advances in the pursuit of sustainability in the planet.

In addition to these debates, Rio+20 assessed practical results from important documents generated from the aforementioned ECO 92, such as Agenda 21, Conventions on Climate Change and Biological Diversity, Declaration of Principles on Forests, Fight Against Desertification, among others that were prepared afterwards, such as the Earth Charter, in 2000.

2.1.3 Sustainability in companies

According to Laville (2009), the pre-historical time of corporate social responsibility (CSR 0.0) was marked by a philanthropic, patronage posture, developed especially from the 1980s to mid-1990s: at that time, different social and environmental imperatives started being acknowledged by financial instances, and companies started realizing that they could not thrive in declining social or natural environments. Thus, they started engaging in the easiest route: implemented and developed foundations or patronage actions, through which they redistributed part of their profits to organizations for environment protection, human rights defense or fight against exclusion – but without changing one bit of their financial model, strategy or offer.

The second era, marking the creation of the concept of CSR per se (which the author calls CSR 1.0),

extended from mid-1990s to mid-2000s: it was characterized by an enrichment of the previous approach, with a more active posture of defense of eco-efficiency and prevention of risks, especially the ones with greater effect on reputations. By opening to outside and to social and environmental issues, companies were confronted with internal and external questions concerning the impact of their own institutional practices in areas such as production, personnel, procurement, among others, over certain issues.

According to the author's reflections, the third era (CSR 2.0), in which we have been for quite some time, corresponds to a revolution that has just begun – but that may have an important impact on sustainable development policies from major groups. Such revolution is fed by several factors combined: the publication of the Stern report, which demonstrated that it is cheaper to fight against climate changes than suffering its consequences; the shock effect from the documentary by Al Gore and the Nobel prize he won; the growing visibility of these topics in the media; the multiplication of headlines about “green growth”; the arrival of “alter-consumers” with strong power of purchase, who incorporate social and environmental criteria to their buying decisions and represent a growing part of the population in developed countries (France, Japan, USA, etc.) (LAVILLE, 2009).

MeloNeto (2004) separates into decades the evolution of the concept of sustainability. Initially, in the 1960s, sustainability emerged as a concept directly associated to environment preservation. Sustainable projects were seen as a set of actions that minimized environmental risks. The idea of preserving natural resources was predominant. Then, in the 1970s, sustainability evolved to the full scope of environmental actions, especially the ones to prevent risks and damages caused to the environment. However, it was in the 1980s that the binomial sustainability/corporate responsibility emerged. He continues by talking about the 1990s with social responsibility practices and, in the 2000s, with social environmental certification practices. It is noticed that the moment requires from companies not only respect with the environment and the use of environmental management practices, but especially the minimization of social risks and the pursuit of solutions for social problems existing in communities.

From this perception has arisen the importance of social as a sustainability factor for any project and/or business. This is the current model – sustainability as a social-environmental management practice focused on formal, legal and institutional instruments for social and environmental certification. (MELO NETO, 2004)

Sustainability as a strategy for companies has currently been seen only as an improvement on a more eco-efficient process or in product changes, making it fully or partially recyclable. In many companies, the topic has not been inserted when it comes to tracing their strategies to generate value. There is an attempt to insert sustainability in a fragmented manner into the product or service, but this insertion is not analyzed in a broad, holistic way. Drucker (2010) ponders that social responsibilities from a business may arise in two areas: they can emerge from social impacts of the institution or from issues in society. The first one addresses what an institution generates to society, and the second, what an institution can generate to society. The modern organization exists to provide a specific service to provide a specific service to an audience in the society and, with this, it needs to be committed to this group considering its insertion through making business in a social scenario, not only financial, a standard in the capitalist paradigm. The exploratory idea of making business is now pressured to a review, and this pressure has also been made by nature itself, which is rebelling against the impact on its lands, waters, climate, biodiversity, among others.

Drucker (2010) states that the purpose of an iron ore plant is not to make noise or release harmful fumes – it is to manufacture high-performance metals to serve its clients. However, in order to do that, it generates noise, heat and fumes. These impacts are incidental to the purpose of the organization, but are largely inescapable products.

Understanding what the impacts the company causes in the society are, including the environment, is crucial so that it can achieve its market and financial goals. And the organization can go beyond; as Drucker (2010) says, it is always necessary to try to turn the elimination of an impact into a business opportunity, but this is not possible in many cases. Most of the times, eliminating an impact means increasing costs. What was an “externality” for which the general public paid becomes a business cost. Therefore, it becomes a competitive disadvantage, unless every player in the industry accepts the same rule. Most of the times, this can only be done via regulation – that is, by some form of public action. Whenever an impact cannot be eliminated without increasing costs, it is up to the management to step forward and elaborate the regulation most likely to solve the problem with the lowest possible cost and greatest benefit both to the public and the business, and then work so that the right regulation is established.

As mentioned on strategies, Porter (2004) states that one of the generic strategies is precisely the leadership in costs, but if the impact of the product, service or business is not measured, this deviation can put this generic strategy in extreme jeopardy, making the organization lose its market share.

Drucker (2010) declares that the social problems are dysfunctions in the society and, at least potentially, degenerative diseases in the political organism. The corporate task is to turn change into innovation, that is, into new business. History shows that social change and innovation have been as important as technology, a fact to alert investors who excessively value technologies and reserve meager amounts to social and human issues.

Porter and Kramer (2010) follow the same topic that companies are in the society, and their interdependence can be analyzed with the same tools used to analyze the competitive position and development strategy. Thus, the company can focus its Corporate Social Responsibility activities on better effect. More than mere good-intentioned actions leveraged by or reacting to external pressure, the organization can develop an affirmative Corporate Social Responsibility agenda that produces the maximum social benefit and business gain. To any company, the strategy must go beyond good practices. This is choosing an unique position – doing things differently than competitors in order to reduce costs or better meet the needs of a particular group of consumers. These principles apply to the relationship between companies and society, as well as with its clients and competitors. Many opportunities for pioneer innovations to benefit the society as well as the company competitiveness may arise from the product offer and the value chain.

Nidumolu, Prahalad and Rangaswami (2009) emphasized that sustainability is a rich niche of organizational and technological innovations capable of generating revenue and profit. An environmentally correct company has lower costs, an important strategy according to the several authors aforementioned, because it uses fewer inputs. Also, the process generates additional revenue – thanks to better products or for allowing the company to create new business. The authors also highlight that, since these are the corporate innovation goals, smart companies are handling sustainability as the new innovation frontier. The study by Nidumolu, Prahalad and Rangaswami (2009) shows that companies that have already started this journey go through five different stages of change.

Table 1 Five Stages for Sustainability

STAGES	MAIN CHALLENGE	NECESSARY COMPETENCES	OPPORTUNITIES FOR INNOVATION
1 ST STAGE Face as an opportunity in relation to rules	Ensure that compliance with rules becomes an opportunity for innovation.	Ability to foresee and influence regulations. Ability to work with other companies, including competitors, to implement creative solutions.	Use the compliance to lead companies and partners to test sustainable technologies, materials and processes.
2 ND STAGE Make the value chain sustainable	Increase the efficiency throughout the value chain.	Proficiency in techniques such as carbon management and lifecycle assessment. Ability to reformulate operations to use less energy and water, contaminate less and generate less waste. Ability to make sure that vendors and retailers also become eco-friendly.	Develop sustainable sources of raw materials and components. Increase the use of clean energy sources, such as sunlight and wind. Find innovative uses to disposed products.
3 RD STAGE Create sustainable products and services	Create sustainable products and services or reformulate the existing line to not harm the environment.	Ability to understand which products and services are more harmful to the environment. Ability to gain real public support with sustainable products (in contrast with skin-deep ecology). Managerial know-how to increase the scale of supply of green raw materials and product manufacturing.	Use techniques such as biomimetics in product development. Create compact and environment-friendly packages.
4 TH STAGE Create new business models	Find new ways to generate and obtain value, changing the base of competition with this.	Ability to understand what the consumer wants and find different ways to meet those needs. Ability to understand how a partner can increase the value of the product or service.	Create new supply technologies to considerably change relationships in the value chain. Create monetary gain models based on services, not on products. Create business models that combine digital and physical infrastructure.
5 TH STAGE Create “next practice” platforms	Question, through the sustainability bias, the current dominating logics in corporate activity.	Ability to understand how renewable and non-renewable resources affect the ecosystem in companies and industries. Confidence to synthesize business models, technologies and regulation in different segments.	Create business platforms that enable clients and vendors to manage energy in a radically different manner. Create products that do not use water in categories where its use is normal, such as in cleaning products. Invent technologies that allow the industry to use energy generated by byproducts.

Source: Nidumolu, Prahalad and Rangaswami (2009)

To boost and effectively include sustainability in corporate strategy, Nidumolu, Prahalad and Rangaswami (2009) state that smart companies pursuing sustainability must follow very simple rules:

- Do not start with the present: if the starting point is the current approach, the vision of future will be an optimistic extrapolation. The best is to start with the future. When there is consensus on the shape the future will take, the company management can bring this future to the present.
- Before investing, learn: the board's interest in sustainability sometimes leads the company to invest in projects before knowing how to execute them. A smart company starts gradually, learns fast and expands the project scale.
- Adjust tactics, but never forget the goal: a smart executive knows he will have to make many tactical adjustments along the way. A route with five different stages, lasting one decade or longer, cannot be concluded without correcting paths and making considerable changes. Although the company shall not forget the greater goal, tactical flexibility is crucial.
- Create collaboration resources: nowadays, it is very difficult to produce innovation – whether to comply with rules, whether to create a new product line – without partnering with other companies, NGOs or the public power. Oftentimes success depends on the executive's ability to create new mechanisms for developing and distributing products and sharing revenue.
- Use the global presence to experiment: an advantage of having a multinational company is to be able to experiment in your own country and abroad. Currently, governments of many developing countries are concerned with environmental issues and encourage companies to launch sustainable products and processes, especially for the population in the pyramid base. For the multinational company, it is easier to innovate in emerging markets. This is where there are less systems established – and traditional ways of thinking – to overcome.

Nidumolu, Prahalad and Rangaswami (2009) state that two major initiatives help the company become sustainable: the first one is when top management decides to strongly focus on the issue by accelerating change, and the second is the importance of hiring and retaining the right type of people. Leadership and talents are critical to the creation of a lower-carbon economy. The existing financial system puts a huge pressure on the planet, but only considers the needs of a quarter of the people that inhabit it. Over the next decades, however, the world will absorb the double of it in terms of new consumers and producers. Traditional approaches to corporate activities will crumble and the companies will have to pursue innovative solutions, a fact that will require quick understanding from leaderships, joining sustainability with innovation.

Due to the difficulty companies face when incorporating sustainability into the business strategy, this paper presents a few qualitative and quantitative research studies to reinforce the discussion.

The research “Communication and Sustainability: What does your organization think and do in this area?,” conducted with the 25 major companies members of CEBDS (Conselho Empresarial Brasileiro para o Desenvolvimento Sustentável, or Corporate Council for Sustainable Development), in October 2008, revealed important data and information on the topic. The prominent information for this paper is that 90% of the respondents commented that sustainability is incorporated in the business strategy, and 10% answered that it is not.

In another research by IBOPE, named IBOPE Environmental Research, from September 2011, with 400 interviews with medium and major Brazilian and multinational companies operating in Brazil, 52% stated having their sustainability area structured, focused exclusively on activities concerning this topic. From the total, 48% have sustainability policies with goals and planned actions. Additionally, in companies that practice sustainable actions, 8 in 10 have a strategic sustainability plan. The research also shows that the share of resources targeted at sustainable prices by companies, regardless of having a structured sustainability area or not, is virtually the same (4% and 3%, respectively), indicating that the investment in isolated sustainability actions has no major highlight, but at the same time it is not known how to calculate/identify how much the sustainability component is inserted in other investments conducted. In other words, this research offers the important information that the theme is not being addressed in companies organically, with the creation of departments, plans, goals and sustainable actions, and a percentage (even if small) of the sales forwarded to this topic. However, as it can be noticed, the research leaves a gap to check how much the topic of sustainability is inserted into other corporate strategies.

Another Brazilian research conducted by Sebrae, named “What micro and small businesses think about sustainability,” launched in 2011, had the purpose of assessing the level of perception of owners of micro and small businesses in Brazil concerning the topics of sustainability and environment.

3,058 businessmen from micro and small-size segments were interviewed. As a result, it was verified that most of these businessmen (58%) state that they don't have knowledge on the topics of sustainability and environment. Despite it, 72% understand that micro and small businesses shall give great importance to the environment and 79% believe that companies that adopt actions to preserve the environment can attract more clients. For 47% of the businessmen interviewed, the environment issue represents opportunities of gain for their companies, 40% do not see gains nor expenses, and 13% believe that the environment issue represents costs and expenses.

Globally, the MIT Sloan Management Review and the Boston Consulting Group conducted a research, released in the winter of 2012, showing that companies are starting to give more highlight to the sustainability issue. From the companies that participated in the survey, 70% have this theme permanently in their management agenda, and 31% believe that sustainability contributes to company profits. The third issue of the yearbook was released with more than 2,800 leaders from major global companies in 113 countries, in different segments of operation. The study also shows that 66% of the companies believe in sustainability as a crucial competitive factor in the current market – in 2010, 55% believed in it. Investments in the area of sustainability have also increased, according to the research.

Another global research released by Accenture and the United Nations Global Compact (2010) shows that most CEOs – 93% – say that sustainability will be crucial for the future success of their companies. Additionally, the CEOs believe that, within a decade, an inflection point can be achieved, there sustainability is related to the core business – in their capabilities, processes and systems, and the entire global supply chain and branches. These are some of the main conclusions from a survey with 766 CEOs worldwide – the biggest studied ever conducted on the topic of sustainability. In addition to an online research, the study included in-depth interviews with 50 of the world's top CEOs. The CEOs mentioned several barriers to achieve their sustainability goals, including:

- The complexity in implementing the strategy in all company areas (mentioned by 49 per cent)
- Competitive strategic priorities (48 per cent)
- Lack of recognition from financial markets (34 per cent)

The CEOs also believe that some conditions must be met before sustainability is completely integrated to the core business, and that companies need to take a leadership role concerning this topic. The action by companies will be necessary in five key areas:

- Configure the consumers' taste, in order to build a strong market for sustainable products.
- Train the management, employees and next generation of leaders to handle sustainability issues.
- Communicate with investors to create better understanding on the impact of sustainability.
- Measure the performance in sustainability – and explain the value of companies in the society.
- Work with governments to define a clear regulation and create fair conditions for competition.

There is also the international ranking of the greenest companies, by the American magazine *Newsweek*. With each company's Green Score, *Newsweek* sums the score related to Environment Impact with two other factors: Environmental Governance and Environmental Transparency. The list, from October 2011, places the giant Munich Re as the greenest company in the planet, with a Green Score of 83.6, where the maximum would be 100. Then, come IBM, with 82.5, and the National Australia Bank, with 82.2. Brazilian bank Bradesco, also with 82.2 points, is ranked in fourth, being the best-rated Brazilian company. Other Brazilian companies featured in the ranking are: Santander (17), Banco do Brasil (50), Itaú (54), Eletrobrás (214), Grupo Pao de Açúcar (248), Vale (312), Petrobrás (364), Ambev (412), and Gerdau (463). Since they don't have industrial facilities, financial companies take an advantage according to the criteria by *Newsweek*. Governance concerns policies, actions, programs and goals each company has to handle the management of natural resources and the impacts of their activities. The score for transparency is assigned to companies that disclose to the public data on their environmental footprint and inventories on greenhouse gas (GHG) emissions. According to *Newsweek*, if governments hesitate to embrace the low-carbon economy, the same cannot be said about private initiative. Corporate sustainability is currently one of the most relevant topics in the business world, and virtually all major companies have long-term plans and are making their activities cleaner and more efficient each year. The 500 companies assessed by the ranking are responsible for the emission of more than 6 billion tons of GHG, which corresponds to the emission by the United States.

Another famous global ranking is the one developed by Interbrand, which assessed in 2011 the performance and perception from 50 global companies in 10 countries – USA, Japan, China, Brazil, Germany, France, Great Britain, Italy, India and Spain. Considering social-environmental data from

more than 3,000 corporations available in the platform ASSET4, research partner Deloitte developed a corporate environmental performance methodology named The Green Performance Score, including the pillars of governance, engagement from stakeholders, operations, supply chain, transports and logistics, products and services. On the other side, Interbrand checked the opinion of 10,000 consumers concerning the brands based on criteria of authenticity, relevance, differentiation, consistency, presence and understanding. Among the main results, stand out the importance of transparency, the difference in opinions depending on the country and the research segment, and the considerable gap between performance and perception. Despite it, the stronger green brands are actually in the intersection between these two items. In 2011, the top 10 companies in the survey are, from the highest score: Toyota, 3M, Siemens, Johnson&Johnson, HP, Volkswagen, Honda, Dell, Cisco and Panasonic.

As it can be noticed, there are many rankings, surveys and ratings on sustainable companies or that are heading towards sustainable development or concerning the topic. On a global vision, there are more accurate data informing that sustainability is slowly becoming part of companies' strategic agenda (which does not occur in Brazilian micro and small businesses). It is believed that these companies answer correctly and are audited in these questionnaires, indicators and benchmarks. However, we question if these companies effectively have sustainability in their business strategy. What may be happening is a couple of actions, plans and programs that are only part of their processes and procedures to become greener, inclusive and responsible. The differences in concepts and interpretations may interfere with the answers to the questionnaires and questionings. We highlight that these practices are highly valuable in a sustainable development process, but are not sufficient, because the complexity of the world and of business has demonstrated that it is necessary to go beyond the existing indicators and programs created by the companies. In Brazil, when a company prepares its articles of incorporation and later defines the methods for sales and profitability, it will necessarily define the products and/or services generated to the society. Thus, generating products and services requires taking care of the processes for production, distribution, sale, collection (take back and recycling), and these process points can adjust to a few rules, standards, legislations, ISOs, etc. The studies by Nidumolu, Prahalad and Rangaswami (2009) have stated that companies will need to achieve the 3rd Stage to create sustainable products and services and then, on the two following stages, develop new business models and platform for the next practices.

Inserting sustainability in the business strategy would happen from the 3rd Stage on, but not only with a few products in the portfolio or a small margin of sale from these products or new markets, but representing most of the company's sales, which would be ideal. For developing these products or services, it is not enough to have a few eco-friendly features, but also closed cycle, transparency, create value in the chain and, complementing with Almeida (2009), with the internalization of social and environmental costs, which favors the durability of assets to be designed to be repaired and updated. We end this discussion in this paper, without exhausting the theme, with Bonilla (2007), who highlights the actual needs, and the created needs, for necessary and unnecessary products.

3 Results

A qualitative research was conducted with comparative secondary data among 21 companies that are benchmarks in corporate social responsibility in Brazil by the 2011 *Guia Exame de Sustentabilidade*. It was noticed which evidence these companies have in the 1st, 2nd, 3rd, 4th and 5th Stages according to Nidumolu, Prahalad and Rangaswami (2009), that is, it was analyzed if the companies effectively started a process of including sustainability in business strategies, understanding strategy as stated by Costa (2009) as the base over which plans are made, priorities are established and modified, external and internal communication is structured, risks are managed and the company path is changed, facing new facts, that is, the tangible cause for the company to exist in the society.

In this research, 99% of the companies declare, via top management, that the company is formally committed with sustainable development and that this commitment is manifested. 40% of these companies demonstrate the commitment through their Vision and Mission; 91% via strategic planning; and 51% through a public document with long-term goals and objectives.

Based on data provided by the magazine, especially the ones concerned the performance of indicators from the 2011 *Guia Exame de Sustentabilidade* about the company and the content of the highlighted article, the table below supports in the following analysis, from such secondary data, if these 21 companies have in their performance any item related to the 1st, 2nd, 3rd, 4th and 5th stages. It is considered in the analysis only what *Exame* magazine mentioned as items in which the company was

above the average from the universe surveyed and the topics described in the article. With this, there is a base for qualitative analysis on the inclusion of sustainability in business strategy, according to Nidumolu, Prahalad and Rangaswami (2009).

Source: Adapted from Nidumolu, Prahalad and Rangaswami (2009)

It is noticed that most companies present evidence that they are on the 2nd stage, where the process of making the value chain more sustainable, is, thus increasing the efficiency of the entire value chain. From the 21 companies, 13 are aiming at creating sustainable products and services or reformulating the existing line to not harm the environment. And 6 of them are trying to find new ways to generate and obtain value, changing, with this, the competition base. A good example of company aiming at creating sustainable products and services is Braskem, which opened a green polyethylene plant in Rio Grande do Sul and has a new project in the area of renewable plastics. The project, which consumed 500 million reais and launched the company into the position of the world's biggest manufacturer of green polyethylene, used to make bags, film and packages for companies. The ethanol-derived ethene plant is in the city of Triunfo, Rio Grande do Sul. In addition to this new product vision, Braskem achieves the 4th Stage, according to Nidumolu, Prahalad and Rangaswami (2009), with the green polypropylene plant, a resin highly applicable to flexible and hard packages, in the automobile industry and in the agricultural industry. This is a new way to generate and obtain value, changing, with this, the competition base.

Another example of the 4th Stage is the company Fibria, which wants to provide food safety income while not being responsible for a “green desert”, due to the high use of land with single-culture crops. One of its operation fronts is apiculture. Throughout Brazil, 585 beekeepers produce honey in

eucalyptus forests from Fibria. For example, in the unit of Jacareí, in the State of Sao Paulo, 46,000 kilos of honey were obtained this year alone with the seal from IBD, which guarantees the product's organic origin. In another 4,000 hectares, 230 families cultivate foods such as corn, bean and fruit along with eucalyptus. In this case, there is an ability to understand how a partner can increase the value of the product or service.

For another example of the 3rd Stage, there is ItaúUnibanco, which put into practice a series of initiatives with the purpose of maintaining a sustainable relationship with its more than 60 million clients. According to its CEO, Roberto Setubal, this implies a change in the way of selling products.

Life insurance redesign is an example, because now it is only offered to those actually interested in it. According to the CEO, this made sales decrease 20%, but the cancellation rates and their costs were reduced by 40%. Another example was the change in the way of analyzing financing approval for the corporate area. In addition to the feasibility of payment and business growth, the bank teams try to analyze the project's impacts on the environment. If they are above what is considered acceptable, financing will not be granted. In other words, the bank does not sell, because it awards credits with sustainability values. This is literally the reformulation of existing lines to not harm the environment.

This study was focused on the perception existing in the 2011 *Guia Exame de Sustentabilidade*, highlighting the main items in which companies were above the average.

4 Conclusion

The paper brings sustainability concepts, recalls international awareness events when several discussions and concepts were created and debated, but with few commitments taken and executed among the nations involved, such as the recently held Rio +20. It dialogues with authors strengthening the point that many companies have sustainable speeches, but still few concrete practices on what is actually necessary, giving attention to recycling or taking care of product and service residues, but unattached to the macro business vision (strategies, value chain, product cycle, mass production, etc.).

It highlights the relevance of including social issues in business strategies to gain competitiveness in the present world. It values data and information from market surveys that enriched and strengthened the discussion of sustainability in company strategies, along with the concepts and theories presented.

The theme is still very little disseminated to the majority of the corporate population, as the survey by Sebrae with 3,085 businessmen from Brazilian micro and small businesses demonstrated, where nearly 60% stated they don't have knowledge about the topic – they represent most Brazilian companies. However, the topic has gained visibility thanks to the higher consumer awareness.

Major market leader or transnational companies in Brazil end up including the theme in their management thanks to movements like the ones from Instituto Ethos, CEBDS, Instituto Akatu and GIFE. These organizations, plus a few international ones, have helped place Brazil as a benchmark of progress in corporate sustainability worldwide. The implementation of indicators mentioned in the text was also a considerable driver of sustainable practices and actions from leader companies in this theme. Indicators and ISO certificates enabled many companies to measure sustainability in their everyday life and, more than that, compare with other companies, establish goals and further improve their processes.

On the research "Communication and Sustainability: What does your organization think and do in this area?," conducted with the 25 major companies members of CEBDS (Conselho Empresarial Brasileiro para o Desenvolvimento Sustentável), 90% of the respondents commented that sustainability is incorporated in the business strategy. Additionally, the survey disclosed by Accenture and the United Nations Global Compact demonstrated that 93% of 776 CEOs interviewed believe that sustainability will be crucial for the future of companies. It was also verified that sustainable development goes beyond simply taking care of the product or service innovation, because every process shall be considered, including strategic business discussions, which must insert sustainability in a macro manner, in synergy with its products and services. When companies in Brazil prepare their articles of incorporation and later define the methods for sales and profitability, this will necessarily go through a product or service to the society. Whatever this product or service is, subsequently there will be its mass production, distribution, sale, and collection (take back and recycling), and these process points can be adjusted to a few rules, standards, legislations, ISOs, etc.

We have noticed that including sustainability in a company's strategy and business has been widely discussed and is somehow being implemented by a few Brazilian corporations, but not in most and not organically. This fact is concerning when considering the topic in small and medium businesses. We also notice that the more sustainable products and services, added with processes, practices, actions,

indicators and plans, must be closely related to corporate strategies. To make this change and transformation, it is necessary to make a major investment in education and awareness about the topic in and out of the organizations, as well as there is the need of mobilizing and engaging the company's different internal and external audiences so that they can turn policies and plans related to strategy into actions, projects and activities.

This research achieves its purpose and may become a base for future researchers. We leave two suggestions for research: one about an in-depth study on the sales figures of sustainable products and services in leading companies, and another about investigating the issue of which sustainable business strategies are benchmarks in Brazil.

We hope that this work effectively cooperates with the construction of new business models, included in sustainable financial, social and environmental development.

The Status and Problems of Resource-Based Industries in Inner Mongolia in China

Wang Shuli, Yun Jilong

School of Economics, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: wangsl@whut.edu.cn, yunjilong@163.com)

Abstract: This paper expounds the meanings of resources and resource-based industries, the status and existing problems of resource-based industries growth in Inner Mongolia. The results show that Inner Mongolia is rich in mineral resources and renewable energy, but there still exist many problems especially regarding the low value-added and high energy consumption. Although energy consumption per unit of GDP in Inner Mongolia gradually decline from 2004 to 2011, it continues to hold the high. Furthermore, the imbalance of regional economic development and the environmental pressure still exist in Inner Mongolia. So Inner Mongolia is supposed to independently innovate, which is useful for achieving transformation and upgrading of resource-based industries.

Key words: Inner Mongolia of China; Resource-based industries; Energy consumption per unit of GDP; Independent innovation

1 Introduction

With the increasing overall demand capacity of technological innovation, resources consumption and ecological environment and other aspects, energy saving has become a long-term approach to develop China's national economy. Inner Mongolia Autonomous Region is located in the northern frontier of China, rich in natural resources such as minerals and land. Constructing the resource-based industries such as energy, agriculture and animal husbandry has obvious advantages and huge development potential. Therefore, understanding the growth status and problems of resource-based industries in Inner Mongolia have important practical significance. The remainder of this article is organized as follows: The second part is the definition of resource and resource-based industries, and the third part analyzes the growth status of resource-based industries in Inner Mongolia by using statistical data, the fourth part is the existing problems, and the last is the conclusions.

2 The Connotation of Resources and Resource-Based Industries

The resources usually refer to the source of production and means of subsistence, however, different research area and scholars have different understanding. Resources have broad and narrow sense, broad resources are all matter and energy of the nature and human society, both including all human natural objects such as sunlight, air, water, minerals, soil, plants and animals, and all useful material in the form of products of human labor, such as a variety of housing, equipment, and other consumer and production goods. Moreover, it also includes intangible assets such as information, knowledge and technology, and human physical and mental. Resources in narrow sense refer only to natural resources, the United Nations Environment Programme (UNEP) define resources as: "Natural resources are defined as the sum of natural environment and conditions that can produce economic value and improve the welfare of human at current or in the future under some conditions of time and location". Academic researchers interpret resources differently from different angles, Li Jinchang (1995) argues that resources equal to natural resources, referring to all useful tangible and intangible elements for mankind under certain technical conditions. Randall (1989) thinks that resources are useful and valuable substances found by the people, and he shows resource is a dynamic concept. In fact, the concept of resources also continues to expand with the economic and social developments. The number of types of natural resources and areas are all expanded due to the improvement of cognitive level and scientific and technological progress. So we can make resources as both a historical category and a product of society, the connotation and denotation continue to expand and deepen with the improvement of technology economy (Chen Ying, 2012).

Resources in the resource-based industries generally refer to natural resources. Since a variety of research and analytical purposes, domestic scholars have different understandings for resource-based industries, such as resources development industry, natural resources industry, mineral resources industry, resource-based industries. At the same time there are different understanding and interpretation

for its definition and connotation. First, it refers specifically to the mining, taking extractive industries as a resource-based industries or resources development industry (Guan FengJun, 2004). Resource-based industries are mainly based on mineral resources, energy and raw materials. The second is taking the development of all natural resources, including agricultural resources, tourism resources, and mineral resources industry, as the resource-based industries. Zhang Fuming (2007) regards resource-based industries as the economic activity sectors whose object of labor are natural resources, such as agriculture, forestry, animal husbandry, fisheries and mining industry. Third, from a generalized perspective, resource-based industries include the development of human resources and natural resources. Fourth, from the perspective of industry-chain, resource-based industries refer to economic sectors which are in order to discover resources, mining, protection, regeneration and increasing the value of its assets including resources survey and evaluation industry, resource mining industry, resource conservation, and resource recycling industry in four levels (Li Shanmei and Li Yuyan, 2005). Finally, developments of energy and mineral industries can be taken as resource-based industries, including the mining and processing industries in manufacturing which are important part of heavy industry. In summary, the resource-based industries is based on the exploration, protection, development and update of the mineral, biological, climate, land and other natural resources, heavily relying on the exploitation and processing of resources.

3 The Growth Status of Resource-Based Industries in Inner Mongolia

Inner Mongolia is rich in resources, natural conditions, mineral and renewable energy, which provide favorable natural foundation and advantages for the development of resource-based industries.

(1) Natural conditions. Inner Mongolia is located in China's northern frontier which is a long and narrow shape. Straight-line distance from east to west is 2400 km, and straight-line distance from north to south is 1700 km. The region's total area is 1.183 million square kilometers, accounting for 12.3% of the country's land area and is the third largest province. Inner Mongolia has a vast territory, complete stratigraphic, magmatic activities, good mineralization conditions, rich in mineral resources. It can be divided into two Classes I of tectonic units according to north latitude 42°, the north of which are the Tianshan - Inner Mongolia - Larix geosynclinal area, and the south are the North China platform area. There exist two leading Class II metallogenic belt in Inner Mongolia, one is North China Craton, n-grade copper-polymetallic metallogenic belt, the other is Daxinganling Class II copper-polymetallic metallogenic belt.

Table 1 The Growth Status of Various Resource-Based Industries in Inner Mongolia

Item		2003	2006	2007	2008	2010	2011
Land Resources	Total Land Area(10 000 sq.km)	118.3	118.3	118.3	118.3	118.3	118.3
	Cultivated Land at the Year-end(10000 hectares)	686.3	748.0	713.3	714.9	714.9	714.9
	Composition of Cultivated Land in Total Land Area (%)	5.8	6.3	6.0	6.0	6.0	6.0
	Area of Afforested Land(10000 hectares)	4068.3	4068.3	4068.3	4068.3	4394.9	4394.9
Forests Resources	Forest Area(10 000 hectares)	2078.9	2078.9	2050.7	2050.7	2366.4	2366.4
	Forest-Coverage Rate (%)	17.6	17.6	17.6	17.6	20.0	20.0
	Stock Volume of the Forest(100 million cu.m)	12.9	12.9	12.9	12.9	13.6	13.6
Prairie Resources	Prairie Area(10000 hectares)	8666.7	8666.7	8666.7	8666.7	8666.7	8666.7
	Utilizable Area(10000 hectares)	6818.0	6818.0	6818.0	6818.0	6818.0	6818.0
Water Resources	Total Water Resources Volume(100 million cu.m)	—	411.3	295.9	412.1	388.5	419.0
	Surface Water Volume	—	294.3	183.0	274.8	253.4	298.2
	Ground Water Volume	—	213.6	206.9	235.2	227.7	231.4
Mineral Resources	Coal Ensured Reserves(100 million tons)	2239.1	2892.6	2981.5	3275.9	3577.5	3690.3
	Iron Ore Ensured Reserves(100 million tons)	23.6	26.1	28.0	33.4	37.1	39.6
	Phosphate Ore Ensured Reserves(100 million tons)	2.8	2.8	2.8	2.8	2.7	5.7
	Rare-earth Ensured Reserves(10000 tons)	8213.4	7893.2	7754.4	7647.7	15998	—
	Copper Ensured Reserves(10000 tons)	346.3	471.8	478.1	501.5	632.9	641.1
	Lead Ensured Reserves(10000 tons)	315.6	485.4	541.0	645.1	983.0	1008.1
	Zinc Ensured Reserves(10000 tons)	1071.7	1426.9	1517.4	1756.0	2047.2	2098.0
Salt Ensured Reserves(10000 tons)	15646.4	18181.0	17782.7	15166.9	15904.1	15904.1	

Note: Total Water Resources Volume is not equal to Surface Water Volume plus Ground Water Volume; there is Duplicated Measurement between Surface Water and Ground Water.

(2) Mineral resources. Inner Mongolia is rich in mineral resources and more than 136 kinds of minerals have been found, accounting for 80% of the country's discovery of minerals. Development and utilization of minerals are 112 species (accounting for 48% of the mineral species) among which 42 kinds of mineral reserves rank the top 10, 26 kinds rank the top 3 and 7 kinds rank the top one. Per capita of 20 kinds of mineral is more than twice of the country. Coal reserves is extremely rich and have been identified coal-bearing area of 100000 square kilometers, retaining proven reserves of 700 billion tons and prospective reserves of 12,000 tons; Furthermore, oil and gas reserves are also very substantial, now proven 13 oil and gas fields, forecasting total oil resources amount to 20-30 million tons, natural gas for 2700-10000 billion cubic meters; non-ferrous minerals proved reserves rank the top five minerals are zinc, lead, tin and bismuth. Ranking 7 to 10 is copper, Ma, Mo, alumina, nickel, and cobalt. The changes in all kinds of resources are shown in Table 1.

(3) Renewable energy. Northwest of Inner Mongolia is major wind resource zones in China. Under the control of westerlies, year-round's average wind power density is 200-300 W/m², greater than or equal to 3 m/s wind speed throughout the year are more than 5000 hours, greater than or equal to 6 m/s wind speed are more than 2000 hours, which is one of the largest wind resource zones in China. The area of wind energy-rich area is 460000 km², and the development and utilization of wind energy resources of 10 m height is 101 million kilowatts, accounting for 40% of the national wind energy resource. Western Inner Mongolia's monthly average temperature is 10 degrees Celsius, the numbers of more than 6 hours of high sunshine are more than 250-300 days, the total annual solar energy is 6.22 billion coke per square meter, which is solar energy resource-rich areas. Eastern Inner Mongolia's monthly average temperature is higher than 10 degrees Celsius, the number of days more than 6 hours of high sunshine is more than 200-300 days, and the total annual solar energy per square meter is 50-62 billion coke, which belongs to the area that solar energy resources are abundant. In addition to the abundant wind energy resources and solar energy resources, Inner Mongolia also has a feature of sparsely populated, low land costs, which has the great advantages of the development of renewable energy.

4 The Problems of Resource-based Industries Growth in Inner Mongolia

There also exist some shortcomings and defects in the development of resource-based industries in Inner Mongolia, which will limit and restrain the economic development in the future.

(1) Low value-added, high energy consumption. Most of the major industries in Inner Mongolia are the basis of the upstream products, industry-chain is short, capability of resource-intensive processing is not strong, and the ability to meet end-market demand is low. In the process of regional development, industries have the highest energy consumption and the most significant environmental pollution. Inner Mongolia is in a phase of rapid development of large-scale development of resources and processing and conversion, an important industry base of national energy and heavy chemical, and a production and export base of metallurgy, non-ferrous metals, building materials and other raw materials, which show the feature of industrialization heavy resistance. The results are high energy consumption and table 2 shows the energy consumption indicators in Inner Mongolia decreased slowly.

Table 2 Energy Consumption Per Unit of GDP in Inner Mongolia (2004-2011)

Year	Energy Consumption Per Unit of GDP (ton of SCE/10 000 yuan)	Energy Consumption Per Unit of Industrial Value-added (ton of SCE/10 000 yuan)	Electricity Consumption Per Unit of Industrial Value-added (kw/10 000 yuan)
2004	2.51	6.33	1761.20
2005	2.48	5.67	1710.44
2006	2.41	5.37	1903.29
2007	2.31	4.88	2092.81
2008	2.16	4.19	1868.65
2009	2.01	3.56	1686.72
2010	1.92	3.24	1701.38
2011	1.41	3.09	1775.90

Data Source: Inner Mongolia Statistical Yearbook 2012. Note: Energy Consumption Per Unit of GDP in 2011 calculated by constant prices in 2010.

Ranking all provinces and autonomous regions (Tibet data unavailable) by energy consumption per unit of GDP in 2011, Inner Mongolia has high energy consumption, ranked sixth in China, far higher

than most of other regions (see table 3). In short-term, heavy-duty industrial structure in Inner Mongolia, mainly including energy, chemicals, metallurgy, is difficult to fundamentally change. High energy consumption per unit not only affects the competitiveness of related products in Inner Mongolia, but also means lower production efficiency, larger resources waste and greater side-effects to environment, the pressure of energy saving is large. This is bound to affect the long-term development of the resource-based industries and a great obstacle for its further development.

Table 3 The Ranking of Energy Consumption Per Unit of GDP (2011)

Region	Energy Consumption per 10000 yuan of GRP	Rank	Region	Energy Consumption per 10000 yuan of GRP	Rank
Ningxia	2.279	1	Henan	0.895	16
Qinghai	2.081	2	Hunan	0.894	17
Shanxi	1.762	3	Shandong	0.855	18
Guizhou	1.714	4	Shaanxi	0.846	19
Xinjiang	1.631	5	Guangxi	0.800	20
Inner Mongolia	1.405	6	Anhui	0.754	21
Gansu	1.402	7	Tianjin	0.708	22
Hebei	1.300	8	Hainan	0.692	23
Yunnan	1.162	9	Jiangxi	0.651	24
Liaoning	1.096	10	Fujian	0.644	25
Heilongjiang	1.042	11	Shanghai	0.618	26
Sichuan	0.997	12	Jiangsu	0.600	27
Chongqing	0.953	13	Zhejiang	0.590	28
Jilin	0.923	14	Guangdong	0.563	29
Hubei	0.912	15	Beijing	0.459	30

Data Source: China Statistical Yearbook 2012.

(2) Regional development is extremely unbalanced. The development of resource-based industries is subjected to resources distribution. Resource-rich areas have a rapid development of resource-based industries which can drive regional economic growth, while resource-poor areas have slow development. Judging from resources distribution in Inner Mongolia, the western region has unique advantages, with a natural basis for the development of resource-based industries, while the eastern and central regions have poor resources distribution, resource-based industries has lagged behind (see table 4). From a policy perspective, Inner Mongolia has been operating a non-balanced development strategy since the 10th Five-Year Plan to promote resource-rich region to develop firstly, The unbalanced development of each region's resource-based industries is not conducive to the regional division of labor, also is not conducive to generate the industrial clusters efficiency and economies of scale, and especially exacerbates the imbalance of regional economic development resulting in serious social problems.

Table 4 Number of above Designated Size Industrial Enterprises and Their Gross Output Value by Region (2011)

Region	Enterprises above Designated Size	
	Number of Enterprises (Unit)	Gross Output Value (At Current Prices) ((10000 yuan))
Hohhot City	267	13659098
Baotou City	625	29990131
Hulunbeier City	384	10355582
Xingan League	147	2140465
Tongliao City	590	24161894
Chifeng City	526	15773267
Xilinguole League	340	7593563
Wulanchabu City	373	7868253
Erdos City	385	37437310
Bayannaer City	275	10169968
Wuhai City	155	7399002
Alashan League	106	6627421

Data Source: Inner Mongolia Statistical Yearbook 2012.

(3) Environmental and ecological pressure is large. Inner Mongolia's ecological environment is fragile, moderate ecological fragile region accounting for 62.5% of the land area, in which severe and very severe vulnerability accounting for 36.7%. Some grassland degradation, destruction of forests, rivers and lakes dry up, serious soil erosion and desertification, salinization exacerbated the desertification area accounted for 55.7% of the land area. Ecosystem's function weaken, and Hulun's storage capacity reduced by 60% in 8 years. The disasters such as drought, dust, storms often occur. Desertification and soil erosion is serious, about 2/3 of the arable land are in the area of soil erosion, water-poor in most areas, poor carrying capacity. Exploitation of resources brought to the ecological destruction and environmental pollution in Inner Mongolia. Water resources reserves in Inner Mongolia are small compared to its rich natural resources, and the distribution is extremely uneven. Water resources in the region in 2010 are 38.854 billion cubic meters, 1500 cubic meters per capita. According to international standards, 2000 cubic meters per capita is the edge of the severe water shortage, 1000 cubic meters per capita is a minimum, and we can see that Inner Mongolia is a serious water shortage edge. Inner Mongolia is not only lack water resource, but also deteriorates the quality of the water. A large number of enterprises, especially small businesses, have outdated facilities and low level of technology, which let the free discharge of industrial waste and result in industrial pollutions.

5 Conclusion

Inner Mongolia is a natural resource-rich region and its development is directly related to China's total economy. The analysis reveals that Inner Mongolia's mineral resources and renewable energy are more abundant, but there are still a lot of problems, especially regarding low value-added and high energy consumption. Although energy consumption per unit of GDP gradually decline from 2004 to 2011 in Inner Mongolia, still high in 2011 and ranking the sixth out of all provinces. Inner Mongolia's regional economic development is unbalanced, and environmental and ecological pressure is large. Therefore, Inner Mongolia should promote independent innovation, improve the venture capital and service system; further build a policy system, improve the business organization system, which are useful for achieving transformation and upgrading of Inner Mongolia's resource-based industries and ultimately promote sustainable economic development in Inner Mongolia of China.

Study on the Multi-Objective Early Warning System of City Economic and Social Development

Cai Wentao, Yang Qing

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: 15922160001@163.com, yangq@whut.edu.cn)

Abstract: Guided by the scientific development concept, this paper studies the basic theory of early warning systems of city economic and social development, designs the early warning system structure of economic and social development of city, and establishes early warning index system and early warning models. Through the application of AHP and Fuzzy Decision Method and the investigation and analysis of experts, this paper obtains the importance of each index, and builds a scientific and rational multi-objective early warning system of city economic and social development providing a scientific method for the early warning management of city economic and social development.

Key words: Early warning system; Economic and social development; Multi-objective decision-making; Early warning model; Index system

1 Introduction

Early warning of regional economic and social development is a widely concerned research. Many scholars have conducted some researches. Zhu Ye, Ye Minqiang^[1] from the system point of view, studied the early warning systems and its structural design problems of regional sustainable development, and established the early warning simulation model. Yan Yaojun^[2] considered that we should learn from the approach raised by developed countries to establishing a “policy simulator” and focus on the development of social risks simulator to realize scientization of social early warning. Some foreign scholars^[3, 4] proposed early warning index for sustainable development and ecological city. Liying Sun, Jinren Ni and Alistair G. L. Borthwich^[5] developed a sustainable development index model based on development, coordination and sustainability among sub-systems.

These researches are mainly for early warning systems of sustainable development of a particular area, scholars have not yet established the corresponding multi-objective early warning system of city economic and social development. Guided by the scientific development concept, the paper studies the multi-target early warning system of city economic and social development.

2 The Basic Theory of Early Warning Systems of City Economic and Social Development

City economic and social development objective system is a complex system composed of many factors, and the monitoring and early warning of objective system compose an alarms and alarms absolving system. It is established in order to prevent the process of regional system operation from getting off track, crisis or serious conflict between the development of economic and social and environmental protection. As a signaling system which can reveal and forecast regional operation and development, it covers the whole regional development process of economic and social. The process includes discovery of the warning instance, analysis and identification of warning signs, seeking warning sources, judging warning degree and absolving the alarm.

Warning meaning, it refers to the early warning index system. According to our analysis, the early warning index system of economic and social development objective system is mainly composed of economy, society, science and education, quality of life, environmental protection and political civilization and so on, and each of them is a warning indexes group. Specific types of early warning indexes can select and determine representative indexes in the basis of different status levels of running and development of subsystems.

Warning instance, it is a phenomenon that including the development of economic and social development deviating from the path, development of a reduction or the operation and development blocked of a subsystem. It is generally described by the warning meaning, that is to say it can be reflected by the measured value of early warning indexes. Clearing warning instance is a prerequisite.

Warning signs, it is the harbinger before warning instance out breaking, also known as leading indexes. Warning signs are divided into economic boom warning signs and trends warning signs. The former directly reflects degree of the system operation and development or the warning instance. The

later reflects the changing direction of the warning instance, positive change or reverse change.

Warning degree, it is a measure of the severity of the warning instance, namely the size of the the warning instance. It is a measure or reference to determine the warning instance, the warning signs and whether the warning existing and it is the purpose of the early warning. It is usually divided into five levels that are no warning, warning light, medium warning, heavy warning and giant warning.

3 The Design of the Multi-Objective Early Warning Systems of City Economic and Social Development

3.1 Setup of early warning index system

Table 1 Multi-objective Early Warning Index System of City Economic and Social Development

Warning degree level Z	Warning instance level z_i	Warning signs level x_{ij}
The early warning of city economic and social comprehensive and coordinated development	1. Economic subsystem ($w_1 = 0.25$)	1. Per Capita GDP ($w_{11} = 0.20$)
		2. Local financial income per capita ($w_{12} = 0.15$)
		3. The proportion of the added value of the tertiary industry in the GDP ($w_{13} = 0.15$)
		4. The proportion of the added value of high-tech products in the GDP ($w_{14} = 0.2$)
		5. The actual use of foreign capital per capita ($w_{15} = 0.15$)
		6. Per capita investment in fixed assets ($w_{16} = 0.15$)
	2. Social subsystem ($w_2 = 0.15$)	1. The proportion of non-agricultural population in total population ($w_{21} = 0.25$)
		2. Gini coefficient ($w_{22} = 0.30$)
		3. The proportion of accessing the social security population in social workers ($w_{23} = 0.25$)
		4. Registered urban unemployment rate ($w_{24} = 0.20$)
	3. Scientific and educational subsystem ($w_3 = 0.20$)	1. The proportion of R&D expenditure in the GDP ($w_{31} = 0.30$)
		2. The amount of accepted patent per ten thousand person ($w_{32} = 0.20$)
		3. The proportion of Cultural, educational, health and scientific expenditure in the GDP ($w_{33} = 0.30$)
		4. The proportion of college population in the college-age population ($w_{34} = 0.20$)
	4. Quality of life subsystem ($w_4 = 0.20$)	1. The per capita disposable income of urban residents ($w_{41} = 0.20$)
		2. Per capita housing area ($w_{42} = 0.10$)
		3. Engel's coefficient ($w_{43} = 0.15$)
		4. Road area per citizen ($w_{44} = 0.15$)
		5. The average number of doctors per one thousand inhabitants. ($w_{45} = 0.10$)
		6. Internet users per one hundred people ($w_{46} = 0.20$)
		7. The natural population growth rate ($w_{47} = 0.10$)
	5. Ecological and environmental protection subsystem ($w_5 = 0.15$)	1. The per capita green area ($w_{51} = 0.2$)
		2. Comprehensive utilization of industrial solid waste ($w_{52} = 0.2$)
		3. The attainment rate of industrial waste water ($w_{53} = 0.2$)
4. Air pollution index ($w_{54} = 0.2$)		
5. energy consumption of output value per ten thousand ($w_{55} = 0.2$)		
6. Political and civilized subsystem ($w_6 = 0.05$)	1. The satisfaction for the work of party and government organs ($w_{61} = 0.5$)	
	2. The satisfaction for the work of anti-corruption ($w_{62} = 0.5$)	

Early warning system of economic and social comprehensive, coordinated and sustainable

development is a multi-warning instance and parallel system. The statistical indexes should follow the selection criteria containing the importance of development, the integrity of statistics, the regularity of volatility, the timeliness of monitoring and the sensitivity of early warning. Combining the analysis of city economic and social development objective system and PCA method, the paper designs the early warning index system (Table 1). Index system is divided into three grades, which are overall objective evaluation (warning degree level), subsystems objective evaluation (warning instance level), status index evaluation (warning signs index). Overall objective evaluation reflects the economic and social comprehensive, coordinated and sustainable development capacity of city, on behalf of the general trend and overall effectiveness of implementation of the strategy. Subsystem objective evaluation is divided into economic subsystem, social subsystem, scientific and educational subsystem, quality of life subsystem, ecological and environmental protection subsystem and political and civilized subsystem. Each subsystem is expressed by a number of status evaluation indexes according to their relationship to reflect the causes and motivation of their behavior, relationships, and changes. Subsystem evaluation is considered as unit in the indexes framework of early warning systems. The framework analyses the early warning situation on six sub-systems of the index system, and based that conducts a comprehensive evaluation. At last, analyzing the policy achieves the aim to warn the economic and social comprehensive, coordinated and sustainable development.

3.2 Early warning model

Using AHP and PCA, the paper clarifies the relationship of multi-level indexes, and selects several key indexes. Taking the comparison of the actual value and the objective value as the standard, and the final total score reflects the pathological degree of overall system caused by the deviation from each index.

First, calculate the contribution rate of the selected early warning indexes. That is to say, it is to determine the importance of each index. The paper uses AHP and Fuzzy Decision Method, and obtains the importance of each index (w_i, w_{ij}) through experts' investigation and analysis, as shown in Table 1.

Secondly, standardize the actual and target values of the indexes. Standardized method is to calculate the deviations of the actual value and the expected value. Deviations occur in two cases, but both the increase and decrease will affect the system. Such as GDP growing too fast or too will have a negative impact slow on the entire economic system. The formula is as follows.

$$y_{ij} = (x_{ij} / x'_{ij} - 1) \times 100\%; \text{ if } x_{ij} > x'_{ij} \tag{1}$$

$$y_{ij} = (x'_{ij} / x_{ij} - 1) \times 100\%; \text{ if } x'_{ij} > x_{ij} \tag{2}$$

In the formula x'_{ij} is the objective value of warning sign level index, and x_{ij} is the actual values. ($i = 1, 2, \dots, 6$)

According to the actual situation in city, we believe that the deviation of the actual value and the expected value is allowed within 10%, and this situation can be defined as no warning. If the deviation is more than 10% but no more than 25%, the index has an effect on the operation of the system, thus this situation is identified as warning light. When the situation deteriorates further and the deviation is less than 50%, it shows that the operational problem is larger than before and the deviation reaches a larger level, and this situation is identified as medium warning. When the deviation is more than 50% and less than 70%, the negative effect has reached a significant level, and this case is identified as heavy warning. If the deviation reaches more than 70%, it indicates that the situation is serious deviated from the objective and the indexes reflect the serious irregularities of the system, soothe situation is giant warning. Each index score can be calculated according to the following formula.

$$\begin{cases} z_{ij} = 0; & \text{if } y_{ij} \leq 10\%; \\ z_{ij} = 1; & \text{if } 10\% < y_{ij} \leq 25\%; \\ z_{ij} = 2; & \text{if } 25\% < y_{ij} \leq 50\%; \\ z_{ij} = 3; & \text{if } 50\% < y_{ij} \leq 70\%; \\ z_{ij} = 5; & \text{if } y_{ij} > 70\% \end{cases} \tag{3}$$

3.3 Early warning signal

Warning threshold is the "check value". Considering the check value as the boundary, the paper determines the "double red", "red light", "light red", "yellow" and "green" signals. When the index exceeds a certain check value, the corresponding signal will light. Meanwhile, each of the signal is

given different scores, such as “double red” is given five points, “red light” three points, “light red” two points, “yellow” one point, “green light” to 0. The score of each subsystem is calculated as follow.

$$z_i = \sum_{j=1}^k w_{ij} z_{ij} \quad (4)$$

In the formula w_{ij} is the importance of the j th index in the i th subsystem (Table 1), and k is the index number of warning signs level in each subsystem.

The formula that calculates the total score of early warning system is as follow.

$$Z = \sum_{i=1}^6 w_i z_i \quad (5)$$

If all indexes are double red, the overall score is up to the highest 5 points. If all are green, the overall score is the lowest zero. Through the overall score, we can judge the situation comprehensively and determine the warning signal.

3.4 The dispose of early warning results

“Green light” outputted in the system indicates that the system is coordinated, and factors and expectation values in the system is closer or is better than expectation values. “Yellow” indicates that the system is more coordinated, and it has the possibility of turning into in coordination or tending to coordination in the short term. If only a few subsystems has problems, we should take the appropriate measures. If the signal is from "red" to "yellow", it means that the system is gradually transformed from a lack of coordination to coordination, and further measures should be taken to make the system tends to be more coordinated. If the signal is from the "green light" to "yellow", it gives us a warning, and we should promptly adjust the control measures to reverse the tendency of the system. "Red" is showing serious warning and indicates the system is much uncoordinated; it is timely to take strong measures to promote a better to change for the system and to avoid the collapse of the entire system.

What we should pay attention to specially is that the economic and social development of city is a dynamic system. The changes in the macro-policy and development environment of our nation can affect its development objective, at the moment it should adjust the objective value correspondingly according to the fact.

4 Conclusion

City economic and social development has an important impact on the level of general development of regions. Establishing multi-objective warning system of city economic and social development provides a scientific method for the early warning management of city economic and social development. Establishing and improving the early warning system are very important measures initiatives to raise the government's ruling ability.

A Study on Concepts of Product Design with Sustainable Development

Zhu He, Yang Xianyi

School of Art and Design, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: 254324986@qq.com, wysd9@163.com)

Abstract: About serious shortage of human resources and the worsening environment, the concept of sustainable product design provides a new way for industrial design. The author's endeavor in this paper is to explore the basic concepts of product design with sustainable development from the ideological level to providing design guidelines, and serve the action for sustainable product research and development. The paper presents the concepts of being Nature-oriented, meeting vulnerable groups' demand, and creating environmental friendly lifestyles.

Key words: Product design; Nature-oriented; Sustainable development

1 Introduction

As we all know, human survival and development depend on nature. We enjoy resources, space of the nature, and the service function of this sustainable system. At the same time, the emissions of waste are thrown to the environment, which affect the structure, function and evolution of natural process. In the past, we set us apart from the food chain of the nature, and even worse, we broke the balance of nature. Many species are slowly disappearing because of human destruction. In 1962, an American biologist Rachel Carson published the "SILENT SPRING", in which he vividly described the mass destruction caused by using a large amount of chemical fertilizer, pesticide, and insecticide with the shocking cases. Facing the current development situation, this paper tries to explain the features of product design from the idea of sustainable development, and further explores the basic concept of sustainable product design from the ideological level to serving as the guidelines of action for sustainable product research and development.

Ecological imbalances and environmental degradation aroused the academe's notice. In 2007, Salah EI-Haggag presented a series of measures and methods for the establishment of ecological industry and the implementation of the sustainable development in his works. The famous "7R" rules are taken by various countries and enterprises as the principles of sustainable development. Liu Xin clarified the misconception of "green" by using the case study in The Notion, Evolution and Practices of Sustainable Design, and he researched the role of designers in the social transformation era. Han Linfei described the principles and works of William McDonough in Cradle to Cradle: a New Phase of Sustainable Development Protocol. Great progress has been made in this field. Researchers only analyzed the aspects of definition, method and evaluation of sustainable product design. However, the core concepts of sustainable product design were rarely mentioned. Then, we shall focus on summing up the main ideas of sustainable product design based on the former researchers.

2 Concepts of Product Design with Sustainable Development

Sustainable product design is considered to be the efficient utilization of energy, the provision of alternative products and the resource conservation and recycling. So people make concerted efforts to promote the green consumption and green products. However, the traditional view maintains that the green product design of sustainable development is only to focus on product performance and cost saving, which is clearly not enough. And the products designed to promote sustainable development need to be redefined, or in simple words, it is an extension for today's environmental design principle. Sustainable product design should meet the safety needs of human spirit and survival security, in order to ensure long-term security and steadiness of social, spiritual, and intellectual development. Sustainable design is related to people's daily life and work, and to everyone's safety and health. Product design should abandon rigid shape and the gesture of conquering all, and then pay more attention to nature and the human way of life. Product design ideas should meet the requirements of sustainable development of society responsibility, making up the damage caused by human industrialization development, and affecting the development of the design industry with new ideas.

2.1 Being Nature-oriented

The nature evolution itself is a sustainable process from cradle to cradle. For example, the fallen

leaves return to the ground to ensure the plants get nutrients through the harsh winter. We know that a healthy sustainable system has a perfect food chain and a nutrition level. But in cities, we clean the leaves in a city park to make the city clean and tidy, which actually cuts off nature's closed loop system. So, following the laws of nature is the key of sustainable product design. However, in the current design community, "people-oriented" design is almost dominant. The "People-oriented" principle is originated from the ideas of western philosophy, especially since the dichotomy of subject-object of Descartes. It says that everything in nature is to serve the interests of people; people are the center of everything in the universe and nature, thus resulting in some "linear design" concept in western industrial civilization. The American William MacDonal and Germany Michael Bulangjiate are co-author of the book "from the cradle to cradle", in which they point out, the idea of modern industry design is from cradle to grave. The mode of thinking is linear, which only cares about the product and handing out to consumers, without considering other things. It is these ideas that make the artificial environment of modern civilization create confrontation of man with nature, with cold reason and possession pushing the humane into the most remote corners.

In the East, one of the important features of Chinese traditional culture is its emphasis on harmony and unity of human and nature. Ancient people believed that people live in nature, so human activities and emotion should be regarded as part of the nature, which determines the creation of human should follow the law of nature and have a stable relationship with nature and society, so as to achieve the harmony between man and nature. In "Kao Gong Ji", it proposed "right place, right time, beautiful material, exquisite handwork". The meaning is to conform to the nature of the universe which exists in all things, to imitate the universe order and regularity, and to conform to the characteristics of material itself. So the products can be excellent. Chinese traditional utensils pursue unification of function and form, material and technology, perceptual and rational standard and finally the harmony of the universe and the people. Laozi's philosophy of "imitation of nature", "Men are the integral part of the nature" and Dong Zhongshu's Chunqiu Fanlu" of "combination of heaven with man into one" show the profound theoretical basis. The design concept of harmony between man and nature is to emphasize the balance of natural environment and symbiosis. It demands that people should think from the overall perspective, from the view of sustainable development, so as to reach the harmony and unity of the act of creation of nature and people. At present, many designers creatively improve the product packaging, and use decomposed paper as packing material, which not only meet the functional requirements, but also make people feel visual and tactile warm. It is learning from the ancient people's wisdom. Nature-oriented design has a strong oriental characteristic. The sustainable development needs the recovering of one's original simplicity, thereby forming a new concept of design trend.

2.2 Meeting vulnerable groups' demand

Sustainable design also means paying attention to the vulnerable groups. The American designing theorist Victor Papanek proposed in his Design for the Real World, the designer's natural and social responsibility. The three major ethical problems of design are put forward in Papanek's works: first, it should be designed to serve the public, especially for the people of the third world. Second, the design should not only work for the ordinary people but also for the disabled people. Third, the design should pay attention to the limited resources. Sustainable design is the reflection of a designer's most noble occupation morality, which not only limited in product design, marketing as well as product satisfaction. With the development of the types of products, designers have made a corresponding scheme for different groups of people. Many products are designed for vulnerable groups. For example, Zhenwei You's B-Touch mobile phone is to let people with visual impairments use mobile phone communication easily. The conceptive B-Touch mobile phone uses a special touch screen with the new Braille technology. It can be text into Braille, which is very convenient to use for the blind. It includes speech recognition, navigation system, scanner, text reading and other functions. Blind people can use the mobile phone like ordinary people. This model can provide greater convenience and possibility for the blind's learning and reading. Due to physical aging, blurred vision, action

Figure 1 B-Touch mobile

inconvenience, hearing loss, memory deterioration, the design for the elderly is focused on these issues. The elderly mobile phone is with large font, large buttons and large volume, which help the elderly to accurately find the location and easier access to information. The designers not only designed for old people to use mobile phone, but also showed care to vulnerable groups. For example, the lighting lamp function provides convenience for the elderly to walk at night. In fact, this functionality is common in all intelligent mobile phone. Such as sending a text message for help, it can be the fastest and most effective rescue in emergency for the elderly.

In developing countries, especially in Africa, there are at least 1/3 people who can't obtain guarantee of safe drinking water, and their healths are greatly threatened. Every year, there are 4 billion of diarrhea cases, and 2.5 million people will finally die. Based on this serious environmental situation, designers make use of design of solar water disinfection to provide African people with the most economical and practical solution. One side of the solar kettle is transparent, so that the UV ray and infrared ray can enter; another side is of aluminous color, so as to enhance reflection and temperature. This low-cost kettle can contain 4L water with high-ratio thickness; its flat appearance is convenient for storage, and its handle can let people easily adjust the angle to obtain the maximum solar illumination area. Besides, the design as concise and practical as solar kettle is "Life Straw", which consists of a plastic pipe with a length of 25cm and a diameter of 29mm, with 7 kinds of filters contained. Firstly, two layers of mesh-made filters with a diameter of 6 μ m are used to filter the dirt, and then the iodinated resin is used to kill 99.3% of bacteria and virus, and finally the activated carbon is used to catch bacteria and virus residual on mesh, thus the impurity in water can be filtered and the water quality can be also guaranteed. It is of great significance for human being's sustainable development to pay attention to vulnerable group's survival and development; if the vulnerable group can't guarantee their own life, they will also be unable to be responsible to their descendant. We can solve the problems related to vulnerable group only through excellent and economical product design, and then can help society to realize overall sustainable development rather than few people's sustainable development.

2.3 Creating environmental friendly lifestyles

The unreasonable human life habits led to the rapid deterioration of the environment. It also allows people to depend on the living habits to make a greater range of pollution. Faced with this situation, designers must persuade the public to select a kind of sustainable behavior. The product designed by designers can improve the sales performance of enterprise they serve, and finally form enterprise culture with obvious characteristics and win consumers' affirmation and trust. The role what the designer plays in social sustainable development is not only limited to create "sustainable product", but also to encourage people to adopt wide sustainable life style through product design. Take the car as an example, firstly, someone invents and designs the car, and then someone starts to use car and gets used to it; finally, a series of serious problems, such as urban congestion, noise, exhaust pollution, energy depletion, and climate warming, appear. As for designers, those problems must be unforeseeable at the beginning of design; therefore, the sustainable design requires a life-cycle forecast evaluation on products.

To begin with, it is application of energy-saving and environmental-friendly materials; the new energy technology such as storage battery and fuel cell will make car thoroughly get rid of the dependence on petroleum; besides, the high-quality alternative fuel is also good for optimizing overall environmental performance of vehicle. The application of environment-friendly materials can provide more new means of transportation, such as small-size electric bus, and large-size bus driven by hybrid power or fuel cell. Besides, a set of complete and innovative smart vehicles with environmental-friendly power concept can realize the perfect combination of driving and environment protection through easy and excellent environmental-friendly power solution; the car body is made from light and high-toughness materials, thus it can be said the model of sustainable car design. In order to encourage consumers, MOTO company gives away free desk calendar with environmental protection knowledge and preferential card to purchase original accessories of MOTO to consumers who throw e-waste to appointed recovery point. After cultivating the consumer's habit in environmental protection and collecting those e-wastes, Fortune Group Nanjing Jinze Metallic Material Co., Ltd. will make use of high-tech means to carry out uniform decomposition processing and thoroughly realize harmlessness and recycling of resources. As for the used batteries-driven clock brought by Taiwan Bor-Ru Huang, the ruling on clock face is designed as 12 battery jars; the used AA batteries are put in the battery jars, and then the pointer can rotate through series connection of used batteries; therefore, the remaining power of used battery can be thoroughly consumed and the used battery of different colors can also make clock become lovely and interesting. The average amount of tooth-brush discarded every day in the world is more than 60 million, which results in serious environmental pollution and resource waste. The

environmental-protection tooth-brush designed by Cai Jinbo can be freely assembled and disassembled through handle and broom head of tooth-brush; if we use such tooth-brush, we needn't abandon whole tooth-brush due to change of broom head. The printer designed by designer Hoyoung Lee can make use of the used pencil stub as source of raw materials for ink printing; after the pencil stub is inserted into printer, the printer can automatically separate the wood from refill of pencil, and then adopt the refill as ink of printer. This concept creatively solves waste of printing paper and recycling of waste pencil; if it is widely accepted by people; more resources will be saved for the society. The sustainable design not only needs to re-design our living habit and manners, but also can arouse people's consciousness in the later sustainable development.

3 Conclusions

About serious shortage of human resources and the worsening environment, the concept of sustainable product design provides a new way for industrial design. People need to gradually change the past people-oriented design idea, and to turn it to the sustainable law in ancient China. The absorption of "harmony between man and nature" into ecological wisdom is used in modern design, to achieve harmony between man and nature. Serving the vulnerable groups is also the concept of sustainable product design. The vulnerable groups can be fully cared, which is also related to humans' sustainable development. Designers need to create a viable solution for vulnerable groups, to achieve common humanity's sustainable development; and sustainable product design is also providing more environmental friendly lifestyles for human, persuading people to develop energy-saving habits. The unreasonable human life habits led to the rapid deterioration of the environment. It also allows people to depend on the living habits to make a greater range of pollution. Designers are not only limited to the design of "sustainable" products. They must create more environmental friendly lifestyles for people. With outstanding product design, they can also encourage people to join the action in sustainable development.

A Study on the Development and Reform of Sustainable Design

Li Shuo, Zhan Wei

School of Art & Design, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: lishuo20@hotmail.com, Sam200e@126.com)

Abstract: The paper based on the review of the development of sustainable design. It experienced from green design to ecological design, which described how contemporary environment and current design thought responded to the issues of sustainable development. And it aims at the central concepts for further interpretation and discussion. Sustainable design involved from a single solution to the life cycles of consideration, finally forming a breakthrough innovation. It transcends green design and ecological design, which balances the development of environment, social and economic three aspects. Sustainable design has been further developed and perfected. The innovative point of this article depends on the combination of concept discrimination and a large number of the latest foreign case analysis, also the analysis of sustainable development mode.

Key words: Green design; Ecological design; Sustainable design; Corporate social responsibility

1 Introduction

Sustainable development has become a topic of environment and humanism. While the “sustainable design” is no longer a new term, that becomes the focus of nation and design industry. Design as a vane guiding people’s living philosophy, which intervenes and promotes sustainable change. Because it has significant chain reaction of economic, environmental and social, thus it plays a key role in the process of solving all kinds of sustainable issues. Design accelerates product, processing, and service dematerialization. More importantly, design changes our attitudes and behavior. Therefore, the design is a key element to improve contemporary level of sustainable development. Currently, under the premise of advocating environmental protection and taking sustainable development as the goal of building a harmonious society, the green design, the ecological design, and the sustainable design are particularly important.

2 The Concept of Sustainable Development

2.1 The concept of sustainability

"Sustainability" refers to the ability of sustainable that persists with time. Its special meaning has been widely used and referred to the ecological life. The contemporary popular concept of sustainable development is “Brundtland definition”, which both meets the needs of contemporary people without compromising the ability of future generations to meet their needs. This means, sustainable development is no longer Utopian. We have the ability to maintain the economic growth and prosperity of modern way of life, as well as to protect earth and ecosystem. Therefore, the essence of sustainable development is creating environmental and social conditions for earth enduring system, so that can benefits mankind. It clearly indicates the absolute dependence of human on earth enduring system.

The document of 2005 UN World Summit pointed out three pillars of sustainable development that are human (social), earth (environment), profits (economic). It constitutes a sustainable development mode. (As shown in Figure 1) The pattern shows that economy is social sub-set, because all the components of human economy depend on the participation of people. However, society does not equate with economy, in turn it is a sub-set of environment. Because our needs (e.g. air, food and water), energy, raw materials of house, traffic and daily necessities are all from the biosphere.

This sustainable development mode admits the limitation of nature, society and the established system that we rely on. Economy depends on social health, and social health depends on the health of biosphere vice versa. This model emphasizes the status of three pillars are equally important, and need to be solved at the same time. Any one of them are being neglected will break the balance. The sustainable development is regarded as the leading myth of modern industrial society by Stewart Walker. He said the concept of sustainable development is our common cultural value remodeling, while it has been gradually forgotten by the rapid development of modern industrial society. So the concept of "sustainability" has the contemporary cultural value, which indicates the importance of our common concerns and views.

Figure 1 Sustainable Development Mode

2.2 The development of sustainable design

The concept of "Sustainable design" is very inclusive, and its essence is to carry out the concept of sustainable development by any means through design practice, design education and design research. On one hand, it has a close connection with the concepts of "green design" and "ecological design". On the other hand, it has its own characteristics. Specifically, sustainable design is different from simple material output design, which is through the integration of products and services to build sustainable solutions to meet consumer demand. Sustainable design reduces resource waste and environmental pollution by using "result" and "benefit" to replace the consumption of material goods, in order to change people' quality of life as the ultimate goal of a strategic design activities. In short, sustainable design is a kind of design strategy of constructing and developing sustainable solutions, which is a balanced consideration of economic, environmental, ethical and social issues. With rethinking design to guide and meet consumer demands, as well as continue to maintain the demands.

Therefore, sustainable design is not simply emphasizes environment protection, but also considers both needs of users, environmental benefits and the development strategy of enterprise. In this context, design as a service industry in the past and now has taken more and more social responsibilities and obligations. The fields which have been covered by design continue to spread.

The development of sustainable design (Or sustainability, sometimes it is abbreviated "DfS") experienced from green design to ecological design, which described how contemporary environment and current design thought responded to the issues of sustainable development. There are subtle differences between them and are often used interchangeably. It shows that about environmental and social design are more and more mature. Moreover, to perceive the relationship between design and sustainable it necessary to understand the development of sustainable design first. This will helps us to comprehend its connotation and spirit.

3 Green Designs

3.1 Green design: the solution of single problem

In early 1990s, the emergence of green design concept means the design began to focus on the single issue or some aspects of ecological effects, such as material and energy consumption. Green design emphasizes the use of materials and energy of low environmental impact. Include of the waste hierarchy management that we often refer to. It is called "3R" principle (reduce, recycle, reuse), reducing material and energy consumption, reclaiming products and components, recycling and reusing for future. The model effectively demonstrates that to deal with waste according to the priority order and using different strategies. Many designers take the approach that using recyclable materials to show the design consideration of environmental problems. They use recyclable polymer instead of raw materials, which tends to be the simplest and efficient approach to solve the environmental impact by design. Also it cannot affect or obviously change the performance and appearance of a product. "Green design" brings the environmental issues into design thinking as basic elements for the first time, which enormously improves the social value of design.

3.2 UK Remarkable Pencil Ltd

One example as UK Remarkable Pencil Ltd, they use recycled polystyrene vending-cups for their design and production. The company has continued to produce every kind of recyclable stationeries for consumers. Its products are almost manufactured in the UK that some of the materials are from UK's recycling waste, some are authorized by the forestry management committee, and some are from organic

materials. In short the method of green design is to use an existing material replace another kind of material.

4 Ecological Designs

4.1 Ecological design: life cycle considerations

Ecological design is not only considers ecological impact of product, but also considers the entire product life cycle from final result to each stage of process. So it can be regarded as the “process of intervention”. Ecological design puts environment considerations and design practice together. Considering the entire product life cycle can ensure designers’ awareness of connection between environment issues and design result. So that designers would try to minimize the overall negative influence of environment. If design results do not have much negative impact on environment, then designers need to consider the possible effects that the whole life cycle of product could have. This means that designers must consider how to deal the relationship with environment in the whole life cycle of product process. (e.g. material selection, production, manufacture, use, metabolism) Specifically, ecological design requires all stages of product development (from raw materials acquisition, production, use, to final disposal) to consider environmental factors. As well as transition time between these stages also should be taken into the consideration. As Philip Goggin said, ecological design emphasizes all stages of product development, at the same time, function, quality, appearance also have to reach the standard level.

4.2 LCA (Life Cycle Assessment)

The product life cycle evaluation LCA (Life Cycle Assessment) is an important measurement of ecological design. It uses the system method and quantitative index to guide and standardize the design process. Life cycle assessment tool makes the contrast of environmental effects of product life cycle between different stages are possible. LCA becomes a key element of national environmental policy. It is divided into “the complete life cycle assessment tool” and “simple life cycle assessment tool”. The complete LCA tool combines with users’ feedback that can provide valuable suggestions for designers, and increases the credibility of environmental protection products. For the simple LCA tool which designers can easily understand and identify the biggest environment impact of design. Especially it gives a rapid evaluation which helps product redesign.

4.3 “From the Cradle to Cradle”

In discussion of ecological design, our minds should be developed along with the development of environment and society. Design can be seen as the gradual transformation from ecological efficiency to ecological benefit. For example, “From the cradle to cradle” is the paradigm of design and production activities that complete the shift from ecological efficiency to ecological benefits. The scheme was first published in Michael Braungart and William McDonald's book “Cradle to Cradle: Remaking the Way We Make Things” 2002. This book provides a theoretical basis for materials cycle management, which distinguishes natural material (biological nutrients) and synthetic materials (artificial nutrition). It conduces to recovery and reuse of materials. “From the cradle to cradle” focuses on material cycling and pays more attention to environmental factors of design and production. Therefore this book has a far-reaching influence on many designers. Another example is Herman Miller Ltd which is a global manufacturer of office furniture. The company considers ergonomic and the concept of environmental protection that are perfectly merged into their design. It reflects the concept of material circulation of “From the cradle to cradle”, so its materials are always closed circulation. Maintaining the materials closed-loop system can both maximize the use of materials and avoid damage of ecological system. Their ergonomic chair design's 42% materials are renewable, and 95% materials are recyclable at end of its life. And if 24 hours uninterrupted use this chair's lifetime could be 12 years.

5 Sustainable Designs: Breakthrough Innovation

From single solutions of green design to environmental life cycle consideration of ecological design, and now to the sustainable design which adds the social impact of production and consumption. Our mode of thinking has been completed from sustainable development of product service system to the exploration of new way of life. In addition design intervention that guides citizen (not just consumers) to take a more sustainable development path. Sustainable design transcends green design and ecological design, which balances the development of environment, social and economic three aspects. The new content of sustainable design involves the sustainable development of local culture, also the respect for culture and species diversity, attention to vulnerable groups, and the promotion of

sustainable consumption patterns etc. Here, sustainable design has been further developed and perfected, that from a single commercial behavior around the material sphere to focus on social harmony, public spiritual and the development of emotional world by the impact of globalization. Sustainable design creates ecological, economic and cultural conditions for design, which brings infinite happiness to mankind.

6 Corporate Social Responsibilities and Sustainable Design

6.1 Corporate social responsibilities

The subject of sustainable development has been changed the roles and responsibilities of designers. Similarly, enterprises are also more and more concern about sustainable design. For large multinationals, sustainability has become guarantee of their future economic growth, as well as to ensure to build new market for their products. Such as the business leaders from DuPont, Johnson, Procter & Gamble and Toyota have been changed their convention of environmental responsibility from past. And they treat sustainability as the first element for growth, opportunities and influence of enterprise now. Corporations undertake corporate social responsibility management according to the sustainable principles that is regarded as rebuilding trust in business. Taking the corporate social responsibility management is not only pay attention to problems, but also to understand the relationship with staff, more extensive human rights, environmental protection, social responsibility and supplier, and take these as the core of enterprise value. Many companies begin to accept the principle of corporate social responsibility in order to upgrade their statues in market place. In these cases, design plays an important role that transforms corporate social responsibility into action. This means that only to consider the environmental and social influence of products, service and system are not enough. There are many problems enterprises have to solve, for example to solve social inclusion, health, education and crime problems by applying design thinking. Thus design can more equitably and efficiently deliver products, services, achievements and corporate values.

6.2 “Interface”

“Interface” is a global ground decoration and carpet manufacturer. Since the nineteen nineties, the company has been the leader of global sustainable development. And it sets up the goal of zero ecological footprints in 2020. The goal runs through every event and every department. To complete this target, “Interface” from seven directions towards sustainable development: towards zero waste endeavor; harmless emissions; use of renewable energy; to advocate the closed-loop recycling and transform waste into “food” by imitating nature; to ensure adequate resources; to create enterprise ecosystem with cooperative principle; accurate assessment of cost, and making the actual price. Moreover it has been the leader in commercial ceramic tile floor rental business, which carpet is as a service rather than a product for sale. The precondition of customers using Interface products is to guarantee the company’s ownership. This forms a new relationship between products distribution, payment system, and company with its customers. Lease model refers to the company investment of carpet technology innovation which makes carpet effectively recycling and remanufacturing at the end of life cycle. This kind of mode gives customers more flexibility and reduces the number of products which allows manufacturer have the ownership of products in its whole life cycle, thereby to optimize it. “Interface” leasing model is a typical example of product service system (PSS). Manufacturers reconsider the product marketing mode by using product service system. It breaks the usage that “the measure of a successful business usually see how many products have been sold”. The profit of Interface is to provide extra services instead of selling products. This indicates that sustainable design can reduce the negative environment impact at the same time to create economic value.

7 Conclusions

To sum up, sustainability is relate to survival and development of mankind, and it is an inevitable trend of development. We have to carry on the concept of sustainable development and using design to influence and change the irrational mode of existence, as well as to guide people' activities, thus to achieve sustainable development of people and the environment. "Sustainable design" is not only deal with single problem, but also actively advocates rational pattern of production and consumption. It seeks for approaches to create more suitable way of life for people. The creation takes account of a kind of economic development, environmental protection, social harmony, cultural heritage and sustainable way.

Abstract: Wushu, as one of the important carrier of Chinese traditional culture, which is a system integrating with body-building, entertainment, value of view, athletics, rich spiritual and cultural life and sentiment edification etc. In recent years, Wudang wushu, as the leader of new spots, has gradually received extensive attention from domestic and foreign tourists. By using the method of literature analysis, expert interview, on-the-spot inspection and mathematical statistics, this article makes relevant research on the theory and practice of the tourism development of Wudang Wushu. Combining with the theory of location, tourism bearing capacity theory and the view of sustainable development, the author constructs the overall goal and strategic steps of the tourism development of the Wudang Wushu, and then puts forward the development strategy according to the current study.

Key words: Wudang Wushu Culture; Wushu Cultural Tourism; Development Strategy

1 Introduction

With the rapid development of the economy and the improvement of people's living standards, people's consumption concepts and the life values are in dynamic changes. The traditional tourism products can not meet the ever-changing travel needs because people have been in pursuit of personalized special, interesting and good for health tourism consumption. With the deep exploitation of the tourism industry, urban residents have got the substantial development in the aspect of recreational sports. Fitness as the main purpose of the sports tourism also becomes the latest must-haves in the market, in particular, traveling with a strong Chinese cultural characteristic—wushu, which contributes to the healthy and rapid development of the Chinese wushu tourism industry. With the characteristics of green environmental protection, low energy consumption, high return and the sustainable development, wushu is favored by the domestic and foreign tourists. With the efforts of Chinese Wushu Association and Shiyan organizations at all levels and the scholars, the cultural excavation and arrangement work of Wudang wushu has made gratifying achievements. However, compared with the long history and the deep connotation of the wushu culture, it is still far beyond the aspects from exploitation, scientific research, development, protection and promotion etc. Therefore, the author tries to provide theoretical reference for wushu tourism industry, and at the same time, also hopes that it can make a contribution to the inheritance and development of the wushu culture.

2 The Connotation of Wudang Wushu Cultural Tourism

Chinese wushu has a long history and also a profundity for its variety, which is regarded as an important element of the intangible cultural legacy of the Chinese nation. It is the treasure and the quintessence of the traditional sports in our country. Wudang wushu culture refers to the traditional Chinese wushu culture and regional culture in the process of mutual reaction, centered within Wudang Mountain, represented by Zhang Sanfeng of the imperial Wudang boxers on exploring the way of Wudang wushu to create the material wealth and spiritual wealth. Wushu culture as one of the most national characteristics of Chinese traditional culture, the questions of its inheritance and development have been received great attention, and the effective ways of long-term unremitting exploration to solve these problems are undergoing. Wushu has found its own development and an effective way, namely to marriage with tourism, resulting in a sunrise industry—the wushu cultural tourism. Under the condition of cultural tourism in Wudang Mountain tourism, the Wudang wushu tourism is to experience China's Wudang wushu culture as the main content, and feel the Wudang Taoist cultural resources in natural

* This paper is supported by Wudang Mountains Tourism Bureau of special economic zones of wushu (WDS[2013]12); National Social Science Fund Projects(11BTY026)

landscapes, which is a kind of social-cultural activity embodying the characteristics of leisure, entertainment, health, knowledge, stimulation etc. Displaying of Wudang wushu cultural tourism has become a new luminescent spot of sports tourism, which has promoted the spread of Chinese wushu all over the world. From the following table, it can be seen that since 1995, the annual reception of Wudang Mountain visitors is around 300000, and other famous mountains of tourist reception is more than 1.5 million people on average, the total number of tourists and tourism revenue have a larger gap.

Table 1 The Annual Reception Of mountain Scenic Spots Visitors And Tourism Revenue

	1995	1996	1997	1998	1999	2000
Wudang Mountain	30.6/2.5	23/2.8	25/3.2	26/4	34.7/4.5	33/4.2
Mount Huangshan	269/8	320/10	400/11	4.9/12	465/14	430/12

Laoshan	58/1.6	70/2.8	100/2.8	110/69	120/3	200/6.5

Unit: ten thousand/ billion yuan

3 Research on the Sustainable Development of Wudang Wushu Cultural Tourism

3.1 The general idea of Wudang wushu cultural tourism development

The development strategy of Wudang wushu cultural tourism is a multi-level and diversity system. The embodiment of the diversification, continuity, stability and long-term effect should be touched upon in its development planning. To fully tap the Wudang wushu cultural tourism resources to transform the development pattern from the resources oriented to the market oriented, that is the market—resources—products—market. Therefore, we must plan well when planning the strategic objectives. Firstly, adjust measures to local conditions and outburst features to ensure the novelty of wushu cultural tourism. Secondly, pay attention to the harmony between human and nature to highlight the integrity of wushu cultural tourism. Thirdly, plan as a whole, support facilities in place, and avoid a down-market to embody the hierarchy of wushu cultural tourism. Fourthly, make a good management of planning and development control to highlight the raw ingredient of wushu cultural tourism.

3.2 Study on the development mode of Wudang wushu cultural tourism

3.2.1 Project-oriented development mode

It is targeted at a specific kind of wushu products, and makes the wushu tourism resources to have a dominant position in attracting tourists. Hence the destination of the tourist is purely attracted by the tourism resources. Wudang Mountain with its rich resources of wushu, can try on this kind of development mode. The World Traditional Wushu Festival is the first traditional wushu competition in the world organized by the International Wushu Federation and the Chinese Wushu Association Organization. It is also one of the biggest wushu activities in the current wushu circles. The event is held completely out of administrative management mode under the planned economy system, through the market leading, which advocates the use of wushu's own cultural values to conduct a series of commercial operations. Both of the 3rd and the 4th World Traditional Wushu Festival were held in Wudang Mountain, among them, there were nearly 2000 athletes from 69 countries and regions during the 3rd World Traditional Wushu Festival. After the fierce competition, 307 gold medals were shared.

3.2.2 Multivariate combination development mode

The mode refers that the wushu tourism and other forms of tourism resources are relatively connected, through mutual integration, making wushu tourism resources do not have the dominant position so that it can achieve the cooperative development and a win-win situation. Wudang Mountain is one of the famous mountains in China, among the mountain scenic spots, Wudang Mountain is regarded as the top one of the five mountains. Wudang Mountain is famous at home and abroad for its spectacular natural scenery, ancient buildings and traditional Taoist culture. With the magnificent, precipice, peaceful peculiar and beautiful characteristics, it can be called the Spirit Mountain. Wudang Mountain has an area of eight hundred, including 72 peaks, 36 rocks, 24 streams, 8 holes, 3 lakes, 9 spring ponds and 10 hole stones, which form the gorgeous natural

landscape. Wudang Temple was built in Tang Dynasty, prospered in Ming Dynasty. During Emperor YongLe ruled in the Ming Dynasty, there are three thousand of craftsmen spending quantities of taxation collected from nine provinces, which lasted 13 years, built 33 ancient building groups with a area of 1600000 square meters, became the supreme “Royal Ancestral Temple” and the Taoist activities center. Wudang Temple was designed and made along with the Palace Museum, which showed the superb ancient architectural craftsmanship and the ingenious structural layout. It has been hailed as “Palace of Hanging on the Cliffs”, “Museum of Ancient Chinese Architectural Achievement”. In 1994, Wudang Mountain ancient building groups have been approved World Cultural Legacy by UNESCO.

3.2.3 Experience-oriented development mode

Experience-oriented development mode is that Wudang wushu tourism is in a subordinate position when traveling, which is different from the project-oriented development mode. When the tourists arrive at the destination, at the same time, they can be attached to wushu tourism. Wudang Mountain was listed in the first batch of National Key Scenic Spots in 1982 by the State Council. In 2000, it was awarded the “National Civilized Scenic Area”. In 2001, it was awarded the “4A Grade National Tourist Attraction” and “Demonstration Site of National Civilized Scenic Area”. Every year, there are more than 200 visitors coming to Wudang Mountain to enjoy the natural beauty and the leisure time. While traveling, they can be attached to the wushu tourism.

Table 2 Wudang Wushu Cultural Tourism Development Mode List

Development Mode	Dominant Ideology	Development Measures	Development Means
Project-oriented development mode	Highlight the features, and build the brand of tourism project.	Develop a series of tours which are available for participation, such as wushu festival, wushu competition, wushu museum, etc.	Given priority to the experience of wushu activities. Pay attention to visual effect, and attach great importance to the subjective feeling of tourists.
Multivariate combination development mode	Integrate resources, and develop coordinately.	Combine with the ecological tourism, cultural tourism and other tourism forms to develop a new kind of new wushu tourism products.	Sightseeing while participate in the activities of wushu.
Experience-oriented development mode	Make clear of the major and minor elements, and expand the scale of the scenic spot fully.	Enlarge the scale of scenic spots, and exploit the depth connection between sports and tourism.	Given priority to sightseeing, and the additional part is to participate in the activities of wushu, watch wushu performance, and have some knowledge about wushu.

3.3 Study on the design of Wudang wushu cultural tourism products

3.3.1 Sightseeing tourism product

The product is mainly refers to the tourists who are far away from the local, watching wushu activities, wushu culture relic buildings and wushu venues. Various wushu experiences processed with different characteristics can meet the appreciating demand of tourists such as watching wushu competition, performance of wushu by the masters, martial arts drama, etc. The 2010 Wudang International Wushu Festival was held in Wudang Mountain. Thousands of athletes of 62 teams from about a dozen countries and regions, including the United States, Russia, Philippines, Iran, Indonesia, and China gathered in Wudang. Apart from the players, there are a large number of visitors to Wudang Mountain to watch the game, and this kind of products belongs to the sightseeing tourism product.

3.3.2 Experiential tourism product

Experiential tourism product refers to the tourists in the process of tourism are the direct participants of wushu sports, and the tourists' experiences are strongly required in this product. For example, when the tourists come to visit Yongnian, they can participate in practicing Yongnian Taiji boxing to experience the loose, soft and the smoothness of Taiji. Also they can have a better understanding of the connotation of this kind of movement. The characteristics of Taiji boxing are

flexibility and slowness, softness with hardness hiding in. Such a movement is a natural and elegant, and can be felt by the rhythm of the music, philosophical connotation, beautiful shape, mood of the poem. In the higher level of enjoyment, it can eradicate disease, make physical and mental healthy. In addition, tourism factors like food, accommodation, traveling, shopping, entertainment, etc should be combined to wushu tourism activities.

3.3.3 Tourism product of commodity

Tourism product of commodity is mainly developed with the Wudang wushu, including a “Wudang”, “Taiji” word or pattern of clothing, wushu equipment, Wudang amulets, Wudang health pillows, Wudang swords, Wudang special stamps, Wudang crutches, Wudang cultural relic replicas (all kinds of Founder Gods made of coppers, Tai Shang Lao Jun, the God of Wealth, Guanyin, Patriarch of Sanfeng, etc.), treasure of home-guarding script and so on. With local characteristics, this kind of tourism products is not only benefit for the sightseeing but also avail to enable tourists to participate in production.

4 Sustainable Strategy of the Development of Wudang Wushu Cultural Tourism

4.1 Strengthen the area reasonably and establish the win-win mechanism

In today's competitive market conditions, win-win cooperation has become the common understanding of competitive parties. We should follow the trend to actively participate in the fair, active competition, and at the same time to strengthen equality, sincerity, with an open and confident attitude to face the competition and cooperation. Wuhan city and other Hubei local government should abandon the narrow regional development view and local protectionism, realizing that it is not realistic to try to entirely build a complete sports tourism industry system in a narrow region. Because some of the sports tourism enterprises (travel agency) have the characteristics of cross-regional cooperation, regional competitions also need cooperation to participate in the sports division of work and cooperation in the tourism value chain. Therefore, regional sports tourism management department (Tourism Administration and Sports Bureau) should set up the correct view of competition, recognizing whether to adopt the cooperative strategy or the competitive strategy are in order to obtain a broader range of competitive advantage.

4.2 Enhance the brand image and competitiveness of Wudang Mountain tourism products

Tourism brand image is to establish a permanent, stable brand for the tourist areas, which not only helps consumers build consumer preference, but also favors the effective implementation of tourism marketing tools, promoting the formation of tourism brand assets. Wudang Mountain must take the road of brand management, implement brand management strategy, create brand image, and establish its own brand personality with a clear brand positioning. Currently we must rely on the three characteristics of resources, that is Wudang wushu, Taoism culture, the ancient building groups, focusing on the construction and the development of a number of tourism projects with the outstanding brand image, the strong local characteristics, deep cultural connotation, high technology and high return, which can meet the various needs of the tourists from at home and abroad By enriching the types of Wudang Mountain tourism products and improving the quality and level of tourism products to seek individual development, constantly enhance the attractiveness and competitiveness of tourism products in Wudang Mountain.

4.3 Increase the publicity of Wudang wushu cultural tourism

Though Wudang wushu tourism has a good prospect, most tourists still have little knowledge about it. At present, the Wudang wushu tourism consumption market has a large number of potential tourists, whom don't know much about this kind of tourism products, they still have a wait-and-see attitude towards it. Therefore, various channels need to be carried out to publicize wushu to stimulate the demand, such as three-dimensional marketing activities, the use of sports media, entertainment media, tourism exhibitions, news, advertising, sports tourism websites etc. It can turn the potential tourists into the reality tourists, thus increasing tourism consumption.

5 Conclusion

Wushu tourism is a kind of cultural tourism project in the domestic emerging in recent years. Wudang wushu tourism resources are abundant, but the present development situation is not optimistic. The system of wushu tourism is still blank, and the development consciousness is lagging behind. Wushu tourism products are single, the cultural content is insufficient and the touring line is not clear. To break the bottleneck restricting the development of Wudang wushu

tourism, we need to rely on the tourism environment of “one river two mountain” in Hubei Province, accelerating the integration steps of Wudang wushu tourism resources. To create the public opinion environment, humane environment and policy environment which are of benefit to the development of the Wudang wushu tourism industry, meticulously build the brand image of Wudang wushu tourism products, broaden the market, innovate marketing push as soon as possible to establish network operation pattern, vigorously promote tourism informatization and industrialization, increase the innovation of tourism human resources development.

Research on Low Carbon Performance and Enterprise Value*

Wang Zhiliang, Jiang Zhifang

School of Economic and Management, North China University of Technology, Beijing, P.R.China,
100144

(E-mail: zlgwang@163.com, jzf8080@sina.com)

Abstract: In this paper, we apply empirical method to study the relationship between low carbon performance and enterprise value. Then, we put forward three hypotheses. Namely, the relationship between low carbon performance and enterprise value is positive correlation, negative correlation and no significant correlation. In the following, we construct the basic theory model of low carbon performance and enterprise value to deduce the three hypotheses. By choosing 14 classes large energy consumption industries in Shanghai A Share manufacturing industries during 2007-2010, we use 258 effective samples of relative data to verify the theory hypothesis. From the results we can show low carbon performance is the influence factor to enterprise value. What's more, the relationship between low carbon performance and enterprise value is positive correlation. Therefore, we must give full attentions to the environment factors in the development of enterprise.

Key words: Low Carbon Performance; Carbon Intensity; Enterprise Value; Tobin Q; Multiple linear regression model

1 Introduction

Global warming has been a serious threat to the earth ecology and human life. Related studies show that the greenhouse gas is the main factor which causes global warming, and the carbon dioxide emission is the main factor. With the rapid development of Chinese economy, the international energy agency (IEA) preliminary estimates that China has become the world's largest energy consumer and the second largest greenhouse gas emitter. Energy crisis and global warming make China face huge pressure to do energy saving and carbon emission reduction. Therefore, Chinese government made a promise that the carbon intensity of per unit output in 2020 will decrease by 40% ~ 45% compared to 2005. Under the international background of climate problem being a major concern, low carbon economic model which means "low energy consumption, low pollution, low emission and high efficiency" quickly catches the attention of all over the world. For China, the extensive economic growth mode will seriously affect Chinese industrialization process. Thus, the development of low carbon economy will become the inevitable strategic choice to keep a balance between industrialization and environmental energy requirements.

As the raising of people's awareness to the issue of climate change and the deepening of carbon emission reduction issues, the issue of low carbon performance has caused wide attentions of scholars and governments both at home and abroad, and some indicators used for evaluation of low carbon performance have already appeared. Otavio Mielnik and Jose Goldenberg (1999)^[1] proposed the carbonization index measurement, which made evaluation for the carbon emissions of developing countries. B.W Ang (1999)^[2] argued that energy intensity indicators were as important as carbonization index in the study of low carbon economy. What is worth noting, these evaluation indexes reflecting low carbon performance are so one-sided that it is controversial whether it can truly measure the low carbon performance or not. For example, under the framework of total factor production and by using the environmental production technology and directed distance functions, Chinese scholars Qunwei Wang, Dequn Zhou, Peng Zhou (2011) constructed the single performance indicator (only requires to reduce emissions of carbon dioxide) and the comprehensive performance indicator (requires to reduce the carbon dioxide and expand economic output at the same time). As the example of Chinese major industrial provinces, they analyze the carbon dioxide emissions performance and emission reduction potential. Research shows that the overall performance is low and has a degradation trend in the period, annual average potential to reducing carbon and increasing economic output is at about 30%; the potential of carbon intensity is significantly less than the initial carbon intensity, and the orders of some industrial provinces will greatly change under the condition of the two kinds of carbon intensity. Using the standard & poor's 500 companies as the research object, Matsumura and Prakash (2010)^[3] studied

* This paper is supported by humanity and social science youth fund project of ministry of education "Research on the Contribution of Beijing High-tech Enterprises to the Low Carbon Economy" (12YJC630222).

empirically on the relationship between the carbon emissions and enterprise value, the equity cost of capital, debt capital cost. They found the carbon emissions being negatively related to the enterprise's market value, negatively related to the equity capital cost, and positively related to the cost of debt capital. However, because of different study basics and samples, current research about the relationship between carbon emissions and the enterprise value doesn't have a definite conclusion. Based on this, we study whether low carbon performance could influence enterprise value or not from a new perspective in this article. In this paper, the research expands the related literature about low carbon performance of listed companies.

2 Research Design

2.1 Research hypothesis

Value creation school regards the increasing environmental investment as a competitive advantage and the ways to improve investors' financial returns, the relationship between the market value and the environmental performance is positive correlation. Enterprises improve energy efficiency through energy saving and emission reduction to reduce carbon emissions, which is one aspect of the enterprises to improve their low carbon performance. Some scholars believe that those enterprises which can be responsible for the environment can also achieve social recognition and competitive advantage. The enhancement of low carbon performance is not only to gain the government incentives, but also help to improve the corporation social image and enhance the corporation reputation in the customers. So they are willing to pay more for green products. The application of the new technology reduces the energy consumptions and waste emissions. What's more, it can reduce the environmental management costs. The increasing of low carbon performance can increase enterprises' economic benefits. Hence, this paper put forward hypothesis 1.

Hypothesis 1: There exists a positive correlation between low-carbon performance and enterprise value.

In addition, the pursuit of the enterprise for environmental performance needs to increase the environmental investment. There may be a conflict in the pursuit of business financial goals. Some scholars believe that the environment cost will reduce the marginal profit in some special industry levels, which can made enterprises are often faced with competitive disadvantages. So companies tend to regard the environmental investment as the additional cost of enterprises. If enterprises want to achieve better environmental performance, some additional costs is bound to occur, which may make the enterprise at a disadvantage in the fierce competition. Thus, this paper put forward hypothesis 2.

Hypothesis 2: There exists a negative correlation between low-carbon performance and enterprise value.

The final influence of low-carbon performance on enterprise value depends on the quantitative relationship between income and expenses. Some impacts related to future periods and this effect may not be brought in a short time. In the end, this paper put forward hypothesis 3.

Hypothesis 3: There doesn't exist a significant correlation between low-carbon performance and enterprise value.

2.2 Sample selection and data source

This article's sample data is all from 14 energy consumption sectors of manufacturing industry listed on the Shanghai Stock Exchange, and we elect the top 5 companies of each sector by the listed company's asset size in descending order. In the end, 258 effective samples are established because of partial data loss and other causes.

The relevant financial data of the article's 258 sample enterprises is all from financial statement databases of CSMAR Service Center. Industrial energy consumptions and industrial outputs are from the Yearbook of China Energy Statistics and China Statistics. We use Microsoft Excel software and SPSS16.0 software to process the data.

The intensity of carbon emission is described as carbon emissions of unit GDP, which is used to measure the ratio relationship between the economic outcomes and the corresponding carbon emissions, the formula as following:

$$\text{The intensity of carbon emission} = \text{total carbon emissions} / \text{total industrial output value} \quad (1)$$

According to the emissions calculation guide of United Nations Intergovernmental Panel on Climate Change, the total carbon emissions of above (1) are as following:

$$C = \sum E_i F_i \quad (2)$$

C represents total emissions of carbon ; E_i represents consumptions of i kind energy, expressed in

tons, and the data can be obtained through the Yearbook of China Energy Statistics; F_i represents carbon coefficient of i kind energy, which is energy heating value multiplied by the carbon oxidation factor, basing on the IPCC (2006) <guidelines for national greenhouse gas emissions inventory >. The different coefficients of carbon emissions are shown in table 1.

Table 1 The Different Coefficients of Carbon Emission

Energy Varieties	Coefficients of Carbon Emission (t/t)	Energy Varieties	Coefficients of Carbon Emission (t/t)
Coal	0.7559	Full Oil	0.6185
Coke	0.8550	Liquefied Petroleum Gas	0.5042
Gasoline	0.5538	Natural Gas	0.4483
Kerosene	0.5714	Electric Power	0.6800
Diesel	0.5921	Heating Power	0.2550

2.3 Model and variable definition

According to the research hypothesis, enterprise value is as explained variable, and the carbon intensity of listed companies is as explaining variable, company size, asset-liability ratio, profitability and growth are as controlling variables. Multivariate regression model is as following:

$$ev = \beta_0 + \beta_1 cei + \beta_2 size + \beta_3 lev + \beta_4 roa + \beta_5 grow + \varepsilon \tag{3}$$

All variables are defined as following: (1) measurement for low carbon performance: normally, intensity of carbon emissions and energy efficiency are used as low carbon performance indicators. Considering energy consumptions affect corporate profits as a cost, thus influence enterprise value. The profitability variable has been as one of the factors that affect enterprise value, so intensity of carbon emissions is used to measure low carbon performance. (2) Tobin Q is used to measure the enterprise value. (3) Controlling variables: the natural logarithm of total assets is as company size; the growth rate of total assets is as growth. The two controlling variables measure the value of the enterprise from the dynamic angle. The ratio of asset-liability is as lev; the ratio of asset returns is as roa. The two indicators evaluate financial position and operating results of an enterprise from financial evaluation level.

3 Results

3.1 Correlation analysis

The correlation analysis of main variables is shown in table 2. Correlation results show that the enterprise value and carbon intensity are significantly negative correlation at 5% level. Thus, it explains that the carbon intensity will really affect the value of the enterprise. In addition, the company size, asset-liability ratio, profitability also present positive correlation with enterprise value. Generally, explaining variables will not affect multiple regression analysis as long as the coefficient is between 0.8 and 0.9. So, the relationship of each variable in the regression model will have not serious influence on the regression results.

Table 2 Correlation Test of Variables

	ev	cei	size	lev	roa	grow
	1.000	-.21	.22	.06	.38	.007
	-.21	1.000	.47	.16	.03	-.01
Pearson	.22	.47	1.000	.22	.17	.03
Correlation	.06	.16	.22	1.000	-.28	-.009
	.38	.03	.17	-.28	1.000	.15
	.007	-.01	.03	-.009	.15	1.000

3.2 Description statistics

Table 3 shows the descriptive statistical results of each research variable. In general, the mean value of explained variable enterprise value is 1.47, the maximum value is 4.57 and the minimum value is 0.48. It means there is a big gap in enterprise values of different public companies in different industries based on the selected samples. The mean value of explaining variable intensity of carbon emissions is 0.6662, the minimum value is 0.0518, and the maximum value is 2.98. There is also a big difference in it. The reason may be the difference between industries of the selected samples. For

example, the intensity of carbon emissions of nonmetal mineral products is 2.27 tons per ten thousand yuan in 2007. The intensity of carbon emissions of black metal smelting and rolling processing industry is 2.98 tons per ten thousand yuan, but for communications equipment, computer and other electronic equipment manufacturing industry, it is only 0.0547 tons per ten thousand yuan in 2007. In addition, with the further development of low carbon economy in China, some energy-intensive industries begin to pay more attentions to low carbon economy. As the example of black metal smelting and rolling processing industry, total industrial outputs values are 33703.01, 44727.96, 42636.15, 51833.58 (billion) respectively from 2007 to 2010. Although the gross values of industrial outputs have a rising trend, the intensity of carbon emissions decreases year by year, the values are 2.98, 2.32, 2.64, 2.26 (tons/per thousand yuan) respectively. It means that the enterprises gradually realize the importance of environmental protection and pay more and more attentions to enterprise's carbon emissions in China. In addition, the differences among the average, minimum and maximum of the controlling variables company size and asset-liability ratio are not large, while the differences of the profitability and growth are large.

Table 3 Description Statistics

Variables	Number	Minimum	Maximum	Mean	Standard Deviation
ev	258	.4848	4.5690	1.472972E0	.7518843
cei	258	.0518	2.9833	.666189	.7792449
size	258	8.9547	11.3595	9.918455E0	.5172095
lev	258	.1653	.9569	.555054	.1419722
roa	258	-.2493	.2367	.035437	.0567225
grow	258	-2.8405E3	234.9606	-1.137248E1	177.8732509

3.3 Regression analysis

In this paper, we estimate and inspect the model parameters by SPSS16.0 software. As it can be seen from the model in the table 4, $R^2 = 0.69$, showing that the regression equation fitting original data is better, and the effect of the observed value regression equation is significant.

Table 4 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.714 ^a	.694	.649	.715357

As can be seen from the anova table 5, $F = 18.06$, $P = 0.000$ (approximation), it shows that the regression equation is highly significant. It can explain that the independent variables and the controlling variables have a highly significant linear influence on the enterprise value with the probability of more than 99.9%.

Table 5 Anova

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	38.334	5	7.667	18.061	.000 ^a
Residual	106.974	252	.424		
Total	145.307	257			

Table 6 shows the regression result of intensity of carbon emissions and enterprise value is negative correlation at the 5% significant level. The carbon intensity of enterprise is higher, while enterprise value is lower. Namely, low-carbon performance is positively related to the enterprise value, hypothesis 1 is tested in this paper. The reason may be that, with the development of low carbon economy mode and the transformation of extensive economic growth mode in china, the government of china begins to focus on industrial enterprises making large carbon emissions, and develop a series of policies and measures to encourage enterprises to carry out energy conservation and emission reductions. Investors will take into considerations of the enterprise's environmental behaviors when making enterprise investment decisions.

Table 6 The Multiple Regression Results of Low Carbon Performance and Enterprise Value

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	4.982	.887		5.614	.000

size	.415	.094	.283	4.407	.000
lev	.828	.312	.157	2.656	.008
roa	6.420	.780	.485	8.232	.000
grow	.000	.000	-.058	-1.056	.292

4 Conclusion

The conclusion of this paper shows that the carbon intensity of China's listed companies has a significant impact on the enterprise value. Namely, the enterprise value is low when the intensity of carbon emissions is high. Our explanations for this are as followings: first of all, the high performance of low carbon is not only making enterprises gain the government incentives, but also helping to improve the enterprises' social image. By enhancing the enterprises' reputation to customers, they will be willing to pay more for green products. Thus, it will improve the products' market value. Second, investors begin to concern the environmental protections of the enterprises. When they make investments, they will begin to take considerations into the enterprise's environmental behaviors. In addition, we can find from table 6 that although the carbon intensity will affect the enterprise value, the sig value closes to 0.05. Showing that with the further development of low-carbon economy, the effective of carbon emissions on some large energy industries is not obvious. On the one hand, this may be due to the nature of the industry itself, on the other hand, the government should enhance laws and adequate of rewards. Thus, as the government should not only increase the intensity of rewards and punishments for energy conservation and emissions reduction, but also increase intensify propaganda to improve investors' consciousness of the environment protection. Only in this way, it may promote the development of low carbon economy in manufacturing industry of China. At the same time, we also find that different sizes, asset-liability ratio, profitability will also have a significant impact on the enterprise value, and the company's growth is positively related to the enterprise value but not significant. Due to data limitations, this paper does not find further specific carbon intensity of each enterprise. So we substitute industry data for enterprise data, this may also affect the research conclusion of this article. Therefore, the conclusion of the article is preliminary and these problems should be further addressed in future research.

The Research on the Effect of Mobile Subscribers' Perception and Behavior on Mobile Number Portability (MNP): Case Study of MNP in Kumasi Metropolis

Daniel Ofori, Ye Haiyan, Zhu Jinsheng
School of Economics, Wuhan University of Technology, Wuhan, P.R. China, 430070.
(E-mail: ofori006@yahoo.com)

Abstract: In order to improve competition and ensure high customer satisfaction in the telecommunication networks in Ghana, National Communication Authority introduced a new functionality called Mobile Number Portability (MNP) following parliamentary approval from July 7, 2011. This research is based on the effect of mobile number portability (MNP) on mobile subscribers in Ghana by focusing on subscribers' perception and behavior related to MNP in the Kumasi metropolis. To achieve the objective of this study logistic linear regression model was used to estimate the impact of Customer service, service problems, usage costs and income on switching preference of network subscribers. The regression results indicate that income of the respondents, high service problems, average service problems, the high usage cost and average usage cost are very important in determining customer intention to switch. Network operators have consequently reduced their tariff rate.

Key words: Mobile Subscribers; Perception; Behavior; Mobile Number Portability (MNP)

1 Introduction

Ghana's telecommunication sector has undergone a major process of transformation through significant policy reforms, particularly beginning with the establishment of National Communication Authority (NCA) with the sole policy to regulate the activities of telecom companies in Ghana. The mobile communication plays a major role in telecommunication industry. Mobile network comes under the service sector, which is experiencing a rapid development which in turn is supporting the growth in Ghanaian economy, provides ample chances employment and self employment generation. The most challenging job for present day for network providers is to retain their customers. Driven by various policy initiatives, the Ghana's telecom sector has witnessed a major transformation in the last decade. It has achieved a phenomenal growth during the last few years and is poised to take a big leap in the future also. In order to improve competition and ensure high customer satisfaction in the telecommunication networks in Ghana, NCA introduced a new functionality called Mobile Number Portability (MNP) following parliamentary approval from July 7, 2011.

Park (2006) defined Mobile Number Portability (MNP) as a system that allow subscribers to retain their existing mobile number when they switch from one mobile service provider to another irrespective of mobile technology being used by the other service provider. Mobile number portability is used as tool by regulators globally to promote and encourage competition in the heavily monopolized wire line telecommunication industry (Reinke, 1998). After the advent of mobile telephones, many countries including Ghana allotted different network codes to mobile operators. In Ghana the following network codes are assigned to mobile operators (Airtel-026, Espresso-028, Glo - 023, MTN - 024/054, Tigo - 027 and Vodafone - 020). What this means is that a subscriber is identified to a particular mobile network by the network codes prior to MNP implementation, however with the introduction of MNP that may not be the case since subscribers can switch to other networks while they retain their original number. For instance an MTN subscriber with network code 024 who ports to Airtel for instances will still maintain his 024 number. Although there have been many studies looking at the effect of number portability on competition at the industry level, across the globe, little attention has been shown on the individual level such as subscribers' behavior or perception.

This research is based on the effect of mobile number portability (MNP) on mobile subscribers in Ghana by focusing on subscribers' perception and behavior related to MNP in the Kumasi metropolis. It will also explore how MNP is impacting on the operational strategies of mobile network providers. Kumasi Metropolis is chosen because, as the second largest city in Ghana with many commercial activities, the city has the highest mobile number subscriber penetration rate of about 80% in 2011 contrasted with national penetration rate of 80.5% for the same period (National communication Authority third quarter Report, 2011). Therefore the city is an ideal place to conduct such research.

Many experts and scholars have presented their opinions on the concept of mobile number

portability in a variety of ways. Humport (2008) defined mobile number portability as a process that permits a mobile phone subscriber to keep his or her mobile phone and number when he moves from one service provider to another. To Yengurk (2003), mobile number portability is the process enabling a mobile subscriber to move from a network operator to another network operator without changing his or her mobile number. The concept simply means that a subscriber can retain the whole mobile number. Various stakeholders in the mobile telecommunication industry have viewed Mobile number portability as an essential policy framework necessary to ensure competition and to protect new entrants into the industry (Lyons, 2006). The motive of providing a consumer with the freedom to move freely between service providers and to ensure healthy competition in the mobile industry has always been the benchmark for regulators to promote mobile number portability (Reinke, 1998 and Lyons, 2006). It must be emphasized that the implementation of mobile number portability does not automatically bring competition in the mobile market (Shin, 2006). It is a facility that leads to; better service quality, reduction in prices, e.t.c. because of the apparent desire to lure more customers, put intense pressure on them to offer a more competitive product to their customers (Park, 2009).

For operational purposes, this study defined mobile number portability as a system that facilitate mobile phone users to switch over mobile network operators without changing their personal number and codes, In pursuit of mobile number portability, Ghana was guided by the challenges that prominently featured in UK and elsewhere in choosing a particular model of porting system to adopt. Realizing the convenient associated with recipient – led porting system and with it international recognition, Ghana adopted the recipient led porting system. Again, Ghana adopted this mode of porting because it really gives meaning to mobile number portability.

2 Methodology

To achieved the objective of determining the impact of mobile number portability on the subscribers’ experience of mobile network in Ghana and to identify the factors that determine the network switching behavior of mobile subscribers in Ghana. In line with this, (Dix, Finlay, Abowd, & Beale, 1998) states that the best way to find out how a system meets users requirement and expectation is to ask the users their views on the effects of Mobile Number Portability. This survey uses the query techniques to obtain information from the respondents. It needs to be noted that the use of questionnaires is an inexpensive way to gather data from potentially large number of respondents. The use of questionnaires is feasible way to reach quite a number of reviewers large enough to allow statistical analysis of the results.

A simple purposive survey was used in this research work. The researcher concentrated on the impact of Mobile Number Portability on subscribers’ behaviors and perceptions in Ghana – using Kumasi metropolis as a case study, this study is based on the primary data. The survey method which was employed in gathering information from respondents consists of direct visitation, observation, interviews and questionnaires. A non-formal interview was conducted by asking operational managers of the various network operators about their views and strategies post MNP implementation.etc.

2.1 Conceptual Framework Extension

The conceptual framework in Figure 1 below is an extension of the work done by Nilsson and Peters (2009) was designed to help estimate the impact of switching characteristics (customer care, service problem, usage costs and income) on subscribers’ intention to switch from one network to another.

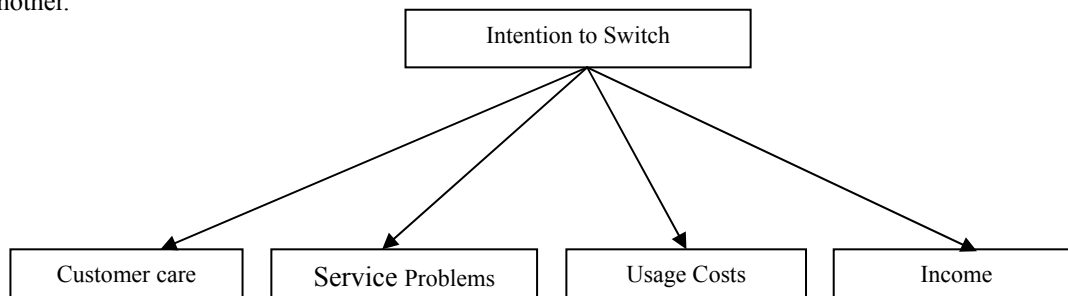

Figure 1 (Sources: Extension of Nilsson and Peters, 2009)

This conceptual framework was designed to enable the researcher find out how variations in these switching characteristics (customer care, service problem, usage costs and income) influence subscribers

switching behaviour following the implementation of mobile number portability in Ghana.

2.2 Tools of analysis (Model Specifications)

In this survey, a Binary Logit model was used. The main model (equation 1) measures the probability that a subscriber is willing to switch network operator. Thus, the model has a qualitative dependent variable with binary or dichotomous responses. According to Gujarati (2003) in models where the dependent variable, is qualitative, the objective is to find the probability of something happening. Thus, in this study the probability that a particular subscriber is willing to switch network operator is specified as:

$$P_i = \Pr(y_i = 1) = \frac{e^{X\beta}}{1 + e^{X\beta}} \tag{1}$$

And the probability that a particular subscriber is not willing to switch network operator is also expressed as

$$(1 - P_i) = \Pr(y_i = 0) = \frac{1}{1 + e^{X\beta}}$$

Thus the odds ratio i.e. the ratio of the probability that a subscriber is willing to switch network operator to the probability that a subscriber is not willing to switch network operator is written as

$$\frac{P_i}{1 - P_i} = \frac{1 + e^{-X\beta}}{1 + e^{X\beta}} \tag{2}$$

The logarithm of the ratio P_i and $(1 - P_i)$ is the log-odds ratio and the log-odds ratio is a linear function of the explanatory variables. That is:

$$\log_e \frac{P_i}{1 - P_i} = \beta_0 + \sum_{j=1}^k \beta_j x_{ij} \tag{3}$$

This equation uses the natural log of the odds, and is called the logistic transformation, or Logic (for short). Logit model (L) has features which include:

- i. As P goes from 0 to 1, the logitL goes from $-\infty$ to $+\infty$. That is, although the probabilities (of necessity) lie between 0 and 1, the logits are not so bounded.
- ii. Although L is linear in the explanatory variables, the probabilities themselves are not.
- iii. If L, the logit is positive, it means that when the value of the regressor(s) increases, the odds are that the regressand equals 1 (meaning some event of interest happens) increases. If L is negative, the odds are that the regressand equals 1 decrease as the value of explanatory variables increase.

Table 2.1 Ranges of Probability, Odds and Log-Odds

		Lowest Level	Mid point	Highest Level
Probability	P	0	0.5	1
Odds	P / 1 - p	0	1	$+\infty$
Log Odds	Log (p / 1 - p)	$-\infty$	0	$+\infty$

Based on the above formulations, logistic linear regression model was used to estimate the impact of customer service, service problems, usage costs and income on switching preference.

Model specification

$$S = f(C, P, U, I) \\ S = \beta_1 + \beta_2 C + \beta_3 P + \beta_4 U + \beta_5 I + \mu \tag{4}$$

Where,

S = Switching preference, C = Customer service, P = Service problems, U = Usage costs

I = Income, μ = Is white noise (include all omitted variables that can influence the dependent variables)

β_s , = Parameters to be estimated to measure the impact of Customer service, service problems, usage costs and income on switching preference.

3 Analysis And Discussion Of Empirical Results

3.1 Tools of Analysis (The Logit Regression Equation)

This session explores the impact of switching factors (income, customer service, service problems

and usage costs) on the probability that subscribers are willing to switch or remain with the same network operator. Thus, the model has a qualitative dependent variable with binary or dichotomous responses. The SPSS (version 16) result of the Logit regression is used to estimate the model in equation 3.0 and the result is contained in Table 1 below. From Logit regression a proper interpretation of the coefficients is done by exponentiating the coefficient and interprets them as odd ratios.

Table 1 The SPSS Logit Regression Result

	B	Sig.	Exp(B)
income	-0.002	0.002	0.998
Low customer service	-0.416	0.734	0.66
Average customer service	-0.713	0.553	0.49
High customer service	-0.871	0.483	0.419
Low service problem	0.439	0.524	1.551
Average service problem	1.502	0.04	4.492
High service problem	4.647	0.022	104.28
Low usage cost	0.386	0.625	1.472
Average usage cost	2.137	0.01	8.472
High usage cost	1.788	0.042	5.98
Constant	1.332	0.276	3.787
Cox & Snell R square: 0.589, Nagelkerke R square: 0.825			
Wald chi- square: 97.853, sig. : 0.000			

Source: Author from field survey data, 2012.

3.2 Income

From table 3.0 below, there is a negative relationship between willingness to switch and the income of the respondents and this is also statistically significant. The negative relationship between willingness to switch and the income of customers indicate that as income of customers increases they will not be willing to switch but remain with the same network operator (i.e. switching will decrease). With GH¢1.00 increase income, mobile subscribers are 0.998 times ($e^{-0.002} = 0.998$) more not willing to switch to different network.

3.3 Customer service

Generally on customer service, the result from table 4.13 above indicate that high customer service, average customer services and low customer services were however not statistically significant in determining the willingness of network subscriber to switch or remain with the same network provider.

3.4 Service Problems

Estimates from table 3.0 suggest that there is a positive relationship between willingness to switch and the high service problems and average service problems and this is statistically significant. The positive relationship between willingness to switch and the high service problems and average service problems means that as high and average service problems crops up, subscribers will be more willing to switch and not remain with the same network operator. The results show that subscribers are 104.280 times ($e^{4.647} = 104.280$) and 4.492 times ($e^{1.502} = 4.492$) more willing to switch to different net work if high service problems average service problems respectively increases. Low services problem was however not statistically significant in determining the willingness of network subscriber to switch or remain with the same network provider.

3.5 Usage Cost

It is clear from Table 1 that there is a positive relationship between willingness to switch to different network and the high usage cost and average usage cost and this is statistically significant. This means that as usage cost increases subscribers will be more willing to switch and not remain with the same network operator. The results show that subscribers are 5.980 times ($e^{1.788} = 5.980$) and 8.472 times ($e^{2.137} = 8.472$) more willing to switch to different net-work if high average usage cost increases. However low usage cost was not statistically significant in determining the willingness of network subscriber to switch or remain with the same network provider.

The chi-square value of 97.853 indicates that the independent variables (Income, Service problems,

Usage cost and Customer service) explain changes in dependent variable (switching preference) by 97.85%. The Cox and Snell's R^2 (0.589) and Nagelkerke's R^2 (0.825) which measure compares the actual results obtained from respondents to the outcome predicted by the model. These two R^2 's accounting (0.589 for Cox and Snell's R^2 and 0.825 for Nagelkerke's R^2) are above 0.5 and therefore the model's explanatory power is high, though 1.0 is the ideal case. Perhaps there may be other more explanatory variables that may also account for the switching preference of subscribers in the era of mobile number portability.

Table 2 Trend in the Ghanaian Telecommunication Industry

Year	2002	2003	2005	2006	2007	2008	2009	2010
Subscriber number (thousands)	1641	3180	6910	13983	23443	26816	29045	32342
Penetration rate (%)	3.6	7.2	15.1	23.2	28.3	36.8	41.9	5.5
Sales (million USD)	6.4	13.7	21.6	33.9	50.5	70.1	86.4	107.3

Sources: The National Communications Authority (NCA) last quarter Report of 2011.

Some of the most noteworthy current developments in the Ghanaian mobile telecommunication services are the start of 3G (third-generation) services which give users up to 2 Mbps download speed on mobile networks. This has propelled explosive growth of wireless Internet in Ghana. Internet is showing sharp growth, boosted by the advance of mobile telecommunication technology, the extensive diffusion of mobile devices capable of connecting to the wireless

Internet and colour LCD display, mobile devices (HSPA USB modems, I pads, palm top e.tc), and diversification of digital content. The wireless Internet market grew from 2.0% of total mobile telecommunication services sales in 2002, to 30% in 2000.

Figure 2 Pattern of Mobile Penetration rate in the Telecom Industry in Ghana
(Source: The National Communications Authority (NCA) last quarter Report of 2011)

4 Findings

The current findings provide new and important information regarding the relationship between subscribers switching intentions and switching characteristics (usage cost, service problem, customer care and income). Although Cox and Snell's R^2 (0.177) and Nagelkerke's R^2 (0.320) were low, some of the estimated coefficients of explanatory variables were significant at 5% level. It was found that there is a negative relationship between willingness to switch and the income of the respondents and this was statistically significant. High customer service, average customer services and low customer services were however not statistically significant in determining the willingness of network subscriber to switch or remain with the same network provider. Again, there was positive relationship between willingness to switch and the high service problems and average service problems and this was statistically significant. It is clear from the result that there is a positive relationship between willingness to switch to different network and the high usage cost and average usage cost and this is statistically significant.

5 Conclusion

We recommended that National Communications Authority should do more education and assist to reduce the porting duration in order to help and lure more subscribers to port. We concluded that generally, the concept of mobile number portability is a good and innovative technology which offers great opportunity to subscribers and network providers alike especially new entrants operational strategies in order to benefit from Mobile Number Portability.

Ethics for Sustainable Development

Christine Syrgiannis, Ivani Catarina Arantes Fazenda
 Educational Program, Group of Studies and Research on Inter, Transdisciplinarity
 Catholic Pontifical University, São Paulo, Brazil
 (E-mail: chrissyrgiannis@yahoo.com.br, jfazenda@uol.com.br)

Abstract: The aim of this Paper is to bring some reflections on how the Vision / Approach of Interdisciplinary Education can help build the attitude necessary towards a new global Ethics for sustainable development. Reverence for Life and space for the creative aspects of the Being can bring innovations aligned to the sense of sustainability beyond the mere need to comply with regulations, but rather, the spontaneous will to adopt Universal Ethical Principles. Research has shown that this attitude is the result of inner transformation, an opportunity which is offered to both, teachers and students, through Interdisciplinary Education, in an environment of mutual trust and respect, helping develop awareness of the Being during the creative process. This attitude will be carried to the personal, academic and professional performance in any field of knowledge, bringing long lasting effects for humanity, as a whole.

Key Words: Creativity; Ethics; Interdisciplinarity; Sustainability

1 Introduction

For centuries, humanity has been striving to find a proper attitude towards the use of resources: material, human and economic. A more utilitarian view has often prevailed, despite the efforts of many, like Ashoka in India 23 centuries ago, for a more respectful view of Life, when he wrote the Dharma.

Eagerness for short time material results was accentuated during the Industrial Revolution, turning men into a mere part of a big production machinery. Natural resources, as well as human efforts have been used to exhaustion in a frenetic rush for more and more production of things: a very counter productive attitude!

In the sixties, a big concern with the outcome of such attitudes moved the people around the world and Sweden proposed the United Nations Organization to arrange an international conference on the issues related to the human environment. In 1972, the Conference in Stockholm gathered 113 countries, 250 non governmental organizations and the United Nations Organization. The outcome was the Statement of Stockholm and an Action Plan for the Environment.

Development could not proceed in the pattern of *single bottom line*- only economical one, in which *bottom line* represents the planet health, without which neither the economic activity, nor life itself are feasible. The *triple bottom line* related to economical, social and environmental development was the result of the Brundtland Commission – the World Commission of Environment and Development WCED in 1988 with the report on “Our Common Future”, in which sustainable development is one which assists the present needs without preventing future generations of doing the same, seeking for new postures, objectives and processes to be adopted by society.

In 1992, at ECO 92 in Rio de Janeiro – Brazil, a document called 'Agenda 21' was elaborated with regional, national and international efforts to stop and revert the deterioration process going on in the environment, together with principles to guide sustainable development stated in the Earth Charter. In chapter 36 of the 'Agenda 21' the basic principles of education are restated, recommending: reorientation of Education for Sustainable Development / expansion of public awareness and encouragement for continuous improvement.

In 1997, Rio + 5, a complementary agenda was elaborated, called *Millenium Development Goal* with focus in globalization policies and poverty eradication, adopted by 199 countries in an Assembly at the UNO, in New York, in the year 2000. In 2002, Rio +10, 'Johannesburg Summit' was produced in South Africa. In 2012, there was Rio +20 strengthening the commitment towards a new attitude to Life. 'Earth Charter International' launched a Campaign in Rio +20 with the slogan: “See the World through the Earth Charter Lenses. Embrace and Live the Earth Charter.” Action is expected in all fields of knowledge. Despite lots of resistance, there have been many achievements all over the world. Students from University of Georgia, in Athens, for instance, have written essays about how the Earth Charter is being put into practice, “Earth Charter in action at University of Georgia”.

We have been in the international UN Decade of Education for Sustainable Development (DESD) (2005 – 2014). Education is expected to bring a new Vision and Approach to develop an attitude of

Reverence to Life, starting in the Being. Since 2001, with Jacques Delors report in connection to UNESCO, there should be 4 pillars in Education: Knowing to know, Knowing to do, Knowing to interact, and Knowing to be.

2 Development

The Interdisciplinary Vision / Approach to Education can be valueable in the development of a new attitude to Life for Sustainable Development, in tune with the four pillars for Education by Jacques Delors and UNESCO.

2.1 Some Ethical Aspects of the Interdisciplinary Vision / Approach to Education

Interdisciplinarity, according to Fazenda (2002) does not have only one definition. It is an attitude towards knowledge: considering the visible and invisible aspects of studies and research. It takes into consideration the epistemological, praxiological and ontological aspects of knowledge – knowing, doing and being, and the various relations that arise – one with oneself, one with the others, and one with knowledge. It resets the position of the Being to a central one, regarding the many possibilities of development, as each one finds his /her own Ethics and Aesthetics, in a creative way, along the process.

Professionals and scholars are welcome to work together in a common project, integrating knowledge, coming out of the process of fragmentation of knowledge, which prevailed for a long time.

Creation of Knowledge, rather than reproduction of knowledge is encouraged, letting each one detect and construct meaning, from inside out, not the other way around. That is how consciousness of the Being emerges, bringing about a sense of worth for Life, as a whole.

It uses the phenomenological approach, as considered by Husserl, suspending judgement - “epoche”, as perceptions give way to more clear understanding, which in turn, becomes knowledge. All this process leads to knowing to know, knowing to do, knowing to be and knowing to interact.

The principles of Interdisciplinarity, by Fazenda (2008) are: Humility to recognize we build the world, Coherence between what we think and do, Respect for oneself and the other, who may be different, but not in opposition; Unnattachment of intellectual and material elements, being open to new ideas; Maturation- observation of phenomenon in time and space, reflection, and action taking in the most adequate time.

In a lecture by Bruce Rich at PUCSP, on April 13th, 2012, – based on his book: “To Uphold the World – a Call for a New Global Ethic from Ancient India”, we had a historical example of how the ruthless Indian Emperor Ashoka learned from his own experience, the futility of war and violence, in an empire prioritizing material wealth, over 22 centuries ago. The book relates to Ashoka's diagnosis of what was necessary to make the world a better place: Ashoka's focus was on mutual respect and sensitive deliberation that can generate it. A big transformation of consciousness showed 'Reverence for Life' to be an essential factor. Based on some Universal Ethical Principles of non violence, religious tolerance, species protection, human rights, compassion, promotion of peace, he set human life out of the utilitarian purpose, by depicting the 'Dharma' on Orissa rock edicts.

'Dharma' from the sanscrit, is related to what sustains Existence, associated to the universal direction, which does not consider only the visible reality. 'Dharma' in India, 'Tao' in China, and 'Logos' in the Western world are related to the universal principles permeating everything, from the creation of Galaxies to the interaction of people. Education that helps move the inner perceptions, in tune to this harmonious dynamics of Life, has long reaching effects.

Pineau (2004) considers that self development, together with hetero development and eco development constitute what he calls permanent development in temporalities. Self development is related to the inner process of transformation, taking place day and night; whereas hetero development is associated to development in connection with a facilitator, or teacher, in a particular time. Eco development being how you interact with the environment, and the influences you receive. These are the three movements going on along the time of the day, and the time of the night.

In the case of Ashoka, self development played an essential part, taking him out of an action which lost meaning. With Humility, he recognized we can build the world, therefore he adjusted his action to his new thinking, to reach Coherence. He could Respect different forms of religious beliefs, as he was Unnattached of the previous beliefs, and because of his own Maturation, he knew when to take action. He was aware of timing. Recognition of the worth of Life permeated his doings, after the big consciousness expansions. He applied the Ethical attitude of worth of Life to all living creatures: Being,

doing and knowing were interwoven.

Peter Singer, a philosopher of the present time, also concerned with preservation of Life in the different dimensions, offers what he calls 'Practical Ethics', the application of Philosophy to situations of everyday life. He believes that we can rationally choose to take an ethical action everyday, with autonomy, developing consciousness of the Being, in order to stop suffering to any living creature. That would help connect Mind and Heart, building an attitude of what he calls 'Effective Altruism', making each of us committed to, directly or indirectly, bring some effective contribution to the whole.

Sustainability requires urgent action taking, as there are millions of Beings inflicted with suffering.

2.2 Temporalities, Self Knowledge and Knowledge Creation for new Ethics

Knowledge development that allows for consciousness of the Being, in perceptions of the moment, help show the worth of Life in each of us – a starting point for an attitude towards new Ethics.

In what concerns Temporalities, Gaston Pineau (2004, p.13) reminds us that:

“Time is a measure of movement, not only its accounting, quantification, its average, but also the tuning, rhythm, tone, quality and meaning”.

We can start developing some awareness of rhythm, by allowing ourselves to perceive the beat of our heart, our breath, the pace of our walk, the way our thoughts flow, as well as our speech. The awareness of our inner rhythmical movements makes us contact our inner flame: Life and Creation inside ourselves. According to Espírito Santo (2007), the educator who has this inner flame lit as a result of self knowledge, so important in his development, will be aware of the importance in activating that in the pupil, creating mutual trust for the process to take place – an open ended process in continuous expansion. In such environment of trust, Creation can take place, as the inner beat finds its way out. Gaston Pineau (2004, p.19) stresses the importance of involving the personal time in education, when he says that: “Each moment one takes possession of his or her time, he or she takes over the temporal development as a condition to one’s evolution. Eminently personal appropriations which also express potentialities of all human kind. A big field of research is open on “Temporalities on Development”. He keeps on valuing (2004, p.220) the ontological development as a permanent one for the human evolution, putting together, in rhythm, the three sources of movement: development with yourself, the others and the things. Allowing this time during the process of development brings about autonomy, which otherwise would not show. That is what Pineau calls “Chrono – Development” (2004 p.15). He says that: “Saving time without gaining your time is a race against the clock, rather compulsive than formative “. Fazenda and Pessoa (2013, p. 18), in their book on Care, show affection as the first element that helps student and teacher walk side by side; “ The deepening of the knowledge of the teacher on the universe of the student takes place through a process of unveiling... Through an embrace it is possible to see the inner eye of the student. Something coming from inside, very deep, essential, but still not shown clearly. Only after the unveiling of the first veil is it possible to approach other factors in the life of the student which are exposed in the written and spoken productions... It is through the speech of the students that the teacher can more clearly see what was hidden in the Being in the beginning of the relation.”

With such care, what was hidden comes forth, opening way to a flow of speech coming from deeper inside, through which Knowledge Creation can take place. There is a flow of inner rhythms transforming what was tacit in an explicit way. Nonaka and Takeuchi (1995) wrote about the Knowledge Creating Company, where constant interactions among the collaborators of the company on particular topics, helped bring to light what was not apparent. Professionals from different departments got together around common projects, integrating knowledge, opening way to the creation of more knowledge, in a spiraling, continuous process: an interdisciplinary attitude.

If the Being is engaged in Knowledge Creation, fully Present in the moment, aware of his/her internal rhythms, the Creation process will bring Self Knowledge too. Temporalities help integrate the four pillars in Education: Knowing to know, Knowing to do, Knowing to be and Knowing to interact.

2.3 An Interdisciplinary Approach to Creation

Being engaged with the spoken /written expression in a foreign language, I had the challenge to help professionals and scholars create and present innovative proposals on a topic. I observed that language understanding and expression took place in a rhythmical pattern.

Indeed, Understanding of a listening or reading comes rhythmically, as the stress of the key words is recognized. Practice through rhymes, poems and songs can help the Being tune his/her own 'inner beat' to that of the message, becoming conscious of the own beat. Equally, in the spoken and written expression, the flow comes with the beat in key words. The Being sustains the flow in a movement from inside out.

In more proficient levels of language development, when ideas are discussed or a point has to be made on a philosophical topic, it is essential to have the chance to expand the perceptions on the topic without getting lost, by registering only words, or pictures first. The correlations of the words or pictures will generate meaning, which can be articulated individually, or in groups.

Then, decision follows on what direction to develop the topic. In this process, feelings, perceptions, possible courses of action are evaluated, for the proposal to gain full flow. Achievement, in offering an innovative proposal comes with self realization, encompassing the Being, doing, knowing and interacting.

Below, I share the 12 'shades' involved from the Creation to the Presentation of a proposal on a topic, considering it a possibility, within the Interdisciplinary Vision / Approach:

Creation	Registering Perceptions on a Topic – through words or pictures Correlating the Perceptions - by putting words / pictures together Detecting the Meaning of the Correlations – through sentences reflecting the ideas
Unity	Selecting some of the ideas or pictures for the Proposal Defining the Position of the pictures / ideas for the Proposal Enriching the Proposal – with examples to illustrate each idea
Way	Adjusting / Confirming the Proposal Rehearsing the Proposal – pictures / ideas on a poster Naming the Specific Proposal
Realization	Defining the Style for spoken / written expression Sharing Joy – feeling happy for being able to create/show your proposal Offering the Proposal – Written / Spoken / Visual Presentation

This approach to Creation can take place after a favorable environment is built, with the Interdisciplinary Vision of Education. The different colors represent attitudes and actions involved in the process.

The three first shades concern the Creation of a proposal: blue refers to the attitude of *determination* to start *collecting words or pictures in relation to a topic*; pink is related to the *loving* attitude which enables *correlations* to be made; yellow represents *wisdom* to *let ideas emerge*.

As for the definition of the Unity of the proposal, which is essential to proficiency, the white shade represents the *selection of the ideas for the proposal*, together with a feeling of *peace*. Even if not all the elements are used in this proposal, they have been registered, and are, therefore, saved for another proposal. Green represents the *organization of the proposal with the ideas chosen*, with *coherence*. Red is related to the attitude of *devotion* in *bringing illustrations which relevant to the topic*, for the development of each idea.

There are not two proposals which are the same. Each one has a specific Way to treat a topic. Richness comes while sharing the various ways. The Purple refers to the possibility to *perform adjustments to the proposal*, if there is a feeling that *something does not fit the proposal well*.

Acqua marine represents *clarity*, enabling the proposal to *be in tune with the author/ authors*. Magenta means *harmony*, to assure a *good flow during development*.

For the presentation of the proposal, be it written, verbal or visual, *special brightness* is reflected in the style, represented by the golden color. A feeling of *joy* will arise for the evidence of *being able* to come from the creation to the presentation of a proposal, represented by the salmon color. All this is *achievement* with a sense of *self realization*, represented by the emerald color.

The moment the Being is not only engaged in knowledge reproduction, but realizes that Knowledge Creation is possible, individually and collectively – making explicit what was tacit, with time to make adjustments and reach clarity and harmony in relation to him / herself, to the others and the environment, a more respectful attitude to Life may be developed, guiding his/her innovative proposals to Reverence for Life. And each one can be perceived as an instrument of Creation – part of a much bigger process that we all share, in a dance, in tune with the beat of the Cosmos, for we have had glimpses of what sustains Existence in ourselves - we share the Logos, The Tao, the Dharma. ..

3 Conclusion

The Interdisciplinary Vision / Approach of Education does not produce these glimpses, but allows us to come to a position to get them, as it regards the infinite possibilities of the Being through the loving eyes of the facilitators, who have had the opportunity to become conscious of their own worth, first. Encouragement of the others to do the same is continuous, with full respect to the individual time, providing the possibility to contact the Essence of the things.

Through the Qualitative Research, Interdisciplinarity approaches Human Nature and the Nature of things for significant learning, awakening the inner sensors to detect meaning, reorienting action. Consciousness of the Being expands and care for Life becomes part of the permanent development.

Sustainability seeks for a new global Ethic, for which the Interdisciplinary Vision / Approach has a contribution to bring, by allowing each of us to awaken the perception of how better we can do our part. Like a fertile soil, it offers itself for the natural unfoldings of those who are open to take place.

Abstract: This paper applies the basic methods and principles of organizational ecology to reveal the ecological characteristics of hi-tech industry clusters, analysis on the connotation and basic components of the organization ecological environment and proposes the evaluation model of ecological environment. Based on pointing out that the human environment factors of hi-tech industrial clusters include the innovative spirit of the actors, the opening atmosphere of ideas exchange and the collaborative relationship of mutual trust, the construction path the human environment of hi-tech industry clusters will create the people-oriented and cooperation cultural atmosphere, build the culture of encouraging risk-taking and tolerating failure and establish the culture system suitable for innovation.

Key words: Hi-tech industry clusters; Organizational ecology; Human environment; Innovation and cooperation

1 Introduction

Autio and Kauranen (1994) pointed out that when entrepreneurs make the decision of location choice, what can have a significant impact is often satisfactory principle rather than the principle of profit maximization. Sakesenning (2001) pointed out that, the success of Silicon Valley industrial area compares with the industrial area near Boston Route 128, which the former engineers and technical experts is a mutual commitment, and committed to the region, while the latter, due to vertical integration, hierarchical, rigid, Jewish traditional family point cultural, resulting in behind, When Saxenian (1992) studied the development of Silicon Valley, he stated that good social relations in the local environment may speed up the generation and dissemination of new knowledge. Li Hui and Li Ge (2007) found that when the industrial cluster sets up, the enterprises within the cluster grow very fast, but it does not have a sustainable development of the environment. When the industrial cluster grows stronger, it will have big competitive power and realize sustainable development. But it takes long time and huge money for the development. So, industrial cluster must develop very quickly at first and the competitive power will be the key to its sustainability. Henjiang and Chen Jixiang Chen (2005) described that the cluster dynamic mechanism for being the fundamental forces of obtaining cluster sustainable competitive advantage and promote the development of industrial clusters and discussed the action mechanism of cluster's continual growth from the endogenous and exogenous dynamic mechanism respectively. Yang Kunpeng and Liang Lei (2004) believes that culture has dramatic effect on enterprise innovation for its intrinsic compulsion, reviews the basic theory of culture and innovation, and then it re-defines the boundary of enterprise innovation and discusses the relative independence of enterprise culture, and probes the effecting mechanism and dimensions of culture to enterprise innovation are put forward to explain the effecting model. Although there are some researches on cluster environment, few scholars specialized in the perspective of the cluster human culture to explore the mechanism of sustainable development and continual growth of the hi-tech industrial cluster.

2 The Composition of Organizational Ecological Environment of Hi-Tech Industrial Clusters

Because they not only adapt to but also make a huge transformation effect on the environment, the hi-tech industrial cluster and its environment are inseparable. Once the hi-tech industrial cluster forms distinctive to prolong the enterprise life cycle and sustain the enterprise brand. A good cluster environment is the fertile soil of the enterprises fast-growing.

The organization ecological environment of industrial clusters is the sum of a variety of environments in which the clusters survive and develop. Specifically, it includes the natural and social environment. The natural environment refers to the indispensable material conditions in the process of survival and development of hi-tech industrial clusters, including climate, vegetation, minerals, geography and so on, the social environment refers primarily to the system, culture, policy, legal and

other conditions, which has a major impact to hi-tech industrial clusters mainly including geography environment, cultural environment, technological environment, institutional environment and social environment (as showed in Figure 1).

Figure 1 Composition of Organization Ecological Environment of Hi-Tech Industrial Cluster

3 The Evaluation Model of Organizational Ecological Environment of Hi-Tech Industrial Clusters

By analyzing the relationship between hi-tech industrial clusters and the cluster enterprises, it can be seen that creating local optimized environment by hi-tech industrial cluster is to attract hi-tech enterprises to grow and develop within the cluster. So the hi-tech enterprises can be regarded as customers, in order to retain their customers, the hi-tech industrial clusters should provide enterprises with products or services that they need, that is hi-tech industrial cluster environments. Based on customer satisfaction theory and model, it can come forward that an evaluation model of the organization eco-environment of hi-tech industrial clusters to analyze the effective mechanism of the organization eco-environment on the performance of hi-tech industry clusters (as shown as Figure 2).

Figure 2 The Evaluation Model of Organizational Ecological Environment of Hi-Tech Industrial Cluster

The core content of this model is the satisfaction of enterprises with organizational eco-environment, is an overall evaluation of business environmental conditions and its experience of hi-tech industrial cluster, which enterprises do. It is also a cumulative satisfaction that it is an overall evaluation, which for some time in the hi-tech industrial clusters hi-tech enterprises experience. The satisfaction level of the organization with organizational eco-environment is affected directly by the satisfaction level of enterprises with what they need, which constitute the main part of the model.

There are two front elements in the model: the enterprise's expectation and perception of hi-tech industrial cluster environment. The main aid which the enterprises enter the hi-tech industrial cluster is to get the resources and conditions which they are not in other parts. Therefore, from the beginning of entering the cluster, enterprises have certain expectations about the cluster environment, which formed an expectation of business on the environment. When hi-tech industrial clusters cannot meet their relatively high expectations and needs, then enterprises will make an impact on the satisfaction of business with environment whether can meet the needs, which will reduce satisfaction of enterprises. And the perception of corporate on the environment is the general understanding of the actual construction of the hi-tech industrial cluster by business, which have a direct effect on the satisfaction degree of business on the environment, and will ultimately affect the satisfaction level of business on the environment .

There is behind elements in the model: the enterprise's behavior. If enterprises are satisfied with the organizational eco-environmental of hi-tech industrial clusters, it explains that the environment will have a positive impact on business performance, these companies will continue to remain in the hi-tech industrial clusters and migration does not occur. But if it cannot meet the needs of hi-tech enterprises, these enterprises will look for the hi-tech industrial clusters that can meet their needs to the environment and thus migration occurs. Therefore, as a hi-tech industrial cluster, the needs of hi-tech companies the on organizational ecological environment should be explored, find out their expectations, and thus make more targeted environment construction, enable enterprises to satisfaction, and ultimately increase the performance of hi-tech industrial clusters.

4 The Human Environment of Hi-Tech Industrial Cluster

Human environment refers to a value system formed by members' the community ideals and beliefs, values, codes of conduct and spiritual habits and so on. Research, development, production, management and sales and other activities of hi-tech enterprise are achieved and completed by business people. Business people live in a certain social and cultural environment, all are social beings. Social and cultural environment have an effect on people, and then business. The cultural environment whose main spirits are encouraging innovation and tolerating failure, can nurture and train a large number of entrepreneurs of courage of development, taking risks and self-sacrificing spirit; On the contrary, the cultural environment of *golden mean* will strengthen people's values and behaviors that do not develop, do not take risks and do not self-sacrifice. To a certain extent, cultural environment can lead to success or failure of hi-tech industries. In 1950s and 1960s, many entrepreneurs set up companies in Silicon Valley, companies from somewhere else have moved in Silicon Valley. In addition to local universities to provide ready-made and readily available human resources for these companies, the unique cultural environment is one of the basic factors that the hi-tech industry in Silicon Valley forms and develops. The essence of Silicon Valley culture is to encourage risk-taking, tolerance for failure, open communication, co-operation. Without this environment, Silicon Valley might never take off. The reason why it is difficult to replicate Silicon Valley's success is also for this reason.

The human environment of hi-tech industrial cluster can be understood as the customs, educational level of labor, psychological quality, mainstream values, social values and social networks and other social and cultural patterns, which is accumulated in a specific area by hi-tech industrial clusters for survival. The human environment of hi-tech industrial cluster generally includes two parts: First, the regional culture in the place where the hi-tech industrial cluster is—it appears as the cultural foundation formed by historical tradition and cultural background and so on, which influences character by environment in the process of development of hi-tech industrial cluster from beginning to end; secondly, industrial culture, which accumulates, based on the cultural foundation with the development of hi-tech industrial clusters, reflects the culture and behavior, especially the consistency of economic behavior. As hi-tech industrial clusters geographically concentrate and extensively divide the work and cooperate, this makes the cluster members be able to not only share the same cultural foundation, but also have a very frequent interaction on the basis of this, which significantly contributes to build the human environment of hi-tech industrial clusters.

Relatively speaking, human environment is a fairly flexible environment system of development. It is the cultural atmosphere of every industrial cluster, mainly comprised by public agreed lifestyle and value judgment formed by external performance of cultural quality, which embodies in each person. This kind of culture will create an external environment for development of an industry cluster by means of recognizing or excluding, and stimulate or limit the emergence and development of industrial clusters. It has a direct impact on whether people have the enthusiasm to pursue innovation, and whether people can establish mutual trust and mutual cooperation between each other.

4.1 Innovative spirits by behavioral subjects

It includes people's acceptance of innovation, recognition, enthusiasm and courage to take risks and so on, which are people's motive power of innovation. The one who is full of adventurous and innovative spirit, will generally hold a positive attitude to innovation activities, be conducive to the transfer and diffusion of knowledge, information and other resources. In such an atmosphere, enterprises have a particularly keen insight to market, are good at discovering the potential needs of the market. And drove by the interests, enterprises result in starting a company and other innovative strong desire, which in turn strengthen the innovative environment, from benign cycle and maintain continuity of innovation.

4.2 Collaborative relationships of mutual trust

Collaborative relationship of mutual trust is the key to clusters of innovation. The reason why hi-tech industrial clusters can overcome the disadvantage of innovation of a single enterprise is the long-term and stable cooperative relationship among enterprises, and foundation of establishing long-term stable cooperative relations is mutual trust and integrity. Game theory experts believe that, economic activity has the typical characteristics of the Prisoner's Dilemma, cooperation can make the overall interests of the participants largest. But in one game, betrayal is always dominant. In the course of repeated games, it is possible to achieve the result of cooperation, trust is one of the mechanisms of its implementation, it provides both parties with a good expectation and cooperative behavior encouraging parties to the transact, and help attract new trading partners.

4.3 Atmosphere of open exchange of ideas

Equal, free and relaxed working environment and open communication environment conduce to communication, learning of new ideas, new technologies in the areas. Equal, free and relaxed working environment makes economic subjects, in the field of its business, do real commitment and energy inputs, and thus they have more hi-quality innovation. Mutual trust and an open mind, making frequent communication and interaction between people, accelerate the speed of diffusing new ideas, information and innovation. In cluster, the boundaries among enterprises, between enterprise and inter-agency are porous, and they mutually penetrate. Enterprises learn in the competition, through formal cooperation and informal exchanges, keep abreast of changing markets and technology, to prepare for innovation.

5 The Construction Path of Human Environment of Hi-Tech Industrial Cluster

5.1 Creating the human atmosphere of people-oriented and cooperation

Human capital is the core strength of construction of hi-tech industrial cluster, and competition of hi-tech industry, in the final analysis, is a competition of talents. U.S. experience shows that the first condition of setting up hi-tech industrial clusters is to have a soft environment to promote production of talents, release of human energy. Because technological talent is the carrier of knowledge and technology, whether can encourage and attract universities and scientists and research institutions to doing business in the park, is the starting point and core to achieve a combination of technology and production, accelerate the industrialization of scientific and technological achievements.

Silicon Valley's success is the success of talents is that, its culture system is made full use by human resources, and provide favorable conditions as well as an appropriate cultural environment. The greatest asset hi-tech companies have, is the human resources of the company and the innovative wisdom of employees.) In the Silicon Valley, the flourish of hi-tech industrial clusters essentially is due to the talent pool, and the pool of talent relies on "people-oriented" concept. Talents are widely respected, human values are fully reflected, giving employees more equitable opportunities in order to get rich by their own, and that is the biggest secret of the success of Silicon Valley. Widespread implementation of the system of holding company bonus, which this incentives system not only greatly strengthened employees' sense of ownership, but also effectively stimulates employees' creative potential, inputs and pursuit on the work.

5.2 Creating the cultural atmosphere of encouraging risk-taking and berating failure

Innovation and risk are often closely linked, and culture of hi-tech industrial clusters encourages a culture of innovation, but also a culture of risk-taking. Silicon Valley entrepreneurs have a spirit of adventure, due to intense competition; there are only one-tenth people who are successful to do pioneering work. However, people are still keen on business, for failure of business, Silicon Valley people are able to recognize and accept. In order to support innovation, Silicon Valley design a reasonable risk aversion mechanism, which inspires Silicon Valley people's spirit of adventure. More and more Silicon Valley people experience that adventure is together with opportunity. No risk, no new opportunities for development. That the Silicon Valley people, in this risk-taking and entrepreneurial careered, previous failure is inevitable. Compared with the outsiders law-abiding, laid-back mind waiting for windfalls, it is difficult to be mentioned in the same breath. Because of this, it is very tolerant for Silicon Valley people to face failure, their understanding and concept of *Failure is the mother of success, business failure breeds success, failure is an asset to the development of human*, which has become a sensible approach generally agreed by Silicon Valley people, but also become an inherent innovative power of spirit for people to take risk.

In Silicon Valley, many companies will take the initiative to reward the one with risk-taking, courage and knowledge, actively participating in, but not to punish the losers in adventure. In Silicon Valley culture, being tolerant of frustration, greatly motivate and inspire employees innovative enthusiasm of bold attempt, courage to explore. It should be said that, in Silicon Valley, the unique culture of encouraging risk-taking and tolerance of failure means that human intellectual development, the development of civilization reaches a new sublimation of the new level.

5.3 Establishing the cultural institution suitable to innovation

Economic and technological development is deeply rooted in the soil based on certain cultural system. Behind the success of Silicon Valley, there is an atmosphere, which can be through design of a cultural institution and arrangements of cultural institution, express the innovative spirit of outstanding creative talents and creative ability to capacity, and from the innovative culture pursuing innovation and excellence. As Professor Sakesenning referred out, Silicon Valley flourished and Route 128 gradually declined, simply because they exist difference of environment of cultural institution and cultural backgrounds.

In Silicon Valley, competition between enterprises is very brutal, only a few companies can survive by the competition of survival of the fittest. However, even in the strong competitive pressure, internal loyalty and mutual agreement on the dominant technology can also unite the members of our industry. Competition requires constant innovation, and in turn, innovation requires cooperation among companies, which are so-called "paradox of Silicon Valley." In order to gain a competitive advantage, both interior of enterprise and exterior of enterprise, have formed a team spirit of mutual cooperation, engineers and experts through formal and informal information exchange and knowledge sharing, blurred the boundaries between employees and employers, the boundaries among companies, form a regional innovative network based on spectral technology. Construction and development of the human environment of hi-tech industry cluster differ from region to region, but have a common law. We can learn from effective models and methods of human environment of foreign hi-tech industrial cluster. Meanwhile, it is also necessary to consider our own cultural traditions and human values, and special effects on the establishment of human environment of hi-tech industrial clusters.

6 Conclusion

Although it is the soil of cluster enterprises which survive and develop, the organization ecological environment of hi-tech industrial cluster also may limit the development of the cluster enterprises. The relationship between the cluster and the environment is not simply to adapt, at the same time but to transform, to guide, even to create a new environment, which leads to the hi-tech industrial clusters towards a healthy, efficient, continuous direction. To a certain extent, cultural environment can lead to the success or failure of the hi-tech industries. The construction and development of the human environment of hi-tech industrial clusters vary due to regional differences, but also have common law. By studying and learning from the effective models and methods of the human environment in Silicon Valley, it is also necessary to consider their own cultural traditions and cultural values, special effects for the establishment of the human environment of hi-tech industrial clusters.

An Exploration for the Rules of Hierarchical Design in Pictorial Map in Tourist Area*

Yao Hongting, Xiong Wenfei

School of Art and Design, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: yaohongting123@163.com, xiongwenfei@gmail.com)

Abstract: Maps help pedestrian to find their orientation and destination in unfamiliar environment. The common maps follow the rules of proportion, and pay attention to the function. But the leisure maps are the special thematic maps which should combine functionality and entertainment. Considering different levels of the crowd, we should use a more freedom way to draw the leisure map. In this way, we can improve the usability of maps. This article is aimed at introducing the concept of pictorial maps and the ways of hierarchical design, through comparing and analyzing the characteristics of world famous tourist area, summarizing the design rules of pictorial maps and presenting the stratification in map design, then they can provide a train of thought for designers.

Key words: Tourist area; Pictorial maps; Hierarchical design; Information classification

1 Introduction

According to the tradition definition, maps all have rigorous foundation of mathematics. The exact map-making can lead the user to get his destination quickly. But there is a form different from other art which we called “pictorial maps” --- without mathematics and technology style. Early in the Renaissance, the pictorial maps were drawn by artists. They used them as a gift to the visited merchants in order to add more business opportunities.

Even in the science and technology developed today, the pictorial maps are still used in our daily life as a irreplaceable way in way-finding, including the site map, the navigation map in public places, the tourist maps and so on. This type of map has various forms and doesn't have a stable standard. The reasons for this situation are two: 1, There is a variety of art forms so the visual perception of information ability is different. 2, Some information of maps is complex and lack of planning. All the information is listed in the map but it's still hard to use. The former is a expression of individual style and the latter is a rational analysis and programming of information. By comparing the two, the latter is easily to hold, especially for less experienced graphic designers.

This article focuses on the discussion of information classification and the ways of hierarchical design in maps. According to the pictorial maps collected from world famous tourist area, discussing the design rules of classification area, map symbols, color, configuration and notes from information classification to visual layering, we can get feasible design proposals.

Figure 1 Pictorial Map -Islands of Adventure

2 Map Information Classifications and Map Design Layered

* This paper is supported by “Basic Scientific Research Special Fund Supported Thesis / Monograph of Central Universities”

Hierarchy division helps clear logical order and show the relationship between the contents in the case of the map information jumbled variety. According to the theme or the content of the tourist area maps classify the information into a complete system. In primary and secondary relation in of the tourist map between visual layering design performance, In order to achieve the transformation from the classification of the information to the visual hierarchy process.

Tourist map from the functional is classified as: tourist attractions / facilities, restaurants, shops and public service facilities, etc. Its content includes name, location, and details. When designing graphic map, because it can not all rely on the traditional method of drawing the maps, so when the map information formed into a complete system, it needs innovative design approach to transform the graphic information into visual elements to show on the map. Map information visualization is not only simply listed, but needs a more intuitive and stereo way to deconstruct and reorganize, in order to achieve a consistent visual experience and information communication.

Layered map design includes two modes: plane layered and solid layered. The plane layered is referred to the average distribution of the different nature of the individual information on the one floor. Solid layered is in accordance with certain rules to divide the tourist map into multiple layers, each layer on the distribution of different information. In the process of analysis design method of the tourist map, we will use the both two modes. Tourist map of graphic information planning is divided into two ways: (1) functional division (2) the first zoning division and then functional division. According to the two different ways of dividing information, corresponding map is also divided into plane layered and solid layered. Such as Figure2.

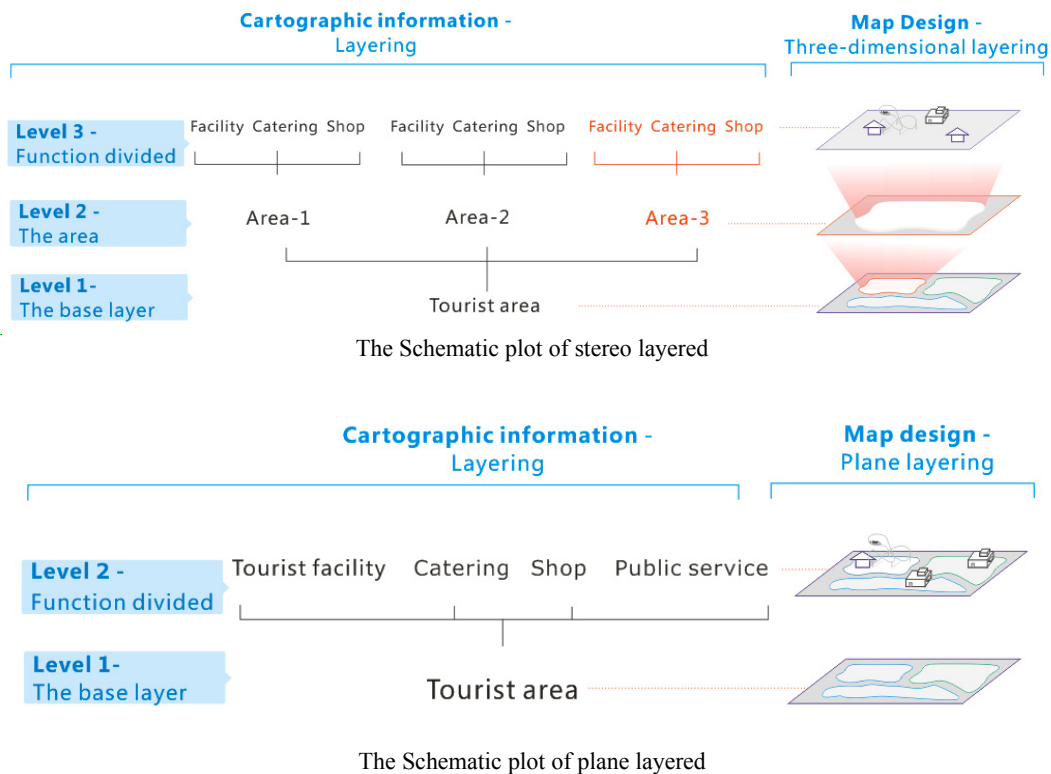

Figure 2 The Relationship Between Information Classified and Layered

3 The Relationship Between the Basement Elements of Pictorial Map in Tourist Area and the Hierarchical Design

The literature is lack of concrete analysis for pictorial maps in tourist area. So I collect a large number of maps, and choose 10 famous pictorial maps as samples. I sum up 9 common elements, and they are shown in Table 1:

10 maps are:

- ① Cedar Point [U.S.A] Ohio Sandusky
- ② Universal Studios Florida [U.S.A] Florida Orlando
- ③ Valdosta Wild Adventures [U.S.A] Georgia State

- ④ Islands of Adventure [U.S.A] Florida Orlando
- ⑤ Efteling [Netherlands] North Brabant
- ⑥ Wild Waters [U.S.A] Florida Ocala
- ⑦ Hong Kong Ocean Park [China] Hong Kong
- ⑧ Disneyland [China] Hong Kong
- ⑨ Guangzhou Chang Long Happy World [China] Guangzhou

Table 1 The Base Elements of Pictorial Map

Tourist map elements	Tourist map of graphic elements	Count
Base Map Elements	Route/communication network	10
	Area divided	5
	Boundary line	1
Tour Elements	Map mark	10
	Scenic spot/facility	10
Supplementary Elements	Annotation text	10
	Title	10
	Live-action photo	3
	Mascot	2

This paper tried to summarize the common elements of pictorial maps in tourist area based on the maps above.

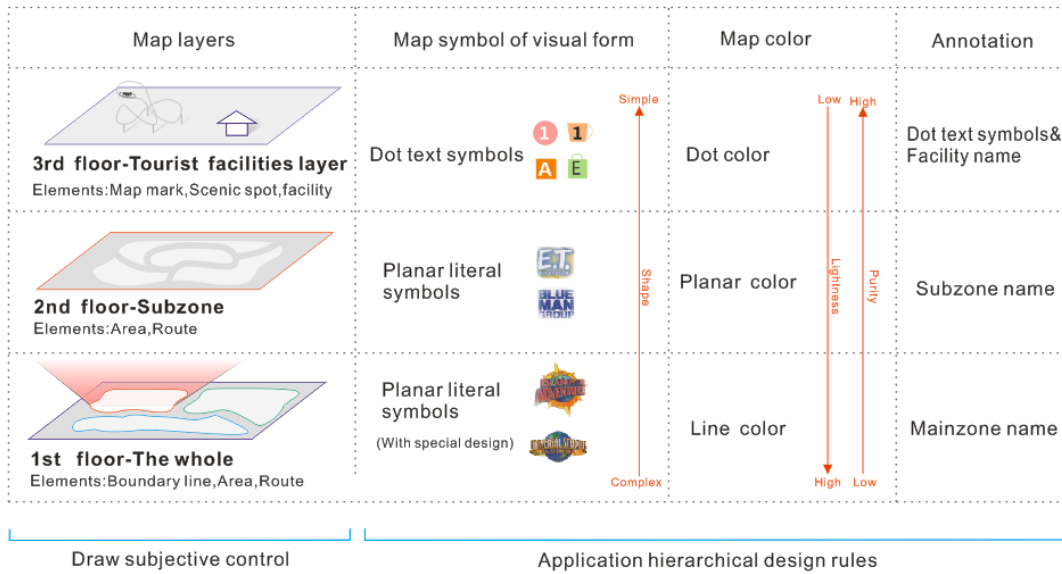

Figure 3 The Layering Show of Pictorial Map

From Figure 3 we can know that the route, area and the boundary line is drawn on the basis of objective environment. The map marks and the annotation text are the directly reflection of information, which added the drawers own subjective thinking.

Except for the information that can be delivered from symbols and marks in basement elements, the color of maps is another way to perform information. None of these three is performing information by a artistic way. They use efficient way to classify information in order to achieve the goal of fast recognition. The following will introduce the relationship among the three and the design principles.

3.1 The pictorial map symbol design based on layering

The symbol system is an important part of map. In the process of map design, we use map symbols to present the similarities and differences of different things in the space. In this way, we can reflect the different nature and important significance. This change of map symbols is called “visual variable” which first proposed by J.Bertin—a French cartography. The basic variable are: location, shape, measurement, orientation, color, annotation (text, number, font), luminance, density.

This passage is focusing on classification and planning of symbols in service facilities. After analysis of 10 pictorial maps of tourist area, getting a conclusion that the four variables: location, shape,

color and annotation, we can get that the symbols in pictorial maps are complex, so according to the different functions of facilities they are divided into two parts: public service facilities mark symbols and tourist facilities/scenic spots/shopping mark symbols. The public service facilities mark symbols is using international general graphics.

3.1.1 Public service facilities marked symbol variable statistics

The main shape of public facility symbols is square, but the use of color difference is bigger. There is blue-white and black-yellow color combination. This color combination is a common color in national public symbols. We should use common symbols and colors on pictorial maps in tourist area. The more colors, the easier visitors get visual confusion.

3.1.2 the various statistics of tourist facility/scenic spot/catering/shopping marked symbols

According to the classification of map symbols in visual form and the generalization from 10 maps, we can get a conclusion that the tourist area pictorial map is primarily using dot text symbols (shape+color+character/number).

Shape: The most commonly shape used to divide function is round and square (facility/scenic spot/catering/shopping). Sometimes it also uses connect in the mind to convey the information, especially in catering and shopping.

Annotation in picture: The annotation was divided into annotation in and out of picture. Annotation in picture means the characters and numbers hints corresponding to the symbols, and the annotation out of picture means extra explanation on the marked map symbol. In this passage specially means annotation in picture.

In the 10 maps collected, the annotation usually is letter and number in order to distinguish different unit. Using which way to make annotation is decided by the specific circumstance we draw maps.

3.2 The color design of pictorial map based on layering

The color of elements for base map and tourism of tourist area pictorial map is drawn by objective environment. There are varieties of color expression, but it doesn't mean that we can't have a system planning for colors. Under the circumstances of clearly readable information, we can have a layered design for colors after the information of map classified. There are color rules to follow in the relatively complex environment.

Color has three properties: hue, value and purity. The representation of colors on maps are: dot color, linear color and planar color.

Dot color means the color of dot symbols. They show the difference of individuals via different colors. The map symbols on 3rd layer of pictorial map mainly use dot colors.

Linear color mainly means the color of route and boundary lines. We use bright boundary lines to divide sections on pictorial maps. The linear color is usually used to divide bigger sections on the whole layer.

Planar color means colors used on a certain area. The main color in tourist area pictorial map is the base color. 5 of 10 collected maps use area divided color. And most of them use low concentration of contrasting colors.

From the related studies we can get the rules of color matching:

Choosing the color of area before color of symbol;

The color of area should be in line with the color of symbol. And we distinguish the two by purity and value. Generally speaking, area color has high value and symbol color has high purity.

3.3 The outside annotation design of pictorial map based on layering

There are 4 of 10 maps classified by functions of tourist area, and other 6 classified by sections. The ways to make annotation outside are 2. One is classified by functions, and another is classified by sections. If we use the former way, we should add names of facilities all by character symbols. For the latter way, first we should divide the area. Then divide facilities, catering and shopping and named under the function. We also should have layered explain for the elements in words on maps. In this way, the tourist will easily find their destination.

The advantage for this annotation is that they can have a comprehensive system of state map information framework. But there are disadvantages too: It may bring noise information at the same time. We should pay attention to the information arrangement when we design. There must have relationship between the color of annotation and the symbols. The annotation outside is the textual description for marked symbols. So they should have corresponding colors and the difference should be their purity.

4 Conclusions

The basic elements of tourist area maps include pattern element, tourist element and subsidiary element. Assist elements include notes, map topic/logo, mascot and real photos.

Symbolic system: Communal facilities would preferably use international symbols and colors, and avoid to use too many colors and difficult patterns.

Symbols for tourist facilities/view spot/shows/restaurant/shopping do not have specific patterns, so we can use regular geometrical patterns or relevant patterns. Among those, restaurant and shopping spot we mostly use relevant patterns. Sectional colors and symbolic colors usually change in pureness and pellucidity. Regularly symbolic colors will be higher than sectional colors in both pureness and pellucidity.

Look out for special symbols while drawing the map--entrance symbol. Using arrows and bright colors for they are easier to identify.

Use stratification to classify colors.

The area color have the same hue with symbol color. The higher the purity of area color is, the lower the purity is. To the color of symbol, the lower the hue is, the higher is the purity.

To sum up, we can get a series of basic and reasonable principles for designing by classifying the information together with designs on the tourist area map and excluding the disturbs from the art forms during drawing the map. Besides improving the designer's works, it may also become a reference of designing virtual maps in the future. People will see the tourist area maps' designs basing on not only designer's experience but also systematic information with better effects in the virtual way.

A Study on the Influence of FDI, R&D on the Energy Intensity in Central Region

Wang Haiyou

Huazhong University of Science and Technology, Wuhan, P.R.China, 430070

(E-mail: wanghaiyohust@126.com)

Abstract: The thesis used the panel data of energy intensity, FDI and R&D in central region from 1998 to 2009, on the basis of panel unit root test, it found that there is long-term equilibrium relationship between energy intensity and FDI, and among energy intensity, FDI and R&D by cointegration test. From the panel regression analysis, we know that FDI can effectively reduce the energy intensity in the central region, namely FDI improved the technological progress in the central region biotechnology spillovers, and R&D is more effective in terms of reducing energy intensity. Meanwhile the thesis put forwards some corresponding policy recommendations.

Key words: Foreign direct investment; R&D; Energy Intensity

1 Introduction

China has a vast region; there is a big difference among different region in economic development level, technology level, opening up level and the resources endowment, etc. Due to the different degree of opening to the outside world, the impact on local energy efficiency of FDI in all different parts is different, too. Central area lies between east and west, has played an important role in linking the east and west. Researching the impact on energy efficiency to central region, can help to make effective opening-door policy, utilization of foreign direct investment to reduce energy intensity in the central region, these have a very important practical significance to realize energy-saving and cost-reducing in central region, to achieve the commitment of China made to the world about the target of energy conservation and emission reduction, and to the sustainable development road.

The influence of FDI to the relatively backward in host country on environment pollution and energy consumption, Lenard(1984) put forward that "Industry to escape Hypothesis" and "Pollution Haven Hypothesis", he thought that the more strict environmental policy in developed countries forced the energy-intensive and highly polluting industries transferred to developing countries. Meanwhile, developing countries may reduce their own environmental protection and energy requirements to attract FDI in order to develop economy, therefore, FDI has a large influence to industrial structure, energy consumption, and consumption structure^[1]. Blackman, etc.(1999) summarizes the foreign investment policy in the field of energy in China, came to the conclusion that FDI is conducive to China's energy efficiency^[2]. Mielnik and Goldemberg (2002) made a statistical regression with the sample of FDI and energy intensity in 20 developing countries, found that the increasing of FDI can significantly reduce energy intensity, the main reason is the presence of FDI technology spillover effect^[3]. Xian Zhou and Yong Zhang (2007) used the spatial regression model to analyze the spatial relations of FDI on energy intensity effect, and thought that FDI has significant spatial spillover effects^[4]. Zongcheng Yin, etc.(2008) used the time series from 1985 to 2006 in China, examined the influence direction and degree of FDI, human capital and science and technology research investment and industrial structure to energy efficiency in China. The result showed that FDI, human capital and science and technology research investment has significant positive effect to improve the energy efficiency in China^[5]. Puyang Sun, etc.(2011) built a panel data around the world covering 74 countries (including the industrialized countries and emerging market countries) from 1985 to 2008, and made verification to the hypothesis of "introduction of FDI can improve their energy efficiency, reduce energy consumption intensity"^[6]. Min Zhang (2012) used the time sequence data from 1986 to 2009, examined the different source of FDI and the relationship between Chinese energy consumption intensity, the result showed that FDI share change in different source on the impact of Chinese energy consumption intensity has a significant difference^[7].

On the one hand, FDI may create "Pollution Haven Hypothesis"; On the other hand, technology spillovers of FDI can improve energy efficiency. The reason is one country's technological progress can improve through technology spillover of FDI, and then to improve energy efficiency. Based on the above literature research, we can find that scholars in FDI and energy efficiency have not formed a consistent conclusion at present, and there are few literatures from the point of area to study the effect of FDI on energy intensity, and few literatures separately aimed at the impact of FDI on energy intensity in central region. Therefore, the article associates FDI, R&D and energy intensity, studying the relationship

between FDI, R&D and energy intensity in central region, in order to explore a new perspective for improving the efficiency of energy utilization in central China.

2 Variable Selection and Data Description

The article selects the sample panel data of six provinces (Jiangxi, Shanxi, Henan, Hunan, Hubei, and Anhui) from 1998 to 2009 to do empirical study. In order to eliminate the influence of price, all variables involving price metric are calculated in 2000 constant price.

2.1 Energy intensity

Energy intensity is the ratio of energy consumption and GDP or area total output value. It indicates the difference of economy development level, technology level in nation or region, it can reflect the energy utilize level in one region to some degree. Energy consumption data of six provinces in central region are from < China Energy Statistical Yearbook >, GDP data are from < China Statistical Yearbook >. The variable was got by energy consumption divided by the GDP expressed by constant price in 2000 in different provinces over years.

2.2 FDI

FDI is expressed by the actual utilization of foreign capital in six provinces of central region. The actual utilization of foreign capital is calculated by dollar in < China Statistical Yearbook >, as a result, by inquiry the RMB exchange rate of those years in < China Statistical Yearbook >, multiplying FDI expressed by dollar, we can get the FDI expressed by RMB, then changing it into the constant price in 2000 by fixed assets price index.

2.3 Independent R&D

The independent R&D in this article is expressed by R&D internal expenditure data. The price index is set to the weighted average of the consumer price index and the fixed assets price index, the weight of fixed assets price index is 0.45, the weight of consumer price index is 0.55. The R&D expenditure price index each year is converted by constant price in 2000. R&D internal expenditure data is from < China Technology Statistical Yearbook > over the years, fixed assets price index and consumer price index are from < China Statistical Yearbook > over the years.

2.4 Energy intensity, FDI and R&D coefficient of variation trend

The article calculated energy intensity, FDI and R&D coefficient of variation by formula of coefficient of variation, as shown in Figure 1.

Figure 1 EI(Energy Intensity), FDI, R&D Coefficient of Variation Tendency Chart in Central Region

From figure 1, we can find that energy intensity, FDI and R&D of central region all showed an overall downward fluctuations, it indicated that the difference among three variables becomes small in central region. Among which, the change tendency of FDI and R&D coefficient of variation are stronger than the change tendency of energy intensity, the reason of which may be there is a certain rigidity in energy utilization technology, however, FDI and R&D are affected by the international and domestic economic development greatly, as a result, it exists a great fluctuation in a certain extent, but the overall difference is reducing.

2.5 Unit root test of panel data

In order to avoid "spurious regression" problem caused by non-stationary time series, it is necessary to make the panel unit root test at first. The article used five test methods to make stationary test to \ln FDI, \ln EI and \ln R&D separately for making the test results more robust. The result is shown in Table 1.

Table 1 Panel Unit Root Test Result

Test Method	lnFDI		lnEE		LnR&D	
	Horizontal Test Result	Difference of First Order Test Result	Horizontal Test Result	Difference of First Order Test Result	Horizontal Test Result	Difference of First Order Test Result
LLC	-0.7147 (0.2374)	-11.3673 (0.0000)	-0.2341 (0.4075)	-8.8050 (0.0000)	-1.6712 (0.0473)	-3.8428 (0.0001)
IPS	-0.1774 (0.4296)	-4.0777 (0.0000)	0.3239 (0.6270)	-2.7215 (0.0032)	-0.5836 (0.2797)	-1.6098 (0.0537)
ADF-Fisher	12.7385 (0.3883)	42.3036 (0.0000)	7.9033 (0.7926)	34.0644 (0.0007)	14.2583 (0.2845)	25.7585 (0.0116)
PP-Fisher	19.6302 (0.0744)	51.5620 (0.0000)	10.8149 (1.0000)	38.1024 (0.0001)	13.0947 (0.3622)	43.9067 (0.0000)
Hadri	4.5674 (0.0000)	4.2666 (0.0000)	4.4266 (0.0000)	5.8815 (0.0307)	2.9162 (0.0018)	7.7408 (0.0000)

Note :Different from Hadri test, the four tests in front:H₀:data is I(1),H₁:data is I(0).The data in parentheses represents the probability corresponding, that is p value.

The result of the five test methods above shows that horizontal quantity of lnFDI, lnEI and lnR&D are not stable, however, their difference of first order has stationary. Judging from these, all of the variables of lnFDI, lnEI and lnR&D are I(1) order of first order integrated, thus to satisfy the necessary condition of cointegration test.

2.6 Cointegration test of panel data

On the basis of unit root test, in order to ascertain whether the three variables have a long-term relationship, it is necessary to make further panel cointegration test. The article will make cointegration test for three pairs of variables. (1) lnEE, lnFDI and lnR&D, (2) lnEE and lnFDI. The result is shown in Table 2.

Table 2 Panel Cointegration Test Result

Statistic		Cointegration Relationship (1)	Cointegration Relationship (2)
Pedroni Test	Panel v	-1.264379 (0.8970)	6.307948 (0.0000)
	Panel PP	-0.792320 (0.2141)	-2.501815 (0.0062)
	Panel ADF	-4.432730 (0.0000)	-4.073775 (0.0000)
	Group PP	-2.077983 (0.0189)	-1.728464 (0.0420)
	Group ADF	-3.625500 (0.0424)	-3.781012 (0.0001)
Kao Test	ADF	-3.453091 (0.0003)	-1.629038 (0.0517)

Note: all the null hypothesis of tests is “non-existent cointegration relationship”. The data in parentheses represents the probability corresponding that is p value.

It indicated clearly from the various test methods result that the three pairs of variables exist cointegration relationship, that means there is a long-run equilibrium relationship among FDI, Energy intensity and R&D, in addition, FDI and energy intensity have long-run equilibrium relationship ,too.

2.7 Regression analysis

By the cointegration test shows above, FDI and energy intensity(EI) have long-run equilibrium relationship. Here, we make EI as the explained variable, FDI as the explanatory variable, to do regression analysis. The regression result is as follow:

$$\text{LnEI}=0.428135 -0.280718\text{LnFDI}$$

(0.0000) (0.0000)

$$R^2=0.997806, \text{Adj-}R^2=0.997603 \quad F=4926.201(0.0000)$$

The regression result showed that there is a significant negative correlation between EI and FDI, which means the introduction of foreign direct investment can effectively reduce the energy intensity in the central region.

Also, by the cointegration relationship, there is a long-run equilibrium relationship among FDI, Energy intensity and R&D. The article makes EI as the explained variable, FDI and R&D as the explanatory variable respectively, for studying the relationship among EI, FDI and R&D. Before using panel data to estimate the three pairs of variable, we make Hausman test and likelihood ratio test first, for judging whether to use fixed effect model or random effects model. The specific test result are shown in Table 3 and Table 4.

Table 3 Hausman Test

Test Summary	Chi-Sq statistic	Chi-Sq d.f	Prob
Cross-section random	9.160304	2	0.0103

Table 4 Likelihood Ratio Test

Effects	Statistic	d.f	Prob
Cross-section F	163.352862	(5.64)	0.0000
Cross-section Chi-Square	188.777303	5	0.0000

The corresponding P value of Hausman Test in Table 3 is less than 0.05, the null hypothesis should be rejected, we should establish individual fixed effects model. P value of Likelihood ratio test in Table 4 is 0, far less than 0.05, the null hypothesis should be rejected, we should establish individual fixed effects model. Therefore, given the above two kinds of tests, the individual fixed effects regression model is more appropriate. Here, we make regression analysis to EI, FDI and R&D, the regression results is shown in Table 5.

Table 5 The Regression Results of EI, FDI and R&D

Variable	Central Region
Constant Term	0.267724 (0.0000)
LnFDI	-0.026415 (0.0693)
LnR&D	-0.276552 (0.0000)
Adjusted R ²	0.968497
F Value	312.8222 (0.0000)

Note: P value is shown in brackets in the table

From Table 5, we know that the adjusted R² is 0.968497 in the model, and the F value is 312.8222, passed the test. It indicated that the model is reasonable. Foreign direct investment is significant at 10%, and the coefficient is negative, which shows that FDI can effectively reduce the energy intensity in central region, that means FDI improved the technical progress of central region by technology spillovers, and improved energy utilization efficiency of the central region. R&D is significant at 5%, and the coefficient is negative, which indicated that R&D also can reduce the energy intensity in central region. From the perspective of variable coefficient, the coefficient of R&D is 0.276552, far more than the coefficient of FDI 0.026415, which means in terms of reducing energy intensity, R&D is more effective.

3 Conclusion

As for policy recommendations, central region should further improve the level of introduction of FDI, taking full advantage of the superiority of FDI in improving regional technology progress. However, introducing FDI blindly is inadvisable, the quality of FDI is important. Central region should pay much attention to the quality and the combination of FDI technology and local energy utilization technology, the introduction of advanced technology and relatively backward technology are not desirable. Meanwhile, we should increase the level of R&D in central China, which can not only promote the local technology progress to a certain extent, but also can better to absorb the relatively advanced technology introducing by FDI, better to promote the reduction of energy intensity and improve energy utilization efficiency.

A Study of Driving-Force/Press Impact Model for Green Supply Chain Management*

Wei Feng, Luo Jianming, Li Weizhao
School of Management, Guangxi University of Science and Technology
Liuzhou, China, 545006
(E-mail: fwei916@163.com)

Abstract: The green supply chain management has become a sustainable development strategy for enhancing international competitiveness in many developed countries. Green supply chain management is still at primary stage in China. Literature about green supply chain management at home and abroad was traced in the study. 'Press - status - response' (PSR) and 'driving force - status - response' (DSR) analysis models were adopted for constructing driving force/press impact model of enterprises to implement green supply chain management. The operating status of supply chain system was comprehensively analyzed for studying the resistance factors affecting implementation of green supply chain management in enterprises, and proposing countermeasures and suggestions in this paper.

Key words: Green supply chain management; Driving force/press impact model; Sustainable development; Resistance factors; Countermeasures

1 Introduction

Green supply chain management has become an important strategy for sustainable development in enterprises^[1] with increasingly stringent environmental production regulations, improvement of public environmental awareness as well as the continuous development of supply chain management. Green supply chain management aims at harmoniously developing environment, economy and society. All node enterprises on the supply chain can optimize overall efficiency of enterprises by cooperating with upstream and downstream enterprises as well as enterprise internal changes, thereby promoting sustainable development of enterprises and supply chain thereof. Min and Galle found that enterprises were not active enough to integrate environmental issues into supply chain management, and enterprise green management was mainly driven by reducing the responsibility of terminal disposal and meeting regulatory requirements rather than establishing environmental partnership^[2] according to green research on U.S. purchasing managers. Environmental management implemented in enterprises is mainly driven by regulations^[3]. Foreign developed countries have relatively mature study in the aspect of green supply chain management driving force. Green management is implemented in some international well-known large companies.

Green Supply Chain Management was relatively late studied in China. Driving force and press were rarely studied. The empirical study of Qu Ying, Zhu Qinghua, etc. (2007) proposed that main driving force and press for Chinese enterprises to implement green supply chain mainly lie in the follows: environmental requirements from enterprise suppliers and higher authorities, cost for implementing environment management in enterprises, foreign environmental regulations, environmental requirements of foreign companies, Chinese laws and regulations and green consumption concept^[5]. Some scholars qualitatively studied the barriers and incentives in implementing green supply chain management^{[6][7]}. However, there are relatively few literatures for comprehensively studying driving force, press and resistance in green supply chain management. Domestic and foreign literature about green supply chain management was tracked in this study. Main driving force and press factors promoting China's enterprises to implement green supply chain management was analyzed and studied. 'Press - status - response' (PSR) and 'driving force - status - response' (DSR) analysis models were adopted for constructing driving force/press impact model of green supply chain management. The resistance factors of implementing green supply chain management as well as countermeasures were discussed.

2 Construction of Driving Forces/ Press Impact Model for Green Supply Chain

* Fund Project: National Education Ministry Project (Project Number: 10YJA630162): Study of relationship between Guangxi traditional manufacturing green supply chain and enterprise green economy behavior; Guangxi University Talent Funded Project (Grant No.: 201050): Study of relationship between Guangxi automobile manufacturing green supply chain and enterprise low-carbon economy behavior.

Management

2.1 PSR and DSR Analysis Model

PSR analysis model was developed on the basis of concept model of sustainable development policy analysis commonly developed by European Organization for Economic Cooperation and Development (OECD) and the United Nations Environment Program (UNEP). A policy analysis concept based on causality was actually proposed in PSR model for explaining three basic questions of ‘What happens? What is current situation? How shall we handle?’ in policy analysis. DSR analysis model replaces PSR mode press into driving force aiming at adapting to addition of some new indicators, such as social, economic, institutional and other indicators.

2.2 Green Supply Chain Management Driving Force/Press Impact Model

Supply chain is a complex system composed of supplier, manufacturer, distributor, retailer and end customers. It is urgent for enterprises to implement green supply chain management since society and government pay much attention to increasingly serious resource and environmental problems. .

PSR analysis model inspires study on implementation of green supply chain management: 1)What happens? - the requirement impact of society and government on the environment is the press (P); 2)What is the current situation? - Low running efficiency of traditional supply chain is the status (S); 3) How shall we handle? Forcible implementation of green supply chain in enterprises is the response (R).

Traditional supply chain system aims at maximizing economic performance on each node. However, the green supply chain aims at maximizing enterprise overall economic performance, social performance and ecology jointly after environmental and social factors are added.

DSR analysis model provides new interpretation for studying green supply chain management: 1)What happens? - economic performance, social performance and ecological performance form the driving force (D); 2)What is the current situation? - Low efficiency of traditional supply chain efficiency is the status (S); 3) How shall we handle? - Active implementation of green supply chain management in enterprises is the response (R).

Social press and government press caused by resource shortages and environmental pollution do not directly drive enterprises to implement green supply chain management. The enterprise solves environmental problems by some resources to reduce external risks and ensure maximum economic benefits [8] [9] at all. Press is converted into driving force under certain conditions, thereby enabling enterprises to actively implement green supply chain management rather than passively implementing green supply chain management in the study. The model is constructed as figure 1.

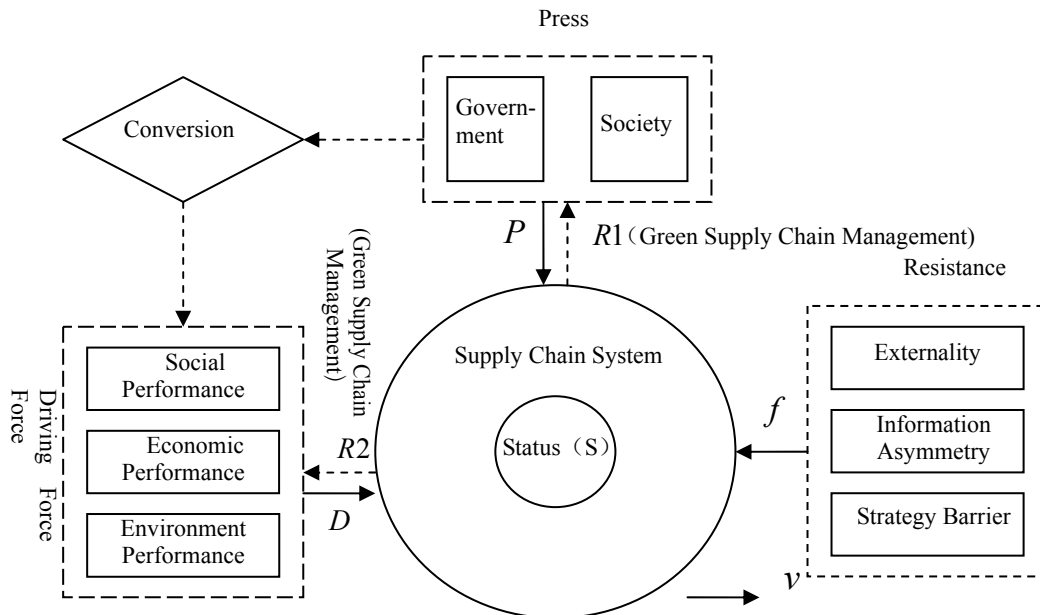

Figure 1 Green Supply Chain Management Driving Force/Press Impact Model

3 Analysis of Driving Force/Press Impact Model for Green Supply Chain Management

The driving force /press impact model for enterprise to implement green supply chain management is composed of press, driving force and resistance, which jointly affect enterprises in implementing green supply chain management.

It is hypothesized in the study that the green supply chain system is a ball on the desktop. The horizontal rightward velocity of the ball v represents the operation efficiency of green supply chain system. The ball is affected by horizontal rightward driving force D , vertical downward press P , horizontal leftward resistance f and the supporting force of desktop to the ball. When $D \leq f$ and $v = 0$, it indicates that the enterprise does not implement green supply chain management. When $D > f$ and $v > 0$, it indicates that the enterprise implements green supply chain management.

3.1 Analysis and Assumption of Press and Driving Force Factor

The press (P) on supply chain system comes from government and society as shown in Table 1. S refers to status of supply chain system. Green supply chain management is passively implemented as response ($R1$). The driving force (D) of supply chain system mainly comes from social performance, economic performance and ecological performance. Green supply chain management is actively implemented as response ($R2$). Assumption: all press and driving force factors are mutually independent. Press (P) does not affect the velocity of the ball (v), enterprises passively implement green supply chain management for converting press (P) into driving force (D) Since the force on the vertical direction is balanced.

Table 1 Associated Factors of Enterprises Under PSR and DSR Modes

Factors	Name	Description
Press (P)	Society (P_1)	Enhancement of consumer awareness of environmental protection, rise of green consumerism, etc.
	Government (P_2)	Domestic and foreign policies, laws and regulations about environmental protection, etc.
Driving Force (D)	Social performance ($D1$)	Serving customer, quality standards, high customer loyalty, etc.
	Economic performance ($D2$)	Cost saving, high market share, continued profit, etc.
	Environmental performance ($D3$)	Low environmental influence (side effects), high resource utilization rate, etc.
Status (S)	Environment pollution (S_1)	Production with high consumption and high pollution
	Resource waste (S_2)	Production with high input and low output
	Efficiency lowering (S_3)	Low efficiency of traditional supply chain operation
Response (R)	Response (R_1)	Enterprise passive implementation of green supply chain
	Response (R_2)	Enterprise active implementation of green supply

3.2 Resistance Factor Analysis

Most enterprises have driving force and press to carry out green supply chain management in China, which are not converted into practice [10]. If green supply chain management is not implemented in enterprises, ie $v = 0$, it is indicated that the resistance for enterprises to implement green supply chain management is greater than the driving force, namely, $D \leq f$, which mainly includes three factors in operation process of green supply chain: resource input externality, information asymmetry and green strategy obstacle.

3.2.1 Resource Input Externality

Externality refers that the individual utility function contains the actions of other people; it can be expressed as follows with the function formula: $F_j = F_j(X_{1j}, X_{2j}, \dots, X_{nj}, X_{mk})$ (1.1)

Where in, j is not equal to k ; F_j is welfare function of j ; X ($i = 1, 2, \dots, n, m$) refers to economic activity. j and k refer to different people (or vendors). It indicates that the revenue of individuals (or vendors) j is not only affected by economic activities controlled by themselves, but also is affected by economic activities controlled by other people (or vendors) k . The revenue of j can obtain profits due to economic activity of k when m is a positive number, namely, positive externality. The revenue of j will be lost due to k activities when m is negative, namely, negative externality.

Generally, externality is studied on the basis of discussion in the same time period, namely, j and k belong to economic entities in the same time period. However, it is clearly not enough to examine economic entity externality only from the same time period according to the study on green supply chain system pursuit of sustainable development goals. It is necessary to examine the externality from different time periods, ie j and k can belong to economic entities in different time periods. Resource is the input source of supply chain operations, which is necessary for operating the supply chain. Supply chain node is determined when its marginal revenue equals to marginal cost according to the resource input and development process due to the presence of self-interested behavior in the supply chain system. There are also externalities in different generations during the development process of the supply chain on resources. It should belong to the public (including the unborn generations) from the ownership point of view although the common property boundaries on resource are clear for collective (community, city, country or world), and every member of society has equal rights in the resource property^[11]. Contemporary must develop high-quality resources with high added value and high return rate in order to lower the resource use cost, thereby maximizing own utility. They ignore environmental costs, thereby leading to over-exploitation of resources and accelerated deterioration of environment.

3.2.2 Information Asymmetry

Information asymmetry theory is used for describing the influence of asymmetric distribution of related information between transaction parties on market transaction behavior on incomplete information market, as well as subsequent issues about market operation efficiency. Information asymmetry is mainly analysis in two aspects in the study, namely, information asymmetry of all nodes in the green supply chain system, and information asymmetry between consumer and green manufacturer on green product market.

The party with information advantage can obtain transaction behavior with relative advantage in the transaction process since each node in the supply chain asymmetrically masters related information on own trading behavior. The relative advantage is mainly reflected in developing internal price in internal market of supply chain system. If there is a supply chain composed of n nodes, the normal margin rate of green products implementing green supply chain management is r , the unit green cost is c , the green cost includes cost of green procurement, green packaging cost, green transportation cost, etc. the internal price of each node transaction in the supply chain is $p_i = c_i(1+r)$ (1.2) under the condition of information symmetry.

Wherein, p_i is price of the i th node, $i = 1, 2, \dots, n$; c_i is the green cost of i th node; r is normal margin rate of green product.

However, the information is asymmetric in actual economic activity. The party with information advantage can falsify the green cost c_i of product and develop higher internal price p_i in the internal market transaction process, thereby getting more profits. However, the exceeded profits are obtained with the expense of encroaching normal profit of other nodes on the green supply chain. The overall total profit on the green supply chain is unchanged. The driving force on the information disadvantage nodes for participating in green supply chain management is weakened, and green supply chain management can not be operated properly as a result.

All nodes of the market in the green supply chain system have information asymmetry on one hand, and the external product market also has information asymmetry phenomena between consumers and green producers on the other hand. Manufacturers are clear about whether their products are green and environment-friendly or not, but they often exaggerate the green and environment-friendly extent of products through media advertising in order to obtain greater profits and higher market share. Consumers can not distinguish green products from traditional products in the case of information asymmetry. The green products are generally replaced by traditional products, and the green supply chain system can not be operated properly as a result.

Examples: It is hypothesized that there are a traditional supply chain and a green supply chain in the market. S_1 refers to the supply curve of traditional supply chain to supply traditional product, while S_2 refers to the supply curve of green supply chain to supply green product. The demand curve of consumers on traditional product is D_1 . The demand curve on green products is D_2 . The general supply curve on the market can be described with $S(S = S_1 + S_2)$ as shown in figure 2 because consumers can not distinguish traditional products from green products on the market.

Figure 2 Market Competition Behavior Analysis of Traditional Product and Green Product

P_1 refers to equilibrium price of traditional products in the market, while P_2 refers to equilibrium price of green products. However, consumers may purchase traditional products according to P_2 price since the aggregate supply curve is composed of traditional product supply curve and green product supply curve. It is hypothesized that: the possibility for consumers to estimate own purchased green products and traditional products according to recognition is respectively e and $(1 - e)$, and the actual demand curve is: $D_0 = (1 - e)D_1 + eD_2$ (1.3)

Actual price is: $P_0 = (1 - e)P_1 + eP_2$ (1.4)

Assumption: r refers to market normal margin, C_1 for the unit cost of traditional product, C_2 for green product unit cost, apparently $C_1 < C_2$. $P_1 = C_1(1 + r)$ $P_2 = C_2(1 + r)$ (1.5) is available under completely competitive market conditions.

Profit rates of traditional products and green products are obtained as follows respectively according to formula 1.4 and formula 1.5

$$r_1 = \frac{p_0 - C_1}{C_1} = r + \frac{e(1+r)(C_2 - C_1)}{C_1} \quad r_2 = \frac{p_0 - C_2}{C_2} = r - \frac{(1 - e)(1+r)(C_2 - C_1)}{C_2} \quad (1.6)$$

The traditional product profit rate r_1 is larger than the product market normal profit r since $C_1 < C_2$. However, the profit rate r_2 of green product is less than market normal profit r of product, namely, $r_2 < r < r_1$ (1.7)

The actual market price P_0 is not beneficial for the green product provided by green supply chain. The supply of green products is reduced on green supply chain system as a result. Consumers' possibility e to estimate own purchase of green products will be decreased due to the reduction of green products, thereby further increasing $\Delta r (\Delta r = r - r_2)$. The green product supply will be further reduced on green supply chain system, and the system will eventually retreat from the supply of green products and turn to provide traditional products in traditional supply chain.

3.2.3 Green Strategy Barrier

More and more domestic enterprises treat supply chain management as enterprise development

strategy at present. However, fewer enterprises treat green supply chain management as enterprise development strategy. It is difficult for enterprises to implement green supply chain management due to weak environmental protection consciousness and imperfect environmental protection system. Firstly, many enterprises ignore the negative externality of environmental problems in developing enterprise development strategies, and believe that cost will be increased if enterprise implements environmental management, which is contrary to the objective of maximizing enterprise value. Secondly, Chinese citizens have not formed concept of green consumption as a whole although their consumption awareness is directed to green products. The citizens are not fully aware of the importance of green consumption on environmental protection prior control. Thirdly, environmental protection system needs strengthening, enterprise pollution behaviors are lightly punished at present according to China's laws and regulations without effective supervision. For example, existing sewage discharge charge collection standards are much lower than the pollution comprehensive management costs. Enterprises always pay sewage discharge charge from the cost-benefit point of view rather than governing the produced pollution.

4 Conclusions

Green supply chain system can not function properly because the resistance factor is greater than driving force factor. The resistance mainly lies in three aspects of resource input externality information asymmetry and green strategy barrier. The following measures are proposed in this study for reducing the resistance of green supply chain system, and meeting conditions of normal operation in green supply chain system, namely, making driving force greater than the resistance:

Firstly, green investment funds should be established; Green investment fund refers that the investment objects are screened according to enterprise social, economic and environmental comprehensive performance for investment in the stock market. Green investment fund is assessed according to social, economic and environmental comprehensive performance, thereby effectively reducing the external barriers of resource input in supply chain. Special green investment fund can be composed of donations from governments, individuals, enterprise, consortia, NGO etc, thereby providing fund support for enterprises to implement green supply chain management.

Secondly, information sharing platform should be established. Information asymmetry lies in all nodes in the green supply chain system, while information is also asymmetrical in product market externally. The local area network information sharing platform for connecting all nodes can be established inside the supply chain, while Internet information sharing platform between supply chain system and the consumers can be established outside the supply chain as shown in figure 3. The information sharing platform in the supply chain can be established by core enterprises of supply chain. The information sharing platform outside the supply chain is established by government.

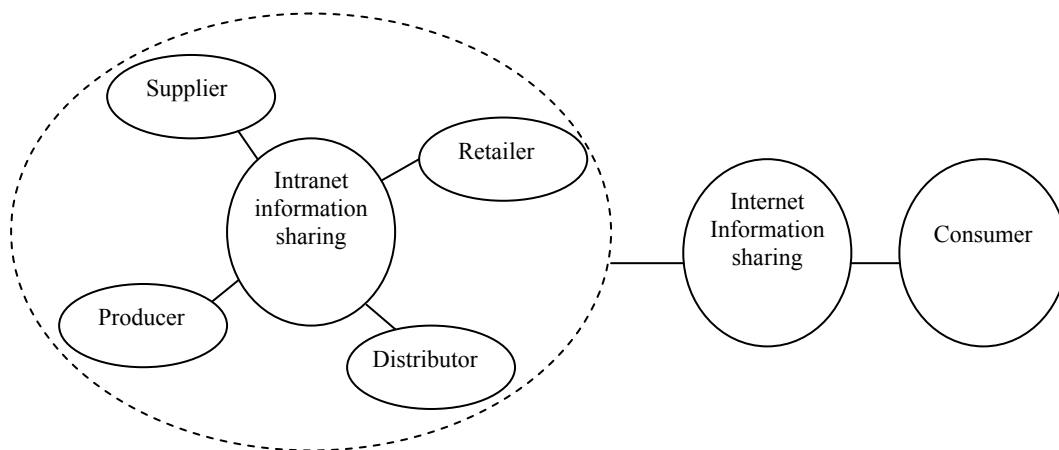

Figure 3 Green Supply Chain Information Sharing Platform Based on Intranet/Internet

Thirdly, green accounting should be implemented. Only economic efficiency of enterprises can be accounted in enterprise financial reports in the traditional supply chain, which ignore enterprise environmental efficiency and social benefits accounting. Green supply chain not only takes into account the economic efficiency of enterprises, but also considers the environmental and social benefits.

Therefore, "green accounting" should be implemented in green supply chain management, i.e. traditional economic benefit accounting accounts should be expanded to integrated accounting accounts including economic, environmental and social benefits. Enterprise financial report includes both economic benefit information and information on environmental and social benefits by green accounting, which has important practical significance. The public can obtain data about enterprise social benefit, thereby enhancing the concept of green consumption, while the government can get data about enterprise environmental benefits, thereby establishing more comprehensive system of environmental protection accordingly. The enterprise development goals are converted from maximizing economic efficiency into maximizing economic benefits, environmental benefits and social benefits jointly. It is bound to treat green supply chain management as enterprise development strategy.

A Research Based on the Local Literature Service Mode under the New Media Environment*

Fu Peng

Library, Yunyang Teacher's College, Shiyan, P.R.China, 442000

(E-mail: 9800846@qq.com)

Abstract: This paper analyzes the present situation of the local literature service mode or environment as a traditional service environment together with the service bottlenecks, and discusses the change to this local service mode under the new media digital environment and innovation. Mainly from the service perspective this paper discusses the intelligent service platform, to improve the depth of the service level, and also the service concept development in the field of subject specialization. Finally a proposal for the local service development direction and prospects is made.

Key words: New media environment; Place literature; Service mode; Change; Innovation

1 Introduction

Local literature as a collection of characteristic literature resources of university library, is a reflection of a certain area of the economy, culture, politics, history, geography, natural resources, science and technology is the floorboard of the literature resources. As new media tools are widely applied in library information science, local literature service mode and fundamental changes have taken place. Traditional local literature service mode has not adapted to the current rapid development of Internet of things era information requirements. The author in March 2012 in hubei province at all levels of the library for the special questionnaire investigation, summarizes the conclusion after all survey data: consciousness of local literature service concept is relatively backward, service efficiency and quality is not high, less number of professionals engaged in the local literature, service mode and the domain is extremely narrow and related conclusions. Especially in new media environment, the information users high expectations on the local literature service model, which requires the library's local literature service to adapt to the current readers' information demand under the new media environment. Using digital technology, network technology, mobile technology, through the Internet and wireless communication network, satellite channels and computers, mobile phones, digital TV terminal in the local literature service work is the trend of the current mainstream in library service, but also to engage in local literature workers put forward the new responsibility and mission.

2 The Status of Current Local Literature Service

2.1 Backward service idea, service consciousness

On the concept of local literature service, is still the continuation of the traditional library information service with the center of literature thought, no more to consider the importance of readers, lack of deep and characteristic of information service^[1]. In library local literature service work, many librarians didn't realize the importance of local literature service in theory and in practice and is bound by traditional concepts and mind-set. Service mode is very passive, waiting for the documents the user visits, lack of initiative service consciousness, active development of local literature information is insufficient. Make a rich and distinctive can not effectively use information resources of library, create rich of local literature resources are idle in library stacks cannot play their literature value^[2].

2.2 Service strength weak, backward service level

After registration of registered in the local literature seminar in hubei province of librarians in questionnaire survey, after finishing summary for library local literature service personnel at all levels education background survey results (table 1), for example.

Service personnel degree level is uneven, service technical force is weak, cause local literature service does not reach the designated position, service level is uneven. After each type of library local literature service in hubei province the result of the questionnaire summary and analysis, from local

* This paper is supported by yuyang normal college youth in 2010 project "development and utilization of local literature research" (project number: 2010C04) and "three periods of the ministry of education CALIS 'wudang culture characteristic database project' instructional project (project number: 4401 - HUB - 507) was one of the research results

literature service personnel's education level analysis (see figure 1) : the specialized level of librarians can only do some simple work of literature retrieval, accounts for about 90%; Research subject service and the active service accounts for the proportion of about 10%, and for some innovation level and the heart is unable to work. Bachelor's degree in librarians relative to improve service levels, can carry on some research service auxiliary service work, but not heavy, the proportion of about 30%; Master degree of librarians in the information retrieval services proportion fell to 50%, and to develop service for teaching and scientific research and the proportion of data mining project is on the rise, accounted for 20% and 20% respectively; Doctoral degree deep subject librarians can do some service, such as: service research, data mining, information integration, information platform construction, etc. A high level of service, can effectively to develop the depth of local literature. But the reality is the library staff in master and doctor of the proportion of less, can't form the team strength local literature development. Various library local literature service work, therefore, there is still a service team strength is weak, the service level and reader demand growing literature also has very big disparity.

Table 1 All levels of Local Literature Service Librarians' Education Background Questionnaire

Quantity and degree Distributing type	Distribute copies	Recycling number	The recovery	Degree			
				College degree	Bachelor's degree	Graduate degrees	Doctoral degree
County library	30	28	90%	95%	5%	nothing	nothing
Higher vocational college library	50	40	80%	80%	15%	5%	nothing
University college library	40	35	88%	15%	30%	50%	5%
National library of province	10	8	80%	nothing	10%	75%	15%

Figure 1 The Degree Level and Local Literature Service Type Proportion Relationship Chart

2.3 Service quality is not high, a single service model

Figure 2 Each Type of Relationship Between Library and Local Literature Service Mode Ratio Charts

Through the analysis of the local literature service questionnaire survey statistics for each type library local literature service project in hubei province, found that at present basically establish the local literature service model in the traditional literature service mode based on borrowed. Main show is insufficient amount of literature, service methods, document resources distribution uneven, local literature service quality and efficiency not higher status^[3]. From each type of relationship between library and local literature service mode percentage chart (see figure 2) can be seen that the traditional circulation pattern in the counties and cities occupy high proportion of the state and the undergraduate course colleges and universities library: about 85%;70%;, and integrating the classification, development of literature service project occupies proportion is small, almost zero depth development. Level rising, but with the library local literature service quality gradually ascend, diversified local literature service mode are complex, diverse direction development.

2.4 Narrow inaccurate positioning, service fields

Throughout the various types of library's local literature service mode can be found that local literature service of positioning is not clear, target is not clear, service sector is very narrow. Traditional simple literature service mode occupy high proportion. The high standard, high quality, occupy a very small proportion of the high level of service. Through the analysis of local literature, questionnaire survey, refer to the hubei province cultural department of local literature statistical reports concluded that local literature service group services in relation to the chart (as shown in figure 3) : the proportion of local literature service for teaching and research accounts for 53%, the proportion is larger; Archaeological history revision occupies 21%; To serve local economic economy accounts for 15%; Macro decision-making for the government hold only 11% of the proportion, some less. Disadvantages of these service models and bottleneck in local literature service platform has been unable to deeper levels of development, make the library local literature service level has been lagging behind the current intelligence service technical level.

Figure 3 The Local Literature Service Group Servicesin Relation to the Rate Chart

3 Change of The Local Literature Service Mode

Readers way of reading under the new media environment and habits change, local literature service mode in the intelligent, the direction of specialization, depth and expand^[4]. As the government departments at all levels have stepped up efforts for the development of local cultural resources, but also in policy, funding, personnel, technology gives certain tilt. Through the guidance of government policy, will be disordered and complex restructuring local literature focus on integration in together, form the literature resource pool. So you can make local literature resources better for readers to use, for scientific research, as used by the government. Local literature service has strong mergence and ages. As engaged in the local literature service workers should extend service field width, expand function and range of professional services, the traditional local literature service combined with the current library service concept knowledge organization, found that latest dig into it, in a flexible and intelligent service concept to promote change and innovation of local literature service.

3.1 Service concept constantly advancing, the service object gradually broad

Local literature service means now with the development of science and technology and the huge change, service concept closely combine with today's advanced science and technology unceasingly, the service object is also gradually spread to the public from professional readers. Especially in modern library reference consultation, sdi service, subject librarians, topic tracking, document searching, universal search, intelligent services service mode has been gradually applied to the local literature service system in^[5]. The modern advanced science and technology level of local literature resources use and development has played a very important role, for the user of the services is more broad. Traditional

local service scope radiation only campus readership, influencing factors is limited. And the wide application of digital technology and network technology makes the local literature service concept gradually with today's technology. Service object is also gradually spread across professional, at all levels and in all areas of each group.

3.2 More remarkable services librarian to professional, the service level

Services provided by the local literature service librarians by non-professional gradually turned to professional transformation. Service team gradually by the part-time staff before the transition to professional senior consulting research librarian. Related statistical data, the author combined with hubei province library after the local literature in a survey data analysis, concludes that hubei province each type library local literature service team of record of formal schooling and title TAB (see figure 4) can be seen: local literature service of librarians' education level are improved, by the general university and college education gradually to the master, doctor degree in transition. Title structure more reasonable, gradually promoted from assistant librarian to research librarian. More and more highly educated and high title of professional librarians are in position on the local culture service. As the service team of high degree, high title librarians ratio increased. Local literature towards professional service teams are starting to service groups also gradually to high-end services, service level is more distinct.

Figure 4 The Degree of Local Literature Service Team With Professional Titles Proportion Relationship Chart

3.3 Gradually improve service quality, service methods are varied

With the continuous development of library cause, the local literature service quality also gradually improve, local literature service quality also gradually from the shallow, passive, low-end, decentralized to the depth, active, high-end, integrated direction [6]. Service mode also gradually from a single literature borrowing, indoor reading services extended to the academic forum and so on some knowledge, academic service level, service quality has gradually improve. Such as local literature forum, regularly invited experts and scholars local literature academic exchange meetings and other forms of activities. In addition service method has various forms, rich and colorful. Through local literature show films, local literature resources development strategy seminar held a variety of activities such as make the jobs of local literature service development situation gradually formed a "heat island effect" makes the local literature service quality have greatly improved.

Such as local literature service extension project in our school invited a Taoism culture, han river, automobile, exile, the three leading figures in the field of culture, the book of culture research: YuBin, Yang Lizhi, rao to bite into, Wang Xuefan forum, experts and scholars to open local culture can not only lead the research direction of local culture, so on sets up the local literature service brand plays an extremely important exemplary role.

3.4 Service technology to deepen and service areas continue to expand

In current local literature service technology, the use of knowledge map, weibo, micro letter, databases, information pushing, qr codes and constructing an RSS technology for users to access business such as trend analysis, the contact between the knowledge work can make local literature service technology becomes more mature. We use the books management system management system, advanced to dig deeper into the car culture. Bibliographic retrieval results from a car culture collection figure related to car culture library as shown in diagram (see figure 5, 6) : car culture aspects of books

by automation system will auto culture through the library's analysis of data and connection of knowledge map visualization can be observed from different latitudes, and local culture more in-depth knowledge of a link between the observation and analysis. In order to more in-depth mining knowledge depth of local literature.

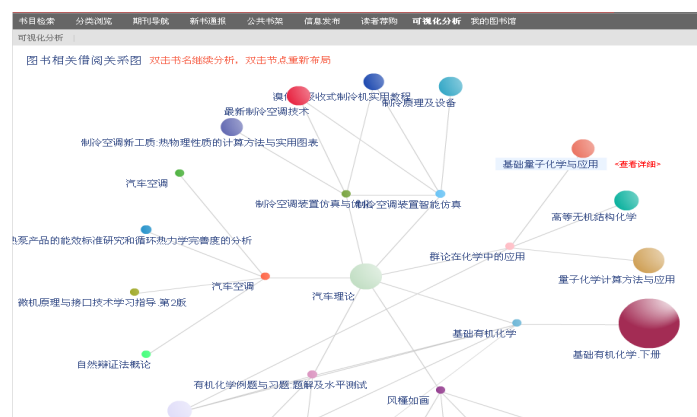

Figure 6 Car Culture Related Library Diagram

4 Local Literature Service Mode

4.1 The innovation of the service concept

Library service concept is the basic principle of guide library service work, is the main component of the overall project. Is the library user service principle, attitude, service mode. For digital and network into the characteristics of modern university library, set up the new service concept is not only their own development needs, is also a response to various challenges under the network environment of competition needs [7]. Local literature service mode of university library under the network environment should have the latest service concept. Using current advanced mobile service platform to carry out the palm reading local literature pattern (mobile), WIFI, etc., to carry out the library's "knowledge service", "intelligence services", "topic" service model, the innovation of the local literature service ideas and means.

4.2 Service technology upgrades

As new media communication technology matures, the library local literature service technology has development in the direction of intelligent, networked and digitized. Knowledge to promote integration and docking with the mainstream media gradually. Blog, BBS, micro bo, micro letter, fetion, QQ group, group of micro letter, fetion group messaging tools such as accepted by the public gradually. Qr code from mobile phone in library bibliographic query system application (figure 7) as can be seen. Readers can direct use of mobile phones will qr code to convert bibliographic information to text information retrieval related literature. Readers at the same time also can use weibo with instant online consulting (as shown in figure 8) : the development of information technology drives the escalation of local literature service technology. As the latest scientific research analysis and evaluation tools such as academic search, database in library local literature service system, the application of these advanced information interchange tool will greatly promote the refinement and deepening the service function of library's local literature.

Figure 7 Phone Qr Code In a Library Bibliographic Query System Applications

Figure 8 Weibo Consulting Service In the Library Application

4.3 Transformation of service mode

Across the land to build local literature. Use academic conference, the aggregate special local literature resources in university library. Through scientific research and academic guidance, to make local literature service specialization, characterization and clustering, brand development pattern [8]. Increase the intensity of local literature service project development, actively carry out local literature forum, the forum of "jingchu" culture; academic exchange activities such as tai chi wudang BBS, can make local literature resources more fully by the scholars. In addition special literature exhibition activities. Will local historical data exchange exhibitions, rubbing, etc; Out of hubei, and promote the wudang between different provinces, literature of hanshui culture exchange activities; Collection, wudang Taoism classics into Taiwan, and Taiwan culture sector to carry out cultural exchanges, with cultural exchanges to promote cross-strait exchanges and cooperation. In addition can also further abroad, to Singapore, South Korea, Malaysia and other countries of wudang literature communication. Really use cultural transmission power scope and field of promoting local literature service. The local literature service of this region to do deep, wide, do strong, do big, do really become culture communication facilitator and enabler of cultural development.

4.4 Development in the field of service

Promote the docking and sharing of local literature platform, service regional economy, promoting the development of local culture. Local literature with 211 schools and 985 colleges and universities cooperation projects. Use high school the abundant technical force and advanced technology and equipment, development, sharing of local literature resources. Through resource integration, technology innovation, to assist the development, mutual benefit cooperation mode, local literature resources in the implication of the literature information digitalization, intensive and public welfare^[9]. Local literature services from pure academic services to service culture, tourism, education, publishing, the Internet industry. Using new media communication tools such as micro letter with qr code identification function, information pushing, information customization, the latest trend of service means such as RSS, constantly digging potential of local literature information resources, establish local literature service department cost region cultural information consultation center of authority.

In addition, must enhance the cooperation with the competent department of culture. Such as museums, cultural centers, art communication. Actively to the government office of local Chronicles understand today's latest research field and relevant government policies. Increased cooperation with tourism departments, to embed the culture elements of local literature classics tourist landscape layout.

Made Suggestions or offered plans to the government department in charge of planning, in the city planning and construction, into the properties and characteristics of local culture. Such as YunXiXiantianhe went into cultural square in Chinese cultural elements. Fangxiancounty of cultural square in the book of songs into the cultural factors. In addition to the danjiangkou water theme park is set with a lot of han river, such as immigration culture elements in it. So say: library local literature service radiation field can be popularized in culture, tourism, urban construction, government policy, education publishing plays a distinctive features such as, produce great social effects.

Combined with regional characteristics as our local literature service project to carry out some of the more characteristics. Such as: to carry out the collection of wudang culture and the culture of han river, development and mining, wudang literature service center was established, offer the experts and scholars of our university in wudang culture knowledge mining. Also often with of shiyan government local historical office to strengthen cooperation, long-term and wuhan university, huazhong normal university, the deployment of colleges and universities to carry out the local literature research project of research, make full use of the library collection literature richness of effective local literature service work, has been the industry peer recognition, some provincial librarians have also follow to learn. Our local literature service in serving local economic construction, scientific research and teaching, tourism and cultural aspects to explore the many worthy of promotion experience, has led to other paid attention to the service of local literature work of university library, has a strong demonstration and leading.

5 Conclusion

Hubei Northwest local literature development and utilization of chongqing should accelerate the construction of shiyanEYuShan adjacent to the regional central city with strong literature guarantee support. As a local university libraries should actively undertake to speed up the build strategic pivot to new mission of local colleges. Bigger and stronger regional local literature service center, integrate the existing literature resources, and increase with 985 colleges and universities, government, culture and tourism department cooperation, improve the local literature service team cohesion and influence, with scientific research and academic guidance driving the development and utilization of literature resources. To seize new opportunities, development platform, for the development of local education, culture, tourism and economy to provide a compendium of high quality support services, encourages local characteristics gradually formed in the local literature service in university library service brand. Make special local resources, improve the contribution rate of colleges and universities to local economic and social development, which provide solid literature for regional center city building security support.

Abstract: This paper puts forward a low-carbon development principle which combines practices of carbon reduction and sequestration with a focus on the latter approach. It proposes a low-carbon development model in China, in order to reduce carbon emissions at source as well as throughout operational processes, achieve terminal biological carbon sequestration, and promote coordinated development between industrial and agricultural sectors through domestic carbon trading.

In order to reduce economic-related carbon emissions, efforts need to be made so as to utilizing low-carbon raw materials and extraction technology to reduce CO₂ emissions at source; saving energy and reducing consumption during the whole process of material exploitation, production and terminal consumption; promoting agro-forestry to increase food yields; developing bio-energy and improving the soil to enhance carbon sinks; and speeding up the carbon recycle and carbon sequestration, to eliminate terminal CO₂ accumulation.

In addition, by referring to the clean development mechanism (CDM), China's industrial and mining enterprises can compromise emissions between themselves. Through off-site carbon sequestration in the agricultural sector, low cost emissions reductions will also be achieved. All these methods will lead to a low carbon economy which does not compromise GDP growth rate and people's living standards. Meanwhile, these methods will provide solutions to issues connected with national energy security, food security, environmental safety, the protection of arable land, urbanization, improvement of the agriculture by the industry, the "Three Rural Issues" (agriculture, rural areas and peasants), thus enabling the country to achieve its low-carbon goals over a long period of time.

Key words: Low-carbon economy; Development model; Low-carbonization; Source; Process; Terminal; Carbon Trading model

1 Introduction

To reduce CO₂ emissions in order to achieve green and low carbon development has become a global agenda. Tackling climate change caused by emissions of CO₂ and other greenhouse gases has become one of the world's biggest environmental challenges. As the climate deteriorates, its impacts have drawn increased attention all over the world. Adopting a low-carbon pathway is believed to be a strategy to combat climate change while also achieving GDP growth, social and ecological development. Under this global trend and with its own goals, China is moving forward to a low-carbon era. As the largest coal consumer and the second largest energy user in the world, China emitted 6 billion tons of carbon dioxide equivalents (tCO₂e) in 2008, surpassing the US to become the global leading emitter. Considering its current GDP growth pace, China's CO₂ emissions will rise by 3% on a yearly basis in the coming years. In response, China has set a target to reduce by 2020 its carbon emissions per unit of GDP by 40-45% than 2005.

In China, unbalanced, uncoordinated and unsustainable development is a prominent issue. To solve this problem, the critical task is to strength the conservation of resources so as to drive economic development. As a big country undertaking international responsibilities, China is doing everything possible to cut its emissions while reducing the carbon intensity. Meanwhile, the country is still facing many issues and challenges, such as food and energy security, preservation of arable land from falling below 120 million hectares, shortage of land caused by urbanization and industrialization, industrial restructuring and efficiency improvement, increased gap between rural and urban incomes, the "Three Rural Issues", energy saving and consumption reductions, as well as environmental protection.

In response to the above-mentioned challenges, the author proposes a low-carbon principle consisting of efforts in carbon reduction and sequestration as well as a focus on the latter. Under this principle, a low-carbon model is to be created in order to achieve carbon emissions reductions at source and throughout operational processes, to facilitate terminal biological carbon sequestration, and to sustain industrial and agricultural development by means of domestic carbon trading.

2 To Avoid High Emissions at Source

In modern industrial production processes, most raw materials come from a variety of sources and are exploited using different methods, which cause different levels of CO₂ emissions. So applying appropriate methods to exploit suitable raw materials will help avoid unnecessary emissions at source. This has proven to be one of the most effective ways to cut emissions. This approach requires support from national policies in taxation, industrial restructuring and upgrading, as well as rational energy pricing mechanisms^[1]. Taking coal-fired power stations as an example, choosing fine coal with low dust and proper excess air ratio can effectively reduce the amount of flue gas and loss of waste heat, thereby enhancing the utilization ratio of coal and cutting CO₂ emissions. Similar results could be achieved by applying the circulating fluidized bed (CFB) and the integrated gasification combined cycle (IGCC) technologies, as well as poly generation and ultra supercritical power generation. Taking the technology to produce synthetic methane as an example, the methane content of the synthetic gas which is produced by using lignite and long-flame coal through Lurgi and CFB pyrolysis gasification processes is about 10% higher than that produced through the entrained-bed gasification process. Technical calculations show that the former processes consume less coal, energy and oxygen, thus creating less CO₂ emissions. The CFB pyrolysis gasification process features dry ash extraction, relative easier heat exchange and low water consumption. And unlike the Lurgi process, the CFB pyrolysis gasification process does not create coal tar, nor does it result in producing phenolic wastewater. Thus the CFB process consumes less energy and is more effective in avoiding high carbon emissions. Avoiding high emissions at source might be realized by the coal chemical industry employing efforts such as producing oxygenated fuels through combined processes. Other methods include an increased use of natural gas as domestic fuel, further development of clean energy (nuclear, hydro-power, wind and bio-mass), the adoption of circular economy in the chemical industry, and an increased production of pure electric vehicles.

3 To Reduce Emissions during Operational Processes

During the whole process of economic activities, all stages, from the exploitation, production, application to end-product consumption, require energy consumption, thus raising an issue of energy efficiency. China's energy consumption for per unit GDP is 20-30% higher than the level of developed countries. In 2007, in comparison to international advanced levels, China needed to consume an extra 44 grams of standard coal to generate per kWh of electricity, an extra 58 grams of coal to produce per tonne of steel, and additional 31 grams of coal to produce per tonne of cement. These figures were 14%, 10% and 24% higher, respectively, than international levels.

On the other hand, a low utilization ratio of products indicates a high energy consumption in the end. Optimizing designs, using highly-efficient and energy-saving expertise and facilities, applying appropriate catalysts and choosing quality products will lead to energy conservation and a reduced consumption of end user products. Reduced consumption of end user products will then lead to reduced production of these products, thus cutting energy consumption and CO₂ emissions accordingly. So far, this is the easiest and the most cost effective way^[2] to reduce emissions. With national mandatory policies in place, these goals could be achieved through enterprises' own restructuring and transformation.

For the large-scale coal gasification process, a key element in the modern coal chemical industry, air separation is an indispensable part which accounts for 50% of both investment and energy consumption. The main product is liquid oxygen, and the byproduct of liquid nitrogen is only partly used, with the rest either used inefficiently or discharged.

If separate-stage cryogenic separation is used, most of the nitrogen composition at the low voltage side will have been sent out as product gas and does not need pressurizing by consuming high energy. The final product of this process is liquid oxygen and some liquid nitrogen. Hyperbaric oxygen required for this process can be supplied through hydraulic pressure with low energy consumption. This greatly reduces the processing and energy consumption of air compression, thus reducing gasification technology investment and energy consumption.

The cost spent in producing nitrogen fertilizer from fossil fuels is high in terms of investment and energy consumption. China also faces problems of low efficiency in production, low quality of nitrogen fertilizer, and poor methods to deliver the fertilizer to the crops. The utilization rate of nitrogen fertilizer in China is only 30% of that in advanced countries. This causes not only waste but also poisonous pollution. If slow or controlled release fertilizers are used and corresponding cultivating methods are

applied, crop yields and the efficiency in the use of fertilizer will be increased, and thus reducing fertilizer consumption and the CO₂ emissions which would otherwise be generated.

In order to substantially reduce energy consumption, it is suggested the chemical industry choose highly-efficient catalysts, energy-saving separation, reaction, heat transfer and pumping equipment, and frequency modulation techniques. For the chemical processing industry, distillation is the most preferred homogeneous-system separation technology and is also currently the process consuming the largest part of energy for chemical separation.

If an inclined, long and three-dimensional NS compound tray, an organic combination of a trapezoidal vertical bar cap cover with structured packing, is used to transform F1 floating valve plate, valve hole kinetic energy factor could reach up to 34, with the opening rate of up to 40% (Currently, the maximum opening is only about 20% at home and abroad). The processing capacity can be improved by more than 200%, much higher than the current maximum of 70%; Meanwhile, downcomer's carrying capacity will be increased by more than three times, with pressure dropping by more than 30% and board capacity rising by more than 30%; operating flexibility will increase by four times. All these will solve issues to do with structure and installation of large-scale tower-shape facilities and is the first case of its kind domestically.^[3]

There are too many energy-saving technologies and products to cite for the varied number of industries in China. All of them are the most effective options for China to achieve emissions reduction goals. What is needed is a coordinated effort between related departments, agencies and associations to promote these solutions.

4 Terminal Sequestration and Storage

Any economic activities which consume resources and energy will inevitably produce carbon emissions. It is impossible to achieve a state of zero carbon emissions. But carbon emissions caused by significantly increased use of fossil energy has risen way beyond the capacity of carbon cycling. And approximately 25.7 billion tCO₂e of emissions is released into the air every year, and its accumulation has led to the global climate change crisis. To tackle the climate issue, enterprises and scholars at home and abroad have paid increased attention to research and implementation of CO₂ capture and storage (CCS). It will be a forced option and the last resort, because it is an immature technology which is both costly and dangerous, and might cause secondary disasters.

In fact, the solutions to anthropogenic CO₂ emissions include not only efforts in cutting emissions, but also those in increasing the utilization of CO₂ in a bid to realize carbon neutral. This is a positive step to take and a breakthrough to make to speed up efforts in emissions reductions. This not only raises a technical issue, but also calls for the creation of carbon markets among enterprises, industries and regions in China for better solutions to cut emissions.

China has surpassed Japan in GDP to become the second largest economy in the world, but per capita GDP in China remains low. China is still in the process of developing its economy, improving its economic structure and increasing living standards of its people. Doing so will lead to an unavoidable increase of the country's CO₂ emissions year by year. This will result in China, which has already been the world's leading emitter, facing an even greater challenger to cut its emissions while growing its economy. Besides, it has to deal with other strategic issues, including national energy and food security, protection of arable land, industrialization and urbanization, nursing the agriculture by the industry, the "Three Rural Issues" and environmental conservation.

Considering China's situation and development stage, and referring to international emissions reduction mechanisms, the author suggests that industries with emissions of varied concentration adopt different carbon reduction and sequestration methods and approaches. At the current stage, for those industrial and mining enterprises which low-concentration emissions, off-site biological carbon sequestration measures is a cost effective option to speed up carbon cycling. This will not only lead to emissions reductions, but also help improve the soil to increase the areas and efficacy of cultivated areas to substantially increase food yield. People's living standards are expected to be improved under the drive to develop a low-cost low-carbon economy. Meanwhile, other strategic issues as mentioned above will be addressed at the same time, thereby increasing the country's capacity and global position in its response to climate change.

For those coal chemical and lime industries with high concentrations of emissions (above 90%), it is a better option to capture their emissions and apply them for such production as dry ice, synthetic urea, salicylic acid, cyclic carbonate and polycarbonate. CO₂ flooding oil extraction and CO₂ gas-fertilizer,

the latter being used for agriculture greenhouses, are among other low-cost and low-energy-consuming methods. At the same time they are effective and profitable ways to use the greenhouse gas to cut emission reductions.

Figure 1 Advantages and Limitations of CCS

Sequestration methods	Volume(10^8 t)	Advantages	limitations	Current status
Natural carbon sequestration	100-1000	Green and Environmental; Using ecological systems to store the carbon element;	Cannot reduce CO ₂ in the air in short time	Large-scale use
Geological sequestration	Diluted oil field: 1250 Exhausted gas field: 8000 Underground salt-water layer: 4000 Deep coal layer: 1480	Capable of improving oil-gas recovery efficiency, and obtaining more oil and gas;	CO ₂ is easy to be emitted and pollutes water if earthquake or volcano eruption occurs	Mature (IPCC)
Deep-sea sequestration	40000	large amount of sequestered carbon;	CO ₂ is easy to be emitted and destroys ocean system if earthquake or volcano eruption occurs	Under development
Optical and chemical synthesis techniques	N.A	High processing efficiency and easy to be combined with other techniques;	Slow reaction time may cause difficulty in large-scaled application	Under development
Artificial reef	N.A	Low cost, no power compensation is required, the product is stable, safe and unpolluted;	Slow reaction time may cause difficulty in large-scaled application	Under development
Ocean fertilization	N.A	Large construction area, capable of increasing fishery production	Large amount of methane emitted may destroy the ocean system	Under development

For the largest number of and widely scattered power plants and small-and-medium-sized boilers with low concentrations of emissions (less than 16%), there is no need for them at this stage to focus on centralized carbon sequestration. Through domestic carbon trading, they could achieve low-cost off-site carbon sequestration.

Considering the factors such as China's land distribution and soil composition, the agricultural status, plans to develop bio-energy, and development imbalance between the industry and the agriculture, the author suggests that industrial and mining enterprises which emit low-CO₂-concentration flue gas re-allocate the investment and operational cost for carbon sequestration to re-feed and support the development of the agriculture and forestry.

Government agencies and related departments could put the funds together for the transformation of low-yield farmlands, to improve grain yield and quality and increase bio-mass production; The money can also be used to improve non-cultivated land, saline-alkali soil and shoals, and address issues of land desertification and heavy metal pollution. To achieve these targets, modern technologies will be applied to the sowing of fast-growing energy plants and crops, to develop carbon sink forests and pastures, and to transform degraded grassland.

All these efforts will enable us to better use solar energy, speed up the carbon cycle, and increase CO₂ utilization, in a bid to reduce the amount of CO₂ which cannot be offset. In return, all these will substantially increase arable lands and production of bio-mass, output of bio-crude through pyrolysis technology, as well as farmers' incomes. At the same time, the cost for enterprises to cut emissions will be reduced. This will deliver a multiple winning result for the industry, the agriculture, the government and the society as a whole. This comprehensive approach could be simply summarized as a process route: enterprises fund the formation of a carbon fund, to invest in agro-forestry, to improve soil and enhance its carbon sink capacity, to increase food and bio-mass production, to produce bio-crude - to

benefit all stakeholders in the end.

Genetic modification (GM) and toxic and hazardous trace substances, which are often issues raised for agricultural food products, are not an issue when bio-mass is used for producing energy fuel. On the contrary, GM technology will help increase crop yield and rehabilitate contaminated soils, thereby delivering economic, environmental and social benefits. Fast pyrolysis of bio-mass is the best technology to utilize carbon to produce bio-fuel, thereby speeding up the carbon cycle and realize a carbon cycle balance^[6].

In addition, humic acid, produced as a result of fast decay of bio-mass within seven days, could be used to produce organic fertilizer, which will help improve soil fertility and water retention, thereby increasing crop yields. To increase the current humus content of less than 1% in the vast majority of soils in China to about 2% will create a huge opportunity to store hundreds billions of tonnes of carbon.

5 Conclusion

The paper suggests developing and choosing appropriate and suitable raw materials and technology will help avoid CO₂ emissions at source. This proves to be the most effective way to reduce carbon emissions.

Energy saving could be achieved during the whole operational process from energy extraction, production and application of product, to end-product consumption. This approach to cut emissions during the process of economic activities is the most achievable and cost-effective way to realize emissions reductions. It is also expected to deliver better economic benefits.

Different carbon capture, utilization and storage methods and approaches are suggested to be adopted by industries with varied CO₂-concentration emissions. Considering the current stage of China's industrial and agricultural development, domestic carbon trading together with off-site carbon sequestration will offer solutions to achieve low-cost carbon emissions and meanwhile benefit both the industry and the agriculture at the same time.

To ensure GDP growth and the gradual increase of people's living standards is the prerequisite for the development of a low-carbon economy, which requires collaboration of the industry and agriculture to better utilize CO₂ to eventually achieve emissions reductions. The low-carbon pathway will also provide solutions to other issues facing the country, including energy and food security, protection of arable land, urbanization, rural problems, and shortage of freshwater resources and strategic challenges of environmental protection. The industry, the agriculture, the government and the society will benefit from low-carbon development. And the country as a whole will see its capacity enhanced to achieve its emissions reductions targets, thus demonstrating its position and contribution to global efforts in combating climate change.

Teacher Education for Sustainability in Pakistan

Nabi Bux Jumani¹, Faheem Abbasi²

1 International Islamic university Islamabad Pakistan

2 Department of Education, International Islamic university Islamabad Pakistan

(E-mail: nbjumani@yahoo.com)

Abstract: Education plays vital role in sustainable development. Education is permanent modification of creativity and behaviour as the result of new experiences through education (Kaushik, 1997). It is not only a catalyst with potentialities to transform all the aspects of development but contributes in the current challenges of sustainability. The aim of education is to ensure and secure the basic purpose of education, to achieve the tasks of life and to attain basic life skills in an integrated and sustainable manner (Azam, 2003). According to Singh (2008) "Education is essentially a process of growth and development, which goes on throughout the whole life" (p.7). Education for sustainability is less understood and less practiced by teacher educators in Government Colleges of Education offering Associate Degree in education and four years B.Ed program. It is difficult to assume that whether teacher educators have proper acquaintance with education for sustainability, skills and willing to incorporate education for sustainability in teacher education policies and practices. In addition, it cannot be presupposed that through experience teacher educators will attain such skills. Therefore, education for sustainability should be carefully planned and made as integral part of teacher education programs instead of ad hoc based approach for education for sustainability.

This study will investigate how Associate Degree for education teacher training program for prospective teachers has been designed or shaped and find out how teacher educators are affianced with education for sustainability in their teaching. The purpose of study is (i) to determine the elements of Education for sustainability before and after Associate Degree program, (ii) to investigate teacher educators knowledge, skills and attitude related to education for sustainability and, (iii) to examine the perception and engagement of teacher educators regarding education for sustainability. The focus of this study will be on five indicators of sustainability which include the social impact of education, education as strategy for development, financial viability, adaptability and capability to bring socio-economic change. A case study approach will be used for this study. Data will be collected through surveys, in-depth interviews and analysis of over five years documents.

Key words: Sustainable Development; Process of growth and development; Teacher educators; Prospective teachers; Social impact of education; Financial viability; Adaptability and capability; Socio-economic change

1 Introduction

The teacher education in Pakistan has been facing serious challenges in terms of policy, quality and lack of resources. During the past two decades several initiatives have been taken to improve the teacher education but recently innovative reforms have been initiated by under PRE-STEP project with the support of USAID. The aim of this innovation was to enhance the quality of teacher training through introduction of a two-year Associate Degree in Education (ADE) and BEd (Hons- a four-year). The new introduced programs have replaced Primary Teacher Certificate (PTC), Certificate in Teaching (CT) and one-year B.Ed program prevalent during transition period. Both the ADE and a four years BEd has been initiated in elementary colleges of education in Pakistan including public universities It is assumed that EFS have been considered in the design of programs.

Education is essentially human capital as it is directly promotes the quality and capability of human being. Education improves and develops the verbal skills, and expenditure on human resources increases the national product and also increases the wealth. Education produces a society, which has more productive capacity to satisfy the material and non- material wants of the population (Singh, 2008, p.80). The teacher has a new role of to improve positive impact on social circumstances (Rao, 2008). The main purpose of education is imparting literacy and numeracy and it is process of socialization and total development (Singh, 2008).

Education for sustainability in teacher education has been also a common term but people know little about EFS. This study was carried out at government elementary college of education to assess knowledge, skills, attitude and perception about EFS in ADE pre-service teacher education program. This study investigated the knowledge, skills and attitude of teacher educators related to education for

sustainability and examined the perception and engagement of teacher educators regarding education for sustainability. The study involved interviews with teacher educators on the inclusion of EFS in teacher training programs.

2 Theoretical Framework

Education promotes social, economic and environmental change in society and development through education and training must be sustainable so that creativity and change in behaviour as result of education should be positive and permanent. Kaushik (1997) believes that news experiences through education and training is permanent modification of creativity and behaviour. The balanced social, economic and environmental thinking for future with reference to development and ensuring quality of life is called sustainability (UNESCO, 2012). The sustainable development is a development that “meets the needs of the present without compromising the ability of future generations to meet their own needs.” (United Nations, 1987, p.15). The transformation of education into all aspects of development is great challenge for sustainability. Azam (2003) argues that the purpose of education and training should be to achieve the basic tasks of life and learn life skills in sustainable way. Singh (2008) define education as a continuous process of growth and sustainable development

The teacher education and trainings is an instrument to provide educational opportunities to individuals to attain the educational objectives to create knowledge making process for sustainable development. In teacher education several approaches and methodologies have been adopted to achieve the educational objectives. The study seeks to answer the following questions

- (1) What are teacher educators knowledge and skills related to EFS
- (2) What teacher educators have attitude to learn about EFS in teacher training program
- (3) What they perceive about EFS and what are their engagements to implement EFS

This study will identify how Associate Degree for education teacher training program for prospective teachers has been designed to ensure sustainable development through teacher education. In addition this paper will determine the fundamental principles of sustainability incorporate in Associate Degree program and changes in knowledge, skills, perception and attitude in teacher educators related to sustainable development. The focus of this study will be on five indicators of sustainability which include the social impact of education, education as strategy for development, financial viability, adaptability and capability to bring socio-economic change.

The study will focus on evaluation of B.Ed teacher education program previously offered by elementary colleges of education and ADE in the context of context of pedagogy, quality, environment, use of technology and cooperative learning in sustainability perspective. The study presents the observations and findings on program design, scheme of study and teaching methodologies to achieve the sustainable development through education

3 Education for Sustainability

Education brings structural social change (Scimecca, 1980). It has been proved that there is a close relationship between school and community which helps to solve the social and economic problems (Silver, 1980). There is a requirement to establish strong linkages between teachers and parents for social change to promote education and sustainability (Safdar, 2005). Education for Sustainable Development (ESD) is gathering momentum in education sector which is “overarching paradigm of the United Nations” (UNESCO, 2012). The teacher training institutions are supposed to scrutinize their role to accomplish education for sustainability in relation to the training of pre-service teachers (UNESCO, 2005). This movement has been facilitated by the development of several initiatives and UNESCO defines that

“Sustainability is a paradigm for thinking about a future in which environmental, social and economic considerations are balanced in the pursuit of development and an improved quality of life. These three spheres – society, environment and economy – are intertwined. The sustainability paradigm is a major change from the previous paradigm of economic development with its damaging social and environmental consequences” (UNESCO, 2012, p.5).

It is expected that teacher education is fulfilling the goals of the United Nations’ Decade of Education for Sustainable Development (DESD). The overall goal of pre-service teacher education is to promote “critically reflective approach to all aspects of the curriculum, especially themes such as citizenship, which lie within the social domain” (Wilkins, 2004, p.242) that leads towards education for sustainability. “The teacher and school should expect that students are developing sense of community

in classroom and establishing climate of mutual respect” (Killen, 2005, p.19). Therefore, it is very pertinent to say that the role of teacher is to bring effectiveness and change new beliefs of students (Macmillan & Garrison, 1988) and teachers can easily motivate community for sustainable social change.

It is fact that “ throughout the world, societies of all kinds are facing war, terrorism,, inequalities, starvations, diseases, energy crises,, environmental disasters, and so many other threats to life and peace” (Mattos, 2009), p.204) and in this critical situation teachers can play vital role in sustainable change and development in society. The role of teacher is to facilitate motivated learning to achieve the objectives of education (Mishra, 2007) which can be possible through proper training of prospective teachers. Information and communication technology is also tool face the challenges of 21st century to achieve the educational objectives and adopt new learning strategies for sustainable development in the new knowledge economy instead of implementation of policies to achieve only learning experiences (Siddiqui, 2007). The UNESCO setting the objectives for Education for Sustainable Development emphasis that:

Education that allows learners to acquire the skills, capacities, values and knowledge required to ensure sustainable development;

Education dispensed at all levels and in all social contexts (family, school, workplace, community);

Education that fosters responsible citizens and promotes democracy by allowing individuals and communities to enjoy their rights and fulfill their responsibilities;

Education based on the principle of life-long learning;

Education that fosters the individual’s balanced development.(UNESCO, 2005, p.9)

The sustainability is required in every aspect of teacher education program including establishment of strong linkages to achieve the objectives of EFS, therefore, to overcome the current challenges and ensure sustainability in teacher education programs it is necessary to enhance the professional development of prospective teachers through training and capacity building. The existing teacher education in Pakistan faces several challenges with reference to education for sustainability. There are so many barriers to EFS that includes absence of sustainability objectives in curriculum, lack of financial resources to integrate ICT in teaching methodology, poor quality of training programs, time constraints, marginalization of education for sustainability and conceptual misunderstandings on the part of stakeholders. An additional potential constraint emerged from limited competencies on the part of supervising teachers in professional practicum schools.

4 Methodology

A case study approach was adopted for this study. Data was collected through surveys, in-depth interviews and analysis of documents. In total 34 teacher educators (18 male and 16 females) of B.Ed program and ADE program participated in study. All 34 teacher educators of ADE classes were surveyed to canvass their views about the EFS. Possible examples were provided verbally, including the social impact of education, education as strategy for development, financial viability, adaptability and capability to bring socio-economic change. The teacher educators worked in groups of 5 or 6, generating 26 response sheets. The teacher educators were offered two suggested models for reporting their responses, either listing pluses or minuses with regard to the scenario, or a PMI (Plus, Minus, Interesting, de Bono, 1992). They were free to respond in any form they chose, however. The anonymous sheets were placed in a box. The responses benefited from the group discussions that took place. The documents produced by groups of teacher educators were analyzed for patterns and outlying responses and as part of a systemic analysis of the enablers and constraints with regard to Efs. The response sheets were codified and the codes tallied to illustrate frequency and patterns of responses.

5 Findings and Discussion

Most of the participants confirmed the importance of education for sustainability, however, all the participants of study were not clear about the indicators of sustainability supposed to be achieved through education and training. A group of teacher educators’ stated:

“We know that education brings social reforms and with the help of community a teacher can change mindset of students and parents to value the knowledge for sustainable development but how those objectives will be achieved that is not reflected in the curriculum and dispensing education for social change.”

Group participants comprising 8 teacher educators indicated “we are training the student to be a

teacher” but “how to achieve the goals of education for sustainable development seems to be missing in teacher training program offered for pre- service training”. Another participants group pointed out that:

“the Associate Degree in Education (ADE) leading towards B.Ed (four years) is new initiative taken by government of Pakistan to improve the quality of teacher education and ensure that the pre-service training program is linked with the recruitment of teachers. We are concerned about the quality of prospective teachers and what skills and knowledge is required to be a good teacher. The concept of educational for sustainability is missing”

The common issue was raised regarding the training teacher educators on education for sustainable development. “We have heard about EFS but neither we are not properly trained nor curriculum objectives specify the education for sustainable development” one group of participants indicated that “social change is the need of hour, our society is shattered, terrorism and extremism has been penetrated in our society, therefore, a teacher can play vital role to bring social change through education”.

All the participants confirmed that new initiatives taken for the improvement of pre-service teacher education are remarkable but “divert ADE/ B.Ed program toward integration of information and communication technology and education for sustainability is missing”. A few teacher educators showed their concerns that “shift of teacher education program for one year to two or four cannot may make significance difference in the quality and sustainability of professional development”, however, rest of the participants appreciated the new initiatives taken by government of Pakistan in the field of professional development.

6 Conclusion

Almost all the participants identified that the objectives of education for sustainability have been envisaged neither in one year B.Ed program nor in ADE and B.Ed four years pre-service teacher education program. The results of study shows that a large number of teacher educators have positive attitude to learn more about EFS but they possess very less knowledge and skills to achieve the objectives of education for sustainable development through teacher training program during the preparation of prospective teachers.

Most of the participants perceive that EFS is very important particularly in the context of Pakistan where low level of participation in education, extremism and terrorism have distorted the society. Teacher educators believe that they prepare prospective teacher who are responsible to impart the education at primary school level, therefore, it is very important that the objectives of education must be sustainable to bring social and economic development. The study did not find any engagement of teacher educators with reference to education for sustainable development.

The constraints and issues were highlighted by the participants that include lack of recourses, inconsistency of curriculum with the objectives of EFS and educational quality. Variance in the in-service teacher training program offered by elementary colleges of education and donor funded projects and recruitment policy issues were highlighted as one of the major concern by teacher educators. The participants also pointed out that ADE and B.Ed are very new initiatives which need more coordinated efforts and policy reform at national and provincial level to ensure the inclusion of this program graduates into the teaching profession.

All the participants highlighted the importance and strength of ADE and B.Ed four years program but suggested that curriculum of these programs must be associated with the sustainability paradigm which will lead towards sustainable social and economic development.

Theoretical and Empirical Thoughts on the Development of Low-Carbon Buildings

Pan Guangyu

School of Management, Wuhan University of Technology, Wuhan, Hubei, P.R.China, 430070
(E-mail: 13801151750@163.com)

Abstract: Under the influence of international situation and domestic policy, low carbon economy has become the trend of world economic development, in recent years, concept prototype of “low-carbon buildings” has also been introduced into the low-carbon economy, and gradually low-carbon technologies and concept are applied to architectural decisions, design, implementation, operations, low-carbon buildings are not only of great significance for resource-saving and environment-friendly society, but also conducive to the ultimate realization of low-carbon economy strategy. In this paper, we conduct a theoretical and practical exploration on theory and ways to achieve low-carbon buildings

Key words: Low carbon buildings; energy consumption; recycling economy

1 Introduction

Air pollution, noise pollution, light pollution and electromagnetic pollution produced by buildings has exceeded 1/3 the amount of total environmental pollution, in addition, construction waste has occupied 40% of total waste generated by humans; With people's living standard continuing to improve, living comfort requirements also are increasingly high, energy consumption per capita has also been accompanied by increased emissions of carbon dioxide and other waste year by year; Statistics estimates that by 2020 China building energy consumption will reach 1.089 billion tons of standard coal, which will lead to 2 billion tons of carbon dioxide^[1]. The promotion of low carbon buildings will achieve low emissions and low pollution, reduce carbon dioxide and other greenhouse gas, mitigate environmental pressures generated by the Earth due to the greenhouse effect, protect environmental and resource to a large extent. Meanwhile, the construction and use process of buildings will be accompanied by a lot of energy and resource consumption, especially with the accelerated pace of China's urbanization, the development of low-carbon construction, efficient use of low-carbon technology, full use of renewable energy, will save a lot of resources and energy which is of great economic significance. Furthermore, low-carbon buildings can meet people's growing needs for construction environment and provide them with a comfortable living environment, such as natural lighting, natural ventilation, water treatment, clean energy and so on. The effective use of low-carbon technologies can achieve the goal of efficient recycling, comfortable and healthy built environment, which reflects its social value. Significance of low-carbon buildings are not independent, but tightly linked around sustainable development objectives, in order to live more harmony between person, buildings and natural harmony.

2 Theoretical Thoughts on the Development of Low-Carbon Buildings

2.1 The theory of full life cycle energy consumption

“Life cycle assessment” (Life-Cycle-Assessment, LCA) stemmed from energy crisis in the 1960s, in mid-1970s, the theory began to focus on energy use and waste recycling, until 1990s, it was introduced by scholars to study the energy consumption of buildings, life cycle is divided into several stages, that is, planning, design, construction, operation, dismantling and reuse. Only by taking appropriate technology in line with various stages of the life cycle of low-carbon buildings, can we truly make it.

Based on the theory of product life cycle, for the building, we evaluate the carbon dioxide's effect on environment according to several stages of the life cycle, that is planning, design, construction, operation, dismantling and reuse, thereby to measure low-carbon performance, such as the material of construction site, and mechanical processing, construction, energy, transport process will all have an impact on the environment, therefore, the effect on the performance of low-carbon buildings at any stage cannot be ignored. As shown in Figure 1.

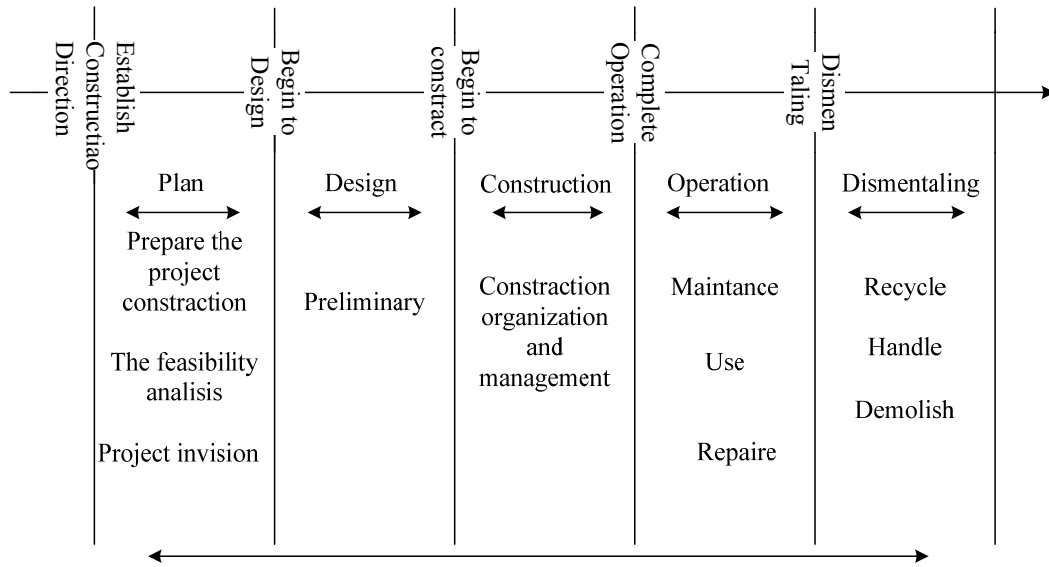

Figure 1 Full Life Cycle Stages of Low-Carbon Buildings

2.2 Circular economy theory

Circular economy is based on ecological, economy and less material of system integration strategies, regarding sustainable development as the goal, focusing on efficiency, and recycling, with the growth model of low consumption, low emissions and high utilization. the circular economy follows “3R” principles, namely reduce, reuse, recycle [2], as shown in Table 1 below:

Table 1 “3r”Principle of Circular Economy Theory

Principle	Specific content	Connotation
Reduce	In the production and services, minimize resource inputs, maximize the utilization of resources, the least consumption of resources, less generation of waste and pollutants, use alternative and renewable resources	Control resources and energy consumption from the source of building life cycle
Reuse	Continued use of product after being repeated, repaired, renovated, in order to extend its life cycle, thereby saving resources input	Reduce the consumption of resources and energy from the process of building life cycle
Recycle	Maximize the waste into resources, which is based on the first two, maximize waste materials into recycling, to reduce the waste of energy and resources and environmental damage	Process and control from the terminal building life cycle processing and control

Based on Circular Economy theory, optimal use of resources plays an important role in achieving the maximization of the performance of low-carbon buildings, including water resources, land resources, timber, etc. Also, attention should be paid to the quality of the indoor and outdoor physical environment, including light, sound, air environment, and they have some pact on the comfort of public life. In addition, resource recycling stage will have influence on carbon emissions, recycling processes will consume energy and carbon dioxide, in order to reduce carbon emissions, carbon emissions need to be quantified.

2.3 System engineering theory

Systems engineering theory is based on the system, the object of investigation, based on the whole and the parts, from the whole and external mutual ties and operations, the relationship between the angle of mutual restraint, the objects are integrated and accurate investigation, thus objects system elaborate nature and law of motion, in order to achieve the purpose of optimization methods [3].

Based on the theory of system engineering, regard low-carbon building as complex system engineering, involving both micro-economic factors and macro-economic factors involved, integral part of a combination of a number of specific features and has a whole, and energy consumption in the building microscopic entities involved in the process input and output is determined by the contents of the interaction or mutual influence, to fully consider the various factors coordination and cooperation between. Systems Engineering-Theory of low carbon building has the following three characteristics:

(1) Overall

For the evaluation of low-carbon buildings, not only to consider the energy efficiency of low-carbon buildings, but also contact the rest of the other elements in order to achieve the maximization of overall function.

(2) Open

Surrounding environment will affect the realization of low-carbon buildings, to achieve the purpose of low-carbon buildings, and we need to work together with surrounding environment, in order to effectively implement low-carbon.

(3) dynamic

As low carbon buildings is not a static implementation process, we need to take resource recycling of full life cycle, project management and other factors are should be taken into account, and carry out dynamic considerations.

Low-carbon buildings is a systems engineering, not only energy associated with its own resources and other factors, but also the need from the project environment, characteristics, and management factors are to be considered, as shown in Table 2.

Table 2 Based on system engineering theory elements to consider low-carbon buildings

Factor	Content	Range
Project environment	Macro-environment	Natural environment and policy environment (including geographical location, construction, conditions, etc.)
	Micro-environment	Reflection of the relevant parties' abilities implementation and monitoring)
Project Features	Site planning	Focus on coordination with surrounding environment, and urban planning
	Project Properties	Size of the project, floor space, building area, as for subsequent quantification
	Item Function	Project adaptation and disaster prevention extent
Project management	Organization	Project organization structure, reasonable estimation etc
	Plan	Project funding, resources and costs reasonable estimate
	Design	Design, construction, operations are the goals of low-carbon buildings, control and manage cost, schedule and quality
	Construction	
	Operations	

3 Empirical Thoughts on the Development of Low-Carbon Buildings

Low carbon buildings is an organic whole, the implementation of low-carbon buildings including the production of material, construction and operation of the project and other aspects, which not only need government guidance, technical support of industry bodies, but also need public propaganda and education, so low-carbon buildings can be divided into three levels, building level, architectural level and social level.

3.1 Construction level

Construction level includes two aspects: firstly, low energy consumption low-carbon material constituting the building, that is, low energy consumption in the process of production, processing, transportation and installation, using material which meets the operational requirements of the process of low-carbon buildings after completion, including steel, concrete, etc. Secondly, the low-carbon systems for the building, namely operational use of the building process, to meet the basic functional requirements, based on low energy consumption, and do not negatively affect the external environment various operational equipment. Including drainage systems, firefighting equipment, etc., it is the building material composition from the low-carbon building perspective overview of the realization is the realization of a low carbon building foundation.

3.2 Project level

The research scope of project level is very broad, is not limited to mere architectural entity, but involves multiple perspectives, including organizational perspective (relationship between the parties involved in the project, participation model, etc.), technical perspective (design, construction, technology, etc.), and so on, from the perspective of the project to study ways to realize low-carbon buildings, only through this level, which can we achieve low-carbon within the project of life cycle, thereby to achieve the goal of building low-carbon buildings. Each part of the project level are

interrelated, which affect the realization of low-carbon buildings. It plays a key role in the implementation level of low-carbon building.

3.3 Social level

The research of social level based on social factors, which have an influence on low-carbon buildings, compared to the previous two research angle is more macroscopic, study objects are also further expanded, including government, media, social institutions, etc., through the mutual cooperation between the main body to form a good atmosphere for low-carbon buildings, to provide “soft” security in environment, public opinion, legislation and other aspects for project level and construction level.

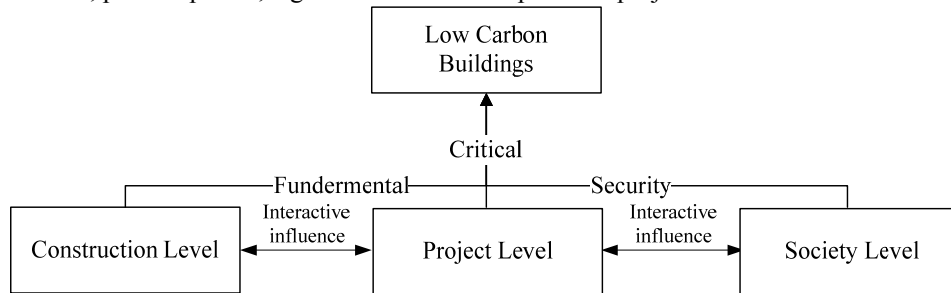

Figure 2 Way to Implement Low-Carbon Buildings

The realization of low-carbon buildings is the result through between architectural projects and social interaction, which is an organic whole (Figure 2). Social level secures the realization of low-carbon buildings in policy, regulatory and other macro directions, provides relevant norms and standards for the project level, construction level, in addition, to create a favorable market environment for low-carbon buildings, make low carbon concept better into people's lives; project level is a key aspect to achieve low-carbon buildings, low carbon concept through project level will be integrated into the construction sector, for the construction of low-carbon level of the material to provide power. Building level is the material basis to achieve low-carbon buildings, low carbon building materials and equipment for research and development and production is the source for building low-carbon entities, construction level is low carbon achievements and social aspects at the project level to achieve low-carbon buildings ways to achieve the effect of reflection. Only through mutually reinforce of system can we ultimately achieve a low-carbon buildings.

Abstract: Postmodernism has required major changes in the various spheres of community life. The growth and development of cities have required new knowledge and practices, both the leaders and the people to choose their representatives. The unsustainability of the planet caused by human predatory attitudes towards the consumption of natural resources, bathed by greed and desperate search by the particular interests of elitist groups have caused devastating effects on the population contributing to an alienated life, instigated consumption and away from active participation in public life. The civic education and policy could alleviate some of the problems generated. This article articulates concepts of postmodernity, emotional intelligence, sustainability of cities, underscoring the Pouso Alegre (MG) Junior Parliament, which operates in the political and civic education of young students from the municipality.

Key Words: Sustainable cities; Civic education and policy; Sustainable leadership; Postmodernity

1 Introduction

The discussion about development's model and environment necessarily involves how urban centers are organized and managed. It is in the cities – which nowadays concentrate most of the world's population – that political decisions are taken, and they are the most fertile ground for a development's paradigm change, either for its countless problems or for its economic and social importance. The estimates predicts that 60% of the world population will live in cities by the year of 2030. In Latin America, Brazil is the most urbanized country, derived from the structuring of cities started in the 50s, concentrating 85% of its population in urban areas with forecast to reach 90% by the year of 2020. The municipalities are facing many problems, which are accentuated with the postmodernity, related to the social inequality, pollution, disposal of waste, mobility, housing insecurity, violence, and others (Sustainable Cities Program, 2013).

Managers have been challenged to act leading more sustainability to cities, apparent challenge to titans against to the existing level of complexity and tending to increase in the municipalities' management.

The development concept begins to consider the sustainability, through economic, social and environmental pillars, and so the adopted management models get in evidence. "We need to change the development model, because science shows us that we are depleting the planet's resources and increasing inequality between people. And the big challenges are in the cities, where the majority of the world population currently lives". Grajew in Toledo (2012) highlights a very delicate issue and makes it difficult, because there are many interests at stake, from groups that take advantage of current model. For example, if you benefit a wide and efficient public transport system, you just hinder the interests of the automobile industry and construction, which by the importance in the economic scenario just have great influence over political decisions. Personal and collective interests often collide due to pressure from groups and corporate organizations (corporatist), holders of power who wish to prioritize their own interests at the expense of the community's goals and interests.

On the cities sustainability's issue, we come across several subjects and areas that are affected by the theme.

The major problem is on the governance of urban space, states the Economist Dowbor in Toledo (2012).

Cities are consumption centers and, under this look, they become inserted in the current discussions of economic and environmental development. The issue revolves around the need for learning to consuming with awareness that natural resources are finite. There is a need for a major paradigm change in the consciousness of individuals, regardless of their economic power. Resist, however, is not an easy task, because we are all incessantly affected by the media appeals, addressed to the exacerbation of an uncontrolled and unconscious consumption. Thus, a civic and policy education is required for all individuals; including human values and principles, holistic vision and sustainability requiring the knowledge dissemination about the interconnection of parts in the whole of the life's web.

The transparency of actions of our political representatives comes in late, but it still missing learn to want follow these practices and realize once and for all that these are only people's representative, then it makes no sense keep criticizing their actions passively or innocently, without understand and participate in fact of this management and the existing challenges by the communities we belong and the own time we arrived and helped to build, with our actions and omissions. "We need to change the development model, because science shows us that we are depleting the planet's resources and increasing inequality between people. And the big challenges are in the cities, where the majority of the world population currently lives" brings Grajew in Toledo (2012).

The discussions about the development model and environment undoubtedly permeate how urban centers are organized and managed, as remember Dowbor in Toledo (2012), where the appropriation of citizenship is needed so that the changes can happen with a balance between rational and emotional aspects, promoting the common good.

For a sustainable leadership of cities, this *paper* articulates on postmodernism, urbanization, emotional intelligence, sustainability of cities and civic education.

2 Methodology

The research is bibliographic and exploratory and implements a practical-cultural reflection addressed to an experiment political-community situated: the Legislative's School at Pouso Alegre (MG). For this purpose, we took the challenge of facing the sustainability topics in cities, on the postmodern context, and its idiosyncrasies. The work is strengthened by the experience of the Legislative's School and their contributions to the civic education of youths. The interdisciplinary treatment of the themes impelled us to move between philosophy, political science, economics, public administration and law.

3 Postmodernism

We live in days coined by changing, by the perceived sense of passage, by instability and incompleteness. For many, they would be the postmodern times¹ (BIRMAN, 2000). However, it is worth clarifying *ab initio* that the adjective attribution to our present contingency of 'postmodern' is not unanimous. Other expressions have been suggested as more appropriate to designate the *status quo*: "super modernity" (AUGÉ, 2004); "reflexive modernity" (BECK; GIDDENS; LASH, 1995); "late modernity" (HALL, 2002) etc.. However – and aware of recognized disagreement (that takes us from his birth to the use) – that was the expression that succeeded greater receptivity in the context of philosophical and contemporary sociological investigations (BITTAR, 2005).

The current socio-cultural contingency remains problematic (sometimes the limit of stalemate!) because, as a transition, have to deal with the tensions between the 'past' (and their intelligibility assumptions) and the 'multifaceted present' (which has no compunction about critically question these same assumptions, and even to remove them). The investigative question of the current condition addressed to the eroded past leads us to experience the 'contemporary condition', within which there are no absolute truths, only compatible discourse anchored on the culture, ideologies, political choices, and even the unconscious. The current condition requires us all, openness, tolerance and otherness. The present is a possible construction among others historical and socially coined compatibilities – the modern experience was not able to stand the test proposed by critical consciousness against the being,

¹ According to Joel Birman, the attribution to the present contingency of "postmodern" or "late modernity" would relate, among other aspects, to political aspects (that are inserted in a global social context). Authors that defend the use of "postmodernity" would align to American culture – the rise of the culture and American mode of being, occurred in the twentieth century, spread through the mass communication media, while authors that defend the use of the expression "late modernity" would align to the European culture – cradle of revolutions and traditions that have indelibly marked the culture and Westerners way of being according BIRMAN, J. Malaise at present: Malaise today psychoanalysis and new forms of subjectivity, 2000.

assumed as natural data, a-historic and thus perennial. The institutions, concepts, social classes and things in themselves are revealed naked – as buildings or born possibilities, reared on the horizon of culture and ending near or far – aligned with interests of the entire order; appearances wanting to be perceived as being.

The world of life – removed the veil of naivety that darkened and calmed the eyes – is no longer assumed as a natural reality against which remains us only a speculative-revelatory nature exercise and became assumed as a possibility or possible experience among others. The nature of things¹ is no longer assumed as inevitability, chalking up the status of experiential and falsifiable hypothesis. The world is not the sum of regularities and mathematical constancies, which focus on things and men inevitably, but an essentially open space which the spectacle – even if, unmistakably, limited by the available resources and accessible to its actors – can be conceived and implemented in different ways. The world is not a finalized and constant creation which meaning and intelligibility would sustain itself in a greater and excellent ratio – laic or not. The absurdity is no longer the dead snake at the foot of modern man (SARTRE, 2011) – penetrable by the modern rationality of Cartesian type that knows and sees everything (although its full potentiality remits us to an apology for the future that will come!) –, indicates, instead, the perception of the crisis generated by the sense of passage, inconstancy and finiteness. After all, the key to our existence and our nausea is on the disintegration of the certainties, the distinctions, the concepts assumed as truths settled in the nature of things.

The term postmodernity may intend to nominate a current state of things or a modification process that project itself over all dimensions of the current contemporary experience. Our habits, values, individual and collective needs; our worldly experience coined by the rupture is called to (re)thinking critically in order to accept-propose new ways of being in the world better suited to the demands of the present time. In the current context of crisis, there is little (or almost none!) space for statements that will get its logical force in the ‘nature of things’ or ‘naturalness’ of the contemporary ‘condition’ – built on the beams of universality, abstraction and generality.

The criticism reaches the imperialisms of modern rationality that is assumed redemptive of the society, able to illuminate the darkness of ignorance² and liberate the man from his bodily contingency. The reason, assumed as higher faculty of the human, would have the power to guide men and societies to meet the beauty of the concepts and liberation of the vices inherent to the bodily condition. However, can reason be thought so apart from emotions? Or more appropriately, should reason and emotion be assumed essentially different dimensions, immiscible?

Recent studies on the neuroscience, psychology and psychoanalysis horizons suggest that no. Emotions are cognitive and perform a prominent role in the personal, social and professional life of people. However, and alongside the numerous evidence supporting this claim, we are not encouraged to think about our emotions. Traditionally, to emotions are associated the errors and mistakes, so emotions should be neutered or strongly contained, otherwise committing, often irreparably, the judgment and the action of the “rational man”.

Emotions, according to the anti-emotional philosophers, should be taken with suspicion and restraint. The wise person, according to those thinkers, not direct their actions and decisions in order to achieve happiness. The search of the wise man is for peace, i.e., by the virtue of the impassivity of soul. Just as the waters of a river flowing, the man should cultivate the state of impassivity towards external events that strike him, whether good or bad. The happiness that the cultivation of philosophy would bring those who seek it engaged was assumed as lasting and, therefore, its search would be worthwhile (at the expense of sacrifice and selflessness). The happiness that events and things external to the self-subject are able to provide you are fleeting. Just as reach you abruptly, generating, as a necessary result, great pleasure, when removed by the Wheel of Destiny that runs incessantly and short of our control, may cause great pain. Live according to the chance and the contingency whims contingency predisposes men to pain and madness. Neutering (or containment) of emotion through the rational exercise predisposes us lasting happiness that builds a solid foundation for a harmonious society.

The postmodern man is heir of this rationality that separates, distinguishes and hierarchizes

¹ The criticism proposed by the historical materialism of Karl Marx invites us to see reality as appearance and not as cause. Is it effect of ideologies, assumed social and historical phenomena, presented us as evidence or realities belonging to the nature of things. The effect is presented us as cause, legitimizing the status quo and its immutability.

² Ignorance thought of as the absence of scientific knowledge derived, desirably, of the empirical and mathematics sciences and not of Socratic molds, as a synonym of education of souls (moral education).

emotion and reason. Professional success will only be achieved, they led us to believe, if the emotion is subdued by the reason. Emotions have nothing (or very little) to do with the professional environment, the school environment or the public decision taking. The kingdom of emotions is limited to the private sphere – where, tendentiously, we not usually do very well in, considering that the topic of emotions is assumed as self-evident and self-explanatory. We are not encouraged to think about our emotions or taught how to deal with them, whether on school or at home, hence our patent inability to live together and develop our emotional competence, absolutely necessary to become also citizens.

According to Martha Nussbaum, it is not possible to think about the public sphere and the public decision taking without summing the emotions. Emotions, differently than common sense says, are not dangerously “close to home” on self- narcissistic mode. (NUSSBAUM, 1995). The experience of the rational emotions situates us on the world and in the cities; the natural instance of the man, according to Aristotle (2008).

We are city beings immersed on the praxis that can only be realized fairly and tending to the happiness of theirs if we assume the human person as a corollary and related of this community experience. The citizen experience begins on the radical assumption of man as the foundation and related of the community experience. An experience that, more every day, becomes complex. Megacities, impersonal and faceless, put all kinds of challenges to the man viewed as citizen. How to exercise citizenship in a sea of cold stone and lifeless where we feel reduced to formless beings, with no history, memory and future?

3.1 Cities

Castells (1999) warns about the urbanization of the third millennium through the megacities when he says that the big cities articulate the global economy, list the informational networks and monopolize the world power. “But they are also depositaries of all these population’s segments who struggle to survive, as well as those groups who want to show their state of abandonment, lest they die ignored in areas neglected by communication networks”. (CASTELLS, 1999, p. 492).

Social actors conceive, decide and implement the spatial logic, which are determined by a technocratic and financial enterpriser elite occupying leadership positions in our societies that will naturally make specific space requirements concerning the material/spatial support of their interests and practices, as well as manifested spatial the informational elite.

Castells (1999) is provocative when talks about the domination of our society which is based on the organizational capacity of the ruling elite, who walks interlinked with their ability to disorganize the society groups that “although they constitute a numerical majority, they see (if they really see) their interests partially represented only within the structure of attendance of dominant interests”.

“The articulation of the elites and the mass segmentation and disorganization seem to be the twin mechanisms of social domination in our societies”. (CASTELLS, 1999, p.505). The management of sustainable cities require an integrated management model. The development of holistic and systemic vision is urgent to act in this context of sustainable urban planning. Several areas interact in cities such as economic, cultural, social, environmental, technological, fiscal, demographic, and others. Responsible for all these areas in the municipalities need to be involved, mobilized and integrated to become aware and commit to the exercise of ethical, transparent, accountable governance and assertive to the demands of the population and the common good.

The Sustainable Cities Program was born on the initiative of the organized civil society, which aims at improving the quality of life and welfare of the general population, proposes 12 thematic axes, grouping principles and values: governance; common natural goods; equity; social justice and peace culture; local management for sustainability; planning and urban design; culture for sustainability; education for sustainability and quality of life; dynamic, creative and sustainable local economy; responsible consumption and lifestyle choices; better mobility, less traffic; local action for health; from local to global. (SUSTAINABLE CITIES PROGRAM, 2013). This program proposes a relatively simple methodology to support municipalities considering: the strategic mapping of the municipality, prioritization of indicators, the future vision of the cities and the development of the plan targets. For each thematic axis to be worked is suggested the application of this facilitator method. Program details can be found in the GPS Guide, Sustainable Public Management (SUSTAINABLE CITIES PROGRAM, 2013).

Front of the level of complexity that the problems arise in cities and in society on our postmodern context – pressed by advanced technologies and media influence, and many of them being instigators of the unconscious consumption – it is up to the individual to organize himself internally, filter information and maintain the balance between reason and emotion, because life prompts you constantly fast

performances (whether they be personal or professional decisions) where these aspects need to be harmonized for living (and survive) with quality and sustainability.

The individual into society needs and requires mobilize himself and act exercising their citizenship, performing public roles or only the role of conscientious citizen, able to react critically to the manipulations of the ruling elites, if he wishes indeed a prosperous, happy and sustainable future.

3.2 Intelligence and emotion in Liquid Modernity

Postmodern context, suggests the diagnosis of Bauman (2001), hypertrophy in the dimension of the work at the expense of the personal dimension. To the liquid modernity and its ideologues interests we become workers zero drag, i.e., no weight and with remarkable (because up to date!) technical knowledge. Instead of large families, we should be free and “un-family” so that we have time and space to develop our technical skills. Education is for life, they insist. To become a valuable workforce in the job market, we must invest our time and money on endless training courses under penalty of obsolescence – fast and cruel on the horizon of a society where the technique endeavors to overlap to knowledge. Knowledge, on the postmodern context, is restricted only to what can be translated into information bits, according to the diagnosis of Lyotard (1979).

The search desirably solitary for knowledge – which is summarized to what can be converted into information bits and which validity is brief or very brief –, falsely locates us in the middle of the society. Education for life is restricted, on the horizon of this model, to the formal education that has nothing to do with moral education or the development of emotional competencies that, we contend, must be developed according to a new perspective of reason and rationality.

Reason and emotion are both important dimensions for life in society and for the construction of a community experience happier and more harmonious.

Traditionally, intelligence is limited to intelligence quotient (IQ) of a person. Each of us would have been bequeathed by nature a certain amount of intellectual force or power, that we would be able to mobilize in order to know the world around us and/or concretize our daily tasks on personal and professional sphere. The identification between intelligence and intelligence quotient, which could even be measured by IQ tests, has been broken by current studies on cognition, intelligence and emotion on different areas of knowledge.

What does it mean to be intelligent? Why do we say about some people that these are intelligent people? According to Goleman (2007), the measure of intelligence is much more complex than an IQ test is potentially capable of measuring. The measurement of the intelligence cannot be measured, if it can, without taking into consideration the following competencies: empathy, self-control, zeal, persistence and self-motivation (GOLEMAN, 2007). These skills, which according to the author can be shaped from childhood (GOLEMAN, 2007, p. 24), are related to emotional intelligence or EQ, constitutive dimension of intelligence.

On Pouso Alegre (MG) there is a project on civic education conducted by the Legislative’s School, focused on students from public and private. In this project, policy issues, citizenship and balance between reason and emotion are worked on your route, contributing to future generations of people more conscious about the issues of citizenship, with active political participation and sustainable. Being a good manager and a responsible citizen is not only know the laws of the city. Surely, this is an important and fundamental dimension to the citizen experience and responsible citizenship. However, what it means, concretely, the fair on the city skyline? This answer is complex, but we should not exclude the question due to its complexity. The fair in the city cannot be achieved authoritatively, but only in the light of important social emotions such as compassion. Being compassionate, enlighten us Martha Nussbaum, is not have pity or empathy. Compassion does not presuppose the belief that the person suffering does not deserve the bad which weighs on his shoulders (piety), nor similarity that approaches us (empathy), but the simple and crude fact that the suffering, experienced by the others, is a human suffering and even in power, could be experienced by me or someone else I hold dear (NUSSBAUM, 1995).

The intelligence that is expected from the manager is technical-scientific-emotional-empathic, i.e., it is not just technical and scientific knowledge, but demand, in addition, the emotional perception, rooted in compassion, of his responsibility. The Legislative’s school does not care only about providing and disseminating information to their students about the procedures and legislative processes, about the routine of city councilors and mayor, on the cold dynamics of the city laws, but assumes a much more complex and fascinating task as the holistic education of their students-people.

Below we present this project as well as discuss about results of a research conducted about it.

4 The Legislative's School at Pouso Alegre (MG)

The current political context of Brazil does not create expectations of popular participation in politics due to factors of corruption, discredit regarding the implementation of public policies and the unsustainability present in cities, as evidenced by the lack of management and valuation on sustainable development guided by the organization and planning. It is also emphasized the inefficiency for the accomplishment of social rights and public services in general.

Before many factors, it is observed a large population disinterest in following and actually effect the political participation. And to minimize this situation of political disinterest and lead the population, especially young people, to participate and monitor the national policy, recognizing themselves as true political actors, rights holders, doing justice to the sovereign power of the people based on the preamble of the Federal Constitution, was created on Pouso Alegre the Junior Parliament aiming the political education and awakening the experience of citizenship for students from 6th to 9th grade of elementary school II.

The Junior Parliament provides students with an opportunity to really know the policy, the forms of participation and know the importance of being active on the political events of our country. The space for debate and voice for participating students of the Junior Parliament puts them in a scenario of real experience of democratic practice and leads them to a conscious formation of the citizen's role and the work of management and leadership in environments where are present.

For the development of civic and political education, the Junior Parliament also encourages the exchange of experiences and knowledge among participants from different contexts and realities. The work takes place holistically considering the political, citizenship, sustainability, among others aspects. A complex set embraces citizenship education while considering adherence to values, knowledge acquisition and learning practices in public life. "It cannot therefore be regarded as neutral in terms of ideological". (DELORS, 1996, p.62).

The citizenship education becomes a fundamental requirement for the formation of sustainable cities in all aspects, relating the political, social, economic and especially revealing values and rescuing them for strengthening ethics and the common good in society. To verify the results obtained with the program Junior Parliament, coordinated by Maria do Carmo Freitas Macedo, was held in 2008, a research of exploratory character with the Junior Parliament of Pouso Alegre, with full details in Macedo and Cols. (2013).

The research investigated the function, structure, organization and difficulties to implement the program, the procedure for choosing students, and participation and evaluation of society in general, especially of those involved directly in the program, such as parents, teachers and city councilors junior.

This space puts students in direct contact with policy, makes them feel responsible and committed to representing your school. By Transversal Themes (MEC 2000), teaching ethics can encourage students to many understandings such as concepts of justice based on equity and may also sensitize themselves to the necessity of building a just society, when they adopt attitudes of solidarity, cooperation and social injustice repudiation, with discussion of existing moral and trying to understand the current values of this society, well as to understand the extent to which they can and must be changed.

The interview was done with 10 teachers, 10 parents of teenagers who participate in the Junior Parliament and/or its projects, 05 authorities of the Education System of Pouso Alegre: representative of the Superintendence of Education, municipal secretary of education, school principal, pedagogical mentor – inspector of students, 05 tutelary counselors of Pouso Alegre and 15 city councilors junior, from a total of 24 (twenty four).

The research results suggests that the student introduced on the procedures and workings of the Legislative comes to understand politics differently that previously envisaged.

For parents, the changing behavior of youth became a reality for the better. They emphasize it is clear the enthusiasm on the participation of the Junior Parliament and share new information with colleagues, friends and family. This movement suggests that the participation of the students on the Junior Parliament not produced effects only to the acquisition of knowledge about the legislative, but had interesting and desirable emotional consequences as the approach of the elements of the family, the approach of student with others members of his environment, the pride and recognition of his value and importance, among others. The civic education, in addition to influencing the construction of citizens more aware and potentially active culminated also in pride, recognition, otherness and openness.

An interesting fact was observed on the evaluation of the project by schools of traditional teaching, in which there were little prominence. Analysis made by the researchers indicated that schools are not

ready to welcome these youths more politically aware, especially considering the performance spaces offered to them in these institutions, so that are practiced the different knowledge and with it this development is enhanced through multiplier agents. However, schools have not created spaces for inclusion of these political knowledge and citizenship in daily didactic teaching. It is observed perhaps the need for a transversal and interdisciplinary work linking spaces and knowledge among traditional schools of basic education and the design of the Legislative's School.

The real process of formation and constitution of the citizen takes place on the pedagogical space, according to Arroyo (2002), by the struggle of citizenship, by the legitimate and by the rights. "Education is not a precondition of democracy and participation, but is part, the fruit and expression of the process of its constitution" (ARROYO, 2002, p.79)

Dowbor in Toledo expresses (2012), that the appropriation of citizenship is needed so that changes happen with balance between rational and emotional aspects, promoting the common good. Think the common good and act through activities that stimulate debate, respect, and group work, arousing young people for the political monitoring, are aspects that develop innovative and conscious management. These characteristics are stimulated at Legislative's School of Pouso Alegre, through several projects developed at Junior Parliament, such as The Great Debate, The Gymkhana of Knowledge, The Educator of the Year Award and the Urn of the Citizenship.

Currently thinking of a structure that provides activities and initiatives for the sustainable future of our communities, is optimal to achieve the formation of inclusive cities, prosperous, creative, educators, healthy and democratic, that provide a good quality of life for citizens and which allow the participation of society on all aspects of public life.(SUSTAINABLE CITIES PROGRAM, 2013)

5 Conclusion

Nowadays, human being comes across major technological advances facilitators to their existence in society, but these advances come with high costs, such as lack of time, affecting their quality of life.

Research points to a growing urbanization tending to lack of control, generating drastic consequences if they do not take care of issues that are tangent to the mobility, the safety, the infrastructure of cities, the urban space, the environment and others, and for this is needed adequate policies and a greater citizen awareness, greater engagement in collective issues and greater participation of local and global policies.

It is necessary the development of sustainable leadership committed to the common good acting in an engaging way and with a conscious community, engaged and articulated.

To have sustainability in cities we must develop persons acting in a balanced way at times to opine, analyze, criticize and decide, not shirking, without omitting and without acting choleric and irresponsible. For such, an active civic education that empowers through political awareness is needed. The research has brought the experience of the Legislative's School of Pouso Alegre (MG), which observed that the root of the apathy and political indifference of society comes from the disillusionment and silent outrage on the political framework in which corruption and inefficiency are highlighted. Erroneously, to get away from this reality, the individual started believing he could live better on the margins of political and public life, establishing an illusory chasm between him and the political decisions, as if they could be immune to these.

The Legislative's School, through its programs, demonstrates the impossibility of this rupture. Explains to students that there is no way to separate the search of the good life of the policy decisions that directly affect people's everyday lives. The school values and develops the perception of young man to get out of your reality (self-centered and ego narcissistic) experiences the feeling of belonging and strengthening on the corporate experience. He lets from feeling the part and becomes part, i.e., realize very clearly that he can act beyond his personal boundaries, transcend his condition of individual to achieve the status of a citizen committed to community.

The practice reported on the Legislative's School brings confidence, develops emotional skills and promotes citizen refinement. Students members of the project come to know more and better about their rights and duties objectively, but also due to the holistic perception that integrate a society which should be mutually responsible for.

To build a common life unity (community) where sustainability is present is not enough to know and enforce laws, regulations, rules and procedures. You need to go beyond, generating reflections and evaluations about yourself, about governances and what are intended to do now, to ensure the existence of future generations more conscious, active and engaged in more sustainable cities.

Chasing Eco-Advantage: What Drives Eco-Innovations in Brazil

Flavia Carvalho

Núcleo de Inovação, Fundação Dom Cabral
(Email: flaviapcarvalho@gmail.com)

Abstract: This paper presents an unprecedented survey of Brazilian firms mapping their eco-innovative patterns. This paper draws special attention to the group of firms that have achieved the stage of “eco-advantage”, in order to find out what drives radical innovation and what are the main characteristics of this group. The results show that the main innovation determinant influencing radical outcomes regards market-driven factors, specially the purpose of creating new market segments. Moreover, this result corroborates with theoretical observations suggesting that spurring green innovation can be seized as opportunities, instead of mere constraints to economic activity. These opportunities are both to fulfill the existing demands of consumers for environmentally friendly products (and services), as well as to emulate preferences while creating new market segments.

Key words: Eco-Innovative patterns; Eco-Advantage; Radical innovation; Market-Driven factors; market segments

1 Introduction

The recognition of global-scale environmental threats gained room into international discussions since the second half of the 20th century. Awareness came up with the somewhat recent scientific observation that “the rapid and accelerating technologically driven modification of our natural surroundings has changed them beyond the wildest Neolithic dreams” (Grey, 1993:464). These risks stimulated consciousness about the necessity of transitioning towards more sustainable use of natural resources.

Light has been shed on the environmental capacity to resist to our patterns of development, creating skepticism over utilitarian frameworks in which natural resources are 'taken for granted'. Environmental responsibility consequently contrasts with previous understandings of progress as inevitable marches forward, assuring mastery over natural resources (Cohen, 1997). Instead of exogenous to human activities, natural systems are complex and co-evolving dynamics, directly affected by technological trajectories and social behavior.

Effects of technologies towards nature consequently raised questions about whether past trends of prosperity can be broadened (or even sustained) in future (Clark *et al.*, 2005). The need for a better harmonization between economic development and the nature calls for a drastic change in the ways that businesses impact the environment. For this to take place, a new paradigm for production, consumption and disposal is required. However, changing paradigms is never an easy task. It demands innovative efforts to bring up alternatives that combine the needs of the economy, society and environment.

Innovations are, therefore, central to this debate. They are concomitantly sources of environmental threats and mechanisms for finding a way out, for escaping from a potential unwanted future (Zizek, 2011). The last feature is represented by what has been labeled as eco-innovations: novelties in processes, products, services and business models that can reduce man-induced environmental impacts. The imperative here, according to Jacobs (1997: 9), is shifting “onto a new path of economic development in which technological advances and social changes combine to reduce, by an order of magnitude, the environmental impacts of economic activity”. This path should be pursued through exploiting opportunities for innovation that concomitantly enhance environmental and economic performance.

Eco-innovations are thus a tool with which firms engage in the shift to a new paradigm of capitalism production. Despite its importance, little is known about the subject, especially in an emerging country such as Brazil. In order to contribute for a better understanding of the Brazilian “eco-innovative” landscape, this paper draws a map of eco-innovative activities within Brazilian firms, unraveling their motivations, processes and results. We present data from a recent and unprecedented survey carried out with 98 Brazilian firms in 2012. The purpose of this paper is to provide an overview of how Brazilian firms are tackling environmental issues related to their businesses and whether they are seizing the opportunity to make such issues a source of competitive advantage. We pay special attention to the group of firms that perform radical eco-innovations. These firms are the ones that will make possible the transition towards a new paradigm of production, in a greener economy.

The remainder of this paper presents, at first, the theoretical background concerning innovation for sustainability and conceptualizes eco-innovations. Later we present our database and research methods. We run a probabilistic regression to find out what factors contribute to the occurrence of radical eco-innovations among Brazilian firms. We conclude with some reflections on the findings of the econometric exercise while linking them with theoretical frameworks.

2 Theoretical Framework

2.1 Innovation for sustainability

Written by a commission convened by the United Nations, the Brundtland Report was as a milestone for the institutionalization of the term 'sustainable development' and its further integration into political agendas (Sachs, 2000). Sustainability here brings in its core the idea of satisfying current needs without jeopardizing needs of future generations (WCDE, 1987). This term mingles together concerns that are not necessarily new, such as poverty, disruption of livelihoods, and threats to 'survival of mankind'. In fact, much of this discussion has been casted in terms of a balanced integration between social, economic and environmental dimensions – the so-called triple bottom line (Elkington, 1998).

Sustainable development as a concept has spread quickly and became central in political agendas, strategies of firms, and agreements conducted by international organisations. Indeed, the concept raised by the Brundtland Report was further reinforced and specified by international meetings. Rio-92 stated principles on forests, climate change, biodiversity and issued the Agenda 21, mobilizing the establishment of blueprints of desired actions (UNCED, 1992). Meetings conducted ten and twenty years later, namely the Johannesburg World Summit, and the Rio+20, reaffirmed commitments in pursuing sustainable alternatives through the engagement of nations, firms and civil society (Kates *et al.*, 2005).

The role played by innovation to chase sustainable pathways has varied between scepticism and optimism, both among scholars and political representatives. In several international discussions, such as Rio-92, Johannesburg Summit, and Rio+20, the tone has been of harnessing innovation so to achieve the goals linked to an environmentally sustainable human development. Indeed, with the rapid spread of sustainability throughout political agendas, efforts to implement sustainable development have emphasized the lack of technical knowledge, rather than social and political mobilization (Clark *et al.*, 2005). Other organisations, such as NRC (1999:7), bring a different perception, stressing that a successful transition towards sustainability "could be achieved without miraculous technologies or drastic transformation of human societies"; requiring, on the other hand, capabilities, social learning and political will to shift to alternatives that are already viable with existent technologies.

Though with distinct emphasis on the relevance of radical technologies to leapfrog unsustainable trajectories, it seems clear that innovation, in its broad meaning, occupies a central place in these discussions. This is because innovation is linked to *change*, and sustainability discourses made clear that society cannot follow the same behavioural and technological tracks pursued in the last centuries.

In order to better understand the role played by innovation in discussions around sustainability, it is important to conceptualize what innovation means, according to evolutionary economic theories. It can be characterized as a continuous, cumulative, systemic, non-linear, path-dependent and generally chaotic process (Van De Ven, 1986; Tidd, 2001). Innovation consists not only in commercializing new products, services or technologies, neither only in generating new processes or business models. It also aggregates processes of market diffusion, as well as absorption and imitation of novelties created somewhere else – as long as they bring an underlying learning process, which stimulates new dynamic capabilities (Tece, 1998). Moreover, they can be classified in terms of impacts they generate – can be engendered as radical (disruptive) or incremental (Freeman and Perez, 1988; Christensen, 2000).

Innovation for sustainability thus includes new services, products, processes, technologies, business models, as well as diffusion of existing novelties, as long as they help shifting towards the new paradigm of sustainable development. They can be essentially different to each other, having different impacts and targeting different objectives. However, to be qualified as 'sustainable', it is essential that these novelties – combined with change in social behavior – contribute to a future in which environmental responsiveness, social inclusiveness and economic performance are better harmonized.

In this context, innovation with a positive environmental impact became a specific field of investigation, and the term eco-innovation became disseminated. Next section presents the conceptualization of the term and a review of the literature on the types and determinants of eco-innovation.

2.2 Eco-innovations: concepts and determinants

Innovation is a critical concept for dealing with environmental vulnerabilities and strengthening the resilience of nature towards possible disruptions within its boundaries. The Stockholm Resilience Centre is one among a handful of organizations investigating “biophysical boundaries at the planetary scale within which humanity has the flexibility to choose a myriad of pathways for human well-being and development” (Rockström, 2009:6). In its preliminary analysis, humanity has transgressed three boundaries (namely climate change, biodiversity loss and nitrogen cycle). Despite knowing what the boundaries are (and impacts of human activities upon them), the study recognized significant uncertainty about thresholds for environmental change beyond return; duration over which system's boundaries can be transgressed; and nature's ability to return to safe levels (Rockström, 2009). The search for solutions to such threats demands finding new relationship patterns between society and the nature, which will ultimately drive the economic actors towards a new paradigm of production, consumption and disposal.

These environmental burdens are, in fact, not seen exclusively as constraints to human activities, but also as opportunities for economic and social prosperity. Environmental harm by industrial operations can be seen as “unnecessary waste, inelegant design, and longer-term comparative disadvantage” (Cohen, 2006:41). These win-win situations – both for economic and environmental performances – have been described, for instance, by Hart (1997) and Porter & Van de Linde (1995).

While Hart presented opportunities for firms to drive innovation and to crystalize a growth trajectory through the internalization of environmental concerns, Porter and Van de Linde postulated (and confirmed) a hypothesis that environmental regulations foster efficiency and innovativeness – and, accordingly, are not constraints to economic activities, as commonly presented in political discourses, but rather opportunities for driving competitiveness. Indeed, previous works corroborate the importance of environmental regulations for the occurrence of eco-innovations in German (Horbach *et al.*, 2012) and English companies (Demirel and Kesidou, 2011).

Similarly, authors from the self-nominated 'ecological modernization' challenged the trade-offs between economic activity and the sake of nature, focusing on simultaneous improvements in human welfare and environmental stewardship. Initially proposed by Huber, this theory describes a hyper-rational strategy for correcting ecological harms of contemporary practices (Cohen, 1997). By encouraging flexible and precautionary governmental and industrial strategies, society is able to spur green innovations and continuous improvements towards environmentally-friendly technological trajectories. These new technological paths should be pursued through exploiting opportunities for innovation to enhance environmental performance of industrial processes, and modernity is seen as a new phase of civilization, in which a super-industrialization is organized around sophisticated environmental technologies (Cohen, 2006).

Following this optimistic perspectives towards technical solutions to environmental hazards, several studies dating from the 2000s have embarked in the task of conceptualising eco-innovations, which can be synthesized in the following: *Eco-innovation is the production, assimilation or exploitation of a product, production process, service or management or manner of doing business that is new for the organization (developing or adopting these) and that results, through the life cycle, in a reduction of environmental risks, pollution and other negative impacts of the use of resources (including the use of energy) compared to relevant alternatives* (Kemp and Pearson, 2007: 7).¹

When dealing with eco-innovation, the gain can be translated as environmental benefit attained (cleaner air, more available water, etc.), as well as economic outcome for the firm. Innovations can be essentially radical or incremental; the radical ones being discoveries that completely disrupt with the current course of things, the incremental ones adding significant improvements to the already existing products or processes. Besides that, eco-innovations can fit into different categories, described on Table 1.

The first category covers the environmental technologies. These may be remedial (end-of-pipe), which seek to reduce the impact caused by an existing technology; or they can also be clean alternatives to the usually more polluting technologies. The second category covers the methods of organizational management that incorporate environmental issues. This includes the strategies applied to production processes and the whole infrastructure and logistics of companies for the reduction of environmental impacts. Internal audits, staff training and even waste and pollution prevention schemes are examples of this category (Kemp and Foxon, 2007).

¹ By relevant alternatives is understood the technologies and/or processes in use in organizations at the moment of implementation of the innovation (Kemp and Pearson, 2007)

Table 1 Taxonomy of Environmental Innovations

Innovation	Examples
Environmental Technology	<ul style="list-style-type: none"> - Technology of pollution control - Clean technologies - Technology of green energy
Organizational Innovation	<ul style="list-style-type: none"> - Schemes of pollution prevention - Environmental management - Management of the value chain
Innovation of Product and Service	<ul style="list-style-type: none"> - Ecologically beneficial products - Ecological and/or less resource intensive services
Green Innovation of the System	<ul style="list-style-type: none"> - More ecologically beneficial alternative systems of consumption and production

Source: adapted from Kemp and Foxon, 2007.

In third place come the environmentally beneficial products and services, such as green certifications or biodegradable products. As regards services, these can include works of waste and pollution management, environmental consultancy, among other services that seek to reduce the environmental impact resulting from productive activities. The last category covers the innovations of systems, which “involve a wide range of changes in technological production, knowledge, organization, institutions and infrastructures and possibly changes in the behaviour of consumers.” (Kemp and Foxon, 2007: 9). It covers alternative systems of production and consumption that are more environmentally beneficial than existing systems. An example of a system innovation is organic agriculture and renewable energy systems (like the one required for electric cars). Such innovations act comprehensively, reaching a wide range of actors and reverberating in various sectors of economic activity.

The definition of eco-innovation prioritizes the result over the motivation of the firm to innovate. If the environmental result was intentionally reached or if it occurred by chance, little is known by the current literature. Learning about the determinants of eco-innovations, however, is central if eco-innovations are to be systematically fostered.

Four factors can be considered the main drivers of eco-innovations, according to the literature (Belin *et al.*, 2009; Horbach and Rennings, 2012). These are: regulations, market factors, firm-specific factors and environmental concerns. They are presented on Table 2.

Table 2 Main Drivers of Eco- Innovation

1.Regulatory push/pull (R)	<ul style="list-style-type: none"> - implementation of environmental policies - anticipation of environmental regulations
2.Technology & factors internal to the firm (I)	<ul style="list-style-type: none"> - cost economies - better productivity - innovation in organizational management systems - R&D activities - networks, cooperation
3. Market determinants (M)	<ul style="list-style-type: none"> - growing awareness of consumers about environmental issues - expectation of increase of participation in new market segments
4. Environmental Concerns (E)	<ul style="list-style-type: none"> - environmental concerns from the company

Source: based on Belin, Horbach & Oltra (2009) and Horbach and Rennings (2012).

Environmental regulations are viewed as a way to induce firms to internalize the externalities created by their activities. As such, they would impose extra costs for firms and act as constraints for competitiveness. Porter and van der Linde (1995), however, introduced a different perspective to this matter by claiming that environmental regulations force firms to innovate and improve resource efficiency and productivity. Regulations would therefore increase turnover and profits (Porter and Linde; 1995; Bernauer *et al.*; 2006; Belin *et al.*; 2009).

Market factors are the pressures on companies brought by consumers and competitors. Customer demands are proven to be a strong driver of firm behaviour. In regard to environmental concerns,

consumers are increasingly aware of threats, and equally interested in knowing what firms are doing about it. Therefore, there are several opportunities for creating new products and services that better suit to these new market demands.

Factors internal to the firm, on the other hand, are mainly its technological and innovative capacities, its strategies, key-competencies, as well as the search for higher productivity, eco-efficiency and other cost reduction benefits (Bernauer *et al.*, 2006).

Pure environmental motivations are those based on strong ethical values driving firms to do the right thing, regardless of regulations or consumer pressure. It is strongly built on the top management values that encourages the firm to take their role in society very seriously (Bansal and Roth, 2000).

3 Method

3.1 Sample and data collection

The present study is based on an unprecedented survey carried out with Brazilian companies in manufacturing and services sectors. The survey was conducted between May and July, 2012. A stratified random sample was utilized, with companies of different sizes. Ninety-eight (98) companies replied to the questionnaire. Such a sample is within the 95% reliability interval with significance of 10% expected for populations between 50 and 100 thousand, the approximate number of companies existing in Brazil (Rea and Parker, 2005).

The survey design was based on an extensive literature research on similar surveys carried out earlier; also, the Brazilian Innovation Survey (PINTEC) questionnaire design was used as a base when similar questions were applied.

The main purpose of the survey was to provide a broader understanding of eco-innovation in Brazilian firms. For that purpose, the questionnaire is divided into five sections: A- general company data; B- general information on the innovative activities of the company; C- objectives of the environmental innovations; D- processes of the environmental innovations; E- results of the environmental innovations.

Section A contains questions regarding capital ownership, revenues, share of revenues obtained from exports. Firms were also questioned about the importance of environmental issues for the business, as well as about the existence of initiatives related to environmental management (ISO 14001, sustainability report, among others). Section B presents questions regarding their innovative activities, the amount invested, the occurrence of R&D activities and the sources of funds intended for innovation. Section C inquires more specifically about the occurrence of eco-innovations and their nature. Section D deals with the processes involved in the innovation activity; in special, the sources of external knowledge used and whether cooperative arrangements for innovation had taken place. Finally, section E enquires about the results of the eco-innovation, as well as the possible obstacles faced in its realization or which prevented it from being successfully implemented.

3.2 Categorizing firms according to their eco-innovative drive

Our quantitative analysis departs from an earlier categorisations of firms proposed by the MEI Project, according to their innovative approach to eco-innovation, which can be essentially passive or proactive (Kemp and Foxon, 2007). We consider that the decision to eco-innovate or not reflects the firm's engagement with environmental issues, that can also be categorised from denial to strong commitment. This engagement evolves with time, as firms matures or forcedly complies with environmental concerns. It is also significantly affected by the capability of firms to foresee competitive advantages from a more responsible, "green-wise" strategy. We merge Kemp and Foxon (2007)'s categories of eco-innovativeness of firms with a 4-stage taxonomy proposed by Esty and Winston (2009) to classify firms according to their environmental strategy:

(1)Eco-resistance: firms that have no eco-innovative activities and no environmental strategy, simply ignoring the environmental concerns around them;

(2)Eco-compliance: a second stage in which firms tackle environmental issues due to regulatory pressure by implementing or developing eco-innovations but with no specific strategy for such;

(3)Eco-efficiency: firms that intentionally implement eco-innovations, either developed in-house or acquired from others with the purpose of achieving better performance, especially better efficiency in the use of resources;

(4)Eco-advantage: firms that undertake eco-innovations strategically, developing green products, services or technologies as their core business, or as a significant share of their activities. This group of

firms most often undertakes radical innovations that modify the way things are done or replaces products or processes that are environmentally prejudicial.

Stages 1 and 2 represent a reactive approach to environmental issues, whereas stages 3 and 4 reflect a proactive positioning of firms. Firms on stages 3 and 4 are working with two important aspects of the environmental impact in their businesses: the downside and the upside. Firms on stage 3 are most focused on reducing the downside, notably reducing costs and keeping risks at the lower possible level. Stage 4 is achieved when firms try to enhance the possibilities on the upside of the environmental issue: generating revenues from creating and exploring new market niches (Esty and Winston, 2009).

The four categories establish a relationship between the environmental commitment of firms, their eco-innovative efforts and the potential of value generation present in each level of commitment and innovativeness. As the firm's eco-innovative effort increases, so does the possible value generation obtained from the result of the innovation. In other words, it means that, the more strategically firms undertake innovation for the environment, the more it translates into economic (above all, but not restricted to) benefits of this effort.

This categorisation will later in the paper be applied to our sample of Brazilian firms in order to provide us an overview of the current engagement of firms to the environmental issues and how passive or proactively they are positioning in this regard.

3.3 Research questions and hypothesis

This work aims at investigating the following research questions:

- ✧ What are the drivers of radical eco-innovations among Brazilian firms?
- ✧ What is the profile of firms that are bringing radical eco-innovations to the market?

In order to trace the profile of radical eco-innovative firms we run an econometric model that tests the following hypotheses:

H1: Firms that carry out R&D activities with the specific purpose of generating environmentally beneficial products have a higher propensity to generate radical eco-innovations

It is widely acknowledged that companies with internal R&D activities achieve better results in science-based innovation (Pavitt, 1984), generating novelties with higher impact. Earlier studies have established a relationship between the presence of R&D activities and the occurrence of eco-innovations both in Brazilian (Young *et al.*, 2007) in German and French firms (BELIN *et al.*, 2011). Nevertheless, no studies were found relating the existence of environmental R&D to the occurrence of specific types of eco-innovations. It seems reasonable to expect that such strong and targeted effort of R&D is related to radical innovations.

H2: Firms driven by market determinants have a higher propensity to generate radical eco-innovations.

It seems reasonable to expect that firms driven by market determinants, in special the purpose of creating new market segments, will generate more radical innovations than other determinants – whereas regulatory policies tend to drive firms to adopt innovations in specific areas, such as waste and recycling.

H3: firms that establish partnerships for innovation have a higher propensity to generate radical eco-innovations.

The literature on eco-innovations tells us that firms have much to benefit from the establishment of cooperative arrangements (Belin *et al.*, 2011; Hart, 1997). A variety of actors/stakeholders involved in the innovation process brings different knowledge and reduces risk, costs and uncertainty. Previous studies have observed that the establishment of cooperation influences positively the probability of occurrence of eco-innovations (Belin *et al.*, 2011; Arruda *et al.*, 2012). Moreover, since eco-innovations are often linked to knowledge that is at the frontier – facing higher uncertainty and requiring more complexity than business-as-usual – those would be most benefited by cooperative arrangements in the innovation process. External partnerships increase the range of knowledge and capabilities available in the innovative process.

Next section presents the general descriptive findings as well as the results of the probabilistic regression, so to test the three above-mentioned hypotheses.

3.4 Econometric model

The dependent variable of our model is *radical innovation*. It assumes value 1 ($Y=1$) when firms report that the outcomes of their innovation process were new to the world; it assumes value 0 otherwise ($Y=0$). Due to the binary character of the dependent variable we use a probabilistic regression that can be briefly described as follows: the occurrence of a radical eco-innovation is influenced by several factors that are summarized by a vector x . Therefore, we need to estimate the following probability:

$$\text{Prob}(Y=1|x) = F(x, \beta)$$

We assume that the sample has a normal distribution: $\text{Prob}(Y=1|x) = \Phi(x'\beta)$. The parameters β reflect the impact of marginal changes in x on the probability (Greene, 2008: 772).

The variable describing the *determinants* of eco-innovation can be classified into the following categories: regulatory push/pull; technology & factors internal to the firm; market determinants; environmental concerns. It assumes value 1 when the firm reports each of the determinants as their main motivation to eco-innovate.

The variable *size* is obtained from the natural logarithm of the firm's net revenues. The variable *cooperation* is binary and takes value 1 when a firm reports having established cooperative arrangements for innovation, and value 0 otherwise. The variable *age* is the natural logarithm of the number of years of the firm's foundation. The variable *EMS* is binary and assumes value 1 when firms have adopted environmental management systems, and 0 otherwise. The variable *foreign* is binary and assumes value 1 when the firm is mostly owned by foreign capital, and 0 otherwise.

4 Results

4.1 General Results of the Survey

In general terms, we can say that Brazilian firms from our sample are aware of environmental issues that affect their businesses. They are addressing these issues through a series of initiatives (waste management programs, energy consumption reduction plans, EMS, creation of a "sustainability team" within the firm, among others). Innovative approaches, in special the more radical and disruptive innovations, are nevertheless limited to a specific group of firms.

From the 98 firms that replied to the survey, 47% reported having carried out eco-innovations in 2011. One third of such were organisational innovations mostly referring to waste recycling or energy reduction initiatives. New environmentally beneficial products or processes represent 38% of the innovations carried out among the sample. The creation of cleaner technologies was reported only by 28% of the sample.

When we asked about the determinants for carrying out eco-innovation, we were surprised to acknowledge that environmental concerns were the key determinant for only 13% of eco-innovative firms. The creation of new businesses was alone the main determinant – 28% of firms reported this as their key driver to eco-innovate. Cost reduction was the third most important factor (22%), followed by the search for brand reputation/image improvement (20%). Regulation was only mentioned as the central determinant for 13% of firms.

Such results seem to suggest that in Brazil there are some key aspects to be observed: regulatory policies seem not to be signalling to the market in regard to potential market creation, or do not exist sufficient regulations to generate market shifts. The fact that a good share (a third) of eco-innovations relate to waste recycling is evidence that one important governmental policy – the Solid Waste National Program (PNRS, in Portuguese) – is moving firms to action, but still limits to compliance.

Other important (and quite surprising) aspect is that approximately a quarter of eco-innovative firms have the purpose of creating new markets and/or expanding to new business niches. This group is of special interest due to the fact that their products – mostly technologies, but possibly also management systems – when disseminated in the economy, will enable other firms to perform their productive activities in a more environmentally positive way. This niche of firms has eco-innovations as their core business and has a strategic approach to the environmental concerns.

We now shift our attention to the kinds of eco-innovation the firms in our sample have undertaken, according to the categories presented in the Method section. First, there is the group of non eco-innovators, that we named "eco-resistance". Such firms opt for turning a blind eye to the environmental issue. This is our largest group, comprising 54% of firms.

The second category, representing a stage ahead in the firm's responsiveness to environmental issues, "eco-compliance", has 16% of firms. Many of these firms are driven by regulations recently established in Brazil and are acting in order to comply with these requirements. Most eco-innovations reported by this group of firms refer to incremental innovations aimed at reducing waste generation, water consumption or energy expenditures.

"Eco-efficiency" is the stage where 20% of the sample stands. The search for better performance while saving natural (non-renewable) resources is the determinant of this group's approach to the environment. Firms at this stage are one step ahead of the earlier stage, as their eco-innovations have a characteristic of concerning with cost reduction.

The “eco-advantage” stage has only been achieved by 10% of the sample. Most firms at this stage are generating knowledge and launching innovations that are radically changing markets and production processes. Unfortunately this is the smallest group, but a central one, as these companies are leading the “green competitive wave”. Among this group are technology-based firms that have an eco-innovation as their main product, setting the environment at their core business.

The distribution of firms from the sample in the four categories proposed in the paper is presented on Figure 1.

Figure 1 Distribution of Firms From the Sample in the Proposed Categories

In order to have a better understanding of the profile of firms within this last group and what drives their radical eco-innovative behaviour, the results of the probabilistic regression (whose model was previously described in this work) is elucidated in the next section.

4.2 Probabilistic regression

Table 3 brings the results of our probabilistic regression, which had a (binary) dependent variable: the occurrence of radical innovations (taking value 1 for yes, 0 for no). Explanatory variables were those mentioned in the hypotheses raised: the different motivations reported by firms to eco-innovate; the existence of R&D activities specially focused on environmentally positive outcomes; the establishment of cooperative arrangements for innovation.

We also asked firms about their age, capital ownership, revenues (in order to measure firm size) and whether they have environmental management systems (EMS), used as control variables.

As expected, the existence of R&D activities specifically oriented to the achievement of environmental outcomes proved to have a positive effect on the occurrence of radical eco-innovations. Once more it became evident that radical outcomes usually demand considerable investments in research and development. In the case of eco-innovations, this tends to be even more important. Indeed, eco-innovations are often more science-based than the ones emerging within traditional systems, as a shift to environmentally friendly alternatives sometimes diverges from the prevailing sociotechnical regimes. We therefore accept hypothesis 1.

Regarding hypothesis 2, two different results came out. First, we corroborated our hypothesis that firms driven by market determinants, and in special those in search of new market segments, have radical innovations as an outcome. We expected that firms driven by compliance motivations would not generate radical innovations, as they mostly adopt innovations developed elsewhere, or lead to end-of-pipe innovations (Horbach *et al.*, 2012). Nevertheless, results have shown that, differently from expected, regulatory determinants also have a positive effect on the occurrence of radical innovations, though not so intensively as market determinants.

A possible explanation for that is the fact that, once recent policies are driving firms to adopt cleaner production processes, some firms are benefiting from this new demand by providing firms with technologies that enable them to adopt cleaner production methods. In this case, some of the radical innovative firms would be operating exactly in the sectors that regulations have already been established. The solid waste program, as earlier mentioned, has boosted firms and raised numerous innovative initiatives among Brazilian firms. Hypothesis 2 is therefore accepted, but the positive effect is extended to the regulatory determinant.

Furthermore, cooperative arrangements for innovation had a positive sign in our model. However, results are non significant in the model. We cannot draw any strong conclusion in this regard, and therefore hypothesis 3 cannot be accepted. The control variables used in our model did not show either significant results and, therefore, conclusions cannot be drawn in this regard. Only the variable referring to firm age had a positive and significant result, suggesting that firms already established in the market have a stronger propensity to develop radical innovations. It seems reasonable to relate such positive effect to the accumulation of experience and knowledge by the firm, contributing to more successful innovative efforts.

Table 3 Results of the Probit regression

	Dependent Eco-innovation (yes=1; no=0)	Variable: Radical

5 Concluding Remarks

The purpose of this paper is to present data from an unprecedented survey of Brazilian firms mapping their eco-innovative patterns. We draw special attention to the group of firms that have

achieved the stage of “eco-advantage”, in order to find out what drives radical innovation and what are the main characteristics of this group.

Our results show that the main innovation determinant influencing radical outcomes regards market-driven factors, specially the purpose of creating new market segments. This result corroborates with theoretical observations suggesting that spurring green innovation can be seized as opportunities, instead of mere constraints to economic activity. These opportunities are both to fulfill the existing demands of consumers for environmentally friendly products (and services), as well as to emulate preferences while creating new market segments. The later tends to be potentially disruptive, as it generates new technological trajectories, business models, products and services.

Other important determinant of radical eco-innovation consists on regulations, due to the imperatives of complying with environmental policies. This observation supports the Porter hypothesis and the perception that environmental regulations can stimulate competitiveness of firms by forcing them to invest on energy efficiency and waste reduction, pay greater attention on their product's life cycle, and so forth. This result in the Brazilian scenario is similar to the findings in other countries, such as England and Germany, and diverges to the widespread idea that weak environmental laws have positive impact on competitiveness of countries. Although weak laws might attract multinationals unwilling to cope with high environmental standards, strong laws are capable of crystalizing a growth trajectory through stimulus to innovative behaviour.

It is also important to bring to attention the fact that regulatory policies, though not yet a main driver of eco-innovations in Brazilian firms, already show its power in creating market for specific technologies and environmental solutions, such as waste management. It signalizes the strength that policies have to shape environmental impacts of businesses.

Performing R&D activities oriented to environmental outcomes, as expected, has also proved to have positive effect on the occurrence of radical eco-innovations. This goes along with the widely acknowledged theoretical description that internal R&D achieves better results in science-based innovation (Pavitt, 1984), such as disruptive novelties involving environmental stewardship. It is interesting to observe, though, that R&D activities are usually tagged to technology-pull (sometimes mission-oriented) initiatives, while this study has shown that market pressures are among the most important determinants to generate eco-innovations.

Furthermore, the descriptive results presented in the previous section stressed the existence of this special group of radical eco-innovators in our sample of Brazilian firms. Even though they exist, their size is still rather limited. It means that there are few firms seizing the opportunities raised by deliberately increasing environmental concerns into their strategies. On the positive side, the existence of the group *per se* means that the opportunities do exist and could be seized by many other firms.

Finally, it is important to stress that this study was limited to 98 enterprises. Although the sample includes enterprises from different sizes and sectors, it is not representative of the Brazilian landscape. Enterprises were targeted according to their potential to contribute to the understanding of determinants and profiles of eco-innovators, not aiming to characterise or generalise the findings to the whole population of Brazilian firms. This work also focused on testing specific hypothesis through the use of econometric tools and descriptive statistics, and, therefore, a later qualitative in-depth study would contribute to better understand the variables and their interconnection.

(E-mail: cxf2010611@163.com, zhccs@163.com)

Abstract: With the arriving of knowledge economy era, knowledge has become a key factor in competition between enterprises. Effective knowledge management could enhance the core competitiveness of enterprises. As a typical knowledge-intensive financial firm, the knowledge composition and management emphasis of commercial bank are very different. This paper establishes evaluation indexes system of commercial bank knowledge management from four aspects including customer relationship, organizational knowledge, business knowledge and external knowledge, and then introduces analytic hierarchy process (AHP) to sort the evaluation indexes, so as to effectively locate the core knowledge of commercial bank and provide reference for the implementation and improvement directions of commercial bank knowledge management.

Key words: Commercial bank; Knowledge management; Evaluation index; AHP

1 Introduction

With the arriving of knowledge economy era, knowledge-intensive enterprises rise rapidly and knowledge becomes a key factor in competition. At the same time, knowledge management also emerges. The knowledge composition management emphases are different with different types of enterprises. Effective knowledge management can enhance corporate value and core competitiveness. The evaluation of knowledge management is an important part of knowledge management, which could evaluate the implementation effect of knowledge management. Compared with general enterprises, the knowledge composition and management emphasis of commercial bank is very different, but most domestic commercial banks are lack specialized knowledge management system and knowledge management evaluation is also lack of uniform standards. There are some studies about knowledge management at home and abroad, but mostly for general business and little from the perspective of commercial banks. Therefore, this paper will focus on commercial bank knowledge management and establish evaluation indexes system from customer relationship, organizational knowledge, business knowledge and external knowledge the four aspects for knowledge management of commercial bank. And then the AHP is introduced for further analysis of the evaluation indexes. The purpose of this paper is to provide the basis for positioning core knowledge of commercial bank and give references for implementation and improvement directions of commercial bank knowledge management.

2 Literature Review

Research on knowledge management started in 1980s. Dr Karl E. Sveiby published the book "knowledge-based enterprises" in 1986 with Swedish, which made him the ideas source of knowledge management theory and practice. In 1990, Swaziland published the book "knowledge management" that was the fist work to with knowledge management as theme. Management scholar Peter Drucker predicted as early as 1965 that knowledge would become the most important product factor replacing land, labor, capital, and machinery equipment^[1]. Management master Peter Drucker (1993) said: "The most valuable asset in 21st century organizations is the organization's knowledge workers and their productivity." Enterprise knowledge includes tacit knowledge and explicit knowledge. According to Delphi Group survey, the largest part of the enterprise knowledge is tacit knowledge exists in minds of employees. Japanese knowledge management expert Nonaka (1995) presented conversion model between explicit knowledge and tacit knowledge and the four basic modes of knowledge conversion. He though it was the intersection between tacit knowledge and explicit knowledge that created learning.

About studies of knowledge management evaluation, Kaplan and Norton (1993) proposed the Balance Score Card and respectively from the financial, customer, internal operations and learning and growth the major four aspects evaluated enterprise intellectual capital; Quitas^[2] etc. proposed evaluation index system including business-oriented development, acquisition and sharing knowledge strategic policy, knowledge strategy implementation and testing and evaluation management activities related to knowledge; Andersen^[3]proposed knowledge management assessment tools including sense of leadership,

corporate culture, technology, assessment and learning behavior change; Domestic scholar Liao Kaiji^[4] measured knowledge management performance from the enterprise knowledge management capability, internal structure, external structure and personnel competitiveness; Ma Xiaoyong^[5] set up measure card as assessment tool of corporate knowledge management capability and used it in corporate real evaluation; Xu Ning^[6] presented commercial banks diagnostic model of knowledge management from culture, management and technology three point of view.

In summary, researches about knowledge management and its evaluation index are very much which could help the construction of knowledge management evaluation indexes of commercial bank.

3 Commercial Bank Knowledge Management

3.1 Knowledge management

APCQ (American Productivity and Quality Center) defines knowledge management as: knowledge management is a conscious adopted strategy of organization, which can guarantee that most needed knowledge is transmitted to those most in need in the most needed time. This can help people share information, and thus put it into practice through different ways so as to achieve the purpose of improving organizational performance.

Classic SECI knowledge transformation model can be further elaborate knowledge management connotation. The model is shown in Figure 1.

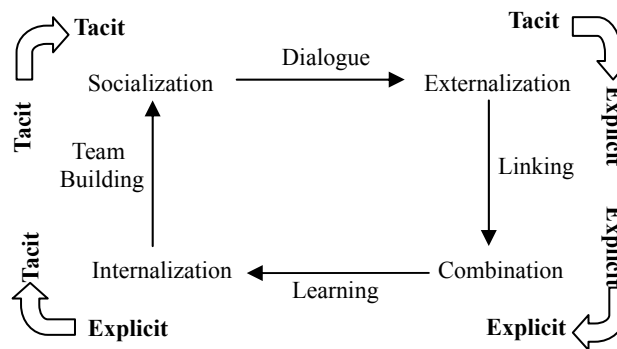

Figure 1 SECI Model

The model assumes that knowledge accumulation and innovation experience four stages of conversion: socialization (tacit knowledge transforms into tacit knowledge and new tacit knowledge is generated by sharing) ---- externalization (tacit knowledge transforms into explicit knowledge through communication) ---- combination (explicit knowledge transforms into explicit knowledge, that means explicit knowledge is combined into more complex and systematic explicit knowledge by consolidation) ---- internalization (explicit knowledge transforms into new tacit knowledge of enterprise through learning). The knowledge of individuals and enterprises is used and developed effectively by the way.

SECI model reveals the starting point for knowledge management or creation source of knowledge to some extent. According to the model we can further define knowledge management as: constructing perfect knowledge organization system that allows continued knowledge innovation through acquisition, creation, sharing, integration, record, access, update and other processes. And the innovation knowledge can go back into the system so as to make individual and organizational knowledge accumulation.

3.2 The characteristics and significance of commercial bank knowledge management

3.2.1 The characteristics of commercial bank knowledge management

Knowledge management always starts in knowledge-based enterprises. Knowledge of general enterprise includes business knowledge, staff knowledge, process knowledge, customer knowledge, product and service knowledge and so on. Bank is a typical knowledge-based industry with no specific physical products, which must belongs to knowledge management industry. The business operations, management coordination and information communication are carriers of knowledge management reflecting the value of intellectual capital. Main body of knowledge in commercial bank could be employees, managers, functional units or business units; knowledge sharing refers to common usage of certain knowledge capital. Specifically, as a special financial services industry, the core of commercial bank knowledge management is intellectual capital management, including customer relationship, organizational knowledge, business knowledge and external knowledge management, among which customer relationship is more important then others relatively.

3.2.1 The significance of commercial bank knowledge management

The success of enterprises increasingly depends on the quality of owned knowledge in 21st century. As a commercial bank, the implementation of knowledge management is significant.

1) The implementation of knowledge management can improve the core competitiveness of commercial banks. The knowledge level is a part of core competitiveness in commercial bank, and knowledge management is the core source of competitive advantage which is a key factor to promote the growth of the core competitiveness;

2) Knowledge management can guard against financial risks effectively. There are various financial risks in bank such as credit risk, liquidity risk, interest rate risk and market risk. For instance, the credit risk can be prevented through grasping the customer's credit information;

3) Knowledge management is the inevitable trend of economic globalization. In the case of economic globalization, knowledge management has been the strategic choice of enterprises and banks. Therefore, commercial bank should put knowledge management as a strategic goal in order to improve the core competitiveness.

4 Evaluation Index Construction of Commercial Bank Knowledge Management

Evaluation of knowledge management is an important part of knowledge management, through which the bank will grasp implementation situation of knowledge management and find out problems and improvement direction. This section describes the elements of commercial bank knowledge management and establishes evaluation indexes system. The system concludes first-level indexes and second-level indexes. The first-level indexes are composed of four aspects: customer relationship management, organizational knowledge management, business knowledge management and external knowledge management. The second-level indexes are subdivision of first-level indexes. According to the characteristics of commercial banks, its knowledge management evaluation index system is shown in Table 1.

Table 1 Evaluation Index System of Commercial Bank Knowledge Management

	First-level index(B)	Second-level index (C)
Knowledge management evaluation of commercial bank (A)	Customer relationship management(X ₁)	<ul style="list-style-type: none"> • Ability to maintain customer relationships(X₁₁) • Customer satisfaction and loyalty(X₁₂) • Development of new customers(X₁₃) • Establishment of customer information database(X₁₄)
	Organizational knowledge management(X ₂)	<ul style="list-style-type: none"> • Learning ability and experience of employees(X₂₁) • The establishment of learning organization in bank(X₂₂) • The establishment of sharing incentives(X₂₃) • Explicit knowledge management targets(X₂₄)
	Business knowledge management(X ₃)	<ul style="list-style-type: none"> • Development capabilities of financial products(X₃₁) • Profitability of commercial bank(X₃₂) • Market share(X₃₃) • Level of customer service(X₃₄)
	External knowledge management(X ₄)	<ul style="list-style-type: none"> • Monetary policy study(X₄₁) • Analysis of market environment(X₄₂) • Competitors awareness(X₄₃) • Brand construction investment(X₄₄)

5 Analyses of Evaluation Indexes Based on AHP

AHP (analytic hierarchy process) is proposed by Saaty in 1970s. It is an analysis method combining qualitative and quantitative analysis, which can quantify experience judgments of decision makers and has rapid development in practical applications. This section will introduce AHP to sort for each level index, so as to determine the key knowledge in knowledge management. The application of AHP to solve problems is generally divided into four steps: 1) establish hierarchies; 2) construct pairwise comparison judgment matrix; 3) calculate index weights; 4) consistency test.

5.1 Hierarchy analysis

Specific issue is generally divided into target layer and restrictive factor layer. In the table 1, knowledge management evaluation of commercial bank is set as target layer expressed by A. First-level index expressed by B is restrictive factors layer composed of X₁, X₂, X₃ and X₄; and second-level index is restrictive sub-factors layer expressed by C. The expression way of sub-factors is shown in table 1. For example, the sub-factors of factor X₁ are expressed with X₁₁, X₁₂, X₁₃ and X₁₄.

5.2 Comparison judgment matrix

In order to obtain quantitative judgment matrix through pairwise comparison between factors, the 1~9 scales are introduced, which is shown in table 2:

Table 2 Definition of Scale 1~9

Scale	Definition
1	Factor X_i and factor X_j are equally important
3	Factor X_i is slightly important compared with factor X_j
5	Factor X_i is more important compared with factor X_j
7	Factor X_i is very important compared with factor X_j
9	Factor X_i is absolutely important compared with factor X_j
2,3,6,8	The correspond scales of intermediate state between two judgments
Reciprocal	If factor X_j is compared with X_i , judgment value is $a_{ji}=1/a_{ij}$, $a_{ii} = 1$

According to the requirements of the above scales, the judgment matrix of each index can be derived through questionnaire survey to experts. Therefore, the judgment matrix expressed as A- X_i of factors in restrictive factors layer B of table 1 is shown in table 3:

Table 3 Comparison Judgment Matrix A- X_i

A	X_1	X_2	X_3	X_4
X_1	a_{11}	a_{12}	a_{13}	a_{14}
X_2	a_{21}	a_{22}	a_{23}	a_{24}
X_3	a_{31}	a_{32}	a_{33}	a_{34}
X_4	a_{41}	a_{42}	a_{43}	a_{44}

Where, a_{ij} represents the scale of X_i compared with X_j , $a_{ji}=1/a_{ij}$ and $a_{ii} = 1$, $i=1,2,3,4$, $j=1,2,3,4$. Similarly, the judgment matrix of factors in restrictive sub-factors layer C could be constructed, which is expressed as X_i - X_{ik} , and k is the number of evaluation indexes of factor X_i .

5.3 Index weight calculation

After constructing judgment matrix, we need to calculate the maximum eigenvalue and eigenvector of the matrix. The calculation steps are as follows:

- 1) Calculate geometric mean of all elements in each row of the judgment matrix. The formula is:

$$\bar{w}_i = \sqrt[4]{\prod_{j=1}^4 a_{ij}} \quad i = 1, 2, 3, 4 \tag{1}$$

Then the vector $\bar{w} = (\bar{w}_1, \bar{w}_2, \bar{w}_3, \bar{w}_4)^T$ is obtained.

- 2) Normalize \bar{w}_i , the formula is:

$$w_i = \frac{\bar{w}_i}{\sum_{i=1}^4 \bar{w}_i} \quad i = 1, 2, 3, 4 \tag{2}$$

So as to get the vector $w = (w_1, w_2, w_3, w_4)^T$, that is approximate eigenvector of judgment matrix, and w_i is the relative weight of factor X_i .

5.4 Consistency test

Consistency test is used to test the validity of the judgment matrix. The steps are as follows:

- 1) Calculate the maximum eigenvalue λ_{max} of the matrix

Expressing the judgment matrix in table 3 as $D = (a_{ij})_{4 \times 4}$, then the calculation formula of maximum eigenvalue λ_{max} of matrix D is:

$$\lambda_{max} = \sum_{i=1}^4 \frac{(Dw)_i}{nw_i} \quad i = 1, 2, 3, 4 \tag{3}$$

Where $(Dw)_i$ is the i element of the vector Dw .

2) Calculation of consistency index CI

The consistency index of judgment matrix is $CI = \frac{\lambda_{max} - n}{n - 1}$, where n is dimension of the matrix.

3) Calculation of consistency ratio CR

Generally, we use consistency ratio $CR = CI/RI$ to measure the consistency of judgment matrix, where RI is the correction value and it is fixed as following table 4:

Table 4 Correction Value RI

Dimension	1	2	3	4	5	6	7	8	9
RI	0	0	0.58	0.9	1.12	1.24	1.32	1.41	1.45

The larger the CR is, the worse the consistency of the matrix is. Generally as long as $CR \leq 0.1$, it is thought that judgment matrix has satisfactory consistency, or building judgment matrix again.

Through the above calculation process, we can get the relative weights of restrictive factors layer B, and by the same way the weights of restrictive sub-factors layer C also could be obtained. Then through the combination weight calculation, the final weights of evaluation factors could be identified. Compared with the weights, the evaluation factors can be sorted. The index weights derived from AHP have certain accuracy and scientificity, which could locate core knowledge of commercial bank.

6 Conclusions

In this paper, evaluation index system of commercial bank knowledge management is discussed. Some conclusions can be drawn.

Firstly, knowledge management is very important for commercial bank and the emphasis of knowledge management is different in different industries.

Secondly, the evaluation index construction of commercial bank knowledge management includes two levels, and AHP can be applied to locate core knowledge of commercial banks which will help to enhance management efficiency and provide improvement directions of commercial bank.

Finally, the weights of evaluation indexes identified through AHP can be used to evaluate the overall level of knowledge management combined with DEA or other evaluation models.

An Empirical Investigation into the Relationship Between Knowledge Management and Innovation Performance of Virtual Enterprise*

Feng Yanfei, Cai Lu

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: blue-star520-520@163.com, lydia-lulucat@msn.com)

Abstract: This paper analyzes the knowledge management activities in virtual enterprise, and makes an empirical investigation about the relationship between knowledge management and management innovation and technological innovation of virtual enterprise from three aspects: knowledge creation, knowledge transfer and knowledge storage. Then it obtains the conclusion that there is a positive, weak linear relationship between knowledge management activities and innovation performance in virtual enterprise. This provides useful reference in future research of knowledge management, management innovation and technological innovation of virtual enterprise.

Key words: Knowledge management; Virtual Enterprise; Management innovation; Technological innovation; Multiple Linear Regression Model

1 Introduction

Most scholars share a common understanding about the definition of innovation that knowledge can be turned into new ideas, new products, new processes and new services to increase competitive advantage, meet the changing needs of customers, and create new values. Virtual enterprise is a network-based and resource-cored dynamic alliance. Grasp of market and control of resources is an important source of competitive advantage, which requires unique innovate ability, and allocates resources effectively and reasonably by technical innovation, and enhances market understanding and positioning by management innovation.

As the basic unit of strategic analysis and the main source of competitive advantage, knowledge is essential to virtual enterprise. In the era of knowledge economy, rapid development of technology shorten the knowledge's life cycle, which has a profound impact on the survival, growth and adaptability of virtual enterprise. Many cases and research have shown that the effective implementation of knowledge management plays a very important role to organization's innovation. As a key segment of knowledge network, the transparency, liquidity and effectiveness of knowledge management in virtual enterprise is the foundation of resources optimal allocation and market information acquisition. It can greatly enhance the dynamic capabilities, bring dynamic competitive advantage. Different from general business, virtual enterprises more rely on network technology which has a series of new characteristics such as larger radiation, stronger stealthiness and higher risk. This means that knowledge management and innovation behavior has greater variability and flexibility, and the sources and direction of knowledge acquiring can not be judged accurately and the knowledge loss rate is high. Thus innovation activities of virtual enterprise demand higher identify ability and sensitivity of acquire technical.

A growing number of virtual enterprises begin to focus on the impact of optimization of knowledge asset allocation to competitive advantage in innovation of management and technology, and work a sound knowledge management system into strategic objectives, the understanding of knowledge management as a new element to support business innovation is strengthen. So the study of knowledge management activities of virtual enterprise can helps managers to absorb and use new knowledge effectively, adapt the virtualization, knowledgeable, networking and informational of virtual enterprise quickly, and thus enhance the innovative capability and performance of virtual enterprise greatly. This paper discusses the relationship between knowledge management and innovation performance of virtual enterprise basing on theoretical achievements and empirical analysis.

2 Conceptual Model and Hypotheses

The knowledge management process is divided into three sections: knowledge creation, transfer and storage. To achieve management and technology innovation, virtual enterprises must create new knowledge associated with innovation activities, then transfer between members and departments, and store them in an easy-to extract and modify way. Virtual enterprises should strive to establish a

* This paper is supported by a grant from the National Natural Science Foundation of China(71271162).

knowledge base on innovative behavior and achieve scientific and rational knowledge management to promote management and technology innovation in order to provide better products and services. Based on this, a conceptual model is built to describe the relationship between knowledge management and innovation performance in virtual enterprise, shown in Figure 1:

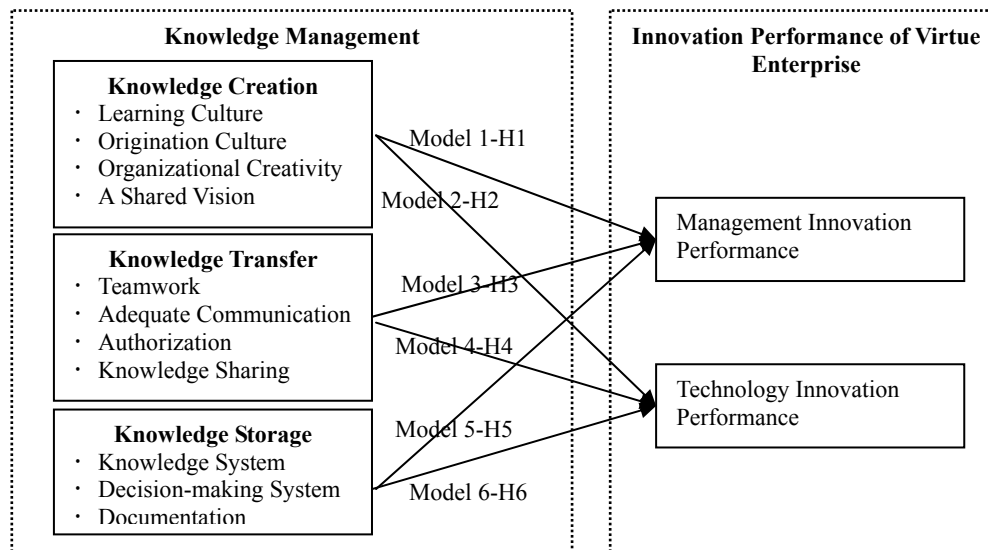

Figure 1 Relationship Between Knowledge Management and Innovation Performance in Virtue Enterprise

Knowledge creation requires organizational members to learn the existing knowledge, transform them through effective channels, and apply them to create new value. The cooperation between member companies provides a convenient environment and basis supports for individuals to create new knowledge and innovation activity. Continuous innovation in virtual work team requires internal learning and communication. Based on this, it proposes two hypotheses for model 1 and 2:

H1: Knowledge creation in virtual enterprise has a positive influence on management innovation performance

H2: Knowledge creation in virtual enterprise has a positive influence on technology innovation performance

With the increase of decentralization, the team’s shared thinking model in innovative behavior has become unified, and the multilevel understanding and cooperation has been strengthened, and then it can urge the timely and effective costs decisions to improve the short-term financial performance. However, the high fragmentation of knowledge may reduce the variation of organizations and restrict competitions which can promote innovation behaviors, so it may bring a negative impact on innovation in virtual enterprise. Based on this, it proposes two hypotheses for model 3 and 4:

H3: Knowledge transfer in virtual enterprise has a positive influence on management innovation performance

H4: Knowledge transfer in virtual enterprise has a positive influence on technology innovation performance

Once knowledge is created and transferred, it should be stored for subsequent use of each member in organization, thus the value of knowledge could be maintained and improved. The storage of knowledge is to make tacit knowledge specific and apply them effectively to achieve "organizational memory", which can play a more important role when they could be recognized more easily by employees and managers who need them. Once the individual’s information is standardized or transmitted into a file or other entities substances, knowledge will spread faster. Based on this, it proposes two hypotheses for model 5 and 6:

H5: Knowledge storage in virtual enterprise has a positive influence on management innovation performance

H6: Knowledge storage in virtual enterprise has a positive influence on technology innovation performance

3 Method Design and Model Testing

3.1 Questionnaire design and sample collection

The questionnaire includes five parts: knowledge creation, knowledge transfer, knowledge storage, innovation performance and the respondents' basic information. This paper chooses 11 items to evaluate the knowledge creation, transfer and storage: learning culture, corporate culture, organizational creativity, shared vision, teamwork, adequate communication, authorization, knowledge sharing, knowledge systems, decision-making system and documentation in virtual enterprise, While 2 items for innovation performance of virtual enterprise: management and technological innovation performance, 4 items for respondents' basic information: gender, age, name of the working company and position. 56 e-business alliances in Wuhan East Lake High-tech Zone are selected as the sampling objectives. To improve the convenience and validity, this paper makes a non-probability sampling, distribute 300 questionnaires to employees of the 56 companies, and reclaim 268 valid questionnaires after screening.

3.2 Sample descriptive statistics

This paper applies SPSS statistical software for data processing and analysis. It makes a descriptive statistics on the main characteristics of respondents, including gender, age, and firm size, in order to understand the sample distribution of these characteristics. There are 268 valid questionnaires returned, the valid recovery rate is 86.67%. Statistics result shows that the male proportion is 69.4%, the employee's age between 20 and 25 accounted for 4.5%, 25-35 accounted for 28%, 35-40 accounted for 33.3%, 40-45 accounted for 18.9%, 45-50 accounted for 11.7 %, and 50-55 accounted for 3.6%. The distribution of employees amount of virtual enterprises investigated in the research is as below: 50-100, 16.4%; 100-150, 27.3%; 150-200, 22%; 200-250, 21.3%; 250-300, 13%.

3.3 Reliability and validity testing

This paper uses Cronbach's alpha coefficient to make reliability test. The delete standard of questionnaire items is as below: if the Cronbach's α coefficients of the questionnaire item and the measured variables are less than 0.4, and the overall Cronbach's α coefficient increases after deleting the item, then this item should be deleted (Churchill, 1979). Test results shows that the Cronbach's α of each variable is higher than 0.70, which indicates that the reliability of this questionnaire is acceptable, and each variable has a good internal consistency; Meanwhile, this paper applies factor analysis to examine the structure validity of the questionnaire. Test results show that the factor loading of each questionnaire item is higher than 0.5, which indicates that the overall quality of the questionnaire is high and the structure validity is good.

4 Solution and Results Analysis

4.1 Correlation analysis

This paper uses the Pearson correlation coefficient to make a twenty-two correlation analysis of the four variables: knowledge creation, knowledge transfer, knowledge storage, and innovation performance, then it obtains the results in table 1:

Table 1 Correlation Analysis Results

Innovation Performance Dimensions		Management Innovation Performance	Technology Innovation Performance
Knowledge Management Dimensions			
Knowledge Creation	Learning Culture	-0.358**	-0.372**
	Origination Culture	0.112	0.100
	Organizational Creativity	-0.434**	-0.281**
	A Shared Vision	0.175**	0.282**
Knowledge Transfer	Teamwork	0.603**	0.566**
	Adequate Communication	-0.453**	-0.325**
	Authorization	0.487**	0.387**
	Knowledge Sharing	0.422**	0.355**
Knowledge Storage	Knowledge System	0.465**	0.378**
	Decision-making System	-0.454**	-0.332**
	Documentation	0.593**	0.656**

* $p < 0.05$ (two tailed test); ** $p < 0.01$ (two tailed test)

Data in table 1 shows that there is a correlation relationship between the variables in the present study. Among them, there is a significantly and weak negatively correlation between the four dimensions of knowledge management (learning culture, organizational creativity, adequate communication and decision-making system) and the two dimensions of innovation performance (management & technology) respectively, while there is a weak and significantly positive correlation between the three dimensions of knowledge management (shared vision, teamwork and authorization) and the two dimensions of innovation performance (management & technology) respectively.

4.2 Regression analysis

Based on the regression analysis, this paper examines the relationship between knowledge creation, knowledge transfer, knowledge storage and innovation performance in virtual enterprise, and confirms whether the dimensions of knowledge management can enter the regression equation of innovation performance.

Table 2 Overall Parameters of Regression Model

Dimensions	R	R ²	Adj. R ²	SEE.	F	Sig.
1	0.605	0.367	0.364	0.79266951	150.467	0.000
2	0.665	0.442	0.438	0.75120505	100.989	0.000
3	0.686	0.465	0.461	0.73349134	75.101	0.000
4	0.696	0.484	0.475	0.72159324	60.529	0.000
5	0.714	0.511	0.505	0.70549014	53.269	0.000
6	0.726	0.528	0.511	0.69878912	46.241	0.000

The stepwise multiple regression analysis results of each dimension of knowledge management and management innovation performance are showed in table 2. Only six factors could be introduced into the regression model: teamwork, documentation, organizational creativity, shared vision, authorization and decision-making system. The adj. determination coefficient indicates that the regression equation can explain 51.2% of the total variance. And the significant probability of F statistic of each dimension is all 0.000, which indicates that the overall regression effect is significant. Teamwork is the first variable into the regression model, which indicates that partial regression variation (the contribution to management innovation performance) is the maximum, followed by documented, organizational creativity, shared vision and authorization, the last one is decision-making system, which indicates that the influence of decision-making system to management innovation performance is relatively minimal.

Table 3 Regression Analysis Results

Variables	Non-std. Coefficients		Std. Coefficients	T	Sig.
	B	Std. Error	Beta		
Constant	-1.61E-015	0.44		0.000	1.000
Teamwork	0.136	0.72	0.136	1.901	0.000
Documentation	0.292	0.65	0.292	4.622	0.000
Organization Creativity	-0.165	0.62	-0.165	-2.927	0.004
Shared Vision	0.226	0.48	0.226	4.634	0.000
Authorization	0.169	0.56	0.169	2.943	0.004
Decision-making System	-0.132	0.56	-0.132	-2.427	0.000

The regression analysis results in table 3 show that: Knowledge management has a significant influence on management innovation performance. The regression equation is as follows:

Management Innovation Performance=-1.61+0.136*Teamwork+0.292*Documentation-0.165*Organization Creativity+0.226*Shared Vision+0.169*Authorization-0.132*Decision-making System

Table 4 Overall Parameters of Regression Model

Dimensions	R	R ²	Adj. R ²	SEE.	F	Sig.
1	0.661	0.429	0.428	0.75502987	195.991	0.000
2	0.689	0.481	0.471	0.72491846	117.918	0.000
3	0.714	0.509	0.498	0.70365198	89.152	0.000
4	0.723	0.523	0.521	0.69265501	70.629	0.000

The stepwise multiple regression analysis results of each dimension of knowledge management and technology innovation performance are showed in table 4. Only four factors could be introduced into the regression model: documentation, shared vision, learning culture and teamwork. The adj. determination coefficient indicates that the regression equation can explain 51.8% of the total variance. And the significant probability of F statistic of each model is all 0.000, which indicates that the overall regression effect is significant. Documentation is the first variable into the regression model, which indicates that partial regression variation (the contribution to technology innovation performance) is the maximum, followed by shared vision and learning culture and the last one is teamwork, which indicates that the influence of teamwork to technology innovation performance is relatively minimal.

Table 5 Regression Analysis Results

Variables	Non-std. Coefficients		Std. Coefficients	T	Sig.
	B	Std. error	Beta		
Constant	-1.76E-015	0.041		0.000	1.000
Documentation	0.287	0.056	0.492	8.641	0.000
Shared Vision	-0.173	0.042	0.191	4.315	0.000
Learning Culture	0.232	0.044	-0.148	-3.188	0.002
Teamwork	0.169	0.062	0.169	2.809	0.005

The regression analysis results in table 5 show that: Knowledge management has a significant influence on technology innovation performance. The regression equation is as follows:

$$\text{Technological Innovation Performance} = -1.76 + 0.492 * \text{Documentation} + 0.191 * \text{Shared Vision} - 0.148 * \text{Learning Culture} + 0.169 * \text{Teamwork}$$

4.3 Result analysis

Based on above analysis, the hypotheses are basically supported by data testing: there is a linear relationship between knowledge management activities and innovation performance of virtual enterprises, and the following factors have a significant impact on innovation performance: learning culture, organization creativity and a shared vision of knowledge creation, teamwork and authorization of knowledge transfer and documentation and decision-making systems of knowledge storage.

It is indicated that building the right atmosphere and system is effective for encouraging knowledge creation, transfer, sharing and maintaining in virtual enterprise, thus it can improve the management and technological innovation performance. The establishment of learning-virtual enterprise can enhance the sharing of information among departments and employees; Organization creativity will reduce the motivation for translating new ideas into new management model and systems to some extent, and then it has a negative impact on the management innovation; A shared vision could make the innovative ideas and behaviors of member companies, departments and staffs consistent with the unified organizational objective; While cooperation between departments and employees brings more new and original ideas to solve specific problems, thus it could promote more innovation; A reasonable authorization could make employees bear responsibility for improving the way of service, and then encourage them to innovate more actively in daily work; Documentation and decision-making system could ensure knowledge sharing and innovation in virtual enterprise from the perspective of organization and technology.

5 Conclusion

As a resource-cored, market-oriented, information-critical network-based dynamic alliance which is established for the implementation of specific corporate strategic objectives, virtual enterprise aims to achieve the best combination of resources and the rapid development. This paper provides some useful references about knowledge management in the virtual enterprise through an empirical analysis into the relationship between knowledge management activities such as knowledge creation, knowledge transfer and knowledge storage and management innovation and technological innovation performance in virtual enterprise. However, the specific quantitative and segmentation of innovation performance of virtual enterprise remains to be further in-depth research.

Patents Forecasting Based on Combination Regression Analysis

Xie Yi

School of Computer Science, University of Lorraine, Metz, France, 57000
(Email: 2233445rt@gmail.com)

Abstract: Patent is one of the core competences to a company. Patents forecasting is an important aspect for the patents decision and R&D strategy selection. This paper employs combination regression method to the patents forecasting and proposes the algorithm of combination regression analysis. The paper takes KE Furniture Company as an example, based on 34 kinds of hard-core patent technologies to conduct the empiric analysis, and comes to the conclusion that the combination regression method is effective in patents forecasting practice.

Key words: Patents forecasting; Combination regression analysis; Furniture industry

1 Introduction

Patent is one of the core competences to a company. Patents forecasting is an important aspect for the patents decision making and R&D strategy selection of a company. So it is necessary to conduct the study of patents forecasting models and algorithm. There are many mathematic models in technological and economic forecasting, whereas each model has its limitation, so combination forecasting can make up the shortcomings of the single model and help improve the patents forecasting validity.

There are many scholars who did study on the patents forecasting. S. Champbell indicates that patent trends analysis is a technological forecasting tool. H. Ernst uses patent data to conduct technological forecasting: on the diffusion of CNC-technology in the machine tool industry. C.V. Trappey et. al. conduct an analysis about China's RFID patent. Aive Segev and Jussi Kantola. use self-organizing maps to the identification of trends from patents

2 Algorithm of Combination Regression Analysis

2.1 Trend Prediction of patent

It has been figured out through analyzing questionnaires that there are altogether 34 kinds of KE Furniture Company's hard-core patent technologies available to export to Home Furnishings Alliance in Shenyang. Then according to IPC (International Patent Classification), we can classify the different technologies as follows:

Table 1 Example Data from 2004-2011 Which is a Part of Full Data 1980-2012

Year	2004	2005	2006	2007	2008	2009	2010	2011
A	0	3	9	5	6	7	10	24
B	10	8	13	11	22	21	30	45
C	1	1	2	0	1	0	2	7
D	35	26	34	45	53	53	99	86
E	83	112	176	228	270	291	366	675
F	9	6	4	11	11	13	10	206
G	12	11	16	7	148	23	27	52

- (1) Modern training in web-based system for education of CAD, CAM and CNC related skills over distance learning :
G09I G06R H04Q
- (2) 3D CAD design and development software :
G06B B23A A61A G01A G05A
- (3) 3D printing technology :
B29S B41V A61B B22E C08L
- (4) Work with robotics and automation in furniture industry:
B25M G05R B23E F16A G01B B65E
- (5) Laser marking technology:
B23C H01L A61C G02K H05T G01C

- (6) Surface finishing:
A47Q B27B E04C B32D F16B
- (7) Decoration/fittings:
B60R B32B B44C F21V

After the classification, the time-series of the distribution of patent applications referring to the seven technology types are checked on the website of China's State Intellectual Property Office (SIPO). The data gathered are listed at table 1.

2.1 Choosing the method to predict

(1) Time Series Forecasting Method

Time series, also called as time sequence, plural of history or dynamic sequence. It is a sequence which is formed by arranging the statistical indexes chronologically. [1] Through working out and analyzing time series, Time Series Forecasting Method is used to predict the possible development level in a certain time or in certain years based on the analogy or extension of the process, direction and trend reflected in time series. The whole process includes: collect and collate of historical materials of certain social phenomenon; check and identify all those materials and to put them into series; analyze time series to figure out the development patterns of this social phenomenon concerning the change of time; apply this development pattern to predict the future of that social phenomenon.

(2) Regression Analysis Prediction Method

Regression Analysis Prediction Method refers to establishing the regression equation between the variables based on the analysis of the relationship between independent variable and dependent variable in market phenomenon. Later, the regression equation will be used as the predicted model to predict the correlation between the dependent variable and the independent variable in a prediction period. [2] Therefore, Regression Analysis Prediction Method is an important method to predict the market. So if we can find out the main factor that influences the market prediction and gather its quantitative data at the same time, then we can apply Regression Analysis Prediction Method to predict the future development and its level in certain social phenomenon. So Regression Analysis Prediction Method is a method to predict the market which is specific, effective and with high practical value.

Time Series Forecasting Method shows some defects in prediction error due to the fact that it focuses on time series leaving out the influences of external factors. Usually, the greater influence of external factors will result in larger deviations. So Time Series Forecasting Method does better in mid-short term predictions rather than in long term ones. Objective things, especially economic phenomena, are probably under a greater external influence in a long time. So certainly they have great impact on economic phenomena. If that happens, and we only take time element rather than external factors in to consideration, then the prediction will be quite different from the reality. [3] As for this prediction, the application and development of patents are under great influences of external factors such as economical ones and social ones, so Time Series Forecasting Method is not suitable. However, Multiple regression analysis is quite applicable in dealing with real economical problems under the influences of multiple factors. So Multiple regression analysis will be used in this patent prediction.

3 Patent Trend Prediction by Using Multiple Regression Analysis

After analyzing the scatter diagrams of annual patent applications for several patents, it can be found out that the scatter diagrams are often in line with the linear model, quadratic curve model and power function model and so on. So here comes the multiple regression curves which reflects the majority of trends:

$$\hat{y} = b_0 + b_1\hat{x}^1 + b_2\hat{x}^2 + b_3\hat{x}^3 + \frac{b_4}{\hat{x}^4} + b_b \ln \hat{x}^5$$

The patent application numbers are closely related to the popularity of certain technology. If a technology is quite prevalent in several years, then the number of newly applied patents which are relevant to this technology enjoys a significant gradually increase, vice versa. Usually, excessive volatility is rather rare. Consequently, we think patent application numbers in recent years are more valuable than those in a long time ago. When using the last squares method to estimate the parameters, I place a parameter φ_i before each square residual ($\varphi_1 \dots \varphi_n$). Since there are n parameters in the whole process of sum of square residual, so we have n parameters from φ_1 to φ_n . All the φ_i are defaulted

as 1. Then the φ_i added to the last few square residual will be gradually increased more quickly than other items. This process increases the proportion of last few items which represent for the data in recent years. It will satisfies the condition in which Goodness of Fit of corrected curves cannot surpass the original one.

Figure 1 is the flowchart of patents forecasting algorithm..

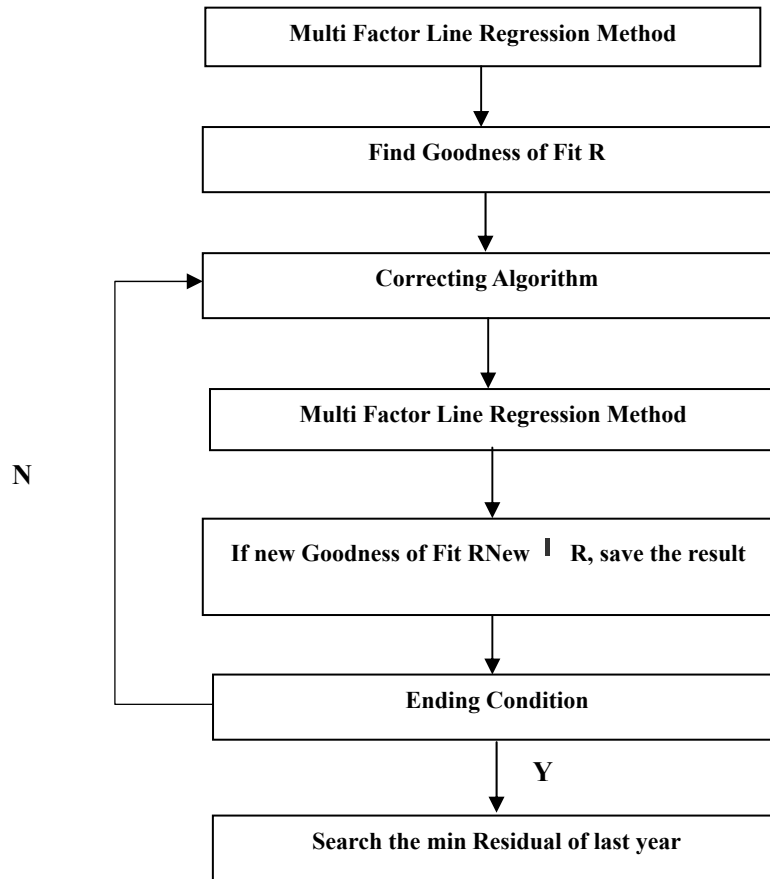

Figure 1 Flowchart for the algorithm

4 Experimental Result

My algorithm has aberration: 16
 Time Series Forecasting Method has aberration: 28
 The future Predictions 2013: 700
 The future Predictions 2014: 1051
 Time = 28.1114s
 Therefore the forecasting is shown at figure 2.

Figure 2 The forecasting outcome

5 Conclusion

After the realization through MATLAB, we randomly carry out the detection of prediction accuracy for 6th technology. Then we choose to compare the known results in 2012, the red line represents for the prediction got through multivariate nonlinear regression prediction, while the red line indicates the results obtained through time series prediction. Among them, the prediction error of multivariate nonlinear regression prediction is only 16, on the contrary, that of time series prediction turns out to be 28. After that we test all of the technology by using this programmer, all of the prediction error of multivariate nonlinear regression prediction was less than that of time series. The different results prove that multivariate nonlinear regression prediction can obtain more accurate results for patent prediction. Thereafter, multivariate nonlinear regression prediction is used to predict the patents application number of patents in the seven technological fields in China from 2013 to 2014.

(E-mail: zyt@whut.edu.cn, 839690891@qq.com)

Abstract: Science and technology are primary productive forces. To achieve fundamental change in economic development, combination of technology and finance is an inevitable choice. How to achieve the organic integration of science and finance? In this paper, we explored the risk factors of operation projects of technology-finance collaboration, and put forward the collaborative risk pre-control paths from perspective of the government according to different characteristics in different life cycle stages of operation projects of technology-finance collaboration.

Key words: Technology-finance; Project risk; Collaborative operation; Pre-control path

1 Introduction

Science and technology are primary productive forces and finance is the core of modern economy. The organic integration of technology and finance will greatly enhance the speed and efficiency in transferring technological achievements into practical productive forces. In order to study the mode of technology-finance collaboration, scholars have put forward ideas about its concept. One of the concepts which is defined by Zhao Wenchang, Chen Chunfa, Tang Yinkai is widely accepted now. They think technology and finance is not only a systematic and innovative arrangement to promote the development of science, the transferring of technological achievements and the development of high-tech industries with a range of financial tools, financial system, financial policy and financial services, but also a system composed of government which provides financial resources, enterprise, market, social intermediary organizations and other scientific entities as well as activities in technological financing process. Technology and finance is an important part of the national science innovation system and the national financial system.

The development of technology and finance has brought new vitality for the development of financial institutions and high-tech enterprises. High-tech SMEs and financial institutions have urgent needs in operation projects of technology-finance collaboration. But the life cycle of these projects is long and it always involves multiple subjects. Meanwhile, there is an obvious cyclical characteristic, and uncertainties in process of these projects. Thus, the risk of the projects should not be underestimated. Should it fail, it will cause huge losses to all participants. Therefore, it has very important significance to enhance risk identification and pre-control in operation projects of technology-finance collaboration.

2 Full Life Cycle Risk Analysis in Operation Mode of Technology-Finance Collaboration

Since the cyclical formative of high-tech enterprises, technology-finance projects also have significant cyclical characteristics, and have its own special risks in every stage of development. Therefore, only in different periods can we analyze different risks and clarify the whole picture of technology-finance projects.

Haier (1959) pointed out that the development of high-tech enterprises can be divided into the seed stage, pioneering stage, formative stage, maturity stage and recession stage, which is the life cycle of technology-finance projects. Seed stage is the period when ideas develop into fruit. In the pioneering stage, the product has been developed successfully, but only for trial production and market test. A commercial scale is not formed yet, so it's difficult to get economic benefits. In the formative stage, products have been accepted by the market with certain market share and series production. The product achieved cash flow breakeven point, but has not yet reached the breakeven point, and in order to expand production capacity, more funds needed to purchase equipment, facilities. In maturity stage, the projects supported by the product already have a stable market with matured technology. At this point, companies already have strong profitability to generate more internal funds, but financing has become diversified. Meanwhile, management problems may occur because of more complicated organizational structure and bigger scale when expanding. In the recession stage, high-tech companies often can't adapt to changes in the industry and technology. As a result the product gradually eliminated, and a rapid

decline occurs in corporate performance, this time, technology-finance project mainly supports enterprises to have a second venture and begin a new round of circulation.

Through analysis of the characteristics at different stages of life cycle in technology-finance project, we can draw out main risk factors, as shown in Table 1. From Table 1, it could be seen that in the seed stage, technology-finance project is very risky due to technical, scientific and technological unknowns. In this case, financial institutions reluctant to get involved which limited financing channels for enterprises. In the pioneering stage, technology risk is still great, and demand for funds also began to increase, and the funding is difficult to bring economic benefits timely. At this time, financial institutions are still reluctant to get involved, adding risk to the project. In the formative stage, financial institutions are willing to get involved, but their investment is difficult to fully meet the needs of high-tech enterprises due to the great demand of capital for expansion of production. And although technical risks are small at this time, market risks and management risks have begun to highlight with bring greatest risk to whole project. At maturity stage, the market has stabilized, together with enhancement in company's hematopoietic capacity and increase of financing channels, the overall risk is minimized in this phase. And in the recession stage, the product is weed out of the market because technology has lagged behind which result in declining of the company's profitability. Meanwhile, technological upgrading and introduction of new products require significant financial support. Then financing risks of enterprise will increase. Therefore, the overall risk level at recession stage increases again. Risk level of technology-finance projects at various stages of the life cycle is shown in Figure 1.

Figure 1 Risk Level of Technology-Finance Projects in Whole Life Cycle

Table 1 Sequencing and Analysis of Risk Factors in Life Cycle of Technology-Finance Projects

Life cycle stages	Risk factors Importance sequencing	Description
Seed Stage	Technical risk	Lack of predictability in technical difficulty and inaccuracies estimation of their own skills. Failed in archiving a technical breakthrough.
	Financing risk	Too many uncertainties, Far from profitable, Lack of financing channels
	Management risk	Small scale and entrepreneur's spirit make management risk minimal.
	Market risk	Market demand of research outcome will decide whether to enter the venture period.
Pioneering Stage	Financing risk	Increasing demand for funds, Lack of revenue. A lot of uncertainty and financial institutions reluctant to get involved make financing risk increases
	Technical risk	Test of large-scale production, stability, technological advance, sufficient technical support after pumping. These are all technical risks in this stage.
	Market risk	products cannot be accepted by the market, or acceptance lower than the original investment plan
	Management risk	Management risk is minimal.
Formative Stage	Financing risk	Serial production, expanding of production capacity, great capital demand to purchase equipment, facilities. Increasing marketing and selling expenses.
	Market risk	Accuracy in market demand predicting, exploring of new markets, increasing of market share, as well as big uncertainty in dealing with competitors
	Management risk	Increase in scale of production and product management, personnel management problems began to emerge. Management risk increase.
	Technical risk	Products have been developed, and have passed the test, the technical risk is small.
Maturity	Management risk	Together with increase of scale, management risk is also growing.

Stage	Market risk	How to deal with competitors and maintain market share is now a major market risk.
	Technical risk	Technical risk is not high any more. Risk mainly comes from the new technology and new outcomes. Because they can leads to the rapid depreciation of old product.
	Financing risk	Financing risk is not high at this time because of enterprise's hematopoietic ability, lots of financing channels
Recession Stage	Technical risk	Enterprise is no longer a leading the technology anymore, enterprises are facing the pressure of technological innovation.
	Market risk	Products have been weeded out of the market at this time. Enterprises are facing the problem of introducing new products. Market risk is very high.
	Management risk	Enterprises may dismiss employees at this time, management risk is high.
	Financing risk	Even though there are certain financing channels, great demand in capital make financing risks high.

It can be concluded from Figure 1 that at the seed stage, pioneering stage, formative stage the project risk is rising, and the lowest risk occurs at maturity stage but at recession stage the risk increases again.

3 The Government Role in Operation Mode and Risk Pre-control of Technology-Finance Collaboration

To guard against financial risk of the technology-finance projects effectively, a trinity collaborative pre-control system composed of enterprise, governments and financial institutions must be established. To achieve a synergistic effect of those three, the government should play a core role in the following reasons: First, before maturity, the projects have high technology risks and serious market failures, so financial institutions are generally reluctant to contribute. Therefore, there is an urgent need for government to solve the problem of market failure in a variety of ways. Second, at this stage, Chinese science and technology incubator still need government support. Third, the government can exert a great influence on technology financial institutions because of their state-owned properties. Fourth, the government needs to finance projects to promote scientific and technological innovation as a demand-side, but also the supply side of technology-finance projects because Government will directly fund scientific and technological innovation, while the government also plays the role of regulator in technology-finance projects, all of the instant institutions and high-tech enterprises will be subject to government regulation. In short, the government is a bridge to contact the financial institutions and high-tech enterprises. Only through the government's lead, parties involved in technology-finance project can achieve synergistic corporation effects.

Currently, on one hand, the government hopes to solve the bottleneck problem of technology innovation by funding technology incubators and participation in technology financial projects in different ways. And gradually form a demonstration effect, to promote the participation of financial institutions, thereby reducing the risk. On the other hand, government intervention may deviate technological innovation from the laws of the market, resulting in the lack of risk control ability in high-tech enterprises and financial institutions, it will not only lead to inefficient investment, but also produce a certain “crowding out” effect on the market, which is not conducive to the development of scientific and technological innovation. To solve this problem it is necessary to define the Role of Government clearly for risk pre-control in technology financial project.

As can be seen from Figure 1, in the seed stage, pioneering stage, formative stage, due to great technical and financing risks as well as market failure, the government must be directly involved in technology-finance project. In maturity stage, because the risk is small, the government should withdraw direct investor role, handover to market. In recession stage, although the risk of technology-finance projects become larger again, but ruled by the market mechanism of survival of the fittest, therefore, the government should not intervene. In short, technology-finance project risk pre-control requires both the government as a “visible hand” and the market as a “invisible hand” function together. Government should be more “at the helm” and less “paddling” in technology-finance projects.

4 Risk Pre-control Path Analysis in Operation of Technology-Finance Collaboration

At present, the Chinese government has taken various measures to pre-control risk in technological finance projects. In May 1999, China's establishment of a "SME Technology Innovation Fund", which is

a discount through loans, grants to support high-tech SMEs. In 2003, it adopted the "SME Promotion Law", and further intensifies efforts to support by fiscal and taxation policy. These measures have played a positive role in creating a favorable financial environment for science and technology, reducing financial technology risks. But there is need for improvement for our government in risk control of venture capital finance project. The author believes that the government should adopt a different policy according to characteristics of each risk, mobilize various positive factors, and achieve a collaborative risk pre-control mode for technology financial projects.

4.1 Technical risk pre-control path: developing science and technology incubator

Technical risk is the main risk factors at the seed stage and pioneering stage of technology-finance projects, but also underlying causes for small and medium sized high-tech enterprises. For technical risks, the government can accelerate the construction of science and technology incubator.

Normally, High-tech companies should go through the incubation process. Technology Incubator has played a big role in the risk control of technology-finance projects. First, the incubator can create an expert database to provide project feasibility studies, technical consulting services for the incubated enterprises. Second, the incubator can not only provide the required test equipment, test equipment and other infrastructure for research and development for the incubated enterprises, but also provide the test base to improve the product gradually. Third, it is difficult to fully grasp all the key technologies for products; it's a trend for high-tech enterprises to establish technological cooperation, technology incubators are in great favor of integration of technology patents. Fourth, technology incubator can become a bridge between research institutions and incubated enterprises, to promote cooperation between them. Therefore, the Government should vigorously develop science and technology incubators. The Government should not only provide preferential policies and financial support for the development of science and technology incubators, but also encourage technology incubators to become allies with more research institutes and high-tech companies, in collaborative incubation, thereby greatly reducing technology-finance project's technical risk, the support network from government for Technology Incubator shown in Figure 2.

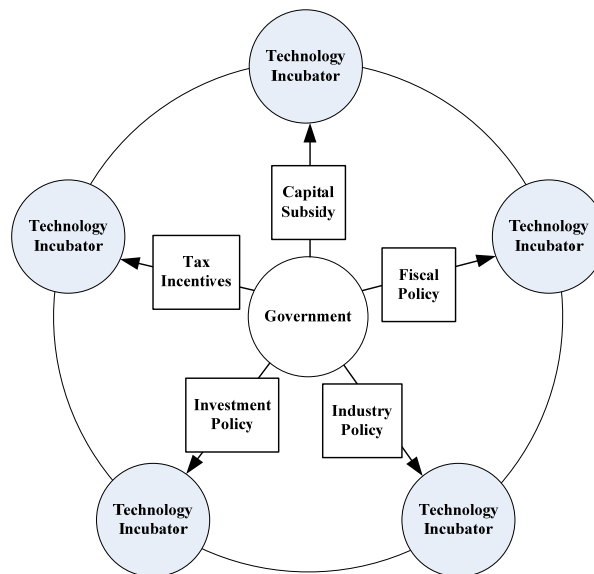

Figure 2 The Government Support Network for Incubators

4.2 Financing risk pre-control path: innovation fund, technology venture and investment bank

Financing risk is the major risk of technology-finance projects, the government should improve the innovation fund system, the development of venture capital and technology bank, so that financing risk can be reduced by the formation of synergies corporation between these three complementary.

First, accelerate innovation fund reform. Innovation Fund is an important method for our government to solve the problem that high-tech financing is difficult. At present, Chinese Innovation Fund has showed a good development trend, but there are still some problems. On the one hand, support for innovation fund is far from need, can not meet the needs of the technology-finance project. According to statistics, in 2011, Chinese SME Innovation Fund has funded 3827 projects, a total amount of 2.4 billion Yuan subsidy, which is totally inadequate for so many high-tech enterprises. On the other

hand, support method is too single. At present, Chinese Innovation Fund only support in three ways including free financing, loan interest and capital investment, these three methods do not effectively mobilize the enthusiasm of high-tech enterprises, prone to moral hazard problem. Therefore, it's in urgent need to broaden the methods of capital investment.

For the first question, I believe that the U.S. Small Business Administration (referred to SBA) and it's "SME investment plans" have a lot of experience worth learning from. "SME Investment Company" is actually a fund, its source of funds is divided into two parts, the direct investment by private capital and the SBA guaranteed bonds, the two types of guaranteed bonds are ordinary bonds and dividends bonds, available for institutional investors. SME investment companies invest high-tech enterprises in equity, debt and other forms, the whole operation mode of shown in Figure 3. Innovation Fund could set up an investment company, and provide guarantees for investment companies to attract organizational capital and private capital to solve the problem of insufficient amount of funds effectively. For the second question, I believe that Innovation Fund should change from direct funding to Warranty. Innovation Fund may invest part of the funds to establish a Warranty Company, and the remaining funds can be raised from public, and then, Warranty Company provides a guarantee for high-tech enterprises which develop well. To reduce the risk of warranty, so Innovation Fund can take part of Warranty risk to the lender, so that both banks and venture capital will be carefully screen technology projects. This risk-sharing approach reduces the financing risk for high-tech enterprises.

Figure 3 U.S. Small Business Investment Company Funding Sources

Second, give efforts to improve risk investment mechanism. Venture capital is a major source of financing at early stage of technology-finance projects, plays a significant role financing activities in the projects. However, Chinese venture capital firms are generally in small scale, there is not enough funding to ensure investment in multiple projects simultaneously, without achieving dispersion of risks. And because of small-scale and underfunded follow-up, many venture capital firms put money into the real estate market and the stock market, and only willing to invest in mature companies, contrary to the original intention of the establishment of these institutions. To solve this problem, we must further improve risk investment mechanism to allow venture capital enterprises become bigger and stronger so that they can play risk-sharing function in Risk Investment. Meanwhile, fully learn experience from abroad, improve the incentive mechanism, and explore limited partnership mode in venture capital, and to strengthen the supervision of risk investment institutions to ensure that risk capital into technological financial projects.

Third, carefully handle regeneration of technology banking risks. Due to high-risk feature of technology-finance projects, it is difficult to obtain loans from traditional commercial banks. In 2008, Ministry of Science and the CBRC set out to design Technology bank embodiment plan. At present, Beijing, Shanghai, Hangzhou and Chengdu have set up technology banking, technology banks appear to solve the problem of financing difficulty for high-tech enterprises. Currently, Chinese technology banks have learned from mode of Silicon Valley Bank (referred to SVB). SVB mainly earn spreads through absorbing customer deposits and putting up loans for high-tech enterprises. SVB mainly support SMEs in two ways, first loans, the second is direct investment. However, due to Chinese "Commercial Bank Law" prohibits direct investment from banks to enterprises, many of commercial banks began to explore the so-called "Option Loan" mode, that is, banks provide a stable and quality credit services to high-tech enterprises, and agreed with enterprises to get a certain percentage of equity subscription rights, the equity subscription rights are obtained by the private equity fund who have cooperation relationship with the bank, the banks and private equity funds share the investment gains in accordance with a certain percentage. Although the model can reduce the financing risks of technology-finance project, but I believe that in the case of imperfect condition of Chinese private equity fund industry nowadays, the risk of this mode cannot be ignored. The Government should carefully develop this mode, start with a small scale pilot, repeatedly implemented nationwide when time is ripe.

4.3 Market risk pre-control path: project selection and technology insurance

With the deepening of technological development, risk of the technical project gradually shift from a technical risk to market risk. To reduce market risk, we should pay attention to market-oriented selection of projects, but also attach importance to the role of insurance technology.

First, carry out a project selection carefully. High-tech business entrepreneurs are generally born engineer or scientist, because of restrictions in professional background, compared with a strong interest in high-tech, and the concern on products' utility and market appeal is not enough, and also lack of relevant expertise. If the market outlook is not optimistic about the project, the possibility of failure is undoubtedly great. Therefore, the market risk should be pre-controlled, we must start from the source, a serious evaluating on outcomes of technological innovation is demand from the view of the market, forecast the market prospect of products, invest only in projects which have good market prospect. Once the investment decision is made, it is necessary to help companies develop plans according to the market and provide advisory services to control market risks.

Second, accelerate the development of technology insurance. The Government should learn from foreign advanced experience in related fields, through financial subsidies etc., to encourage insurance companies to accelerate development speed, so that the insurance company can develop technology insurance to fulfill the needs of insurance for technology financial projects, providing more complete risk protection system.

4.4 Management risk pre-control path: personnel training and strengthen supervision

Technology-finance projects with serious information asymmetry, and with the increasing size of organizations, will have principal-agent problem. Therefore, the Government should strengthen cooperation with research institutes and high-tech enterprises, pay close attention to the introduction and training of a large number of professionals who not only understands technology but also understands finance, accelerate improvements of professional and risk control ability of related practitioners to reduce information asymmetry. At the same time, strengthen supervision of high-tech enterprises according to the rule of technological innovation activities, standardize enterprise behavior, and create a favorable environment for innovation.

5 Conclusions

Government is both main participant and main supplier of technology-finance projects. Meanwhile, a lot of government-affiliated institutions and state-owned enterprises are intermediary organizations of technology-finance projects. Therefore, the Government is a bridge to connect important parties involved in technology-finance projects. In this paper, from perspective of the government, we proposed a collaborative risk pre-control path for technology-finance projects based on analyzing the basic risk factors during different life cycle stages. We think that there mainly exist technical risk, financing risk, market risk and management risk during technology-finance projects' life cycle from seed stage to recession stage. We can pre-control technical risk through developing science and technology incubator, financing risk through the using of innovation fund, technology venture and investment bank, market risk through project selection and technology insurance and management risk through personnel training and strengthen supervision. There are more risk categories waiting to be researched and need more pre-control path to deal with different types of technology-finance projects.

Abstract: Food safety regulations have already been an important approach to provide adequate protection for consumers, mandatory or voluntarily. Under the framework of analysis of benefit and cost of food safety regulations, the scale of food producers plays a very important role. Based on the analysis of the incentives for the voluntary adoption and the effects of the scale of the firms on the motivations, this paper compares the equilibrium condition and constraints of voluntary regulations for SMEs with that of large firms. It concludes that for the imperfect product social liability and penalty compensation system in China, voluntary food safety measures are much less likely to be adopted by SMEs. And due to insufficient market incentives of voluntary regulations for small firms, the mandatory regulations are indispensable for safety assurance. And then it recommends that SMEs in China can be motivated for voluntary adoption by the government intervention and supervision, fund encouragement, and through consumer education and cultivation as well.

Key words: Voluntary regulations; Food safety; Small and medium entrepreneurs (SMEs); Benefit and cost; Game theory

1 Introduction

Due to the imperfection and asymmetry of food safety information, market failure exists all the time, and as a result that in that the supply of food safety is always lower than the social optimum. Food safety regulations have already become an important approach to provide adequate different types of protection for consumers, such as in terms of voluntary and mandatory regulations. For consumers' concerns on food safety are more than ever before, their expectation for safety tends to be as adequate as possible. But food producers have always worried about the higher and higher cost caused by the overprotected safety regulations. How to improve the efficiency of food safety regulations is always the goal of government and the food producers as well.

Most research focused on the comparison on the mandatory and voluntary food safety regulations. Kathleen Segerson(1999) discussed the conditions of voluntary adoption of food safety regulations, and concluded that market forces were insufficient to provide adequate consumer protection. M'hand Fares (etc. 2010) investigated the complementarities between public and private systems undertaken by food firms based on the nature of contamination risk. Private regulations has played more and more important role in the food safety improvement. The empirical research of Ollinger (2008) found that the contribution of government mandatory accounted only 20% while the voluntary adoption of food firms contributed 80% of the safety improvement.

However, little research has focused on the distinguished performance of different food producers of different scale when imposing the safety regulations. The frequency of fake and inferior products would be negatively related with the increase in the degree of monopoly and concentration of industries (Ping, 2002). The expectation and benefits from voluntary regulations usually differ in the firms of different scale which then affect their motivation in adoption. It is the novelty of this paper which aims to discuss the constraints of voluntary adoption of food safety regulations on the small and medium entrepreneurs (SMEs) comparing with large firms. Based on the analysis of the incentives for the voluntary adoption and the effects of the scale of the firms on the motivations, this paper compares the equilibrium condition and constraints of voluntary regulations for SMEs and large firms. It concludes that for the imperfect product liability and penalty compensation system in China, voluntary food safety measures are much less likely to be adopted by SMEs. And then it recommends that SMEs in China can be motivated for voluntary adoption by the government intervention and supervision and fund encouragement, and consumer education and cultivation as well.

2 Different Types of Regulations and Incentives for Voluntary Adoption

2.1 Different types of food safety regulations

Food safety regulations could be set and enforced by government or by private producers and the third party. Based on the different level of government intervention, there are different types of regulating model. The least intervention by government is no intervention at all and the supply of food safety is determined by the market itself. It would usually result in market failure for the insufficient protection of consumers. And the strongest intervention is direct regulation which takes the form of prohibition and requirement of certain actions, direct food safety standards or production process control by function mechanism and regulators, even including some penalty prescriptions. Every food producer should comply with these mandatory rules under the threat from government, and nowadays they are indispensable due to the insufficient market forces. Meanwhile, producers and sellers can also take measures to improve food safety voluntarily, or without any food safety control unless being confined by the government or other public policy. This can be called as self-regulation or voluntary regulation. Those third party certification and label are voluntary food safety regulation, which will be devoted to get more market share and reputation of specific producers not just for safety assurance.

Mandatory regulation is a kind of public safety assurance with the advantage of its strict constraint and uniform standard, while voluntary regulation is of private rules which provide efficient safety protection for its flexibility and adaptability. Both of them are complementary to each other. Normally, these two forms of regulations may have the same effect on the food safety of producers. However, for firms with different size, the benefit and cost may be different and the constraints of the voluntary adoption could be distinguished from each other.

Facing the increasing seriously food safety situation, government has been bearing much heavier burden than ever before to provide adequate protection for consumers. In order to take the advantage of both regulations, there is a trend to choose the mix of public and private regulations that is called co-regulation. So, to investigate the effect of the features of food producers, especially the scale, on the incentives and constraints for voluntary adoption will help to design the best co-regulation mechanism.

2.2 Incentives for voluntary adoption

2.2.1 The availability of the food safety information

The availability of the safety information distinguishes in search goods, experience goods and credence goods. For search and experience goods, enough information can be provided by producers in terms of label and certification system to demonstrate their safety features, or it is easy for consumers to judge through their own experience. However, for credence goods, safety cannot be easily discerned by consumers even after they have already consumed them. Food is more of experience and credence product. Just because of inadequate and asymmetry information, producers are weakly motivated to take safety measures voluntarily, unless they can signal to consumers that their products are safer than those of others. For individual consumer, it is actually hard to identify those special and safer information, so mandatory regulations have been imposed on food producers to provide the basic safety information. However, those firms undertaking voluntary regulations intend to provide consumers with additional safety information as much as possible, and try to become famous for their higher safety food than the average, and then gain more confidence from consumers. It is the voluntary regulation that offsets the information asymmetry and inadequacy and obtains the credence of consumers in some degree. So to supplement safety information becomes one of the motivations of voluntary adoption.

2.2.2 The efficiency of strategy of higher food price

Comparing with mandatory regulations, voluntary regulations usually needs more fund spending for its additional capital input. So, the voluntary adoption is always encouraged by the higher pricing strategy while mandatory regulations couldn't make any difference in the price for the food of the same standard. Consumers' assessment on the risk and their self-protection decision would affect the success of the strategy of higher price. Consumers may overestimate or underestimate the risk of food. When consumers are risk averse who can estimate the risk objectively or overestimate food risk, their willingness to pay (WTP) for safer goods would be positively related with the safety status quo. So the safer goods could be priced higher successfully in the market and food producers might be motivated by voluntary adoption. However, among the people who are unaware of or even underestimate potential damage, high-price strategy would run counter to firms' desire rather than attract them. If it is common in the market, not only high pricing strategy does not make any sense, but also will it lead to the adverse selection, like a "lemon" market. So the high pricing strategy accepted by both the consumers and the market is critical for the voluntary adoption.

2.2.3 Subsidy from government and loss from safety scandals

In front of the increasing difficulties in solving the food safety issues, more and more governments have resorted to co-regulation through subsidy for food producers and the third party to design and

implement voluntary regulations. Adoption of food safety regulations always works upon production cost while direct subsidy may encourage food producers to undertake them voluntarily. At the same time, implementing additional safety control is likely to reduce the probability of occurrence of contamination episodes which will avoid serious damage for those contamination firms. If it is we can detect those peculiar firms that are related to the specific food contamination and impose penalty on them effectively, food producers would be motivated to implement overall safety control. So subsidy together with strict supervision and penalty will be one of the motivations for voluntary adoption.

3 Effects of the Scale of Firms on Voluntary Adoption

Comparing with the large size firms, small and medium size food firms are those economy units with smaller number of employee, amount of registered capital and production scale. In China, most of them are private enterprises or farmers with relative lower capital labor ratio. Take the milk production as an example, 70% of domestic milk supplied by scattered farmers and producers. For the rapid growth of the demand for milk and milk products, the expansion of milk production has already challenged the development of Chinese glazier industry. Small-scale peasant economy is one of the significant features of Chinese food production, especially in most poultry breeding whose quality is critical to the safety of the final food products. Under the framework of analysis of benefit and cost of food safety regulations, the scale of food producers plays a very important role that results in the motivation for voluntary adoption is distinct for large and small firms.

3.1 Difference in cost of regulations

Constant and variable cost of production after undertaking safety regulations by large and small firms could be different. Firstly, the constant cost may be larger for small and medium enterprises than that of large ones. Maybe most of large firms have already been equipped with testing machine and lab and professional staffs, but for most of SMEs, to implement a new safety control might be a huge cost burden for them. It usually needs a totally new input through new machinery purchasing and staff training. In addition, the variable cost would be larger for small firms too. This additional cost could be shared by larger output of large firms at a lower average cost while it is impossible to be diluted for SMEs with smaller amount of output. So, SMEs usually have little motivation for voluntary adoption of safety control under the heavy cost pressure.

3.2 Difference in market benefit

The benefits from food safety regulations are composed of direct benefit from greater market share which comes from significant sale increase of safer food, and indirect benefit that is in terms of both price premium caused by rising in WTP and market reputation accumulation effect or public relationship improvement for firms with higher food safety standard. Usually, large firms gain more from voluntary regulations, especially in the direct benefit of the reputation and public relationship improvement. However, they also suffer more with occurrence of contamination episodes for losing confidence of consumers. But it is not the case for SMEs. Many smaller size firms can't achieve the same benefit as the large ones, not only the increase in the market share but also the indirect market reputations. Meanwhile, the loss from contamination episodes will also be smaller for SMEs than large firms because they could often be hidden behind large firms for their dangerous production if without strict supervision. Hard to ascertain the causation relationship with small contamination producers and trace back to the source of small suppliers in China make them avoid the loss of market reputation much easier than most developed countries. Considering the less benefit from voluntary adoption and the less loss caused by scandal as well, there must be weaker motivation for SMEs to implement regulations voluntarily.

3.3 Difference in compensation payment

Penalty compensation is an important part of product liability system and food safety regulations. How much a producer should pay for its damage depends on its faultiness, the enforcement strength of food safety laws and victims' awareness on self-protection. However, the amount of judicial proceedings that a producer could pay is more or less constrained by the size of firms. Generally speaking, it is more difficult for small firms than large ones to execute the payment. So large firms will be more likely to adopt food safety regulations voluntarily to accumulate more market reputation and avoid large amount of damage payment. At the same time, for lacking of consciousness of litigation of most Chinese consumers, many SMEs firms have the fluke mind of escaping from punishment and pay less attention to product liability system. In China, the light sentence even no punishment on small contamination producers have already formed a bad demonstration effect for all the SMEs which has weakened their

motivation for voluntary adoption.

4 Constrains of Voluntary Adoption for SMEs

Firstly, the safety episode occurs or not will alter the benefits of different firms in scale with voluntary adoption obviously, so there are two cases to be discussed: no contamination episode occurring and after contamination episode. Secondly, there would be different equilibrium conditions for SMEs whether the threat of food safety regulation imposed by government is strong or not, then it will examine the constraints of voluntary food safety regulation on SMEs in terms of with or without the mandatory requisition for food safety regulations.

4.1 Parameters explanation

The parameters and their definition are presented in the Table 1.

Table 1 Parameters Explanation

Parameter	Definition
r	Mandatory requirements from government, $r \in (0,1)$. 0: without any mandatory threat; 1: strongest mandatory threat of regulations implementation
p	Probability of occurrence of safety episodes without any safety regulations, $p \in (0,1)$
q	Probability of occurrence of safety episodes with implementation of safety regulations voluntarily or mandatorily, $q \in (0,1)$ and $p > q$
B_S, B_L	Benefits from voluntary regulations of SMEs and large firms respectively, $B_L > B_S$
B_{S0}, B_{L0}	Benefits for SMEs and large firms without any safety regulations, respectively
B_{S1}, B_{L1}	Benefits for SMEs and large firms after occurrence of contamination episodes, respectively
C_S, C_L	Cost of regulations for SMEs and large firms respectively, $C_S > C_L$
L_S, L_L	The compensation payment for victims by SMEs and large firms after safety events, $L_S < L_L$

4.2 Incentives on SMEs for voluntary adoption with occurrence of episodes or not

The final payoffs for food firms different in scale with or without the contamination episodes are presented in the Table 2. According to Table 2, with voluntary food safety regulations and no contamination episode, the payoffs of two kinds of firms are $B_S - C_S$ and $B_L - C_L$ respectively. Based on the previous analysis, if there are not any contamination episodes, the large ones could get more market benefits in reputation and price premium than small ones, that is $B_L > B_S$. And regarding the cost, C_L might be smaller than C_S . Even as some scholars postulates that the cost difference is not very obvious and it is supposed that they equal to each other, the net benefit for large firms is larger than that of small ones if no contamination episodes, that is $B_L - C_L > B_S - C_S$. As a result, those measures could decrease the probability of the occurrence of incidents are more likely to be implemented in the large firms voluntarily than in small firms.

In contrast, when a contamination episode occurs with a probability q , the SMEs and large firms will get the payoff as $B_{S1} - C_S - qL_S$ and $B_{L1} - C_L - qL_L$ respectively. For those firms with confirmed causation relationship, the loss in reputation and market share must be considerably serious, while SMEs might suffer less. And the benefit change with occurrence of episodes might be $B_L - B_{L1} > B_S - B_{S1}$, and even with the result of $B_{S1} > B_{L1}$ if without clear causation relationship with SMEs. When the loss of large firms is so huge to surpass their cost difference, the final outcome will be $B_{S1} - C_S > B_{L1} - C_L$. At the same time, for lacking of perfect liability system and penalty compensation system in China, L_S usually is smaller than L_L . In the end, the result is more likely to be $B_{S1} - C_S - qL_S > B_{L1} - C_L - qL_L$, so it is to maintain net benefit that provide incentive of voluntary adoption for both large firms, while it is much weaker for SMEs especially without any mandatory threat from government.

Table 2 Payoff Matrix of Voluntary Adoption with Occurrence of Episodes or not

	No contamination episodes	After contamination episodes
Large firms	$B_L - C_L$	$B_{L1} - C_L - qL_L$
SMEs	$B_S - C_S$	$B_{S1} - C_S - qL_S$

4.3 Constraints on SMEs for voluntary adoption

The equilibrium for voluntary adoption for SMEs refers to the conditions under which firms would voluntarily implement safety regulations without any threat from government. If food could be sold in the market without any safety regulations control, the equilibrium condition for voluntary adoption of SMEs is $B_S - C_S - qL_S \geq r(B_S - C_S - qL_S) + (B_{S_0} - pL_S)$. Here, B_{S_0} represents the direct benefit only from market share other than benefit of reputation and price premium due to voluntary regulations. Similarly, the equilibrium condition for large firms is $B_L - C_L - qL_L \geq r(B_L - C_L - qL_L) + (B_{L_0} - pL_L)$. So, whether the government imposes mandatory threat or not, the constraints of voluntary adoption for producers might be different.

1) Strong mandatory threat ($r = 1$)

As in Table 3, if the threat of imposing a mandatory program is strong, that is $r = 1$, the brief equilibrium condition shifts to $B_{S_0} - pL_S \leq 0$, which means when benefit is smaller than compensation payment for the victims, SMEs will plan to undertake safety measures. In the same way, the brief equilibrium for large firms can be simplified as $B_{L_0} - pL_L \leq 0$. Without any safety measures it could be supposed that the benefits for every producers is same that means B_{S_0} equals B_{L_0} . And then, if $L_S < L_L$, the equilibrium condition for SMEs is more difficult to be satisfied than for large ones.

Table 3 Constraints of Voluntary Adoption with Mandatory Threat or not

	Strong mandatory threat ($r = 1$)	No mandatory threat ($r = 0$)
Large firms	$B_{L_0} - pL_L \leq 0$	$(p - q)L_L + (B_L - B_{L_0}) - C_L \geq 0$
SMEs	$B_{S_0} - pL_S \leq 0$	$(p - q)L_S + (B_S - B_{S_0}) - C_S \geq 0$

2) No mandatory threat ($r = 0$)

When the threat is very weak, that is $r = 0$, the brief equilibrium condition for SMEs and large firms is $(p - q)L_S + (B_S - B_{S_0}) - C_S \geq 0$ and $(p - q)L_L + (B_L - B_{L_0}) - C_L \geq 0$ respectively. Based on the previous analysis, if $L_S < L_L$ and $B_L > B_S$, the net payoffs of large firms are more than SMEs. It concludes that without government threat, large firms will be encouraged to adopt the safety system voluntarily, while incentives from market for SMEs are insufficient.

4.4 Findings

The scale of food producers is a very important factor which will affect the benefit and cost of food safety regulations adoption, so firms with different size have distinguished incentives and constraints for voluntary adoption.

The market benefit due to voluntary safety regulations is more attractive for large firms than for SMEs if there is no safety scandal, while the loss from the occurrence of contamination episodes for large firms is also bigger than that for small ones. Both of them explain why large firms have always been more active in investing in safety regulations voluntarily than small ones. However, for the uncertainty of the occurrence of the contamination episodes and the possibility to escape from being punished, SMEs are of weak incentives for voluntary adoption of safety regulations.

Comparing the equilibrium condition of voluntary adoption for large firms and SMEs, it concludes that when the government threat is weak, it is more difficult to be satisfied for small ones. It is the credence feature of food and lack of strict supervision that let the large amount of food from those producers that haven't implemented any safety regulations, especially from SMEs, still show up in the market. Nevertheless, even when the mandatory threat from government is strong, SMEs have also been less motivated to implement safety regulations voluntarily because of the unclear causation relationship with those safety scandals and weak penalty system.

5 Conclusion

For market forces for voluntary adoption by SMEs is not enough so the mandatory threat by the government is indispensable to ensure the adequate supply of food safety. The stronger the mandatory threat by government, the more likely is the safety regulations to be implemented by small firms. And imperfection in both penalty compensation and social liability system on the contaminating firms for SMEs in China has also weakened their motivations for voluntary adoption.

To encourage SMEs to undertake voluntary food safety measure, the government direct intervention, fund support and strict penalty are all necessary. Firstly, it is the strong threat from the

government that can provide the basic safety assurance for all the people. Secondly, subsidy on those SMEs with voluntary adoption is a useful encouragement. Finally, imposing strict supervision in terms of penalty compensation and product liability system is a good way to eliminate the opportunity for SMEs to escape from being punished. In addition, through the consumers' education and cultivation to increasing their willingness to pay the price premium for safer food and let SMEs achieve more indirect benefits will also consolidate their motivations for voluntary adoption of safety regulations.

Abstract: In the information age, confidential or key information of the enterprise (such as corporate strategic planning information, core technology information, customer information, etc.) has become an important strategic asset. And information access, treatment, and security have become an important component of overall enterprise strength. This paper focuses on the research of “enterprise information security risk management”, and proposed the Enterprise Information Security Risk Cause Model, Risk Calculation Model, as well as the Enterprise Information Security Risk “Four Whole” Management Model (whole staff, whole risk, whole process and whole methods).

Key words: Enterprise information asset; Enterprise information security; Risk management; “Four Whole” management Model

1 Introduction

The twenty-first Century is the era of information. Human society, from a society mainly depending on the material and energy, begins to change into a society that the material, energy and information are closely connected. Information security is related to national security and social stability. Some people put forward the concept of “Information War”, and point out that following “nuclear weapon”, “biological weapon” and “chemical weapon”, “Information Weapon” is becoming as the fourth great modern weapon¹. June 7th to 8th, 2013, Xi Jinping-President of the People’s Republic of China, and Obama-President the United States, met in Annaboge Manor in California, and “cooperation on network security” is one of the main topics.

In the background of the network security risk increasingly, information security risk issues of modern enterprise has aroused great attention from all sectors of society. In information era, more and more enterprises are becoming dependent on computers and information systems. While they enjoy the huge interest access to information resources, they also face a severe test of information security risk. At present, the whole world is in the period that enterprise information security risk events spring up, and the degree of the influence is far more than ever. For example, in 2009, Rio Tinto spy gate event caused economic losses of up to about 70 billion Yuan for the steel industry in china. When the national security department checked a computer in Rio Tinto Shanghai office they found out that: the computer had stored detailed information of dozens of Chinese iron and steel production enterprises, including their procurement plans, inventory of raw materials, production arrangements, even monthly steel production, sales situation and other data. Media joked that Rio Tinto even know more about the company than some enterprises Misters. In June, 2011, a former Apple employee Paul Devine admit that during the 5 years (from 2005 to 2010) when he was employed by Apple Corp, he had sold major confidential information of Apple Corp, including new product forecasting, blueprint, price and product features. Devine admitted that the Apple Corp. lost more than 2.41 million dollars because of the information leakage.

Frequent enterprise information security risk event puts forward a challenge to the theory and practice research of enterprise information security risk management. Aiming to improve enterprises’ information security risk management abilities, to ensure their competitive advantages and long-term stable development, this paper focuses on the research of “enterprise information security risk management”, and proposed the Enterprise Information Security Risk “Four Whole” Management Model (whole staff, whole risk, whole process and whole methods).

2 Theoretical Backgrounds

2.1 The definition of enterprise information security risk

* This paper is supported by the China Postdoctoral Science Foundation, and the project is “Research on Enterprise Information Security Risk Early-warning and Emergency Management”.

Comprehensive consideration of many factors, such as environment, personnel, management, technology, law, economy and system, the enterprise information security risk is divided into 12 types: personnel risk, organization risk, physical risk, information confidentiality/integrity risk, system risk, operational risk, communication infrastructure risk, business continuity risk, third party risk, risk-assessment risk, legal risk and risk-decision risk (See Figure 1)².

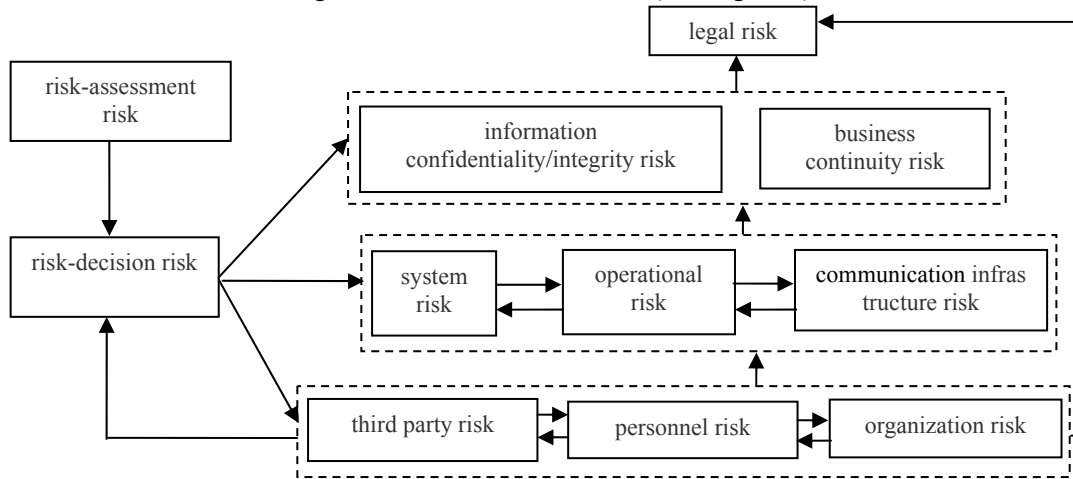

Figure 1 The 12 Types of Enterprise Information Security Risk

2.2 The Enterprise Information Security Risk Cause Model and Risk Calculation Model

Enterprise information security risk management has three main features:

(1)The importance of enterprise information assets is huge. Once the enterprise information security event happens the consequence will be very serious. The long-term development and the core competitiveness of enterprise are relying on their key information. Confidential or core information assets (such as a unique business model, the key technology information, new product information, and users information) have become an important strategic resource of the enterprise³. Once the enterprise information security event happens, it will do serious damage to the competitive advantage, profit ability, social image and the stable development of the enterprise.

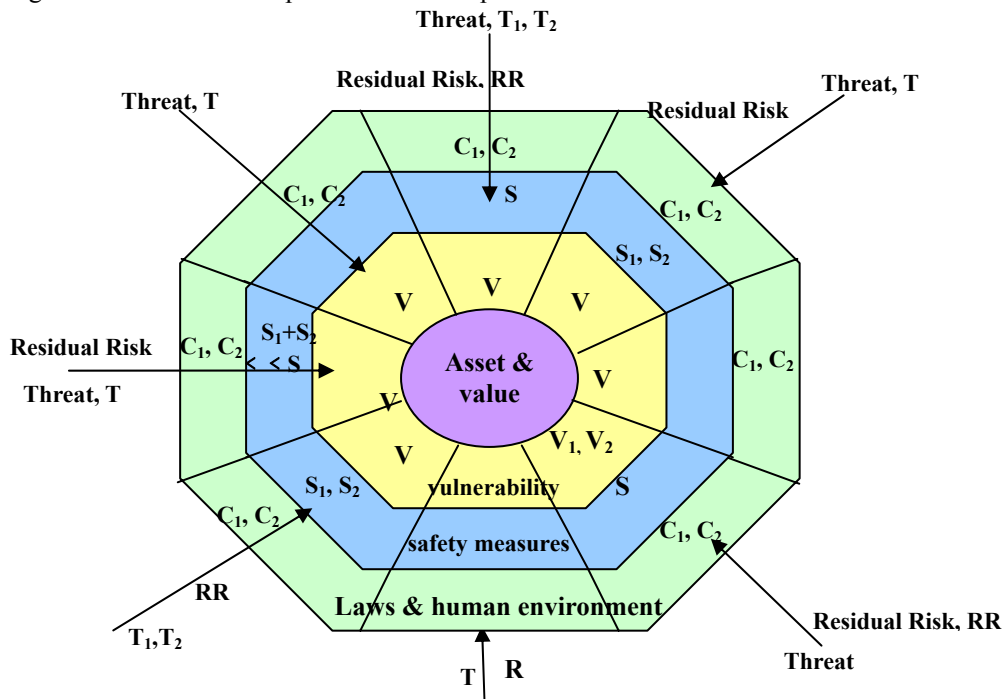

Figure 2 The Enterprise Information Security Risk Cause Model

(2)The vulnerability of enterprise information assets is obvious. The enterprise information assets are facing high threat and risk. As long as there are information assets in enterprise, it is inevitable to face the vulnerability or weakness in its objective existence. Design, management or performing defects, hardware design, equipment manufacturing flaws, operating system or application software design problems, all these features are inherent flaw or weakness of enterprise information assets. Once these flaw or weakness was used intentionally or unintentionally, serious enterprise information security risk could be caused. Enterprise information assets threat means the potential situation, event or person, which may lead to information system damage, confidential data leakage, data tampering or denial of service. Threat is the impact of external factors on the system, and it always accompanies the vulnerability or weakness in the system. The system without weakness does not exist. So the threat is everywhere. Nowadays, there are more and more commercial spies and hackers, as well as more and more advanced means to steal information. Meanwhile, the ways of the enterprise information dissemination are diverse, and the scope of the enterprise information dissemination becomes extensive. Therefore, the vulnerability of enterprise information of asset become more and more obvious, and the enterprise information security risk become higher and higher.

(3)Enterprise information security event handling is urgency. Once the information security incidents happens, enterprise should take measures very quickly, such as launching the emergency response plan, aiming to minimize the losses.

The Enterprise Information Security Risk Cause Model is as shown in figure 2. The Enterprise Information Security Risk Calculation Model is as shown in figure 3.

The Enterprise Information Security Risk Cause Model (See figure 2) shows that: key information assets are of high value for enterprises, but on one hand they have their own vulnerabilities, on the other hand there are all kinds' threats outside the business, which eventually leads to high possibility of information security risk. Information assets owner should take safety measures(S) to protect the key information assets, and find ways to compensate the vulnerability (V), which leads to reduce the risk. The relevant laws and regulations and specific human environment (C) also can play an important role to stop or reduce the threat (T) and the residual risk (RR). Through the above measures, the enterprise information security risk will be reduced, and the enterprise information assets security will be ensured⁴.

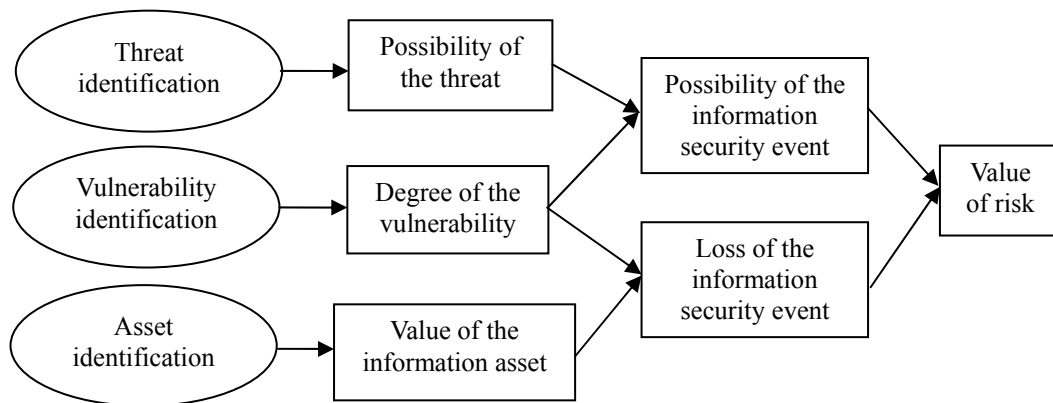

Figure 3 The Enterprise Information Security Risk Calculation Model

3 The Enterprise Information Security Risk “Four Whole” Management Model

In order to realize the comprehensive and effective management of enterprise information security risk, enterprise should accomplish "Four Whole" management Model (See Figure 4): (1) whole staff. Information security risk management is not only the business of IT department. The whole staff of the enterprise are accompanied by the responsibility of information security management. The enterprise should call for all employees participate in the information security management. (2) whole risk. All enterprise information security risk should be included in the management category, including the 12 types of the enterprise information security risks which are mentioned above. (3) whole process. Including pre-crisis risk management-enterprise information security risk early warning management, risk treatment, and the enterprise information security risk emergency disposal. (4) whole method. Including enterprise information security education & training, security system, security rewards and punishments, and other various measures or methods.

4 Conclusions

The twenty-first Century is the era of information. Information security is related to national security and social stability. In information era, more and more enterprises are becoming dependent on computers and information systems. While they enjoy the huge interest access to information resources, they also face a severe test of information security risk. This paper focuses on the research of “enterprise information security risk management”, and proposed the Enterprise Information Security Risk Cause Model, Risk Calculation Model, as well as the Enterprise Information Security Risk “Four Whole” Management Model (whole staff, whole risk, whole process and whole methods). All of there are very useful and efficient methods to improve enterprises’ information security risk management abilities, to ensure their competitive advantages and long-term stable development.

Study on Requirements of R&D Knowledge Management System of Enterprise*

Yin Guoli¹, Yin Xilin¹

1 SAIC GM Wuling Automobile Co., Ltd, Liuzhou, P.R. China, 545007

(E-mail:Guoli.Yin@sgmw.com.cn, Xilin.Yin@sgmw.com.cn)

Abstract: Due to the importance of research and development for knowledge enterprise is more and more big, many enterprises began to think about how to develop their own research and development knowledge management system. This article analyses the specific needs of the development of the enterprise research and development knowledge management system from the aspects as research and development knowledge accumulation, research and development knowledge retrieval, research and development knowledge sharing, research and development knowledge reuse, and research and development knowledge innovation.

Key words: Enterprise; R&D knowledge; Management system; Study on requirements

1 Introduction

R&D knowledge for the enterprise R&D activities plays an increasingly important role, so that many enterprises begin to pay close attention to the enterprise research and development knowledge collecting and accumulation, to the R&D knowledge tidying and classification, to the R&D knowledge retrieval and sharing, reuse, and innovation, via the structural classification and development of and research and development system, to the information security of R&D knowledge.

Enterprises set up R&D knowledge management system for the purpose of shortening product development cycle, improving the enterprise research and development ability, and enhancing enterprise core competitive ability. Specific system requirements include organizes and stores enterprise R&D knowledge effectively to accumulate the enterprise R&D knowledge, provides tools to retrieve and share knowledge quickly, establishes a convenient knowledge learning and communicating platform, realizes reusing knowledge and assisting knowledge innovation, constructs knowledge security protection system.

2 Enterprise R&D Knowledge Accumulation

Enterprise R&D knowledge accumulation means the enterprise collects sorts and codes the successful experience and failure lessons of developing products in the past, and then stores those in the enterprise knowledge base according to certain rules. The basic process of knowledge accumulation is shown in figure 1.

Enterprise knowledge, on the one hand, comes from the R&D experience accumulation employees have made for a long time, can also be found and innovate through technical means, such as knowledge discovery and knowledge mining. The accumulation mainly includes the following several aspects:

(1) Personal knowledge

It refers to the personal skill improvement and experience accumulated in work. Such knowledge, which is tacit, needs employee alone or with the help of the external forces to summarize and discover, and then record it as document to make the tacit knowledge explicit.

(2) Case knowledge

It refers to data accumulated from the previous product researching and developing or competitor products analysis, it includes product design results (Drawings, d/a, all kinds of parameters, etc) , records of R&D management progress (Project planning, meeting records, work arrangement, stage summary, failure analysis, etc) and Entity model. This type of knowledge condenses a lot of experience, is the wealth of the enterprise survival, needs to be properly kept, and provides convenient query function, so that the knowledge in the new project can be effectively utilized. Before reusing, this kind of knowledge requires summing up, and then be formed as standardized document.

(3) Standard specification

It refers to the products shall comply with all standards and specifications, including international,

* This paper is supported by the Guangxi scientific research and technology development projects (10123003-5, 1298027-5)

national, industry and enterprise standards and specifications. This kind of knowledge usually is a standard document.

(4) All kinds of documents

It refers to various documentation involved in product research and development, besides the aforementioned knowledge, such as enterprise rules and regulations, work template (meeting minutes template, summarize the work template, fault record templates, etc.), engineer manuals, etc.

In the process of research and development of the accumulation of knowledge there are three key problems. It is tacit knowledge being made explicit problems. Second, knowledge coding issues, that is encoding the enterprise knowledge the some forms that is easy of computer to store and process. This is also known as the process of knowledge representation. Third, knowledge mining and knowledge discovery is the core problem in the artificial intelligence and decision support system, and the knowledge management system, but also a difficult point for further development and effective application of these systems.

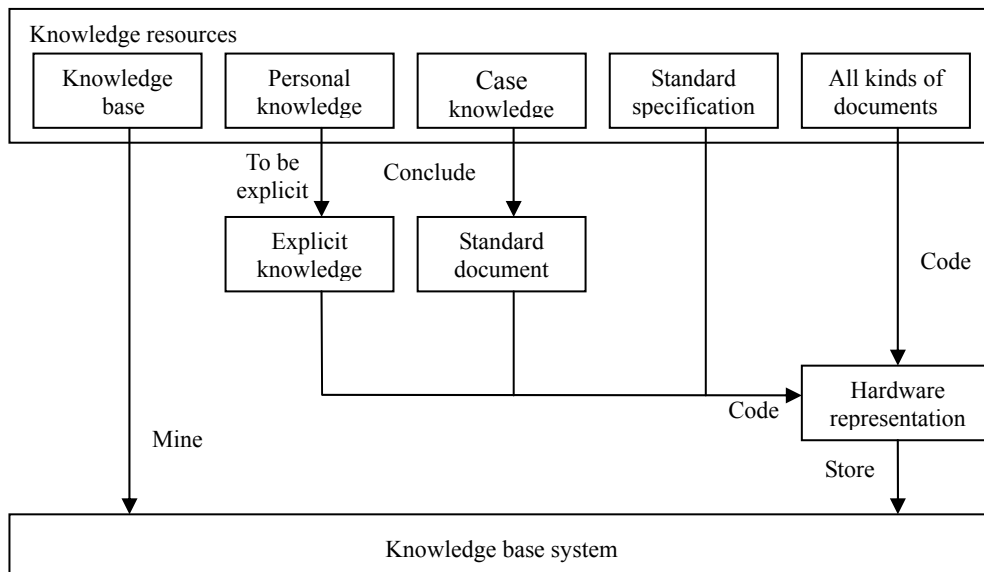

Figure 1 Knowledge Accumulation Processes

3 Retrieval and Sharing of the Enterprise R&D Knowledge

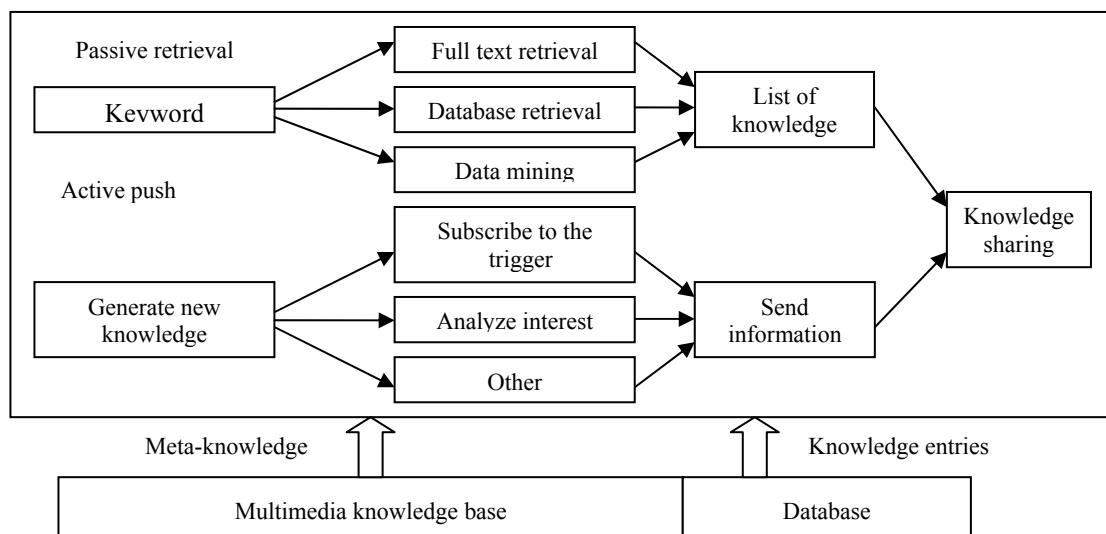

Figure 2 The Basic Needs of R&D Knowledge Retrieval

Knowledge sharing is one of the objectives of knowledge management, and is also the basic need of knowledge management system. Knowledge retrieval, which is the means and tools of realizing knowledge sharing, usually requires fast retrieval speed, high accuracy, and the good ability to reject invalid information.

Knowledge retrieval method can be divided into active push and passive retrieval. Active push refers to according to the customer subscribing, customer interest analysis, customer responsibility model send the new knowledge or message in the knowledge base to the related users on a regular basis. Passive retrieval refers to the customer put forward the keyword or key words to retrieve the knowledge needed in the knowledge base. The basic needs of knowledge retrieval are shown in figure 2.

4 Reuse and Innovation of Corporate R&D Knowledge

Knowledge reuse and knowledge innovation is one of the ultimate goals of knowledge management in enterprise, also is the important and difficult problem in the study of the knowledge management.

Knowledge reuse refers to the process of taking the advantage of the existing knowledge in the enterprise knowledge base, using the knowledge again after dealing with the parameter change etc. in new research and development program. The function implementation is focused on the accumulation of the past R&D knowledge and the reasonable use of the product or components parameters change rules. Knowledge reuse exists throughout all links of product research and development, figure 3 shows the model of knowledge reuse and knowledge innovation based on product development process.

5 Security of Enterprise R&D Knowledge

Enterprise characteristic product knowledge is enterprise's core competitiveness and proprietary technology, is an enterprise's important resources and wealth, and requires safe and reliable security. Corporate R&D knowledge security needs mainly include the following levels:

(1) Network security. It refers to provide security protection measures technically between enterprise network and the network to prevent the external personnel illegal access to the enterprise internal knowledge base system.

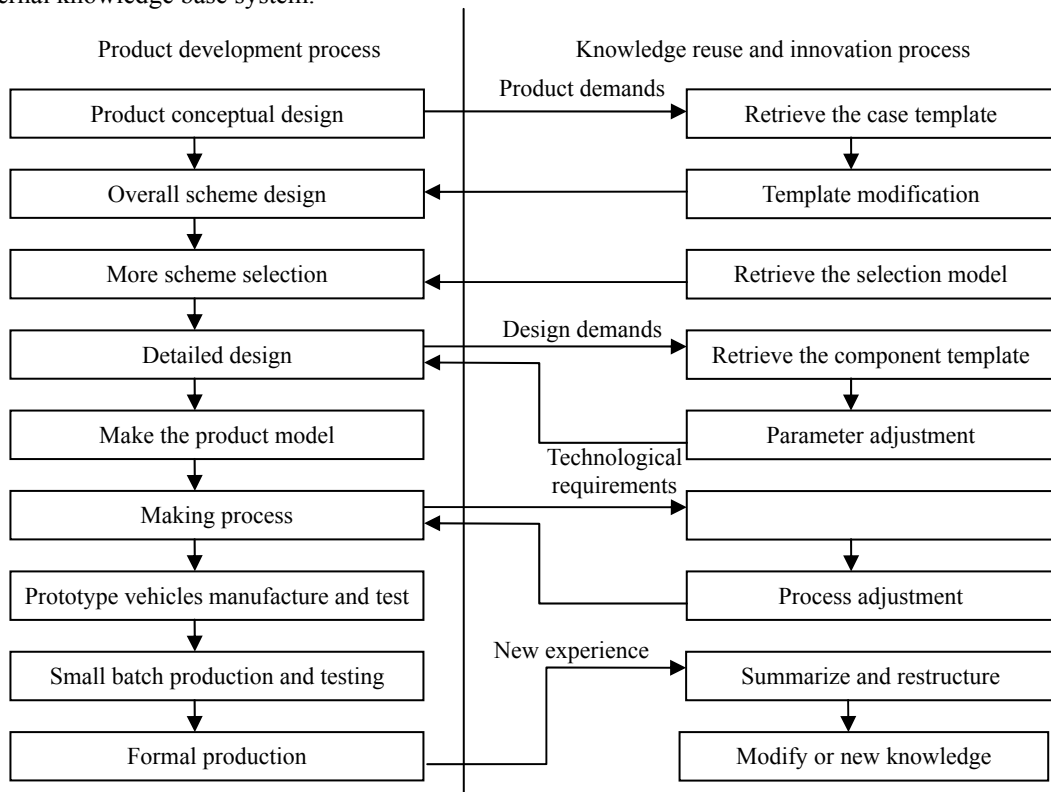

Figure 3 The Model of Knowledge Reuse and Knowledge Innovation Based on Product Development Process

(2) System security. It refers to provide safe and reliable running environment for system operation, including the stability of system operation, the disaster recovery after the system collapse, system audit, and log management and so on.

(3) Data security. It includes the secure storage of the data and safety access, the two aspects. Safety store involves data backup, backup cycle, backup location, etc. Security access refers to the process of operator accessing knowledge scope and the control of operation could be done.

Access permissions can be set up through access matrix to realize security access, including knowledge of the submission, review, read, download, print, etc. According to the organization form of enterprise research and development institutions, there are three aspects to manage the security access, namely, the knowledge level, job, operation permissions.

(1) Safety control based on the knowledge level. If the knowledge of each knowledge point is divided into KL1, KL2,..., KLn, N level, according to its confidentiality level and sorts from low to high in turn according to the confidentiality requirements. And then corresponds the confidential level of knowledge with the operator access level OL1, OL2,..., OLn. If the access level of the operator O is OLi (1≤i≤n), O can access to the knowledge level of KLi all of the following (including KLi). Usually in enterprise the knowledge access level of domain experts and department managers is higher than general employees or new employees. The level set of knowledge involves the core skills is higher, and general knowledge level is low, so that most or all employees can browse and learn.

(2) Safety control based on the work. In enterprise each department, each department, each job has its relatively independent design tasks, the scope of knowledge, staff on different posts can refer to, also will be affected by certain limitations. The control model is shown in table 1.

Table 1 Matrix of Control Scope of Knowledge Access

knowledge classification	Department 1						...
	technical office 1			technical office 2			...
	station 1	station 2	...	station 1	station 2
knowledge 1							
knowledge point 1							
knowledge point 2							
...							
knowledge 2							
knowledge point 1							
knowledge point 2							
...							
...							

Through the matrix shown in table 1, the access of the station or technical office or department to certain knowledge or knowledge point can be controlled.

(3) Access control based on the operating authority

Permissions to the operation of the knowledge in research and development of enterprise knowledge management can be divided into submission, knowledge update, knowledge audit, read, printing, download, etc. Employees of different operating authority will be different. The requirements are as follows:

1) The submitter has the right to update the knowledge he (or she) submitted.

2) Before releasing the knowledge submitted must be approved by the designated experts, and is read by permission.

3) There is an “and” relationship among the scope of knowledge access, access level and read permission.

4) Authorized operator can download and print the specified document within the prescribed reading competence.

5) Only designated personnel can set the security access system.

6 Conclusion

Through analysis, the enterprise should research when develops the research and development

knowledge management system from the aspects of R&D knowledge accumulation, R&D knowledge retrieval and sharing, R&D knowledge reuse and innovation, and the R&D knowledge safety, to improve the pertinence, operability and effectiveness of enterprise research and development knowledge management system significantly.

Abstract: Patent information is effective in clarifying the research policy and strategy of a company and its competitors through the analysis of technological trends. In this study, we devised a patent analysis system that incorporates one patent search system, YUPASS (Yamaguchi University Patent Search System), and patent mapping software. In order to confirm the effectiveness of this analysis system, we focused on the differences in technological features of exposure equipment of Canon, Nikon and ASML for use in semiconductor manufacturing and their market share, and attempted to infer the technological reason for the changes in each company's market share through the analysis of patent maps. The analysis result correlated well with the market share investigation report, and we have found that it is a useful analytical tool in clarifying a company's or its competitor's research strategy and policy.

Key Words: Patent information; Patent map; IPC; FI; F term; Semiconductor; Exposure equipment

1 Introduction

Patent information is effective in clarifying the research policy and strategy of a company and its competitors through the analysis of technological trends. In the five years up to 2012, the average number of patent applications in Japan was about 354,000, which represents an enormous amount of information. Therefore, there is a demand for a highly accurate, high-speed and stable patent search system, and a variety of such systems have been proposed. Patent mapping is a technique whereby, using quantitative-, qualitative- and correlation-analysis fitted to technological information within the patent information as the search object, analysis results can be visually represented in a way that is easy to understand, and so patent information keywords are rendered visible, and invisible actualities can be grasped visually. In this study, taking up the example of exposure equipment, which is indispensable in semiconductor manufacturing, and using a patent analysis system that incorporates one patent search system, YUPASS (Yamaguchi University Patent Search System), and patent mapping software, we will investigate patent information technology trends analysis in terms of the impact of technology changes on the market.

2 Features of the Patent Analysis System

In this study, YUPASS was used as the patent search system, and Patent Map EXZ, an all-purpose patent mapping software, was used to map acquired data. YUPASS is a search system that has been being developed since 2004 by Yamaguchi University, and improvements continue to this day. Its main features are as follows:

(1) A function to collectively search all text data contained in the bibliographic items within patent publications (including weighted searches).

(2) A function to search wording from all text from start to finish (no automatic rounding off of particles and other such parts of speech in search phrases).

(3) A function to output the search results report in CSV format, a report citation display function.

(4) It is possible to search stably as it is set up on the campus server.

(5) Since 1993, there has been full text search support for utility model patents.

Among patent information search services, various systems have been released, from free, simple systems to paid-for multi-functional systems, and by employing a variety of search methods, each search system can output patents matching the search terms. In addition, by statistically processing the analysis elements such as keywords contained in patent information using mapping software, we can find out about technology trends, technology distribution, trends in new technologies, the discovery of new fields of technology, and we can grasp the differences in development between a company and its competitors.

Patent maps are well known as an example of the macro analysis of patent information. They use

sets of patent information selected and gathered by patent investigations and searches as the population, perform quantitative-, qualitative- and correlation-analysis matched to the search object on that population, and the results of that analysis are visually presented in a chart or table, which makes it possible to easily visually ascertain the realities of technological development.

There are two types of patent maps, the statistical type and the list type; a different type is used depending on the goal. Also, in order to analyse a large quantity of patent information, and to efficiently create a patent map based on it, there is a need to use mechanical information processing, not the former manual method. The flow of information for the manual and the mechanical method is shown in Figure 1.

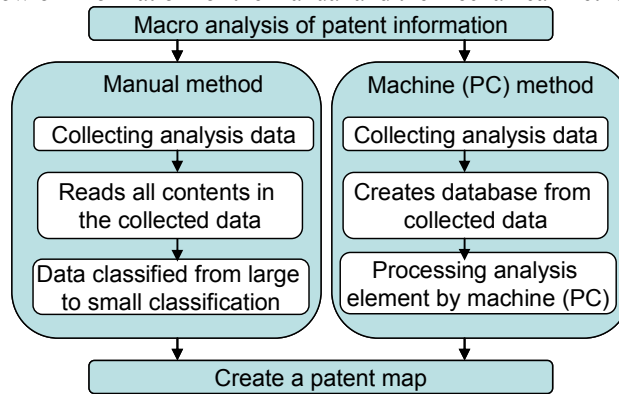

Figure 1 Macro Analysis Method in Manual and Mechanical Styles

Analysis is performed by classifying analysis element into a hierarchical structure from large to small, with the element of analysis being the content in the patent applications. Depending on how the data would be viewed, analysis element will go through various re-arrangement and process before finally rendered visually by a mapping software. One weaknesses of mechanical system is, it cannot interpret the contents of individual patent applications, which mean that, depending on the analysis element being used, the level of analysis will be easily affected. As shown in Figure 2, patent document contains the detailed description of the invention that applied to be patented. It covers the summary of the application, the scope of the invention claim, challenges and solutions, purpose/utility/operation/effect of the invention, and its implementation. Patents are classed according to the subject of the invention. Usually each patent document has a fixed format and assigned with special identification sign such as the publication, date and classification number to makes its classification more systematic. As shown in Figure 2, the content of a patent application document can be extracted into smaller elements that are:- the numbering system, date system, word system etc. These can be used as an element of analysis alongside other bibliographic items (applicant, inventor, name, and classification).

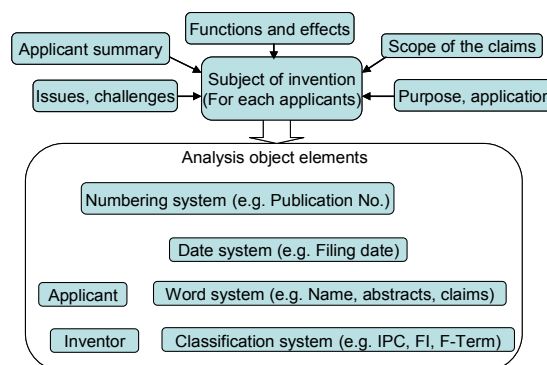

Figure 2 Elements That are the Target of Patent Information Analysis

2.1 Analysing Technological Content Using F-Terms

Because mechanical patent mapping is a method of analysis that uses only particular analysis elements, such as the applicant, IPC, or FI, compared to the manual method, whereby individual application contents are read and analysed, the lack of capability to analyse thoroughly the technological content is a problem. When classification system is used as an element of analysis, the analysis level is

determined by the type of classification, and depending on the classification there is a possibility that the information to be analysed will be analysed at a high level. As shown in Figure 3, when F-term, a technology (classification system) that was developed for mechanical searching, is used as an analysis element to efficiently conduct the prior art investigation (search) for wide-range classification, IPC main groups, IPC subgroups, FI and patent information investigations, the total number of classifications will be large, so compared to IPC classification and similar systems, when F-terms are the analysis element a higher analytical level can be expected.

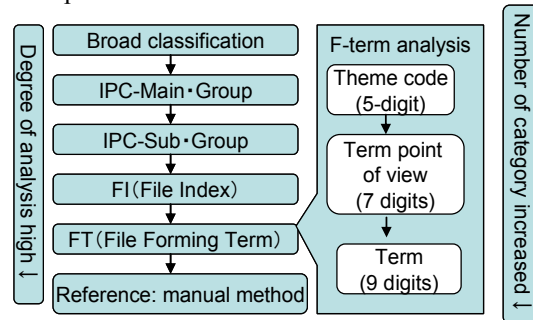

Figure 3 Evaluation of the Degree of Analysis According to the Analysis Element of the Classification System

When using only the current IPC, there is a lot of prior art literature that should be investigated; because F-terms are the product of sub-dividing and re-dividing IPC by specified technological field from various technological viewpoints (objective, utility, structure, material, method of manufacture, processing operation method, means of control), by searching for a combination of F-terms, the search can efficiently be narrowed down to relevant prior art. As shown in Figure 4, F-terms are composed of a 5-digit theme code + 2-digit viewpoint + a 2-digit number. For some themes, a one-character code called the option code is also established. The appended code adds the symbol “.” after the F-term. In F-terms many theme codes for a variety of technologies are provided, and a unique analytic viewpoint is defined for each code.

Figure 4 F-Term Structures and the Hierarchy of Digit Number by Analytical Element

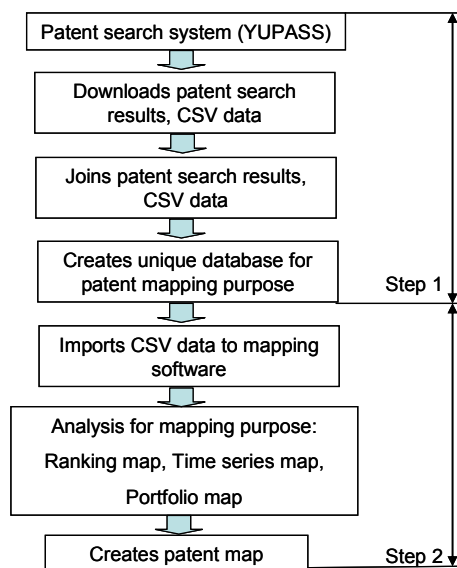

Figure 5 Overall Flow of Analysis

As the method for this study, we focused on F-terms as the element of analysis, extracted F-terms from patent information to be searched, and created patent maps. In the actual analysis, based on the fact that F-term codes are expressed as 5-digit theme codes and 4-digit term codes, a total of 9 digits (10 including the appended code), the theme code was reset as the large classification, the first two digits of the term code (analysis viewpoint) as the medium classification, and the last two digits (technological content) as the small classification; by changing the depth of the hierarchy (the number of F-terms digits) of classifications expressed as between large and small, analysis could be done from many viewpoints. The overall flow of analysis is shown in Figure 5.

2.2 Analysis Procedure

As the first step in creating each type of patent map, from the online database of patent literature, we gathered patent literature that was to be analysed, and in order to make a dedicated database, entered keywords suitable for a YUPASS detailed search, and acquired the search result electronic data as a CSV file. YUPASS can produce a search list of up to 100,000 results at a time, and because it can be outputted as CSV data 3,000 results at a time, searches can be done accurately and without omission. Also, because of the fact that literature on patent information to be analysed acquired by search is gathered and stored on each search in the CSV file format, this data could be combined using Excel or similar general-purpose software. Next, the results gathered in their own patent map database were imported into mapping software and ranking maps, chronological maps, portfolio maps and so on were created and analysed. However, because patent maps are for conducting analysis of information, in order to judge the results specialist knowledge on the target of analysis is required.

3 Analysis of Exposure Equipment Patents

In the 1990's, Canon and Nikon split the global exposure equipment market share between them. However, entering the 2000s, they surrendered the top share over to ASML, Dutch semiconductor manufacturing equipment maker. Until now, various reasons for Nikon's and Canon's exposure equipment business decline have been examined from the points of view of economics and management; in this study, in order to confirm the effectiveness of the patent information analysis system we have constructed, we focused on the differences in technological features of exposure equipment for use in semiconductor manufacturing and their market share, and attempted to infer the technological reason for the changes in each company's market share through the analysis of patent maps.

3.1 Market Share of Exposure Equipment

Figure 6 shows the changes in world market share of Nikon, Canon and ASML as shown by quantity of sales. As can be understood from the graph, in the 1990's Canon occupied 40% of the market share. In the year 1996, Nikon held 50% of the market and Canon held 25%, 75% between them. At that time, ASML's market share was around 15%. Entering the 2000s, the three companies, Nikon, Canon and ASML, started to engage in a fierce battle for market share. In 2001, the semiconductor exposure equipment market was divided between Nikon at 41.6%, Canon at 34.8% and ASML at 22.4%. However, five years later in 2006, ASML's share reached 40%, and 60% in 2010, and it established itself as the world number one semiconductor exposure equipment maker.

From an economic or management point of view, one cause of this trend is said to be that ASML was ahead of the rest of the industry in developing immersion exposure equipment. In August 2004, ASML's Twinscan AT:1150i α -machine immersion exposure equipment was delivered to New York State University's Albany NanoTech, and after that ASML continued to ship out more equipment of this type. In terms of the market for i-line steppers, the simplest lithography technology for making low-end chips, according to the "The Global Market for Equipment and Materials for IC Manufacturing" report, in 2006 Canon held 48.8% of the market, Nikon 34.9%, and ASML 16.3%. Even in 2011 the i-line market share situation hadn't changed greatly, with 52.9% of the market share going to Canon, 40.0% to Nikon and 7.7% to ASML, but the i-line exposure tool is for low end semiconductor manufacturing use, and the market price is low. In addition, ASML holds a large market share in ArF immersion exposure, a high-end type of exposure equipment. In the 2006 immersion exposure market, ASML held a 72.4% share, Nikon held 27.6%, and Canon had not expanded into the high-end market. In 2011, ASML's share expanded yet further to 82.0%, and Nikon's dropped to 18%. In this way, because, at 80%, ASML showed an extremely strong hold on the immersion exposure market share, they became the top market shareholder in the exposure equipment world market. ASML greatly increased their share to 60%, Nikon dropping to 20.5% and Canon to 10%.

From the fact that, in 2008, ASML held 40.7% of market share by number of sales, Nikon 30.2% and Canon 29%, and that in terms of sales proceeds ASML held 65.4%, Nikon 23.3% and Canon 11.3%, we can see that ASML increased its market share across all types of exposure equipment.

Figure 6 Semi-Conductor Exposure Apparatus Manufacturer Market Share Changes

4 Results of Analysis

4.1 Five-digit F-terms: Large Classification (Technical Field) Ranking Map Analysis

Figure 7 Ranking Map of 5-Digit F-Terms

Table 1 5-Digit F-Terms (Technical Field)

FT 5 digits (Large classification : Technical field)	
FT	Theme code
5F146	EXPOSURE OF SEMICONDUCTORS, EXCLUDING ELECTRON OR ION BEAM EXPOSURE (NEW)
5F046	EXPOSURE OF SEMICONDUCTORS, EXCLUDING ELECTRON OR ION BEAM EXPOSURE (OLD)
5F031	CONTAINERS, MOVEMENT, FIXING, AND POSITIONING OF SEMICONDUCTOR WAFERS
2H097	EXPOSURE AND POSITIONING OF PHOTSENSITIVE MATERIALS COMPRISING PHOTORESISTS

In order to analyse the technical field, we analysed the percentage of applications of each company

for inventions in exposure and lithography using ranking mapping of 5-digit F-terms (theme code). Figure 7 shows the results of analysis. As can be understood from the graph, 5-digit F-terms, 5F146 and 5F046 theme codes appeared most frequently for all three companies, ASML, Nikon and Canon, and no difference can be seen in the field of technology between the three companies, which all show the same trend. 5F146, and 5F046 are both seen as the technology field of “exposure for semiconductors (apart from electron and ion beam exposure)”. Table 1 shows the 5-digit F-terms and theme codes of the top four headings by appearance frequency.

Next, we conducted the analysis of the middle classification, to see what viewpoint each manufacturer focused on within theme code 5F146 (“exposure for semi-conductors [apart from electron and ion beam exposure]”), the field that appeared most frequently in the analysis of the large classification.

4.2 Seven-digit F-terms: Middle Classification (Viewpoint) Ranking Map Analysis

Figure 8 shows the ranking map for each company by 7-digit F-term analysis. As can be understood from the graph, ASML, Nikon and Canon shared the trend that within the technology field 5F146, “exposure for semiconductors (apart from electron and ion beam exposure)”, viewpoint BA, “type of UV light exposure”, appeared most frequently. Table 2 shows the codes of the top four viewpoint headings acquired.

Next, the analysis results of the middle classification show that viewpoint BA, “type of UV light exposure”, appeared most frequently within technology field 5S146, “exposure for semiconductors (apart from electron and ion beam exposure)”. Analysis of the small classification was then performed to determine which technology within viewpoint BA each manufacturer focused on.

Figure 8 Ranking Map of 7-Digit F-Terms

Table 2 7-Digit F-Terms (Viewpoint)

FT 7 digits (Medium classification: Viewpoint)	
FT	Viewpoint
5F146 BA	KIND OF ULTRA-VIOLET RADIATION OR ULTRA-VIOLET LIGHT EXPOSURE
5F146 DA	OBJECT OF EXPOSURE CONTROL OR ADJUSTMENT, OR CONTENT THEREOF
5F146 CB	OPTICAL SYSTEM
5F146 CC	STAGE OR CHUCK MECHANISM AND OPERATION THEREOF

4.3 Nine-digit F-terms: Small Classification (Technological Content) Ranking Map Analysis

Figure 9 shows the analysis results of a ranking map of 9-digit F-terms. The analysis shows that while for both Canon and Nikon the heading BA05, “projection exposure: scanning projection exposure, reflection projection exposure” within BA0, “projection exposure”, appeared most frequently, for ASML

BA11, “immersion exposure” appeared most frequently.

In this way, by deepening the analysis, we can finally confirm the point of difference between Canon, Nikon and ASML. From the above results we can see that ASML focused mainly on immersion exposure as a means of making a great profit in the exposure equipment market, with this heading comprising 33.1% of the technological content, while Nikon and Canon had a greater percentage of projection exposure technology. Immersion exposure has been identified in previous studies as the cause of ASML’s success.

Figure 9 Ranking Map of 9-Digit F-Terms

Table 3 9-Digit F-Terms (Technical Content)

FT	All digits (Small classification: Technical contents)
FT	Technical contents
5F146BA11	· IMMERSION EXPOSURE
5F146BA03	· PROJECTION EXPOSURE
5F146BA04	· · REDUCED PROJECTION EXPOSURE
5F146BA05	· · SCANNING PROJECTION EXPOSURE OR REFLECTION PROJECTION EXPOSURE

4.4 Chronological Map Analysis

We conducted analysis using chronological maps to investigate in detail the variations in each company’s exposure method technology. Figures 11(a), (b) and (c) show the changes in technological content for each company. The vertical axes show the percentage of each technological content heading, and the horizontal axis shows the year from 2002 to 2011. From Figure 10 (a) we can see that in 2002, for Nikon results were equally high for the projection exposure technology of BA05, “projection exposure: scanning projection exposure, reflection projection exposure”, BA04, “reduced projection exposure” and BA03, “projection exposure”, and thereafter the percentage of BA05 and BA03 dropped but that of BA03 levelled off and remained high. BA11 (“immersion exposure”) increased sharply in 2005 before levelling off at a high percentage.

Figure 10 (b) shows the results of analysis for Canon. In the graph we can see that the percentage of BA03 and BA05 is high, and particularly BA03 shows an upward trend. BA11 peaked in 2007 and then dropped. This can be thought to be due to Canon’s focus on low-end i-line stepper over immersion exposure. Figure 10(c) shows that while in 2006 ASML’s percentage was about the same for BA11, BA03, BA04 and BA05, after that the percentage of BA03 and BA11 soared, but after 2009 only BA11 increased while all the other technologies dropped. Especially in 2011 the percentage of BA11 exceeded 50%, and all the other technologies remained low at about 15%. It is thought that this is connected to an attempt to expand market share of immersion technology applied to exposure equipment.

Figure 11 shows variations in market share along with each company’s immersion exposure equipment percentage. Regarding changes in market share relative to changes in the percentage of

immersion exposure technology for each company, since 2006 the percentage of BA11 in ASML has been increasing continuously, and at the same time its market share has also increased. Next, looking at the changes in Nikon, up to 2010 BA11 maintained on average a high proportion, and since then there has been an upward trend, but compared to ASML's increase this upward trend is lagging. Since peaking in 2007, Canon's market share has declined along with its BA11 percentage. From these points a correlation can be observed between changes in each company's immersion exposure technology (BA11) and changes in their market share.

(a) Nikon

(b) Canon

(c) ASML

Figure 10 Chronological Maps of 9-digit F-terms (Theme Code: 5F146; Viewpoint: BA)

Table 4 9-Digit F-Terms (Theme Code: 5F146; Viewpoint: BA)

FT	Technical contents for theme code:5F146 viewpoint: BA
5F146BA01	· CONTACT EXPOSURE
5F146BA02	· PROXIMITY EXPOSURE
5F146BA03	· PROJECTION EXPOSURE
5F146BA04	· · REDUCED PROJECTION EXPOSURE
5F146BA05	· · SCANNING PROJECTION EXPOSURE OR REFLECTION PROJECTION EXPOSURE
5F146BA06	· · PATTERN GENERATORS
5F146BA07	· BEAM SCANNING EXPOSURE
5F146BA08	· INTERFERENCE EXPOSURE
5F146BA09	· HOLOGRAPHIC EXPOSURE
5F146BA10	· OTHERS
5F146BA11	· IMMERSION EXPOSURE

Figure 11 Changes in Immersion Exposure Percentage and Each Manufacturer’s Global Market Share

In the above way, using patent maps we can analyse changes in the technologies (in this case, exposure methods and immersion exposure) on which each manufacturer focuses. Through F-term small classification ranking maps, we can see that ASML put more emphasis on immersion exposure compared to other manufacturers, and from the immersion exposure by manufacturer chronological map we can deduce what kind of exposure technology each manufacturer is currently proactively developing based on the number and proportion of results for a given heading.

4.5 Portfolio Map Analysis

Figure 12 Nikon: Portfolio Map of 9-Digit F-Terms (Theme Code: 5F146)

We conducted analysis of the small classification of theme code 5F146, “exposure for semiconductors (apart from electron and ion-beam exposure)” using portfolio maps. Here, the vertical axes show growth, and the horizontal axes show the composition ratio. “Growth” expresses the changes in the number of applications in the target period relative to the reference period, showing the number of

applications (in this case the number of F-term small classifications) in the target period and the reference period as a logarithm. Composition ratio represents the ratio of various technological contents contained within a given technological field. The reference period for the portfolio maps was from 2002 to 2005, and the target period was from 2006 to 2011.

Figure 13 Canon: Portfolio Map of 9-Digit F-Terms (Theme Code: 5F146)

	5F146DA07 5F146DA27 5F146DA34 5F146DA11 5F146DA12 5F146DA13 5F146DA11 5F146DA12 5F146DA13	<ul style="list-style-type: none"> • Wafers or vicinity of wafers • Pressure or atmospheres • Maintain performance of immersion lithography • Projection exposure •• Projection optical system ••• Magnification, optical path lengths or distortion • Projection exposure •• Projection optical system ••• Magnification, optical path lengths or distortion

Figure 14 shows ASML’s portfolio map. Table 5 describes the portfolio map’s F-term headings. As can be seen from the figure, within ASML’s F-term small classification, BA11 (immersion exposure) has

a component ratio of 16.3%, the highest in the F-term small classification, and growth is above +1. Also, in the small classification viewpoint DA (exposure control, target of adjustment, contents), the F-term with the most growth was DA34 (immersion exposure equipment performance support), with growth of ∞ . This is because it had no appearances in the reference period but it made an appearance in the target period. It is shown on the 0 axis on the map due to a limitation of the software. The fact that in ASML's portfolio map the growth of all small classification F-terms is 1 or above demonstrates how actively they have been engaged in development relative to the reference period. Also, the high component ration of BA11 (immersion exposure) and the highest growth of DA34 (immersion exposure equipment performance support), reflect the fact that ASML has been focused on and expanding development in immersion exposure methods and related technology.

Figure 12 shows Nikon's portfolio map. From the graph we can see that, as for ASML, the highest component ratio belongs to BA11 (immersion exposure), but that growth is low compared to ASML and compared as a whole to ASML, the overall growth in the appearance of small classification F-terms is not high. This indicates that compared to ASML the progress of development was lagging.

Figure 13 show Canon's portfolio map. As the graph shows, the exposure method BA03 (projection exposure) represents the highest component ratio, and as for Nikon overall growth is not high. In addition, it can be considered that much of the negative growth can be accounted for by the downward trend in technological development.

Looking at the above results, if we assess the differences and features of each manufacturer, we can see that ASML has focused on immersion exposure and related technology; many of the small classification F-terms have shown positive growth, and the company is actively pursuing development. However, the growth of Nikon and Canon is not very large, there is also some negative growth, and it can be deduced that they are not as actively engaged in development as ASML. From these results, it can also be thought that the state of development work on the particular technology each company focused on is one factor that affects the company's market share.

5 Discussion

By analysing technology trends with regard to the influence on the market of technological changes in exposure equipment used in semiconductor manufacturing, using a patent analysis system that incorporates a search system and patent mapping software, the following conclusions were reached.

(1) By analysing F-terms, it is possible to not only find out about the fields of technology, but also to attain detailed information about various viewpoints within those fields.

(2) By analysing different hierarchy depths of F-terms, it is possible to specifically analyse a variety of information in each technological field, in which the depth of the hierarchy leads to highly detailed classification. In this study, when F-term hierarchy depth was analysed in large to medium classifications, the viewpoint of the exposure method (in the field of semi-conductor exposure) upon which ASML, Nikon and Canon were focusing could be understood. When further analysis was done into small classifications, the fact that ASML focused more than Nikon and Canon on immersion exposure became clear. In other words, the greater the complexity of classification, the more the differences and features of each company can be identified.

(3) By analysing F-terms by different hierarchy depths, it can be seen that ASML's special feature was immersion exposure, which correlates well with information on market share obtained from economic investigation.

(4) Using patent maps, it is possible to analyse changes in the technology (in this case, exposure methods and immersion exposure) upon which each manufacturer focuses. Through a ranking map of F-term small classifications, it can be seen that ASML emphasized immersion exposure more than other manufacturers, and from a chronology map of immersion exposure by manufacturer, we can deduce from the number and proportion of appearances of a given heading what kind of exposure technology each manufacturer is currently proactively developing.

(5) If we assess the differences and features of each manufacturer based on portfolio maps of ASML, Nikon and Canon, we can see that ASML has focused on immersion exposure and related technology, that many of the small classification F-terms show positive growth, and that the company is actively pursuing development. On the other hand we can see that the growth of Nikon and Canon is not very large, and that there is also negative growth, and it can be deduced that they are not as actively engaged in development as ASML. From these results it can also be thought that the state of

development work on the particular technology each company focused on was one influencing factor on the company's market share.

(6) In this study, the analysis of patent maps correlated well with the market share investigation report. Accordingly, the application of the patent analysis system used in this study to analyse technology trends in patent information can be a useful analytical tool in clarifying a company's or its competitor's research strategy and policy.

Research on Corporate Network Response after Product Harm Crisis

Yang Limao, Wang Yuling

School of Business, Hubei University, Wuhan, P.R.China, 430062

(E-mail: ylimao@163.com, 352673533@qq.com)

Abstract: This paper constructs conceptual model that enterprise network response influences on customer brand loyalty and purchase intention. The paper analyzes network response impact on consumer brand loyalty and purchase intention through mediating variables: the brand trust and brand emotion and perceived risk by the method of the empirical research after product harm crisis. A analysis of variance showed that company online remedial response measures help reduce consumer perceived risk, increasing brand trust and brand emotion. Correlation analysis showed that perceived risk are negative related with brand loyalty and purchase intention, brand trust and brand emotion are positive related with brand loyalty and purchase intention separately.

Key word: Product harm crisis; Network response; Brand trust; Brand emotion; Perceived risk

1 Introduction

Product harm crisis is an occasionally appeared and widely published event that a product is defective or harmful to the consumer. According to whether the company can clarify and prove the product is no defect or harmless in the media or court. Smith and Larry (1991)^[1] recognize product harm crisis can be divided into indefensible type and defensible type. Fang Zheng (2007)^[2] classified product harm crisis and the styles of dealing with crisis, identified and distinguished three conceptions of product harm crisis. After Product harm crisis will not only give consumers' physical and mental cause certain damage, but also affect enterprise's brand image and business activities.

Product harm crisis occurred frequently, such as "drunkard wine" events, "KFC crash chicken" events, "Lipton tieguanyin rare earth overweight". Product harm crisis would bring enterprise multiple effects, such as product sales decline, marketing efficiency decreases, the brand assets value reduction and offset consumer's trust. With the rapid development of the Internet, the exposure amplitude of enterprise product harm crisis becomes bigger, propagation speed faster, negative effects more big. However, many enterprises all appear more panic, or flinch before, or vague answer when crisis comes. These coping styles in a certain extent affect consumer trust of enterprise and brand emotion, and then damage consumer's brand loyalty and purchase intention. Through the research this paper would find how to use the network to deal with the crisis to wine consumer trust for enterprises, in order to enrich and complement the existing theories of product damage crisis and to improve the enterprises' ability of dealing with product harm crisis.

2 Research Hypothesis and Model

When enterprise faces product harm crisis, consumers will doubt and mistrust about enterprise brand. Due to the development of the Internet, the enterprise negative information spreads quickly, the influence time will be also longer and spread range will be wider. Through the network active response enterprise can change consumer perceived risk, brand trust and brand emotion, affecting consumers' purchase invention and brand loyalty.

Laufer and Coombs (2006)^[3] point out also product harm crisis has a negative impact on the enterprise market share and stock prices ,yet threat enterprise reputation. Enterprise reputation will affect potential customers, investment income, senior talent introduction, job satisfaction and media reports. Zeng Wangming, LiWei (2008)^[4] consider from the point of perception loss, perceived loss and perceived risk is related positively in the product damage event. Perceived loss is negatively related to brand emotion and brand trust, does perceived risk; brand emotion and brand trust are positively related to brand loyalty. Peng Liang, Lu Bingxin (2009)^[5] think product damage incident will bright serious damage to consumers' physical and mental health, but also lead to significant influence on the enterprise brand management. Product damage crisis will influence consumers' brand cognition, further influence the attitude, and then affect consumption behavior, so that enterprise needs timely to make the right way to deal with. Whether the crisis is true and false, enterprise' positive response can let the consumer feel that enterprise has the ability to undertake product damage events. The present research mainly concentrated on the handling ways of different subjects such as the enterprise, government, experts and

so on, but related researches of dealing with product harm crisis reported are less from the angle of network. Therefore, this article mainly discusses how the enterprise online coping styles affect brand trust and brand emotion as well as consumer perceived risk. Based on this, we put forward the following hypothesis:

H1: After product harm crisis happens, network positive response can enhance consumers' trust to enterprise brand.

H2: After product harm crisis happens, network positive response can deepen the consumer emotional experience to the enterprise brand.

H3: After product harm crisis happens, network positive response can reduce consumer perceived risk.

Zeng Wangming, Li Wei (2008) [4] put forward after product harm incident, the best approach is to make consumers feel the company to be worthy of trust using all possible measures. Consumers believe that the company can avoid such events happen again to ensure their interests in the future, thus reducing consumers' doubts about the brand, weakening their perceived risk. Chaudhuri and Holbrook (2001) [6] also put forward the hypothesis that brand emotion has positive influence on brand loyalty. These were verified in empirical research.

H4: After product harm crisis happens, enhancing consumer trust for enterprise brand has positive influence on cultivating consumer's brand loyalty.

H6: After product harm crisis happens, deepening consumer brand emotion has positive influence on cultivating consumer's brand loyalty.

H8: After product harm crisis happens, to reduce consumers' perceived risk has positive influence on cultivating consumer's brand loyalty.

Howard and Sheth put forward brand trust that is one of the decisive factors to purchase intention for the first time in 1969. Similarly, Bennett and Harrell thought trust played an important role in predicting buying intention. After product harm crisis the enterprise brand image would be damaged. Consumer trust may fell sharply to buy the competitor's products, threatening the development of the enterprise. Wang Xingdong, Jing Fengjie (2011) [7] take field experimental method to verify when the crisis enterprise took network media communication timely, positive network response can reduce the customer's perception of risk, to maintain the customer's purchase intention. During the process of researching, enterprise ability and enterprise social responsibility influenced on purchase intention, Chieh-Peng Lin, Shwu-Chuan Chen (2011) [8] thought that owing certain feelings for enterprise brand will affect the purchase intention. Bhattacharya and Sen (2003) [9] also said brand emotions can make consumer psychological more attach on and focus on the company, which actively arouse their purchase intention.

H5: After product harm crisis happens, enhancing consumer trust for enterprise brand has positive influence on consumers' purchase intention.

H7: After product harm crisis happens, deepening consumer brand emotion has positive influence on consumers' purchase intention.

H9: After product harm crisis happens, to reduce consumers' perceived risk can strengthen consumers' purchase intention.

To sum up, this research model is shown in figure 1.

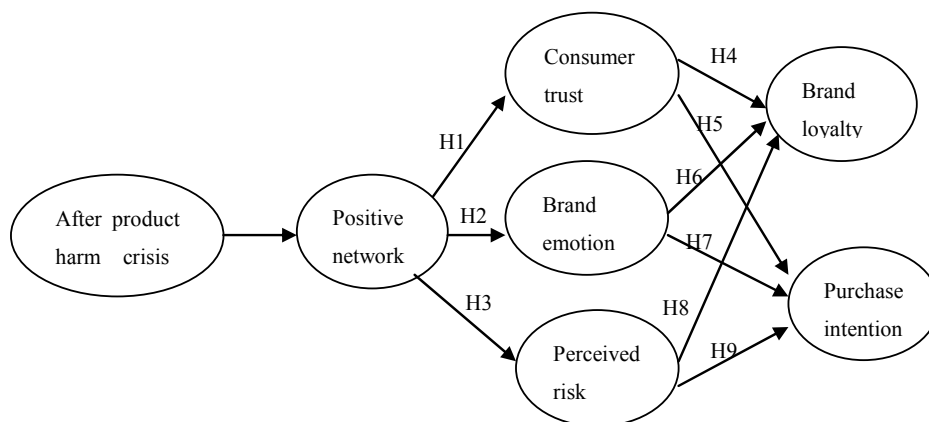

Figure 1 Research Model

3 Research Design

3.1 Questionnaire design

This research explores that how positive network responses influence the brand loyalty and the purchase intention. The answer to the questionnaire rates with 5 level Likert scale, because most scholars believe that 5 level Likert scale is more reliable, it can reflect the differences of respondents' mild opinions and strong opinions. The five point scale is easy to judge, so as to ensure the accuracy of the data. The involved problems of each dimension in the questionnaire were measured by 5 level Likert scale. 1 = "strongly disagree", 2 = "disagree", 3 = "not sure"; 4 = "agree"; 5 = "very agree". The higher the score, the higher the degree of the agreement; the lower the score, the lower the degree of the agreement. Perceived risk is measured as 1 = "very dangerous", 2 = "dangerous", 3 = "not sure"; 4 = "no risk"; 5 = "completely without risk". The higher the score, the lower perceived risk; The lower the score, the higher perceived risk. The study involved five test variables of brand trust and brand emotion, perceived risk and brand loyalty and purchase intention. The test variables of purchase intention refers to Pavlou (2003) ^[10] measurement scale; the test variables of brand loyalty refer to Aaker (1996) ^[11] measurement scale; the test variables of brand trust refer to sirdeshmukh^[12] and Jin Yufang measurement scale; the test variables of perceived risk refer to Jocoby (1972) and Simokos measurement scale; the test variables of brand emotion refer to Keh and Xie (2009) ^[13] and Chaudhuri, A., & Holbrook measurement scale.

Table 1 Measurement Scale of Five Variables

Variables	Research problem	source
Brand trust	I believe that the enterprise has the ability to manage current business.	Sirdeshmukh,2002 Jin Yufang, 2005
	I think XX brand is worth trusting.	
	I think XX brand is very honesty and integrity.	
	When appearing the crisis, I think the enterprise took positive measures.	
Brand emotion	I like company image of XX company.	Keh and Xie,2009 Chaudhuri, A., & Holbrook, M. B. (2001)
	I think XX company staff' service attitude is good.	
	Purchasing XX brand made me happy.	
	Using XX brand let me feel very at ease.	
Perceived risk	I think XX brand does damage to body health.	Jocoby,1972 Simokos,1994
	I think XX brand does damage to financial condition.	
	I feel XX brand does damage to mental health.	
	I feel XX brand does damage to the society.	
Brand loyalty	I will repeat to buy XX brand product.	Aaker,1996
	In the purchase of similar products, I preferred XX brand.	
	I always hope to recommend XX brand to friends.	
purchase intention	As long as having the opportunity, I going to buy XX brand product.	Pavlou,2003
	As long as having the opportunity, I going to buy XX brand product in the future.	
	In the near future, I may buy XX brand product.	

3.2 Research object

This study chose a defensible product harm event – taking fruit milk "Coca-Cola poisoning" event as test object, questionnaire design uses scene type. The scene is adapted by reported real syrutra events happened during November 30, 2011 to December 7. Using this event as the research object, one reason is that milk powder is daily necessities, for the vast numbers of consumers are familiar with, we all have the experience of using or purchasing. The other reason is that the event belongs to the defensible product harm event, not causing substantial damage to consumer.

3.3 Questionnaire test/data collection

This research takes the way of random intercept and online survey, random intercept in Wuhan city part of the large business super and convenience stores, such as questionnaire survey at ZhongBai storage, ZhongShang supermarkets. The survey time is arranged on Saturday and Sunday. Online surveys first were uploaded the questionnaire to questionnaire star website and spread by weibo and

friend net. Do preliminary research before the final research.

4 Data Analysis and Interpretation

4.1 Descriptive analysis

Considering the selected research object of fruit milk drink daily product, in order to endure this investigation widely, the formal research was carried out on October 11, 2012 to November 15, every Saturday and Sunday at ZhongBai storage, ZhongShang supermarket, Wal-mart in Wuhan, China. We issued 260 research questionnaires, the number of recycling research questionnaires is 207, including 195 effective questionnaires. Tested consumers of 195 valid samples collected are made by descriptive statistical analysis.

From table 2 frequency analysis to see, 113 people in 195 valid questionnaires heard of the "Coca Cola drinks poisoning", occupy 57.9% of the population to be measured, including 39 people hear the "Coca Cola drinks poisoning " incident through people around, traditional media or other channels, 74 people knew this event by the internet, the proportion was as high as 65.5%, indicating that the Internet let the enterprise product harm crisis spread wide.

Table 2 Frequency Analysis

Did you hear about Coca Cola drinks poisoning incident?		Frequency	Percent	Cumulative Percent
Valid	yes	113	57.9	57.9
	no	82	42.1	100.0
Which channel did you get Coca Cola drinks poisoning incident?		Frequency	Percent	Cumulative Percent
Valid	network	74	65.5	65.5
	people around	18	15.9	81.4
	traditional media	17	15.0	96.5
	other channels	4	3.5	100.0

4.2 Reliability and validity analysis

Validity refers to whether the scale can reflect what we want to measure.

Reliability is also called consistency, to measure the item of scale consistency degree. Detection methods in common use is Cronbach 's coefficient method, a coefficient between 0 ~ 1. Generally speaking, internal consistency coefficient is(Cronbach 's α value) > 0.7 ,which shows that the effect is good.

The five variables reflecting test problems of the questionnaire were carried out by reliability analysis, the results were showed such as table 3.

Table 3 Variables Reliability Analysis

Variables	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
Perceived risk	.856	.857	4
Brand trust	.862	.865	4
Emotion	.761	.811	4
Brand loyalty	.926	.926	3
Purchase intention	.888	.888	3

It can be seen from table 3, the internal consistency of brand loyalty is (Cronbach 's α value) $0.926 > 0.9$. The internal consistency of perceived risk and brand trust, purchase intention is more than 0.8, The internal consistency of brand emotion is (Cronbach 's α value) $0.761 > 0.7$, which means that the test questions have good internal consistency.

4.3 Variance and correlation analysis

Variance analysis can test whether consumers different perception of corporate network to deal with harm crisis has a significant impact on perceived risk ,brand trust and brand emotions. The premise of the analysis of variance tests data normality and homogeneity of variance. Do variance analysis with SPSS16.0, The results were showed as table 4.

Table 4 Analysis of Variance about Remedial Measures Response Perception and Perceived Risk, Brand Trust and Brand Emotion

Independent variables	Dependent variables	Df	F	Sig
Consumer perception about Internet remedial measures	perceived risk	1	101.897	.000
	brand trust	1	50.329	.000
	brand emotion	1	16.499	.000

According to consumer perception to the Coca-Cola company crisis response, we divide to into the consumers two groups, each group of perceived risk, brand emotion and brand trust values was shown in table 5.

Table 5 The Mean of Brand Emotion, Brand Trust and Perceived Risk under Different Perception of Remedial Measures

Consumers perception to Cocacola corporate network measurements	Means of perceived risk	Means of brand emotion	Means of brand trust
Positive response	3.28	3.35	3.28
No positive response	2.20	2.74	2.20
Total	2.84	3.10	2.84

As was shown in table 5, with consumers' different perception to the corporate network measurements as independent variables, perceived risk, brand trust and brand emotion as dependent variables, the results of analysis :Sig = 0.000, indicating that consumers' perceived risk, brand trust and brand emotional difference is significant. Due to the perceived risk in the questionnaire survey 1-5 representative from high to low, the brand emotion and the measurement of brand trust, 1-5 represents from low to high. According to mean analysis results which were showed in table 5, when the company took positive measures as a response, brand trust and brand emotion were higher than no positive response; perceived risk was less than no positive response. H1, H2, H3 are verified.

Through correlation analysis we analyzed how brand trust and brand feelings, and perceived risk affect consumers purchase invention and brand loyalty after product harm crisis. The SPSS16.0 for analysis, the results was showed in table6.

Table 6 Correlation Analysis of Perceived Risk, Brand Emotion, Brand Trust and Brand Loyalty, Purchase Intention

		Perceived risk	Brand emotion	Brand trust
Brand loyalty	Pearson relation	.412**	.692**	.463**
	Sig. (2-tailed)	.000	.000	.000
Purchase intention	Pearson relation	.421**	.586**	.533**
	Sig. (2-tailed)	.000	.000	.000

** . Correlation is significant at the 0.01 level (2-tailed).

As can be seen in table 6, the correlation coefficient of perceived risk and brand loyalty is 0.412. The significance level is 0.000 (< 0.05), which indicates there is a relationship between perceived risk and brand loyalty. Because of the perceived risk in the questionnaire 1-5 varies from high to low, and brand loyalty measurement 1-5 varies from low to high. it was verified that to reduce the consumers' perceived risk has positive influence on cultivating the consumer's brand loyalty after product harm crisis, H8 is verified; Similarly, the correlation coefficient of perceived risk and purchase intention is 0.421, the significance level is 0.000 (< 0.05). After product harm crisis, to reduce the consumers' perceived risk can strengthen the consumer purchase intention, H9 is verified. The correlation coefficient of brand emotions and brand loyalty is 0.692, the significance level is 0.000 (< 0.05), which indicates that deepening consumer brand emotion has positive influence on cultivating the consumer's brand loyalty, H6 is verified. The correlation coefficient of brand emotions and purchase intention is 0.586, the significance level is 0.000 (< 0.05), which indicates there is very strong positive correlation between brand emotions and purchase intention, H7 is verified; The correlation coefficient of

Brand trust and brand loyalty is 0.463, the significance level is 0.000 (< 0.05), that indicates enhancing consumer brand trust has positive influence on cultivating consumer's brand loyalty, H4 is verified; The correlation coefficient of brand trust and purchase intention is 0.533, the significance level is 0.000 (< 0.05), which indicates that there is very strong positive correlation between brand trust and purchase intention, H5 is verified.

5 Conclusion

Based on previous literature research, this paper discussed how enterprise network response influence consumers' purchase intention and brand loyalty when product harm crisis happened. Through the empirical research, related data confirmed that brand trust and brand emotion are higher than no positive response if the enterprise took positive response measures after the occurrence of crisis; risk perception is less than no positive response. In addition, this paper also confirmed that reducing consumer perceived risk, improving consumer brand trust and brand emotion can promote consumers purchase and brand loyalty in a certain extent.

Facing product damage crisis, enterprise doesn't need to be panic or ignoring. The enterprise takes positive response measures by internet, so avoiding consumer panic a wide range in time, reducing consumer perceived risk. And enterprise's apology description, recall or other active measures will not only enhance consumer confidence, but also strengthen enterprise brand of emotion, and promote consumer brand loyalty and purchase intention.

Although this paper drawn some conclusion, it still has some limitations. First, this paper research object is defensible product damage crisis events. The applicability of indefensible product harm crisis has yet to be further verified. Second, this paper researched a single enterprise' product harm crisis, but did not consider the industry product harm crisis phenomenon, such as "Shanxi old vinegar" event and "drunkard wine" event which influenced the industry development.

A Research on the Strategies of Intellectual Property Protection Based on the View of Knowledge Management

Chen Yongzhi, Qian Zuoqin, Gao Lan
Wuhan University of Technology, Wuhan, P.R.China, 430063
(E-mail: cyz@whut.edu.cn)

Abstract: when knowledge has become the most valuable asset of an enterprise, and been embedded into the core competence, intellectual property management then turn into a indispensable component of enterprise knowledge management aimed at obtaining and sustaining high profit. This paper clarifies the essence of knowledge management and intellectual property, analyzes the existing problems in knowledge management and intellectual property protection, and then proposes the strategies of intellectual property protection based on the view of knowledge management.

Key words: Knowledge management; Intellectual property; Property rights strategies; Solutions

The time comes to the 21st century, it is the era of knowledge economy, knowledge management emerges as the times require, and the intellectual property has been indispensable, the three penetrate into each other, interacts with each other, promote each other and develop together into the mainstream under the condition of high technology^[1]. Knowledge and information has gradually leveled with human resources, funds as the third important strategically resource. Enterprises employ knowledge as products, and protect their own rights and interests using knowledge as well, which is the fundamental goal of knowledge management, of which the objective is to maximize the value of intellectual property in order to obtain sustainable competitive advantage^[2]. Under the background of knowledge management, to carry out the protection strategies of intellectual property display much importance.

1 The Essence of Knowledge Management and Intellectual Property

1.1 Knowledge management

Knowledge management is defined as the management of information and human jointly, knowledge management is to combine the information processing capacity and human's innovative ability in order to better accustom the organization to the business environment^[3]. It is a brand new management mode, and an irrevocable outcome of the development of the market-oriented economy. Knowledge management is a major step to exhibit human ability and intellectual human resources, say, the information technology, market expectation, economic strategy and operating strategy, etc., and integrates them sharply, quickly and efficiently, to make them play a active role in maintenance and development of the competitive advantages of enterprises in the condition of a fierce market competition^[4].

From the view of enterprises, the aim of knowledge management is to enable the knowledge to create more value, hence to promote the management quality of the business operation, increase business profit, enhance business core ability, help businesses grow sustainably and healthily. The details include solving problems, setting strategic plan, protecting knowledge property, obtaining commercial information, enhance the adaptive capacity. From the view of the society, the aim is to promote knowledge innovation.^[5]

1.2 Intellectual property

Intellectual property is the knowledge asset protected by the law, and is a vital component of the knowledge asset, hence it is also called intellectual property asset. Since knowledge asset is a codified knowledge and the material form of the enterprise core ability, enterprises are always actively pursuing proper ways to protect knowledge asset in order not to be imitated by the competitors. The realization of this aim relies on the intellectual property. The forms of knowledge assets are various, while the core part is the knowledge with the property rights. The existences of intellectual property system not only render the knowledge asset protection by law, and also convert the intellectual property into a form of asset.

In the condition of knowledge economy, knowledge becomes capital, and knowledge asset is a important component of knowledge capital, while intellectual property is knowledge asset with property rights and a very important knowledge capital, see in figure 1. According to the core capability-based theory of the firm, we could find that intellectual property also has the three fundamental features which constitute the core capability of the firm, which are the attribute of value, the attribute of asset, and the

attribute of knowledge [6].

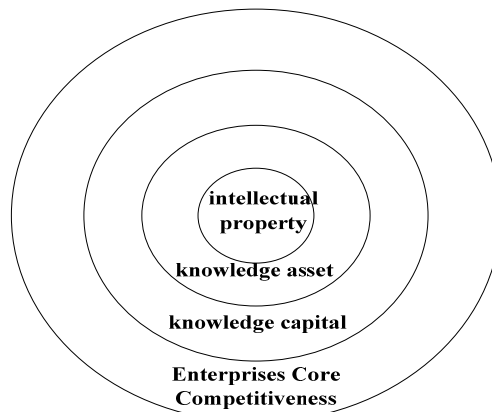

Figure 1 The Relations Between Intellectual Property, Knowledge Asset and Knowledge Capital

From the view of business administration, the first is the general term of intellect production rights that include copyrights, trademark rights, rights of invention, rights of discovery, business secrets, business names, geographical indication, etc., which is the civil rights enjoyed according to law by the human based on the outcomes of intellectual activities and experience from the operation activities. The first has five features, which are intangibility, statutory, exclusiveness, timeliness and territoriality [7].

1.3 The comparison between the first and the second

The first is an important content of business tow. Business tow is a management mode that businesses obtain, use, store, promote and transfer knowledge and intellect. Merely from the definition, the two have no significant correlation; however, from the analysis based on different angles, we can conclude that the two have connections and distinctions [8]. See in the table 1.

Table 1 Compare with Intellectual Property of Knowledge Management

	project	intellectual property	knowledge management
connection	common goal	Promote knowledge innovation	Promote knowledge innovation
	Interco ordination	Intellectual property rights protection use flexibility personal knowledge management	Knowledge management is the foundation of establishing intellectual property rights protection mechanism
difference	range of knowledge	Focus on explicit knowledge	Focus on tacit knowledge
	management technology	Using legal means to protect intellectual property Use technology to manage the enterprise intangible assets Using management implementation of intellectual property rights	Scattered in different link in enterprise human resources management all kinds of information technology market analysis and business strategy such as harmonious and unified
	fundamental function	Solve the problem of knowledge of use promote knowledge innovation	Market-oriented to promote knowledge innovation knowledge application
	Mechanism	Balance of interests legal contract	Values interests balance
	market access	Market value through knowledge possession	Through guidance to promote knowledge sharing knowledge into the market

2 The Existing Problems in The Second and Protection of the First

2.1 Business one management awareness weak

It is the premise of the first management that the businesses are aware of the importance of the first. Currently, the most businesses still have weak the first awareness, which has a significant correlation with the economic policy our country has been applied. Many enterprises are misled by the situation of large volume of China’s market, pursue blindly the factors like market, channels, prices, etc., ignore the care for core technologies, and hence pay a high price. Most enterprises have not established specific agents that manage the first so that some specific affairs about the first management and protection can not be solved timely, which cause the enterprises can not make quick response to newly emerging technological achievements in the market and bring the enterprises tremendous economic loss [9].

2.2 Lack of proprietary one right and core technologies

In our country, many research staff once get some achievements in invention and creation, they will first consider to publish papers, achievement appraisals, award applications, instead of seeking for the first protection. According to a certain statistic, each year our country have about thirty thousand significant science and technology achievements, but only ten thousand of which have been applied patents for. Take Jiangsu Province as an example, there are around 50000 enterprises with output value over CNY 5 million, and a total patent applications of 3889 cases with an average value of 0.07 cases per enterprise. There are 1438 high-tech enterprises, and 1618 patent applications with an average value of 1.12 case per enterprise. Contrary to this phenomenon, many foreign enterprises apply for a large number of patents, many of which have been the core technologies in certain industries. They employ the strategy of the first in advance so that imposes heavy restrictions on our country's enterprises.

2.3 Weak institutional framework, system construction, personnel allocation and strategies

The developed counties have been increasingly enhancing the protection of the first and the second, lifting considerably the level of the first protection, establishing and carrying out the second and the first strategies, advancing transformation of international the first rule vigorously. Their purpose is to serve for their economic development, and maintain their great power status and global influence. Meanwhile, the United States, Europe and Japan have intent to counter the developing countries including China through carrying out the first strategy. And the western countries have always had conspire to contain China's development, so these factors integrally threaten and put heavy pressure on our country. We have to be sensitive to the new situation of international the second and the second developments, particularly the basic trends that the developed countries are doing in the second and the first, in order to correctly seize the macro trend of the international the first system transformation and know ourselves. After the over-three-decade development process, we have accumulated our own experience, start to display our unique features, hence we could not simply copy the foreign measures. Therefore, enhancing the first and the second protection, carrying out the first strategy, developing the full potential of the role of the first system in business development, boosting the business technological innovation, accelerating researching the products with proprietary the first rights, and strengthening the international competitiveness, have been the urgent task of our enterprises. The enterprises should take the first and the second protections serious, must break the normal procedure and leap forward, and build and development the first protection strategies under the knowledge management as soon as possible.

3 Intellectual Property Protection Strategies Based on the View of Knowledge Management

3.1 Patent strategies is an important component of enterprise 1 strategy

Enterprises patent strategy means enterprises use the features and functions of patent and patent system to seek for the competitive advantage. It can be divided into two strategies, which are aggressive patent strategy and defensive patent strategy. The aggressive patent strategy means the strategy the enterprises employ to apply for patent rights more positively and actively in order to obtain initiative in the fierce market competition and reward the enterprises more economic benefit. The defensive patent strategy means the strategy the enterprises employ to defend themselves against loss when other enterprises wage patent attacks or other enterprises' patents impede their operation.

3.2 Apply trademark strategy, promote enterprise competitive advantage

Trademark is an important intellectual property pertaining to the survival and development of an enterprise, and is used by the manufacturers and services provide to distinguish their goods and service from those of others. Since the trademark law was published in 1992, the trademark work has made great achievements. The number of trademark registration per year is several hundred thousand. Foreign companies pay more attention to the trademark registration in China; hence market competition aroused by trademarks has been increasing fierce in our country. However, from the development of the enterprises of our country, trademark does not play an important role in the consideration of business operation. The first problem is that enterprises register not so many trademarks, and the second problem is that enterprise is not willing to maintain and carry forward the trademarks they possess. The enterprises in Jiangsu Province have also had such problems. For instance, Nanjing Guan shengyuan's overdue filling let the reputation of the nationwide Guan shengyuan brands impaired; Suzhou Xiang Xuehai was sold at a low price of only CNY1.04 million, such cases imply that the enterprises pay no enough attention to trademark management. The enterprises should actively apply for trademark registration both at home and abroad according to their technology realm and product categories to carry

out the trademark strategy. In activities like joint venture and cooperative production, the enterprises should pay attention to the protection of the existing trademarks and identify the real value of the intangible assets, meanwhile the enterprises have to maintain their own trademark reputation, and protect the domain names correlated with their trademarks and enterprise names^[10].

4 Conclusion

With the advent of knowledge economy, economic competitiveness has been weakened in traditional areas, and knowledge displays increasing importance and becomes the indispensable condition for business innovation, and this intangible asset will be the most valuable form of asset in 21st century. Enterprises must learn to protect themselves using the first law, and establish and carry out the first strategy, if they want to compete in the future world competition. Through collection and research of the first information and relevant information, businesses obtain relevant technology development information, market competition information, and law information, predict the trends of relevant technologies and economic development, and win the initiatives of the first competition and the whole market competition.

Abstract: In order to reveal the incentive functions of enterprise informationization (EI) construction during the process of knowledge transformation, the structure equation modeling (SEM) is used in this paper. By model deduction, research design and model verification, the SEM can effectively reveal the correlation between informationization construction and knowledge transformation in Chinese Enterprises. For illustration, the collected copies are 300 enterprises, in which 271 copies are valid. The empirical results show that the reliability and validity in the information construction measurement model are quite well and the reliability and validity in the knowledge transformation measurement model are also quite well. The empirical research has revealed the EI-related microcosmic mechanism in the process of the knowledge transformation, which can provide the effective theoretical references and support for enterprises to further strengthen the informationization construction and raise the efficiency of the knowledge transformation.

Key words: Informationization; Knowledge transformation; Socialization; Structural equation model

1 Introduction

The knowledge transformation was firstly made by Japanese scholar Ikujiro Nonaka (Nonaka) in 1995, which referred to the internal conversion process between the tacit knowledge (belief, metaphor, intuition, knack and thinking patterns) and the explicit knowledge (knowledge of formatted dissemination with the standard and systematic language) in business management ^[1]. In Nonaka's vision, the knowledge transformation consisted of four stages such as socialization, externalization, combination and internalization. The socialization referred to the transformation between the tacit knowledge. In the first stage, each person's tacit knowledge was converted to tacit knowledge now also held by other members, who can make the communication each other through sharing experience, exchanging experience, and discussing idea or opinions in the micro community. Externalization meant the transformation from the tacit knowledge to the explicit knowledge. The body of knowledge can make the tacit knowledge apparent with the defined concept and the language through such ways as metaphor, analogy and model and so on. Combination referred to the transformation from the explicit knowledge to the explicit knowledge. At the third stage, this newly explicit knowledge became widely disseminated, discussed, redesigned and modified through document, conference, telephone discussion and electronic exchange. Potential customers, potential suppliers as well as the company CEO may all get involved. Internalization meant the transformation from the explicit knowledge to the tacit knowledge. Internalization converted the changed, explicit knowledge was converted into the tacit form by many people such as a product or a service ^[2].

2 Research Model Deduction

2.1 Elements design

According to research results of the literature ^{[3][4]}, EI construction system can be divided into four essential factors such as the information infrastructural construction, the application of information system, the cultivation of the information human capital and the information strategy management, which can reflect the comprehensive conditions of EI construction in China.

The information infrastructural construction refers to the maintenance, the transformation and the promotion of EI system, which is related to software systems (system software and application software), hardware systems (central processing unit, storage device, output and input device), and peripheral

* This work was supported by NSF (No.70773001) and Bid Project "Xinjiang SME Internal Control Issues". The project was from Humanities and Social Sciences Key Research Base in Xinjiang Normal University-Enterprise Development Research Center of Xinjiang.

support systems (converter, router and transmission line). Being the primary factor of raising the efficiency of the information system, the application of the information system means the use, the development and the excavation in enterprises. Being the important factor of deciding the information efficiency, the cultivation of the information human capital refers to the development, the training and the motivation of human resources of the specialized information technology. The information strategy management means the design, the implementation, the feedback and the adjustment of overall plans relation to the information construction and the trend of development, which can manifest the platform function of the information technology from the perspective of the enterprise development strategy.

The four links of knowledge transformation have an effect on the knowledge transformation; however the effect has the big randomness and the uncertainty, which can mainly change along with the various factors' changes in the internal and external environments.

The information infrastructural construction has provided the essential technological means and the material base for the knowledge transformation so that persons can deal with kinds of knowledge transformation with the aid of the information tool. The information system application has provided the most direct service platform for information transformation so as to enhance the process standardization and optimize the flow process of the knowledge transformation. The cultivation of the information human capital has enhanced the application scope, the breadth and the depth of the information technology on a large scale. The information management strategy has carried on the scientific plan to information construction and the trend of development in enterprises to save the cost of information operation, enhance the rationality of the information investment layout, which can provide the strategic guarantee for the comprehensive enhancement to the knowledge transformation efficiency.

2.2 Theoretical analyses and hypotheses

According to the above theoretical analysis, the hypotheses of the empirical research can be seen in Table 1.

Table 1 Research Hypotheses

Hypothesis name	Path representation	Hypothesis contents
H1a	$\xi_1 \rightarrow \eta_1$	Chinese enterprise information infrastructure construction promotes the efficiency of the socialization of knowledge.
H1b	$\xi_1 \rightarrow \eta_2$	Chinese enterprise information infrastructure construction promotes the efficiency of the knowledge externalization.
H1c	$\xi_1 \rightarrow \eta_3$	Chinese enterprise information infrastructure construction promotes the efficiency of the knowledge combination.
H1d	$\xi_1 \rightarrow \eta_4$	Chinese enterprise information infrastructure construction promotes the efficiency of the knowledge internalization.
H2a	$\xi_2 \rightarrow \eta_1$	In Chinese enterprises the application of the improved business information system promotes the efficiency of the socialization of knowledge.
H2b	$\xi_2 \rightarrow \eta_2$	In Chinese enterprises the application of the improved business information system promotes the efficiency of the knowledge externalization.
H2c	$\xi_2 \rightarrow \eta_3$	In Chinese enterprises the application of the improved business information system promotes the efficiency of the knowledge combination.
H2d	$\xi_2 \rightarrow \eta_4$	In Chinese enterprises the application of the improved business information system promotes the efficiency of the knowledge internalization.
H3a	$\xi_3 \rightarrow \eta_1$	The cultivation of Chinese EI human capital promotes the efficiency of the socialization of knowledge.
H3b	$\xi_3 \rightarrow \eta_2$	The cultivation of Chinese EI human capital promotes the efficiency of the knowledge externalization.
H3c	$\xi_3 \rightarrow \eta_3$	The cultivation of Chinese EI human capital promotes the efficiency of the knowledge combination.
H3d	$\xi_3 \rightarrow \eta_4$	The cultivation of Chinese EI human capital promotes the efficiency of the knowledge internalization.
H4a	$\xi_4 \rightarrow \eta_1$	The improvement of Chinese EI strategy management promotes the efficiency of the socialization of knowledge.
H4b	$\xi_4 \rightarrow \eta_2$	The improvement of Chinese EI strategy management promotes the efficiency of the knowledge externalization.
H4c	$\xi_4 \rightarrow \eta_3$	The improvement of Chinese EI strategy management promotes the efficiency of the knowledge combination.
H4d	$\xi_4 \rightarrow \eta_4$	The improvement of Chinese EI strategy management promotes the efficiency of the knowledge internalization.

3 Research Design

3.1 Enterprise information index system design

According to research results^{[3][4]}, the following index system of the measurement model design can be drawn, which is combined with the feasible practice in enterprises.

The information infrastructural construction can be divided into four measurement indexes such as the rational information investment (X1), enterprises' local network quality (X2), database performance (X3) and system maintenance (X4). The rational information investment refers to the distribution rationality of the investment projects including software, hardware, and personnel assignment and so on. The quality of enterprises' local network refers to the perfection of the interior network system in enterprises. The database performance refers to a series of functions such as the data message memory, the filtration, the classification and the conformity of enterprises' database. The system maintenance refers to the examination, the monitor, the promotion and the transformation ability of EI system.

The information system application can be divided into four measurement indexes such as business process reengineering (BPR) (X5), customer relationship management (CRM) (X6), the policy-making support (X7) and the electronic commerce construction (X8). The BPR refers to the renewal and the adjustment of the original business process by means of information technology. The CRM refers to the excavation of the latent commercial value of the customer information with the help of information technology. The policy-making support is to make the management decision of different levels on the strength of the superiority of the information technology. The electronic commerce construction refers to the various commercial activities on the basis of the information technology.

The cultivation of the information human capital can be divided into four measurement indexes such as informationization training investment (X9), informationization specialists proportion (X10), multi-talented ratio (X11) and staff's information ability (X12).

The information strategy management can be divided into four measurement indexes such as system planning (X13), strategic guidance (X14), strategic layout (X15) and function management (X16).

3.2 The index system design of knowledge transformation

According to research results, the index system of knowledge transformation concerning the measurement model can be designed.

The knowledge socialization (↑1) can be divided into four measurement indexes. There existed the harmonious work atmosphere where the staffs can learn and help each other in enterprises (Y1). The decision-maker holds that it is important for enterprises' departments to strengthen communication and cooperation from a long-term point of view in enterprises (Y2). The staffs are willing to pass their own experience and skills on to others for enterprises' long-term benefits (Y3). The enterprise pays great attention to absorbing the competitors-related superiority and advantage (Y4).

The knowledge externalization (↑2) can be divided into four measurement indexes. The enterprise frequently encourages the staffs to sum up their own skills and the experience (Y5). In the organizational structure of enterprises there is the perfect experience promotion mechanism (Y6). The staffs are willing to format the individual skills and experience (Y7). The enterprise pays great attention to propagandizing and encouraging the outstanding achievements (Y8).

The knowledge combination (↑3) can be divided into four measurement indexes. There is the higher application efficiency insider information system in enterprises (Y9). There is sharing database with the stronger performance (Y10). The enterprise encourages various departments to make the reorganization and the adjustment of the accumulated work experience, the administrative regulations, and the technical process and so on (Y11). In enterprises the departments pay great attention to collecting related materials and data in terms of the business process (Y12).

The knowledge internalization (↑4) can be divided into four measurement indexes. The enterprise pays great attention to the enhancement of staffs' service skills and the establishment of a set of effective mechanisms (Y13). The enterprise pays great attention to the construction of enterprise culture (Y14). The enterprises provide sufficient incentive to the internal BPR (Y15). The enterprise pays great attention to the construction of the learning organization (Y16).

3.3 The establishment of research model

According to two index system designs, the structural equation model is shown in Figure 1.

Figure 1 Structural Equation Modeling

4 Model Verification

4.1 Technical thinking

Based on sixteen cause-effect relationship hypothesis, the structural equation modeling is put forwards to verify the authenticity of the theory supposition and influence scope [5]. The structural equation modeling is related to four extraneous source variables ($\xi_1, \xi_2, \xi_3, \xi_4$), sixteen extraneous source targets (X1 to X16), four endogenous variables ($\eta_1, \eta_2, \eta_3, \eta_4$), sixteen endogenous targets (Y1 to Y16), sixteen cause-effect relationship as well as six related paths. Optimal model can be obtained through the effect matrix (τ), the effect matrix (β), the extraneous source variable covariance matrix (ϕ), the extraneous source variable factor load matrix (Λ_x), the endogenous variable factor load matrix (Λ_y), the extraneous source target variance matrix (Θ_ϵ), the endogenous target variance matrix (Θ_δ), the model residual covariance matrix (ψ), and kinds of fitting index and so on. By means of the optimal model, the path coefficient significance, the factor load significance, and the factor error variance significance can be estimated scientifically, which can finally fulfill the confirmation of above theoretical supposition.

4.2 Data collection

In the paper there are 300 samples resulting from enterprises' database in a consultant company. These samples come from 11 provinces, cities or autonomous regions including Beijing, Tianjin, Shanghai, Chongqing, Henan, Anhui, Jiangsu, Zhejiang, Shanxi and the Inner Mongolia Autonomous Region and so on. By the aid of electronic questionnaire, mail questionnaire, telephone interview and face-to-face talk with 300 investigation objects, the author seeks the data support from the senior managerial personnel such as CEO, CIO and CKO and so on in enterprises. There are 271 effective sample data, and the effective rate of collection is 90%, which has satisfied the requirement that the sample returns ratio is not less than 20%.

4.3 Analysis on reliability and validity

4.3.1 The reliability and validity analysis on the measurement model concerning information construction

The exploring factorial analysis results show that Alpha coefficient and half-value respectively is 0.9231 and 0.8860 in measurement model concerning information construction and the factorial analysis results in the accumulation explanation quantity is 81%. In the information infrastructural construction the intrinsic consistency check coefficients of four indexes are 0.7239. In the information system application the intrinsic consistency check coefficients of four indexes are 0.7169. According to the confirmation factorial analysis results indicate that the minimum value of 16 factor loading is 0.52, the maximum value of 16 factor loading is 0.89, the smallest T value is 2.17, NNFI=0.951, CFI=0.970,

RMSEA=0.044, $\chi^2(98) = 133.46$. Obviously, results of the reliability and validity in the information construction measurement model are quite well.

4.3.2 The reliability and validity analysis on the measurement model concerning knowledge transformation

The exploring factorial analysis results show that Alpha coefficient and half-value respectively is 0.8091 and 0.7255 in the measurement model concerning knowledge transformation. In the knowledge socialization the intrinsic consistency check coefficients of four indexes are 0.8282, and the relevance and Alpha coefficient do not change obviously. In the knowledge externalization the intrinsic consistency check coefficients of four indexes are 0.8309, and the relevance and Alpha coefficient do not change obviously. The confirmation factorial analysis results indicate that the minimum value of 16 factor loading is 0.58, the maximum value of 16 factor loading is 0.92, the smallest T value is 2.08; NNFI=0.931, CFI=0.900, RMSEA=0.032, $\chi^2(98) = 147.54$. Obviously, results of the reliability and validity in the knowledge transformation measurement model are quite well.

4.4 Model checking

By aid of SPSS11.5 and LISREL8.7, the effect matrix (γ) is shown in Table 2.

Table 2 Effect Matrix

Exogenous variables	Inner variables	Path assumption	Load coefficient	SE	Tvalue
Infrastructure construction	Knowledge socialization	$\xi_1 \rightarrow \eta_1$	0.39	0.09	4.37
Infrastructure construction	Knowledge externalization	$\xi_1 \rightarrow \eta_2$	0.18	0.07	2.43
Infrastructure construction	Knowledge combination	$\xi_1 \rightarrow \eta_3$	0.23	0.07	3.21
Infrastructure construction	Knowledge internalization	$\xi_1 \rightarrow \eta_4$	0.19	0.11	1.75
Application of information system	Knowledge socialization	$\xi_2 \rightarrow \eta_1$	0.24	0.08	3.00
Application of information system	Knowledge externalization	$\xi_2 \rightarrow \eta_2$	0.28	0.09	3.10
Application of information system	Knowledge combination	$\xi_2 \rightarrow \eta_3$	0.45	0.09	5.01
Application of information system	Knowledge internalization	$\xi_2 \rightarrow \eta_4$	0.17	0.10	1.70
Cultivation of human capital	Knowledge socialization	$\xi_3 \rightarrow \eta_1$	0.41	0.12	3.66
Cultivation of human capital	Knowledge externalization	$\xi_3 \rightarrow \eta_2$	0.27	0.09	3.00
Cultivation of human capital	Knowledge combination	$\xi_3 \rightarrow \eta_3$	0.15	0.12	1.33
Cultivation of human capital	Knowledge internalization	$\xi_3 \rightarrow \eta_4$	0.76	0.13	5.87
Information strategy management	Knowledge socialization	$\xi_4 \rightarrow \eta_1$	0.33	0.08	4.01
Information strategy management	Knowledge externalization	$\xi_4 \rightarrow \eta_2$	0.15	0.09	1.78
Information strategy management	Knowledge combination	$\xi_4 \rightarrow \eta_3$	0.32	0.08	4.00
Information strategy management	Knowledge internalization	$\xi_4 \rightarrow \eta_4$	0.46	0.11	4.18

The shaded areas indicate the path coefficient parameter which has been picked out in the process of model revision.

The model fitting index tabulation is seen in Table 3 (revision) simultaneously.

Table 3 Fitting Index Tabulation

Fitting index	Df	CHI-Square	RMSEA	NNFI	CFI
Index current value	410	674	0.030	0.922	0.901
Optimum value trend	—	Smaller is better	<0.08	>0.9	>0.9

Therefore, the model's fitting effect is good so that model revision does not need to be made [6]. (Other related confirmation results are omitted here).

5 Conclusion

From the information construction's angle, the enhancement of the efficiency of the knowledge internalization lacks the significant promotion although both the information infrastructural construction and the information system application have made the efficiency promotion of the knowledge socialization, the knowledge externalization and the knowledge combination to a certain extent. The information human capital cultivation has made the efficiency promotion of the knowledge socialization, the knowledge externalization and the knowledge internalization to a certain extent, but the enhancement of the efficiency of the knowledge combination lacks the remarkable stimulation. The information management strategy has made the efficiency promotion of the knowledge socialization, the knowledge combination and the knowledge internalization to a certain extent, but the enhancement of the efficiency of the knowledge externalization lacks the significant promotion.

From the perspective of knowledge transformation, the enhancement of the efficiency of the knowledge socialization stems from the promotion of the information infrastructural construction, the information system application, the information human capital cultivation and the information strategy management. The enhancement of the efficiency of the knowledge externalization derives from the promotion of the information infrastructural facilities, the information system application and the information human capital cultivation. The enhancement of the efficiency of the knowledge combination originates from the promotion of the information infrastructural facilities, the information system application and the information management strategy. The enhancement of the efficiency of the knowledge internalization stems from the cultivation of the information human capital and the promotion of the information management strategy.

The model's fitting effect is well on the basis of the fitting index tabulation. Therefore, the information construction has promoted the efficiency of knowledge transformation in Chinese enterprises to a certain extent.

Abstract: The project promotion strategy has already become a sharp weapon for the local government to develop local economy, gathering essential factors of production by the project promotion, giving impetus to the growth of investment by the project promotion, transforming government functions by the project promotion, enhancing the comprehensive competitiveness and reserved strength for economic growth. Thesis will be to analyse the project promotion strategy of the local government from the view of investment and financing management. The aiming at to Combined with the local actual and conduct scientific and rational analysis, exploring and enriching the theories of investment and financing management of the local government.

Key words: Project promotion; Investment and financing management; Regional economical development; Local government

1 Introduction

During the periods of "Eleventh Five-Year Plan for National Economic and Social Development", the local government takes highly of the implementation of the central policy for expanding domestic demands, closely seizes the historical opportunity that central government promoting regional economic development, and grasps the turning point of the country imposes 4,000,000,000,000 economical stimulation plan under the background of global financial crisis, takes the project as the guidance, with the aid of investment and financing platform, expands the investment scale, promotes the optimization of investment structure gradually, improve investment benefit. However, dose the project promotion only a slogan or an economical strategy adapts to Chinese national conditions? What is the relationship of the local government's investment and financing management which discusses hotly and it? Dose the local government implement project promotion strategy a rational choice or follows blindly? Can the project promotion become a kind of effective pattern to impel the local economy development? So far, researches about "project promotion" are really few. Therefore, this article will carry on scientific and rational analysis from the local conditions, exploring and enriching the investment and financing management theory of the local government, expected to instruct project promotion practice of the local government.

2 Analysis on the Economic Intension of Project Promotion Strategy

2.1 Project promotion is a pattern of investment and financing management leading by the government

The investment refers to the utilization process of the capital, while financing refers to the collection process of the fund. As for a concrete economic entity, the investment and financing are simultaneously exist. The goal of investment and financing is to realize the value of capital, and in a sense, the value of capital is to pursues the profit, thus realize the hedge and increase of capital. The investment and financing management refers to the process of policy-making, plan, organize and control to investment and financing activities. The local government investment and financing management is local government collect funds through multi-channel and multi-form, and guide the social idle capital to the weak links and the key areas of the economic society development which the central government plays a leader role. It mainly includes the infrastructure construction domain, the livelihood construction domain, the technical research and development domain, the human capital development and the cultivation domain as well as the high tech development domain, etc. And it mainly solve the problem of the public product, approximate public product supplies insufficiency and the problems related to important project and the key project construction's needs of national economy and livelihood. This is a concept expands from the government investment and financing, which means the government collect funds through finance and the credit method, and adopts the investment or the financing way to assign the funds among the department, the enterprise or the institution which urgently need development to realize certain goal of industrial policy and other policy. However, under our country's existing system,

the local government's property rights and governance is asymmetrical; The market economy is not mature and imperfect; The regional economy development is imbalanced, all entrusts local government with more economical functions. At present the economic construction expenditure take up nearly 30 percent of the government expenditure in our country^[1]. The local government can play a critical role in promoting the local economy, regardless of the national conditions or the actual need. Zhong Pengrong called it the official compels people to be rich, and each local conditions also demonstrate the project promotion, the attract bid for invite investments are the most important. The local government's investment and financing management is not to limit to the public infrastructure construction aspect, but pay more attention to the project, the industry and innovation which in favor of the economy growth. Therefore, the local government's investment and financing management is supposed to be a broader concept, which contains not only the government invest and finance directly, but also the management of local government's investment and financing behavior.

2.2 Project promotion is an important way to speed up the transformation of economy growth mode.

The project can be an important engine to drive the city and the local economy growth, and also an important way to speed up the economy growth mode transformation. Input project promotion in baidu encyclopedia search column, demonstrated 760 entries involves the province, the city, the county, the town all levels of local government. The project promotion has become a proper noun which widely used in local government's work report, becomes the effective device for the local government to develop local economy. The project has the division of big, medium and small, has division of scientific research item and the industrial project, the attract bid for invite investments project, the national, provinces and cities industrial policy project, the project which the monetary fund gives full support and etc, but the local government cares more about the project which can impel the local economic development. The author consider that, the project promotion refers to the local government carry on the economic activity of investment and financing management which take the project as the guidance in order to develop the local economy and local resources.

2.3 The project is an important carrier to support the government's invest and finance behavior

Figure 1 Project Promotion Flow Path

Considering the local practices, the main method of the project promotion is to attract bid for invite investments, for instance, the majority of local government implement the project promotion strategy primarily depend on attract bid for invite investments. The government of Hangzhou, the central area of Zaozhuang, Le'an County in Fuzhou explicitly proposes the implementation of project promotion and strengthen attract bid for invite investments in the government work report of year 2012. The goal of the project promotion is to stimulate economic growth, the Chong Ren County's government work report of year 2012 advanced, directs the project by opens, expands the investment by the project, guarantees the growth by invests, which fully explained relations between the project, the investment and financing behavior and grows, and concluded the economical growth is the foothold of the project promotion. The project promotion flow path including three processes which are the project introduction, screening and reserving, initiating a project and the project implements, as shown in figure 1. This is in accordance with the conclusion of the six stage pattern during the investment decision-making process which proposed by Fried and Hirsch after their empirical investigation. It includes the origin of investment plan, direction screening of the venture capital, comprehensive screening, the first stage appraisal, the second stage appraisal and Deal (including foundation and negotiations)^[2]. The standards which widely used in appraising the project promotion are investment and financing activity as well as its scale. There were 1662 significant basic construction items which above hundred million Yuan in 2010 Hunan, and the planned total investment reached 1,140,000,000,000^[3], and took the proportion of significant basic construction items occupies the total project as the standard to weigh the regional economy. He Nan Province established the big project office to put forward the management measures of the key construction project, explore the establishment of comprehensive valuation system for attract bid for invite investments, and enhance the quality of attract capital. Thus it can be seen, the core of project

promotion is investment and financing management. The project promotion is a kind of pattern of the local government's investment and financing management, combining the investment behavior and the government instruct enterprises financing together closely with the carrier of project.

3 Valid Analysis That the Project Promotion Avoids the Risk of Government'S Investment and Financing

3.1 Risk analysis from the investment and financing of the local government

The local government's investment and financing platform has become the most actively and noticeable financing main body, since our country implemented the positive financial policy and the moderate loose monetary policy to deal with the international financial crisis in November, 2008. However, the impulse to invest of the local government inflates continually, and the local government's debt scale and the risk accumulated ceaselessly. The local government's investment and financing platform performed many, mixed and disordered in quantity. 6576 investment and financing platforms have been set up around the whole nation till 2012 year's end, among which 3243 were stressed on financing function of government's construction items and 1173 combined financing function with investment function of the government's construction items, as shown in Table 1. The local government's investment and financing platform is large in scale, the remaining sum of company's government debt on the financing platform was 4,971,068,000,000 Yuan in the end of 2010, account for 46.38% of the remaining sum of the local government debt. The channel of financing is unitary, the loan increased 9,590,000,000,000 Yuan in 2009, increased 4,690,000,000,000 Yuan over the same period of the previous year. The financing amount of banks accounted for nearly 40% of the additional loan amount, and the total quantity was nearly 3,800,000,000,000 Yuan. The profit ability of local government's investment and financing platform is quite bad, the ability to meet the debt is insufficient. For instance, 358 companies serve the 105,971,000,000 Yuan debt which government have obligation of warranty and other correlation through the way of borrow new and repay the old, the average ratio is 55.20%, and 148 companies have over due debt 8,004,000,000 Yuan, the average ratio has reached 16.26%^[6].

Table 1 Government financing platform function and distribution

The total number of financing platform	Distribution platform of all levels		Financing platform function and platform number	
			Financing function	Platform number
6576	Province	165	Give priority to the government construction project financing	3234
	City	1648	Compatible with other investment construction	1173
	County	4763	With other business activities	2169

Moreover, the problem of idle fund is serious, up to the end of 2010, the remaining sum of disbursed government debt reached 1,104,447,000,000 Yuan. The primary reason for idle fund is that some local government float a loan blindfold, the projects and the fund do not match, trend of the investment has not carried out, the preparation is not adequate and over financing for fear of tight-money policy.

3.2 Valid analysis that the project promotion avoids the risk of investment and financing from the government

Many experts carried on analyze of the local government's debt risk and proposed suggestions. For instance, Ba Shusong(2009) advanced to impel reform on local government's investment and financing platform. The implicit liabilities should be published, the current situation of information opacity should be changed, financing behavior in local government's investment and financing platform should be marketized the bank must choose more careful risk management action to local government's financing, and liability of the local government's investment and financing should be established. The government audit report proposed to advance the cleaning up standard on the financing platform's companies continuously, prohibit local government's illegal guarantee, and promote the multiplication of investment and the consummation of the corporate governance structure. However, enhance the validity of the project can be the only way to really solve the problems exist.

The project promotion has already become an effective way for the local government to avoid risks on the investment and financing platform, after several years' exploration. The project promotion take the attract bid for invite investments as the platform and the project as the carrier, it prominent "project

guidance” function, and combine government financing behavior with investment behavior closely, drive the urban and the regional economy growth. Significant project construction can not only brings the direct benefit for the local economy development, but also may promote the necessary project construction as well as the upstream and downstream industry development, gather factors for industrial development.

4 Adaptability Analysis for Project Promotion to Local Economical Gradualness Development

4.1 Unbalancedness analysis on regional economical development

The local government make a reasonable decision should first consider the local conditions. In view of the economic situation, our country has a vast territory and large population; levels of local economy development have big difference. Given the development situation in the 11th five-year planning period, in the undeveloped area industry foundation is weak and the consciousness to start an enterprise is not thick. The undeveloped area basically have “payroll finance”, moreover, some county has heavy historical burden, and many economical resources have been at the idle condition for a long time. Considering advances from the publicized “12th five year plans”, though the Fifth Plenary Conference of Seventeenth Central Committee has given the signal that the economic growth will be suitable postponed in the “12th five year” period, but the central and the local government hold different views, particularly in undeveloped mid-west area, they still have high expectations on the economical development in the “12th five year” period. Different regions develop out-sync, and the local government faced with the different situations, especially in the undeveloped mid-west area, facing with competition of international and domestic market, development can be more difficult, but is beset with difficulties, but the ardor is very high. All this called for higher request to the local government’s investing and financing management.

4.2 Local difference analysis on project promotion strategy

In a country various areas face with similar system, but as the resources endowment various, the human resources, financial resources and the material resources which the local government can utilize have a big difference. Simultaneously, different local government may have distinctly different ideas, levels of effort and innovation abilities. The local government’s supplies function is major affected by resources factor and the potency factor. For example, some areas have projects but lack of fund, while some areas have sufficient fund but lacks the high quality projects, some areas lack of projects as well as the fund, an effective method to breaks through the bottleneck of the local development is urgently needed. This request the local government to carry on the investment and financing management reasonably, explore a economical development way which suit the local conditions positively.

Government in undeveloped areas often have to face with this problem: when projects and fund are both lacked in developing economic, government use the investment and financing platform to invest public infrastructure or financing, will inevitably result in big debt and risk. Whereas, in the developed areas, as the entity economy has developed greatly, the total quantity of urban economy is very big no matter in quantity or the scale. Thus it’s economical to make up public products’ insufficiency through the investment and financing platform. Method in Shanghai, Tianjin and Chongqing proved that the government debt problem is extremely prominent in undeveloped areas. Moreover, Li Xueqin and Fang Xianming^[7] constructed intercept changed panel data with fixed influence based on the correlative financial target data from 1998 to 2008 in seven different regions and analyze the connection between the financial support and the economical development from aspects of the bank, securities and insurance business. Conclusion can be obtained from the research that positive correlation exists between the financial support and the economical development in our country. The financial support can truly promote the economical development, but the explicit relations between financial support efficiency and the economical development does not exist, the financial support efficiency in some economical developed region even can be lower than the undeveloped areas. Therefore, the unbalanced regional economic development requests difference in the investment and financing management strategy inevitably, and the local government must make policy according to the actual conditions.

4.3 Gradual characteristic analysis on the Project promotion strategy

In different economical development stages may request for different investment and financing management and it decide that the project promotion strategy has obvious gradual characteristic.

Three stages existed in local economy development. Firstly, combine the investment with financing through the attract bid for invite investments. The attract bid for invite investments may be one way to

impel the project promotion which impelled under government's leadership. Its main purpose is to obtain the development fund, and gain advanced technology and managerial experience through project implementation. Secondly, construct the fund project platform through the utilization of investment and financing policy. Government's main function is to build good investment environment, and construct fund project platform for the enterprise. Thirdly, project promotions strategy in this stage, arrange investment project according to the local economy development need, then arrange money for the project and enhance the efficiency through combination of investment and financing. The government may mainly concentrate on the public infrastructure project.

Among the three stages in the project promotions strategy, the project promotions idea throughout, but location of the project various in different stages. The project promotions strategy is different with the project impel strategy which is driven by money, as it take the project as the core and the forerunner.

5 Conclusion

During “the 12th five year” period, the central positive financial policy and the loose monetary policy fade out gradually, and the financing environment been tightly. The supply scale and the supply rhythm of the capital supply on project are limited. Moreover, the competition between regions become seriously, and talents, capital, project resources become intense. The project promotions strategy take the project as a forerunner, the investment and financing as the platform, is adapted to the gradualness development of the economical undeveloped area. It will effectively solve the project and capital problems exist in the local development, avoid the investment and financing risks and bring about a coordinated development to regional economies.

Abstracts: This thesis researches the relationship among money supply, money output, and price fluctuation, basing on the enterprise motivation model, by using statistics of China from 1985 to 2008. Empirical study find the following results: If China's money supply stock follow i.i.d (independent identically distributed), the inflation rate and output volatility will be random; when China's economic grows rapidly it must be accompanied by great money supply shocks in a long term which will make inflation rate go even higher. This means to fundamentally avoid the high inflation rate when money supply shocks makes the output a upswing, it will be little returns if only use money policy. China's decision maker should pay more attention on improve workforce flexibility in order to maintain the sustained, rapid and steady development of the national economy.

Key words: Incentive; Money supply; Output; Price; Fluctuation

1 Introduction and Literature Review

Economic fluctuation means GDP fluctuates centering on macro-economy trend. Such fluctuations was called economical cycle for its cyclist. Since Burns and Mitchell put forward the specific descriptions of economic cycle, the theory of economic cycle has such a basic hypothesis that secular trend of macro-economic is stable which its average level will play the role of an axis. Such short time fluctuate of GDP which centers on the above axis is caused by economic demand. In a economic cycle, if actual economic growth is higher than average level, then the economic is in a expansion stage; conversely, it is in a cut-throat stage. Such hypothesis was adopted by Keynesian and monetarism and neoclassicism. However, we need to make economic decision before things happen, but the axis effect can only work after things happen. So there still need to be discussed in methodology if we want to find so called "cyclist style". Different people have different opinions on what caused economic fluctuation. But to my opinion, all these arguments can be classified into 3 kinds:

1.1 Result of material economic itself

On the effect of material economic to economic fluctuation, W.S.Jevons think that the cause of economic fluctuation is that agriculture industry always influenced by weather, especially by sun. the sun spot occur with constant periodicity influenced the agriculture industry, and then influenced the whole economic system. He also think that the frequency of economic fluctuation is approximately equal to that of the sunspot's occurrence. Since 80's of 20th century, the Real Business Cycle Theory of neoclassic firstly challenged the traditional economic cyclist theory from the angle of analytical procedure. They think that most changes of output are not centered on the average level but eternal. The changes of material economic caused by new technology shock are not cyclical but random. They try to combine the technology shock into the standard neoclassic model which holds that the origin course of economic fluctuation is practical factors, especially technology shock. Marxian economics holds that economic fluctuation is originally caused by the contradiction of market supply and demand.

1.2 Results of Financial factors (especially monetary factors)

There are many works discussing the effect of finance to economic fluctuation. In all of the financial factors, the monetary factors catch the most attention. So this article mainly researches the relation of monetary factors and economic fluctuation. From 1913 to 1937, English economist R. Hwatrey came up with the Quantity Theory of Money and business cycle theory which hold that is it just only monetary factors caused economic fluctuation and we can explain business cycle well just through the amount of money. The economic system influence the whole amount of output and income by creating money. The Modern Economic Cycle Theory of Fried was mostly inspired by above theory(Laidler, 1993, P.1068). Fried and Schwarz through study found that although in most years of economic boom and depression, the money stock is increasing compared with last year, however, the growth rate of money supply in depression is always lower than that in economic boom. Those 100 years they investigated in which money stock absolutely decreased are right in 6 depression period.

* This paper is supported by The National Natural Science Fund (71172004).

What's more, those facts which causes monetary squeeze almost has nothing to do with the changes, synchronously or in advance, of the output of material economic and prices. They hold that monetary squeeze can not be the result of great depression, so monetary squeeze must be the cause of great depression. In the sme way, we can elicit that monetary expansion must be the cause of economic boom. Consequently, money stock plays a decisive role in economic cyclist fluctuation.

1.3 Results of both material economic itself and financial factors (especially monetary factors)

Lucas, from school of neoclassic reasonable expectance, combined Muth's rational expectations theory with Friesman's Natural rate Hypothesis. He holds that economic fluctuation and pursuing the maximized personal interests is not contradicts to the market clearing price system (presented by money). Because economic subject makes rational expectation on the information they thought trustworthy, the miscarriage can be vary.the random shocks which cause output fluctuation in material economic mainly are technology factors. Although Lucas's economic cycle theory doesn't deny the role of technology factors in economic fluctuation, he holds that the fluctuation is mainly caused by sudden or unexpected money supply changes. Suppose two marketing participants only know part of the market price information, they will wrongly judge the price change. Such wrongly judgment consequently makes the output and employment deviated from the average level in a long term. Then economic fluctuation was caused.

New Keynesianism holds that the cause of economic fluctuation can either be money factors or material economic. They hold that once economic deviates from average level, because of wage rigidity (efficiency wages, long term contracts and union power etc) price stickiness (represented by money), the output is hard to restore to the average level of full employment. Then economic fluctuation happens. In the 70's, 21th century, economists represented by Fisher had already started to revive Keynesianism. The pioneering work of Fisher was the symbol of the revival of Keynesianism.

J.A.Schumpeter come up with the theory of "innovation cycle" which holds that the original source of economic fluctuation is the changes of enterprisers investment timing preference in 1939. In our opinion, because an enterprise has the power to assemble capital and human resources, enterprises play a important role in economic fluctuations. The capacity of such power depends on whether enterprises can successfully incentive workforce work hard by capital at right investment time, if yes, output will be raised, if no, output will be diminished and then cause economic fluctuation. So we hold that under set investment opportunity and capital limitation, how enterprise can incentive workforce is the determining factor and solid micro-foundation of economic fluctuations.

This article established the following research framework basing on Fisher(1977)、Mankiw(1985) and Ball&D.Romer's (1990) researches: a representative monopoly enterprise, labors are homogeneous and their skills won't change in two adjacent periods, the enterprise make valid wages and choose optimal raw labor to maximize its profits. The key of this framework is the standard for enterprises to decide wages, whether wages are reasonable and does wages still depends on exogenous staggering contract. We finally find that efficiency wage model of Laffont&Martimort (2002) is suitable for our research. Efficiency wage models ask monopoly enterprisers to make a judgment on workers output. The enterprisers have to set a wage to stimulate workers work hard. Firstly, before production, the factory fix a wage which can stimulate workers to work hard. At that time the enterprises give workers their wages as expected for the production hasn't start. Secondly, the enterprise should has enough patient for the workers' work ability won't skip in two periods and workers' probability to increase yield is the same. There still will have wage stickiness. However, our conclusion still has some different with conclusions of stickiness wage model and rational expectations models. What's more, our conclusion is the direct evidence to prove that money policy can not stimulate economic, only money supply shocks and demand shocks can have real and long term effects on output and price fluctuations.

2 Wages, Incentives and Economic Fluctuations

According to Jean-Jacques Laffont & David Martimort's (2002) researches, enterprise's aim always is to maximize their profit and at the same time stimulate them to work hard. Suppose enterprisers firstly choose a wage to stimulate workers to work hard. Following are their plans:

$$\begin{aligned}
 &Max\{E_{1t}(P_t Y_{1-t_1})+(1-E_{1t})(P_t Y_{2-t_2})\} \\
 &E_{1t}t_1+(1-E_{1t})t_2-C > E_{0t}t_1+(1-E_{0t})t_2 \\
 &E_{1t}t_1+(1-E_{1t})t_2-C > 0
 \end{aligned}
 \tag{1}$$

Y₁ stands for the high output when workers work hard. Y₂ stands for the low output when workers work hard. P_t stands for the price in the t period, t₁ stands for the wages hard workers can get. t₂ stands

for the wages idle workers can get. E_{1t} stands for the probability workers produce Y_1 in term t_1 , E_0 stands for the probability idle workers produce Y_2 , C stands for the costs hard workers.

The wages enterprisers give to workers can be deduced as formula (2) and (3). It shows the wages enterprisers give to workers is actually the ratio of workers' cost C to the probability ($E_{1t}-E_0$).

$$W_t = E_{1t} C / (E_{1t} - E_0) \tag{2}$$

$$E_{1t} = e^{-\lambda} \lambda^{z_t} / z_t! \tag{3}$$

in which λ is parameter, Z_t is worker's work time in t period.

It is obvious that the utility value of hard work is larger than idle work, of course is also larger than that of not work. (see the two constraints in formula 1) That's why enterprise can always hire workers successfully. The enterprisers choose a suitable number of workers he hired in order to maximize his profits. Following is his plan:

$$\text{Max}\{Y_t P_t - N W_t\} \tag{4}$$

In the above formula $Y_t = AN^a$ and we can get the following result from formula (4),

$$a P_t A = W_t N^{1-a} \tag{5}$$

We get formula (6) from transformed formula (5) which is the expectation in period $t-1$.

$$\ln(a) + \ln(A) + \ln(P_t) - \ln(W_t) - (1-a) \ln(N) \tag{6}$$

In formula (6) $\ln(P_t)$, $\ln(W_t)$, $\ln(N)$ are the logarithm of P_t , W_t , N separately. According to formula (2), (3), (5), and (6), supposing workers have the same work time in period z_t and $t-1$, we can deduce enterprise's output formula from formula (6):

$$y_t = A + a[(p_{t-1} p_t) / (1-a) + \ln n] \tag{7}$$

In formula (7) $\ln(P_t)$, $\ln(W_t)$, $\ln(N)$ are the logarithm of P_t , W_t , N separately.

3 Money Supply and Equilibrium Models

According to Taylor (1977) and Mankiw's (1982) research, this essay makes the following assumptions:

$$y_t = m_t - p_t \tag{8}$$

According to Lucas(1972b) and Benassy's(1999) researches, this thesis suppose the money supply formula is

$$m_t = g + m_{t-1} + \epsilon_t \tag{9}$$

In which m_t stands for the money supply amount in t period, g is a constant, ϵ_t stands for the money supply shock in t period and it is a winding item.

According to rational expectation rules and formula (7), (8), (9), we can elicit following formulas:

$$(1-a) \epsilon_t + \ln(P_t) = p_t \tag{10}$$

$$y_t = g + m_{t-1} + a \epsilon_t - \ln(P_t) \tag{11}$$

Formula (10) shows that normal price depends on money supply shocks ϵ_t and the price expectation of current period from former period. Formula (11) shows that the output depends on the supply amount, money supply shocks ϵ_t of former period and the price expectation of current period from former period.

After we introduced an aggregate demand shock, formula (8) can be wrote as

$$y_t = m_t - p_t - d \tag{12}$$

We can get formula (13),(14) by using formula (7), (8) and (12).Formula (13) shows how aggregate demand effects price. Formula (14) shows how aggregate demand effects output.

$$(1-a) \epsilon_t + (1-a) d_t + \ln(P_t) = p_t \tag{13}$$

$$y_t = g + m_{t-1} + a \epsilon_t + a d_t - \ln(P_t) \tag{14}$$

Formula (13) and (14) indicates two pieces of information in macro-economics: 1. Money supply and demand shocks have long-term effects on price and output but only shocks of current period can have such effects. 2. Formula (13), (14) provide theoretic basis for unite root movement of price and output..(see formula 15,16) It shows that the unite root movement of output is actually decided by the expectation on wages (by money) which enterprisers give to workers.

According to rational expectation rules, formula (10),(11) can be transformed to formula (15),(16). Formula (17) shows that price depends on price of former period p_{t-1} and money supply shocks ϵ_t . Formula (16) shows current output is decided by output of former period y_{t-1} and money supply shocks ϵ_t .

$$(1-a) \pi_t + p_{t-1} = p_t \quad (15)$$

$$y_t = a \pi_t + y_{t-1} \quad (16)$$

If only money supply shocks π_t obey i.i.d, then formula (15) and (16) can provide evidence for the random walk of price and output. However, if money supply shocks π_t don't obey i.i.d, we can transform formula (15) and (16) into (17) and (18). In formula (17) and (18), $F_p = p_t - p_{t-1}$, $F_y = y_t - y_{t-1}$; formula (17) shows that inflation rate F_p is decided by money supply shocks π_t . Formula (18) shows the changes of final output depends on changes of money supply.

$$(1-a) \pi_t = F_p \quad (17)$$

$$F_y = a \pi_t \quad (18)$$

4 Conclusions

This article provided theory support for the long term effect of money supply shocks by introducing enterprises incentive model. At the same time, it reveals that money supply shocks can also have long-term effect under rational expectations models. This conclusion provides empirical evidence for New Keynesianism. If money supply shocks meet the conditions of i.i.d, thus this article's research conclusion can provide theory support for random inflation and output fluctuation.

At the same time, we finished our study basing on Chinese really economic. Our study conclusion on the one hand shows the rationality of this thesis's research model, on the other hand indicates two important things of Chinese economic: 1. Chinese money policy do not have validity in long time. 2. Money supply shocks have long-term effects on GDP output fluctuate. That means, China has to make great money supply shocks in order to realize high economic growth. At the same time, such great money supply will surely bring up price. Which effect will be more pronounced depends on the workforce flexibility and it directly relates to people's welfare. When it effects the output fluctuations more than price, it will improve people's welfare; on the contrary, it will bring down people's welfare. China's decision maker should pay more attention on improving workforce training, spastically front line worker's technical level, in order to improve workforce flexibility. Only that can China avoids the high inflation brought by money supply shocks when it pushes the output upward fluctuates.

This article's further research direction is to make an empirical research on international statistics, which is to re-examine our research model.

Orientational Comparisons of University Libraries and Public Libraries: China as an Example

Lv Jingping

Library of Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: 913397921@qq.com)

Abstract: The purpose of this paper is to help University Libraries and Public Libraries in China correctly understand their unique positions in the process of their developments. Methods of comparing analysis between two types of libraries and survey-statistics of Chinese 39 "985" university libraries and 31 mainland provincial libraries are used. The university libraries are assistants for teaching and research, with embedded service regarding teaching and research units as their center, while local public libraries' dominant direction is a combination of reading and relaxing, with embedded service throughout community sites. The university libraries firstly serve their teachers, researchers and students, while public libraries give more consideration to the general public. The university libraries emphasize profession, research, academic features in literature collection, and database-driven, while public libraries outstand popularity, leisure, localized features and paper-document-driven.

Key words: University libraries; Public libraries; Feature; Comparison; Survey-statistics

1 Introduction

University libraries and public libraries are two main types of libraries. In recently library construction and the corresponding researches, emphasizing the integration of the two types of libraries becomes a focus. For example, in order to meet the needs of readers in the community, our university library recently bought some books about health, knitting, cooking, and some for children reading, however, our university does not have such discipline above. So does the integration of the two types mean the elimination of differences between them? Does such practice represent the future direction of Chinese libraries development? Such issues are worth considering. In the future development, under the limited funding conditions, in order to make these two types of libraries better serve readers, and better integrate into public service system, it is necessary to understand these two types of libraries development orientation, avoid lowering their service quality because of the fuzzy understanding. In the study of library science in China, many papers have been raised, about single kind library's development orientation, such as: Chen Li held that the local public library need to serve the local economic development, according to its features, to collect books, and to establish relational thematic databases.^[1] Xing Jun introduced operating ways, services to special groups, diversified convenient services, etc. of local public libraries in developed countries.^[2] Zhao Yumei discussed that the university library builds special discipline-collections libraries.^[3] In other countries, Kadiri thought that the university library exists in an academic context, and serves as academic support for teaching, learning, and research by faculty and students.^[4] Elizabeth Ann Hubbard realized public libraries should serve the special needs of specific populations (such as labor union) within their communities by providing the materials and resources.^[5] However, there are very few researchers noticing the difference between these two types of libraries, Feng Bin and Qihao Miao noticed the difference of reader of two types of libraries, but they did not compare their other aspects.^[6]

This paper attempts to make a comparative study from service concepts, service objects, features and other aspects of the two types of libraries, and to help people better understand these two different kinds of libraries' developing orientation, combining with statistical analysis between the Chinese mainland 39 "985 Project" university libraries and 31 provincial libraries.

2 Comparison of the Service Concepts

The service idea of the university libraries is its embedded services centered on teaching faculties and research institutes with its professional collections as assistant of teaching and research. University library is an important role of teaching and research, "a bridge between students and lecturers"^[4]. It is not entertainment venues, which determines that it has more normative manners, and its atmosphere more emphasizes on calm and seriousness. There are two main aspects of embedded services in university libraries: first, space embedded. Through modifying the system of the traditional main-library-centered to the branch-led, the total resources will be distributed to all branches, each

branch close to or integrate with the corresponding professional institutes, departments, colleges, so that libraries can provide readers convenient services as much as possible. Second, staff embedded. Some professional librarians in branch change to excellent discipline librarians who are tied together with teaching and research teams, providing literature renewing, data collection, latest book procurement and other services. Now the developments of discipline-branch-libraries in Chinese universities is becoming a trend. There are 26 "985" universities have clear disciplinary branches, accounted for 66.7% of the total "985" university libraries, that is to say, the average number of discipline-branch-libraries in "985" University is 2.77. (Table 1) If adding discipline branches transformed from reference rooms of affiliate colleges, the real number is far more than this.

Table 1 Discipline Branch in "985" University Libraries

985 University Library	The amount of Specialty Branch	985 University Library	The amount of Specialty Branch
Tsinghua University Library	7	Tongji University Library	1
Xi'an Communication University Library	1	Xiamen University Knowledge Resource Port	5
Zhejiang University Library	6	Tianjin University Library	3
Southeast University Library	2	Nanjing University Library	0

Zhongshan University Library	2	Northeastern University Library	0
Ocean University of China Library		East China Normal University Library	0
Chongqing University Library	6		
Total	108	Average	2.77

The service idea of the local public libraries is as a communicating place and its embedded services should be extended to some sites in community along with the joy of reading, "Public libraries must more and more take their place as street corner universities, providing real opportunities for everyone regardless of their place in society"^[7]. For those who wish to acquire knowledge, public libraries provide a quiet reading environment. And for the other peoples, public library is a place of communication and leisure even joy. So more spaces in public libraries don't emphasize calm and serious. That is the important difference contrary to the university libraries. Their function, as some scholars have said, "public libraries promote social cohesion and community confidence by fostering connections between groups and communities....The library can help individuals, especially older people, overcome the problems of social isolation and loneliness."^[8] The public libraries can also carry out cultural and recreational activities to attract local residents - readers, "the perception of the role of the public library has often been a largely recreational one, as is evident, for example, in responsibility for services being transferred from Education to Leisure Departments by many local authorities."^[9] So "the library has to serve not only the earnest seekers after knowledge, but also those who are merely gratifying an elementary curiosity, and those who are seeking relaxation and recreation"^[10]. Embedded services of

local public libraries are not discipline branch model, but rather to send the book into community, or establish book delivery sites, this trend in the West is called “Libraries build community”^[11] or “The street corner university”. In addition, more convenient services are provided to the physiologically vulnerable groups, for example, establishing some areas for the disable, the elder and the children. The appearing frequency of service areas for children and old people in the Chinese provincial libraries is up to 74 %, while for disable people is up to 42%. (Table 2).

3 Comparison of Service Objects

For the university library, its priority is to serve their teachers, researchers, students, and the special collections of university libraries will also attract professional researchers in society. These two types of readers are professional and research-oriented, and thus have strong purposes when they are reading. These readers’ orientation rightly mirrors the original value of all libraries that is “a prime place of expansions of thought and knowledge”^[12] University libraries opening to the public as a trend now, it must attract readers outside the universities, but we hope it is not because of leisure books, rather those professional featured literature.

For the public library, its clients are the general population. Local featured literature will attract some of the local scholars who interested in local politics, economics and cultural studies, but its main target is still the general population. “Contrary to the homogenous user groups in university libraries, public libraries cover a wide range of users – they could not refuse any group of readers but adapt themselves to the variety of needs.”^[6] Behaviors of such readers usually do not have particularly strong purpose, even if there are purposes, their purposeful object to be read generally are popular science books, basically nothing to do with the technological frontiers of knowledge.

4 Comparison of Collection Features

Distinctions of service concept and service objects inevitably affect the collections of both types of libraries with different characteristics. Currently, these two kinds of featured collections in China are not

done enough. Quite a few libraries still continue the model of “large and all-inclusive” or “small and all-inclusive”, but lack of clear development idea. As readers’ different objects and different needs to knowledge, local public libraries and university libraries in the future should make more efforts on the special collections. Except the national center library, other types of libraries should expertise in a particular field, a certain type of literature collection, and give up acquiring other areas or professional literature. Specifically, the two kinds of collections should widen the gap in the following aspects:

4.1 Profession or popularity

For the university library, its collections should be focus on profession, while the public library, popularity. Professional collections ask for books with certain depth, which generally meet the needs of those people equipped with strong professional knowledge and capabilities. The stronger professional books are, the target readers often narrower and the circulation lower. For colleges and universities (especially research universities such as the “985” in China), this kind of books are precisely the focus of their acquiring. But for public libraries, purchasing such books is not to say that there is no audience, however low efficiency, so such books should not be the focus of their collections. Popularity does not chase the depth connotation or require professional knowledge and abilities, only need basic abilities of reading. Such books tend to have larger circulation, very wide range of readers, and the large borrowing amounts. These types of books should be priority objects of public libraries, while the proportion of such books in university libraries should be continually reduced.

4.2 Research or Leisure

Behind profession and popularity, differences between research and leisure-recreation are hidden. For the university library, its collection feature emphasizes research, to serve professional researches and university teaching and research. This collection features not only serve the university teachers and students, but also become the non-university researchers’ the priority literature sources with speeding up process of university libraries open to the public. As for the public library, its collection features should be more emphasized leisure-recreation, taking serving people’s daily lives and recreational needs as the primary purpose. Such collections should be concerned about hotspots of people’s daily lives, such as diet, health, entertainment, recreation, hobbies and so like. “A public library has to meet the much more diversified user needs, such as for everyday problem solving, for enjoying leisure, or for just killing time”^[6]. Currently, local libraries accumulate large number of electronic documents, a considerable part of which are a variety of audios and videos entertainment products, but such basic electronic literature does not appear in the university libraries.

4.3 Discipline feature or regional feature

In the different development of the two types of libraries, in addition to the above-mentioned two distinctions, they are faced a problem forming their own characteristics by the collection of featured literatures. Featured literatures represents the characteristics of library collections, so it is very important for the library. There are many reasons in forming featured literatures. Firstly, because of the rapid growth of varieties and quantities of social publications and the diversification of carriers patterns, single library cannot meet the needs of each reader. Therefore, it is necessary to adjust development ideas of the collection, find or form their own features. Secondly, because of the development funding constraint caused by the government’s insufficient investment, especially at some local public libraries in China, there are nearly 1/3 of them no new collections because of lack of funding. Thirdly, because of historical reasons, some libraries in their own development have noticed to form their own characteristics and make a certain accumulation of special kinds of collections. Finally, because of the readers’ needs, with the improvement of the level of social civilization, readers will consciously choose what to read, and evaluate a library service quality based on the extent that books meet their own needs.

The collection feature of university libraries is their characteristic of discipline. Their own distinctive brand professions and key disciplines will gradually form disciplines specialty features in the corresponding data collection aspects of professional books. Along with the academic exchange internationalized and digitized, the characteristics of discipline often reveal itself through commercial professional databases and self-built specialized databases around the core disciplines. Statistics shows that (Table 3), “985” universities average have up to 188.9 specialized databases, and 85,700 kinds of electronic journals, 1,829,500 electronic books, 12.54 self-built specialized databases. The data is much higher than the average level of local public libraries.

The collection feature of local public libraries is their localized features, appearing as the accumulation of local literatures. Local literatures refers to literatures which about local culture, local resources, economic and other aspects. Since some literatures with special characteristics result in special characteristic libraries, localized literatures is the advantage of public library collections.

Statistics shows that (Table 4) in Chinese mainland provincial libraries, the frequency of occurrence of localized literature collection rooms or similar agencies are up to 1.39, while the average amount of the localized collection databases are more than 5.58.

Average	1.39	5.58	0.9

Some colleges and universities form regional features in their research (mainly in the social sciences and humanities), and accordingly localized characteristics will be formed. From the overall, however, which does not eliminate the differences in the collection features. First, because the proportion of these universities is smaller (less than 40%), second, the specialty areas of collections are relatively narrow, the numbers are relatively limited, and therefore they cannot really deconstruct geographical features of public libraries.

4.4 Database-driven and Paper-document-driven

For the university library, for the sake of the needs of international perspective and academic exchanges, the construction of the database is the most important thing, especially for science and engineering. The funding of introducing databases is the bulk of expenditure of libraries, and expenditure ratio of traditional paper books is declining year by year. “For all the ARL academics, expenditures for electronic resources have risen an average of 85.32 percent annually in this seven-year period(1996-2003)”^[13], while its colleagues in China may keep pace with the same or a higher developing speed. For public library, the paper document is still absolutely dominant because of the historic cause and lack of funds, its databases are built around the localized characteristics, and less like the university library that spend heavily on a variety of professional databases from abroad. In addition, the frequency of occurrence of a featured collection in local libraries—“Rare Books Collection Room”, is up to more than 90% in the provincial libraries (also see Table 4), and such collections only appear in

key comprehensive universities, but not in science and engineering universities. Such kind of special collections precisely exist in paper form.

5 Conclusions

Only university libraries and public libraries taking differentiated development paths can they win more rational basis in order to exist. The provincial libraries in China have more clear positioning, and get impressive results in aspects of embedded services in community, humanistic solicitude, localized featured literature collections, etc. Most important university libraries in China have correctly positioned, too, and have made considerable progress in the aspects of embedded services in teaching and research institutes, providing calm atmosphere of academic, organizing discipline-featured literature, etc. They are two types of libraries' developments in China. But some university libraries, quite a few district public libraries, and most county public libraries in China exist the problem of position ambiguity, for example, some university libraries' collections are lack of professional features, but pursuit large and all-inclusive patterns of collections, lack of embedded services far away from teaching and researching places, too emphasis on leisure, and some university libraries' opening to the public without any limit of the expertise degree of readers in community, only attracting the public for its collections of leisure, etc., while some district level libraries are on the developing way of small and all-inclusive, lack sense of service embedded into community and without local featured literature collections, and too profession of some books in their collections to be read by the public readers. Libraries which exist these problems should seriously review their own development orientation and return to the right way, which just is the practical significance of this paper.

In future studies, the author will investigate more and more libraries in Chian at all levels and all types, finding excellent libraries, establishing models of the library at each levels or each types, meanwhile noting the problems existing in some libraries, analyzing causes of them, discussing the possibility of problem-solving.

Intellectual Property Management of Digital Publication in China: Some Problems and Solutions

Chen Jundong

Press, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: chenjd@whut.edu.cn)

Abstract: Setting objects of management of intellectual property in digital publication (IPDP) and describing its boundary range, and then we can get the management model of intellectual property in digital publication. Further researches on managing relations of IPDP and its change based on this model are focused on. The main task of the researches is to find out and analyze the problems existed in the process of the management of IPDP, including what is the intellectual property in digital publication, how to possess, authorize, and transfer it and how to manage the added value of IPDP. Based on the analysis, solutions to the problems are provided.

Key words: Intellectual Property Management; Digital Publication; Management Model of IPDP

1 Introduction

With the development of information technology, especially the growing popularity of mobile networks, digital publishing has gradually risen. Digital publishing in China started late, but its development speed is very quick. In the last decade, it has developed into a new type of economy industry. The industry mainly include electronic books, digital newspapers, digital periodical, network literature, network educational publications, network map, digital music, animation, network game, network database publications, mobile phone publication. The publication content almost covers all areas and reaches beyond the traditional publishing. In the past few years, the average annual growth rate of global digital content industry exceeds 33%. In China, comprehensive reading of various media include books and periodicals and digital publications among the 18 to 70 years of national, the rate was 77.1%, in which digital reading contact rate was 32.8%, 8.2 percentage points higher than last year.^[1]

The composition of China's intellectual property rights is mainly composed of copyright, patent, trademark exclusive etc, so the study on intellectual property management are mostly concentrated on developing policies and regulations in these few areas.^[2] Foreign scholars have more detailed research in this field. The distinction of object to the protection of intellectual property rights are more careful and logical.^[3] Devoted to the study of intellectual property right relationship and management for digital publication does not see more.

2 Setting Management Model of Intellectual Property in Digital Publication.

Research on intellectual property in digital publication is focused solely on copyright in many articles. Copyright is only one of the important contents of intellectual property right. In the intellectual property system to the digital publications, the copyright is the core, and it is the main object researched in this article. Category of intellectual property system in digital publications is far more than copyright.

Like traditional publishing, digital publishing is also concerned with the providing or multiplication of documentation and recorded information; carefully checked and peer reviewed, original, integral and authentic. Even until today, the publishing process was traditional and reclusive. Publishing as a whole is very big business, with several mega-companies that dominate the landscape. Major categories of publishing are scholarly publishing, professional publishing, text book publishing, reference works, dictionaries, multi-volume compendia, etc. The basic activities in publishing are selection, editing (copy and language), design and illustration, translation and indexing, production, promotion, marketing, sales and distribution.^[4] That is to say, information content is the prime object of digital publication. The information is usually composed by 3 components: information content that conveys the meaning of the message; information form that consists of two sub-components: information format is the type of information such as text, mathematical models of numeric data; information structure is the means of expression of information content such as specific language used in the text, or types of graphs; and information medium is the package in that information being captured and communicated, whether on paper or electronic format. Accordingly, intellectual property of digital publications is composed by different right of these 3 components.

On the basis of the above analysis, a model of intellectual property rights management of digital

publications can be simply constructed. The model can be used to describe the structure of intellectual property rights system of digital publications. The elements of the system are consisted of information content and the providers, information format & structure and the designer, information medium and the designer. Relations between the elements which are formed through the conclusion of relevant legal relationship are the object of management of the system, see figure 1.

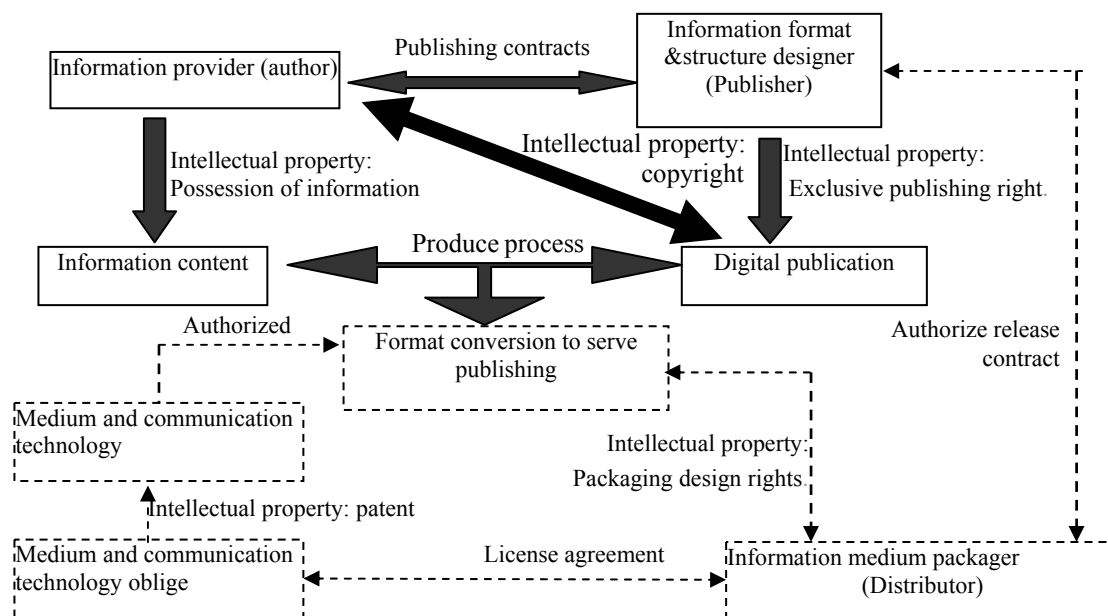

Figure 1 Model of Intellectual Property Rights Management of Digital Publications

3 Problems of Intellectual Property of Digital Publications Management

Although digital publishing is to digitize content resources of traditional printed books, the conversion of the expression form has broken through the visual limitations; it can be text, sound, image to spread the information content. That is to say, digital publishing is a digital technology, with the continued rapid development of the information technology closely related. The development of information technology has brought the development of digital publishing, and brought new problems to intellectual property management of digital publishing at the same time.

On the other hand, from the recipient of knowledge content point of view, digital publication is mostly spread through the network, which makes the regional difference, time difference, and even the difference between senders and receivers are continuously vanishing. The vanishing of difference in digital publishing has thoroughly changed the ultimate form of publishing industry. Many new problems will occur in the new industry.

3.1 The system structure of intellectual property management of digital publications become more complicated

The dotted frame part in Figure 1 is the added part on the base of traditional publishing intellectual property management system. The distributor is induced into digital publishing industry. Usually, the distributors are network platform operators, mobile platform operators etc. The distributor packs the information content provided by press through some medium and new technology. The adoption of new technology makes the system more complicated:

- Various types of digital publications, diversity, especially the new form of media or media technologies are constantly emerging, the traditional classification of categories of publications become fuzzy, it increases the difficulty to determinate the ownership of intellectual property of digital publications.
- In order to adapt to the transmission of digital publications, sometimes information content should be reformed to adapt to the production, this transformation has been beyond the publishing editor's category, and derive new kind of intellectual property rights from the digital publications.
- To meet the personalized publishing requirements, special design of digital publications is often

required. The design is also a kind of knowledge production labor process, material fruits of that work should also have the intellectual property rights.

- In digital publishing process, the application of new technology is inevitable, this new technique is also related to intellectual property rights.

3.2 The boundary of object of digital publications intellectual property rights management is not clear

The complexity of the system increase will undoubtedly lead to its boundary turn to uncertain. Digital publishing is mainly originated in digital network platform. Many works has entered the public domain before being published. The information content of works in the public domain will be continually rewritten and adapted during the process of communication by the audience according to their requirement. In this respect, a typical example is the open source code in information field, each programmer can add and modify the original works code according to their own style, the famous operating system —Linux is formed in this way. It is impossible to find out what is the boundary of intellectual property rights set in this case.

The essence of digital publication is that it is the existence of digital information content, it is dynamic. Digital publications are spread on the Internet, sometimes just some data, such as database products, which does not meet the legal meaning of traditional copyright works definition. Online meeting, online editing, interactive computing is widely used in the production process of digital publications. Information content published by the form listed above, will be of how much originality, or to what extent cannot be determined. These changes made boundaries between the original works and the interpretation of the works become blurred.

3.3 It is difficult to determine the term of validity of digital publications Intellectual property rights.

In order to promote scientific and cultural development, encourage the intellectual achievements of the public, it is a common principle in world to limit intellectual property in time. Known from the IPM model, the intellectual property system of digital publication is a complex of different rights. The protection period of any kind of these intellectual property rights is not the same, that is to say, the deadline of the protection period is different. So it is necessary to make strictly distinguish between different digital publications intellectual property rights. However it is difficult to make this distinguish in many cases.

Protection period of copyright — the core of digital publication intellectual property system is sometimes difficult to determine. Different country gives different rule to manage the intellectual property. The protection period will be ended at the 31st Dec in the 50th year after the death of the owner according to China's copyright law. If it is a cooperative work, the deadline will be the December 31st in the 50th year after the death of the last author. In some cases, all the authors of network works are difficult to fully determine down, not to mention the last one to die.

It is also difficult to determine the start date of digital publication right of copyright protection period. Digital publications distributed on the network are not accomplished at one stroke. Before the complete works published, some of its contents may have entered the field of communication (complete published), and in the network environment, this part of the content may be constantly interpreted, to determine the initial state of the works is very difficult. Therefore, it is not so clear to determinate the first published date of digital publications as traditional publications?.

4 Solution to Problems of Intellectual Property of Digital Publications Management

Until today, the digital publication of the intellectual property management is a hot issue. Many countries give careful consideration to it in the policy formulation and legislation. The establishment of special intellectual property management services is also a good plan to solve these problems. For the protection of intellectual property rights of special problems, there should also be more flexible solutions to them.

4.1 Perfecting the legal system of intellectual property protection of digital publications

According to the legislation of China, the intellectual property law is only a concept, and not a specific system method. The legal system of intellectual property law is mainly constructed by the copyright law, patent law, trademark law, anti-unfair competition law and other laws, administrative regulations or rules and judicial interpretation, the relevant international treaties constitute. Among them, the copyright law is often cited as judicial ruling to intellectual property rights in digital publications.

In order to improve the intellectual property of digital publication management, current corresponding legal norms should be perfected. The following should be taken into consideration during making laws about intellectual property protection of digital publications:

- Give definition of digital publications on law to accurately describe the object of intellectual property management of digital publications;
- Laws and regulations on intellectual property of digital publications transfer, value-added, trade and other links
- Determination of the subject of rights should be clear, not easy to determinate in the network circumstances should give reasonable presumption principle.
- The legal gaps in the region due to the application of new technology should be filled in time.

4.2 Establish special intellectual property management services system

It is essential to develop an intermediary, agent, consulting and other services system for an industry to get a healthy and orderly development. The establishment of a self management industry association is also useful guidance. The services should include the following tasks:

- They will support the development of not one but several intellectual property of digital publications management systems, mandated by the diversity of publishing in China and the disparate needs of the various industry sectors. The systems will represent a fusion of technological, business, and legal components.
- Play a role in the development Uniform File Identifiers and other pro-competitive standards to facilitate publishing in a networked environment.
- Provide guidance in the marketplace, where intellectual property management systems of digital publications are already being developed.
- Play a leadership role in promoting and strengthening legislative protection for materials in digital form.

5 Conclusions

The digital publishing and intellectual property industry are still developing in their primary stage. As well as all new things, although it has rapid development, digital publishing and intellectual property industry has encountered all kinds problems in the process of the development. A model of intellectual property of digital publishing management is set up in the article, and based on the model, the problems are analyzed and summarized. This class of problems has not been limited to the discussion in the academe at present stage, government departments also attach great importance to them. The corresponding policies and regulations are being developed and perfected. Further observations and researches will be required when the new legal system promulgated.

An Innovative Model for China's Patent Management: Based on Analysis of China's Current Patent Law

Qi Haiyan

School of Law, Sichuan Agricultural University, Ya'an, P.R.China, 625001

(E-mail: 1643076273@qq.com)

Abstract: This paper intends to adopt the methodologies of practical analysis and comparative analysis, draw lessons from the advanced patent management experiences in the United States, Japan and South Korea, which will then be combined with China's actual situation, and then put forward an innovative model for China's patent management based on the deficiencies of the current patent law in China. Meanwhile, this paper points out that China's patent management should be planned and improved from the main body, building a three-in-one patent management model from the government, enterprises, colleges and universities in three aspects, which can make up for the inadequacy of China's current law, fully arouse the enthusiasm of the principal subjects in various aspects to promote the research and development, protection and utilization of patented technology, and adapt to the trade competition in era of knowledge economy.

Key words: Patent law; Patent management model; Enterprise; Government; University

1 Introduction

Because of the arrival of the knowledge economy, every country attaches great importance to the protection and management of intellectual property. In the field of intellectual property, patents are the largest part of economic interests, so the states and enterprises have attached great importance to the patent strategy.

The United States which established early patent system has more advanced managerial experiences in the management of the Patent. The patent law in the United States is very comprehensive and detailed in the nation in terms of patent. In setting institution, it specifically set Patent and Trademark Office to be responsible for the registration and management of patents, which enumerated the duties of the Patent and Trademark Office officials in detail, and set up the completed power control mechanism. Compared the United States with the rest of the world, it has a mature model of university management patent that is used for reference. According to Academic Ranking of World Universities, ARWU 2007⁷ that was published by Shanghai Jiao Tong University Institute of Higher Education, there were 17 universities in the United States in the world's top 20 universities. The universities in USA attached great importance to encourage the motivation of the patent creation in the model of university management patent. The famous "Du Pont Act" in the United States provided for such a principle of "who invented, who owns patents", which took the intellectual property owners from funders into completers. This principle greatly stimulated the enthusiasm of universities for researching science and technology, and created a good atmosphere of scientific research.

Japan is also the intellectual property power, which obtains patents with attracting worldwide attention. After World War II, Japan established the perfect system of intellectual property rights for encouraging technological innovation and increasing R & D efforts and the patent application. Japanese enterprises grasped the historical opportunity. On the one hand, it actively introduced and absorbed the advanced western technology. On the other hand, it constructed a rigorous peripheral patent encirclement with bypassing the strong Western technology to out flank the strategic offensive and applying for the "peripheral patent", to gradually reduce the scope of patent protection in the West and Japan, so that others finally had to cross license.

South Korea's intellectual property developed relatively late, but it caught up from behind and had made remarkable achievements in the field of science and technology. South Korean government attached great importance to the development of science and technology, though increasing scientific research investment and actively encouraging technology innovation, finally had reached the world top level in terms of quantity, scientific research personnel of research investment and patent application rate of growth. In addition, South Korean Patent Office had also established free intellectual property retrieval system, that was convenient for accessing and exchanging patent information. With the positive actions from South Korean government in the patent knowledge management, South Korea's power of science and technology made a spurt of progress.

China's current "patent law" only sets regulation on the country's patent administrative department

as the authorized organization for patent management, its subject single, unclear functions, the administrative department for patent, countries simply passive registration and management, did not have the effect of promoting patent technology application. In China's patent law, the patent managements of enterprises, colleges and universities are not mentioned, so there are a lot of loopholes.

2 Overview of Patent Management Model

2.1 Concept of patent management model

Patent is proprietary rights that law gives inventors on the creation in certain period of space and time. Firstly, the patent is the main economic resource which modelrn countries have. Secondly, it is an important manifestation with the comprehensive national strength and international competitiveness. Thirdly, it is also the key for the modelrn enterprise to maintain the competitive advantage and sustainable development capacity.

Patent management model is a series of comprehensive utilization about the integration of resources and the control of management process through the establishment of a sound system of law and the patent, which is to achieve the maximum economic benefits and improve the international competitiveness. Meanwhile, patent management model also stresses the development of patent technology in addition to the full utilization of existing resources and protection.

2.2 Classification of patent management model

This paper classifies on patent management model according to the subject of patent management, and discusses all kinds of management model in detail. The most basic purpose of patent management is to encourage innovation and protection of intellectual property rights, so management should be overallly designed center on the acquisition and protection of patents and the value of patent utilization. Specifically, it is divided into the following three categories.

First, it is the national patent management model. This model is based on the country as the main body of the patent management, which manages patent through the establishment of patent policy and the patent system. The management model of the national patent, is to make full use of the advantage, to provide legal and institutional support for the development of patent technology, and to promote the patent to be used.

Second, it is enterprise patent management model. Enterprise patent management model is that the enterprise carries out activities about organization, integration and implementation of patent resource through the use of patent resources development and patent resources market, which refers to in order to give full play to the role of the patent system in the development of enterprises. Generally, enterprise patent management model includes the three factors of patent development, patent protection, patent operation.

Third, it is patent management model in colleges and universities. University patent management refers to the development of the school through the patent technology management, utilization and other forms, which promotes the development of patent technology and improves the research level and obtains patent income model. In addition, we should distinguish invention and non-service invention, funders and completed in the patent rights of attribution. The invention naturally belongs to colleges and universities, however patent rights is owned by completed, not sponsor. For a service invention-creation, to give the actual inventor appropriate the material and spiritual incentives, so as to fully guarantee the inventor of creative enthusiasm.

3 Insufficiency of Chinese Current Patent Management Model

Because the economic development started lately in China, the development level of local economy is different, and many systems are not perfect. Issued the first "patent law" since 1985, now less than 30 years. The patent system is mostly the experience of other countries for reference, not be nurtured from China's own actual conditions and legal traditions, a lot of problems will appear when some systems are actually used. Because influenced by the economic level and system, the patent consciousness of many enterprises and individual is not strong. They do not know the importance of patents, but also lack funds and technical ability for patent research. In addition, they also lack experience in patent management, patent utilization, patent protection, and so on, so they are in inferior position in international competition.

3.1 Lack of initiative in patent management of the government

According to the regulations of Chinese "patent law", the National Patent Office is responsible for the examination, registration and management of the national patent. That mainly includes the form of

review and substantive review about patent application from all over the world, and applications through substantive examination of patent are awarded the patent announcement, registering number and collecting the patent fee, providing the patent search service. Based on the above definition of patent management, the government not only provide the basic service for patent, but also emphasis on full protection and utilization of patent for promoting the development of patent technology. In China, the National Patent Office is engaged in some patent examination and registration services, but not in the patent policy and patent incentive mechanism for the establishment of the patent and the full utilization of resources. And the rules of "patent law" are relatively simple and the function of the government is not clear, besides it lacks the construction of incentive mechanism and patent resources utilization mechanism. Due to lack of the national initiative and imperfection of national system, which greatly hinder the development of China's patent technology, China is at a disadvantage in the international competition.

3.2 Lack of patent consciousness of enterprises

As the market economy started lately and the economic development is not mature, China is lack of competitive enterprises and there are big problems in patent management for Chinese enterprises. There are some common problems in Chinese enterprise patent management model.

Firstly, the majority of Chinese enterprises lack patent consciousness, and do not know the importance of patents. Because the patent investment cost is very large and difficult to bear fruit in the short term, a lot of enterprises are unwilling to give investment in the patent development, but in some lower technical threshold industry, or get patent through the transfer of the patent from abroad.

Secondly, intellectual property is a small proportion in the enterprise assets, most Chinese enterprises have not set up management department, which is responsible for the management of patent technology R & D and patent protection for preventing patent infringement. This leads to that research and development of patent technology is not enough, utilization of the patent technology is not sufficient. Thus the enterprise is difficult to respond promptly and effectively in the face of these problems.

Thirdly, the international patent consciousness of Chinese enterprises is not strong. Most companies are focusing on the immediate interests, not a long-term international vision, and no application for foreign patent protection. Now, some of the world's powerful enterprises have attached great importance to the international patent application, and patent protection is applied for nationality, where their own patent products may be used, so a international protection network of patent product will be formed, and greatly enhancing the enterprise's international competitiveness and influence.

3.3 Poorness of scientific research ability for university

College is the cultivation base of national talents, and teachers and students in colleges and universities are the main force of the national science and technology innovation, so that universities are the major national scientific research position. But Chinese did not give full play to their talents, and the contribution rate of science and technology is not high. For example, the overall number of inventions is not high. The important invention patents of technology are less valuable. The threshold of the utility model and design patents is low. Patent applications are more repeated and the utilization is not enough. Because of the examination-oriented education system, students lack the ability of creative thinking, and the university education is not to cultivate a positive attention on the students' innovative thinking and ability. With lack of understanding of the importance of the patent, college pay much emphasis on the employment rate, rather than scientific research ability, which leads to the shortage of patent technology, the insufficiency of patent protection and the imperfection of the patent incentive mechanism.

4 Improvement of the Patent Management Model of China

China's "patent law" simply provides some functions in the management of national patent, resulting in patent management model is single and backward, which greatly hinder to the development of patent technology and improvement of the international competitiveness of china. Based on analysis of the existing patent management problems of China, to survive in the tide of knowledge economy, we should perfect and innovate patent management model. This paper is divided from the main body, with changing the former single national patent management model, and establishes the coexistence of countries, enterprises, colleges and universities in three models, which respectively play a role in patent management model and promote the development of science and technology in China. There are the following three aspects.

4.1 Improvement of national patent management model

As it is self-evident importance in patent management, to promote the development of patent

technology, we should firstly perfect the management model of national patent. According to China's specific conditions, China can learn technology strategy from Japan to strengthen national initiative in patent management and improve the intellectual property strategy on national strategic height. The national patent development strategy must have a corresponding system to guarantee the goal realization, so the "patent law" should be modified and perfected, which have a clear national function in the patent management for establishing patent incentive mechanism, being awarded patent technology, cracking down on patent infringement of patent and the construction of patent protection mechanism. The government also adjust the industrial structure for encouraging the development of high-tech enterprises, and provide a relaxed policy environment for enterprises. In a word, the states must give full play to the advantages of national status in patent management and actively participate in the promotion of patent development to improve the technical strength in China.

4.2 Innovation of patent management model for enterprises

Enterprises are the most active subject in economic activities, and intellectual property is the important resource of enterprise. Most Chinese enterprises do not have the specialized intellectual property management departments. Aiming at these problems, enterprises should establish specialized intellectual property management departments through changing the blending model of management in the past and innovating enterprises patent management model, which is responsible for handling all matters related to intellectual property rights. To set up intellectual property department, Chinese enterprises can learn from the advanced experience of enterprise patent management in other countries, and combined with China's actual level of economic development.

I think that there are the following aspects. First, enterprises should strengthen the importance of intellectual property rights, increase research investment and restructure enterprises development strategy. Second, there is clear attribution of rights of patent. Belonging to the service invention patent should belong to the scope of the enterprises. Take the enterprises as the subject of patent technology to ensure recovery of patent investment, for making full use of the patented technology and maximizing the economic and social value. Third, to encourage R & D innovation patent technology through the establishment of patent incentive mechanism. Finally, talent is the fundamental force of the development of science and technology, enterprises should strengthen the introduction and cultivation of scientific talent. Meanwhile, enterprises have competitive patent technology to remain invincible in the competition in the world through the patent management model innovation of enterprises.

4.3 Establishment of patent management model for colleges and universities

To promote the development of Chinese patent technology, china must establish the university patent management model and perfect for making full use of the talent advantage and promoting the development of college patent technology. Firstly, colleges and universities should change educational idea and the previous way of examination-oriented education, increase training of academic ability and create an open academic atmosphere for encouraging teachers and students to carry out creative activities. Secondly, china should establish scientific incentive mechanism to increase scientific research investment and incentives. Thirdly, it also should improve the quality of college patent technology, and have development in high-tech fields. In a word, colleges should establish and perfect university patent management model to stimulate the enthusiasm of students and teachers, and give full play to the advantage of talents for making greater contributions to the development of national patent technology.

5 Conclusions

With the coming of knowledge economy, the market competition is becoming more and more fierce. In order to succeed in the world competition, China should fully recognize the importance of patent technology, and take various measures to promote the development of science and technology and enhancing the competitiveness of the country in the world. This paper analyzes the current situation of patent management mode, summarizes the existing problems of Chinese patent management model, draws lessons from the advanced experience in reference to the United States, Japan, South Korea in patent management, combined with the actual situation in China, puts forward to build Chinese patent management model from the government, enterprises, colleges and universities in three aspects. Specifically, China must firstly carry the innovation on patent management model, strengthening national initiative in patent management, and constitute strategic target of rejuvenating the country for improving the legal system and providing policy and the good system environment. Secondly, enterprises should establish specialized intellectual property management departments by innovating patent management model, and pay attention on the patent technology of the independent research and

development and transformation of the achievement for enhancing the strength of science and technology by the transformation from manufacturing industry to the new high-tech industry. Thirdly, colleges should also establish patent management model for universities, and give full play to the advantage of talents to improve quality of patent for providing everfount talent and technology support for national and social development of science and technology. All in all, the development of patent technology of China needs the mutual cooperation and support of government, enterprise and college, which play their respective advantages for promoting scientific and technological progress of China. In the future, China should pay attention to the specific system of each model based on Patent Law, and make Chinese patent management model more perfect and specific, practical and operable.

Puzzles and Solutions of China's Intellectual Property Culture Construction

Shu Yuan

School of Arts and Law, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: shuyuan1212@163.com)

Abstract: Intellectual property produced in the western industrial revolution and technological revolution, it far-reaching influence to western economic and social development. China's intellectual property is produced in the process of modern China's integration into the world. Today, intellectual property legal system construction in China has made great achievements, but also facing a lot of problems. The basic theory of intellectual property is very weak, blending and collision of traditional culture and the new trend of intellectual property rights, also some internal contradictions, surging Chinese intellectual property system process. The research about intellectual property culture is particularly weak, and can't adapt to research the legal system of intellectual property boom, many legal problems need to be solved. This article is from the legal perspective, by means of explaining concepts, comparative research, discusses the legal problems existing in Chinese intellectual property culture construction, to solve these puzzles. In order to put forward ideas and suggestions for Chinese intellectual property culture development.

Key words: Intellectual property; Intellectual property culture; Intellectual property strategy; The legal system; Comparative analysis

1 Introduction

A nation needs to maintain vitality of thought, and cultural traditions, to stand among the nations in the world. Intellectual property culture in China is pregnant with the intellectual property law system transplantation and introduced. The profound change and influence of this process cannot do without the international community. In June 5, 2008, China's State Council issued the "outline of national intellectual property strategy", the intellectual property culture as one of the key part of this strategy. Advocating for intellectual property culture "respecting knowledge, innovation, integrity of the law" in the whole society. Construction of intellectual property culture has become an important component of China's ideological and political education in new period. However, the construction of intellectual property culture in China there is a dilemma, not only the concepts of intellectual property rights has win support among the people, for the establishment of the intellectual property system is often ignored cultural field, only focus on the construction of legal system. What is causing these difficulties, how to overcome difficulties, China's construction of intellectual property culture road should decide on what path to follow.

2 Intellectual Property Culture Outline

2.1 Cultural and intellectual property culture

Culture such as water, nourishes everything. In a sense, culture is a kind of valuable self-conscious peculiar to human beings, it is to distinguish from the animal kingdom. The first point of education is to inspire awareness. Formally proposed the term intellectual property culture is the 2003 World Intellectual Property Organization (WIPO) will be the construction of intellectual property culture into one of the strategic goals of WIPO, put forward the "intellectual property rights to promote development and prosperity, the establishment of intellectual property culture" of creativity, hope all parties to build a suitable for their needs of intellectual property culture. What is the culture of intellectual property right, the academic community has for its definition unable to agree on which is right, many scholars believe that the parent system of intellectual property culture is the culture of law. But the author thinks, the legal culture from the perspective of jurisprudence, starting from the legal norms of legal theory, and mental habits are studied, and can not be completely open to various forms of intellectual property culture. In the current Chinese intellectual property development without sufficient to support the basic theory, the culture of intellectual property right in any one culture system, is not comprehensive, research on intellectual property culture in China, can not ignore its existence characteristic.

Intellectual property culture is a kind of advanced culture, in China is in the enlightenment and cultivation stage, this stage is very fragile and special, many phenomena perplexing. Therefore, the

general understanding of intellectual property culture is better than in a narrow sense, and also conducive to the development of intellectual property culture. So the author advocates, intellectual property culture refers to human generated in the creation, use, protection, management, and other intellectual property rights related activities, all the spiritual concept of the impact of the development of intellectual property rights, and the cultural connotation of the intellectual property system and the material achievement reflects the value. It contains three internal structure, namely the intellectual property culture ideology, including intellectual property rights, intellectual property rights consciousness and conception of academic thought and behavior; The culture of intellectual property right system configuration, including the concept of cultural value behind intellectual property policies and regulations and management; and intellectual property culture material forms, including entity forms of intellectual property intellectual achievements can reflect the specific cultural individuality and commonness of connotation, such as trademark, patent products, cultural works what can show the culture.

2.2 The culture of intellectual property right and legal system

In China, the culture of intellectual property right and the legal system of intellectual property rights is accompanying. Intellectual Property Law refers to collectively regulate social relations caused by intellectual creation activities. From a legal point of view, the force of law reflected in the regulation of force on people's behavior, the behavior caused, change and termination of legal relationship, behind the law reflects the legislators expect in the legal system and the ideal order, select the should be made to the public proper behavior.

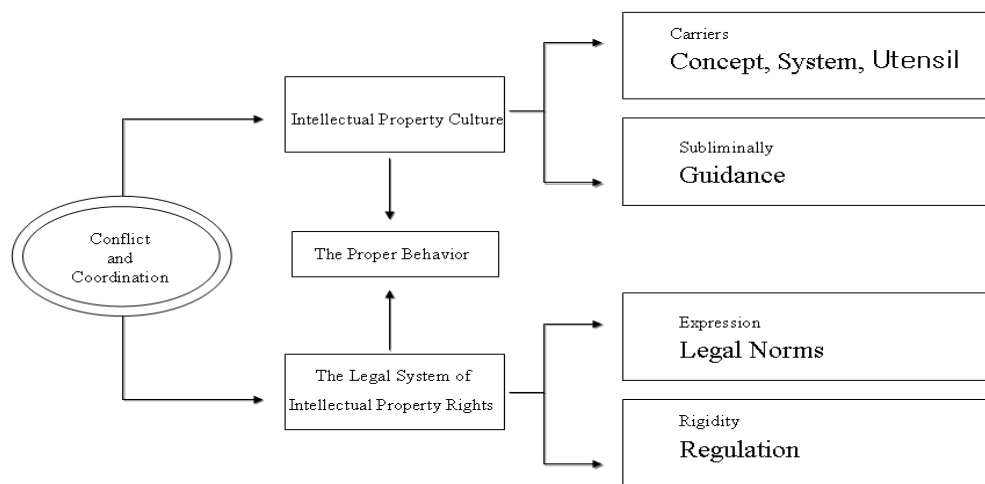

Figure 1 The Mechanism of Intellectual Property Culture and Intellectual Property Legal System

As the Figure 1 shows the different mechanisms about intellectual property culture and the intellectual property legal system. From a cultural point of view, consciousness is the core of the culture, it is influence character by environment leads and infiltration affect attitudes people's ways of thinking and behavior, and guide people's behavior habits and patterns, and accepted by the general public. That is to say, the influence of different mechanisms with rigid regulation is the culture of intellectual property right and the legal system of intellectual property rights have, they depend on each other, the legal system of intellectual property rights, the operation process and the degree of its validity, essentially depends on the current social culture is formed and adapt to the environment.

3 The Construction of Intellectual Property Culture Abroad

3.1 Development strategy of intellectual property rights in America and Europe

The United States is intellectual property power, also is one of the world's earliest establishment of the intellectual property system, intellectual property protection as a basic national policy to as early as the beginning of its foundation. The United States intellectual property system is built around the theme of the market economy, the combination of patent and trade is a prominent feature of the United States Patent policy.

In 2002 the United States Patent and Trademark Office issued a "twenty-first Century outline strategy", to develop a quality as the core, high working efficiency, sensitive to the market organization,

to support the market driven system of intellectual property rights. The main contents of American intellectual property strategy including law continuously revised and formulated, promote the transfer of technology, technology innovation, improve industrial competitiveness, strengthen the protection of intellectual property rights in international trade, the reform of the administrative institution of intellectual property rights, special emphasis on the research of patent strategy, and pay attention to strengthen intellectual property alliance with other powers.

With the basic completion process of intellectual property law in EC 1973 “integration”, as one of the intellectual property system and the modern legal important birthplace birthplaces of the European Union for the protection of intellectual property rights very seriously, in some ways even more strictly than the United States. Especially, the legal system of intellectual property rights is quite mature, supplemented by complementary measures. Notable is, there are some intellectual property divisions between the US and Europe, but not because of different views of the law, but in order to maintain their own competitive advantage and economic interests.

3.2 The development of intellectual property strategies in Japan and South Korea

Japan is the earliest implementation of patent system in Asia. In recent years, put forward “the information age of innovation, intellectual property country” policy, as well as the construction of “powerful Japanese” seven strategic. In 2002, Japan introduced include intellectual property right innovation strategy, the protection of intellectual property rights strategy, intellectual property strategy and intellectual property talent strategy four aspects of “intellectual property strategy outline”, and in the same year in November formulated the “intellectual property law”, then the security mechanism of the establishment of law and policy initiatives. These measures are largely targeted at china.

The industrial structure in South Korea began to change since late twentieth Century, the invention and utility model patent application volume growth success brings its per capita GDP growth, which rely on the rapid rise of intellectual property. According to researchers, South Korea in recent years in the research and application of life sciences and biotechnology has invested huge. South Korea also developed their own intellectual property strategy, it attaches great importance to IPR protection in foreign countries, according to statistics, South Korea not only pays attention to apply for a patent in China, the number of patent applications in the developed countries is far higher than china.

Table 1 Comparison of Intellectual Property in the Four Countries

Intellectual Property in the Major Countries	America (Since the founding of the American)	Europe (Began in England and France)	Japan (The earliest implementation of patent system in Asia)	South Korea (Relying on the intellectual property rights to drive GDP growth)
Intellectual Property Strategy	Aggressive and expansionary trends	Intellectual property law “integration” of the EC	Intellectual property protection, application, innovation and talent strategies	Pay attention to their own intellectual property protection in foreign countries
Key Areas and Characteristic	The combination of patent and trade	Legal system and matching system	Legislative and administrative support	Research and application of the life science and biotechnology

3.3 Enlightenment and reference

The development of intellectual property rights, many economic powers ahead of China is not only the legal system of intellectual property rights, and intellectual property research and construction. These measures with the background of national intellectual property strategy, the cultural connotation is more recessive. In the case of the United States of the world powers have gradually began to replace the traditional industrial economy to knowledge economy, the knowledge economy has come of age in the world. China must be sensitive to seize the new mode of human society transition period of economic development, respect for knowledge and talent, pay attention to intangible assets, especially economic patent accumulation. Secondly, the need to pay attention to supporting the establishment of the protection system of intellectual property rights, reducing the judicial cost, improve administrative efficiency, save the limited resources, better protection of intellectual property rights, and create a good environment for integrity of the law in the society. Once again, China in compliance with the rules of the world trade organization, to perform at the same time the international protection of intellectual property rights obligations, should also increase the intensity of innovation and basic research, explore the

intellectual property resources potential, create advantage areas, safeguard national interests, to make intellectual property culture and system construction of parallel and promote deepening.

4 The Plight of China's Intellectual Property Culture Construction

4.1 Chinese intellectual property culture and citizens

In recent years, along with the process of Chinese reform and opening-up, intellectual property has exerted great influence in the government, enterprises, universities and the theory, but from the ordinary citizen is the distance. On the one hand, excessive pricing knowledge product neglects the present Chinese consumer affordability and reasonable interests, misunderstanding and resentment for intellectual property. On the other hand, publicity and education of intellectual property rights under realistic conditions, in the economically developed city and area, people have a certain degree of understanding of intellectual property rights of Chinese citizens. But most of the people, the illegality of infringement of intellectual property rights do not have enough knowledge, even as the people have the right to intellectual property awareness of self-protection is quite indifferent, not good at through legal means to advocate and safeguard their legitimate rights and interests.

4.2 Chinese intellectual property culture and enterprise, society and the state

Intellectual property rights as an important lifeline of China's current development, the system construction and cultural construction need parallel. China whether can get rid of in a passive position on the issue of intellectual property rights, to build an innovative country, whether the protection and use of intellectual property effectively, slowly find advantages in the new round of International competition, hang upon this single action. The development of intellectual property culture is also a positive response to the party construction culture "big development, great prosperity", since 2008 the "outline of national intellectual property strategy" promulgated, China intellectual property culture rule set has been basically completed, but the consciousness of intellectual property rights has not yet win support among the people, there are many vacuum and confusion in the research field. Since a paragraph of period, China's intellectual property pays much attention to the legal construction, ignored legal spirit and value idea behind cover, the construction of intellectual property and cultural alienation, difficult to grasp.

At present, more and more Chinese entrepreneurs realize that intellectual property rights of the "soft power" have great significance for the enterprise competition ability and development strategy. However, there is a considerable number of enterprises weak awareness of intellectual property rights, infringement phenomena have occurred. The ability to use intellectual property to improve the competitive advantage of enterprises is very poor. The development of intellectual property in China is facing many inherent theoretical emptiness and external competition pressure, there is confusion and contradiction. In the construction of the legal system of intellectual property rights to achieve leap-forward development, research and development of intellectual property culture is extremely unbalanced.

5 The Causes of China Intellectual Property Culture Construction Difficulties

5.1 The influence of Chinese traditional culture

Respect knowledge is the basic value idea of intellectual property right culture, its performance for the whole of society widely advocated respect for talent, respect for creation, respect for rights idea; innovation is the culture of intellectual property right is the basic quality of spirit, its performance is to carry forward the innovation, the courage to compete, the spirit of tolerance of failure; integrity of the law is the ideological foundation of intellectual property culture benign orderly inheritance, its performance for the widespread practice of honesty and credit, law-abiding, comply with the public interest, the harmonious development of the fashion. But China lacks rooted soil for intellectual property culture to development. Some Chinese traditional culture and intellectual property culture does not adapt.

In the feudal society of China, the Confucian absolute legitimacy and political centralization, limiting the ability of expression and innovation thinking in a long time. On one hand, the invention and creation skills as "diabolic tricks and wicked craft", heresy, depend on the industry used to constraint, the rejection as the standard, technical personnel not only to reuse, and even attracted the fatal disaster. On the other hand, Chinese traditional society with particular emphasis on sharing collectivism culture, from knowledge possession, private domain and the public domain boundaries are fuzzy, "free", "sharing", "seeking" is considered to be one of self-cultivation and virtue, do not pay attention to the protection of private rights, nor pay attention to knowledge creation whether can bring tangible benefits. Therefore, it is easy to do not understand or blame for the intellectual achievements of use restrictions.

In addition, Chinese traditional culture has on the "past" very strong dependence, lack of

philosophical dialectic, are often loosely followed over all, gross consciousness persistence in society, especially in some economically underdeveloped areas, seriously hindered the spread and development of innovative fashion.

5.2 The internal conflict of intellectual property rights

The internal contradictions of intellectual property in the form of system of the intellectual property right in the field of culture, more requirements to increase research on basic theory of intellectual property rights. Some scholars conclude, the contradiction between mainly includes the knowledge product non-excludability and intellectual property monopoly exclusive, Scholars conclude, the contradiction between mainly includes the knowledge product non-excludability and intellectual property monopoly exclusive, conflicts between intellectual property rights and public interests. And the conflicts in these aspects such as intellectual property rights of knowledge of both excitation and inhibition, intellectual property rights and justice, freedom, regional and global, national and international.^[1]

In a word, study of intellectual property rights often pay attention to the practical benefit of knowledge economy can bring, and legal system building, policy strategy, while neglecting to explore its cultural connotation. Vision research is far from enough, many problems have not been solved, which intensified the internal contradictions of intellectual property rights.

6 The Way of Chinese Intellectual Property Culture Construction

6.1 Critically inheriting Chinese traditional culture

Material civilization and spiritual civilization are related to each other, any kind of cultural development, can not be completely out of the existence of the original environment and social foundation. For Chinese construction of intellectual property culture, first of all need to from the thought “liberation”, dialectical thinking about the essence of traditional culture, absorb and carry forward, to create a good social atmosphere of intellectual property culture. For example, in the traditional Chinese society and culture, the importance of education, attention to the inherent quality and moral spirit, suit one's measures to local conditions, ideas and intellectual property culture have in common. Should be absorbed on this cultural essence, making them more adapted to the spirit of the times of intellectual property culture.

6.2 Strengthening the research theory of intellectual property rights foundation

Cultural roots and development can not leap forward, it has followed step by step in the evolution of human society, the culture of intellectual property right is no exception. Therefore, the construction of intellectual property culture itself is a long-term, arduous and complicated engineering. The construction of intellectual property in China generally focus on the legal system of intellectual property and intellectual property strategy, and ignore the cultivation of the good social intellectual property culture, although this behind the time pressure, but need to be vigilant, not indulging in intellectual property construction like rootless duckweed. Practice the correct guidance of scientific theory, it is necessary in the University, enterprise and society to explore a set of intellectual property to basic theory research association cooperation, increase research efforts. The legal system of intellectual property rights to intellectual property and cultural support, and the practice of intellectual property law system have great influences on the evolution of intellectual property culture. That is to say, the construction of intellectual property culture in China needs the combination of China's current legal system of intellectual property rights in the reality, and on this basis to play the leading role of theory.

For example, some researchers and business managers are beginning to realize that, the urgency of cultivating enterprise culture of intellectual property, intellectual property culture enterprise positioning as “an innovative enterprise culture”, it will be incorporated into the system of enterprise culture. However, the enterprise culture is generally acceptable in today's world and look at perspective comes from the management, strategy and system level, the formation of enterprise intellectual property culture is the comprehensive effect of the coordination about all aspects such as environment, history, industry, human performance, etc.^[2] So the author think, if starting from the enterprise culture of enterprise intellectual property culture, it is not to be abandoned cultural education and cultivation. In the research of intellectual property culture should pay attention to from more aspects of the study field, to avoid biased.

6.3 Development path with Chinese characteristics of the intellectual property cultural

The development process of China's intellectual property rights has its own characteristics, so the Chinese cultural construction of intellectual property rights must be based on China's national conditions, exposure to the Chinese intellectual property strategy background, explore the development path of

development suited to their own, with its own characteristics in all aspects.

First of all, in the construction of intellectual property culture ideology should pay special attention to fusion of all kinds of useful theories, ideas, respect knowledge, education, cultivating citizen awareness of intellectual property; In the construction of intellectual property culture system form, should focus on technology innovation, cultivating innovative talents, such as the embodiment of the spirit of innovation and product innovation, advocating justice incentive mechanism, form a good creation, management, use and protection of intellectual property rights and social culture atmosphere; In the construction of intellectual property culture material form, should pay special attention to the integrity of the law, social law, such as trademark logo vector rational treatment, packaging, patent products contain culture, respect for cultural heritage, and fully demonstrated the unique value and charm of its connotation.

Then, to explore the establishment of safeguard measures a set of intellectual property culture, can introduce from abroad, but also can find inspiration from the existing mechanism in the system, the key is on practice. Support from the thought, strengthen innovation talents with professional knowledge and ability training. Support from the organization, increase the public intellectual property legal system publicity, and management mechanism construction. Protection from the conditions, the construction of all kinds of domestic and international intellectual property rights exchange platform, academic discussion and learning meaningful activities, increase the input of funds, improve the convenience of patent, trademark and other intellectual property retrieval system access, so people can quickly obtain information related to intellectual property rights. Support from the policy and system, reasonable pricing of enterprise knowledge product to safeguard the interests of enterprises and social public interest balance, improve the relevant legal system of intellectual property rights, promote in the process of reform and opening up and the socialist market economy environment, the rule of law and intellectual property culture, towards a more autonomous, science on the road ahead.

7 Conclusions

Culture is not only an important force in promoting social progress, but also a strong support to promote national prosperity. At present, research on the basic theory of intellectual property in China is very insufficient, often concern are hardly lasting in-depth, especially for the study of intellectual property culture has obvious shortcoming. Most of the people in China for intellectual property of universal awareness and consciousness is not enough, violations have occurred, no formation mechanism and environment to protect the knowledge property use, and lack of cultural sedimentation. Especially in Chinese enterprises, with independent intellectual property rights of quality rarely, practical foundation and capability of intellectual property is serious insufficient, which has affected the core competitiveness of enterprises, the more influence to academia to mature for the interpretation and research of intellectual property culture. All these make China among the pressure facing the world economic power, very easy to produce uncomfortable.

The author thinks, the cultural cultivation and construction of intellectual property in China, not to seek a similar concept is simple and applied in the past to explain inherent theory, research results can not passively waiting for foreign, blindly with international standards for transplantation. Attention should be paid to critically inherit traditional Chinese culture, a deep understanding of intellectual property culture concept, intensify IPR basic theory research efforts, taking a development path with Chinese characteristics of the intellectual property cultural.

Abstract: This paper uses case analysis, literature search, and normative analysis to conduct the research. The paper firstly analyzed case of Bayer Aspirin, Based on this case analyze, And put forward first mover advantage is the important factor for development of different innovational brand equity. On this basis, It is considered that consumer switching cost, preemptive market entry and preemptive patenting are key factors to build innovation brand equity, and the preemptive market entry and preemptive patenting are key factors to first mover advantage of innovational brand equity. Then the paper thoroughly and systematically research the mechanism of each key influencing factors on first mover advantage of innovational brand equity. At last, This paper draw a conclusion that the innovation brand should make use of advantage of technology and consumers are in general risk averse psychology, adopt preemptive market entry, thus the innovational brand equity can be established easily, it also can make innovational corporation obtain competition advantage in the market.

Key words: Innovational Brand Equity; First Mover Advantage; Preemptive Market Entry; Preemptive Patenting

1 Introduction

As pointed out in some management literatures, the innovating brand equity represents a competitive advantage that is protected by high imitation barriers due to the combination of high ambiguity and legal property rights. However, as Porter has pointed out, a competitive advantage building on innovative brand equity is not a cause but rather an outcome.^[1] Moreover, marketing expenditures also often quoted as investments in brand equity, they are insufficient in building a strategic advantage since such marketing expenditures are easily imitated. Nevertheless, companies can differentiate their products and service from the offerings of competing companies through marketing activities by building subjective attributes. However, if the product or service does not hold its promises, the advantage generated through marketing expenditures will be very short lived.

The starting point of any positive reputation or image associated with a certain trademark or brand name is the underlying superior product and service offering. Thus, the starting point of any superior brand recognition is a technological advantage the company holds in relation to competitors. This advantage generates by offering customers an objectively superior product and service a positive image on the market. Firms own such a technological lead, and they are able to enter a market ahead of competitors with a new or improved product or service, so they are called first mover firms. Such a first mover position is either gained through good luck or through the systematic generation of new immaterial technological assets. As Schmalensee has pointed out, These original innovators have three significant advantages besides the possibility to appropriate the returns of investments in research and development due to their temporary monopoly position. These three advantages that emerge from technological innovation, are the possibility: (1) to move down the experience curve ahead of competitors, (2) to acquire scarce complementary resources and thus preempt competitors, (3) to lock in customers through high switching costs.^[2] As will be presented, all three first mover advantages can be used by the original innovator to efficiently establish innovational brand equity which in turn represents a considerable and extremely long lasting market entry barrier for companies envisaging to subsequently enter the market.

2 An Example

The technical advantage and brand equity is a support helping enterprises gain sustaining competitive advantages. For example, Bayer has succeeded due to its strong global brand equity Aspirin to dominate the ASA (Acetyl Salicylic Acid) market over a period of more than 100 years, Because it had obtained widespread patent protection and preemptive market entry for its innovation. Bayer AG which had been one of the early companies developing new drugs entirely within the company through organized R&D(Research and Development) activities, it is still one of the leading European companies

with respect to R&D expenditures in the pharmaceutical field. In fiscal year 2009, Bayer had invested some US \$ 2.18 billion in R&D activities in the field of Pharmaceuticals. Moreover, with respect to ASA Bayer AG even represents the only company devoting significant financial resources to research and development. Thus, Bayer AG has occupied since the early 20th century a technologically leading position in the field of ASA and has defended its position throughout the century by significantly investing in R&D.(see, table 1). On the other hand, ASA is no longer the drug of first choice in all countries, nor is Bayer Aspirin the undisputed leading brand in the analgesics market. Nevertheless, the brand equity is still the second most important international analgesics brand in the world after Tylenol and represents one of Bayer's most important pharmaceuticals. In fiscal year 2009, for example, Bayer Aspirin was the company's 3rd most important pharmaceutical in terms of sales with an annual turnover of some US\$ 980 million(see, table 2).^[3]

Table 1 Most Important Brands of Bayer AG in the Field of ASA

Year	Innovation	Advantage	Brand
1899	Acetyl salicylic acid	Effectiveness, Low side effects	Aspirin®
1900	ASA Tablet	Ease of dosage, Reduction of consumer	Aspirin®
1904	Soluble ASA Tablet	Ease of utilization	Aspirin®
1971	ASA + Vitamin C effervescent tablet	Reduction of side effects, vitamin C	Bayer Aspirin+C®
1992	Chewable ASA tablet	Ease of utilization	Bayer Aspirin direkt Kau-tablet®
1993	Enteric coated ASA tablets for the long-term treatment & heart attack prophylaxis	Effectiveness in the treatment of heart attacks, improved gastric tolerability	Bayer Aspirin Protect®
2000	ASA Tablets for treatment of migraine	Effectiveness in the treatment of strong pain	Bayer Aspirin Migraine®

3 Methodology and Analyze

The above presented case studies Bayer Aspirin have the aim to further specify research focus, point out the relationship between technological advantage and preemptive market entry based innovational brand equity, In this respect it has to be stressed that Bayer Aspirin had built and fostered its market based and technology based competencies in close interrelation. Whereas in both cases the starting point presents a technological innovation, the long-run success of the Bayer Aspirin relies on the mutual influence of technological expertise and brand equity. Thus, the brand equity was built and maintained by the companies' specific technological expertise, on the other hand, the companies were able to defend their technologically leading position because of the established brand equity. The following research investigates in particular how established innovational brand equity influences the switching cost of customers, as well as which enable innovational companies to most efficiently build innovational brand equity.

3.1 Innovational Brand and Consumer Switching Cost

The customers can often not evaluate the objective quality of a certain offering ex ante consumption^[4]. By assuming that consumers are in general risk averse, they stick to the brand on which they possess the most information about its quality even if the established brand is more expensive than unknown 'me too' brands. One famous management scholar Schmalensee has cited the example of prescription drugs, where following companies cannot overcome the disadvantage vis a vis pioneering brands by merely offering the same pharmaceutical at a lower price, but they have to offer distinct

therapeutic benefits. Thus, consumers can be expected to face considerable switching costs if they have to change to a brand whose quality they do not know in advance. This phenomenon is particularly pronounced in industries that are featured by high cost of acquiring information, a low frequency of purchase, and relatively stable technology and consumer requirements. On the other hand, also an information overflow can be assumed to increase consumers brand awareness because of the extremely high costs of information processing.

But why do first mover have an advantage in building innovational brand equity? Psychological literature argues that customers pay disproportionate attention to innovations. Consequently, pioneering brands will occupy a relatively large mind share. Moreover, a first mover firm occupies a temporary monopoly so that customers do not have the choice between several different product offerings sold under different brands and consequently customers acquire significant information about the pioneering brand, in addition, the initial innovator is able to define the product or service attributes which customers will subsequently consider as important within a particular product or service category.^[5] Thus, successive entrants have to invest considerable amounts in advertising, offer their products and services at considerably lower prices, and have a significantly superior offering in order to attract customer attention and create purchasing incentives.

Thus, established innovational brand equity can be assumed to be an important market entry barrier for late movers that cannot be overcome by offering the same product and simply charging a lower price than the established firm. It follows that established innovational brand equity presents an important strategic advantage which puts in particular 'me too' brands at a disadvantage and thus effectively deters potential market entry. However, how can firms possessing a certain invention establish most effectively brand equity that builds a significant market entry barrier for subsequent entrants in the market?

3.2 Innovational brand equity and First Mover Advantages

As pointed out in the preceding discussion, companies that are first on the market with a certain innovation which creates a perceivable consumer benefit, it have advantages in building innovational brand equity vis-a-vis late movers. Moreover, such established innovational brand equity which combines legal and reputational aspects, represents an important strategic resource due to asymmetric information prevailing on most markets about the objective quality and characteristics of the various offerings and the risk aversion of customers. Thus, established innovational brand equity increases customers' switching costs and in turn augments customer loyalty. However, which factors do lead to such first mover advantages that result in a persisting strategic advantage? The following sections analyses in particular the two factors of preemptive market entry and patenting which are crucial in the establishment of innovational brand equity.

3.2.1 Preemptive Market Entry

Innovational firms are, by definition, the first to offer a certain product or service on a specific product, service, and national market. Advantages of preemptive market entry that result in a innovational brand equity position emanate from four main effects: (1) Fast establishment of loyal customer base, (2) Opportunity to gain broad distribution,, (3) Benefit of learning curve and economy of scale effects, (4) Standard building prospect.^[6] As already discussed above, customers pay more attention to innovations as to subsequent 'me too' products and gain information about the quality of the innovational brand since they cannot choose between different comparable offers. Thus, first mover firms can benefit from a rapid formation of their customer base which will show a high brand loyalty. This is due to the temporary monopoly position of the innovator and the customers' accumulated information about the quality of the products and services sold under the specific brand. Moreover, innovators can by simply being a pioneer, profit from a advantaged product image. Hence, pioneering firms have to spend less on marketing and promotion activities to inform customers about their offerings and simultaneously profit from a positive image of being the 'innovator.' Another point in advantage of being first is that innovators can in general more easily establish a broad distribution and obtain advantageous shelf or store space locations.^[7] This represents a significant advantage since customers' contact with the brand is improved so that brand awareness will be increased. Moreover, in industries where retailers have a decisive influence on customer purchasing behaviour and represent an important source of information about the product quality (so called 'shopping good') a broad distribution can lead to advantaged sales figures. However, in industries where retailers can reliably evaluate product quality and endanger their reputation in the case of inaccuracy of the evaluation, the positive effect of a broad distribution gained by the innovator may be relatively unimportant and short lived.

In industries where learning curve and economy of scale effects prevail, first-mover firms can build rapid brand recognition which in turn increases the quantity sold and thus drives again economy of scale

and learning curve effects. Consequently, the innovational firm will by following a target costing strategy, efficiently deter imitation and market entry in the long-run due to the impossibility of subsequent market entrants to eliminate the innovator's cost advantages. As can be seen in figure 1, the demand curve D1 shifts out to D2 due to the increased appeal of the good through the innovation. By lowering the prices from P1 to P2 the innovator increases the quantity sold from Q1 to Q2. Consequently, the innovational firm benefits from a reduction in the long-run average cost (shift from LAC1 to LAC2) because of EOS (Economies of scale) and learning curve effects due to the increase in quantity sold.^[8] Thus, late-mover firms which are expected to sell lower quantities because of the lack of established brand equity, will be effectively deterred from entering the market by the innovator's predatory pricing strategy.

Figure 1 Market Dynamics of Innovation

Another advantage of innovational companies is their ability to establish a product or even technology standard. Once consumers are used to the qualities of the leading brand subsequent entrants have to carry out the same qualities and they have to invest in informing the customers about the specific qualities of their offering. Although, late-movers may be able to offer the same product or service with some new features and at a lower price, customers may stick to the established innovational brand because of the acquired information about its quality and the risk-aversion of customers. Moreover, if a brand that customers rather perceive as a late-mover offering comparable products at a lower price, and tries to sell a high priced innovative product, customers may just get confused since the product may not fit the brand's image or reputation. Consequently, the company has to invest in intense customer information and still faces an extremely high risk that the market launch of the innovation may result in a complete failure.

3.2.2 Preemptive Patenting

Another advantage of first-mover firms and in particular firms that generate patentable inventions that they can deter immediate imitation of its invention by legal prosecution of patent infringers. However, as broadly discussed, the patents do not bestow its holder with perfect protection, thus appropriation of the returns of the innovation. In most industries patents are invented around within a few years, they are obviated on another legally feasible way years before the actual patent right officially expires.^[9] Although, the temporary monopoly position delivered by the patent right may be too short to appropriate an adequate part of the returns of the innovation, it may be sufficiently long to establish market based brand equity. Moreover, as a patent attorney pointed out, patents do represent an important 'image object' since the company can efficiently communicate competitors, the potential cooperation partners as well as customers its inventive capacity and the leading technological position of its products and services by filing patents. Thus, we can argue that companies can by filing for patent protection on their technological innovations, it benefited from a temporary monopoly not only to appropriate a sufficient part of the returns of the innovation to justify the investments in their generation, but also to establish market based assets such as strong brand equity. Thus, the innovative companies bestowed

with patent protection of their invention may be able to benefit of a longer duration of its monopoly position and thus to more effectively establish considerable brand equity vis-a-vis innovators not owning patent right protection and hence a legal monopoly over their technological invention.

The innovational brand equity in contrast to patent rights and technology in general extremely long-lasting and hard or even impossible to obviate by competitors. Once the innovational company has successfully established a advantaged brand equity position with regard to later entrants by means of its temporary monopoly position established by patent right protection, the company benefits of the advantages of a company that followed a preemptive market entry strategy. These market based advantages will persist even if competing companies succeed in inventing around the subject matter of the patent or if the patent right expires. Thus, patent protection bestows the innovational company with a legal monopoly that subsequently enables it to effectively build complementary brand equity. The established innovational brand equity will then substitute for the loss of patent protection once the patent has expired or competitors have successfully invented around the subject matter of a valid patent right. Accordingly, Schmalensee has stressed: "By granting pioneering brands exclusive use of their trademarks forever, society grants something like a patent with infinite life."^[10] Consequently, the innovational brand equity can be classified as an important strategic resource that may enable an inventing company to efficiently uphold market entry deterrence or at least bestows the innovator with a long lasting advantage which enables him to appropriate a significant part of the revenues generated by his innovation. A prominent example of a company that successfully used its monopoly position due to patent right protection to establish innovational brand equity represents the case of the innovator of NutraSweet.

4 Results

Consequently, first-mover firms benefit from lasting advantages vis-a-vis later entrants. This is in particular true in industries characterized by durable, irreversible, market specific assets, such as innovational brand equity, and that are not subject to frequent changes in the underlying technology. Moreover, established market-specific assets are of particular strategic importance in markets where information about product quality is difficult or even impossible to obtain ex-ante purchase (e.g., in the case of experience and credence goods), or if the perceived risk of the purchaser is relatively high. This is in particular the case if the product or service is infrequently purchased and thus private information are incomplete, if the unit price is high, and if the consequences of a bad choice are significant. These factors create a high importance of innovational brand equity in conveying information about a product's quality and create a high awareness of the consumer about the pioneering brand. In addition, first movers benefit from the consumers' information advantage in relation to subsequent 'me too' brands due to previously accumulated experiences. These accumulated information create a significant customer lock in due to apparent brand switching costs. In these circumstances pioneers have an advantage in developing brand equity with regard to later entrants.^[11] The established innovational brand equity, in turn, represents an important sustainable strategic advantage which may enable the innovator to effectively deter market entry.

5 Conclusion

Nevertheless, one has to keep in mind that technological innovation and preemptive market entry does not unreservedly entail success. Various scholars have stressed the immanent disadvantages of being first since fast followers may be able to enter a market more efficiently due to the opportunity to learn from the original innovator's experience.^[12] This is in particular the case in industries that are confronted with frequent changes in the underlying technology or where no dominant design has been established yet. Moreover, in markets where no uncertainty and thus no risk for the purchaser exists, the brand equity does not have a significant economic value. In such circumstances pioneering firms cannot rely on establish brand equity as a sustainable strategic advantage and consequently followers may be able to leapfrog market leaders. Thus, the innovation brand should make use of advantage of technology and consumers are in general risk averse psychology, adopt preemptive market entry, so the innovational brand equity can be established easily, it also can make innovational corporation obtain competition advantage in the market.

Abstract: The level of scientific and technological resource allocation is directly related to the momentum and direction of regional science and technology and economic development. Optimizing the allocation of scientific and technological resource is a core issue enhancing the regional independent innovation capability and national competitiveness. This paper starts from the main body of regional science and technology resource allocation, introduces the cooperative game theory, researches and analyses on the path of optimal allocation of regional science and technology resources.

Key words: Region; Scientific and technological resource; Optimal allocation; Cooperative game; Path choice.

1 Introduction

Technology innovation refers to the sum of all kinds of resources which the main body of science and technology innovation is used for achieving economic and social benefits in technological innovation activities. Science and technology resources allocation is according to the needs direction, various scientific and technological resources' allocation usage in different subject areas, process, space and time. The key of optimal allocation of regional science and technology resources is to handle the relationship and responsibilities between the configuration principal parts in the region correctly. The core issue is to maximize the efficiency of the regional resources allocation to make it more adapted to the needs of the development of regional technology and economy. Currently, there forms a view in domestic academic circles about regional resources allocation's research, dominated by market allocation and supplemented with government allocation. About how to define the concept of scientific and technological resources and expand the scope of the resources allocation, there are also some studies in the academic circle. However, there are few system studies about the relationship and responsibilities between the configuration principal parts of the optimal allocation of regional science and technology resources. Therefore, this paper tries to take governments, companies, universities, research institutions and other regional science and technology source distributions as the object of the research, uses cooperative game theory to analyze the main characteristics of the configuration, and form a good pattern of having an accurate position, creating synergy innovation, optimizing the regional configuration in regional innovation system.

2 The Optimal Allocation of Regional Science and Technology Resources Based on Cooperative Game Theory

In order to achieve goals, regional science and technology resource distributions will maximize the use of community resources and improve the input-output ratio according to their affordability in a certain region. In reality, a subject of science and technology resource allocation will become the dominant integrated and consolidated with other subjects of science and technology resource allocations in the hands of technology resources. It will become the subject of science and technology resource allocation temporarily, i.e., to become the main user of scientific and technological resource allocation and other subjects of science and technology resource allocation will become a provider of scientific and technological resources. In a certain region and different kinds of events, each subject of science and technology resource allocation configuration will become either the provider or the main user of the science and technology resource allocation. Under different conditions, the main user of the subject and the resource provider can be transformed into each other and occur linkage of changes. All aspects have mutual contacts and effects. Any problem existing will affect the overall effect of technology resource allocation.

The main user of the subject of science and technology resource allocation will always consider the bearing capacity and satisfaction degree of the provider of science and technology resource allocation to

decide the use of specific configuration measures. And a rational resources provider will forwardly consider the interests and requirements of the main user when they are deciding on which actions to take. If the main user and the resource provider can take a cooperative attitude and reach some kind of agreement to which they can both obey, then a cooperation game relationship will be formed in the optimal allocation of regional science and technology resources.

The cooperative game which includes more than 2 players is called multiplayer cooperative game. Assuming the player number is 3, it is possible to form a situation which includes all 3 people participating or 2 of 3 people in the collaborative. To the union which is formed by 2 people, two people can make their maximum benefit and the possible distribution of benefits may dominate the formation of alliances. Set the main user as M_A , and the technology resources he owns as $R = (x_1^k, x_2^k, \dots, x_r^k)$, r . And R is the number of types of resources. According to various main users of scientific and technological resources, we form n sets of strategies. Based on how much their vote in person, we can desire m sets of configurations, then $\sigma_{Ai}^k = \{f_{ij}^k(x_1^k, x_2^k, \dots, x_r^k), (j=1, 2, \dots, m)\} (i=1, 2, \dots, n)$. Set the number of resource provider ($z=1, 2, \dots, z$) is Z and the main user's science and technology resources allocation strategies $\sigma_{zj}^k = (u_{zj}^k / d_{zi}^k) \times 100\%, (i=1, 2, \dots, n)$ are NO. Z resource provider's satisfaction to optimal allocation policy $f_{ij}^k(x_1^k, x_2^k, \dots, x_r^k)$.

Regional science and technology resource optimal allocation of cooperative game really needs to go through two levels of the game process to determine the cooperation game solution. The first level of the game is resource provider Z 's game process and it corresponds to one of the main user's strategies. It assumes that there is a collection of all non-optimal allocation schemes. (Central Core) (In cooperative game theory, non-optimal describes the concept of allocation scheme n is not only to meet the satisfaction individual rationality $x_i \geq U_i$ and to meet the rationality of "small collective". Otherwise it is impossible to achieve the large group N 's allocation scheme as well as the alliances. Core (Core) represents the collection of all non-optimal allocation schemes.) When selecting an allocation scheme in the core issue, the person will no longer be able to reject the proposal. Under this kind of allocation scheme, it is possible to achieve maximizing the collective interests of the main user. Set B as the collection of the resource provider, corresponds to the main user of the No. I strategy. The resource provider selects the most optimal allocation scheme σ_{Bip}^k (A allocation scheme in the core issue.) from M sets of strategies.

The second level of the game is the game process between the collection of Z resource provider and the main user is the Z -game consisting of a collective resource provider B and the main use M_A , corresponds to n sets of strategies $\sigma_{Ai}^k = \{f_{ij}^k(x_1^k, x_2^k, \dots, x_r^k), (j=1, 2, \dots, m)\} (i=1, 2, \dots, n)$ of the main user M_A . The collection of resource provider B selects n optimal strategies $\sigma_{Bip(i)}^k (i=1, 2, \dots, n)$ from m strategies. Then the main user M_A and the resource provider B select the best cooperative game solution through consultation from n sets of strategies $(\sigma_{Aip(i)}^k, \sigma_{Bip(i)}^k)$. It is to say, the main user M_A and the resource provider form a big alliance N to achieve the maximum benefit $V(N)$. And through selecting a best allocation scheme from n sets of strategies, they give the maximum benefits to the people in the game. People get benefits from distribution in more than (or not less than) the benefits they get from doing it themselves or forming small groups.

Set $u_{A(ij)}^k = e_{Aij}(x_1^k, x_2^k, \dots, x_r^k) - c_{Aij}(x_1^k, x_2^k, \dots, x_r^k)$ as the actual profit the main user can get from the strategy $f_{ij}^k(x_1^k, x_2^k, \dots, x_r^k)$ after putting technology resource $(x_1^k, x_2^k, \dots, x_r^k)$, $e_{Aij}(x_1^k, x_2^k, \dots, x_r^k)$ is the benefit and $c_{Aij}(x_1^k, x_2^k, \dots, x_r^k)$ is input costs.

Set $u_{B(ij)}^k = e_B(f_{ij}^k(x_1^k, x_2^k, \dots, x_r^k), \sigma_{Bj}^k) = \sum_{z=1}^Z u_{z(ij)}^k (f_{ij}^k(x_1^k, x_2^k, \dots, x_r^k), \sigma_{zj}^k)$ as the total benefits that the collection of resource providers B can get after the main user's technology resource allocation scheme $f_{ij}^k(x_1^k, x_2^k, \dots, x_r^k)$. Then the game matrix of the collection B of Z resource providers and the main user can be expressed as table 1.

Table 1 Regional Science and Technology Resource Allocation Game Matrix

	σ_{A1}^k	σ_{A2}^k	...	σ_{An}^k
σ_{B1}^k	$(u_{A(1,1)}^k, u_{B(1,1)}^k)$	$(u_{A(2,1)}^k, u_{B(2,1)}^k)$...	$(u_{A(n,1)}^k, u_{B(n,1)}^k)$
σ_{B2}^k	$(u_{A(1,2)}^k, u_{B(1,2)}^k)$	$(u_{A(2,2)}^k, u_{B(2,2)}^k)$...	$(u_{A(n,2)}^k, u_{B(n,2)}^k)$
	\vdots	\vdots	\vdots	\vdots
σ_{Bm}^k	$(u_{A(1,m)}^k, u_{B(1,m)}^k)$	$(u_{A(2,m)}^k, u_{B(2,m)}^k)$...	$(u_{A(n,m)}^k, u_{B(n,m)}^k)$

In summary, the formation under cooperation game of regional science and technology resource allocation can be seen as resource providers in a certain region, and resource providers have cooperative game. The main user and resource providers have cooperative game, and it is the results of these two levels. In table 1, there is a benefits allocation scheme which is negotiated and both sides can accept in cooperative game theory matrix. Through negotiations, in the premise of taking the collective rationality into account, users can find an optimal decision scheme which is good to both the main user and the resource provider.

3 Conclusion

The correct understanding of the regional science and technology resource allocation will provide objective evidence to the regional science and technology planning, science and technology system reformation, science and technology running structural adjustment, optimal allocation of regional science and technology resources, science and technology management, and make the regional limited human, material and financial resources to achieve the best integration of technology resources.

Under the circumstance that the amount of regional technology resources is constant, the best way to improve technology resources outputs efficiency in short-term is through expanding integration technology resources and achieving the maximum outputs in optimization configuration. Technology resources configuration is in the premise that it won't damage any benefits of technology resources providers, and not reduce any technology resources of the technology resources provider to find an optimal decision scheme which is the best to both sides in different regulatory means and different application areas. It will achieve the optimal allocation of technology resources. In the process of science and technology resource allocation, each main configuration should enhance communication and take positive and cooperative attitude to form a cooperative game and meet the effects of "1+1>2".

Conversion Management of Patent Achievements in Colleges and Universities of China Based on Triple Helix Model

Yuan Dachao

Office of Science and Technology Development, Wuhan University of Technology, Wuhan, P.R.China,
430070

(E-mail: yuandachao@whut.edu.cn)

Abstract: Nowadays, patents in Chinese colleges and universities grow quickly, but the rate of the patent achievements conversion is low. How to improve the patent achievements conversion in colleges and universities is becoming an essential task. This paper uses triple helix model to solve the problem of patent achievements conversion in colleges and universities of China. It puts forward the specific method including: guided by the triple helix model, colleges and universities should make the system construction, platform construction and talent team construction regular, strengthen the relationship among colleges and universities, enterprises and government, making use of the social resources, and broaden the channels of patent achievements conversion. Thus they can achieve the goal of promoting the patent achievement conversion.

Key words: Triple helix model; Colleges and universities; Patent achievements conversion management

1 Introduction

The western developed countries attach great importance to the conversion of patent achievements and have achieved very good results. According to statistics, the western developed country patent achievements conversion rate is more than 45%, and the transformation of science and technology to production ratio has reached 60%~80%. The output value of high-tech enterprises has reached 25~30% of the social total output value proportion.

The report (2010) of colleges and universities intellectual property in China shows that from 1985 to 2010, the total number of patents application in colleges and universities are 319,595, and the average annual growth rate is 19.8%. Cumulative patent authorization amounts to 150,029, and the average annual growth rate is 26.0%. In 2010, there are 79,332 applications of patent in Chinese colleges and universities. The number is 52 times compared with that of 1985. Meanwhile the number of patent grant is 4,3153, which is 113 times compared with the figures from 1985 to 1986. According to statistics, during the period of "11th five-year plan", a total of 284,856 colleges and universities across the country apply for patents, but only 130,404 of them has acquired the licenses and among all the patents only 8,223 has been transferred into practical application(accounting for 8.65%), and this figure is far lower than that of developed countries (accounting for 60% to 70%). For example, the survey named "Chinese Patent Licensing and Maintaining in Wuhan's Higher Educational Institutions During 2005 to 2008", given by Wuhan University and Wuhan Intellectual Property Office, has illustrates that among 15 universities, 147 of 590 have been applied (only occupying 24.9%), whereas there are still 211 of 443 haven't achieved conversion. As a result a large number of patent achievements are idled. Thus, it can be seen that the distance between the increasing number of patent licenses and the low patent conversion rate has arisen a serious issue. How to deal with the issue and promote the patent conversion rate is becoming a significant problem faced by all Chinese higher educational institutions.

2 The Role of Triple Helix Model in Colleges and Universities' Patent Achievement Conversion Management

Triple helix model is given by sociology Professor Henry Etzkowitz of New York University in 1995. It is about the interaction and synthesis between enterprises, universities and governments in the regional economic development. The model is based on the biological characteristics, molecular biology and the molecular structure of the double helix of DNA crystallography three-spiral structure. That means the university, government and enterprise in the process of innovation, close cooperation and interaction, should keep their own independence and characteristics^[1]. Colleges and universities, enterprises and government use structure arrangement, system design and overlapping to affect each other, in order to form the increasingly spiral "triple helix" relationship to achieve resource and information sharing and full communication among all of them, and finally achieve maximum beneficial effects. William research shows that in the triple helix model, the cooperation among the different

organizations explains the success of technological innovation network application and commercialization of leap^[2]. According to the triple helix model, universities, enterprises and governments need to play an important role in social innovation and development. At the same time, the development of society will constantly push the colleges and universities, enterprises and governments forward, as a result of a positive tendency.

The role played by triple helix model in colleges and universities' patent achievement conversion management is quite important. In the late 20th century, a lot of colleges and universities in Europe and the United States, such as MIT and Stanford universities, the Munich Technical University and etc., make full use of their own patents and set up high-tech companies to accelerate the conversion of patent achievements and incubation, creation, and establishment of new industries. The universities, enterprises and government form three spiral patterns to develop closely social link. Through methods such as school-run enterprises directly involved in the conversion of scientific and technological achievements, the good social effect and economic effect have been created as a result. The patent achievement conversion based on triple helix model mainly functions in the following three aspects: first, push the universities to become the source of technology transfer. Triple helix model elements arranged through the positive reconstruction and innovation adjust and improve the original innovation of science and technology, making the universities, companies and governments maximize the participation and cooperative engagement. In this process, colleges and universities use their intellectual resources, acting as central agencies to unite enterprises and governments closely and to realize their social and economic goals in the development of social economy. The triple helix model also plays an increasingly prominent role in innovation radiation effects. Using the Massachusetts Institute of Technology for example, it insists on synchronous development in economy and discipline, and produces great economic benefits and social benefits. The school's graduates and teachers have created more than 4,000 enterprises around the world and about 1.1 million jobs, with annual sales up to \$2, 32 billion, which equals to about \$1,16 billion GDP, what is a little lower than South Africa, but is higher than Thailand^[3]. Second, triple helix model can promote the patent achievements more in line with the needs of society. Triple helix model is a kind of multivariate innovation system, and the premise of its growth is encouraging innovation activities from all walks of life. Because universities enable to understand social needs accurately by exchanging information with enterprises and governments, and thus the university's patent achievements will be more in line with the societal demand and reduce the "junk" patent and inspire teachers with more innovative ideas to development services for the society. Third, triple helix model can provide an open and dynamic information model for the patent conversion. Under the triple helix model, colleges and universities, governments and enterprises are participating in the science and technology innovation activities, which makes colleges, enterprises and governments contact more closely, exchange information more smoothly and makes enterprise understand latest patent achievements in colleges and universities more conveniently and utilize new patent achievements to upgrade technologies more actively.

Thus, under the guidance of triple helix model, the conversion rate of patent achievements in European and American countries are greatly increased, which can be of great references in the conversion of scientific and technological achievements in China.

This article analyzes the present situation and problems of patent achievement conversion of colleges and universities by applying triple helix model in China. The purpose is to solve the existing problems and promote the conversion of patent achievements.

3 Reasons for Low Conversion Rate of Patent Achievements in Colleges and Universities

3.1 Useless patents accounting for a large proportion

The patent is the premise of the achievement conversion, and R & D subsystem's function is to create the patent. Comrade Deng Xiaoping once mentioned, science and technology is the first productivity. Science and technology plays an important role in the development of our society. Colleges and universities, as an important force of innovation of science and technology, have made great achievements in the aspects of scientific and technological innovation efforts. According to statistics, for each year, China's colleges and universities obtain patent achievements even more than 10,000, but the real implementation of conversion and industrial achievements is less than 1/10. The college and university's technology innovation ability has been greatly improved, but patent achievement conversion of is still too slow. Although this external cause results promotion, but the most important is the college

and university's patents do not meet the development needs of the market and enterprises. They produce a lot of "useless" patents, wasting the massive science and technology resources and human resources.

3.2 Irregular teachers' evaluation mechanism

The number of funds is an important index. The evaluation of college and university's scientific research strength and social status therefore relies on the evaluation of teachers. Teachers tend to undertake research projects, publish papers and awards as the standard, quantitative indicators and detailed assessment contents. Positive evaluation mechanism can inspire the college and university teachers' research projects, published papers for science and technology awards, but indirectly block the path of patent achievements conversion. Many teachers do research on patents or identification of patents, more often than patent achievement conversion, because it is more conducive to the examination, a period of school status consolidation. Therefore, teachers' evaluation mechanism, focusing on theoretical research, is not conducive to the patent achievement conversion and the restrict output of the patent achievement conversion of colleges and universities.

3.3 Irregular research project review system

At present, the longitudinal research projects from China's government financial allocations are declared by the Science and Technology Management Department of College and University organization. Research projects focus primarily on the basis of fields, so the technology project review is paying attention to the model of project application, neglecting the project itself, and is not conducive to the patent achievement conversion. This brings two problems: firstly, for the College and University Science and Technology Management Department in the declaration of the project, research contents mainly focus on application projects, but the market value and real value are ignored. The teacher will be in the "baton", pointing to the direction of the project, and they do not consider the market demand and the achievements of the scientific research project. Secondly, the course of the study focuses on the theoretical analysis and evaluation, and the results are often laboratory prototypes or theoretical papers, and monographs, generally not referring to the problem of markets or enterprises and being out of touch with reality.

3.4 Lack of professional talents

Patent achievement conversion team in colleges and universities is mainly composed of two parts, namely, the patent achievement conversion department and the scientific research personnel. In colleges and universities, the scientific research personnel understand their professional knowledge and are good at the innovation and scientific research in model, but for the needs of the markets and enterprises, they do not know much besides lack of patent achievement promotion ability and management experience. Conversion of patent is the department responsibility for the patent achievement promotion agency. The staff should not only have a certain understanding of the major and important patents, but also understand the society and the demand of the enterprises. Now many universities of the patent department staff are very difficult to have these qualities, which affects the conversion of our patent achievements in certain extent.

3.5 Deficiency of strict process protection and management system

Figure 1 Duration of Effective Invention Patents in Higher Institutions

First of all, the lack of censorship for patent applications leads to the great number of but low quality applied patents, many of which have no practical use. Secondly, disregarding the management of authorized patents also plays a great role. According to statistics, in colleges and universities, effective

invention patents last time (life) distribution as follows: 1-4 years 17,055, accounting for 48.2%; 5 years or above, 18,358, accounting for 51.8%^[4]. Nearly half of the invention patents give up their rights four years later, which further induces the less likely conversion of patents (Figure 1). Thirdly, the path for patent achievement conversion is singular, which lacks of professional and efficient patent achievement conversion platform.

4 The Advices for Patent Achievement Conversion Management in Colleges and Universities

Patent conversion is considered a systematic work according to triple helix model. During the process, universities, enterprises, and governments are indispensable in the conversion chain. It is necessary and important for universities to coordinate the relationship between businesses and governments, and build the university - enterprise - government three-spiral pattern. Based on the triple helix model, universities should establish a close connection among corporations and governments, by making rules and regulations as the foundation, also by establishing platforms and cultivating talents as the guarantee. Maximize the social resources and widen the conversion path to promote the patent achievement conversion.

4.1 Strengthening the “direction” function of system

The scientific research evaluation system has a thorough knowledge of the control and guidance for university teachers and technical personnel. Colleges and universities should actively carry out the relevant research, and constantly perfect the scientific evaluation system as well as enhance the scientificity and operability of the evaluation performance. Specifically, the patent conversion system construction in colleges and universities not only need to have a clear distribution of interests, but also should be linked to teachers' title promotion, performance appraisal, etc. Only ensure the patent conversion to be closely linked to the immediate interests and long-term interests of teachers, can teachers consider the feasibility of the technology and achievement conversion during the process of patent application, and also consider the advancement and technical maturity of achievement in product appraisal. Thus this will arouse the enthusiasm of teachers in scientific research.

4.2 Establishing patent review mechanism

At present, the patent application and grant has reached a certain size and the patent work center should be transferred from quantity increase to quality increase. The first measurement is to establish patent review mechanism. Before the patent application, research products should pass through thoroughly the analysis and argument, which should include not only the advancement of technology, but also include the prediction and analysis of industrialization prospects. Projects that have no practical value or are obviously useless in social development and industrialization should be given certain limits or even banned from declaration. Second, we should strengthen the management process. Through the appraisal and evaluation of patent authorization system, colleges and universities can select prospective and potential patents to provide them with financial supports and longer time for right maintenances. What's more, this kind of mechanism is beneficial for colleges and universities' hatching and nurturing good patents.

4.3 Improving the patent achievement conversion platform construction

To make research products and patents converted from universities to corporations, colleges and universities should further improve the science and technology achievement conversion platform, and integrate the government and social resources to form a favorable environment, so that both sides of supply and demand can trade easily. The realization of information exchange makes patent achievement conversion platform a real connection between colleges, universities, governments and other research institutions, which promotes the virtuous circle of exchange between the technical and economic, so as to promote the conversion of patent technology.

4.4 Strengthening the patent achievement conversion team

Talents are the key to the conversion of scientific and technological patent achievements in colleges and universities. Colleges and universities should utilize their own advantages and strengthen the patent achievement and talent cultivation. Creating more opportunities for patent service personnel to get training, they will not only have a better understanding of their work, but also learn more about the marketing and management. Thus, the well-trained, interdisciplinary, professional team will be cultivated as results.

4.5 Strengthening the relationship with social intermediary service platform

Under the triple helix model, intermediary service agencies will play an effective and critical role in

helping patents convert into the investment and financing, offering the policy guidance in conversion of patents and providing the evaluation of intellectual property rights, etc. Colleges and universities can rely on the professional intermediary service institutions to make objective evaluations about the marketing situation, as well as giving full play to the advantages of information network and propagandizing the patent conversion purposely to work for patent conversion services.

5 Conclusion

Scientific and technological patent achievement conversion in colleges and universities has its internal regularity. It is not simply imposing the method system of the triple helix model into the management of the process of scientific and technological patent achievement conversion, but from a deeper theoretical level, grasping the essence of conversion of scientific and technological achievements in colleges and universities, thus to promote the conversion of scientific and technological patent achievements.

In the university-enterprise- government triple helix model, the conversion of patent not only needs supports of the government and the active participation of the enterprise, the efforts of colleges and universities are also necessary. In the three spiral model, the colleges and universities should actively improve the management system, adjust the organizational structure, enhance the personnel ability, and closely combine with the practical need of our society, making the college and university patent achievement conversion gradually enters the benign development track and making greater contributions to the social progress and China's economic development.

Research on the Policy System in the Construction and Development of Wuhan City Circle*

Ma Hui, Zhang Mengjing

School of Arts and Law, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: luomafaxue@163.com, 15927021860@163.com)

Abstract: On September 10th, 2008, Wuhan City Circle comprehensive reform scheme has finally been implemented and officially approved by the State Council. This is the first city circle (group) throughout the nation to start the comprehensive reform pilot. And it is consisted of 9(1+8) cities. To promote the implementation of the comprehensive reform, Hubei Provincial Government quickly issued an overall implementation framework which is especially for the construction of city circle and builds the blueprint of Wuhan City Circle construction on the whole. This paper analyzes the Two Type Society of Wuhan City Circle policy and holds the view that the problems are so notable with imperfect policy, narrow policy coverage, poor pertinence, and short of a complete set between policies and laws. Focused on six supporting policies, this paper aims to solve these problems, propose solutions, and conduct special research about the policy system of the construction of Wuhan City Circle, and it makes every effort to improve the policy system of Wuhan City Circle.

Key words: Wuhan City Circle; Policy system; Status analysis; Perfection measures.

1 Introduction

On September 2008, Wuhan City Circle Construction of Conservation-minded and Environment-friendly Society Comprehensive and Complete Reforming Experimental Regulation was officially approved by the State Council. With the guidance of the overall plan, Hubei Province City Circle comprehensive reform and relevant departments have issued five special planning and six supporting policies, thus forming the overall framework and policy system.

Currently, throughout the world, the representatives of mature urban agglomeration development are America, Japan, Britain and France.^[1] For instance, Sansan, Boswash, Chipitts in America; London City Group in Britain; Paris City Group in France; Tokyo metropolitan; Nagoya metropolitan; Osaka metropolitan. Among all of them, as the dimension of Tokyo metropolitan is almost equal to Wuhan City Circle, there are much experience can be learnt from it. The constriction of Tokyo metropolitan in Japan benefits from the perfect law system. Japan has paid great attention on transportation, investment in industrial cluster and financial center development; they also attach tremendous importance to land and environmental protection.^[2] All of these are perfect experiences for Wuhan City circle to draw on.

2 Current Situation of Policy System of Development of Wuhan City Circle

Figure 1 Wuhan City Circle Development Policy System

On July 31st, 2009, Hubei Provincial People's Congress has approved Wuhan City Circle Construction of Conservation-minded and Environment-friendly Society Comprehensive and Complete

* This paper is supported by Wuhan Technology Division, project number: 2013040906010433

Reforming Experimental Regulation, which becomes the basic law of guiding the development Wuhan City circle. There is also another one, Wuhan City Circle Corporate Stock Equity Funding Registration Trial Method; this one is under the control of local government regulations. There are no more laws beyond these two concerning Wuhan City Circle. However, policies referring to Wuhan City Circle are enormous. This paper has combed the policies referring to Wuhan city circle and statistics are as follows.

According to Figure 1, it is clear that the framework basically set up the supportive policy system, reflected through the following six aspects, investment, land, environmental protection, fiscal tax, finance and human resources. But, only depending on polices of these six aspects is not able to regulate all the problems inside Wuhan City circle. For now, there are still problems in many aspects.

3 Problems Existed in Current Policy System

3.1 Too narrow of the policy's coverage

Through observation, it is found that six supporting policies are settled by the policy system, they are investment policy, human resource policy, fiscal tax policy, environmental protection policy, finance policy and land policy. But the development of Wuhan City Circle should not simply rely on these six aspects. There are no policies which are relevant to such as technological innovation, administrative system, people's livelihood which is actually essential to the core benefits of the city circle. Meanwhile, among the six supporting policies, the number of discipline in financial policy and land policy are relevantly small, while those of the others are relevantly large.

3.2 The penetration between policies is not strong enough

Even though the six supporting policies of Wuhan City Circle each belongs to a different area, there is certain independence between these policies, but the penetration between policies is still existing. Disciplines in financial policy are relevantly weak. As is known to all, there is close relationship between finance and investment. Disciplines in financial policy may probably influent investment direction, while disciplines in investment policies may probably influent financial policy. Wuhan City Circle policy system, however, seldom relates to disciplines of generality of the policies. The phenomenon of policy disposition is ubiquity in the area of investment, fiscal tax, and finance.

3.3 The pertinence of the polices is not strong enough

The six supporting policies specially planned six significant fields individually in Wuhan City Circle. But the disciplines are much too extensive and lack of specific details and the target is not strong. Such as the investment policy, the most core policy is "Rules on Promoting the Investment for Wuhan City Circle of Hubei Province Government", this rules made a rule on 15 different aspects, such as renewing the working philosophy of in investment, converting the growth pattern of investment, strengthening infrastructure and the basic industries construction and so on. But the rules are much too general, which are poor in practice.^[3] It is the same in all the other five fields. Even though there is relevant policy guidance to specific practice of Wuhan City Circle, there are no targeted enforcement rules.

3.4 Incompatible between policy and law

Talking about policies, laws are essential to refer to. Policy and law, as two tools to adjust the society, play an irreplaceable roll in the development of Wuhan City Circle. So far, there are only two directly relevant laws to Wuhan City Circle. On the contrary, there are so many policies on Wuhan City Circle. The use of a large amount of policies may certainly result in the existence of "prefer policy to law". Each city in the city circle has the power to make policies, but Wuhan is the only city among the city circle which has the power of legislation, this objectively deprives the power of participating in legislation. How to solve the problem of legislation in Wuhan City Circle, especially the problem of who is the legislative subjection, which makes it vital for policies and laws to supporting each other.

4 Improvement of Policy System in Wuhan City Circle

4.1 Extending the coverage of policy

First, Financial Policy. In order to systematically guide the construction for regional center of Wuhan City Circle, it is essential to publish the suggestions and the specific planning schemes of practice of Wuhan City Circle and the construction of financial center in regions. Besides, it is necessary to perfect the financial market in Wuhan City Circle and to establish the system of financial integration in Wuhan City Circle. Furthermore, for the sake of carrying out the process of financial integration in Wuhan City Circle, it is of great importance to establish a series of systems, such as the integration of

credit finance, the integration of funds cleaning and the integration of bill market.

Second, Fiscal Tax Policy. It is supposed to integrate the fiscal system in Wuhan City Circle and to surely coordinate the government finance among different cities. For the sake of guaranteeing it, the economic development of local area will benefit and belong to the local city, make innovations in system of sharing government finance and fully take care of the development initiative of every city based on ensuring the sharing proportion of public finance in every local administration.

Third, Human Source Policy. At the standard of talent selections, gather the people from all over the world, appoint people on their merit, possess both political integrity and ability, and win people by virtue. To guarantee the policy, it is necessary to establish the integrate system from the employment, dismissing, allowance to promotion. To manage the talents, encourage the flow of talents, and to establish Wuhan City Circle technical talents sharing system.

Forth, Investment Policy. Expanding the investment to a great extent, and take advantage of transportation to motivate the positive interaction and motivate the exchange of key elements and the integrity of resource among different cities in urban circle.

Fifth, Land Policy. On the basis of the current land policy, develop the new ways of intensive land-use and increase the guarantee of the rural land.

Sixth, Environmental Protection policy. Learning experience from the United States, taking regional management framework, and breaking the boundaries between states. The whole country could be divided into ten geographical regions according to geography and social economic. Set up regional offices, and carry on united management. Paying attention to concept that the government is playing leading role of environment protection and enterprises are the main force.^[4]

In addition, on the aspect of technological innovation and reform of public administration, it is necessary to accelerate the process of formulating policy measure to promote the industrialization of high and new technology and implement the reform of public administration.

4.2 Strengthening the connection of policies effectively

First of all, in the field of finance and investment. Except that scaling up the direct financing on existing foundation and developing the pretty loan of small and medium-sized enterprises, actively promote constructing technological investment loan system to solve the financing problems for the small and medium-sized enterprises, especially the technological ones.

Secondly, in the field of environmental protection. The formulation and performance of the environment protection policy affect the development of Wuhan City Circle. The environment concept should be sun through in every policy of the policy system,

Finally, in the field of finance and taxation. Besides linking up with environment protection policy, it also should be based on the important and difficult points of investment. It has to offer financial policy support to, for example, strengthen environment construction and the investment of livelihood of urban and rural people. Furthermore, it should give some tax preference to small and middle sized high and new technology industry, advanced manufacturing business and modern agriculture construction.

4.3 Establish policy implement and assessment system

First of all, concerning of the body of policy making and assessing, it is necessary to clean up the existing policies and eliminate those different local policies that do not agree with the 'six assorted policies'. Thus, guaranteeing the policy unity in the whole Wuhan City Circle.

Besides, concerning the evaluation standard of policy implementation, regulate the behaviors between direct and indirect implementation subject. Increase the diaphaneity justice of government policy implementation, and foster a kind of system that citizens take part in policy supervision.

At last, concerning the evaluation effect of policy implementation, I think it is essential to evaluate the effects of policy implementation of Wuhan City Circle and according to the professional work field of every department, then give the marks judging by the policy implementation, and make every effort to reflect the policy implementation of every field objectively, fairly and completely.

4.4 Perfect the relevant laws and regulations and elevate the mature policy to the law

Refactoring legislation system in Wuhan City Circle, the author suggested Hubei Province People's Congress (NPC) set up "joint committee of Wuhan City Circle legislative work". The committee is made up of nine municipal people according to certain proportion, and sets up into a standing body. Henceforth, the legislative work of Wuhan City Circle is uniformly completed by the organization. In addition, in the process of legislation, opinions should be widely listened, letting the environmental protection department, the legal profession, business, education, ordinary citizens participate in the legislation suggestion work and understand the demands of the law. What's more, based on the current situation of the development of Wuhan City Circle, a comprehensive local laws and regulations should

be issued as soon as possible.

5 Conclusion

The Report to the Eighteenth National Congress put forward the construction of the grand goal of “beautiful China”, and Wuhan City Circle is the best practice for this goal. Wuhan City Circle policy overall framework basically established the Wuhan City Circle development policy support system which is mainly reflected in investment, land, environmental protection, taxation, financial and personnel from six aspects, and made good protection effect on the development of Wuhan urban construction. This paper analyzes existed problems caused by the policy system and puts forward measures to solve these problems to promote the coordinated development of Wuhan City Circle.

Business Associations, Horizontal Joint Action and Upgrading in Industrial Clusters*

He Bin

School of Public Affairs, Zhejiang University, Hangzhou, P.R.China, 310027

(E-mail: hbsxyw@gmail.com)

Abstract: Industrial cluster upgrading is a complex task that is affected by many factors. Joint action is an important aspect of collective efficiency and it can play an important role in promoting industrial cluster upgrading. But because enterprises which manufacture the same or similar products in an industrial cluster usually face competitive pressure coming from each other, joint action, especially horizontal joint action is difficult to be realized. This paper discusses the role of business association in promoting horizontal joint action and industrial cluster upgrading. Using descriptive clustering method, we classify and explain that business association can serve as a provider, an organizer or a compensator in fulfilling this task. At last, we point out that in order to facilitate business association to perform this task, the rule of establishing business association corresponding to administrative division needs to be abolished, and a management system based on the character of industrial cluster should be established.

Key words: Business association; Industrial cluster; Upgrading; Horizontal joint action; Descriptive clustering method

1 Introduction

Industrial clusters play an important role in prompting local economic development and labor employment. Geographically concentrated and interconnected companies in an industrial cluster can obtain inputs; access information, technology, institutions and public goods; coordinate with related companies; and measure and stimulate improvement more efficiently (Porter, 1998). Empirical evidence also shows that small and medium enterprises in an industrial cluster have a competitive advantage over isolated enterprises (Pietrobelli and Rabellotti, 2004).

However, with the development of economic globalization, enterprises face unprecedented competitive pressure arising from increasingly globalized product markets (Schmitz, 1999). In such circumstances, industrial clusters may lose former market share if they cannot improve their competitiveness. To respond to the challenge of globalization, the literature on competitiveness suggests enterprises to 'upgrade'-to make products more efficiently and to increase value adding activities etc. (Humphrey and Schmitz, 2000).

Collective efficiency is a central concept introduced by Schmitz (1995) for analyzing competitive advantage of an industrial cluster. The collective efficiency argument "suggests that the upgrading called for cannot be advanced by SMEs on their own. A collective response is needed" (Nadvi, 1999a). Thompson (2004) also argues that active collective efficiency (joint action) which stems from purposeful cooperation between enterprises in a cluster is important for process upgrading, functional upgrading and product upgrading, for "Cooperation is necessary because the individual firms are too small to carry out such a project." Some scholars divide joint action into vertical and horizontal ones and demonstrate the relation between industrial upgrading and them respectively. In the vertical side, Nadvi (1999a) argues that enhanced vertical interactions "facilitate a wider set of technical discussions within the supply chain on quality and technical upgrading". Pietrobelli and Rabellotti (2004) also point out that vertical joint action with suppliers and buyers is crucial to improving products. In the horizontal side, Nadvi (1999a) emphasizes that horizontal joint action can assist the process of upgrading by facilitating the flow of technical formation, assisting in managerial training and creating a reputational basis for the industrial cluster's products. And Giuliani et al (2005) and Pietrobelli and Rabellotti (2004) also point out that multilateral horizontal cooperation plays an important role in product upgrading through actions such as participation in trade fairs, collection of information and connection with international buyers.

Joint action is critical for upgrading and accordingly, for enhancing competitiveness of an industrial

* This paper is supported by the Key Research Base of Philosophy and Social Science in Zhejiang Province (Center for Labor Economics & Public Policy Studies:10JDLB04YB), the Humanities and Social Science Foundation of Ministry of Education of China (Youth Project: 12YJCZH066) and the Fundamental Research Funds for the Central Universities.

cluster, however, it is difficult to be realized, especially the horizontal joint action. In many industrial clusters local producers are often also local rivals (Nadvi, 1999b). "...under competitive market conditions businessmen ways have to face the possibility of being driven out of business by their competitors, and that one of the ways by which they can ensure their survival in the market is by doing everything they can to eliminate their competition" (Schmitter and Streeck 1999). Allowing for the competitive relation among enterprises, Schmitter and Streeck (1999) argue that though homogeneity increases the range of common interests, meanwhile it also fosters competition and makes mutual cooperation more difficult to be established. Pietrobelli and Rabellotti (2004) also point out directly that "Horizontal bilateral linkages are not well developed, with rivalry among firms prevailing over cooperation". In addition, some empirical researches also demonstrate that relative to vertical joint action, the level of horizontal joint action is lower (Schmitz and Nadvi, 1999; Schmitz, 1999). Therefore, it is difficult to realize horizontal coordination amongst enterprises which have similar products. In this paper, we will discuss the role of business association in prompting horizontal joint action. Finally, we summarize and raise some issues which need to be solved in the future.

2 The Role of Business Association for Prompting Horizontal Joint Actions and Upgrading

Pressure of competition coming from outside an industrial cluster and trust deriving from long-term relationships within an industrial cluster can promote horizontal joint action. Besides, organizational concertation executed by business association is of critical importance. There are a lot of papers relating to the role of business association in promoting joint action among enterprises (Doner and Schneider, 1998; Humphrey and Schmitz, 2002; Pietrobelli and Rabellotti, 2004; Giuliani et al. 2005; Johannes, 2008). For the main worries of an entrepreneur who wants to provide collective goods may be the deterioration of his competitive advantage, as we have referred to in part 1, business association may make effort to promote an adjustment of the distribution of cost and gain in member enterprises and take the worries away accordingly. Based on the existing research, we develop the role of business association from the perspective of benefit balance.

In 2012, we conducted an investigation in Zhejiang Province and 30 business associations were investigated. Based on the investigation results, below we classify all the roles that business association can act for overcoming the difficulty of horizontal joint action among competitive enterprises into three types, that is, provider, organizer or compensator, and discuss them in detail.

2.1 Business association as a provider of collective goods

Business association is a formal organization which collects membership dues and spends it in promoting the common interests of the members. Therefore, providing collective goods by business association is one of the most important forms of horizontal joint action. The role of this kind of horizontal joint action in promoting industrial upgrading lies in a very broad field. Business association may promote process, product or functional upgrading by setting up a research and development center, contacting with universities and research institutes for overcoming technical problems, developing regional brand, marketing for increasing the influence and customer loyalty of the product manufactured by its membership, providing information about new market, organizing trade fairs for promoting product sales, regulating the behavior of the members for protecting innovation and assisting members in meeting new quality standards raised by customers, competitors in other clusters, new bill etc.

The problem that only one or a few enterprises bear all the costs can be solved by business association's behavior of providing collective goods. But it has to be noted that the cost of collective goods provided by business association is shared by all the members. Therefore, 'small' collective goods can usually be provided by business association without disputation. For collective goods which are 'big' and have an uneven distribution of gains (or the gains that an enterprise gets do not match the dues it pays), if they are still provided by business association, an argument may be triggered.

2.2 Business association as an organizer for providing collective goods

Business association is an organization that facilitates members to communicate. Regular exchange of views such as sodality, forum and conference can help members get familiar with each other, and so promote joint action among them. Moreover, when cluster enterprises face a special threat, business association can organize a special forum for responding to the risk event. Business association may invite those enterprises which are in the same danger to participate the forum. Then business association gives suggestions about joint action for vanquishing the danger. And according to the gains of every member from the joint action, business association distributes the cost of joint action to every member.

In this way, the provision of collective goods will not change the market position of these enterprises which take part in joint action. Therefore, the threshold of providing collective goods returns to rational restraint condition. That is, for an entrepreneur, as long as the gains he can get from collective goods are more than the cost that he must bear, he will choose to participate in the joint action.

2.3 Business association as a compensator for providing collective goods

For an entrepreneur, to provide collective goods means he will face some risks. The risk not only comes from that what he gets from collective goods is less than the cost. It also comes from that he needs to bear the whole cost of collective goods without acquiring the whole advantage of them. In this condition, other enterprises may gain a relative advantage because they can get gains from collective goods without bearing any cost. That is, it is only the basic condition that gains from collective goods are more than costs. For making the provision of collective goods come true, a further condition that the relative competitive advantage of the provider is not affected by the provision of collective goods must also be satisfied. Unbalanced distribution of the benefits from collective goods may lead the entrepreneur to provide collective goods even if he cannot get all the gains. This happens when the gains he can get from collective goods will bring him more competitive edges relative to his main competitors, even if taking the cost into consider. That is, the provider of collective goods must get more advantages than his main competitors. Besides, there are five situations in which positive advantage does not necessarily bring about the action of an entrepreneur. We list them in Table 1.

For promoting the provision of collective goods, business association needs to compensate the provider. But the compensation must be provided based on an analysis on the characteristic of collective goods, such as, the benefited range of collective goods, the relative level different enterprises benefit from collective goods, etc. Based on these analyses, business association needs to make sure that resources are used fairly. In addition, different types of providers of collective goods may have different concerns, business association may design different patterns to compensate the provider according to his main concern so as to reduce the financial pressure arising from the compensatory behavior.

For performing these functions well, business association needs sufficient capital and human resources, mature governance structure and autonomy etc. Besides, management system of business association should be adjusted according to the need of industrial cluster upgrading. In china, business association is required to be set up corresponding to the administrative division. And for a given industry, only one business association can be set up in an administrative area. If an industrial cluster spreads into two or more administrative divisions, enterprises in an industrial cluster will be divided into several different business associations. This will make horizontal joint action much more difficult. Through coordination by a business association corresponding to a higher order of administrative district, this problem may be resolved. But business association in a higher administrative district may contain many enterprises which are not in the industrial cluster, so it cannot act singly on behalf of the industrial cluster. Therefore, the management system for business association needs to be adjusted when such a situation happens. And a management system corresponding to the character of industrial cluster needs to be designed and established to relieve the difficulty of horizontal joint action.

Table 1 Five Conditions in Which Enterprises are Not Willing to Providing Collective Goods Even if the Advantage is Positive

Types	Detailed description
I Competitive Edge Dwindle	Industry leader losses part of competitive edge because the gap between him and his main competitors is reduced when he provides collective goods.
II Competitive Edge Lose	Industry leader losses all his competitive edge because the gap between him and his main competitors is removed when he provides collective goods.
III Be Overtaken	Industry leader is overtaken by his competitor and losses his leadership position because of his providing of collective goods.
IV Drop into Inferior Position	An entrepreneur drops behind the same rank competitors because of his providing of collective goods.
V From Disadvantage to more Disadvantage	An entrepreneur who is in a bad place drops into a worse place because of his providing of collective goods.

3 Conclusions

This paper has illustrated that horizontal joint action which is important for industrial cluster upgrading may be difficult to be realized. It is because that although there is demand for cooperation among enterprises, at the same time there is fierce competition among them, especially among direct competitors. Horizontal joint action happens mainly among enterprises which produce the similar

products. Therefore, demand for horizontal joint action may be overwhelmed by competitive relations among them. Business association can be a provider, organizer or compensator of joint action and therefore may play an important role in promoting horizontal joint action. But for realizing the function, business association needs to overcome the problems of capital, human resource, autonomy, etc. In China, the current management system is a restriction for business association to fully perform the function. It is because when an industrial cluster spreads into some different administrative districts, the enterprises in the industrial cluster will be divided into many different business associations. And this will increase the difficulty of coordination by business association.

This paper is only a primary analysis about this question and there are many problems that need to be solved in the future. At first, an entrepreneur pays attention to both net gains and relative gains compared with his main competitors. And he may make decisions based on a complex consideration of the two values. Therefore, an experimental study needs to be conducted to develop the analysis presented in this paper. Second, the degree of difficulty of horizontal joint action will be influenced by the cluster structure, type of horizontal joint action (such as, joint venture or joint marketing), enterprise market position, external pressure, social capital, distribution of collective revenue etc. and the theoretical and empirical research need to be done to reveal the comprehensive influence of these factors. In addition, in China, the actual role of business association in promoting horizontal joint action and its advantage relative to other governing subjects needs to be researched empirically and based on this, the feasibility of allowing business association to be founded corresponding to industrial cluster may be discussed.

IT Industry Development and the Role of Regional University: The Case of Ruby Course at Shimane University

Yoshiyuki Matsuura¹, Tetsuo Noda², Naomi Takashimizu², Mikiyo Satoh¹

1 Yamaguchi University, 2 Shimane University

(E-mail: matu@yamaguchi-u.ac.jp, nodat@soc.shimane-u.ac.jp, s007wc@yamaguchi-u.ac.jp)

Abstract: Human resource cultivation and agglomeration underpins sustainable regional development and regional university is expected to play this role. Matsue city and Shimane prefecture collaboratively promote IT industry development utilizing Japan native and easy-to-learn open source computer language Ruby as strategic regional resource because of the creator residence. Shimane University respond to this demand and has offered Ruby specializing courses as cultural subjects. This paper introduces the development and the challenges of the courses in the context of regional development with referring to the competitiveness of Ruby.

Key words: Open source Software; Ruby, Programming education; Regional industry development

1 Introduction

The programmer's choice of programming language is affected by multitude of factors. She may prefer the language which they used at the very beginning of their career just like mother tongue. Or she can choose the language fitting best to her cognitive and psychological set. On the other hand, organization she belongs may determine for securing efficient teamwork and knowledge sharing. Customer can also designate the language for preserving internal consistency. And in some cases, development environment will prescribe the language

Language, as a tool, changes over time in any sense, while many languages come and go. Object-oriented languages (Java, C++) dominate today in place of procedure-oriented (C) ones both in academia and practice^[1], and programmers should adapt to the change. Ideally, programmer thus can handle wide range of languages and choose appropriate one depending on the situation just like multilingual person. Widely held view suggests that expert programmer should have broad view, general and specialized knowledge, problem solving competence, common to experts in other fields^{[2],[3]} and the core ideas for computer teaching, the algorithms, the architectures and the design principles, have remained unchanged^[4]. Given this, if the purpose of computer programming courses at higher education institutions is to nurture novice programmer's competences requisite for letting some of them become expert, instructors should choose the language best fitting to the purpose or develop pedagogical language such as SCHEME, PYTHON and BLUE, if necessary, and there is a substantial body of literature studying the influence of language selection on student's learning effect^{[5],[6],[7]}.

Meanwhile, Shimane University, a regional university in Japan, offers a unique programming course along with regional economy course among cultural subjects for all students specializing in Ruby. Ruby is an object-oriented language created by Yukihiro Matsumoto, known as "Matz" in open source communities, and released in 1993. Since then, Matsumoto, living in Matsue, the municipal capital of Shimane prefecture, has been developing Ruby in collaboration with many open source developers all over the world through the Internet. The number of core contributors for Ruby development is about seventy in 2011, and the two-third of them is Japanese. Ruby is one of the very few open source projects that Japanese engineers mainly commit to development. At the earlier stage, while Ruby lured geeks so much, it had not been spread in business uses. But, in 2005, David Heinemeier Hansson – a programmer in Denmark, released Ruby on Rails, web application framework constructed by Ruby. Hence, Ruby came to attract attention and to be used also for commercial purpose, particular in web application field, and the number of Ruby engineers has been astonishingly soaring. Ruby ranks 10th next to SQL, according to the recent popularity investigation by Lang Pop.com^[8].

IPA (Information-technologies Processing Agency), the Japanese government agency, has devotedly support the Ruby project toward the standardization of Ruby workflow. As Ruby is an open source language, there are many implementation ways of Ruby. Ruby 1.8 affiliate (implemented by C language) and the current Ruby 1.9 and 2.0 affiliate (implemented by virtual machine YARV), IronRuby (implemented to operate Ruby on .NET Framework), MacRuby(implemented to operate Ruby on Mac OS X), and Rubinius (bytecode interpreter on a virtual machine), etc have coexisted which altogether impair the interconnectivity and the portability of program written in RUBY. IPA started standard specifications making, first domestically based on standard specifications in 2008, and constituted it as

JIS (Japanese Industrial Standards) in 2011. Finally, Ruby became international standard ISO/IEC 30170 in April 2012, and the approval as an international standard is expected to enlarge market potential of Ruby.

In addition to the Japan nativeness and explosive dissemination in practice across the world, the background motivation for the course offering at Shimane University comes from the ongoing regional effort to revitalize Matsue city and Shimane prefecture with the heading of “Ruby City Matsue” since 2006, underpinned by close cooperation among local industry, academia, and government. Shimane University in turn aspires to be the education hub for Ruby education by tapping the experience of the involvement this regional effort^[9]. Backing to the educational challenges for novice and beginners in computer programming, the crucial question is whether effective Ruby education is different from that in general programming education or whether Ruby is appropriate to be used as first language students learn at the university education. While some insist Ruby is easy to learn and a voluntary yet influential Ruby organization promotes it as “a programmer’s best friend,” it is still unclear the ease and the friendliness can also apply to novice programmers. Addressing these issues will lead to breakthrough in designing systematic human resource cultivation from novice to expert with distinctive Ruby competence and consequently help IT industry development in the region. Besides, it is of interest whether attending regional economy course focusing on Ruby affects psychological and cognitive attitude toward Ruby programming course.

This essay documents the midterm achievement and reflection found in the classes during the past few years. We believe this report will be suggestive to two classes of readers. First class involves local government staffs who are thinking regional development in peripheral region, particularly IT industry development including human resource cultivation. Second class comprises teachers of programming classes and teachers and coordinators in charge of liaison activities. The paper is organized as follows. Section 2 briefs the progress of the regional effort in Matsue city and Shimane prefecture. Section 3 refers to the experiment in which the advanced/expert programmers were the subjects for assuring easiness of learning and productivity of Ruby. Section 4 reports the course and discusses the feedback from attending students and stakeholders. Section 5 concludes.

2 Progress of the Ruby-Centered Regional Effort

Exploiting open source knowledge like Ruby enables independent IT firms to grasp business opportunity free from vendor’s power, strategy and legal rights. Open knowledge is ubiquitous, and it is tested and grown mainly in virtual world. Given this very nature of open knowledge and the work style of programmers, any region can leverage on open knowledge for IT industry development yet it can hardly achieve and sustain competitive advantage as newly generated knowledge rapidly disseminate through the internet beyond geographical border. Besides, Ruby is technically a language or a tool for expressing knowledge. In this sense, Ruby City Matsue is a unique case trying to develop IT industry by emphasizing a language. Before the project commencement, the degree of IT industry agglomeration in Matsue city had been below national average but the municipality aspired to take full advantage of “Matz” residence and the presence of some active contributors for Ruby working together with Matz at Network Applied Communication Laboratory (Nacl) Ltd, where he has worked as an employee.

The project started by opening “Matsue Open Source Laboratory” for interaction between IT engineers and information sharing about open source software (OSS) in July 2006. Subsequently Open Source Software Society was established with the purpose of enhancing members’ skill and competence and cultivating competitive human resources through deepening interaction among practitioners, engineers, researchers and students who engage in open source software development. Although the municipality initially led the project, the active players came from firms and universities in Matsue city and attempted to enhance management capability of the local IT service firms by substantializing Bazaar style development in the region^[10], based on the collaboration among industry, academia and government. It should be stressed that while Ruby has played crucial role as symbol as well as tool, the underlying objective was to insulate dominant distributed project style observed often in the virtual world to the region.

Industry development program should create local market attractive enough to make companies join in the movement, particularly at early stage. Thus Matsue city and Shimane prefecture strategically ordered system development with specifying Ruby as the application programming language and consequently the local IT firms involved in these system developments enhanced the Ruby related technological competence and capability. Proactive municipal order subsequently led to autonomous IT

solution business development by the local firms and induced direct investment from outside the region for technology learning which implies competitive advantage in Ruby exploitation for business purpose.

Competent programmers and engineers development is crucial for sustainable IT industry development. Shimane prefecture commenced human resource development program specializing in Ruby and Ruby on Rails for practitioners in 2007 while promoting the introduction of OSS and Ruby courses at the regional higher education institutions. In response, Shimane University among started “Ruby Programming” course where students learn the basics of Ruby programming, web application development with Ruby on Rails and the lecture by engineers and developers adopting RUBY. The efforts have achieved magnificent outcome so far. During the first three years, the aggregate sales of IT service industry in Shimane had surged by 26.7% against 7.7% increase nationwide, while the number of the employees had soared by 50.7% despite 1.8% decrease in Japan. The success inspired other local governments, including bigger cities and prefectures having the breadth of resources and providing chances of widening Ruby applicable field, to examine exploring OSS and Ruby as industry development tool. For instance, Fukuoka prefecture, having highly regarded existing IT industry agglomeration initiated Ruby centered industry development in 2008. Strategic and distinctive HR development, by stimulating psychological and cognitive factors in addition to developing technological competence, will be one of the key success factors to compete against other regions and sustain growth for long.

3 Productivity of Ruby and Easiness of Learning for Experts

Ruby has been said to attain 10 or more times the productivity of Java. The amounts of the code description by Ruby are less than that of the other programming languages, and the grammatical composition is quite similar to human language, which make Ruby programming highly productive and agile. Presumably RUBY was adopted at earlier phase in Web application development field for this reason, as quick release and frequent changes are of utmost importance. It may suggests that even expert programmers who are familiar with specialized computer languages prefer more natural expression and switching to Ruby is relatively easy for them.

To investigate the capability of Ruby, Chugoku Region Ruby Business Development Forum, chaired by Noda, executed an experiment comparing the productivity among Ruby, Java, and Perl, another popular script language), cooperated with an IT company in 2009. Subject was requested to develop web applications that had the common functions (Message board systems that have functions of comments contribution, multiple contribution prevention, indispensable check, and the automatic deletion) by Ruby, Java and Perl, daringly without using web application frameworks. TABLE I is the result of the comparison of each programming language’s productivity.

Table 1 Effect of Language on Productivity

Languages	Java	Ruby	Perl
Lines	177	46	42
Man-Hour (Coding and Test)	Coding : 8 hours Test: 1 hours	Coding and Test: 2 hours	Coding and Test: 0.75 hours
Require Modules	19	2	4 (uses)
Operating Condition	Servlet	Http Server	Http Server
Operating Checking Server	Tomcat	Apache Anhttp	Apache Anhttp
Experience Years of Using Language	7 years	0 years	5 years
Experience Years of Development	7 years	7 years	7 years

As a result, Ruby far exceeded Java both in terms of the amounts of the codes and the man hour. Contrary, we could not conclude Ruby was not more productive than Perl. However, this ambiguous result was at least partially attributed to the experience of using language. In spite of the first experience to use Ruby, the subject could complete the program by the same amount of codes with that of Perl case, as the subject had five years’ experiences to use Perl. Though, the speed manufacturing time of Ruby engineers is slower than that of Perl engineers, if they are trained coding, the productivity will be expected much higher. Several factors can be conceivable for interpreting the subject using Ruby from the first time could do well. First, Ruby is truly natural and easy to learn with least jargons and peculiar syntax. Second, the Ruby system resembles (but perhaps more efficient) to certain language the subject

is familiar with. Third, the subject had built his career as programmer so that, as an expert, he was flexible and versatile enough to adapt to different language and explore the potential of the language at a high level. Presumably the experiment result reflected the combined effect of these factors along with others. From higher education institution's viewpoint, whether the first factor affect performance is of interest, as in that case it will possibly lower the hurdle to study computer language for novice and allow instructors to spend more time for nurturing their creativity and applicability.

4 Ruby Courses at Shimane University

4.1 Courses Outline and Students Attributes

Ruby centered courses, "Ruby Programming" and "Web Application Framework," and "Information and Region," are classified as multidisciplinary (selective) subjects among cultural subjects at Shimane University. In this sense, those are not compulsory course like CS1, rather applied and practical supplement. Multidisciplinary subjects aim to offer students opportunity to comprehend the role and character of each major with respect to a specific theme. In accordance with this aim, the Ruby courses are designed to let students learn recent environment and technology development in IT business with special reference to Ruby from guest speakers such as active engineer and researchers along with basic programming skill and knowledge. The two courses are interrelated as "Web Application Framework" builds on the knowledge and skill acquired in "Ruby Programming" course. "Ruby Programming," regarding Ruby as a local resource, intends to let students consider its potential and ferment a sense of intimacy along with studying basics. "Web Application Framework" is more technical course aiming to comprehend the whole web application development process with Ruby on Rails. While "Information and Region" where active businesspersons, IT engineers and municipal staff give lectures on OSS and Ruby expects broader audience, it is designed to complement the technical courses and let students examine the potential of Ruby and OSS in the context of regional IT industry development. The technical courses also offer focused discussion with those guests.

From technical viewpoint, adopting Ruby and Rails has four advantages. First, as it is an OSS, installation and version up can be made flexibly and at a minimal cost. Students can also install to their own PC and practice at home. Second, owing to high productivity, Ruby and Rails enable students with limited use experience of Ruby to complete preliminary web application development with limited number of classes. Third, Rails is an application framework so that programmers can develop application with lesser codes. Fourth, Rails is equipped with simple web server and database management system and students can easily execute operation check once installing Rails.

Whole the courses open to all the third or fourth year undergraduate students, most of the students taking the technical courses belong to the department of science and engineering. The number of the registered students has ranged approximately from 10 to 30 since the first year. While the courses assume a certain amount of programming experience, few students are found to be complete beginners, mainly social science students taking "Information and Region" course. Most experienced students use Java and C reflecting the languages used in regular programming courses at the university yet some students learn Ruby on their own. One third of science and engineering students attend "Information and Region."

4.2 Discussion

Learning script language such as Ruby at beginning in general cuts two ways. As mentioned above, students can complete entire development process within limited time range and the motivation for studying arises from a sense of accomplishment. Contrary, because novice programmers are limited to surface knowledge and lack detailed mental models^[11], the simulated success experience may prevent them from studying fundamental computer science as it takes much effort from psychological perspective, or in worst case harm problem solving competence. We believe programming education for computer science major should build on solid body of knowledge to be competitive expert thus we don't intend to replace current CS1 programming language by such practical and productive language but aim to complement those courses. As Ruby was written in C language, programmers who want to develop Ruby further needs to be capable of procedural language. Actually while the students attended "Web Application Development" course on average expressed their satisfaction as they relatively easily developed web application on their own with the application framework, some students seemed to confused with the difference from other languages and be indigested.

From regional development perspective, whether students having adequate potential are motivated by attending the courses and subsequently would like to work in the region or to keep contact with the local IT community even if they work in other place. In this respect, one of the important issues is to

nurture their cognitive vicinity to Ruby and local OSS community. Thus in addition to “Information and Region” course, we invite Matz and other key players in the region as lecturers in “Ruby Programming” course and let the students interact closely with competent experts and consider career as programmer or engineer. It is worth to be noted that one of the students was inspired by Matz’s lecture and commented he started to consider the possibility of working at SME.

We also observe synergy among Ruby related courses. Science and engineering undergraduate students are on average reluctant to take economic and business courses, while social science students have a prejudice against programming courses. Promoting Ruby as a regional resource succeeds to break down the cognitive barrier to some extent, although social science students tend to struggle at programming related courses. Another favorable observation is that students are inclined to regard those courses as advantage of studying at the university, implying cognitive linkage between Ruby and the university.

5 Conclusion

This paper reports our ongoing endeavor to cultivate human resources for serving IT industry development tapping Ruby and other OSS. We evaluate our efforts so far make success to some extent at least cognitive level as many students start to feel sympathy with Ruby and the some graduates taking the courses decided to work at local IT companies. We will have to continuously examine the objective and positioning of Ruby education at the university and collaboration with other institutions among region-wide Ruby education efforts. Though, we believe the utmost and immutable mission for computer programming education at university is to let students build solid foundation necessary for expert from the basics and enlarge their potential as we are not sure whether and how attending the Ruby courses affect to their career and competence development due to the limited samples.

Sustainable OSS focused IT industry development with competing against other regions largely depends on the agglomeration of good programmers, engineers and customers capable of understanding IT and OSS. In this sense, non-computer science majoring students do not need to have deep and wide knowledge about programming yet they are expected to acquire basic programming. Ruby programming course can be rearranged by examining the reasons of the Ruby’s easy to learn feature for that purpose. Besides, OSS project by its nature accompanies different development approach which in turn demands different personality and competence. Although this report doesn’t argue these aspects, introducing this development style into classroom will help nurture desirable human resources. These issues are investigated in future education.

Reviewing Service Quality in Higher Education

Sanaz Farjam, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:farjam8@ymail.com, Steven_64@163.com)

Abstract:The purpose of the present study is to review the conception of service quality in higher education and appraising various service quality models to identify issues for future research and provides directions to service quality researchers. In addition, the paper attempts to present useful information about measuring service quality in higher education based on studies, which selected from well-known databases, Also this research, try to highlight a linkage between the different service quality models.

Key words: Service quality; Higher education; Measuring instruments

1 Introduction

Service industries are playing an increasingly important role in the economy of many nations. In today's world of global competition, rendering quality service is a key for success, and many experts concur that the most powerful competitive trend currently shaping marketing and business strategy is service quality (Zeithaml et al. 1996). In recent years "Higher education has been increasingly recognized as a service industry and, as a sector, it must strive to identify the expectations and needs of its clients, who are the students" (Mello, Dutra, 2001). Prominently, the service quality has established itself as an important part of the higher education; Higher education institutions are constantly looking for ways to improve their offering for competitive advantage, Moreover Universities have realized that their long-term survival depends on how good their services are and that quality sets one university apart from the rest (Aly and Akpovi, 2001; Kanji et al., 1999), Therefore service quality highlighted as the critical element in higher education. (Sultan, Wong, 2010).Higher education is a pure service that requires greater amount of interpersonal contact. As higher education provision is a service and students are expected to fund their educational expenses, it seems appropriate that universities make a shift from being product-led, i.e. relying on the product to sell, towards a more customer-led approach (Angell et al., 2008).

Research has shown that good service quality in higher education depends on many factors. the concept of quality of education in education, is associated with the achievement of agreed standards, as well as consistency between the objectives of the program and the competence of graduates(Hanna Shauchenka,2010).Based on the Parasurman's perspective, The service quality is the size and the difference between the customers' Perceptions and expectations of the service (Zahedi & Biniaz, 2009). Measuring service quality and customer satisfaction has been one route to determine a service firm's deficiencies in order to make improvements. While this approach has become ubiquitous amongst firms, firms continue to search for other means to gain differential advantages. (Srinivas Durvasula, Steven Lysonski, A.D. Madhavi, 2011). A variety of methods are used to assess service quality, each has its advantages and drawbacks. There has been a continued research on the definition, modeling, measurement, data collection procedure, data analysis etc., issues of service quality, leading to development of sound base for the researchers.(Nitin Seth, S.G. Deshmukh, Prem Vrat, (2005)).

In this paper attempts to review the conception of service quality in higher education and assessing different kind of service quality models to determine identify issues for future research. Additionally, this study provides a functional source of information on measuring service quality in higher education.

2 Service Quality and Higher Education

The study of service quality has been hotly debated in the marketing literature for over Two decades (Brady and Cronin, 2001), But Quality in higher education is a complex and multifaceted concept and a single appropriate Definition of quality is lacking (Harvey and Green, 1993). According to Cheng and Tam (1997) "education quality is a rather vague and controversial concept" and Pounder (1999) argues that quality is a "notoriously ambiguous term". Also, there is a general perspective that Service quality is a multidimensional or multi-attribute construct (Parasuraman, Zeithaml,V. and Berry, 1985),however there is no general agreement as to the nature or content of dimensions.

Every stakeholder in higher education has a particular view of quality dependent on their specific

needs (Voss et al., 2007). According to Parasuraman *et al.*, it is only the customer who is qualified to evaluate service quality, and Other’s evaluation is not accurate and in this case, it's necessary to pay attention to student’s desires. The overriding value in measuring service quality in higher education lies in the identification of critical aspects of the service delivery (Abdullah, 2006). However, this presumes a customer-led strategy, whereby the student, as the buyer of the service exchange, is regarded as the customer (Owlia and Aspinwall, 1996). Numerous studies have attempted to explain the concept of quality in higher education Institution; Table 1 shows service quality dimensions as identified by various researchers in different countries. The findings of these studies suggest that dimensions of higher Education service qualities vary widely in the context of culture, university and even School or department, and one of the reasons for this is that student perception is shaped By culture, previous interaction, and experience and marketing communication Messages (Sultan, Wong,2012). Abdullah, (2006) suggest that the dimension access is the most important determinant of service quality in higher education In other words, students perceived access to be more important than other dimensions in determining the quality of service they received.

3. Measuring Service Quality:

In recent years, there has been an increasing amount of literature on measuring service quality. According to Rowley (1997) valid, reliable and replicable measures of service quality are needed, it is necessary to identify and implement the most appropriate measurement tool in order to gain a better understanding of the quality issues that impact on students’ learning, faculty’s teaching and the total student and teacher experience. This part begins by description of the important measurement tools of service quality in common use in the business sector; it will then go on to describe their application in higher education. The main instruments are SERVQUAL, Gronroos model, Servperf model, HEDPERF, PHed-model, ARCHSECRET and an integrated model

3.1 SERVQUAL

The most common model in service quality literature to measure the quality of services is SERVQUAL The first version of SERVQUAL was developed in 1985, based on a series of studies by Parasuraman and his colleagues who conceptualized service quality as the gap between customer expectations and perceptions (Ham et al., 2003; Parasuraman et al., 1988).Service quality are Influenced by five “gaps”:

Table 2 The SERVQUAL (1985) Dimensions

Dimension	Definition
1. Tangibles	Appearance of physical facilities, equipment, personnel, and communication materials.
2. Reliability	Ability to perform the promised service dependently and accurately.
3. Responsiveness	Willingness to help customers and provide prompt service.
4. Competence	Possession of the required skills and knowledge to perform the service.
5. Courtesy	Politeness, respect, consideration, and friendliness of contact personnel.
6. Credibility	Trustworthiness, believability, honesty of the service provider.
7. Security	Freedom from danger, risk or doubt.
8. Access	Approachability and ease of contact.
9. Communication	Keeping customers informed language they can understand and listening to them.
10. Understanding the customer	Making the effort to know customers and their needs.

Source: Zeithaml et al. (1990)

(1) Gap 1 indicates the difference between customer expectations and Management perceptions of customer expectations.(2) Gap 2 is the difference between management perceptions of consumer Expectations and the translation of these perceptions into service-quality specifications. (3) Gap 3 is the difference between the service actually delivered by frontline service Personnel on a day-to-day basis and the specifications set by management. (4) Gap 4 represents the difference between service delivery and what is promised in external communications to consumers.(5) Finally, Gap 5 is the difference between customer expectations and perceptions Gap 5 is influenced by Gaps 1-4, which are all within the control of an organization and Therefore need to be analyzed to identify any changes that should

implemented to reduce Or eliminate Gap 5. Parasuraman et al. (1985) argued that such “gap analyses” are critical For identification of discrepancies between the provider’s perceptions of service-quality Dimensions and the consumers’ perceptions of those dimension (Riadh Ladhari, 2009). The SERVQUAL questionnaire has two parts; one is related to customer Expectations in relation to a service sector and the other to evaluate perception in relation To a certain service company. To measure the customer's perception of service quality, Parasuraman et al. (1985) developed the SERVQUAL scale. The scale was based on in-depth interviews with executives and focus group interviews with consumers from four different service categories. They analyzed the data and concluded that customers evaluate service quality based on ten general criteria or dimensions. The name and definition of each of these ten dimensions are as indicated in Table 2.

In 1988, Parasuraman Refined the SERVQUAL scale by dividing the ten original dimensions into five. The reason was because there were considerable correlations among seven of the ten original dimensions in that study. Competence, courtesy, credibility and security were consolidated into one dimension called assurance. Access, communication, and understanding the customer were grouped into another dimension called empathy. The original SERVQUAL scale uses 22 questions to measure the five dimensions Of service quality: reliability, tangibility, security, empathy and responsibility. Brochado(2009) mentioned that in the context of higher education these dimensions include the appearance of the university’s physical facilities, equipment, personnel, and communication materials (tangibles), the ability of the university to perform the promised service dependably and accurately (reliability), the willingness of the university to help students and provide prompt service (responsiveness), the knowledge and courtesy of teachers and their ability to convey trust and confidence (assurance) and the caring, individualized attention the university provides its students with (empathy). The questionnaire of 22 items, which is administered twice: first to gain customers’ expectations and second to gain their perception of performance, is answered by customers on a 7 point Likert scale from ‘strongly disagree’ to ‘strongly agree’. The results of the two sections (perceptions and expectations) are compared to Reach a parameter (gap) for each of the questions, that is, the final score is generated by The difference between them (Parameter = Perception – Expectation). A negative result indicates the perceptions are below expectations, revealing the Service failures that generate an unsatisfactory result for the client. A positive score Indicates the service provider is offering a better than expected service (Seth N., Deshmukh, 2005).

3.1.1 Proposal for adaptation

Oliveria and Ferreria(2009), adapted version of the SERVQUAL scale for Higher education services, table3 shows the adapted questionnaire model that was used to conduct the quality expectations and perceptions survey in higher education.

Table 3 SERVQUAL Questionnaire Adapted to Higher Education Services

Tangibility	1 – Excellent Higher education institutions must have modern Equipment, such as laboratories. 2 – Higher education institution installations must be well Conserved. 3 – Employees and teachers at excellent institutions of Higher Education must present themselves (clothes, cleanliness, etc.) in an appropriate manner for their position. 4 - The material associated with the service provided in Excellent institutions of Higher education, such as journals ,Printed matter must have a good visual appearance and be up to date.	1 – Your Higher education institution has modern equipment, such as laboratories. 2 – Your Higher education g institution installations are well Conserved. 3 – The employees and teachers at your institution of Higher Education present themselves (clothes, cleanliness, etc.) in an appropriate manner for their position. 4 - The material associated with the service provided in your institution of Higher education, such as journals, printed matter, has a good visual appearance and is up to date
Reliability	5 – When excellent institutions of Higher education promise to do something in a certain time, they must do so. 6 – When a student has a problem, excellent institutions of Higher education demonstrates sincere interest in solving it. 7 – Excellent of institutions of Higher education will do the job right the first time and will persist in doing it without Error.	5 – When your institution of Higher education promises to do something in a certain time, it does so. 6 – When you have a problem, your institution of Higher education demonstrates sincere interest in solving it. 7 – Your institution of Higher education will do the job right the first time and will persist in doing it without error.
Responsibility	8 – Employees and teachers at excellent institutions of Higher education promise their clients the services within deadlines they are able to meet. 9 – The employees and teachers at excellent	8 – Employees and professors at your institution of Higher education promise you the services within deadlines they are able to meet. 9 – The employees and teachers at your

	<p>institutions of Higher education are willing and available during service providing. 10 – The employees and teachers at excellent institutions of Higher education will always show good will in helping their students. 11 – The employees at excellent institutions of Higher education are always willing to explain doubts their students may have.</p>	<p>institution of Higher education are willing and available during service providing. 10 – The employees and teachers at your institution of Higher education always show good will in helping. 11 – The employees and teachers at your institution of Higher education are always willing to explain your doubts.</p>
Security	<p>12 - The behavior of employees and teachers at excellent institutions of Higher education must inspire confidence in the students. 13 – Students at excellent institutions of Higher education feel safe in their transactions with the institution. 14 - The employees and teachers at excellent institutions of Higher education must be polite to the students. 15 – The employees and teacher at excellent institutions of Higher education must have the knowledge needed to answer student questions.</p>	<p>12 - The behavior of employees and teachers at your institution of Higher education inspire confidence. 13 – You feel safe in your transactions with your institution of Higher education. 14 – The employees and teachers at your institution of Higher education are polite. 15 – The employees and teachers at your institution of Higher education have the knowledge needed to answer your questions.</p>
Empathy	<p>16 – Excellent institutions of Higher education must have convenient business hours for all students 17 – Excellent institutions of Higher education must have employees and teachers who provide individual attention to each student. 18 – Excellent institutions of Higher education must be focused on the best service for their students. 19 – Excellent institutions of Higher education must understand the specific needs of their students.</p>	<p>16 – Your institution of Higher education has convenient business hours for all students. 17 – Your institution of Higher education has employees and teachers who provide individual attention to each student. 18 – Your institution of Higher education is focused on the best service for its students. 19 – Your institution of Higher education understands the specific needs of its students.</p>

Source: (Oliveria & Ferreria 2009)

This methodology operates by means of identifying “expectations” and “perceptions” with the aim of closing the gap between the two. These can be demonstrated in five dimensions in Relation to educational settings. (Roland K. Yeo, 2008). Brochado et al. (2009) mentioned that There are a lot of empirical applications of the SERVQUAL paradigm to measure service quality in HE (Hill, 1995; Anderson, 1995; Cuthbert, 1996a, b; Kwan and Ng, 1999; Sohail and Shaikh, 2004; O’Neil and Wright, 2002; Sahney et al., 2004; Ho and Wearn, 1995; Tan and Kek, 2004)

3.2 Gronroos model

Gronroos (1982, 1984) was one of the first authors to conceptualize service quality with the development of the perceived service quality model; he created a model that attempts to illustrate how the quality of a given service is perceived by customers. According to Gronroos (1982; 1984; 2001), there are three fundamental aspects to service quality: technical quality, an evaluation based on what the customer receives. In fact, these are the relatively quantifiable aspects of the service, which the customer and supplier can easily measure. Another aspect is functional quality, an evaluation based on how the service is delivered. Indeed, functional quality refers to how the service is provided and the interpersonal behaviors contributed by the service employee during the service encounter. Technical (or outcome) quality is evaluated after service performance while functional (or process) quality is evaluated during service delivery, and mental image, which could be referred to reputational quality. (Swartz and Brown, 1989, Gronroos, 1984). In addition, it is important for managers to understand how the technical quality a functional quality of a service is influenced, and how customers perceive these quality dimensions (Gronroos, 2007) to ensure perceived service quality is maximized.

3.3 Servperf model

Cronin and Taylor's (1992) questioned the gap between expectations and functionality as the basis for measuring service quality and proposed SERVPERF's measurement which evaluates the quality. Based on their studies, the concept of function-based scaling is the adjusted form of service quality measurement structure of SERVQUAL scale (Carrillat, Jaramillo, and Mulki, 2007). In fact, SERVPERF extended SERVQUAL with the addition of an evaluation of service performance embodied in satisfaction (Cronin and Taylor 1992). Comparing with SERVQUAL the SERVPERF uses a single set of questions concerning post consumption perceptions of service quality and does not seek to measure expectations (Cronin, 1992). Abdullah et al. (2005) mentioned that many authors concur that

customers' assessments of continuously provided services may depend solely on performance, thereby suggesting that performance-based measure explains more of the variance in an overall measure of service quality (Oliver, 1989; Bolton and Drew, 1991a, b; Cronin and Taylor, 1992; thus confirming that SERVPERF (performance-only) results in more reliable estimations, greater convergent and discriminate validity, greater explained variance, and consequently less bias than the SERVQUAL and EP scales (Cronin and Taylor, 1992; Parasuraman et al., 1994; Quester et al., 1995; Llusar and Zornoza, 2000).

3.4 HEdPERF

Abdullah (2005) proposed HEdPERF (Higher Education PERFORMANCE-only), a new and more comprehensive performance-based measuring scale that attempts to capture the authentic determinants of service quality within higher education sector. He states that the aim of this model is to capture a context specific view of service quality in higher education, enabling the whole student experience to be measured. The instrument measures 41-items and each item has been tested for reliability and validity, using both types of factorial analysis, exploratory and confirmatory (Abdullah, 2006). The HEdPERF scale is a four dimensional construct conceptualized on the SERVPERF scale (Abdullah, 2005). These 41-items consisting of 13 items adapted from SERVPERF, and 28 items generated from literature review and various qualitative research inputs namely focus groups, pilot test and expert validation.

The 41-items include: Promises kept, Sympathetic and reassuring in solve problems, Dependability, On-time service provision, Responding to request promptly, Trust, Feeling secured with the transaction, Politeness, Individualized attention, Giving personalized attention, Knowing student needs, Keeping student interests at heart, Knowledge in course content, Showing positive attitude, Good communication, Feedback on progress, Sufficient and convenient consultation time, Excellent quality programmers', Variety of programmers/specializations, Flexible syllabus and structure, Reputable academic programmers, Educated and experience academicians, Efficient/prompt dealing with complaints, Good communication Positive work attitude, Knowledge of systems/ procedures, Providing service within reasonable time, Equal treatment and respect, Fair amount of freedom, Confidentiality of information, Easily contacted by telephone, Counseling services, Student's union, Feedback to improve service performance, Standardized and simple delivery procedures, Eigen values, Percentage of variance, Cumulative percentage of variance. The comparative Sultan & Wong (2012) showed that the HEdPERF scale captures more variance relative to that of the SERVPERF scale.

3.5 PHed-model

Sultan & Tarafdar (2007) developed the performance based higher education service quality model. They claim that PHed-model is comprehensive approach compared to the HEdPERF model. Performance based attitudinal items are generated from review of literature of the relevant fields.

Of them, 13 items are adapted from the HEdPERF, which is also consistent with the SERVPERF and the SERVQUAL scales, and 54 items are developed from pilot survey focus group interview, experts' opinion and literature review. They determined eight independent variables including dependability (Depen), effectiveness (Effec), capability (Capab), efficiency (Effi), competencies (Compet), assurance (Assu), unusual situation management (USM), and semester-syllabus-grading (SSG). Also their study focus on ODL Universities which, shows the guidelines that are worth for measuring and ensuring the education quality in open and distance learning universities. Sultan & Tarafdar (2007) point out that the empirical results for the PHed model are significant and seems to play a greater contribution in performance based service quality measurement for the higher education institutions, a comparative study among PHed, HEdPERF and SERVPERF can produce relative strengths of these models.

3.6 ARCHSECRET

Vaughan & Woodruffe-Burton (2010) suggested new disabled service user-specific service Quality model called "ARCHSECRET". They try to empirically test this model, against a modified SERVQUAL model in the context of disabled students within higher education. Their research designed to compare ARCHSECRET and a modified SERVQUAL model in terms of their ability to predict and explain the variation in the service quality experience of disabled students in higher education. In the development of the ARCHSECRET model, the multi-attribute scale had been refined from 40 attributes to a set of 26 attributes, covering expectations, perceptions across ten hypothesized dimensions of the ARCHSECRET model. (Vaughan and Shiu, 2001). This scale contained 26 service quality items, worded in a positive format. The model Dimensions include: Access, Responsiveness, Communication, Humaneness, Security, Enabling/empowerment, Competence, Reliability, Equity, Tangibles. The model when presented to both operational and strategic managers of the collaborating social care organization was

affirmed as reflecting key service quality features and dimensions that were highly applicable to the organization’s internal quality systems. Further, the model was deemed to be a potentially powerful tool for management action in its identification of service quality shortfalls to ensure the most effective allocation of scarce resources Within the voluntary sector organization. (Vaughan&Woodruffe-Burton, 2010). ARCHSECRET service quality dimensions:Access (distinct from PZB) 3 attributes, Responsiveness 4 attributes, Communication 4attribute, Humaneness 3 attributes, Security 2 attributes, Enabling/empowerment 2 attributes, Competence 3 attributes Reliability 3 attributes, Equity1 attribute, Tangibles 1 attribute (Vaughan, Shiu, 2001). Vaughan claimed that ,ARCHSECRET was superior to the modified SERVQUAL in terms of its overall predictive power; ARCHSECRET key drivers were different and better in predictive power than those of the modified SERVQUAL; and ARCHSECRET was found to be reliable and valid for the measurement of the disabled student experience in higher education, while acting as a diagnostic tool for the identification of service quality shortfalls.

3.7 An integrated model

In their major study, Sultan & Wong (2012) attempted to develop and empirically test an integrated model incorporating the antecedents and consequences of service quality in a higher education context .they employed both qualitative and quantitative research methods. The model provides a good explanation of a university brand image, and perceived service quality was found playing an important role in this model (see Figure1). Universities intending to enhance their image are encouraged to consider focusing their efforts on marketing communication information, service quality, student satisfaction and trust. this study used 59 items.

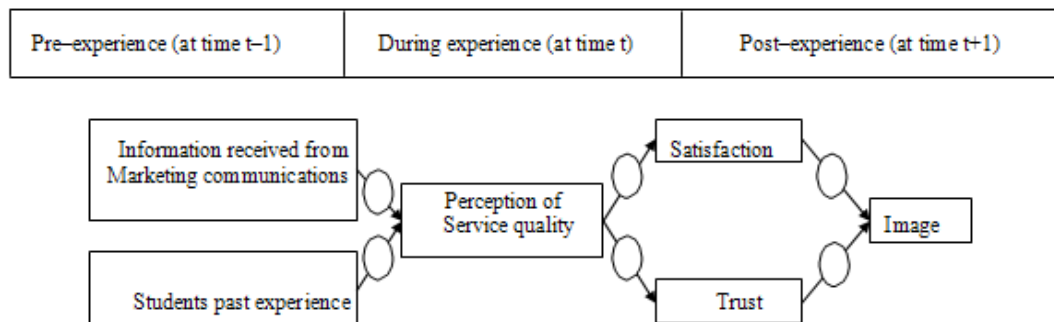

Figure 1 The Research Model

Sultan & Wong (2012) found that information (marketing communications) is more statistically Significant than past experience as the antecedents of service quality. The consequences of service quality are composed of trust, satisfaction, and image. Overall, the results suggest a good validity of the theoretical model and the key paths in the model are found statistically significant, except past experience affecting service quality. In fact, A modified five-factor structure of HEDPERF is put forward as the most appropriate scale for the higher education sector (Abdullah, 2006).

4 Conclusion

This paper has attempted to review and integrate studies on service quality of higher education in these areas: definition and concept of service quality in higher education institution and measuring models of service quality .Since the quality of service largely depends on human behavior, the quality dimensions of the measuring instrument differ in different service settings (Shauchenka, 2010). With considerable changes occurred in higher education institutions over the last two decade, it seems that higher education should be regarded as a business-like service industry, which focuses on meeting and exceeding the needs of students (Gruber et al., 2010) . Parasuraman (1985) was apparently the first to suggest the practical model for assessing service quality that called SERVQUAL; many researchers consider that SERVQUAL has undoubtedly a major impact on the business and academic communities as it reviewed in the literature. For instance, Cuthbert (1996), believes that the Q=E-P paradigm still appeared to be the most practical model for the measurement of service quality despite much criticism in the literature. Llusar and Zornoza (2000) argued that SERVPERF results in more reliable estimations, greater convergent and discriminate validity, greater explained variance, and consequently less bias than the EP scale. And Abdullah,2006 mentioned that, A modified five-factor structure of HEDPERF is put forward as the most appropriate scale for the higher education sector. Furthermore, Brochado (2009)

compares the some alternative instruments to measure service quality in higher education such as SERVQUAL, SERVPERF, HEDPERF, concluded that SERVPERF and HEdPERF Present the best measurement capability, but he admitted that is not possible to identify which one is the Best, his findings seem to be agree with other research like Clewes, 2003 that, there appears to be no definitive instrument that accurately measures service quality .Also, Abdullah (2006), points out a review of service quality literature brings forward diverse arguments in relation To the advantages and disadvantages in the use of these instruments. In general, the arguments make reference to aspects related to the characteristics of these scales notably their reliability and validity. The long practice and experimental application for modifying suitable instrument are essential for further research. More than fifty papers related to high education service quality measurement gathered from reliable sources are considered in this paper.

Table 1 Service Quality Dimensions in Higher Education

Author (date)	Items	Dimensions	Country/university
Sultan and Wong(2010)	67	Dependability, effectiveness, capability, efficiency, competencies, assurance, unusual situation management and semester-syllabus	Japan
Angell et al. (2008)	18	Academic, leisure, industry links and Cost	One university,UK
Abdullah (2006)	41	Non-academic, academic, reputation, access, program and understanding	Malaysia
Oldfield and Baron (2000)	21	Requisite, acceptable and functional Business and management faculty	one university, UK
Kwan and Ng (1999)	31	Course content, concern for students, facilities, assessment, medium of instruction, social activities and people	China and Hong Kong
Tsinidou, Gerogiannis and Fitsilis(2010)	40	the academic personnel, the administration, the library, the curriculum, the location of the institute, the available infrastructure the services and future career prospects.	Greece
Enayatī, Modanloo, Behnamfar, Rezaei (2013)	22	Tangibility, Reliability, Responsiveness, Assurance, Empathy	Iran
R.Jain,sinh and S.K.De (2010)	40	Academic Facilities, Non-academic Processes, Curriculum, Support Facilities, Interaction Quality, Industry Interaction, Input quality, Campus	India
R. J. Angell, T. W. Heffernan and Phil Megicks(2008)	38	Academic, Leisure, Industry links, Cost/Value for money	UK

An International Comparative Study on the Features of University-Industry Linkage Modes

Wan Zi

Foreign Language Institute, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: wanziwendy@126.com)

Abstract: This paper analyses the international modes of university-industry cooperation in R&D abroad and attempts to give implications on the collaborations among the three sectors: universities, research institutes and enterprises in China. A comparative study on the university-industry linkage modes in America, Germany, Canada and Japan is conducted. Thus close combination, pragmatism-orientedness, learning-basedness and sound systems and institutions are the key experiences for China to fully develop university-industry cooperation. However, even though China has achieved great progress in combing the three sectors to stimulate technological innovations, it still lags behind for the lack of autonomy, vitality and adaptation of universities, running off numerous scientific resources and talents, unestablished relevant policies, regulations and coordinated sets of measures for university-industry cooperation. In the end the paper attempts to give implications on the measures about perfecting university-industry linkage mode in China.

Key words: University-industry linkage mode; Technological innovations; High-Tech talents; Comparative study

1 Introduction

The university-industry linkage mode in higher education aims at fostering students' overall qualities, comprehensive skills and competitiveness in job-hunting by taking advantages of the resources and environments at universities, research institutes and enterprises where classroom teaching and practical work can be combined closely to train students to meet the requirements from the society.

In the past two decades, with the shortened cycle of the transformation from scientific technology to productive force, higher education is required urgently to provide the wanted talents and technology to stimulate economic development. The university-industry linkage is an inevitable tendency in that universities are compelled to seek financial support from the industrial circle, which is eager to obtain talents and High-Tech research results from universities in turn so as to seize favorable opportunities in the market. Evidences prove that the university-industry linkage, as the major tendency of higher education, can cultivate practical talents effectively, facilitate the transformation and application of science and technology and serve economic development. This paper aims at achieving implications on how to promote the combination of the three sectors---universities, research institutes and enterprises and the application of it by analyzing the international modes of the university-industry linkage.

2 International Comparative Study on University-Industry Linkage abroad

2.1 American Mode

In the development of American university-industry linkage, the characteristics of the combination of universities, research institutes and enterprises show themselves in multiple levels, forms and large scales. The striking features of university-industry linkage in America can be listed as follows:

First, universities cooperated with the government closely. As early as the World War II, American universities had undergone technological innovations under the guidance of the government. Technological innovations were added to the function of American universities besides the traditional role of spreading profound theoretical knowledge, undertaking scientific researches and serve the society. In the 1980s, Reagan administration advocated cooperative research undertaken through the joint efforts of universities and enterprises by proclaiming the counter-measures to cope with the recession-- "We should stimulate domestic economy and rejuvenate the nation's prosperity".

Second, universities and enterprises undertook cooperative researches. To this end, research projects were chosen by two or either side and conducted by the alliance between universities and enterprises, which enables universities to extensively participate in technological innovations. The research projects were targeted for universally existing technical problems of some line of business to undergo explorative researches, which is regarded as applied research. The four first-rate research universities---Berkley Institute in California, Harvard University, Massachusetts Institute of Technology

and Stanford University are typical cases of the successful integration of industries and enterprises. Enterprises entrust universities with research and development and provide training bases for internship. The two sides assigned their own staff to co-build centers of researches, development and application;

Third, financial support is guaranteed through three major channels. Special funds are established to sponsor the cooperative research projects by the federal and state governments; subsidiaries, donation and cash donation for non-special programs given by profitable large companies, enterprises' transfer of scientific and technological equipments to universities by way of donating or charging symbolic fees and setting up researching or teaching posts for college professors to do research work in accordance with sponsors' projects and requirements whose salaries are paid by the enterprises; the funds obtained from local authorities and communities help cope with the training of local talents and problems.

Fourth, management branches are founded, whose main concern is to deal with contents of research and development, numbers and scales of training talents, arrangement of curriculum, management of finance and the mutual assignment of staff.

Therefore, close combination, extensive contents, long stability, financial guarantee and practical application are the leading features of American mode of university-industry linkage.

2.2 German Mode

Compared with American mode, German university-industry linkage focuses on consistency of targets, lasting processes and high efficiency, stemmed from vocational education---“the dual system” under which theoretical knowledge is laid as the solid base and application as the purpose; teaching activities are arranged alternately in universities and enterprises; it is the task of mutual sides to train practical talents. The operative framework can be illustrated as follows:

First, university-industry linkage plans come into being in accordance with vocational education laws, strengths in disciplines and needs of enterprises. The plans which deal with cooperative means, aims, programs, deadlines, investment of capital and sponsorship, mutual rights and obligations are proposed by enterprises and coordinate with relevant universities, therefore executive plans can meet expectations from both sides. Second, the training and cultivation of vocational talents are viewed as priority. As is stipulated in Germany vocational education law, it is a must that 80% of the young people receive vocational education at different levels. After finishing their fundamental education, most of the children become apprentices, receiving trainers' guidance in factories where teachers are assigned to give relevant theoretical assistance while learning theoretical knowledge at vocational schools where professionals come to negotiate curriculum and teaching, which greatly increase the efficiency of cooperation between universities and enterprises. Third, research and development are targeted for the market. Pragmatics is German people's way of doing things. Based on the market demands, enterprises proposed cooperation projects to universities who are responsible for research and development and then finish the trial of the whole project with staff of the enterprises before the products are put in the market. The right to use the cooperation funds sponsored by enterprises is entitled fully by universities under the supervision of them. For one thing, universities obtain resources, transform knowledge into productive force and become better acquainted with the market and accordingly they can adjust the arrangement of disciplines and specialties; for another, enterprises win the market and profits. Fourth, advisory cooperation system is held in esteem, which leads to the emergence of advisory cooperation system. Under such a system, teachers are required to assume the post of counselors for different lines of business; large or small enterprises authorize the right of counseling to professors of universities of technology and open an free access of information about them to professors.

Once the linkage between universities and enterprises is established, it will be long, stable and close, which aims at pragmatic efficiency. The renowned reputation for German products around the world is inseparable from their cooperation model.

2.3 Canadian Mode

There are two ways of cooperation in terms of Canadian university-industry mode.

One of the two features is the cooperation among universities, students and enterprises, the major feature of which is the combination of students' specialties with their practical work. The basic procedures are: after finishing certain courses, students are arranged to designated companies or enterprises to undertake paid work. The working hours should reach at 1/2 of the time spent in learning their courses. Universities are responsible for contacting enterprises which could offer traineeship program as well as fees for students; universities will follow up with the investigation on students' internship performance and enterprises will give guidance and appraisal in the traineeship program. Canadian universities reckon that the three sides participated in the cooperative model can gain benefits respectively: students can obtain practical relevant work experience, establishing a solid foundation for

their future career, and receive payments to cover their tuition; enterprises can discover and recruit excellent future staff by evaluating their working performance, thus reduce training expenses for their employees and have the possibility of hiring temporary workers; universities can be aware of the social requirements from graduates and adjust talents training strategies accordingly to recruit more competent students, enlarge the scale and profits of education by strengthening the bond between enterprises and the society. The other feature is to stimulate socialization of teachers, i.e., employees of the cooperative enterprises are encouraged to assume teaching post. For instance, 1,800 teachers at Algonquin College of Applied Arts and Technology in Ontario come from industrial or business fields. In order to grant the uniformity of teachers' content of teaching and the orientations of universities' cultivation of students, a council was set up, consisting of 17 committee members authorized by the authorities, the majority of who come from local enterprises and business sectors, to make important decisions and provide guidance to school teaching.

Canadian mode of cooperation views "learning" as the priority in the university-enterprise linkage, thus the function of talents who received higher education can emerge, which is the striking feature different from other models.

2.4 Japanese Mode

The cooperation in research and development between Japanese universities and enterprises started as early as post World War II. In 1960s, Japan's Economy Council issued a paper titled as "On the Requirements of the Newly Established Universities in Economic Society" in the memorial ceremony for the 10th anniversary of the foundation of the Association of University Standards, claiming that the first function of new universities is to train professionals and technicians for industrial circles; the second is to undertake applied and pragmatic industrial researches, which serves as the starting point of the development of university-enterprise linkage. The features of Japanese model include the following aspects:

First, cooperation in research and development between universities and enterprises is regarded as one of the basic state policies. The Japanese government advocates that higher education and academic research should be closed linked to the industrial circle. In order to promote cooperative research, Japan has taken measures to set up a series of systems to guarantee the development of university-enterprise linkage, as is stipulated in Fundamental Research and Technology Plans in July, 1996 and Educational Reform Programs in January, 1997, which mainly focuses on Japanese government's policies and strategies on how to promote the cooperation in research and development.

Second, measures about how to stimulate the bond between universities and enterprises are systematized. A variety of systems such as authorized research systems entrusted training system, donation and scholarship system, donation lectures, laboratory system, funds allotment and expenditure system, guarantee of research right system and mutual assignment of staff on both sides are the summary of Japan's experience and lessons after ten years' operation of this university-enterprise linkage model.

Third, universities and enterprises should strengthen their cooperation in training senior researchers and technical talents. The two sectors shoulder important educational responsibility in training talents. Postgraduates in Japan finish their studies on fundamental theories before they enter the cooperative firms which provide funds, workplaces and research topics, assisting them in achieving their degrees.

Fourth, universities establish hi-tech parks as carriers of the cooperation between university-enterprise linkages. Hi-tech parks have been built where universities, special research institutes and firms are densely situated to produce hi-tech talents and newly-developed products, University of Tsukuba being a good case in point.

Table 1 Features of International University-Industry Linkage Mode

Nations	Features
America	Close combination with the government and enterprises; guaranteed financial support; founding of management branches;
German	The dual system protected by laws; training of vocational talents as a priority; R&D targeted for the market; the application of the advisory cooperation system
Canada	Combination of students' specialties and their practical work; stimulation of the socialization of teachers;
Japan	The linkage guaranteed by state polices; systematized measures to promote cooperation; strengthened cooperation in training senior researchers and technical talents; establishment of hi-tech parks by universities.

The countries mentioned above have their own distinctive feature of university-enterprise linkage modes originated from their respective conditions and situations.: American university-industry mode features close combination, extensive contents, long stability, financial guarantee and practical application; German mode is pragmatism-oriented; Canada views learning as the priority in the university-industry linkage, thus the function of talents who received higher education can emerge; the bonds between universities and enterprises in Japan are more systematic and institutionalized.

3. Domestic Situation of University-Industry Linkage

3.1 Major modes of cooperation

After years' of university-industry cooperation practice, cooperative means are various, such as co-founded engineering and technology research centers, enterprises' technology centers, post PhD workstations, making full advantage of universities and research institutes to train technical talents and management employees. There are several major ways of cooperation between universities and enterprises in research and development.

First, technological innovation bases are built to stimulate production transforming. In the past decade, development and industrialization bases are constructed to center on the needs of the national economic development. There are all together 5,090 R&D institutes at universities, the fixed assets of which reach as much as 158,000,000 RMB. Besides, there are 106 key state laboratories and more than 50 national engineering research centers located in universities. What's more, universities, enterprises and local government co-built numerous university-industry cooperation centers, technology development centers and research development centers. Second, strengthening the cooperation with local governments to prosper the development of regional economy is another feature of university-industry linkage. According to the statistics of 2003, more than 80% of the large and medium-sized enterprises, the majority of provinces and cities have established full-scale cooperation in development and transferring of technological results. Third, hi-tech parks at universities are the incubators of hi-tech enterprises, training bases for innovative talents and platforms where all sources and elements are gathered. The state-qualified 22 hi-tech parks incubated 2,511 hi-tech enterprises, developed 3,561 new products, which help to better industrial structural adjustment, provide 100,000 employments workers, attract investments from different social sources, thus a multi-dimensional service system for hi-tech innovations is established.

3.2 Problems emerging in the cooperation

In terms of the domestic situation, China's style of economic increase hasn't achieved fundamental changes for the development and technology aren't geared to economic increase; besides, the allocation of educational and technological resources can't meet the needs of the market economy. Consequently, the problems mentioned above have become the major element that limits educational level, economic development and international competitiveness. The unfavorable elements that affect the university-industry cooperation include the following.

First, the lack of autonomy, individuality, vitality and adaptation because of historical reason make Chinese universities sealed off from the society and the industrial world. With the reform and opening-up, the conflict between the isolation of universities and the gradual establishment became intensified, calling for prompt changes to step out of the sealed condition. Through the university-enterprise linkage, the extensive cooperation with the social sectors and the industrial circle has made it possible to efficiently decide on research topics and technological innovation projects, preventing from sealing off from social practice. On the other hand, the teaching and research staff at universities have little awareness of research and development and they don't see the value of hi-tech products. Therefore, there is still a large gap between the projects oriented at obtaining quick returns required by small or township enterprises and the hi-tech research results and technological innovations. Most enterprises can't afford the long cycle, huge risks and large costs; whereas technological innovations are not mature enough in terms of technical equipment to be applied in production.

Second, even though the research capabilities of enterprises have been improved, but numerous scientific resources and talents are not gathered there, which is the key to the low competitiveness of their products. At the same time, enterprises are not willing to invest more capitals in the training of graduates, which is considered as wasting enterprises' resources and increasing costs.

Third, relevant policies, regulations and coordinated sets of measures haven't established. The fact that legislative work in terms of education and technology is still in its preliminary stage constrains the university-industry linkage. For the time being intermediary agencies for coordinating universities,

research institutes and enterprises are too scarce to function as a bridge to provide service in consultation and smooth the relations among the three sides. What's more, lack of capitals is another barrier to the cooperation in research and development.

4 Conclusion

The university-industry linkage is a complex system, involving interests, laws and the governments at all levels. Comprehensive measures should be taken to motivate the cooperation between universities and enterprises. The comparative study on the mode of university-industry linkage of different developed countries has given implications in the cooperative mode, setting up of government regulations and implementation.

First, the government's function in management and guidance should be strengthened. Governmental support is an indispensable element in promoting the rapid development of university-industry cooperation. The government should establish sound legal and institutional systems to serve as the rules to regulate market behaviors. Besides, it is of great importance for the government to support university-industry cooperative innovations in form of setting up scientific and technological plans, so as to avoid the risks brought by technological innovations to the enterprises, which can cover the shortage of the current national scientific and technological plans in supporting the university-industry cooperation.

A Case Study on the Means of Distributed Innovation in Iron and Steel Industry

Li Tielin, Liu Guoxin, Yang Kun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 007ltl@163.com, syliuguox@126.com, yangkun12345688@126.com)

Abstract: As a traditional pillar industries, the iron and steel industry are actively exploring the path of efficient innovation and resource sharing given the background of the continuous development of economic globalization and the IT era, and thus the distributed innovation are given more attention in the iron and steel enterprises. This paper analyzed the major modes and means of distributed innovation based on the case study of the typical steel enterprise, and further studied the features and management points of the distributed innovation in the iron and steel industry, so as to provide theoretical and practical guidance for the innovation management in iron and steel enterprises.

Key words: Iron and steel enterprises; Distributed innovation; Innovative approaches; Case study

1 Introduction

As the pillar industry of national economy, iron and steel industry still shows its vitality and vigor, after the rapid development in the 20th century. To keep the competitive advantage in the market and irreplaceable position of steel material, the world's major iron and steel enterprises all possess their own research & develop team and carry out all kinds of research projects to consolidate their market share. Distributed innovation (DI) has gradually become the most important way to improve the efficiency of research and development in many good iron and steel enterprises. Distributed innovation means the innovative activity between enterprises and its cooperative enterprises in different places, based on the principle of source sharing and with the help of the common network platform^[1]. Currently, the distribution innovation approaches in the international iron and steel industry mainly has the following ways: (1) cooperative innovation with institutions of higher learning and scientific research institutes; (2) cooperative innovation with government and social institutions; (3) cooperative innovation with industry chain (upstream, downstream and peers); Those distributed innovative approaches emerge in the iron and steel industry and display their vigor and vitality.

2 Industry-Academic-Research Cooperative Innovations with Universities

2.1 Case of cooperation between Arcelor Mittal Corporation and University

Constructed by Arcelor Mittal Corporation cooperated with the department of material science, chemical and mechanical in McMaster University, McMaster steel research center is a typical research center under the lead of enterprise¹ together with the university. The center is located in Hamilton, Canada (shown in Table.1).

Table 1 Projects Carried out by Arcelor Mittal Corporation Cooperated with McMaster University

Project	University	Project leader	research contents
Research on ferrous metallurgical process	McMaster University	Dr. Gordon Irons	Vacuum and electric furnace steelmaking
Research on ferrous metallurgical process	University of British Columbia	Dr. Matthias Militzer	Metallurgical process design for high grade steel--from casting to hot rolling finished product
Automatic control technology and information technology	McMaster University	Dr. John McGregor	Improvement of cost, buckling-strength coefficient, and quality with automatic control technology and information technology

As to the relationship between the Steel Corporation and McMaster steel research center, the R&D director in Arcelor Mittal said: “the cooperation with McMaster University and McMaster steel research center today is more important than any time before, because it affects whether or not our company could get continuous innovation in the long term groundbreaking research [2].” From the above case, we can conclude:

(1) Arcelor Mittal Corporation thinks very highly of the model of Industry-University-Institute

¹ This paper is supported by NSFC(71072076)

Cooperative innovation in in the strategy level. In the current increasingly fierce international competition environment, it is impossible for enterprises not to take advantage of the “extended mind” to increase innovation capability and efficiency.

(2) The cooperation between Arcelor Mittal focuses on the basic research for iron and steel metallurgical process. This kind of research is the foundation for technology improvement in production filed and the research result is with a wide range of adaptability. As basic research has a longer period and higher requirement for academic background, it is very right to cooperate with universities.

2.2 Practice of cooperation research between Baosteel and Universities

(1) Car plate using technology joint laboratory constructed by Baosteel and Shanghai Jiaotong University

Baosteel and Shanghai Jiaotong University founded “Baosteel-Shanghai Jiaotong university joint laboratory for car plate using technology” in 2000. The laboratory is located in car body manufacturing technology center in Shanghai Jiaotong University, with two directors from Baosteel and Shanghai Jiaotong University respectively. Both directors are fully responsible for the joint laboratory work. The two cooperation sides assign its own communicator to take responsibility for the communication and contact with each other. The joint laboratory sets joint research projects according to the strategy development needs every year, in order to solve technical bottlenecks. With relatively fixed members, the laboratory will held joint conference every year to discuss the cooperation plan and development and some other important issues. Once a quarter, the research institute will held academic activity to communicate about the recent development for joint research project and relative technologies domestic and broad.

Nine years have passed since the establishment of the joint research. With complementary advantages, resource sharing, the research center carried out close cooperation in car plate design, manufacture, application field and close communication between staff from two sides. A number of theory, technology, method, and test specification with independent intellectual property rights are formed; Special software and experimental equipment are developed; The key technology in stamping simulation for automobile body covering parts is solved; Significant achievements has been achieved in the control of stamping scrap for large key covering parts, which promotes the application of high strength steel plate in the lightweight body^[3].

(2) EPM joint laboratory for electromagnetic processing of material founded by Baosteel and Northeastern University

The history of industry-university-institute cooperation between Baosteel and Northeastern university can be traced back to the 1990s. With the annual meeting system (the two sides held annual meeting at least once every two years), Baosteel and Northeastern university has lead a multi-level cooperation from the technical research and development, personnel training, *etc.* on a large scale. In 2000, Baosteel and Northeastern university built "Baosteel – Northeastern University electromagnetic process for material (EPM) joint research center", for the research of electromagnetic metallurgy technology. At present, the laboratory has reached the international leading level in the aspect of hardware and software facilities, and the electromagnetic continuous casting billet achievements has reached the international advanced level of similar research, which was awarded the first prize for 2002 year China metallurgical science and technology.

In order to better carry out the research work, Northeastern University built the new building for the laboratory and also especially set up a studio for Baosteel researchers, all of which provides a convenient environment for researchers. Since it was founded in 2000, the center assumed and completed a series of major national research projects in the field of material electromagnetic process, and carried out more than 180 cooperations in scientific research. In applied research, the iron making magnetic segregation cloth project replaced the Japanese technology and has implemented the industrial application. The industrial experiment research for electromagnetic soft contact continuous casting technology has reached the international level.

(3) “Key laboratory for metal functional materials development and application” founded by Baosteel and Tongji University

The lab's predecessor was founded in 1995, affiliated to the Shanghai iron and steel research institute, Shanghai key laboratory of metal functional materials development and application. Shanghai iron and steel research institute and Tongji University cooperated to build this lab in 2002. Shanghai iron and steel research institute was affiliated to five steel co., LTD, a branch company of Baosteel in 2003. Since then, Baosteel and Tongji University started to build the laboratory course. Cooperation field is mainly focused on the metal functional materials research & development, and gradually expands to the

inorganic, organic functional material research & development. The development goal is to become a comprehensive research & development of the national key laboratory of functional materials^[4].

After years of development, the laboratory has introduced the domestic and international advanced instruments and equipment and cultivated a group of senior materials research workers. It has become a first-class metal functional materials laboratory in Shanghai and across the country.

3 Industry-Academic-Research Cooperative Innovations with Government and Social organization

3.1 Case of Arcelor Mittal—OCAS research center

Arcelor Mittal OCAS R&D center is the world's top level of research and development center, founded by Arcelor Mittal and Belgium Flemish regional government and converted from the original company Arcelor steel flat material research and development center of Ghent. The center is located in Gent. The purpose of the local government investment is to push Belgium district economic development and technological progress^[5]. Figure 1 shows the shareholder structure.

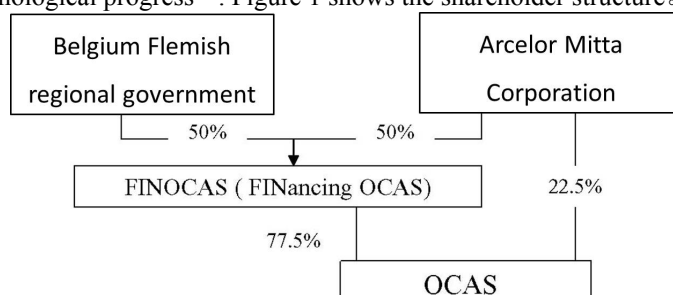

Figure 1 Shareholder Structure of OCAS R&D Center

From Figure 1, Belgium Flemish regional government and Arcelor Mittal paid 50% of the OCAS enterprise fund respectively, and the fund is managed by OCAS enterprise management (FINOCAS). This fund set up a joint venture with Arcelor Mittal to found OCAS R&D center, including OCAS enterprise funds accounted for 77.5% of total equity. The main R&D field of this center is for the ordinary steel used in industry---household electrical appliances, machinery, building and construction, pipeline, air conditioning, heat sinks, drum, furniture, electromagnetic application, energy generation, energy transfer and storage system *etc.* . The main object of service is for Arcelor Mittal's customers. Overall, the OCAS R&D center has the following features:

(1) OCAS R&D center is the product of government-industry-academic-research collaboration. The birth of it is due to the government's emphasis on scientific research. The main service object is Arcelor Mittal's customers, and it also played a role to promote regional economic development and technological progress in Belgium. So to speak, this collaboration achieves a win-win situation, so to speak.

(2) From the OCAS R&D center of shareholder structure, it can be found that OCAS is a marketable operation center and it must follow the market rules. It implements "all customer oriented" marketing strategy. All service points to the purpose of establishing long-term partnership with customers. The establishment of long-term partnership established the R&D center of market position, also brought Arcelor Mittal enterprises stable customers.

(3) The Center itself is also a teaching unit. The combination of teaching and research eliminate the transition from university to market and the result of research could serve for industry directly. Combining study with research is already very popular in foreign companies and many big companies can be independent to award degrees. Whereas at home, enterprise usually forms alliances with universities and talent is cultivated by enterprise and college together with common research and development project. The final degree is awarded by colleges or universities.

3.2 Global or regional innovation platform of cooperation innovation practice

The practice of innovation based on the plat form of the world steel association, the European Union, Japan iron and steel union and other international or regional cooperation is very rich. The innovative results also emerge in endlessly.

(1) World steel association

World steel collaboration for the iron and steel industry is the world's largest, most dynamic industry association, with more than 190 members, including iron and steel production enterprises,

national and regional industry association and independent steel research institutes. In this international innovation platforms, a large amount of project based cooperation innovation practice is under research, such as the breakthrough plan for CO₂, project for Living Steel, life cycle assessment, by-products of management, etc.^[6].

(2) The European steel technology platform

Driven by the European commission in 2004, initiated by Arcelor, the main stakeholders in European steel industry, namely the seven iron and steel enterprises, one industry association, four research institutes, 25 member states representatives, 47 universities, two unions, suppliers, and the European commission together, formally established steel technology platform in Brussels^[7]. Since it was established, the specific strategic goals were put forward: (1) Ensure the European iron and steel industry profits through innovation and new technologies; (2) Meet the needs of society through cooperation with relevant industrial partners quickly; (3) Attract and protect steel human resources; To achieve the strategic goal, the European steel technology platform set up six big working group for innovation, automobile, construction, energy, environmental, and human resources ,*etc.*.

4 Distributed Innovation of Industry Chain

4.1 Cooperative innovation practice in Arcelor Mittal industry chain

The strategic alliance of this new enterprise cooperation innovation mode in the iron and steel related industry chain between enterprises began to appear between the upstream and downstream enterprises in the 1990s, and presented the trend of more and more close and widely cooperation. Arcelor Mittal established extensive cooperative innovation relations with vast majority of global auto manufacturing and other downstream enterprises. Figure 2 and Figure 3 shows its cooperation with Global auto manufacturers and downstream users of other strategic cooperation.

Figure 2 Cooperation Innovation Between Arcelor Mittal and Automobile Manufacturer

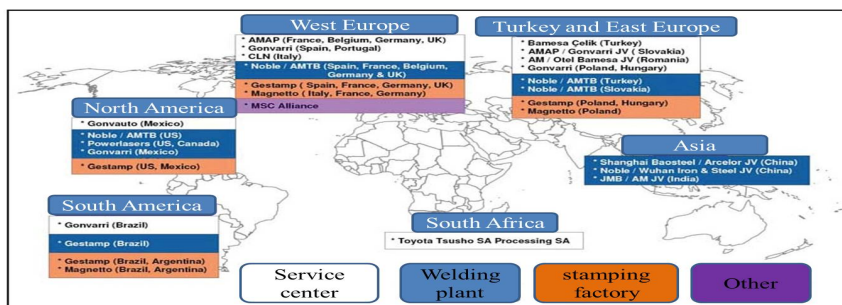

Figure 3 Cooperation Between Arcelor Mittal and Downstream Users

In response to the auto industry globalization and to meet the global supply system demand, Arcelor Mittal set up strategic alliance with Nippon steel in the car plate production and related business areas to develop a close technical cooperation. Both sides jointly established the "global strategic alliance steering committee" (GSC) and professional committee in the field of relative business. The chairman of the committee is designated by both sides, from one of senior vice Presidents from each company. Members of the committee consist of experts from both sides. In the core business areas of technical alliance - car plate production technology, Arcelor Mittal and Nippon steel, have adopted the following cooperation:

(1) Joint owned products and services: Both sides choose together about 100 varieties of products as the joint owned products, and establish mutual technology/product service system in Europe, Japan, North America, South America, China, and other regions. Through cross licensing, both sides supported each other in terms of products and services, and will not affect the normal competition between the two sides.

(2) Joint owned technology research: Both sides develop joint owned technology research in higher strength grade of steel, including the new steel grade development, squeezing and collision test simulation and development of welding technology.

(3) Cooperation to develop new technology: Both sides mainly conduct study about the new steel grade, new production processes and new steel solutions for research and development.

(4) Build joint venture plant: As China has become a global auto production country; the two sides will focus and target the market in China, and set up joint venture with Shanghai baosteel to provide high quality product for the Chinese car manufacturer, in line with the global standard.

Although the initial technical alliance between Arcelor Mittal and Nippon steel is limited to the car plate business, in recent years, with the deepening of cooperation, the cooperation has begun to set foot in other fields, such as raw materials procurement, utilization, joint development of new strategic business, etc..

4.2 United States Nucor and Australia's BHP, Japan IHI cooperative innovation

In 1988, Australia's BHP Billiton and Japan IHI company (formerly known as ishikawa island company) jointly developed Castrip technology (the technology has many advantages: less investment, lower operating cost, energy conservation and environmental protection, covers an area of less, flexible operation), named project M. Project M ended in 1999, in the ten years of development, the two sides overcame the technical difficulties, on the basis of Mr. Bessemer's original concept. Many process was improved and the total roll out was more than 30000 tons of steel, which are used in the roof, pipe and packaging, etc..

Although technical success was achieved, the feasibility of double roller rolling thin steel strip in industrialized mass production remains to be verified. BHP and IHI realized that they need an iron and steel enterprises as partners, to achieve double roll thin strip roll casting process for industrial application in the end. In March 2000, America's biggest steelmakers, Nucor steel company joint BHP Billiton and IHI Company, and the tripartite cooperation established the organization, Castrip LLC., for double roller cast-rolling Castrip technology development and application of the thin strip.

In May 2002, Castrip LLC successfully built the world's first set of all commercial double rollers rolling thin strip steel plant, used to produce carbon steel and stainless steel, at Nucor steel company Crawford's factory. It's the world's first commercial operation of this technology. The development process of Castrip process is shown in Figure 4.

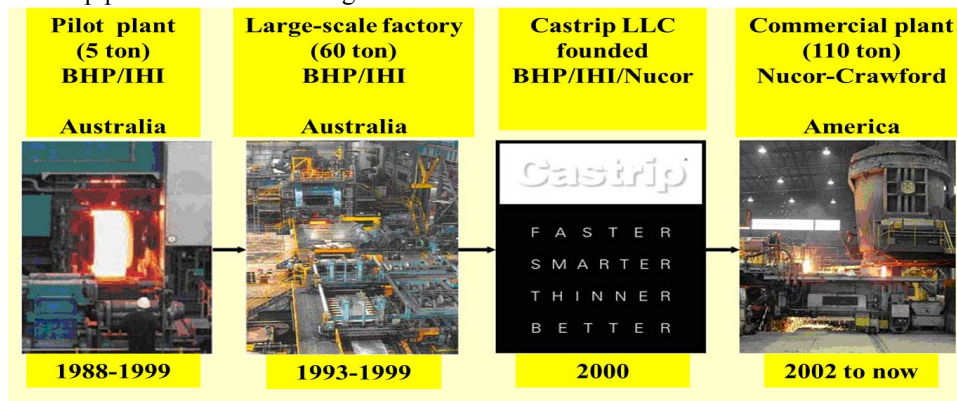

Figure 4 The Development Process of Castrip Process

4.3 ThyssenKrupp and JFE cooperation innovation practice

The distributed innovation practice between ThyssenKrupp in Germany and Japan JFE is in the form of technology strategic alliance. ThyssenKrupp and JFE are both strong in technical strength, but the production and sale of the two companies have their own certain regional, technical characteristics. JFE's production and sales are mainly limited in Japan and Asia, whereas ThyssenKrupp's production and sales are mainly in Europe. In response to the growing steel industry competitive environment and increasing trend of the globalization in the downstream of the automobile industry, the two companies

started the technology alliance for the performance of the cooperative innovation process in 2002.

In April 2002, ThyssenKrupp signed a cooperation agreement with NKK (at that time, Japan's second largest steel company) and Kawasaki steel (the third largest steel company at that time and in 2002 September affiliated into JFE group), visioning not only to jointly develop directly for global auto makers, but also to build a global supply network system, and constantly enhance their competitiveness through collaboration^[8]. In October 2004, with the goal of entering the mainland China auto industry market, the two sides agreed to exchange the researchers to complete a new generation of high strength automotive steel research and development work. In late 2004, ThyssenKrupp got JFE's authorization to produce JFE's Nano high tension steel plate (precipitation strengthening type), and JFE company can also produce ThyssenKrupp company's CP high tension steel plate (composite reinforcement type), thus the system in which the two company can produce the opposite side's product is built. Then, the two sides established the promote committee consisting of senior leadership from two companies to promote strategic cooperation issue, and high strength steel sheet, surface treatment, related application technology, and other working groups were set respectively under the promoting committee. In June 2005, JFE Steel Corporation formed a joint venture with ThyssenKrupp, named JEVISE new company, which is responsible for the coordination of both sides in the market and technical communication, by both parties each holding 50%, headquartered in Tokyo. In January 2008, the two companies announced the successful development of a new composite structure hot-rolled steel plate with high tension for car manufacture, and put forward the patent application for this technology.

ThyssenKrupp and JFE cooperative innovation is a typical combination of complementary advantages. Through the cooperative innovation, research and development efficiency is improved greatly, research and development achievement is outstanding, the cooperation process is full of trust, mutual benefit and reciprocity is strengthen, and ultimately a win-win situation is achieved.

5 Characteristic Analysis of Typical Distributed Innovation of Steel Enterprise

5.1 Characteristics of distributed innovation of Arcelor Mittal

Arcelor Mittal is an international iron and steel enterprises with the largest crude steel production in the world, merged by the world top two iron and steel companies, Mittal steel company and Arcelor steel company in 2006. Arcelor Mittal company research and development work is controlled by group management board members and senior executive vice President. All funds are collected by the enterprise internal financing and allocated directly by the President, used in products and technology, quality assurance and long-term strategic research and development.

As a super steel carrier with thousands of R&D centers, its industry-academic-research cooperation activities covered various forms. Due to its internal scientific secrecy and the limitation of information collecting channel, very detailed information cannot be got, but through the specific case, it is able to understand the characteristics of its production practice.

(1) Arcelor Mittal is a multinational enterprise group, with factories all over the world, thus its distributed innovation activity has obvious regional characteristics. The forms of cooperation are also varied with the OCAS research center cooperated with local government to participate, jointly research center with universities and other study alliance with other iron and steel enterprise.

(2) OCAS cooperation mode combines the development of enterprise with the progress of area economic and technical development. As joint-stock R&D, stabilizing and enlarging market share and helping customers to realize its value become the focus of the research and development work. Actually, OCAS research center is built on the basis of Mittal's industrial steel research center, thus there is overlap phenomenon in such aspects as personnel, equipment and workplace between the two research institutions. The cooperation mode takes advantage of Arcelor Mittal's research and development resources such as internal people, money, and goods and external funding. It is still good to promote the cultivation of talent and keep stability of human resource.

(3) The cooperation between Arcelor Mittal and universities is focused on the basic research for iron and steel technology. Joint research projects are not just confined to the above cases, and should be more widely and deeply. Due to the limitation for information acquisition, the detail is not discussed here.

(4) The establishment of strategic alliance for cooperation between enterprises of innovation practice by Arcelor Mittal can be rated as the model of the steel industry. The main strategic alliance is on the basis of technical cooperation, and established a relatively perfect operation mechanism, equipped with professional personnel. On the choice of strategic alliance partner, it also selected from

all walks of life with outstanding technical capabilities, on the condition that their business are with coordination or complementary effect. Strategic alliances not only bring benefit for users, but also create favorable conditions for the publicity for their own technologies.

5.2 The characteristics of Baosteel distributed innovation

Since the establishment in 1978, through the first, second, third term of construction and a series of joint reorganization after the adjustment and transformation, Baosteel has become China's largest and most advanced in technology and equipment among the integrated iron and steel enterprises. Its development has experienced three stages of technological innovation: the first stage set introduction, digestion and absorption as the main body; the second stage was to master imported technology to realize secondary innovation on the basis of comprehensive digest; the third stage or the current stage is based on the orientation of autonomous integration "open innovation". It is necessary to emphasize that the distributed innovation runs through the whole historical process. Figure 5 illustrates Baosteel strategic objectives for technology innovation and distributed innovation.

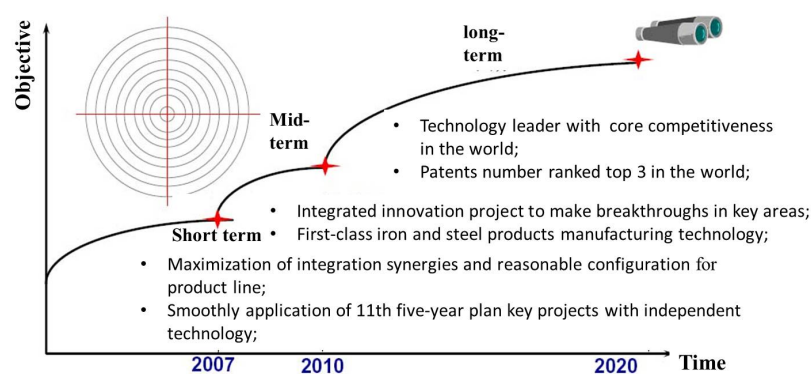

Figure 5 Baosteel Strategic Objectives for Technology Innovation and Distributed Innovation

In recent years, Baosteel makes full use of the scientific research resources at home and abroad in the exploration and practice of new model for distributed innovation and new method for process. With constantly tries to build platforms for the communication of knowledge sharing and cooperation, technology innovation has made considerable progress. Baosteel distributed innovation presents the following features:

(1) Industry-academic-research cooperation practice of Baosteel has been closely related to the company's technical innovation strategic target, and is an important part of company technology innovation system. Around a new round of development strategy, advantage colleges are carefully chosen by Baosteel as a strategic partner, which is based on specific projects, in various related fields, in order not only to ensure the input-output balance of scientific research project, but also to realize the industrialization of research results.

(2) Baosteel conducts widely international cooperation about Cutting-edge technology, high-end fields such as metallurgy technology, automotive steel, with Europe, North America and the Asia Pacific region scientific research organization. And it also takes an active part in the world steel association activities, carrying out the study of more than 10 public projects. Through the international technology cooperation, the technology and knowledge source of Baosteel were enriched. The technology innovation ability and the level of resources in Baosteel are improved. A huge knowledge communication network formed internal and external Baosteel.

(3) By cooperating with key colleges and universities to carry out laboratory, etc., Baosteel directly involved in the national technology research frontier subject. Except for the cooperation with northeastern university, Shanghai Jiao tong university and so on to build the "EPM joint research laboratory material electromagnetic process" and "use of car plate technology joint laboratory", Baosteel also actively participated in the construction of national engineering research center, undertake or participate in many national 863 plan, 973 plan, major industrialization projects and supporting high-tech engineering and project

(4) In terms of exchanges and cooperation about talent cultivation between colleges, "Baosteel professor", "Baosteel part-time tutor," "joint training graduate students", "Baosteel education fund" and other measures, all provide many excellent talents for enterprise.

6 Conclusions

The valuable experience of the above excellent iron and steel enterprise in the development of distributed innovation are worthy of reference and thinking. In order to further promote the enthusiasm and creativity of scientific research personnel in iron and steel enterprises, and build first-class research and development base, distributed innovation system construction of iron and steel enterprises in China should pay attention to the following aspects:

(1) Japan and South Korea's iron and steel enterprises existing patterns are more worthy of reference, considering organization mode of the distributed innovation. But Arcelor Mittal advanced development concept and R&D service market, customer oriented strategy, are worth learning and using for reference

(2) As the world's first-class national research and development center, the research and development strategy must be well designed hierarchically, considering not only the production process research plan, but also the next 5 to 10 year or even longer plan for the future of new technologies.

(3) Construction of higher level of professional research and development center. Strengthen technical collaboration between research and development center and allocate the R&D resources rationally.

In addition, in the process of actual operation and management innovation, experience should be drawn accordingly:

(1) The principle to choose cooperative innovation partner should be based on the outstanding technical capabilities and the complementary advantages coordinated with each other.

(2) Cooperation with universities or colleges should be based on actual project, with the principle of pragmatic to form stable cooperative system.

(3) Pay attention to strengthen industrial chain (including upstream and downstream, peers, etc.) cooperative innovation to form a stable mechanism of cooperative innovation and technology innovation chain.

(4) Take further cooperation and communication with foreign excellent steel enterprise, and use good steel enterprise's technology ability to achieve leapfrog development.

Open Innovation: An Opportunity for Pharmerging Countries to Close the Technology Gap?

Hind Louiza Chitour, Yang Qing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: chitour.hind.louiza@gmail.com, yangq@whut.edu.cn)

Abstract: The pharmaceutical industry is entering a critical phase in its history, with declining profits and patent cliffs fallouts awaiting their former blockbuster drugs. It is in this context that this paper will address the opportunity emerging pharmaceutical markets could benefit from when this open innovation model is applied to the pharmaceutical industry. Mainly, we will discuss the integration of this strategy within big Pharma companies in their efforts to enter what is designated as “Pharmerging countries” in general with a special focus on one key global health market: China. We will discuss the impact of this innovation strategy could bring in terms of both tangible and intangible benefits and potential drawbacks.

Key words: Pharmaceutical Industry; R&D; Open innovation

1 Introduction

Current Pharma industry situation is critical according to most industry analysts, this new decade marks the start of a the dramatic yet predictable patent expiration wave for major drug blockbusters such as the anti-thrombosis drug Lovenox manufactured by French SANOFI-Aventis or Swiss Roche’s anti-cholesterol drug: Lipitor. The latter drug generated \$10.7billion in 2010 only, illustrating the crucial role these blockbuster drugs play in the big Pharma’s so far unprecedented profitability, peaking in the eighties and nineties ,a golden era for the Pharmaceutical industry worldwide where few Pharma Multinationals (Big Pharma) had a quasi monopoly on the global drug market.

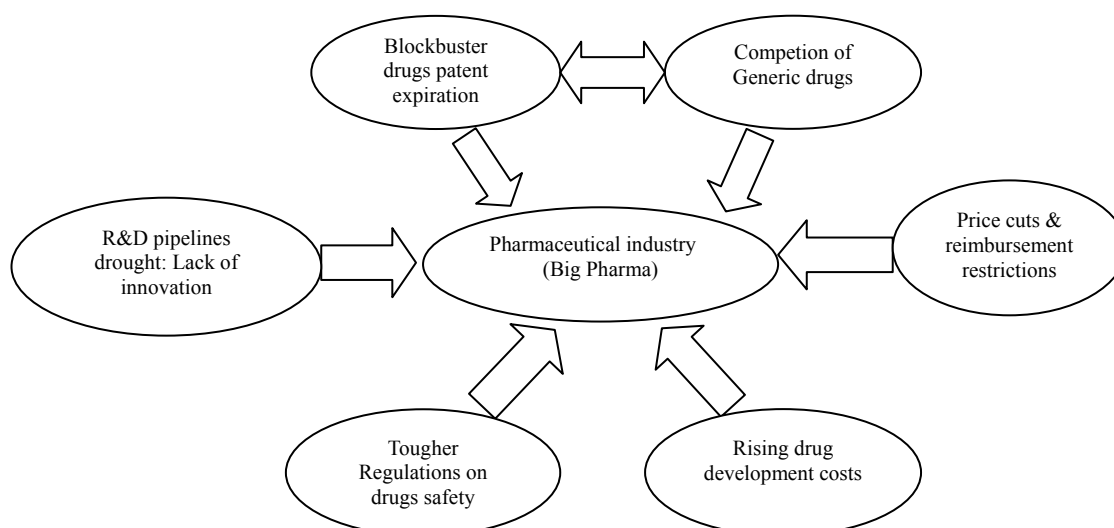

Figure 1 Challenges Hampering the Growth of the Pharmaceutical Industry

Today’s Pharma market is still one of the most profitable, with \$600billion in 2011 and a 6.5 percent CAGR essentially driven by a strong near-term growth in the U.S market and the rise of new drug markets in developing countries like China or India, where the size of the drug market is making Big Pharma salivate over colossal future profits. Nevertheless, we are currently far from the golden age of Pharma industry with Big Pharma ruthlessly dominating the market and earning astronomical return on investments with a few powerful patented drugs, namely the blockbuster drugs treating widespread conditions: Coronary diseases, Hypertension, Diabetes, Cancer...Etc. This clear blue sky is now threatened by the drug patent expiration storm and the generic drugs competition which are usually 30-80 percent cheaper than the original drugs and set to generate \$129.3 Billion USD in 2014 with a double-digit expected growth especially in Pharmerging countries (15-17 percent CAGR), also the constant pressure of price cuts governments are imposing now on the healthcare expenditures illustrated

by Austerity plans in EU countries affecting the healthcare reimbursement schemes & social security in many countries: France, Spain, UK or the Obama's Medicare plan in the US to curb health spending. Add to that the rising pressure of what some Pharma executives already qualify as an "over-regulated" industry. This refers to an increasing set of laws and regulations passed by governments through regulatory organizations such as FDA in the US and AFSSAPS in France. These organizations impose more control and transparency for clinical trials and new drug approval.

In the UK, the pharmaceutical industry faces tougher legislation on the disclosure of adverse events in clinical trials following the MHRA's thwarted attempt to prosecute GlaxoSmithKline for allegedly withholding information about risks of suicidal behavior in children and adolescents taking its antidepressant Seroxat (Paroxetine). Another example is the bill enforced by the congress in the USA allowing FDA new authority to impose safety requirements on medicines once they go on the market, including restrictions on consumer advertising. The bill also would require registration of clinical drug trials and their results in public databases. The FDA Amendment Act of 2007 has forced the FDA to increase the standards for approvals of new drugs introducing mandatory risk evaluation and mitigation strategies (REMS).

Another major issue that the Pharma players need to address is the constant increase in the bill to develop a new drug, Pharma companies have been spending more to develop drugs but with an attrition rate of 999/1000. These costs are starting to weigh on the Pharma companies budget especially when they will not necessarily lead to the next Blockbuster drug. A study conducted in 2003 in the Health Economics Journal showed that the cost of developing a new drug for Pharma companies average of \$802 million apiece to produce in 2000, or \$1 billion in 2011 dollars when accounting for inflation^[4]. Even if there has been some controversy about the validity of these results, an independent study has been conducted to verify the accuracy of these claims and it concluded that the costs are more or less accurate with 5 percent error rate for the 2003 estimated numbers. Yet, Pharma industry remains a profitable business when conducted well and based on a promising innovative drug R&D project. Hence, Pharma companies have been trying to figure solutions out to these rising R&D costs by outsourcing some of their operations in regions where operating and labor costs are cheaper: India, China, Brazil...etc.

Despite all the aforementioned challenges the industry is facing, the most critical factor that would seal the industry's fate is the adoption of a new R&D Innovation approach that would ensure the Pharma industry's sustainable growth. Developing promising drugs is a complex equation in which consequent human and material resources are combined to result into a new drug or therapeutic approach for a given disease. So far, this has been achieved throughout a closed model in which all stages of the drug development from the discovery of the potentially active molecule or compound to its commercialization in the market were handled in-house by the same Pharma Company. This generated the highly innovative and jealously protected patented drugs; these blockbuster medicines yielded considerable benefits to their manufacturers who invested considerable financial & Human resources to develop these products yet yielded colossal profits after it was out in the market.

Unfortunately for the industry players, this single or multiple blockbuster drugs based model could not indefinitely provide sustainable growth and profits this conundrum justifies the deep rooted restructuring the pharma industry is undergoing at various levels: organizational structure, operations, production processes, supply chain and most importantly the R&D model. The latter restructuring of R&D processes has been influenced by the ascension of a new innovation model, called 'Open Innovation', which has 3 key objectives throughout the process of its implementation within an R&D structure:

- Sharing the risks (and profits) associated with the drug development process
- Reduce time & costs related to a new drug development
- Provide a sustainable growth strategy for an industry facing a drying R&D pipeline

2 Open Innovation in Pharmaceutical Industry

2.1 The open innovation concept

The concept originally dated back to the 1960's with a special focus on inter-firm cooperation in the R&D departments. However, the open innovation and its applications in today's fast-paced business landscape is a model promoted by Henry Chesbrough, a professor and executive director at the Center for Open Innovation at the University of California, Berkeley, in his book *Open Innovation: The new imperative for creating and profiting from technology*. The concept is related to user innovation, cumulative innovation, Know-How Trading, mass innovation and distributed innovation.

“Open innovation is a paradigm that assumes that firms can and should use external ideas as well as internal ideas, and internal and external paths to market, as the firms look to advance their technology”. The boundaries between a firm and its environment have become more permeable; innovations can easily transfer inward and outward. The central idea behind open innovation is that in a world of widely distributed knowledge, companies cannot afford to rely entirely on their own research, but should instead buy or license processes or inventions (i.e. patents) from other companies. In addition, internal inventions not being used in a firm's business should be taken outside the company (e.g. through licensing, joint ventures or spin-offs.)

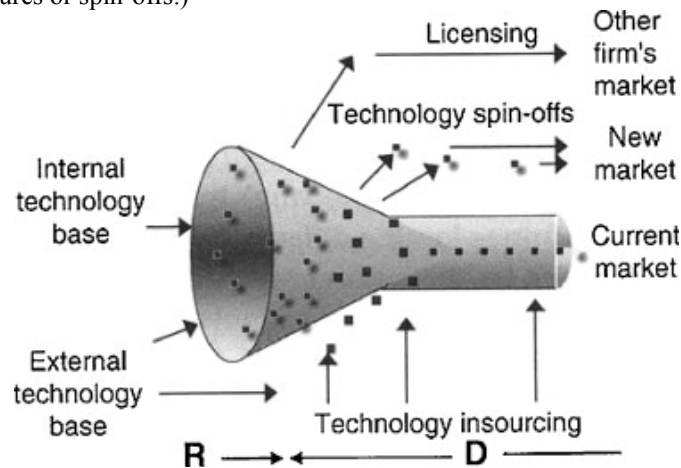

Figure 2 The Open Innovation Model (Chesbrough,2006)

2.2 Open innovation in Pharma industry-The necessary transition from closed to open model
