Open innovation is more than just a trend for the pharmaceutical industry. Indeed, the sector is undergoing a critical phase in its history, with R&D pipelines desperately dry with R&D departments either unable or not dynamic enough to produce an innovative, safe and profitable drug. The Pharma sector is an industry where R&D is the core business unit within the organization and the rest of the departments' organization and size depend on how innovative and time efficient the research unit is. Until recently, the drug makers were solely operating on a very efficient “closed model” where all stages from research of active components, identification of the targets, pre-clinical, clinical trials and finally the registration and marketing of the drug were exclusively handled by the Pharma company, this would start off with consequent human and capital investment in the potentially successful compound or molecule, which eventually would yield a considerable return on investments due to its patent protection.

This patent would guarantee the exclusivity of the new drug, extending the protection from the active compound itself called “Princeps” to its adjuvants, its production processes and its therapeutic use all property of the Innovative Pharma company which discovered the drug for a duration that would vary from 10 to 20 years. After the expiration of this patent, the drug would experience what we call a patent cliff, illustrated in a steep drop in sales due not only to declining unit numbers, but also because of price erosion up to 70% within months mainly due to the introduction in the market of cheaper substitutes, with the same active ingredient, but with different adjuvants and/or methods of manufacturing. (Fig 2.2)

Patent cliff would essentially impact individual Pharma companies in the mid-term future within the period 2010 - 2014, the revenues of drugs whose patents will expire is around \$89.5 billion USD. In 2011, Lipitor, the bestselling drug of Pfizer will go off patent as will Plavix (anti-thrombosis drug), Actos the anti-diabetic drug as well as Sequel and Zyprexa, which are used to treat schizophrenia and bipolar diseases. The loss induced by patent cliffs could only be compensated by the launching of new products, for example, new indications such as osteoporosis, cancer, multiple sclerosis or respiratory illnesses. Hence, the urgent need for new drugs and treatments to limit the losses induced by these patent cliffs. Another way to minimize the damages of patent cliffs is to sell branded generics, which are the authorized version of the patented drugs as a mean to maintain the bigger market share even when the latter drugs would no longer be protected by their patents.

Figure 3 Illustration of Patent Cliff of Blockbuster Drugs (Royal Chemistry Society, 2009)

In a bid to retain as much revenue as possible from its Lipitor cholesterol pill, which lost patent protection in the US in May 2011 and now faces generic competition, the US Pharma giant, Pfizer is undertaking several unusual strategies. These include offering incentives to health plans and pharmacy benefit managers to favor its brand-name drug, providing consumers a co-pay card that lowers their cost significantly and partnering with a specialty pharmacy to mail Lipitor directly to patients. The gambit is being closely watched by other drug makers, payers, pharmacies and regulators for the implications as numerous best-selling meds also encounter generic rivals. Lipitor generated \$10.7 billion in sales last year: capturing even a small slice of ongoing sales is important to Pfizer. To gain some insight, Reimbursement Intelligence's recent market research showed that Pfizer would lose 54.5 percent of the market after 6 months and 75 percent after a year. Pfizer's aggressive strategy towards pharmacy retail stores and healthcare providers is a pioneer model, that if proved to be successful could be applied by other Pharma companies willing to stop the brand erosion they are facing and to some extent considerably slow down the roaring success of generic drugs in the global market. This latter strategy shows how desperate Pharma firms are in retaining as much revenue as they can from their star drugs.

The biggest issue in Pharma remains the lack of innovation. Where the long-term forecast is merely 1 new drug per company per year, productivity in the sector has declined by 20 percent from 2001 to 2007. This phenomenon could be the combination of many factors: after the M&A fever in 2009 that had resulted in a series of acquisitions of smaller biotech companies by Big Pharma trying to penetrate new markets by purchasing smaller generics manufacturers in this field USA leads the pack with over 114 deals made in 2010 including 8 worth more than \$500 million USD. These deals represent 50 percent of the deals made in 2008-2010 such as SANOFI-Aventis who boosted its presence in China in the OTC market by acquiring BMP Sunstone in 2010 for \$520million USD. Although these M&A activities might have their perks, it seems that it has become a brick in the "R&D wall" Pharma industry is hitting: several experts argued that the M&A might keep its promises in terms of market penetration and strengthen a firm's position in a new market. However, in terms of innovation it had to some extent failed to produce tangible results, the explanation could emanate from the fact that by merging and acquiring new firms Pharma companies simply lost in efficiency what they gained in size. The lack of inter-firms synergy between the mother company and the newly acquired ones, as well as the vertical structure of the decision making processes is affecting the R&D more than any other department, hence shifting the focus of these companies from innovation to deal with integration issues within the organization.

Over time, complexity becomes a drag on the quality and speed of decision making and there is a need to shift towards leaner models such as Virtual development which have been proven to be successful for Eli applying Chorus virtual model molecules through candidates identification and Phase

I at median cycle times that were 40 to 60 percent faster than the industry average.

Another issue hindering the development of new drugs is the heavy focus on biotechnology and small molecules, though they are promising for the future. So far, however, Pharma companies who acquired these firms have failed to translate these discoveries into concrete drugs or clear therapeutic indications. A recent analysis showed that out of 6,000 biotech projects available for late-stage licensing; only about 200 are likely candidates for larger Pharma companies and fewer than 100 have the potential to become top-sellers. Combined, these projects would account for \$30 billion USD in potential revenues. Another example of promising projects with so far meager results is the Human Genome Project, while undeniably a huge scientific achievement; results have fallen far short of expectations. The project simply has not yielded the sort of immediate benefits in terms of therapeutic treatments and diagnostics that had been hoped. New models for “data-driven” public/private collaboration are poised to transform industrial drug discovery. Pharma is then set to enter a new era: The open innovation era, based on what seems to be at first the very notion the industry has been jealously avoiding: data sharing and collaboration.

This shift towards a pre-competitive era is a necessity to foster creativity and ideas on a global scale and from this paradigm; it should profit everyone from drug makers, healthcare providers to patients desperate for new and efficient therapeutic solutions. This open collaboration has many forms, we can see it in the growing number of private-public consortiums of various kinds such as Merck’s SAGE initiative.

This acknowledges the common need to develop tools and frameworks able to analyze and integrate data from multiple sources and across disciplines (for interest in chemistry, biology and agriculture etc), fostering the innovative ideas from industry, academia and NGOs.

This SAGE initiative would rather account as an exception in the open collaboration field as it has non-profit purposes. But we have seen an increasing number of projects involving Pharma companies either with each other or with biotech firms to boost the drug discovery process and yield tangible results within shorter deadlines. Another case of this new model is illustrated by Lilly’s new open innovation platform designed to help build its pipeline and to identify new treatments for multi-drug resistant tuberculosis, which builds on the success of Lilly’s Phenotypic Drug Discovery Initiative (PD2), launched in 2009 to facilitate research on molecules around the world that have the potential to ultimately be developed into medicines. The Open Innovation Drug Discovery platform utilizes a secure website that offers Lilly’s proprietary computational and informatics tools to aid scientists in the design and selection of molecules. Once a scientist submits a molecule to the website and it meets certain specified requirements, Lilly tests it – free of charge – in a series of biological assay panels that evaluate it for its uniqueness and potential to be further optimized into a drug candidate. Comprehensive data reports are then provided to the submitting scientist. In the case of the cancer, endocrine, cardiovascular and neuroscience screenings, Lilly receives first rights to negotiate a collaboration or licensing agreement with the submitter in return for the data’s provision. If no such agreement is reached, the external scientist retains “no-strings-attached” ownership of the data and can choose to use it in publications, grant proposals or to further refine their hypotheses about the molecule’s potential as a medicine. In the case of the MDR-TB screening, promising data could result in collaboration between the submitting organization and the Lilly TB Drug Discovery Initiative. Lilly’s R&D operations, through this project recognized the “many untapped sources of ideas and molecules” outside the company.

The initiative is part of Lilly’s wider goal of raising R&D productivity with faster development times and lower costs. Another Lilly R&D project entitled Chorus, focuses on leaner development processes, and aims to reach decisions about 12 months earlier and at about half the cost of the current industry model. Novartis is another big Pharma company who believes in the potential of open innovation to thrive and sustain its growth strategies on a global scale.

GlaxoSmithKline, the UK based Multinational Pharmaceutical company, is putting thousands of possible malaria-treating drugs into the public domain in a move that the Wall Street Journal calls a ‘Linux approach’ to pharmaceutical screening. Of course, synthesis or discovery of new chemicals is cheap compared to efficacy and qualification studies, but this is a refreshing change from the current practice of providing no information at all until after all patents have cleared. J&J executives see the appeal of this new R&D model to enhance intellectual entrepreneurship and multidisciplinary collaboration to find solutions for healthcare problems. It has lately signed a deal with GE the powerhouse of medical imagery and diagnostics to joint their efforts in the Alzheimer disease research. Terms of this collaboration have not been disclosed but it would essentially combine the two companies ‘expertise in data integration, imaging, informatics and genomics in order to find a set of biomarkers as

a way to diagnose people with higher risk of developing the disease as they grow older. Also worthy of note is GE's efforts to advance breast cancer treatment through the open innovation platform in which they invested \$100million USD in collaboration with private Pharma companies, venture capital entities Kleiner Perkins Caufield & Byer venture capitals with a special focus on data. So whether it is competitors teaming up together for the research phase or Pharma collaborating with Academia like the collaboration announced in 2011, where 37 US universities and colleges were announced as the recipients of the British Council's New Partnerships Fund which would enable George Washington University to work with Oxford University and Tata Memorial Centre, Mumbai, India on cancer research), these partnerships whether for profit or non-profit motives are set to be the new way to perform research work in healthcare field at least for early stages research efforts to respond more proactively to the growing demand for innovative, ad-hoc therapeutic solutions. This paradigm enables Pharma companies and Academia research institutions or other partners to use each other's forces and combine them, with Pharma finally acknowledging that all talents are not necessarily part of their organizations, hence providing their expertise and financial support to those who might nurture promising ideas but fail to translate them into concrete drugs due to lack of funding or their inadequate infrastructures.

2.3 Open innovation impacts on the Chinese pharmaceutical industry

2.3.1 Overview of Chinese Pharmaceutical industry

With an absolute GDP of \$91trillion USD in 2009 and a pharmaceutical market that is estimated to drive \$40billion USD in growth through 2013, China is leading the pack of Pharming countries. Driven by aggressive government spending on healthcare and an increasing demand for drugs to treat chronic illnesses such as: Diabetes, Arthritis...etc. China's pharmaceutical market expanded at an astonishing 20percent in 2009. A landmark \$125billion USD incremental government funding is at the heart of the healthcare sector's transformation, targeting substantial improvement to the nation's healthcare infrastructure, a move which is set to double the size of China's pharmaceutical market by 2013. Nevertheless, the operating environment remains complicated and a challenge along with local competition, government intervention on drug pricing and uncertainty of healthcare reforms. Due to all these factors, big Pharma see China as their saving grace whether to increase their sales volume in the Asian region with the two ascending Pharma giants China and India injected \$180billion USD in the global drug market through drug sales; or to boost their research departments through collaboration with Chinese counterparts. Bayer's incremental growth is mainly attributed to investments in China and Turkey and its capacity to adapt to the local market environment by investing in products highly sought by these markets such as Glucobay for Diabetes and Adalat for hypertension, the company has achieved a dominant position in these high-growth therapy areas and now derives 3percent of global revenues from China and this number is likely to rise in the next five years.

2.3.2 SWOT analysis of Chinese Pharmaceutical industry

China Pharma industry is considered as a High-tech industry, where drug applications for patents ranks in the top 3 of the overall patent applications in China. The number of these applications is a good indicator of the innovative capacities of this sector and it has been increasing steadily for the period 1985-2005 and it is set to grow at an even faster pace. China has already made tremendous inroads as a manufacturing center for the world. But now it's making enormous investments in R&D to propel the country into the top ranks of world innovators. In his speech in January 2006, Hu Jintao the Chinese president expressed his aim to make China an innovative country by 2020. Pursuing that goal, China has already passed Japan for R&D spending, and is ranked 2nd with the R1D/GDP growing 1.67% between 2000 and 2007. And it's turning to companies like Sinovac to develop new drugs. Sinovac is pushing a new bird flu therapy. China's R&D budget is growing at a rate of 20 percent a year, making it likely that a lot more Sinovacs will be created in the years ahead. The neuralgic centers of Pharma are located around the Beijing-Tianjin area and the Yangtze River delta area with Beijing, Shanghai, Guangdong, and Shandong being the top 4 in the industry. So far, the industry heavily relied on traditional chemistry methods for new drugs formulation and biotech sector still lags behind. Nowadays, the Chinese Pharma industry is shifting its research efforts in the anti-tumor and cardiovascular drugs. The country gets also to play another card with drug development from natural extracts and from its millennial expertise in the TCM field. This tremendous source of knowledge could provide her a worldwide competitive and innovative edge. The government is pushing the industry towards innovation allocating 9-10% of their GDP to the R&D sector which represents \$10billion USD/year, adding to the financial involvement a

series of measure such as the “863” plan that focuses on the Pharma and drug industries resulting in measures to increase drugs affordability through investing approximately RMB 850 billion (\$124 billion) over the initial three years of the plan in the country as well as a growing number of modern biotech parks (more than 20) including the famous Zhang Jiang High tech park in Shanghai operating in China and generating series of support industries to boost the research progress. With the research and development centers of big Pharma MNCs like AstraZeneca, Roche, Novartis and GlaxoSmithKline (GSK) swarming to a once remote area in Shanghai, Zhangjiang Life Science Park has become a flagship for China's burgeoning biomedicine industry. Companies in the life science park realized total sales of 10.2 billion Yuan (US\$1.5 billion) in 2008, and the park management hopes to create more local innovations by opening a large 'incubator' to provide a well-equipped launch pad for Chinese start-up companies. China is also striving to get its patent law up-to-date to provide a safe and adequate environment for innovation in the Pharma industry, the Patent law who has been revised in 2000 and then in 2003 clearly guarantees all drugs manufactured in China with patent protection. This could provide the Chinese Pharma industry a serious competitive advantage over the Indian Pharma industry.

Table 1 Chinese Government Policies to Build an Innovation-Driven Pharmaceutical Industry

Innovation promotion policies	Goals
Increase direct investment in the Pharma industry	Combine industry, Academia and partner industries' innovation capacities
Tax credits or concessions speed up depreciation of R&D facilities & equipments	Encourage & support enterprises in setting up R&D centers with favorable measures
Establish and/or renovate Public technical support platform for Pharma industry	Help firms reach their innovation goals
Government purchasing of domestically produced drugs	Encourage local firms to provide effective and marketable drugs by demand encouragement measures
Investment in the renovation of TCM research facilities	Promote TCM drugs research to capture value

Another consequent advantage for China is the cheap labor and operating costs, as it requires 40percent less investment to develop a drug or to run a clinical trial in China than in Western countries which explains the booming number of CROs in China operating for Big Pharma laboratories and the investment in these structures is forecasted to rise in the next five years.

Another segment on the rise is the API production which makes up more than 50% of the export value of China's pharmaceutical trade. As a result, the Chinese market for APIs is rapidly growing and is estimated to witness a compound annual growth rate (CAGR) of 18% from 2010 to 2017. Ingredient suppliers in the Chinese API market will be keenly following the events in the pharmaceuticals industry, which is in the midst of integration. Apart from the sustained and rapid growth of the pharmaceuticals industry, the long-term use of multiple specialized drugs for an aging population and the reform of the Chinese medical system have also given a shot in the arm to the Chinese API market. As drug administrations in China put more effort into the supervision of the pharmaceutical industry, safety and environmental protection issues have become the areas of concern for the API producers. API producers in China are required to follow the guidelines such as the good manufacturing practice (GMP), which was revised by the Ministry of Health of the People's Republic of China in 2010. These manufacturers are also required to reach higher levels of standards and certifications, which are similar to the Japanese and European standards. These measures have resulted in interdisciplinary joint research projects between universities, research institutes and industry's local players which foster innovation and creativity in the country. All these efforts are designed to overcome major challenges still hampering the sector such as the counterfeit drugs scandals that are plaguing China's Pharma industry's image with the last one to date involving Colgate. The scandal follows the discovery of a shipment of Chinese-made contaminated with DEG toothpaste in the US. The US Food and Drug Administration (FDA) said DEG, which is sometimes used as a low-cost but potentially deadly substitute for Glycerine sweetener in cough medicines, posed a "low health risk" but did not belong in toothpaste. Palmolive-Colgate company's executives were quick to distance themselves from what turned out to be Chinese imitation destined to be exported to South American market. As a result, Two-thirds of multinational drug companies shared that they remained concerned about both IP protection and corruption in China. But drug makers have found some allies in the Chinese courts. Pfizer won a landmark trademark-infringement case in 2011 when a Chinese court ordered a domestic company to stop using

Pfizer's logo on its website and fined the offender \$25,000. Novartis CEO Daniel Vasella, for one, cites China's "enlightened" patent laws as the reason the Swiss drugmaker will continue to invest in China vs. India, where a court recently rejected the company's attempt to protect a patent on a leukemia drug. Therefore, Chinese Pharma industry has to work hard on polishing its image by tightening controls for the manufacturing and distribution process and quality control to make sure the products are high quality and safe to use for the consumer on both the local and global market. Adding to that the relatively poor input in medical biotechnology research which accounts for 1/500th of China's foreign counterparts investments and input, with 20million patent applications for the US between 1985-2005 are still from China's reach with a meager 90thousands applications. The lack of collaboration between domestic research institutes and drug companies, is also one other challenge the Chinese pharma industry has to overcome. Moreover, China's pharmaceutical industry still lacks independent and efficient research and development capabilities, with poor corporate support for new drug research. The sector is also challenged by a lack of intellectual property rights to effectively protect domestic innovation, contributing to destructive competition in the field illustrated by the Vitamin C case where a Chinese scientist discovered an innovative manufacturing process: the two-step fermentation but due to the lack of legal knowledge he did not patent his discovery and only published in a paper, a foreign firm acquired the rights for this method and patented it abroad with paying the scientist only few thousands of USD instead of the several millions this new technology was worth. That affected the Vitamin C exports of China as foreign firms were already using the same techniques and that resulted in huge losses for Chinese manufacturers of Vitamin C. Add to that the serious threat India is posing to China, with the huge pool of English speaking qualified staff and scientists the country is producing, the cheap labor and operating costs it provides for both local and domestic firms, and the aggressive M&A strategies implemented by Indian Pharma companies to go global such as the recent acquisitions by Ranbaxy laboratories in Germany, for all the aforementioned factors ,India will constitute the biggest threat, especially if the Indian government pushes toward a tighter control of IP and patent rights in the country reinforcing the existing Patent Act.

Table 2 SWOT Analysis of China Pharmaceutical Industry

Strengths	Weaknesses
<ul style="list-style-type: none"> -Government's support : "863" plan, healthcare system renovation, Biotech parks: Shanghai, Beijing & Tianjin -Solid patent protection system for drugs -Rapid growth of bio and natural extract patents -Cheaper labor & operating costs in comparison to the Western countries. -API booming market -Tax incentives for biotech & Pharma industry players 	<ul style="list-style-type: none"> -Poor outcomes & poor inputs in medical biotechnology research compared with USA or EU -Lack of management skills and entrepreneurship of Chinese R&D staff -Weak innovation capacity from firms and lack of synergy between academia and industry -Counterfeit drugs and quality control issues(Fake Insulin, Melamine contaminated milk scandals) -Out-of-date infrastructures & Low level of technology in drug patents
Opportunities	Threats
<ul style="list-style-type: none"> - New collaborative R&D model in Pharma industry through open innovation schemes -Growing and ageing population -Growing interest of Pharma MNCs in Chinese market - Growing interest in TCM integration& Modernization 	<ul style="list-style-type: none"> -Increase in patent applications by Foreign Pharma in China -Outflow of HR & output in Pharma and high turnover rate -Competition: India and other Pharmerging countries

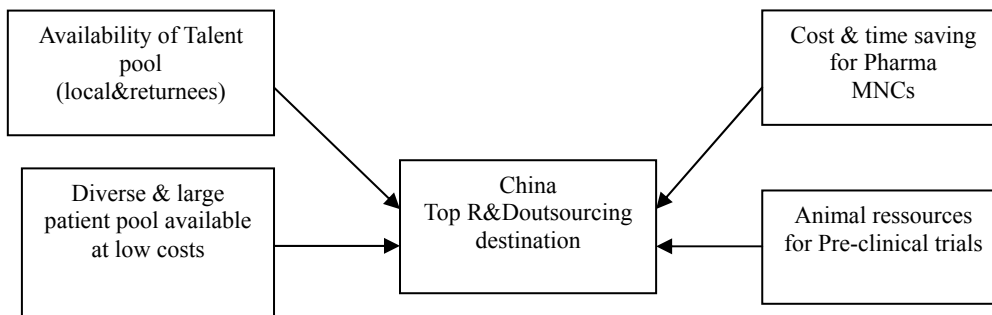

Figure 3 China: An R&D Outsourcing Destination of Choice

Despite all these challenges one huge opportunity looms ahead of the Chinese Pharma industry, following its entry to the WTO Chinese Pharma industry could benefit from international alliances and foreign investment opportunities. These goals would be achieved mainly through open innovation setting that could be carried out throughout the entire Pharma industry value chain. China is becoming a destination of choice for R&D outsourcing thanks to the several advantages the Chinese Pharma industry's landscape offers (see figure 2.3).

3 Acceleration of Open Collaboration Innovation in China

China is becoming a destination of choice for foreign firms to establish their R&D headquarters, considering the size of the population which has not been heavily medicated especially in villages; making clinical trials even more efficient and accurate when carried out in the Mainland. Adding to that the availability of various mammals for the clinical trials and the cost savings from operating in a low labor cost environment, constituting the main reasons why the industry in China is and will continue to flourish. The drought in Big Pharma R&D pipelines along with the attractiveness of the Chinese drug market is changing the dynamics of the drug research and development processes through open innovation model. Whether through the collaboration with Academia, independent or government sponsored Research institutes or partnerships with CRO's or with domestic Pharma companies in China, all these strategies would benefit the involved parties. Various collaborations projects are to be carried out between China and foreign Pharma companies or universities in several fields. Notably, the recent healthcare research partnership between the Dutch Imagery giant Phillips with West China hospital in Chengdu affiliated to Sichuan University. The project is designed to develop new medical imaging procedures for diagnosis and monitoring of certain types of cardiovascular diseases, cancer and mental diseases involving MRI(Medical Radioactive Imagery),CT(Computed Tomography),PET(Positron Emission Tomography),SPECT (Single Photon Emission Computed Tomography)scan images.This project would eventually benefit both parties, as it will allow the Phillips strengthen its position inside the Chinese market, especially in smaller provinces and villages where it lacks local market knowledge and adequate distribution channels. It permits them to produce innovative therapeutic solutions and devices to launch in the global market, if proven to be successful, with keeping development costs in control by carrying them out in a favorable R&D outsourcing country like China. As for the Chinese hospital in the Sichuan Province, the open innovation setting would allow them to use the industry leading imaging capabilities of Phillips and use it to leverage its outdated imaging system in these hospitals, another third party constituted by patients would reap the benefit from this open collaboration by accessing better diagnosis tools and thus better therapy approaches towards the diseases affecting them.

In June 2011, J&J opened a medical device& diagnostics R&D center in Suzhou, Zhejiang province in China focused on market-appropriate innovation with new product development & marketing as well as clinical research and regulatory and quality assurance and operations. This is a perfect example of the open innovation dynamics, where a multinational (J&J) opening its doors and sharing their know-how for marketing, management and legal framework in China and providing access to their database to advance research in specific fields such as Cancer which is the leading cause of death in China with just over 450 "cancer villages" spread across the Chinese territory. It is not a coincidence that R&D is and will be more focused on Asian specific diseases such as Cancer: Stomach, liver and lung and also cardio and cerebro vascular diseases considering the size of the Asian market and the incremental incidence of environment related affections worldwide. That would result in the acceleration of the development of more specific drugs by combining the experience of foreign firms in the treatment of these ailments and their technical & financial capabilities to nurture the innovation abilities and data provided by Chinese research institutes and hospitals which would be part of these strategic partnerships.

The French Pharma multinational Sanofi-Aventis has chosen the path of strategic partnerships with Chinese counterparts instead of the classical M&A strategy to enter the Chinese drug market by collaborating with the Institute of hematology and blood diseases hospital academy of medical sciences in Tianjin to carry out a study on stem cells in order to isolate acute myeloid leukemia stem cells and develop monoclonal antibodies.Sanofi-Aventis didn't establish collaboration or acquired CROs in China, but is relying instead on strategic alliances with universities and state-sponsored research institutions with a special focus on cancer and Rheumatoid arthritis drugs.Thus,the company provides its experience shepherding drugs through regulatory processes and nurture the already existing innovative ideas of

their Chinese partners to speed up the development and marketing of new and more efficient drugs for an increasing number of patients worldwide.

Recently, GSK the UK Pharma giant reaffirmed its commitment to China; with a total R&D investment in China has exceeded RMB1 billion in the past 20 years. Research focus adheres to the disease control priorities set by Chinese government, such as infections, diabetes, oncology and respiratory diseases. Along with economic development and increased healthcare core transformation in the Mainland, GSK is planning to develop a more comprehensive and robust R&D strategy to bring China into a key strategic center for GSK global R&D in near future. Including Clinical Research Centers in China with over 200 drug development projects conducted in collaboration with over 30 leading medical universities/hospitals focusing on hepatitis, asthma, diabetes, oncology and mood disorders in China. With also a substantial investment still dedicated to drug discovery and genetic research in leading medical universities and the Chinese Academy of Science. The latest to date open collaboration scheme is illustrated by a partnership program in the field of combinational chemistry with the Shanghai Institute of Materia Medica (SIMM). One year ago, Novo Nordisk committed up to \$100 million to expand its Beijing R&D center. As much as \$40 million of that will go to build new labs for diabetes research. The company also said it will add 200 new jobs by 2015. The Beijing center will become the company's largest R&D facility outside of its native Denmark.

Another project is set to deliver promising outcomes in the cancer research field, with the United States and China being international leaders in nanotechnology research, they have both launched national programs to support nanotechnology efforts. The accelerating trend of co - authorship among US and Chinese nanotechnology researchers demonstrates that individual scientists already recognize the potential for cooperation, providing a strong platform for creating additional partnerships in pre - competitive research areas. Mechanisms that could help to enhance US–China cancer nanotechnology partnerships include: developing new programs for bi - directional training and exchange; convening workshops focused on specific scientific topics of high priority to both countries; and joint support of collaborative research projects by US and Chinese funders. In addition to the accelerating scientific progress, expanded cooperation will stimulate important dialogue on regulatory, policy, and technical issues needed to lay the groundwork for US and Chinese scientists to move greater numbers of cancer nanotechnology applications into the clinic.

These various open innovation collaboration projects between Pharma International players and Chinese Partners would eventually benefit the Chinese Pharmaceutical industry in several ways:

- It will increase the financial investments whether governmental or private to further boost the industry. Also, the budget allocated to this industry is likely to rise in the near future considering the demographic data in the country allowing China to be competitive on a global scale.

- Both governments and private partners see the opportunity of these open collaboration projects could bring to the local players and thus will encourage the Chinese partners by supporting them financially and making them able to constitute qualified partners for Pharma partners.

- It also allows the research to shift its focus from the traditional chemistry-based techniques to more modern tools: Genomics, Biotechnologies, Nanomedicine...etc. The lack of focus on the latest technologies lie on the fact that most research centers in China do not have the necessary R&D tools and technologies to nurture their potential drug discoveries. By building R&D state-of-the-art facilities in China, Pharma MNCs make their technology available for Chinese scientists to carry out their research efforts.

- Improve the industry's image through more international exposure when cooperating with prestigious international organizations: Big Pharma, Harvard university, Swiss Federal Institute of Technology, MIT, GE...etc.

- Benefit Chinese patients who could not afford the treatments under non collaborative circumstances, especially in secluded rural areas such as the sinister "cancer villages" and tailor the drug development to the specificities of the Chinese population

- Provide the Chinese scientists with the necessary legal and management knowledge lacking in the Chinese research.

- Finance innovative and promising small Chinese biotechnology firms in drug research who would be carried out in a low-labor & operations costs environment.

- Help the promising TCM research sector thrive and modernize its structure through the TCM integration with Western Medicine and the update of TCM products R&D techniques.

- Set the right environment for the transition from "Made in China" to "Discovered in China" such as the Academy of Military Medicine which helped develop artemether-lumefantrine, considered the

most effective antimalarial drug on the market. One example among a rising number of other Chinese drug manufacturers operate in state-of-the-art production facilities and supply the U.S. market with high-quality products.

The open innovation strategy can also be carried away domestically between Chinese pharma firms and universities or research institutions. Lately, inter-collaboration between the public and private organizations in the healthcare sector to share data and encourage “domestic innovation” illustrated by the strategic partnership concluded between Simcere Pharma group, a leading manufacturer and supplier of branded generics and innovative pharma in China, with Sun Yat Sen University cancer center in order to develop innovative anti-cancer drugs that would benefit the University hospital patients with innovative therapeutic solutions and at the same time enhance Simcere R&D capabilities through this open collaboration.

The foreign firms or organizations participating in these open innovation projects can benefit from these initiatives in various ways:

- Cut their research and development costs through operating in a country where cheap, competent labor and APIs are available and where clinical trials cost 4times less of what they would cost in western countries.

- Fill up their R&D pipelines with external ideas and techniques instead of relying on in the house research from scratch that would take longer and cost more with a high attrition rate.

- Improve their position within the Chinese market profiting from their partners knowledge of the market needs, specificities and effective distribution channels especially deeper into tier 2& 3 cities alongside with rural areas.

- Speed up the drug discovery process by funding late stages clinical trials in innovative research areas that would yield lucrative therapeutic solutions.

4 Conclusions & Future Research Prospects

Open innovation is becoming an obligation rather than an option for out-of-ideas Pharma industry, with the new “innovate or dissipate” imperative the healthcare industry needs to join forces in order to accelerate the drug discovery pace. We have seen that through these strategic partnerships, the industry could achieve faster and more probing results while keeping R&D costs from soaring when operating in pharmerging countries especially in China, where the government is deeply committed to broaden healthcare coverage to the entire population and make the innovation a national priority both to be achieved by 2020.

China is so far an outsourcing destination of choice for some Big Pharma companies whether through partnering with CROs or with academia through open innovation settings to achieve tangible results faster and at lower costs.

Throughout this paper, we have seen that this open-collaboration model is set to yield benefits for both parties through scientific data sharing, their management skills and regulatory expertise in the research process provided by foreign partners combined with the innovative research projects carried out by Chinese scientists from both public and private sectors. Such as GSK’s global R&D Center set in Shanghai in 2007 focusing on research into neurodegeneration to create new medicines for profound medical needs as multiple sclerosis, Parkinson's disease, and Alzheimer's disease. The center will eventually direct the global discovery and development activities within its therapeutic area, from drug-target identification to late-stage clinical studies, while collaborating with research institutions elsewhere in China.

Nevertheless, the sustainability of Big Pharma’s strategy in China is questionable. So far, Chinese domestic Pharma industry is unable to contend with its foreign counterparts due to lack of financial assets, management and regulatory skills crucial in the industry. It is so far mainly focused on the production of generics, the “imitation” of patented drugs. But these companies are growing at a fast pace, they receive more governmental support through favorable policies and financial support, they see the benefits of collaborating with research institutions and universities in China which are the epicenter of innovation in the country, all these factors will provide China with the necessary experience and know-how to become an innovative powerhouse in the pharma industry and therefore rely less on the foreign expertise in its research projects. Or at least capture much more value from this open collaboration model which is so far mainly beneficial for the multinational pharma companies at least when it comes to financial returns on investments.

A major issue is looming ahead when implementing these pre-competitive strategies in China or elsewhere. We will see a rising number of IP disputes that would result from the discoveries made through this open innovation framework. Indeed, when a collaboration project yields discoveries that could result in blockbuster drugs the issue would then rise on the party who would have the right to market the drug discovered especially if the terms of the initial collaboration which lead to the discovery did not clearly address the intellectual property right attribution terms and conditions and this could lead to more delays in the drug development processes and new costs would be allocated to trials and legal fees for the two parties in case of disagreement.

Because of the length of the drug R&D processes, we cannot measure the impact this pre-competitive model in the pharma industry just yet.

But what will be apparent by then is whether open innovation and precompetitive collaborations and consortia, as applied to drug discovery, are just a passing fad or an alternative (and perhaps better) way of structuring and managing pharmaceutical R&D. The myriad of 'open' initiatives are only going to be impactful if they make drug discovery innovation system more efficient and equitable.

Open innovation has a long way to go when it comes to transparency and inclusivity which are the main issues to address when implementing this open innovation model whether in Pharma or any other sector. So far, all of the precompetitive initiatives between pharma/biotech companies and academia remain distinctly early stage, if not exploratory. So the main problematic in the future is to see how the industry will shape these new models of cooperation into more efficient ways of developing drugs and. What's more, open innovation, within the pharma industry at least, has been invoked to describe widely varying and often inexactly defined undertakings. Therefore, some pharma companies remain skeptical on the potential of this pre-competitive model as it might lead to projects where long-term cost is small but [where the outcome is also] unproductive.

The solution to make this collaboration model a sustainable R&D strategy, the solution might relate on the level at which this paradigm is applied to avoid conflict of interest, for the Pharmaceutical industry it would be translated in the collaboration with drug screening partners that would not have the ability to be involved in further research on the potentially active compound and could benefit from pre-existing data Pharma MNCs could provide for them, or with clinical trials organizations that would not be involved in the drug development process.

The other solution to the IPR war that would be triggered by the open innovation paradigm would be the inter-industry collaboration where the knowledge-transfer and exchange will benefit without overlapping both parties strategic goals prior to this collaboration. Further research is critically needed to assess the different impacts the open innovation would have on specific industry sectors, as the R&D outsourcing to cheaper operating countries is on the rising trend this model would likely become an imperative rather than an option, therefore, making it urgent to define the scope in which the open innovation model could be used at to what extent by tailoring it to a specific industry's characteristics.

To conclude this paper I would quote Mr. Werner Lanthaler, CEO of Hamburg, Germany-based drug developer Evotec which shared his thoughts on the open collaboration model in the pharma industry "Let's give it time—but not too much time," As the projects using this paradigm are on the rise, only time will tell whether it will reshape the R&D structure permanently rather than just a temporary phenomenon.

Factors Impacting International Marketing: Configuring Strategies and Incorporating Co-Opetition

Casius Darroux, Sun Xixiang

School of Management, Wuhan University of Technology, Wuhan 430070 P.R. China

(Email: kharibdarroux2@hotmail.com, 13971190718@163.com)

Abstract: Innovative international marketing strategy is no longer an abstraction but a stark reality that virtually all firms face. In all business sectors there is the unabated pressure of global competition domestically and globally, regardless of size, they must configure strategies in the broader context of world markets to anticipate, respond and adapt to changes. Business entities initially testing international markets will be concerned with learning and selecting an appropriate arena to compete, and determining how to leverage core competencies to maximize returns. As firms stretch their tentacles internationally, they need to move from home based-centered strategies to improve integration and coordination, leveraging competencies and skills to develop. While traditionally the relationships among competitors were seen as based on competition, recently a new approach, called co-opetition sees the same relationships based on the cooperation among companies. Specifically, co-opetition is a concept that combines competition and cooperation, by simultaneously competing for market share. This paper will introduce the concept of international marketing, uncontrollable marketing environment and co-opetition.

Key words: Innovative marketing; Global competition; Core competencies; Co-opetition

1 Introduction

Marketing is arguably the most crucial idea in any institution and the most dominant force in any culture. Today the mass media saturated society has encapsulated our lives, satellite TV, broad band internet, instant messaging via web and hand held devices, all of which means message can reach you virtually any time and place. This means that international marketing pervades all aspects of society on a millisecond basis without territorial boundaries. In this era of drastic technological and business landscape transformation all enterprises stand at a point where the factory model marketing is no longer a sustainable and viable means to compete aggressively. Firms in order to strategically withstand the global reformation need to confront the pressure of internationalization and all forms of technological advancement to anticipate and remodel core competencies and strategies to integrate and establish presence. Organizations need to equip its marketing personnel on how to assimilate and disseminate innovative strategic marketing wealth by utilizing most advanced new emerging technologies and the forces of globalization to harness the impossibilities. Any organization engaged in international marketing are obliged to embrace critical thinking, problem solving, collaboration across nations, agility, adaptability, entrepreneurialism, effective communication, accessing and analyzing information and accepting new ideologies. In order for business to fully withstand the world wide waves of technology and globalization they need to be prepared to navigate and must become 21st century literate in marketing on multicultural aspect, media information, emotional, ecological, financial and cyber literacy's. After amassing the above mentioned skills the marketer can incorporate internal and external networking to provide a conducive marketing environment for innovation, value added creativity and techno-entrepreneurialism which will further develop new marketing insight to serving with quality and time effectiveness. When organization can achieve a level of internal satisfaction, enter, defend and increase market share and most importantly good customer relationship and loyalty then they can further forge ahead to establishing organizational co-opetition. With co-opetition each individual institution will still be competing for comparative advantage and gaining market share however the varying marketing tactics will make the difference once it's being done rigorously, efficiently and effectively by overseeing and accumulating market intelligence through innovation to meet the market demand.

2 International Marketing and Strategic Importance

Marketing personnel are eyeing the increasing necessity to develop the skills, attitudes and knowledge to rigorously compete on international scene. The emergence of a more open 21st century world economy, the globalization of consumer tastes and unabated expansion of Internet access globally all increase the interdependency and interconnections of nation economies (Ohmae, K. 1990). The

internationalization of the marketplace consists of a population of 7.2 billion people which is expected to reach 8.1 billion by 2025 and is expected to reach 9.6 billion by 2050 (un.org/en/development/desa/population). Global affluence is increasing and this is mirrored in increased demand. Increasing affluence and commercial dynamics has seen nations across Asia, Central and Eastern Europe and to some extent South America emerge as rising economies. Increasing affluence and demand means that consumers will actively seek variety, choice, and quality whilst paying attention to time factor (just in time) with the result that globally, competition is intensifying as companies compete to win the battle for emerging markets. Population growth and increased affluence together have helped create a ‘global youth culture’ – teenagers now account for 30 per cent of the population globally (World Population Prospects: The 1992 Revision). In many countries, more than half the population is pre-adult, creating one of the world biggest single markets, the youth market. When ‘virtual reality’ is commonplace, the world wide youth culture market will exceed all others as a premier global market segment. For organization to strategically position for global competitiveness companies are consolidating through mergers, acquisitions, and co-opetiting to reach the scale considered necessary to navigate the global trend.

3 Attribute of International Marketing

Marketing is the social process by which individuals and organizations obtain what they need and want through creating and exchanging value with others (Kotler and Armstrong 2010). International marketing has been defined as 'the performance of business activities that direct the flow of goods and services to consumers or users in more than in one nation (Kotler and Armstrong 2010)'. It is different from domestic marketing in as much as the exchange takes place beyond the frontiers, thereby involving different markets and consumers who might have different needs, wants and behavioral attributes. International marketing involves (a) focusing and analyzing the needs and want of the customers, (b) identifying the most feasible means of satisfying those needs and wants, (c) aligning the company towards satisfying those needs and want and finally (d) achieving the organizational goals (the institution best prepares itself to achieve competitive advantage in the marketplace). It then needs to strive to maintain this advantage by manipulating the controllable functions of marketing within the largely uncontrollable marketing environment made up of SLEPT factors: i.e. Social, Legal, Economic, Political and Technological. The conceptual framework is not going to change to any marked degree when a company moves from a domestic to an international market; however, there are two main differences. First, there are different levels at which international marketing can be approached and, second, the uncontrollable elements of the marketing environment are more complex and multidimensional given the multiplicity of markets that constitute the global marketplace.

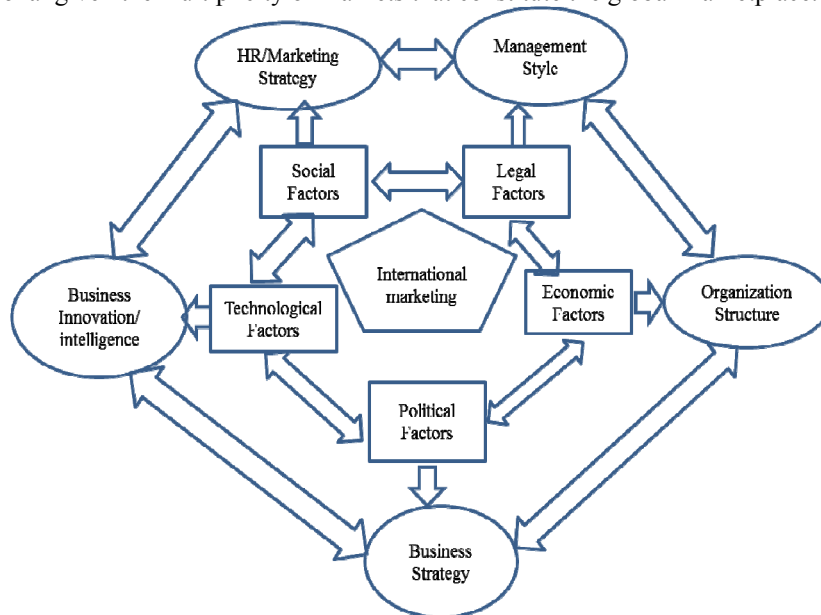

Figure 1 Relationship Of SLEPT and Business Operations

From fig.1 it is evident that the uncontrollable factors do not only impact on marketing itself but also on five major operational elements of the organization. The SLEPT factor which is the first layer from the core (international market) will adversely impact (1) HR and marketing strategy, (2) management style, (3) organizational structure, (4) overall business strategy, and (5) business innovation and intelligence. In the second layer each aspect on its own will also affect the organization in its operating environment. This means that everything surrounding international marketing must be properly tailored and align in order to achieve competitive advantage.

4 The Social /Cultural Aspect

The social and cultural influences on international marketing are immense. Differences in social conditions, religion and material culture all affect consumers' perceptions and buying behavior. It is these segments that determine the extent to which consumers across the globe are either similar or different and so determine the potential for marketing. A failure to understand the social/cultural dimensions of a market is complex to manage for example in China, though one country, its delicacies characteristics vary from regions. In the South the food is sweet, North salty, East spicy (peppery) and in the West it is sour. Therefore it means that any foreign food company for example McDonald or KFC would need to give consideration to the taste of the locals. Cultural differences and especially language differences have a significant impact on the way a product may be used in a market, its brand name and the advertising campaign. Initially, Coca-Cola had enormous problems in China as Coca-Cola sounded like 'Kooke Koula' which translates into 'A thirsty mouthful of candle wax'. They manipulated the pronunciation to 'Kee Kou Keele' which means "joyful tastes and happiness". Pepsi Cola had to change its campaign 'Come Alive with Pepsi' in Germany as, literally translated; it means "Come Alive Out of the Grave". Although there seems to be a conflict in translating in various countries this is expected to change as the world continues to integrate. For example iPhone 4 had a good introduction to the Chinese market except for some defaults however if the cultural aspect was as strong as when Coca-Cola was introduced that could have been problems because in China 4 is pronounced as death thus the customers would most likely refuse to patronize. Even with the construction industry some buildings do not have a 4th floor since customers would refuse to purchase an apartment on that floor for the same reason that 4 is pronounced as death in Chinese. In terms of marketing the marketer needs to pay attention to high and low context culture. At the early stage of internationalization it is not unusual for firms to experience what appear to be cultural gaps with their counterparts in Latin America and Asian countries as well as in different regions of those countries. Intellectuals argue that there are visible signs that social and cultural differences are becoming less of a barrier though there is a vast and, sometimes, turbulent mosaic of cultural differences, they believe there is evidence that a global integration is significantly reshaping the worldwide marketing boundaries.

5 The Legal Arena

Legal systems vary both in content and interpretation. A company is not just bound by the laws of its home country but also by those of its host country and by the growing body of international law. Firms operating in the European Union are facing ever-increasing directives which affect their markets across Europe. This affects many aspects of a marketing strategy – for instance advertising – in the form of media restrictions and the acceptability of particular creative appeals (e.g. Tobacco companies are supposed to give graphic images on tobacco products). Product acceptability in a country can be affected by minor regulations on such things as packaging and by more major changes in legislation. In the USA, for instance, Huawei, one of the earliest Chinese companies to seek globalization and has depended on markets outside the Chinese mainland was being treated as spies or on espionage fears (BBC news business 8 October 2012). This issue of Huawei seems to be an approach to protect the US technology and telecommunication companies. It is important, therefore, for the firm to know the legal environment in each of its markets. These laws constitute the 'rules of the game' for business activity. The legal environment in international marketing is more complicated than in domestic markets since it has three dimensions: (1) local domestic law; (2) international law; (3) domestic laws in the firm's home base.

5.1 Local domestic laws

The most feasible way to navigate through the legal ground in international markets is to use on the ground experts who is capable of handling separate legal systems and laws pertaining in each market targeted. For example there might be local institutions that may hold rights to certain inventions or

discoveries and if misinterpreted the new business may get into trouble with the law as in the case of the supreme court of the United State Bowen VS Monsanto Co.et al. Respondent Monsanto invented and patented Roundup Ready soybean seeds, which contain a genetic alteration that allows them to survive exposure to the herbicide glyphosate. It sells the seeds subject to a licensing agreement that permits farmers to plant the purchased seed in one, and only one, growing season. Growers may consume or sell the resulting crops, but may not save any of the harvested soy-beans for replanting. Petitioner Bowman purchased Roundup Ready soybean seed for his first crop of each growing season from a company associated with Monsanto and followed the terms of the licensing agreement. But to reduce costs for his riskier late-season planting, Bowman purchased soybeans intended for consumption from a grain elevator; planted them; treated the plants with glyphosate, killing all plants without the Roundup Ready trait; harvested the resulting soybeans that contained that trait; and saved some of these harvested seeds to use in his late-season planting the next season. After discovering this practice, Monsanto sued Bowman for patent infringement (certiorari to the United States court of appeals for the federal circuit .no. 11–796. argued February 19, 2013–decided may 13, 2013)

5.2 International law/trading blocs

There are all sorts of international laws that hinder organizations and their international marketing activity. Some are international laws covering intellectual and property rights; others are more international conventions and agreements and cover items such as the International Monetary Fund (IMF) and World Trade Organization (WTO) treaties, Caribbean Free Trade Area (CARIFTA), North American Free Trade Agreement (NAFTA), Asia-Pacific Economic Cooperation (APEC) patents and trademarks legislation and harmonization of legal systems within regional economic groupings, e.g. the European Union.

5.3 Domestic laws in the home country

The organization's domestic legal system is crucial for two reasons. First, there are often export controls which limit the free trading of certain goods and services to particular marketplaces, and second, there is the duty of the organization to act and abide by its national laws in all its activities, whether domestic or international it will be readily understandable how domestic, international and local legal systems can have a major impact upon the organization's ability to market into particular international market. Laws will affect the marketing mix in terms of products, price, distribution and promotional activities. Often firms operating internationally face ethical challenges in deciding how to deal with differing cultural perceptions of legal practices. In many mature markets they face quite specific and, sometimes, burdensome regulations. Some governments are reluctant to develop and enforce laws protecting intellectual property partly because they believe such actions favor large, rich, and multinationals.

6 Economic Development:

It is important that international marketer understand economic developments and how they impact on marketing strategy. This understanding is important at a global level in terms of the world trading infrastructure such as world institutions and trade agreements developed to foster international trade. Firms need to be conscious of economic policies of countries and the direction in which a particular market is developing economically in order to make an assessment as to whether they can profitably satisfy market demand and compete with firms that has been established. Another key challenge facing companies is the question as to how they can develop an integrated strategy across a number of international markets when there are convergent levels of economic development. Such disparities often make it difficult to have a cohesive strategy, especially in pricing. To examine these challenges further marketers divided the economies into developed economies and developing/less developed economies. The developed economies of the North American Free Trade Area (NAFTA), European Union (EU) and Japan account for 80 per cent of world trade. For many firms this constitutes much of what is termed the global market. In the European Union nearly 70 per cent of the international goods traded are traded within the European Union; in NAFTA, 50 per cent of goods exported are to other members of NAFTA. This leads some commentators to argue that most competition, even in today's global market-place, is more active at a regional level than a global level. It is from these developed economies that the global consumer with similar lifestyles, needs and desires emanates. However, emerging markets are now becoming more economically powerful and moving up the ranks, especially such countries as Brazil, Russia, India and China (BRIC).

6.1 Emerging economies

In countries such as Brazil, Russia, India and China, (BRIC economies) CIVETS (Colombia, Indonesia, Vietnam, Egypt, Turkey and South Africa), EAGLEs (Emerging and Growth-Leading Economies)(Source, Wikipedia: growing economies) : there is a huge and growing demand for everything conceivable from of products which are viewed as key growth markets where there is an evolving pattern of government-directed economic reforms, lowering of restrictions on foreign investment and increasing privatization of state-owned monopolies. All these emerging economies herald significant opportunities for the international marketing firm. Such markets often have what is termed as a 'dual economy'. Usually there tends to be a wealthy urban professional class alongside a poorer rural population. Income distribution tends to be much more skewed between the 'haves' and the 'have not's' than in developed countries. From negligible numbers years ago, China has a middle class of 100 million which is forecast to grow to 700 million by 2020 (An Hodgson July 25, 2007)

7 Political Environment

The political environment of international marketing includes any national or international political factor that can affect the organization's operations or its decision making. Politics has come to be recognized as the major factor in many international business decisions, especially in terms of whether to invest and how to develop markets. Politics is intrinsically linked to a government's attitude to business and the freedom within which it allows firms to operate. Unstable political regimes expose foreign businesses to a variety of risks that they would generally not face in the home market. At present the political arena is the most volatile area of international marketing. The tendencies of governments to change regulations can have a profound effect on international marketing strategy, providing both opportunities and threats. The instability in the Middle East, the Arab spring in Egypt, Tunisia, Libya, and Syria etc. and continued threat of global terrorism have served to heighten firms' awareness of the importance of monitoring political risk factors in the international markets. Lesser developed countries and emerging markets pose particularly high political risks, even when they are following reforms to solve the political problems. The stringency of such reforms can itself lead to civil disorder and rising opposition to governments, as has been seen recently in Kenya, Venezuela, Libya and Egypt. Political risk is defined as a risk due to a sudden or gradual change in a local political environment that is disadvantageous or counterproductive to foreign firms and markets (Kennedy, C. (1988): "Political Risk Management A Portfolio Planning Model", Business Horizons, Vol. 31, p.2). The types of action that governments may take which constitute potential political risks to firms fall into three main areas:

7.1 Operational restrictions

These could be exchange controls, employment policies, insistence on locally shared ownership and particular product requirements.

7.2 Discriminatory restrictions

These tend to be imposed on purely foreign firms and, sometimes, only firms from a particular country. The USA has imposed bans on imports from Libya and Iran in the past. Such barriers tend to be such things as special taxes and tariffs, compulsory subcontracting, or loss of financial freedom.

7.3 Physical actions

These actions are direct government interventions such as confiscation without payment of indemnity, a forced takeover by the government, expropriation, nationalization or even damage to property or personnel through riots and war. In 2001 for e.g. the Nigerian government claimed ownership of Shell's equipment and machinery without any prior warning. Investment restrictions are a common way governments interfere politically in international markets by restricting levels of investment, location of facilities, choice of local partners and ownership percentage. When Microsoft opened its Beijing office, it planned to use its Taiwan operations to supply a Mandarin language version of Windows. The government not only wanted such an operating system to be designed in China but also insisted on defining the coding standards for Chinese characters' fonts, something Microsoft had done independently everywhere else in the world. In a flurry of meetings with officials, Bill Gates argued that the marketplace, not the government, should set standards. But the Chinese electronics industry threatened to ban Windows and President Jiang Zemin personally admonished Gates to spend more time in China and 'learn something from 5000 years of Chinese history'.

8 Technological Environment

Technological environment is an incomparable driving force both in international marketing and in the move towards a more global marketplace. The impact of technological advances can be seen in all

aspects of the marketing process. The ability to gather data on markets, management control capabilities and the practicalities of carrying out the business function internationally have been revolutionized in recent years with the advances in electronic communications. Satellite communications, Internet, ISDN and cable as well as email advanced telephone networks have all led to dramatic shrinkages in worldwide communications. Shrinking communications means, increasingly, in the international marketplace information is power. Manufacturers wanting to know the price of X product or the relevant position of competitors in terms of their share price or new product activity have it at their immediate disposal. As wireless technology renders land cables and telephone lines redundant, developing countries are abandoning plans to invest in land-based communication. They are bypassing terrestrial communication systems, enabling them to catch up with and, in some cases, overtake developed countries in the marketplace. In emerging economies consumers are jumping from no telephone to the latest in global communications technology. Wireless application protocol (WAP) technology allows online services to be available to mobile phone users on the move, wherever they happen to be in the world. The use of Global System for Mobile Communications (GSM) technology enables mobile phone operators to determine the location of a customer globally to send them relevant and timely advertising messages. Increasingly companies are using India as a Centre for their global online customer service operations. The ease of hiring computer-literate graduates by the hundred, who are intelligent, capable, keen and inexpensive to hire, as is local property to rent, makes India an attractive location

9 The Role of Co-Opetition

It's no longer a mirage, business cannot survive in isolation and thus organizations need to come to the realization that in a networked economy business must cooperate and compete and thus making co-opetition an added factor impacting international marketing. The idea of co-opetition might soon be recognized as an added factor transformation SLEPT factors in SCLEPT factor in international marketing. The idea of co-opetition might be new but it requires companies to reconfigure strategies that capitalize on relationships in order to create value in the international market. On the international market co-opetition is a new model in which a network of companies co-operate and compete and is becoming the most significant business perspective these days. The explosion of technological advancement has made it feasible by enabling relationship through information dissemination as well as integration. In this era of competitive and rigid environment co-opetition will become a vital powerful tool for identifying market opportunities and configuring business strategies. The concept of co-opetition was expanded upon by Adam Brandenburger and Barry Nalebuff, professors at the Harvard Business School and the Yale School of Management respectively in their book entitled "co-opetition" in 1996". The information high way has significantly altered the barriers galloping competition in the international market. It has led international marketing to a point where time is becoming a critical factor and a scarce resource in term of analyzing, adopting, reacting and responding to drastic market changes. To reap the benefits of co-opetition, organization need to foresee and configure business strategy to get an over view of the companies possible network, i.e. customers, suppliers, competitors and complimentors. Today's sophisticated business network is demanding business to move away from the factory model strategy to a techno-model strategy to cushion the demanding business landscape. With the idea of co-opetition international marketing personnel can it as one of the most significant bargaining cheap to collect marketing intelligence to bring about new ethical approach to deal with the SLEPT aspect of marketing. Co-opetition will broaden the scope of business in all aspect to cushion the dilemmas business face when opening up to new and emerging markets. What business needs to do is to use it to strategize, compete and create added value to let its presence be known on the international business landscape.

10 Conclusion

The international marketing environment has and will continue to be transformed in par with technological advancement and will consists of factors external to an organization that will affect its marketing strategies/activities. Elements of the marketing environment are largely uncontrollable, although marketers with clear marketing vision have influence over some factors. The international marketing environment factors will continue to affect the size and development rate of markets and will influence marketing activities. Thus, changes in the marketing environment offer significant opportunities and threats to marketers. Identifying and responding effectively to these opportunities and threats is a major challenge but can be overcome or cushioned with configuring strategies as the

marketing landscape is being transformed. Marketing personnel need to keep up to date with the international marketing trend and take drastic measure if they are to succeed since quitting is never an option. Innovation, Techno-entrepreneurship, competition, collaboration and networking are the key elements for successful integration in the international marketing stage.

A Theoretical Framework of the Knowledge Stickiness of Distributed Innovation*

Yang Kun, Liu Guoxin, Li Chen

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: yangkun12345688@126.com, syliuguox@126.com, 785160930@qq.com)

Abstract: From the perspective of practical activities, drawing on the theory of situational behavior patterns theory, activity theory and distributed cognition theory, this paper builds up a theoretical framework of Distributed Innovation (DI) and the sticky knowledge in it, and then analyzes the factors that influence the knowledge stickiness in the Distributed Innovation Network (DIN) to try to provide a theoretical reference for understanding and further study of the problem of knowledge stickiness in DIN.

Key words: Distributed Innovation (DI); Knowledge stickiness; Situational theory; Activity theory; Cognition theory

1 Introduction

Given the background of the economic globalization and the rapid development of the knowledge and information technology, DI, the innovation activities which is on the basis of the resource sharing in the enterprise and between the cooperative upstream and downstream enterprises in different regional and carried out based on the common network platform^[1], became into being. Due to the definition of innovation networks which are various institutional arrangements that bring about the characters of collaboration & mutually beneficial interaction of DI, each innovation base in DIN is one node of the network. While, the flowing processes of knowledge between different nodes are not smooth due to a variety of factors, but be sticky and difficult to move to the knowledge-receptors, which can be called knowledge stickiness^[2]. The knowledge stickiness seriously hampers the innovation efficiency of the DI.

Innovation is the product of practical activity, and DI is the innovative practical-activity with marked distributed character in the context of global ICT and across integrating heterogeneous technical knowledge\ cultural. There've been some studies on DI applying complex-network or knowledge fermenting theory which contributed to the explanation of DI; however, the theoretical framework of DI based on its nature of practical activity has not been formed. This paper argues that the theory of situated action, activity and distributed-cognition clearly explain the mechanism of knowledge sharing and creating of DI respectively from the perspective of situation, activity and cognition. This paper will respectively comb and integrate these theories and their nexus with DI, and then construct the "S-A-C" (Situation - Activity - Cognition) theoretical framework to provide a theoretical basis for further research of knowledge stickiness of DI.

2 Formation of "S-A-C" Theoretical Perspective of DI

2.1 The "Situation" perspective of DI

Table 1 The "Situation" Perspective and Its Lessons for DI

The "Situation" perspective of DI	Its lessons for DI (It is advisable....)
① DI concerns the situation of multi-site & multi-factors.	to take full advantage of the commutative complement and support between nodes to promote the efficiency of DI.
② The practical effect of innovation can also be improved by individual creativity or innovation through cooperatively integration and re-upgrade.	to focus on creating the atmosphere of interaction within the DIN to acquire or construct original knowledge and creative more effectively through cooperation and integration.
③The diversity of situations promote the view reflecting in DI activities.	to appropriately take use of contextual differences between different nodes in the DIN to stimulate the generation of innovation.

Suchman (1987) proposed the theory of situated-action which argues that human activity derive

* This paper is financially supported by self-determined and innovative research funds of WUT (135203002), and NSFC (71072076).

from the given environment rather than strictly in accordance with pre-planned^[3], in other words, it emphasizes the affect of special circumstances and unexpected emergency action on activities. Lave proposed (1988) to attach importance to the relationship between person and environment in analyzing the activity of persons-acting in setting. The situated-action gives a unique perspective to analyze the relationship between action and situations. In summary, the theory of situated-action provides such theoretical perspective for DI just as shown in Table 1:

2.2 The “Activity” perspective of DI

“Action” is effort the subjects make to achieve a particular goal. Kuutti (1997) argued that activity theory is an interdisciplinary study framework of human practice, including personal and social level, as well as the use of products^[4]. Rubinshtein. Etc have made contributions to the development of activity theory, the main ideas of which are as follows: 1) The analysis unit of activity theory is the activity system including 6 interactive elements which are subject, tool, object, labor division, the community and rules. The operating structure will change when the objective is constant but the acting situation changes (Leont'ev1974)^[5] because of the flexibility of activities (Bødker, 1989)^[6]. 2) It proposed a specific concept of situation which argued that the activities themselves are situations which are formed by the actions of participants and products. 3) A key concept is “products mediation” which refers to human control of products^[7]. 4) Activity is an object-oriented process^[8]. Generally, activity theory focuses on the social and situational relations between the individuals\groups, tools and collaborators in an activity, as well as the purpose, objective, and results of an activity^[8].

Activity Theory is a framework for understanding human practice activities, and is beneficial for analyzing DI. This paper advocates that activity theory is a descriptive tool rather than prescriptive theory, and so the DI from the “activity” perspective can be referred just as shown in Table 2:

Table 2 The “Activity” Perspective and Its Lessons for DI

The “Activity” perspective of DI	Its lessons for DI (It is advisable...)
①The DI activities are object-oriented.	to clear the object, including the requisite resources, the situational background and the main motivation of the DI activity.
②The analysis of DI activities should be expanded on the basis of the activity system.	to clear or deeply analyze the system of DI activity (including the participants, the exchange places, the expected innovation, etc.) and its structure which refers to the activity itself, the related sub-activities as well as the relationship between them).
③The DI activities are situational context themselves.	to focus on and take advantage of the specific situation and dynamic characteristics of the DI activities, such as the internal and external driving factors as well as the dynamic relationship between the members.

2.3 The “Cognition” perspective of DI

Ed Hutchins (1995) and his colleagues in UCSD proposed the theory of distributed-cognition^[9]. Hutchins (1991) proposed that cognition should be understood as distributed phenomenon, which is different from the traditional view that cognition was local phenomenon through information processing on a personal level. With the rapid development of cognitive tools and information and communication technology, distributed-cognition was attached more and more importance because that the interactive cognition between individuals and tools can’t be explained by the traditional individual analysis of cognition. According to the mainstream understanding of distributed cognition of scholars, distributed cognition emphasized the nature of cognition distributed in cognitive subject and environment, and it presents a new function system of “analysis unit”. This system involves not only individuals but also the collection of distributed interaction between people and products. “Products” is the core term which refers to tools, thinking and methods and so on.

Table 3 The “Cognition” Perspective and Its Lessons for DI

The “Cognition” perspective of DI	Its lessons for DI (It is advisable...)
① The polymerization force of cognition is composed of persons and products, and they are equal with individual, group and community.	to initiatively look for people, teams, businesses, communities, and infrastructure to build DI system, and to maximize the power of individual ,products and community
② Suppliers, manufacturers, innovators and distributors share knowledge, and thus produce the dynamic ability of quickly learning to overpower the competitors.	to create a widely distributed network for connection and interaction in order to achieve the huge overall advantage.
③ Information technology play a significant role in distributed cognition.	to take full advantage of ICT technology and other supporting infrastructure whose cost is getting lower and lower.

Combined with the features of Distributed innovative, this paper argues that the distributed cognition theory provide the important perspective of “Cognition” of DI just as shown in Table 3.

2.4 DI from the perspective of “S-A-C”

Based on the three theoretical systems above, DI can be interpreted from the perspective of “S-A-C” as: DI is a process of innovative cognition generating based on distributed innovative activities in the context of DI. The context of DI is the unity of the context of the DIN, between the nodes and in every node; the activity of DI is the combination product of situational background, orienting goal, products regulation and flexible coordination; the cognition generating of DI is the product of innovation composed by the subjects, environments and the systematic planning with the aide of products (Figure 2).

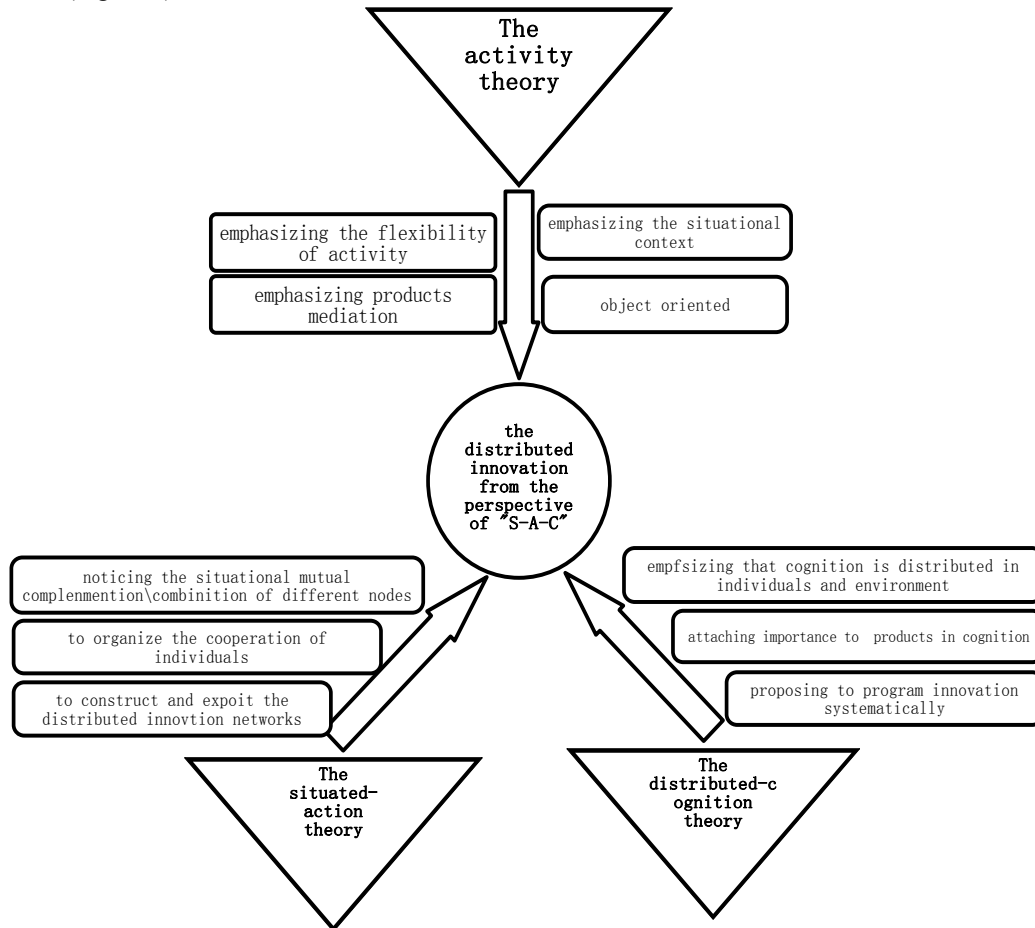

Figure 2 DI from the Perspective of “S-A-C”

3 Theoretical Framework of the Sticky Knowledge of DI from the Perspective of “S-A-C”

3.1 The conceptual conformation model of sticky knowledge from the perspective of “S-A-C”

According to the connotation of DI, knowledge sharing is not only the competitive advantage of DI, but also the guarantee of the efficiency of innovation. According to the above, it is not difficult to draw the following views: In the DIN, the flowing efficiency of knowledge between nodes is closely related to the situations, activities and cognitions of the network, and thus, it is necessary to probe the conformation of sticky knowledge in the three dimensions of situations, activities and cognitions from the three angles of structure (by “situation”), process (by “activity”) and behavior (by “cognition”).

Thus, this paper built “The conceptual conformation model of sticky knowledge from the perspective of ‘S-A-C’” (Figure 3). This model assumes that: 1) any process of innovation in DIN is impacted by the situations of all nodes involved as well as the situation of the entire network; 2)the activities within the network include the independent behavior of one node as well as the interaction of

the nodes; 3)the sticky knowledge conforms gradually in the process of knowledge flowing in activities of DI with the influence of multiple situations in the DIN. It is not difficult to draw that the conformation of sticky knowledge in the DIN is affected by the sticky layer of situation, activity and cognition, and all the sticky knowledge in the network constitute the network knowledge stickiness.

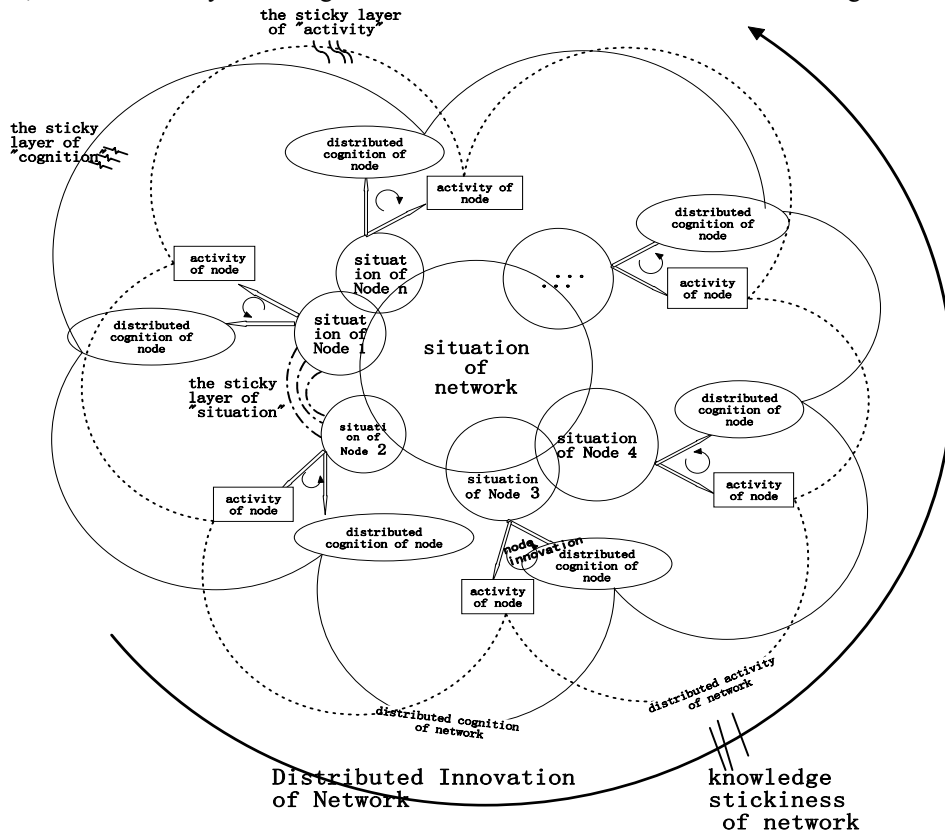

Figure 3 The Conceptual Conformation Model of Sticky Knowledge from the Perspective of "S-A-C"

3.2 The factors of each sticky layer and the framework constructing

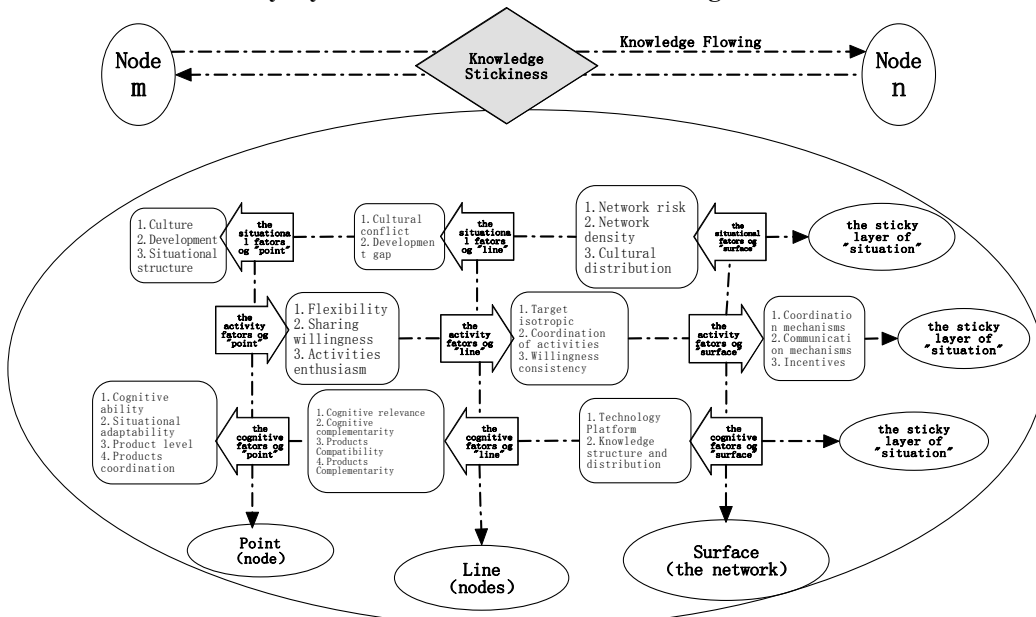

Figure 4 The Sticky Layers and Their Influencing Factors from the Perspective of "S-A-C"

The knowledge in DINs is no longer within the enterprise, either a linear or parallel distribution, but is mesh & three-dimensional distributed to “point-line-surface” in the network. “Point-line-surface” respectively refers to each node in the network, the communication and cooperation between the nodes and the set of lines with various directions. The knowledge sharing of the network is often reflected by the “surface” which is determined by the systematic role of “line” and “point”. Based on the theoretical perspective of “S-A-C”, the processes of knowledge creating and flowing in “point” “line” and “surface” are all affected by the related factors of “situation” “activity” and “cognition”, which means that this three sticky layer is respectively constituted by the sticky factors of “situation” “activity” and “cognition” in the level of “point” “line” and “surface” (Figure 4).

3.2.1 The sticky layer of situation and its influencing factors

On the level of “point”, the sticky layer of situation is mainly reflected in the cultural openness, innovation and flexibility of node, as well as its organizational development and internal structure^[10]. On the level of “line”, the sticky layer of situation is mainly reflected in the cultural conflict (or coordination), knowledge differences in the structure (such as the core technology and the difference in the field)^[11] and the development gap between the nodes^[12]. On the level of “surface”, the sticky layer of situation is mainly reflected in the risk, density and culture of the Network. The risk of the network which will affect the knowledge sharing of nodes comes mainly from the open and dynamic nature of DIN, such as the exit & joining of nodes. The density of network which will make member nodes more actively to protect their reputation and abide the guidelines due to the constraints of cooperation model proposed by Coleman refers to the surrounded situation by the main third-party with the contact and link from the network^[13]. Many studies consistently show that similar culture is an important factor for efficient and cost-effective knowledge flowing, however, for DIN which is bound to be diverse and balance in cultural, compatibility play a crucial role in the process of knowledge flowing and sharing.

3.2.2 The sticky layer of activity and its influencing factors

On the level of “point”, the sticky layer of activity is mainly reflected in the flexibility of objectives, plans and implementation^[14]. On the level of “line”, the sticky layer of activity is mainly reflected in the coordination of objectives, plans and implementation^[15], as well as the synchronization of their willingness and frequency of knowledge sharing. On the level of “surface”, the sticky layer of activity is mainly reflected in the setting and running of the mechanism of coordination, communication and incentives of the network^[16]. For the nodes in DIN, their cooperation is dynamic and complex which calls for better mechanism to coordinate to avoid conflict, collision, risks and opportunism. Good communication is necessary because it helps each other to discover the advantages of avoiding disadvantages, and constantly optimize the content and direction of the knowledge flowing to improve the efficient of knowledge sharing. Besides, the mechanism of incentive is better to be based on all the nodes and target satisfying them to stimulate effective and beneficial knowledge sharing^[17].

3.2.3 The sticky layer of cognition and its influencing factors

On the level of “point”, the sticky layer of cognition is mainly reflected in the cognitive abilities of the node, the cognitive subjects, the coordination of the situation, as well as the development of the tools, theory and technology^[12]. On the level of “line”, the sticky layer of cognition is mainly reflected in the correlation of cognitive ability of the nodes, complementary of their tools, databases and other products, as well as the coordination of their culture and other multi-directional scenario^[18]. On the level of “surface”, the sticky layer of cognition is mainly reflected in the technology platform and the distribution structure of knowledge. Technology platform refers to the shared information retrieval tools, databases, exchange and sharing system services within the range of network. Besides, the difference of depth and width of knowledge affect the efficiency of knowledge transferring^[21].

4 Conclusions

This paper constructed the “S-A-C” theoretical framework of DI and the knowledge stickiness of it, and further analyzed the factors and composition of knowledge stickiness. Generally, the followings are advisable for the weakening management of knowledge stickiness:

- 1) Make technology become the innovative tools that can be controlled and used by innovators, and thus innovators will more effectively lead and coordinate innovation activities by dominantly taking full advantage of a variety of technical features;
- 2) Considering the importance of original knowledge or techniques in economic development and the status of China, DI activities should be positioned in promoting the innovators to develop high-level innovation capability and implement creatively innovation, as well as supporting their independence, cooperation, researching and reflection;
- 3) It is

advisable to study the cognitive development given the interaction of internal and external factors.

Finally, it is necessary to call for further correction and empirical for this "S-A-C" theoretical framework although it was derived from mature theories.

A Study on Influence Factors of Uncertainty of the Enterprise Financial System

Deng Mingran, Wang Pengjie, Fang Ming

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: dmr@whut.edu.cn, wangpengjie@163.com, 1667701898@qq.com)

Abstract: Understanding and grasp of the corporate financial system with uncertainty is helpful for avoiding the financial risks of enterprise, improving the economic efficiency of enterprises and realizing the enterprise health and sustainable development. This paper discusses the enterprise financial system in which exist objective uncertainty and subjective uncertainty, and analyzes the factors affecting enterprise financing system of objective uncertainty and subjective uncertainty, which is of significance in reducing and avoiding financial risks, and then strengthening enterprise financial management.

Key words: Enterprise financial management system; Objective uncertainty; Subjective uncertainty; Influence factor; Strategy

1 Introduction

From the viewpoints of management, enterprise financial management is constructed by the four activities of raising funds, long-term investment, working capital and corporate profits allocation and then form the cycle of financial contents as shown in Figure 1. As for the working procedures, it is necessary for an enterprise to make financial forecast, financial decision-making, financial budget, financial control, financial accounting and financial analysis and then form the cycle of financial processes as shown in Figure 2. The cycles of content and process of enterprise financing are faced with the perplexing, changing the macro environment and micro environment, which causes a lot of uncertainties for enterprise financial management, and increases the risk of business financial system. Therefore, the analysis of uncertainties in business financial system can identify the financial risk, control financial risk control and realize the financing goal.

Figure 1 The Cycle of Financial Contents

Figure 2 The Cycle of Financial Processes

When it comes to uncertainty, people will immediately think of risk. Then what is the relationship between uncertainty and risk? On the relationship between uncertainty and risk, there exist two kinds of views of the theory of identity and the theory of difference. Identity theory believes that the risk is the same as the uncertainty. But most scholars hold the theory of difference and assume the risk and uncertainty are two different concepts. In decision theory, the decision-making problem of state probability is known as risk decision-making, and the state probability of the unknown called the decision uncertainty decision. Obviously, this distinction between risk and uncertainty is in need of mathematical modeling. This paper thinks that the uncertainty and the risk are not synonymous with each other. Uncertainty is one of the causes of risk, but is not all reasons, at the same time, some uncertainties can create risk, but some other uncertainty can not. The uncertainty can be subdivided into

objective uncertainty and subjective uncertainty. Objective uncertainty is a reflection of the objective nature of uncertainty. For example, Burkart thought, uncertainty is an impossibility certainty that can be definitely determined by research and development project. Daghfous and White assumed that uncertainty the accurate information of the research project. These two definitions can reasonably reflect that the objectivity of the essence of the uncertainty is the objective uncertainty, which can also be known as the narrow sense of uncertainty; subjective uncertainty stems from the shortage of the decision-making body in ability to obtain recognition and process the objective information. Both subjective and objective uncertainty is collectively referred to as the generalized uncertainty. Enterprise financial system covers both objective and subjective uncertainties. The author thinks, objective uncertainty of enterprise financing system refers to various kinds of financial factors in the financing process. Objective certainty has the following characteristics: (1) It is existed in future events. In the present moment, only when we forecast the future activity objective uncertainty would appear accurately. Let t be the current time, t_m is future observation time, when $t < t_m$, the existence of objective uncertainty; when t is greater than or equal to t_m , there is no objective uncertainty due to past and current events or factors have happen or occur. (2)The objective uncertainty of enterprise financing system not only refers to the uncertainty, but also the emergence of various "factors" in each stage of enterprise financing process. Subjective uncertainty of enterprise financing system refers to incomplete information about the understanding of the subjective and objective reasons of all kinds of financial factors in the financing process. When $t \geq t_m$, and there is no objective uncertainty, but the existence of subjective uncertainty. The study on the uncertainty of enterprise financial management system refers to the study on uncertainty of the generalized, namely objective uncertainty and subjective uncertainty.

There are objective and subjective uncertainties in enterprise financial system because in the enterprise financial management system, there is a breeding soil and conditions for objective and subjective uncertainties. The study of the macro environment facing the enterprise financial management system and microcosmic environment of enterprise financing system of objective uncertainty and subjective uncertainty, is very important for us to identify the financial risk source, control financial risk, intercept financial risk conduction, cut off the path of financial risk conduction, and realize the key steps of financial risk management.

2 Analysis of Objective Uncertainty of Enterprise Financial Management System

Objective Uncertainty of Enterprise Financial Management System is presented as in Figure 3.

Figure 3 Objective Uncertainty of Enterprise Financial Management System

(1) The economic factors of objective uncertainty of enterprise financial management system

Economic factors can affect the objective uncertainty of enterprise financing system mainly include: the economic cycle, economic system, economic structure and resource conditions, market and price, financial market, financial revenue and other factors. These factors have a significant impact on enterprise financial management system, investment and financing distribution caused by the financial activities. A small change in these factors will give a great change on marketing, production and supply objectives, and then cause a series of uncertainties.

(2) The social and cultural factors of objective uncertainty of enterprise financial management system

Social and cultural factors include education, science, literature, art, press and publishing, radio and television, sports, health, environmental protection, world view, moral beliefs, customs and social system to adapt with the rights and obligations of concept, moral concept, organizational discipline idea, concept of value, labor attitude. These factors have a direct impact and indirect effect on corporate finance, and some effects are very little, the most important factor is: education and scientific factors.

In the educational factors, due to the application of enterprise financial management involves a large number of words, math and modern management tools and means. If the education is in the backward situation, the quality of financial personnel is low, it is hard for enterprises to improve the level of enterprise management, and it is difficult for them to adapt to complex and dynamic environment, which will lead to a

lot of uncertainties in the enterprise financial activities. This situation in the modern management method, financial network, e-commerce application is more and more popular, some enterprises will be difficult to adapt to the financial risk is everywhere, its loopholes appeared one after another.

In the scientific aspects, firstly, the scientific development is conducive to the improvement of enterprise financial management theory. Besides, the development of enterprise financial management theory is not isolated, many areas of development economics, mathematics, statistics, the modern science of management, accounting, are developing financial theory to a certain extent. Secondly, the development of science has created favorable conditions for the enterprise financial management work, for example, application of computer, and the popularity of communication equipment have also promoted the improvement and innovation of financing method. Besides, changes of scientific factors will cause different degree of enterprise financial management concepts and management means, if the enterprise cannot keep pace with the times, master science and technology, modern method and means, will cause the enterprise financing activities there are a number of uncertainties.

(3) The type factors of objective uncertainty of enterprise financial management system

Type of business is usually divided single proprietorships, partnership enterprises and companies. At the same time, enterprises can be further divided into giant enterprises, large enterprises, small and medium enterprises. Different types of enterprises have the different financing risk, especially small and medium enterprises, which have the poor ability to take risks and then are confronted with financing problems, so there are different degrees of uncertainty in the enterprise financial activities.

Type of enterprise also can be classified as technology-intensive enterprises and labor-intensive enterprises.

Technology-intensive enterprises always use more fixed assets but few production workers. A large amount of funds are occupied in fixed assets, which requires this enterprise to raise sufficient long-term funds to meet the investment in fixed assets; on the contrary, if the enterprise is labor-intensive enterprises, and then more short-term funds should be consumed. Moreover, ship and aircraft production enterprise have the longer production cycle and more long-term funds are used; food production enterprises have the shorter production cycle and more short-term funds are used. The different types of enterprises will influence the enterprise financing activities and result in the existence of different degree of uncertainty in the financial activities of enterprises.

(4) The stakeholder factors of objective uncertainty of enterprise financial management system

Enterprise financial management is actually dealing with economic relations among stakeholders. Stakeholders mentioned here refer to the enterprise internal or external interest groups involved. It not only refers to a natural person, also refers to legal entities as follows.

The first are owners or shareholders. The owners or shareholders are the owners of enterprises, and then the enterprise should protect the owner's investment value. The owners of enterprise have great influence on decision-making and the implementation of financial activities such as financing, enterprise long-term investment, liquidity, profit distribution.

The second are creditors. Creditors such as bondholders and loan bank lend money to the enterprise. Enterprise financial management has the responsibility of repaying debts to the creditors, if not, the default will affect the credibility of the enterprise, and even lead to the bankruptcy of the enterprise.

The third are employees. The employee is refers to the staff employed in enterprise production and management activities. The enterprise must provide favorable wages and good working conditions to meet the needs of employees, to mobilize the enthusiasm of employees, and to create wealth for the enterprise; otherwise, the production and operation targets. will be affected.

The fourth are customers. The product and service quality of enterprise are up to the customers to test. Therefore, the success or failure of the enterprise, in the final analysis depends on customer. In order to better meet the needs of customers, enterprises should do a good job in advertising, strengthening the after sale service, in good faith service, to ensure high quality and inexpensive products, improve customer satisfaction and loyalty, to enable enterprises to sustainable development.

The fifth is he governments at all levels. There exist some interests between government and enterprises, the main is the enterprise must be in accordance with the law and pay taxes timely. The enterprise finances enough capital to meet the needs of tax.

The last one is society. Corporate social responsibility also has a significant impact on the financial management of enterprises. For example, corporate make donations to religious or education agencies, this will reduce the enterprise funds or profit. Besides, environmental pollution caused by enterprise should require the enterprise to invest in clean up pollution, which leads to changes of enterprise capital demand.

3 Analysis of Subjective Uncertainty of Enterprise Financial Management System

In the process of financing, due to the incomplete and inaccuracy understanding of corporate financing and its various elements and results related to, a lot of uncertainties are caused in enterprise financial system for financial decisions and judgments, which is defined as subjective uncertainty for the enterprise financial management system.

Information asymmetry of enterprise financing activities on enterprise production and management activities will lead to the uncertainty of financing activities. As the founder of information theory, Shannon said the information is the elimination of uncertainty. Enterprise must grasp more information in order to reduce uncertainty. Business forecasting, financial system process of decision-making and budget work, should be to master, choosing the right direction, to avoid mistakes, the pursuit of efficiency for the purpose, adopt all sorts of ways to increase the amount of information to reduce uncertainty, reduce financial risk, realize the goals of financial management. Of course, reduce financial risk objective is to minimize the risk of loss, and access to information need to spend a certain price, including the information acquisition cost and time investment. Therefore, enterprise should trade off the loss of information due to cost and uncertainty risk.

According to the theory of dissipative structure, open system far from equilibrium state will exchange the material, energy and information with the outside and then from change the disorder state into order state. Enterprise financial management system is an open system, which needs to know a lot of information from the outside world such as the fund-raising, investment forecast, decision-making, budget. The disorder in enterprise financing system is actually the response to an uncertainty. When the enterprise financial system becomes ordered system, the information of this system will be grasped by tall or most of the operators or policymakers. If enterprise financial system is open, financial management will be a process of information continued to be increased, and then uncertainties will continue to be reduce. Therefore, access to information is crucial to the subjective uncertainty of reducing enterprise financial system. That is to say, the amount of information is sufficient or not is crucial factor in subjective uncertainty of enterprise financial management system.

4 Conclusions

(1)The cycles of content and process of enterprise financing are faced with the perplexing, changing the macro environment and micro environment, which causes a lot of uncertainties for enterprise financial management, and increases the risk of business financial system.

(2) The factors that can affect the objective uncertainty of enterprise financing system include: economic factors, social and cultural factors, stakeholder factors as well as enterprise type factors.

(3) The main factors affecting the subjective uncertainty of enterprise financing system refers to information asymmetry.

Understanding and grasp of the corporate financial system with uncertainty and its reasons can help enterprises to use financial management theory to correctly and effectively solve the uncertainty for the sake of reducing or avoiding the financial risks of enterprise, improving the economic efficiency of enterprises and realizing the enterprise health and sustainable development.

Research on the Driving Mechanism of Intermediary Business Development of Chinese Commercial Banks

Hu Jing¹, Bai Xiaozhong²

1 School of Economics and Management, Hubei University of Education, Wuhan, P.R. China, 430205

2 School of Economics, Politics & Law, Hubei University of Technology, Wuhan, P.R. China, 430068

(E-mail: 466927332@qq.com, 43974681@qq.com)

Abstract: Commercial banks can broaden the scale of intermediary business and improve its economic profits while balance sheet is not changed currently; the intermediary business in Chinese commercial banks is in primary development stage and far behind the developed countries. It is urgent for Chinese commercial banks to find a way to accelerate the development and innovation of the intermediary business, to realize diversified operation and expand the new growth points. From the view of driving mechanism, this article has an analysis and comparison between intermediary business development and its driving factors in international commercial banks, combining the national conditions and the features of intermediary business in commercial banks, and puts forward driving mechanism model “6+1+1” effecting the innovation and development of intermediary business in Chinese commercial banks on the basis of TRICK model.

Key words: Commercial banks; Intermediary business; TRICK model; Driving mechanism

1 Introduction

The intermediary business in Chinese commercial banks is in development stage, facing unprecedented opportunities and challenges. In China, many problems exist in the process of the intermediary business development. To keep the intermediary business in Chinese commercial banks sound, rapid and sustainable development, it is necessarily urgent to form the operation and innovative mechanism of the commercial banks' intermediary business suited to China's national conditions, based on the research on the innovative mechanism.

2 The TRICK Theory under the Western Mode “5+1”

Regarding to the driving mechanism of intermediary business's innovation and development of commercial banks, TRICK theory, an authoritative research result in western countries, obtained by the seminar on asset securitization of the deposit institutions and the development and risk of intermediary business held in the U.S. in February 1987.

This theory explains the reasons of the appearance and development of intermediary business:

TRICK + rational self-interest = intermediary business's development + securitization

Above that formula, T in the TRICK is Technology, R is Regulation, I is Interest Risk, C is Competition for Customers, K is Capital Adequacy (the first letter of capital is K in German).

TRICK mode can be understood in this simple way. This mode formulates the driving factors effecting the innovation and development of intermediary business as a 5+1 mode. It means that the development and securitization of intermediary business is driven by the elements in TRICK from the external driving factor, while self-restraint and motivation made by the commercial banks for seeking more profit opportunities and development space can be internal impetus. The model indicates that the banks' intermediary business facing the outside pressure, like financial regulation, risk of interests, competitive force and the request of minimum capital fund from financial regulatory authority, or even all of above.

It has to point out this model illustrates the driving mechanism of intermediary business's innovation and development based on mature marketing environment and operation mode of commercial banks' intermediary business in western countries and the model is also not perfect. Applying this model to Chinese commercial banks' intermediary business shall be subjected to the test of Chinese financial market and need to be further improved.

3 The Comparison of External Driving Factors Affecting the Innovation and Development of Intermediary Business Between China and Foreign Countries

Here it is the comparison of 5 external driving factors affecting the innovative development of intermediary business between China and foreign countries

3.1 Technological Progress

It is apparent that the contribution of technological progress to intermediary business's innovation and development. The high technology, especially the widespread application of computer technology and communication technology to financial industry not only fundamentally change the way and efficiency of operation of commercial banks' intermediary business, but also make formerly impossible products of intermediary business happen, it also dramatically reduce transaction cost for suppliers bank, and make more convenience for customers. The typical example is appearance of bank cards and internet bank products

In China, it is prevalent to apply modern high technology to the financial industry. Banking industry has been one of the digital and electronic profession in high degree. All commercial banks in China have installed their data base, thereby sharing information with other commercial banks and the government departments, which lay a solid technological foundation for the development of commercial banks' intermediary business. But comparing with developed countries, the high technology, in particular the application of electronic technology in Chinese financial industry still fall behind, reflected in development and application of software lags behind business development, slow computerization.

3.2 Financial Regulation

The theory of driving effect produced by financial regulation in the development of financial innovation originates from the theory of regulation evasion of Kane and Mishkin. According to this theory, the financial institutions evade regulation through financial innovation to gain the profits from outer regulation. Developing or innovating intermediary business products is the best approach to avoid the financial regulation and increase returns.

The act of financial regulation is prevalent in China. It has the strict rules in interest rate, exchange rate and capital adequacy ratio. From the perspective of widespread financial regulation, China's financial environment is beneficial to the promotion of intermediary business's development. Currently, China is the country in the socialist market economy system, which should be an environment for financial innovation, but in fact, no effect has been achieved, the reason to that is the way of implementation of regulation. The regulation is enforcement acts that can be carried out not only by legal means, also by administrative means, while the difference between China and abroad is the adopted means. Taking the example of US and China, Federal Reserve in American Central Bank adopts legal means to regulate financial market; the features of legal means are stability and more operation room for banks, lower risks. While China regulates the financial market by means of administrative order made by Central Bank or China Banking Regulatory Commission, some new financial products are banned to be developed by bank, which lead to the commercial banks' failure of expected effect to products' development. Undoubtedly, it is a killer for commercial banks' initiative to develop the intermediary business products.

3.3 Interest Rate Risk

Interest rate risk promotes intermediary business' innovation and development of commercial banks. In theory, the rate of interest and exchange fluctuates in financial market, which not only can increase the risk of interest rate and exchange rate, but also increase the demand of intermediary business that be able to transfer price risk. For example, developed countries witnessed the fluctuation of the rate of interest and exchange in a frequent and dramatic way in 1970s-1980s, which led to the emergence and development of intermediary business products.

However, Chinese situation is different from developed countries. China have been adopting official interest rates system, after WTO entry, the country allowed interest rates to fluctuate within limits, but according to the national conditions, the state still have a strict restrictions on interest rates, the real interest market in China is not fully formed. Currently, the foreign exchange market in China is not truly exchange market, just a exchange market among the banks. Although this system of rates of interest and exchange plays a relatively positive role in stabilizing Chinese financial market, but it curbs the innovation and development of intermediary business product in financial derivatives in order to avoid risk.

3.4 Horizontal Competition

Taking an American example, due to the development of American financial market, especially the intermediary business in 1970s, the type of financial structure increased and a large number of non-bank financial institutions stormed into the market that belong to banking financial institutions. For example, Prudential Financial, the largest American insurance company and Merrill Lynch stepped into banking businesses. Prudential Financial made use of subdivision engaging in intermediary business, like deposit, credit cards, mutual fund, security and mortgage loan. While Merrill Lynch has more securities

operation, except for bond and mutual fund, it also works on consumption loan, credit cards, corporate finance and life insurance that belonged to business of banks or insurance companies. Moreover, even some non-financial institutions start to engage in financial business. For instance, Ford Motor Company set up Ford Finance Company, the special agency, to run financial service, and this company has become one of the top ten American Credit Cards companies and Mortgage companies. The fierce competition results in shrink of deposits and loans business in American commercial banks, which weaken the banks' competitiveness. Confronting this situation, the commercial banks have to explore new business and innovate the intermediary business so as to keep competitive and pursue new growth opportunities.

There are their own characteristics in Chinese commercial banks' competition. First, state-owned commercial banks play a dominant role in banking industry, it substantially outnumber joint-stock commercial banks in terms of asset size, capital fund, network distribution and technology. Though, recent research shows the market structure in China's banking industry transformed from oligopoly-monopoly to monopoly competitiveness, thus, our banking industry still lacks of competitiveness comparing to the developed countries, which is bad for the innovation and development of commercial banks' intermediary business.

3.5 Capital Adequacy Ratio

After Basle Report released in 1980s, all banks were required that the minimum CAR of capital risk reach 8% in the end of 1992. This rule plays a positive role in preventing global financial crisis, but has a negative influence on the development of assets business of commercial banks that under fierce international competition. Under this circumstance, financial industry appears the phenomenon of on-balance-sheet in off-balance-sheet clothing in America and other western countries, and transfer the profitability from asset business to intermediary business then continue to expand. It reflects that commercial banks avoid the requested CAR, which promotes the innovation and development of intermediary business.

Chinese government accepted the rule about CAR made by Basle Committee. Central bank introduced many measures for adding the capital of state-owned commercial banks to reach the rule of Basle Committee. But Chinese state-owned banks is still in monopoly, facing lower pressure of competition and increasing capital ratio, adding that CAR is not mandatory, so the banks lack of motivation to develop banking business due to the escape of CAR regulation.

4 “6+1+1” Driving Model to Innovate and Develop Chinese Commercial Banks' Intermediary Business

It is clear that emergence and content of TRICK theory has characteristics of times, which is manifested by the effect of CAR rules on the innovation and development of intermediary business. It is unavoidable that the foundation and application of this model has limitation because of different countries and different national conditions. Current China is far different from 1980-1980s' and US, so researching the innovation and development of Chinese commercial banks' intermediary business with the use of TRICK theory should take national conditions, social and economic environment, international environment into consideration. From this point, it is necessary to improve the original TRICK theory.

It is proved that the 5 driving factors of external pressure mentioned by TRICK theory in “5+1” model promoting the innovation and development of commercial banks can provide the motivation to study the innovation and development of commercial banks. So did the internal driving factors of self-interest maximization pursued by the commercial banks, as a microeconomic individual. But in my opinion, the driving mechanism of the innovation and development of commercial banks' intermediary business described by TRICK theory need to be complemented and perfected according to Chinese conditions. Here is the discussion and supplement to the original TRICK model

4.1 The external driving factors for market demand

At present, China saw the rapid economic development. No countries can compare to China in terms of the scale or potential scale of financial market, potential vitality of financial market and some special situation appeared in the development of financial market. In regard to the external driving factors for the innovation and development of Chinese commercial banks' intermediary business, huge market demand for intermediary business is an impetus to promote its innovation and development. It is discussed from the 3 aspects.

Firstly, the demand of 1.3 billion people is a factor to promote the innovation and development of Chinese commercial banks' intermediary business.

For 1.3 billion Chinese people, after 30 years of reform and opening up, their pursuit for material and spiritual culture is different comparing to before. All kind of services are demanded for commercial banks' intermediary business and it facing a huge demand, which can substantially drive the innovation and development of commercial banks' intermediary business for individual.

Take the market of credit card in Shanghai as an example; the citizens own 50.2 million credit cards in Shanghai till the end of August 2006, which means every resident owns 3 credit cards on average. As the advancement of national networking, the foundation and improvement of credit investigation system, it cannot imagine the potential of market of credit cards in China.

Secondly, the disparity between poor and rich stimulate the innovation of commercial banks' intermediary business.

It is an unavoidable fact that the reform and opening up in China and continuous rapid development of economy caused the increasing gap between rich and poor, which indicates about 80% wealth is owned by 20% population, and the number of these people is huge. In addition, the so called "middle class" is coming into being. The several resident groups in different degree of affluence promote the innovation and development of commercial banks' intermediary business, due to the huge demand of all kinds of groups.

Thirdly, the population structure of aging speed up the rapid innovation and development of Chinese commercial banks' special intermediary business.

China, with a considerable number of senior citizens, has entered aging society, which will certainly promote Chinese commercial banks to innovate and develop the special intermediary business aiming to these elderly people. As the economic development and social progress in China, the elderly people have an increasing economic income and independent economic capability as well as consumption ability. The national working committee for elderly people investigated the senior citizens' consumption ability in 13 provinces, found that their consumption ability had a rapid growth annually and predicted it would reach 2000 billion RMB in 2010. Thus, it can be seen that the market of personal finance and intermediary business for senior citizens has a substantial potential.

At present, elderly people's demand to financial products is management of cash income, trust service and financial counseling etc. The financial institutions should make innovations in financial products for elderly people. For example, combining savings business with medical insurance to set up the product aiming to medical treatment needed by the elderly people; developing the financial product that meet senior citizens' demand made by weakening resource intergenerational transfer of family; developing the care insurance product for elderly people and individual financial counseling business etc.

4.2 The influencing factors of the social credit system

The social credit system in financial market constitutes financial institutions and clients, which is a system of bilateral relations. The sound credit system has a dynamic effect on stimulation of financial business' innovation and development and acceptance of financial products positively. Appositively, unsound social credit system do harm to the interests of financial institutions and customers. It can be illustrated that there are bank credit problems, such as information asymmetry, lack of transparency when commercial banks introduced some businesses, like finance products and principal agent business, which is the big concern to clients who tend to buy these products. In the current Chinese financial market, clients have a considerable demand to the products of intermediary business, but bank credit problems hamper its development, as a result banks and clients need to bear the losses that caused by banks credit problems to some extent. Hence, with regard to the innovation and development of intermediary business, its credit system construction is either the impetus or the obstruction, which is different from mentioned some external driving factors. So the author research on the supplement to TRICK model, setting this factors out of six external driving factors and internal interests driving factors effecting the innovation and development of the intermediary business.

5 Conclusions

The western mode "5+1" created in 1980s has its limitation when applied to 21st century China. At present, no countries can compare to China in terms of the scale of financial market. And some special situation has appeared in the development of financial market, such as the great disparity of wealth between the rich and the poor in the process of "middle class" formation, a considerable number of senior citizens and unsound social credit system. Because of this, research on the driving mechanism of intermediary business development should consider these factors.

In summary, the factors that affect the innovation and development of the intermediary business in

commercial banks consist of six external driving factors, a factor of impetus or hamper that affect bilateral relations and the internal driving factors of the benefit maximization pursued by commercial banks. The driving mechanism of the emergence and the development of Chinese intermediary business can be come down to a multiple function model “6+1+1”:

$$Z = F ((T, R, IR, CC, CA, D) +CS +SI)$$

Z represents Driving Power; T represents Technology; R represents Regulation; IR represents Interest Risk; CC represents Competition for Customers; CA represents Capital Adequacy; D represents Demand; CS represents Credit System; SI represents Rational Self Interest.

The Level of Development of the Inland Open Economy in Central China

Wang Shuli, Qiu Minrong

School of Economics, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: wangsl@whut.edu.cn, 200658313@qq.com)

Abstract: Evaluation indicator system of inland open economy is established from three aspects, which are intra-regional, inter-regional and international. We analyze the development level and trend of inland open economy in central China, and compare with the eastern and western regions as well as the national average. The results are as follows: comparing with the eastern and western regions of China, the development level of open economy is middle in central region, but the growth rate of development level of open economy is highest in central region.

Key words: Inland open economy; Evaluation indicator system; Central region; Degree of openness

1 Introduction

“Inland open economy” is the opposite to the conception of “coastal open economy” (Xiao Junfu and Lin Yong, 2009). The development mode of inland open economy refers to inland region make full use of the advantages of resources, environment and lower labor costs to vigorously carry out foreign economic activity and to introduce capital and technology of advanced countries and coastal regions. The inland regions away from the port, and have their own distinctive features in the choice of resources and logistics. Therefore, inland regions can not simply copy the successful experience in coastal regions. Ascani et al. (2012) argue that the process of globalization is progressively increasing the importance of regional processes and the role of local actors in shaping development trajectories. Therefore, economic development patterns are characterized by strong spatial concentration at the regional level and that distance and geography do matter in a global world (Brakman and van Marrevijk, 2008). Fast-growing locations are not closed and independent economies, but rather they are most likely those areas hosting MNEs and their international investment which crucially connect the region with foreign markets and resources (McCann and Acs, 2009). This is particularly the case of developing countries where the bulk of available information is locally produced rather than imported from exogenous sources and, thus, such an external knowledge tends to play a primary role (Pietrobelli and Rabellotti, 2009).

2 The Evaluation Indicator System for the Inland Open Economy

2.1 The established principles of evaluation indicator system

There are some basic principles and approaches before we establish the evaluation indicator system for an inland open economy, which based on the reality development of the study object. The main principles are as follows:

1) The principle of feasibility. Feasibility is the most important principle in the establishment of evaluation indicator system. Although there have more scientific statistical indicators, the application scope and practicality of the indicator system will be greatly hampered if the data acquisition don't have or have low feasibility. Therefore, the indicators should take into account the availability of the data.

2) The principle of systematicness. Open economy is a concept which is broad, integrated and systemic that the indicator system should be reflected. Therefore, each indicator in the evaluation indicator system could reflect the development level of one's open economy, and an organic link exists in the indicator system.

3) The principle of independence. Independence between the various indicators is an often overlooked problem when scholars establish the indicator system (Li Yanqing, 2009). There are many indicators to reflect and measure the development level of an open economy, and there indicators may be have a closely relationship. For example, there have highly positive correlation relationship between international investment and international labor cooperation.

4) The principle of openness. There are many factors to affect the development level of open economy in reality. Therefore, we must see the economic openness as the center point, and excluding some indicators which have no directly relationship with the development of open economy. According to the concept of inland open economy, reflecting the regional economic openness from three perspectives which are marketing openness, factor openness and informational openness.

2.2 The establishment of evaluation indicator system

According to the concept of inland open economy, the economic openness of a region are mainly the flow of the goods (tangible and intangible) and the factors of production (capital, technology and labor) in inter-regional and inter-national, which contains many content, such as the division of production, factor mobility. Therefore, the flow of goods and factors are the firstly reflected elements when we measure the development level of inland open economy. Besides, the open foundation of the intra-regional, such as economic base, technology and infrastructure, is also the important factors that reflect the development level of inland open economy.

Table 1 The Evaluation Indicator System for the Inland Open Economy and Weights

Sub-system	Indicators	Index weights	
		Sub-system	Indicators
Open foundation of the intra-regional I₁		0.2367	
	Economic base I₁₁		0.0991
	-Level of economic development I ₁₁₁		0.0640
	-Proportion of non-state-owned economy I ₁₁₂		0.0351
	Technological base I₁₂		0.0509
	-Activity in technology market I ₁₂₁		0.0158
	-R&D capabilities I ₁₂₂		0.0351
	Infrastructure I₁₃		0.0867
	-Telecommunication capacity I ₁₃₁		0.0348
	-Transportation network density I ₁₃₂		0.0519
Degree of openness of the inter-regional I₂		0.2367	
	Market openness I₂₁		0.0966
	-Activity in commodity market		0.0507
	-Tourism market openness		0.0199
	-Cargo density		0.0260
	Factors openness I₂₂		0.0966
	-Degree of capital flows I ₂₂₁		0.0507
	-Degree of technology flows I ₂₂₂		0.0260
	-Degree of labor flows I ₂₂₃		0.0199
	Information openness I₂₃		0.0434
	-ease of information dissemination I ₂₃₁		0.0154
	-Activity in information exchange I ₂₃₂		0.0280
Degree of international openness I₃		0.5267	
	Market openness I₃₁		0.2038
	-Dependence on foreign trade I ₃₁₁		0.0494
	-Dependence on foreign investment I ₃₁₂		0.0546
	-Degree of foreign economic contribution I ₃₁₃		0.0667
	-Dependence on international tourism I ₃₁₄		0.0331
	Factors openness I₃₂		0.2180
	-Degree of capital flows I ₃₂₁		0.0864
	-Degree of technology flows I ₃₂₂		0.0809
	-Degree of labor flows I ₃₂₃		0.0507
	Information openness I₃₃		0.1048
	-Internet penetration I ₃₃₁		0.0723
	-realm name penetration I ₃₃₂		0.0325

Therefore, there must have open foundation of the intra-regional and degree of openness inter-regional and international when we measure the development level of inland open economy in central China (Ying Jian and Zhang Guolin, 2002). The openness of international is to strengthen ties with the world and to improve the development level of open economy through the forms of

international trade, attract foreign investment, outward investment and participation in the international market competition. The openness of inter-regional is to strengthen economic and technical contact with the eastern and western provinces, and to undertake the transfer of industries of eastern which to promote the rational flow of factors and to improve environment of trade and investment, and the final goal is that to comprehensively improve the level of competitiveness and development. The open foundation of intra-regional is the basis of implementation of inter-regional and international, including the economic base, the level of technology and infrastructure.

There are three aspects (openness of market, openness of factors and openness of information) both in the openness of intra-regional, inter-regional and international. The evaluation indicator system of inland open economy is shown in Table 1.

2.3 The Index weights of evaluation indicator system

The degree of each index is obtained by questionnaire, and then, the indicator weights in the evaluation indicator system are calculated by the analytic hierarchy process (AHP), which the advantages is the judgment matrix could through the consistency test. There are four steps to calculate the indicator weights: building the hierarchical model, construct the judgment matrix, single-sort and consistency test, hierarchy of sorting and consistency test. The hierarchical model is seen Table1. The important degree of each index takes number 1 to 9 and its reciprocal in constructing the judgment matrix. Based on the questionnaire, we use Yaahp 0.5.2 to empower the indicators, and take the scaling methof of $e^{(0/5)} \sim e^{(8/5)}$. Besides, the average random consistency values of judgment matrix are less than 0.1, which illustrate through the consistency test. Table1 gives the results of the index weights.

3 The Level of Development of Inland Open Economy

3.1 Data sources

Our sample data from 2000-2009, and the data sources are in Table 2.

Besides, in order to eliminate the dimensionless impact on the value of the indicators in the evaluation indicator system, we select Min-max standardization to dimension the original data. The formula is as follows:

$$x'_i = \frac{x_i - \min\{x_i\}}{\max\{x_i\} - \min\{x_i\}} \tag{1}$$

x_i is the actual value of i ; x'_i is the standard value of i ; $x'_i \in [0,1]$; $\min\{x_i\}$ and $\max\{x_i\}$ are respectively the minimum value and maximum value of i .

Table 2 Data Sources of Indicator

Data	Sources
exchange rate, cargo turnover, total length of transport routes, retail sales of social commodities, foreign industrial output, industrial output, tourism earnings, technology market turnover, number of internet access, length of long-distance optical fiber cable, post and telecommunication service (2001-2009), fixed and mobile phone users (2001-2009)	China Statistical Yearbook
regional GDP, per capita GDP, total investment in fixed assets, investment in fixed assets of state-owned enterprises, investment in fixed assets in the self-financing (2004-2009), foreign direct investment (2009), import and export of goods	Provinces Statistical Yearbook
foreign direct investment, domestic tourism revenue, business volume of post and telecommunications (2000), fixed and mobile phone users (2000)	China Compilation of Statistical 1949-2008
foreign contracted projects (2000-2004), foreign labor service cooperation (2000-2004)	China Foreign Economic Statistical Yearbook
foreign contracted projects (2005-2009), foreign labor service cooperation (2005-2009)	China Trade and External Economic Statistical Yearbook
flowing of domestic technology market, introduction of foreign technology market, R&D expenditure	China Statistical Yearbook on Science and technology
change number of labor, movement number of labor	China Labour Statistical Yearbook
number of realm name	CNNIC
population	China Population & Employment statistical Yearbook

3.2 The analyze of the development level of central China's inland open economy

From the Figure 1, we can see that the development level of open economy in eastern region is much higher than the level of development of the central and western region, even higher than the national average level. Specifically, in 2000-2009, the development level of open economy in eastern region is more than 1.5 times than the national average and more than 2.5 times than the development level of open economy in central and western region. This phenomenon is similar to the economic development of eastern region. Since the reform and opening, the eastern region relying on its unique geographical advantage, a good industrial base and infrastructure, the economic development of eastern regional has made unprecedented achievements, which become the most flash area in China's economic development, and its degree of market openness is up to the top in China. Therefore, the development level is the highest in eastern region. Besides, the development levels of open economy in central and western region are lower than the national average level. And the development level of open economy in central region is slightly higher than the western region. In 2000-2009, the development level of open economy in these two regions reached only the two of three of the national average level.

However, in 2009, the development level of open economy in central and eastern region increased by 1.23 times and 1.17 times compared with 2000, which is higher than the 1.14times of eastern region. This phenomenon shows that the level of economic development and degree of opening up are lower than the eastern region, but their speed of economic development and opening up have show a strong upward trend under the support of national policies and their own efforts. Therefore, the region's economic development strategies, such Rise of Central China and West Development, have achieved initial results, and further demonstrate the reality is significant in this paper.

Figure 1 The Level of Development of Open Economy in Central China

4 Conclusions

The strategy of Rise of Central China made great achievements of economic and social development in recent years. We establish evaluation indicator system of inland open economy from three aspects, which are intra-regional, inter-regional and international in this paper. And take the data from 2000 to 2009, we analyze the development level and trend of inland open economy in central China, and compare with the eastern and western regions as well as the national average. The results are as follows: the development level of open economy is highest in eastern region, the lowest in the western region. However, the growth rate of development level of open economy is highest in central region. In the future, the central region should further expend levels of opening and cooperation.

Evaluation of Cultural Tourism Competitiveness Based on Catastrophe Progression Method

Mao Chencheng

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: maochencheng1988225@163.com)

Abstract: The goal of this research is to establish an evaluation system of the competitiveness in cultural tourism industry. Based on the Catastrophe Theory and Catastrophe Progression Method, this paper has established an evaluation system, which presents three main indicators to evaluate the cultural tourism competitiveness, including the contribution capability, the development capability and the supporting capability. An empirical analysis is conducted by collecting the information from 8 cities located in western Hubei eco-cultural tourism circle. From the experiment, the author analyzes the cultural tourism competitiveness in each of the 8 cities and puts forward suggestions to each city with the purpose of enhancing their cultural tourism competitiveness.

Key words: Catastrophe theory; Catastrophe progression method; Cultural tourism competitiveness

1 Introduction

Competitiveness evaluation is the basis for tourism development. The research on the competitiveness of tourism is not only a simple description of the current situation, but also a contribution to cultivating and promoting the comparative advantages of tourism industries in different regions.

In recent years, the research on the competitiveness evaluation mode system has increased by domestic and foreign scholars. Metin and Mike (1999) built up the index system of tourism destination competitiveness^[1]. Ritchie and Crouch (2000) updated their first version mode of destination competitiveness (1999). A new mode of destination competitiveness and sustainability was established by 5 main factors, i.e. qualifying and amplifying determinants, destination policy, planning and development, destination management core resources and attractors, supporting factors and resources^[2]. Enright and Newton (2003) surveyed tourism practitioners in Hong Kong, and rated both the importance and relative competitiveness, in a method consistent with importance performance analysis (IPA).^[3] Dwyer and Kim (2004) developed a model of destination competitiveness that would enable comparison between countries and between tourism sector industries. Wilde and Cox (2008) conducted focusing group discussions with tourism industry stakeholders in a mature destination on the East Coast of Australia. Their study indicated competitiveness factors related to three fundamental elements identified by respondents.^[4] WAN Xianjin and LIU Yalin (2006) combined regional industry competitiveness determinant model with the features of the tourism to establish the regional tourism competitiveness determinant model.^[5] LI Chuanxin, MA Yaofeng and LI Zhenting (2007) introduced an entropy evaluation method and Analytic Hierarchy Process to realize the cluster analysis and comparative analysis in tourism competitiveness of 31 provinces in China.^[6] LI Jia, CHENG Shengkui and GAN Hong (2007) constructed the evaluation index system of regional tourism competitiveness including four decisive factors, i.e. production factor, market, industry and support competitiveness. Principal Component Analysis (PCA) and Analysis Hierarchy Process (AHP) were applied to calculate the values of competitiveness of the provinces in Southwest China.^[6] LI Chuangxin, MA Yaofeng and GAO Jun (2008) used PCA to establish the regional tourism competitiveness based on multi-index comprehensive evaluation. They applied systemic clustering method to the evaluation unit difference analysis and clustering analysis.^[7] WANG Zhaofeng (2008) analyzed previous literatures of tourism competitiveness and constructed the regional tourism competitiveness valuation model including tourism resources, tourism management and tourism environment competitiveness.^[8]

From the discussion above, it appears that great progress has been made in this field. Different methods have been used to analyze the tourism competitiveness, e.g. Analysis Hierarchy Process (AHP), Principal Component Analysis (PCA), Fuzzy Comprehensive Evaluation (FCE) etc. However, there has not been generally accepted evaluation system for tourism competitiveness. In this paper, the Catastrophe Progression Method (CPM) will be adopted to establish the evaluation system of cultural tourism competitiveness. An empirical analysis will be conducted about 8 cities in western Hubei eco-cultural tourism circle. As some methods have defects with subjectivity on weight decision or have

extremely complex processes in calculation, Catastrophe Progression Method (CPM) has an advantage of avoiding the subjectivity on weight decision by only taking the relative importance of indicators into consideration. CPM has advantages in solving problems of fuzzy multiple object decision because the catastrophe progression is a multidimensional fuzzy membership function. With these characteristics, the method is easier and the results are relatively precise.^[9]

2 Catastrophe Progression Method

Catastrophe Theory was advanced by Thom and further developed by Zeeman. It is a special topic within the broader domain of nonlinear dynamical systems that pertains to sudden discontinuous changes of events. There are 7 fundamental catastrophe types, in which 3 common types are usually used, including Cusp Catastrophe, Swallowtail Catastrophe and Butterfly Catastrophe. The relevant functions are shown in Table 1.

Table 1 Common Used Catastrophe Model and Functions.

Common type	Potential function	Bifurcation equation	Normalized formula
Cusp Catastrophe	$f(x) = x^4 + ax^2 + bx$	$a = 6x^2$, $b = 8x^3$	$x_a = \sqrt{a}$, $x_b = \sqrt[3]{b}$
Swallowtail Catastrophe	$f(x) = \frac{1}{5}x^5 + \frac{1}{3}ax^3 + \frac{1}{2}bx^2 + cx$	$a = 6x^2$, $b = 8x^3$, $c = 3x^4$	$x_a = \sqrt{a}$, $x_b = \sqrt[3]{b}$, $x_c = \sqrt[4]{c}$
Butterfly Catastrophe	$f(x) = \frac{1}{6}x^6 + \frac{1}{4}ax^4 + \frac{1}{3}bx^3 + \frac{1}{2}cx^2 + dx$	$a = 10x^2$, $b = 20x^3$, $c = 15x^4$, $d = 5x^5$	$x_a = \sqrt{a}$, $x_b = \sqrt[3]{b}$, $x_c = \sqrt[4]{c}$, $x_d = \sqrt[5]{d}$

As shown in Table1, the $f(x)$ means the potential function of some state variable x in a system. The coefficient a , b , c and d are the control variables of x . How to choose the catastrophe type is based on the number of the indexes decomposed. The bifurcation equations are derived from the potential function in different systems. We get the normalized formula of every system after transformation and derivation of the bifurcation equations.

3 Establishing Evaluation System Based on Catastrophe Progression Method

According to the purpose and the underlying mechanisms of the evaluation system, we decompose the cultural tourism competitiveness evaluation system into a multi-layer system which includes a number of indicators. In this condition, it only needs to know the data of the lower sub- indicators. The number of every layer’s indicator and single indicator’s sub-indicators should be no more than 4 in a common catastrophe system. Evaluators could determine the importance of every indicator according to one’s own experience when the evaluation index has been done. The relatively more important indicators are put in front of the system, while the less important ones are put after them^[10] shown in Table 2.

Table 2 Cultural Tourism Competitiveness Evaluation System.

General indicators	Abstract indicators		Concrete indicators
	First level	Second level	
Cultural Tourism Competitiveness, a	Contribution capability, b_1	Tourism income, c_1	Domestic tourism income, d_1
			Tourism foreign exchange income, d_2
			Tourism gross income, d_3
			Per capita tourism consumption, d_4
	Tourist reception, c_2	Quantity of domestic tourist, d_5	
		Quantity of inbound tourist, d_6	
		Inbound tourist days, d_7	

			Quantity of gross tourist, d_8	
		Economic contribution, c_3	Income ratio of GDP, d_9	
			Increasing rate of income ratio of GDP, d_{10}	
	Development capability, b_2	Scenic resources, c_4	Quantity of national 4A-level and 5A-level scenic spots, d_{11}	
			Quantity of national below 3A-level scenic spots, d_{12}	
			Quantity of industrial and agricultural demonstration sites, d_{13}	
			Quantity of advanced units in developing tourism, d_{14}	
		Cultural resources, c_5	Quantity of cultural heritage, d_{15}	
			Quantity of national relic protection unit, d_{16}	
			Quantity of national historical and cultural city, town and village, d_{17}	
		Receiving tourist capability, c_6	Quantity of above 4-star hotel(4 star hotel included), d_{18}	
			Quantity of below 4-star hotel, d_{19}	
			Quantity of travel agencies, d_{20}	
		Supporting capability, b_3	Economy environment, c_7	Consumer Price Index, d_{21}
				Retail Price Index, d_{22}
				Fundamental construction investment, d_{23}
				Total investment in fixed assets, d_{24}
			Traffic environment, c_8	Volume of passenger transportation, d_{25}
	Passenger transport amount, d_{26}			
	Highway density, d_{27}			
	Ecological environment, c_9		Built-up area green coverage rate, d_{28}	
			Built-up area green space ratio, d_{29}	
			Number of days exceeding grade-2 of air quality, d_{30}	
			Per capita green area, d_{31}	
	Publicity capability, c_{10}		Quantity of tourist festival and event, d_{32}	
			Tourist festival and event duration, d_{33}	
			Keyword search result, d_{34}	

4 Calculation with Data

Firstly, we need to process the original data in dimensionless method and make the value of the processed data range from 0 to 1. All the concrete indicators can be divided into cost-type and benefit-type, and be calculated by the formula 1 and formula 2.

$$\text{Cost-type: } y_{ij} = \frac{x_{ij} - \min x_{ij}}{\max x_{ij} - \min x_{ij}} (0 < j < n)$$

$$\text{Benefit-type: } y_{ij} = \frac{\max x_{ij} - x_{ij}}{\max x_{ij} - \min x_{ij}} (0 < j < n)$$

Among the formula 1 and formula 2, i means the number of indicators, j means the number of evaluation objects.

Secondly, we deal with the original data collected from *Hubei Tourism Statistical Yearbook* (2012), *Hubei Statistical Yearbook* (2012), Hubei Tourism Administration's official website, the official websites of the tourism administrations in western Hubei eco-cultural tourism circle et al. The non dimension

data of the 8 cities in western Hubei eco-cultural tourism circle is shown in Table 3.

Table 3 Dimensionless Data of the 8 Cities.

	d_{30}	0.0000	0.9351	0.2987	0.6883	0.6623	0.6364	0.6753	1.0000
	d_{31}	1.0000	0.9314	0.5515	0.0000	0.6642	0.8456	0.5539	0.7843
c_{10}	d_{32}	0.0000	1.0000	1.0000	0.6667	0.0000	0.3333	0.3333	0.0000
	d_{33}	0.0882	0.1765	0.4412	0.1471	0.0000	1.0000	0.3235	0.7059
	d_{34}	1.0000	0.2420	0.1963	0.1918	0.3014	0.0594	0.0000	0.2192

According to the Catastrophe Theory, if the indicators with the same objective are not complementary, the principle is to choose the smallest value and if the indicators with the same objective are complementary, we choose the average value. Here, the City of Suizhou is taken as an example to demonstrate how the calculation of the competitiveness evaluation is done in this paper.

We can get that c_1 , i.e. the tourism income, should be calculated on the basis of the four indicators through the Butterfly Catastrophe Model. Since the four indicators are complementary, we have:

$$c_1 = \frac{\sqrt{d_1} + \sqrt[3]{d_2} + \sqrt[4]{d_3} + \sqrt[5]{d_4}}{4} = \frac{\sqrt{0.3304} + \sqrt[3]{0.2875} + \sqrt[4]{0.3228} + \sqrt[5]{1}}{4} = 0.7472$$

We can get that c_2 , i.e. the system of tourist reception, should be calculated on the basis of the four indicators through the Butterfly Catastrophe Model. Since the four indicators are complementary, we have:

$$c_2 = \frac{\sqrt{d_5} + \sqrt[3]{d_6} + \sqrt[4]{d_7} + \sqrt[5]{d_8}}{4} = \frac{\sqrt{0.3417} + \sqrt[3]{0} + \sqrt[4]{0.0227} + \sqrt[5]{0.1802}}{4} = 0.4206$$

We can get that c_3 , i.e. the system of economical contribution, should be calculated on the two indicators through the Cusp Catastrophe Model. Since the two indicators are complementary, we have:

$$c_3 = \frac{\sqrt{d_9} + \sqrt[3]{d_{10}}}{2} = \frac{\sqrt{0.0726} + \sqrt[3]{0.4289}}{2} = 0.5103$$

Since the three indicators, c_1 , c_2 and c_3 in the sub system of contribution capability b_1 are complementary, based on Swallowtail Catastrophe Model, we have:

$$b_1 = \frac{\sqrt{c_1} + \sqrt[3]{c_2} + \sqrt[4]{c_3}}{3} = \frac{\sqrt{0.7472} + \sqrt[3]{0.4206} + \sqrt[4]{0.5103}}{3} = 0.8196$$

Following this procession principle, we can get the results of the others, as shown in Table 4:

Table 4 Results of Calculation of Suizhou.

c_1	c_2	c_3	c_4	c_5	c_6	c_7	c_8	c_9	c_{10}
0.7472	0.4206	0.5103	0.1898	0.4668	0.3133	0.8815	0.6989	0.8523	0.4213
b_1			b_2			b_3			
0.8196			0.6532			0.9071			
			a						
			0.9163						

We can respectively calculate the other cities' results using the same method and steps. The evaluated results are shown in Table 5 and we can get the rank of each column.

Table 5 Evaluation Results of The 8 Cities.

City	Yichang	Shiyan	Enshi	Xiangyang	Jingzhou	Suizhou	Jingmen	Shennongjia
c_1	0.9854	0.9135	0.8250	0.8749	0.7215	0.7472	0.5302	0.1665
c_2	0.9564	0.8753	0.9506	0.7920	0.6446	0.4206	0.4544	0.3300

b_2	0.9685	0.8482	0.9287	0.8061	0.8193	0.6532	0.7985	0.3811
b_3	0.9215	0.9418	0.8050	0.9584	0.9119	0.9071	0.9326	0.5791
a	0.9779	0.9652	0.9642	0.9527	0.9441	0.9163	0.9004	0.8095

5 Conclusion

From the evaluation results, we can see that some of the scores and rankings of sub systems are not consistent with the final results of the overall system, with even a sharp contrast. But cultural tourism competitiveness evaluation results are consistent with the real situation. The final results of 8 cities can be divided into 4 categories, as shown in Table 6.

Table 6 The 4 Categories of The 8 Cities.

Categories	Classification standard(the final results)	Area(the 8 cities)
I	≥ 0.9600	Yichang, Shiyan, Enshi
II	0.9400—0.9600	Xiangyang, Jingzhou
III	0.9000—0.9200	Suizhou, Jingmen
IV	≤ 0.9000	Shennongjia

Yichang, Shiyan, Enshi are the top 3, their results are more than 0.9600, and these cities belong to the category of I. Yichang has the strongest competitiveness with obvious comparative advantages. Its result is much higher than the others'. Its contribution capability and development capability rank in the top 3 and its environmental supporting power ranked the 4th. We can affirm that Three Gorges of the Yangtze River and the Three Gorges Dam have brought lots of benefits for Yichang, and Yichang has remarkable achievements in developing cultural tourism resources and its receiving tourist capability. Relatively speaking, the indicator of the ecological environment of Yichang has a relatively low score due to the score of the quality of air. Shiyan's contribution capability, development capability and supporting capability all rank in the top3. The indicator of evaluation of economy environment relatively has a relatively low score. Shiyan should contain the excessive price growth and boost the investment. Enshi is the 3rd place. Its score is almost the same as Shiyan's. Its contribution capability and development capability results have outstanding performances. But its economy environment and traffic environment results rank the 7th. We can get that Enshi has to increase investment, contain the excessive price growth, and improve their transport facilities.

Xiangyang and Jingzhou belong to II. Xiangyang's supporting capability ranks 1st, while its contribution capability and development capability respectively rank 4th and 5th. Xiangyang should maintain its comparative advantage of traffic environment and its publicity capability. And Xiangyang needs to enhance its tourist reception capacity. Jingzhou is in the 5th place. Most of its evaluation results are in the lower middle position, but 4 sub indicators rank in top 3, i.e., cultural resources, economy environment, traffic environment and ecological environment. Jingzhou should deeply develop the scenic resources and improve the quality and increase the quantity of the tourism festivals.

Suizhou and Jingmen belong to III. Suizhou's score of economy environment rank 1st, but the other indicators' scores are generally low. The most important thing for Suizhou is to explore the connotation of Emperor Yan culture and other precious cultural resources and to build a batch of large scale tourist scenic areas. It is also important to strengthen the tourist reception capability and enhance the publicity. Jingmen is in the 7th place. We can get that Jingmen needs to upgrade the tourism infrastructure construction, improve the tourism comprehensive environment, and focus on the development of characteristic agricultural tourism.

Shennongjia's evaluation results rank at the end. Shennongjia has a high quality of ecological resources, which is suitable for developing outdoor, adventure and other special tourism. But it is not appropriate to develop large-scale modern artificial landscape. Shennongjia should accelerate the traffic infrastructure construction to improve the traffic environment and promote the reception facility to meet the tourism demand.

The Catastrophe Progression Method (CPM) is used to evaluate the cultural tourism competitiveness of the 8 cities in western Hubei eco-cultural tourism circle. It can remedy the disadvantages of the static assessment methods, reduce the subjectivity of weight assignment and avoid the uncertainty of subjective judgment. However, this method can only deal with problem with no more than 4 control variables. So it is inevitable to make some induction and division in setting the indicator system. In this paper, some indicators can only be replaced or cancelled due to the difficulty of obtaining data. Therefore, the evaluation results are influenced and we hope there will be improvement in the future.

Empirical Study on Interactive Development Between Manufacturing and Logistics Industry in Hubei Province of China

Cao Aiping

Department of Logistics, Hubei Urban Construction Vocational and Technological College, Wuhan,
P.R.China, 430205

(E-mail: wonderfulcap@163.com)

Abstract: This article designates manufacturing and the interactive development in logistics industry in Hubei province as the object of study, and finds out that there isn't an interactive development relationship for promoting and influencing each other between manufacturing and logistics industry at the moment in Hubei by means of quantitative and qualitative analysis on the current condition of the interaction. And then it puts forward that government ought to strengthen the guidance and create a good management environment for the interactive development by taking measures like developing relevant encouraging policies, and industry organizations should fully play their important role in various aspects, including standardizing market competition order, strengthening industry self-discipline, introducing logistics technology and so on. Moreover, manufacturers should separate off logistics business by means of integrating and optimizing business processes, and logistics enterprises need to have an insight into manufacturing supply chain model and improve the ability of logistics services to strongly promote the development of manufacturing.

Key words: Manufacturing industry; Logistics industry; Interactive development; Empirical study

1 Introduction

Logistics is an important means to enhance the core competitiveness of manufacturing enterprise, and manufacturing lays the basis for development demand of the logistics industry at the same time. The state council has put forward many requirements in "adjustment and revitalization plan of logistics", including actively expanding market demand for logistics, vigorously promoting logistics socialization and specialization, pushing the interactive development between logistics enterprises and manufacturing enterprises, and boosting an organic combination throughout the supply chain.

Thanks to the outstanding regional advantages in transportation, the logistics industry in Hubei province has an extremely important strategic position in the national development. It is necessary to attach more strategic significance to the development of logistics industry to turn Hubei into an important strategic fulcrum aiming at promoting the abrupt rise of mid area. However, the logistics industry in Hubei still has a long way to go. In order to promote the leap-forward development of logistics industry throughout the province, the logistics need to build an interactive development relationship with manufacturing industry and boost an organic combination of each link of the supply chain as well as strengthen the infrastructure construction for logistics and create a good business environment, which is of great significance for the adjustment and optimization of industrial structure and the shift of economic growth mode.

Until now, the theoretical research on relationship between manufacturing and logistics industry has been relatively mature, and the interactive development between the two industries has also been well studied. However, most of the literature put emphasis upon the necessity of the interaction between them and the major problems existing in the interactive development at present in our country. The empirical study on the interactive development between manufacturing and logistics industry is quite rare, and it remains a blank as for the research on the interactive development between the two industries in Hubei province. This article designates Hubei province as the object of study and proposes corresponding countermeasures and suggestions by means of quantitative and qualitative analysis on the interaction between the two industries, which is of certain originality.

2 Analysis on the Current Condition of the Interactive development Between Manufacturing and Logistics Industry in Hubei Province

2.1 The current condition of the interactive development between the two industries in Hubei province

2.1.1 Government attaches great importance to the interactive development between the two industries

The interactive development project between manufacturing and logistics industry has been

designated as one of the key projects during the 12th five-year plan period. The government will encourage large-sized and medium-sized enterprises, especially the state-owned ones, to integrate and optimize the business processes, separate off the logistics assets and business and make innovation in the logistics management pattern. In addition, government will speed up the transformation from the traditional transportation, warehousing and freight forwarding enterprises to modern logistics enterprises to improve the capacity and the level of the service for manufacturing industry offered by the logistics. Government will also fasten the construction of the information sharing mechanism of logistics and promote the process of the interaction between the two industries with informatization. Moreover, the government intends to formulate relevant policies and organize and carry out a number of demonstration projects and key items to promote the organic combination and the interactive development between modern manufacturing and logistics industry.

2.1.2 The logistics business still deals predominantly with self-support trading in the large-sized and medium-sized provincial enterprises, while there is a relatively low proportion of outsourcing business (Ran Baosong, 2012)

The manufacturing industry is the foundation and support for the productive service industry and can create space of demand for it. According to relevant materials, however, the power of manufacturing industry for driving up the productive service industry development is inadequate, which can be confirmed from the fact that the proportion of provincial three industries is 13.6 percent, 49.1 percent and 37.3 percent respectively in 2010 with quite an obvious feature that the economic growth relies mainly on secondary industry. Moreover, the ratio of logistics outsourcing is less than 15 percent in manufacturing enterprises in Hubei. With a few exceptions that many car-manufacturing companies like DPCA choose the logistics outsourcing, the majority of large enterprises, including WISCO, Wuhan tobacco group, Huaxin Cement Company, Yihua group, Jingmen petrochemical company, provincial energy group and so on, are engaged in self-support logistics.

2.1.3 The level of logistics outsourcing is quite low in manufacturing industry

Among manufacturing enterprises choosing logistics outsourcing, the majority have confined themselves merely to outsourcing the basic logistics services such as transportation, warehousing and so on, while manufacturing enterprises remain dominant in operation and management of logistics, which makes transporting and warehousing enterprises just follow their requirements to provide logistics services. Meanwhile, the lack of platform for information communication and exchange among manufacturing enterprises and transporting and warehousing enterprises has caused many problems. On the one hand, it prevents the links from closely locking into each other so that the logistics resources can't be well integrated with a low utilization rate. Moreover, they tend to shirk responsibility to each other when anything goes wrong, which results in poor operation efficiency in integral logistics. On the other hand, it makes it even harder for manufacturing enterprises to manage logistics suppliers.

2.2 The main restrictive factors for the interactive development

2.2.1 The fact that the manufacturing industry deals predominantly with self-support logistics leads to the insufficient social demand of Third Party Logistics

It is widely recognized that manufacturers should focus on their core business and outsource the non-core services. From the perspective of logistics operation model in Hubei, however, there are many limiting factors on outsourcing as follows. Perception is one of the factors. The leaders in a number of manufacturing enterprises equate logistics with the basic steps like transportation and warehousing and invest little in logistics as a result of the lack of knowledge about the modern logistics. Even though some manufacturers' leaders have recognized that logistics is "the third profit resource", they still reject the socialized logistics mode. Another factor is management system. Specialized logistics management department is normally not available within a great many manufacturing enterprises resulting from the influence of enterprise management model. Since the raw materials purchase, production, product sales, accessories and other services are respectively managed by purchasing department, production department, sales department and after-sale service department, logistics enterprises need to communicate with multiple departments if they introduce the third party logistics, facing the high difficulty of coordination and the difficulty in accurately calculating the cost. The last factor is the high cost of quitting self-support logistics. As the large-sized manufacturers, especially the state-owned ones, have built their own logistics system by investing heavily in the construction of logistics facilities and equipments and placing many employees there, logistics outsourcing may mean the sale of assets and relocation of workers and can cause significant changes in the management structure of the company. And then it may create a series of operating risks and make the cost of quitting self-support logistics high (Liu Wen, 2011).

2.2.2 The ability of logistics service needs to be further strengthened

In recent years, the logistics industry in Hubei has presented a state of developing quickly, and the logistics industry scale has been continually improved. From an overall perspective, however, the ability of logistics service remains weak in several ways as follows. Firstly, the logistics service level is relatively low with a lack of innovation capacity. Take the highway freight as an example. The majority of logistics enterprises just provide the simple transport services according to customers' requirements, while there are significant inadequacies in many aspects such as making special transport plans for customers, selecting rational vehicle, optimizing routes and so on. Secondly, there are few integrated logistics enterprises that can offer full one-stop service. For the moment, the majority of third party logistics enterprises are the transportation-based and warehousing-based ones on the logistics market in Hubei, most of which even just can be called freight transport enterprise or a warehouse. The last shortcoming is the general low management level and informatization degree among logistics enterprises due to many factors like operation philosophy and shortage of funds (Li Jingyu, Jia Jinzhu, 2009).

2.2.3 The interaction mechanism is unsound

The unsound interaction mechanism shows up in many aspects. First of all, the distribution of interests is unfair. Since manufacturer, who is always in dominant and strong position in the cooperation and considers problems or treats the cooperation primarily from its own point of view, tends to maximize its own interests and drive hard bargains, the profit margins that logistics enterprises deserve are reduced, which seriously restricts the development of logistics enterprises. The second performance is the weak credit consciousness. For the moment, many logistics enterprises lack integrity, and various problems often take place in these companies such as absconding with the funds, offering services inadequately and so on. As a result, a great many manufacturers refuse to outsource logistics or outsource the entirety of logistics to avoid being controlled by others or just in fear of the information leakage, which then restricts the interactive development between the two industries. Finally, there is a lack of logistics service standard. Currently, the logistics service standardization evaluation system has not been established in our country, which seriously affects the normative and ordered development of logistics and makes it difficult to coordinate the various benefit relationships between upstream and downstream enterprises. And then the interactive development between the two industries is restricted to some extent.

3 Empirical Study on the Interaction Relationship Between Manufacturing and Logistics Industry

3.1 Variables selection and data description

This paper intends to adopt the Granger Causality Test to conduct empirical research on the interactive development relationship between manufacturing and logistics industry in Hubei province, aiming at finding out whether there is a sustainable long-term development relationship between them and whether this relationship is the interaction relationship for influencing and promoting each other.

In the econometric analysis, this article chooses the value added as the output indicator to evaluate the development of manufacturing and logistics industry in Hubei. Since manufacturing is the main part of industry in Hubei, the article replaces value added in manufacturing with industrial value added to reflect the development level of manufacturing, taking the availability of data into consideration. Besides, IND and LOG are used to respectively represent the time series in the value added indicators of industry and logistics. Because of the heteroscedasticity in time series, logarithmic form is applied here for the data transformation to steady the variance of time series and reduce the series volatility, and the series trend will remain at the same time. Therefore, natural logarithm of the time series data on IND and LOG is taken, and the natural logarithm treated indicators are denoted by LIND and LLOG. The selected statistical data is from the statistical yearbooks over the years of Hubei province or collated from the network data, as shown in Table 1.

Table 1 Data on Value Added in Industry and Logistics from 2001 to 2010 in Hubei

Year	IND(100 million Yuan)	LOGI(100 million Yuan)
2001	1072.8	316.58
2002	1170.5	347.84
2003	1364.8	384.65
2004	1664.7	460.9
2005	2007.21	365.71

2006	2392.22	425.37
2007	3262.36	479.92
2008	3842.33	584.19
2009	4742.23	642.72
2010	6136.51	748.91

3.2 Co-integration analysis

According to the co-integration theory and method put forward by Granger, even though some economic variables themselves are non-stationary series, their linear combination may be stationary, which is called as co-integration equation and can be interpreted as the long-term stable equilibrium relationship among the variables. This paper adopts the Granger Causality Test to conduct co-integration analysis on the time series in the value added indicators of manufacturing and logistics industry in Hubei, aiming at finding out whether there is a co-integration relation between them. On the basis of co-integration test ideas, the paper conducts stationarity test on the variables applying ADF co-integration test method first. If the two variables pass the stationarity test or are integrated of the same order, which means that they meet the condition of co-integration test, the ordinary least squares method will be applied to establish the regression equation. And then the paper will take the stationarity test on residual series of the regression model to make sure the regression equation setting is reasonable when the residual series is stationary, which shows that there is a stable equilibrium relationship between manufacturing and logistics industry in Hubei.

3.2.1 Stationarity test

Since unit root test is the standard method of conducting stationarity test, the ADF test (Augmented Dickey-Fuller test) will be applied in the paper. With regard to the choice of test form, the series curve is adopted for the judgment on whether the test model contains constant term and time trend term, and correlation coefficient between variables is used here for the definition of lag phase.

(1) Stationarity test on the time series IND

Figure 1 Sequence Diagram of LIND

It can be seen from the Table 2 that the value of t test statistic is -2.152380, which is greater than the critical value of -3.590496 at 10% significance level. Then we can conclude that the null hypothesis that the series has a unit root can be accepted at 90% confidence level, which means that the series LIND is non-stationary in an indication that the variable of value added in manufacturing of Hubei is a non-stationary time sequence.

Table 2 The Result of ADF Test on Series LIND

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-2.152380	0.4502
Test critical values: 1% level	-5.835186	
5% level	-4.246503	
10% level	-3.590496	

Next, it needs to be confirmed that whether the non-stationary time series is integrated series by conducting unit foot test on its difference sequence. Let the first-order difference sequence and the second-order one of LIND be marked as DLIND and DDLIND respectively, the curves of which are drawn as shown in Figure 2 and Figure 3.

Figure 2 The First-Order Difference Sequence Diagram of LIND

Figure 3 The Second-Order Difference Sequence Diagram of LIND

The results of unit foot test on the first-order difference sequence and the second-order one of LIND are shown in the following tables.

Table 3 The Result of ADF Test on Series DLIND

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-2.690384	0.2742
Test critical values:		
1% level	-6.292057	
5% level	-4.450425	
10% level	-3.701534	

Table 4 The Result of ADF Test on Series DDLIND

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-5.013111	0.0432
Test critical values:		
1% level	-7.006336	
5% level	-4.773194	
10% level	-3.877714	

It can be seen from the table 3 that the value of t test statistic is -2.690384, which is still greater

than the critical value of -3.701534 at 10% significance level. Then it can be concluded that the null hypothesis that the series has a unit root can be accepted, which means that the series DLIND is non-stationary either. According to the table 4, the non-stationary sequence LIND becomes stationary after the second-order difference, which shows that the value added series LIND in manufacturing of Hubei is integrated of order 2 with a label of I(2).

(2) Stationarity test on the time series LLOGI

The unit foot test is conducted on the value added series LLOGI in logistics of Hubei with the same method, the results of which are shown in Table 5, Table 6 and Table 7.

Table 5 The Result of ADF Test on Series LLOGI

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-1.133900	0.8496
Test critical values: 1% level	-5.835186	
5% level	-4.246503	
10% level	-3.590496	

Table 6 The Result of ADF Test on Series DLLOGI

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-1.839949	0.5912
Test critical values: 1% level	-6.292057	
5% level	-4.450425	
10% level	-3.701534	

Table 7 The Result of ADF Test on Series DDLLOGI

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-2.494367	0.0226
Test critical values: 1% level	-3.007406	
5% level	-2.021193	
10% level	-1.597291	

It can be seen from the test results that the non-stationary sequence LLOGI becomes stationary after the second-order difference, which shows that the sequence LLOGI is also integrated of order 2 with a label of I(2).

Considering that the original sequences LIND and LLOGI are non-stationary, and both of them become stationary after the second-order difference in an indication that they are integrated of order 2, we can conclude that the two value added time series in industry and logistics of Hubei meet the precondition of co-integration test. And then the co-integration test will be carried out on the two sequences to make sure whether there is a stable long-term co-integration relation between manufacturing and logistics industry in Hubei.

3.2.2 Co-integration test

(1) Establish the regression equation with the ordinary least squares method

Table 8 The Result of the OLS Regression

Variable	Coefficient	Std. Error	t-Statistic	Prob.
LIND	0.439861	0.054171	8.119855	0.0000
C	2.714717	0.421487	6.440805	0.0002
R-squared	0.891793	Mean dependent var		6.127781
Adjusted R-squared	0.878267	S.D. dependent var		0.282195
S.E. of regression	0.098459	Akaike info criterion		-1.621503
Sum squared resid	0.077553	Schwarz criterion		-1.560986
Log likelihood	10.10752	Hannan-Quinn criter.		-1.687890
F-statistic	65.93204	Durbin-Watson stat		1.729607
Prob(F-statistic)	0.000039			

A regression model is built between the two variables LIND and LLOGI with the ordinary least squares method, taking LIND as the independent variable and LLOGI as the dependent variable. The estimated result of the regression model is shown in Table 8.

The regression equation is:

$$LLOGI = 2.71 + 0.44LIND \tag{1}$$

The test result of the regression model shows that both the coefficient of determination and adjusted coefficient of determination approach 1 as $R^2 = 0.891793$ and $R^2 = 0.878267$, which indicates that the model works well in the fitting. What's more, the concomitant probability of the F test is 0.000039, which means that the regression equation is highly significant in an indication that the independent variable has a highly significant linear relation with the dependent variable.

(2) Stationarity test on residual series of the regression model

The residual series of the regression model is defined as u , and the values of it are shown in the Figure 4.

Figure 4 Line Chart of the Residual Series u

The unit root test is conducted on the series u according to the steps of the ADF test with the test result shown in Table 9.

Table 9 The Result of ADF Test on Series u

	t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic	-1.754049	0.0762
Test critical values:		
1% level	-2.886101	
5% level	-1.995865	
10% level	-1.599088	

Since the value of t test statistic is -1.754049, which is less than the critical value of -1.599088 at 10% significance level, it can be concluded that the null hypothesis that the series u has a unit root can be rejected at 10% significance level, which means that the residual series is stationary. According to the test procedure above, the series LIND and LLOGI are found to be co-integrated, which means that there is a stable long-term co-integration relationship between manufacturing and logistics industry in Hubei.

3.2.3 Granger Causality Test

The co-integration test can be used to decide whether the regression equation setting is reasonable, but it can't reflect the interaction relationship between variables. To make sure whether manufacturing and logistics can influence each other in Hubei, the Granger Causality Test will be conducted on LIND and LLOGI. The test result is shown in table 10 with the lag phase $p=1$, while the test result with the lag phase $p=2$ is shown in Table 11.

Table 10 The Result of Granger Causality Test with $p=1$

Null Hypothesis:	Obs	F-Statistic	Prob.
LLOGI does not Granger Cause LIND	9	0.07578	0.7923
LIND does not Granger Cause LLOGI		4.99715	0.0668

Table 11 The Result of Granger Causality Test with p=2

Null Hypothesis:	Obs	F-Statistic	Prob.
LLOGI does not Granger Cause LIND	8	0.21322	0.8193
LIND does not Granger Cause LLOGI		1.20535	0.4129

The results of F test in the two tables above show that the probability of making the type I mistake to reject the null hypothesis that the LLOGI is not the Granger cause of LIND is 0.7923 when $p=1$ and 0.8193 when $p=2$, which demonstrates that the probability that LLOGI isn't the Granger cause is quite large, and the null hypothesis can't be rejected. With regard to the null hypothesis that the LIND is not the Granger cause of LLOGI, the probability of making the type I mistake to reject it is 0.0668 when $p=1$ and 0.4192 when $p=2$, which demonstrates that the probability that LIND is the Granger cause is quite large, and then the LIND is considered as the Granger cause of LLOGI.

In conclusion, the logistics is not the Granger cause of the manufacturing development while the manufacturing is the Granger cause of the logistics development in Hubei according to the test result.

3.3 The conclusion of the empirical analysis

3.3.1 The result of co-integration analysis

According to the result of co-integration analysis on the value added in manufacturing and logistics in Hubei from 2001 to 2010, the manufacturing and logistics in Hubei are found to be co-integrated, which means that there is a stable long-term equilibrium development relationship between the two industries from a long-term development perspective.

3.3.2 The result of Granger Causality Test

According to the result of the Granger Causality Test, the manufacturing is an important factor for promoting the rapid development of logistics industry in Hubei, while the development of the logistics doesn't contribute to the development of manufacturing. Then it can be concluded that there isn't an interactive development relationship for promoting and influencing each other between manufacturing and logistics industry at the moment in Hubei.

4 Countermeasures of Promoting the Interactive development Between Manufacturing and Logistics Industry in Hubei

4.1 Creating a good management environment for the interactive development under the government guidance (Qin Renzhi, Zhang Hongxing, 2011)

1) Government should develop policies on encouraging the interactive development between manufacturing and logistics. For example, the qualified enterprises like WISCO and Wuhan tobacco group should be encouraged to separate off the logistical assets from their main business to establish sole proprietorship or joint venture, and they can also choose to overall transfer it. For the enterprises who transfer their entire property right, the government ought to give preferential treatment to them in terms of fiscal tax. In addition, the qualified enterprises and projects undertaking the program of interactive development between manufacturing and logistics deserve the capital support from government. What else the government can do is to plan and construct logistics land and give support in aspect of the land policy and so on.

2) Government should organize and carry out a number of demonstration projects and experimental units to promote the interactive development. Taking DPCA as the demonstration enterprise, its experience can be summarized and promoted across the large manufacturing enterprises within the province. Something else can be done is to choose a batch of key manufacturing enterprises and logistics enterprises from different industries and areas, such as tobacco company logistics center in Hubei, steel market in Central China, auto logistics center in Shiyan, chemical products logistics park in Jingmen and so on, as pilot enterprises of the interactive development and organize the relevant experts to provide guidance on the integration of the logistics business for manufacturers and the implementation of business process reengineering.

3) The "12th Five-Year Plan" about the development of the modern logistics industry in Hubei province should be fully implemented to promote the sustained, rapid and sound development of the modern logistics industry. According to the results of the empirical analysis, the development of logistics industry in Hubei is not the influencing factor for promoting the development of manufacturing. Therefore, the government ought to vigorously create a policy environment for supporting the development of logistics industry to promote the rational allocation of logistics resources and establish a

modern logistics service system in the province, which consequently can promote industrial upgrading and structural readjustment and increase the potential for economic development in our province.

4) Government should seed up the cultivation and introduction of logistics talents through various forms. For example, the way like the combination of short-term training and long-term training and the combination of formal education and on-site training can be adopted to cultivate the urgently-needed talents for logistics market. Given the advantages of scientific research of universities and colleges in the province, enterprises should be encouraged to cooperate with colleges and scientific research institutions on improving students' practical operation ability through adopting order training mold, jointly working out a talents training scheme and writing fine-designed teaching materials. What's more, it is necessary to strengthen the vocational skill education and carry out the work on job qualification training and certification in the logistics field.

4.2 Providing industry guidance and building an interactive development bridge between the two industries

1) Industry organizations like Hubei Logistics Association and Hubei Federation of logistics and purchasing ought to conduct in-depth research and fully play their important role in various aspects, including standardizing the market competition order, strengthening industry self-discipline, introducing logistics technology, cultivating talents and so on. What's more, they should give assistance to the relevant government departments in improving the industry regulation and services as well as provide references for the government to make and introduce policy of promoting cooperation between the two industries.

2) It is necessary to facilitate information sharing and standard docking between logistics and manufacturing industry. The establishment of logistics public information service platform facing the upstream and downstream customers in manufacturing enterprises and logistics enterprises should get key support, which can realize the real-time data acquisition and promote the establishment of logistics information docking and sharing mechanism. Besides, it is essential to construct and perfect the logistics standard system of manufacturing industry and accelerate the formulation of standards and industry regulations in many fields like logistics information, service process, data code, tools and Instruments, technical equipments and so on.

4.3 Increasing interaction between enterprises to promote the main theme of the interactive development

1) The demand for logistics services can be released through the process reengineering of manufacturing enterprises. Manufacturers can realize the logistics management model innovation by means of integrating and optimizing business processes and separating off logistics business. On the one hand, manufacturers can gradually outsource the integrated part or the whole logistics business to professional logistics enterprises. On the other hand, the logistics department within manufacturing enterprises can conduct independent accounting when conditions are ripe and carry out logistics service to the society.

2) Logistics enterprises need to have an insight into manufacturing supply chain model and improve the ability of logistics services to strongly promote manufacturing development, which is the critical factor to the interactive development between the two industries in Hubei. First of all, logistics enterprises ought to strengthen the service consciousness of the staff. Since logistics belongs to the productive service industry, only when all the links of logistics operation effectively interlock with each other can the quality and efficiency of the service be promised. Thus, every employee in logistics enterprises should have a good sense of service and get to concentrate on the work and serve whole-heartedly. Secondly, they should extend the contents of services according to customers' requirements. The existing traditional logistics enterprises, providing the services like transportation, warehousing and freight forwarding and so on, can speed up the transition to integrated logistics enterprises through making strategic alliances or merger and reorganization with other enterprises to integrate the resources, extend the service contents and spread the service boundary as well as keep promoting the level of integrated services. Thirdly, they can ensure the stability and consistence of logistics services via process and standardization construction. Finally, it is necessary to strengthen the construction of specialization, which is reflected in two aspects of hardware and software. The concrete expressions of the hardware aspect contain the application of professional logistics facilities and equipments, adoption of advanced logistics technology, uniform terminal area facilities with rational planning and so on, while the software aspect is expressed in the forms of corporate cultural construction, mental outlook and services of employees and so on.

3) The mutual trust and deepening of cooperation between manufacturing enterprises and logistics

enterprises is the key to the interactive development. Logistics enterprises can help manufacturers get separated from the complicated basic logistics business via participating fully in the supply chain management of manufacturers, including front-end raw materials purchasing logistics, inventory management, JIT delivery for the production line, product sales logistics, reverse logistics service and so on, which can make the capital and energy of manufacturers able to mostly fall on the core business like new product research and development and product manufacturing. Meanwhile, logistics enterprises themselves should have stable volume of business and never stop the step of self-development in the process of providing services. In a word, only when manufacturing enterprises and logistics enterprises deepen cooperation for mutual benefit, can the interactive development between the two industries be strongly promoted.

5 Conclusion

The interactive development between them has been the general consensus among the industry. As a major province in the centre of China, Hubei province is facing many obstacles in the process of promoting the interactive development between the two industries as follows. On the one hand, manufacturing enterprises have confined themselves merely to outsourcing the basic logistics services such as transportation, warehousing and so on, while they remain dominant in the integrated operation due to many factors like operation perception, enterprise management system, operation system and so on. On the other hand, owing to the insufficient social demand, the development of professional logistics enterprises is restricted, and the logistics service capability needs to be improved. What's more, the imperfect mechanism of the interaction has slowed down the pace of the interactive development between manufacturing and logistics industry, and some enterprises who have carried out the interaction are faced with many problems like the relatively low interaction level. According to the result of the empirical study, manufacturing is the important factor for promoting the rapid development of logistics industry in Hubei, while the development of the logistics doesn't contribute to the development of manufacturing. Therefore, there isn't an interactive development relationship for promoting and influencing each other between manufacturing and logistics industry in Hubei province at the moment.

To improve the level of interactive development between manufacturing and logistics industry in Hubei, all parts, including government, industry organizations and enterprises, should make joint efforts. First, government ought to strengthen the guidance and create a good management environment for the interactive development between the two industries by means of developing relevant encouraging policies, organizing and carrying out a number of demonstration projects and experimental units and speeding up the cultivation and introduction of logistics talents. Secondly, industry organizations should strengthen the guidance and build an interactive development bridge between the two industries by fully playing their important role in various aspects, including standardizing the market competition order, strengthening industry self-discipline, introducing logistics technology, cultivating talents and so on. Finally, manufacturers should separate off logistics business via integrating and optimizing business processes, and logistics enterprises need to have an insight into manufacturing supply chain model and improve the ability of logistics services to strongly promote the development of manufacturing, which is the critical factor to the interactive development between the two industries in Hubei. In a word, only when manufacturing enterprises and logistics enterprises trust each other and deepen cooperation for mutual benefit, can the interactive development between the two industries be strongly promoted.

Abstract: The international students' education programs in China are popular currently. Those students from different countries and backgrounds come there to study together, and they have to overcome the difficulties in languages, religions and cultures, while our teachers also face the difficulties in teaching higher courses in English and in international thoughts, the new international education market brings us both the challenge and the opportunity. But how to satisfy those international students in their education programs, this paper aims to explore a teaching evaluation system of international students' education program taught in English, and find out the typical problems and feasible solutions by taking an empirical analysis on the teaching practice for international students in Wuhan University of Technology.

Key words: International students; Higher programs in English; Teaching evaluation

1 Introduction

As China's comprehensive national strength and international status was improved, the process of the internationalization of higher education is accelerating and the quality of talents' cultivation is significantly enhanced. The international students' education in China is becoming more and more popular. According to statistic data, in 2012, there are some 328, 330 international students from about 200 countries and regions distributed in 31 provinces, autonomous regions and municipalities, directly under 690 universities, research institutes and other educational organizations^[1]. In 2010, the Ministry of Education launched "Study in China program", aiming at making up to 500,000 international students study in China, and making China one of Asia's largest destination for international student education in the year of 2020^[2].

However, international students not only come from continents and countries, but also have different backgrounds in races, languages, religions, educational systems, and cultures. Theirs coming to China presents new challenges to our traditional teaching modes and teaching organization forms, and has put forward higher requirements for the teachers in language, communication, higherism organizational skills, teaching methods, and teaching resources; Nevertheless, theirs coming has played a positive role in promoting the process of the internationalization of China's higher education as well.

This study aims to explore the evaluation system of international students' education program taught in English, to find out the typical problems and feasible solution, through an empirical analysis on the teaching practice for international students in Wuhan University of Technology.

2 Composition of Teaching Evaluation System for Higher Programs in English

In order to promote the development of international students' education, the Ministry of Education, Ministry of Foreign Affairs Ministry of Public Security issued "Institutions of Higher Education To Accept Foreign Students' Management Regulations", in 2000, and cleared the management system of international students teaching, for example, giving advice on using bilingual education to meet the requirements of internationalization. In order to greatly promote the development of international students' education, colleges and universities have carried out Taught in English mode, which is feasible and necessary^[3].

In order to continuously improve the quality of international students' education and enhance the educational value of international students, many institutions of higher education have established evaluation index and system of teaching effectiveness, by using evaluation methods systematically and regularly to give feedback on the educational quality and effectiveness.

Evaluation index system of teaching quality evaluation is the premise and basis, which decides the orientation towards which teachers and students make efforts. In order to improve its scientific nature

* This paper is supported by Teaching and Research Project Fund of Wuhan University of Technology(201117)

rationality and authenticity, many experts and scholars devoted themselves to the research of evaluation index system. The evaluation index system of teaching effectiveness which exists in domestic colleges and universities is substantially the same basic elements mainly constituted by five aspects: the teaching attitude, teaching method, teaching content, teaching ability, teaching effectiveness, and the refinement of secondary indicators were set up on the basis of primary indexes (see Table 1). In recent years, some experts and scholars have been concerned about the personality characteristics of teachers, the higherism of curriculum, the academic of teaching and other indicators, especially some personalized indicators, such as: charisma, teaching style, higher practice, higher innovation, academic achievements etc. As Rice has put out it three forms of knowledge which runs through the process of teaching, namely: summary knowledge, pedagogical knowledge and pedagogical content knowledge^[3]. In addition, some experts believe that we need multi--dimensional trade-offs while evaluating the university teachers' teaching. As British scholar Trigwell and others consider that the evaluation consists of four dimensions, namely: knowledge, reflection, communication and concepts^[4]. Based on the relevant literature, this indicator is set up in accordance with foreign experience, on the basis of the general principles of national evaluation of teaching effectiveness, in combination with the common indicators, teaching evaluation effectiveness of international students and personality characteristics of teachers. Evaluation of the research is set as table 1 below.

Table 1 Teaching Effectiveness Index System

First grade assessment indicator	Second grade assessment indicator
Teaching level (X_1)	English (X_{11})
	Qualifications (X_{12})
	Teaching life(X_{13})
Teaching attitude (X_2)	teaching inputs(X_{21})
	Racial Discrimination(X_{22})
	The degree of attention (X_{23})
Teaching content (X_3)	textbook sources (X_{31})
	Curriculum (X_{32})
	Higher Practice (X_{33})
Teaching methods (X_4)	teaching methods (X_{41})
	Classroom interaction (X_{42})
	Evaluation (X_{43})
Teacher-student relationship (X_5)	AC frequency(X_{51})
	Communication(X_{52})
	Teacher-student relationship (X_{53})

The basic meanings of each indicator:

For the primary indicators, there are five aspects: teaching level, teaching attitude, teaching content, teaching methods and teacher-student relationships, specifically:

(1) Teaching level (X_1): the higher level of English (at least, be fluent in English and with accurate pronunciation to meet the communication needs between teachers and students in classroom); a certain level of expertise, enough knowledge reserves to qualify teacher, be well--matched in qualifications and teaching duties; having taught international students for a certain amount of time and with educational experience of teaching international students.

(2) Teaching attitude (X_2): rigorous scholarship, serious preparation, correcting homework carefully, earnest counseling; treating students equally, no racial discrimination; paying attention to all students' study and personal development, and being fully responsible for helping students to adapt to study and life so that every student learn something.

(3) Teaching content (X_3): choosing appropriate teaching materials in line with international standards, especially novel content; improving the knowledge system; making curriculum system more reasonable, highlighting the emphasis and difficulties; setting up practical courses appropriately, providing more practice opportunities, developing the ability to combine the theory with practice.

(4) Teaching methods (X_4): teaching in the right way, having Heuristic, focusing on developing abilities in various aspects; having classroom activities and teacher-student interactions, creating strong

atmosphere of students' participation in discussions; obtaining good teaching effect that students can master the basic teaching materials after lectures; grasping the emphasis and difficulties of courses, enhancing students' ability of analyzing and solving problems.

(5) Teacher-student relationship (X_5): frequently exchanges between teachers and students, assessing the international students' minds and living conditions in time, giving students guidance in their study and life in a timely manner; choosing the appropriate way to communicate with students; building up harmonious relationships between mentors and students so that students will have a favorable impression on their mentors and are willing to exchange words.

3 Empirical Study: Taking Teaching Practice of International Students in Wuhan University of Technology as an Example

3.1 Overview of International Students in Wuhan University of Technology

Wuhan University of Technology is not only one of China's first universities receiving international students which started in 1952, but also one of the colleges that have Chinese Government Scholarship for outstanding international students. As of November 2011, the school has trained more than 1,600 students from more than 100 countries, more than 1,000 students of whom have graduated successfully. Moreover an all-round, multi-level and wide-ranging education pattern has been initially built up.

Wuhan University of Technology has 20 faculties, 79 professions for undergraduates, 138 professions for graduates, and 68 professions for doctoral students.

3.2 Teaching Effectiveness Analysis

In this study, through a small range of expert interviews combining the actual situation of Wuhan University of Technology with research purposes, a survey for international students was conducted. All data were processed, with the help of SPSS 13.0 software package and EXCEL processing. Data analysis results are shown below.

3.2.1 Teaching Level(X_1)

The evaluation of teaching effectiveness mainly contains three aspects, the English level of international students' teachers, their qualifications and teaching life. From the survey data, 36% teachers' English is splendid; 28% teachers' English is very well, 29% teachers' English reaches fluency level. In the part of teachers' qualifications, 100% teachers have a master's degree or above, including 78.6% teachers with a doctorate degree or above. The teachers involved in research have taught international students for an average of six years, indicating that their teaching experience is rich. From three perspectives to make comprehensive comparisons and analysis on teachers' teaching, we can see that international students' teachers in Wuhan University of Technology are equipped with extensive experience and high teaching level.

3.2.2 Teaching Attitude(X_2)

The data from the survey of teachers' teaching attitude shows that more than two fifths international students think that our school teachers pay more attention to them compared with their former teachers, and more than a quarter believe they get the same degree of attention as their former teachers, while about 29% think that is even worse than their own. In the aspect of domestic workload for preparing lessons, 57% teachers made four times efforts, 22% teachers made three times compared to the undergraduate teaching, indicating that the teachers devote more to international students' education and make more adequate preparation. In addition, 99.7% respondents believe that they are treated equally; there is almost no racial discrimination. Based on the above data, it's clear that our school's teachers teach international students with positive attitude, and in a very responsible way.

3.2.3 Teaching Content(X_3)

Teaching content is an important indicator of the evaluation of teaching effectiveness which is made up of three secondary indicators, namely: material sources, curriculum organization, and higher practice. Thereinto, Curriculum consists of curriculum structure and course difficulty.

As can be seen from the Figure1, the way that international students get their teaching materials is various. However, 59% students purchase through school, indicating that students need unified teaching material, which encourage the school to unify customization or purchase materials. As we can see in Figure2, most students use materials written by other countries or schools, of which more than 50% students use foreign materials, rarely using textbooks written by our school. In order to enhance teaching effectiveness in students' education, attention should be paid to material unity.

Figure 1 Channels to Get Materials

Figure 2 Materials' Written Agency

Table 2 Curriculum

	Very reasonable	reasonable	general	unreasonable	Very unreasonable
Course Structure	12.5%	60.71%	21.43%	3.57%	1.79%
Course difficulties	5.36%	26.79%	62.5%	3.79%	1.79%

As can be seen from the table 2, over 72% respondents believe that course structure is reasonable; 62.5% think that course has general difficulty, explaining that the structure is rational, while the difficulty of the course needs improving.

In addition, data from the survey shows that 76.79% students believe that practice is of great importance and more than 98% think that is very critical, implying that more attention needs to be paid to practical aspects in international students' education program. However, 75% international students think that they were provided with few opportunities to practice. So increasing the proportion of practice should be taken into consideration in international students' education.

3.2.4 Teaching Methods(X₄)

Figure 3 Teaching Methods

As can be seen from figure 3, the choice of this question is rather dispersed, half of which is Gakken interaction, while no people choose cramming teaching. Judging from the selection, all choices are relevant to interaction between the teachers and students, indicating that students prefer interactive teaching, hoping to melt into the classroom and making more exchanges with teachers.

3.2.5 The Teacher-student Relationship(X₅)

From Figure 4, it can be seen that 39.29% students regularly communicate with their teachers, 50% occasionally exchanges, only 10.71% seldom exchanges. This shows that communication between teacher and student is relatively frequently, but still needs to be strengthened.

Figure 5 shows that the process of international students' education, teachers and students communicate with each other mainly by face to face communication and e-mail exchanges, respectively 51.79% and 28.57%, so the teachers' English is demanding, including oral and written skills.

Figure 4 Communication frequency

Figure 5 Communication Means

In addition, 78.6% teachers expressed their willingness to establish good relationships with students, expecting to help them in their study and guide them in their daily lives so that they would not feel alone in a foreign country.

3.3 Problem Analysis

As can be seen from the international students' survey, 60.71% students think barriers still exist in communicating with their teachers, while 37.5% students argue that pressure comes from learning communication. Language barriers occurred mainly due to different accents. The results of the survey show that cultural differences still exist, but the teachers' reaction is greater than the students; In teaching methods, students agree with heuristic teaching. However, some teachers still continued the traditional teaching way, which indicates that the teachers and students have some divergences on teaching methods, so there is a need to improve promptly. In the survey, only 10.71% students get a lot of practice, while 76.79% believe that practice is very important. Besides, from the international students' Taught in English curriculum assessment form in Wuhan University of Technology, we can see the practice is not attached enough importance to, indicating that the assessment method needs to be further optimized to make it more reasonable. In the selection of textbooks, in Wuhan University of Technology, 75% international students are using foreign materials, which is a big challenge to teachers, because teachers must improve the understanding of foreign knowledge so as to fully highlight the advantages of using foreign materials.

4 Conclusion

Through surveys and interviews on international students and teachers, our school's Taught in English mode is relatively good, reflected in the higher levels of teachers' English, having access to large numbers of teachers who have higher qualifications with the experience of studying abroad or being visiting scholars and rich teaching experience; Students think our school has good teaching effectiveness, there are many teacher-student interactions and students establish very harmonious relationships with their mentors. However, there are still some problems in our school's Taught in English mode, manifested in the curriculum beneath reasonable, less practical course; teaching content not rich enough to fully arouse students' interests. Our school still needs to further improve international students' education.

Study on Simulation Model for University Mass Events*

Cai Chun

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 21770646@qq.com)

Abstract: University mass events drag more and more attention from society. The characteristics, influential factors and the warning system function are summarized and elaborated for University mass events. Based on the idea of parallel computing, introducing the concept of the immune system, the simulation model of the mass events warning is built, including simulation, the mapping, simulation steps, parameters and hypothesis. These make for the comprehensive scientific understanding of the evolution mechanism of University mass incidents and better realizing the early warning.

Key words: University Mass Events; Immunology; Early Warning; Simulation; Agent

1 Introduction

It is indicated in the blue book of 2012 from Chinese Academy of Social Sciences that the unsteady and uncertain factors of the social environment of the international economic have been standing out, and that China is still facing various problems and challenges concerning employment, labor relationship, division of income and social management. For the past few years, the number of mass events resulted from various social contradictions has reached ten thousand even a hundred thousand. The crisis of public opinions, security incidents and the like, all of which have shocked us. As statistics shows, the number of undergraduates, which shows a growth trend year by year, has reached more than 20 million. As an important part of the society, being situated in the multivariate society and faced with complicated and changeable environment, undergraduates are affected by many social problems in all kinds of ways. In recent years, university mass events, including personal safety, personal health, food security, mental injury, school violence, have been seen frequently in newspapers and other media. Every time these occur on campus, they will disturb regular education and life, bringing about heavy casualties and ill social affects.

University mass events refer to events that are influenced by both internal and external factors and dominated by numerous university students, who gather by means of certain contact and organization and adopt the ways of assembly, demonstration, sit-down strike to impose pressure upon the school or other authorities, aiming at expressing their feelings or protect their benefits. Among various factors, some may cause mass events when interacting with each other.

2 Influential Factors of University Mass Events

2.1 Characteristics of university mass events

University mass events being part of public mass events, the particularity of a university decides that these university mass events have not only the overall characters of public ones--suddenness and perniciousness, but also the characteristics of diffusibility, sensibility, subjects' activeness, etc.

2.1.1 Suddenness

Certain matters, which are incidental and result in mass events, are the fuses and sally ports. The time, the extent, the posture and the influence depth of mass events are hard to predict, which means suddenness.

2.1.2 Perniciousness

The property and extent of university mass events will lead to schools' damage and loss in different degrees, and some may even bring about political influences. Besides, easily spreading to other universities in this city or even all over the country, once utilized by people with ulterior motives, the extent and range of perniciousness can be objectively multiplied.

2.1.3 Diffusibility

Universities are places for higher education, the vital town for scientific research theory innovation, and the base for high-level personnel training. It is a place with large aggregation of the crowd.

2.1.4 Sensibility

Belonging to a special group, views of the college students upon the whole world, life and value

* This paper is supported by "the Fundamental Research Funds for the Central Universities(WUT:2013-lb-024)"

are being established, during which time abilities of thinking rationally and their psychological qualities, especially mentality and capability against mass events, are too weak for them to endure these problems.

2.1.5 Subjects' activeness

As an open cultural organization, universities are in the very front of knowledge and our era. Large quantities of students with extensive knowledge, profound thoughts and sincere passions, are assembling here. They are sensitive in thoughts and active in participation.

2.1.6 Inducing factors' diversity

Inducing factors may range from great affairs related to national sovereignty and dignity, to trivial ones related to personal issues such as food, fees and dormitory management problems. All may develop into university mass events, and some may even result from collective tumult caused by a power cut of the school.

2.1.7 Organization behavior's concealment

With the rapid development of network technologies, college teachers and students can utilize convenient network communication, such as MicroBlog, WeChat, online communities and other channels for transmitting information quickly.

According to the characteristics above, it is necessary to set up a relevant early warning system by simulating and revealing the omens, occurrence, evolution mechanism of university mass events.

2.2 Early Warning System of University Mass Events

Usually, the early warning system of university mass events includes information monitoring, risk assessment, early prevention, early warning signal releasing, emergency preplan starting, early warning signal removing or emergency disposing, etc. Basic functions of the early warning system of university mass events are as follows.

2.2.1 Information monitoring

The early warning system can provide successive and automatic monitoring for mass events and record irregular monitoring results. It will institute an array of systemic statistical data by long-term monitoring and recording upon various data and information.

2.2.2 Risk assessment

The early warning system being a multivariate and omnibearing information collecting system, conclusions could be inferred and problems could be solved by analyzing and summarizing statistical data, accumulating experience in administration, eliminating false information, sieving out and analyzing the reality.

2.2.3 Early prevention

Portents of some mass events can be detected by monitoring and analyzing information. And then reduce identification events of emergencies and improve reaction velocity by keeping track of these portents. Even if some are inevitable, it would be better to make preparations for dealing with university mass events according to existing information. Conclusions should be transmitted to the emergency agency of the school through the rapid and efficient emergency mechanism so that the system's function of information providing will take effect.

Currently, it is hard to give a comprehensive response and a precise forecast; nevertheless, simulation models are relatively a fresh and scientific method. When conducting a simulation, indexes reflected in the actual situation should be transformed. Indexes can be refined on the basis of scientificity and pertinence as the Figure below.

Table 1 Parameter Indexes of University Mass Events Simulation

Event	Index	State	
University mass events simulation	Range of influence	Affecting the school order	Affecting the social order
	The number of people involved	Less than 100	More than 100
	Effectiveness of emergency	Invalid	Valid
	Inducing factors	Internal factors	External factors
	Location	Inside the campus	Outside the campus
	Time	Normal period	Sensitive period

3 The Simulation Model of University Mass Events

3.1 The simulation framework

Wang Feiyue et al.^[1] proposed "Artificial Societies--Computational Experiments--Parallel Execution" (ACP method), which was applied to emergency management. It can realize the parallel

evolution of artificial society and real society by using multiple data sensing and assimilation means, and achieve dynamic optimization management and control by conducting computational experiments to test possible future reality, analyzing and evaluating the action plan.

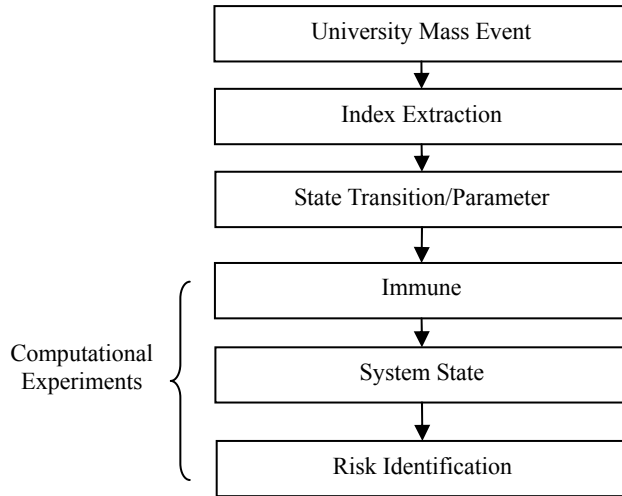

Figure 1 Stimulation Process of University Mass Events

The traditional social scene simulation studies often use complex differential dynamics-- difficult to demonstrate the complex giant system fully, while modeling method based on agent can combine organically the microscopic behavior of individual in complex systems with the overall properties of systems--macroscopic “emergency” by describing the interaction of individuals in complex systems in an agent way, and modeling interaction between individuals and between individual and the environment [2]. There are various forms of intrinsic mechanism in the correlation and causation between elements in the social economic system, presenting various types of complexity, such as time delay, information asymmetry, evolution mechanism, etc. And generally, it will present a complex phenomenon of “emergence” under the influence of nonlinearity and external world [3]. Some scholars have found that the problem faced by natural immune system is very similar with emergency management: the process of defending foreign invasion in the human body’s natural immune system is actually the process of identifying and treating risk constantly [4].

Constructed by de Castro [5], the immune network algorithm (aiNet) is used to simulate the reaction process of immune network defending primary stimulation, mainly including antigen recognition process, affinity maturation and network suppression. Learning from immune algorithm, this study will conduct computational experiments to bring university mass events as antigens into the immune system to react, exploring the characteristics of the response and digging the laws of evolution of university mass events. The computational experiment is a kind of research method to explore emergency management strategies, guided by integrated methodology, combined with computing technology, and then reveal the complexity and the law of evolution of the emergency.

3.2 Simulation Steps of University Mass Event

Dorm in $\delta = \{0,1\}^l$, affinity algorithm is Hamming algorithm [6], the formula is as follows:

$$opt(ab, ag) = \sum_{i=1}^l \delta_i \begin{cases} \delta = 1, ab_i \neq ag_i \\ \delta = 0, otherwise \end{cases} \tag{1}$$

ab refers to antibody, presents emergency measures; *ag* refers to antigen, presents emergency.

Antibody mutation probability formula of each cycle is as follows:

$$p_j = \frac{j}{n} \times \exp\left(\frac{\beta t}{T}\right) \times ab_j \tag{2}$$

P is the probability of No. *j* antibody’s variation, *n* is the total number of antibody, *j/n* links variation scale with the antibody’s ranking in the colony. Antibodies with higher affinity have smaller variation scale, which is good for comprehensive search of better antibodies. Exp (*βt/T*) links evolution algebra with variation scale, thus bigger variation scale is attached to evolution in the initial stage of immune reaction. Then, with the increase of the evolution algebra, variation scale gradually becomes

smaller, which is good for rapid convergence and fine search. β is the control parameter. ab_j is the numerical value of current antibody. The specific steps of simulation are as follows:

Step1: pretreatment of the input data, to transfer mass event information to statistical modeling data.

Step2: initialization of the immune system, the setting of antigen (mass event) scale, randomly generates antibodies and memory unit.

Step3: calculation of affinity, use Hamming distance algorithm.

Step4: colonial selection algorithm. Combination of high frequency variation and multi-point crossover, to clone the individual with higher affinity, and to treat ones with lower affinity in the way of mutation and crossover.

Step5: selection based on memory. To remove the individuals with low affinity, to retain the individuals with high affinity, and tolerance test, and conduct tolerance test.

Step6: to clean up antigen, and update antigen appropriately.

Step7: to reach the termination condition or simulation cycle.

4 The Simulation Test of University Mass Events

Genes are represented by binary string, including Self, antibody R and Non-self, three of them are binary string combination whose length is l . Assuming that all self centralized bit strings are independent with each other, that is each bit string is selected randomly from U . Based on agent modeling, artificial social system simulation is an effective method to solve the complex social system, which conducts parallel evolutionary computation on the Swarm platform. The major simulation parameters of university mass events are the speed of transmission (R), the effect of resistance (D) and the probability of mutation (p). Each individual is an agent in mass events, and each agent has the three parameters above. R represents the probability of the event's effect passing to the next person; D represents the probability of decreasing of people affected by the event; p represents the probability of unconventional process of the event evolution. Simply burst detection from multiple data streams on the network^[7], the interaction of two agents also depends on changes of the three parameters, as shown in Figure2:

Figure 2 Agent Interaction in University Mass Events

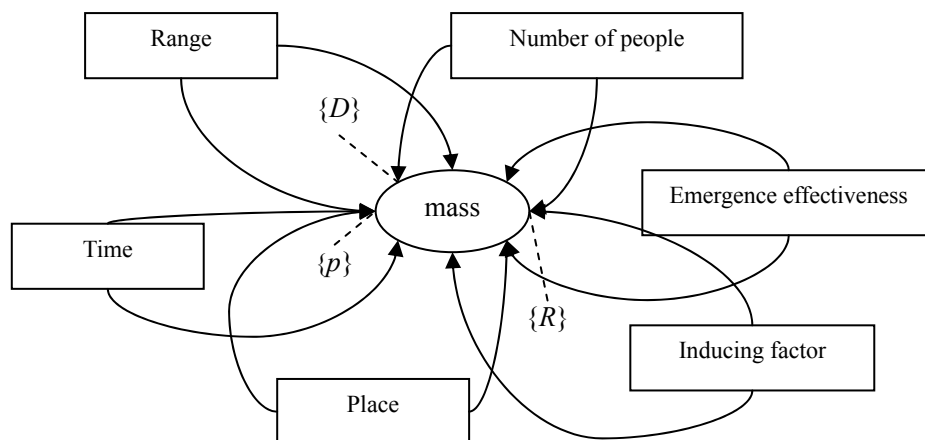

Figure 3 The Relationship of Simulation Parameters in University Mass Events

Based on the interactive mode, changes of parameter and indexes of mass event will be integrated. University mass events has the parameters collection of many Agent: $\{D\}$ 、 $\{R\}$ 、 $\{p\}$, As shown in Figure 3:

As shown in the Figure 3 above, every index has different effect on mass, and every index has a group of impact value (R, D, p). In fact, with the perfection of system, influential parameters will gradually increase, in order to reflect the complex system truly. Simulation parameter hypothesis of university mass events are as follows:

Through simulation parameter hypothesis of university mass events and Comparative analysis of the real event, the real Simulation data are generated, thus achieving further study of university mass event. It is a kind of new exploration for research methods in this field.

Table 2 Simulation Parameter Hypothesis of University Mass Events

Event	Index	State			
Simulation parameter hypothesis of university mass events	Range of influence	Affecting the school order	$R+0.1$, $D+0.1$	Affecting the social order	$R+0.2$, $D-0.1$
	The number of people involved	Less than 100	$R+0.1$	More than 100	$R+0.1$
	Effectiveness of emergency	Invalid	$D-0.1$	Valid	$D+0.1$
	Inducing factor	Internal factors	$p-0.1$	External factors	$P+0.1$
	Location	Inside the campus	$D+0.1$	Outside the campus	$D-0.1$
	Time	Normal period	$R-0.1$	Sensitive period	$R+0.2$, $p+0.2$, $D-0.2$

Note: “+ , -” means plus or minus on the basis of the original parameter values.

5 Conclusion

Study on the university mass events is a long-term work, because the former theoretical studies cannot get certain conclusions through the practical experiments and empirical research. Involving computational experiments and antigen antibody response in immune system, the early warning simulation model is an important subject to improve the function of early warning.

The information of the event is refined and transferred into index and binary string, and then input into a computer system. Through the simulation parameters and parameter hypothesis of university mass event, mass events are brought into the social immune system to react, which is a new research method, and is conducive to a comprehensive and scientific understanding of evolution mechanism of university mass events, achieving early warning more effectively.

Empirical Analysis of China's Coal Consumption, Carbon Emissions and Economic Output*

Wu Xiang, Li Shengnan

School of Economics and Management, Northeast Dianli University, Jilin, P.R.China, 132012

(E-mail: dianyuanwuxiang@163.com, 1419910719@qq.com)

Abstract: China's economic growth depends on the consumption of coal, and the increase in coal consumption is the main cause of the increase in carbon emission. In this paper, we use the classic econometric method, such as cointegration analysis, impulse response function, and the variance decomposition technology to analyze the relationship from the point of view of the demand side. The empirical results for annual data show that there is an existence of the long-term cointegration relationship between the three variables of coal consumption, CO₂ emissions and economic output. Change in coal consumption is Granger reason that led to the changes on the carbon dioxide emissions in short-run. The change in economic output is not the same for the carbon dioxide emissions in short-run, but it has a potentially significant impact in the long-term. The impulse response function and variance decomposition show that the increase in coal consumption in the short-run lead to an increase in carbon dioxide emissions, and has a strong impact on the changes in the growth rate of carbon dioxide emissions. Based on the above empirical findings, this paper presents policy recommendations.

Key words: Coal consumption; Carbon dioxide emissions; Economic output; VEC model

1 Introduction

Coal is the most basic energy source in China and it is given an important strategic role in the economic growth of the country. In accordance with data from the National Bureau of Statistics, coal consumption accounted for 66.4% of the total disposable energy consumption in 2012. As it's abundant in reserves, relatively cheap price and stable supply, coal will continue to be an important component in our primary energy in recent decades. Being in the process of industrialization and urbanization, China's economic growth depends on consuming a large amount of different types of fossil fuels such as coal. Since the use of coal is an important cause of greenhouse gas emissions, in the global carbon emission reduction scenarios, it has great practical significance to study the relationship between the three variables of coal consumption, CO₂ emissions and economic output.

For the research of the relationship between coal consumption, carbon emissions and economic output, the current literature retrieved most focused on studying the relationship between two variables of energy consumption and economic output by using various measurement methods, and on this basis put forward relevant policy recommendations to save energy and reduce emission for different countries or regions. With global warming, the countries pay more attention to the increase in greenhouse gas, mainly carbon dioxide emissions. People gradually realized that it is necessary to put the growing carbon dioxide emissions into the energy consumption model for analysis. For example, James (2012) studied the relationship of energy consumption, pollutant emissions and economic growth in French from 1960 to 2000 by using cointegration and error correction model, and pointed out that economic growth has a significant effect on the increase in energy consumption; Hsiao-Tien Pao (2009) analyzed emission by taking advantage of the grey prediction model; Xing-Ping Zhang (2009) analyzed the causal relationship between these three variables in statistical data during 1960~2007, and argued that either carbon emissions or energy consumption is not the main reason for economic growth, therefore, in the long-run, the energy conservation policies will not harm economic growth; Based on environmental Kuznets curve model, Mohammad Jahangir Alam (2012) analyzed the relationship between the three variables in the Middle East and North Africa countries, he said that energy consumption had a positive effect on carbon dioxide emissions; Li. F. Dong (2011) researched panel data of China during 1985~2007, and argued that the energy consumption elasticity coefficient in eastern of China is two times higher than the western region. In addition, some documents also studied the situation of energy consumption and economic growth in different countries, such as Halicioglu. F

* This paper is supported by Ministry of Education, Humanities and Social Sciences Planning Fund(12YJA790146) and China Postdoctoral Fund Project(20110491324).

(2009), Paresh Kumar Narayan (2012), etc.

Above all, the above brief literature review shows that it is useful for empirical study to establish the relationship between the total energy consumption, carbon emissions and economic output. The current characteristics of China's energy consumption are that coal consumption has been in a dominant position in China's total energy consumption and is the basis energy for economic development. Since the coal is one of the highest carbon emissions energy species, it is necessary to study the relationship between coal consumption, carbon dioxide emissions and economic output. Some literature analyzed the relationship between coal consumption, carbon emissions and economic output in China, such as Li (2011), Harry (2012). Because of the different angle of the research, the diversity of variable selection and sample data section, so the conclusions are not consistent. The aim of this paper is to investigate the relationship between China's coal consumption, carbon emissions and economic growth since the reform and opening up.

2 Model Construction and Data Sources

2.1 Construction of economic models

In order to analyze the dynamic relationship between China's coal consumption, carbon dioxide emissions and economic output, we based on the viewpoint of demand to establish the econometric model of relationship between the three variables, as shown in Eq. 1.

$$CO2_t = COAL_t^\alpha GDP_t^\beta \varepsilon_t \quad (1)$$

Where $CO2_t$ is carbon dioxide emissions in the t year, GDP_t represents China's actual economic output in the t year, $COAL_t$ is China's coal consumption, After taking the natural logarithm of Eq., α, β are parameters to be estimated.

2.2 Data sources

The data used in this paper are annual data, and the sample interval is from 1980 to 2011. Carbon dioxide emissions refer to China's total carbon emissions and data derive from the 2012 BP World Energy Statistics Yearbook, in units of one million tons. China's economic output data come from the World Bank, the real GDP in 1995 as the base period were deflated treatment. Coal consumption data stem from the 2012 British BP World Energy Statistics Yearbook, in units of one million tons oil equivalent value. In order to reduce heteroscedasticity and nonstationarity of the data, in the Eq. (1) all variables data are plotted on a logarithmic scale.

3 Empirical Analyses

3.1 Time series properties of variable data

To test for the unit root property of each variable time series, we use two test methods of ADF test and PP test to verify the stationary of time series. Test results of each variable data are shown in table 1. The results show that, the variables in levels are non-stationary series, and after the first order difference they are all stationary series.

Table 1 The Variable Data Time Series Unit Root Tests

Sequence	ADF test			PP test		
	Test value	5% critical value	Whether smooth	Test value	5% critical value	Whether smooth
$\ln(CO2)$	0.1612	-2.9364	no	1.1012	-2.9604	no
$\Delta \ln(CO2)$	-3.0093*	-2.9640	yes	-3.1603*	-2.9640	yes
$\ln(COAL)$	0.6604	-2.9763	no	0.1569	-3.6617	no
$\Delta \ln(COAL)$	-3.9815	-2.9763	yes	-3.3566*	-2.9640	yes
$\ln(GDP)$	0.3673	-2.9640	no	-1.8815	-2.9604	yes
$\Delta \ln(GDP)$	-3.2078	-2.9640	yes	-3.2914*	-2.9640	yes

Note: * indicates significant at the 5% significance level; Δ indicates the first order difference.

3.2 Cointegration and causality tests

After confirming the existence of unit root, the Johansen cointegration test will be performed. The optimum lag suggested by the AIC criterion for Eq. (1) is 2. Table 2 gives results of Johansen cointegration relationship. From table 2, there is at most one cointegrating relationship in Eq. (1). The result suggest that there is a long-run equilibrium relationship among the variables in Eq. (1).

Table 2 The Cointegration Test Results of Eq. (1)

Null hypothesis	haracteristic root	Trace test		Maximum eigenvalue test	
		Trace stat.	Critical Value	$\lambda - \max$ stat.	Critical Value
No cointegration	0.6127	31.7932*	29.7971	27.5068*	21.1316
At most one cointegration	0.1344	4.2864	15.4947	4.1878	14.2646

Eq. (1) corresponds to the cointegration relationship as shown in Eq. (2):

$$Ln(CO2_t) = 0.8372 Ln(COAL_t) + 0.1148 Ln(GDP_t) - 0.7071 + \hat{\epsilon}_t \quad (2)$$

(-47.8461) (-11.2082)

Under the parameter estimation results in Eq. (2), the values in brackets are t-statistical values. The cointegration relationship in Eq. (2) shows that carbon dioxide emissions increased 0.84 units along with coal consumption increased by 1 per unit. And carbon dioxide emissions increased 0.11 units in pace with GDP increased by 1 per unit. This shows that China’s carbon dioxide emissions increase is mainly caused by coal consumption.

Cointegration relationship between variables indicates that in the Eq. (1) at least exists Granger causality in a certain direction. Therefore, in order to further identify the direction of causality, we use vector error correction model, namely VEC model to judge of the causality direction. The causal effect is shown in Table 3.

Table 3 The Causality Test Results Based on VEC Model

Dependent variable	wald χ^2 statistic		
	$\Delta Ln(CO2)$	$\Delta Ln(COAL)$	$\Delta Ln(GDP)$
$\Delta Ln(CO2)$	—	5.6533*	0.5668
$\Delta Ln(COAL)$	3.5825	—	0.6548
$\Delta Ln(GDP)$	0.3175	0.3085	—

Causality relationship in table 3 show that for Eq. (1), the change of coal consumption is the granger cause of changes in carbon dioxide emissions, this shows that the coal consumption in China is a major cause of carbon dioxide emissions.

3.3 Impulse response functions and variance decomposition

3.3.1 Impulse response functions.

According to the modified likelihood ratio test of Sims (1996), we choose the VAR model of lag 3 order. In the impulse response function graph, the horizontal axis represents the time interval, selecting the lag period of 10 units. The vertical axis represents the percentage of change; the dotted line represents the confidence interval of plus or minus 1 times the standard deviation. Figure 1 and Figure 2 show the impact reaction results of carbon dioxide emissions, coal consumption and changes in economic output in the Eq. (1).

Figure 1 IRF from Ln(CO2) to Ln(COAL)

Figure 2 IRF from Ln(CO2) to Ln(GDP)

In figure 1, when 1 percentage shock of Ln(COAL) occurs, the reflection on impact of Ln(CO2) reaches 0.002 percentage points in second year, while a slow decline begins. It shows a slight shrinkage from the beginning of the third year and the shrinkage effect increased gradually with time. From the second year, the line trend smooth, resulting in a decline in Ln(CO2) and long-term negative effects. This suggests that the increase in coal consumption increased carbon dioxide emissions in short-term, because of the strict implementation of energy saving measures led to a reduction of carbon

dioxide emissions in the long term.

In Figure 2, when 1 percentage shock of $Ln(GDP)$ occurs, reflection on impact of $Ln(CO_2)$ shows a trend of gradual expansion, and as time goes by, its expansion is monotone increasing trends. This shows GDP growth has long-run continuous drive effect on China's carbon dioxide emissions. From another side, China's economic development must change the mode of economic growth, from energy consumption-driven development to intensive development pattern aimed to efficiency of production, to improve energy utilization efficiency.

3.3.2 Variance decomposition.

Variance decomposition can characterize the contribution of structure impact to the changes level of endogenous variable, and to evaluate the importance of different structural impact. Based on the idea, variance decomposition, we can identify in Eq.(1) the contribution degree of change rate of $Ln(COAL)$ and $Ln(GDP)$ to $Ln(CO_2)$. The resulting of variance decomposition estimation is given in table 4.

Table 4 The Variance Decomposition Results of $Ln(CO_2)$ Growth Rate

Period	Standard deviation	$Ln(CO_2)$	$Ln(COAL)$	$Ln(GDP)$
2	0.023254	98.56219	0.762408	0.675405
4	0.036813	96.74968	0.797266	2.453050
6	0.044160	92.22588	3.500605	4.273519
8	0.048154	85.23009	7.727472	7.042434
10	0.051076	76.91848	11.82779	11.25373

Results of Table 4 shows that, with the passage of time, both the change rate of coal consumption and economic output show a gradual increase of the contribution to carbon dioxide emissions, and with the extension lag, the contribution to change rate of $Ln(COAL)$ is greater than $Ln(GDP)$. This suggests that change in coal consumption has important influence on China's carbon dioxide emissions, and also shows that China's economic growth is energy driven growth.

4 Conclusions

Applying the VEC model, impulse response function, variance decomposition and other classical measurement technology, this paper investigates the relationship between China's carbon dioxide emissions, coal consumption and economic output by establishing econometric model from the perspective of demand side. Based on the above analysis, we draw the following basic conclusions:

(1) There is a long-run cointegration relationship between China's coal consumption and carbon dioxide emissions; the change of coal consumption is granger cause of the change in the carbon emissions. The result of Impulse response function shows that, the increase of the coal consumption in the short term leads to an increase in carbon dioxide emissions. Carbon dioxide growth rate variance analysis also shows that the coal consumption changes exert a strong influence on changes in carbon dioxide.

(2) Economic output change in the short run has not significant effect on carbon dioxide emissions, but in the long run, the growth in economic output potentiality impact on carbon dioxide emissions, and with the increase of economic output, carbon dioxide emissions continue to increase.

Based on the above conclusions, this paper can extend out the relevant policy recommendations and measures as follows:

(1) At present, China's economic development is characterized by industrialization and urbanization, this feature determines that China's consumption of coal is a large and rigid. In view of the characteristics of energy resource endowment in China, in the disposable energy consumption coal will occupy the dominant position in the long term. In order to ensure sustained economic growth, it is bound to consume large amounts of coal as expense. Due to the constraint of environmental protection, our country should be in line with the principle that coal cannot be without, but do not use indiscriminately, to efficiently use coal. Based on this, to improve the efficiency of coal use is currently the most pressing issue. Therefore, to set energy saving policy of strategic vision and to increase energy-saving technology research and effective promotion on coal consumption are effective way to improve the utilization efficiency of coal.

(2) Industrial sector, especially the power generation sector, is the main coal consumption sector,

how to reduce carbon emissions of power department is a top priority. From the point of current technology, it is the main way to a large margin to reduce carbon emissions by using carbon capture and sequestration technology for coal power industry. The high coal consumption industry sectors, such as chemical, steel and cement, reduce carbon dioxide emissions by using energy saving technology research and the necessary carbon capture and sequestration technologies.

(3) Adjusting the industrial structure is to speed up the formation of industry structure mode, service primarily. The development experience of developed countries proved that the service industrial structure can effectively realize conditions stable economic growth of low carbon scale. In order to speed up the adjustment of industrial structure, to reduce carbon dioxide emissions, the government can use economic and administrative means as industrial structure adjustment measures. In the economic tool choice, the economic means, such as a carbon tax and energy tax, adopted by Nordic countries can be used to reduce carbon emissions and enhance the level of China's industrial structure. In the administrative means, direct control way can be adopt to restrict the development of the high carbon high energy consumption enterprise, and also to encourage the development of low energy consumption, low emissions, high value-added business.

Abstract: China and Brazil have their own cultural backgrounds and standards of thinking, being and acting, and these differences strongly influence the Sino-Brazilian relations. Culture gains an increasing role in the connections between the two countries. This paper gives an overview about the cultural exchange between Brazil and China, highlighting the Confucius Institute initiative as a soft power strategy. It aims to provide an understanding on how cultural aspects have an impact as the cultural contacts take place and the exchanges advance, intertwined with the cultural systems. The authors state that although still in its starting phase, the initiative is on the right path. The potential of Brazil-China cooperation is unparalleled and now it is just a matter of enlarging the mutual cooperation. In this process, the Confucius Institute in São Paulo plays a key bridging role.

Key words: Cultural Exchange; Soft Power; Confucius Institute; Brazil and China

1 Introduction

Brazil and China have very different cultures and characteristics. While China has been a prohemint civilization in the world for millennia, Brazil is a young country and a true melting pot, combining original American, European, African and Asian traits. Although so different and distant, both countries have been in touch and developed cooperation relations.

Why study Brazil and China? Because these two emerging countries stand out in the world, increasingly enhancing cooperation and composing the group called BRICs (originally referring to Brazil, Russia, India and China). Created in 2001 by Jim O'Neill, of the Goldman Sachs Bank, the acronym comprises the countries at a similar stage in economic development, being predicted that in the near future (the year 2050) together they will surpass the richest economies of the present. China, East's (and world's) biggest emerging power, and Brazil, West's biggest emerging economy, have established better commercial and cultural relations that are also more and more intense – and this makes mutual cultural understanding between the two countries paramount. For Leite (1999), Brazil and China shared the presence of the Portuguese colonizers and the Jesuit missionaries, having more in common in terms of mutual cultural influence than they imagine. Besides, since 1812 Chinese immigration has played this connecting role as well. At first, as the coolie labor force, but contemporarily as an urban population with pronounced entrepreneurial trait. This can be especially seen in São Paulo state, which shelters half of the 200,000 *huaren* and *huayi*¹ existing in Brazil. São Paulo city is highlighted in the process, too, making evident the region's historical calling to bridge Brazil and China, corroborating the thesis that the countries are strongly interconnected.

Culture, in this process deserves to be stressed. Reeves and Baden (2000:4) define culture as the distinctive patterns of ideas, beliefs, and norms which characterize the way of life and relations of a society or group within a society. This set of beliefs shared by a group is frequently assumed to be natural and unchangeable. Culture also consists of the sum of the total learned behaviors transmitted from generation to generation, generally considered to be the tradition of that people: explicit and implicit patterns acquired and transmitted by symbols, constituting the distinctive achievement of human groups. The essential core of culture consists of traditional ideas and their attached values. Different cultural groups think, feel, and act differently, and there is no scientific standard for considering one group as intrinsically superior or inferior to another.

When it comes to international cooperations, contact between societies may affect cultures, and produce or inhibit social changes in cultural practices. Understanding cultural differences is essential in the modern world. How people from many cultural backgrounds communicate, in similar and different ways, internally and externally, is the object of study of cross-cultural communication. Understanding cultural differences will help ensure that communication across borders is effective and successful. This way, the concept of cultural competence is of importance. It refers to the capacity of efficiently interacting with people of different cultures, and comprises four components, namely: awareness of

¹ *Huaren* and *huaqiao* are the so-called Chinese overseas. *Huayi* are their descendants (Vêras, 2008).

one's own cultural world view; attitude towards cultural differences; the knowledge of different cultural practices and world views; and intercultural skills. According to Martin and Vaughn (2007), the capacity of efficiently understanding, communicating and interacting with people from different cultures is the result of the development of one's cultural competence.

In this context there will be an introduction of the Confucius Institute experience in São Paulo, Brazil and its developments along the last three years. An overview will be given about this academic exchange cooperation that involves the Chinese Government (represented by the Han Ban), the Hubei University (China) and the São Paulo State University - UNESP (Brazil). Besides introducing the initiative, the paper aims to comment the experience in terms of accomplishments, opportunities and overcoming challenges in bridging the two countries. As part of a comprehensive soft power political strategy of the Chinese Government, and aiming at the diffusion of Chinese language and culture, the Confucius Institutes were created in 2004 by the Han Ban, which is an organism of the Chinese Ministry of Education. The Institutes have mushroomed around the world since, and the São Paulo chapter officially started in 2009, being the first in Brazil. Now with capacity for more than a thousand students, the Confucius Institute in São Paulo has achieved the prize of best Confucius Institute twice (2010 and 2012) and countless partnerships. In a context of world economic crisis, a growing number of countries are willing to intensify their relationship with China, and in Brazil the topic of Sino-Brazilian relations became more relevant after 2009, when China became the country's main trade partner. As a result, in the last years many Brazilians have devoted themselves to learning Chinese. Although it is a new process, it is fast-paced and already successful, with high potential for further developments.

In terms of Sino-Brazilian relations, Paulino and Pires (2011), point out the need to strengthen cultural ties through the incentive of the already existing activities, such as the Confucius Institute at UNESP, and the support to spreading Brazilian culture in China and the implementation of centers for Brazilian studies and advertising Brazilian culture in Chinese universities. Some of the proposed aspects for an agenda of mutual cooperation have already been launched and start to yield fruitful results.

2 The Sino-Brazilian Relations: an Overview

The Brazil-China relationship is not a new one. As previously seen, according to Leite (1999), for a number of reasons, Brazil and China have been in touch since colonial times (which in Brazil were from 1500 to 1822). Both countries established diplomatic relations in 1974, and since the visit of then President Lula to China in 2004 these relations have been intensified. One of the main things the two lands shared was the Portuguese presence. Devoted to their double mission (mercantile and religious), the Portuguese circulated among Brazil, Portugal, Africa, India, Japan and China (especially Macau), promoting an intense exchange of people, goods and knowledge. Moreover, in spite of Portugal's prohibition of direct trade among colonies, it happened anyway. Therefore, Brazil received Chinese influences concerning foods, habits, and even architecture and arts. In the colonial period, the Jesuits were the ones to bridge Brazil and China, teaching and applying different kinds of knowledge from one place to the other. In the early 19th century, when the Portuguese court was transferred to Brazil, the Chinese emperor presented the royal family in Brazil with exquisite pieces of art and even soybean seeds (being responsible for the introduction of the crop in Brazil).

Immigration is another point of contact between Brazil and China. At first brought to Rio de Janeiro in 1812 as coolies by the King D. João VI to plant tea, they soon disappeared or committed suicide for being discontent about the working conditions. This characterized the failure of the coolie initiative in Brazil, resulting in the Qing Dynasty's interruption of the flux of Chinese workers to the South American country. Nevertheless, the Chinese immigration in Brazil went on, but now with a different characteristic: most immigrants are urban and come in unconnected waves, basically in an individual or family basis, self-financed. Nowadays the contributions of the Sino-Brazilian community are remarkable. Around the world the Chinese diaspora is calculated in 35 million people, and about 200,000 Chinese and descendants are estimated to live in Brazil, half of which just in São Paulo state. Therefore, as seen above, the region has an old calling to bridging the two countries. In the 20th century, famous Chinese painter Chang Dai-Chien produced works in Brazil for almost 20 years (Véras, 2008).

Both Brazil and China have continental dimensions, have been empires, and have an east coast near which most people live. In the two countries the development runs towards the west. There are many differences, though. Brazil is characterized by a diverse culture and geography, and historically it has been the source of important natural resources in its 513 years of official history. It is the largest country in South America in both population (approximately 190 million) and area (8.5 million square kilometers), and its

culture is a fusion of Portuguese, African and indigenous influences, resulting in a rich and distinct culture. One could say that the family is the foundation of the social structure and forms the basis of stability for most people. Although family size has been diminishing in recent years, families tend to be large and the extended family is quite close. China's rich cultural heritage must not be overlooked when discussing cultural interactions with this country. With a 5,000-year history and a mix of ethnic groups, it can be said that it is the only continuous ancient civilization. Founded on October 1, 1949, the People's Republic of China is situated in eastern Asia, with an area of 9.6 million square kilometers and a population exceeding 1.3 billion, which makes up 22% of the world total (the world's most populous country). China has followed a family planning policy since the 1970s in order to bring the population growth under control. Today, the country is implementing reform and opening-up policies, and has established what they call a socialist market economy, or socialism with Chinese characteristics. Throughout most of Imperial China's history, Confucianism was the official philosophy and the country's traditional social values were derived from various versions of this philosophy. Duty, sincerity, loyalty, honor, filial piety, respect for age and seniority are the most valued virtues in Confucianism. The society itself becomes stable through the maintaining of harmonious relations. The *guanxi* (relationship) is another relevant aspect. A need for group affiliation, whether to family, school, work group, or country characterizes the Chinese society as a collective one. They will act with decorum and will avoid anyone's public embarrassment for the sake of maintaining a sense of harmony. The concept of harmonious relationships is the essence of Confucianism, and the culture will revolve around it. The society as a whole will function smoothly if proper behavior through duty, respect and loyalty are shown in the relationships.

Both Brazil and China have historically been described from an Orientalist¹ angle, using the category by Said (2003). Moreover, François Jullien (1998) describes many cultural differences between Eastern and Western thoughts. As an heir of Europe's, Brazilian culture is highly influenced by the concepts of utopia, ideal reality, transcendence, and how to transform the reality is a main concern. The Oriental culture, especially the Chinese one, is rather pragmatic and resigned facing the reality. Authors such as Jullien (1998) emphasize China as a place where meaning is built in indirect and tacit ways.

From the trading point of view, China has been top priority of the Brazilian agenda. Over the last years the relations between the two countries have increased considerably. According to Paulino and Pires (2011), the Chinese market is Brazil's greatest source of commercial revenue (USD 30.8 billion in 2010 – representing 15.2% of the total). Chinese economy, in turn, was also the second greatest supplier for Brazilian market (USD 25.6 billion – 14.1% of all import expenses). China also led in direct foreign investment in Brazil in 2010 – making 32% of the total (in contrast to the 0.25% of the total in 2009). As pointed by Gama and Cajueiro (2012), among the Chinese companies in Brazil are JAC, Huawei, ZTE, Haier, Chery, Dong Feng, Sinopec, Bank of China, Sinotruck and Lenovo.

The Brazilian investments in China, on the other hand, show another picture. Data from China's Ministry of Commerce (MOFCOM) indicate that from 2000 to 2010, Brazilian companies invested US\$ 572.5 million in China, representing only 0.04% of the stock of foreign investments in the Asian nation. As for the Brazilian companies in China, we may highlight Vale (the first one, come in 1973), Marcopolo, Embraco, Petrobrás, Apex Brazil, Bank of Brazil, Itaú BBA, Comexport, BRF, Brazil Foods, Odebrecht, Suzano Papel e Celulose, Weg, Sertrading and the shoe manufacturers (Frischtak; Soares, 2012).

For beyond economic and political issues, the socio-cultural relations between Brazil and China deserve to be seen from an important angle, which should be systematically explored, such as cooperation in various areas of mutual interest. This is highlighted as a new and strong connection at an expanding stage. Paulino and Pires (2011) emphasize the need of a strategic agenda for this cooperation with China: the strengthening of social, cultural and educational relationships.

3 The Soft Power: Mutual Cooperation and Socio-Cultural Exchanges

This paper presents the Confucius Institute in São Paulo as an example of *soft power* cultural initiative of cooperation between Brazil and China. The Confucius Institute is named after the Chinese philosopher Confucius (551–479 BC, Qufu, Shandong Province), in an effort to associate the cultural initiative to the country's tradition and avoid political connotations, in spite of the philosopher's having been in the 20th century criticized and associated to feudal China. Now it has become a trademarked brand name. We may not forget that the proliferation of Confucius Institutes around the world not only has purposes of language and culture diffusion, but also the encouraging of trade ties and the extension of the Chinese campaign of soft power into the educational sphere in foreign countries. This way can China expand economic, cultural, and diplomatic reach through the promotion of Chinese language and culture.

¹ Defined according to the Western/European view.

In order to understand the initiative, the concept of soft power is essential. It was developed by Joseph Nye Jr. (1990; 2004) to describe the ability to attract and co-opt rather than coerce, use force or give money to persuade. Now the term is widely used by both analysts and statesmen regarding international affairs. In 2007, the then President of People's Republic of China, Hu Jintao, said that China needed to increase its soft power during the 17th Communist Party Congress. Countless other examples of world leaders referring to soft power can be seen, valuing it as an efficient instrument of security through diplomacy, communication, foreign assistance, civic action and conflict resolution, in ways that are different from the traditional military ones. Culture diffusion can be part of this strategy.

Hubei University has taken an active part in establishing two branches of the Confucius Institute abroad to follow the spirit of "promoting Chinese and upholding the fine culture of China", namely in the USA and Brazil. The first was established with the University of Memphis in USA (2007). The Confucius Institute established with the UNESP, Brazil, had its Inauguration on November 26, 2008. The creation of the Confucius Institute has an important role to play, following the mission to teach Chinese language, also divulging the Asian country's history and culture. This way, strengthening the Brazil-China cultural exchange. Besides language courses, the Institute also provides courses in Portuguese about China's art history and, for interested companies, classes on the Asian country's business environment (comprising cultural, legal, political, economic and taxation aspects).

The cooperation with Brazil has been so intense that in 2012 the University opened its Center for Brazilian Studies, and the scientific interest about the South American country has grown among the University researchers. The opening of the Center happened taking into account that:

(1) China and Brazil have a long history of friendship, and especially since the reform and opening up, China has had a closer relationship of exchange and cooperation with Brazil in all areas including politics, economy, culture, military, education, etc. The two countries have established the strategic partnership of mutual benefit. Hence, studies about Brazil grow important;

(2) Hubei University has carried out the research on Brazilian history since the 1960s. The staff translated and published the first General History of Brazil (Russian Version) in China. The studies on Latin America history advanced in China in the 1980s and the 1990s;

(3) Hubei University and UNESP co-established the first Confucius Institute in Brazil, which offers a platform of academic exchange and cooperation.

Therefore, Hubei University sets up the Center to improve the research level on Brazilian studies focusing on Brazilian history, economy, culture, international relations and tourism, and to contribute to the exchange and cooperation between two countries and two peoples. As for the Portuguese language studies, at present 130 students from different majors are taking Portuguese courses. These majors comprise Teaching Chinese as a Second Language (Undergraduates and Masters Degrees), International Intercultural Communication and English Majors (Masters Degree). Some of these students are selected to do an intensive training at the Han Ban in Beijing, and then sent to Brazil. Portuguese courses have existed in the University since 2009.

The presented above is in accordance with other aspects that Paulino and Pires (2011) believe to be fundamental to the Sino-Brazilian relations: the incentive to publishing works by Chinese authors in Portuguese, and to publish works by Brazilian and lusophone authors in Mandarin, both classic and contemporary. Valuing the common cultural heritage (especially the role of Macau) and encouraging the exchange between research institutions and universities from Brazil and China, with development of joint investigations in fields of common interest (such as new technologies, renewable energies, public health, among others, as presented by Paulino and Pires, 2011) are ways to increase and stimulate the exchange between the two countries.

4 The Hubei-São Paulo Cooperation and the Results

There has been an increasing demand for Chinese learning in Brazil due to China's growing importance for Brazilian economy. In terms of bilateral trade volume, China surpassed the USA in 2009 and became Brazil's largest trading partner. Brazil's exports to China reached 44 billion US dollars, and imports, 32.7 billion in 2011 (Gama; Cajueiro, 2012). Moreover, the Confucius Institute's mission in São Paulo is to spread Chinese language and culture, both in and outside the UNESP. This is true provided that UNESP has a tradition in community action. To meet these objectives, regular Chinese language courses in 15 cities in São Paulo state are provided, in addition to cultural activities – such as exhibits, Chinese film festivals, and workshops on art, cuisine, traditional medicine, among other topics. For the development of these activities many partnerships are established between public and private

entities. There are three basic motivations for the development of this project, equally perceived as important by the two countries involved:

(1) Apart from being a developing economy, China has over 5,000 years of history and culture, which triggers Brazilian people's interest;

(2) Since 2001 the well-known term BRICs has been part of the agenda of many organizations. Both Brazil and China are members of the BRICs, therefore intensifying the relationship, exchange and cooperation in all areas;

(3) Both universities (UNESP and Hubei University) value international exchange and cooperation, which could benefit teachers and students from both sides.

In addition, from China's part, one should not forget the strong soft power motivation for the cooperation, and a somewhat declared propaganda strategy. Since the beginning of its operations, the Confucius Institute in São Paulo has had a substantial increase in the number of participants. When it comes to sending Chinese teachers to Brazil, these are divided in two categories: the Volunteers (recruited among Hubei University's students) and the Professors (recruited among Hubei University's teachers). Here below are figures of personnel from Hubei University sent to Brazil:

Table 1 Chinese Personnel from Hubei University sent to Brazil (2009-2013)
Chinese Personnel from Hubei University sent to Brazil (2009-2013)

Year	Volunteers	Professors	Total
2009		2	2
2010	3		3
2011	8	1	9
2012	13		13
2013	4		4
Total	28	3	31

The volunteers would normally stay a year. Nevertheless, especially in the recent years, more of them have agreed to stay two years or more in Brazil. Their being called "volunteers" does not imply lack of remuneration for their work, but that their work has more of an "internship" characteristic, as they are students.

As for sending Brazilian students to China, they are basically of two categories: the students who come for the short summer course (June and July) and the ones who come for the one-year scholarship. More recently, there are six-month scholarships, too. Since 2010 the evolution can be seen:

Table 2 Brazilian Students from Confucius Institute at UNESP sent to China (2010-2013)

Year	Summer Course	Scholarship		Total
		Chinese Language	Masters in Teaching Chinese as a Second Language	
2010	35	8	1	44
2011	34	12		46
2012	23	29	1	53
2013	18	42	1	61
Total	110	91	3	204

Figure 1 Brazilian Students from Confucius Institute at UNESP sent to China, 2010-2013

As for the Center for Brazilian Studies at Hubei University, future plans include: setting up database of Brazilian books, journals and other documents; inviting Brazilian officials and scholars to give lectures and present conferences; and implementing a “Week of Brazilian Culture” every semester or every year, through lectures and shows on Brazilian film, food, dance, etc. – in order to let more and more Chinese people know Brazil.

As previously said, a significant accomplishment of Confucius Institute in São Paulo was their winning of the Confucius Institute Prize on December 16, 2012 in Beijing. The prize aims to choose the best Confucius Institute in the world. The Institute in São Paulo had already won the same prize in 2010. To win this prize the Institute has to compete with over 400 institutions in more than 100 countries. In order to select the winner, the Han Ban distributes a lot of formularies for the branches to fill out, besides demanding them to write reports about number of students (sent to China and received in Brazil), cultural activities, professional management, training of teachers, etc. What the Han Ban pays attention to: they check what the branches have done, always checking their spreading and improvements, and assessing the Chinese teaching and the efforts. More classrooms (capacity) give more points to the Institute. More campuses too. What put UNESP in a good position was their hosting of the Latin American Conference of Confucius Institutes, the increase in the number of students enrolled and the cultural activities (shows and stage performances). The Chinese partner (Hubei University) was also evaluated: for example, in the summer course and scholarships. They also assess how much Hubei University supports the initiative in terms of sending teachers, receiving students; how much UNESP supports; the Government too. How much a personnel is supported is evaluated in both cases, and even if there are any local teachers (Brazilian teachers of Chinese). Also about staff, a characteristic that makes a difference is that the Confucius Institute in São Paulo can count on staff provided by UNESP, which is hard to find. Publications and press release matter, too. For example, the UNESP publishing house works on translations of important Chinese works into Portuguese, such as the Confucius’ *Analects* and Yu Xuanji’s poems (Yu, 2011). Performances are meaningful, and the Confucius Institute has even taken part in a samba school carnival parade. And very importantly, a good relationship with the Han Ban matters a lot, as well as a smooth cooperation UNESP-Hubei University.

The Confucius Institute in São Paulo has also developed partnership projects with public and private organizations: the Confucius Classroom Program. Besides being partners with private universities in São Paulo, in the end of 2012 they started an important cooperation with the São Paulo State Secretary for Education in order to offer Chinese language courses. More than 300 students from public schools have been reached by the initiative in four cities in São Paulo state, namely Araraquara, Franca, São José dos Campos and São Paulo. The agreement is expected to be expanded to more language centers throughout São Paulo state. The public schools’ students ages range between 12 and 17, and all they have to pay for is the textbook.

5 Conclusions

Since 2004 the Confucius Institutes have been spread around the world as a political soft power initiative by the Chinese Government, not only to advertise Chinese culture and language, but also to offer the Chinese vision on facts, and gain political space, in an effort to improve the image of China, as part of a persuasive strategy. As one of the most ancient cultures of the world, Chinese culture has great appeal among scholars and the general public. Pragmatism, on the other hand, is also what makes so many countries embrace the initiative, once the world is doing business with China. When it comes to the BRIC agenda, Brazil can have a special relationship with China. Unlike Russia and India, Brazil does not have historical problems with China concerning borders or political disputes. Brazil and China do not have to make up for past situations in their relationship building.

The Confucius Institute at UNESP results from the action involving the Han Ban, UNESP and Hubei University, and the support of each of the three partners is very significant. The Han Ban is the headquarters, the matrix from which everything stems, including the conception, methodology, training of professionals – and not less importantly, funding. Hubei University is the Chinese partner university, providing training, recruiting, and education in teaching Chinese as a second language. Also, the Chinese director of the Institute. In Brazil, UNESP provides the venues, resources, advertisement, community action and the Brazilian director. As in every branch of Confucius Institute around the world, a Chinese director and a local director work in cooperation, in a local host university.

Open in 2009, the Confucius Institute in São Paulo is still new in its operations, but has grown fast, soon reaching the capacity of one thousand students. As previously said, there are many factors that

arouse people's interest in Chinese language and culture, ranging from business opportunities to cultural heritage. Of course there are challenges, though. In Brazil Chinese language still has the reputation of being too difficult, what puts many people off. If English is seen as difficult to achieve, let alone Chinese. However, more and more people are breaking the initial barrier, and perhaps a strategy to make Chinese language/ culture more present in the Brazilians' daily life would make the latter more familiar with the language, hence more capable of learning it. São Paulo's having a Chinese community would help in the process.

The interaction between such different cultures is complex and such a theme obviously deserves a deep discussion. Here "comparing cultures" does not mean attributing positive or negative values to any of them. The same way having more similarities does not mean that the relations are better. A better relationship will rather come from the comprehension of the difference. Each country has its own cultural particularities: a mixture of attitudes, values, and social expectations. One important aspect of Sino-Brazilian relations is the complementarity issue. In her visit to China in 2011, the Brazilian President Dilma Rousseff stressed the importance of this aspect for the promotion of pacific development, highlighting a shared gain. For Stearns (2007), world history is more and more seen and understood in terms of shared processes and contacts. For this author, in general the contact between two or more different societies is seen as complex and potentially fruitful – making way to possibilities of both imitation and innovation – although not tension free. Few are the societies that rapidly or totally convert to another's standards, even when there are intense contacts and an actual conquest. Also for Stearns (2007), more often than not what happens is a set of compromises called syncretism, in which local beliefs and the ideas brought by the new contact mix, even when the fusion unites apparently incompatible elements. As the contacts happen and the exchanges advance, they are more and more intertwined with cultural systems. In the case of Sino-Brazilian relation, it is interesting to remark the Buddhist presence in the surroundings of São Paulo city, where the Zulai Temple is located. Also, it is important to observe the interaction of commemorative dates in the calendars. Chinese New Year, for example, is now celebrated in São Paulo according to the lunar calendar – and at present many of the celebrations are thanks to the Confucius Institute there. In Wuhan, in turn, in 2013 there was the I Week of Brazilian Culture, with presentations of films, live dance performances, typical foods, and academic lectures introducing the formation of Brazilian people and their habits. Although it was a still small initiative, it plants the seed of curiosity, and contributes for mutual understanding.

The contact can also operate small changes. For example, among Brazilians, hugging and backslapping (and even kissing in specific situations) are common greetings if people are close. Also, this would be an acceptable behavior if people are business partners for a long time. They would never be acceptable in the Chinese situation, though. Nevertheless, with the increasing exchange between Chinese and Brazilian students, it is noticeable that slowly the Chinese counterparts start adopting the Brazilian behavior, and after having this contact, every time they meet a different Brazilian person, they already know that this behavior is not disrespectful; therefore they sometimes incorporate the new approach. Although the results are still unknown, it is interesting to point out the affective interactions. For example, the new (Brazilian-Chinese) mixed couples that have been formed over the last years, both in Brazil and China, as a result of the Sino-Brazilian academic and cultural cooperation are remarkable.

Even with cultural globalization, Brazil and China still do not know about each other, and the two countries are overall restricted to football, samba and coffee when it comes to Brazil; and martial arts, acupuncture, Shanghai and Beijing when it comes to China – just to mention some examples of how exotic and strange they are to each other. Both countries are a lot more than this. Although the access to information is increasing, not all assimilate it the same way. With the expansion of migrations, exchanges, cultural movements, business and academic cooperations, distances that go beyond geography are shortened. At last, Stearns (2007) highlights that the contact of different societies are an unparalleled opportunity to understand their cultures, practices and developments. The complex impact of cultural contacts may result in a fertile context and mutual knowledge. What happens in the long run when two distinct cultures such as Brazilian and Chinese interconnect systematically?

Confucius Institute has taken action to minimize the problem of lack of mutual knowledge by offering scholarships to Brazilian students in China and by promoting cultural performances, art exhibits, translation of classics of Chinese literature, lectures, and Chinese film festivals, in addition to the regular language courses in Brazil. When it comes to translation of Chinese works into Portuguese, however, the pace is still slow for there are relatively few professionals up to the task (the same must happen the other way round, as few Brazilian titles are found in China). The Brazilian Ministry of Foreign Affairs (Itamaraty), through Brazilian diplomatic representations (Embassy and Consulates) around China have

made the translation of Brazilian classics available to Chinese audiences, such as in the case of works by Mário Quintana. With the support of the Consulate of Brazil in Hong Kong and Macau in 2012 the University of Macau published *The Man Who Knew How to Speak Javanese* by Lima Barreto (2012).

Anyway, there is still a lot to do. In China, the Center of Brazilian Studies at Hubei University not only will develop research, but will organize Brazilian film festivals and performances. But all in all, everything is still new and may take time to realize bigger events. Although still in its initial phase, the process is on the right path. The potential of Brazil-China cooperation is great, for many reasons herein listed. Now it is just a matter of enlarging initiatives and making them even faster. In this process, the Confucius Institute in São Paulo plays a key bridging role.

Study on Influencing Factors on the Sense of Belonging to the City of the Migrant Workers' Children in Wuhan of China

Li Fang, Wang Kangjing

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 274517549@qq.com, 948587836@qq.com)

Abstract: Through field interviews and a questionnaire, this paper investigates the sense of belonging to the city of the children of migrant workers in Wuhan, via using the methods of the exploratory factor analysis and descriptive statistical analysis of the final results of the investigation. The finding shows that the influencing factors of the sense of belonging to the city are interpersonal skills and adaptability, role consciousness, self-awareness and self-expression, the degree of acceptance in Wuhan, and external awareness. This paper proposes solutions from these five aspects in order to improve the sense of belonging to Wuhan of the children of migrant workers and to help them grow up healthily.

Key words: Children of migrant workers; Sense of belonging to the city; Influencing factors; Factor analysis

1 Introduction

With the advancement of technology, China's comprehensive national strength has constantly increased, let alone, the progress of industrialization and urbanization has been carried forward. To solve the issues concerning agriculture, countryside and farmers, increase farmers' income to improve their living standards and narrow the gap between the rich and the poor, the labor industry has been developed rapidly across the country and the majority of farmers have flocked to the city to make ends meet, so the immigrant population is becoming increasingly large. Thousands of migrant workers rush around every corner of the city like the migratory birds. Since the late 1990s, the proportion of family migration has increased in population movements, gradually emerging out the trend to become a "family". A large number of school-age children came into the city with their parents and the number increased dramatically, which comes into being a large quantity of substantial problems directly related to their children, especially the increasingly prominent problem of their education. The twentieth chapter of the Twelfth Five-Year Plan for China's national economic and social development has mentioned that the full-time public schools should be the major channel to accept the children of migrant workers to ensure that they can have the equal access to compulsory education and do a good job on the convergence between senior and high school education, which signifies the country's attention on the issue about the education of the children of migrant workers.

Currently, there are as many as 14.46 million children of migrant workers studying at school in Wuhan. They have become a special group in the society. They come to a strange place, experience a lot of psychological problems in the process of integration in the city and bear the pressure of life, academic frustration and unfair treatment in their little hearts. Always staying among the state of self-abasement, stress, confusion and puzzle, their psychological behaviors have gone through various degrees of defects and deviations, so that they are also vulnerable groups in the schools and classes. In the just-concluded sample survey on the current situation of China's children of migrant workers, the result displays that nearly a quarter of migrant children show self-abasement because of being discriminated against, thinking that people in the city look down on them. Some of them have had the psychological problems such as self-abasement, timidity, sensitivity, solitary, depression and hostility. Because they lack of psychological preparation for integration into the urban environment and have no sense of belonging to the city, making it difficult to blend into the life in the city, however, the future development of them is directly related to the future development of the city.

Migrant workers and their children, who are surviving in the cracks under the social exclusion in the city, are the city's vulnerable groups. Under the recent mainstream slogan of building a harmonious society, full attention should be given to this problem. However, children of migrant workers are not only the object for us to simply impose sympathy on, but also the object that needs to be paid attention on by the whole society. How to solve this problem of migrant children's integration into the city depends on the innovation and improvement of the entire social system and the demolition of the urban barriers, and also relies on that people fundamentally attach importance to the right to education for migrant children, and on the care of the community. Furthermore, raising the people's cultural quality,

narrowing the cultural gap between the urban and the rural, the tolerance and understanding given by the urban community will help migrant children integrate into urban society, in order to achieve the goal of socialization as well as to promote social harmonious development.

2 Related Researches

2.1 Definitions of Migrant Workers

This research is targeted at the children of migrant workers. Migrant workers are those who are still the rural registered residence and come to the city to engage in various “freelance” as their main sources of income^[1]. There are narrow and general conceptions of migrant workers. Generalized migrant workers includes two parts: one part is the rural labor force that is employed in the local township enterprises but not leaves their hometown, the other part is the rural labor that goes out of the town working on the second or third industry. In the narrow sense, migrant workers mainly refer to the latter part of the people. The migrant workers referred to in this paper are those in the narrow sense. The research object --- children of migrant workers refer to the children who study in the city coming with their parents or other guardians.

2.2 The Concept of the Sense of Belonging

American psychologist Maslow believes that the sense of belonging is at the third level of psychological needs after the physiological needs and the security needs, which is a more stable psychological characteristic at a higher level. “Sense of belonging” pertains to the psychological aspect of social culture, which is an internal subjective sense generated by the effect of the external environment on humans. And the results of the effect have far more influence on people’s behaviors in the environment.

The sense of belonging generally divided into a sense of community belonging, regional belonging, and organizational commitment.

The subjects of this article are the children of migrant workers living in Wuhan, their sense of belonging to Wuhan is area belonging, thus borrowing a concept that “areas inhabited by members of the community and their respective cultural group identity, love and attachment”^[2].

2.3 The Research of Influencing Factors of the City Sense of Belonging

For the children of migrant workers in cities belonging factors issues, some literatures analyze the influencing factors of sense of belonging to urban children of migrant workers on a system perspective. Furthermore, the restrictions on the household registration system, the exclusion of the education system, lack of government public service systems, lagging behind in urban management systems and tools, and so on, are a major obstacle for the children of migrant workers in urban society. Therefore the government should reform the system and create a more equitable institutional and cultural environment^[3] for the migrant workers and their children. But the authors only described from the social level, their related policies services and the security aspects, a sense of belonging.

The author takes into account that the change in the system is not an overnight thing, but it is imperative to ensure the healthy growth of children of migrant workers. The senses of belonging, which are a subjective consciousness and feelings, are more closely related to their own small environment. Thus this article studies the sense of belonging from the perspective of individual cognitive children of migrant workers.

3 Research Instruments and Sampling Conditions

3.1 Questionnaire Design

The questionnaire refers to " Questionnaire of the Sense of belonging of Middle-school student ", which consists of two parts, the first part is the basic information, including migrant children’s gender, grade, age, parents’ occupation and Educational background, guardians, residence time and moving frequency in Wuhan; there are 20 questions in the second part and we use the Likers’ 5-point scale. This study ultimately gets fourteen entries and five factors, of which explained variance reaches 53.023%, the sum of five factors’ Cronbach alpha is 0.696, and the reliability is within an acceptable range.

The structure of the questionnaire was shown in Figure1, and the result is shown in Table 1.

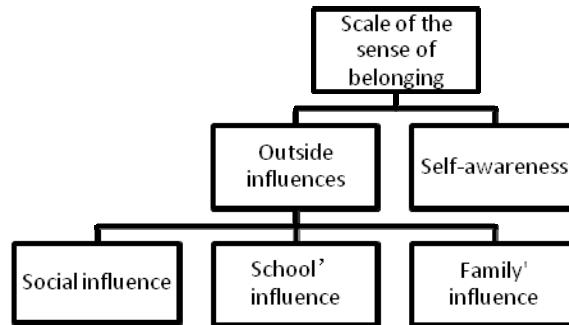

Figure 1 Questionnaire' Structure

Table 1 Factor Analysis

Project	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5
Happy extracurricular life	0.733				
Like the new environment quickly	0.657				
Often get recognition	0.504				
Felt social care	0.445				
Like to play with the children	0.430				
I relate to Wuhan development		0.788			
I'm a part of Wuhan City		0.735			
Like to be offered voluntary services		0.566			
be willing to raise my hands to speak			0.687		
Effort can make things better			0.561		
Like home now			0.558		
Like Wuhan City				0.783	
Comfortable living in Wuhan				0.761	
The people around me do not understand my own ideas					0.871
explained variance (53.023%)	12.984%	11.610%	10.638%	10.085%	7.706%

According to the structure of the scale shown in Table 3-1, we will name factor one as interpersonal skills and adaptability; factor two as role consciousness, factor 3 as self-awareness and self-expression, factor 4 as the degree of acceptance to Wuhan, factor 5 as external awareness.

3.2 Sample Profile

250 Questionnaires were sent to students, 217 copies of them were returned and 177 were valid. The survey was conducted in Wuhan Ling-Zhi Primary school and its Branch school, and the investigation object is the students in third grade to sixth grade. There are 94 boys, who make up 53.11% of the total number of students, and 83 girls, which accounts for 46.89% of the total number of students. There are 30 copies of the third grade, 63 copies of the fourth grade, 44 copies of the fifth grade and 40 copies of the sixth grade. The average age was 9.98 years old, and the mean residence time is 4.67 years.

4 Statistical Analysis of the Results

4.1 Impact of Demographic Variables

We will carry on the descriptive statistical analysis of the five factors and their possible influencing factors - gender, grade, age, parents' occupation and educational background, guardians, residence time and moving frequency in Wuhan. In order to show the scores of each factor clearly, we will converse factor scores into the value between 1 and 100, which means that the lower the value is, the weaker the sense of belonging to Wuhan is, on the contrary, the greater the value is, the stronger the sense of belonging to Wuhan is. The conversion formula: converted factor score = (factor score + N) * M, where: M = 99 / (maximum of factor score - minimum of factor scores), N = (1 / M) - minimum of factor score. The conversion does not change the nature of factor scores.

First, we use the statistical analysis of various factors as well as the gender, the study discovered that the female students' average score of factor one, factor two, factor five are higher than the male students' average score, which indicates that the female students' interpersonal skills and adaptability, role consciousness as well as external awareness are stronger than the male students. Meanwhile male students' average score at factor three and factor four are slightly higher (lower than 2 points) than the female students, explaining that the male students' self-awareness and self-expression, as well as an admission degree in Wuhan are slightly strong in the female students'.

Then we utilize the statistical analysis of various factors as well as the grade, the study found that the third year students get the highest average scores points in all factors except factor five, which may explain the low grade student' sense of belonging is stronger to a certain extent. The study also discovered the sixth year students get the lowest average scores points in all factors except factor two, which may explain the higher the grade is, the weaker the sense of belonging is, but its explaining degree is lower than the former. Then we carried on the statistics to analyze of students' age of each grade, the sixth grade students' average age is 11.410 years old and the 5th grade students' average age is 10.25 years old, the 4th grade students' average age is 9.404 years old, the third grade students' average age is 8.609 years old after rejecting 17 invalid values, which may draw a safely conclusion that the younger students are, the stronger the sense of belonging is.

At last, we are going to do a statistical analysis of the parents' vocational education, residence, moving, and dependents. At first, scores were divided into five levels through the processing of levels, which is less than or equal to 100 and more than 80 for the first level, less than or equal to 80 and greater than 60 for the second stage, less than or equal to 60 than 40 for the third grade, less than or equal to 40 and greater than 20 for the fourth grade, is less than or equal to 20 and greater than or equal to 1 for the fifth grade. The higher the level is, the corresponding the stronger is, also the sense of belonging the stronger is. According to the statistics, we found that parental education and occupation and dependents have no direct influence on the five factors' scores, as well as the significance of its regression analysis was not obvious. However, according to the statistics, we found that factor 1 and residence have a certain relationship, the longer the average residence of students, the higher score the factor I got, which means with the increase of years of children of migrant workers in Wuhan, their ability of communication, adaptation get stronger. There are no obvious relationship between factor 2 and other possible influence factors. Factor 3 has a more significant relationship with the time of moves, we found that the grade which is at the lowest level of the average number of moves (1.818) get the highest average score (86.386) in factor 3, while the grade which is at the highest level of the average number of moves (3.286) get the lowest score (9.263), which indicated that the times of moving has affected to the ability of self-expression and self-cognitive to the children of migrant workers. Factor 4 also has a certain relationship with the time of moving, we found that the grade which get the lowest of the average score (28.5215) moves most frequently (3.5), indicating the degree of acceptance in Wuhan has a certain relationship with the moving times. Factor 5 has low explained variance which is meaningless to make statistical analysis on it.

5 Conclusions

After an exploratory factor analysis we got five efficiency factors which affected the sense of belonging of migrant workers' children, and then we came to four conclusions through the descriptive statistics analysis of factors and put forward some suggestions according to the problems.

1) In this study, girls have stronger ability to adapt to the life of Wuhan, but the boys accept the city more easily. Although girls have stronger communicative ability, they have difficulty in accepting the new thing quickly in their inner heart, while boys are more willing to accept new things, who can quickly adapt to the urban life. So, we suggested that schools should carry out some psycho-educational activities, so that more girls can accept the city from the heart.

2) Low-grade students have a stronger sense of belonging. We hold the view that psychological gap is smaller to younger students, so the younger students can more easily generate a sense of belonging for Wuhan. On the other hand, younger students spending less time in their hometown, which make it easier for them to accept life of Wuhan quickly. In this regard, we propose that the school should combine the high grade students' future with the future of Wuhan well when they carry out educational activities, in order to arouse the awareness of the higher grade students that Wuhan City needs them just like their own growth is Inseparable with Wuhan City.

3) Self-awareness and self-expression are positively correlated with moving frequency. For one thing, the unstable life makes children feel negative and uneasy; for another, the changing of the learning environment lead to the poor learning foundations, causing the tired of study and the inferiority complex. We learned that the main reason why the migrant workers move frequently is that they don't have a steady work and a permanent house. At this point, we advise parents to try not to move frequently, giving our children a stable living and learning environment; the migrant workers are the main workforce in urban construction, in order to give migrant workers and their children a stable living environment, measures should be taken by government, for instance, to build a number of simple housing with safety standards and rent to them at a low price, then the housing pressure as well as the moving frequency will be reduced.

This study found five exploratory factors: interpersonal skills and adaptability, role consciousness, self-awareness and self-expression, the degree of acceptance in Wuhan, external awareness, which plays a substantial role on the sense of belonging of children of migrant workers. At the same time, we also found that students in low grades have the stronger sense of belonging, and the long residence time and less moving frequency will contribute to children building stronger adaptability and self-cognitive ability. The community and parents should give our children more care and help them improve the sense of belonging to Wuhan; children should also adapt themselves to the city to have a better learning experience. Enhancing the sense of belonging of children of migrant workers not only makes the children grow up healthily, so that they can be better educated; but also reduces the mental health problems of migrant workers about their children, stabilizing the mentality of migrant workers so as to build a more harmonious city life.

Limited to the conditions, this study investigated only two schools which just receive the children of migrant workers, so we cannot make the comparative study between the city children and the children of migrant workers, on which we can make further study.

Abstract: In order to make the analysis of e-commerce performance system in Chinese enterprises, factor analysis is used in this paper. By pre-test and pilot test, data collection, single-dimension scale test, reliability test and validity Test, factor analysis can effectively conduct empirical research on e-commerce performance system in Chinese enterprises. For illustration, the collected copies are 300, and the effective rate of collection is 100%, which has satisfied the requirement that the questionnaire returns-ratio is not lower than 20% in the data investigation. The empirical results show that there is the stronger correlation between marketing management and marketing channels and marketing strategy can more effectively promote the growth of marketing performance. But in the expansion process of Chinese enterprises' e-commerce marketing channels, e-business models have still not significantly effectively enhance the market visibility of enterprise-related products, which shows that e-commerce strategy for Chinese enterprises have not entered a highly sophisticated stage.

Key words: Electronic commerce; Network technology; Chinese enterprises; Factor analysis

1 Introduction

Since the mid-1990s, e-commerce wave has caused the attention throughout the world, and e-commerce has increasingly apparent impact on all sectors of national economy. The shock waves of e-commerce involve in numerous fields from developed countries to developing countries, from OECD to governments and from enterprises to consumers.

E-commerce is the means to achieve business goals via electronic technology, including information exchange, electronic money transfer, online information access, network access server technology and design, information classification services, information directory access, online shopping and interactive technologies between TV and network ^[1]. E-commerce can improve the interaction between business and the external environment and internal process automation, which offers convenience for companies to quickly accept the new technology and provide the virtual environment of product exchange, knowledge exchange, and user communications for technical innovation.

2 Enterprise E-Business Performance System Design

The premise of developing e-commerce between enterprises is to greatly improve the level of corporate information, comprehensively update operation mode of enterprises, and conduct a gradual development of electronic commerce ^[2]. At present, the major constrained elements in relation to the development of enterprise e-business are followed. Firstly, the level of awareness of e-commerce is not enough. Many buyers are confused with e-commerce shopping, TV shopping, mail-order shopping so that e-commerce is only seen as tools of inquiring on Internet and tools of understanding market conditions rather than real shopping behavior ^[3]. Secondly, overall quality of logistics services is poor. Thirdly, the security concerning online transactions and online payment is poor. These measures cannot solve the security problems of online transactions ^[4]. Fourthly, Internet service system is not sound. Currently there is no a unified international standards and rules to ensure the smooth implementation of e-commerce ^[5].

Based on the above analysis, the design of Chinese e-commerce performance systems are shown in Table 1.

* This work was supported by NSF (No.70773001) and Bid Project "Xinjiang SME Internal Control Issues". The project was from Humanities and Social Sciences Key Research Base in Xinjiang Normal University-Enterprise Development Research Center of Xinjiang.

Table 1 Chinese E-Commerce Performance System

Elements name	Indicator name	Indicator significance
Marketing management 1	Transaction risk control X1	There is a strong risk control to e-commerce activity risks.
	CRM management X2	Enterprises pay emphasis on the collection, screening and use of customer information and customer data.
	Marketing network management X3	Enterprises conduct the effective maintenance of e-commerce network marketing channels.
	Marketing account management X4	Enterprises conduct information management towards marketing accounts.
	Marketing regional expansion X5	E-commerce models enable enterprises to effectively expand sales area.
Marketing channels 2	Expansion of marketing products X6	E-business models make more and more products implement on-line business.
	Post-sale service quality promotion X7	E-commerce models improve the post-sale service quality in enterprises.
	Promotion quality of marketing X8	E-business models effectively enhance the market visibility of enterprise-related products.
Marketing performance 3	E-marketing ratio X9	Online product sales accounts for the ratio of sales volume of enterprise total products.
	Marketing growth X10	E-business models promote growth of overall sales in enterprises.
	Marketing cost savings X11	E-commerce models effectively reduce the cost of traditional marketing in enterprises.
	Customer satisfaction X12	E-commerce models effectively improve enterprises' customer satisfaction.
	Construction of dynamic alliance X13	Enterprises can form a dynamic and mutually beneficial business alliance online with the related enterprises.
Marketing strategy 4	Marketing skills to absorb X14	Enterprises can attract online business skills from the corresponding enterprises.
	Virtual strategy implementation X15	Enterprises can effectively utilize various market resources to form a virtual enterprise.
	Network technology development X16	Enterprises can continuously make the maintenance, development and upgrading of information technology.

3 Model Checking

3.1 Pre-test and pilot test

Based on the above analysis, authors found that the distribution of Cronbach's α value of the variables was between 0.7226 and 0.8395. According to Hau Kit-Tai's proposal, the questionnaire reliability can be accepted as long as Cronbach's α value was greater than 0.7. Therefore, authors believed that the questionnaire used in this study had the sufficient reliability^[6].

3.2 Data collection

The paper accepted seven-scale system to make the industry-related data collection. Samples were distributed in Beijing, Shanghai, Tianjin, Chongqing, Shaanxi, Sichuan, Yunnan, Jiangsu, Shandong, Zhejiang and other 10 provinces, which basically represented general characteristics in the area of Chinese enterprises. The total of 300 valid samples were obtained, the effective questionnaire returns-ratio was 100%, which had satisfied the requirement that the questionnaire returns-ratio was not lower than 20% in the data investigation.

3.3 Single-dimension scale test

The results showed that KMO value was between 0.718 and 0.820, and there were a large number of significant correlations in coefficient matrix. In this paper, 160 randomly selected sample data were selected from the total samples to conduct the exploratory factor analysis, and factor analysis results were shown in the following Table 2.

Table 2 Exploratory Factor Analysis

Second level index	Factor 1	Factor 2	Factor 3	Factor 4
Transaction risk control X1	.674	.119	.185	.431
CRM management X2	.709	7.60E-02	.243	.275
Marketing network management X3	.690	.187	.178	.354

Marketing account management X4	.540	.217	5.23E-3	5.08E-2
Marketing regional expansion X5	2.192E-02	.810	.329	.316
Expansion of marketing products X6	.222	.603	.169	.187
Post-sale service quality X7	.412	.588	.378	.196
Promotion quality of marketing X8	2.955E-03	.695	.192	2.12E-2
E-marketing ratio X9	.480	.115	.720	.421
Marketing growth X10	.289	.204	.717	.153
Marketing cost savings X11	.312	.198	.543	.289
Customer Satisfaction X12	.423	2.121E-3	.809	.327
Construction of Dynamic Alliance X13	3.454E-02	.436	7.19E-2	.596
Marketing skills to absorb X14	.313	.278	.405	.757
Virtual Strategy Implementation X15	.290	6.587E-3	.378	.58
Network Technology Development X16	.109	.356	.367	.612
Cronbach's α	.7318	.7255	.7376	.8169
Cumulative variance (%)	23.123	37.978	68.568	87.192

The results showed that the validity of the sample structure was strong, and each indicator in the corresponding factor loadings was greater than 0.5 on the critical value.

3.4 Reliability test

The reliability method was commonly used through α coefficient that was created by LJCronbach, and α coefficient ranged from 0 to 1. It can be seen from above table that the minimum value of Cronbach's α was 0.7255 and the sample reliability was higher.

3.5 Validity test

Validity referred to measure the effectiveness or accuracy of the questionnaire results. Validation method was commonly used confirmatory factor analysis. This paper used SPSS11.5 and LISREL8.7 confirmatory factor analysis (fixed variance), factor loading parameter list was shown in Table 3.

Table 3 Factor Loading Parameter List

Factor name	X1	X2	X3	X4	X5	X6	X7	X8
Factor loading	.29	.24	.23	.21	.27	.74	.37	.12
SE	.11	.08	.07	.08	.08	.09	.12	.07
t	2.6	3.0	3.3	2.6	3.4	8.2	3.1	1.5
Factor name	X9	X10	X11	X12	X13	X14	X15	X16
Factor loading	.33	.26	.79	.27	.24	.23	.23	.21
SE	.11	.11	.13	.09	.11	.09	.11	.08
t	3.1	2.3	6.0	3.0	2.3	2.5	2.1	2.7

The fit index list was shown in Table 4.

Table 4 Fit Index List

Fit index	df	CHI-Square	RMSEA	NNFI	CFI
Present Value Index (PVI)	159	233	0.049	0.921	0.945
Optimum value tendency	—	Smaller is better	<0.08	>0.9	>0.9

4 Conclusions

According to the fit index list, the model-related fit effect is well [7]. Therefore, business e-commerce system has strong practical performance and reliability in Chinese enterprises, which can provide a strong theoretical reference for e-commerce strategies for Chinese enterprises.

According to the factor covariance matrix, there is the stronger correlation between marketing management and marketing channels, which indicates that the basic management of e-commerce can effectively promote the development of marketing channels. Meanwhile, there is the stronger correlation between the marketing performance and marketing strategy. Therefore, compared to marketing

management and marketing channels, marketing strategy can more effectively promote the growth of marketing performance.

According to the factor loading parameter list, factor loadings of index X6 and X11 are high, and has certain significance. Therefore, in the process of building Chinese business e-commerce, the implementation of online marketing products can be continuously expanded, and more and more products can be sold online, in which the major measures to improve the efficiency of e-commerce is marketing channels currently. At the same time, e-commerce marketing performance reflects in savings on traditional marketing cost to a large extent, which is a routine phenomenon reflected in enterprises' marketing activities at the mature stage of the implementation of e-commerce.

According to the factor loading parameter list, factor loadings of index X8 lacks significance. Therefore, in the expansion process of Chinese enterprises' e-commerce marketing channels, e-business models have still not significantly effectively enhance the market visibility of enterprise-related products, which shows that e-commerce strategy for Chinese enterprises have not entered a highly sophisticated stage.

The Global Company, Inequality and Employment

Mozart Nino

Program of Post-graduate Studies in Social Sciences ^[1]
Pontificia Universidade Católica–São Paulo, Brasil
(E-mail: mozart.nino@gmail.com)

Abstract: Extremes of socioeconomic inequality demand the need for work, jobs, employment and the resulting income all across the planet more than anything else. This article attempts to explore the contribution of what part of this task, companies and namely the large global companies do.

Key words: Companies; Employment; Inequality; Market; State; Sustainable development

1 Introduction

The debate on sustainable development in its economic, environmental and social dimensions, through the media, the *academia*, the organizations and social networks, have led companies and notably the great global company – including in Brazil, to regularly develop the so-called sustainable actions and almost always disclose and/or obtain media coverage of these initiatives, where they seek to present themselves to society - market and constituted powers, as responsible and committed institutions both to the environment and to the socioeconomic human progress.

This article aims to show what has been the contribution of these companies by evaluating the level and evolution of their direct jobs in the global market, taken from a doctoral research project in progress, whose theme is the capital and the social dimension of sustainable development and the focus is its role, responsibility and commitment to the reduction of socioeconomic inequality, poverty and misery on the planet, under orientation of Prof. Dr. Miguel Chaia, PhD ^[2].

2 Crisis and Society

The world socioeconomic crisis in the years 1970 ^[3] had as precedents high inflation, swollen States, stagnation, low productivity and high level of state interventionism. The reaction via liberal public policies – still interventionist, but to a lesser extent – announced by some nation States, causes the collapse of the system that was based on a set of job control practices, technologies, consumer habits and economic and political power settings; triggers a process of change, uncertainty and instability in capitalism, with production and flexible jobs, geographic mobility, changes in practices of consumption.

Taken to extremes in the years 1990 and 2000, such policies bring as result, a global financial crisis at start, which evolves into another extremely serious socioeconomic crisis, once financial markets have liberalized to a point of being unstable, generating low growth, recession and unemployment.

The ever finding of a persistent poverty, world widely scattered amid high and growing concentration of wealth, the growth of inequality and its reappearance in developed societies highlight the socioeconomic issue and has made arise ever since movements of humanitarian and assistance character by direct help from NGOs / CSOPs ^[4] to populations in precarious and difficult conditions both also by wars and natural disasters as well as the absence, indifference and very little successful integrated action between States and markets, governments and companies.

The change in the political model of the welfare State – its retreat from its presumed social function on one side, and the innovations brought by the information and communication technologies on the other, increase the problem and the visibility of backwardness and socioeconomic inequalities.

However, reducing inequality and poverty and even eradicate misery, requires substantial change in the lives of its protagonists. The imperative is that all should not be just passive agents of assistance and paternalism, but subjects who seek projects that require initiative, dedication, commitment and responsibility in the search for higher standards and quality of life. Necessary becomes that they directly participate in the development of income generating projects as remuneration for the work done and not just receive emergency resources, in order for them to make the entry by assistance programs already linked to a decent way out by a productive work generator of income.

This action is ethically and morally required. But to also be socioeconomically sustainable it needs to happen by the learning on how to use the resources of nature, transforming them, with capital and labor, in production and trade in a free market. As a result of this natural process instinctively created by human beings since very early and improved throughout history, come innovation, productivity and increase in the standard of living to all that of this process actively participate.

Due to the global scale of operations many companies already operate their own projects and a myriad of others along with humanitarian associations. With that they hope to be seen as institutions with social vision, acting beyond the economic dimension focused only on remuneration of investments.

The local and business elites are impacted in a particular form of consciousness and taken to act socially with moral and religious motivations as well as social legitimation.

However, in general they should not understand the exercise of good citizenship as a business imperative only and just only because it is assumed to be good for the company.

The liberal thought inherited from the Austrian School of Economics ^{[5] [6] [7]} rejects the welfare State as a paradigm of the process or the institutional system of social life, also because it is a generator of accommodation to benefits with no commitments nor responsibilities and, in addition, to discourage the innate motivations and capacity of human beings to learn, engage and take risks.

Actually what is proposed here is that this socioeconomic rescue could be much more successful if the participation of the capital, assumed here as imperative, happens integrated and complementary to both public authorities and independent social movements.

Although there are records of previous initiatives, it was only from the years 1960, with the advent of the administration by objectives and the rational management focused on efficiency in order to serve the economic and social progress ^[8] that companies began to define and develop policies, practices and objectives so-called social—both internal and external—and many of them accountable and disseminating at least part of those called social investments.

This growing interest of the company for a more relevant social role should and needs to be much more than the capitalist accumulation, its perpetuation and security to continue to generate value and obtain profits. Beyond the human being's behavior with regard to power and money, the crisis of the State, either hypertrophied, minimum or absent, and constituted public officials taking care over their own personal and family power projects, one should discuss the role of business in reducing inequality, in overcoming poverty and in meeting essential needs of human beings and society.

This 2008 and still ongoing socioeconomic and political crisis already made disappear millions of jobs in the formal market of developed economies. The resulting instability, we have seen, in addition to having already toppled Governments, has jeopardized even some democracies.

Even where there is unemployment insurance, discloses the international media, people have taken informal jobs with low pay, no social protection and with risks even for survival. More than 200 million people may fall into absolute poverty – in addition to the hundreds of millions already there.

A crisis of these proportions cannot be solved by the ideological dogma of the austerity cutbacks of expenses and investments. On the contrary, the elite world leaders should make the generation of jobs an absolute political priority, to at least sustain some more consumption by income growth and not just by people's indebtedness.

In addition, allow and/or facilitate debt restructuring – needs, interest and time limits – where applicable, and to improve the functionality of the credit system, make credit flow more for medium-sized, small and micro enterprises. Even more important would be the reduction of taxes and charges paid by entrepreneurs and employers on investments and wages, as a stimulus for companies to invest and to hire people.

Stimulate and preserve its internal market, Governments spending better and within limits of a tax burden that focuses and not only punish the productive investment generator of jobs, should be the basis of the plans of any nation organized as a market economy, open to research and knowledge transfer, with a necessary State, more agile, less bureaucratic and provider of quality public services.

In Brazil, although there are occasional adverse effects that may even expand, one has to highlight the performance of the Brazilian economy in the current crisis, at least so far, as a result of governmental action of developmental and social focus, generator of jobs, broad support to social programs and, in particular, the existing greater control and regulatory action of the local financial banking system market. Still not perfect, has served as an example and model to Governments and global institutions for monitoring, control and promotion of economies and markets.

But the lack of large-scale infrastructure investments, the complexity of legislation and high level tax rates on production, consumption, income, labor and payroll, Government spending, deficits and excessive waste, added to the inefficiency of the administrative engine at all levels, are the focus and essence of the vulnerabilities of the Brazilian economy. The industry, commerce and services sectors of the economy suffer severe competitive limitations imposed by the endless series of legal, bureaucratic, logistical, tax and fiscal barriers. Without structural changes, Brazil will continue to follow on the margins of the global economy, always fighting symptoms, not the causes of inefficiencies.

4 Inequality

*In my commonwealth... For no kind of traffic would I admit
Letters should not be known... No name of magistrate
Riches, poverty and use of service, none... No occupation... No sovereignty
All things in common... Nature should bring forth of its own kind... All foison, all abundance
Line of Gonzalo, honest councillor of Alonso, King of Naples
The tempest. William Shakespeare. 1611.*

Conceptually, inequality is expressed as social due to the many existing objective differences, particularly in the economic and legal fields, between members of a community or between groups of reference with which one is able to draw comparisons regarding cause of actions and reactions in order to eliminate these differences ^[9]. Actually and more specifically, the concept being used here is of socioeconomic inequality expressed from the differences in abilities, commitments and responsibilities of individuals, families, regional populations and also between markets and nation-States with generation, accumulation and distribution of wealth and income.

It is known that the above-mentioned councillor Gonzalo's paradisiac commonwealth - that in fact, none of the characters in the play takes seriously, even centuries before the time it was written nor today, can be considered as an example of a society with social organization, quality of life, well-being, innovation and development, since what could be the idealization of paradise is actually the description of a precarious way of life of populations and cultures of very primitive hunters – gatherers nomads.

In his research, Jared Diamond ^[10] shows that even today, there are people living out of nature by collecting plants and hunting. Nomads just like more than 10,000 years ago, they do not experience quality of life and social organization capacity even minimal under the so-called civilized standards, at least in Western terms, once they do not even dominate food production technology, with domestication of animals and primitive agriculture. As they all have to devote most of their time looking for food, they tend to develop more egalitarian societies, in a collectivist production model, in a tribal society and still no social classes, no bureaucrats, no hereditary chiefs and a minimum of political organization.

However, priests already act among them with the worship of deities, the help to reduce fears and grievances and also, to bring relief to suffering and evil ^[11].

In our contemporary times ^[12] there are successes and signs of hope for better well-being and quality of life, with infant mortality dropping, increased human life expectancy, the proportion of adults in the world who can read and write, as well as increases the proportion of children starting school. In addition, the world food production increases more rapidly than population growth.

However, the same processes that produced these gains also gave rise to trends as, in absolute numbers, there are more hungry people, who cannot read or write, who do not have safe drinking water, safe and comfortable houses nor energy for cooking and heating. The gap between rich and poor countries increases – does not diminish – and there are few prospects, taking into account the trends and present institutional arrangements, that this process reverts. Socioeconomic inequality varies between societies, historical periods, economic structures and systems (capitalism or socialism), wars and abilities of individuals to create value and wealth. But mankind has never managed to end the horror of war and famine, these being the biggest systemic failure of human society ^[13].

Dramatically true ever since and when written (1987) as it is today. Since always human beings have talent, innovation, technology, resources, power, politics, Government, bureaucracy and personal interests sometimes nothing but transparent. But also lack desire, commitment and responsibility.

By analyzing and trying to answer why some societies flourished more than others, Jared Diamond ^[14] identifies in food production – the beginnings of the agricultural revolution, with irrigation technologies, plant cultivation and domestication of animals – the formation of the first human groups and the origin of socioeconomic inequality.

Stocks of food release humans from the daily effort to ensure food. However, the complexity resulted from the need for planning, resource use and mainly with the stockpiling of food, raises the need for the organization of human groups in towns and cities later and also its protection and security.

From the existence of herds and the stockpiling of food and around that wealth, arise both craftsmen and scribes as well as a political elite to control, taxation, full-time political, administrative and safety activities. All of them free from the obligation to produce and ensure their own food. So then begins the development of settled societies, established, politically centered, socially stratified, economically complex and technically innovative ^[15], bringing to join religion, the need for governance, social management, regulation, control, bureaucracy, and the already cited protection and security.

From here also changes virtually every relationship of humans with the environment because it begins the reversal of the relationship of prevalence of nature onto the human being, with his process of intervention, search and use of natural resources, fed by the slow, continuous, long, inexorable, unending and irreplaceable evolution of innovation, productivity, science and technology.

Metals expert craftsmen produce swords and other weapons, and along with the production and supply of food, humans acquire a base from which to mount police and armed forces, make wars and create civilizations, empires and dynasties. Thus, by the accumulation of wealth and power by the fittest and most productive and technologically advanced and, along with the environmental effects arising, the political power, the economic power and the socioeconomic inequality broadens and consolidates.

So, politics, the military, the public administration and production join mysticism and religion, which with its natural vocation for power, feeds on humans a life haunted by spirits and demons, subduing them with guilt and fear, intimidation and duress and precepts of good and evil, with appeals not only to accept a superior metaphysical entity protection, essential to their salvation and redemption, but also ^[19] one moral of compassion and of exaggeration of piety. Princes, kings, emperors, nobles and military, dictators and tyrants, rulers and bureaucrats, join priests and religious not only to the deification of the State but also to the exercise of moral and social regulation in the world. All this permeated not only by beliefs generators of ideologies, disciples and followers, as well as by fears of the unknown, structured from economic power, environmental imbalance and socioeconomic inequality.

In contemporary times there are alerts that the damage of economic activity has gone beyond the limits of sustainable survival of the planet and the human species, which in turn has never experienced existence without extremes of wealth and poverty, misery and famine.

Inevitable is the controversy over the morality and usefulness of inequality and its effects on human society once no system of social division of labor should dispense a method that makes individuals responsible for their contribution of free choice to the joint effort of production, responsibility established by the framework of prices, with the consequent inequality of income and wealth, essential characteristics of a market economy, whose alleged distributive inefficiency was also never worked out by State interventionism, lavish model in the transformation of free individual choice to generate well-being, in bureaucratic human beings abiding by orders and obligations without any relation to the real needs of the consumer market ^[18]. The fully awareness of the innate inequality between humans is that it is this inequality that leads to social cooperation and to civilization. And what makes possible the evolution of society is precisely the fact that peaceful cooperation under the sign of division of labour in the long run, pick up and meets better to the selfish interests of all. The superiority of market society consists in the fact that its operation confirms this principle ^[16].

However, even if it is accepted that the selfish human initiative and its innate inequality – and not the provoked – can be a promoter of investment, extremes of socioeconomic inequality need to be seen as a social problem that widens and becomes great, if not the greatest generator of harm to society.

It is well established that ^[17] also in the richest societies the poor live less and suffer more of almost all social problems. However, one common factor binds societies healthier and happier: the greatest degree of equality among its members. In addition, more unequal societies with extreme boundaries of wealth and poverty generate negative effects to the wellbeing of the upper limit of the band, not by any form of deprivation of essential needs, but, for example, ^[20] more crime, more fear and insecurity that are reflected by increasingly aggressive use of fences and walls for homes and condominiums, internal and external surveillance cameras, armored cars and private security.

Being a wide socioeconomic inequality a deplorable social phenomenon and indeed destructive to society and its individual constituents everywhere, what should and can be done and how best to reduce it? In general has prevailed the State action with assistance via redistribution and transfer of income and philanthropy of individuals and businesses. However, from what can be seen, at best this only mitigates extreme situations. More than often it does not overcome it, once preserves the inequality by maintaining the populations served on poverty.

Seems to be the challenge of our time ^[22], to match the minimum essential needs of the world's population consumption with physical and environmental limits of the planet and with less extravagant consumption patterns, without compromising the dynamism of market economies and individual freedoms, once egalitarian experiences, always associated with both left and right-wing totalitarianism, have failed and demoralized throughout the 20th century, no longer being viable and sustainable options.

Among the many reasons for socioeconomic inequality, the remuneration for work has been singled out as its biggest cause ^[21] and examples of extremes between Nations and companies, individuals and jobs are plentiful, in this ^[23] contemporary organizations and knowledge era.

4.1 Metrics and extremes

The evolution of the GDP ^[24] of the 153 emerging countries, where more than 5 billion human beings live (4/5 of world population) ^[25] with the lowest HDIs ^[26] of the planet and the revenues of the 500 largest global companies with their direct employment looks like this:

	YEARS	2012	2011	2010	2004	2000	1994
GDP 153	US\$ trillions	27.3	25.7	21.9	9.1	6.5	4.8
REVENUES 500	US\$ trillions	30.3	29.5	26.0	16.8	14.1	10.2
EMPLOYEES 500	Millions	64.9	63.7	60.7	47.9	47.2	34.2

Sources: GDP ^[27]; Revenues and Employees ^[28]

The OECD ^[29] estimates the formal jobs on the planet in 1.2 billion, for a population between 15 and 64 years estimated at 4.5 billion ^[30]. Thus, the participation of the 500 global companies in direct formal employment around respectively of 5% and 1.2% is unimpressive. However, their revenues have always been greater than the GDP of the 153 Nations.

Among the several indices to measure income inequality, the Gini coefficient ^[32] grew by over 10% (1985 to 2010) and has never been so high among the OECD member countries, in most developed economies and societies and with the highest HDIs of the planet, where data are available.

Gini Coefficient Income Inequality – OECD Average

YEARS	1985	1990	1995	2000	2005	2007	2010
GINI	0.286	0.293	0.297	0.307	0.314	0.315	0.316
BASE	100.0	102.3	103.6	107.1	109.6	109.9	110.2

Source: OECD May 13, 2013 Report ^[31]

The average income in the entire OECD of 10% richest population increased from 7 to 9 times that of the poorest 10% in 25 years from 1985 to 2010. Even countries traditionally more egalitarian, as Germany, Denmark and Sweden, had the gap between rich and poor increased from 5 to 6 times since the 1980. Some countries have managed to reverse this trend more recently-Chile and Mexico, even though the incomes of the richest are still more than 25 times those of the poorest. In Brazil, which is not part of this index, although it has made progress, this relationship is still 50 times ^[33].

About 2/3 of the world's population – four billion people – lives on less than US\$2 a day ^[34]. Four million children died from no access to water (2005) and 10 million die of absurd causes each year ^[35]. No less absurd, 20% of the richest people held 70% of the income in 1960 and in 2000 already reached 85%. In the same period, the fraction of income of the poorest 20% fell from 2.3% to 1.1%. A total of 94% of the world income goes to 40% of the population, causing 60% of the population live with only 6% of this income and more than a billion human beings live on less than \$ 1 dollar a day ^[37].

About 21% of the world's population of the advanced capitalist countries control 78% of world production of goods and services, and consume 75% of the energy produced. In the last 50 years the planet lost 1/3 of the forest cover and 1/5 of humanity has no access to drinking water. Industrialization didn't bring development to 2/3 of humanity-just watch the growth and level of wealth from developed countries and the remaining ^[36].

In Brazil, local research *PNAD/IBGE* ^[38] ^[43] also published by *IPEA* ^[39], shows that from year 2002 on, income of the richest 1% reversed to slightly below the income of the poorest 50%.

For families receiving *Bolsa Família* ^[40], the *IDF* ^[41] in 2012 shows significant progress in access to improvements regarding: child development (0.85), income (0.63), vulnerability of the family (0.74) and housing conditions (0.78). However, lower knowledge (0.38) and lower work (0.29) indicate that the dependence on the monthly income transfers program follows high, since these dimensions, sustainable natural way out of paternalism, have not yet had their specific vulnerabilities exceeded.

5 Work and Market

From divine curse to divine condition; from forced to spontaneous; from punishment to reward; from active life to contemplative life; from natural law to moral duty; from option to needing; from frustration to supreme achievement; from doing to learning; from manual to intellectual; from material to immaterial; from control to power; from search to receiving; from right to responsibility – all these are some of the multiple social categories of human work incorporated throughout history.

Work can be defined as an activity whose purpose is to use natural things or even modify the environment to meet human needs – generating dependency of human beings in relation to nature, preparation or use of natural elements and, more or less effort, pain and fatigue as consequent human cost^[42]. Work can also be time spent in tasks increasingly abstract, partial and immaterial, in exchange for a remuneration system and not only just for a salary^[70].

From subsistence to accumulation and hence for the exchange and for sale of its fruit which can both be essential, necessary, complementary and even quite often superfluous, none of that matters more than the fact of the work as an agent of transformation of humans into social beings, whether he's an artisan or part of a production gear. The duty to work to survive needs to be lived and performed as a manifestation of freedom, of overcoming the limits of nature and never as alienation and subjugation. Necessary is that humans work in what they like most, that like much of what they do and also seek the sound balance in their professional, personal, family and community lives.

This close connection between work and human existence ennobles it and the distressing aspect in many activities is much more associated with social conditions in which is performed than the work itself, once be natural that the activity would should be nice or to seek out pleasant ways of doing it, process that becomes rewarding with success even if partial in finding a way out^[44].

However, we cannot lose sight that, as throughout history, even today persist monotonous jobs, under pressure, unhealthy, dangerous and even stupid, brutal and terrible environmental conditions, and under orders from mediocre, stupid, despotic bosses, giving the working human being not even minimal conditions to overrun^[45].

In this overcoming, work in general can benefit from technology, social organization, market, trade unions, political system^[51], as transformation and quality factors in society in general and in company of any size in particular, although its operating and economic-financial gains continue to overlap on a large scale the common welfare in our society.

Despite the criticism of the excessive financial and economic power and the successive scandals over time, Galbraith^[46] recognizes that the global company has become a central factor in the modern economy, where exercise extremely useful role in contemporary economic life. Boldly, Roddick^[47] proposes that, in terms of power and influence, we can forget the Church and politics, by advocating that there is no institution more powerful than the company in contemporary society.

A society that aspires growth, innovation, stability and social equity – real benefits for society as a whole – needs to rely on a strong ethical market, innovative and competitive, as well as also needs to rely on a State with constitutionally defined and limited powers, and an ethical, active, efficient and inductor Government. But it is also imperative, the separation, balance and alternation of power and the regulation of both State and market, by local and multilateral organizations, legitimate, articulated, institutionally strong and active.

In thus, the best starting point for growth generator of work, employment and income, still assumes the free choice of individuals, the possibility of quick reaction in the economy, a free consumer, entrepreneurs free, aware of all the risks and responsible for their actions^[48], in a free and competitive market, and a political power which regulates and guarantees the freedom, law and order.

But, Drucker teaches^[49] – social and political theory since Plato and Aristotle always focused power. Responsibility, however, should be the principle to inform and organize post-capitalist society, once the organizations and knowledge society demand organization and governance based on it. A company to be considered fully responsible, needs to assume an economic responsibility – profit being the first and the base from which enables it for an environmental responsibility, a prerequisite for its own sustainable growth, and a social responsibility as a good employer, good corporate citizen, good neighbor, integrated in the communities where it operates.

In an entrepreneurial society, unanimity is not necessary nor possible, not even conceivable. It does not assume that all are entrepreneurs nor that all are to believe in companies. But, of course, is a society of trust, where whoever has the power to decide, influence, create, train, teach, judge, serves as a model, mostly adheres to behaviors that constitute a development society^[50], the best generator of work, employment and income for society.

6 Nations, Companies and the Rise of China

The revenues of the 500 largest companies have always been greater than the GDP of all 153 emerging and developing countries. However, the GDP 472.5% growth exceeded by large both the 195.8% growth of revenue of the 500 companies and the 101.4% of GDP of the developed Nations.

The gap has decreased though. In this 18 year period, the revenue that surpassed GDP in 114.9% (1994) falls to only 11.0% (2012) mainly due to the insertion of China in the global economy – most important geopolitical fact of the end of 20th century, being confirmed at this early 21st century.

China's GDP, \$ 559.2 billion (1994), reached \$ 8.2 trillion (2012), increasing share among the 153 emerging countries from 11.7% to 30.1% and from 2.1% to 11.5% among the 188 Nations.

Brazil's 11.5% share (1994) drops to 8.8% (2012) among the 153 emerging countries, whereas China went from 11.7% to 30.1%. However, Brazil won positions among the 188 world nations – from 2.0% (1994) to 3.3% (2012), once influenced by 101.4% growth and greater economic weight of the 35 developed countries, the 188 countries grew only 167.3%.

7 Companies and Direct Employment

The values of the main economic and financial valuation metrics — revenue, net income, assets and shareholders' equity – for the 500 Global largest companies are impressive not only for its size, but also for its sustained growth over the most recent period considered, and there's no reason to imagine that has been different over time in prior periods.

These growth rates illustrate very well its strength and economic power. Between 1994 and 2012 revenues increased 195.8%, profits 447.0%, assets – investments – 293.9% and equity 350.7%.

However, although the number of jobs has increased by 30.3 million (34.5 to 64.9 million), this represents an increase in the period of just 88.0%.

The gain, of course, is fully reflected in productivity, 57.3% in revenues, 190.9% in profits, 109.5% in assets and 139.7% in equity, and entirely appropriated by the invested capital, ensuring its remuneration, feasibility, economic and financial sustainability and investment capacity.

The Global Top 50 employers – 10% of businesses, generate around 38% / 40% of the jobs generated by the Global 500. It is worth noting that in recent years of the first decade of the 21st century, both economic and financial indicators such, and the number of jobs generated, show strong growth due to the presence of the Chinese economy in the global market and the entry of their companies not only in the 500 and 10 global in revenues but also among the 50 top global employers.

In the total direct jobs generated by the 500 largest, the jobs of Chinese enterprises accounted for 1.1% in 1994, 12.2% in 2000, 14.1% in 2010 and 13.3% in 2012. Among the 50 largest employers, China had 2 companies and 3% of jobs (1994), 8 companies and 30.2% (2000), 15 companies with 37.3% (2010) and 15 with 36.8% (2012).

It is also worth pointing out that this significant presence of the Chinese economy and enterprises in the global market generates a statistical distortion of growth, since the large Chinese company is notably State owned and, therefore, generates more direct jobs and lower productivity as consequence.

DIRECT JOBS	1994	2000	2010	2012

8 Employment and Population

The first and the most important among the contributions the company and, for sure, the big global corporation can offer to society is the generation of not only direct employment but also work and income for the economically active population of society. However, even considering a period of sustained economic growth since the mid-1990, comes as a surprise the comparison of the evolution of the offer of direct jobs of the 500 largest companies with the evolution of the population from 15 to 64 years, taken as the age of the target population for paid work. Between 1995 and 2010 (these UN statistics for years 0 and 5 only), the number of direct jobs the 500 largest companies grew 25.6 million (72.9%), while the 15 / 64 years world population increased by about a billion human beings (28.1%).

These Global 500 corporations, employed 0.89% - less than 1% (1995) and 1.24% (2010) of the EAP, a very small direct employment when compared with the income-generating needs of society. One can certainly point out also that, not to mention socioeconomic crisis, technology, productivity, outsourcing and informality, do not contribute to overcome this problem.

YEARS	GLOBAL 500	WORLD EAP (1) ^[71]	% (2)
	DIRECT JOBS	POPULATION 15 TO 64 YEARS	
2010	60,710,587	4,524,850	1.24
2005	50,538,508	4,197,009	1.10
2000	47,225,289	3,851,820	1.13
1995	35,119,851	3,531,208	0.89
% GROWTH			
2010 / 1995	72.9	28.1	35.0

9 Population and Work

In 2009, the world economically active population around 4.5 billion people ^[52], participates ^[53] of a world labour market of 4.2 billion people, where the formal employment is estimated at 1.2 billion and the informal jobs – production and trade of legal and regular products and services, with no registration and without social security – arrive at 1.8 billion. So between 1.2 and 1.4 billion people in active age do not exist in economic terms and are part of the \$1 or \$2 a day of the statistics ^[54] ^[55].

The participation of direct jobs of 500 largest companies in 2009 in the world labour market of 1.3% and in the formal market of 4.7% and work on economically active population around 1.2%, is very small, even with China, whose insertion into the global market with its state capitalism and large amount of State-owned enterprises, greatly increased the number and growth rate of direct jobs.

Even with the growth of economies and companies from the years 1990, in many developing countries, the informal labour market grows, is broad and pervasive with outsourcing and services, does not generate tax revenue and social protection for workers and their dependents and not rarely is the most dynamic segment of the economy, and also the only generator of jobs and income on large scale. Until 2020, this market should increase by one-third, retained the current projections of population growth and economies. But this increase may be even greater, if more formal jobs are lost amid the ongoing crisis and, more migrants return to their countries of origin and, mostly, for informal jobs ^[58].

EAP	4.5

10 The role of the Company

Beyond the man's behavior with regard to power and wealth, the crisis of the contemporary State increasingly hypertrophied caring more of itself and a wealth accumulator selfish capitalism, make sense to discuss the role of free enterprise – essence and foundation of capitalism, in the generation of work, employment and income and in meeting the needs of human society.

But even with technology, managerial capacity and investment, companies have not been able to make a relevant contribution to cope with the deep problem of global poverty ^[56], once they do not involve not only the hundreds of millions of people on the sidelines even of the informal market of work but also of those who, in the formal market, are at the base of the social pyramid, where instability and insecurity of employment relationships are larger.

Even though accepting that the companies are part of the most innovative and financially most efficient sectors of all, in his reflections on what should be the role of enterprises in aid to the world's poor, ^[57] companies still have no direct mechanism to implement its practices in elimination of poverty.

Still, the contribution of large enterprise in generating more jobs, work, income, investment and consumption in the economy, can and should come from private investment, made not with charity and philanthropy, but as business and through their value chains ^{[59] [60] [61] [62]}, heavily focused on supporting the local development of communities where they operate ^{[63] [64] [65] [66]} and where else it can generate business, notably in the vast market of the socioeconomic pyramid base on the planet ^[67].

Some people do not agree. To devise a threading model in structural spaces for study of the problems and needs of society, Santos ^[68] suggests that political parties, trade unions, social and popular movements, NGOs and a welfare-State join to counter the so-called dominant forces of society.

Quite the opposite, ^[69] in an entrepreneurial society model, Peyrefitte argues that non-inclusion, co-option or even cooperation notably of the large enterprise of the private sector of the economy, as another one of organizational forms in the development of actions and solutions, actually generates a huge waste of energy by competition and not an appreciable gain in value as a result of the involvement and collaboration of all these essential social actors.

11 Final Considerations

The participation in the direct jobs market of the 500 Global companies around 1% of the target population and less than 5% of formal employment is disproportionate with its capacity for investment, business, wealth and value generation, and too small for the needs of work, employment and income of the human society. Even its spread in their production chains, brings only a few tens of millions out of these 1.2 billion formal jobs in an estimated 4.2 billion target human beings of the total market.

There is no way out through the generation of direct employment. A large-scale wave of entrepreneurship and the conscious consumption of goods and products that meet specific needs of populations, are at the heart of the eradication of poverty, through the generation of work, employment, income, savings and investment, and credit as financial leverage and not pure and simple indebtedness.

Entrepreneurship – with the consequent generation of work, employment and income, and hence consumption and investment, as a creation of human beings by their natural need and ability to create linkages and value, evolved and has consolidated its position in enterprises, the more complex and sophisticated institution of society in generating goods, material values and quality of life.

Inappropriate economic policies have generated trade and currency exchanges wars, disordered caps, inflation, deflation, more income and wealth inequality, poverty, economic and social instability and produced authoritarian regimes, riots, conflicts, guerrillas and military wars.

To prevent repetition of this tragic sequence, no other action of the business and Government leaders on the planet could have more priority than one focused on the creation and preservation of jobs, mainly in trade and services in general, whose generator and multiplier effect on income and consumption in the economy is much faster.

Society needs active, efficient and inductor Governments, less inclined to create and raise taxes and promote confiscations, and more prone to exemption and modernization of the supply and distribution chains, as well as it needs strong, innovative and competitive markets. Both ethical, limited and regulated by laws and autonomous institutions.

What is not sustainable and cannot continue is this concentration of political power and wealth of Governments and corporations propagating to billionaires and millionaires family fortunes for a few

thousand people in a society that has not been capable to generate livelihoods with a minimum of dignity for some billions of human beings.

At no time in the history of human beings, not with religion, philosophy or science, neither Governments nor companies, mankind managed to overcome inequality, hunger, poverty and extreme misery. Quite the contrary, seems to have them extended. The frustration is not just of our time or of any particular society, but neither should nor can it serve as a mitigating circumstance, consolation or hopelessness, in an attempt to improve today and the future of the human society and the planet.

Abstract: This paper discusses the significance and strategy of user experience in brand marketing. Brand marketing is a process in which various marketing strategies are used to enable customers to form understanding, acknowledgment and acceptance of enterprise brand, products and services. It has shifted from traditional model which emphasizes production, product and market to experience-based one that stresses the satisfaction of consumer need. In the face of increasing diversification, large-scale operations and similarity of products and services, customers become more critical and rational. Simply providing experience platform and service for the customer is no longer an effective means to attract customers and enhance brand value. In conclusion, experience-based marketing strategy should be built on the basis of analysis of dimensions, characteristics and factors of user experience to provide perfect experience, and finally enhance brand value and bring profits for company.

Key words: Brand marketing; Dimensions of user experience; Factor of user experience; experience marketing

1 Introduction

With the rapid development of goods and service economy, brand marketing has become more and more mature. The consumption behavior, demand and the life style of customers have changed very much. Under this background, Gilmore (1999)^[7] suggests that “the era of user experience economy has come.” Together with Pine (Pine and Gilmore, 1999), he puts forward the concept of user experience. Besides, he also raises the idea that “the experience economy has gradually been a new stage of development after the service economy.” From a interactive perspective of enterprise and customer, Schmitt (1999)^[6] suggests that user experience is a collection in which enterprise can communicate with customer the sensory stimulation, information and the points of emotions.

Tao Wang and Guohua Cui in domestic suggests that user experience is a wonderful and deep feeling owned by the consumer in the consumption process, which is provided by the enterprise, since he is immersed in the design and product-promotion. However, Hongli Guo(2010) thinks that “in order to improve customer value, enterprise should start with the user experience, consider factors of user experience and organize these factors.”

Research at home and abroad only discuss the concept and contents of user experience. However, what is the process of the construction and characteristics of user experience, as well as the factors, still need systematic theory to support. This paper argues, company should develop different experience marketing strategies for customers on the basis of analysis of dimensions, characteristics and factors of user experience in difference marketing environments.

2 Dimensions of User Experience in Brand Marketing

2.1 Brand marketing and user experience

Briefly speaking, brand marketing is a way to give the product some kind of images to impress the customers. Philip Kotler, a famous marketer, thinks that marketing targets contain ten types, including the product, invisible service, event, experience, person, place, property right, organization, information, and concept. American scholars John C Mowen and Michael S Minor consider that the experience each side got from exchanging process, apart from the product, service, and money during exchanging activities was also one of the exchanging resources. As a marketing resource, experience is recognized publically.

In the age of experiencing economy, the purpose of a customer's purchasing products is to realize self-value through satisfying his need but not to help the enterprise make a profit. He would take into account product, service, and purchase and usage experience to judge a brand. Therefore, to reach the goal of brand marketing, the user experience analysis becomes so crucial.

Analyzing user experience could start with analyzing dimensions of user experience, and according to the features and influencing factors of analyzing experience to draw up experience marketing strategy, to design favorable experience environment, superior experience service, and impressive experience

interaction and so on to decrease user’s payment and increase user’s value.

2.2 Dimensions of user experience in brand marketing

Schmitt (1999) divided experience dimensions into five types, “feeling, experience, thought, action and relation”. He thought we should choose proper “experience media” to control the whole process. This paper is based on Schmitt’s division to experience dimension and borrow the concept of elementary geometry to further subdivide user experience into experience point, acknowledgment line, and emotion surface and acceptance body. Through analyzing dimensions of user experience, enterprise could adjust and integrate better of each stage to user experience to design different user experiences purposefully.

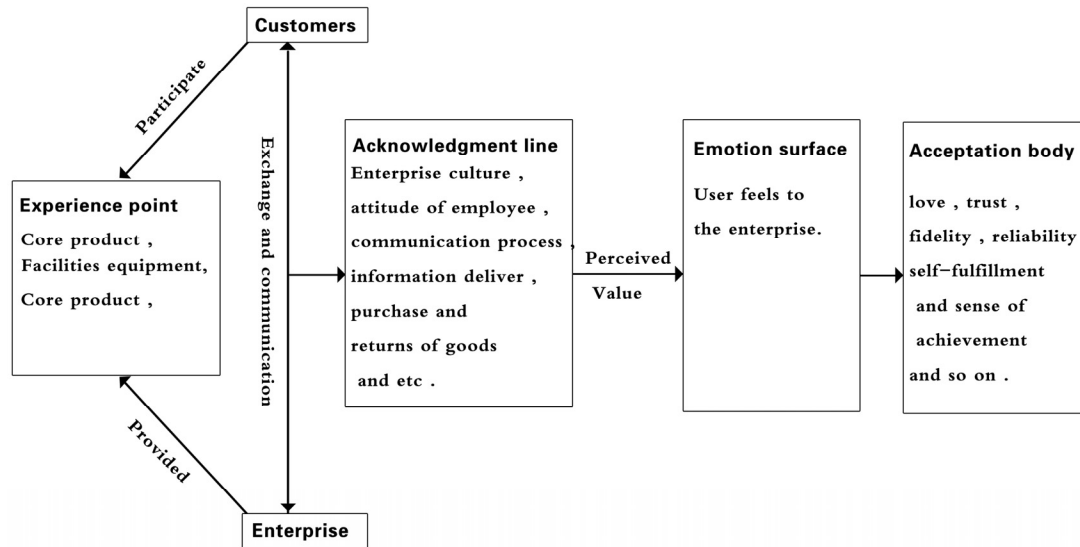

Figure 1 Dimensions of User Experience

2.2.1 Experience point

Experience point is any point that user and enterprise may touch. It mainly includes three aspects, core product; facilities equipment; employee and manager. For example, when we go to a computer experience store, we will get a series of experience points, such as the store sign, its name, the interior design, the computers, the posters, and the employees, the computers’ texture, function and price, etc.

2.2.2 Acknowledgment line

Acknowledgment line is a collection of experience points and information exchange, including enterprise culture, attitude of employee, communication process, information delivery, purchase and returns of goods and etc. For example, when experiencing a computer or exchanging information or conducting the product interaction with the employees, the user would have a process of thinking, thus form a whole acknowledgment of the experience store, which is so called acknowledgment line

2.2.3 Emotion surface

Emotion surface is an accumulation of all of acknowledgment lines, some kind of induced emotion, and the holistic experience that user feels to the enterprise.

2.2.4 Acceptation body

Acceptation body is a collection of emotion surfaces. Once the users accept the enterprise, they would produce some feelings, such as love, trust, fidelity, reliability, self-fulfillment, sense of achievement and so on.

3 Characteristics of User Experience and Influential Factors

3.1 The three characteristics of user experience

Since Gilmore (1998) proposed the famous judgment—experience economy era, the commercial potential brought by user experience has been recognized gradually. As a result, many enterprises hope to focus on experience to enhance customer value and their own interests. But user experience has strong personalized features, so it is necessary to practically analyze its characteristics and influential factors.

According to the above analysis of dimensions of user experience, we find the experience characteristics mainly include: environmental experience, emotional experience and comprehensive

experience. Environmental experience is the content which is covered by experience point—that is the experience of perception and five senses. Emotional experience contains information communication, emotional communication, enterprise culture and so on, which is corresponding to cognitive line. And comprehensive experience is the overall feelings of customers’ emotional factors which is created to emotion surface and acceptance body.

In order to better strengthen customers’ perceived value, It is necessary to create a good atmosphere and highlight the core products of enterprise to let customers directly come into experience role with a clear priority and target by improving environmental experience design ; At the same time, we should attach importance to emotional experience design to improve the efficiency of service, care and guide customer to make sure of effective transmission of experience information, finally let customers have a good comprehensive experience.

3.2 Influential factors of user experience

Experience is the feelings of customers in the process of their interaction with the enterprises. As a result, the factors of customer experience could be analyzed from the two perspectives—customer’s and enterprise’s perspectives. From the enterprise’s point of view, the focus is the experience conditions, which include to enterprise’s products, services, environment, brand, employees, etc. (Schmitt, 1999). from the perspective of customer, it mainly includes customer’s demand motivation, personality and education background (Bearden, 1998). This paper, based on the theory supported by Bearden, further analyze the factors that will affect experience and lay importance to customer’s psychological experience, which can be divided into three parts. The first part is psychological demand, which determines the purchase desire; the second part is age psychology, which determines the purchase motivation; and the last one is property class, which decides to the purchase results.

In order to improve the customer experience as much as possible, the enterprise should determine the targeted effects based on the enterprise’s operating conditions, industrial characteristics, earning performance and competition performance. Besides, it is necessary for the enterprise to interview and conduct investigation to gain feedback from customers so that the customers’ psychology and motivation and even their current situation can be better understood. Based on the information gathered, companies can manipulate all kinds of favorable elements to perfect the customers’ experience.

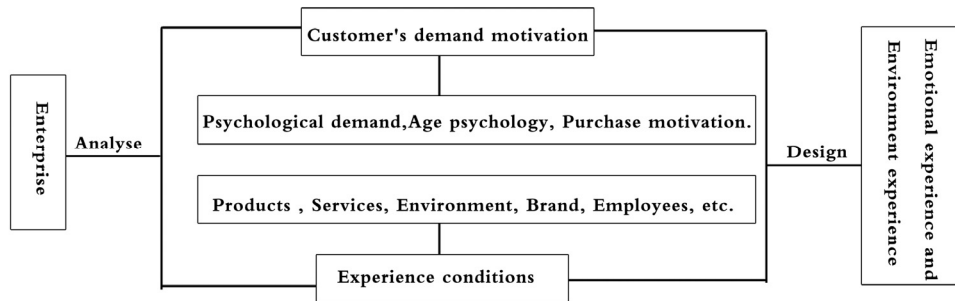

Figure 2 Factors of User Experience

4 Marketing Strategy Based on Customer Experience

4.1 Management framework of user experience

From the process and characteristics of user experience to the analysis of influencing factors, experience-based marketing strategy contains the idea of improving user experience in the practice of experience. Company should formulate the experience marketing strategy on the basis of relevant management of user experience. For this purpose, it is necessary to build the management framework of user experience.

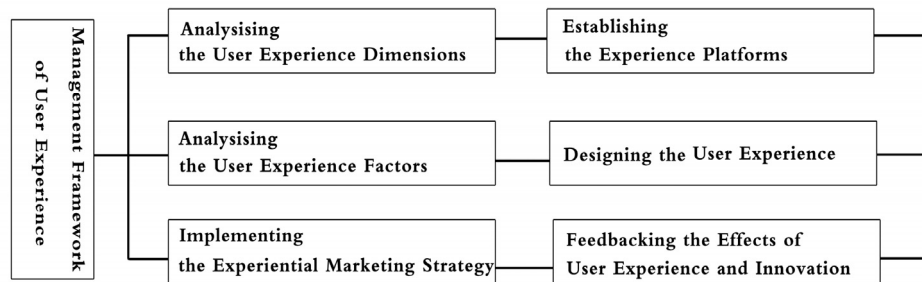

Figure 3 Management Framework of User Experience

4.2 Experiential Marketing Strategy

Experiential Marketing is mainly classified into five catalogues, sense, feeling, thinking, action, and relation (Schmitt, 2004)^[4]. To realize experiential marketing aim, proper experience types must be pinpointed. In this paper, integrated with Mr. Schmitt's five catalogues, it is further classified into three types. First, making the customer purchase unconsciously; second, attracting the customer to buy in the process of interaction; third, attracting the customers to buy under the knock-on effect.

4.2.1 Sensory marketing and emotional marketing—making the customers purchase unconsciously

Sensory marketing means making the customers purchase through stimulations through satisfying the customers' sensory pleasure, excitement and desire etc, while emotional marketing attaches specific emotions to a brand. These two types of marketing tactics take advantage of the customers' sense to bring enjoyment and excitement, and then stimulate their imaginations through the story and culture of the brand and trigger their purchase desire.

In the market of daily use chemicals, sensory marketing is the most traditional tactic. Unilever's "Dove" brand reinterpreted "beauty" through the "Campaign for Real Beauty". All women were instructed to adopt a positive attitude to change their living conditions. By doing so this brand successfully and deeply impressed consumers. This type of marketing will build deep emotional connection with customers, so that it will beat the competitors easily.

4.2.2 Action marketing and thinking marketing—attracting customers during interaction

Action marketing and thinking marketing allow customers to generate reflection and feeling through participation in the experiences. Its most important principle is to surprise and impress people unexpectedly, and to stimulate customers' interest.

Dove is quite outstanding with regard to this aspect. It first puts forth the question "What is real beauty?", followed by the establishment of "True Beauty" website through which women can think and interact so as to build a real customers' community.

4.2.3 Related marketing—relevant experiences under knock-on effect

Relevant experience means stimulating the customers' desire to change themselves so as to experience the strong relationship between the enterprises and their customers. Through such an experience, the enterprise's can increase the customers' acceptance and loyalty to the brand.

Generally people like the brands which can help them shape their personality. Coca-Cola expresses an optimistic attitude which arouses a sense of belonging and attracts people all over the world.

5 For the Brand of the Domestic Mobile Phone—How to Catch up With Samsung and Apple

There is a big gap existing between the Chinese domestic brand and Samsung or Apple in the mobile phone market of China. The key for domestic mobile phones to catching up with Apple and Samsung lies in improving the hardware and technology, and moreover in taking practical measures to improve customers' experience.

5.1 Grasping the dimensions of experience and understanding clients' psychology

Many measures should be taken if domestic mobiles aim to be as good as Samsung and Apple. First of all, good experience platform should be established on the basis of a profound understanding of the dimensions of customer experience, such as the establishment of experience store and experience center as well as designing better experience environment and humanistic service. Second, profound understanding of customer psychology should go before the design of the customer experience. For

example, to provide a quick experiencing and purchasing and easy returning for the customers who are suffering from a busy work so as to make them feel convenient.

5.2 Using marketing strategy timely in the process of experiencing

Samsung and Apple, the former as a leader in the field of smart phones and the later as a bellwether in humanized service, undoubtedly did a marvelous work by taking the experience marketing model perfectly. As for domestic mobile phones, which are still trapped by the traditional marketing model, innovations should be made insistently through studying marketing strategies made by Apple and Samsung.

Zhuopu could be regarded as a good example by keeping pace with experiencing marketing as Apple and Samsung did. Apart from that, it has its own unique features now and its store-marketing can be found in more than 100 experience stores and adopt a strategy to sell its products both on line and in traditional market at the same time, aiming to provide its customers with the excellent sense, action and thinking experience, as well as other experiences related with consumption and after-sale service.

Of course, brand power should not be neglected in brand marketing. Only when domestic mobile phones integrate user experience into the current brand marketing system and continuously improve the quality of the hardware can they satisfy the consumers' need and beat the competitors.

6 Conclusions

If company wants to achieve the best effect of brand marketing, it must realize the value of user experience. In order to create the perfect user experience, company should study the experience management framework and use the strategy of brand marketing for experience marketing on the basis of analysis and anatomy of dimensions, characteristics and factors of user experience. In the increasingly competitive environment of experience economy, companies that attract the customer will become the final winner. In order to keep a long-term competitive capability, company should realize the importance of influential factors of user experience in brand marketing, and finally help the enterprise's customer value and financial profits.

Analysis of Residents' Leisure Behavior in Medium-Sized City: A Case Study of Xianning City of China *

Li Jiangmin, Tan Lijuan, Mo Qinrong

School of Economics & Management, China University of Geosciences, Wuhan, P.R.China, 430074

(E-mail: ljm1437@163.com, 1217183016@qq.com, xiaorong@163.com)

Abstract: With the rapid development of economy and the increase of national holidays, leisure tourism has gradually become an important part of city residents' life, which provides a reference for developing and managing recreational land to analyze leisure behavior characteristic. In order to provide a reference for leisure tourism, the study focuses on the leisure tourism of medium-sized cities which is less concerned at present and taking Xianning city of China as an example, probes into residents' leisure way, tourism preference, travel motivation, travel frequency, travel time and other behavior characteristics. Lastly, a conclusion of how to conduct the leisure behavior is drawn.

Key words: Medium-sized city; Leisure tourism; Travel behavior; Xianning city

1 Introduction

With the sustained development of national economy and steady increase in national income, China has entered the "era of leisure", leisure is the welfare that the public should enjoy when economy has developed to a certain level, and also is the important method to increase national happiness. There are totally more than 115 days of vocation time for Chinese throughout the year at present, so the leisure demand is greatly inspired. In recent years, some scholars have researched on residents' leisure behavior in some big city. For example, Zheng Yiqing summarized the residents' leisure impediments and revealed the current situation of Shanghai public leisure activities (Zheng Yiqing, 2006); Liu Ningning predicted the development trend of leisure activity in the future (Liu Ningning, 2004); Xu Xiaoxia and Chai Yanwei analyzed on the gender difference of Beijing residents' daily leisure behavior (Xu Xiaoxia, 2012); Liu Changxue and Wang Degen analyzed Hefei urban residents' weekend leisure travel behavior by using "need-motive-behavior" mode (Liu Changxue, 2005); Wang Bin and Wang Zhaoli analyzed on the difference between Dalian residents' leisure motivation and behavior (Wang Bin, 2008).

The scholars' research object is mainly concentrated on big city, and the research on residents' leisure behavior in medium-sized cities is still weak and lack of attention (Lu Xiaoli, 2006). In order to understand Chinese residents' leisure behavior characteristic comprehensively and provide a reference for developing leisure tourism in medium-sized city, the article focuses on medium-sized cities, and takes Xianning city in central China's Hubei Province as an example.

2 Research Method

Using the questionnaire investigation method, the author went to Xianning Qianshan Forest Park and Hot Spring Square for random sampling to leisure visitors in March 2012. 250 questionnaires were released totally and 203 available questionnaires were recalled, with an effective rate 86%.

The population characteristics of the sample are as follow: Males account for 45.32%, females account for 54.68%; Tourists' ages mainly are between 18~24 (48.2%), 25~34 (21.18%) and 35~44 years old (16.26%); Occupation compositions are student (29.56%), freelancer (28.08%), company staff (16.75%), business owner (8.37%), civil servant (6.90%), teacher (5.42%), farmer (2.96%) and military (1.97%); Education background compositions are college (40.39%), high school or technical secondary school (27.59%), bachelor (15.76%), junior high school (10.34%), primary school (4.43%) and master (1.48%); Monthly income level compositions are 1000~1999 (37.44%) and 2000~2999 (29.56%). The sample composition is thought to be in accord with Xianning's basic population characteristics as well as the social economic development. Therefore, the following analysis is representative.

3 Analysis of Leisure Behavior Characteristic

3.1 Choice of leisure activity way

The result of the survey sample "choice of leisure activity way in weekend and vocation" shows that

* This paper is supported by a grant from the National Science Foundation of China (No. 41301156) and the Special Fund for Basic Scientific Research of Central Colleges-CUGW130211

residents' main entertaining ways are watching movie or TV, sleeping and shopping, which respectively account for 37.44%, 34.98% and 33.99%; The choice of "tourism leisure" accounts for 30.05%. Other options such as "doing housework", "reading books or newspapers", "visiting relatives", etc, also occupy a certain proportion. It indicates that residents' leisure activity ways in weekend and vacation are still mainly home-based activities at present, which has a great potential for development. (Figure 1)

Figure 1 Choice of Leisure Activity Way

3.2 Travel motivation

Statistical on "residents' travel motivation" survey shows that the proportions of two options "life-enriching" and "friend-gathering" are the highest both in urban and suburban, respectively accounting for 44.34% and 41.14%, which are followed by "exercise" and "leisure", occupying respectively 36.45% and 43.84%. Others such as "relatives/friends-visiting"(22.17%), "business activities"(11.33%), "religious belief"(2.96%), "native product-buying"(1.97%) and "other" (5.17%), etc occupy a small proportion. The tourism projects have high attractiveness only when tourism designers design them in accord with the demand of residents.

3.3 Frequency of tourism leisure

The statistics of residents' leisure frequency within a year shows that, residents' leisure frequency is mainly concentrated on "1~2 times", accounting for 47.78%, which is followed by "3~5 times", accounting for 24.63%, "more than 6 times" accounting for 19.21%. It is in accord with the regular that the more times of traveling, the smaller proportion is. Besides, the data also shows that 3.94% respondents' leisure frequency is 0. The reasons include limited income and then limited tourism purchase capacity, a heavier burden or no leisure time. The reason also includes that some people have no ideas on tourism for their poor educational background. However, the proportion of this part is small, which indicates that the travel demand of residents is strong.

3.4 Tourism products preference

The survey on "residents' tourism products preference" shows that, "forest park" is residents' most favorite leisure project, and the proportion of it is the highest, 46.80%. The proportions of "playground", "lakeside resort", "farmhouse", "temple", "industrial parks" and "other attractions" are distributed, and account for the indifferences. Overall preference shows residents' psychological preference that they like to be close to the nature and want to return to the nature as well as their diverse needs of tourism products. Therefore, leisure tourism development should focus on the investment and innovation of forest park, and take forest recreation tourism products which is based on eco-tourism as the main leisure tourism development, and other tourism products as subsidiary ones. (Figure 2)

Figure 2 Tourism Product Preference

3.5 Travel time

The survey on “Resident’s travel time” shows that the proportion of “weekend” is the highest, accounting for 36.45%. This is followed by holidays and small holidays, respectively accounting for 35.96% and 29.06%. The proportion of “golden week” is relatively small, only 18.72%. It indicates that weekend leisure tourism has become one of the main forms for current residents to travel, and resident’s choice of travel time is more rational. And on the seasons’ choice of the year, since the climate in spring and autumn is pleasant, there is a high proportion of people traveling in these two seasons. And because it is hot in summer and cold in winter, there is a relative low proportion of people traveling in these two seasons. Therefore, the seasonal fluctuations of Xianning city of China on traveling is big. For this reason, tourism enterprises can increase publicity appropriately, influence people’s tourism decision-making, guide people to take part in tourism activities harmoniously, and avoid the emergence of the phenomenon that there is a more excessive number of travelers in some seasons and too limited number of travelers in off-season. (Figure 3)

Figure 3 Travel Time

3.6 Travel partner and transportation

In the aspect of travel partner, the survey shows that among the four options “family”, “friend”, “colleague” and “other”, “friend” accounts for the highest proportion, 60.10%, which is followed by “family” with a proportion 35.96%. “Colleague” accounts for 25.12% and “other” accounts for 4.43%, which is in accord with fundamental realities of Chinese focusing on family and friendship. Besides, travel with family or friend is a good way to relax and improve the relationship.

The survey on “transportation” shows that, the proportion of “Travel by public transport” is the highest, 41.38%. This is because most of the tourists are middle working class or students, whose discretionary income is limited while the surrounding spots’ distance is fairly big so that the bus and public transport has become the first choice. Self-driving accounts for 37.93%, which means domestic cars have been available to the public at present. Self-driving travel is very convenient and is favored by people. (Figure 4)

Figure 4 Travel Partner and Travel Methods

3.7 Ways to get travel information

The result of the survey show that the highest proportion of “ways to get travel information” is

recommendation by friends or relatives, accounting for 42.36%. It is followed by “Internet”, and “TV”, which account respectively for 41.87% and 38.42%. Therefore, scenic areas should focus more on “word-of-mouth” publicity although TV and website publicity also play an important role at the same time. Scenic areas should establish a website to publicize actively and make use of television skillfully to advertise tourism area. Besides, to get information through newspapers and books also occupies a certain percentage, which can not be ignored. Travel managers can make hierarchy publicity contrary to source markets after cleared these publicity utility. (Figure 5)

Figure 5 Way to Get Travel Information

3.8 Days may stay

The number of “Overnight visitors” always is an important indicator among tourism statistics. The results show that in the survey of days may residents stay in peri-urban travel, there are 41.87% of respondents may stay for two days, which accounts for the highest proportion, followed by “stay for three days”(24.63%), the share of “stay for four days” is 5.91%, “more than four days” is 7.39%, above are all “possible overnight visitors”. The share of “return in that day” is 18.72%, which is relatively less than “possible overnight tourists”. All results indicate that the source market scale of Xianning residents is huge and has a large development space.

3.9 Requirements of accommodation and expenditure

Tourist’s impression of tourism destination is easily affected by accommodation in tourism activities. The survey shows that, on meals during traveling, people eager to be able to taste the local specialties in the peri-urban leisure travel, this proportion reaching 77.34%. The next is “farmhouse meal”, accounting for 27.59%, and only 8.37% of residents selects “fast food”. 0.99% of residents hope to participate in the upscale banquet. Thus, it is optimal that the repast in or around scenic area should reflect the local characteristics.

In terms of expenditure on traveling, the survey shows that most people can withstand a total personal consumption between 100 to 500 Yuan whether in city or pier-urban leisure tourism, the proportions of in city and pier-urban are as high as 79.80% and 74.39% leisure tourism, while the share of personal consumption which is greater than 100 but less than 500 is relatively small. The data indicates that people’s price requirement is relatively modest, for which limited requirement when the price is too high and low-grade travel route when the price is too low that easily leave bad impression . (Figure 6)

Figure 6 Consumers’ Willingness

3.10 Travel satisfaction and travel recommended willingness

In surveying the satisfaction level, we found that the proportion of “general” is the highest, accounting for 57.14%. “Very satisfied” only accounts for 3.94%, and “very dissatisfied” is 0. On the one hand, this result illustrates that information tourist obtained usually exaggerates the travel effect which makes residents have high expectations each time before traveling, and on the other hand, it explains that there are deficiencies in peri-urban scenic construction and it needs to improve. (Figure 7)

Travel satisfaction not only is an important factor of willingness on travel recommendation to others, but also a free publicity of travel products. According to the survey, 60.59% of residents will recommend the places they have ever visited to their friends and relatives, and this proportion is much higher than other options. Only 2.96% of residents won’t recommend it definitely. It reveals that residents have a high travel recommendation willingness which has a tremendous impact on “word-of-mouth” publicity.

Figure 7 Travel Satisfaction

3.11 Travel complaint

Surveying on “travel complaint” shows that the proportion of “complaint” is the highest when residents are dissatisfied with the travel service, accounting for 36.95%. It is followed by “complain to anyone”, accounts for 27.09%. The proportion of “submit to humiliation” is 18.23%, and only 16.26% of residents do not mind. For complaint departments, the highest proportion is “complain to the unit”, the second is “complain to superior”, and accounting for 27.59%, the last is “complain to industrial and commercial sector or media”. The result shows that residents deal with problems rationally when they are dissatisfied with the travel services. Tourist complaints always affect surrounding crowd’s impression of scenic area and have a greater impact on scenic development. Therefore, scenic area needs to pay attention to tourists’ complaints and satisfaction and maintains a good image of the tourist places.

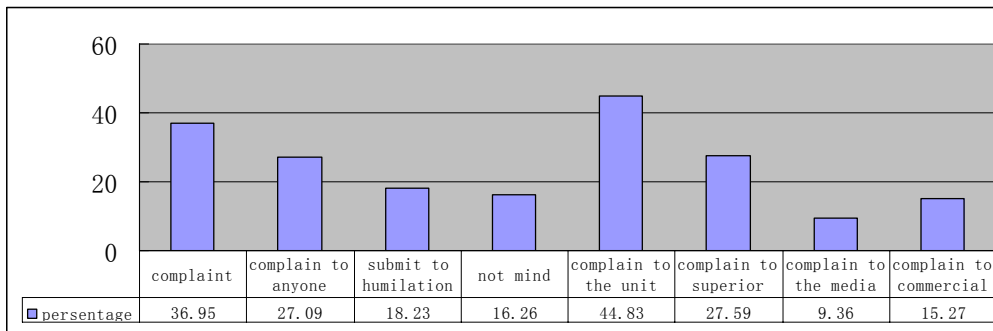

Figure 8 Travel Complaint

4 Conclusions

4.1 Develop leisure tourism vigorously and create a good leisure tourism environment

Leisure tourism has become the main leisure activity of residents in medium-size city to enjoy life and relax and has a huge development potential. A good leisure tourism environment not only can stimulate residents’ consumption and promote the development of many industries, but also can increase people’s well-being sense and meet the growing demand of leisure travel. To create a good leisure tourism environment, firstly, it requires the government to play its leading role, to scientifically manage and rationally plan leisure tourism products, to strengthen the construction and improvement of leisure

tourism infrastructure and related facilities. Secondly, it requires tourism providers to develop high quality and healthy leisure tourism products, to improve the quality of travel services, to concern about travel complaints and satisfaction issues. Lastly, it requires promoting leisure education vigorously, advocating the civilized and scientific leisure lifestyle to improve residents' quality of leisure life.

4.2 Develop diversified leisure travel products which is ecological tourism-oriented and suitable for residents to gain knowledge and share feelings

Residents travel motivations are to enrich life and gather with friends. Tourists expect to relax and share feelings with friends and relatives while broadening their horizon and enriching their life when appreciating the natural beauty, customs and culture in different places. Residents overall travel preference is diversified leisure tourism product--forest recreation--ecological tourism-oriented. Thus, only when tourism providers develop tourism products which meet residents' leisure demand in view of residents' travel motivation and travel preference, can tourism products be able to attract the attention of residents and stimulate residents' travel consumption.

4.3 Tourism area must pay attention to "word of mouth" publicity in their management

The ways residents obtained travel information illustrates that most residents will choose a tourism area according to the satisfaction degree of their friends and relatives of the area. While tourists' recommendation willingness indicates that most tourists would like to recommend the places that they have ever visited to surrounding people. Therefore, if tourism areas want to do great job in marketing, "word-of-mouth" publicity is essential. Because "word-of-mouth" publicity is unique and other marketing means can not replace, it is the best way to enhance tourism area's various aspects of service quality, improve tourists' satisfaction, and maintain a fine expression to tourists, for gaining a good "word-of-mouth" effect. A fine impression in tourists' mind is the basic of "word-of-mouth" publicity.

4.4 Develop self-help tourism market vigorously, and pay attention to promotion of individual market

At present, the most popular travel decision-making way for residents in medium-sized city is self-arranged travel with their relatives and friends, so self-help tourism market develops fast in recent years and has very large development potential. In addition, taking bus and self-driving are still the main methods to travel. Therefore, tourism planners should fully consider the self-help tourism market and develop good self-help tourism products vigorously. Considering the larger difference between self-help tourism and package tours in marketing, tourism providers should treat product publicity differently and pay attention to the promotion of individual market.

Abstract: The macro-regulation of the Chinese Central government has accelerated the development of real estate investment trusts (REITs). This paper analyzes the risks facing REITs in China. It suggests that a risk management system be set up to prevent the risks. It is concluded that the government and REITs companies should both play their part to promote its sound development. REITs market can actually help reducing the overall systemic risk of China's financial market, it will help to accelerate China's development on financial tool to serve the rapid development of the real estate economy.

Key words: REITs; Risk; Management; China

1 Introduction

With the tightening of the Central Government's macro control, China's real estate investment and financing patterns are changing. The main channel of financing – "credit" gradually is now shrinking with the emerging of all sorts of direct financing channels, such as property funds, trust, overseas listing of the securities, securitization of assets and etc. More and more real estate enterprises rely on the real estate trust for fund raising. However, in the development of China's real estate investment trusts, there exist many risk factors due to the market immature and the imperfection of the relevant laws and regulations. The purpose of the paper is to outline the risk management system of REITs. In order to achieve this, the following contents will be covered: the status quo of the REITs; the risk analyses of China's REITs; the risk management framework of REITs.

2 REITs in the Western Countries and in China

A REIT is basically an organization with the sole purpose of owning and managing investment properties-including apartments, shopping malls, office buildings, industrial parks, hotels and warehouses and etc. Typically there are Equity REITs, mortgage REITs and hybrid REITs. A equity REIT owns, or has an "equity interest" in, rental real estate rather than making loans secured by real estate collateral. Mortgage REITs makes or owns loans and other obligations that are secured by real estate collateral. Hybrid REITs combines the investment strategies of both equity REITs and mortgage REITs. Typical benefits of REITs include: (1) Access to real estate investment, REITs provide the opportunity for small investors to invest in expensive real estate assets that would otherwise be accessible only to institutional and wealthy individual investors; (2) Diversification, REITs allow investment in a portfolio of assets and provide an alternative to investing in listed property company shares. For institutions such as insurance companies, which require steady returns to match their long-term liabilities, the stable income stream of a REIT is an alternative to holding bonds; (3) Regulated status, REITs are typically a highly transparent and regulated means of investing in real estate, which boosts investor confidence; (4) Tax transparency, Most countries treat a REIT as a tax transparent vehicle, so the income earned by a REIT is only taxed on distribution to the investors and not at the REIT level, thus avoiding double taxation.

2.1 Reits in the U.S

Internationally, the United States was the first country to introduce the REITs. One of the main reasons the U.S. Congress created real estate investment trusts (REITs) was to provide economies of scale to individual investors participating in the risk-return tradeoff of large-scale real estate properties^[1] In 2006, the US had 197 REITs worth about 330.7 billion U.S. dollars compared with 34 REITs worth a total of 1.5 billion U.S. dollars in 1971 to U.S dollars in 2006. According to the NAREIT, the total market capitalization of equity REITs increased from \$0.33 billion in 1971 to \$151.27 billion in 2002. In addition, increasing participation by institutional investors resulted in a structural change in the early 1990s.^[2] Wang et al. document that institutional ownership in REITs between 1979 and 1990 ranged from 6.66 to 15.60%.^[3] Institutional participation had increased to 30%, according to Chan et al.^[4] The U.S. REITs is now in a period of relative stability.

2.2 Reits in Canada

REITs are relatively new phenomena in Canada, As of November 1994, there were only three REIT

strading in Canada, and just five by March 1997. At the time of the Initial Public Offering (IPO) pilot study reported, there were 13 REITs trading on the Toronto Stock Exchange (TSE), seven of which were launched in 1997. Total assets in Canadian REITs grew from Cdn\$80 million in 1993 to \$4 billion in 1998. Since 1998 the Canadian REIT market has been relatively quiet. Riocan acquired REALFUND and Summit acquired Avista, both on unsolicited offerings. Three new funds have issued IPOs: Cominar in September of 1998, O&Y REIT and Retirement Residences REIT (RETREIT) in 2001. RETREIT and CPL REIT announced in 2002 that they would merge.

2.3 Reits in China

According to the State Statistical Bureau of China in 2005, the domestic REITs market continued to show rapid development(as shown in Figure 1). Not only the types and scale were expanding, the product structure also showed a sign of diversification. Up to Dec. 31, 2005, a total of 121 REITs were issued with a value of 15.727 billion yuan, an increase of 28.73% over the same period in 2004. The issuing number and scale hit a historical height since 2002. At the end of 2006, China lifted the policy restrictions on foreign banks' operation in RMB deposit and lending. This means the Chinese real estate companies will compete in a fiercer environment and a new round of innovations in financial products and services will be spurred.

Figure 1 Loan Amount of Real Estate Industry Between 2000-2008 in China

3 Risk Analyses of Reits in China

As the natural selection of real estate development, REITs can widen the direct financing channel, raise the proportion equity financing of the developers, establish a mechanism for sharing risks and benefits. The introduction of REITs is widely welcomed by investors in China. But there do exist some risks due to imperfection of legal systems and lack of professional management in REITs

3.1 Legal risks

In the United States, there are some relevant laws to regulate REITs, such as Securities Act of 1933; Securities Exchange Act of 1934; Internal Revenue Code of 1986 (Sections 896-960); Tax Reform Act of 1986. For example, the Internal Revenue Code of 1986 stipulated that: REITs entity must be managed by one or more directors or trustees; Shares or beneficial interest in the entity, if the entity is operated as a trust, are transferable; The entity must have a minimum of 100 shareholders; The entity is not closely-held (no more than 50% of the entity's shares may be held by five or fewer individuals; The entity invests at least 75% of its total assets in real estate assets ;The entity derives at least 75% of its gross income from real property rents or interest on mortgage on real property; The entity pays dividends of at least 90% of its taxable income. All these laws are necessary for the sound development of REITs in the United States. But in China there exist some legal risks.

3.1.1 Risks brought by the imperfection of corresponding laws

In addition to one law and two regulations, China issued the Provisional Regulations on the Management of REITs Businesses of Trust Investment Corporations in 2004. These laws and regulations have specified some problems existing in REITs and made some breakthroughs. However, some of the important rules for the establishment of REITs are not proper, for example, the rule that stimulates that

the total copies of contract to a trustee should not exceed 200; the rule that all the REITs products are not allowed to promise profit to the buyers.

At the same time, the Fund Act, the Securities Act and other regulations all avoid such checking mechanism as corporate governance. The existing laws and regulations have not clearly stipulated such important questions as conflict interest, frauds, inside trading, agents and etc. Imperfection of laws would hinder the sustainable development of REITs.

3.1.2 Risks brought by the insufficient attraction of the preferential tax policies

REITs enjoys tax reduction worldwide, that is, the profits just transferred from the trusts to the investors, it should not be taxed twice. It is the preferential tax policies that attract the investors most. Up to March, 2006, the Chinese tax laws have not recognized this, nor have the qualification of REITs bodies. Currently for investors who invest in listed REITs or ordinary listed companies, they will face a 33% of the corporate profit tax and a 5% of the commercial tax. Such high tax has reduce the attraction to the investors.

3.1.3 Risks brought by frauds in the property ownership

A perfect system of property ownership and its transparent trading constitute the foundation of the REITs market. Fraud risks may occur if (1) the definition of property right is not clear. The existing laws and regulations basically deal with the property right in the state-owned real estate, and have not covered a variety of forms of property right; (2) the registration process is too complicated. REITs demands high flow, if the complication of the registration process will certainly increase operation costs; (3) the segmentation and transfer of property rights are not clearly specified. REITs raise funds by gathering the individual investors together. Thus the investors share the property rights. When the property rights are transferred, it comes to the question of how to divide the rights. But the existing laws only allow the whole transfer of property right.

3.2 Risks brought by the real estate market

Risk factors in the real estate market may affect the REITs value, such as the real estate price, the interest rate the rental return, the stock return. At present, the risks and REITs are closely tied to the capital market. With the interest rates going down worldwide, most of the investors buy REITs with the expectation that REITs will go up and they would rather accept a lower stock return. If the interest rate rebounds, the financing cost will increase and negative effects will occur.

3.3 Risks brought by the absence of fiduciary responsibility

REITs would suffer from poor management and investment failure if fiduciary responsibility is absent. As fund managers, the fund management companies, they are independent legal entities established in accordance with the Company Law, and should be supervised under the corporate governance. But the reality is that the shareholders of the fund management companies of China are mostly security companies, banks, listed companies, insurance companies. This kinds of shareholder structure would inevitably result in connection transactions and conflicts of interests.

4 Risk Management of Reits

The governments, trusts and investors all have their share and demands in the development of REITs. At the same time, they bear different risks. A risk management system can be established to prevent the risks with the concerted efforts by the governments and REITs.

4.1 Legislation by the government

4.1.1 Establishment of a sound legal system

In addition to the special laws concerning the investment fund, REITs should be regulated by the Securities Act, the Company Law, the Fund Law and the Contract Law jointly in order to achieve consistency in the legal environment. Preferential tax laws should also be made to attract the REIT investors.

4.1.2 Recognition of valid property ownership and the establishment of information disclosure

In order to establish a perfect REITs market, the government should bear in mind that: Recognition of valid property ownership is the prerequisite for the approval of REITs. The investment banks should reduce the risks via verification report and check before IPO. The capital management companies should check to insure that property ownerships they are purchasing are valid.

The supervising agents of the government should regulate information disclosure, ensuring that (1) *information* disclosure should be done in the media assigned by the supervising agencies; (2) strict and detailed rules should be made concerning such information disclosure as interest conflict, fraud, inside transaction and etc; (3) information disclosure should be done according to the specifications and texts

laid down by the supervising agencies.

4.2 Risk-reducing efforts by the trust companies

The trust companies should realize their full potential by releasing products of various risks and benefits through the creative design of the structure so as to meet the diversified and customized demands of the REITs market. In this way, the risks brought by the real estate market will be reduced. At the same time management by professional managers should be adopted to protect the interests of the investors.

4.2.1 A new mode to develop commercial property REITS

A new mode to develop commercial property has been introduced in China. It is similar to financing lease. The investment companies with strong managerial capability invest in retail and commercial properties and then lease them to the foreign retailers who do not want to invest and possess their own. Thus a strategic cooperation partnership is formed. The investment companies rely on the rentals for returns and the foreign retailers can save a large amount of money. The former can take advantage of the latter's brand name. The latter can depend on the former's managerial capability and the attraction to the international lessees and gather more customers. The investment companies can collect fixed rentals or can share portion of the sales profit plus the fixed rentals. In this way the value of the commercial property will be added.

4.2.2 Professional management of REITS

Professional asset management companies and managers should be hired to manage the daily affairs and the operations of REITs. They use their professional knowledge to devise the investment portfolios to reduce the risks so as to ensure higher returns.

The asset management companies should be highly skilled in a series of functions. For example, they know how manage the portfolios of real estate assets, know how to establish and explore future asset acquisition channels, know how to deal with the affairs related to investors. At the same time, professional manager system should also be set up to improve corporate governance, to establish a comprehensive internal control framework, to formulate the organizational constitutions and rules and etc.

5 Conclusion

Though REITs has developed rapidly in China, there do exist some risks due to imperfection of legal systems and lack of professional management in REITs. A risk management system should be set up to ensure the sound development of REITs. The government should try to improve the legal system, set up a system of information disclosure, and supervise and severely punish the law-violating practices. As for the REITs companies, they should realize their full potential by releasing products of various risks and benefits through the creative design of the structure so as to meet the diversified and customized demands of the REITs market. To sum up, the joint efforts by the government and the REITs field can reduce the risks and ensure its healthy development.

An Analysis of the Chinese Firms Investments Political Risks in West Africa

NABA Boukari Moctar, Chen Xiaofang

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: mocnaba@yahoo.fr, cxf2010611@163.com)

Abstract: This paper analyzes the political risks of Chinese investments in The West African Economic and Monetary Union (WAEMU) using the International Country Risk Guide (ICRG) methodology and data. The ICRG data are used to calculate Chinese investments risk index in WAEMU counties. The results show that the risk associated with the Chinese investments in WAEMU countries is lower than the risk associated with investments in general.

Key Words: Political risk; Chinese investments; WAEMU

1 Introduction

Political risk refers, for multinational companies, to the risk that a host country will make political decisions which prove to have adverse effects on the multinational's profits and/or goals, provoking strategic, financial or personnel losses. Currently, Chinese companies are becoming the biggest investors in Africa; where the political risks are very high hence a debate on the relationship between Chinese investments and their host countries political risks.

The aim of this paper is to analyze the Chinese investments political risks in The West African Economic and Monetary Union (WAEMU). It first presents the political risk variables according to the international country risk guide (ICRG), and then it uses the ICRG data to calculate the political risk for Chinese companies. The rest of the paper presents a review of the literature (2), a brief presentation of WAEMU (3), the methodology used (4) the results (5) and the conclusion (6).

According to C. Kennedy, political risk is related to changes in macroeconomic and social policies such as fiscal, monetary, trade, investment, industrial, income, labor and developmental policies or to political instability such as terrorist attacks, riots, coups, civil wars and insurrections.

In developed countries political risks is usually due to regulatory excesses while in developing countries is often linked to structural risks. These include regime instability, sync economic policies and ethno-religious-cultural imbalances in development, due to the monopoly of political power and economic wealth by a single dominant ethnic or religious group.

From the regulative institutional perspective, a decision on location choice for multinationals is to determine favorable locations where regulative institutional constraints are less repressive to FDI activity so that multinationals can more readily conform to the regulative constituents of the host countries (KANG & JIANG, 2011). The political and legal regime is one of the main dimensions of these regulative institutions. In this regard, host country political risk can be considered alongside any other kind of external influence that affects the company's operations, whether that means the possibility of expropriation or nationalization of the investments, or other government actions or changes in the political and social situation that could have a negative effect on economic activity (Kobrin, 1979; Robock, 1971; Simon, 1984).

The differences in political risk between countries affect the stability of their markets, which affects foreign companies aiming to do business there. The high degree of uncertainty associated with foreign ownership or increased asset exposure in the event of eventual expropriation are some of the factors that can hinder FDI decisions (Brouthers, 2002; Pak & Park, 2004). As a result, the conventional wisdom suggests that higher political risk will be negatively related to FDI, given that multinational companies will be more reluctant to invest in countries that are a high risk or have an unstable environment.

Although some papers focusing on Chinese multinationals support the view that Chinese investments are negatively related to higher political risk (Duanmu & Guney, 2009), there is empirical evidence suggesting that the risks of the host country do not affect Chinese multinationals in a conventional way. Cui and Jiang (2009a) found that country risk does not affect how Chinese multinational commit FDI resources. Buckley et al. (2007) did not confirm that Chinese outward FDI is negatively associated with high levels of political risk in the host country. Some papers even report that Chinese multinationals tend to invest in countries with higher levels of risks (Malhotra & Zhu, 2009; Ramsey, Yeung & Laforet, 2011).

2 An Overview of the WAEMU Countries

The West African Economic and Monetary Union (Union Economique et Monétaire Ouest Africaine, UEMOA) is a regional organization of eight West African countries (Benin, Burkina Faso, Cote d'Ivoire, Guinea Bissau, Mali, Niger, Senegal and Togo). They share the same money, West African francs (CFA francs), monetary policies, and French as an official language. The objective of the union is to promote regional economic integration and create a common market. Benin, Cote d'Ivoire, Guinea Bissau, Senegal and Togo are on the coast of West Africa whereas Burkina Faso, Mali and Niger are landlocked countries. The climate ranges from warm and humid on the southern coast and dry and hot in the semiarid countries. The economy is predominantly agricultural. Cocoa, coffee, timber, cotton, onions, sesame seeds, and Arabic gum are among the cash crops produced and exported by the union and also mining industry: oil, uranium, gold. Cote d'Ivoire, which represents the largest economy of the union, has some manufacturing activities.

Political stability has improved in some member countries. Niger after one year of military transitional regimes elected a new president in 2011. Cote d'Ivoire, after social conflict and a political crisis, organized a democratic election and a new president was elected in 2011. Senegal elected a new president in 2012 in accordance with the constitution after an attempt by the outgoing president to modify the constitution and remain in power. However, in 2012 there was political instability in Mali with a rebellion in the northern area and a coup d'état.

3 Methodology

The methodology is based on the international country risk guide (ICRG) methodology. The ICRG political risk index is a general index. In this paper, the political risk index is calculated for Chinese investments

3.1 The ICRG political risk rating

The ICRG political risk rating includes 12 weighted variables covering both political and social attributes. The aim of the political risk rating is to provide a means of assessing the political stability of the countries covered by ICRG on a comparable basis. This is done by assigning risk points to a preset group of factors, named political risk components. The minimum number of points that can be assigned to each component is zero, while the maximum number of points depends on the fixed weight that component is given in the overall political risk assessment. In every case the lower the risk point total, the higher the risk, and vice versa. A political risk rating of:

- 0.0% to 49.9% indicates a Very High Risk;
- 50.0% to 59.9% High Risk;
- 60.0% to 69.9% Moderate Risk;
- 70.0% to 79.9% Low Risk; and
- 80.0% to more very Low Risk.

3.2 Variables

Table 1 The Twelve Variables with Their Corresponding Maximum Score

	Variable	Score
A	Government Stability	12
B	Socioeconomic Conditions	12
C	Investment Profile	12
D	Internal Conflict	12
E	External Conflict	12
F	Corruption	6
G	Military in Politics	6
H	Religious Tensions	6
I	Law and Order	6
J	Ethnic Tensions	6
K	Democratic Accountability	6
L	Bureaucracy Quality	4

Table 2 The Subcomponents of the 5 Variables (A,B,C,D,E) in Table 1

A Government Stability	B Socioeconomic Conditions	C Investment Profile	D Internal Conflict	E External Conflict
1-Government Cohesion	1-Unemployment	1-Contract Viability	1-Civil War	1-War
2-Legislative Strength	2-Consumer Confidence	2-Repatriation	2-Terrorism	2-Cross-border Conflict
3-Popular support	3-Poverty	3-Payment Delays	3-Civil Disorder	3-Foreign Pressures

3.3 Data

Data was collected from international country risk guide (ICRG) for the West African economic and monetary Union Countries. From the 8 countries, data for Benin was not available and China does not have any relationship with Burkina Faso hence, the study was conducted with only six countries namely: Cote d'Ivoire, Guinea Bissau, Mali, Niger, Senegal and Togo and data is calculated mostly for western countries investment. According to interviews and data collected for terrorism attacked, (computed in variable D Internal conflict). The political risk index is calculated for Chinese investments in West Africa.

4 Results

Table 3 The Scores and Political Risk in 2012

COUNTRY	A	B	C	D	E	F	G	H	I	J	K	L	Political Risk 2012
Cote d'Ivoire	8.5	2.5	8.0	8.0	9.5	1.5	2.0	2.0	2.5	2.0	3.0	0.0	49.5

To calculate the Chinese investment political risk in West Africa, The highest score of 4 is given to the second column of variable D internal conflict which corresponds to Terrorism. Then the Political risk index is calculated for Chinese investments in West Africa. The result is given in table 5.

Table 5 The General Political Risk and Chinese Investments Political Risks in 2012

COUNTRY	Political Risk 2012	Chinese invest political Risk 2012
Cote d'Ivoire	49.5	51.50
Guinea-Bissau	48.5	50.00
Mali	51.0	53.00
Niger	50.0	51.50
Senegal	56.0	57.00
Togo	50.5	51.50

Figure 1 The General Political Risk and Chinese Investments Political Risks in 2012

The results show that the risk rating score for Chinese investments is higher than the general risk rating. The risk went from very high (less than 50%) for Cote d'Ivoire and Guinea-Bissau to high risk (between 50% and 60%) for all the 6 countries for the Chinese investments.

5 Conclusion

Although there is a debate about the Chinese investments and the political risks in their host countries, it can be concluded that the political risk for Chinese investments is quite different from the one for western investments. This study has shown that the political risk in WAEMU for Chinese investments is lower than the one for western countries. It therefore can be recommended to Chinese investors to assess their own political risk indexes in Africa because it may be different from the one for western investments.

A Theoretical Study on Health Quotient Promotion-based Physical Education Reform at the University Level

Fu Junfen

Sports Department, Jiaying University, Jiaying, P.R. China 314001

(E-mail:Qingang918@hotmail.com)

Abstract: University-level physical education does not currently include or implement health education. As a consequence, college and university students have a very weak theoretical understanding of health. This study maintains that university-level physical education should focus on the state of students' health, using the principles of the health quotient. Of particular importance are problems related to mental health, social adaptive ability, and lifestyle. Physical education should incorporate instruction based on health quotient-related theories and techniques; doing so will lay a strong foundation for students' lifelong physical education. In addition to opening up new paths and methods in research related to the all-around health education of college students, this can also enrich and perfect the theoretical system of modern sports science, as well as provide a new line of thinking and perspective to university-level physical education reform.

Key words: Health quotient; University-level physical education

1 Introduction

In the National Mid-to-Long Term Educational Reform and Development Program Outline (2010-2020), it is stated that maintaining comprehensive individual-based all-around education is the strategic theme of educational reform and development. At its core is finding a solution to the question of what kind of people education should aim to cultivate and the methods that should be used to do so. Key points include gearing education towards the entire student body and promoting the comprehensive development of students. It also emphasizes the importance of striving to increase students' sense of responsibility towards serving their country and society, their daring and creativity, and their problem-solving abilities. University-level physical education must firmly establish the idea of "health first," increase the quality of physical education, strengthen mental health education, and promote students' mental and physical health. The *National General College and University Physical Education Course Instruction Outline*, issued by the Department of Education in August of 2002, names "strengthening one's physical constitution, improving health, an overall increase in students' physical strength and ability to adapt to their environment, and promoting the comprehensive development of mind and body" as the most important responsibilities for university-level physical education in China. This publication gives prominence to health objectives that include allowing students to achieve comprehensive development in "the five areas of exercise participation, exercise skill and technique, physical health, mental health and social adaptation". If students are to achieve comprehensive development, health quotient education is a key indicator that can test schools' administrative principles, direction, and strength. College and university students are a special group; they have specific life experiences and growth environments. Institutions of higher education require measures and strategies that focus on individuals at varying stages of development; they should regard students' individual health quotient growth from the viewpoints of development and change. The purpose of health education is to foster good hygiene and exercise habits among students and to allow them to achieve comprehensive development in regards to health, so as to strengthen their social adaptive abilities.

The key points of higher education in China, as well as all-inclusive education, include the education and cultivation of a proper lifestyle and the establishment of scientific views towards health. The concept of the "health quotient" offers us a new line of thought that can be applied to these tasks. An urgent problem exists in university-level physical education theory and practice. While carrying out health-based instruction, schools must demonstrate how to apply physical education to increase students' use of the health quotient, such as through the effective use of classroom-based and extracurricular physical education activities; additionally, schools must be able to evaluate and predict the health conditions of their students. In addition to opening up new paths and methods in research related to the all-around health education of college students, this can also enrich and perfect the theoretical system of modern sports science, as well as provide a new line of thinking and perspective to university-level physical education reform.

2 Analyzing and Understanding Health and the Health Quotient, and Methods of Their Promotion

2.1 Health and the Health Quotient

In 1949, the United Nations World Health Organization (WHO) defined health as not only the lack of disease or physical weakness, but rather the satisfactory state of one's body (in terms of physiology), mental health, and social adaptive abilities. Fifteen percent of health and longevity is determined by heredity, ten percent is related to social conditions, eight percent is related to healthcare conditions, seven percent is determined by environmental factors, and sixty percent depends upon an individual's behavior. The health quotient (HQ) reflects an individual's knowledge and understanding of health and is an effective evaluation index of one's state of health. It uses a statistical index to measure an individual's knowledge understanding of health as well as the ability to maintain one's health. The health quotient gives particular prominence to personal healthcare. It emphasizes that through personal healthcare an individual can achieve optimal physiological, psychological and social health. Additionally, it focuses on the individual's healthy lifestyle and habits, as well as the whole and systematic study of methods of health care.

2.2 Promoting Health and the Health Quotient

In 1988 the WHO defined the promotion of health as the promotion of the methods of maintaining and improving individuals' health. Their definition also states that health promotion is a strategy of harmonizing people with their environment, and should decide every individual's responsibility in regards to their health. They emphasize the importance of active participation in the promotion of health on the individual, group, and even the societal level. People must correct unhealthy habits and behavior, optimize their lifestyles, and promote the improvement of the environment. The promotion of health can be applied to a wide range of settings and can aid the analysis, prediction and explanation of many behavioral habits and trends. Like the concepts of the intelligence quotient and emotional quotient, the health quotient is one characteristic of an individual. It can be improved through education, by applying willpower or emotional intelligence, and through diligent physical effort. The health quotient is an accumulation of health-related skills and knowledge. Through education, environmental development, as well as the additional accumulation of skill and knowledge, it can continue to grow. On these grounds, the author attempts to define the promotion of the health quotient as the individual's proper use of health care-related knowledge, the direction-based analysis and improvement of one's health score, as well as the maintenance and promotion of healthy habits and behavior. The promotion of the health quotient ensures that people can successfully synthesize healthy behaviors and activities with stable mental health. Its purpose is to give people full control over their own health.

3 Viewing Existing Deficiencies in University-Level Physical Education from the Perspective Of University Students' Personal Health

3.1 The troubling current state of university students' personal health

3.1.1 University students' quality of health continues to slide

On September 2, 2011, the Department of Education, the National Office of Physical Education and the six national ministries and commissions jointly published the *2010 Study and Research Results of the Nationwide Physical Condition and Health of Students*. This publication points out that as the physical health of elementary and middle school students improves, the collective physical health of university students continues a downward trend. The amount of physical exercise among university students is clearly below that of elementary school students; university students spend an excessive amount of time online, watching movies, and playing video games.

3.1.2 Although college students pay attention to their personal mental health, they lack timely and effective solutions when facing psychological problems

This eventually results in a poor capacity for handling psychological problems and the lacking of abilities for interpersonal communication and dealing with disappointment.

Between November 30, 2010 and February 28, 2011, the University Student Press and the Chinese University Student Network focused on ten aspects of psychological problems among university students, such as the causes of these problems, students' current conditions, and countermeasures against these problems. In an online evaluation carried out to assess the state of mental health among university students, the most prominent problems were pressure in interpersonal communication, the pressure of finding employment, and poor self-management abilities. In 2005, eleven top scorers in the national college entrance examination were rejected from the University of Hong Kong after undergoing

personal interviews, the reason being that the university did not admit “bookworms”.

3.2 Viewing the current deficiencies in university-level physical education from the perspective of university students' health

3.2.1 In physical education classes, university students cannot achieve a theoretical understanding of health and personal healthcare and cannot satisfy the objectives of health education

Physical education at the university and college levels devotes a great amount of time to classroom education. In contrast, the theoretical knowledge of physical education is given comparatively little attention, only composing between fifteen and twenty-five percent of classroom content in a semester. Classes in physical education theory derive their content from *An Outline of Physical Education Culture*, edited by Yu Kehong and Jin Fuchun. Its educational content is primarily related to sports and physical education, such as the role of physical education in personal development, the Olympic Games, a comparison of physical education culture in China and the West, and the causes and treatment of sports-related injuries. It lacks instruction dealing with mental and physical health, as well as lifestyle-related content and theories. Students are unable to obtain a good understanding and comprehension of health theory or proper health care habits through theoretical study. The majority of the semester consists of practical classes that are based on the study and instruction of skills and techniques; students' grades are still based on skill evaluation. In these classes it is impossible to discuss and explain theoretical knowledge, and health education cannot be included. There are many ways to achieve an understanding of health. Physical health may be demonstrated through a physical education class, but mental health, social adaptability and moral health should be taught through other kinds of athletic activities; they cannot be taught dogmatically. Physical education teachers in universities have their own understanding and views towards health, but weekly physical education classes do not allow students to achieve a satisfactory collective understanding of physical education theory or skills and techniques. The basic quality of grading is steadily decreasing, and assessments and evaluations also continue to decrease their requirements.

3.2.2 Course selection still cannot satisfy students' interests or needs

Apart from required courses, students prefer teaching materials that are relaxing, lively, and exciting. Students enjoy dance (including “dance sport”, hip-hop dancing and aerobics), small-ball sports (tennis, badminton, shuttlecock), and other entertaining activities; they also desire to study traditional Chinese methods of health care. Male university students pay attention to major national and international sporting competitions, especially American NBA league matches and CBA games, as well as tennis competitions like the US Open and Wimbledon. These students wish to learn the basic knowledge used to enjoy, discuss and analyze these exciting sports competitions; they are also very interested in studying the methods used to referee these matches.

3.2.3 University students' physical education grades are still based on skill evaluation and participation
This grading system lacks a comprehensive evaluation of students' knowledge of health, their behavior or their personal health care skills.

University students' physical education grades are still based on skill evaluation and participation. These grades do not reflect physical health, mental health, or social adaptability and lack a comprehensive evaluation of students' knowledge of health, their behavior or their personal health care skills. This form of assessment – which only focuses on skill and technique and ignores the formation of good habits and the understanding of healthy exercise – still continues at present. As a result, students believe that physical education class is merely the study of athletic skill and only attempt to achieve passing grades.

4 What Path of Development Should Health Quotient Promotion-Based Physical Education Reform at the University Level Take?

Basic Requirements of the Health Education of University Student (Test), published by the former national education commission, mentions that “every institute of higher education must include health education in their curriculum. Additionally, according to their own needs and conditions, schools must offer lecture courses and electives in health education.” The publication offers a guarantee to research based on these principles. University students are a special group; the promotion of the health quotient involves students' use of proper healthy habits and strategies, observing and evaluating their personal state of health through the use of the health index, direct analysis and increase of their health scores, and improvement of their level of health. On these grounds, the strength of university-level physical education reform should be measured by the health quotients of university students. But if the increase

of university students' health quotients is made a part of university-level physical education and leads to the incorporation of health education, in what ways will it lead to it? (See figure 1)

4.1 Research on the relational degree between the health quotient and the objectives of university-level physical education

This publication gives prominence to health objectives that include allowing students to achieve comprehensive development in “the five areas of exercise participation, exercise skill and technique, physical health, mental health and social adaptation.” According to *Health Quotient*, edited by Professor Xie Huazhen, the health quotient consists of five dimensions (personal health care, health knowledge, lifestyle, state of mind, and life skills) and twenty factors (see picture 1). Achieving unanimity in regards to objectives is a prerequisite of increasing an individual’s level of health. Following is an analysis of the relationship between the dimensions and factors of the health quotient. Firstly, these dimensions and factors both place importance on achieving an understanding of health and the methods of maintaining a healthy mind and body. The health quotient emphasizes the use of a point-based score in regards to lifestyle and habits to judge an individual’s level of health. University-level physical education must incorporate the spread of information and behavioral instruction; it must help individuals as well as groups achieve an understanding of proper health and hygiene. Physical education at universities must establish proper concepts of health. Schools must willfully adopt a curriculum that includes courses and activities that support healthy behavior and a healthy lifestyle. Secondly, physical education does not give much attention to the healthiness of students’ lifestyles (smoking, alcohol, drugs, eating and drinking, nutrition) and also neglects to address students’ psychological health. Rather, students attend weekly physical education classes that only require them to understand certain athletic skills and techniques. Additionally, health education is essentially a kind of intervention. The time spent on this sort of intervention needs to be increased in activities both inside and outside class. The health quotient can be used to evaluate students’ personal health. Finally, in regards to using the aforementioned dimensions and factors to evaluate students’ states of health, physical education currently lacks any kind of specialized assessment or evaluation of its target areas. University-level physical education only bases its assessments on individual class grades; books are used to evaluate students’ knowledge of theory.

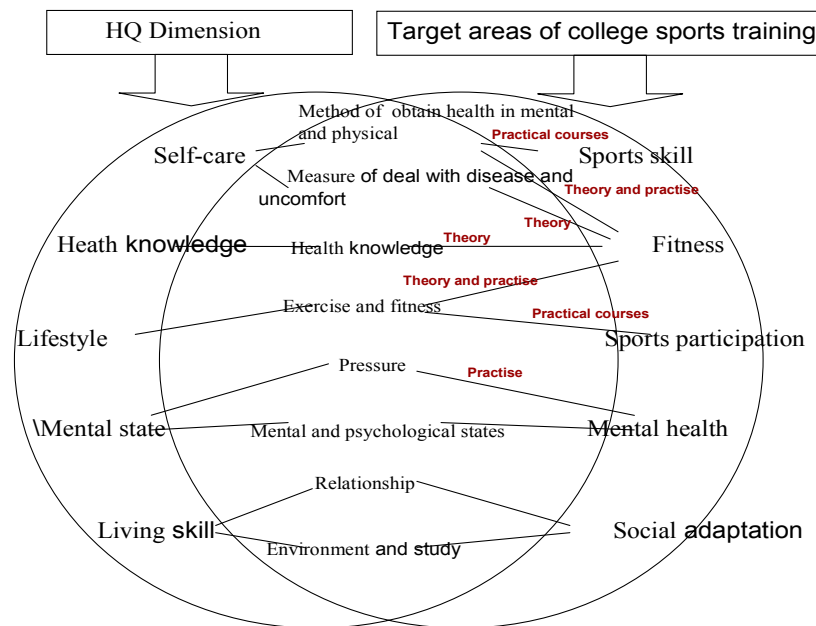

Figure 1 Relational Degree Between the Health Quotient and Target Areas of University-Level Physical Education

4.2 Research on health quotient-based physical education reform at the university level

4.2.1 Establishing a guiding ideology of “health first” and carrying out all-around student instruction in physical education classes

Firstly, if physical education courses at universities are to foster students' all-around development, their priority must be the cultivation of students' social adaptability. Educators can plan and implement group activities and use all sorts of different tools and settings to carry out group-based and individual challenges and tests. Examples include outdoor exercises, creative small group activities in musical athletic elective classes, and the psychological "trust fall" game. Through these kinds of activities and programs, individuals can gain an understanding of how to work with a group, the constant need for communication when cooperating with others; they can also promote interpersonal communication between students. Through cooperating, students will learn to accommodate the needs of others as well as the importance of group coordination; as a result they will be aware of group and social dynamics. This will strengthen students' willpower and allow them to view themselves and others from a proper perspective. These activities will result in an increase in students' social adaptability.

Secondly, in order to provide students with comprehensive, university-level physical education courses must also focus on cultivating healthy lifestyle habits. Doing so will ensure the increase of students' level of health. One way this can be carried out is through the distribution of pamphlets explaining healthy lifestyle habits. Also, splitting students into competing groups in the classroom will help give them a clear understanding of healthy lifestyle habits. Through the addition short essays on healthy lifestyles to physical education curriculums, students can learn about personal health care, understand how to live a healthy lifestyle, and also fulfill part of their physical education grade – how can one argue against implementing this?

4.2.2 The content of university-level physical education must be expanded

Classes on theory must include content on health-quotient education, particularly in respect to lifestyle, personal health care and healing. Practical classes should incorporate group-building activities. For instance, according to the respective needs of physical education programs, schools should add group-based practices and competitions that increase group awareness and collective competition. Such activities include group competitions in the form of large-ball games like basketball, volleyball and football. These competitions may be carried out between teams or even amongst different classes. These do not need to utilize a full court for these activities; many places may be used for small-scale activities. Students may freely organize teams for small-ball sports (table tennis, badminton, tennis); Shooting games may also be carried out. Activities with musical accompaniment (aerobics, hip-hop dancing, rhythmic exercises) can even test students' ability to create routines.

4.2.3 More time must be devoted to theoretical study in class.

Students must improve their understanding of health and health care and should learn how to determine their own state of physical health.

Classes on theory must be increased. Content taught in technique-based classes must be flexible and direct enough to incorporate instruction and perspectives related to the health quotient. Some students take a greater interest in learning about rather prominent health problems. Classes may provide a daily log for students; through constant attention, teachers may provide assistance to students or coordinate with other professional instructors to directly correct and maintain healthy behavior and habits.

4.2.4 Increasing the overall quality of university physical education instructors;

Carrying out a comprehensive evaluation of the objectives of physical education courses – physical health, mental health and social adaptability. Physical education instructors must not only possess athletic knowledge and skill but should also have an abundant knowledge of health and health care. In addition to evaluating students' physical abilities, they must be able to carry out the comprehensive analysis of the physical education course objectives of physical health, mental health and social adaptability.

4.2.5 University-level physical education must include health quotient-based education in its scope of evaluation.

Self-evaluation should be combined with the evaluation of students, not simply students' evaluation of their instructors.

5 Conclusion

The increase of university students' health quotient levels is intertwined with the permeation of health education in university-level physical education. Physical education classes can broaden students' understanding and develop their social adaptability. Through a series of lecture courses and theory-based classes on healthy lifestyle habits, schools can effectively use classroom education to

further educate them about the health quotient and to instruct them to practice personal health care in a scientifically sound manner. Under the guiding concept of “health first,” university-level physical education can carry out health-based education to truly achieve its goal of improving students’ health.

School Physical Education and the Chinese National Sports Culture Innovation

Zhong Pengfei

Physical Education Department of Wuhan University of Technology, Wuhan, China, 430070

(E-mail: zhongpengfeiaaa@163.com)

Abstract: This paper, beginning with a research of our national physical characteristics and aiming at the adverse situation of modern Chinese national sports development process, puts forward a strategy of promoting our national physical culture. Namely, unearthing Chinese national sports general rules so as to blend national physical culture into physical education field and school sports teaching activity into the essence of national physical culture. Meanwhile, processing and promoting national physical projects to achieve a goal, which is, rousing national spirit, strengthening national unity and enhancing the popularity of national sports culture from generation to generation. In addition, inheriting and carrying forward the excellent Chinese national sports culture through education position to walk along a road of national traditional sports development with Chinese characteristics.

Key words: The national sports; School sports; Sports culture

1 Introduction

Sports culture, created by human beings in sports life and sports practice, is reflected through tangible physical configuration, movement skills, sports equipment, material and intangible will, conception, age spirit related with social attributes and reveals the existence of the unique way. During the course of sports life and practice, body morphology changes and movement skills can be shown by the means of athletics, entertainment and education for the sake of healthy development both physically and mentally—and that is what sports culture with motion properties is. The inheritance of sports culture refers to the remaining certain characteristics of attributes handed down from different ages. Since the sports culture is based on body movements as its elementary form of expression, the body becomes the main way of heritage. However, the unique languages and characters attached to the sports culture also function powerfully in the aspect of inheritance. Some changes of content, structure and even mode may happen during the historical development course of sports culture, which is called the innovation of sports culture. Definitely, it is tortuous and tough to walk along a road of sports culture innovation. Nevertheless, it is generally moving forward and achieves the unity of progressive and twists.

The school sport is an important part of all-round development of school education all over our country. Furthermore, it plays a significant role in improving students' healthy level, enhancing students' physical fitness and enriching their cultural life. In addition, it can also produce a positive effect on students' overall development of intelligence, moral character, aesthetic ability, etc. Chinese national sport is precious cultural heritage of the Chinese nation. There are so many excellent national traditional sports, which are not only of high fitness value but also of great artistic value and can function well both in entertainment and education. Including national sports into school education, for one part, can be a significant supplement and development to the content of school education; for another part, can help to set up the "people-oriented" education concept and have a profound realistic influence on invigorating our national sports and cultivating students' national emotion.

2 The Cultural Characteristics of Our National Sports

There are 56 ethnic groups living in China and reproducing from generation to generation. The colorful and stylish traditional sports, created by each group, draw an outline of magnificent spectacle of Chinese sports and a splendid view of Chinese civilization. It plays a particular role in the national modernization construction, national fitness campaign and cultural blending between East and West.

2.1 Nationality and Heredity

Where there lives a certain ethnic group, there exists national sports culture and different ethnics show different distinct characteristics—that is what nationality refers to. Since an ethnic group depends on a certain area as its living space for long-term thriving, their sports activities and some national sports cultural phenomena, such as values and aesthetic taste, can be defined, to a great extent, by the region they inhabit. Therefore, the content and form of our national sports activities, seen from another angle, reflect the production mode and living way of a certain place and its social climate. Influenced by different geographical environment, varied, colorful but also distinctive national sports activities are formed in minority areas. And these activities are by all means one of the local folks' skills gained in the process of living, such as the boating race in south area, Northland ice-skating, camel racing in desert, mountain walking, horsemanship and archery in prairie, jungle shooting, etc, which all retain the trace

of production mode and lifestyle in diverse geographical conditions. Along with the development of local folk culture, these stylish sports activities with distinct local features still remain nowadays and continue growing maturity.

2.2 Fitness and Recreation

The fitness performance of national sports is self-evident. As early as in primitive society, people have realized the effect of exercise on the health of the human body; There is a popular analogy “moving things are unlikely to go bad”, and it doesn’t take a genius to see that people from ancient times had some awareness of movement value. In martial arts, for example, it puts great emphasis on the following factors: combination of form and spirit, cultivating of the inside other than the appearance, inner temperament refining as well as outer muscle practicing. In that way, martial arts have always been considered a way to, as advocated by the world, keep in good physical and mental health. All kinds of laws of boxing and kicking in martial arts have high demands in the flexibility and explosive power of body, in addition, give a lot of exercise to muscles and ligaments; Body work as “underhand, back-up, drop, fold and stack” have good training on the properties of human body coordination. Soft, slow and light shadow boxing, Eight-sectioned Exercise and Guide can regulate mood and relieve stress, effectively enhancing human health.

Entertainment is one of the greatest features of Chinese national sports. In ancient times, pleasant physical activity is an indispensable and important content of mankind’s cultural life. The stylistic features of traditional sports with combination of style are that sports and watchers are to be joyful mind, cultivate temperament, adjust taste, and satisfy the spiritual and cultural needs. In a number of traditional festivals, there are many singing and dancing, lively and amusing sports and entertainment activities with bright rhythms as the main content. Such as: “A’XiTiaoYue” of the Yi nationality, “XiangJiao Drum” of the Dai nationality, “DongBa dance” of the Naxi nationality, “LuSheng Jump” of the Miao nationality and so on. They are the sports and entertainment projects inclusive of fitness, entertainment, fun and art..

2.3 Season and diversity

In China’s minority areas where agricultural production is the main activity, sowing in spring, hoeing in summer, harvesting in autumn and stocking in winter are the pace of life. Steppe peoples dominated by animal husbandry and hunting are also under the influence of phonology and climate, thus their cultural life is associated with a certain season of life. Therefore, many national sporting events are often derived from a farming season and held in the season, such as the torch festival of the Yi nationality, the water-sprinkling festival of the Dai nationality, the autumn chasing festival of the Miao nationality, “Nadam Fair” of Mongolian, the harvest festival of the Goshen nationality and activities likewise. There are corresponding contents of national traditional sports activities in them so that the national sports activities implemented takes on a distinct seasonality.

On the vast territory of the motherland, each nation’s traditions, the subjective and objective conditions are not entirely the same, which accounts for the differences of interests and hobbies. Thereafter, sport will inevitably takes on a multiple characteristics. According to the statistics of “The Chinese nation tradition sports records”, China has sorted more than thousands of national traditional sports, which can be called in the world.

2.4 Integrity and Cultural Value

It has already been learned by people from the national sports activities of our country that human’s survival and development rely on groups. Integrity is the adhesive to bind different individuals. For example, in the sword dance of Jin Po nationality and the black tiger sacrifice of Yi nationality, participants act as a group and their movements are all the same. That increases their awareness of teamwork and overall approval, consequently forming the national affinity and cohesive power. What’s more, in many activities such as horse racing, bullfight and wrestling, the participating unit is generally a village. Besides strong awareness of competition, the participants should also have collective sense of honor. It is that trait that makes national sports plays an important role in the group education of minor nationalities.

The cultural attribute of traditional nation sports mainly reflect in its blending and absorbing for national culture. Traditional nation sports chiefly stem from the nation’s origin tales, the multiply of races, the primitive production, and the living and religious customs. This makes the traditional nation sports possess a variety of features of national culture, involving the national history, ethics, religions, philosophy, art etc. It reflects the value, the aesthetic view and the national emotion, which enables the traditional national sports to be the carrier, and also the important part, of national culture.

3 The Present Inheritance Situation of Chinese National Sports Culture

3.1 The Inheritance Dilemma

On the first half of the century, in the competition of national and foreign sports, though the national sports was once back with some kind of sports items being adapted and added to the national sports meeting, its returning was just a flash in the pan. In the sampling survey on the Zhan nationality of Guans Xi province on April in 2006, traditional national sports items are decreasing at a rapid speed, and the scale of the remaining items is also narrowing. For an instance, the research result shows that the number of remaining traditional national sports items of Zhan nationality in Guangxi province was 134, which reduced into 40 in 2006. Besides, the scale is narrowing and distribution area is decreasing. Previously, most of the traditional national items were blossoming everywhere. However, now there are only bits and pieces of activity clues exist in a few representative districts. Thereby, the problem of failing to hand down the traditional sports culture from our past generations is fairly serious.

The sports culture which are mainly based on exercise are chiefly universal types with extensive mass foundation, and they are deeply favored by the vast majority of people. But in the marketing economical system, their many contents are gradually disappearing from our life. There are several reasons. Firstly, with the reform and open policy, seas of new and novel entertainments are flooding to our life. People began to regard those traditional ones as obsolescent with nothing new, and they turned their attention to the newer types. That is to say, interest transfer appeared. Secondly, with the modern life pace accelerating, people are too busy to learn the fists in the traditional sports culture; in turn clumsy fists are tend to make the participants lose interest. Thirdly, it is because of the continuous improvement of the social productive forces, "art" is no longer the main source of income. People who still get income from their fists will find that the loss outweighs the gain. As a result, fewer people will learn it. Finally, people's concept towards folk festivals are gradually fading. Hosting the folk activities is nearly becoming the government action while some folk festivals are only remaining "festivals" never "a-day-off". Even if there are activities, people still can't afford the time to participate in. With the reasons mentioned above, the contents of this kind of traditional sports culture are gradually fading with some even already disappearing in our life.

3.2 Inheritance Driving Force of Our National Sports Culture

The formation and the development of Chinese traditional sports is a historical process, and its function determines is vitality. At the early time, in order to survive, our ancestors had to not only fight with natural living environment, but also resist foreign aggression and protect their own national interests from the invaders. This had promoted the development of martial arts, wrestling, riding and archery and some other traditional sports, whose functions were mainly to adapt to and meet the needs of production and normal life. With the changing times and rapid development of our nation's productive forces, national sports' functions of adapting to the production and people's lives are far from being able to meet people's growing material and spiritual needs. Chinese national sports teaching is not only of great value in exercise, entertainment and education, but also bears the power social function of culture heritage, national economy development and humanistic connotation highlight(see table1).

Table 1 National Physical Culture Items Classification

number	Category	National Sports
I	Combat sports	Boxing class: long boxing, Shaolin boxing, mantis boxing and other Instruments: hook shot, body type, single instrument, double instrument, the soft instrument
II	Recreational activities	Broomball: polo, pearl ball, soft ball etc Dance drama class: the dragon and lion dances, shaking the boat, the bamboo pole dance The boat show: the dragon boat, dragon boat, canoe, Saipi raft race Water play: swimming, diving Snow and ice skating, skiing, playing: ice GA Chess: chess, chess etc. Other categories: qianghuapao, swing, kite, shuttlecock, rope skipping etc.
III	Fitness sports	Tai Chi Class: the fitness of Taijiquan, Taiji sword, Tai Chi ball rod etc. Dancing class: Dunhuang style dance, dance Mulan, Mulan fan dance etc.
IV	Health Sports	Wuqinxi, muscle-bone strengthening exercise, eight section brocade

3.3 Inheritance Status of Our National Sports Culture

Sampling survey of sports projects in parts schools showed that 85% of the schools surveyed offer national sports in their physical curricula; 77% of students have great interest in national sports, including Long Fist, Tajik, folk dance, shuttlecock, spine, dragon dance, lion dance, kendo and so forth, among which Chinese martial arts takes the major part. Some sports like skating, swinging, swimming, archery, wood shooting, kiting and drum, which are greatly influenced by ethnic customs, territories, climate and some other factors, are quite universal among elementary and secondary schools in areas of minority nationalities. The survey also implies that sports teaching prepared in class appears in the games. Secondary and high school students have less interest in national traditional sports and most of them insist that theoretical teaching of national traditional sports should be added to physical curricula so as to provide them a better understanding of Chinese traditional culture, thus scaling them up globally.

About the understanding that national sports can be a part of school teaching content or not, only 45% students hold the view that it should be a part of school teaching content. According to the survey among teachers, 86.5% teachers believe that national sports are a part of school teaching content. Whether it is feasible that schools should have national sports or not, 76% students and 89% teachers think it is feasible. This consensus provides a good practical basis for national sports entering into schools.

With the development of society, many of national culture and traditional sports are on the verge of extinction in the local area. Faced with the situation, schools should consciously assume the responsibility of inheriting and developing the national culture. With the national sports activities as a breakthrough, we can sort out the national sports and organize some activities to popularize these sports. National sports, as an important part of distinctive culture of all ethnic groups, play a significant role in carrying forward national cultural, inspiring national spirit, promoting national sports cultural and strengthening national unity.

4 The National Characteristics of School Physical Education Core Value System

Exploring school physical education core value system in our country, we must establish connection with rich national cultural in our country. Meanwhile we'd better to consider it with the background of Chinese characteristic socialism core value system and the construction of socialist harmonious society. Of course, it is necessary to take the Marxism as the guiding ideology, reflecting the patriotism as the core of the national spirit and the Time Spirit with the reform and innovation as the core; even reflecting the socialist sense of honor and disgrace. School physical education core value system must firmly grasp the socialist orientation of advanced culture; carry forward the national excellent cultural tradition; draw lesson from beneficial achievements of human; advocate the idea of the harmony; cultivate the harmonious spirits; set up the common sports faith and ethic.

4.1 The connotation of the school physical education core value system

Physical education core value system reflects the core values of sports. Physical education system has been deepening continuously during the process of recognition of sports. Surely it forms from the function to the human and society. It is based on the multiple sports value. In fact, it is formed in the process of carrying forward leading, containing variety, discarding the dross and selecting essential, discarding the false and retaining the true, and blending. This system is clearly reflected in China's Confucian culture of "harmony is precious" and "harmony but not sameness" thought. Therefore, sports core values are essentially based on the multiple sports value system and it forms from the foundation of summing, concentration and innovation. The school physical education core value system map out of school education thought. It also plays a vital role in people's development lifelong physical education. The school physical education core value system shall be integrated into the essence of national culture and inherit rich national culture in our country.

4.2 The construction of school physical education core value system

The school physical education core value system is the root of building harmonious sports culture and has the important entry point of constructing the sports core value system with Chinese characteristics. Firstly, it must reflect the natural attribute of sports—the function of bodybuilding and entertainment. And it should reflect the joy of sports within the process of exercising and the change both in body and heart. Secondly, it should make the law as the foundation and maintain the justice and equality of sports. Only in the condition of rule by law, can the fair and justice of sports be achieved. And the pursuit of sports value by society and individuals can be guaranteed in the same condition, with

satisfying constantly the people's need of body fitness. Thirdly, it must establish a new relationship which is harmonious and between man and man, man and society, man and nature. As a result, sports can make people and nature more friendly and intimate. Bathing in the sunshine and dew, people accept the baptism in the embrace of nature.

4.3 The national characteristics of schools' corn physical education system

The schools' corn physical education system embodies our nation's national characteristics. Firstly, being a harmonious system, it can elaborate the educational function of schools' physical education and help students utilize sports to meet the differences existed in their needs. Secondly, it reflects the "people-oriented" education idea and cultivates students' fine personality traits. Furthermore, the spirits and pursuit of value shared by the whole country and nation are also being reflected in this system. Possessing distinctive characteristics, it reveals the specific essence and value orientation owned by physical education. Thirdly, the schools' corn education system is a constantly innovating opening system. It can inherit the excellent traditional sports cultures in our nation, learning and absorbing all achievements of civilization which are beneficial to the development of our national sports and improvement of whole nations' physical and psychological qualities. Developing and creating sports culture continuously meets people and society's demand for sports and provides inexhaustible drive power for our national sports' better and faster development.

5 School Sports' Inheritance and Innovation to Our National Sports Culture

5.1 School sports inherit our country's venerable sports cultural resources.

Schools' sports corn value is the optimal incarnation to all kinds of unique aspects, related to campus' physical education ideology, spirits, morality and humanism concept and value orientation. These aspects are formed and developed in the process of wide teachers' long-term physical education teaching, and students' action practices. They have co-created and continuously accumulated these aspects, the sports culture. Possessing long history, plenty contents, various formation, extensive influences, our national sports own the values of great ideology, edutainment, competitiveness, entertainment, appreciation, fitness as well as distinctive national characteristics. Promoting national physical education in schools is the distillation to the school's corn physical education system.

5.2 Our national physical education culture enriches schools' physical education contents

National sports and modern sports are reciprocally complemented and inseparably interconnected with each other. Accordingly, they are rich in content and combine the fitness, amusement and edutainment together, showing the extraordinary entertainment and appreciation, and functioning significantly both for strengthening bodies and entertaining minds. When the national physical education provides colorful activity content, it also plays an indispensable part in the development of schools' physical education teaching.

5.3 Our national sports culture cultivates students' patriotic sentiment.

In the process of implementing physical education, adding the national traditional sports' teaching and training can improve students' body constitution quality and educate them about patriotism, nationalism as well as collectivism. In addition, the fact that national physical education teaching process gives students access to share the perfect art and ingenious skills of national sports brings benefic to increase the mutual understanding and harmony between all nationalities, boost unity and enhance nation's cohesive force and centripetal force. Conducive to broaden students' horizons, invigorate their thought, cultivate their taste, the teaching about national traditional sports theory and practice promote school's physical education to develop in a diversified orientation. At the same time, these teaching practices are of considerable significances to enrich the school's physical education teaching material and activities, represent schools' national style and regional features, build training bases for national sports talents, foster national sports talents for country and regions, and serve the economic development. Being of great avail to disseminate the culture of national sports and carry forward national spirit, the teaching about national traditional sports theory and practice reveals our national sports' elegant appearance and national spirits.

6 Conclusions and Suggestions

The physical education reform demands that the country establish the instructive code of conducts that can standardize people's activities in the light of nation's strategic height, and ensure that our physical education develops at a balancing, fast, healthy and orderly pace. To adapt to the needs of changing social development, deepen the directed function of physical education reform, make definite

our nation's physical education direction, consequently, the national physical education culture are expected to be developed at a height of strategy.

6.1 Constructing and perfecting school's value system of sports culture, brightening our traditional advantaged sports item, maintaining the core competitiveness of school sports

Chinese sports culture should actively absorb the value that people have recognized on the basis of respect for other value systems. Our sports culture can be acknowledged worldwide because it has the value orientation of treasuring the harmony, the life attitude of harmony without uniformity, and the culture attitude of absorb anything and everything uncritically. Searching for the way to promote the elite of national sports can help achieve the value of our sports culture system. Firstly, we should stick to the sports spirit reflecting from the Chinese sports culture value. Then, considering the worldwide demand, we should actively absorb other countries' universal sports culture elements and consistently promote our sports culture's national and epochal character. Thirdly, in order to make our country reach out to the world, we must take drastic measures, such as excavating and clearing up our national advantaged sports items and continuously studying and developing national sports items, to forge the core competitiveness of Chinese school sports.

6.2 Study the regulate of national sports general rules, create innovation of China's national sports school-based curriculum

With the development and improvement of our society and with the widely spread of the modern sports, it is essential to further deepen national sports general rules, to make it develop towards the direction of competitiveness, gradually inform and perfect its scientific and standardized administration. On the base of keeping the national sports its own substitutive characteristic, develop towards the direction of more equal and open on competitiveness; more scientific and standardized on technique, tactics and training methods; more perfect and reasonable on administration and system (including competition rules, regulations and some other restriction mechanism). In order to conform to the trend of the world's sports development, take the law of modern sports development as reference, promoting China's national sports out of the region and step into the world. Simultaneously, the overall level of China's national sports will have a further improvement.

On one hand, we should consider its fitness, practicality and manipulation, on the other hand, we should also consider the suitable of region, season and the physical truth of our school, and choose the ones due to the place, time and people. Secondly, they should equip the pertinence and purpose of sports education. When developing and use the curriculum resources, we should renew the basic idea, choose with pertinence based on the general view of health of "physical, psychology and accommodation to the society", search regarding of the using scope and the educational target, then put the demand on sports of these projects into effect. Study the national sports short term effect and long term effect. Put national sports projects into the regulation of school sports curriculum, not only is the supplement and development of the school sports content, but also can enrich tremendously on school sports curriculum, which has a commendable interact effect on school sports curriculum's reform and the national sports system's inherit.

6.3 The department of education proceed promulgate relative policies, to ensure that China's tactic direction of implementing national sports teaching in school sports.

School education has a long-range and profound impact to national sports inherit. Schools should energetically inherit and promote national sports culture, foster students' consensus to the national sports, stimulate students' patriotic mind, appreciate China's national sports' implicated glamour. "China's sports spirit" gained sublimation. The traditional national sports which have strong national style and local characteristic gained a fast development, enriched people's mental culture life, strengthen national cohesion. School sports have become the main position of advocating advanced sports culture and fostering national spirit. Sufficiently express the function of national sports, to make sure that school sports work presents the prosperous scene of the combination of modern sports and national sports, performance and competition, entertainment and fitness. Promoting school sports enterprise developing forward vigorously.

An Empirical Research of RMB Real Exchange Rate Volatility Effect on Sino-Japan Trade

Zhou Ye^{1,2}

1 Economics and Management School, East China Jiaotong University, Nanchang, P.R. China, 330013

2 Jiangxi Financial and Economics University, Nanchang, P.R. China, 330013

(E-mail: zhouyear@sina.cn)

Abstract: The existing research did not give a consistency conclusion whether RMB exchange volatility has a significant effect on China's import and export trade or not. Based on the import and export demand equations, this paper establishes the import and export demand cointegration models to study Sino-Japanese trade decision factors. Research results found that RMB exchange volatility had no significant influence on the import and export trade, the two countries' respective domestic income has the biggest positive significant influence on bilateral trade. The RMB exchange rate against the yen and the breakout of financial crisis has significantly positive effects on export to China, but both had no significant effect on China's imports. Then the paper analyzes the reasons behind the results and puts forward relevant policy suggestions.

Keyword: Import and export demand equations; RMB exchange volatility; Sino-Japanese bilateral trade

1 Introduction and literature review

As close neighbors, the trade between China and Japan is developing very rapidly. In 1993, China began to become Japan's second largest trading partner, accounting for 6.7% of the proportion of the import and export of Japan, and in 2007, China overtook the US as Japan's biggest trading partner and kept up till now. Japan is China's third largest trading partner, the fifth largest export destination. Instead of 2008 US financial crisis's great shocks, Sino-Japanese bilateral trade volume is still up to US\$ 297.8 billion in 2010, surpassing the highest level before the financial crisis. Since 2005 RMB exchange rate reform and especially the outbreak of US financial crisis in 2007, the RMB exchange rate volatility has been increased, as shown in figure 1, the Japanese Yen against the RMB exchange rate volatility has experienced three times great volatility during successively ten years. So, does the RMB exchange rate volatility have any influence on the Sino-Japanese bilateral trade? And what factors have effectively influenced Sino-Japanese bilateral trade since the outbreak of US financial crisis? This paper tries to answer the aforementioned questions.

Figure 1 Exchange rate volatility of the Yen/ RMB exchange rate

About exchange rate volatility on the influence of international trade, there are many literatures completely reviewed (McKenzie, 1999; Bahmani - Oskooee and Hegerty, 2007, etc.). In a word, the economic theory of exchange rate volatility effects on export didn't get consistent conclusion, that the exchange rate volatility can promote or hinder a country's export. Early researches (Ethier, 1973; Clark, 1973) argued that, in the exporter's risk averse assumption, the exchange rate volatility is regarded as a kind of risk, when exchange rate volatility cause uncertainty about future cash flow and profit, the exporter will increase domestic sales proportion and reduce the proportion of export in order to reduce risk, so exchange rate volatility has negative effective on export. Under the assumption of exporter risk

neutral, Demers (1991) and Franke (1991) state that higher exchange rate volatility leads to more exports because exporters can reduce the uncertainty of volatility through the forward market transactions. De Grauwe (1988) argues that exchange rate volatility may have negative or positive influence on export, which depends on exporters marginal utility function is convex or not. Bacchetta and Wincoop (2000) research shows that the volatility has no significant effect. Empirical study also didn't get consistent conclusions. De Vita and Abbott (2004) study the British exports to the United States by the influence of exchange rate volatility, and find that the short-term volatility have no effect on exports, and long-term volatility has significant negative effects. Bustaman and Jayanthakumaran (2006) test the Indonesia's exports to the US as a result, supporting higher volatility hinders trade. Jiranyakul (2010) studies Thailand's exports to the US and Japan, finds that exports to Japan have been significant negative influenced and exports to the US have not been significant influenced.

Domestic investigations are relatively few. Li (2004) studies show that the risk of exchange rate volatility for classification trade exists two-way effect and difference of impact degree. Chen et al. (2007) show that the real exchange rate risk cause the more significant negative impact to export enterprises to. Gu and Gao (2007) find that the RMB exchange rate volatility influence on import and export depending on studying period, in the short term appearing the negative impact and in the long run appearing positive impact for import, but for export appearing negative impact. Chen and He (2008) find that by way of HS classification data, different types of export commodities show different affect, Xu and Zhao (2010) have similar conclusion. An and Huang (2009) find that the real exchange rate volatility influence on Sino-US trade is not significant, the real exchange rate volatility influence on Sino-Japanese trade is significant negative.

The research may exist the following aspects to be improved: first, the existing researches study exchange rate volatility effect from the perspective of export, few from import and export as a whole; secondly, few related researches study China and a single trading partner, especially analysis of Sino-Japanese trade; thirdly, as one country doesn't have monthly GDP data, related researches using monthly high frequency data take the industrial added value or industrial production index as GDP substitutional variables, and we know that in many developed countries the GDP proportion of industry is far lower than services, there may be errors with the industrial added value instead of monthly GDP data. Therefore, this paper uses relevant quarterly time series variable to study the main factors which influence the Sino-Japanese bilateral trade.

2 Model Specification, Variables and Data Sources

(1) Model specification. Estimation model adopts the traditional import and export demand function equation (Arize et al. 2000; Choudhry, 2005), factors which influence import and export include national income, commodity prices, and foreign exchange volatility. Considering the outbreak of the financial crisis in August 2007, introduce dummy variable d_t :

$$d_t = \begin{cases} 0, & \text{before financial crisis} \\ 1, & \text{after financial crisis} \end{cases}$$

In order to analysis the financial crisis and the influence of exchange rate volatility on trade, introducing dummy variable d_t and volatility interaction term form as the explanatory variables, denoted

$$\text{as } vd_t = v_t * d_t$$

Therefore, China's export demand equation is:

$$ex_t = a_0 + a_1 r_t + a_2 y_t^{jp} + a_3 v_t + a_4 d_t + a_5 vd_t + u_t \quad (1)$$

China's import demand equation is:

$$im_t = \beta_0 + \beta_1 r_t + \beta_2 y_t^{cn} + \beta_3 v_t + \beta_4 d_t + \beta_5 vd_t + \varepsilon_t \quad (2)$$

In the equations, and ex_t is China's export to Japan and im_t is China's imports from Japan in t time, y_t^{jp} and y_t^{cn} are China and Japan real GDP in t time; r_t is the the RMB exchange rate against Japanese Yen, v_t is the RMB exchange rate volatility against Japanese Yen, u_t and ε_t are random error terms. If export relative price increase, the export will decrease, so a_1 and $\beta_1 < 0$; If a country's

real GDP increase, the country's import will increase, so $a_2 \beta_2 > 0$; Financial crisis have side effect to import and export, therefore a_4 and $\beta_4 < 0$; The influence of exchange rate volatility on import and export not sure, and signs are not sure.

(2) variables and data sources

1) exchange rate. Due to the influence of the nominal exchange rate of import and export is uncertain, so here use actual and effective exchange rate. Real effective exchange rate for the nominal exchange rate (nom) after Sino-Japanese bilateral CPI index adjusted, calculation formula is:

$$r_t = \text{nom} \frac{\text{cpi}_h}{\text{cpi}_f}$$

cpi_h for China's consumer price index, cpi_f as Japan's consumer price index, the yen against RMB nominal exchange rate from the UBC 's Sauder business school's world currency database, CPI data from the International Financial Statistics (IFS).

2) the rate of exchange rate volatility s. Due to exchange rate volatility rate (risk) depends on the people to the prediction of exchange rate volatility s, can use rate of the actual value and the value predicted by deviation to measure. A method is to use rate logarithmic first-order difference standard deviation to measure the exchange rate volatility, another kind of method is Bollerslev's (1986) GARCH model to measure the condition of exchange rate volatility. Čorić and Pugh (2010) conclusion is different measure methods of exchange rate volatility will not affect research conclusion, in this paper taking the exchange rate logarithmic first-order difference standard deviation to measure the exchange rate volatility.

3) the import and export trade between the two countries and GDP. Because it is the quarterly data, both the X12 method through seasonal adjustment, and with cpi index flat reduced to remove the effect of inflation, specifically, China's export trade with China's consumer price index flat minus, China import trade with Japan consumer price index flat minus, data also comes from IFS.

All variables are the natural logarithm processing, sample period from 1995 to 2010 in 1st quarter in the fourth quarter.

3 The Empirical Test and the Result Analysis

Because most of the time series data is not stationary, so first of all to each variable between stationarity inspection. This paper use ADF (the Augmented Dickey - Fuller) inspection to discriminant variables whether there are unit root. Inspection results show in table 1.

Table 1 Unit Root Test Results

Variables	ADF	Test form	Prob.	Variables	ADF	Test form	Prob.
lnex	-0.3307	(C,0,4)	0.9133	Δlnex	-3.5866*	(C,0,4)	0.0090
lnim	-2.45077	(C,T,5)	0.3507	Δlnim	-3.65883*	(C,0,4)	0.0074
lnyjp	-2.70752	(C,T,1)	0.2374	Δlnyjp	-5.65042*	(0,0,0)	0.0000
lnr	-0.15254	(0,0,3)	0.6269	Δlnr	-3.20621*	(0,0,2)	0.0018
lnv	-1.37763	(0,0,0)	0.1548	Δlnv	-7.74121*	(0,0,0)	0.0000
lnycn	-2.68572	(C,T,5)	0.2462	Δlnycn	-3.85899**	(C,T,3)	0.0201

Note: test form (C, T, k) said method with ADF unit root test, regression equations including constant term and time trend function, (C, 0, k) only include constant term, (0, 0, k) no constant term and time trend function. *, ** said in respectively 1%, 5% significance level is significant, the same below. Critical value are given by EVIEWS6.0.

Table 1 shows that all variable original sequence non-stationary, the first-order differential stationary. Therefore, the original value variables are I (1) process, the differential variables are I (0) process, each variable single whole order number consistent, can to each variable, the author carries on a cointegration relationship inspection. The E - G two footwork of model 1 and model 2 cointegration test, after the return of the residual sequence for stationary sequence, the variable sequence that there is a cointegration relationship between variables.

Thus the establishment of China's export to Japan model cointegration equation for:

$$\text{Lnex} = -135.233096 + 11.389342 \text{lnyjp} + 0.806943 \text{lnr} - 0.002393 \text{lnv} + 1.55865 \text{D} + 0.373816 \text{VD} \\ (7.798769)^* \quad (0.608196)^* \quad (0.327756)^{**} \quad (0.046826) \quad (0.296679)^* \quad (.084430)^* \\ \text{Adjusted R-squared} = 0.919517, \text{Log likelihood} = 32.21869$$

It shows that Japan's income has significantly positive influence on China's export, export income elasticity is 11.39, the RMB against the yen exchange rate changes on China's export a significantly positive effects, which the devaluation of RMB (that is, the Japanese yen appreciation) will increase the export of China, both of which conform to the expectation, but the price elasticity is smaller than income elasticity, which means China's export depending on the Japanese domestic income. The real exchange rate volatility influence on export is not significant, supporting the point of view that exchange rate volatility has no effect on export trade. Financial crisis dummy variable and the interaction of exchange rate volatility are on China's export show a significantly positive influence, meaning the outbreak of the financial crisis has a positive influences on export, but a careful analysis can find China's export to Japan precede three is clothing, agricultural products and electronic products, clothing, agricultural products is the necessities of life, electronic products is also often for low-end products, the above products generally lower prices and elasticity of substitution is small, so after the financial crisis it will increase the low end products from China demand.

China's import from Japan model cointegration equation for:

$$\ln \text{im} = 6.508860 + 1.171508 \ln \text{ycn} + 0.513863 \ln \text{r} - 0.01372 \ln \text{v} - 1.388848 \text{D} - 0.340629 \text{VD} \\ (1.028922)^* \quad (0.063445)^* \quad (0.409965) \quad (0.058978) \quad (0.405893)^* \quad (0.109090)^* \\ \text{Adjusted R-squared}=0.918215, \text{Log likelihood}=17.00952$$

On display, China's income of China's imports from Japan has significant positive influence, but import income elasticity was 1.17 is far less than the export income elasticity. RMB against the yen, the actual exchange rate and exchange rate volatility influence on imports is not significant, and support point of view that exchange rate volatility has no effect on import. Financial crisis dummy variable and the interaction of exchange rate volatility of import have significant negative influence, the former and expected the same symbols, the latter shows that the financial crisis on China's exchange rate volatility times indeed import from Japan have a negative impact, the reason behind it is enshrined in the import trade of particularity, namely China often imported from Japan all kinds of intermediate product assembly exported after Europe and the United States, namely in the so-called "East Asian production network system" in Japan is the low value-added production links transferred to China, its production and export technology and capital intensive intermediate products to China, the latter after assembly to export the world. When the financial crisis after the outbreak of Europe and the United States since China's import decline, and indirectly lead to China from Japan imports also fall subsequently.

4 Conclusions

By using in q1 1995 to 2010 fourth quarter quarterly data, this paper the established the import and export trade cointegration model, the results of the study show that:

Firstly, there is a cointegration relationship between the volatility, China's export, significant income effect and price effect, and the income effect will far outweigh the price effect, the two countries exchange rate volatility has no significant influence on exports, but after the financial crisis in the export has significantly positive influence, and the financial crisis on China's export to Japan are significant positive influence.

Secondly, there is a cointegration relationship between China's import, real exchange rate and the volatility. China's imports from Japan are mainly affected by the domestic income, the real exchange rate and the volatility's influence on China's import is not significant, but the financial crisis and the exchange rate volatility on Chinese imports both have significant negative influence after the financial crisis.

Thirdly, due to the Sino-Japanese trade structure of the special reasons, influence factors of China's import and export have obvious differences. The first is the import and export demand elasticity has obvious asymmetry, China's export demand elasticity far outweigh the import demand elasticity, followed by export price elasticity size on export has significant positive influence on and import demand elasticity size on import not significant effect, once again, is the financial crisis on China's export to Japan has significant positive influence on and to import has significant negative influence.

Therefore, we put forward the following policy suggestions:

1. relaxing appropriately the yen against the RMB exchange rate floating range, further promoting the internationalization of RMB. The Yen as at present a few direct and RMB listed for trading foreign exchange types, the RMB exchange rate volatility by market forces should be more decision, and between the trade structure makes the exchange rate volatility will not influence China's export trade, and relaxing appropriately exchange rate floating range between the yen against the RMB can

promote the RMB exchange rate formation mechanism of the middle price marketization reform, attracting more trade enterprises to settlement by RMB or Yen.

2. between the two countries to speed up the establishment of a free trade area of negotiations, as a free trade area of the system construction to promote the further development of bilateral trade. At present the WTO talks stalled Doha agenda, which makes the members have to seek other way to promote international trade and economic development, and Free Trade Zone is a kind of conform to the status quo of economic development between the two countries the form of regional economic integration. This round of international financial crisis shows that the us and Europe east Asia economic depend on external market is unsustainable, Sino-Japanese bilateral trade is their biggest influence national income, speed up and complete the Sino-Japanese free trade negotiation, construct a unified east Asia regional internal market, between the two countries is to ensure economic trade one of the effective ways to sustainable growth.

Abstract: This paper addresses an important contemporary phenomenon– the internationalization strategy from developing countries. The current and opportunities of international marketing in developing nations referred to as “bottom billion” as Paul Collier would put it, are ascertained in this study with reference to Namibia in some cases and inter alia. The authors also employ evidences and use aspiring quotes from different economies in the justification of creating value from developing nations for the international arena. The analysis of this paper is value-focused perspective from an economic and marketing view points to a substrate of cross-country differences. Some strategic implications that are imperative to developing economies to grow their manufacturing sectors through process of industrialization with the hope and objective for the bottom billion economies to be value creator and sustainer rather than being recipients or consumers of imported goods.

Key words: Bottom billion; International marketing; Value creation; Knowledge economy

1 Introduction

Managers around the globe are recognizing the increasing necessity for their companies and organizations to develop the skills, aptitudes and knowledge to compete effectively in international markets. The emergence of a more open world economy, the globalization of consumer tastes and the unabated expansion of Internet access globally all increase the interdependency and interconnections of nation economies across the globe. The need for managers to develop the skills to respond to these pressures affects companies of all sizes. Thus far, the paper theoretically attempts to analyze and pave strategies for developing economies to market their goods internationally.

On context of Namibia as a developing country in the southern part of Africa endowed with abundance of mineral resources among which is one of the world’s largest exporters particularly in uranium, diamond and gold. The country has the necessary and potential capabilities in terms of resources to be among the top billion economies in the world creating and offering value on the international scale. Namibia derives its income mainly from the export of raw materials, According to the National Accounts Tables 2010-2013 of the Bureau of Statistics. The question of what holds Namibia to be industrialized and what to be done to achieve industrialization with a link to international marketing that consequently drives creation of value by firms across the borders of the country is also stressed in this paper.

2 Theoretical Foundations on Cross Border Marketing

The Chartered Institute of Marketing defines marketing as the ‘Management process responsible for identifying, anticipating and satisfying customer requirements profitably’. Thus marketing involves:

- focusing on the needs and wants of customers
- identifying the best method of satisfying those needs and wants
- orienting the company towards the process of providing that satisfaction
- meeting organizational objectives.

However the focus of this research paper is on international marketing. Tapping into cross border markets for value creation and offering is an important strategic corporate initiative that enables firms to extend their current businesses, leverage their current capabilities, and diversify into related markets. Marketing internationally can be an important mechanism for corporate governance convergence in today’s world. In marketing products from developing countries it is important to understand the differences in internationalization strategy of firms from developed, emerging and developing countries as some factors still matters as the world is not flat but semi-globalized (Ghemawat, 2007). Many influencing factors in international marketing by firms from developed countries would be substantially different from those in the developing country, such as international experience and exposure, corporate governance, cultural background, government regulation, and maturity of the domestic capital market.

Two theories on the determinants of returns on cross border marketing offers a map clearly on firms and economies as a whole promoting cross-border marketing, namely the classical theories and the

neoclassical theories. The classical theories on the cross border marketing focused on diversification, operational efficiency and market power as sources. The neoclassical literature has focused on the changes in shareholder rights and changes in other corporate governance features implicit when acquirers and targets of acquisitions are from substantially different governance regimes.

3 Characteristics of Developing Countries in International Marketing

One common characteristic of many developing nations is that their exports are concentrated in a small number of primary products. There's much dependence on primary products. Inter- alia, are prevalence of imperfect markets and limited information, and dominance, dependence and vulnerability in International relations (Blink & Dorton, 2007).

3.1 Prevalence of imperfect markets and limited information

The trend in developing countries in the last 20 years has been towards a more market-oriented approach to growth. This has sometimes been promoted or encouraged by international bodies such as the IMF and the World Bank. However, this is possibly problematic, since while market-based approaches may work well in economies that are efficiently functioning, many developing countries face imperfect markets and imperfect knowledge. Developing countries may lack many of the necessary factors that enable markets to work efficiently such as lack of functioning banking system, which enables and encourages savings and then investment, lack a developed legal system, which ensures that business takes place in a fair and structured manner, inadequate infrastructure, especially in terms of transport routes of all types, which would enable raw materials, semi-finished products and final goods to more around the country, and to be moved out of the country, efficiently and at low cost, and lack accurate information systems for both producers and consumers, which often leads to imperfect information, the misallocation of resources and misinformed purchasing decisions.

3.2 Dominance, dependence and vulnerability in international relations

In almost all cases, developing countries are dominated by developed countries because of the economic and political power of the developed countries. In addition, they are dependent upon them for many things, such as trade, access to technology, aid and investment. It is not really possible for economically small, developing countries to isolate themselves from world markets. Developing countries are vulnerable on the international stage, and are dominated by, and often harmed by the decisions of developed countries over which they have no control. Some would argue that what is needed is for the developing countries to act as a bloc, to gain more power in trade negotiations.

The graphs below shows regional categorically value creation as measured by GDP growth, which portion of it should be potentially exported across borders. It can be seen from the graph that bottom billion economies particularly that of Africa and Latin America still lags in value creation. However, growth rates increased in Africa because of the continuing dynamism in sub-Saharan African economies and a partial recovery in the Northern African countries whose economies had been strongly affected by internal conflicts in 2011. However, it will be difficult for the latter countries to return to their 2010 GDP levels before 2013 owing to a slow revival of their tourism revenues, high unemployment and the recession in Europe which is an important market for them. In South Africa, strong growth in public investment continued to support economic activities in early 2012.

REGIONAL CONTRIBUTIONS TO WORLD GDP GROWTH, 1970-2012 (Per cent)

Source: World Bank, World Development Indicators.

Note: Data are averages for the periods.

4 Assessing Namibia's Value Creation

The Gross Domestic Product (GDP) in Namibia expanded 4.30 percent in the fourth quarter of 2012 over the previous quarter. GDP Growth Rate in Namibia is reported by the Namibia Statistics Agency. Historically, from 2004 until 2012, Namibia's GDP Growth Rate averaged 1.76 Percent reaching an all-time high of 13.30 Percent in September of 2007 and a record low of -8.80 Percent in December of 2004. Namibia has one of the biggest GDP per capita in Africa. Yet, due to an uneven distribution of income, there is still concern of the population lives in immiseration. The Namibian economy is dependent on the extraction and processing of minerals like diamonds, uranium, lead, zinc, tin, silver, and tungsten. Subsistence agriculture is the main source of income for 50% of Namibians. This page includes a chart with historical data for Namibia GDP Growth Rate. From the chart below we can posit that Namibia's GDP growth is not sustainable as keeps fluctuating giving a signal of lack of stability in value creation that arise from the domestic produce that cannot be supplied across border.

Source: Namibia Statistics Agency

The GDP Growth Rate shows a percentage change in the seasonally adjusted GDP value in the certain quarter, compared to the previous quarter. Because of climatic conditions and holidays, the intensity of the production varies throughout the year. This makes a direct comparison of two consecutive quarters difficult. In order to adjust for these conditions, many countries calculate the quarterly GDP using so called seasonally adjusted method. The Gross Domestic Product can be determined using three different approaches: the product, the income, and the expenditure technique, which should give the same result. In sum, the product technique sums the outputs of every class of enterprise. The expenditure technique works on the principle that every product must be bought by somebody, therefore the value of the total product must be equal to people's total expenditures in buying products and services. The income technique works on the principle that the incomes of the productive factors must be equal to the value of their product, and determines GDP by finding the sum of all producers' incomes.

5 International Strategic Options

The main objective of any international strategy should be to manage the large differences that arise at the borders of markets, according to Ghemawat (2007). With this objective, Ghemawat (2007) presents a strategic framework for meeting the challenges of globalization/internationalization. The framework is called "AAA Triangle," encompasses three effective strategic responses: adaptation, aggregation and arbitrage. These effective strategic responses are crucial bottom billion nations that realize the creation of value in offering sophisticated products across borders pays off, and not the exports of raw materials, agricultural products and minerals.

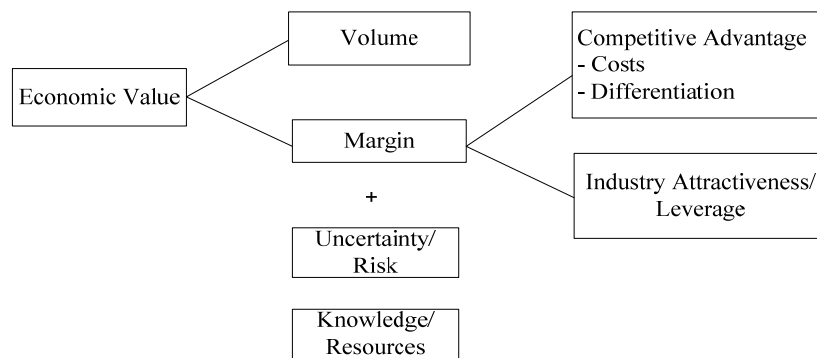

Adaptation is the strategy used by companies when they seek to boost revenues and market share by maximizing local relevance. Aggregation describes the attempt to deliver economies of scale by creating regional, or sometimes global, operations. Finally, arbitrage is when companies exploit disparities between national or regional markets, often by locating different parts of the supply chain in different places. Examples include call centers in Namibia, factories in South Africa to convert diamonds into sparkling jewelries, and retail outlets in USA. Adaptation strategies are designed to help companies adjust to differences across borders; Aggregation strategies are designed to help companies overcome some country differences by grouping them based on similarities; Arbitrage

strategies seek to profit from some of these national differences rather than treating them as constraints. To build sustainable competitive advantage is best to focus on one or two when trying to build competitive advantage.

One more framework to help companies deal with cross-border differences; it's called the ADDING value scorecard parses cross-border value addition (or subtraction) in manageable, commensurable components to facilitate robust and meaningful analysis of international strategies. This Framework is proposed by Ghemawat (2007) to help companies operate across borders. The ADDING Value Scorecard is a framework to help companies assess whether a particular strategic move makes sense to add value to the business both locally and globally.

The acronym stands for –

- A – Adding volume, or growth;
- D – Decreasing costs;
- D – Differentiating or increasing willingness—to—pay;
- I – Improving industry attractiveness or bargaining power;
- N – Normalizing (or optimizing) risk;
- G – Generating and deploying knowledge (and other resources and capabilities).

Source: Ghemawat (2007)

Once the company is able to track the above components into quantitative values is able to assess the followings;

$$\text{Your margin} = \text{industry margin} + \text{your competitive advantage} \tag{1}$$

$$\begin{aligned} \text{Your competitive advantage} = & [\text{willingness to pay} - \text{cost}] \text{ for your company} - \\ & [\text{willingness to pay} - \text{cost}] \text{ for your competitor} = \text{your relative willingness to pay} \\ & - \text{your relative cost.} \end{aligned} \tag{2}$$

Normalizing risk and generation of knowledge and other resources—reflect the large differences that persist across countries. Thus, they are customary add-ons in global strategy. To be effective at operational level need to recognize the value of options (alternatives) in an uncertain world. Strategy options often vary greatly in their "learn-to-burn" ratios – the rate at which they generate information about which scenario will come to pass versus the rate at which they commit resources to particular scenarios (Ghemawat, 2007). Once you take this kind of option value into account, it opens the door to additional strategic possibilities: e.g., mixed supply chains (rather than complete offshoring or on shoring), toeholds as ways of exploring new markets and, more generally, sequenced strategies.

7 Strategic Implications

7.1 “A journey of a thousand miles must begin with a single step.” - Chinese Proverb

Practical and realistic policies pay in a long run, meaning policies should achieve SMART goals, which is specific, measurable, attainable, realistic and timely. A developing country like Namibia has to learn lessons from the development experiences of South Korea. Namibian policies should not only enforce laws that give opportunity to private sector but enforce laws that allow the conversion of raw resources into physical goods and improving the service sector in driving the country's economic development. The import substitution industrialization approach still has merits in Namibia today. In fact no country developed without imposing a form of economic nationalism. Mercantilism which drove industrial revolution in Britain was actually a form of economic nationalism. American protectionism at the beginning of its industrialization revolution is well known. South-East Asia too had its share of

protectionism. The current gospel of free market and free trade is, as Ha-Joon Chang put it, “a clever device of kicking away the ladder”. This is the very ladder the developed countries climbed to greatness. Now, through liberalization policies they are kicking away the ladder so that the developing countries continue to be “the bottom billion”.

7.2 "Logic will get you from A to B. Imagination will take you everywhere." Albert Einstein

Bottom billion countries should invest more in innovation and information to transform the economies from mere production of agricultural products to a more knowledge economy that transforms the production of agriculture and mining into value chain innovations. Knowledge economies are determined by creative people through their creative imagination and ideas in bringing innovative products. Most inventions are from the West, while little from the African counterparts in the international trade, and while developing countries such as Korea exports Automobiles and other sophisticated products. Africa is the richest part of the world in terms of all kinds of resources such as oil, diamonds and agricultural yet are struggling economies due to what the authors would refer to as leadership myopic. Law makers in developing nations should get away from corruption and short term ambitions into economy transformation by embracing laws that strictly focus on value addition in the production of goods than trading raw minerals to developed nations that convert them into value products such as Swiss diamond rings and watches that are sold back to Namibia at unbelievable prices. Namibia should rather import the use of capital and know-how from developed nations through partnership than exporting diamonds and other raw resources without adding any value. Namibia's economy can boost like that of South Korea and China, through the trade of valuable physical products. Innovation is the key to an economy progress and transform into an industrialized and prosperous country; this is where Namibia and most bottom billion countries still fall behind in the international marketing.

7.3 “Never doubt that a small group of thoughtful, committed citizens can change the world.” - Margaret Mead

Bottom billion nations need to have commitments in making a change to be where they want to be. To achieve industrialization a country like Namibia has the capability, they nation should be committed in activities that drive the economy's prosperity, such as manufacturing and use of technology. Namibia and most developing nations are largely in the primary activities, the real economy which creates value and wealth is made up of secondary and tertiary industries. The primary industries sector is dominated by mining and quarrying. According to the Prebisch-Singer thesis the terms of trade between primary products and manufactured goods deteriorate over time. This means that revenue from the export of raw materials will diminish eventually. Prebisch and Singer suggested that developing countries like Namibia should embark on manufacturing if they want to gain from international marketing in the long run. This advice was taken seriously by South-East Asia especially that of South Korea as a perfect lesson for the developing nations.

8 Conclusion

The local private sector and government should intensify investments in innovation and the production of consumer goods. Through foreign direct investment the country should be able to leverage technology, capital and expertise in order to start manufacturing durable goods such as cars, iron and steel products. African nations should strongly unite to form a bloc to avoid economic disturbance from egoistic leaders and other nations competing for the African resources.

Comparative Experience of Trade Relationships Between Mexico and China

Argelia Munoz Pahuamba, Ye Jianmu, Abdoulaye Oury Bah
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: argmuz@gmail.com, jianmuye@126.com, bahgio2008@hotmail.com)

Abstract Mexico and China established diplomatic relations in 1972 and since the 1990s, Mexico and China have both made progresses in their foreign trade. Expansion of their trade volumes and overseas markets, the overlapping parts of their exporting products and markets have been being enlarged. This paper analyses the trade relationship between Mexico and China in the context of the economic openness enacted by both nations, also analyses the current trade relations between Mexico and China, presenting similarities and logical relation along with the results of their commercial policies and specific business practices.

Key words: Mexico; China; Foreign Trade

1 Introduction

Mexico and China established diplomatic relations in 1972 and a strategic partnership in 2003. Mexico and China relations enjoyed steady progress in 2010. Friendship and mutually beneficial cooperation between the two sides were strengthened across the board. Since the 1980s, Mexico and China almost simultaneously began to implement policies of economic liberalization and open trade. These phenomenon occurred as a result of changes in the international economic system and in the socio-economic structures of each country and the perspectives of their leaders, rooted in ideology and based on domestic political conditions. By the 1990s, China and Mexico have both made progress in their foreign trade in the background of the global integration and the regional consolidation, which makes them outstanding in the developing economies.

The expansion of their trade volumes and overseas markets, the overlapping parts Mexico's and China's exporting products and markets have been being enlarged, for sure in some extend a fierce competition exists between the two nations. Some scholars turned to the competitive or complementary trade relation between Mexico and China and made relevant empirical analyses on it. Soler (2003) finds that China has deteriorated Mexico's export more or less. By comparing the trade competitiveness indices among China, other Asian economies and Latin American countries, Lidoy et al (2004) believe that there's significant rivalry between Mexico and China. Bernard et al (2004) make comparison between China and other US' main import origins, and argue that the exports similarity between Mexico and China is relatively higher. Peters (2005) suggests that China, after its accession into the World Trade Organization (WTO), has affected Mexico's position in the US market due to their similar resource endowments and export-oriented policies. Jia (2005) investigates the competitiveness and complementariness in Sino-Latin America trade and find there is much resemblance in the exports of the pre-mentioned two countries. Liu (2007) reports the competitive industries between the two nations through empirical studies.

However, trade disputes between Mexico and China will be raised and resolved in multilateral dialogues, as an example; in June 2013, the presidents of Mexico and China agreed to broaden relations between their countries and expand trade ties, including opening the Chinese market to imports of Mexican tequila and pork. After meeting privately both presidents, Mexico's Enrique Pena Nieto and China's Xi Jinping said they are transforming the relationship into a "strategic partnership" and taking steps to move toward balancing their trade, which now is heavily in favour of China. The leaders signed a dozen memorandums of understanding and cooperation agreements in areas including energy, mining, education and infrastructure. "Today, we are giving way to a new relationship, a new phase of the relationship," Pena Nieto said in a joint statement. Xi said China wanted better relations with Mexico, which he called "a great friend and a great partner in the Latin American region." The Mexican President Pena Nieto said the new agreements are aimed at balancing trade between the two nations and also seek to increase Chinese investment in Mexico. He said Mexico hopes to become a "platform" for Chinese companies to trade with other nations in the region. This paper analyses the trade relationship between Mexico and China in the context of the economic openness enacted by both nations, also analyses the current trade relations between Mexico and China, presenting similarities and logical

relation along with the results of their commercial policies and specific business practices.

2 Mexican and Chinese Economic Openness

Ever since the 1980s, Mexico and China have been implementing extensive economic liberalization policies that are somewhat similar in essence but possess very different characteristics. Both countries began their opening processes because of historical, political, economic and social asymmetries. Moreover, the future prospects of the nations and the objectives of their leaders at that time were very different. Accordingly, “Mexico’s globalization strategy came straight out of the Washington Consensus handbook [...] and China took a more gradual, government managed approach to globalization” (Gallagher 2008).

Actually, Mexico’s economy is clearly not complementary to China economy, but from a standing start they would have to be seen as being in direct competition and in many ways similarly structured. While Mexico has sought to develop domestic industries through interaction with the external market in North America, China has done the same in East Asia. Mexico established the system of maquiladoras for multinationals and companies from the US to take advantage of cheaper Mexican labour and less corporate regulation often accompanied by more profitable tax and financial environment. China established (relatively) large-scale Special Economic Zones (SEZs), and then Export Processing Zones (EPZs) in major cities to import technology and to produce goods for export in much the same way as the maquiladoras operated. Costs of production are clearly an important determinant of the Mexico–China trade pattern and their competition. According to most estimates, labour is on average approximately three times more expensive in Mexico than in China, with higher ratios experienced in some sectors (Carrillo, Chen, and Goodman 2011).

China began its economic opening process in 1971 with Nixon’s visit to China. The obvious reason for China’s rapprochement with the US was to further the strategy of establishing a new global geopolitical balance (especially China–US–USSR). The modernization led by Zhou Enlai and Deng Xiaoping promoted contacts with Western countries, resulting in a strong acceleration of trade in the early 1970s. At this time, emphasis was placed on the importation of industrial plants and modern equipment. Trade more than doubled between 1970 and 1975, reaching 13.9 billion USD in 1975. Growth during this period was approximately 9 per cent a year. As a proportion of GNP, trade grew from 1.7 per cent in 1970 to 3.9 per cent in 1975. In 1976 the atmosphere of uncertainty resulting from the death of Mao and pressure from the Gang of Four, whose members opposed reliance on foreign technology, brought another decline in trade (Kuang, Li, and Meng 2005: 119-120). In the late 1970s China resumed its pace of modernization through economic liberalization and foreign trade. As Jiang (2008: 30) stated, China embarked on a process of economic liberalization more than a decade before the collapse of the Berlin Wall. As market forces began to play an increasingly important role in China’s economic development, and as the country integrated into the global economy, the living standards of the Chinese people began to rise. China clearly understood that its economic liberalization programme depended on a peaceful and stable international environment in the post-Cold War era, in turn recognizing the need to adjust its foreign policy toward that end.

China reforms began in the agricultural sector, reversing the process of collectivization during the Maoist era. After that, the reforms were extended to the liberalization of prices, following the process of fiscal decentralization. As part of the reforms, more independence was granted to business enterprises owned by state government. This led to the creation of various types of privately held enterprises within the service and manufacturing sectors. The banking system was also diversified, and Chinese stock markets started to develop and grow as economic reforms in China took hold. There is a consensus that market liberalization in China has brought about both economic growth and economic polarization between social classes and between rural and urban areas. Nevertheless, China is currently the world’s second-largest economy, only after the United States. During the past 30 years, growth rates averaged approximately 10 per cent. In 2011 China became the world’s top manufacturer, surpassing the United States. Concomitantly, China is the largest exporter and second-largest importer of goods in the world. In 2011, the country’s Gross Domestic Product (GDP) (measured in terms of Purchase Power Parity, PPP) was 11.3 trillion USD, and GDP per capita (in PPP) was 8,400 USD (Central Intelligence Agency 2012).

In the meantime, Mexico since the 1980s has alternately served as a model of market-oriented economic restructuring and a cautionary tale of the limitations associated with a market-led development strategy. It was a leader in the process of structural adjustment and economic reform that

swept Latin America. The change in policy came in response to the 1982 debt crisis and the apparent “exhaustion” of the import-substitution industrialization model; successive Mexican governments shifted away from state-led, essentially inward-oriented development policies. They embraced a “new” economic model. Reformers liberalized trade, deregulated foreign direct investment (FDI) and financial markets, and aggressively privatized state-owned enterprises. The pace and breadth of the reform process made Mexico a paradigm for economic liberalization (Middlebrook and Zepeda 2003: 3). As a result of the economic liberalization, Mexico emerged as an important exporter of manufactured goods. This, however, did not translate into economic growth; instead, the expansion of trade and foreign investment significantly increased the Mexican economy’s vulnerability to external shocks.

Facing openness and liberalization, the results have been different for Mexico and China. One of the most striking differences is the growth in GDP. According to World Bank data, while China achieved an annual average growth of about 9 per cent in the 30 years between 1981 and 2010, the corresponding increase in Mexico was 3.2 per cent. This feature is evident in Table 1, which covers the ten years from 2001 to 2010. Other important indicators that explain the differences in the behavior of Mexico’s and China’s GDP are the Gross Capital Formation (which in the case of China was 80 per cent higher than Mexico’s in the decade from 2001 to 2010) and growth in FDI. Total reserves are also significant.

Table 1 Main Economic Indicators of Mexico and China (2001 - 2010)

	Mexico						China

Source: World Bank 2011; UNCTAD 2011.

The highly asymmetrical economic structure between Mexico and China is the result of large differences in the strategies implemented by both nations’ policies of liberalization and economic openness. Furthermore, differences in political system, economic structure, and the national objectives of the two nations’ leaders have led to different outcomes and constitute the background of current trade disputes between Mexico and China.

3 Mexico’s Foreign Trade

For several Mexican presidential administrations, foreign trade has been defined by a policy of diversification. Since the 1990s it has not had the expected results. Mexico has strengthened ties with the US, one plausible explanation for which being that Mexican foreign policy during the last few years has mainly been driven by internal factors. Mexican entrepreneurs, confronted with difficult markets in the Asia-Pacific area, which are characterized by complex distribution channels and which receive little support from government agencies, have preferred to look northward (Faust and Franke 2005). Mexican economy is particularly vulnerable to external factors, especially to the economic behavior of the United States, given the highly integrated nature of its manufacturing sector with that of its northern neighbor and given its high dependency on the US as both a destination of exports and a source of FDI. The vulnerability of Mexico in relation to changes in the global economy is reflected in the GDP reduction of 6.1 per cent in 2009 when external demand declined sharply (Table 1). In Table 2, in 2009 there was a reduction of 24.26 per cent in foreign trade, which shows the high correlation between economic growth and foreign trade in Mexico. The effects of global economic changes on the Mexican economy remain a major concern for the country’s ruling classes. The current situation has deep roots in the economic policy implemented by Mexican political elites. With the objective of promoting economic growth, the government of Mexico designed and implemented a “new” economic model based on the principles of liberalism.

Two other markers of the economic liberalization policy of the Mexican government were the maquiladora programme established in the 1960s and the signing and implementation of NAFTA in 1994. After the signing of NAFTA, Mexico continued negotiating and signing other trade and

investment preferential agreements (known as free trade agreements, FTAs) based on the traditional idea of economic diversification. Mexico's pursuit of free trade with other countries was a way to bring added benefits to the economy and to reduce economic dependence on the United States. By 2005, Mexico had signed 11 treaties with 41 countries. Existing treaties between Mexico and partner countries include ones with the United States, Canada, Chile, Bolivia, Costa Rica, Nicaragua, Uruguay, Guatemala, El Salvador, and Honduras. Mexico has also negotiated FTAs outside of the Americas, in July 2000 entering into agreements with Israel and the European Union. Mexico became the first Latin American country to have preferred access to these two markets. The Mexican government expanded its outreach to Asia in 2000 by entering into negotiations with Singapore, Korea and Japan. In 2004, Japan and Mexico signed the Economic Partnership Agreement, the first comprehensive trade agreement that Japan had ever signed with any country.

Mexico began trade liberalization in the early 1980s; its trade with the world has risen rapidly. Mexico's exports are increasing more rapidly than its imports. Mexico's trade balance with all countries went from a deficit of 7.7 billion USD in 1993 to a surplus of 13.4 billion USD in 1995. Following that, Mexico had maintained a comfortable surplus until 2010, when it reported a deficit of 3.1 billion USD (Table 2). The trade balance with the United States went from a deficit of 2.4 billion USD in 1993 to a surplus of 72.5 billion USD in 2009. Exports to the United States increased from 42.9 billion USD in 1993 to 234.6 billion USD in 2008, and then declined to 184.9 billion USD in 2009. Mexico's imports from the United States increased from 45.3 billion USD in 1993 to 152.6 billion USD in 2008, and then declined to 112.4 billion USD in 2009 and 72.2 billion USD in 2010 due to the economic downturn (Villarreal 2010: 1).

Table 2 Mexico's Foreign Trade, 1993 - 2010 (in billion USD)

Year	Exports	Imports	Total	Balance	Total Trade Change (%)
1993	51.832	59.468	111.300	-7.636	
1994	60.817	72.347	133.164	-11.530	19.6
1995	79.541	66.162	145.702	13.379	9.4
1996	96.004	81.470	177.474	14.533	21.8
1997	110.237	99.207	209.444	11.030	18.0
1998	117.539	114.193	231.732	3.346	10.6
1999	136.362	128.795	265.157	7.567	14.4
2000	166.121	159.382	325.503	6.739	22.8
2001	158.780	154.934	313.713	3.846	-3.6
2002	161.046	154.099	315.145	6.947	0.5
2003	164.766	154.481	319.247	10.286	1.3
2004	187.999	178.997	366.996	9.001	15.0
2005	214.233	201.218	415.451	13.015	13.2
2006	249.925	234.777	484.702	15.148	16.7
2007	272.044	258.723	530.767	13.321	9.5
2008	292.637	289.380	582.016	3.257	9.7
2009	229.620	211.201	440.821	18.420	-24.3
2010	271.237	274.363	545.600	-3.126	23.8

Source: Secretaría de Economía and Banco de México.

In addition, to the flow of imports and exports in Mexico, a very positive role has been played by the international transfer of wealth by Mexicans who are living abroad (mostly in the United States). These transfers accounted for 21.2 billion USD in 2009 and 21.3 billion USD in 2010. In 2011 Mexico entered 22.7 billion USD in remittances, a 6.68 per cent higher figure than the 21.3 billion USD collected in 2010, according to the Bank of Mexico (Banco de Mexico 2012). Mexico's foreign trade has performed impressively, with an average annual growth rate of 11.26 per cent from 1993 to 2010. These data contrast with the small economic growth performance over the last 30 years, whose average annual growth rate is 2.4 per cent. In Figure 1, from 2000 to 2010, the situation was the same: While growth in foreign trade was 10.5 per cent, the increase in GDP was 2.5 per cent. This shows that there is no direct correlation between economic growth and foreign trade, but GDP growth also depends on

other factors.

Figure 1 Mexico: Relation between GDP and FDI, 2000-2010 (in per cent)

4 China's Foreign Trade

China's relations with the outside world have gone through long periods of opening and closing. The first 30 years of the current regime have been characterized by little or no relationship with the West, but from the late 1970s onward, an opening has characterized China's relations with the world. China's foreign trade has dramatically changed the country's relationships with its trading partners, as a product of internal political conditions and its relationship with the international system. The first ten years of the socialist regime, approximately 70 per cent of trade was made with the Soviet Bloc. After the conflict with the USSR, China conducted its foreign trade through Hong Kong and began to increase its trade relations with Western Europe, Japan and Australia. Over the last 20 years China has emerged as a major force in international trade, particularly in manufactured goods. Its huge markets, vast supply of low-cost labour and growing manufacturing competence have attracted large amounts of foreign investment that have led to dramatic increases in China's exports and imports. In turn, these increases have resulted in major changes in global trade volumes and patterns (Lenz 2003).

In the last 30 years, China's foreign trade growth has been very impressive. From 1980 to 2010 it rose from 38.1 billion to 3 trillion USD, and in the past ten years averaged an annual surplus of 133 billion USD. China's 2010 foreign trade level of 2.97 trillion USD, was one third more than it was 2009, which had decreased from 2008 because of the global economic crisis. In 2010 Chinese exports grew by 31.1 per cent while imports increased by 38.7 per cent. The overall growth is estimated to be 34.7 per cent (Figure 2).

Figure 2 China's Foreign Trade, 1978 - 2010
 Source: National Bureau of Statistics, various years; Xinhua 2009, 2010.

The change in China's production structure is reflected in its foreign trade. China's trade expansion has been achieved almost totally in manufactured goods; 88.6 per cent of the goods it exported in 2001 were manufactures, up from 71.4 per cent in 1990 (Lenz 2003). In 2008, as shown in the table 3, 94.5

per cent of its exports were manufactured goods, and only 5.5 per cent were commodities. Regarding imports, 68 per cent were manufactured goods and the remaining 32 per cent, primary commodities.

Table 3 Total Value of Imports and Exports in China, 2004 - 2008 (in billion USD)

	2004	2005	2006	2007	2008
Total value of imports and exports	1,154.6	1,421.9	1,760.4	2,173.7	2,563.3
Total exports	593.3	762.0	968.9	1,217.8	1,430.7
Primary goods	40.6	49.0	52.9	61.5	78.0
Manufactured goods	552.8	712.9	916.0	1,156.3	1,352.7
Total imports	561.2	660.0	791.5	956.0	1,132.6
Primary goods	117.3	147.7	187.1	243.1	362.4
Manufactured goods	444.0	512.2	604.3	712.9	770.2
Balance	32.1	102.0	177.5	261.8	298.1

5 Trade Relationships between Mexico and China

Trade relations between Mexico and China started with the reestablishment of diplomatic relations in 1972. During the early years, there were some attempts to satisfy the market needs of both parties, but the institutional conditions for trading were still very difficult, so direct trade exchange remained small and their commercial value was low. Since the 1980s, trade between Mexico and China has experienced unprecedented growth. With both countries' implementation of economic openness, their commercial relationship has changed dramatically. The dynamics of regional integration and the participation of both countries in multilateral institutions like the World Trade Organization and the Asia-Pacific Economic Cooperation (APEC), through which both countries acquire rights and commitments that shape their participation in the regional economies of Asia and the Americas and in the global market, have an impact on the economy. The trade and flows of capital influence the configuration of the domestic production structure, balance of payments, technology transfer, competitiveness, employment and the environment.

Trade between China and Mexico is characterized by its focus on a few products. China's major exports to Mexico include electrical equipment, electronic devices, audio-video equipment and spare parts, mechanical equipment and spare parts, toys, game products, optical and photographic medical equipment, and plastic products. China's imports from Mexico include base metals, minerals, electro-mechanical equipment, transportation equipment, plastic, rubber, chemical products, and leather products. Bilateral trade between China and Mexico has other important attributes we should pay attention to. First of all, from 1996 to 2010, it was reported that trade increased 37.63 per cent annually, but the Mexican deficit has also risen 41 per cent annually, as shown in Table 4. Mexican exports to China depend heavily on auto parts (25 per cent), followed by several raw materials such as copper, ores slag, iron, steel and aluminium (accounting for 37.4 per cent in 2010).

It should be noted that there is a big difference in the trade figures reported by China and Mexico as a result of each country's method of compiling statistical information. In 2008, Mexico reported a deficit of 39.3 billion USD, while China reported a deficit of 10.2 billion, as shown in Table 5. Compared to Mexico's calculations, China reported more imports of Mexican products in their national figures and a much lower level of exports to Mexico. This probably reflects the triangulation of bilateral trade through third economies (Hong Kong, Singapore and the United States) (Dussel Peters 2005a: 50-61).

6 Conclusions

Mexican and Chinese Economic Openness processes were almost simultaneous. However, these concurrent events led to very different results due to each country's particular political and economic situation. For much of the nineteenth and twentieth century's, direct trade between China and Mexico was almost non-existent, as Mexico was fighting for independence and internal disorder ruled in China. Direct trade relations between China and Mexico started in the 1970s with sporadic exports and imports of some commodities in small volumes. The current trade boom between the two countries began in the 1980s and was the result of the change in the trade policies of both China and Mexico. In this new context of global exchange, Mexico-China trade relations have gone far beyond a bilateral relationship, as they now include triangular production and marketing relationships with the US; an interchange with

and within North America (Roett and Paz 2008) and the East Asian region and with the world economy as a whole; partaking in the global commitments defined by international agencies; and a new international division of labour. In short, throughout history, the trade volumes between Mexico and China have had drastic ups and down. This has been caused by domestic political factors as well as changes in the international political system.

Since the 1990s, China and Mexico have made progress in their foreign trade. With the expansion of their trade volumes and overseas markets, the overlapping parts of their export products and markets have enlarged, which has brought about competition between the two nations (Yue 2009). However, it is also clear that there are opportunities for complementary production and marketing. The commercial relationship between Mexico and China (and consequently, their production relationship) is complex and difficult. In Mexico, there are concerns in sectors of manufacturing about the role of China in world trade and especially about the trade relationship between the two countries. Both countries need to find new formulas of cooperation, including bilateral trade and commercial relations with the rest of the world.

An Empirical Analysis on Passenger Unexpected Events of Civil Airports under Flight Delays Scenarios*

Wan Chunhui, LuoFan

School of Management, Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: wanchunhui0115@163.com, 64984473@qq.com)

Abstract: It becomes very urgent how to prevent and reduce the adverse social impact of flight delays, since flight delays caused by a variety of reasons occur frequently and passenger clashes increase too. Based on the questionnaire and interview conducted by relevant departments of an airport, the problems of passenger unexpected events are analyzed under flight delays scenarios from the perspective of the airport. The improving suggestions replying to passenger unexpected events of civil airports are proposed, including improving flight delays compensation standards, establishing the early warning system of passenger unexpected events caused by flight delays, consummating the mechanism of communication and coordination between various departments and innovating the learning mechanism relating to passenger unexpected events of civil airports.

Key words: Flight delays; Unexpected events; Compensation standard

1 Introduction

With the booming of our national economy, the development of Chinese civil aviation transportation is rapid, civil aviation transportation total turnover volume has been ranking the second in the world since 2005, becoming the great aviation power and making huge achievement. In 2011, each index of the airport throughput at historic high. The 2011 national airport production statistics bulletin, published by China civil aviation administration in March 2012, shows that the passenger throughput of China transport airport is 620.537 million people in 2011, more than 2010 growth 10.0%. In 2011, the aircraft movement of China transport airport is 5.98 million, increasing 8.1% from the previous year. With the expanding of civil aviation traffic and passenger volume, various passenger emergencies caused by flight delays increased year by year, especially in recent years, a large number of conflicts and dissensions happened because of flight delay, even lead to group incident and affected the social harmony and stability. For example, on September 8, 2004, Hainan airlines flight HU7435 by Haikou turning Shenzhen flying to Xuzhou delayed nearly four hours, enraging all the passengers. A large number of Guangzhou BaiYun airport flights delayed caused by rainstorm on April 13, 2012, raising an event of radical passengers created confusion in the airport. Flight delaying has always been a big problem struggling with civil aviation both in China and abroad. Thus the flight delaying management, especially dispute management caused by flight delaying is problems that urgently need to be solved for sustainable development.

By consulting literature domestic and oversea, the research on the passenger conflict events caused by flight delaying is extremely rare, the main reason lies in the differences of compensation mechanism between countries in the world and lacking of uniform compensation standard. Foreign airlines provide food and accommodation, transportation and communication service according to transportation condition. And to compensate for flight delaying is very little, in cash is rare and the passenger conflict caused by the flight delaying is rarer. With the number of conflicting events caused by flight delaying, relevant domestic scholars have done some research and gained rich research achievements since 2000.

Xu Hong(2007) analyzes the causes of passenger group incidents from the perspective of the legislation and policy, airlines and airport, passenger itself and media. Yu Lan (2009) argues that poor airline service, inaccurate compensation and failure communication would result in flight delaying group events. Yang Lei(2010) thinks the flight delaying caused by the aviation company accounted for a large proportion of the whole. The reasons are listed as follows: one is machine fault, the other is flight deployment, the third is unit business that flying flight unable to execute the task because of its own reasons and leading to the occurrence of group incidents. Yuan Donglin(2011) argues that the flight delaying is a complicated process and the civil aviation should ensure the safety of the passengers, any link will all bring flight fault and passenger conflict while going wrong. Li Weihua(2010) thinks that neglecting passengers' feeling is the main reason for the conflict after flight delaying. Shi Xinliang(2012)

* This paper is supported by National Nature Science Foundation of China "Research on air traffic safety coupling mechanism and warning decision support system"(authorized number 71271163)

thinks that most of passengers understand the reasons for flight delaying, but the airline service, which is an important reason for both conflict. From the literature we can see flight delaying are result from many factors, which caused by airlines, airport and passengers. The airport plays an important role in such conflict events, and there is a few researches on passengers conflict from the perspective of airport. In order to prevent and reduce passenger conflict events on the adverse effects caused by civil aviation, this research analyzes the problem in passenger conflict while flight delaying and putts forward the civil airport passengers conflict strategies based on practical investigation on an airport.

2 Data Source

This paper chooses a certain airport comprehensive management department, business department, the Department and other 5 departments as the research sample questionnaire survey, 151 questionnaires were sent out, 140 were reclaimed, the recovery rate is 92.72%, 135 were effective, efficiency of 96.43%. The questionnaire was investigated the basic information as shown in table 1. From the survey of gender perspective, proportion in 1:1, degree level in college or above, at the age of 40 years old; Look at years of work, the staff whose years of work below 10 years accounted for 40%, more than 10 years accounted for 60%. Overall, survey sample was comprehensive and representative, research conclusion has strong reliability and persuasion.

3 Passengers' Emergent Situation in Flight Delaying

3.1 Current Compensation Provisions in Flight Delaying

In order to improve normal flight rate, reduce the conflict caused by flight delays, General Administration of civil aviation of China release a "Civil Aviation Administration of China on domestic airlines for their own reasons to cause delays to give passenger economy compensation guidance (Trial) " in 2004. "Directive opinion" (for Trial Implementation) specified in the compensation is conditional; airlines give financial compensation only on its own causes to flight delays.

Table 1 The Research Staff's Rational Understanding about the Current Compensation Provisions

Sort	The original serial number	Option	Percentage (%)
1	(2)	Not rational	77.8%
2	(3)	Unclear	18.5%
3	(1)	Reasonable	3.7%

From Table 1, 77.8% of the airport staff think compensation standard about the flight delay at present is not reasonable, 18.5% was not clear, only 3.7% of people choose the reasonable. As can be seen most of the staff did not satisfied the flight delay compensation, its reason has the following three points: One is the compensation standards are not uniform. Civil Aviation Administration of China issued the "guidance" to the standard of compensation is not uniform, but advised Airlines establish compensation scheme according to their own situation. The airline specific situation is different, so the compensation standards will differ, the passengers was easy to dissatisfy individual airlines or trigger clashes after encountered flight delay; Two is the Civil Aviation Administration of China issued the "guidance " of the flight delay compensation have no legal effect, does not belong to the legal laws and regulations, no mandatory binding, belong to advices of the economic compensation, there is no direct to the airlines and passengers to produce legal effects; Three is the Civil Aviation Administration of China's guidance is different from international conventions. Current flight delay compensation method of regulation is not the same all of the world, but most countries have no unified flight delay compensation standard. Foreign airlines only in its general conditions of carriage for provisions provide accommodation, transport and communications services after flight delay, but put forward the compensation explicitly is very small.

3.2 Passenger Emergency Problems Solving in Flight Delaying

Research results show that: 85.2% of the airport staff thinks the existing passenger emergency problems of airport flight delay is mainly stem from the poor coordination among relevant departments; 66.7% of those surveyed thinks the vulnerable spot in passenger emergency caused by flight delay lies in the related policies and laws weak.

The statistical results of Table 2 show that the airports take the following actions to cope with the vulnerable spot in passenger emergency rooted from flight delays:

- (1) The coordination among relevant departments should be strengthened, not only the

reinforcement of the coordination among internal sectors, but also the coordination speed among airports, Airlines, air control center and so on. In the meantime, corresponding service of each sector and the service consciousness should be further improved.

Table 2 Deal With the Problem of Flight Delays Travelers Emergencies Exist at the Airport

order	original order	options	percentage (%)
1	(2)	poor Coordination between departments	85.2%
2	(6)	weak policies and laws	66.7%
3	(3)	fail to foresee and grasp the trend	44.4%
4	(5)	poor disposal ability	40.7%
5	(1)	Lack of awareness	33.3%
6	(4)	lack of related professional knowledge	25.9%
7	(7)	others	8.9%

(2) Related policies, laws and regulations need to be further perfected. In current situation of increasing civil aviation volume and airspace resources shortage, the flight delay is inevitable. In order to reduce the dispute between airline companies and passengers, the airlines should take feasible measures to guarantee flight normal, formulate establish unified flight delay compensation standard as soon as possible, establish and perfect the flight delay compensation mechanism, and build a convenient, safe and harmonious environment.

(3) Through the interview we understand that the deficiencies in coping with emergency include airport staff fail to reach the place in time and the manager who is on duty needs to strengthen the ability to deal with emergencies.

3.3 Vital Approaches to Improve Emergency Dealing Abilities

Research results show that 84.1% of the airport staff think improve work personnel emergency main way is to learn emergency professional knowledge; 80.1% of the airport staff think improve work personnel emergency main way is usually to strengthen emergency drill, accumulate the related processing experience. 73.0% airport staff thinks improving work personnel emergency is a main way to actively participate in emergency treatment.

Table 3 Main way Civil Airport in Improving Emergency

order	original order	options	percentage (%)
1	(3)	Learning expertise about emergency	84.1%
2	(6)	strengthen emergency drill	80.1%
3	(4)	Actively participate in emergency treatment	73.0%
4	(2)	Strengthen awareness	48.1%
5	(5)	Increase relevant training	33.3%
6	(1)	Strengthen the sense of responsibility	29.6%

Statistical results of Table 3 show that learning professional knowledge of emergency, strengthening emergency drill and participating in emergency treatment actively can effectively improve the ability to deal with emergencies.

4 Conclusion

Of the civilian airport flight delays contexts respond to emergencies in management status through a questionnaire survey and interviews showed that: From the point of view of the airport most of the staff is not reasonable to think that the compensation standard provisions flight delays. Flight delays contexts travelers emergencies main problems, including the organization coordination between the departments is not enough quickly and effectively, and related administrative law is weak. Improve the airport to cope with emergencies main ways to include the expertise of learning emergency, emergencies drills, and accumulated experience in handling, actively involved in the handling of emergencies. To reduce and avoid the occurrence of such events, and suggestions for improving the flight delay compensation standard administrative regulations, the establishment of an early warning system for flight delays passengers emergencies, and perfect the mechanism of communication and coordination between various departments and innovation airport learning mechanism to deal with

incidents of travelers four aspects of the improvement of hope some inspiration flight delays passenger emergency management situations.

Evaluation on Performance Management of Vehicle Repair Cost Effectiveness Based on F-AHP

Zhang Jian, Cheng Dongfang

College of Equipment Engineering, Engineering University of CAPF, Xi'an, P.R.China, 710086
(E-mail: 080900200@163.com)

Abstract: Aiming at the current deficiency of performance management of vehicle repair cost effectiveness, F-AHP method is used to evaluate performance management of vehicle repair cost effectiveness. The F-AHP method based on the principle of performance management is supplied to analysis of vehicle repair cost evaluation index. Determine the membership degree of each index by using expert scoring method and the weight coefficient of each index by the analytic hierarchy process (AHP). Establish the evaluation method of F-AHP. And performance management level of vehicle repair cost effectiveness of some unit is studied as an example. The results show that: this evaluation method can accurately grasp the situation of the performance management of vehicle repair cost, find out the influence of performance management level, and improve the efficiency of management.

Key words: Vehicle repair; Cost; Performance Management; F-AHP

1 Introduction

Performance management of vehicle repair cost effectiveness is conducive to making and planning the decisions of optimization of vehicle repair cost in a given financial conditions, improving the management efficiency of vehicle repair cost effectiveness, completing repair tasks efficiently, and achieving the organic combination of military and economic benefits.

2 Establishment of Evaluation Index system of Performance Management of Vehicle Repair Cost Effectiveness

In view of the fuzzy and relative evaluation on performance management of vehicle repair cost, and considering about many factors that influence vehicle repair, the author puts forward the evaluation index system based on the F-AHP (Table 1):

Table 1 Evaluation Index System of Management of Vehicle Repair Cost Effectiveness

	First-level Index	Second-level Index
Performance Management of Vehicle Repair Cost Effectiveness U	A_1 Supply Efficiency of Repair Cost	Realization Extent of Repair Goal B_{11}
		Quality of Repair B_{12}
		Timeliness of Repair B_{13}
		Innovation of Repair Technology B_{14}
		Military and Civilian Repair Capacity B_{15}
	A_2 Management System of Vehicle Repair Cost	Organizing Agency B_{21}
		Management System B_{22}
		Management Style B_{23}
	A_3 Quality and Abilities of Personnel	Professional Quality B_{31}
		Attitude toward Work B_{32}
		Degree of Education B_{33}

3 Evaluation on Performance Management of Vehicle Repair Cost Effectiveness

According to the actual situation of Evaluation on performance management of vehicle repair cost effectiveness, evaluation index system is established and performance is evaluated combined with F-AHP.

3.1 Calculate the Weight of Each Index

The evaluation index system is established for the system with the size and importance of different, and it can be given with different weight to this difference between the evaluation indexes. In this paper, the application of AHP is used to determine the weight of each index. The weight coefficient of the index calculated by AHP is actually based on the establishment of orderly index system and the comprehensive evaluation results are used to compute weight coefficient of each index through pairwise comparisons between indexes to Evaluation on each index in the system. This method has been widely applied in the analysis of complex system. In recent decades, many kinds of improvement or deformation of AHP have been developed. This paper uses an AHP method based on consistent matrix.

According to the actual situation of Evaluation on performance management of vehicle repair cost effectiveness, experts and judges are invited to score for the relative importance of each index. Scoring rules based on 1-9 scale of AHP are used to construct judgment matrix of every index layer:

$$B = \begin{bmatrix} u_{11} & u_{12} & \cdots & u_{1j} \\ u_{21} & u_{22} & & u_{2j} \\ & \vdots & \ddots & \vdots \\ u_{i1} & u_{i2} & \cdots & u_{ij} \end{bmatrix}$$

Product method is used to determine weight factor matrix and judge the consistency. The specific steps are as follows:

1) Normalize each column of judgment matrix:

$$\bar{u}_{ij} = \frac{u_{ij}}{\sum_{i=1}^k u_{ij}} \tag{1}$$

2) Add the judgment matrix treated by row up:

$$\bar{w}_i = \sum_{j=1}^k \bar{u}_{ij} \tag{2}$$

3) Normalize $\bar{w}_i = (\bar{w}_1, \bar{w}_2, \dots, \bar{w}_r)^T$, i.e.

$$w_i = \frac{\bar{w}_i}{\sum_{j=1}^k \bar{w}_j} \tag{3}$$

Obtain result: $w_i = (w_1, w_2, \dots, w_r)^T$. It presents the weight vector of the relative importance that element on the same level compares with corresponding element on the upper level.

4) Consistency Test

Because of the complexity of the objective things and vague and diversity of people's understanding, the judgment matrix is not entirely consistent, so it is necessary to carry out the consistency test. First, calculate the maximum characteristic value λ_{\max} of judgment matrix.

$$\lambda_{\max} = \sum_{i=1}^k \frac{(p_w)_i}{kw_i} = \frac{1}{k} \sum_{i=1}^k \frac{(p_w)_i}{w_i} \tag{4}$$

In the formula: $(p_w)_i$ presents the i-th element of vector p_w :

$$p_w = \begin{bmatrix} (p_w)_1 \\ (p_w)_2 \\ \dots \\ (p_w)_i \end{bmatrix} = \begin{bmatrix} u_{11} & u_{12} & \cdots & u_{1j} \\ u_{21} & u_{22} & & u_{2j} \\ & \vdots & \ddots & \vdots \\ u_{i1} & u_{i2} & \cdots & u_{ij} \end{bmatrix} \begin{bmatrix} w_1 \\ w_2 \\ \vdots \\ w_i \end{bmatrix} \tag{5}$$

$$CI = \frac{\lambda_{\max} - N}{N - 1} \tag{6}$$

Type: CI represents consistency index.

$$CR = CI/RI \tag{7}$$

When $CR < 0.10$, it is generally believed that the consistency of judgment matrix is satisfactory.

Otherwise, it should be adjusted. RI is the average random consistency index. Table 2 presents the value of RI of 1-10 order.

Table 2 The Value of RI:

Order	1	2	3	4	5	6	7	8	9	10
RI	0	0	0.52	0.89	1.12	1.26	1.36	1.41	1.46	1.49

3.2 Evaluation Based on F-AHP

Performance management of vehicle repair cost effectiveness based on F-AHP can be represented by comprehensive evaluation index which consists of 4 elements:

1) The evaluation factor set (U_i). It includes the collection of various main factors affect the assessment object:

$$U_i = \{u_{i1}, u_{i2}, \dots, u_{ij}\}$$

2) The evaluation set (V). The comment for evaluation object may be as follows:

$$V = \{v_1(\text{excellent}), v_2(\text{good}), v_3(\text{general}), v_4(\text{poor}), v_5(\text{very poor})\}$$

3) Fuzzy subset of index weight coefficient:

$$\tilde{A} = \{a_1, a_2 \dots, a_k\}$$

4) The fuzzy evaluation matrix R:

$$R = (R_2, R_3 \dots, R_i)^T = \begin{bmatrix} r_{11} & r_{12} & \dots & r_{15} \\ r_{21} & r_{22} & & r_{25} \\ & \vdots & \ddots & \vdots \\ r_{i1} & r_{i2} & \dots & r_{i5} \end{bmatrix} \tag{8}$$

R_i of i-th line, belonging to the vector R, reflects the membership degree of i-th factor for the comment of evaluation set. The j-th column reflects the extent of factors of evaluation object taken from j-th comment of evaluation set, including: $i=1,2,\dots,11; j=1,2,3,4,5$. The (U, V, R) is called as evaluation index system of performance management of vehicle repair cost effectiveness based on F-AHP.

Fuzzy set of fuzzy matrix is:

$$B = A \times R = (a_1 a_2 \dots a_i) \cdot \begin{bmatrix} r_{11} & r_{12} & \dots & r_{15} \\ r_{21} & r_{22} & & r_{25} \\ \vdots & \ddots & \ddots & \vdots \\ r_{i1} & r_{i2} & \dots & r_{i5} \end{bmatrix} = (b_1 b_2 b_3 b_4 b_5) \tag{9}$$

4 An Example

Now performance management level of vehicle repair cost effectiveness of some unit is taken as an example, combining with the algorithm model proposed, to evaluate its effectiveness. The specific process is as follows:

4.1 Obtain judgment matrix from scoring by experts, calculate consistency weight and test matrix

Table 3 Judgment Matrix (U-A):

U	A_1	A_2	A_3	W	Consistency test
A_1	1	1.3431	1.9893	0.4440	$\lambda_{\max} = 3.0061$
A_2	0.7428	1	1.5215	0.3333	CI=0.0031
A_3	0.5124	0.6597	1	0.2227	CR=0.0060<0.10

Table 4 Judgment Matrix ($A_1 - B_1$):

A_1	B_{11}	B_{12}	B_{13}	B_{14}	B_{15}	W_1	Consistency test
B_{11}	1	0.6248	1.2348	0.8421	0.6998	0.1658	$\lambda_{\max} = 5.0033$
B_{12}	1.6145	1	1.9864	1.3452	1.1429	0.2671	CI=0.0033
B_{13}	0.7895	0.5132	1	0.6679	0.5714	0.1336	
B_{14}	1.2167	0.7486	1.5146	1	0.8571	0.2007	CR=0.0026<0.10
B_{15}	1.3896	0.8754	1.7428	1.1684	1	0.2327	

Table 5 Judgment Matrix ($A_2 - B_2$):

A_2	B_{21}	B_{22}	B_{23}	W_2	Consistency test
B_{21}	1	0.7101	0.4875	0.2212	$\lambda_{\max} = 3.0808$
B_{22}	1.6667	1	0.9851	0.3717	CI=0.0404
B_{23}	2.1242	1.0153	1	0.4071	CR=0.0777<0.10

Table 6 Judgment Matrix ($A_3 - B_3$):

A_3	B_{31}	B_{32}	B_{33}	W_3	Consistency test
B_{31}	1	1.4357	2.4132	0.4728	$\lambda_{\max} = 3.0150$
B_{32}	0.7143	1	1.6067	0.3271	CI=0.0075
B_{33}	0.4386	0.5987	1	0.2001	CR=0.0144<0.10

4.2 Judgment matrix of fuzzy evaluation matrix

This evaluation, with the evaluation team composed of 10 experts, will evaluate with five orders: excellent, good, general, poor and very poor (Table 7):

Table 7 Performance Management Level of Vehicle Repair Cost Effectiveness:

First-level Index	Second-level Index	Excellent	Good	General	Poor	Very poor
Supply efficiency of repair cost	Realization Extent of Repair Goal	0.3	0.3	0.2	0.1	0.1
	Quality of Repair	0.4	0.3	0.1	0.2	0
	Timeliness of Repair	0.6	0.1	0.3	0	0
	Innovation of Repair Technology	0.4	0.2	0.3	0	0.1
	Military and civilian repair capacity	0.7	0.1	0.1	0.1	0
Management system of vehicle repair cost	Organizing Agency	0.5	0.1	0.1	0.1	0.2
	Management System	0.5	0.2	0	0.2	0.1
	Management Style	0.4	0.2	0.3	0	0.1
Quality and abilities of personnel	Professional Quality	0.7	0.2	0.1	0	0
	Attitude toward Work	0.5	0.3	0	0.1	0.1
	Degree of Education	0.4	0.3	0.2	0.1	0

4.3 Obtain fuzzy evaluation matrix of repair cost supply efficiency (R_1):

$$R_1 = \begin{bmatrix} 0.3 & 0.3 & 0.2 & 0.1 & 0.1 \\ 0.4 & 0.3 & 0.1 & 0.1 & 0 \\ 0.6 & 0.1 & 0.3 & 0 & 0 \\ 0.4 & 0.2 & 0.3 & 0 & 0.1 \\ 0.7 & 0.1 & 0.1 & 0.1 & 0 \end{bmatrix}$$

The corresponding weights matrix is:

$$W_1 = [0.1658 \quad 0.2671 \quad 0.1336 \quad 0.2007 \quad 0.2327]$$

Second-level comprehensive evaluation can derive repair cost supply efficiency of first-level evaluation factors:

$$B_1 = W_1 \cdot R_1 = [0.4593 \quad 0.1779 \quad 0.1442 \quad 0.0965 \quad 0.1221]$$

The same procedure may be easily adapted to obtain second-level comprehensive evaluation indexes from the first-level evaluation factors of management system of vehicle repair cost and quality and abilities of personnel:

$$B_2 = W_2 \cdot R_2 = [0.3670 \quad 0.1594 \quad 0.1258 \quad 0.0780 \quad 0.0852]$$

$$B_3 = W_3 \cdot R_3 = [0.5746 \quad 0.2527 \quad 0.0873 \quad 0.0527 \quad 0.0327]$$

4.4 Comprehensive Evaluations

1) Comprehensive evaluation matrix of first-level indexes (R) is composed of B_1 , and B_3 :

$$R = \begin{bmatrix} 0.4593 & 0.1779 & 0.1442 & 0.0965 & 0.1221 \\ 0.3670 & 0.1594 & 0.1258 & 0.0780 & 0.0852 \\ 0.5746 & 0.2527 & 0.0873 & 0.0527 & 0.0327 \end{bmatrix}$$

2) Comprehensive weight matrix of first-level index is:

$$W = [0.4440 \quad 0.3333 \quad 0.2227]$$

Performance management evaluation matrix of vehicle repair cost in this unit is:

$$B = W \cdot R = [0.4542 \quad 0.1884 \quad 0.1254 \quad 0.0806 \quad 0.0899]$$

The results of evaluation show that: performance management level of vehicle repair cost in this unit is that 45.42% of the people think excellent, 18.84% think good, 12.54% think general, 8.06% think poor, and 8.99% think that is very poor. According to the maximum membership rule, performance management level of vehicle repair cost in this unit is excellent.

5 Conclusion

In this paper, the application of the AHP method and fuzzy evaluation method are used in performance management Evaluation on vehicle repair cost. Combination of the qualitative and quantitative analyses makes the procedure easy to operate ,grasps the situation of the performance management of vehicle repair cost accurately, find out the influence of performance management level, improve the management efficiency, and promote performance management level of vehicle repair cost to upgrade continuously.

Abstract: The paper tried to evaluate the competitiveness of services scientifically in a region based on factor and cluster analysis method, and then provided efficient and visualized reference data for the scientific development of regional services. It used the statistical data of 30 provinces and autonomous regions in China in 2008, and gave the evaluation results and the gradient distribution which was substantially the same with the gradient of economic development. Finally, some suggestions about services in a region were put forward based on the previous results.

Key words: Services; Scientific evaluation; Factor analysis; Cluster analysis

1 Introduction

Services are also colloquially known as the tertiary industry. Both are long used at domestic. Since 1985, the National Bureau of Statistics has defined the concept of "the tertiary industry", that is, the general term for all industries except agriculture, manufacture and construction industry. In the service economy age, the proportion of service industry in developed countries has accounted for more than 70%, while only about 55% -60% in the developing countries including China, and most of them are on the junior level showing the state of unbalanced development in various provinces and cities. However, the level of the service industry is an important way to measure the level of economic development in a region or even a nation. According to the experience of developed countries and domestic practice, the scientific development of the service industry plays a role in the overall improvement and the sustained and stable development of the national economy, employment and the optimization and upgrading of industrial structure. Therefore, it is theoretically and practically significant for the promotion of scientific and sustainable development of the service industry to identify the main factors that affect the development of the service industry, and to analyze why different levels of development of the service industry exist^[1]. Competitiveness is the most intuitive and direct indicators reflecting the comprehensive competitiveness and level of development of services. The development of the service industry depends on their competitiveness. Competitiveness of regional service industry has become an important support for sustainable development of China's regional economic science^[2]. The economic growth and the promotion of comprehensive level in a region or even a nation are relied on highly competitive service industry^[3].

2 Construction of Evaluation Index System

Competitiveness of Service industry is a comprehensive system covering the services itself and other indicators such as the relevant elements, relationships, and behavior etc. The construction of a reasonable evaluation index system is the premise of the scientific evaluation in the multi-index comprehensive evaluation^[4].

Competitiveness and Evaluation Research Center of Renmin University of China said, competitiveness of services is an integrated system covering service industry itself and the elements, relationships, and behaviors etc., therefore, the evaluation of the service industry should be systematic. According to the scientific, systematic, dynamic and operable principles, index system that can comprehensively evaluate the level of the development of services is constructed from the size, structure, innovation, growth and management¹. These include: scale competitiveness, structural competitiveness,

* This article is supported by the National Natural Science Foundation(70772075) and Project of Ministry of Education(12YJA790155,11YJA790219)

¹ Competitiveness and Evaluation Research Center of Renmin University of China. Report on services Competitiveness of China's 31 provinces. China Information News[N], 2003.8.22 (in Chinese)

growth competitiveness, innovation competitiveness and management competitiveness.

Finally, according to the principles of comparability, science, operability, systematicness, and combining absolute principle with relative principle, then evaluation index system of services competitiveness were built from four aspects of the economic strength, the overall situation of services, the development performance of main services, scientific and technological strength in the reference “comprehensive evaluation of competitiveness for our provincial services” by Wu Shiyuan^[5]. Thus this study selected 17 indicators to build the evaluation index system of services competitiveness. (seeing Table 1)

Table 1 Evaluation Index System of Services Competitiveness

	First level indicators	Second level indicators
Evaluation index system of services competitiveness	economic strength	GDP per capita(X1)、 Per capita disposable income of urban residents (X2)、 Services output value (X3)、 The total number of Services (X4)、 urban fixed asset investment of services(X5)、 Urbanization rate (X6)
	the overall situation of services	The added value of services in GDP (X7)、 Services output per capita (X8、 The proportion of employees in Services (X9)
	The performance of main services	Traffic volume (X10)、 wholesale and retail total of consumer goods per capita and catering Accommodation Total (X11)、 Telecommunications per capita (X12)、 amount of financial and insurance per capita (X13)、 tourism income total (X14)
	scientific and technological strength	The number engaged in scientific and technological activities per million people (X15)、 the number of college students per ten thousand people(X16)、 patents total per ten thousand people (X17)

3 Empirical Research on Comprehensive Evaluation of Services Competitiveness

The factor analysis may identify a representative factor in many variables by Classifying variables of the same nature as a factor to reduce the number of variables, and may also examine the relationship assumptions among the variables. This paper used factor analysis to evaluate the services competitiveness in a region, that is, each index can be integrated to a comprehensive variable that can assess competitiveness of services. Firstly, principal component analysis was used for the evaluation index in order to obtain the factor-fit-testing table, from which we can see whether the value of the KOM and the value of sphericity test is in line with conditions of factor analysis. Then, the selected data was used to make the common factor scree plot. According to the scree plot, some appropriate factors were selected as the main factors.

According to the characteristic roots of the main factors, the weight formula of each main factor is obtained as follows:

$$W_i = \frac{\lambda_i}{\sum \lambda_i}$$

λ_i (i=1,2) is the characteristic root corresponding to each main factor, which can be used to construct the competitiveness evaluation model for services.

$$F = W_1F_1 + W_2F_2$$

(i=1,2) is score matrix of each factor, from which evaluation score can be obtained.

This paper selected evaluation data from 30 provinces and autonomous regions as samples (except the province of Tibet, Taiwan, Hong Kong and Macao Special Administrative Region) to do integrated factor analysis and evaluation. The sample data are obtained from “the tertiary industry in China Statistical Yearbook 2009”^[2] as well as provincial and municipal Statistical Yearbook.

The number of variables is 17, and the sample size is 30. Factor analysis was done by using SPSS statistical analysis software. Results of KMO and Bartlett test (0.821) were shown that the correlation matrix was the identity matrix, which was suitable for factor model. Subsequently, the common factor scree plot was made through the selected data (not shown). As the scree plot can be seen, when one or two common factors were extracted, eigenvalues changed a lot; when more than three common factors were extracted, the changing of eigenvalues almost leveled off. Therefore, following the principle that eigenvalues were greater than 1, two common factors were selected, which reached 88% in the cumulative variance contribution rate, that is, they contained most information and have a significant representation that can fully reflect competition level of the 30 provinces and municipalities. Therefore,

they can be extracted as common main ingredients.

These three indicators had a great load explanatory power for the scale of development of services and explained the previous development situation, so that F2 factor was called as the development factor.

$$F = 0.7436F_1 + 0.2564F_2$$

The scores and ranking of comprehensive competitiveness in China's 30 municipalities and regions can be obtained by using SPSS 20.0 (Table 2). Cluster analysis was used to deal with the selected 17 indicators by using the software SPSS (results not shown), then the competitiveness gradient distribution (Table 2) of services in 30 provinces and cities can be obtained.

Table 2 Scores and Ranking of 30 Provinces and Autonomous Regions' Services competitiveness

4 Conclusions

As Table 2 was shown, the provinces and cities of the top composite score were Beijing city, Shanghai city, Guangdong province, Zhejiang province, Tianjin city, Jiangsu province, Shandong province, Liaoning province and Fujian province. All of these provinces and cities lie in the eastern region of China, of which eight are located in the coastal zone. F1 scores of Beijing and Shanghai were far ahead, that is, huge development potential which was due to the local economic strength, the

scientific and technological strength, and political and financial support by government.

Tianjin, a portal of the Beijing-Tianjin-Tangshan region as one of the three major economic groups in China started late in the development of the tertiary industry without enough accumulation. However, Tianjin has great potential in the development of the tertiary industry as the Free Trade Zone, series of policies and funds support.

There were nine provinces and municipalities ranking last, which were Hainan, Jiangxi, Xinjiang, Guangxi, Ningxia, Yunnan, Gansu, Qinghai and Guizhou. Except Jiangxi and Hainan, most of them are located in the western region without good geographical conditions and transportation, so that its slow economic growth affects the investment in the tertiary industry.

12 provinces ranking in the middle are located in the central and northeast region of China, with good foundation of industry and agriculture, abundant labor resources as well as relatively good infrastructure and transportation construction. However, the burden of excessive population reduced per capita indicators. Inner Mongolia Autonomous Region had an eye-catching performance score in the 12 regions, because Inner Mongolia has rich mineral resources. Its industrial development and GDP growth rate far exceeded the national average, which led to the development of the tertiary industry, realizing the combination of manufacture and services.

It is not difficult to see from the weight and the score that the main factors affecting the competitiveness of China's services are economic base, industrialization and government policy, while the influence of scientific and technological strength and new service industry on competitiveness is not great. In the meanwhile, there are uneven development happening in different regions, which differs from Western developed countries.

Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: 38198802@qq.com, 157234264@qq.com)

Abstract: International Financial Reporting Standards (IFRS) is a standard system of accounting which issued by the International accounting standards board (IASB), making each country do business easily in International economic relations. Based on the previous studies, this paper objectively analyzed the status of the objectives and benefits of IFRS. We comparatively analyze the differences between China's Accounting Standards and IFRS, and work out the reasons. Finally, some conclusions and proposes have been put forward.

Key words: IFRS; China's Accounting Standards; Comparative analysis; Accounting

1 Introduction

International Financial Reporting Standards (IFRS) is a standard system of accounting which issued by the International accounting standards board (IASB), making each country do business easily in International economic relations. IFRS is a global financial rule, based on the international standard operation standards of financial management. The function of IFRS is to regulate accounting work within the scope of the enterprise or other economic organization all over the world. Generally speaking, there exists only one accounting rule in each country, to avoid some unnecessary financial losses for different standards having different calculation methods. Especially, the IASB is to train the professional senior accountants by entrust the professional accounting organizations, such as International CPA Professional Senior Accountants (AIA). So far, it already has more than 100 countries in the world has passed this standard, including some countries in Europe, China, Hong Kong, Russia, Australia, etc. Actually, the most vital function of IFRS is to establish an effect standard and to meet SME's requirements in business. As a rapidly developing standard, IFRS will bring great benefits to the society and have good prospects for development

2 IFRS' Objectives and Characteristics

Correct and reasonable intentions have a very good guidance for the business.

First of all, the IFRS is to develop a high quality, clear, enforceable and global set, which can be accepted by international financial reporting standards (IFRSs) and the IASB (standard-setting body). That is, high quality financial statements provide useful information to a mass of users, including investors. While, some key factors are required, including the accurate economic reality depiction, less managerial manipulation, timeliness. (Ray Ball, 2006, p11). Compared to the legalistic, political, and tax-influenced standards, which is typified by the Continental Europe, IFRS is designed to a highly sensitive barometer of the economic substance, the economic growth or losses, the economic information and the useful balance sheets. Also, IFRS aims at creating some hidden reserves and the potential economic losses from the public perspective. The ISAB already has a vigorously system, which requires the enterprises reporting in line with the rules of high quality, transparent and comparable information. The governance and oversight of the activities are undertaken by the IFRS Foundation and its standard-setting body rests with its Trustees, which are also responsible for safeguarding the independence of the IASB and ensuring the financing of the organization. The Trustees are publicly accountable to a Monitoring Board of public authorities. In pursuit of this goal, the IASB works hard for the close cooperation with stakeholders around the world, including investors, national standard-setters, regulators, auditors, academics, and others who are interested in the development of high-quality global standards. The brand could gain more great experiences or supports to pay for promotion and find out commons by some communications with each other. Actually, the progress of approaching this goal is steadily developing. All major economies have built time lines to converge with or employ IFRSs in the coming future. The international convergence efforts of the organization are also supported by the Group of 20 Leaders (G20) where, on September 2009 meeting in Pittsburgh, US called on international accounting bodies to redouble their efforts to achieve this objective within the context of their independent standard-setting process. In particular, they asked the IASB and the US

FASB to complete their convergence project. (The IFRS Foundation Web, 2013). Benefit from the continuous efforts of this organization, the goal is approaching. Related industries will have a lot of positive change. Also, people's life style will change a lot in the future.

IFRS is to meet the financial requirements of emerging economies and small and medium-sized enterprises. SMEs have become integral parts of the market and they really matter in the whole society economic growth. Consequently, meeting their needs is really essential. SMEs serve as a backbone to keep an economy going and boosting it up when facing the hard time, such as the great economic recessions. They are considered as the main source of modernization, innovation and entrepreneurial spirit. Several companies, irrespective of their size, are constrained to the statutory rules of a particular country in which they undertake to prepare financial reports to confirm the specified set of accounting principles. There are much ongoing debate on whether the suitability of one set of accounting standards in a country for all its operating enterprises, regardless of their size. As well as IFRSs, the Board has issued IFRS for SMEs, to meet the needs and capabilities of small and medium-sized entities (SMEs) and users of their financial statements. Any company, no matter what its size is, is eligible to use the IFRS for SMEs, provided it does not have public accountability. An entity has public accountability if it is publicly traded, or it is a financial institution or similar entity. The IFRS for SMEs is based on IFRSs but is much less complex. Hopefully, the IFRS for SMEs is a self-contained standard of 230 pages, designed to meet the needs and capabilities of small and medium-sized enterprises (SMEs), which are estimated to account for over 95 per cent of all companies around the world. Compared with full IFRSs (and many national GAAPs), the IFRS for SMEs is flexible in a number of ways; to read more about how complexity was reduced. In this paper, the topics not relevant for SMEs are omitted, such as earnings per share, interim financial reporting, and segment reporting. While full IFRSs allow accounting policy choices, the IFRS for SMEs allow only the easier option. For instance, they only consider some issues like the no option to revalue property, equipment or intangibles, a cost-depreciation model for investment property unless fair value is readily available without undue cost or effort. Many principles for recognizing and measuring assets, liabilities, income and expenses in full IFRSs are simplified. Such as, mortise goodwill, expense all borrowing and R&D costs, cost model for associates and jointly-controlled entities, no available-for-sale or held-to-maturity classes of financial assets. Significantly fewer disclosures are required (roughly a 90 per cent reduction). The standard has been written in clear, easily translatable language. To further reduce the burden for SMEs, revisions to the IFRS will be limited to once every three years. (IFRS Foundation Web, 2013) The standard is available for any jurisdiction to adopt, whether or not it has adopted full IFRSs. Each jurisdiction must determine which entities should use the standard. The IASB's only restriction is that listed companies and financial institutions could not use it. The IFRS for SMEs provides a lot of convenience and build a good platform to small and medium-sized entities, so that exchanges and cooperation with large companies could become simpler, and the benefits for each enterprise would be maximized in this extensive business environment.

3 Comparative Analysis of China's Accounting Standard and IFRS

With the rapid economic growth of China, the CAS (China's Accounting Standard) is studied by more and more scholars. And the issue on identifying the differences between the CAS and IFRS is popular recent years. This paper concludes three differences which are showed in table 1 following.

Table 1 The Differences Between China's Accounting Standards and IFRS

	<i>Difference (a)</i>	<i>Difference (b)</i>	<i>Difference (c)</i>
CAS	CAS is the top standard of all the accounting standards.	The reliability of the information is of the first place and the relevance is of the secondary.	The CAS contains the "profit" factor.
IFRS	The framework of IFRS is established to help evaluate the existed IFRS. When a conflict is occurred, the details of the existed IFRS talk.	The relevance of the information is of the first place and the reliability is of the secondary.	The IFRS doesn't contain the "profit" factor.

Note: CAS denotes China's Accounting Standards.

We are convinced that the reasons why the above differences occurred are the different standards

system and legislation system. On the other hand, the different capital market also matters. Different levels of capital market have various demands towards the accounting information. The details of the reasons are as follows.

Table 2 The Reasons Why the Differences Occur

	<i>The Different standard systems and legislation systems</i>	<i>The Different Capital Market</i>
CAS	(a)The general framework of CAS is one of the parts of the existed accounting system. (b)CAS has the force of legislation.	In China, the capital market is not mature. As a result, the reliability of the accounting system is more important.
IFRS	(a)From the western countries' accounting system aspect, the framework of IFRS is the theoretical base of the accounting system. (b) Do not have the force of law.	In most western developed countries, the capital market is well developed. As a result, the relevance of the accounting information is more important.

However, the IFRS is the most popular international accounting system today. So it is of social value and of theoretical value to study further the IFRS. And this can also help us to improve the China's Accounting Standards.

The adoption of International Financial Reporting Standards has created a number of benefits.

(a)Through the strengthening of cross-border comparability of financial information, it can improve something such as transparency of information (actually, one of the main objectives of International Financial Reporting Standards is to improve the comparability and transparency.)and market data, changes in market liquidity, reducing the cost of capital and increased cross-border investment. It is considered that holding direct impact on the wide spread of International Financial Reporting Standards. To achieve these goals, the investors can acquire a better understanding of the company and market performance at a lower cost. Therefore, investors are more confident and comfortable for the domestic and international investment. The company could access to capital easier with a lower cost, and cross-border investment will increase. About the advantages of the International Financial Reporting Standards elaborated mainly for two different objects. One is public sector and especially the other is Chinese companies.

(b)The public sector reporting calls for high requirements. At the same time, they also need to develop a work plan by related data and materials. So it is necessary to implement a wide range of appropriate financial reporting standards. The objective of financial statements is to provide information about the financial position and performance of an organization that will be useful to a range of people in making economic decisions, and additionally for public sector accounts, demonstrating how taxpayers' money has been spent to the various stakeholders. The general experience is that stakeholders show little interest in the accounts and few authorities expect this to change any time soon. One practitioner said: They didn't mean much before and they mean even less now. The fundamental issue has been lost sight of, which is to provide stakeholders and local taxpayers with a clear picture of what has been spent on the provision of what services and how this compares to the budget on which their tax demand was based. (Peter Bateman,2012) The focus is on entities that are public benefit entities (PBEs) in the public sector, including Government Departments, DHBs, Tertiary Education Institutions and Local Authorities. In the UK, public sector financial reporting is undergoing the most fundamental change since the introduction of resource accounts. IFRS will be used to produce the annual financial statements for central government, health bodies and certain other public sector bodies from 2009/10. The 2008/09 accounts will also have to be restated using IFRS principles. For local government the timetable runs one year behind these timescales. (Stuart Wayment and Technical Information Service,2009) Then under IFRS, there are stricter requirements, including accruals, for staff benefits such as accrued leave. For some government departments, this will be a significant challenge, not only because of the size of the payrolls, but also due to the nature of leave arrangements. For example, the MoD has various arrangements, most notably for serving personnel. Here the movement in accrued leave due to operational requirements may vary significantly year-on-year, whereas for other departments the year-on-year movement may be insignificant. Local authorities are well placed to develop universal success after the first year of IFRS accounting. CIPFA has noted concerns to the guidance and complexity of the accounts of local authorities. The institute responded: "The transition to IFRS was a significant challenge for the local government sector. Bodies should therefore be congratulated on managing the change so well. Though, the successful transition should not be a

surprise given local government's track record in implementing such changes.”

(c) With the advent of economic globalization, that China is developing rapidly and it is inevitable of making communication and cooperation with other countries in many ways. In the economic field, the trend towards the development of a set of globally accepted accounting standards is inevitable. We find that significant steps toward convergence occurred through the issuance of four successive Chinese GAAPs: 1992, 1998, 2001, and 2006. Convergence occurred both through the direct import of standards from IFRS and progressive changes to Chinese GAAP. Direct import was observed for items either reflective of traditional Chinese accounting practice or ones that addressed situations not considered or not relevant under the previous accounting model. Progressive changes to Chinese GAAP were observed on items substantially different from traditional practice. Overall, we conclude that the phased implementation, combination of direct import has been practical and effective methods for demonstration in Chinese accounting standards and international financial reporting standards (Elsevier Inc, 2009). Convergence to International Financial Reporting Standards (IFRS) has benefited the Chinese economy, by making accounting earnings more informative and therefore more useful to domestic and international investors. The researchers examined all Chinese companies which listed on the Shanghai Stock Exchange and Shenzhen Stock Exchange provided investors with more information between 2003 and 2009, to understand IFRS convergence in its financial statements. The study looked for changes to the value-relevance of earnings-the degree to which changes in reported earnings affect share prices -and found that this increased following IFRS convergence in 2007, and was almost certainly the result of convergence itself. Actually, the incentives of the enterprises really matter when IFRS convergence led to companies improving the quality of disclosures (ACCA global web, 2013). To evaluate the integration process, we determined key measurement items and matched in each treatment in the International Financial Reporting Standards. In the period from 1992 to 2006 of the four stages of the development of China's accounting standards, this step allows us to measure the level at each stage of the Chinese accounting standards convergence. We found that the Chinese government is continuing taking efforts to improve the quality of accounting standards and it has been successful in promoting IFRS convergence, consistent with the predictions of teleological process theory. By analyzing the changes in the content, we identified specific practices in the efforts of China Convergence, from an accounting concept and with time go by gradually changing the direct import, it related factors associated with these successful practices. If these factors are interested by other countries, they could consider of the use of International Financial Reporting Standards.

4 Conclusions

In the context of XBRL global rapid promotion, the promotion and protection of the International Financial Reporting Standards (IFRS) is adopted on a global scale unanimously. International Accounting Standards Committee Foundation (IASCF) was launched in 2002. Based on IFRS XBRL Taxonomy formulation, XBRL team officially formed in 2005, which is responsible for formulating the taxonomy of IFRS. Accordance with decision feedback, IASCF decided to use the same classification of the standard technical architecture between the full version of IFRS and the SME IFRS. It contains the SME IFRS 2010 IFRS Taxonomy draft released on February 19 2010 and officially release on April 30.

In the near future, the pursuit of a global scale for IFRS may be not the best choice. According to the experiences of implementation of IFRS, full adoption of IFRS involves that not only a change in accounting principles. However it will be involved in the change of company processes and systems, and even management statements and performance measurement methods may be adjusted accordingly, the level throughout the company has affected. If the company converted to IFRSs, it required lengthy planning and execution. Then the control of progress is also very important. During the conversion process, different companies often find many new issues, which could affect the progress of the original conversion. In addition to time, good conversion plans could avoid the unexpected switching costs. The key of the IFRSs convert to success lies in good planning, effective implementation, good communication and the assistance of experts.

China's economic is roaring in the past years and has a good growth trend, which means the CAS should be changed to fit the varying demands of the capital market. As a result, we should take some measures to improve the external environment of the accounting standards and narrow the gap the CAS and IFRS.

Analysis of Risk Perception Behavior of Entrepreneurial Team Based on Members Personality

Wang Qing

School of Management, Wuhan University of Technology, Hubei, 430070

(E-mail: wangqing@sohu.net)

Abstract: Entrepreneurial activity is accompanied with risks itself, entrepreneurial teams risk perception as the name suggests that entrepreneurial teams have the sensory and cognitive for the possible risks of entrepreneurial activity, which are also the cognition of members who based on risk perception of the overall. This paper analysis the principal personality factors affecting risk perception of entrepreneurial team, and then proposed the optimization strategy based on personality behavior Patterns of team, which is expected to offer guidance to entrepreneurial team.

Key words: Risk perception; Entrepreneurial team; Members personality

1 Introduction

Facing the increasing pressure of employment, many people chose the way of self-employment, consisting of individual entrepreneurship of entrepreneurial team gets the attention of people gradually. There are no uniform standards and metrics in the current study on the definition of entrepreneurial teams. In the previous study of entrepreneurial team, which many scholars have had many different definitions. Leon Schjoedi thought: the entrepreneurial team was made up of two or more people, they were responsible for the future of enterprises, shared a common financial or other obligations, and depended on each other in the work to accomplish the common goal, they were responsible for their entrepreneurial teams and enterprises as well. In the early stages of entrepreneurship (including before the establishment of the enterprise and its inception) they were in the position of the execution layers^[1]. Also some scholars studied on the association between the entrepreneurial decision and the personality of entrepreneurs, put forward the relationship of personality between entrepreneurship and the founders^[2]. Entrepreneurial personality of the variables in the previous studies were summarized by Li Hailei et al., they thought that these variables included seven aspects roughly^[3]. Li yan based on the entrepreneurial personality theories in Holland proposed the view that the entrepreneurial personality formed on the basis of genetic predisposition, in repeated activities, in school, family, relatives and friends according to the different environment types provide opportunities to form and strengthen^[4]. On this basis, some scholars have studied the entrepreneurial risk perception also. Liu Wanli etc considered risk perception was cognition that entrepreneurs in the startup phase could meet all kinds of risks at the beginning of the project selection^[5].

From what has been discussed above, we find that many scholars mainly studied on entrepreneurial team traits or entrepreneur personality traits of the individual, and there was no clear definition and classification for the personality traits. There are some researches about entrepreneurs' risk perception and the relationship of entrepreneurial decision-making, but only focusing on the aspect of risk perception, the analysis of personality of entrepreneurial team members and entrepreneurial teams risk perception are rare. Based on existing research, this paper mainly discusses the analysis about the members of the personality of entrepreneurial team risk perception behavior.

2 The Principal Personality Factors Affecting Risk Perception of Entrepreneurial Team

2.1 The Principal Personality Factors

(1) Personality Factors

Members in entrepreneurial team must have differences in personality, and some may be sociable. Generally, they are lively, enthusiastic, positive, and some of them may be practical and hard-working. Such different character in the entrepreneurial process results in different risk perception behavior. Specifically, sociable and lively members are not too sensitive to risk. They are careless in many respects because of their outgoing personality, which make them not too sensitive to what is happening and predicting. Under these circumstances, their risk perception becomes low. Those more honest, taciturn and introverted members are more sensitive to what is happening, and have higher risk

perception than extroverted people.

(2)Attitude Factors

There are positive aspect and negative aspect in attitude factors of risk perception of entrepreneurial team. Confident and optimistic members tend to think of the bright side in subconscious. They generally think that problems can be solved. So their risk perception in entrepreneurial process is relatively low. Conversely, when negative and pessimistic people are in trouble, they are easily immersed in the problem, which is not conducive to find a solution to the problem. In risk perception process, they are generally much more sensitive to risk, and thus have a higher risk perception.

(3)Emotional Factors

A person’s emotion can easily affect the working efficiency and quality. Good mood at work can play a multiplier effect. In the entrepreneurial process, entrepreneurs need to maintain a stable emotion, meaning that they can’t act on impulse. For those people who are emotionally sensitive, a little emotion swings can easily lead to unfavorable situation such as decision failure. They are very easy to worry about the future because of the present adverse conditions. In this case, their risk perception is easily too high because of emotional factors.

(4)Awareness Factors

Awareness includes many aspects. In this paper, we focus on the study of the impact on innovation of risk perception of entrepreneurial team. In the entrepreneurial team, members with innovative mind put more emphasis on developing thinking when finding a solution to problems, which tend to show more initiative. Innovation itself represents a risk. Successful innovation can promote better development. If it fails, it means money, time and technology inputs. Therefore, to some extent, innovation is risk-taking behavior. Innovative weaker members may be more willing to do step by step, which tend to avoid risk.

2.2 Correlation Analysis of Personality Factors and Risk Perception of entrepreneurial team

Entrepreneurial team composes of different members. In the team’s operations and development, different types of “Team Personality” will be shaped. In this study, based on the above four factors, “Team Personality” is divided into three kinds, extroverted “Team Personality”, introverted “Team Personality” and compound “Team Personality”.

Extroverted “team personality” is created because of the dominant members in the team are more lively, optimistic, emotional and creative. They are more inclined to outward manifestations, and always maintain a positive mood, like to try, and are willing to take risks. Therefore, the Entrepreneurial risk perception of this “team personality” will be “risk-seeking”. Introverted “team personality” manifests that dominant members in the team are generally more stable and careful. Also they are more willing to be with their feet on the ground, and unwilling to take risks. The Entrepreneurial risk perception of this “team personality” will be “risk averse”. Compound “Team Personality” is created by the extrovert’s and the introvert’s neutralizing effect. The dominant members in the team have both extroverted, lively personality and the introverted, cautious personality. The formation of this compound “team personality” in the risk perception of entrepreneurial team is “risks neutral type”. Specific analysis of Team Personality and entrepreneurial risk perception is shown below:

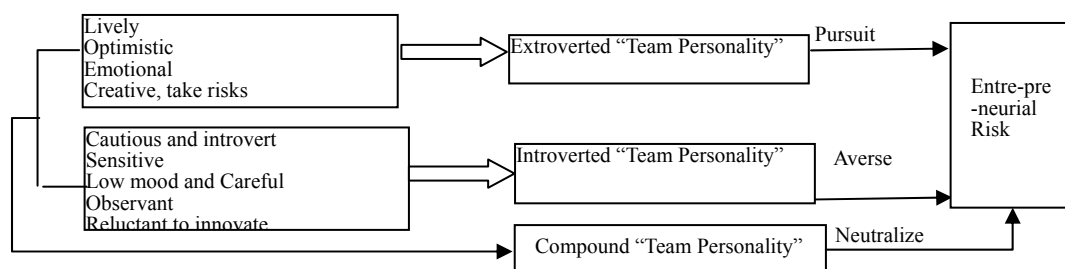

Figure 1 Correlation Analysis of Personality Factors and Risk Perception of entrepreneurial team

(1)Risk Perception Behavior Patterns of Entrepreneurial Team Based on Extroverted Personality

The model of risk perception of entrepreneurial team has a great relationship with “team personality”. Different “team personality” will create different behavior patterns. Risk perception of entrepreneurial team has extroverted personality characteristics because extroverted personality which plays a dominant role in the team will creates the extroverted “team personality”.①Generally the overall

atmosphere of extroverted entrepreneurial team will be lively, optimistic, positive, and quick thinking. They are more inclined to find pleasure in creating, and willing to take risks for the unknown factor. ② Extroverted entrepreneurial team shows confident and optimistic in all respects, and tend to forecast good results. Thus, they also have a positive outcome of the unknown result in decision-making. ③ Extroverted entrepreneurial team specializes in interpersonal relationships, which provide them a very good condition for using social resources in the entrepreneurial process. In the meantime by using social resources actively to solve business problems in the process, they also realize risk sharing in the entrepreneurial process. Therefore, because of the more optimistic predictions of the future and a positive attitude towards the occurrence of risk, subjective risk perception of extroverted entrepreneurial team is relatively low.

(2) Risk Perception Behavior Patterns of Entrepreneurial Team Based on Introverted Personality

Since introverted entrepreneurial team reflects the personality characteristics of introverted personality as a whole, when facing risk, they tend to be cautious. Subconsciously, they will tend to take risk-averse behavior. ① Those who have introverted personality generally lack a sense of security, and they are unwilling to expose their inner mind, and more adept at hiding themselves, so they are more hesitant in decision-making. ② Introverted entrepreneurial team has higher requirements for implementation and program. The implementation is more accustomed to take a single approach, which also makes the introverted entrepreneurial team lacks adventurous spirit, and it prefers to make decisions which are quite sure. ③ There is a subconscious unspeakable fear for the person with introverted personality towards the outside. They are more addicted to their inner world because they do not like or with other reasons and refuse to contact with the outside world. With the communication to the outside world, they actually are worried about the occurrence of risk. Therefore, the introverted entrepreneurial team is more sensitive to risk perception, and is trying to avoid the occurrence of risk because of personality factors. In fact, the paper argues that introverted “Team Personality” may be existed, but introverted entrepreneurial team will face many problems in the actual business.

(3) Risk Perception Behavior Patterns of Entrepreneurial Team Based on Compound Personality

Due to a team has both extroverted members and introverted members in the dominant role, Compound “team personality” is created. Thus it shows a more balanced state. Compound entrepreneurial team is necessary to consider both optimistic estimates of extroverted members and careful analysis of introverted members in decision-making. In this way, the understanding of risk can be neutralized and the risk perception is more at rationalization in entrepreneurial management. It is easy for compound entrepreneurial team to combine members’ respective strengths and play their active role in decision-making in the development. But it may be more time-consuming when two opinions agree.

3 Optimization Strategy Based on Personality Behavior Patterns of Team

3.1 To Strengthen Communication within the Team

Now as an entrepreneurial team, members should cooperate with each other and promote each other, and the personality, attitude, ideology of members should complement each other and they should make best use of the advantages and bypass the disadvantages in the development process. Communication between people and between people and the team is about the process of thoughts and feelings passing and feedback. Good communication can achieve consistency thoughts and clear expression of feelings. In the entrepreneurial team, there are two forms of communication: ① Verbal communication; By oral, written, pictures and other forms to communicate and to achieve the transfer of information and expression. ② Body language to communicate; For example, by using gestures, facial expressions, gestures and sounds to express feelings and to achieve mental and emotional exchanges. Friendly physically express will have a positive effect for team members in the feelings and emotional aspects.

In entrepreneurial team, communication is helpful to achieve harmonious exchanges, so that we can strengthen the consciousness of cooperation among the members, and establish goals for the common determination. By the bidirectional communication or more directional, members can realize the advantages of others, find their weaknesses, and thus improve their own personality deficiencies. Meanwhile, risk communication also promotes members easily to reach consensus on risk perception in the process of cooperation.

3.2 To Strengthen the Quality Development of the Team

Quality development activities are the process for team members strengthening exchanges and

promoting team integration. With an experiential learning, most of the curriculum will be held in the outdoors and through a series of new and exciting scenarios, participants can experience and solve problems actively. When participating in the process, their mental is challenged, and their mind is inspired so that they can think, discover and awaken in a particular environment. Also they can rediscover and reposition the individual and the team. Therefore, not only quality development activities can stimulate, adjust, enhance and sublimate the team members' psychological, physical, and moral qualities, but also they make members' self-confidence, responsibility, adaptability, innovation, team work and other aspects be enhanced. Besides, they can inspire imagination and creativity to improve the ability to overcome difficulties, and then enhance team spirit and develop teamwork skills.

Quality development is also very important in entrepreneurial team. Team members can achieve deeper understanding and mutual understanding, strengthen team cohesion, and put the team's interests in the first place through a number of scenarios and games. Extroverted members who play positive role in transferring the atmosphere, adjusting attitude, and organizing processes can guide introverted members. Meanwhile, the introverted members can also analyze more rigorously and tend to be more rational in decision-making. With the quality development of the team, team members can achieve mutual understanding and strengths, and improve their own personal problems actively, and then improve the "team personality." Thus, in face of the entrepreneurial risk, the members are not only easy to reach agreement in risk perception, but also can collaborate in solving problems actively, and play their respective roles better.

3.3 To Establish Incentive and Restraint Mechanisms of Personality Development

To establish incentive and restraint mechanisms of personality development is that team members achieve complementary advantages from the mechanisms. Incentives are an integral part of management activities. Effective incentive is conducive to promote the team members to make progress better, and to promote team goals to come true. Introverted members in the team should be encouraged to innovate boldly, be inspired their enthusiasm, and be promoted them to exchange actively. For extroverted members, it is better to encourage them to look at the problem rationally, and they should not easily make decisions because of a moment of enthusiasm. Constraint mechanism is to enable members to build and develop "what can be done and what cannot" in the team. We should train members of the moral sense and a sense of duty, and make it become a habit with the constraints of external forces.

4 Conclusion

The risk associated with the entrepreneurial process always can't be avoided, so entrepreneurial team needs to perceive risk reasonably and actively mitigate risks. Through the above analysis, we find that the "team personality" shaped by the dominant personality in the team is on behalf of the entire team's personality characteristics and operational characteristics largely. This "team personality" also makes the team shape their risk perception behavior. However, the "team personality" affects the operation of the entire team. In the continuous process of development, we must continue to improve and optimize it so that the entrepreneurial risk perception becomes rational and accurate.

Study on Reconstructing the Contribution Model of Education to Economic Growth

Liang Chuanjie

Institute of Higher Education Research, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: cjliang@whut.edu.cn)

Abstract: Based on the productivity function by Cobb-Douglas this paper reconstructs the dynamic productivity function on the educational input to productivity growth. With the relevant data between 1980 and 2005 the coefficients related with the reconstructed model have been measured and calculated, and their reliability has been analyzed. Through the Cobb-Douglas productivity function, we reconstruct the contribution model of education to economic. As a result a new model to measure and calculate the contribution of education to economic growth is proposed.

Key words: Education; Economic Growth; Contribution Rate

1 Introduction

In 1930s when American mathematician C.W Cobb and economist D.H. Douglas were researching into the role of labor and capital in American manufacturing on industry they successfully proposed a productivity function, famously named as Cobb-Douglas Productivity Function^[1]:

$$Y = AK^\alpha L^\beta \quad (1)$$

Among which, Y means output, A means the constant of technological level, K means capital input, L means labor input, α means the elastic coefficient of capital output, and β means the elastic coefficient of labor output, with the prerequisite as the below:

$$\alpha > 0, \beta > 0, \alpha + \beta = 1 \quad (2)$$

Considering the contribution of education to the improvement of labor quality, such a contribution can also be regarded as helpful for increasing the initial labor input by certain ratio. In his paper of the Contribution of China Education to Economic Growth in 2000 CUI Yuping creatively divides L of labor in the Function into the product of L_0 for labor multiplied by and E for education input^[2]. Therefore, the Cobb-Douglas Productivity Function can also be expressed as:

$$Y = A_t K_t^\alpha (L_{0t} E_t)^\beta \quad (3)$$

Where it means the variable of time.

Since any education has its certain period for completion, its contribution from a student after his graduation from primary school can be laggard for at least six years, and that from a graduate from university can be as long as 16 years. When such a laggard is taken into consideration the function mentioned above can be further modified as:

$$Y_{t+n} = A_{t+n} K_{t+n}^\alpha (L_t E_t)^\beta \quad (4)$$

in which n means the laggard of education

The laggard of contribution from education can be measured and calculated by:

$$n = \sum n_i h_i \quad (5)$$

in which n_i refers the study length for different levels of degree, and h_i refers to the percentage of the educated people for different degree over the total educated.

Based on the data in 2000 the laggard period of contribution from education can be measured by the above equation as:

$$n = 6 * 34.4\% + 9 * 49.99\% + 12 * 8.44\% + 16 * 5.45\% = 8.4488 \quad (6)$$

If the increased governmental emphasis on education and the quick expansion on higher education are considered, the educational level for average people can be expected much higher. As a result, the laggard from education contribution can even much longer. For the convenience of calculation, such a laggard of 8.4488 can be simplified as 9 years. So, the Cobb-Douglas Function can be written as:

$$Y_{t+9} = A_{t+9} K_{t+9}^\alpha (L_t E_t)^\beta \quad (7)$$

If the natural logarithm is conducted from either part of the equation, the Time t is derivated, and then the differential equation is approximately substituted by the difference equation, the equation as

below can be reached:

$$y_{t+9} = a_{t+9} + \alpha k_{t+9} + \beta l_t + \beta e_t \tag{8}$$

in which, y_{t+9} refers the economic growth in the year of $t+9$, a_{t+9} and k_{t+9} respectively refer to the technological progress and capital growth in the period of $t+9$, l_t refers to the growth rate of education scale, and e_t refers to the growth rate of educational investment. From this equation the contribution from education to economic growth can be regarded as the ratio of $\beta l_t + \beta e_t$ over y_{t+9} . So the model to measure the rate of educational contribution to national economy can be reconstructed as:

$$c_e = (\beta l_t + \beta e_t) / y_{t+9} \tag{9}$$

in which c_e refers to the share of educational contribution to the annual growth rate of national economy.

2 Parameter Measurements

The equation of

$$y_{t+9} = a_{t+9} + \alpha k_{t+9} + \beta l_t + \beta e_t \tag{10}$$

can be a derivation from Cobb-Douglas Function. For convenience of calculation the variable of a_{t+9} for technological progress can be regarded as a constant, so this equation can be used as a three-element regression linear equation. Hereinafter the data from 1980 to 2005 are used for regression analysis into this linear equation.

Table 1 Growth Rate

Year	Growth Rate of Total Fixed Assets Investment (Price Factor Considered)	Growth Rate of Education Scale	Growth Rate of Education Investment (Price Factor Considered)	Actual Growth Rate of Annual GDP
1980				7.8
1981	3.03	0.502623	5.05	5.2
1982	25.64	0.416181	9.98	9.1
1983	14.51	0.593876	11.14	10.9
1984	24.67	0.512263	13.44	15.2
1985	27.53	0.397335	15.26	13.5
1986	15.75	0.507205	14.25	8.8
1987	13.24	0.141739	-0.29	11.6
1988	-1.04	1.134219	2.40	11.3
1989	-21.01	1.485178	-1.84	4.1
1990	5.32	-0.08636	9.83	3.8
1991	13.07	1.83948	11.88	9.2
1992	23.67	-0.48684	10.80	14.2
1993	31.45	0.769069	7.26	14.0
1994	18.09	2.276704	10.90	13.1
1995	10.93	0.895903	2.07	10.9
1996	10.06			10.0
1997	7.03			9.3
1998	14.12			7.8
1999	8.03			7.6
2000	7.22			8.4
2001	7.87			8.3
2002	8.88			9.1
2003	7.63			10.0
2004	4.26			10.1
2005	8.46			10.2

Whereas in the table:

(1) the Growth Rate of Total Fixed Assets Investment = [(Current-Year Total Fixed Assets Investment — Total Fixed Assets Investment in Year Before)/Total Fixed Assets Investment in Year Before]/Price Index of Current-Year Fixed Assets Investment — 1;

(2) Growth Rate of Education Investment = [(Current-Year Education Investment — Education Investment in Year Before)/ Education Investment in Year Before]/Current-Year Retailing Price Index — 1;

(3) Growth Rate of Education Scale = [(Current-Year Education Scale — Education Scale in Year Before)/ Education Scale in Year Before];

(4) Education Scale = Primary Education Scale*1 + (Junior Education Scale + Senior Education Scale*1.277 + Associate College and Above Education Scale*1.603 (Index based on Mincerian Rate of Return in China proposed by Prof. MIN Weifang^[3]).

The results are calculated by SPSS as listed in the Table below.

Table 2 Relativity between the Growth Rate of Education Investment and Economic Growth

Coefficients(a)						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.727	1.302		2.862	.015
	VAR00001	.250	.043	.918	5.839	.000
	VAR00002	4.811	1.093	.517	4.404	.001
	VAR00003	-.130	.107	-.194	-1.222	.247

a Dependent Variable: VAR00004

From the results it can be found that there is no relativity between the growth rate of education investment and that of economic growth, so the former variable can be eliminated from the regression equation. By linear regression analysis the results are reached as listed in the Table below.

Table 3 Mathematical Model

Coefficients(a)						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	7.572	.955		7.933	.000
	VAR00001	.202	.051	.741	3.974	.002
2	(Constant)	3.003	1.184		2.537	.026
	VAR00001	.215	.032	.789	6.637	.000
	VAR00002	0.773	1.107	.534	4.494	.001

a Dependent Variable: VAR00004

Through such a regression analysis the mathematical Model to measure the education contribution to economic growth can be constructed as:

$$y_{t+9} = 3.003 + 0.215k_{t+9} + 0.773l_t \tag{11}$$

3 Conclusions

From the modeling and regression analysis it can be concluded that: (1) the growth rate of both capital and education scale has positive impact on the economic growth rate^[4]; (2) There is no evidence that the economic growth rate can be influenced by the growth rate of education investment. The quantitative analysis shows that from 1980 to 2005 the elastic coefficient of capital output is 0.215 and that of labor output is 0.773, which means the contribution rate of capital investment to economic growth can be 0.215 and that of educational development to economic growth can be 0.773.

3.1 The High Economic Growth Rate Owes to Educational Development

The rapid growth over10% of Chinese GDP in recent years has attracted world attention, which

makes China the second largest economy. Without the strong emphasis of education development such a high growth rate of economy can never realized. From the modeling and analysis we may easily find that education has contributed quite a lot to the economic development by means constantly providing sufficient skilled labor forces. To maintain the sustainable development of Chinese economy in the context of world economy slowdown, the investment into education should be increasingly expanded by keeping the goal of education investment maintained at least 4% of the GDP.

3.2 Education Development Contributes more than Capital Investment to Economic Growth

From the modeling and quantitative analysis it can be concluded that the contribution of education development to economic growth can amount to 0.773, which is as higher as 3.6 times than that from capital investment. The successful economic recovery and rapid development in Japan after the World War II further confirms that governmental emphasis and continuous investment on education have positive impact on sustainable development of economy. Much can be learnt from this experience that China should continue its heavy emphasis and increase input into education development for the purpose to maintain its social and economic development.

3.3 Contribution of Education Development to Economic Growth Can be Universal

Quantitative research by American scholar A. Maddison shows that in recent 20 years the contribution rate of education development to economic growth in the United States of America is 0.7^[5], which is quite similar with our conclusion of 0.773 for that in China. This could add evidences about the universality of contribution of education development to economic growth no matter wherever the economy is.

A Firm Capability and Foreign Market Entry Modality: Art of Management Versus Diversification of Strategies

Abodohou Alexis, Nie Guihua, Liu Pingfeng

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mails: abodohouialexis@yahoo.fr, niegh@whut.edu.cn, lpf@whut.edu.cn)

Abstract: This research firstly, investigates and set an overview about mainly strategies posture on the firm about the mode of the entry in the market. These strategies identified exert some impacts on the choice on an international and global market. After analyzing the different types of paradigms, theories and concepts and their criticisms, we develop an ideal choice of entry in foreign market based on a continuum approach made by strategies and art of management. Secondly, goal of this research act as an introduction to the entry mode special issue about the combination's theories by outline issue's objectives and the contribution to it.

Key words: Firm capability; Foreign market entry modality; Art of management; Strategy

1 Introduction

The International Business (IB) and the New Globalization of Labor are led to increasingly globalization environment typified by tremendous opportunities for abroad expansion. This decision to operate in international market is one of most critical decision for the companies (Xu, Y. and al., 2011). The companies have different approaches to operate in foreign market mainly in order to get competitive advantage. Then, entry mode is one the most important strategy because it represents the organizational policies in the international context and has been considered as a new research field on internationalization of firms.

Early in 1986, M. Porter distinguishes multi-domestic from global strategies according to the activity concentration in the value chain, the location and the coordination between activities regards to the level of delegated autonomy. This distinction allows state that the degree of the coordination and the concentration coupled with the environmental impacts pushed the organizations to adapt its services to overseas market. In the literature, there are voluminous empirical and theoretical researches that relate diversifications strategies with the different options about the way of doing business in abroad. Mostly, there are four basic types of entry mode: foreign trade, contractual arrangements like licensing and franchising, joint venture and wholly-owned subsidiary (WOS) (Xu, Y. and al., 2011). Each entry mode has its specificities, advantages and barriers according to different theories and paradigms that mark the field of international management studies.

When analyzing the entry mode choice, different issues have been debated. The scholars proposed a variety of theories such as the transaction cost theory, organizational capabilities theory, eclectic theory, evolution theory, contingency theory, and bargaining power theory. Here in our studies, we will focus on the first three of them that are mostly used in the literature.

The goal of this paper is to shed light on the different theories, paradigm and conceptual framework about the mode of entry. In this research, we realise that the optimal entry mode decision is affected by some factors the competition intensity in the market, the size of the enterprise, its general commitment and of course its general knowledge about the market. Under these conditions where all the theories and paradigms on the entry mode on the market suffers from a deficiency in relation to their exploitation, we wonder if the company's internationalization process should not be guided by art of strategic management? The first section presents the concept and the framework of the international entry mode choice and the contribution of the main theories and paradigms in the international business. Based on the scholars, we provide a persuasive explanation of them for the real comprehension. In the next section we dedicate it for the research methodology. In the last section follows up with the use some variables related to foreign market entry choice using in entry mode to provide a unifying paradigm that accounts for the many diverse forms taken by organizations.

2 Background about theories and conceptual frameworks of the entry mode

The research of Otto allows us to make the different about theories and conceptual frameworks that help to increase scientific understanding through a systematized structure capable of both explaining and predicting phenomena. Otto (1997) states that a conceptual framework is not a theory since it will not

have all the prerequisites of theoretical constructions.

Since two decades, some scholars have tried to define the concept of internationalization and entry mode. Whereas some scholars described as the outward movement in a firm’s international operations others perceived it as a part of outgoing strategy process of most business firms. According to Otto A., (1997): “Internationalization is the process of adapting exchange transaction modality to international markets”. This definition includes both entry mode strategy and international market selection. Entry mode has been defined as an institutional arrangement for organizing and conducting international business transactions, such as contractual transfers, joint ventures, and wholly owned operations (Root 1987).

3 Foreign market entry mode and mains paradigms

3.1 The early contribution of classical internationalization theories and limits

Robert A. Mundell (1957) refers to the factor mobility to explain the internationalisation. Mobility involves the movement of factors between countries either within industries or across industries. His theory demonstrates that international factor mobility can act as a substitute for international trade in goods and services. For this author, free trade can be benefits not only for the countries but also for the workers. However this theory is limited because even the nations work to abolish the trade tariff, the phenomena of the internationalisation of the firm is far to be stopped. Hymer (1960) stated that the companies possess firm-unique advantages or monopolistic advantages not available to other countries’ enterprises before going to foreign market. MNEs’ monopolistic advantages include: i) superior knowledge advantages; ii) economies of scale; iii) access to raw materials; iv) cost and financial advantages; v) production efficiency and product differentiation. However, Hymer’s monopolistic advantage theory could not explain why MNEs choose FDI rather than exporting or licensing very well. Vernon (1966) developed the theory of product life cycle, based on the study of internationalization of American manufacturing firms. Vernon considered that the monopolistic advantage theory analysis was relative static, and it could not explain how enterprises would choose between export and FDI. He divided product life cycle into 3 stages: new product, maturing product and standardized product. Buckley and Casson (1976) take market imperfections as the precondition of theoretical analysis. Internalization theory stresses that enterprises prefer to retain monopolistic advantages within the enterprise because of market imperfection and transaction cost. This theory does not show the motivation of the companies to operate internationally.

3.2 Entry Mode and the Transaction Cost Approach (TCA)

With his theory about transaction cost, Williamson explains why companies exist, and why companies expand or source out activities to the external environment. For him, when external transaction costs are higher than the company’s internal bureaucratic costs, the company will grow, because the company is able to perform its activities more cheaply, than if the activities were performed in the market. For instance, if a company is thinking about offshoring outsourcing, joint venture its production of a given product, it may assess the costs related to such a transaction with the environment. The TCT was used and still used by different scholars in different field of studies (Anderson and Gatignon, 1986, 1988; Otto, 2007, Hennart 1982, 1988a, 1991a, 2009, 2010). By 2009, John Dunning wrote that “for much of the last two decade the theory of internalization . . . has been the dominant explanation of the existence and growth of the MNE” (Dunning 2009: 44).

However, resource constraints severely restrict SMEs in their choice of equity entry modes, even when internalization is rational (Erramilli & Rao, 1993). First, SMEs lack important resources (Cheng & Yu, 2008). Second, SMEs generally lack knowledge and experience related to internationalization (Lu & Beamish, 2001). Thirdly, SMEs with inexperienced managers, for instance, inevitably lack the legal, social, and political discernment to operate abroad (Buckley, 1989).

3.3 Entry mode and the internationalization process of the firm

In their researches, Johanson and al. (1997) have developed the model of internationalisation process of the firm that focuses on the development of the individual firm.

Figure 1 The Basic Mechanism of Internationalisation – State and Change Aspect (Johanson and Al, 1977)

Particularly, on its gradual acquisition integration and the use of the knowledge about the foreign markets and operations, and its successful increasing to foreign markets (Johanson and al. 1977). The figure 1 below displays the basic mechanisms of the processes of internationalization of the firms.

For these authors, the resources commitment, the market commitment and the knowledge commitment about the foreign market are crucial and important for the internationalisation.

3.4 Entry Mode and the Organizational Capability Perspective

Recently the organizational capability (OC) perspective has been introduced to explain entry mode choices. According to Madhok (1997), the OC perspective perceives the firm as a bundle of relatively static and transferable resources, which are then transformed into capabilities through dynamic and interactive firm-specific processes (Otto, 1997) where individual skills, organization and technology are inextricably woven together. The OC perspective seems to be somewhat restricted as concerns the predicted modes of entry: Madhok's (1997) focus on internalization vs. collaboration.

3.5 Entry mode and the eclectic paradigm

Dunning (1980, 1988) suggests that the following factors will influence a firm's choice of entry-mode: Ownership Advantages, Locational Advantages, and Internalization Advantages. Ownership (O) advantages are firm-specific assets and skills. Locational (L) advantages reflect how attractive the specific country is, and the attractiveness of a country has been characterized in terms of its market potential and investment risk (Root 1987). Finally, the internalization (I) advantages are concerned with the costs of choosing a hierarchical mode of operation over an external mode (Dunning 1988, 1993). The eclectic paradigm permits researchers to create new determinants in order to predict entry mode but this theory lacks to plan an important role of innovation in sustaining and upgrading the competitive advantages of firms and countries needs to be better recognized. It also needs to be more explicitly acknowledged that firms may engage in FDI and in cross-border alliances in order to acquire or learn about foreign technology and markets. Second, the paradigm needs inter-firm cooperation or collective competition, which tend to address issues of static efficiency, need to be widened to incorporate questions of dynamic efficiency... Third, the eclectic paradigm needs to acknowledge that the traditional assumption that the capabilities of the individual firm are limited to its ownership boundaries is no longer acceptable whenever the quality of a firm's efficiency-related decisions is significantly influenced by the collaborative agreements they have with other firms (Dunning 1995). The eclectic paradigm, contrary to the internationalization model, is static in nature.

4 Study Methodology

Our study methodology is based on the mains theories and empirical cases studies recently about the internationalisation. Our analysis focuses on the foreign market entry mode decision according to the size of the companies. We use perish (Harzing 2010) to collect some important research about our subject. The dependent variable is the entry mode which was discussed according to the previous mains theories and paradigms. The independents variables are related to the strategies typologies that influenced the mode of entry. There are: foreign market opportunity, country risk factors, institutional, psychic distance and cultural factor, and knowledge commitment. Our below analysis will focus on these factors.

5 Entry Mode and Independent Variables

We have identified in the literature some variables that impacting the mode of entry mode choice in different situation. These variables are:

- ✧ Foreign market opportunity: Before going to international it better to get first some global information about the market. It can help reduce uncertainty in decision making and maximize your opportunity;
- ✧ Country risk factors: The risks in a host country, and the cultural distance between the host country and home country, are two of the most prominent variables identified as environmental determinants of foreign market entry mode choice. Then the company which decide to go abroad for its business should first consider country risk in the target country.
- ✧ Institutional psychic distance and cultural factor: The differences in the national cultures of two countries can be measured by cultural distance (Xu, and al 2011).
- ✧ Knowledge commitment: In internationalization process model knowledge commitments in the relationships between shareholders help to trust each other. The more knowledge a firm has about a market, the more valuable is the resource and the higher will be the commitment to the

market.

It is worth noticing that each theory has their strengths and weakness. Erramilli and D’Souza (1993) found that the differences between smaller and larger firms are negligible when capital intensity is low, but become substantial when capital intensity increases, and that the effect of external uncertainty on entry mode choice is moderated by firm size. The mode of entry depends on the art of management of leaders and managers of the firms.

6 Entry modes and the art of management

Management is not only about strategies or theories. Most of people refer art to the panting, poem, opera or lyrics. Jack Adamson (1989) defines art as “any personalized or stylized way of expressing an idea, product, skill or service”. For this author, art and creativity are synonyms. According to that definition, we can state that everybody somehow are creative in something.

In our case, the theories and paradigms about entry mode can give to managers, leaders, economic operators some skills about their decisions to go abroad but they need to be creative. The art feeds their skill and their competences. Then, we need more artistic manager. Furthermore, the artistic or creative manager is the one that figure out the future of the company, its global policies. The manager should be a visionary. We are better that every theory or axioms. Our mind is terrible to spoil. “He does not fight the things he cannot control, but he does dive in his own imagination and fight the things he can control” (Adamson, 1989).

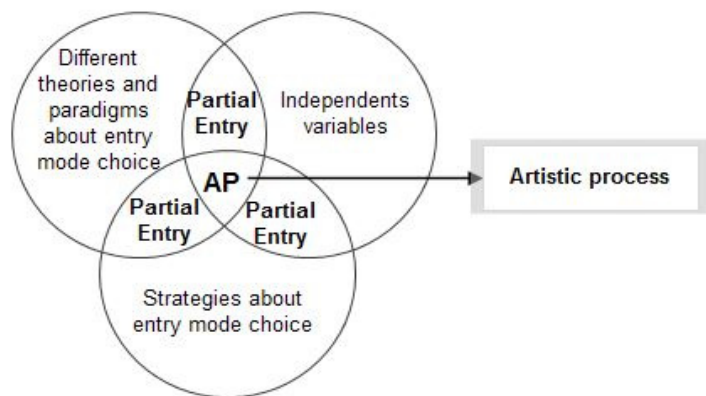

Figure 2 Artistic Process of Entry Mode Strategy

The figure 2 displays that in any situation the artistic power of the manager is really important. The following passage compares excellently the roles of managers like artists. “Just as artists master their crafts, business managers need to perfect their skills in dealing with people and in expressing themselves verbally; just as artists need visions and passion to realize them, managers need imagination and audacity to redesign their organizations; and just as great masters communicate their visions, great leaders inspire those who work for them...If a manager loses heart and does not follow any dream or vision, the organization is doomed” (Henry M. Boettinge 1975). The imbalance between the characteristics causes partial entries.

7 Conclusion and Future Research

Finally, it is important to say that different company has several choice of mode of entry. The choices could be export, international subcontracting, outsourcing, the license agreement, the transfer international technology, joint venture (joint venture) international merger and acquisition or subsidiary as appropriate input mode. Each mode of entry has some independent variables that impact its operations in the foreign market. However be international is not to produce in higher volume the products and move it somewhere else. It needs some strategies coupled with an art.

This research provides some evidence in specific topic: entry mode choice in international setting. We found some empirical support from the literature that helps us to understand the topic and give some limits about each conceptual framework. We should use not only best strategy depending on the size or situation of our company but also we need to also artistic manager. However, it is really qualitative and solely based on the literature.

Future research may focus on the clean-up about the multiplicity of the theories and the paradigms. A research that could put together overall of the theories will help the International business studies to move ahead. Many theories are interested mostly in the organization's mode of entry forgetting that internationalization of the firm generates the New Global Division of Labor. Theories must also take into account this aspect which nowadays becomes an important field of study. The majority of researches are concentrated on the entry modalities of economic enterprises regardless if it is small, medium or large. Nevertheless, they we did not find some research that focuses on the entry mode of Non-Government Organization which constitutes also an important research field of international management.

A Study on Improvement of Service Perception of College Staff Based on Internal Marketing

Qiao Yunli

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 56853633@qq.com)

Abstract: The staff plays an extremely important role in university education system. Therefore, it is very critical for colleges to promote their staff's enthusiasm. The paper describes the status of staff service, and makes a detailed analysis about the application in colleges on the basis of internal marketing, so as to prove that the internal marketing is critical and quite adapt to the universities. Then, it put forward that the way to improve the perception of staff service includes several stages: participation, satisfied, loyalty. All in all, the paper has certain significance for it will provide new ideas for the better development of higher education system.

Key words: Internal marketing; College Staff; Service Perception; Construction;

1 Introduction

Colleges are important places to spread knowledge, cultivate talents, have innovation of knowledge and create new knowledge, and are the only education base that involves and relates to the spread, innovation and production of knowledge and information^[1]. College staffs are engaged in both teaching, and college students' ideological and political education, daily management and college students' quality education and cultivation, and thus play an increasingly important role in the entire higher education system.

Therefore, with the rapid development of service industry currently, it is of very important significance to enhance college staffs' service perception. The objects of college elementary trade union work are teaching and administrative staffs, and the core is to safeguard the legitimate rights and interests of staffs under the leadership of the party, and comprehensively promote and mobilize all positive factors of staffs, fully activate all thoughts that are beneficial for the development of higher education, fully release all resources that are beneficial for the development of higher education, and give full play to all kinds of enthusiasm that are beneficial for the development of education^[2]. Therefore, how to mobilize and give play to the enthusiasm of staffs and enhance the service perception of college staffs is very important for college elementary trade union.

2 Service Status of College Staffs

With the acceleration of the pace of life in the society, college staffs also face great pressure in terms of physical and psychological aspects etc. The entire society and the academic circle concern this a lot, and have made relevant theoretical and empirical researches.

Li Hongchang (2011) pointed out that: with intensive teaching work, heavy research tasks, busy family life and social affairs, coupled with constant reforms, college staffs increasingly felt the intensity of competition and the instability of life and work^[3]. Li Shuwang and Wang Fei et al (2011) also mentioned in the literature that: in recent years, elites of many colleges died young, which sounded the alarm to school management personnel and the society^[4]. In addition, in the literature of Li Hongchang (2011), we could know a survey on the occupational stress of college staffs, and this survey indicated that, 228 of 286 people had great pressure for a long time, accounting for 80%, 21 people often felt fatigue, accounting for 75%, 131 people often had insomnia and could not sleep well, accounting for 46%, while 100 people had memory loss, accounting for 35%^[3].

For these phenomena, scholars also proposed corresponding measures for improvement. Feng Xiaolan (2009) analyzed the current situation of motivation of college staffs and proposed strategies to motivate college staffs^[5]. Gou Junping et al (2010) also mentioned in "Analysis of psychological motivation mechanism in college personnel management"^[6] measures to effectively implement psychological motivation in college talent management. Besides, many scholars also studied measures to promote physical health of college staffs, including empirical studies on the relationship between health-related fitness and sports participation^[4], building of sports clubs^[7], improvement of artistic accomplishment, and establishment of harmonious atmosphere^[8] etc. These guided the work of college trade union to a certain extent, so that services that college staffs had received were more humanized

and diversified. However, literature mainly discovered physical and psychological problems, and found solutions, lacked of consideration of the overall situation, and could not fundamentally solve the problem of service perception of college staffs.

Although scholars constantly propose improving recommendations and the service improving measures of college trade union are also constantly conducted, we actually see more about: college staffs generally feel mentally fatigue and even exhausted with lots of work such as scientific researches, teaching, professional title appraisal and job competition etc. Services that college staffs have received are not as complete as imagined. Therefore, based on previous studies, we should consider about ways to enhance service perception of college staffs from an overall perspective, so that the trade union could truly be the home of staffs, and staffs are more satisfied with and more loyal to union services.

3 Study on The Application of Internal Marketing in Colleges

With economic globalization and further promotion of China’s ownership reform, competition of domestic industries is increasingly intense. Internal marketing could help enterprises enhance internal market performance, increase organizational capacity and obtain long-term advantages that competitors could not imitate. So, in reality, enterprises that focus on internal marketing indeed show better staff attention, department coordination and sensitivity to market changes. Therefore, the powerful charm of internal marketing could be seen.

Internal marketing refers to “a process of creating market atmosphere within organizations to ensure that the needs and desires of internal customers could be met.” [2] Its content could be generally divided into two parts. Firstly, carry out marketing by regarding internal staffs as consumers, and secondly, coordinate the relationship of internal staffs which are also internal consumers. Although internal marketing is mostly used in enterprises, we could also use it in colleges to give play to more roles, which is showed in previous literature. Zhang Jinfeng (2010) pointed out that, to obtain better sources of students, colleges should start from internal marketing, carry out external marketing on the basis of improving internal marketing, to get twice the results with half the efforts [9]. Duan Jun (2011) discussed about the application of people-oriented internal marketing concept in higher vocational education management, in order to give better play to the initiative and creativity of staffs in higher vocational colleges, and thus improve their schooling level and management level [10]. Zeng Xiaojun (2011) built a contractual relationship model between internal marketing and the psychology of college young teachers by analyzing and studying, in order to develop related marketing ways and improve the psychological contract level of young teachers [11].

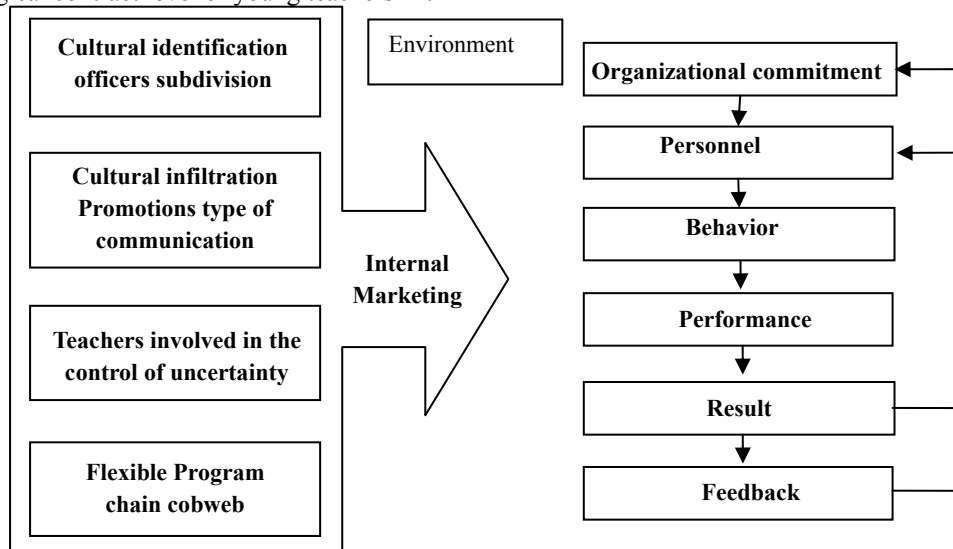

Figure 1 Based on Internal Marketing Management College Staff

From Figure 1, with social development and the reform of education system, internal marketing also gradually becomes a powerful way to enhance competitiveness of education industry. By analyzing the importance of enhancing the service perception of college staffs mentioned above, and the status of generally low service perception of college staffs, we realize that we should consider ways to solve

problems fundamentally from an overall perspective. Besides, internal marketing has been applied in colleges, and good results have been achieved. So, this paper aims to analyze ways to solve service perception problem of staffs from internal marketing.

4 Measures to Enhance Service Perception Based on Internal Marketing

Internal marketing for college staffs could be understood as taking college staffs as customers, and improving the participation of internal customers through a series of similar marketing activities, in order to promote the satisfaction of internal customers and thus improve their work efficiency and loyalty.

4.1 Take multiple forms of services simultaneously and encourage staff participation

College staffs are a special group, with high degree of education, their own views for harmony and freedom, and individual needs of services. So, they do not like dogmatic rules, or speak favorably of mandatory requirements. To enhance service perception of staffs, we should firstly let them participate more in these services. Therefore, to carry out internal marketing, we should firstly start from the real needs of these internal customers, and create diversified forms of services, in order to encourage them to participate in more freely and independently.

According to previous literature, scholars have proposed that we should increase sports participation, enhance artistic atmosphere, and strengthen psychological counseling and health testing etc for staffs respectively. In addition, by referring to a variety of counselors in counselor system of U.S. colleges, carry out service forms that could maximize students' interests^[12]. We divide service forms of college internal customers—staffs into psychology clubs, sports clubs, art clubs and academic clubs etc. These clubs would be established by trade union organizations, and staffs participate freely, and carry out activities with the principle of activity forms trying to be close to staffs. On the one hand, this avoids the mandatory nature of making staffs participate in activities, increases the level of activities in the form of clubs, and also eliminates the resentment of staffs. On the other hand, diversified clubs allow staffs to receive physical and psychological services according to their interests, cultivate their temperament and indirectly improve their work efficiency during activities.

4.2 Smooth communication starts from the heart and promote staff satisfaction

It is far from enough to enhance the service perception of college staffs by only improving their activity participation. As people are social beings and would seek benefit maximization, after successfully involving staffs in this service circle, the heart of staffs should be impressed by a series of measures so that they could be satisfied with this service.

According to Maslow's hierarchy of needs theory, people have physiological needs, security needs, interaction needs, esteem needs and self-actualization needs. Also, when low-level needs are met, people would seek a higher level of needs. Therefore, after improving physiological, security and interaction needs etc through the form of trade union clubs, colleges should have the goal of meeting a higher level of needs of staffs, that is, esteem needs and self-actualization needs. This should be based on good communication.

Communication is critical for any enterprises or people. With poor communication, it is likely to be misled, and even causes more serious consequences. Therefore, colleges should pay attention to communication with staffs. For such a group of highly educated and high-quality people, communication should focus on heart-to-heart communication, that is, attach great importance to the role of "esteem" during communication.

Therefore, on the one hand, colleges should pay attention to improving channels of communication with staffs, and maintain smooth upward communication and horizontal communication, so that staffs could exchange thoughts, emotions and information with leaders and colleagues, and thus meet their interaction needs and demand of expression of interests. On the other hand, colleges should fully respect the needs of young staffs for expression and decisions of interests, establish a mechanism that staffs participate in management, cultivate their sense of ownership and sense of belonging, and thus enhance their commitment to the organizations.

4.3 Fully carry out people-oriented emotions and enhance staff loyalty

With the improvement of service participation and satisfaction of staffs, it is difficult to eventually make staffs be loyal to services to some extent, but plays a critical role in truly enhancing staffs' service perception. To realize this purpose, besides using the concept of internal marketing perfectly, colleges should optimize services with an emotional line by being people-oriented. Specifically speaking, fully stand on the ground of staffs, know their difficulties, and solve problems for them from a humanized

perspective.

For example, for the phenomenon that most of staffs have a strong thirst for knowledge and urge for improvement, colleges could provide training mechanism and ways that are suitable for academic development of staffs, in order to meet their strong needs of career development. In addition, colleges should be concerned about staffs' psychological needs of increasing salary and welfare, and implement performance-based pay system, so that staffs' salary could be effectively connected with work performance, in order to enhance staffs' motivation and sense of belonging, and thus improve work performance. Meanwhile, to better reflect esteem for staffs' academic power, colleges could have some incentives appropriately, so that staffs could have teaching and researches etc according to their style and academic interests etc.

To sum up, colleges should be truly "people-oriented", try to provide rich academic resources for staffs, create a relaxed, harmonious and free academic atmosphere, and stimulate staffs' motivation for academic researches and academic development. Thus, colleges could meet their strong esteem needs and self-actualization needs to a maximum degree, and enhance their loyalty and they could maintain a high degree of service perception for a long time.

5 Conclusion

With today's rapid development of service industry, to truly enhance the service perception of college staffs, internal marketing should be ultimately relied on. However, the purpose of enhancing staffs' service perception by the concept of internal marketing cannot be accomplished in an action, but should go through three indispensable stages namely participation, satisfaction and loyalty. Only by this way, can the enhancement of staffs' service perception be truly realized, and thus ensure the high quality of college education system. However, it is an eternal topic to enhance staffs' service perception. With the development of the times, needs are constantly changing, and thus measures should change accordingly. However, as long as the trade union adheres to the concept of internal marketing, constantly devotes itself to innovative service means, deepens service content, and enhances staffs' service perception, and China's college education would usher in a better tomorrow.

(E-mail: girl1220@163.com, lixuan201@126.com)

Abstract: Firstly, this paper summarized the theoretical research of psychological capital. Then with taking domestic enterprise staff as the research object, the paper preliminary explored the effects of demography variables on psychological capital and other factors based on the investigation and study. Finally, it verified the significant difference between gender, education level, job time and hope, optimism, tenacity, and some or all of the psychological capital. The authors expect the work to provide reference for enterprise decision-making.

Key words: Demography variable; Psychological capital; Scheffe method

1 Introduction

The research of psychological capital at home has just started. The concept of psychological capital appeared in economics, investment and sociology in the literatures for the first time over abroad, which is coming from the theory of human capital and positive psychology at home. It can be approximately divided into three parts on how to define the concept of psychological capital on the summary of experts' views: trait theory, state theory and synthesis theory^[1]. But there are few literatures related to the effects of demographic variables on psychological capital and its structural elements in the previous studies of psychological capital. This paper preliminary explored the effects of demography variables on psychological capital and other factors with domestic enterprise staff as the research object, based on numerous studies of pertinent literatures at home and abroad.

2 Questionnaire Design and Survey

The author divided the psychological capital into three parts: hope, optimism and tenacity. And adopted the scale that Fred Luthans (2005) studied on Chinese employees' psychological capital^[2]. Then defined the standard scores sum of the three variables of hope, optimism and tenacity as psychological capital's measured value. The questionnaire evaluated grade in using Likert5 system^[3]. Taking four variables: gender, age, education level and time in job as demographic variable.

To make sure of the convenience of collecting the questionnaire and the accuracy of the results, the author adopted a different approach to accomplish this process. The author took advantage of the internet and distributed the questionnaires via email. In total, 120 questionnaires were distributed, among which 118 were returned and 106 were valid.

3 Data and results analysis

3.1 Independent sample's t test for different gender

Set gender as group variables, and hope, optimism, tenacity and psychological capital as test variable. Conduct the difference examination in using the t sample. Here are the results:

Table 1 The Result of Independent Sample's t Test for Different Gender

Test Variables	Gender	Number	Average	Standard Deviation	F	T	Significance
Hope	Male	51	20.6275	3.57189	0.003	0.075	0.959
	Female	51	20.5686	4.32784			
Optimism	Male	51	33.6863	5.12441	4.247	-.879	0.042
	Female	51	34.4706	3.78604			
Tenacity	Male	51	52.3725	7.10763	4.220	2.168	0.043
	Female	51	49.7255	5.05204			
Psychological Capital	Male	51	106.6667	12.48466	6.720	0.872	0.011
	Female	51	104.8039	8.78184			

From the table, we found that: the difference between male and female staffs in optimism, tenacity,

psychology capital is significant; female’s value is higher than male in optimism and obviously lower in tenacity and psychology capital.

3.2 The variance analysis for different staffs

People will be divided by age into four parts^[4]; Conduct the difference examination in using the analysis way of single factor. Here are the results:

Table 2 The Analysis Result of Different Age Groups

Test Variables	Age groups	Number of people	Average	Standard Deviation	F	(Sig.)
Optimism	under 25	28	34.3214	4.8994	0.496	0.686
	25-35	69	34.0290	4.4125		
	36-45	4	32.2500	3.7749		
	over 46	1	38.0000			
Tenacity	under 25	28	50.9286	5.7602	1.389	0.251
	25-35	69	50.7246	6.4052		
	36-45	4	57.2500	6.6521		
	over 46	1	52.0000			
Psychology Capital	under 25	28	106.6071	11.5801	0.677	0.568
	25-35	69	104.9855	10.5712		
	36-45	4	110.0000	9.6609		
	over 46	1	116.0000			

From the table, we found that there is no obvious difference in hope, optimism, and tenacity between different group ages. So there are no obvious effects between ages and the value of hope, optimism, tenacity, psychology capital.

3.3 The variance analysis of different education lever

We will divide people into three parts by education lever for the convenience and accuracy of investigation in using single factor analysis of variance method^[5]. Here are the results:

Table 3 The Variance Analysis Result of Different Education Lever

Test Variables	Education lever	Number of people	Average	Standard Deviation	F	(Sig.)
Hope	under bachelor	20	20.2500	2.1491	3.319	0.04
	Bachelor	62	19.6935	3.2823		
	master or above	20	21.6000	2.0105		
Optimism	under bachelor	20	31.9000	3.4167	1.642	0.199
	Bachelor	62	33.6774	4.2302		
	master or above	20	33.5000	2.8928		
Tenacity	under bachelor	20	52.4000	4.3698	0.571	0.567
	Bachelor	62	50.7258	6.8835		
	master or above	20	50.7000	5.9921		
Psychology capital	under bachelor	20	104.5500	7.4796	0.058	0.943
	Bachelor	62	104.3548	10.8976		
	master or above	20	105.2000	6.7481		

From the table, we found that there is obvious difference in hope between different education lever staffs, and there is no obvious difference in other factors.

Then we will explore what kind of education lever has the obvious difference by the way of scheffe’s multiple comparisons.

Table 4 The Scheffe's Multiple Comparisons' Result of Different Education Lever

Dependent variable	Educated lever(I)	Educated lever(J)	average difference (I-J)	(Sig.)
Hope	under bachelor	bachelor	0.55645	0.755
		master or above	-1.35	0.338
	bachelor	under bachelor	-0.55645	0.755
		master or above	-1.90645(*)	0.041
	master or above	under bachelor	1.35	0.338
		bachelor	1.90645(*)	0.041

* The mean difference is significant at the .05 level.

From the table, we found that there exists obvious difference between bachelor degree and master degree or above, and the bachelor is lower in hope value.

3.4 The variance analysis of different time in job

According to the length of time staying in the company, they are falling into four groups, and we can get results as follows under the method of single factor analysis.

Table 5 The Variance Analysis Result of Different Time in Job

Test Variables	Time in job(year)	Number	Average	Standard deviation	F	(Sig.)
Hope	<1	50	19.6800	2.96538	4.150	0.019
	1~5	49	20.5306	2.90188		
	5~9	3	24.3333	0.57735		
Optimism	<1	50	32.0200	3.30423	3.111	0.049
	1~5	49	32.2449	3.38828		
	5~9	3	37.0000	4.00000		
Tenacity	<1	50	50.4400	5.84549	0.473	0.625
	1~5	49	51.6735	6.83553		
	5~9	3	51.0000	3.60555		
Psychology capital	<1	50	102.0400	7.19399	2.629	0.077
	1~5	49	104.7143	10.31585		
	5~9	3	112.3333	7.02377		

According to the above table, after the variance analysis of the employees which vary in the length of time in the current company. We can found that the staff differs in hope and optimism, but there is no significant difference in resilience and psychological capital.

When it comes to the obvious difference in hope and optimism of the employees vary in time length staying in the company. We adopt multiple comparison compare method and scheffe method to explore specific period of time which lead a significant difference and the test results are as followed:

Table 6 The Scheffe Comparison Result of Different Time in Job in Hope and Optimism

Dependent variable	Time in job(I)	Time in job(J)	Average difference (I-J)	Significance
Hope	<1	1~5	-0.85061	0.35
		5~9	-4.65333(*)	0.03
	1~5	<1	0.85061	0.35
		5~9	-3.80272	0.094
	5~9	<1	4.65333(*)	0.03
		1~5	3.80272	0.094
Optimism	<1	1~5	-0.2249	0.946
		5~9	-4.98000(*)	0.049
	1~5	<1	0.2249	0.946
		5~9	-4.7551	0.064
	5~9	<1	4.98000(*)	0.049
		1~5	4.7551	0.064

* The mean difference is significant at the .05 level.

From the above chart, there is a significant difference in hope and optimism between the employees who work less than a year and those who work for 5 to 9 years, the fact is that the latter has less hope and optimism than the former.

4 Conclusions

This paper verifies that it is partially or totally different in hope, optimism, tenacity and psychological capital among the testes that differ in gender, education and the time staying in the company. According to the result, enterprise can develop some plans about exploiting and motivating human resource and some relative rules of it, so that the company can gain a maximum output with a minimum input and reduce the risk of input-output. At the same time, due to various reasons, this paper only studies that how demographic variables influence the psychological capital and structural elements of it, and there is no further dig in the degree of influence on how much the demographic variables work on psychological capital, which can be one of research priorities in the future.

A Novel Electronic Cash Application Model of Conditional Anonymity Based on Trusted Third Party

Chen Yang, Zhou Lulin

School of Management, Jiangsu University, Zhenjiang, P.R.China, 212013

(E-mail: cy256@mail.ujs.edu.cn, zll62@mail.ujs.edu.cn)

Abstract: Internet payment is the core part in Electronic Commerce and direct related to the development of Electronic Commerce. This paper firstly analyzes the characteristics of electronic cash as the network currency. On this basis, we propose a novel electronic cash application model of conditional anonymity based on trusted third party, which refers the making, issuing, the payment process of the electronic cash, as well as the functions of electronic cash software (ECS); Finally, the feasibility of this electronic cash model is discussed.

Key words: Internet payment; Electronic cash; Conditional anonymity; Electronic commerce

1 Introduction

Cash flow operation based on Internet and financial private network is the important part of the electronic commerce, which also is an important guarantee for the smooth development and application of electronic commerce. At present the main ways in the Internet payment market are through network bank and the smart card payment in China, lack of diverse means to pay, especially the lack of small payment means suitable for e-commerce. While electronic cash can make up for this deficiency, provide a new way to pay for the Internet consumers in China.

Since Chaum(1983) published the first paper on electronic cash, it has caused extensive concern of the Central Banks and experts due to the potential of its anonymity and replacing physical cash (currency and coins). Electronic cash (E-cash) is also known as electronic currency (E-money), which converts the cash value into a series of data encryption which represents the various amount of the cash. Now the research on electronic cash has made some progress. The smart card proposed by David M'Raihi et al.(2001) has the function of memory, calculation and encryption is suitable for the electronic wallet, which can be used in e-cash items^[1]. Popescu and Oros (2007) and Wang et al. (2008) proposed two trustee-based anonymity-revocable e-cash systems using bilinear pairing^{[2][3]}. However, Popescu and Oros' scheme violates anonymity. Eslami and Talebi (2011) proposed an untraceable electronic cash scheme and claimed that their scheme protects the anonymity of customers, detects the identity of double spenders and provides the date attach ability of coins to manage the bank database^[4]. The domestic scholars have also made certain achievements in electronic cash payment protocol, system design technology and so on^{[5][6]}. But for the sake of safety and practicality, real and practical large-scale electronic cash system is rare. Especially the research on electronic cash in China is still at the beginning, lack of attention in this area. We hope to provide some experience through this study in the electronic cash application.

2 The Basic Characteristics of Electronic Cash

The essence of e-cash is the electronic of paper cash, which should has many advantages like paper currency. And meanwhile considering the Internet, the special application platform, a real rational electronic cash application system should have the following characteristics:

(1)Monetary value: E-cash must be the same as the traditional paper cash, and has certification, credit and financial support from the bank.

(2)Network currency role: It has the similar effect as the currency on the Internet, which can still complete the payment function safely and conveniently without the online support from the bank.

(3)Security: The application of corresponding technology and management mechanism can effectively prevent any electronic cash copy, counterfeit, reusable and repudiation behavior. E-cash can also avoid payment account information leakage when using debit card, even resulting in the whole cash in card stolen. Because E-cash is used to small payment, the par value will not be much. Even if stolen, also won't cause much loss. It will help Internet users to receive this payment.

(4) Conditional anonymity: Generally, no one can peep private information of consumers using e-cash and track their buying behavior and buying habits. But in special circumstances, such as the legal requirements, a trusted third party can cancel the anonymity of e-cash. Therefore it would effectively

prevent crime because of complete anonymity of e-cash.

(5) Divisibility: E-cash could be divided into smaller amounts.

(6) Transferability: E-cash can be transferred and circulated in users without the involvement of banks, just like currency.

(7) Storability: E-cash can be safely stored in hard disk of computer, IC card, electronic wallets or special software of electronic cash and so on. And strict security measures are carried out when users store or transfer the e-cash.

(8) Independence: Security of e-cash can't only depend on any hardware environment or a specific operating system, and should use various cryptographic techniques to ensure security of electronic cash on the Internet including transmission process.

3 A Novel Electronic Cash Application Model of Conditional Anonymity Based on Trusted Third Party

In order to achieve and give full play to the above properties of e-cash, a series of process from e-cash production, distribution to use must adopt a new model.

(1) The issue of e-cash. General: e-cash should be produced and issued by the People's Bank of China in accordance with the standard, other commercial banks authorized by the People's Bank of China can conduct related business activities as deposit, withdrawal.

(2) The process of e-cash issuance. In this paper the People's Bank of China assume a trusted third party who can revoke the anonymity of e-cash in some particular cases. The whole process of e-cash issuance is completed by the central bank and its authorized banks. For the convenience of description in this paper, we take the Industrial and Commercial Bank of China (ICBC) as an example to introduce the specific issue process as follows:

1) First the user establishes an account in ICBC and deposits a certain amount of cash, so that one can exchange e-cash from this account.

2) The user could apply for the ID and initial password of e-cash special software to the People's Bank of China by virtue of the capital account in ICBC and the necessary proof of personal identity. The ID must be uniqueness and map with the personal information of the user. Meanwhile the user can download the E-cash Special Software (ECS) from the People's Bank of China or its authorized bank website. Here it refers to the ECS in ICBC (hereinafter referred to as IECS). In this process, the People's Bank of China will record all the related information into the Electronic Cash Database (ECDB), data fields are as follows: ECS ID, personal identity information, the bank, account information in the bank.

3) The user installs IECS on this machine, and changes the initial password. Then adds the personal digital certificate obtained from Certificate Authority (CA) into the IECS. The specific content and format of digital certificate should obey by the international popular ITU-Trec.X.509 standard. At the same time, adds the account of ICBC got in the first step into the IECS.

4) The user now can apply for the exchange of e-cash with the built-in functions in IECS, after ICBC receive this request instruction, it will verify the account whether has adequate money firstly:

① Capital adequacy. ICBC would submit the ECS ID, the amount one intends to exchange and the digital certificate of the user to the People's Bank of China, who will encrypt the e-cash sequence number (mark A) already prepared with the user's public key, then transmits to ICBC. In this process, the People's Bank of China will find the corresponding ECS ID in ECDB, record the change event. Fields are as follows: ECS ID, personal identity information, the bank, account information in the bank, sequence number of the e-cash in the exchange, the amount to exchange.

ICBC digitally signs A together with the corresponding value, mark B. Finally the value of C is encrypted with the user's public key and sent to the user. Meanwhile ICBC deducts corresponding amount in the user's capital account. So the e-cash proposed in this paper is structured as follows: E-cash={e-cash sequence number, signature to the value of this e-cash by the bank, the value of this e-cash}.

② Lack of funds. ICBC rejects the exchange behavior.

5) The user uses IECS to received D transferred by the bank and decrypts A of D to get the e-cash sequence number. Now the union of N (e-cash sequence number), B (signature to the value of this e-cash by the bank) and C (the value of this e-cash) is just the e-cash which has a certain value. The user can save this e-cash in hard disk or IC card or ECS for use.

The above steps constitute the production and distribution process of e-cash. As banks can not back to the user of e-cash just produced, because the banks couldn't get the N.E-cash is with good anonymity.

But when there is a special need, the People’s Bank of China as a trusted third party could withdraw its anonymity. The issuance process of the e-cash in this paper is shown in Figure 1:

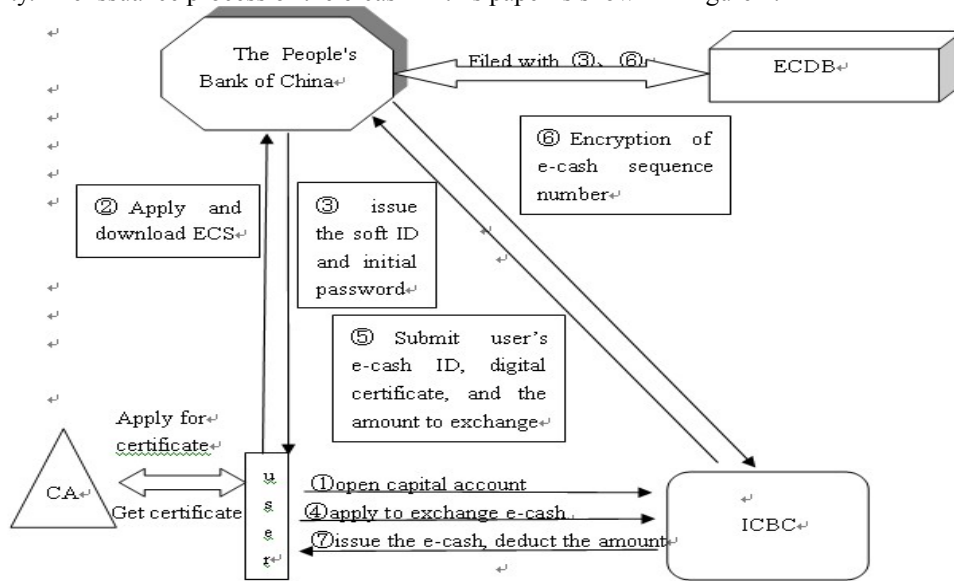

Figure1 Schematic Diagram of E-Cash Issuance

In order to realize the basic characteristics of reasonable e-cash, we still need ECS. Now we briefly explain the main function of the ECS.

4 ECS

(1)Secure connection: ECS firstly establishes a connection before transferring the funds, then starts the communication and transfers the e-cash. Suppose there is an e-cash will transfer from ECS-A into ECS-B, ECS-A would send a connection request to ECS-B. And then use the Diffie-Hellman key exchange protocol to determine the session key, K . Automatic establishes the secret and safe passage with symmetric encryption algorithm.

Suppose q is a prime, a is a primitive root of q ($a < q$). And q and a are written by the People’s Bank of China when generates the ECS. So q and a are public to ECS-A and ECS-B.

ECS-A: randomly select a private key X_A , calculate $Y_A = a^{X_A} \text{ mod } q$, and send Y_A to ECS-B, i.e. $Y_A \rightarrow B$;

ECS-B: randomly select a private key X_B , calculate $Y_B = a^{X_B} \text{ mod } q$, and send Y_B to ECS-A, i.e. $Y_B \rightarrow A$;

ECS-A generates a secret session key $K_A = (Y_B)^{X_A} \text{ mod } q$;

ECS-B generates a secret session key $K_B = (Y_A)^{X_B} \text{ mod } q$;

Can be proved, $K_A = K_B = K$. Because X_A and X_B are confidential and random, so the session key K is safe, and every time is different when connecting.

(2) Apply for e-cash. ECS can be used online for the application of e-cash to the bank. The instruction including e-cash special software ID, digital certificate, the amount to exchange are submitted to the bank in this process.

(3) Combine and generate e-cash. Combine the e-cash sequence number, i.e. N , signature to the value of this e-cash by the bank, i.e. B , the value of this e-cash, i.e. C to generate the union which is e-cash of certain value. This process is done automatically by the ECS and is transparent to the user.

(4)Storage of e-cash. One can store the received E-cash in ECS.

(5)Division of e-cash. The reasonable application model of e-cash can let users carry out accurate payments, reduce the times of withdrawal. It can not only reduce the network traffic, but also can improve the efficiency of the system. The ECS in this paper should support such an application. In order to ensure the e-cash will not be re-used and suffer replay attacks, the division of e-cash is according to

the following procedure: If the user has the value $Q1$ of e-cash, needs to pay $Q2$, and $Q1 > Q2$. Due to the nature of e-cash is a series of electronic encryption sequence number, its value is determined by the bank's signature. So to ensure the e-cash after division still possess the corresponding value of the currency, ICBC's private key should be solidified into IECS with strict encryption algorithm. The division of e-cash is the application in interface layer to the user who will not involve the key information.

Suppose the user has the e-cash $Q1$: {e-cash sequence number, bank signature of $Q1$, $Q1$ }, when the user ask for dividing $Q2$ out of $Q1$ ($Q1 - Q2 = Q3$), according to the algorithm of rule:

① If $Q1 > Q2$, the operation result is : {e-cash sequence number, bank signature of $Q2$, $Q2$ };
 {e-cash sequence number, bank signature of $Q3$, $Q3$ }.

② If $Q1 < Q2$, deny the division and send a warning.

(6) Payment with e-cash. In the payment process when IECS receives the payment instruction, firstly judge the legality of expenditure, i.e. whether e-cash is beyond the capacity to pay. Then split to the required e-cash which is transferred to the receiving party. At the same time, the e-cash that the user had before is subtracted from the amount just paid.

(7) Record and Query. IECS would record each transaction for customers to query regardless of success or failure, including transaction date, transaction status etc. Meanwhile in order to effectively curb the illegal use of e-cash to engage in illegal activities, IECS should have such a special recording function: "Tracking key" of the People's Bank of China is cured in IECS and symmetric encryption algorithm is used to record the expenditure of user's e-cash. Content includes: ECS ID of spending party, ECS ID of receiving party, e-cash sequence number, the amount of the transaction, the transaction date, which only can be decrypted by "Tracking key" of the People's Bank of China. In special circumstances, such as legal requirements, anonymity of e-cash can be cancelled by the People's Bank of China to combat criminal acts powerfully. Suppose the user T_1 exchanges e-cash H from bank with IECS. In circulation process, H circulates from T_1 to T_m in a legal case, i.e. $T_1 \rightarrow T_m$. If the user T_m used e-cash H to engage in illegal activities, such as the purchasing of drugs, which was transferred to T_n . Police arrested T_n and may request the People's Bank of China to cancel the anonymity of e-cash H so to punish T_m .

5 Process of E-Cash Payment

Based on the e-cash application model discussed in this paper, the payment protocol refers four parties: the People's Bank of China, bank, customer, shop. The People's Bank of China and the bank will not participate in transaction process between the customer and shop to ensure the safety. Reasonable e-cash model should emphasis on off-line payment, i.e. without bank real-time intermediary payment processing.

The e-cash application model is based on SSL protocol, specific payment process is as follows: Symbol definition: C: customer; CPK: customer's public key; CSK: customer's private key; S: shop; SPK: the shop's public key; SSK: the shop's private key; BPK: the bank's public key; ORD: order; ORDN: order number; K: session key; E-cash: electronic cash.

(1) C visits the shop's website, chooses own like merchandise and selects the e-cash payment mode;

(2) ECS of C is activated and sends connecting request to the ECS of S after login. Then a temporary safe secret passage is established between C and S;

(3) C will use SPK to encrypt ORD and K assigned randomly by C and send to S. i.e.

$E_{SPK}(ORD, K) \rightarrow S$;

(4) After receiving the information S would use his private key to decrypt, verify the order information (product, type, quantity, price, etc). S has the signature of ORD which is added corresponding ORDN and uses K to encrypt the above signature. i.e.

$D_{SSK}(E_{SPK}(ORD, K)), E_K\{E_{SSK}[\text{Hash}(ORD, ORDN)]\} \rightarrow C$;

(5) C receives the signed order, then pays the encrypted E-cash to S after verification. i.e.

$E_K[E_{CSK}(E - \text{cash})] \rightarrow S$;

(6) After checking the validation (i.e. $D_{BPK}(E - \text{cash})$) and amount of E-cash, S sends payment confirmation to C and prepares for delivery.

The e-cash payment process is shown in Figure 2.

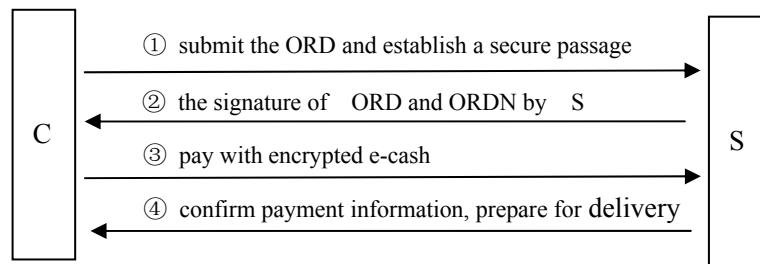

Figure 2 Schematic Diagram of E-Cash Payment Process

6 Evaluation of the E-Cash Application Model

(1) Security analysis of the model: ①The e-cash model in this paper refers many security measures, such as symmetric encryption algorithm, public key encryption algorithm, digital signature, digital certificate and so on to ensure the security of information transmission and transaction; ②ECS as a special software will facilitate the users to use e-cash. Users can not modify, destroy the program. If there is any malicious software crack or aggressive behavior, ECS will immediately start "explode" program, to ensure that the confidential information not to be leaked.

(2) Analysis of nonreusable e-cash: E-cash we have paid will be automatically deducted from the ECS. When performing a division of e-cash, the original large amounts of e-cash automatically is divided into a plurality of small value of e-cash. This is just as in the real life when we have paid by cash which will not belong to us.

(3) Analysis of unforgeability: The value of e-cash is determined by the bank's signature to ensure that any falsification is not viable, because they could not get the bank's private key.

(4) Analysis of conditional anonymity: Under normal circumstances any personal information will not be left over after the user's transaction. But in special conditions user's anonymity will be withdrawn by the People's Bank of China.

(5) Non-repudiation: Both parties use digital signature respectively in the transaction to ensure that both sides are not to deny their behavior. Arbitration can be made when necessary.

(6) Analysis of efficiency: Compared with the existing models of e-cash, e-cash model in this paper fully supports off-line transaction and can guarantee the security of the transaction and the real implementation of the person-to-person. At the same time, the exchange of e-cash does not need to go through the bank, which can circulate freely in the market. So e-cash can simply the transaction process and improve efficiency. It has a strong practical value.

7 Conclusion

Internet payment is the key problem of application in Electronic Commerce. This paper firstly analyzes the characteristics of electronic cash as the network currency. On this basis, we propose a novel electronic cash application model of conditional anonymity based on trusted third party, which refers the making, issuing, the payment process of the electronic cash, as well as the functions of electronic cash software (ECS). Main security technologies as symmetric encryption algorithm, public key encryption algorithm, digital signature, digital certificate are applied in this model. Finally, the feasibility of this electronic cash model is discussed. Compared with the similar schemes, this model has a series of higher security features, as can prevent repeat attacks, non-repudiation, anonymity, unforgeability and can not be traced etc. Our research also would make up the deficiency in application of electronic cash in China. Hope to enrich the payment method when the denizens carry on the Internet payment. But in order to further strengthen the safety and the function of e-cash as network currency, still need to be explored from the following aspects: the settlement of accounts of e-cash in multi-banks, more efficient digital signature and encryption algorithm, enacting and improving the laws and regulations of e-cash etc.

AHP-Based Approach to Performance Evaluation of College English Elective Courses

Peng Aimin

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: irenepeng4597@sina.com)

Abstract: The arrangement of courses is playing a leading role in teaching reformation. A tentative study on the teaching performance of English optional courses helps to create a scientific evaluation index system. This paper firstly proposes an 18-element performance evaluation index system for college English elective courses, by inquiring experts as well as students and by using the Delphi method through six steps. Based on the principle and theory of analytic hierarchy process, an AHP-based evaluation model for college English elective courses is constructed via pair-wise comparisons. Finally, the equation of evaluating the curriculum performance is put forward.

Key words: AHP; Performance Evaluation; Index System; College English Elective Courses (CEEC)

1 Introduction

College English is not only a language course that provides basic knowledge about English, but also a capacity enhancement course that helps students to broaden their horizons and learn about different culture in the world. When designing College English courses, therefore, it is necessary to take into full consideration the development of students' cultural capacity and the teaching of knowledge about different cultures in the world^[1]. Colleges and universities in China have formulated a scientific and systematic College English syllabus to guide their teaching innovations, such as graded teaching & learning and offering elective courses for students whose English is better. The system of college English elective courses (hereafter referred to as CEEC) includes dozens of specific courses, which can be divided into three types: the course module in language skills, English courses for practical uses, and courses of language and culture. In addition, the credit system is adopted by most universities. The teaching quality of selective courses greatly varies from one university to another.

It is urgent to improve the system of optional courses in order to smoothly implement College English teaching reform. Moreover it is of great significance to develop a scientific evaluation system, which should be in line with the law and rule of English teaching and the character and objective of college English.

2 Selection of Evaluation Indexes for CEEC

An evaluation index system is essential to assess the teaching quality of English elective courses. The design and selection of indexes should be in accordance with the feature of optional courses, and can be tenable with the development of college English reform. Also the evaluation criteria should be diversified and feasible. See the constructing process of evaluation system as shown in Figure 1.

First, review and analyze the literature on course assessment^[2], as well as academic papers concerning the arrangement of college English elective courses. Then a conclusion can be roughly made that the successful implementation of a curriculum is influenced by multiple factors, including the quality of faculty, teaching management, course arrangement, teaching & learning environment. The above mentioned factors are affected by a group of sub-factors, namely evaluation indexes. A list of more than 30 different sub-variables or

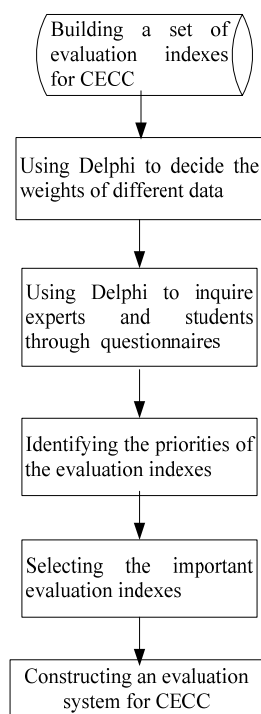

Figure 1 Procedures of Construction the Evaluation Index System for CEEC

a set of evaluation indexes for CEEC is shown at random in the following: teachers' specialized knowledge, teaching hours and credits, teaching methods, teaching contents, forward-looking lectures, difficulty of testing problems, students' attitude towards learning, practical usefulness of the course, relation between teaching and testing, diversified teaching materials (audio, video or pictures), abundant academic resources (books, literatures, Internet lab), comprehensive and formative course assessment, advising and coaching students, relation between classroom teaching and aim of specialized learning, to acquire knowledge in English culture, teachers' ability to express themselves, mental satisfaction in class, to make friends, teachers' academic titles, class size, to cultivate interest in English learning, teachers' personalities, learning atmosphere, to broaden specialized learning, comprehensibility of the textbooks, purposes of learning, to stimulate students' overall development, language used in the textbooks, flexible testing, classroom equipment, diversity of elective courses, ways of learning, to develop ability to use English, a reasonable timetable, varied homework or assignments, teachers' attitudes to their work.

Secondly, interview 11 experts experienced in linguistics or certified as qualified English teachers, apply Delphi method and determine the weight between experts' opinions and students' comments. The decided result is 0.7: 0.3.

Thirdly, the Delphi technique is employed again and the above-mentioned experts are inquired, aiming to quantify their opinions by using a structured questionnaire and the 5-point scale (1, least important; 2, less important; 3, moderately important; 4, more important; 5, most important) on each of the course criterion listed in Table 1. The 273 students taking English elective courses are also invited to do the same questionnaire task as the experts.

Lastly, the results of the Delphi judgment from experts as well as students' in Step 3 are averaged. The weight for experts' averaged scores is 0.7 and the weight for students' scores is 0.3. Calculate the weighted averages. If an index has a value higher than 3, it can be chosen. The others lower than 3 are excluded by the expert panel because they are less important course criteria. List the chosen indexes in order as detailed in Table 1.

Table 1 Evaluation Index System for CEEC

Object	Factors	Sub-factors
Evaluating College English Elective Courses (A)	teaching staff (B1)	teachers' specialized knowledge (C1)
		teaching contents (C2)
		teaching methods (C3)
		diversified teaching materials (C4)
		teachers' attitudes to their work (C5)
	course arrangement (B2)	comprehensibility of the textbooks (C6)
		language used in the textbooks (C7)
		practical usefulness of the course (C8)
		diversity of elective courses (C9)
		a reasonable timetable (C10)
		teaching hours and credits (C11)
	learning environment (B3)	forward-looking lectures (C12)
		abundant academic resources (C13)
		classroom equipment (C14)
	curriculum functions (B4)	learning atmosphere (C15)
		to develop ability to use English (C16)
		to acquire knowledge in English culture (C17)
		to stimulate students' overall development (C18)

3 AHP-Based Evaluation Model Construction and Data Analysis Procedure

3.1 Setting-up Evaluation Model of CEEC

Analytical Hierarchy Process (AHP) is adopted to analyze the constructed evaluation index system of CEEC. The AHP is a methodology for structuring, measurement and synthesis, which was advanced by an American mathematician Thomas L. Saaty in the 1970s. The AHP method represents human thinking process in arithmetic means, and quantifies people’s subjective judgments. It helps the decision-makers to simplify the analytical procedure and maintain consistent thinking process [3]. AHP is utilized when dimensions are independent, and is suited to solving problems involving dependent dimensions; therefore AHP has been widely applied to deal with complicated social problems and issues in the field of economic management. It can be also employed to cope with the evaluation system of CEEC by using mathematic tools. To simplify the model calculation, the following indicators are calculated by using a linear function.

3.1.1 Building Hierarchical Structure Model

On the basis of Table 2, Analytic Hierarchy Process divides the research object into 3 levels. The goal layer of the model (A layer) is evaluating CEEC. The four factors such as teaching staff, course arrangement, learning environment, and curriculum functions can possibly determine the quality of CEEC. They are also the intermediate link and are named the criterion layer of the model (B layer). The effect of each factor in B layer can be reflected by a series of other relevant factors. These sub-factors form the scheme layer of the model (C layer). All the sub-factors in the evaluation system are non-quantitative indicators and do not have comparability, so experts should be consulted to judge the factors in order of importance and mark them. Hence the sub-factors $\{C_1, C_2, \dots, C_{18}\}$ are assigned and their values are based on a unified scale of measurement.

3.1.2 Building the Pair-Wise Comparison Matrix

After building the AHP-based evaluation model, pair-wise comparisons are performed. This step judges the relative importance of any two factors in a certain level, and hence decides the order of importance of each factor at a higher level. This process is the key of the AHP method because it influences the priority of the factors. The assessing result can be observed better if displayed in the form of pair-wise comparison matrix. It assumes that B_k layer relates to C_1, C_2, \dots, C_m of C layer, and $C_i (i = 1, 2, \dots)$ has a ratio ω_{ki} to B_k . The values in the ratio ω_{ki} are then organized in a m pair-wise comparison matrix ω_k , $\omega_k = (\omega_{k1}, \omega_{k2}, \dots, \omega_{kn})$ ($k=1, 2, 3$), and $\sum_{i=1}^m \omega_{ki} = 1$ (m is the number of sub-factors of B_k).

In layer C, the local priorities between C_i is represented by α_{ij} which can be calculated by using the formula $\alpha_{ij} = \frac{\omega_{ki}}{\omega_{kj}}$. Due to the limitation of human beings’ brain capability, the ratio-scale of local priorities is also limited in the AHP method. The scale range 1–9 is assumed to sufficiently represent human beings’ perception. Then the normalized pair-wise comparison matrix P_k can be built as follows to rank the relative importance of factors (n is the order of matrix).

$$P_k = \begin{pmatrix} \alpha_{11}^k & \alpha_{12}^k & \dots & \alpha_{1n}^k \\ \alpha_{21}^k & \alpha_{22}^k & \dots & \alpha_{2n}^k \\ \dots & \dots & \dots & \dots \\ \alpha_{n1}^k & \alpha_{n2}^k & \dots & \alpha_{nn}^k \end{pmatrix} = (\alpha_{ij}^k)_{n \times n}$$

3.1.3 Calculating the Eigen-Value and the Eigenvector

The weight sum of each sub-factor in C layer can be calculated, based on the equation $P_\omega \omega_k = \lambda_{\max} \omega_k$, where λ_{\max} is the maximized eigen-value of matrix P_k , and ω_k is the eigenvector.

Due to the fact that $\omega_k = (\omega_{k1}, \omega_{k2}, \dots, \omega_{kn})$, it can be normalized to $\omega'_k = (\omega'_{k1}, \omega'_{k2}, \dots, \omega'_{kn})$ as the weight vector where

$$\lambda_{\max} = \frac{1}{n} \sum_{i=1}^n \frac{(\alpha\omega_k)_i}{\omega_k} = \frac{1}{n} \sum_{i=1}^n \frac{\sum_{j=1}^n \alpha_{ij}^k \omega_{kj}}{\omega_k}, \quad \omega'_{ki} = \frac{\omega_{ki}}{\sum_{j=1}^n \omega_{kj}}$$

3.1.4 Computing the Weights

In this step, the averages of the factors in each row of the normalized pair-wise comparison matrices are calculated. The result is the priority vector that gives the relative weight of each performance indicators in the criterion layer B. The priority vector has the following form: $\omega_j^{(k)} = [\omega_{1j}^{(k)}, \omega_{2j}^{(k)}, \dots, \omega_{nj}^{(k)}]^T$, where ω_i is the weight of the performance indicator C_i and it is equal to the average of the factors in row i of the normalized pair-wise comparison matrix, as

in $\omega_i = \frac{\sum_{j=1}^n a_{ij}}{n}$. Then by using the weights, we can now estimate the value of criterion B:

$$B_i = \sum_{i=1}^n \omega_i C_i. \text{ This process is repeated for all established criteria (B1, B2... Bn).}$$

The upper hierarchy study estimates the global performance measure (A) as a weighted average of the criteria (B1, B2, B3... Bn). The estimation involves three steps, namely construction of pair-wise comparison matrix, synthesis, and consistency ratio estimation, and it is similar to the lower hierarchy study. We can get the matrix of the weights of each criterion, which

$$\text{is } W_n^1 = \prod_{i=2}^{l-n} W_i^{i-1} = W_n^{n-1} \times W_{n-1}^{n-2} \dots \times W_3^2 \times W_2^1.$$

In short, Evaluation of CEEC (A) is estimated by taking into account the priority vector and the value of each criterion.

In the light of the above derivation processes and the Delphi survey results, the evaluation index of CEEC can be obtained, that is, $\omega_1^{(2)} B1 + \omega_2^{(2)} B2 + \omega_3^{(2)} B3 + \omega_4^{(2)} B4 = 0.3B1 + 0.35B2 + 0.2B3 + 0.15B4$.

3.2 Checking the Consistency Property

This measurement is one of the important factors in priority determination process according to pair-wise comparison. Each human being ideally wants consistent decision. On the contrary, there are many cases in which the decision makers cannot make perfectly consistent decisions. The AHP method can tolerate inconsistency by providing the measurement of assessment inconsistency.

Consistency Index (CI) can be calculated by using the formula $CI = \frac{\lambda_{\max} - n}{n - 1}$. After acquiring CI,

the next step is calculating Consistency Ratio (CR) by using the formula $CR = \frac{CI}{RI}$, where CI is the

consistency index, CR is the consistency ratio, λ_{\max} is the largest eigen-value of the pair-wise comparison matrix, n is the matrix order, and RI is random index. Table 2 shows a set of recommended RI values presented by Saaty [4].

Table 2 Random Consistency Index (RI)

N	1	2	3	4	5	6	7	8	...
RI	0	0	0.52	0.89	1.12	1.26	1.36	1.41	...

If the value of CR is greater than 0.10 for a matrix larger than 4x4, it indicates an inconsistent judgment. Decision makers should revise the original values in the pair-wise comparison matrix. The higher the CR value is, the assessment result becomes more inconsistent.

For the proposed example, we have CR=0.083. Since CR< 0.1, the comparison matrix in the example is consistent. As the comparison matrices for detailed criteria are in accordance with their respective upper level dimension, their eigen-vectors and consistent ratios are obtained.

4 Conclusion

Education system is a complicated one, involving many factors, and it is true of the teaching evaluation system. A scientific and reasonable course evaluation system determines the teaching quality to a greater degree. The purpose of building an evaluation index system of CEEC can encourage the English teachers to update their ideas and concepts, enhance their skills in teaching and research, and thus ensure a satisfactory performance. The proposed index system in this research helps to promote staff training and teaching levels, make the best of teaching resources, and devise a student-oriented curriculum. Under the guidance of such an evaluation system as well as strict management policies, the task of teaching English elective courses can be implemented orderly and smoothly, students may be stimulated to develop their potentials to the greatest extent, and bring their individualized learning skills into full play. Accordingly, the expected goal of offering English elective courses can be successfully achieved.

Research on City Marketing in Wuhan of China Based on the Citizen's Happiness Index

Wang Dan, Chen Yani, Liu Qinfang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: drwdd@163.com, 376604860@qq.com, 625667522@qq.com)

Abstract: City development is one of important points in economic society. There also some issues during the course, though. As Wuhan of China to be an example, the paper tries to connect the theories of citizen's happiness index and city marketing, construct the system of citizen's happiness index, consequently survey by a questionnaire, and then calculate citizen's happiness index in Wuhan of China. Finally some conclusions and suggestions are drawn, which include innovative city plans, outstanding city image, good government service, attracting more citizens to join and so on.

Key words: Wuhan of China; City Development; City Marketing; Citizen's Happiness Index

1 Introduction

With the development of its economics, China has played a great role in the world. One of the proofs in economic development is new changing of city construction. City has been not only a political or cultural centre of one area, but also a motor of blooming in economics and society. During the course, city managers are exerting strategies of city marketing in order to attract more city consumers. Meanwhile, "people oriented" is popular in present harmonious society. How to integrate both? It seems to be a real problem. So it is natural that people are more and more focusing what on earth city development has brought to them. Could they acquire more happiness from city development? Have governments considered demands of citizen when making city marketing plans? Does city development include all kinds of factors or just a number about GDP?

As Wuhan of China to be an example, the thesis tries to connect the theories of citizen's happiness index and city marketing, construct the system of citizen's happiness index, consequently survey, calculate and analyze citizen's happiness index, and finally draw some conclusions and suggestions it's the purpose.

2 Literature Review

2.1 About happiness index

Happiness is so abstract that everyone has his own unique understanding. The measurement system of happiness index was the first established by the king of Bhutan which is a small country in southern Asian. He created the concept of Gross National Happiness (GNH) and replaced Gross Domestic Production (GDP) with it. The king has paid more attention to environment protection than economic development and thought government's first target was to realize citizen's happiness^[1]. Selman (1990) set up positive psychology and designed happiness equation^[2]. Layard (2002) found a statistics system of GNH, which was similar to that of GDP calculation system^[3].

2.2 About city marketing

There are American branch and European branch in this area. The American Waitt (1999) researched from the relationship between city ideology and city marketing and he found city marketing depended on city ideology^[4]. Gotham (2002) contributed brand of city marketing and he thought traveling and cultural activities were helpful in order to strength the positive image of city^[5]. The European branch considered both supply and demand, and market. Ashworth (1990) regarded city needs to give more information about local development to consumers, and city could attract consumers by financial support and normative behavior^[6]. Bergotal (1999) compared city marketing as a service system including citizen, enterprises and tourists. Facing fierce competition, city should accept more modern commercial concepts, optimize management organizations and improve efficiency^[7].

There have been some literatures about index of citizen happiness and city marketing. There, however are scarce related to both of them, or to a specific city. These just leave research space for the thesis.

3 Data and Methodology

3.1 Setting up investigation system of citizen's happiness index

When designing citizen’s happiness index, it should be noticed that citizen live in city which constitutes living conditions. Facilities, policies, environments and so on have a great influence to citizen. Living in different city, citizen could feel different happiness degree. Fully considering these, investigation system of citizen’s happiness index is shown as Table 1.

Table 1 Investigation System of Citizen’s Happiness Index

City products	Variables	Investigation index
Visible products	Basic facilities in a city	Energy development and supply facilities
		Water supply and drainage facilities
		Road and traffic
		Post and telecommunication facilities
		Facilities to prevention natural calamities
	City environment	Clear degree of water sources
		Safe degree of food
		House conditions
		Price in market
		Income conditions
		Medical and hygiene
		Education conditions
		Culture and amusement
		Social insurance
	Innovation environment	
	Views in a city	Architecture style
		Views in main roads
		Sign views
		Advertisement outdoors
Invisible products	Government ability	Efficiency of government
		Fairness and honesties
		Policy implementations
		Public and democratic decision-making
		Information degree of government
	Level of public service	Officers’ quality
		Efficiency of public service
		Career morality
		Degree of office automation
		Professional quality

3.2 Measurements to citizen’s happiness index

The purpose of setting up investigation system of citizen’s happiness index is to acquire credible happiness index. Then the next question is how to measure citizen’s happiness index. Here taking measurement to customer attitude in customer satisfaction as a reference, we get measurements to citizen’s happiness index which is shown in Table 2.

Table 2 Evaluation Traits and Marks

Evaluation	Traits description	Marks
Far beyond satisfactory	Satisfactory degree to issues is much higher than expectation	90-100
Beyond satisfactory	Satisfactory degree to issues is higher than expectation	80-89
Satisfactory	Satisfactory degree to issues is the same to expectation	70-79
Not satisfactory	Satisfactory degree to issues is lower than expectation	60-69
Not satisfactory at all	Satisfactory degree to issues is much lower than expectation	0-59

3.3 Data collection and analysis

Data were collected by internet survey and face to face survey after questionnaire had been finished. In order to clear the topic, those who were investigated were limited to constant citizen in Wuhan of China, which is one of the biggest cities in central China. 400 surveys were issued and 337 surveys were returned, among which 309 surveys were effective. All data were managed with SPSS 17.0 software package.

Calculation results are showed as follows. From Table 3, all Cronbach's Alpha Coefficients are above 0.7, which means questionnaire is with higher credibility. From Table 4, all KMO values are above 0.7, which means factor analysis is practicable. Also from Table 4, all Bartlett sphericity tests of P values are lower than 0.001, which means questionnaire is with higher validity. Table 5 shows that keeping all items is reasonable.

Table 3 Cronbach's Alpha Coefficient

Variables	Cronbach's alpha	Cronbach's alpha based on standardized items	Items
Basic facilities in a city	0.750	0.752	5
City environment	0.735	0.748	10
Views in a city	0.731	0.740	4
Government ability	0.716	0.738	6
Level of public service	0.728	0.741	4

Table 4 KMO and Bartlett Test

Variables	KMO value	Approximate χ^2	Sig
Basic facilities in a city	0.712	169.715	0.000
City environment	0.724	168.782	0.000
Views in a city	0.768	119.023	0.000
Government ability	0.735	154.341	0.000
Level of public service	0.754	202.849	0.000

Table 5 Rotated Component Matrix

Variables	items	Factor Loading	P-value	Variables	items	Factor Loading	P-value
Basic facilities in a city	X1	0.660	***	Views in a city	X16	0.602	***
	X2	0.708	***		X17	0.728	***
	X3	0.603	***		X18	0.580	***
	X4	0.655	***		X19	0.652	***
	X5	0.591	***		Government ability	X20	0.753
City environment	X6	0.669	***	X21		0.473	***
	X7	0.633	***	X22		0.597	***
	X8	0.652	***	X23		0.508	***
	X9	0.610	***	X24		0.511	***
	X10	0.590	***	X25	0.629	***	
	X11	0.559	***	Level of public service	X26	0.779	***
	X12	0.703	***		X27	0.677	***
	X13	0.517	***		X28	0.753	***
	X14	0.525	***		X29	0.756	***
	X15	0.532	***	Notice:*** means P<0.001			

4 Results

Through Weighted Average Method, citizen's happiness indexes of 5 variables in Wuhan of China are shown in Table 6. By further calculation, citizen's happiness index of visible products in Wuhan of

China is 82.97 and citizen's happiness index of invisible products in Wuhan of China is 81.37. Finally, citizen's happiness index in Wuhan of China is 82.17, belonging to a beyond satisfactory area.

Table 6 Citizen's Happiness Indexes of 5 Variables in Wuhan of China

Variables	Basic facilities in a city	City environment	Views in a city	Government ability	Level of public service
Happiness index	86.36	79.99	82.57	76.99	85.75

Although citizen's happiness index shows they are satisfied with the city, Wuhan of China is still far to an ideal status in citizen's mind. According to Table 6, basic facilities acquired the highest mark, which means that city construction and rebuilding indeed have brought convenience to citizen in Wuhan of China during the course of city marketing. Evaluations to level of public service and views in Wuhan of China were in the middle. The mark of city environment was below 80, which shows government has paid more attention to economic development, ignoring the principle of "people oriented". The lowest mark was in evaluation to government ability, which shows inner management of government has more space to increase.

5 Conclusions

In conclusion, there is going to be more work to be done by city marketing in Wuhan of China, such as making innovative city plans, setting up outstanding city image, supplying good government service and attracting more citizens to join. In further research, we can also apply the method to other cities.

The Legislation's Success and Deficiency in the Tort Liability of Traffic Accident Caused by Defective Motor Vehicle

Lin Huijuan

School of Arts and Law, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 313374743@qq.com, linlegal@hotmail.com)

Abstract: The traffic accident caused by defective motor vehicle is the damage caused by accidental combination of motor vehicle defect and driving behavior, which belongs to several tort. Although it both meet the constitutive requirements of traffic accident liability and product liability, it can not solve effectively the liability of several tort, which is not beneficial for victims' protection. Otherwise, there are some conflicts between current legislation and judicial practice in the liability of several tort. However, the article 51 of the Tort Liability Law has special provision about the tort liability of traffic accident caused by assembling or scrap motor vehicles, that is, the assignor and the assignee should take joint and several liability, which actually bridges traffic accident liability and product liability. Even though the provision has solved the problems above, it can not apply to the tort liability of traffic accident caused by all defective motor vehicle. By analyzing the success and deficiency of the legislation, there is a try to make up the legislation deficiency of the tort liability of traffic accident caused by defective motor vehicle with joint and several liability, taking example from the the article 51 of the Tort Liability Law.

Key words: Defective motor vehicle; Traffic accident liability; Product liability; Joint and several liability

1 Introduction

The article 51 of the Tort Liability Law provides that the assignor and the assignee should take joint and several liability when the traffic accident is caused by assembling or scrap motor vehicle, which was transferred by the assignor to the assignee, such as sale. It is first to make the special provision about the tort liability of traffic accident caused by assembling or scrap motor vehicle in the section of traffic accident liability which should be taken by the motor vehicle keeper based on "the dominance of run" and "the interest of run" theory. However, the assignor takes the liability out of neither the dominance of run or the interest of run, but his behavior about transferring unreasonably dangerous assembling or scrap motor vehicle. According to the article 2 of Scrap Car Recycling Management Approach and the article 2 of Motor vehicle Compulsory Scrapping Standard Regulation, what is called "assembling or scrap motor vehicle" is the defective motor vehicle with unreasonable danger. The traffic accident caused by defective motor vehicle, is the damage caused by accidental combination of motor vehicle defect and driving behavior, which belongs to several tort. It both meets the constitutive requirements of traffic accident liability and product liability, so that, does the joint and several liability bridge the two liability? Even if it is so, the article 51 can not apply to the liability of traffic accident caused by all defective motor vehicle.

To this case, whether the civil law countries or the common law countries, there are both no special regulations about the liability of traffic accident caused by defective motor vehicle from the perspective of several tort, but there are other regulations to protect victim's rights and interests. Such as, in some common law countries, there is the theory of "rational man standard"^[1], which would exempt the traffic accident liability but to confirm the product liability; in some civil law countries, it clearly regulates that the motor vehicle keeper can not exempt liability by a plea of motor vehicle defect. Relatively, there are no these regulations to ensure the rights and interests of the victim in Chinese civil laws. Since the Tort Liability Law has provided its own system of traffic accident liability and product liability, would it be effective to solve the liability of several tort only by a single system of them? Perhaps, would it be available to the liability of several tort based on the provision about several tort theory? Maybe, would it be better to take example of joint and several liability from the the article 51 of the Tort Liability Law?

2 Traffic Accident Liability and Product Liability of Traffic Accident Caused by Defective Motor Vehicle

2.1 The traffic accident liability of traffic accident caused by defective motor vehicle

The Road Traffic Safety Law has provided "traffic accident" is a incident that a running motor

vehicle on the road causes personal injury or property loss, out of a fault or an accident. Obviously, illegal behavior is not necessary to the constitutive requirements of traffic accident liability. As the special tort liability, the constitutive requirements cover several aspects, such as, the accident must be caused by running motor vehicle on the road; there must be some damage; there must be causality between the traffic accident and the damage. The traffic accident caused by defective motor vehicle, is the running motor vehicle with defect on the road causes personal injury or property loss. The cause involves vehicle defect, but there is also inseparable causality between the run of motor vehicle and the damage, because traffic accident could not happen by static motor vehicle. So, the tort of traffic accident caused by defective motor vehicle meets the constitutive requirements of traffic accident liability.

The article 48 of the Tort Liability Law provides, "Where a motor vehicle meets with a traffic accident and causes personal injury or death or any property loss, the liability of indemnity should accord to relevant provision of The Road Traffic Safety Law", which lead to its article 76 about the apply of doctrine of liability fixation and defenses. Firstly, the insurance company shall pay indemnity within the liability limit of motor vehicle third party liability compulsory insurance, the part in excess of the liability limit shall be indemnified in either of the following ways: (1) Where a traffic accident occurs between motor vehicles, it applies fault liability principle, so the faulty party shall bear the liability or both parties in fault shall each bear their proper share of the liability. (2) Where a traffic accident occurs between a motor vehicle and a non-motor vehicle or a pedestrian, it applies non-fault liability principle,^[2] so the motor vehicle shall bear the liability; however, if the non-motor vehicle or the pedestrian is in fault, the motor vehicle's liability may be mitigated; if the motor vehicle is not in fault, the motor vehicle's liability may be less than 10%; if the injury and loss of the traffic accident are intentionally caused by the non-motor vehicle or the pedestrian, the motor vehicle shall exempt liability. About the liability of traffic accident caused by assembling or scrap motor vehicle, the article 51 of the Tort Liability Law has special provision that the assignor and the assignee should bear joint and several liability without distinguishing traffic accident type, under non-fault liability principle and no legal defenses.

After all, it is the defective motor vehicle that causes traffic accident and the damage is the combination consequence of motor vehicle defect and driving behavior which belongs to several tort. In some civil law countries, it clearly regulates that the motor vehicle keeper can not exempt liability by a plea of motor vehicle defect, such as Germany and Japan, so that the victim's rights and interests would be protected well even if the traffic accident is caused by motor vehicle defect. But in some common law countries, such as America and England, there is the theory of "rational man standard" in tort^[3] that the person takes some measures as a rational man in similar situation, even the measures are not wise or some faulty,^[4] which would exempt the keeper of driver's liability. Comparatively, the Tort Liability Law or other legislation in China has not any rules about it, so the motor vehicle keeper can take a plea of causality based on the defect, which will not benefit for victims' indemnity by the litigation of traffic accident liability. Because the defect is not the fault of motor vehicle keeper, if the traffic accident is between motor vehicles, he will take less even no liability; if the traffic accident is between a motor vehicle and a non-motor vehicle or a pedestrian, he will take less than 10% liability.

2.2 The product liability of traffic accident caused by defective motor vehicle

Defective motor vehicle, is wheeled vehicle with unreasonable danger to person and property safety, such as cars, motorcycles, agricultural vehicles and so on, which is moved, dragged, driven on road with power device for carrying person or goods, or doing special engineering operations. Defective motor vehicle includes the defective automobile which is regulated by the Defective Automobile Product Recall Management Regulation, and assembling or scrap motor vehicle which is regulated by the Tort Liability Law. The tort of traffic accident caused by defective motor vehicle happens in the run of motor vehicle, which is not similar with the tort of defective motor vehicle in the static condition, such as spontaneous ignition. During the run of defective motor vehicle on road, the tort of traffic accident is just the tort of defective product. As the motor vehicle is defective, there is the damage of personal injury or property loss, and there is causality between the defect and the damage, so it meet the constitutive requirements of product liability.

It is provided in the article 12 of the Supreme Court's Judicial Interpretation About The Law-application For Road Traffic Accident Damage Cases in Dec. 2012, "when the damage of traffic accident is caused by motor vehicle defect, the court should support the party's claim that the manufacturer or seller would take liability according to the chapter 5 of the Tort Liability Law." From the the article 41 and 42 of the chapter 5, when the damage is caused by defective product, the manufacturer should take strict liability and the seller should take fault liability. But for the victim, he could claim

indemnity from manufacturer as well as seller without considering the seller’s fault,which is different from the seller’s fault liability,but some lawmaker believes that this is only the advance responsibility of the seller.Meanwhile,after each of them taking the liability, the manufacturer has the right to recover it from the faulty seller,or the seller without fault has the right to recover it from the manufacturer.Visibly,the fault of seller is only the foundation that the manufacturer asks for recovery of the compensation,but not the necessity for victim to claim seller’s product liability,so the seller’s liability is still strict liability.What is “the victim”,there are different statements,such as,“the infringed” in the Tort Liability Law,“the victim” in the Product Quality Law and “the Consumer and other victims”in the Protection of Consumer’s Rights and Interests Law,but the connotation of these statements is not different,that is,they are the right subjects, including the driver,the passenger and others who suffer damage in the traffic accident.

As the Product Quality Law is the special law about defective product tort,there are three defenses for the manufacturer in the article 42,such as(1)the product is not put into market;(2)the damaging-defect does not exist,when the product is put into market; (3)the level of science and technology can not discover the defect,when the product is put into market.In the tort of traffic accident caused by defective motor vehicle,the vehicle has been put into market,so the manufacturer usually can exempt liability because of the defect caused by victim’s fault,such as misuse,abuse,overuse,refit or disassembling without any warning and so on.Although it does not provide whether the seller can claim the defenses,thinking about the manufacturer’s liability is the origin of the seller’s liability and the source of the recovery right ,the seller should claim it as the same as the manufacturer.As for the victim’s fault,it is the motor vehicle keeper’s fault in fact,for example,failure to repair the breakdown timely;overuse the mandatory scrap motor vehicle out of durable years or the leading scrap motor vehicle of reaching its maximum mileage;assemble motor vehicles without warning; drive defective motor vehicle with intention.If the manufacturer or seller exempts liability because of these defenses above,the victims will not get indemnity.On the other hand,the tort happens in traffic accident in relation to driving behavior,so the manufacturer or seller could claim less liability on the defense of causality.But in some common law countries,such as America and England ,although there is the theory of "rational man standard" to exempt the traffic accident liability,the tort of defective product takes strict liability,so the driver take no liability but the manufacturer should take the product liability.

2.3 The deficiency of regulation by traffic accident liability or product liability separately

Table 1 Comparison of Traffic Accident Liability and Product Liability of Traffic Accident Caused by Defective Motor Vehicle

		Doctrine of liability fixation	Liability subject	Right subject	Indemnity	Defense and Consequence
Traffic accident liability (A and B)	motor vehicles	Fault liability	Fault party	A B A,B	B,a A,a a	Personal injury Property loss
	A motor vehicle and A non-motor vehicle or a pedestrian	Non-fault liability	A	B,a	Personal injury Property loss (less than 10% liability without fault)	The defect ↓ Relief or Exemption
Product liability		Strict liability	Manufacturer	A,B,a	Personal injury Property loss (except the loss of defective motor vehicle)	Victim’s fault ↓ Relief or Exemption

The traffic accident caused by defective motor vehicle,is the damage of accidental combination of driving behavior and motor vehicle defect,which both meets the constitutive requirements of traffic accident liability and product liability.To presume that “ A” is the defective motor vehicle,“ a”is the passengers,“B”is the non-motor vehicle or pedestrian,based on different liability selection,there will be

different doctrine of liability fixation, liability subject and protection for right subject, as shown in table 1. Each traffic accident liability or product liability can not solve the liability of several tort effectively, which is not beneficial for victims' protection.

In accordance with traffic accident liability, the legislation does not provide that motor vehicle defect can not be the defense, and the defect is not the driver's fault. So, if the traffic accident occurs between motor vehicles, the liability subject (maybe A or B or A, B) can relieve or exempt liability; if the traffic accident occurs between a motor vehicle and a non-motor vehicle or a pedestrian, the liability subject A can claim less than 10% liability. Therefore, the indemnity is restricted to the personal injury and property loss caused by driving behavior, excluding the part caused by motor vehicle defect, which will not be got in the traffic accident liability.

In accordance with product liability, if the defect is caused by improper use of A, such as misuse, abuse, overuse, refit or disassembling without warning and so on, the manufacturer and seller can exempt liability, so that B and a will not get the indemnities; if the traffic accident is caused partly by improper driving, the manufacturer and seller can claim relief liability by causality plea, so that B (only it is non-motor vehicle) and a will not get the indemnities caused by improper driving in the product liability.

3 Joint and Several Liability: The Coalition of Traffic Accident Liability and Product Liability

3.1 The legislation about the joint and several liability of traffic accident caused by defective motor vehicle

As mentioned, defective motor vehicles include defect automobiles under the mandatory recall and assembling or scrap motor vehicles. The article 51 of the Tort Liability Law has special provision about the tort liability of traffic accident caused by assembling or scrap motor vehicle, that is, the assignor and assignee should take joint and several liability, but it only apply to the situations of transfer, which is unclear but including sale. Some scholar thinks, it is to let alone the damage of traffic accident that the assignor and the assignee deliberately take illegal way to transfer the assembling or scrap motor vehicle which is banned by law, so they have joint fault in the traffic accident damage, which are joint tort.^[5] There are enough reasons to believe that the assignor and the assignee know about the transferring vehicle is assembling or scrap motor vehicle, because they should do the registration of ownership transfer after sale but the banned vehicle cannot be done this registration; if they neither check out relevant certificates nor do transfer registration, they will be presumed deliberate. But these reasons to identify the subjective state is only based on the sale, in which the assignor and the assignee are jointly faulty and are of subjective joint tort. In addition, it is impossible to identify the subjective state of the assignee, so the assignor and assignee are of several tort without joint fault. Thus, the tort of traffic accident caused by assembling or scrap motor vehicle in the article 51 includes both subjective joint tort and several tort without joint fault. However, the tort of traffic accident caused by other defective motor vehicle is usually several tort without joint fault, because this vehicle is deemed as the legal one and the manufacturer, seller, consumer or others are impossible to know about the defect jointly.

With regard to several tort liability, the Tort Liability Law has a system of provisions. In the article 8, joint tort is just defined as subjective joint tort based on the subjective theory, which lead to joint and several liability. The article 11 and 12 regulate the several tort without joint fault separately, if each tort is enough to cause all damage, it will lead to joint and several liability; if each tort is not enough to cause all damage, it will lead to proportionate liability. So, the tort liability of traffic accident caused by assembling or scrap motor vehicle in sale is joint and several liability according to article 8; the tort liability of traffic accident caused by other defective motor vehicle is proportionate liability according to article 12 but not article 11, because each of the motor vehicle defect and driving behavior is not enough to cause all traffic accident damage.

The joint and several liability of traffic accident caused by assembling or scrap motor vehicle, can not be regulated by the general provisions of joint and several liability in article 8 and 11 simultaneously, instead in conflict with the proportionate liability in article 12. Therefore it is the consequence of special legislation provision, based on policy considerations and protection of the victim.

3.2 The judicial practice about the joint and several liability of traffic accident caused by defective motor vehicle

Before the Tort Liability Law, the liability of several tort is regulated by the Supreme Court's Judicial Interpretation About Law-application For Personal Injury Cases in Dec. 2003 (the Interpretation

for short). The Interpretation defines joint tort in article 3 that two or more person commit a tort with joint intention or joint negligence causing damage, or without joint intention or joint negligence, but the same damage is caused by the direct combination of several torts, which will lead to joint and several liability. Obviously, the joint tort includes subjective joint tort and part of several tort without joint fault. As for the several tort without joint fault, if the same damage is caused by the direct combination of several torts, it will lead to joint and several liability, which is called objective joint tort; if by the indirect combination of several torts, it will lead to proportionate liability. What is called “direct combination”, a legislator thinks, several torts are combined with each other occasionally but closely as a joint tortious act, which brings the victim damage jointly, so that the causation and the damaging part of each act can not be distinguished.

In the judicial practice, the traffic accident caused by defective motor vehicle is the damage caused by direct combination of motor vehicle defect and driving behavior, which is a whole and common causation to the traffic accident damage. After all, the traffic accident does not happen when the defective motor vehicle is not running on road, and it is unrelated to product tort when the traffic accident is caused by motor vehicle without defect. So it belongs to objective joint tort, which lead to joint and several liability. In the traffic accident caused by assembling or scrap motor vehicle by sale, even if the tort of assignor and the assignee is subjective joint tort, they also take joint and several liability. Therefore, it is enough to regulate the tort liability of traffic accident caused by defective motor vehicle with joint and several liability according to the Interpretation, whether the tortfeasors have joint fault or not.

3.3 The success and deficiency to bridge traffic accident liability and product liability with joint and several liability

Based on the several tort theory, there are contradictions of the liability of of traffic accident caused by defective motor vehicle between the legislation and the judicial practice, which is easy to cause the confusion of law application. According to the legislation, the liability is either joint and several liability or proportionate liability, and the proportionate liability is still based on the each system of traffic accident liability or product liability; according to the judicial practice, the liability is joint and several liability. As shown in table 2.

Table 2 Comparison of the Provision of Several Sort in Legislation and Judicial Practice

	Several sort and Liability form			the tort liability of traffic accident caused by defective motor vehicle	
				Assembling or scrap motor vehicle	Other defective motor vehicle
Legislation	With joint fault	Several tort	Joint and several liability	article 51 of the Tort Liability Law	Several sort without joint fault
	Without joint fault	Each tort is enough to cause all damage		Proportionate liability	↓
Each tort is not enough to cause all damage		Joint and several liability	Proportionate liability		
Judicial Practice	With joint fault		Several tort	Joint and several liability	Subjective joint tort
	Without joint fault	Direct combination			
		Indirect combination	Joint and several liability	Joint and several liability	

However, the joint and several liability in the article 51 of the Tort Liability Law makes a good example to eliminate the contradictions above. As what mentioned before, the article 51 is the consequence of special legislation provision, which just bridge the traffic accident liability and product liability. Although it is set in the chapter “Motor Vehicle Traffic Accident Liability”, the assignor is not the motor vehicle keeper who is usually the owner or driver and should take traffic accident liability based on the “dominant of run” and “the interests of run” theory^[6]. The accountability of the assignor is to provide defective motor vehicle which causes traffic accident damage. Because of the product defect causing damage, the manufacturer and seller should take product liability. As for the overuse of the mandatory scrap motor vehicle out of durable years or the leading scrap motor vehicle of reaching its maximum mileage, the manufacturer and seller can exempt liability, but the owner of motor vehicle transfer it to others to drive or assemble and the behavior of transfer and assembling is equivalent to manufacture and sale of defective motor vehicle. In this sense, these person should take product liability who are the assignor compared to the assignee, so the liability of the assignor in fact is the product

liability. The joint and several liability bridges the traffic accident liability and product liability where the doctrine of liability fixation is non-fault liability principle without defenses, the liability subject includes product liability subject and traffic accident liability subject, the right subject involves the victims except the assignor and the assignee in the traffic accident, the indemnity contains personal injury and property loss. The special provision solves the liability of several tort effectively, which makes up the deficiency of regulation by traffic accident liability or product liability separately and is beneficial for victims' protection. But, it can not apply to the tort liability of traffic accident caused by all defective motor vehicle.

4 Conclusion

About the tort liability of traffic accident caused by defective motor vehicle, it can not solve the several tort liability effectively by traffic accident liability or product liability separately, and there are contradictions between the legislation and the judicial practice based on the several tort theory, both of which violate the purpose of the victims' protection of the Tort Liability Law. However, the article 51 of the Tort Liability Law has solved these questions above. Both of traffic accident caused by assembling or scrap motor vehicle and by other defective motor vehicles, are the damage caused by accidental combination of motor vehicle defect and driving behavior, which belongs to several tort. So it is possible to take example of joint and several liability from the article 51.

4.1 From assembling or scrap motor vehicle to defective motor vehicle

Defective motor vehicles, besides assembling or scrap motor vehicles, include defective automobiles which are regulated by the Defective Automobile Product Recall Management Regulation, all of them with unreasonable danger to person and property safety. At the beginning of 2013, the Defective Automobile Product Recall Management Regulation has been implemented, which regulates defective automobiles by the way of administrative regulation. Like assembling or scrap motor vehicles, there is also a reality need to regulate these defective automobiles. Besides, the traffic accident caused by defective automobile, is also the damage caused by accidental combination of motor vehicle defect and driving behavior, which belongs to several tort, so there is the theory basis to regulate it with shared liability. Meanwhile, considering the protection of victims, the legislation should settle the system predicament that each of traffic accident liability and product liability can not solve the liability of several tort. Therefore, it is necessary and available to regulate the tort liability of traffic accident caused by all defective motor vehicles with joint and several liability by special legislation provision, based on several tort and the protection of victims, which is also good for playing a role of private law in social control of defective motor vehicles.

4.2 From multiple doctrine of liability fixation to non-fault liability principle

As before, the joint and several liability actually bridges traffic accident liability and product liability, but the key is to deal with the multiple doctrine of liability fixation in their respective system. The joint and several liability in article 51 of the Tort Liability Law takes non-fault liability principle, which is out of the assignor transferring dangerous and defective assembling or scrap motor vehicle with intention, and the assignee enjoying the dominant of run and the interest of run of assembling or scrap motor vehicle. This is similar to the tort of traffic accident caused by other defective motor vehicles. The product liability subject should take strict liability out of producing and providing defective product, which has nothing to do with the knowing about product defect; the traffic accident liability subject should take liability out of enjoying the dominant of run and the interest of run of the motor vehicle, whether it is the subject's fault or just an accident. So it does not violate the multiple doctrine of liability fixation in the system of traffic accident liability or product liability to take non-fault liability principle.

4.3 From self liability subject to joint and several liability subject

In the tort liability of traffic accident caused by defective motor vehicle, there are both traffic accident liability and product liability, that is, there are both traffic accident liability subject and product liability subject. Although the joint and several liability subject of traffic accident caused by assembling or scrap motor vehicle are the assignor and the assignee, they actually are product liability subject and traffic accident liability subject, because the assignor is the person who produces or provides defective motor vehicle and the assignee is the person who is usually the owner or driver of defective motor vehicle. In the system of traffic accident liability or product liability, both of the subjects are responsible for themselves, but the assignor and the assignee skillfully turn self liability subject to joint and several liability subject. Similarly, it is available to apply to the liability subject of traffic accident caused by

other defective motor vehicles. After all, to the consumer, the manufacturer and the seller are the assignor; the consumer as the assignee usually is the owner and the driver of motor vehicle.

Abstract: The development level of regional logistics is an important indicator of the development level of economic. Evaluating the regional modern logistics development level scientifically is of practical significance for making scientific decisions and improving the environment for modern economy. This paper selects 19 factors from 5 dimensions including socio-economic level, production and consumption distribution level, transport level, human resources level and information development level. Firstly, with the help of MATLAB7.11, it uses the gray correlation analysis method to exclude lower correlation factors; Secondly, make a quantitative evaluation of 31 provinces (cities) in China on the regional logistics development with the help of SPSS19.0, combining the principal component analysis and the cluster analysis method; Then it divides the regions into four categories according to the regional logistics development. Finally, it makes qualitative conclusions on the evaluation results, and puts forward some suggestions on the coordinated development of regional logistics.

Key words: Regional logistics; Grey correlation analysis; Principal component analysis; Cluster analysis

1 Introduction

Modern market competition has gone beyond the competition between enterprises, since the French scholar Gottmann put forward the concept of "metropolitan economic zone" in 1957, along with the accelerated pace of economic globalization, market competition has risen to regional competition, and even the national competition, which was different from the counterbalance between the enterprises and supply chains in the past, "regional logistics" concept also would be born. As an indispensable part of the regional economy, the development level of logistics is not only the carrier of parting regional development elements, but also an important content of regional industrial activities, playing an important role in guaranteeing the achievement of department labor division, area labor division and being bridges of economic ties. If we can scientifically evaluate the development level of modern regional logistics, thus make scientific decisions and improve the environment for the modern economy development, it will be significantly important for the regional logistics competitiveness and will promote the whole development of regional economic development.

2 Literature Review

Many Chinese scholars studied the development of regional logistics from different aspects such as content, service performance, structure optimization and evaluation of regional logistics. Now, this paper will review the studies mainly in the aspects of the evaluation factors system and evaluation method of development level of logistics.

The current studies on evaluation factor system of logistics development are shown as follows: The annual status report(2002)^[1] provided by U.S. the Cass Information system Inc Prologis Logistics is the most representative in the business logistics field of evaluation, the main indicators are: business logistics system cost and its share of GDP, freight index and so on. Action Agenda Steering Committee, issued the "Agenda for Action" (2002)^[2], respectively from the assessment of the importance of the logistics industry, sector structure of transportation and logistics industry and so on. Dai Weiwei (2004)^[3] selected 17 factors ,such as the GDP, the proportion of tertiary industry in GDP, population density freight volume, total retail sales of social consumer goods and so on.

The evaluation method of logistics development: Wang Du (2005)^[4] used the analytic hierarchy process, determined the index weights by investigations and used fuzzy comprehensive evaluation method on Tianjin's development level of logistics; Wang Zhenfeng (2006)^[5] and so on used the non-linear principal component analysis to analyze the logistics development of Henan, and made a comprehensive strength evaluation of logistics development in different regions of Henan. Dong Haiying (2010)^[6] used principal component analysis to make a comprehensive evaluation on logistics

development in Sichuan Province.

Regional logistics development itself is a difficult concept to define; there are always subjective factors in determining the weights while using fuzzy comprehensive evaluation method, AHP and so on. Therefore, for the evaluation of regional logistics development level, to a certain extent, we should avoid subjectivity, and making objective comprehensive evaluation according to available scientific of statistical data is very necessary.

3 Construction of the Factors System Based on Grey Correlation Analysis

3.1 Principle of selecting factors

Comprehensiveness: The evaluation factors should be taken full account of various factors from macro and micro, internal and external. Objectiveness: Factors should be objectively reflected, and the sources of data should be true, reliable, and accurate. Scientific nature: Each factor should have a strict scientific meaning. Comparability: From horizontal and vertical comparison, the meaning, statistical time and space of the selected factors should be comparable.

3.2 Research objects and data sources

In this paper, the logistics situations of 31 provinces (or cities) in China are taken as the research objects. The data in this paper are the relevant data from the China Economic Information Network database from 2004 to 2011, and the data are processed by SPSS19.0 and MATLAB7.11.

3.3 Evaluation system

3.3.1 Primary election factors

This paper argues that the factors affecting the level of regional logistics development are from the following five aspects, Firstly, socio-economic level, which is a comprehensive reflection of socio-economic base, including GDP (X1,hundred million yuan), Real GDP per capita (X2,yuan), urban household per capita disposable income (X3,yuan), rural residents per capita annual income (X4,yuan).Secondly, production and consumption circulation level, includes agricultural output (X5, hundred million yuan), construction output (X6, hundred million yuan), industrial output (X7, hundred million yuan), the total retail sales of social consumer goods (X12, hundred million yuan), which reflect the needs of regional logistics development situation and the scale of demand. Thirdly, transport level, reflecting the material basis of the provincial logistics development, includes total cargo turnover (X10, ton-km), total freight traffic (X11, ten thousand tons), highway mileage (X15, km), the railway operating mileage (X16, km), transportation, storage and postal added value (X19, hundred million yuan). Fourthly, human resources level which reflects the human resources of logistics development, includes general, college graduates (X13, million), transportation, storage and postal services private enterprises and individuals year-end number of employees (X14, million).Fifthly, information development level, reflecting the logistics information development level, includes the number of mobile phone users (X8, million), telecommunications services (X9, hundred million yuan), the number of Internet users (X17, million), telephone penetration (X18, the number of telephones per hundred persons have).

3.3.1 The established factors system based on grey correlation analysis

The authors consider using gray correlation analysis method firstly, and calculate the gray correlation degrees between each factor and X19, excluding the factors with a lower index.

This paper takes the whole China as a symbol and selects the data of 19 factors from 2004 to 2011, and the data should be normalized. Firstly, the grey correlation is

$$\xi_i(k) = \frac{\min_i \min_k |L_0(k) - L_i(k)| + \rho \max_i \max_k |L_0(k) - L_i(k)|}{|L_0(k) - L_i(k)| + \rho \max_i \max_k |L_0(k) - L_i(k)|} \quad (1)$$

And then calculate the gray absolute degree: the gray absolute degree between evaluation sequence and the reference sequence is:

$$r_i = \frac{1}{n} \sum_{k=1}^n \xi_i(k) \quad (2)$$

Compare the gray absolute degree, sort in descending order .The gray correlation sorting results are shown in Table 1.

Table 1 shows that the cargo turnover(X10) has the biggest correlation value with transportation, storage and postal added value(X19), indicating that the scale of freight transport accounts for a large proportion of regional logistics development level. Select the factors with the correlation greater than

0.85, while the railway operating mileage(X16), general, college graduates(X13), telecommunications services(X9) and highway mileage(X15) these four factors that gray correlation is smaller than 0.85 can not be considered, and to select the other 14 factors as a factor system.

Table 1 The Gray Correlation Sorting Results

Factor No.	Factor Name	The Gray Correlation	Sorting Results
X10	total cargo turnover	0.9433	1
X3	urban household per capita disposable income	0.9421	2
X2	Real GDP per capita	0.9416	3
X1	GDP	0.9370	4
X18	telephone penetration	0.9297	5
X8	the number of mobile phone users	0.9212	6
X7	industrial output	0.9186	7
X12	the total retail sales of social consumer goods	0.9089	8
X11	total freight traffic	0.9088	9
X4	rural residents per capita annual income	0.8980	10
X14	transportation, storage and postal services private enterprises and individuals year-end number of employees	0.8919	11
X5	agricultural output	0.8839	12
X6	construction output	0.8755	13
X17	the number of Internet users	0.8570	14
X16	the railway operating mileage	0.8430	15
X13	general, college graduates	0.8075	16
X9	telecommunications services	0.7988	17
X15	highway mileage	0.6665	18

4 The Evaluation of Development Level of Regional Logistics Based on Principal Component Analysis and Cluster Analysis

In response to the factor system, as the factors are too many (14), so making a comprehensive evaluation is more complicated. The main idea of principal component analysis is dimensionality reduction, using the less comprehensive evaluation factors to replace the original factors, and the comprehensive factors retains most of the original information, and unrelated to each other, enabling complex problems simple.

4.1 The use of principal component analysis with SPSS

4.1.1 Results test

Using SPSS for KMO and Bartlett test on sample data, KMO is $0.802 > 0.5$, Bartlett test value Sig. = .000, which means that the correlation between variables is not significant, so the symbol can be used principal component analysis.

4.1.2 Principal components using principal component analysis

The explained variance is shown in Table 2, it can be seen from the table, in the premise of the cumulative contribution rate $89.749\% \geq 85\%$, three principal components are extracted, they are F1, F2, F3, and their contribution rate descending are 48.208%, 31.231% and 10.039%.

Table 2 The Explained Variance

Components	Initial Eigen values			Extract and load squared			Rotate squares and loading		
	Total	Variance %	Cumulative contribution rate	Total	Variance %	Cumulative contribution rate	Total	Variance %	Cumulative contribution rate
1	8.408	60.055	60.055	8.408	60.055	60.055	6.749	48.208	48.208
2	3.349	23.919	83.974	3.349	23.919	83.974	4.372	31.231	79.440
3	.771	5.505	89.479	.771	5.505	89.479	1.406	10.039	89.479

Firstly, create the original factor loading matrix with the three main factors extracted components

F1, F2 and F3, and then simplify its structure, and get the varimax orthogonal rotation matrix, as is shown in Table 3 below:

Table 3 Rotated Component Matrix

Factor	Components		
	1	2	3
the number of mobile phone users	.966	.135	.074
number of Internet users	.950	.191	.041
GDP	.940	.278	.169
the total retail sales of social consumer goods	.939	.291	.135
industrial output	.907	.255	.216
agricultural output	.791	-.367	.308
total freight traffic	.776	-.114	.516
construction output	.711	.463	.085
transportation, storage and postal services private enterprises and individuals	.630	.208	.433
year-end number of employees	.630	.208	.433
telephone penetration	.089	.946	-.079
rural residents per capita annual income	.187	.929	.204
Real GDP per capita	.106	.928	.215
urban household per capita disposable income	.237	.928	.135
total cargo turnover	.298	.453	.798

The results show that the first factor mainly in the network infrastructure has a larger load can be named as science and technology factor; the second factor mainly in the economic level has a greater load, can be named as economic factor; the third factor mainly in transshipment have a greater load, can be named cargo flow factor.

4.1.3 Comprehensive factor scores

The expression formula of the three main components show as follows:

$$Z_1 = 0.167X'_1 - 0.077X'_2 - 0.021X'_3 - 0.054X'_4 + 0.115X'_5 + 0.129X'_6 + 0.146X'_7 + 0.208X'_8 - 0.187X'_{10} + 0.038X'_{11} + 0.177X'_{12} + 0.014X'_{14} + 0.212X'_{17} + 0.007X'_{18}$$

$$Z_2 = 0.016X'_1 + 0.222X'_2 + 0.226X'_3 + 0.220X'_4 - 0.170X'_5 + 0.087X'_6 + 0.006X'_7 - 0.012X'_8 + 0.013X'_{10} - 0.126X'_{11} + 0.024X'_{12} - 0.022X'_{14} + 0.008X'_{17} + 0.263X'_{18}$$

$$Z_3 = -0.115X'_1 + 0.112X'_2 - 0.023X'_3 + 0.075X'_4 + 0.115X'_5 + 0.176X'_6 - 0.047X'_7 - 0.220X'_8 + 0.810X'_{10} + 0.398X'_{11} - 0.157X'_{12} + 0.303X'_{14} - 0.261X'_{17} - 0.237X'_{18}$$

The consolidated factor score formula is:

$$Z = 0.48Z_1 + 0.31Z_2 + 0.10Z_3$$

0.48,0.31,0.10 are the variance contribution rate of three principal components, calculate three principal component scores and composite score for each region, and do prevail composite score in descending order to get the table in Table4.

Table 4 Three Principal Components Scores and Composite Score for Each Region

Regions	Z1	Z2	Z3	Z
Guangdong	2.83767	0.75579	-1.60944	1.44
Jiangsu	2.20792	0.91874	-0.48893	1.3
Zhejiang	1.08929	1.74436	-0.43032	1.02
Shandong	1.95137	-0.37272	1.82918	1
Shanghai	-1.11226	2.63851	2.47148	0.53
Beijing	-0.41365	2.69729	-1.66286	0.47
Liaoning	0.2354	0.30771	1.91568	0.4
Henan	0.95966	-1.07021	1.14342	0.24
Hebei	0.61383	-0.59967	1.02668	0.21
Fujian	0.06862	0.73113	-0.95151	0.16

Hubei	0.53215	-0.40858	-0.1447	0.11
Sichuan	0.79344	-0.78239	-0.39089	0.1
Tianjin	-1.2592	1.68948	0.92229	0.01
Hunan	0.42446	-0.74228	0.09595	-0.02
Anhui	-0.03614	-0.83732	1.4712	-0.13
Inner Mongolia	-0.5461	0.16505	0.69484	-0.14
Shaanxi	-0.13001	-0.36895	-0.40029	-0.22
Heilongjiang	-0.20471	-0.48297	-0.16407	-0.26
Jilin	-0.42048	-0.07617	-0.50408	-0.28
Shanxi	-0.28797	-0.40345	-0.22039	-0.29
Chongqing	-0.4511	-0.19152	-0.21484	-0.3
Guangxi	-0.21086	-0.83233	0.43904	-0.32
Jiangxi	-0.34007	-0.61724	0.25832	-0.33
Yunnan	-0.28671	-0.76268	-0.58209	-0.43
Xinjiang	-0.5469	-0.45201	-0.5356	-0.46
Hainan	-1.03073	-0.11481	-0.53479	-0.58
Guizhou	-0.55793	-0.8277	-0.63883	-0.59
Gansu	-0.65267	-0.79924	-0.51226	-0.61
Ningxia	-1.06559	-0.13849	-0.61274	-0.62
Qinghai	-1.05575	-0.25341	-0.86721	-0.67
Tibet	-1.10499	-0.51393	-0.80225	-0.77

4.2 Cluster analysis

This paper uses cluster analysis according to the composite factor scores, clustering method uses the connection method between the two groups, distance measure uses Euclidean distance. The results are shown in Figure 1.

Figure 1 The Result of Cluster Analysis

From the composite score and cluster analysis results, the regional logistics development level in 2011 can be divided into four categories, as are shown in Table 5.

Table 5 The classification of regional logistics development level

Category	Logistics level description	Regions
One	Better	Guangdong, Jiangsu, Zhejiang, Shandong
Two	Good	Shanghai, Liaoning, Beijing
Three	medium	Henan, Hebei, Fujian, Hunan, Hubei, Sichuan, Tianjin, Inner Mongolia, Anhui
Four	inferior	Gansu, Ningxia, Hainan, Guizhou, Guangxi, Qinghai, Xizang, Jiangxi, Shaanxi, Shanxi, Xinjiang, Jilin, Chongqing, Yunan, Heilongjiang

From the composite score and clustering results, a good level of development of regional logistics areas are mainly concentrated in the eastern coastal and inland along the side, while the development level of logistics of the western part in China is much lower, not only the location and the region related, but also related to their development level of regional economic, that is to say regional logistics demand and supply are well balanced. The areas with low development level of regional logistics should study market and the macro environment, and promote regional logistics industry to flourish.

5 Conclusion

This paper builds evaluation index system of regional logistics development from socio-economic, production and consumption distribution, transportation development, human resources and information development, and establishes evaluation model on development level of regional logistics based on gray correlation analysis, principal component analysis and cluster analysis, which is clear principle, simple calculation. Using this model makes a comprehensive evaluation on the development level of logistics of 31 provinces(cities) in China, in the meanwhile, the conclusion is objective, accurate and more convincing. The comprehensive evaluation result can provide an important reference for formulating correctly, scientifically, competitively regional logistics development strategies.

Abstract: In this paper, a comprehensive literature analysis, comparative analysis and other methods are used to deeply research the social service system of distance education. Firstly, this paper comparatively analyzes the traditional education and distance education, and concludes that the distance education is a new education way which is mainly reflected in the relatively isolated state between teachers and students, or a student and another student; Secondly, it briefly introduces the research status at present, basic concept, characteristics, composition and necessity of the social service system of distance education; Thirdly, it makes a detailed analysis of network education institution in the social service system and the management of social service system of distance education, it focuses on 4 kinds of set modes and 2 kinds of operation mechanism of the 68 colleges, and 3 virtual platforms: organization and management platform, resource integration platform and quality testing platform; Finally, it puts forward some problems of distance education socialization service system for deep exploration.

Key words: Distance education; Service system; Setting

With the development of science and technology, the global information level has also been gradually improving. In the popularity of the network age, distance education has begun to enter the eyeball of the broad masses, and enjoyed a rousing reception. Distance education is a new education mode, which has changed the traditional face-to-face education mode to a separated teaching mode. It mainly depends on the computer network, digital media as the media. The most essential difference between distance education and traditional education lies in: the position between teachers and students or students and students. For the former, they are in relatively separated state, while for the latter, they are in the face-to-face state.

1 A Survey of the Social Service System of Modern Distance Education

1.1 research status of the social service system of modern distance education at present

The early development of network teaching is to achieve the purpose of remote teaching. At the end of twentieth Century, the support campus network teaching management system began to come out. Along with the coming of twenty-first Century, distance education becomes more and more popular, at the same time, the foreign species of distance education management system is becoming brisker day by day. For example, E—Learning、 Web CT、 Black Board Learning System are very popular in the world.

In recent years, the development of teaching management system of network has also been one of the most important topic for the domestic scholars who are engaged in technology and educational research. At present, the domestic development has entered the practical stage, and there are some mature network teaching platform, such as Anbo network teaching platform, the sky network teaching system, Qinghua network school and Peking University Network Teaching platform.

At the same time, the Ministry of education also began to pay attention to the pilot work of distance education, and there are 68 colleges that are qualified to accept the pilot. the pilot work is very smoothly, but inevitably many problems are exposed. The social service system of distance education is the inevitable result of the development and promotion of modern distance education, a bridge which transmit high quality education resources, an important means to optimize the teaching management, student services. At moment, there are three modern social service system which has been approved by the Ministry of education, they are the openg remote education center, Hiroshige education, Zhijin Education.

1.2 The basic concepts and characteristics of the social service system of distance education

The social service system of distance education is a system whose purpose is to better meet the needs for learners, means is the modern educational technology. The establishment of this system can better promote distance education, improve school teaching support service level for distance education pilot colleges, provide a good platform for the students to study efficiently. Distance education

socialization service system has the following basic characteristics: (1)independence; (2)the professional organization; (3)functional dependency;(4) the high efficiency of operation.

1.3 The formation of the modern distance education socialization service system

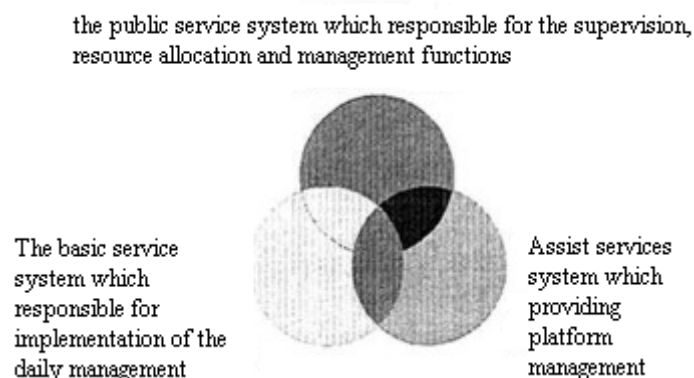

Figure 1 Social Service System of Distance Education.

The three parts are mutually independent, but promote and complement each other. To promote social service system of modern distance education is gradually perfect, the three systems are indispensable.

1.4 the necessity of the creation of the modern distance education socialization service system

In the driving of the development and progress of distance education, social service system is very necessary. Practice has proved that: the development of the social service system of distance education is not only the call of distance education industry, but also the request of adapt the change of the external environment of the distance education system.

1.4.1 The development of the social service system of distance education is the call of distance education industry

(1) improving the rate of cyber source can be achieved by optimization the resource allocation of distance education. In the socialist market economic system, in order to reduce the wastage of resources, improve economic efficiency, we must rationally allocate and optimize the existing resources of distance education. While the social service system can appropriately provides a good platform for the operation of the market to configure and optimize resources. Therefore, continuous development and growth of the social service system of distance education, can provide more possibilities for realizing the sharing of resources.

(2) the diversification of education can be achieved through the development of the market space of distance education socialization service system. The development of the social service system is like the development of a airlines, airlines are not intended for one or two aircraft service, but for all aircraft services in the port. Similarly, the social service system of distance education development is not intended for one or several universities service, but for all school that join the network service. But it is worthy to notice that courses each academy offers for students are not the same, In general, each academy is completely independent, and possesses its owns characteristics. Therefore, the responsibility of the social service system is that recruiting more distance education institution to add to this system, and provide all kinds of services for all institutions and students in the system. Only constantly expanding the market space of the social service system, can add more content for distance education, promote the diversification of remote education, achieve maximum economic and social benefits for remote education.

1.4.2 The development of the social service system of distance education is the request of adapt the change of the external environment of the distance education system.

(1) Fitting in policy environment. In order to promote the network education management more standardized, more healthy, and orderly; the government often make many major policies. However, the existing operational mechanism has been unable to sustain the quality of the service and management for network in 67 College Campus Learning Center, it is because these schools which include universities, adult colleges and TV University and other units, are very complex, that will leads to the lack of a unified system of social services. Therefore, in order to effectively control the quality of

modern distance education, to achieve the national demand level, establishing a unified social service system of distance education is necessary.

(2) Adapting to the market environment. Firstly, compared with other types of education, distance education in China requires to improve the quantity of the students. In general, the overall quantity of the students basically keeps in a steady state. As the most important part in higher education, colleges and universities will occupy a high proportion of students market; at the same time, the occupation education that the state encourages will also split a part of students market share. Secondly, after China's entry into the WTO, online education market in China also began to expand, because of the impact of foreign distance education industry, which no doubt will provide opportunities for domestic distance education industry, and also bring serious challenges. In the dual pressure of traditional campus education in China and the relatively developed foreign education, only distance education in China expands the scale of teaching, occupies a greater market share, can it get a space in the market which is full of fierce competition. In all, the development of distance education and social service system in China, is the important guarantee for improving the situation that viciously competes in the Chinese internal remote education system, the effective way that promotes the maximization of resource sharing and sets up China's own brand for distance education.

2 Analysis of the Settings of the Mechanism of Distance Education in the Social Service System

At present, the 68 colleges of the mechanism has 4 kinds of setting mode (as shown in Figure 2): (1) Network Education, Adult Education, training are all separated, the proportion is 7%; (2) Network Education, Adult Education, training are all centralized, the proportion is 56%; (3) Network Education is separated, Adult Education, and training are centralized, the proportion is 32%; (4) Network Education, Adult Education are centralized, training apart is separated, accounts for 5% of the proportion of the total. From the current situation and essence of network education, we can summed up the four set for two kinds of settings and operation situation, the way (1) and (3) attributed to separate settings and operation situation, way (2) and (4) attributed to continuing education institutions education integration settings and operation situation.

Figure 2 Four Sets and Proportion of 68 Pilot Colleges and Universities

2.1 Continuing education institutions education integration settings and operation situation.

From the concept of continuing education, centralized management mechanism which is the important part of mode (2), has many functions, such as management, running and so on. in addition to a few pilot institutions which establish ministry of education, continuing education or education development center as a management mechanism, the vast majority of the pilot colleges and universities establish the new school of continuing education or distance school of continuing education as a centralized management mechanism. Integration mode: gradually remove the original structure or dilute the brand. This kind of integration is relatively complete, but for different teaching institutions, in the way of integration is slightly different.

(1)while independently developed adult education, network education and training by sponsoring entity, the the functions department must be responsible for the continuing education of the school. the mode is mostly utilized by the famous university whose continuing education and advanced training development are very mature, such as Peking University. The settings of continuing education department of Peking University is shown in figure 3.

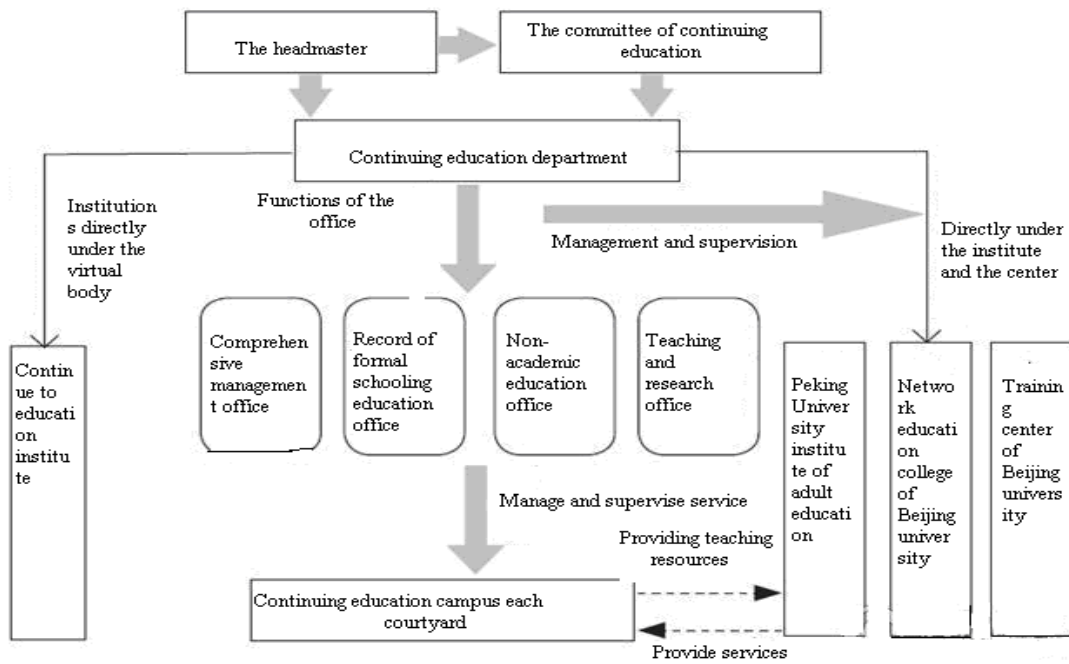

Figure 3 The Sets of Continuing Education Department of Peking University

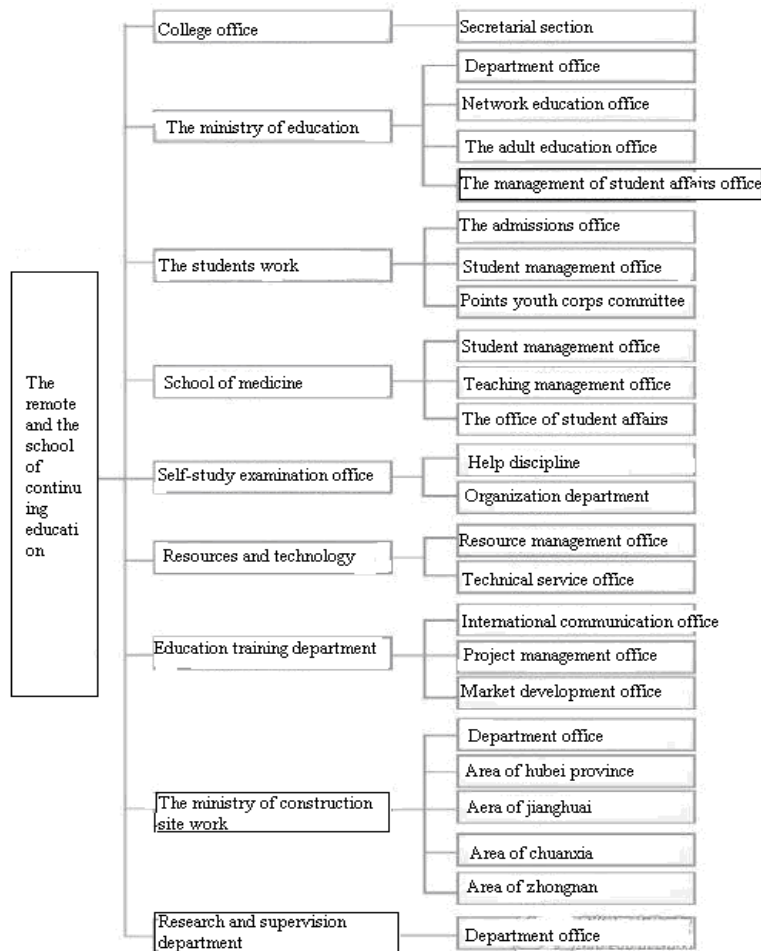

Figure 4 The Settings of Distance Continuing Education College of the Science and Technology University of Huazhong

(2)The settled department is fully opened, and set up according to the function, not according to the teaching form. Necessary department are these: the admissions department, the administration department, the resources and technology department, the student affairs department, the financial department and the office etc.. This mode is mainly used by college which is not only the management organization, but also sponsoring entity, and possesses multiple functions,such as the Science and Technology University of Huazhon. the settings of distance continuing education college of the Science and Technology University of Huazhon is shown in figure 4.

(3) in order to increase the competitiveness of the internal mechanism, to reduce the resistance when the merger the institutions, some college of education set up some operation department which is irrelevant and public support services department according to their own school form, such as the settings of continue education and teacher training department of Beijing Normal University(as shown in figure 5).

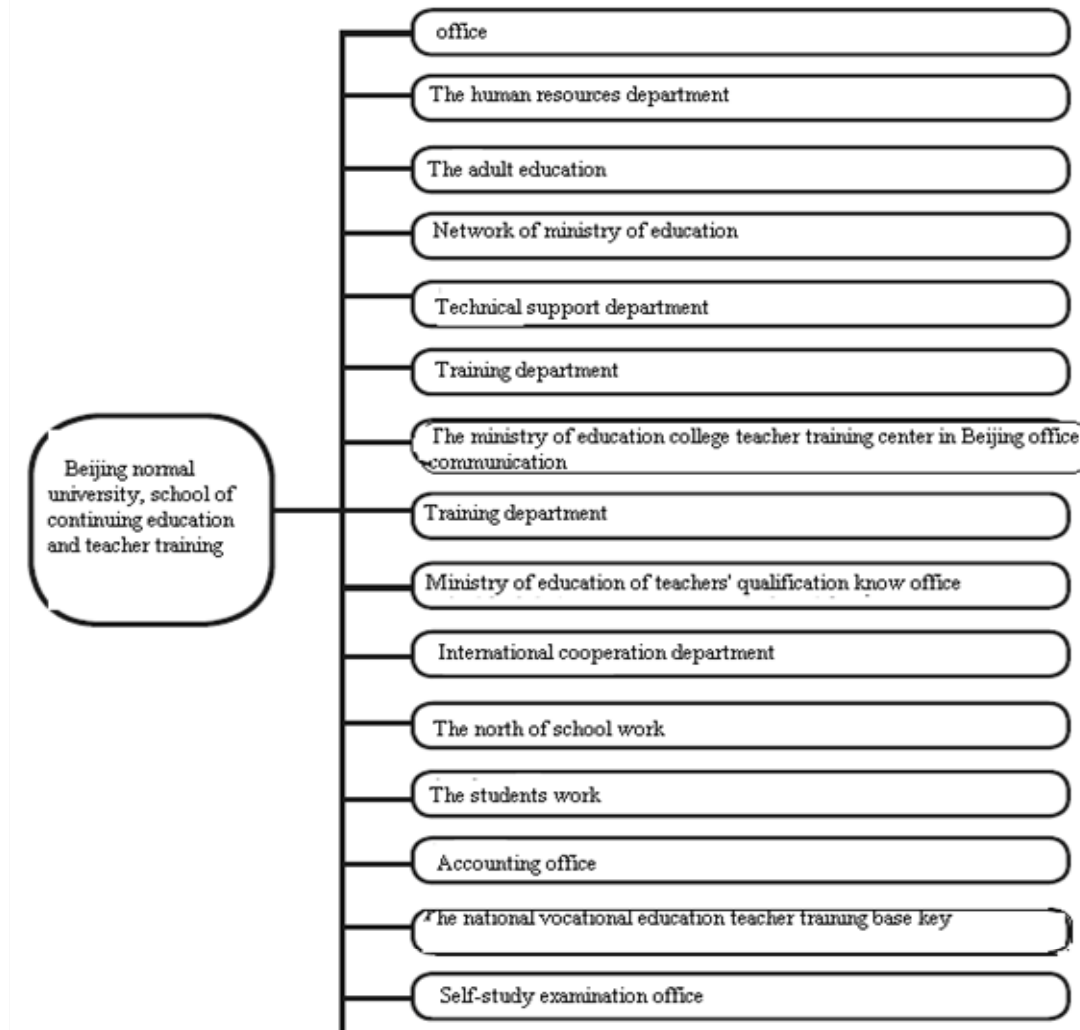

Figure 5 The Settings of Continue Education and Teacher Training Department of Beijing Normal University

2.2 Separate settings and operation situation

The set is mainly used in the network teaching, some college education and continuing education resource integration has not yet been implemented. This kind of academy is one of the best economic benefit departs, it is the main income-generating sector of the school and it owns good prospects for the development . The network institute possesses much power, such as the power of design and management of the teaching plan, organization, the power of independent management for all people, money in the academy, etc. Therefore, the network education institutions need set up more departments. For example, it sets up 10 distance education department in Zhengzhou University(as shown in Figure 6) .

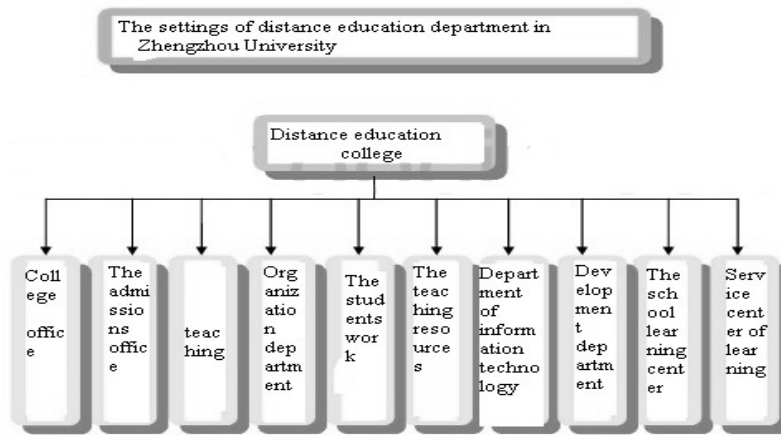

Figure 6 The Settings of Distance Education Department in Zhengzhou University

Generally speaking, some pilot college network education should make more efforts for the integration and centralized. The reason for this situation may have the following three: (1)the disorder that caused by the mode and operation mechanism; (2) there exists great differences in the aspect of resource integration and centralized because of the financial and personnel interests; (3) the original design institute may bring different degree of difficulty for the integration and centralized management. But whether from promote the sharing of resources or from the view of management, integration and management is an important content of constructing social service system of distance education.

3 Analysis the Management of the Social Service System Of Distance Education

Management of the social service system of distance education mainly adopts the management mode of vertical platform. Platform management mode’s goal is to provide and monitor the teaching and management support services; the core is to guarantee the quality of teaching; the guiding theory are modern education and management theory; forms are three virtual platform, organizations is the radio and television university organization system; behavior object is individual and collective behavior that is closely linked with the interests of distance education; the collaborative system is three plats- six programs - seven links. In general, the basic framework of modern distance education socialization service system management mode mainly includes the following three basic platform.

3.1The organization management platform

In this platform, the Central Radio and TV University forms complementary relationship with the open education service system, the provincial administration center as the central service system commissioned units, is mainly responsible for the management, supervision and inspection of the distance education project operation as well as the specific business behavior of the provincial learning center. Therefore, as for organization management platform area, the provincial administration center is very important, it is essential for the national distance education socialization service system, its exist is in relation to the construction of remote education socialization service system with Chinese characteristics. The framework of organization management platform is shown in figure 7:

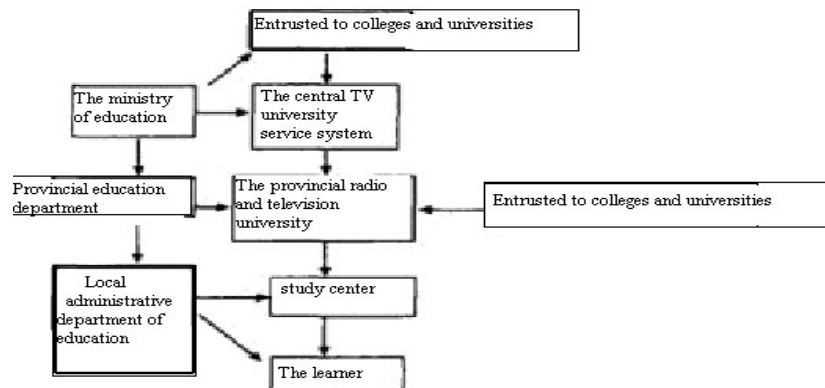

Figure 7 The Framework Diagram of Organization Management Platform

3.2 Resource integration platform

Resource integration mainly includes two aspects: curriculum resources and network resources integration. In this platform, distance education learning center is the learning center of the whole province socialization service, not just a pilot colleges and universities learning center; provincial RTVU can maximize their proper function, stimulate and promote the development of the whole service system. the framework diagram of the resource integration platform is shown in figure 8.

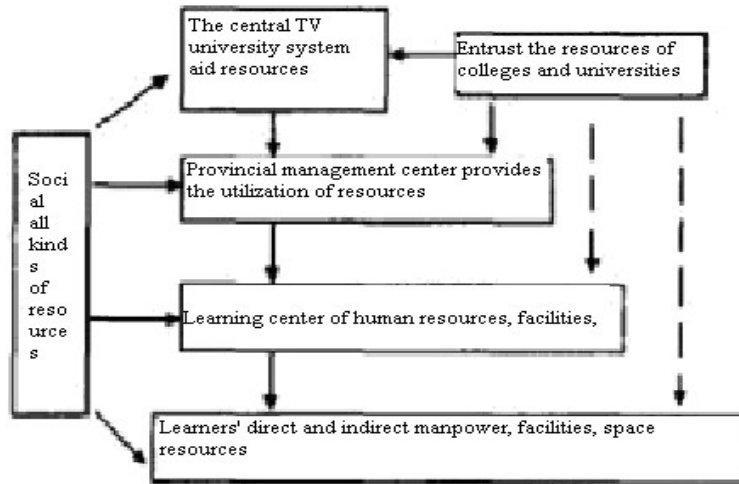

Figure 8 The Framework Diagram of the Resource Integration Platform

3.3 Quality testing platform

This platform mainly is to evaluate the operation quality of the social service system of distance education. As for evaluating the operation quality of distance education socialization service system, from the essence, it is to evaluate the value of distance education. From the principle of educational evaluation, educational evaluation types mainly include the following: student evaluation, curriculum evaluation, school evaluation, group evaluation, project evaluation, personnel evaluation. Therefore, to reach the standard requirements, evaluation of distance education value should also be carried with from the following three aspects: the learner, the service system and the teaching resources..The framework diagram of the quality testing platform is as shown in figure 9.

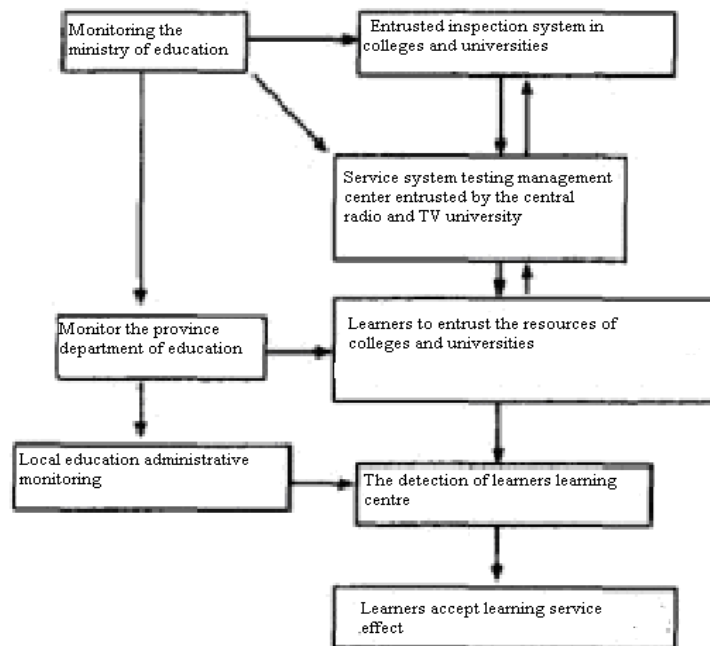

Figure 9 The Framework Diagram of the Quality Testing Platform

4 Several Problems of Deep Discussion for the Social Service System of Distance Education

4.1 The theoretical system of remote education socialization service system has not been established

Research on distance education socialization service system mainly includes the theory and reality. These two aspects are mutually independent, but are inseparable. Specifically, it is the bridge between China's distance education theory and operation level of distance education to construct the social service system. Lacking of reasonable construction methods will seriously affect the construction of distance education socialization service system. Practice has proved: the study on the social service system of distance education in our country has gone deep into the level of practical research, but the depth level needs to be improved.

4.2 The content that study on the social service system of distance education needs to be enriched and improved

It needs develop from the theory and application aspects to study the social service system of distance education. On the theoretical side, we should deeply study the relation between the development of RTVU System, or open education and social service system of distance education. On the application level, we should put the influence of the socialist market economic system on social management system of remote education into the category of the study, based on in-depth analysis of the influence, proposing the appropriate policy of playing a positive role, and eliminating or reducing the negative impact.

4.3 The lack of further discussion of related research of distance education socialization service system lack

In fact, the social service system of distance education involves many deep-seated contradictions and relations. Therefore, the majority of scholars should overcome the past all sorts of thinking, understand the significance of this system in essence within the opened vision, and put into action, contributing our own force for the comprehensive construction of social service system of distance education. For example, if the distance education market can't work normally, the problem we should further discuss are those: how to manage and monitor the socialized service system, how to achieve the service and guarantee the quality of service by relying on the chain management means, or how to improve the quality and efficiency of service through the rational allocation of resources.

4.4 Distance education socialization service comparisons need to be carried out

At present, research on distance education socialization service in China only stay in the domestic education sector. To learn advanced service concept and successful management experience from other countries or industry, and promote the sustained and healthy development of distance education in our country, it is necessary that make a comparison for our existing distance education socialization service system and foreign distance social education system or other industry service system. In fact, only in this way, can we not isolated study, find the gap, so as to put forward reasonable strategies to optimize service system.

5 Conclusion

Distance education is a new education mode, the "new" is mainly reflected in that they are relatively isolated between teachers and students, or students and students. With the driving of the progress and promote of distance education, it is very necessary to develop social service system of distance education. The construction of Chinese social service system of modern distance education is still in the experimental stage, and still exists a lot of problems. But it is inevitable. Within the in-depth development of the pilot, the distance education socialization service system will become more and more perfect and will constantly develop distance education in the direction of health

Study on Performance Evaluation of University Teachers Based on P-O Fit

Zeng Zhu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 9562600@qq.com)

Abstract: University teachers' level and motivation not only determines the quality of the training level in certain degree, but also has important implications on the development of university itself. Beginning with the analysis of performance evaluation theory, the paper studies the status and problems of university teachers' performance evaluation. Then it puts forward some suggestions to improve the performance evaluation system of university teachers. There will be a certain practical significance for the development of universities and personnel training.

Key words: Performance evaluation; University teachers; P-O fit

1 Introduction

Since reform and opening, China's market economic system has improved steadily, the influence of universities is also increasing in the whole society. But if the universities want to maintain their vitality and to achieve sustainable development, their managers should focus on improving the university management level and the overall efficiency, mobilize the creativity and enthusiasm of the staffs, and optimizing the management team and university teachers. Teachers are the subjects of higher education, and their level and motivation not only determines the quality of the training level in certain degree, but also has important implications on the development of university itself. Then it come to be more and more important to evaluate the university teachers performance.

2 Performance Evaluation for University Teachers

2.1 Performance Evaluation

Both domestic and foreign scholars have given their different definitions to performance evaluation. Ya Fu pointed out in his book "Performance Management" that performance evaluation is one of the core contents in modern human resource management system, it reflects the daily work of employees objectively and fairly through a series of evaluation indicators, aims to set a link between employees' daily work performance and their gains, and thus to mobilize the employees' maximize potential and to achieve a two-way development of both individuals and organizations. Performance evaluation can fully reflect the actual situation of a staff, and it's an important basis for their promotion and demotion, salary bonuses and benefits, training programs, career planning and recruitment planning, so it is essential to establish an effective performance evaluation index both for the organization and the staffs^[1].

Junqing Wu's view in his book "Performance Evaluation Theory and Methods: In the practice of scientific research institutions" is "performance evaluation refers to the process of identification, observation, measurement and development of human performance in organizations and it is an important management tool, it is connected with the four main functions of management, planning, organizing, directing and controlling, it's an important basis for the reward, promotion, training and dismissal in an organization, and especially the criterion in validity research of personnel selection^[2]."

Scholar Shuming Zhao pointed out in "Performance Management and Evaluation" that "Performance Evaluation refers to the process of measuring the behavior and results of the staff or the team, it is a process of using the past made performance evaluation system to compare and evaluate the employees' working performance within the evaluation cycle, and ultimately feed their performance evaluation results back to them^[3]."

Therefore, performance evaluation is an important part of enterprise management, and its effective implementation is good for the management and development of corporate human resource. In the context of university reforming era, the performance evaluation of teachers had to shift from a single assessment of the teaching quality to the direction of encouraging teaching and educating. Such shift can play a great guiding role in improving the quality of teaching and the level of scientific research, and also it is able to enhance the scientific research level of China's universities foundationally.

2.2 Performance Evaluation for University Teachers

University is a special organization which is different from enterprises, its nonprofit nature

determines its particularity in the introduction of performance management. In recent years, performance management has gotten into governments and other non-profit organizations such as school. The implementation of performance management in universities can improve the management level and the overall efficiency, mobilize the creativity and enthusiasm of staffs and optimizing the management team and university teachers, and have a great significance for the achievement of the universities' overall objective. The traditional management system for teachers can no longer meet the requirements of faculty development, how to digest and absorb the performance management for enterprise and use it in university is the chief thing that the administrators need to consider and resolve.

In his thesis "Research on Performance of College Teachers' Evaluation Index System", scholar Hefeng Pang noted that "Performance evaluation, is a one of the core concepts in management system of modern human resource, it's an important basis for the staffs' promotion and demotion, salary bonus and benefits, training programs, career planning and recruitment planning, otherwise it can link the employees' work and their income rationally and effectively. Meanwhile, in the process of performance evaluation, the evaluation indicators and evaluation criteria can also guide and control the work of the staffs. Performance evaluation is a realistic and face to face evaluation, although the process of revision and implementation is difficult, the implementation is a real need for organization and its employees^[4]."

Just as there are no two exact same leaves in the world, even performance evaluation has been widely used in enterprises, but when it's applying on universities, it has its own peculiarities because the difference in several basic elements of the evaluation, such as the evaluation subject, object, methods, and standards. Therefore, the introduction of performance evaluation should take teachers as a breakthrough.

Theodore H. Curry put forward three assumptions for performance evaluation of universities, including the teacher's independence and self-dominant, the teachers' expectations in the evaluation and the fairness in the evaluation process. Based on the above assumptions, Theodore H. Curry noted that the performance evaluation for university teachers can be divided into six parts. First, clear objectives, vision and values of the university; Second, fair workload and establishment of performance expectations and standards; third, teachers' professional growth plan based on the annual review; fourth, annual activity reports of teachers' self-summary and self-evaluation; fifth, the establishment of peer review committee which evaluate teacher performance; sixth, the written reports of the feedback process and the evaluation.

Teachers' performance evaluation is an important step in personnel management for universities, and also a key step for the modern management of colleges. when assessing the teachers' performance, we should not only evaluate the merits of their current status of work, but also be able to analysis, decide and solve the existed problems in reality, thus to achieve a virtuous cycle of personnel management.

2.3 Status and Problems of University Teachers' Evaluation

The status quo of teachers' performance evaluation in university is that their evaluation methods are too simple, and are basically the "index-quantify" mode and can be generally divided into three levels, including assessment advice for the university, for the college and for the department. This evaluation method is feasible and emphasizes on data quantification^[5]. Nevertheless, our performance evaluation for university teachers still has many problems, and there is a certain gap between the expected results and its implementation. First, due to the pursuit of a comprehensive index, the performance evaluation cannot make the focal points stand out, and it's over fined; Second, excessive pursuit of result data quantification does not exactly match the actual working conditions of teachers; Third, the performance evaluation system is single and cannot accurately reflect the professional characteristics of different specialized teachers^[6]. It's obvious that this method cannot well reflect the true performance output of university teachers.

2.3.1 Evaluation Objective problem

The performance evaluation for university teachers should not only aim at evaluating the working conditions of teachers, but also concerning the process of their work combined with the university's culture and its overall objectives. China's current performance evaluation system for teachers in universities focus too much on the results, while ignoring the process of monitoring, which can easily lead to university teachers mentally value quality over quantity, and this attitude is negative to the academic atmosphere as well as the country's education. On the other hand, teachers are often being seen as isolated individuals in the performance evaluation, therefore ignored the overall efficiency of the school as a whole.

2.3.2 Evaluation Indicators problem

The indicators of performance evaluation system for teachers are generally divided into qualitative

and quantitative, the majority of universities often perform the evaluation with a large number of quantitative indicators. In the actual work of university teachers, there are a considerable number of indexes that cannot be accurately measured by numeric. This has resulted in the over pursuit of quantitative data and cannot match with the teachers' actual work situation in current performance evaluation system for teachers. Although quantitative data can reflect the results of the evaluation clearly and directly, the authenticity behind the data remains to be considered.

2.3.3 Evaluation Period setting problem

China's current performance evaluation cycle is typically one year. This one-year evaluation period can improve the motivation of university teachers in some extent, and it plays a positive role in promoting the teachers to complete their teaching task. However, a considerable number of academic researches often take several years to truly complete, so the research has a deferred nature. The one-year evaluation period can easily lead to university teachers seek for quick success and instant benefits in academic and pursue short-term returns rather than long-term investment.

3 The Concept of P-O Fit

P-O Fit is short for Person-Organization Fit. Generalized Person-Organization Fit refers to "the consistent degree between the individual's traits, beliefs, values and the organization culture, policy requirements, norms and values" (Brdtz, Ash&Dreher, 1989). This concept comes from psychology, and gained long-term attention by scholars. At present, the international researches on P-O Fit generally use P-O Fit as the independent variable, while use the organizational commitment, organizational citizenship behavior, employee performance, job selection decisions, turnover intention, job satisfaction and organizational identification as the dependent variables, and to study its variation trends.

In 1991, Vancouver & Schmitt pointed out, after visiting principals and classrooms in more than 300 secondary schools, that if a common goal is formed between the superiors and subordinates as well as among the members, then it will play an active role in job satisfaction and organizational commitment, also in improving employees' performance level.

Bretz (1993) and Judge (1996) consider P-O Fit as an indicator to measure career success. Through research they found that P-O Fit affects the employee's career advancement and salary in certain extent. It can be seen that P-O Fit is closely related to the employees' performance.

2002, Kristorfetal pointed out in his study that in addition to Person-Organization Fit, person-job fit and person-team fit could also affect job satisfaction independently and significantly. At the same time, employees will assign different weights to the three fits based on their working experience, and the three fits in turn affects the employees' working attitude.

In 2005, SongqingZhu and WeizhengChen raised four types of fits between employees' value and organizational value, and these types take the value realization degree of the organization and the value of employees as two dimensions. Through research they found that the employees' satisfaction is upmost when the two dimensions are at a high level, meanwhile the employees' performance output increased in response, and the overall objective of the organization will be more easily achieved.

A combination of the above findings and the reality in schools prove that teachers-college fit affects performance output of university teachers. Therefore, in addition to evaluation of rewards and punishments, the teachers' development target should also be reflected in the performance evaluation in the process of introducing performance management in the universities, we also need to fit the target between the individuals and the university, therefore to improve the performance management evaluation system and balance the status quo of excessive pursue for data quantification in the existing evaluation system.

4 Views on Performance Evaluation of University Teachers Based on P-O Fit

4.1 Evaluation should reflect the unity of overall development objectives both for teachers and the school

Performance evaluation for university teachers should reflect the unity in overall development objectives both for teachers and the school, and combine the needs of individual teachers and the university, and to achieve the P-O fit. Such performance evaluation system can stimulate the enthusiasm of individual teachers and achieve the overall development of the school. Teachers participate in the performance evaluation, allowing them to better understand the school's development goals, and accordingly achieve the integration of goals between individual teachers and the school, and thus achieve the mutual improvement between teachers and universities.

4.2 Evaluation should reflect the dominant position of teachers

Teachers are the evaluated objects in traditional evaluation system, and it is difficult to bring out the teachers' initiative. The teachers' dominant position should be emphasized in the performance management and they should be given more power, the active participation of teachers would be helpful to the achievement of self-management and self-motivation, and make the management performance evaluation system to play its greatest role.

4.3 Evaluation should reflect the fusion of reward and punishment evaluation and development evaluation

Reward and punishment evaluation and development evaluation are not entirely opposed. British experience showed that the two evaluations have their own advantages and disadvantages, they should learn from each other, integrate mutually, and find their meeting point. When making a management performance evaluation system, it is necessary to set development as the chief goal and set punishment and reward as a method, it is one-sided to focus only on one of them.

4.4 Pay attention to the use of the evaluation results in the evaluation process

Current evaluations for university teacher are mostly reward and punishment evaluation mode. This evaluation results should be improved in two aspects. The first one is oriented by the "teacher development", that is to highlight the teacher's development in a motivation way and lessen incentives in the current evaluation system, the second is to consolidate the university spirit of "free academic, professors rule", reshaping the atmosphere of academic and respect for teachers.

Thus it can be seen that a rational and scientific performance evaluation system for university teachers can objectively and accurately evaluate the performance of university teachers, which have an outstanding academic significance and show off significance to modern management of universities both in the theory side and practical side. A rational and scientific performance evaluation system for university teachers can optimize the allocation of the university's human resource, and can improve the school's overall efficiency and achieve its overall goals from the overall situation by encouraging university teachers.

5 Conclusions

As an important part of performance evaluation management for university, the evaluation of teachers should meet the goal of promoting the development of universities by encouraging university teachers' enthusiasm and creativity. University administrators should make a good use of performance evaluation to achieve the overall management of the teachers' work. Current performance evaluation systems in our universities have an excessive pursue for quantitative data, and ignored the teacher's personal development and the school's overall development. Based on which, this paper start the discussion from the perspective of P-O fit, pointed out some management issues that should pay attention to in performance management of university teachers. Use performance evaluation to find the shortage in teachers' work, and make improvement plans that suited to each professional teachers according to their different characteristics, thus to meet the teachers' individual needs and achieve the overall development of the school. The combination of reward and punishment evaluation would, to a certain extent, eliminate the situation of which the teachers are passive and inactive in the evaluation process, university teachers in the evaluation process passive situation, and can mobilize the creativity and enthusiasm of teachers to achieve the overall objectives of the university.

An Empirical Analysis on Impacts of College Students' Internship on Their Innovating and Business-Starting Incentive

Zhu Xiaodong

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 646831967@qq.com)

Abstract: Based on sample data of questionnaires in universities of Jiangxi Province, the paper applies descriptive statistics to analyze 13 factors of 4 types of college students' internship on their innovating and business-starting incentive, and then tests it with quantitative model. The results shows that students' personality type, characters of internship posts, training practical ability, earning living expense and other internship motivations are major factors affecting college students' innovating and business-start incentive. Finally, the paper puts forward practical policies and suggestions to push forward campus innovation and business start.

Key Words: Internship; Innovation and Business-start; Empirical Analysis; Probit Model

1 Introduction

Universities' internship is students' practicing base of innovation and business start. It is catalyzer, training field or simulation laboratory of students' independent business-start and thus is of significance for universities' business-start education and students' independent business-start. Therefore, research on impacts of students' internship on their innovating and business starting is of both theoretical and practical significance. This paper is intended to study students' innovating and business starting incentive by descriptive statistics and quantitative model, hoping to provide a theoretical base for the country to make efficient and effective policies.

2 Data and Descriptive Statistics

2.1 Fundamental Conditions of Samples

From Feb. 2012 to May 2012, 11 universities in Jiangxi Province including Nanchang University and Jiangxi Agricultural University are selected to undertake questionnaire investigation of random sampling. The questionnaire is designed to investigate 4 respects such as internship characters, college students' innovation and business start character, personalities and students' knowing of the country's and university's policies about students' internship. Until the middle of May, 2012, through investigator's face to face interview with students, 328 effective questionnaires were finished and used for research.

2.2 Selection of Factors

According to Luo Xiaofang, Cui Ningning and others' related research achievements and qualitative experience, the paper selects 13 factors of 4 types to study students' innovating and business starting incentive. They are (1) Internal factor: personalities including gender, party membership and personality type; (2) External factor: internship nature including internship place and internship character; (3) Internal factor: internship motivation character including training practising ability, earning living expense, spending spare time, mass following, increasing social experiences and laying a base for future business, and (4) Internal factor: knowing the country's and university's policies about students' internship.

2.3 Analysis of Discriptive Statistics

Table 1 lists results of analysis of discriptive statistics.

Table 1 Iscriptive Statistics of Factors of Internship Affecting Students' Innovation and Bsiness-Start (%)

Factors		Students' Innovating and Business-starting Incentive (n=157)				
		Very unwilling (n=6)	Unwilling (n=8)	Average (n=31)	Willing (n=83)	Very willing (n=29)
Gender	Female	33.3	50.0	51.6	38.6	34.5

3 Construction of Model

3.1 Definition of Variables

On the basis of analysis of descriptive statistics, to prove factors' impacts, a quantitative model is necessary to be constructed. Before model construction, the research subject – college students' innovating and business starting incentive and its 13 factors must be defined as follows in Table 2.

Table 2 Definition and Prediction of Related Variables

Variables	Symbol	Definition of Variables	Prediction
Innovating and Business-starting	Y	Very unwilling=0; Unwilling=1; Average=2; Willing=3; Very Willing=4	
Gender	X ₁	Female=0;Male=1	+
Communist Party Membership	X ₂	No=0;Yes=1	-
Personality Type	X ₃	Conservative=0;Neutral=1;Adventurous=2	+
Internship Place	X ₄	On Campus=0;Out of Campus=1	+
Internship Character	X ₅	Temporary Post=0; Fixed post=1	+
Training Practical Ability	X ₆	Very Disagreeing=0; Disagreeing=1; Average=2; Agreeing=3; Very Agreeing=4	+
Earning Living Expense	X ₇	Very Disagreeing=0; Disagreeing=1; Average=2; Agreeing=3; Very Agreeing=4	-
Spending Spare Time	X ₈	Very Disagreeing=0; Disagreeing=1; Average=2; Agreeing=3; Very Agreeing=4	-
mass-following	X ₉	Very Disagreeing=0; Disagreeing=1; Average=2; Agreeing=3; Very Agreeing=4	-
Increasing Social Experiences	X ₁₀	Very Disagreeing=0; Disagreeing=1; Average=2; Agreeing=3; Very Agreeing=4	+
Laying a Foundation for Future Business	X ₁₁	Very Disagreeing=0; Disagreeing=1; Average=2; Agreeing=3; Very Agreeing=4	+
Knowing National Policy of innovation and Business-start	X ₁₂	Very Unknowing=0; Unknowing=1;Average=2; Knowing=3; Very Knowing=4	+
Knowing Univerasity's Policy of innovation and Business-start	X ₁₃	Very Unknowing=0; Unknowing=1;Average=2; Knowing=3; Very Knowing=4	+

3.2 Construction of Model

The explained variable is Students' Innovating and Business-starting Incentive. According to related definition, a rank-based model may be adopted for research. First, a linear model of potential variable y_i^* with explaining variable X_i as follows:

$$y_i^* = \mathbf{x}_i \boldsymbol{\beta} + \mu_i$$

Where potential variable y_i^* is considered as “benefit” of college students' innovation and business start; explaining variable X_i are factors affecting students' innovating and business starting incentive; $\boldsymbol{\beta}$ is the predicted coefficient of factor model. If knowing the observed value of students' innovating and business starting incentive y_i (i=0, 1, 2, 3, 4), then the observed value y_i is defined according to potential variable y_i^* by the following rule:

$$y_i = \begin{cases} 0, & \text{if } y_i^* \leq \gamma_1 \\ 1, & \text{if } \gamma_1 < y_i^* \leq \gamma_2 \\ \vdots & \vdots \\ 4, & \text{if } y_i^* > \gamma_4 \end{cases}$$

To make observed variable y_i match up with potential variable y_i^* , suppose if $y_i^* < y_j^*$, then $y_i < y_j$. Suppose cumulative distribution function F of u_i is logistic distribution, then the probability of observed value y_i is decided as follows:

$$\Pr (y_i = 0 | \mathbf{x}_i, \boldsymbol{\beta}, \gamma) = F(\gamma_1 - \mathbf{x}_i \boldsymbol{\beta}) = \frac{1}{1 + e^{\mathbf{x}_i \boldsymbol{\beta} - \gamma_1}}$$

$$\Pr (y_i = 1 | \mathbf{x}_i, \boldsymbol{\beta}, \gamma) = F(\gamma_2 - \mathbf{x}_i \boldsymbol{\beta}) - F(\gamma_1 - \mathbf{x}_i \boldsymbol{\beta}) = \frac{1}{1 + e^{\mathbf{x}_i \boldsymbol{\beta} - \gamma_2}} - \frac{1}{1 + e^{\mathbf{x}_i \boldsymbol{\beta} - \gamma_1}} \quad \dots \dots$$

$$\Pr (y_i = 4 | \mathbf{x}_i, \boldsymbol{\beta}, \gamma) = 1 - F(\gamma_4 - \mathbf{x}_i \boldsymbol{\beta}) = 1 - \frac{1}{1 + e^{\mathbf{x}_i \boldsymbol{\beta} - \gamma_4}}$$

4 Results of Model

According to Stata 11.0, results of Empirical Model are as listed in Table 3.

Note:***, ** and * respectively show that z is notable at level of 1, 5 and 10.

Table 3 Results of Empirical Model

Variables	Symbol	Coef.	Std. Err.	z	P>z
Innovating and Business-starting	X ₁	0.125	0.354	0.35	0.725
Gender	X ₂	-0.400	0.423	-0.94	0.345
Communist Party Membership	X ₃	1.161***	0.358	3.25	0.001
Personality Type	X ₄	0.080	0.332	0.24	0.809
Internship Place	X ₅	0.718**	0.349	2.06	0.040
Internship Character	X ₆	0.446**	0.185	2.41	0.016
Training Practical Ability	X ₇	-0.709***	0.203	-3.5	0.000
Earning Living Expense	X ₈	-0.408**	0.190	-2.14	0.032
Spending Spare Time	X ₉	-0.334*	0.178	-1.88	0.061
mass-following	X ₁₀	-0.074	0.251	-0.29	0.769
Increasing Social Experiences	X ₁₁	0.674***	0.213	3.16	0.002
Laying a Foundation for Future Business	X ₁₂	0.517**	0.240	2.15	0.031
Knowing National Policy of innovation and Business-start	X ₁₃	-0.231	0.211	-1.1	0.273
LR chi2(13) =82.4	/cut ₁	-2.688	1.063	—	—
Prob > chi2=0.0000	/cut ₂	-1.468	0.998	—	—
Log likelihood =-154.373	/cut ₃	0.355	0.986	—	—
Pseudo R ² =0.2107	/cut ₄	3.816	1.044	—	—

From results of Table 3, the prediction of the model is good as as whole, while R2=0.2107 which issomewhat small but still reasonable for research on impacts of internship on students’ innovating and business starting incentive. As for notability of factors, of personalities, only personality type is notable; of internship character, only internship post character is notable; of internship motivation, training practising ability, earning living expense, spending spare time, mass following and laying a base for future business are all natable; of knowing the country’s and university’s related policies, knowing of the country’s policy is natable.

5 Conclusion

According to the above research, policy recommnedations are made as follows: (1) increase fixed posts of internship; (2) cultivate students’ initiative to participate in internship and lead them to innovate and start business; (3) upgrade work- study education to improve students’ quality; and (4) enhance propaganda of campus innovation and business start to heighten campus innovation and business start consciousness.

Research on the Relationship Between FDI and Labour Income in China

Qin Xiaojing, Yang Man

Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 10906455@qq.com, 525875206@qq.com)

Abstract: Based on the previous researches, this paper clarifies the influential mechanism of FDI on the income of labors. From the aspects of overall trend and regional differences trend, we conclude some information about the current status of China's income of labors. The proportion of the income of labors to GDP has gone through a process of declining after increasing during the period of 1993 to 2010. From three different perspectives, which are convergence, absolute difference and relative difference, we find that there exist significant differences of the share of the labors income in different areas. Establishing an econometric model based on the panel data of eastern area, central area, and west area from 1993 to 2010, we find that FDI has a significant role in promoting the share of labors income reduction.

Key words: FDI; Labour income; Reform and opening of China; Panel data regression

1 Introduction

Since the reforming and opening up, China's increasing openness, FDI level has been an objective of development, on the other hand, since the 1990s there has been a gradual decline in workers income phenomenon, in fact, a declining share of labour remuneration may cause a series of serious economic and social problems. The shares of labor income issues have been widespread concern in the current society.

Chinese government needs to, relying on the concerted efforts of all the Chinese people and based on economic and social development, step up efforts to develop institutions that are vital to ensuring social fairness and justice; establish in due course a system for guaranteeing fairness in society featuring, among other things, equal rights, equal opportunities and fair rules for all; and foster a fair social environment and ensure people's equal right to participation in governance and to development.

2 Literature Reviewing

After the 1980s, many scholars found that labour income share of some developed countries are decreasing (Blanchard, 1997; Harrison, 2002; Guscina, 2006). Bruno and Paul (2008) used 1980-2000 data of 94 developing countries; empirically finding that capital-output ratio of the labor share of income effect is positive but not significant. Bentolina and Saint-Paul (2003) found that, the capital-output ratio of the labor income share is significantly negative impact in OECD countries. And the elasticity of substitution is equal to 1.06. Rodrik (1997) was convinced that the accelerating trend of economic globalization and trade openness gives more capital than labor mobility, increased mobility of capital to gain more profit opportunities outside, the owners of capital corresponding bargaining power of workers improve workers wages is maintained at a low level, so that the labor income share continued to decline. Harisson (2002) estimated that between 1993 and 1996 in developing countries experienced at least 0.3% average decline in the labor share of income, while FDI flows from developed countries to developing countries on a scale of at least \$ 20 billion, and its ensuing two empirical analysis of economic phenomena is certainly a negative correlation exists between the theoretical expectations, and that globalization is hidden in the labor income share of FDI to developing countries, the negative effects of the deep-seated reasons behind. Decreuse and Maarek (2007) that the share of FDI on the impact of labor income has a "technical rented effect" and "wage competition effect" two aspects.

Domestic scholars' study shows that the impact of FDI on labor income is significantly negative. Luo Changyuan (2009), Li Lei (2012) found that FDI is not the main factor of the improvement of labour income share. And the increasing share of workers income is not conducive to attracting foreign investment. Bai Chong-En (2008) used 1998-2005 data of industrial enterprises above designated size to calculate the elements of China's industrial sector allocation. He thinks that factor income share of industrial sector mainly due to changes in the product market monopoly and state sector increased reform of the labour market caused by changes in the environment.

3 The Status of the Labour Income in China

3.1 The Analysis of the Labour Income Share of the Overall Trend

As can be seen from Table 1, from 1993 to 2010 period, China's share of income from workers compensation law domestic product (GDP) growth experienced decreased significantly after the first procedure. In 1993 the ratio was 0.506688, and 1998 overall upward trend may be due to non-wage income of wage reform makes wages gradually being included, while agricultural price increase. But since 1998, the remuneration of employees' income approach GDP ratio continued to decline began, to 2007 only 0.397397.

Table 1 The Labour Income and the GDP During 1993 to 2010 in China

year	Labour income	GDP	ratio
1993	17332.81	34208.07	0.506688
1994	23217.82	45395.69	0.511454
1995	30453.77	57632.78	0.528411
1996	36622.20	68584.30	0.533974
1997	40628.24	76956.61	0.527937
1998	43988.95	82780.25	0.531394
1999	45926.43	87671.13	0.523849
2000	49948.20	97209.37	0.513821
2001	54934.80	106766.26	0.514533
2002	60099.40	118020.69	0.509228
2003	67260.69	135539.14	0.496246

3.2 The Analysis of the Differences of the Labour Income in Different Areas

Table 2 shows the results of the σ convergence analysis, the absolute difference analysis, and analysis of the relative differences. As can be seen, before 2001, there did not exist σ convergence. While since 2001, there exists the σ convergence and the differences in workers income decreases. The absolute difference analysis showed that the absolute difference in remuneration of workers in the expanding; the relative difference analysis showed the relative differences in workers income first increases and then decreases to 2001 for the sector. To some extent, workers income is the difference between observed trends in the absolute gap increases, the relative gap decreases.

Table 2 The Differences of the Labour Income in Different Areas

year	σ index	Range	Standard deviation	Relative to the average deviation	Max/min	CV
1995	0.1196	1546.7564	778.6354	0.1042	1.3391	0.1474
1996	0.1265	1828.0385	914.8403	0.1042	1.3616	0.1527
1997	0.1397	2166.0897	1085.1182	0.1177	1.4080	0.1708
1998	0.1525	2699.1410	1361.8842	0.1342	1.4509	0.1884
1999	0.1606	3180.7179	1607.2007	0.1421	1.4797	0.1987
2000	0.1718	3794.5128	1904.6769	0.1468	1.5229	0.2103
2001	0.1733	4404.1538	2202.9597	0.1407	1.5262	0.2077
2002	0.1682	4846.0641	2430.5399	0.1391	1.5042	0.2001
2003	0.1642	5385.9615	2693.4056	0.1330	1.4934	0.1975
2004	0.1573	5915.1795	2957.7121	0.1275	1.4693	0.1902
2005	0.1438	6216.0897	3148.2682	0.1283	1.4189	0.1783
2006	0.1362	6621.4872	3352.9288	0.1215	1.3931	0.1689
2007	0.1219	7099.6282	3553.5962	0.1018	1.3480	0.1490
2008	0.1232	8542.2821	4282.3256	0.1046	1.3520	0.1510
2009	0.1132	8552.6538	4295.7088	0.0975	1.3188	0.1392
2010	0.1071	9195.0641	4668.1972	0.0961	1.2965	0.1328

4 Empirical Analysis

We establish the panel data model as follows to analyze the relationships between the FDI and the labour income empirically.

$$income_{it} = \alpha_{it} + \beta_{it} FDI_{it} + \gamma_{it} Z_{it} + \varepsilon_{it}$$

Z is the control variable, which contains the economic growth and the education level. And the Hausman test shows that we should use the fixed effect model to solve this model. And after calculating the value of F1 and F2, we are convinced that we should use the Varying Coefficient Model.

$$F_1 = \frac{(S_2 - S_1) / [(N-1)k]}{S_1 / (NT - N(k+1))} \sim F[(N-1)k, N(T-k-1)]$$

$$F_2 = \frac{(S_3 - S_1) / [(N-1)(k+1)]}{S_1 / (NT - N(k+1))} \sim F[(N-1)(k+1), N(T-k-1)]$$

Table 1 The Results of the Empirical Analysis

Variable	Coefficient	Std.Error	t-statistic	Prob
C	2.3868	0.3132	7.6210	0.0000
EAST-EDU	0.1272	0.0282	4.5077	0.0001
MID-EDU	0.1995	0.0286	6.9866	0.0000
WEST-EDU	0.1924	0.0502	3.8361	0.0005
EAST-ECO	1.1719	0.0919	12.7453	0.0000
MID-ECO	0.7444	0.1112	6.6586	0.0000
WEST-ECO	1.1431	0.1750	6.5323	0.0000
EAST-FDI	-0.5077	0.0996	-5.0974	0.0000
MID-FDI	0.0380	0.1056	0.3600	0.7209
WEST-FDI	-0.5040	0.1623	-3.1064	0.0037

The results show that, the coefficient of the MID-FDI-MID doesn't pass the t-test, while the other variables' coefficients are significant. As we focused on the impact of the FDI on labour income, we can draw a conclusion that in the eastern and western regions FDI has a significant negative role in the labour income and the effect values are -0.507722 and -0.504033, which means the FDI can accelerated the labour income gap in these areas.

5 Conclusions

We can draw some conclusions as follows based on the analysis above.

(a) The absolute gap of the income distribution in the three regions increased year by year. The relative gap trend the inverted U curve. And the σ convergence analysis shows that the income gap between regions 1995-2001 satisfied σ convergence. While during the 2001-2010, the income gap has σ convergence trend.

(b) FDI has a significant role in declining the share of the labour income. And also the difference of the economic growth and the education level in different areas expand the income gap.

Study on Honesty-Credit Evaluation System of College Students in China

Zhu Min

Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: hellomia224@sohu.com)

Abstract: The paper is based on the obvious performance of college students lacking credibility, such as cheating in the examinations, credit default and lack of honesty-credit in life and employment during the selection of the various acts, which already severely influence the public impression on college. So it has become imperative how we evaluate the situation of college students and keep timely feedback and correct discreditable behavior. Above all, the paper is about to build integrity evaluation and integrity files as well as the punishment for losses of the discipline as one of the college students' credit evaluation system to enhance the effectiveness of Honesty Education.

Key words: University student; Honesty-Credit; Evaluation system; Construction

1 Introduction

Honesty, the basic contents of the civic and moral education is the traditional virtue which is rooted in the history of human being. Honesty has an immeasurable impact on the development of the society, in the integrity of the social and economic value of the new economic era. However, the credit crunch is prevalent in many areas of social life in recent years, and also continues to affect and erode the soul of the college students, hindering the formation of good moral character of the college students. Therefore, how to evaluate students' credit timely feedback and put right the students' acts of dishonesty have become imperative.

Many overseas developed countries have attached great importance to the integrity education of college students. Taking the United States, Germany, United Kingdom, and Japan for example, they have accumulated a great amount of successful experience we can learn from, such as the German Moral Education of multi-disciplinary, multi-level integrity of College Students, and the education of integrity in Japan almost throughout all their life. And they almost make all use of the mass media and religion in Honesty Education.

In China, honesty education has been concerned by the theory and practice of community; many scholars claim to take measures for the construction of social credit environment, the integrity of the legal system, education, moral education and teachers' moral qualities of integrity. Quoting the available research, it can be concluded that theorists are more concern about studying the integrity issues, while fewer experts keep their eyes open on studying the integrity of the evaluation.

In this paper, the reconstruction of integrity is to great extent guaranteed with cogent system and favorable conditions instead of merely individual morality. Profoundly speaking, the honesty-credit evaluation system of college students, consisting of established credit system and corresponding awards and penalty is playing a key role. Along with dogmatic education, the worthwhile evaluation system should be constructed, integrating integrity evaluation, credit files and discipline, which is beneficial for uniting integrity with self-discipline and heteronomy.

First of all, it strengthens effectiveness of integrity education. The content and form of current college education are less than systematic and always expound knowledge mechanically, which is said to be in lack of persuasion. On the other hand, the fresh evaluation system, centralized on integrity infuses the education objectivities into students' daily behaviors, finally strengthening its effectiveness because of the honest atmosphere and the explicit theme of education.

Secondly, it restrains behavior of college students. In daily life, owing to the defective yard stick of integrity assessment, the majority of students are apt to indulge themselves totally regardless of those behavior rules. For this reason, through the regulations on study or work is the construction of the newly established system able to help students recognize their words and actions, then pick up what the society advocates and forsake the bad habits, more importantly, only by this can they cultivate good habits and improve comprehensive quality.

In the end, it ensures scientificness of the evaluation. In the implementation of this modified system, the qualitative and quantitative methods will be adopted to quantify students' behavior and then qualify their scores. This process will ensure students' integrity degree to be objective and accurate and

the result is the authentic reflection of their integrity. In the terms of authorities, this system is of great significance to let them informed of students' specific performance and then they will be offered particular assistance.

2 Organization and Implementation of the Honesty-credit Evaluation System

The evaluation system contains the integrity commitment of university students in school, together with the honesty files and integrity evaluation, which is the comprehensive evaluation and assessment system of college students' personal credit. How to implement it can be referred to the comprehensive evaluation of the college student. Firstly, the leading agency designated by Student's Affairs Department is in charge of formulating the integrity evaluation of the whole school system in order to perfect the management and process supervision. Secondly, faculties are supposed to establish working groups to take specifically charge of the implementation of the department's work.

2.1 Establish and perfect college students' credit files

The most important part of college students' credit evaluation system is college students' credit files. Based on their credit situation, students' personal credit file can know well of the integrity of the state of the students promptly so that they can make recording mechanism more perfect and effective. If so, the contents of the college students' credit file records can become the basis for evaluation of the integrity evaluation system.

College students' credit files include: individual letter of commitment, students basic information (including name, birthplace, state of health, family background, etc.), integrity of information in Learning (including academic performance, homework completion, the examination), integrity of information in Economic (including the repayment of student loans, credit card repayment, etc.), integrity of information in Employment (including whether students on employment offer a variety of real information). Students must sign on in the letter of commitment as soon as they get the file, fostering the establishment of the concept of integrity.

2.2 Establish the feasible integrity evaluation system

Based on the credit file, we can classify the state of the integrity of students into different levels and set up quantitative assessment of operational standards and establish credibility evaluation system. At the beginning of each school year, students can get their credit file. After filling out their basic personal information and signing in the letter of commitment, they will get the integrity of 100 basis points.

2.2.1 The evaluation index

According to the result of an investigation of Wuhan University of Technology in China, it can be concluded that the basic indicators for the evaluation of the integrity of elements are learning, economic, the integrity of life, employment; then clarify the integrity evaluation system at all levels of indicators and set different levels of standards in order to reference position on each indicator; Finally, choose the way of the integrity evaluation by students' self-evaluation, peer assessment, teacher appraisal. In this way, we can assess the integrity of the situation of students in the past and present, and record the results in the students' personal credit file. The specific operation is shown below:

Table 1

The evaluation index	Score standard	score	aimed score	self-evaluation	peer assessment	teacher appraisal
1.Learning information integrity (20')	1.1 learning attitude diligent	A10 B8 C5 D3	10			
	1.2 complete job and papers independently, no cheating	A5 B3 C2 D0	5			
	1.3 compliance with the examination rules, no entrainment	A5 B3 C2 D0	5			
2.Economic integrity (30')	1.1 honesty economic situation of the family, no false information,	A10 B8 C5 D3	10			
	1.2 strict compliance with the provisions of national student loans and repay on time	A10 B8 C5 D3	10			
	1.3 timely payment of the tuition and fees, no malicious default	A10 B8 C5 D3	10			

3.Life integrity (20')	1.1 keep their promise when socializing with people	A5 B3 C2 D0	5			
	1.2 abide by social morality, be helpful, returning lost money	A5 B3 C2 D0	5			
	1.3 truthfully inform others the physical health	A10 B8 C5 D3	10			
4.Employment integrity (30')	1.1 truthfully fill out the resume, no fraud	A10 B8 C5 D3	10			
	1.2 conscientiously fulfill the employment contract, no unprovoked breach of contract	A10 B8 C5 D3	10			
	1.3 legitimate and proper behavior in the competition	A10 B8 C5 D3	10			

Note: The grading standards for documentary assessment score, combined with the actual performance of students (including grade A, grade B, grade C, grade D).

A means doing well about the requirements described in the scoring criteria;

B means reaching the requirements described in the scoring criteria, except some aspect;

C means basically reaching the requirements described in the scoring criteria;

D means not reaching the basic requirements in the scoring criteria in many ways.

2.2.2 Evaluation methods

On the premise that the above requirements are observed, more practical evaluation rules are able to be laid down according to the respective circumstances of each class even the school, scoring them based on their actual performances. Self-evaluation refers that students evaluate themselves truthfully; peer assessment means class evaluation group score each student about the varied index. The peer assessment result=(the sum of the class evaluation group scores—the top score—the lowest score)÷ (the number of the group) , then the final evaluation score=10% of the self-evaluation score + 60% of the peer assessment score + 30% of the teacher appraisal.

2.2.3 Evaluation grades

The scores will be graded like this:

Table 2

Scores	Grade	Evaluation quality
Above 85 points	A	High integrity、credible
75 points to 84 points	B	Relatively high integrity and credibility
65 points to 74 points	C	Not high integrity, credible generally
Below 65 points	D	Low integrity, incredible

3 Perfecting the Mechanism of Supervision and Punishment and Ensuring the Implementation of the Evaluation

(1) Students are prone to be honest owing to the huge cost to be dishonest, which will be guided by reward and penalty. Only by high price of bad faith can their fluke mind be eliminated completely, resulting in their keeping promises and being honest and for building up self-disciplinary habit. The disciplinary inspection departments of related universities are supposed to be equipped with scientific regulations of supervision used to restrict students' behaviors, shaping their integrity. Annual regular inspections confirm the evaluation to students' integrity and morality from certain functional departments; meanwhile, the feedback of teachers and students can be gathered simultaneously. Combining the moralization and punishment, the university authorities should improve the punishment mechanism, enforcing the regulations unswervingly as soon as someone is cheating and violating the credit regulations. Only by this way can they be saved in time and abide by the moral bottom line, avoiding the greater loss they may cause to the nation, the society or even themselves. As for the school conditions, the integrity status will be banded together with comprehensive assessment, scholarship, exemption graduates, excellent students, party members and student loan. Those whoever persists in keeping credibility and promise on any occasions will be praised instantaneously. Students with grade B should be offered moral encouragement, while those outstanding ones with grade A could

be offered material rewards or any other ways such as a preferentially authoritative recommendation. among which students with grade D are in limit to be awarded as excellent students and beyond their reach to the student loan, while students with grade A are in possessive priority. On the other hand, the credit files are delivered to employers after graduation, extending their credit record to the society that will be the second identity card.

(2) The professional evaluation groups are advocated. Integrity assessment is a specific but tedious process, so it can be a full-time or a part-time work. The counselors are the full-time staff; at the same time, those teachers in the related administrative departments are the part-time staff, such as those working in finance section and the students' affair office and the librarians, who will be responsible for the regular evaluation.

(3) Accordingly, the index should be adjusted so that the methods can be improved in practice. The process of the evaluation system and index is open and dynamic, stable as well. Additionally, the operation of this system is supposed to be supervised, especially by all the students. During the process of application, the evaluation system is bound to be ameliorated on the basis of development of the society and the university, where the e-record and information websites are accessible to update the evaluation results, then making their comprehensive scores public at the right time is helpful to feed back the students' materials. More significantly, the lower scored students must be studied about their thoughts in mind by the specially-assigned teachers. In all, the genuine effective system is the one adapted to the realities all the time.

(4) In cultivating better integrity quality, the moral education is playing an essential role. Generally speaking, the evaluation system is not scientific enough to substitute the moral education that is likely to optimize this established system, ultimately achieving the expected effect. The cognition and their sense of social duties are accessible for guiding them to set up the beliefs of integrity.

4 Conclusions

To crystallize the integrity education, a long-term and arduous cause with urgency is necessary for all people to participate, for morality is essential for everyone. In this case, morality and law work together should stick up for the order and restrain the misconduct, leaving a kind of favorable surroundings for education and forming a virtuous pattern. It's of great importance to establish scientific and effective evaluation system, associating the school education with the self-education, and management, and further enhancing the effectiveness of the integrity education, which is said to lay a strong foundation of building a harmonious socialist society.

Significance Study of Resources Influence on Innovative Talents Cultivation in Henan Higher Education: Based on the Methodology of Principal Component Analysis

Chen Yan

Luoyang Institute of Science and Technology, Xi'an University of Architecture and Technology, Xi'an, P.R.China, 710000

(E-mail: Technologxyan001230@163.com)

Abstract: The cultivation of innovative talents is a complex system project and plays a significant role in objective evaluation of higher education's creativity which is regarded as the combination of scientific advance and talents cultivation. From the perspective of resources and based on the concerned statistics in the year of 2004 to 2008 in Henan Province, this article has established an evaluation system and carried out a significance analysis of the influence with the methodology of Principal Component Analysis. Results indicate that the overhead of science and technology activities ($\times 10^4$ Yuan RMB) and the total assets value of the campus hardware (billion Yuan RMB) will have the most distinctive significance influence on innovative talents cultivation in higher education; In view of the classification of second indexes, the key elements will be Science and Technology Projects, Scientific and Technological Achievements, the Acceptance and Authorization Quantity of Three Patents, High Technology Intellectual Property Right and Science and Technology Organizations.

Key words: Resources; Innovative talents; Principal Component; Significance

1 Introduction

The cultivation of innovative talents is a complex system project which aims to realize the overall processed omnibearing and continuous talents cultivation mechanism in the way of renewing cultivation notions, updating cultivation modes and reforming education quality evaluation and talents evaluation system. In view of social structure, the government is the key among the factors such as government, society and trade unions concerned; in view of innovation fields, besides science and technology, social sciences are in the urgent need of innovative talents as well. However, to manufacture innovative talents requires a good context for their survival and development, a powerful system and mechanism assurance, an eco-chain for innovation education resources and effective eco-chain link ups between education, trade unions and society.

Colleges and universities are the joints of advanced technology and talents cultivation, whose technology innovation potential should be assessed objectively before the optimum support and promotion of "three spirals" including resources, surrounding and mechanism have been acquired in the process of higher education talents cultivation. Thus it'll be greatly important for policy making and high level innovative talents cultivating that the university's innovation potential is accurately appraise, the scientific, systematic and comprehensive evaluation index system established, the essence and rules of innovative activities mastered and the factors promoting technology innovation academic titles systemically generalized.

From the perspective of resources and based on the concerned statistics in the year of 2004 to 2008 in Henan Province, this article has established an evaluation system and carried out a significance analysis of the influence with the methodology of Principal Component Analysis.

2 Establishment of the Evaluation System

2.1 Establishing Principles

The resource-based evaluation system is a complex one made up of various interactive factors. In order to achieve an overall and practical reflection of the essence and constitution of resources-talents cultivation evaluation, the establishment of the index system should be in accordance with the following principles.

1) Scientific. Being scientific also means accuracy and comprehensiveness. The form and content of the index items will be able to indicate the connotation of the index and the data should be accurate, which will reflect by the large the features of the subject or the whole cultivation process influenced by resources.

2) Systematic. Each item of the indexes should have its own connotation and denotation. They form

an organic unit with no overlapping but logically related, thus to realize a systematic resource-innovative talents cultivation process.

3) Comparable. The comparability between different years has to be reckoned with, meanwhile, all the data have to be strictly screened and standardized to convert the incomparable indexes into comparable ones.

4) Feasible. It's still an exploration for the evaluation of innovative talents cultivation under the perspective of resources and presently there is not much references concerned available. Therefore, data chosen should be available and feasible in quantization.

5) Successive. The promotion of creativity itself is a course of dynamic development and continuous improvement which will objectively reflect the situation, potential and trend. Thus when selecting indexes, it would be desirable to combine the static indexes with the dynamic ones so that the static indexes could be used to reflect the resource configuration status of Henan Province while the dynamic ones to predict the prospects.

2.2 Constitution of Index System

The Resources-based Comprehensive Evaluation System for Higher Education Innovative Talents Cultivation in Henan Province is constituted under the principles mentioned above, with three first-class indexes including human resources, facility resources and scientific research resources. Under the first-class indexes there are 15 second-class indexes, for example, the teaching staff, and there will be 51 more detailed indexes subordinating to the second-class ones to make the third level.

Table 1 Resources-Based Comprehensive Evaluation System for Higher Education Innovative Talents Cultivation in Henan Province

First-class Index	Second-class Index	Third-class Index	Year 2004	Year 2005	Year 2006	Year 2007	Year 2008
Human Resources	Teaching Staff	Full-time Teachers ($\times 10^4$ people)	4.18	4.63	5.29	5.88	6.49

3 Significance Analysis

Principal Component Analysis is a methodology of mathematics transition which converts a related group of given variables into unrelated group in the way of linear transformation. These new variables will be arranged in the declining variance order. With a constant total variance in the mathematics transition, the first variable is given the maximum variance, which is defined as the first principal component. The second variable's variance is next to the first one's but remains unrelated to the first one, which is defined as the second principal component. In this way, when there are number of I variables, there will be number of I principal components.

According to the sig values of resources-innovative talents cultivation, the paper works out the most influential factor set for policy making which will fully utilize resources in innovative talents cultivation.

3.1 Mathematics Model for Principal Component Analysis

The principal component analysis is the method to analyze subject by finding out its principal component. It is a kind of transition in which the new variables are the converted linear combination of the original variables.

Given samples $n=15$, with each sample observing indexes $p=4$: X_1, X_2, \dots, X_p , a primitive data matrix is achieved:

$$X = \begin{bmatrix} x_{11} & x_{12} & \cdots & x_{1p} \\ x_{21} & x_{22} & \cdots & x_{2p} \\ \vdots & \vdots & \ddots & \vdots \\ x_{n1} & x_{n2} & \cdots & x_{np} \end{bmatrix} = (X_1, X_2, \dots, X_p)$$

Thereinto:

$$X_i = \begin{bmatrix} x_{1i} \\ x_{2i} \\ \vdots \\ x_{mi} \end{bmatrix} \quad i = 1, 2, \dots, p$$

The linear combination of number of p index vectors for X in the data matrixes, which could be abbreviated as:

$$F_i = a_{1i}X_1 + a_{2i}X_2 + \dots + a_{pi}X_p, \quad i = 1, 2, \dots, p$$

The following conditions are imposed to exert a restriction:

$$a_{1i}^2 + a_{2i}^2 + \dots + a_{pi}^2 = 1, \quad i, j = 1, 2, \dots, p$$

The comprehensive index vectors F_1, F_2, \dots, F_p satisfying the conditions mentioned are the principal components. The information amount supplied by the number of p components from the total information amounts of original indexes is declining. The information amount from each principal component is measured by variance and the principal components variance contribution rate will be the corresponding eigenvalue λ_i in the former index concerned matrix. Each principal component's combined coefficient $a_i = (a_{1i}, a_{2i}, \dots, a_{pi})$ is the corresponding eigenvalue λ_i , seneigenvalue

$$t_i \text{ variance contribution rate } \alpha = \frac{\lambda_i}{\sum_{j=1}^p \lambda_j}. \text{ The bigger the value of } \alpha_i \text{ is, the more sufficient}$$

valuable information will be supplied by the principal component in policy making.

3.2 Calculation of the Principal Components

(1) Calculation of sample data's covariance matrix $s = (s_{ij})_{p \times p}$ with

$$s_{ij} = \frac{1}{n-1} \sum_{k=1}^n (x_{ki} - \bar{x}_i)(x_{kj} - \bar{x}_j), \quad i, j = 1, 2, \dots, p$$

(2) Calculation of engenvalue S $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_p > 0$ in covariance matrix and its corresponding orthogonalization unit engenvector:

$$a_1 = \begin{bmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{p1} \end{bmatrix}, \quad a_2 = \begin{bmatrix} a_{12} \\ a_{22} \\ \vdots \\ a_{p2} \end{bmatrix}, \quad a_p = \begin{bmatrix} a_{1p} \\ a_{2p} \\ \vdots \\ a_{pp} \end{bmatrix}$$

Therefore, the No. i principal component of X will be: $F_i = a_i X, i = 1, 2, \dots, p$.

The determination principles of coefficient a_{ij} :

F_i and $F_j (i \neq j; i, j = 1, 2, \dots, p)$ are unrelated;

F_1 is the one with the largest variance in all linear combination of X_1, X_2, \dots, X_p ;

F_2 is the one with the largest variance in all linear combination of X_1, X_2, \dots, X_p unrelated to F_1 ; F_p is the one with the largest variance in all linear combination of X_1, X_2, \dots, X_p unrelated to F_1, F_2, \dots, F_{p-1} .

(3) A number of r principal components will be chosen among all the determined number of p principal components to realize the ultimate appraise analysis. Variance contribution rate α_i is used to

describe the information amount reflected by the principal component F_i . The determination of r is that the accumulated contribution rate $G(r) = \sum_{j=1}^r \lambda_j / \sum_{j=1}^p \lambda_j$ is big enough (above 85%).

3.3 Equalization of Data

With dimensionless method, it becomes possible to remove the influence between the primitive data and reflect the variation information.

When the original data are given as $X = (X_{ij})_{n \times p}$ with $y_{ij} = \frac{x_{ij}}{x_j}$, $i = 1, 2, \dots, n; j = 1, 2, \dots, p$.

Thereinto: $\bar{x}_j = \frac{1}{n} \sum_{k=1}^n x_{kj}$, $j = 1, 2, \dots, p$, to achieve the normalized matrix $Y = (y_{ij})_{n \times p}$

Suppose the covariance matrix of $Y = (Y_1, Y_2, \dots, Y_p)$ is $U = (u_{ij})_{p \times p}$, when each vector's mean of Y takes the value 1, it will be:

$$u_{ij} = \frac{1}{n-1} \sum_{k=1}^n (y_{ki} - \bar{y}_i)(y_{kj} - \bar{y}_j) = \frac{1}{n-1} \sum_{k=1}^n (y_{ki} - 1)(y_{kj} - 1)$$

$$= \frac{1}{n-1} \sum_{k=1}^n \left(\frac{x_{ki}}{\bar{x}_i} - 1\right) \left(\frac{x_{kj}}{\bar{x}_j} - 1\right) = \frac{1}{n-1} \sum_{k=1}^n \frac{(x_{ki} - \bar{x}_i)(x_{kj} - \bar{x}_j)}{\bar{x}_i \cdot \bar{x}_j} = \frac{S_{ij}}{\bar{x}_i \cdot \bar{x}_j}$$

Among them, u_{ij} is the raw data of covariance, $i, j = 1, 2, \dots, p$ is special

for $u_{ii} = \frac{S_{ii}}{(\bar{x}_i)^2} = \left(\frac{\sqrt{S_{ii}}}{\bar{x}_i}\right)^2$, which means the covariance matrix diagonal of the normalized data is the square of variation coefficient between indexes.

Given r_{ij}^* is the correlation coefficient between indexes of the normalized data, thus we can conclude:

$$r_{ij}^* = \frac{u_{ij}}{\sqrt{u_{ii}} \sqrt{u_{jj}}} = \frac{\frac{S_{ij}}{\bar{x}_i \cdot \bar{x}_j}}{\sqrt{\frac{S_{ii}}{(\bar{x}_i)^2}} \sqrt{\frac{S_{jj}}{(\bar{x}_j)^2}}} = \frac{S_{ij}}{\sqrt{S_{ii}} \sqrt{S_{jj}}} = r_{ij}$$

Thereinto, r_{ij} is the correlation coefficient between primitive indexes, that is, normalization will not change the correlation coefficient between indexes.

3.4 Solutions

Extract and normalize the data needed to acquire the concerned coefficient matrix. Calculate the variance contribution rates to determine the numbers of principal components, as what have been shown in Table 2, 3 and 4.

Table 2 Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	39.515	77.480	77.480	39.515	77.480	77.480	37.446	73.424	73.424
2	5.461	10.708	88.188	5.461	10.708	88.188	6.505	12.755	86.179
3	4.380	8.588	96.775	4.380	8.588	96.775	5.404	10.596	96.775
4	1.645	3.225	100.000						
5-51	.000	.000	100.000

4 Conclusion

(1) For factor load is the correlated coefficient of a variable and a common factor, a variable will have closer relationship with a factor with bigger absolute value, that is to say, the variable will be better represented. According to the variance analysis result of Table 2, Factor 1's variance is 39.515, more significant than Factor 2's 5.461 and Factor 3's 4.38. Therefore, Factor 1 is the most significant in the influence on innovative talents cultivation in higher education.

(2) According to the factor score coefficient matrix in Table 4, the element which has the most significant relation with Factor 2 is the Overhead ($\times 10^4$ Yuan RMB) in Expenditure for Science and Technology Activities, Total Assets Value (Billion Yuan RMB) in Campus Hardware. The statistics from our national Science and Technology Ministry indicate that the proportion of R&D funds in American basic research expenses is 19.1% in the year 2003 while Chinese 5.4% in the year 2005 and Henan Province less than 5% in the year 2008. Meanwhile, every year in America almost half of the research funds has been obtained by colleges and universities and the proportion of basic research in overall higher education research cost is always higher than two thirds while in China, higher education research funds is only 9.89% of the national R&D funds in the year 2005 and only 18.6% of the 2004 year's national R&D overhead is for basic research. In the last case, less than 10% went to colleges and universities in Henan Province. Taking the year 2005 as an example, the average personal science and technology funds in Henan Province is only one seventh of that of Hubei Province, even Jiangxi Province which is ranged the second to the last is 65% higher than our province. Science and technology fund is like blood to technology innovation, and inadequate science and technology funding investment has become the main factor influencing the improvement of technology innovation in Henan higher education. Therefore, government should be fully aware that funding investment is the material

guarantee to improve innovation in higher education. Also the government should further reinforce its investment in higher education's research funding, highlight the leading position of government and gradually build up the mechanism of annual increasing technology investment in higher education. Based on their own orientation and reality, colleges and universities should plan their own research funding investment proportions in the annual budget to make sure of the annual increase of science and technology funds. In the meanwhile, through active cooperation between colleges and enterprises, colleges and universities will uptake the investment and sponsor from enterprises and society to enlarge overhead resources.

In addition, in the item of Equipments and Facilities, the total assets value of Henan colleges and universities have increased from 195.04 billion Yuan RMB to 370.18 billion Yuan RMB, almost doubled within 5 years but is still slower than the national increasing speed. In the process, as the important support of science and technology innovation, lab needs not only more investment for advanced instruments and equipments, but also high-quality technology talents to enhance its comprehensive strength in scientific study.

(3) In view of the classification of second-class indexes, Science and Technology Projects, Science and Technology Achievements, Acceptance and Authorization Quantity of Three Patents, High-tech Intellectual Property Right, Science and Technology Research Institution are the crucial resources influencing the innovative talents cultivation.

Instruction of English Musical Film and TV Drama Appreciation Based on CBI Theory

Wu Lan

(Foreign Language School, Wuhan University of Technology, Wuhan, P.R.China, 430070)

(E-mail: 21984559@qq.com)

Abstract: CBI (content-based instruction) is the theory according to which foreign language teaching is adjunct to the teaching of a subject or a subject matter, aiming to combine course content and language learning. It emphasizes learning language via using it rather than simply learning it as a subject, and therefore CBI is considered the most effective approach in foreign language teaching. It has four main instruction models: theme-based approach, sheltered content course, adjunct courses, and language for special purposes. English Musical Film and TV Drama Appreciation is an elective course for non-English major postgraduates. This article introduces CBI theory and how it is applied to the instruction of English Musical Film and TV Drama Appreciation, discusses the guiding significance the former has for the latter, and analyzes how the instruction can get good effects, hoping to draw the attention of more English teachers to this field so that they can do more extensive and intensive research of the application of CBI theory in foreign language teaching.

Key words: CBI theory; English Musical Film and TV Drama Appreciation; Foreign language teaching

1 Introduction

College English Curriculum Requirements published in 2004 points out that the objective of college English teaching is to cultivate students' comprehensive ability to use English, especially English listening and speaking ability to enable them to have effective communication in oral and written English in the future work and social activities (Shi Ying, 2005). The new College English Curriculum Requirements published in 2007 further points out that colleges and universities should set the college English teaching syllabus according to the specific situation, and form the individualized college English curriculum system (Gao Hongmei, 2012). The author of this article is an English teacher for non-English major postgraduates. Postgraduate education is the highest education in educational structure, aiming to train the talents with high quality and creativity for the modernization construction of China. The objective of postgraduate English teaching is to effectively improve students' comprehensive ability to use English (listening, speaking, reading, writing and translating) from a high starting point. In recent years, some elective courses have been offered for postgraduates in the author's university to meet the needs of postgraduate English curriculum reform (for non-English majors). English Musical Film and TV Drama Appreciation is one of the elective courses and the author is the lecturer. Since the new College English Curriculum Requirements was published, the elective course, English Movie (TV Drama) Appreciation has been widely offered in colleges and universities, which to some extent has motivated the students in English learning and improved their comprehensive ability to use English. This article introduces CBI theory and how it is applied to the instruction of English Musical Film and TV Drama Appreciation, and analyzes how the instruction can get good effects, hoping to draw the attention of more English teachers to this field so that they can do more extensive and intensive research of the application of CBI theory in foreign language teaching.

2 CBI Theory

2.1 What is CBI ?

CBI (content-based instruction) is the theory according to which foreign language teaching is adjunct to the teaching of a subject or a subject matter, aiming to combine course content and language learning. It emphasizes learning language via using it rather than simply learning it as a subject, and therefore CBI is considered the most effective approach in foreign language teaching.

CBI theory originated from the immersion programme conducted by St. Lambert in Montreal, Canada in the 1960s. In the following decades, CBI attracted extensive attention and was applied to various fields such as immersion language teaching, bilingual teaching and foreign language teaching in developed countries. Nowadays this theory has been more and more widely applied to EFL teaching all over the world. Language is a means of human communication; therefore language learning is different from the knowledge acquisition of a specific subject. Language competence is more habitually acquired

than intentionally learned. CBI theory is considered a more natural way to develop language competence, for it resembles the way in which learners learn their mother tongue. In CBI, the students concentrate on the knowledge structure acquisition of a certain subject or the discussion on a certain theme; the knowledge structure or theme can be anything they are interested in, ranging from the precise subject knowledge to the news report, topic even music, movie, TV play, novel, singing star, film star, etc they like. The students use English to acquire knowledge and discuss themes, but not learn English for the sake of English learning. In this way, they eventually improve the comprehensive English competence. Once the students are motivated, the teacher is able to conduct smooth foreign language teaching, so CBI attracts students very much (Shi Ying, 2005).

2.2 The theoretic basis of CBI

CBI theory is mainly based on the second language acquisition theory and the cognitive learning theory, both of which emphasize providing the second language learners or foreign language learners with multiple opportunities of real and contextual interaction and challenging interaction with language materials in a communicative and academic atmosphere. According to Krashen's language input theory, the condition for the most successful second language acquisition is that the second language acquisition environment is similar to the first language acquisition environment. When foreign language teaching focuses on language meaning but not language form, when language input is equal to or higher than the learners' language level, and when there is enough opportunity for the learners to use the target language meaningfully without anxiety, the second language acquisition is most effectively achieved (Dai Qingning, 2004). The core idea of the second language acquisition theory is that language learning should emphasize meaningful content learning; the cognitive learning theory lays emphasis on the relation between language teaching and the learners' life experience as well as acquired knowledge so that the learners could be motivated and on their own build knowledge meaning in language study (Gu Feirong, 2009).

2.3 Three elements (characteristics) of CBI theory (Dai Qingning, 2004; Gu Feirong, 2009)

2.3.1 Subject knowledge is the core

The CBI classroom teaching should be centered on a certain theme or subject but not be organized according to the traditional language forms, functions, contexts or language skills. The students acquire language communicative ability by learning a specific subject or theme.

2.3.2 Using real language materials

The learning materials of CBI such as texts, videotapes, audiotapes and other audio-visual materials should be those used by the native speakers. The instruction activities should pay attention to understanding and imparting meaningful information as well as accomplishing real tasks in real target language. The students acquire new information with the use of the acquired subject knowledge and contextual understanding.

2.3.3 The instruction contents and activities should meet the needs of the students

The instruction contents and activities should fit the language level, cognitive competence and need for affection of the students, and be suitable for their professional needs and individual interests.

2.4. Common models of CBI theory (Dai Qingning, 2004; Cai Weijun, 2012)

CBI is a teaching idea than a specific teaching method which has no unified model. On the basis of different teaching objectives, there are four common CBI models: theme-based approach, sheltered-content courses, adjunct courses and language for special purposes.

2.4.1 Theme-based approach

The teaching objective and key point of theme-based approach is language teaching. The instruction is centered on a certain specific theme or related topics of a certain specific theme. The teaching materials are all kinds of original themes and topics of the target language; in addition, those themes and topics should meet the needs of the students and arouse their interests so that they can be motivated to take part in various thematic activities. The goal of language teaching is achieved by students' using the language in the activities. Theme-based approach aims to acquire new information by means of language and at the same time improve language level. It is suitable for the second language / foreign language learners or lovers of all levels.

2.4.2 Sheltered-content courses

Sheltered-content courses lay particular emphasis on more subject knowledge teaching than language teaching: the students naturally acquire language skills through grasping subject knowledge. Language is considered the means by which professional knowledge is acquired. The specialized course teaching is carried out in the target language; the students are able to mainly master the

professional knowledge and skills, and at the same time improve the target language level. The teaching materials should be selected from all kinds of specialized courses in the target language with the difficulty in line with students' language level and professional receptivity. What's more, this CBI model is relatively demanding to teachers, who need both be familiar with the specific subject knowledge and proficient in the target language: they should be able to give an understandable lecture in perfect target language through various means to make the students understand and grasp the subject knowledge. The students must be intermediate or upper intermediate language learners.

2.4.3 Adjunct courses

Adjunct courses mean that specialized courses and language courses are offered at the same time with equal class hours. The professional teacher is in charge of subject knowledge teaching and the language teacher conducts foreign language teaching. Language courses are adjunct to specialized courses and the students are required to grasp professional knowledge with the help of language knowledge. In this CBI model, the subject teacher and language teacher should work in close cooperation and the latter needs to be familiar with professional knowledge. The students must be intermediate or upper intermediate second / foreign language learners.

2.4.4 Language for special purposes

The instruction content of this CBI model is closely related to a certain industry or profession and is often applied to various professional or group training. The teaching materials are selected from practical work or related subject fields. This CBI model can be taken charge of by either professional or language teachers.

Table 1 Common Models of CBI Theory

Name	Goal	Teacher	Learner's Language Level
Theme-based Approach	Language teaching	Language teacher	All levels
Sheltered-content Courses	Subject knowledge teaching	Professional teacher	Intermediate or upper intermediate
Adjunct Courses	Language teaching and subject knowledge Teaching	Professional teacher and language teacher	Intermediate or upper intermediate
Language for Special Purposes	Professional knowledge teaching	Professional teacher or language teacher	All levels

3 Instruction of English Musical Film and TV Drama Appreciation Based on CBI Theory

3.1 Three elements of CBI theory in the instruction of English Musical Film and TV Drama Appreciation

English Film (and TV Drama) Appreciation has been widely offered as an elective course in universities and colleges. There are various genres of English films and TV dramas, such as science fiction, action, romance, thriller, horror, disaster, fantasy, spy, musical, etc. The instruction of English Musical Film and TV Drama Appreciation focuses on the genre of musical; meanwhile, as an English elective course for non-English major postgraduates in the second semester, its emphasis is apparently not merely English language learning and practice but learning about the musical film and how to appreciate it. Generally speaking, English Film (and TV Drama) Appreciation is a course which can attract and motivate students. To most students the visual and audio enjoyment and impact brought by films and TV dramas is far greater than that of pure language, not to mention that the students are all lovers of films and TV dramas. Besides this course is also involved with the topics of music, singing, dancing, and singing star, which the students are more familiar and fascinated with. Therefore this elective course meets the need of the students' interests and feelings. What's more, the teaching materials and language are both English so that the students are able to finish real tasks in real target language, and acquire new information based on acquired knowledge. This is meaningful learning.

The instruction of English Musical Film and TV Drama Appreciation includes four parts. Part one is the general introduction of the musical film: what is the musical film, the brief history of it and the master works. In Wikipedia, "The musical film is a film genre in which songs sung by the characters are interwoven into the narrative, sometimes accompanied by dancing. The songs usually advance the plot or develop the film's characters, though in some cases they serve merely as breaks in the storyline,

often as elaborate ‘production numbers’. The musical film was a natural development of the stage musical after the emergence of sound film technology.” The standard definition helps the students to learn about what the musical film is. Most of the master works (only with brief introduction) are classic original English musical films in different periods, and among them, four most popular musical clips are played to students to deepen their impression of the musical film. It is very necessary for the students to have a general idea of the musical film, for nowadays the musical film is not the most popular film genre. Part two deals with film music, including the main functions of film music as well as the relation between film music and frames. As for the latter, some technical terms are introduced such as “synchronism”, “counterpoint” and so on. Although most students are music lovers, they seldom pay attention to and think about the functions of film music, and know little about the relation between film music and frames. The instruction of this part, through the combination of theories and examples, enables the students to acquire the new meaningful information. Part tree is the appreciation of a musical film *The Phantom of the Opera* (2004). The students, guided by the teacher, first learn about the basic information, story and storyline of the film, then have music appreciation (with selected songs), and finally discuss the main characters and film theme. Part four is the appreciation of an American musical sitcom *Glee*. Similarly, the students learn about the basic information, story and main characters of it, think about the cultural reflection (the theme), and have music appreciation (with selected songs). Generally speaking, the instruction of English Musical Film and TV Drama Appreciation focuses on music appreciation.

Table 2 Outline of the Course

General Introduction To Musical Film	Definition
	History
	Master Works
Film Music	Functions of Music in a Film
	Music and Frames in a Film
<i>The Phantom Of The Opera</i>	Basic Information
	Story
	Storyline
	Music Appreciation (with selected songs)
	Discussion on Main Characters and Film Theme
<i>Glee</i>	Basic Information
	Story
	Main Characters
	Cultural Reflection
	Music Appreciation (with selected songs)

3.2 Theme-Based Approach and Sheltered-Content Courses of CBI Theory in the Instruction of English Musical Film and TV Drama Appreciation

Some articles which discuss CBI theory and the instruction of English Film Appreciation hold that the latter is only based on theme-based approach of the former (Shi Ying, 2005; Gao Hongmei, 2012). However, the author of this article believes that the instruction of English Musical Film and TV Drama Appreciation is the combination of both theme-based approach and sheltered-content courses of CBI theory. Theme-based approach focuses on language teaching, while sheltered-content courses lay emphasis on subject knowledge teaching. In the author’s view, this course should achieve both goals, namely make the students practice and improve comprehensive ability to use English and grasp the subject knowledge of film, TV drama, and music so as to improve literary and art quality.

3.2.1 Theme-based approach and the instruction of English Musical Film and TV Drama Appreciation

As mentioned above, though English Musical Film and TV Drama Appreciation is an elective course, it is part of non-English major postgraduates’ English curriculum, aiming to enable the students to have meaningful language learning and practice through the activities related to the themes or topics of film and music, which attract and motivate them. The objective of college English teaching is “to cultivate students’ comprehensive ability to use English, especially English listening and speaking

ability”, and “to improve students’ comprehensive cultural quality in order to meet the needs of China’s social development and international communication”. The course of English Film and TV Drama Appreciation is an effective approach to improve the students’ comprehensive English ability (listening, speaking, reading and writing). English films and TV dramas provide an opportunity for the students to thoroughly feel and use English: the real scenes (real contexts) and the English used by native speakers can improve the students’ English listening and speaking ability; meanwhile, the historical and cultural background as well as local customs can also help them understand the cultural elements in the language, thus promoting language learning. As the musical film highlights the performance of singing and dancing, and musical achievement, it usually has a simple storyline and theme. Music and dancing, as independent art forms, serve as more appealing and touching means than language to express the characters’ thoughts and feelings. The lines (lyrics) in *The Phantom of the Opera* are formal, standard, graceful, lyrical, and also understandable to the students. The students who take this course are almost upper intermediate English learners and some students can even memorize the lines (lyrics) which impress them most. In class, the students retell the story, review the storyline, analyze the main characters, and discuss the theme of the film. Those oral activities help them practice and improve English thinking and speaking ability in the real language environment. *Glee*, a modern American musical sitcom, is quite different from *The Phantom of the Opera* in creation background and artistic style. Comparatively, American TV dramas are more familiar and attractive to the students who mainly learn the language used in daily life and idiomatic expressions from the TV dramas. What’s more, the cultural reflection in TV drama appreciation is important to broadening the students’ horizon in language learning.

3.2.2 Sheltered-content courses and the instruction of English Musical Film and TV Drama Appreciation

Through English musical film and TV drama appreciation, the students should not only practice and improve English, but also acquire the subject knowledge of film, TV drama and music in order to cultivate their musical quality and artistic taste. Most students are lovers of films, TV dramas and music, but they seldom pay attention to and know little about the musical film, film music, film language, etc. and even do not know how to appreciate films and music. The course of English Musical Film and TV Drama Appreciation provides the students with the professional knowledge of musical, musical film and music appreciation. Since the students are non-art majors, they are only required to have a general idea and understanding of the relevant knowledge without deeper thinking and exploration. Thus the difficulty of this course fits the students’ receptivity in art and their language level. In the lecture, music appreciation (with selected songs) plays a major part. For each song (piece of music), the students are required to understand the related plot, the characteristics of melody and rhyme as well as their change (sometimes combined with the scene change), how the music and singing develop the story, create atmosphere and express the characters’ feelings, etc. Besides the teacher’s lecture, the students are expected and encouraged to think. They watch the film (TV drama) to learn about the story and the characters, listen to the music (song), feel the thoughts and emotions of the character in it, and think about why certain thought and emotion of the character are expressed in the music (song) (this has something to do with the character’s personality and film theme). *Glee* features large amounts of cover versions of songs in pop music history. In music appreciation, apart from the above tasks, the teacher introduces different pop music styles to the students, guides them to compare the cover versions and the original versions, and encourages them to think about the influence of cover version (a very popular art form today) on pop music development trend.

4 How the Instruction of English Musical Film and TV Drama Appreciation Can Get Good Effects

English Musical Film and TV Drama Appreciation is a more specialized course compared with English Film and TV Drama Appreciation. How the instruction of it can get good effects depends on both the teacher and the students. Sheltered-content courses of CBI theory require the teacher to be not only familiar with the specific subject knowledge but also proficient in the target language: they should be able to give an understandable lecture in perfect target language through various means. In the instruction of English Musical Film and TV Drama Appreciation, being proficient in the target language (English) is not difficult for the teacher; however, being familiar with and mastering the professional knowledge of the musical film, film music, etc. is what the teacher should work hard for. Being a film and music lover is not enough for the teacher, who also needs to spare time and efforts to acquire the related professional knowledge, collect and select the materials involved, and finally summarize,

methodize and systemize the useful information. Only in this way can he / she be qualified to give the lecture and achieve the teaching objective. Thus the teacher should constantly improve the comprehensive cultural quality and theoretical level in order to be experienced and skillful in classroom instruction.

It has been mentioned above that even though film, TV drama and music are the topics most students are familiar with and interested in, as the musical film is not the most popular film genre today and most songs in the musical films are far less well-known to people than the pop songs, not to mention that the students are all the generation after 90s, they have little idea and impression of the classic works decades ago, and few of them know how to appreciate films and music. According to schema theory, the large amount of knowledge people acquire and master is not stored disorderly in the human brain, but is linked to each other to form a certain knowledge unit centered on a subject, which is schema. The learner does not passively receive information, but actively links the new information with the acquired knowledge and experience in schema. Therefore to some extent, at the beginning the musical film and TV drama appreciation is something unfamiliar to most students and does not meet the needs of their feelings. So the learners, especially the learners of high level, such as postgraduates should attach importance to the accumulation of comprehensive cultural knowledge and improvement of literary and art quality (this is what the students of science most lack) in order to get better effects in this course.

5 Conclusion

Studies in recent years have proved that the course of English Film and TV Drama Appreciation helps to motivate the students in English learning and improve their comprehensive ability to use English. English musical film and TV drama appreciation based on CBI theory gives consideration to both language teaching and subject knowledge acquisition to enable the students to not only practice and improve English, but also acquire the professional knowledge of film, TV drama and music, and thus cultivate the mind and improve their literary and art quality. This also promotes the learning of foreign language and culture. As a newly-offered elective course for non-English major postgraduates, the instruction of English Musical Film and TV Drama Appreciation undoubtedly needs improving. In order to get good instruction effects, both the teacher and students need to enhance comprehensive cultural knowledge and personal art quality. CBI theory emphasizes that the students finish real tasks in the target language in instruction; the teacher motivates the students with meaningful and challenging tasks in language learning. The teacher needs to have overall planning for the whole instruction and reasonable arrangement of the teaching process so as to achieve the smooth and effective classroom instruction, and ensure the students to improve target language level at the same time they grasp professional knowledge. CBI theory has broadened the thinking of foreign language teaching in the new period; this article discusses the guiding significance it has for the instruction of English Musical Film and TV Drama Appreciation, hoping to draw the attention of more English teachers to this field so that they can do more extensive and intensive research of the application of CBI theory in foreign language teaching.

Study on the Influencing Factors of the Regional Industrial Upgrading Based on the Perspective of the Global Production Network

Shao Hua

Huazhong University of Science and Technology, Wuhan, P.R.China, 430070

(E-mail: shaohuahust@126.com, whtjwjh@163.com)

Abstract: The formation and development of the Global Production Network is affected by various factors. Network governance models, policy systems, external environment and enterprise characteristics are the four main factors which have a great impact on the upgrading of the Global Production Network. This paper focuses on analyzing the influencing mechanism and performance of the above factors on the regional industrial upgrading, which aims at providing guidance for the local industrial upgrading and structural optimization.

Key words: Global production network; Regional industrial upgrading; Influence

1 Introduction

At present, the global production network system of labor division constantly becomes perfect, and production capability of developing countries and enterprises involved in the network is increasingly improved, and the enterprises' development have pushed the industrial upgrading, which improves their status in the global network system. However, to further their development, the following works should also be done: on the one hand, make a comprehensive analysis on various factors influencing enterprise competence and industrial upgrading; on the other hand, classify these factors and then learn and use these factors selectively, really promoting industrial structure upgrading and structural optimization. After reviewing the generating reasons of global production network and its determinants, we found that policy systems, network governance model, enterprise features and external environment are the key impact factors of regional industrial upgrading.

2 Network Governance Model on Network Industrial Upgrading

The concept of transaction cost was first put forward by Coase and then inherited and developed by scholars of institutional economics. Transaction cost was originally used to analyze the market and enterprise's resource allocation, and later was used to explore the trading mode and its substitution relation within enterprise and market. In the words of Hart, market trading organization is suitable for the trades with low asset specificity and low transaction frequency, which is based on contract and property rights and characterized by price mechanism in the core; the internalization trading patterns is appropriate for those trades with high asset specificity and high transaction frequency, which is also called internal governance mode. Certainly, there are many other trading modes between the above two extremes except these two compound modes, market and enterprise.

2.1 Governance structure features of global production network

The emergence of global production network enriched the intermediate state of trading mode with the following characteristics:

Firstly, in the global production network, the relationship between leading manufacturers and processors is based on mutual benefit, maximizing their self-interest with complementary labor division. And then a formal or informal contract is come into being based on the interdependent relationship, thus conducting different stages of labor division of the same product. The new-type organization model, global production network, can provide stable relational contract, and the uncertainty of bilateral trade is small on basis of mutual benefit, thus avoiding fraudulent conduct brought by opportunism and reducing unnecessary transaction cost, and at the same time, it can lower costs generated by principal-agent relation. Therefore, the mode of global production network, based on trust, pays more attention to long-term interest, creating an open contract that can give up short-term opportunism behavior. Global production network model not only swallows the advantages of traditional dual governance mode, but also avoid all kinds of unnecessary transaction cost, improving organization management efficiency and production capability, thus enhancing enterprise's international competitiveness.

Secondly, for what global production model conducts is labor-division production, we should pay more attention to external governance and co-governance. In the traditional insider system, what

enterprise conducts is internal resource allocation, so internal resource allocation efficiency is taken as the core of operation management. However, under the global production network model, enterprises are not only concern about the allocation of their own resources, but also pay more attention to bring external resource, technology and managerial experience to self-development to promote enterprise development. Global production network by combing manufactures around the world together to produce the same product, taking advantage of different regions' comparative advantages, thus expanding the scope of using resource and making the boundaries of firms obscure. Therefore, under the global production network model, enterprises should pay close attention to coordination of external resource in addition to the efficiency of internal resource allocation. The larger the global production network scope and the longer the value chain, the more external resource we can use and the greater importance of external coordination and governance. Meanwhile, in the global production network, long-term stable cooperation relationship based on the principle of mutual benefit is built between production main bodies, thus maximizing their own self-interest. Such complementary relations of cooperation must have corresponding control mechanism, making the same product run smoothly between different main bodies.

Thirdly, there's a core manager in the global production network model, controlling the whole production network based on the co-governance of all stakeholders. In every integrated production network, leading manufacturers, as the core manager, occupying the highest part of the value chain, possessing advanced technology and managerial experience, has the highest added value, so it can control the resources and production flows of the whole production network. Special capital that occupying the strategic link is of great importance in global production network, playing a very significant role in the formation and development of the whole network. Because special capital possesses all kinds of advantages, it can attract other capital, thus constantly developing and expanding the production network. This kind of special capital can gather other capital together to organize production, so it is called the core capital of production network. Core capital can be tangible, such as producer-driven technology, and it also can be intangible, such as purchaser-driven brand.

2.2 Network governance model and industrial upgrading potential

As it can be seen from the network governance model analysis that the way and degree of knowledge transfer are different as the models are different. From the perspective of supplier, different network models will directly influence the amount, complexity and value of knowledge and technology acquired from other manufacturers. Generally, it is most difficult for suppliers to get knowledge and technology from market-oriented production network. Then follow leadership-oriented network and modular-oriented network. And it is the easiest to get from relationship-oriented network, for the knowledge and information are diffused different stakeholders, which will be easier for suppliers to gain difficult knowledge. As can be seen from the analysis above, production network model controls the speed of industrial upgrading by indirectly influencing the difficulties that suppliers get knowledge.

3 The Influence of Policy Systems to Industrial Upgrading in the Network

Local industrial network upgrading is largely affected by the regional policy system. We can understand policy systems from two aspects of the local government policy and economic system. The former affects the formation and development of the global production network, the formation of industrial cluster in the production network depends largely on the local government policy, the latter mainly includes the technology infrastructure construction of the attracting foreign investment policies, human capital, etc.

Government should fully realize the importance of participation in the global production network for regional industrial upgrading, so local companies should be encouraged to involved in production and processing system of global production network more, while, this need support of policies, which includes financial, foreign exchange, taxation: First, providing preferential policies in terms of foreign exchange and tax, to create a good policy environment for the region enterprises to involve in production and processing of global production networks, such as import duty free export tax rebate policy for processing and manufacturing products of some key industries. Second, the processing enterprises must overcome technical problem, improve their level of technological innovation, which requires the support of government policies, including the provision of financial, tax and other aspects of support for the development of the underlying technology. Third, personnel policies, including the provision of technical personnel training, the information of talents flow unimpeded, etc, to meet the demand of external processing enterprises for talent.

Different economic system of a country will affect the efficiency of economic operation, and affect the speed and effect of network upgrading. Developed countries and developing countries have difference in economic system, the strategy and policy of industrial development, the path and mode of industrial upgrading, but most of leading companies of global production networks from the developed countries, as a result, many companies from developing countries and regions encountered all sorts of system constraints problems when they integrated into the global production network. Taiwan and Hong Kong of China has been able to achieve industrial upgrading rapidly through the global production network, the emphasis is the development of good economic system environment, select the appropriate industrial development and foreign trade policies, constantly absorbing and digesting the management experience and advanced technology from multinationals, improve their international competitiveness. In contrast, some countries and regions in Africa, lack of good economic system factors, lag behind in the incentive of the individual interests and maintaining of good competitive order, therefore, they cannot make full use of various advantages which is bring by the global production network, hinder the industrial structure upgrading and optimization.

We can explain why the global production network can achieve industrial upgrading by compare the policy system and economic system in policy of Asian and Latin American region. In Asia, due to the countries develop a good industrial development planning, produce technology and talent development strategies, take active foreign development policy, coupled with the influence of such factors as regional, cultural, making the production network in Asia developing rapidly. Since the late 1980 s, various measures are taken to all countries and regions to create a good environment to attract foreign investment, and encourage the development of foreign trade, attract foreign investment, such as lower threshold of the entrance of foreign investment, improve information level, increased investment in transportation construction, etc. In addition, Asian countries reduce the costs of product import and export, increase the competitive advantage of product import and export by setting various preferential policies of tariff, and on this basis to promote the formation and development of the global production network. Over foreign investment policy, tax policy measures have greatly reduced the transaction costs between manufacturers in the production network, play a key role in the process of the formation of the production network, and also promote the formation of regional industry cluster.

4 The Influence of External Environment to Industrial Upgrading in Network

4.1 Service link cost

Service link cost is the main cost of trans-regional production trade, including various coordination costs of transport, communications and other link over a long distance. Due to the international trade in global production network, the service link cost is higher than the domestic production, including various traffic, communication and other fees that come into being by enterprises from different region engage in production, management and coordination, which is important content of transnational trading costs, therefore, reduce the service link cost can promote the development of the global production network, and make enterprises from more areas participate in the global production network. Scale economy is the one characteristic of service link cost, so there will be a concentrated distribution in some areas of fragmentation of the production scale, to reduce costs, and also promote the formation of local industrial cluster, and this will in turn continue to reduce service link cost, forming a virtuous cycle effect. Therefore, in order to promote local enterprises more involved in global production network, share the benefits of global production network, should build good service system on the traffic and communication aspects, promote the formation and development of industrial cluster, thus reducing transaction costs across the region, and realize the industrial structure upgrade and optimization.

4.2 The development of related industry

In the process of promoting the development of industry, a part of industries share the same channel, service, and some common technology, is similar or complementary to each other, this part of the industries called related industry. Tend to develop in industry process, related industries gradually become a supporting industry group through continuous communication and cooperation, which has drawn the related manufacturers in the production network to the industrial clusters for the supplier, the arrival of the leading companies will make the production process of the industrial clusters increase, spawning many new production base, make more enterprises in the region enjoy the benefits of globalization; In addition, the reasonable division of labor in the related industry cluster can promote industrial independent innovation, thereby giving impetus to the development of the industry.

4.3 Factor conditions

Factor conditions include the region's labor supply conditions and the enterprises' technical conditions, these directly affect the high or low of production cost, and these are important influence factors for the local enterprises to enter global production network. Developed countries and developing countries and regions have difference in such aspects as resources endowment and economic development level, they have their own comparative advantage. Developed countries have a bigger superiority in such aspects as technical, management experience and brand, while the enterprises in developing countries and regions mainly rely on cheap labor and abundant resources advantage to enter the production network, but global labor wages increased significantly in recent years, if want to continue to maintain the local enterprise's competitive advantage and achieve industrial upgrading, then must improve labor productivity through the modes such as the transformation of devices and the upgrade of technological innovation, thus effectively absorb all kinds of knowledge and technology transferred from the network, realize industry upgrading in the form of absorption, consumption and re-innovation.

4.4 Demand conditions

The demand conditions of local and domestic market directly affect the product sales ability of enterprises, which are the important reasons of enterprises that participate in global production network to realize the upgrade. In the early stages of the participation of enterprises in the global production network, promoting domestic enterprises to continuously improve the level of science and technology, improving product quality, to improve the international competitiveness of products, which mainly rely on the international market that leading companies have, and then take advantage of all kinds of technology and knowledge acquired by the mechanism of the transfer and diffusion of the knowledge. As the local and domestic demand expanding, demand levels improving, could encourage local businesses to continue the innovation of product and technology to meet the demand of market diversification, improve the level of profits and speed up product upgrading.

4.5 Environmental foundation factors

Regional environment foundation conditions are important factor of whether multinational companies will set some production in the region, and then form industry cluster to promote local industrial structure upgrading and industrial optimization. In global production network, environment foundation factors including perfect infrastructure, such as the condition of the urban function supporting, traffic, communication, traffic communication, and government efficiency, and also including the ecological environment.

4.6 Geography and social cultural factors

Geography and social cultural factors are also the important factors influencing the formation and development of production network. The transportation cost between the regions that have adjacent geographical space is low, at the same time, the enterprises in regions could exchange easily when they have close socio-cultural background, reduce the cost created by the difference of culture or system, thus forming production network more easily. Instead, the transportation and communication between regions that have relatively distant is more, socio-cultural difference will also increase cost, and these are not conducive to the formation and development of production network.

5 The Influence of Enterprise Characteristics to Industrial Upgrading in Network

Being the microscopic body that participates in the global production network, technology, management efficiency and leader ability will influence greatly on whether it can realize the product and industrial upgrading through the global production network. While the external environment and opportunities are also the factors that could affect the upgrading of enterprises, internal factors of enterprises are the key when they in an increasingly competitive global economy, and are also the important factors whether enterprises can effectively use of external resources. Enterprise characteristics which mainly refer to enterprises' internal management mechanism and ability are the key determinants whether enterprises can realize the network upgrading.

Among them, the enterprise's own ability is mainly refers to the ability of absorption and innovation of knowledge. One of the strengths of global production network which is the new organization mode is can raise the level of enterprise technology through mechanism of the transfer and diffusion of the knowledge, and this is important approach to the promotion of local industrial upgrading. Only by the effective use of the knowledge that transfer through above two mechanisms and the continuous accumulation and digestion, can enterprises achieve technological upgrading. Between them, the process of knowledge diffusion is more important for enterprises to realize the network upgrading,

which is the process of knowledge internalization, including socialization, externalization, combination and internalization four stages, so as to build their own knowledge system. The knowledge internalization and ability promotion of processing enterprises depend largely on the enterprises' own condition. Specifically, mainly includes two aspects: one is processing enterprises' original knowledge base; the other is the strength of processing enterprises' absorption and innovation of knowledge.

6 Conclusion

For the upgrade of regional product, we need to create the learning processing and manufacturing enterprises, improve the learning efficiency and effectiveness; close to the leading companies of the global production network, get more knowledge transfer, gradually raise the level of production technology and management experience, improve the quality of products, and realize the upgrade and transformation of products from low value-added to high value-added. For the upgrade of ability of regional enterprises, we should improve the ability of absorption and innovation of the regional enterprise in China to make the leading companies in the network transfer more products or production processes of high technical content to the region, and improve enterprises' ability through the mechanism of the transfer and diffusion of the knowledge. For the upgrade of regional role, we could resist and bypass the inhibition of leading companies, improve their status in global production network, and that is the key of realizing the role for regional processing trade enterprises. For the upgrade of regional value chain, processing enterprises should make leading processing enterprises that embedded in the global production network as the core, widely absorb related enterprises' technology, make full use of resources from two markets at home and abroad to serve themselves, and realize the upgrade of production. For the upgrade of regional industry, the government must guide the investment of local foreign capital enterprises to local high-tech industry actively through various preferential policies, make more local enterprises into the global production network of high-tech industries; meanwhile, seize the development opportunity brought by the financial crisis actively, encouraging enterprises to participating actively in well-known enterprises of Europe and the United States to achieve a win-win result. For the upgrade of regional correlation and spillover, we should promote the entrance that intermediate input products in region into the global production network, improve the quality of the products, achieve the requirement of multinational companies in technology and quality; meanwhile, we should establish perfect logistics system, reduce logistics cost, and improve the income of enterprises; finally, we should promote the personnel flow between the foreign-funded enterprises and the regional, attract and retain talent, provide the guarantee of talent for the upgrade of the regional correlation and spillover effect.

Study on the Problems and Countermeasures of Chinese Delay Retirement Process

Wu Zhenghao, Zhu Xinyan, She Yilin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wujh63@sina.com, wuthr05@163.com,422648533@qq.com)

Abstract: Form the perspective of the demographic changes of China and the revolution of the retirement system of the developed countries, we have found that in China the delayed retirement age would become the main reform direction in the near future. The necessity of delayed retirement age of China is elucidated with the pension gap problem under its ongoing retirement system. Adjustment of the delayed retirement age would confront with generous problems such as the reform of our social policies. Thus, the essential causes of the postponing retirement age are studied profoundly, and several countermeasures are proposed to delay the retirement age of China.

Key words: Delayed retirement; Pension gap; Problem; Countermeasures

1 Introduction

Lead into an aging society in the era of changing population structure, the international community has implemented delay retirement policy to deal with pension gap. However, how to overcome obstacles delaying retirement become the universal challenges. In China, the delay retirement policy is also an inevitable trend; and in the process of implementing delayed retirement policy, China would encounter numerous resistances too. We intend to study delay retirement to find out what influencing different labor groups, income changes to different people before and after their retirement in the current income distribution system, delay retirement policies affecting on youth employment issues. Then, we would reveal out the main problem of delay retirement that China confronted with. Finally, several effective countermeasures are put forward to solve the problem.

2 The Background of Delayed Retirement Issues in China

2.1 Chinese population structure changes lead to an aging society

The sixth national census data released that, China, the world's most populous country, has a population of approximately 1,339,000,000 people in 2010. With the implementation of the population policy about birth control of China, its birth rate has evolved from 12.4 ‰ in 2005 down to 11.9 ‰ in 2011, as shown in Figure 1. Though Population growth has been effectively controlled, issues that the labor force growth rate is lower than that of non-labor has appeared. The labor force will begin to decline; aging population will accelerate, until in 2039 it will begin to decline. That is, the demographic dividend period is coming to an end in China; the situation that less than two taxpayers supporting a pensioners will come in 2039.

Figure 1 The Birth Rate in Recent Year in China

From the view of demographic point, children aged 0-14 account for 19.8% of the total population in 2006 which dropped to 16.5% in 2011, 65 years of age or older showed a growth trend which was 7.9% of the total population in 2006 and reached 9.1% in 2011.(as shown in Figure 2). The proportion of the child population reduced, the proportion of the elderly population increased, trend towards an aging

society was obvious.

Internationally, when people aged 65 or older account for 7% of the total population, it means that people in the country or region are in the standard of aging society. China is one of the highest aging degree countries in the world, the population of 65 years of age or older has nearly been 130 million, occupied 9.5% of the total population. The number of 65 years of age or older in China will exceed 200 million, reaching 202 million, which occupied 14.8% of the total population. In the whole 31 provinces, 26 of them has entered the aging state. By 2050, this figure will reach 432 million people, which is more than 29% of the total population.

Figure 2 The Population Structure in Recent Year in China

Moreover, the longevity expectancy of the Chinese population has shown a steady upward trend. During 1980 to 2010, which average increase about one year every five years. If the existing retirement age policy (male 60, female 55) does not change, it means that after retired elderly population will increase longevity, the pressure of pension payments will rise. Pension issues of aging society can not completely burden on the young people; it can not rely on the existing pension either. Only by extend the retirement age, let older people extend their youth can help to solve this social problem.

Fertility declining, longevity expectancy increasing, and the proportion of the elderly population increasing are the signs of an aging society. In the long term, with the demographics changes especially the labor structural changes, couples with the longer longevity expectancy, extending working hours, delays retirement is the only trend.

From the “Young China” to “old China”, China complete this process for less than 20 years when western countries usually for decades or even a hundred years.

2.2 The policy changes under the oppression of retirement pension gap

In 1990s our country has set up the basic pension insurance system, the pension is constituted of the social pooling and individual accounts, and the social pooling is burdened by the unit, currently occupied 20% of total wages. The individual accounts are burdened by stuffs, occupied 8% of individual wages. Pensions paid for the retirees who retired before the establishment of the pension system, burdens by the subsequent contributors, which caused the system cost. When compared with the uptime about insurance system of American-European, China’s pension system is much younger. So there are some big problems in somewhere such as perfection in the pension system, pension accumulation funds, and pension funds operate. Exactly the 20 years running time of pension insurance is just the period-rapid development of China’s economy. Over the past nine years, China’s CPI averaged 2.2%, but investment yield of pension account is less than 2%.As the higher is CPI, a huge loss of welfare formed. Meanwhile, the urban social average wage over the last 10 years has grown at an average of 15%, made the actual purchasing power of the pensions declining. By 2013, the pension gap would reach 18.3 trillion RMB. If the current pension system does not change, the gap will enlarge year by year. Supposing GDP growth rate is 6%, by 2033 the pension gap will reach 68.2 trillion RMB, occupied 38.7% of GDP. Because of the impact of aging population, the number of retirees will increase; the country will spend more and more money on pensions.

Facing with common practice in many countries which have delayed retirement age policy recent times, many scholars have proposed that the proposal to make up for pension gap by extending the retirement age. With statistics showed, every one year it delayed for the retirement age, pension pooling

funds will grow by 4 billion RMB, cut down on expenses about 16 billion RMB, reduce pension gap about 20 billion RMB. Then after 10 years it will be able to slow down the gap about 200 billion RMB.

China can not cope with the current retirement age policy challenges raised by aging. According to World Bank data, only in the past 25 years, the average longevity expectancy in China increased from 68 to 73.5, which has reached the level of moderately developed countries, and the trend is still rising rapidly, but the corresponded birth rate is declining. Therefore, it can be predicted that the extent of aging population in the coming period will continue to deepen. “Old before getting rich” in China will face a series of challenges in the proportion of the labor force, The inflection point of the human dividend stock reduces is coming, and demand for social security will increase. Those can be seen from the increasing burden of pension fund. View from the institutional dependency ratio, population aging caused by increased proportion of elderly population, and lead to increasing demand for pensions. From the self dependency ratio, increasing longevity expectancy implies for extending the time of pension supplied. This structural change makes it more difficult for pension funds. Gradually, extending the retirement age is undoubtedly an effective measure to strengthen the financial pension system, both to increase the contribution years of labor, and to reduce pension benefits.

The current retirement age policy basically follows the general provisions of “Labor Insurance Regulations” (1951) and “the retirement Interim Measures of the staff of state organs” (1955), it can be summarized as “Male’s retirement age is 60, female cadre’s retirement age is 55, female work’s retirement age is 50 when she has served over 10 years”. It should be noted that after 60 years in this policy, lower retirement age, retirement age gap between men and women and other issues have become increasingly apparent. Apparently it can not be able to adapt to the rapid growing and changing economic, society, and population, and it can not comply with the international rule of a general increasing retirement age in most countries either. With the continuous development of social economic and increasing average longevity expectancy, it is said to be an inevitable trend to delay the retirement age appropriately.

2.3 The trend to delay retirement in international community

After experiencing the debt crisis in Europe, it was just the measure to delay the retirement age to ease the burden on national fiscal expenditure in many European countries. Throughout the world, especially in the past two or three decades, both developing and developed countries are dealing the pension gap bring by the aging society with delaying the statutory retirement age, most of which are expected to increase the retirement age 2-5 years in the early 2030s. It can be seen that almost international communities who entered the aging society have use the usual tactics as delaying retirement, the difference is to the duration of retirement, and the period of the implementing policies. Even now, the delayed retirement policy in these countries is still running. The retirement age is still changing, but it is much longer than that in China (male 60, female 55), as shown in Figure 3. In American-European developed countries the retirement age for male is 10 years later than that in China, and for female is 5 years later. So view from the international community, delaying retirement pension is the only trend to solve the aging-society problem for China.

Figure 3 The Retirement Age in Developed Countries

3 The Problem to Implement the Policy of Delaying the Retirement Age in China

3.1 The diversity of labor issues brought by delaying retirement age to different group

Delaying age of retirement is a comprehensive social policy; implementing such a policy should balance the demographic change, employment conditions and the developing requirements of social security systems. From policy, technology, methods to take into account the interests of all social strata can promote the reform of retirement policy effectively. Except for a number of officials and experts expressed to support the delayed beyond retirement policy, general public conveyed voice through various means, especially by the network media, and almost unanimously opposed the implementation of the delay-retirement-policy. According to the survey results shown by www.china.com, only 2.3% of respondents indicated clearly that they support the delayed age for pensioners, while 94.2% show the opposite attitude, as shown in Figure 4.

Figure 4 The Result Surveyed by www.China.com

Why there are so many objections about delaying the retirement age while the policy conform the social development. To this issue, we conduct further analysis and find that supporters are mainly technical staff, university teachers, civil servants, managers and other so-called white-collar groups because at the time their careers is coming in a stable developing stage, and have stable and substantial incomes. Especially some of them master the powerful management positions near retirement age. Therefore, these groups of people are often willing to extend the retirement age. While the so-called blue-collar groups, such as migrant workers, the general population and other social enterprises in the production line workers, are opposed to the extension of the retirement age. Because the work they are engaged in has great labor intensive, low wages, poor working condition and poor physical condition, they do not want to continue to engage in the original post. With depth study, a significant difference exists about the income between “supporters” and “opponents” before and after retirement. On the other hand, opponents raise objections that delay retirement age is also not conducive to youth employment problems.

3.2 The obvious difference of incomes for different people before and after retirement caused by existing income distribution system

Like other developing countries, in the pursuit of economic growth process there is the problem of unfair distribution of income in China. For example, the unequal assigned status lead to that some members of the community have a strong position participating in income distribution. They are able to earn high incomes, even privileged access to earn a large number of non-normal incomes. While some workers keep in a vulnerable position, only get low-income, or even unable to participate in the distribution of income, such as arrears of wages. Unfair allocation criteria, namely workers pay different for equal work. Some of the members have high-income standard, such as workers in monopoly industries; some of the members have low-income standard, such as non-monopoly industry workmen, especially front-line workers, migrant workers. Unequal distribution means that some members can only obtain labor incomes, while some members can also obtain non-normal income, with capital, technology and other factors of production income by virtue of powers means.

“Delay Group” belongs to gainers in the current income distribution system, in addition to the normal wage income in a comfortable working environment before retirement; they can earn bonuses,

benefits, research remuneration and even the gray income, etc. Once retired, other incomes disappear, they can only earn retirement incomes. Maybe they can not endure the huge gap after retirement, so they would like to extend the retirement.

“Retirement Group” belongs to losers in the current income distribution system; they work very hard with large amount of labor while their working conditions are generally worse than white-collar workers. In addition to wages, there is scarcely any other income, and there is little difference in wages between on the job and retired for them. So they do not want to extend the retirement.

3.3 The youth employment challenge brought by the delayed retirement

In the era of world economic integration, affected by the downturn of the global economic, the employment situation in China is very grim. Since 2012, economic growth in China has slowed down. GDP growth fell from 8.1% in the first quarter to 7.6% in the second quarter, and the third was 7.4%. Employment will drag by the economy, so the employment situation is even more severe.

Besides the demand market, it is difficult to expand production or provide more jobs, especially newly added white-collar jobs are limited. What's worse, the number of college graduates is steadily rising, the situation will be more severe to those graduates from in-service education. Only retirees release their existing jobs currently, can youths take the position. Delay retirement means the vacated positions would kept by delayed retirees. Young people can not get jobs and affect employment rates, at last will bring employment problems.

In order to successfully implement the policy about delaying the retirement age in China, it is necessary to improve the working environment, wages of the blue-collar group and resolve the issue about employment of young people.

4 Some Countermeasures to Solve Problems about Delayed Retirement

4.1 Improve the treatment of blue-collar workers from multiple channels

The main objectives to delay retirement are those blue-collar men who are in fair or poor job. There are not much different between their retirement pensions and wages on the job. So they are willing to take retirement pension early, then they can get pensioners while find another career, these are their expect life in old age. Due to blue-collar workers transfer different positions after retirement, the possibility of reduced income, blue-collar worker's motivation might be affected. It is proposed to adopt a multi-channel to improve the treatment of blue-collar workers to deal with retirement measures.

For sustainable development of the unit, many enterprises have earmarked expenses which are devoted to training of human resources for new employees. A portion of this budget can be used to subsidize the blue-collar workers because they can be engaged in helping with young people to develop enterprises. Indirectly, it can help the unit to save the cost for human resources training. Part of the development fund can be also extracted to improve the research environment. Thus, they can work in mental with a relatively comfortable working environment. With their experience and skills they can contribute to the sustainable development of the unit. Also, we can take temporary units personnel expenses from business administration fee to pay for those blue-collar delayed retirees. Meanwhile, state departments establish series of related sponsor policies about relief delay retiree pension obligations, indirectly increase their wages.

With a series of policy measures, the blue-collar workers would gain increased wages and improved working environment during the delayed retirement so that they are willing to delay retirement. But part of the increased revenue should not be offset by personal income tax. Appropriate policies should be set up to ensure the blue-collar workers' personal income when they postponed retirement. However, eliminating personal income tax of all retirees is not conducive to social justice, Owing to the original income of white-collar workers is high, this policy can not narrow the income gap. Raising personal income tax threshold is relatively better to protect blue-collar workers, and then they get benefits during the delayed work and support the delayed retirement policy.

4.2 Take the “small step” instead of “flexible delay”

The “flexible” in the flexible delay retirement policy implies voluntary. It can give individuals the option. Flexible selection can be based on individual physical condition. The public has the right to be self-selection, so the policy may be more easily accepted. But view from the whole society, generally it is not appropriate to delay retirement in manufacture. Suitable industries concentrate on mental industry, that's why white-collar groups are willing to delay retirement while blue-collar groups do not want to delay retirement. However, the current implemented pension is a dual system, which means white-collar groups essentially pay no pensions, so there is no help to reduce the pension gap. On the contrary it is

precisely the subject of pensions paying are blue-collar groups. So there is no use to ask workers to choose whether to work longer or not according to personal preferences as the flexible delay retirement policy for the pension gap.

Extending the retirement age is a lengthy process; it won't be set up immediately. It may take one decade, two decades or even longer to complete this process in a foreign country. "Early decision, small step, step by step", the retirement age can be delayed 1 year every 3 years and gradually rising to 65 years old. As the plan, before 2030, retirement age will reach to 65. This is also a common mode of operation in a lot of international developed countries.

4.3 Take "off-the-job" and not "retired" working mode

In the period of to delay retirement, the original managers in leadership positions must be stepped down in order to avoid getting more personal interests with power, generating more social conflicts and affecting the enthusiasm of blue-collar groups. University teachers, senior technical staff can quit teaching, researching and other first-line positions, concentrate solely on research work, To think about problems in the development of the frontier, to summarize profession problems in the research area, to guide Follow-up echelon members solidly inheritance technique. The enterprise employees of blue-collar groups exit the first line of production in the period of retirement, because there is no longer a problem with apprentice graduated master starved, they can turn to helping the young workers, and teach newcomers with valuable experience. Or they can get a reorientation work to design new products, or play an advisory role in development planning in the unit. Getting out of the first line of production, the blue-collar groups work with mental, both improve their working environment, and reduce the amount of labor, improve the production skills of young workers, develop more new products to enhance the competitiveness of the unit, create a higher productivity.

As the original groups of retired officers get out of the front-line jobs, vacated jobs can be complemented by subsequent staffs. There are still new jobs to recruit new staff, so it's no need to worry about the employment issues due to the delayed retirement age.

5 Conclusions

Based on the analysis of the main problems named implementation delay retirement policy that China confronted with, we put forward many channels to improve the blue-collar delay retirement staff treatment. Several countermeasures such as using the "small step" instead of "flexible delay" strategy, take "off-the-job" and not "retired" work strategies are proposed to solve problems of Chinese delay-retirement policy.

Abstract: The development of Guangxi Beibu Gulf Economic Zone has provided lots of job opportunities for post graduates. As personnel training bases, universities in Guangxi province play an important role for supplying talents. Although enterprises in this area demand lots of post graduates, the employment problem is still serious. In order to solve the problem, we plan to set up a unified labor market and a public employment service system for the top-level and middle-level talents in Guangxi Beibu Gulf Economic Zone. Meanwhile, we also aim to promote the informatization of labor market, and offer compensatory salary to post graduates. In order to cope with serious competition, universities should train postgraduates to have mature skills and students should strive to improve their comprehensive quality. Therefore, this paper focuses on how to improve the service of Guangxi Beibu Gulf Economic Zone's labor market, and how to improve the comprehensive quality of post graduates.

Key words: Guangxi Beibu Gulf Economic Zone; Labor market segmentation; Post graduates; Characteristic of employment's behavior; Questionnaire method

1 Introduction

Since January 16, 2008, the Chinese State Council approved the implementation of Guangxi Beibu Gulf Economic Zone Development Plan, which provides unprecedented development opportunities for the Beibu Gulf region, and the Beibu Gulf region entered a new stage of the leaps and bounds. Nowadays, the economy of the Guangxi Beibu Gulf Economic Zone grows very fast, but the talent is the key to fast development in this region. Nine industrial base strategic decisions in Guangxi Beibu Gulf Economic Zone have huge demand of highly educated graduates with high skills. Local government and employers have realized that the talent is an important support for economic development, and they have paid a great effort in the talent introduction^[1]. However, the high-end talent is still scarce in the Guangxi Beibu Gulf Economic Zone. Looking back to the beginning of the Reform and Opening up of China, the Shenzhen Special Economic Zone and other economically developed areas grew very fast, one reason is there were lots of high-quality talents. Therefore, if the Guangxi Beibu Gulf Economic Zone wants to be the new economic growing pole, a unified labor market should be established to attract talents

Guangxi Beibu Gulf Economic Zone develops very fast and it provides lots of job opportunities for post graduates in Guangxi. As the personnel training bases, universities in Guangxi play an important role to supply talents. Since the restoration of college examination system, Guangxi Higher education enhances their ability of management and postgraduate education develops fast. The number of post graduates in Guangxi increased from 747 in 1995, to 5774 in 2003, 13291 in 2006, and 16570 in 2008. With the expansion of postgraduate education, there is no huge advantage for postgraduates compare with undergraduates when they hunt jobs, there is no academic advantage compared with the doctoral. In fact, they has gradually become an awkward group in society, also employment situation is not satisfying. Take the example of Guangxi University, there are 6300 total graduates on July 31, 2010, and the employment rate was 90.41%. Among them, 29 students were Ph.D graduates, and 28 students were employed and employment rate was 96.55%; 1551 students were post graduates, and 1336 students were employed, and employment rate was 86.14%; 4720 students were undergraduates, 4332 students were employed, and the employment rate was 91.78%. The employment rate of post graduates is lower than the average employment rate in the whole university.

Although the enterprises in this area need post graduates for working, there are difficulties when the students from universities in Guangxi hunt jobs. The reasons that lead to this paradoxical phenomenon are the rising enrollment, the financial crisis, university education mode, and imperfect

labor market^[2]. The crucial factor is the labor market segmentation in Guangxi Beibu Gulf Economic Zone, through studying the theory of the labor market segmentation and analyzing the operation condition of labor market in Guangxi Beibu Gulf Economic Zone. Base on the systematic summary of relevant literature, this paper discusses the characteristic of employment behavior of post graduates in Guangxi under the background of the labor market segmentation in Guangxi Beibu Gulf Economic Zone by studying the employment preferences and job hunting^[3].

Enterprises in Guangxi Beibu Gulf Economic Zone want to employ lots of post graduates, but the employment rate is still small. I think the main reason of this difference is the post graduates have obvious preference to the major labor market where the position is limited under the background of the labor market segmentation in Guangxi Beibu Gulf Economic Zone. Therefore, the unemployment of post graduates mainly is the structural unemployment. Meanwhile, institutional labor market segmentation also constrained the development of our country employment support policy. In order to solve the problems, we need to construct a unified labor market in Guangxi Beibu Gulf Economic Zone, and set up the senior personnel public employment service system and accelerate the informatization of labor market, and break the monopolies, and deepen the reform of household management system in gulf region, and promote the ability of absorbing employment promotion to the non-public economy unit, and offer compensatory wages, and complete the work of the cultivation of post graduates, and improve their comprehensive quality, and etc.

2 Improving Labor Market in Guangxi Beibu Gulf Economic Zone

2.1 Constructing the unified labor market

Chinese labor market segmentation is the consequence of dual economic structure, and it leads to high cost of job changing which reduce labor mobility, limits the efficient allocation of human resources, and restricts employment success of masters who have clear preferences in employment units and areas. Therefore, to alleviate the graduate employment problems in Guangxi, institutional barriers need to be eliminated, and the monopoly and labor market segmentation need to be broken, and a unified labor force market needs to be established^[4].

As the history of Guangxi Beibu Gulf Economic Zone labor is not long, the situation of segmentation here is much more serious than the developed region's and it cannot be completely eliminated in a short term. Setting up the unified labor force market is a long-term and formidable task. Thus, the integration of the labor market should be promoted based on the regional development of the labor market situation and introduced the advanced experiences from advanced regions, and it prefers to the allocation function of the market on labor resources instead of the mandatory administrative intervention of the relevant functional departments. Similarly, speeding up construction of the legal system to provide an institutional guarantee for building a unified labor market and reducing the cost for job hunting and conversion is the good ways to attract talents to come to this region^[5].

2.2 Establishing a public employment service system for the top-level and middle-level talents

Talents are very important supports for regional economy and industry development. Accelerating the pace of opening up and development of the Beibu Gulf Economic Zone and the strategic decision of nine industrial base constructions requires all kinds of talents^[6]. A consensus has been developed between governments and enterprises here on introduction and cultivation of talents and there are many preferential policies on the shortage of talents. However, the effective employment policy has not yet been introduced by local government to improve the public employment service system due to the differences in Beibu Gulf regional economy development. Beibu Gulf Economic Zone has not yet established a harmonious public employment service system for different kinds of talents which limits the cities' employment services, and the existing employment service organizations have not been fully utilized to adjust talents flow and jobs creation, which is caused by its feature of strong administration, low marketing, weak base and less efficiency. The regional governments in Beibu Gulf should take some effective measurements to fulfill its public service functions, and improve the public employment service system, and accelerate the flow of professionals who are urgently needed in this area and provide open and transparent labor market environment to reduce the costs of talents flow and transaction. With the increasing scope and intensity of the regional economic cooperation in the Beibu Gulf, market brings forward the new requirements to talent flow. Therefore, Guangxi Beibu Gulf Economic Zone need to set up a trans-regional middle and senior talent public employment service system to reduce the impact of labor market segmentation on the talent flow for the establishment of unified labor market of the Guangxi Beibu Gulf Economic Zone.

2.3 Accelerating the informatization of labor market

The efficient and convenient information platform will benefit the establishment of flexible labor markets in Beibu Gulf Economic Zone, and the timely information of labor supply and demand which is provided by higher levels informational labor markets can optimize the allocation of labor resources and speed up the unification process of the labor market in the Guangxi Beibu Gulf Economic Zone. Although the Web portal of recruitment and job hunting for Guangxi Beibu Gulf Economic Zone was established with a top-level talent section, but there are only 84 records in almost four years, and compared with that in developed regions the gap is still quite big, and the ability to provide services for both the labor supply and demand should be improved^[7]. Therefore, it is necessary to speed up the process of information-based labor market to improve its service for talents, which is an important measurement of perfecting employment service system for middle and senior talent public.

2.4 Breaking monopoly of industry

Labor market wage mechanism does not accurately reflect the relationship between labor supply and demand under the administrative intervention. The income gap between different industries in Guangxi Beibu Gulf Economic Zone has evident features of inter-industry labor market segmentation. The monopoly industries have higher wages, better benefits and working environment, while competitive industries is just the reverse^[8]. The big difference between these two industries caused that graduate students prefer to stay unemployment or continue to hunt for the company in the primary labor market. Even they cannot enter the primary labor market successfully rather than enter the secondary labor market to work. Therefore, the government needs to improve the mechanism of competition, gradually weaken the preferential policies on the protection of the monopoly industries and break the inter-industry labor market segmentation, to establish an equal competitive labor market.

2.5 Enhancing the ability of non-public economic units to absorb employment

In general, non-public economy in Guangxi Beibu Gulf Economic Zone grows rapidly under the market-oriented policy, individuals and the private enterprises as the primary non-public economy have become an important channel to absorb employment with diverse and flexible ways. However, compared with some developed regions in China such as Zhejiang, the gap is still big that the scale of non-public enterprises in Guangxi Beibu Gulf Economic Zone is small, and the productivity is poorly competitive. Therefore SME is difficult to start business and development mechanism is not fully developed. Traditional channels of employment in state-owned units, urban collective units still absorb lots of employees in urban areas, but the number is decreasing. There is some gap in non-public economic development between Beibu Gulf regions due to the economic, historical reasons and non-public employer in Nanning has become the main channel for creating jobs. In 2008, the proportion of working in non-public enterprises is more than that in public departments, and was 52.3%. In contrary, the public departments are the major employers in Beihai City. In 2008, the proportion of people working public departments is 77.6%. In order to broaden employment channels for post graduates, Guangxi Beibu Gulf Economic Zone should make efforts to develop non-public economy (Table 1).

Table 1 The Employee Distribution of Four Cities in Beibu Gulf (2008)

City	Nanning	Beihai	Fangchenggang	Qinzhou
Employees in cities and towns (ten thousand)	84.39	10.33	13.33	24.52
State-owned unit enterprises	37.95	7.23	5.79	9.46
Collectively-owned enterprises	1.99	0.79	0.87	0.88
enterprises invested from HongKong, Macao, and Taiwan	0.85	0.36	0.06	0.30

3 Cultivating Qualified Post Graduates in Guangxi

3.1 Gradually optimizing the disciplinary structures of universities

Efforts on talent education and training applicable talents for the Beibu Gulf economic construction

are incumbent on the Guangxi Universities. The more the needs of graduate students during the economic development, the more requirements needs to be proposed on universities postgraduate training mode and structure, and that also will bring opportunities and challenges for universities postgraduate employment. Disciplinary structure is strongly correlated with regional economic development, which is a concrete manifestation of the higher education resource allocation and an important platform to carry the three main functions of higher education. With the adjustment of industrial structure, disciplinary structures in universities of Guangxi need to be optimized gradually to suit the needs of economic development. The development of disciplines in universities in Guangxi are growing fast, such as Management, Education and Law, which is in line with the trend of industrial structure from the primary industry gradually shifting to the secondary and tertiary industries, while Philosophy, History, Literature and other similar discipline are developing slightly slow. Considering that the opening of Beibu Gulf is not long, it becomes increasingly important to optimize the disciplinary structure to cultivate applicable talents for the Guangxi Beibu Gulf Economic Zone (Table 2).

Table 2 The Number of Post Graduates in Different Disciplines in Guangxi Universities

Year	2003	2004	2005	2006	2007	2008

Data source: Guangxi education almanac from 2004-2009 year

3.2 Carrying out employment education for graduates

The employment guidance institutions of universities in Guangxi need to strengthen employment guidance and career planning for graduates. Meanwhile, universities need communicate more with employers to maintain close contact with the labor market, understand well the market demand what types of talents is shortage, and then widen the channels of employment of graduate students. During the process of education, universities should focus more on practical ability of graduates, to improve graduates comprehensive quality, employability and competitiveness. For this reason, universities employment guidance institutions should construct graduate internship platform to open the unify channels of internship to employment, guidance staff to provide timely services to graduate students in their job hunting. Most universities offer career guidance courses and actively explore new courses. In 2009, Guangxi University began to use external platform to carry out pre-employment education, their enrolment and vocation guidance center cooperated with the Times Honor International Education Science and Technology Co. Ltd (Beijing), brought in pre-vocational education network school. In this way they accumulate quality education resources and can provide vocational education programs for graduate students and improve their competitiveness in the job market.

4 Elevating Graduates' Comprehensive Quality

With the development of Guangxi Beibu Gulf Economic Zone, more and more college graduates from other provinces and cities regarded Guangxi Beibu Gulf Economic Zone as a new employment hotspot, employers of part of the Beibu Gulf region will hold special recruitment in other provinces colleges when graduates in Guangxi couldn't meet their requirements. Graduates from other provinces, the undergraduates, Ph. D and other practitioners of the Guangxi region all might be competitor.

Therefore, during the school time, postgraduates should strive to improve their overall quality to cope with the fierce competition for talent. On one hand Postgraduates from Guangxi should train themselves to be person with good theoretical knowledge, practical skills and creative ability to success in competition. On another hand, they should take an active part in social practice, to improve practical ability and interpersonal skills, and keep close relations with society. Employers need skillful talents who can set to work immediately, so postgraduates had better to actively take part in social practice, and combine scientific research with social practice, and find internship opportunities to improve their overall quality and get fully preparation on vocational skills and mental diathesis during the school. This is much better than adapting to the workplace and society gradually after step into the work passively. Through the research interviews, we found that the when the employers recruit graduate students, they more focus on the practical ability. They prefer graduates with combination of theoretical knowledge, practical experience, a positive attitude, and appropriate expectations. As the manager of the recruitment said, there are some understanding deviations during graduate students hunting jobs.

This research also found that postgraduates of Guangxi obviously prefer to job with high wages, but when the salary does not meet their expectations, they usually decide to have a voluntary unemployment and continue hunt another job, but this can cause waste of talent. In the case of incomplete labor market, the postgraduates should reduce salary expectation, and set a reasonable target, and take a job at first then select different careers, which is a more wise choice. Meanwhile, postgraduates in employment should adjust mindset, and start with the basics, and never be too ambitious.

Internship is the best period to adjust attitude, gain experience, and change to social style from the style of student. Postgraduates should clearly understand that solid theory cannot compete with practical ability. They should forget the degree factor and learn more from older employees, and think more of the units I need to do rather than what the units can provided for me. They also constantly absorb new knowledge in accordance with the requirements of the job, but not limited to their own professional range. At the same time, they must learn how to be mannered, as the ultimate goal is to mainstream their selves into the society, to create value for society. Whether or not they can get the maximized society support and recognition is decided by their own social level, taste and the way of dealing with others.

5 Conclusions

The segmentation of labor market will affect employment of postgraduates for a long time. Although Guangxi Beibu Gulf Economic Zone has great demand of postgraduates, the overall employment situation is not as good as expected, as there is obvious labor market preference. How to let postgraduates play a greater role as a high-level talent under the severe employment situation is worthy issue to discuss. In summary, the developing of Guangxi Beibu Gulf Economic Zone brings opportunities and challenges for postgraduates' employment; and we must accelerate the pace of constructing the labor market to build a unified labor market. Furthermore, we must cultivate postgraduates to enhance their comprehensive quality to promote employment.

Normative Management of College English Teaching Mode*

Wang Ming, Wang Dajin

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: wmanthea@sina.com, djking@whut.edu.cn)

Abstract: English is one of the most important information carriers. The reform of college English teaching mode is the inevitable result of the development of information technology. Normative management is the key to ensure the smooth and effective implementation of college English teaching reform. This thesis probes into the normative management of college English teaching mode, aiming to improve college students' English comprehensive application ability and teachers' overall teaching and research quality.

Key words: College English; Teaching mode; Normative management; Reform

1 Introduction

As is known to all, the 21st Century is the century of economic globalization, the integration of science and technology, and the coexistence of information, knowledge and economic. Because English is one of the most important information carriers, our society is desperate for professional and technical personnel proficient in English. In order to cultivate talents of this era, the Ministry of Education has invested substantial manpower and financial resources into the comprehensive research on the current situation of college foreign language teaching, finding that "At present, The English comprehensive application ability of China's college graduates is generally low. They can't listen, speak or write well." (Zhang Hengzhen, 2004) How to reform the current teaching mode, teaching methods and improve the efficiency of foreign language teaching has become the common concern of the foreign language field.

The purpose of college English teaching reform is to make the students acquire more English knowledge and thus enhance their English level, through reforming the English teaching mode and improving the teaching efficiency on the premise of not increasing students' learning burden. In China, English learning basically relies on classroom teaching, but the success of college English teaching relies more on developing students' autonomous learning after English class. The rapid development of modern information technology, especially the development of network technology, is breaking the traditional English teaching mode. Instead there is a student-centered, communication targeted, open, vibrant and dynamic teaching mode. The various characteristics of multimedia computer technology and network technology can effectively promote students' cognitive development, and particularly be suitable for the realization of the constructive learning environment, such as "situation", "cooperation", "conversation" and "meaning construction". In a sense, the reform of college English teaching mode is the inevitable result of the development of information technology. Normative management is the key to ensure the smooth and effective implementation of college English teaching reform.

2 The Normative Management of College English Teaching Mode

2.1 With the leaders' attention and the department cooperation

College English teaching reform is a systematic project, involving the school teaching management departments, the modern information technology departments, and the teachers and students' active participation and cooperation. Among all the factors, the leaders' attention is the essential and the department cooperation is the guarantee. Only with the school leadership's enough attention and the close cooperation between the various departments can the college English teaching reform carry on smoothly and effectively.

Our school has established college English teaching reform leading group in March, 2004: the school vice president in charge of teaching as the group leader, and the deputy director of the Academic Affairs Office and the vice president of Foreign Language School in charge of teaching as the vice group leaders. The members include the head persons of the Academic Affairs Office, the Supervision Department, the department of modern educational technology, the network center, the teaching office of Foreign Language School, and the college English teaching department of Foreign Language School. The leading group holds 2-3 symposia each semester to research, coordinate and solve the problems in

* This paper is supported by the 2011 Hubei Province Teaching and Research Program "Deepening the reform of curriculum system and improving students' comprehensive ability of using English(No. 2011032)".

the teaching reform.

2.2 Changing ideology and unifying understanding

College English curriculum is an open system and it is the result of separate interaction of teachers and textbooks, teachers and students, students and textbooks. Teaching and courses are open, interactive, and interlocutory. Learning is not only the process of imparting knowledge, but also questing for and creating knowledge. Learning is the process of knowledge construction. Students should not be satisfied with knowing the content, but knowing the possibilities of what might be, in order to create a possible world. During the study, students should take the initiative to select and explore, to enhance the capacity of independent thinking and judgments. (Zheng Hui, Mi Sha, Yang Yali, Yang Dongling, 2010)

To implement the normative management of college English teaching mode, first of all, the guiding ideology of education should be changed from the examination-oriented education to quality education. Secondly, change the teacher’s role from the knowledge teacher to the students’ English comprehensive application ability instructor. Thirdly, change the emphasis of the teaching content from on language knowledge teaching to on the students’ communicative competence. Fourthly, the success of the college English teaching reform lies in the teaching mode changing from the teacher-centered to the student-centered. Fifthly, teaching assessment changes from the summative assessment to the combination of the process assessment and the summative assessment.

2.3 Updating teaching mode and strengthening listening and speaking

The reform of teaching mode, fundamentally speaking, is to change from the teacher-centered, simply imparting language knowledge and skills to the student-centered, imparting the normal language knowledge and skills and what’s more, cultivating the students’ language application ability and autonomous learning ability. Reasonable teaching mode is a security for the successful college English reform. The characteristics of college English teaching reform is to change the teaching ideology and the teaching mode, guarantee the new teaching mode inheriting the advantages of the traditional teaching mode, be backed with modern information technology and network technology and direct the teaching into the personalized, independent development. For the college English teaching reform backed by the modern information technology and network technology, we should not only focus on the use of new technology, but pay more attention to the real reverses of the teaching mode, the teaching approach and the teaching core. Among them, the reform of teaching mode is the most important.

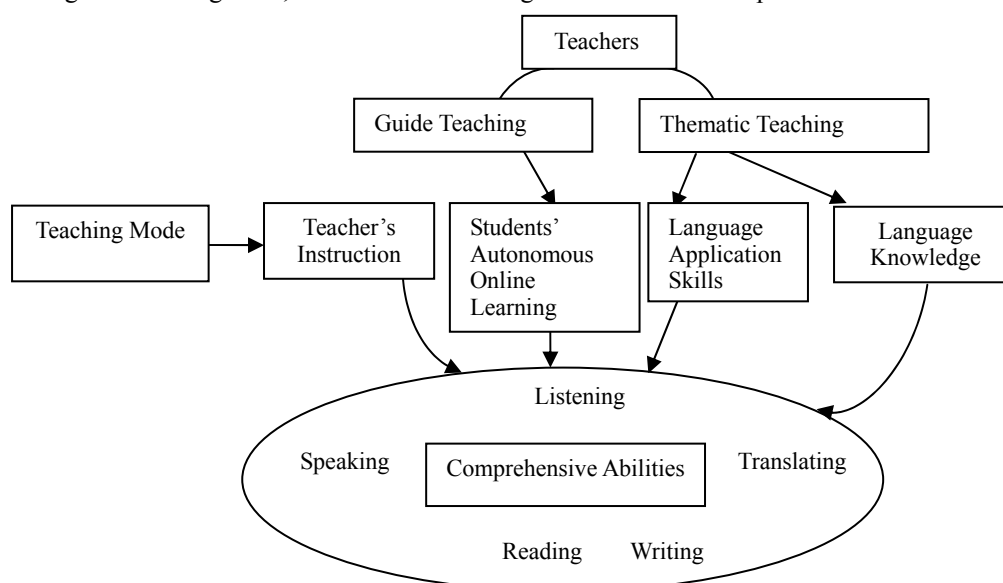

Figure 1 Teaching Mode

Teaching model is dynamic. It should be established corresponding to the basic condition of the school and the students’ English level and make adjustments with the change of the students’ English level in the operation to receive the best effects. Based on the constant exploration and summary of the college English teaching requirements and basic cultivation targets, we formulate the teaching mode integrated by guide teaching and thematic teaching with the characteristics of our university. This mode combines the traditional classroom teaching mode with the modern information technology, considering

both the relationship between individual autonomous learning and classroom teaching and the relationship between language foundation and comprehensive language application ability. Its main characteristic is to provide the teachers and students more independent space and help to improve the students' English learning autonomy and participation and the students' comprehensive abilities of listening, speaking, reading, writing and translating. (Figure 1)

2.3.1 Guide teaching

Guide teaching mainly refers to that the students do independent learning under the guidance of teachers. The main teaching content is the audio-visual course, aiming to improve the students' listening and speaking ability. We use the two instructions (i.e.: autonomous learning strategy instruction before class and online question answering guidance) and two inspection ways (i.e.: classroom teaching inspection and online course booking inspection) to ensure students' autonomous learning effect. (Figure 2)

Autonomous Learning is a modern way of learning corresponding to the traditional accepting learning. It regards students as the subject of study, and it can achieve the learning objectives through the students' independent analysis, exploration, practice, questioning and creation. (Wang Xin, Tian Ming, Yuan Lijuan, 2013) Teachers should constantly track students' online learning, knowing the study gress and effects. So that students can adjust their learning strategies and improve study methods before they start their autonomous learning with a definite aim.

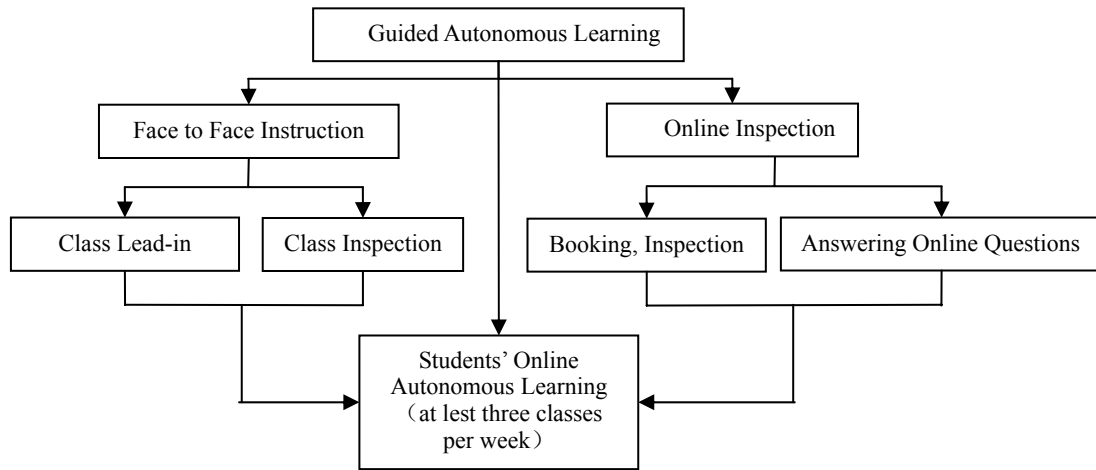

Figure 2 Guide Teaching

2.3.2 Thematic teaching

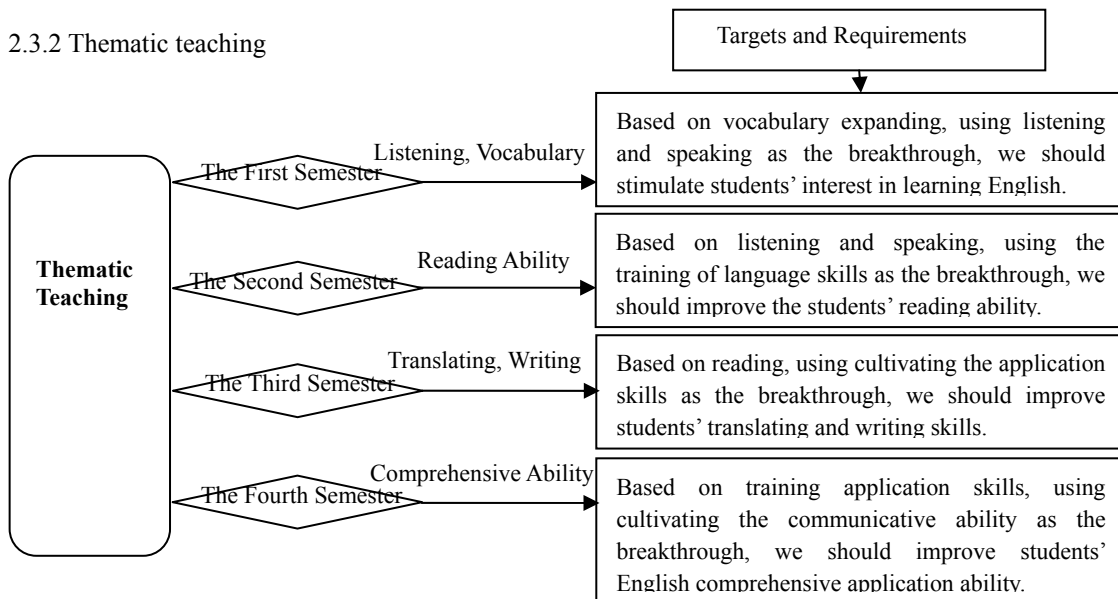

Figure 3 Thematic Teaching

Thematic teaching is a specific form of task-based teaching method. It has five characteristics: 1) The target language is learned through communication. 2) The real material is introduced into the learning environment. 3) The learners not only pay attention to language learning, but also pay attention to the learning process. 4) The learner's life experience is used as important resources of classroom learning. 5) Class language learning and after-class language learning activities should be combined together. (Wang Xiaoli, 2013)

Thematic teaching mainly refers to organize the multimedia classroom teaching by focuses and semesters. The content mainly includes reading, writing and translating. The teaching of the first semester focuses on cultivating the students' interest in learning English and training their listening and speaking skills. The teaching of the second semester focuses on training their reading skills and expanding their reading. The teaching of the third term focuses on training their translation and writing skills. The teaching of the fourth term focuses on training the English comprehensive application ability. The purpose is to improve the students' English comprehensive application ability. (Figure 3)

We can use the following chart clearly show the relationship and requirements of levels 1-4. (Figure 4)

Figure 4 Comparisons Between Levels 1-4 Cultivation Requirements

From chart 4, we can see that Level 1= 1+2, Level 2= 2+3+4, Level 3= 4+5+6 and Level 4= 6+7. Each semester has its special focus. But the requirements among levels and terms are closely connected.

2.3.3 Offering higher level courses and requirements

The object of higher level stage learning refers to the students basically at level 2 according to the English classification examination at the beginning of the first academic year. These students achieve the General Requirements of the "College English Curriculum Requirements (for Trial Implementation)" after three semesters' foreign language learning. In the fourth semester, the selective courses are offered to improve students' comprehensive application abilities. After four semesters of foreign language learning, they should meet the basic requirements of "College English Curriculum Requirements (for Trial Implementation)".

The selective courses of higher stage learning are divided into three categories. Each category offers 3-4 courses for students to choose. Each course has 32-36 hours and 2 credits. Students must take two with the total of 4 credits. Students can obtain credits after passing the examinations. If they cannot pass the exam, students can retake the course or choose another English selective course until they get 4 credits.

3 Conclusion

The development of college English teaching is not motionless. That means the exploration of new modes of college English teaching is endless. To establish a new personalized autonomous college English learning mode, the first thing is to continuously strengthen the construction of the network environment, providing a good environment for students' autonomous learning. Second, teachers should face the new teaching mode, update ideas and promote the continuous development of college teaching reform. Third, colleges should intensify the training of computer network multimedia technologies for teachers and students.

The normative management of college English teaching mode can help students learn independently and arouse their interests to some degree. Students have more time to control so that they can make more decisions on their learning and they feel more relaxed without so much control of the teacher. Nearly all teachers admit the current teaching mode management possesses advantages in lightening teachers' workload, diversifying the learning channel, and providing chances for students to practice listening and speaking skills. And most teachers are optimistic that it can improve students'

all-round abilities, arouse students' interests and motivate students. As we strengthen the normative management of college English teaching mode, and adopt a series of reform measures, English comprehensive application ability of our university's students can be greatly improved. Meanwhile, the overall quality, teaching, and scientific research ability of teachers can be improved obviously.

Abstract: Lots of research shows that entrepreneurial economy is the main driving force for global economic development, which is substantially a kind of innovation economy. By sorting out the relevant reference of entrepreneurial economy and discussing theoretically, the author analyzed the characteristics of the entrepreneurial economy, and proposed the basic conditions for the path dependence, the multiplier effect and the value overflow, so as to construct theoretical framework of entrepreneurial economy, and provide a theoretical thinking for the entrepreneurial economy development.

Key words: Entrepreneurial economy; Chain group; Hypergraph; Path dependence; Multiplier effect

1 Introduction

The economic globalization brought the entrepreneurial activities many development opportunities in many developing countries since the 1990s. After accumulation for many years, the entrepreneurial economy in China has been a new economic growth point to the sustainable and healthy economic development. Entrepreneurial activities are quite lively in various fields, like electronic information, and biological medicine in high-technology field; information consultant, modern logistics in new service industry, all of the above make space for entrepreneurial economic development in China. John G. Burch (1986) defined entrepreneurship as the activities of setting up a corporation^[1]. While Chen, the initiator of entrepreneurial economy in China, thinks the entrepreneurship to establish one's own career through creating and seizing opportunities^[2]. Entrepreneurship is generally to create or expand an enterprise, with the core of resource integration, resource allocation optimization, and value realization. Entrepreneurship is essentially an innovation activity. Peter F. Drucker proposed the thesis of "entrepreneurial economy" in 1985^[3], thinking small and medium enterprises play the leading role in entrepreneurial economy, which has some era limitation. Since the middle of 1990s, Organization for Economic Cooperation and Development (OECD), Asia-Pacific Economic Cooperation (APEC) etc, started to make a thorough study on policies that various countries adopt to promote entrepreneurship and develop entrepreneurial economy. Domestic scholar Chen Shiqing thought, the entrepreneurial economy showed the economic regulation based on the entrepreneurship. Entrepreneurial economy reflects the laws of economic development, which concentrates mainly on innovation, entrepreneurship, opportunity, human subjectivity, and the relationship between the subject and the object. Li Zheng and Li Yuling proposed that entrepreneurial economy is an economic development model^[4], in which the productive entrepreneurial activities play a key role in growth of a country or a region. In this paper, the author believes that the entrepreneurial economy is an economic form that the entrepreneurs create new business or innovate through entrepreneurial activity, and realize value from a micro point of view, and promote the economic development from the macro point of view.

2 Characteristic of Entrepreneurial Activities

The 2010 GEM report shows that the Total Entrepreneurial Prevalence Activity Index (TEA) of China is relatively high, means China is an active entrepreneurial country. From the development and growth of many entrepreneurial enterprises, we can see entrepreneurial activities in different environment have different characteristics, due to the impact of opportunity, organizing model, and environment and so on. The entrepreneurial economy development is effected by both micro factors and macro environment (Busenitz et al, 2003)^[5]. The micro factors include entrepreneurs and the team, entrepreneurial opportunities and organizational model. In the GEM, the entrepreneurial environment is defined as financial support, government-project support, government policies, education and training,

* This paper is supported by Wuhan Soft Science Project (Nos.201141333443-2).

barriers-entry, physical infrastructure, research transfer, commercial and professional infrastructure and cultural and social norms.

2.1 Attribute of entrepreneurial economy

1) Area attribute

Due to local resources, local policy or some other reasons, the Chinese entrepreneurial economy shows the typical regional entrepreneurial economic characteristic, such as the “opportunity-based business model” in the Chinese high-tech development, represented by Zhongguancun; another example is the “survival entrepreneurship model” in the Wenzhou and south Jiangsu Province, represented by folk economy. Coastal areas and rapid-development areas have the advantages of talented personnel with higher-level education, sufficient human resources, policy to promote entrepreneurial economic development and local government support. Shanghai, Zhejiang Province and Guangdong Province are of this kind.

2) Network attribute

The network is a platform for the members to interact and exchange resources, so as to promote the economic activities. Entrepreneurial individual contacts with each other to constitute an entrepreneurial network; through this way the resources can be found. Entrepreneurial enterprises can take advantage of the networks within or between enterprises to seek opportunities for cooperation and integration of resources at any time. Whether “protogenic economy” or “derivative economy”, it is necessary to share the existing resources within the network, and promote cooperation on the basis of a relatively high trust, through relation or location convenience to constitute inner or outer network system of entrepreneurial economy. The relationship interaction can gradually expand the existing social network of the entrepreneurial economy, and improve the updating rate and covering scope of the information, finally create a social network in the pattern of "many to many". Similar entrepreneurial enterprises emerge, through diffusion via the network, to promote industrial expansion, the regional advantage, and a virtuous cycle of industry clusters and entrepreneurial economy.

3) Resource property

The resources can be divided into direct resource and indirect resource. The former includes policy resource, information resource, technology resource; the latter includes financial resource, management resource, human resource^[6](Lin Song, 2007). Acquisition and integration of entrepreneurial resources go through the whole process of entrepreneurship. The entrepreneurs should be able to identify and integrate various entrepreneurial resources, finally realize the core competitiveness and growth of the enterprise.

At the start of entrepreneurship, the identification of entrepreneurial opportunities and entrepreneurial resources are closely correlated, so the entrepreneur should decide whether there is enough resource to support the entrepreneurial activities. During the development process of an enterprise, the entrepreneur needs to pay attention to the effective use of resources as well as acquisition of entrepreneurial resources. Through test, study, growth, guidance, demonstration and share, entrepreneur can realize the expansion and mature of an enterprise. For an enterprise, the most important thing is not the quantitative accumulation of entrepreneurial resources, but the qualitative leap. The process of entrepreneurship is essentially the process of entrepreneurial resources integration, and finally gains superiority.

2.2 Characteristic of entrepreneurial economy

1) Chain group

On the basis of resources relations, enterprises are connected with each other in the form of chain. The starting point of some industrial chains is based on the industrial structure hole. The access to resources is basically the constantly exploration of the structural holes in the network; then gradually change the network structure, so that the enterprises in this network could gain a competitive advantage. On the basis of value, supply and demand, the industrial chain is formed between the entrepreneurial enterprises and other enterprises through an equilibrium process. The formation of entrepreneurial cluster is a concentrated process of chains homogenization in a specific area. Many factors affect this process, like location advantage, traditional industry, but the most important one is the combination of local traditional industry advantage and the exploration of entrepreneurial network. The pursuit of profit maximization is the intrinsic motivation and lasting power for the formation and development of an enterprise cluster. Weber's cluster economic function demonstrates that system functions of a enterprise cluster is bigger than the sum under the dispersed state, that is $1+1 > 2$.

The relative enterprises in a clan are adjacent in location, which is advantageous for information communication and technology overflow. Professional knowledge or technology is obtained whether

from independent innovation or imitational innovation. The well-known "Wenzhou pattern" has a obvious feature of chain group. Through the pattern that "one household help another household, one village help another village", Wenzhou forms a professional industrial chain, that "one breed in one town, one industry in one village", and further give birth to various characteristic professional markets. So, on the basis of similar industry, regional clusters form "massive economy", and then industry cluster one by one. Through expansion of "point", lengthen "chain" and cultivate "group", together with the "invisible hand" of market, entrepreneur could breakthrough the obstacle of marketization, to form a unified element and product market; construct regional brand; amplify the market impact; derive new interest chain and entrepreneurial group; deeply develop entrepreneurial activity and finally promote the lasting development of entrepreneurial economy.

2) Lattice

The cluster of entrepreneurial enterprises is advantageous to the formation of a new enterprise, further the expansion of that enterprises cluster. New entrepreneurial enterprise is usually derived from entrepreneurial cluster, for the cluster has concentrated technology information, active innovation, technology innovation, and relatively good innovation circumstance. Incubator effect of enterprise cluster continually promotes formation of new enterprise. "Derivative economy" of entrepreneurship is a new economic development pattern that entrepreneurial enterprise uses the surplus resources widely exist in the social network to obtain profits through production. In local entrepreneurial economy, in order to be a pillar to local industrial development, large enterprise is always the important supporting objects of the government. No matter in public or non-public ownership, large enterprises can play a leading role in a region. Local entrepreneurial economy can form an industrial structure in chain or ring type, and then cultivate a complete entrepreneurial economy chain based on social network. There are two patterns as shown in Figure 1.

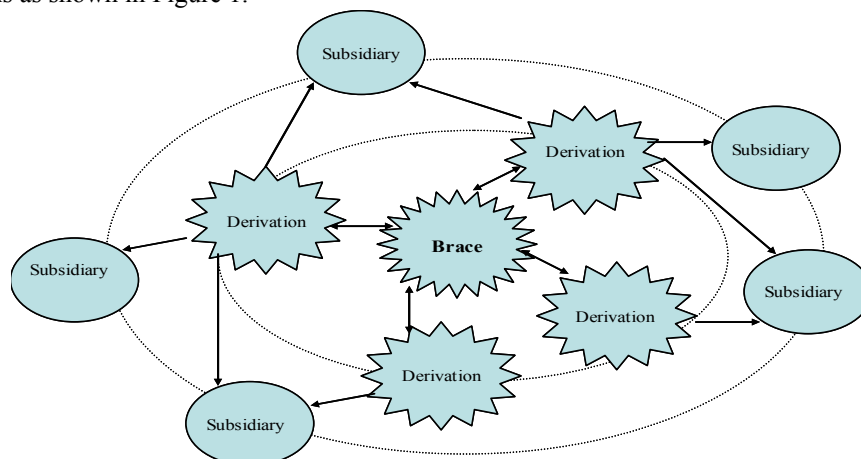

Figure 1 Social Network Radiation Effect Of Entrepreneurial Enterprise

Origin is entrepreneurship pillar enterprises, there derivative lattice network in radiation pattern, and the central region denotes the native pillars of entrepreneurial enterprises. With the improvement of social labor division and specialization, enterprise concentrate more on the core area, and create an opportunity for other aspects of the value chain to serve other enterprises. Under the economic development pattern that "a big one cultivate several small ones", dynamic entrepreneurial parks are constituted, and they are bound to bring about the development of the local service industry, and finally form a complete regional entrepreneurial economic industry structure.

In the ring network pattern, the entrepreneurial derivative enterprises, denoted by the sub-central region, are the main drive power. Derivative enterprises are always private enterprises, which are strongly rooted, and have prominent endogenous growth. After a certain stage of sound development, private enterprises obtain foundation development forces, and become the hot spot of regional economic growth. With the development of entrepreneurial enterprises, the derivative enterprises can also nurture pillar enterprises, and then evolve for the place of the original pillars of entrepreneurial economy. The new pillar shelter development of subsidiary companies, so the "grass roots economy" develop to be "banyan economy", and a new lattice emerges [7].

3) Hypergraph

There are multiple sub-networks in the network presented by the hypergraph, those sub-networks are connected with each other through differentiation of resources, resource sharing, technology imitation, competition and cooperation. Different entrepreneurial enterprises take different roles of entrepreneurial booster, for example, providing funds, providing raw materials and semi-finished products, sharing information, being a distributor or providing other value-added services. Generally speaking, entrepreneurial enterprise network is constituted by different levels of sub-networks. Each entrepreneurial enterprise is embedded into a sub-network, according to its certain functions, relationships, and resource properties. Within the network, the flows of information and resources have vectors that are from the inferior to superiority. When the entrepreneurial enterprises with the same property are at the same level of subnet, then the subnet is stable, and realizes value increment through this stable conversion cycle.

Figure 2 Hypergraph Model of the Entrepreneurial Economy

The entrepreneur experience a process that from individual to enterprise, and then to the society. During this process, the entrepreneurial resources integrate and optimize on the basis of spatial concentration, industry concentration and correlation extent. Economic forms change responding to different entrepreneurial stage, and the hypergraph pattern of entrepreneurial evolution is shown in Figure 2, V is the economy vertice, E represents the hypergraph edge. The folk individual economy transform to derivative economy through making use of existing and derivative resource network. With the development of contact between regions and industries, the banyan economy and cluster economy emerge. The discovery of super-path is advantageous to effective and sound development of entrepreneurial economy. Considering the multi-dimensional nature of market opportunities, in the hypergraph model based on correlation, any path demonstrates that two entrepreneurial economy forms have relation and is feasible. Therefore, the key to judge whether it can transform is to find the relation between the entrepreneurial relations between economic forms, in other words, to find the hypergraph path.

3 Basic Conditions for Entrepreneurial Economy

1) Path dependence

Each individual in the social network of entrepreneurial enterprise is similar to each other. Which entrepreneurial pattern to choose is mainly decided by the entrepreneurial resources and environment. Once the entrepreneurial enterprise enter the entrepreneurial network, it will rely on the network principal and resource, then develop along a certain path, and self-reinforce in the intended direction, this is called "path dependence". The original ecology of the entrepreneurial economy always starts in the form of folk family workshops, like individual entrepreneurship, family entrepreneurship, partnership entrepreneurship and franchising; then, original ecology of the entrepreneurial economy develops to "grass roots economy", under the combined effects of micro factors, like individual behavior and character, relation network, and macro factors, like policy, technology, culture; finally, it evolves to "derivative economy" through making use of excessive resources to develop new product or enterprise.

Each region has its specific entrepreneurial cluster, for their special historical traditions, the accumulation of conventional technology and the entrepreneurial spirit incentives, after a self-reinforcement and economic scale development. Among them, the self-reinforcement makes the entrepreneurial cluster

strengthen and further "lock" during the aggregation process of increasing returns; or entrepreneurial cluster may slide down the wrong path, which harms or weakens the competitive advantages. The path dependence executes the memory function of entrepreneurial enterprise, and it is a special skill.

2) Multiplier effect

The multiplier effect is a macro economic effects; it denotes the chain reaction of the economic aggregate according to the increment and decrement of a variable. The integration of entrepreneurial enterprise network resources will largely upgrade the efficiency of the entire network, and each enterprise benefits from shared network resources. Once the entrepreneurial cluster forms, it has a tendency of self-reinforcement and self-evolvement. With the growing number of enterprises, the cluster's competitiveness continuously enhance with the help of developing companies and the dominant industrial clusters. The above-mentioned is essentially the embodiment of the multiplier effect, which promote the cluster to develop to a higher stage.

Entrepreneurial economy advocates entrepreneurship to create jobs, which can get twice the result with half the effort. The entrepreneurship can bring about groups of the employment growth, rather than in the usual sense of personal behavior. In other words, entrepreneurship provides not one-to-one employment, but multiplier employment opportunities. For example, according to the State Administration for Industry & Commerce of the People's Republic of China, until the first half year of 2007, there were 5205 thousands private enterprises in China, providing 69275 thousands jobs. The average employment size of the private enterprise is 13.31 persons, means the development of this economic organization is based on the 13 multiplier means that the development of this form of economic organization is providing jobs at the rate of 13 multipliers. That is to say, one entrepreneur creates 13 employment opportunities.

3) value overflow

Value overflow means that some successful enterprises have various cumulative resources, while some may be excessive, those excessive resources will still realize their market value in the market environment in the aim of value appreciation.

In view of resource sharing, entrepreneurial enterprise social networks and industrial clusters are advantageous for entrepreneurial enterprise to coordinate, cooperate and spread risk; and they also provide entrepreneurial enterprise with invisible value-added services that cannot be measured by money. When the rational pursuit of profit is significant, the network effect is obvious, at this time, entrepreneurial enterprise network create the largest profit margins for its partners.

4 Conclusions

The entrepreneurship becomes a driving force of the global economic development. The entrepreneurial activities in China upsurges, and the entrepreneurial system is gradually established under the policy conduct and industrial structure adjustment. It is essential to carry out research on entrepreneurial economy and constitute the theoretical frame to conduct entrepreneurial economy. The research on the entrepreneurial economy often focuses on qualitative analysis, little quantitative analysis meanwhile. Using mathematical model to discuss that how to explore the lattice and hypergraph of entrepreneurial enterprises to play the creative economy is the research direction in the future.

Utilization of Constructivism in Innovation of Listening Teaching Modes*

Zheng Xiaoxi

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: zhengxiaoxi80@126.com)

Abstract: This paper takes constructivism perspective to discuss how to use the theory to reform the teaching modes of listening class. Constructivism emphasizes the learner-centered teaching and the teacher's principal role is to help and guide learners to inspire their independent study abilities, and make them to construct the meaning by themselves. The paper considers that constructivism uncovers the cognitive rules of learning process, which enlightens and conducts the reform of English language teaching. The paper explores the innovative teaching patterns of English listening class and gets the conclusion: to apply constructivism in teaching will improve learners' cognitive ability and listening comprehensive ability.

Key Words: Constructivism; Cognition; Schema; English listening teaching

1 Introduction

The development of constructivism is historically influenced by such well-known educationalists, psychologists and educational psychologists as J. Piaget, L.S. Vygotsky, J. Bruner and so forth. Constructivism, based on the cognitive theory, is the development of cognitive theory. However, constructivism was initially from the theory of children's cognitive development. In the 1960s, Swiss psychologist Piaget (1966), the specialist of cognitive development, put forward the constructivism. According to Piaget's theory children could gradually construct knowledge of the external world with interaction of environment, in addition, through the cognitive process their own cognitive structures could be developed in the end. In 1970s, a leading American educational psychologist Bruner (1960) introduced the former Soviet Union educational psychologist Vygotsky's (1978) historical and cultural psychology in American constructivist study, which promoted development of constructivism. Moreover, Kohlberg made a further research on the nature and development conditions of cognitive structure, while Sternberg and Katz emphasized the key role of individual initiative in the process of cognitive construction. Consequently constructivism is enriched by the variety of learning theories and gradually developed and formed to be a relatively completed system. Because constructivism better revealed the cognitive rules of human learning process, in 1980s, the theory became one of mainly basic theories of educational reform and was concerned and applied in foreign language teaching.

2 Guiding Significance of Constructivism in Foreign Language Teaching

2.1 Present study of constructivism in FLT

Since the 1980s, although there is still a heated discussion about the merits between cognitive psychology and behavioristic psychology, the former theory has been gradually replacing the latter one to be the main thought to guide the educational reform, by which chance, constructivism has become very important on the development of pedagogy. In 1990s, because the multi-media and internet technology developed rapidly and were applied universally in education, constructivist learning context was easily built, which provided an opportunity for the development of constructivism. Meanwhile, constructivism was introduced into China. The earlier Chinese constructivist researches focused on introducing constructivist application in education, or comparing constructivism with other teaching theories. Recently, constructivism attracted FLT educators' concerns, and the theory provided a completely new perspective of cognitive study for FLT staffs. Thus, subsequent research of constructivism involved three main aspects, such as applying constructivism to instruct the teaching reform of methods and teaching modes of FLT (i.e. teaching design, curriculum reform), to train students' cognitive strategies and learning strategies, to design and construct the learning context as well. The above shows the combination of constructivism and FLT has occurred at all research levels and fields.

2.2 Basic concepts of constructivism

* This paper is supported by "the Fundamental Research Funds for the Central Universities(WUT:2013-Ib-058)"

According to Piaget, children's cognitive process is gradually built up in two complementary processes: assimilation and accommodation, and their knowledge will be constantly enriched and developed in the "balance-unbalance-new balance" cognitive cycle, which means when children use prior knowledge to assimilate new information, the cognition stays in balance; when the prior "schema"¹ can't meet children's cognitive needs of achieving new information, the cognitive balance is destroyed, the children need to change their cognitive structures to understand new information; finally children modify and create new schema to accommodate new information, so as to achieve the new balance of cognitive state. Vygotsky stressed social, cultural and historical background in students' cognitive process, and emphasized the significance of interaction between the schema of prior knowledge and new information. Vygotsky defined two kinds of cognitive behaviors as "bottom-up" and "top-down"; the former emphasized the students' prior knowledge, and the latter focused on the acquisition of knowledge in learning context. Thus, students can make cognitive progress completely only when they combine the two kinds of knowledge available from two cognitive behaviors.

As mentioned above, constructivism emphasizes learners' subject status in cognitive activities, and considers that learners' intellectual schema is activated by modifying, processing and acquiring; secondly, teachers are responsible for stimulating and promoting the learners' cognitive interest, making authentic or realistic learning context for learners, providing learning resources for them and encouraging them to explore and complete the construction of meaning and cognitive process. Among teachers, learners and learners themselves, they interact with each other and do collaborative learning adequately. Therefore, utilization of constructivism will change traditional teacher-centered teaching mode and eliminate the "chalk and talk" phenomenon, and fully mobilize the enthusiasm of learners to get the ideal learning effect.

2.2.1 Constructivist view of teaching and learning

According to constructivism, learning should be based on the learner-centered mode, and learner constructs knowledge by himself in learning process. Through rethinking prior knowledge, learner creates new schema to construct the meaning of new information. What's more, in the learning process, learner should understand knowledge actively rather than just wake up memory and recite the knowledge. Yet, teacher needs to instructive and help learner to develop his analytical and problem-solving ability. (Kafai & Resnik, 1996) Moreover, teaching process can be designed as a web in which every teaching activity (i.e. new learning task, knowledge and intellectual skills) should be placed around the teaching theme. In addition, learner needs to explore and discover an appropriately prior knowledge to complete learning task with teacher's instruction. Thus, in constructivist teaching process, the learner's learning initiative is maximized, while his learning strategy is being trained. The teaching process emphasizes that teacher creates learning context and adopts a "top-down" teaching method.

2.2.2 Constructivist modes of teaching

Constructivism stresses learner-centered mode, in which teacher is the instructor and assistant of learners. Constructivist modes of teaching focus on four elements: learning context, collaboration, conversation and construction of meaning. Constructivism thinks that the knowledge of textbook makes no sense, yet construction of meaning is constructed through constant process of assimilation and accommodation of old and new knowledge. Constructivism has designed three kinds of mature teaching modes: Scaffolding Instruction, Anchored Instruction and Random Access Instruction.

1) Scaffolding Instruction

Scaffolding instruction derived from Vygotsky's theory of the zone of proximal development (ZPD). The concept of ZPD is that the distance exists between children's really independent learning ability (the first development level) and the potentially advanced learning ability (the second development level) which can be achieved with teacher's assistance. A child's mental development level should be improved from the first level to the second one, even the higher level through teaching. Based on Vygotsky's ZPD theory, constructivist uses metaphor-"scaffolding" to indicate that with the support of "scaffolding" the learner's intelligence could be facilitated from low level to advanced level without pause. Scaffolding instruction includes five points: firstly, to construct conceptual frame around learning task, teacher divides the total task into several parts and instruct learner to learn from the shallower to

1 A Schema is a structured cluster of concepts which can be used to represent objects, scenarios or sequences of events or relations. The original idea was proposed by philosopher Immanuel Kant as innate structures used to help us perceive the world. (Michael W. Eysenck, & Mark. T Keane. Cognitive Psychology A Student's Handbook, (6th.)[M] East Sussex: Psychology Press. 2010 Retrieved from psyppress.com (<http://www.psyppress.com/ek6/>))

the deeper part; secondly, to create learning context to guide learner to explore the conceptual framework; thirdly, to cultivate learner's independent learning ability with teacher's inspiration; fourthly, through consultation, every learner shares his construction of meaning to make the concept and learning task clearly and completely; finally, to do learning reflection or the evaluation of learning effects.

2) Anchored Instruction

Anchored instruction places learning situations within real event or the problems-solving context. Once the true event has been determined, the teaching content is fixed, which is similar to the ship being moored anchor. Constructivism identifies learner should be placed in real context to learn the attribute of things, law of development and relationship of things. The principles of Anchored instruction are as follows: firstly, creation of an "anchor", to design a contextualized case study and learning questions which is relevant to the learning subject; secondly, guidance of autonomous learning, to guide the learner to explore the methods to solve learning problems; thirdly, cooperation or collaboration of learners, learners get the learning clues from teacher to explore the problem-solving process, and learners exchange their views through discussion to deepen the understanding of the problem; fourthly, reflection and evaluation of learning effect, to observe and record the students' performance.

3) Random Access Instruction

Individuals may have different understandings of the same problem from different aspects. Random access instruction emphasizes teacher should display the learning task at different times, in different contexts, with diverse teaching ways and respective teaching purposes. Because the learning emphases are different, the problem can be studied from multiple perspectives. Thus, learner gets a comprehensive understanding of new learning task. This teaching mode could promote learner's cognitive ability and knowledge migration ability. Four principles are included: firstly, design of teaching context, teacher encourages learner to select different perspective to learn; secondly, teacher pays attention to training learner's thinking ability and guiding him to think from shallow to deep aspects of problem; thirdly, learner group-based discussion, learners share and evaluate the others' ideas; lastly, evaluation of learning effect, teacher analyzes learners' group contribution, especially, whether or not the learners have got construction of the new knowledge.

In a summary, constructivist modes of teaching contain four elements: teaching context, collaboration, conversation and construction of meaning. Some FLT scholars subdivide the above elements into six elements such as creating context, raising problem, building bridges, collaborating, showing the result and reflection of learning. (Feng Yufang, 2006) The above concepts of constructivism provide a new idea for FLT curriculum design and give important rules to instruct the innovation of FLT.

3 Innovations on Listening Teaching Modes with Constructivism

3.1 Utilization of constructivism in advanced learning stage

According to Spiro et al. (1991), learning has two stages: primary learning (the low stage) and advanced learning (the advanced stage). In the primary learning, teacher only teaches important concepts and facts, and learner just shows what he has learnt or feedback of learning in the test. Spiro thinks traditional teaching blurs the line between primary learning and advanced learning, so it is not reasonable to use teaching strategies of primary learning in advanced learning stage. Without doubt, constructivism is suitable for directing advanced study.

3.2 Constructivist modes of listening teaching

Brain inputs, processes and thinks language information while listening, so listening is complex cognitive process. The process of listening comprehension consists of three stages: perception, parsing and utilization which connects each other and runs in circles, being continuous and recursive. Moreover, English listening class requires students to have fixed basis of English language knowledge and application abilities, in the listening process, students need to mobilize long-term memory and prior knowledge to construct the concept of listening material. The prior experience and knowledge is the schema which plays a central role in interpreting languages and non-verbal input, retrieving information, organizing action, deciding target, allocating resource, and directing cognitive processing procedure. (Gui Shichun, 2000)

The traditional listening teaching is based on teacher-centered mode, which takes the "bottom-up" approach to understand the listening materials, such as teaching vocabularies, repeating listening material and completing the exercises. Through passive listening, students fail to activate the relevant schema. But constructivist modes of teaching gets perfect coherence among three stages of listening comprehension, especially through the creation of learning context and teaching design, the teacher

guides students to activate the long-term memory and relevant schema effectively to complete construction of meaning, further to improve the learners' ability of listening. The table below compares the traditional modes of listening teaching with the constructivist one, which is clear to show the significant differences of the two teaching theories in teaching concept, learning process, learning effect and curriculum design etc.

Table 1 Comparison of Traditional Modes and Constructivist Modes of Listening Teaching

Traditional Modes of Listening Teaching	Constructivist Modes of Listening Teaching
Teacher-centered: teacher teaches knowledge directly, students get the knowledge passively; teacher is authority.	Student-centered: teacher guides the students to explore the learning process, students are active in teaching; teacher is an assistant and instructor, the teacher's main role is negotiation.
"bottom-up" teaching method: teaching is based on textbook, vocabulary and exercise and repeating listening	"top-down" teaching method: teaching is based on problem-solving context, focuses on students' improvement of comprehensive listening ability
Fixed teaching task, the teaching begins with the parts of the whole	Around teaching task, all parts are designed as sider web to be linked with each other, teaching begins from whole to parts
Students learn alone	Students learn in groups, interaction occurs between teacher and students, and students themselves.
Feedback or assessment is through teaching, for example to correct student's mistake	Reflection and assessment is done after class, teacher analyzes students' performance (views, thinking ability, contribution to groups), students do the same analyses of the others' outcomes
Students get the knowledge through reciting	Students get the construction of meaning, improve the cognitive ability and find suitable learning strategies.

1) Creation of listening context.

First of all, teacher's task is to break down the bound of teaching task; secondly, teacher selects the relevant audio-visual materials to enrich the teaching, and before listening asks students to consider how to solve the problem when they encounter the same context, after listening, the teacher asks students to summarize the concepts of listening material, while students can get the hints of key content of listening material from teacher; thirdly, teacher designs opening questions from the surface of question to the inside one, while the teacher also introduces his personal experience or experts' methods to help students to solve similar problems, and encourages them to think about different methods to solve the problem. Based on constructivism, learning how to solve problems helps the students to develop their autonomous learning abilities and creative thinking abilities, also helps them to form good learning strategies.

2) Collaborative learning

Students are randomly divided into study groups in every class to ensure they can get fresh views of learning experience from different team members each time. Let students exchange views in groups, first of all team members get representative group opinion through group discussion, then each group exchanges and discusses the group opinions. Through collaborative learning, students actively exercise their cognitive thinking abilities, not only for the individuals, but also the learning groups get construction of meaning of new knowledge. Therefore, the learning effect is more outstanding than the traditional class.

3) Learning reflection and assessment of learning effect

The teacher organizes students to evaluate the learning effect or do assessment in time. First of all students analyze their learning behaviors, such as the learning abilities they have, learning strategies they used, the extent of new knowledge they have obtained and the problem they met in listening process, and students also evaluate learning behaviors of group members and analyze the enlightenments of the others' outcomes. Moreover, teacher gives overall evaluation on students' learning effect and process of construction of meaning, guides students to find suitable learning strategies and to identify the weak spots of listening. Through learning reflection or assessment of learning effect, the learning task turns from abstract to concrete. Eventually students acquire new knowledge and they can use the learnt knowledge to solve kinds of problem within different contexts as well.

4 Conclusions

Constructivism provides an effective cognitive concept and teaching idea for us, and it especially

emphasizes the student's principal status. Actually the learning interaction between teachers and students is more frequent and in-depth: for teachers, they are instructors and promoters who help students to construct meanings; for students, they learn knowledge actively, think actively and have completely creative and critical spirit. Thus, Constructivism effectively innovates new teaching modes of listening and instructive the reform of FLT. Nowadays, the FLT classes still see irrational teaching modes which are criticized by constructivism. Although the paper has discussed the reasonable utilization of constructivism can improve the learners' comprehensive ability of discourse in listening process, promote their cognitive ability, and eventually improve their comprehensive application ability of English, through some empirical studies, scholars find some teachers can't effectively carry out constructivist modes of teaching because of lack of higher teaching abilities. Therefore, teachers need to use constructivism critically, and it's better to do experimental teaching preparation at first, to observe the students' reflection and do continuous improvement, then to carry out constructivist modes of teaching completely.

Teaching Exploration about the Course “Evaluation of Building Installation”*

Dong Lan

School of Management, Wuhan University of Science and Technology, Wuhan, P.R.China, 430070
(E-mail:strawberry_d@163.com)

Abstract: As the characters of engineering management undergraduates cultivating are different from engineering technology and other management undergraduates, the ideas of teaching them is also different. In This paper, “technology” support and “ability” training are emphasized as the core of teaching. Around the core, three aspects of teaching in class should be done along with teaching logic thinking of “Evaluation of Building Installation”. Firstly, how to understand construction plan should be strengthen which is the basis of teaching. Secondly, the methods of system analysis and quantities calculating should be improved which are teaching difficult points. And lastly, the beginning and end of the classroom teaching should be extended. After analysis of three aspects above, conclusion has been made. “Evaluation of Building Installation”of classroom teaching should be done with the system concepts of engineering management to help students to engage in actual jobs of project cost and other related work smoothly in construction engineering field.

Key words: Building Installation; Construction cost; Construction drawing; BOQ(Bill of quantities)

1 Introduction

1.1 Research on Theory Teaching Mode

In the aspect of theory teaching mode of relevant engineering cost courses, scholars agree that teachers should use various teaching methods based on practice to cultivate students’ interest, to improve the understanding level of construction plan and to strengthen their calculation ability of BOQ.

Scholars think that teachers should select a typical case to organize students to analyze the situation and background of the case and to guide the students thinking and exploring actively in the context of the specific problems to meet the need of teaching objectives, which could cultivate the learners’ comprehensive ability and quality^[1].

Teachers using the method of case teaching to organize classroom teaching would help the students to contact with the engineering practice during the process of the classroom learning and would also help the students to combine the learning of theory knowledge and developing of practical ability organically, so as to improve the students’ ability of occupation^[2].

Besides research on the method of case teaching, the experts also discuss some other classroom teaching models, such as the teaching modes named “workshop” and “shunt stratification”^{[3],[4]}.

1.2 Research on Practical Teaching Mode

In the aspect of theory teaching mode of relevant engineering cost courses, scholars agree that the design training is very important for students to study building installation engineering.

Scholars believe that the curriculum design is an important part of the practical teaching, which is the crucial means to train students’ practical ability and innovation consciousness. Teachers should select the curriculum design closely combined with the practical engineering item to cultivate students’ ability to solve practical engineering problem and improve their innovation consciousness.

In the process of design training, teachers could choose some typical engineering part from a large project which is a carrier of practice teaching to combine the segmentation of the “single practice teaching” with “comprehensive practice teaching”. Thus, teachers could format some typical engineering project as the representative of the “comprehensive practice teaching”^[5].

In the process of course design, teachers can give students some time to learn and use budget bidding software, and ask them to use the software, which is good for them to improve enthusiasm and ability of curriculum initiative so as to improve the quality of curriculum design.

Therefore, teaching mode of cost courses about case teaching and design training has been done in colleges and universities. However, at the same time, we also found that in the literature the concrete

* This paper is supported by Teaching Research Project of Wuhan University of Science & Technology “the Exploration of Teaching Mode About Courses of Engineering Cost Based on Cultivating Engineer Practical Ability”(2011x045)

teaching method how to improve the ability of engineering practice of students is lack, which is an important content of the research.

2 The Main Contents of the Course“Evaluation of Building Installation”

Figure 1 Teaching Contents of the Course“Evaluation of Building Installation”

3The Characteristics of Teaching the Engineering Management Undergraduates

3.1 Emphasis on "Engineering Technology" Teaching

The most important of teaching engineering management undergraduate students is how to improve the practical ability in engineering practice. On the one hand, this kind of practical ability is different from other disciplines of management engineering, which should be supported by strong special technical knowledge of such engineering disciplines as construction engineering, building water supply and drainage engineering, building heating ventilation air-conditioning engineering and building electrical engineering. On the other hand, this kind of practical ability is also different from other engineering disciplines mentioned above and should be supported by wider special technical knowledge in almost all the engineer fields. Engineering undergraduate students are always confronted with a difficult task as lack of Professional foundation both in theory and practice. Thus it is important for us to strengthen the teaching of technical courses.

3.2 Focusing on Cultivating “Engineering Practical Ability”

After graduating, most of engineering management students would do specific work in the field of engineering construction. In order to enable students to have the ability of project budget making and have the ability of BOQ bidding, it is very important for teachers to cultivate the engineering practice ability of student. As an important professional course for engineering management undergraduate students, “Evaluation of Building Installation”is no doubt that it should be taken on this responsibility. In the classroom teaching, practical ability training has been completed from four steps shown in figure 2. The first step is about identification ability of construction drawing of such engineering disciplines as civil engineering, building water supply and drainage engineering, building heating ventilation Air-conditioning engineering and building electrical engineering. The second step is about analysis capability of decomposition and re-composition of each unit of engineering system. The third step is about making BOQ according to the related calculation rules. And the last step is about summary ability of sub-divisional work cost based on BOQ.

4 The Logic Clue of Teaching the Engineering Management Undergraduates

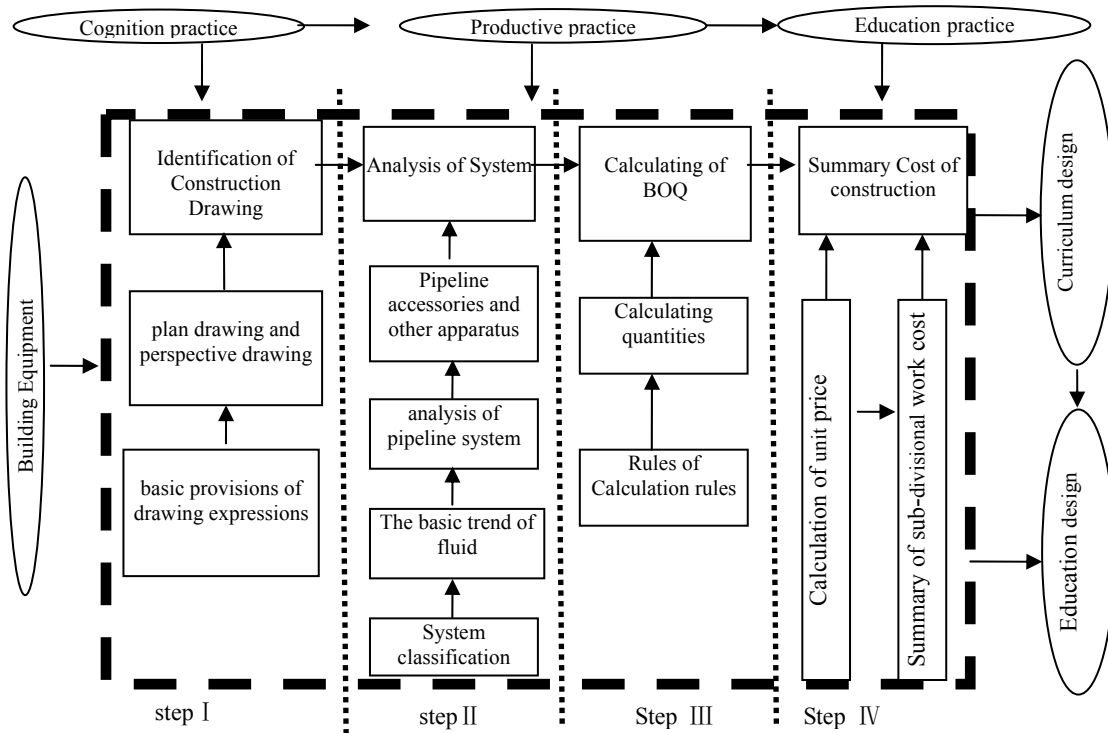

Figure 2 Teaching Frame of the Course “Evaluation of Building Installation”

4.1 Strengthening the Basis of Classroom Teaching—Identification Ability of Construction Drawing

“Building Equipment” covers a wide range and has big capacity of engineering knowledge, so it is a challenge for teachers to study and teach it. Since the restrictions of teaching time and textbook content, the basis of identifying drawing is weak for students.

In traditional teaching method, we will generally follow the existing teaching materials, starting from “step III” in Figure 2. After giving a brief overview of the basic composition of the system, teachers will directly explain cost calculating mode of quota and BOQ, and then train students according to the corresponding rules.

There are two problems in this traditional teaching method. Firstly, as the calculation rules are cumbersome, it is considerable difficulty for undergraduate students who are lack of both construction drawing foundation and practice experience to understand and absorb the rules. Secondly, in this order it is not conformity with the Epistemology: practice--theory--practice, which would affect the students to absorb knowledge.

The installation engineering involves relative large and complex engineering boundary, so each kind of installation engineering drawing would have different characteristics in expression and illustrations of its own. Compared with the identifying architectural and civil engineering drawing, students will feel it much more difficult in identifying installation engineering drawing, which is not only because of the chances of students contact with installation engineering drawing relatively fewer, but also because of the contents of installation engineering drawings relatively independent and more complicated.

Therefore, before contacting with the specialty construction drawing, students should be taught special engineering knowledge to understand construction drawing, which could get twice the results with half the effect.

For example, in teaching building water supply and drainage engineering, teachers could divide the process of identifying the construction drawing plan into two parts in which is shown as “step I” in figure 2.

One is the most important basis, namely basic provisions of drawing expressions, including expressions of proportion, elevation and pipe diameter in water supply and drainage engineering. For

example, the meaning of pipeline elevation for water supply pipeline and water drainage is different pipeline in both plan drawing and perspective drawing. Being the pressure pipeline, the elevation of water supply pipeline refers to the pipe center. However, the elevation of water drainage pipeline refers to the pipe bottom as fluid in this tube is gravity flow.

The other is made on the basis above, which is about how to analyze the contents including in plan drawings and systemic perspective drawing. For example, in figure3 we could learn some information about layout of pipeline in plan drawing, which includes the main plane distance between construction, equipment and pipeline. And we could learn other information about the layout of pipeline from systemic perspective drawing.

Therefore, in the process of teaching method to understand construction drawing, teachers should require students to cognize the plan and perspective drawing together, to understand the specific layout of pipeline and equipment from the whole.

Gradually forming this good habit, the students can find it is easy to find the level size from the plan drawing and the vertical line size from the perspective drawing, which is helpful for them to make a rapid transition from identifying of drawing (Step II in figure2) to calculating of BOQ (Step III in figure2).

4.2 Solving Teaching Difficulties—Analysis of System and Calculating of BOQ

The course of “Evaluation of Building Installation” plays an important role in relevant cost courses. In actual teaching, we teachers found that students often feel difficult in system analysis and quantity calculation as they unfamiliar with the construction engineering drawing especially the part of construction installation engineering. Thus, it is very important for us to teach students in accordance with their aptitude and characteristics.

In actual teaching, teachers can classify the overall cost course at first, and then introduce main parts of the course to students to provide a systemic view to them. Then, in the students’ initial stage of installation work cost learning, teachers could help them to establish a strong system idea to complete the learning of other various steps of this course. This is both the logical thinking training and the learning habits training to students.

As shown in Figure2, it is not only a learning logic clue of this course, but also necessary steps for students to calculate unit cost.

Strictly speaking, we could not completely separate analysis of system from calculating quantities. The purpose of analysis of system is mainly to help students to understand the drawing contents better and also to help them to calculate BOQ faster and more accurate on the basis above.

Figure 3 The Construction Plan Drawing of Building Water Supply and Drainage Engineering

For example, shown in figure3, the analysis of system can be done by taking these steps. Firstly, the system of water supply and drainage could be divided into two categories---- “P” and “J” according to the different types of fluid in the pipelines. For “J”, we can decompose it into four subsystems: the introduction pipeline subsystem, branch 1 subsystem, branch 2 subsystem and branch 3 subsystem

according to the arrangement of Equipment and pipelines. Secondly, we could calculate the amount of engineering subsystem one by one. Finally, we could aggregate forming part of the total quantities of pipelines according to the pipe material, pipe diameter and so on. In such systemic analysis method, we can easily understand the system, and can calculate the quantities of subsystems of the project, and the final summary, reducing the calculating difficulty.

4.3 Extending the Boundary of Beginning and End of the Classroom Teaching

“Building Equipment” is the leading foundation for undergraduate students to learn “Evaluation of Building Installation”. Due to time limitation, some necessary basic knowledge of engineering cost must be taught in such leading course. The main contents of “Building Equipment” include the building water supply and drainage, HVAC (Heating ventilation and air conditioning building) and electrical building construction. For example, through learning of The building water supply and drainage engineering, students should not only understand the basic composition and function of this kind of engineering, but also found a solid basis for the next study.

In order to ensure that students can quickly correspond up the project of physical and engineering drawing in the study of cost course, teachers should make full use of the cognition practice.

Teachers could not only lay the foundation for students to learning cost courses through leading knowledge teaching, but also help students to increase their actual engineering practical ability of knowledge and improve their future job capacity through extending in the subsequent process of teaching.

Since the majority of engineering management students will work in the filed of engineering cost after graduation, the follow-up practice training should be set up in order to consolidate their learning outcome and to reduce their transition time from the school to the enterprise at the same time.

These kinds of practice training generally include the course design and graduation design. In curriculum design, the teacher can assign a set of relatively independent of the drawings. The students think independently, and analyze them step by step with the method learning in the class and then complete the total cost of the project. Through the curriculum design, the students could both test the learning outcome of theory knowledge and enhance the application ability of theory knowledge stage.

In the graduation design, the teacher may require students to complete the total cost of a single project, which is not only helpful for students to strength their professional proficiency through the classroom learning, curriculum design to graduation design, but also helpful to deepen their professional understanding the connection between the two kinds of engineering courses “Evaluation of Building Installation” and “Evaluation of civil engineering”. In this way, curriculum provisions are better able to combine theory and practice, and to cultivate graduates students’ ability of engineering management.

5 Conclusions

Classroom teaching exploration should be done in three aspects, which include strength understanding construction plan, solving the most difficulties of anglicizing the system and calculating quantities of BOQ, extending the beginning and end of the classroom teaching. And this Classroom teaching exploration has been practiced in teaching practice. In the process of teaching, we found that teaching effect is good according to the feedback of students. In order to keep pace with the new development, teachers should also teach students to consider the problem about construction cost from lager field^{[6][7]}.

Measure Model of Architecture Knowledge of the Product*

Ji Peining, Gu Yuanxun

School of Economics and Management, Beijing Jiaotong University, Beijing, P.R. 100044
(E-mail: 15210579670@sina.cn, yuanxungu@126.com)

Abstract: The product architecture (PA) is the main output of product design and embodies the strategic direction of product innovation of enterprise. For the purpose of measuring architecture knowledge of the product (AKP), this paper explores the related influence factors of AKP from a perspective of management and establishes a measure model of AKP. It consists of twelve factors classified from four aspects, which are environment, organization, technology and user. The environment factors are market competition, market expectation and sale force. The organization factors are enterprise scale, organizational support and coordination and absorption of the organization. The technology factors are product feature, technology standardization and technology learning and diffusion. And the user factors are market share, customer satisfaction and feedback. Also, it presents three optional contexts of AKP. Finally, the strategic value of measure model is discussed, as well as shortages of this paper and directions of future research.

Key words: Architecture knowledge of the product; Measure model; Influence factors; Context

1 Introduction

In the late 1990s, the influence of PA gradually attracted people's attention acting on the international competitiveness of product. Thus, the theory of PA came into birth. The PA is the main output of product design, embodies the strategic direction of product innovation of enterprise and has direct effects on product innovation, competitive advantage, supply chain management and business model innovation. Whether in the high-tech industries such as computers, software, or in the car (Chen Hong, 2010), books, machinery and other traditional industries, the PA plays an extraordinary role. Ulrich (1995) first of all proposed the concept of PA for manufacturing enterprise from multi-disciplinary perspective such as design theory, software engineering, operations management and product development management. He thinks that PA is a systemic scheme formed by assigning product function to physical chunk, embodying the decomposition and integration of product system. However, AKP is defined as the cognitive ability of the organization on learning and applying the technique, skill and experience related product that embedded into the product architecture design (GuYuanxun, 2012).

AKP is a systematic method to understand and grasp the essence of PA (GuYuanxun, 2012). It can help enterprise further understand the products from management level and business level. Thus, how to use and measure AKP is very important, which is one of the big challenges related to AKP currently. The study of measure model of AKP provides evidence for the use and measure of architectural knowledge, provides scientific and reasonable decision-making reference for assessment and optimization of the PA, contributes to understanding the product more deeply, helps enterprise

2 Literature Review

The concept of PA is put forward by Ulrich, which implies that the PA exists as a systemic unit and consists of three basic elements, that is system, chunk and interface (Ulrich, 1995). At present, the form is the dominant way to understand the PA (Ulrich, 1995; Baldwin&Clark, 2000), in this paradigm the PA is commonly divided into two types, modular or integral. In fact, the form of architecture is evolutionary switching between modular architecture and integral architecture along with the context of the firm (Shibata et al., 2005; Fixson&Park, 2006; Gu, 2012), then if we simplify the PA into either modular type or integral type, the essence of PA cannot be grasped, and we have weak measures to improve the quality of PA. Based on the above, GuYuanxun (2012) establishes a full picture of AKP from a perspective of knowledge production and diffusion to understand the essence of PA. Also, he puts the conceptual expression of AKP into a value chain perspective to think, not only confined in the PA area.

implement product management and knowledge management activities, serves for product innovation strategy, and contributes to improving core competitiveness and business performance.

Up to now, the concept and essence of PA has been discussed a lot by existing researches (Ulrich,

* This paper is supported by the Fundamental Research Funds for the Central Universities of China (No.2013JBM027) in Beijing Jiaotong University.

1995; Baldwin&Clark, 2000; GuYuanxun, 2012; etc.). At the same time, many extended researches explore issues such as the effects of PA, the generating mechanism of the effects of PA, the context of effects evolved and model researches about PA (Henderson&Clark, 1990; Gu, 2012; Shibata et al., 2005; Sanchez&Mahoney, 1996; etc.). GuYuanxun (2012) establishes a conceptual model of AKP, which consists of the context, modules and relations among modules. Especially, the context confines the boundary of the PA. Wouters et al. (2011) propose an approach to financially assess the product architecture decision about the incorporation of a product feature. Four product architecture decisions are conceptually developed and operationalized in an assessment method. Yet up until now, we did not get a measure model of the AKP. Then, the purpose of this paper is to establish measure model of AKP and outline related strategic value of AKP.

3 Measure Model of Architecture Knowledge of the Product

Based on a perspective of management, considering enterprise external environment, internal environment, the product itself and user experience, this paper analyses the related influence factors of AKP from four aspects, environment, organization, technology and user.

1) Environment factors

Market competition (M_1) is the basic orientation of PA because the advantages of product performance represent market demand. It is a reflection of demand, thus promotes the pace of product innovation. Market expectation (M_2) reflects the strategic objectives of PA. The improvement of PA has positive effect on achieving market expectation. Sale force (M_3) is actually limited for enterprise. So, proper and adequate sale force provides an important safeguard for bringing AKP into play.

2) Organization factors

Enterprise scale (M_4) determines the form of product architecture innovation, thus affects the use and deliver of AKP. Organizational support (M_5) mainly includes support and involvement of organization managers, whether the product is incorporated into major projects and so on. Coordination and absorption of the organization (M_6) can affect the use efficiency of AKP.

3) Technology factors

Product feature (M_7), the direct expression of AKP, is mainly about product performance, product advantage and product innovations. Technology standardization (M_8) is used to adapt to the changes in the market. Its stability leads to rapid product innovation. Technology learning and diffusion (M_9) has positive effects on the use and deliver efficiency of AKP.

4) User factors

Market share (M_{10}) is measured by the number of the product users in this paper. It indirectly reflects the rationality of PA, which further implies the effectiveness of AKP. In order to make assessment and optimization for PA, we need to refer to customer satisfaction (M_{11}) and feedback (M_{12}).

For the product, the form of PA should be matched to its context. Then, we are able to understand and analyze the effects of PA very well (Gu, 2012). It is the basis and premise of the success of PA research that how to define and describe the context. This paper provides three optional contexts for the measure of AKP, namely product upgrading, product life cycle and enterprise value chain. Each context has direct and indirect effects on the twelve influence factors.

Now, we get a measure model of AKP:

$$M(AKP)=M_1K_1+M_2K_2+M_3K_3+M_4K_4+M_5K_5+M_6K_6+M_7K_7+M_8K_8+M_9K_9+M_{10}K_{10}+M_{11}K_{11}+M_{12}K_{12}+E(context)$$

Where,

M_i represents one of the twelve influence factors in sequence. Meanwhile, K_i is the percentage of M_i of the total, and $K_1+K_2+K_3+K_4+K_5+K_6+K_7+K_8+K_9+K_{10}+K_{11}+K_{12}=1$.

$E(context)$ is the effect of some specific context on the measure of AKP. Different contexts bring different effects.

$M(AKP)$ is the meaning of measure model of AKP. It has three kinds of variable, M_i , K_i and the effect of some context.

4 Strategic Value

This paper presents the essence and extension of PA, then, explores related influence factors in order to measure the AKP. Thus, a measure model is established with the definition of context from a perspective of management. It has high strategic value for the enterprise.

From the product perspective, the measure model of AKP provides evidence for the use and

measure of architectural knowledge and provides scientific and reasonable decision-making reference for assessment and optimization of product architecture.

From the enterprise perspective, this paper contributes to understanding the product more deeply, helps enterprise to implement product management and knowledge management activities, serves for product innovation strategy, and contributes to improving core competitiveness and business performance.

5 Conclusion

The architectural knowledge of the product plays key role in the understanding of product from management level and business level. Thus, it is very important that how to use and measure AKP. The measure model of AKP has three kinds of variable, that is, influence factors of AKP, its percentage and the effect of some context. The innovations of this paper lie in the measure model and three optional contexts.

Nevertheless, there are two shortages in this paper. One is the quantification of M_i , K_i and $E(\text{context})$. We need to explore an objective, scientific and reasonable method to quantify the variable, for the purpose of putting the measure model into use. The other is that the analysis of influence factors cannot be all-sided. With the continuous development of technology, the main influence factors may change. Therefore, the measure model lacks of stability, and we need to analyze the influence factors of AKP from a perspective of dynamic evolution more comprehensively. The two shortages are the future directions as well.

An Innovative Study on Inquiry Grammar Teaching with Scaffolding Theory *

Jiang Yan

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: jiangyanwut@126.com)

Abstract: With the help of the scaffolding theory, an innovative method of inquiry grammar teaching, consisting of three major stages *individual inquiry*, *cooperation inquiry*, and *heuristics inquiry*, has been proposed. An empirical research has been conducted to evaluate the effectiveness of inquiry grammar teaching compared with traditional grammar teaching approach and instruction. To illustrate how each of the three stages functions, one experimental lesson on relative clause has been introduced. Based on the results of the current research, the conclusion has been drawn that inquiry grammar teaching is more effective than traditional grammar teaching approach and instruction, for scaffoldings can achieve the three effects of timeliness, dynamics, and guidance.

Key words: Inquiry grammar teaching; Scaffolding theory; Experimental research; Interaction

1 Introduction

Inquiry grammar teaching, which presupposes students' interaction while learning, can be viewed as a cognitive process of learning English that reflects the sociocultural theory proposed by the Russian psychologist and philosopher Vygotsky (1978). Vygotsky's *Zone of Proximal Development (ZPD)* involves two main stages of an individual's development. The first stage is what a child or learner can do by himself; the second stage is his potential, what he can accomplish with the help of a more competent person. ZPD refers to the disparity between the current level and the potential level concerning the children's intellectual development. Based on the concept of ZPD, such scholars as Wood (1976), Bruner (1983), Mercer (1994) proposed scaffolding theory denoting a person who helps students to accomplish what they cannot do by themselves. Scaffolding theory, derived from the cognitive psychology, is currently applied in educational psychology. The significant contribution of the scaffolding theory to the field of applied linguistics is that it shows how teachers can focus on the actual level of students, adjusting the complexity of the material so that learners will be able to reach what initially is beyond their level. In different circumstances, scaffoldings can be manifested by cognition scaffolding, tool scaffolding, and question scaffolding. (Gao Yimei, 2011)

Since its inception, scaffolding theory has drawn much attention in applied linguistics due to the great theoretical significance and the wide practical value as well. The main research fields can be divided into listening teaching (6.7%), speaking teaching (10%), reading teaching (44.4%), writing teaching (35.6%) and grammar teaching (3.3%). Figure 1 reveals that fewer researches are concerned with the application of scaffolding theory into grammar teaching. In this case, this paper attempts to probe into the inquiry grammar teaching from the perspective of scaffolding theory.

Figure 1 Data of Five Research Fields

2 Inquiry Grammar Teaching

Inquiry grammar teaching is viewed as critical, reflective, and constructive. Under the teacher's guidance and assistance, the students take the initiatives to study grammatical points, reflect on the grammatical rules and eventually explore the problem-solving methods. In this research, inquiry grammar teaching consists of three equally important stages: *individual inquiry*, *cooperation inquiry*, and *heuristics inquiry*. To illustrate how each of these stages functions, one experimental lesson on relative clause was conducted. With the help of the scaffolding theory, the lesson achieved a marvelous teaching effect.

2.1 Individual inquiry

Individual inquiry is the first stage of inquiry grammar teaching. This stage is characterized by studying independently. Students should be given opportunities to figure out everything by themselves, receiving help only when necessary. Concerning the relative clause, choice of relatives takes the high priority. During the class instruction, each student was offered one passage containing various relative words. The passage is as follows:

It was Valentine's Day when a little old couple who looked out of place walked into McDonald's where many young couple were eating.

They walked right up to the cash register, where they placed their order with no hesitation and paid for their meal. Seated at the table near the back wall, they started taking food off the tray, which contains one hamburger, one order of French fries and one drink. Carefully, the old man cut the hamburger in half, counted out the French fries, and divided them in two poles, one share of which was neatly placed in front of his wife. He took a sip of the drink. So did his wife.

As the old man about whom the crowd were curious began to eat his share, while his wife just sat there, watching him attentively, the crowd began to get restless, thinking all they could afford was just one meal for the two of them.

A young man who was cool and gentle came over to the old couple's table and politely offered to buy another meal for them. The old man refused, saying they were used to sharing everything.

Again and again the young man offered to buy, whose face went red, but he failed. As the old man finished eating and was wiping his face with a napkin, at which time the young man could stand it no longer and wondered what they shared, demanding an answer to it. The old man told him peacefully the reason why she didn't eat was that she was waiting for the teeth.

So to the world, you may just be somebody...but to somebody, you may be the world.

Thanks to the acquired knowledge of relatives in high school, the students managed to underline all the relative words individually and accurately. The teacher provided the students with the cognition scaffolding by which the new point could be assimilated into the acquired knowledge. The teacher started from where the students were and with her help they improved their knowledge of grammatical structure. As soon as they reached a certain level on which they felt confident, they were eager to show their understanding of the subject matter. They were aware that learning English was a process of solving problems and they were willing to explore the new point based on the "love" passage. Thus, an inquiry learning atmosphere was created and highlighted.

2.2 Cooperation inquiry

Cooperation inquiry is the second stage calling for group work and peer interaction. Once students are in a group, they assign themselves roles. In this case, the role distribution is based on "who knows what to do". Peer interaction creates a certain micro-world that enables the students to negotiate the assignment, clarify tasks, and even provide each other with corrections. It definitely develops their strategic competence. (Savignon, 1972) In this stage, the "love" passage was under discussion again, where the relative pronoun *as* was excluded. Therefore, group work served to deepen the understanding of *as* by distinguishing between the following two sentences.

1) *This is the same book as I lost.*

2) *This is the same book that I lost.*

While the students were busy discussing the examples in small groups, the teacher waited for a few minutes at the outset, without circulating among the groups so that the students could establish a bit of momentum. Within the rest of the time the teacher monitored from a distance, encouraging all attempts at communication. Moreover, the teacher showed two students' textbooks in an effort to resolve their puzzles. Such a tool scaffolding facilitated the inquiry process, in consequence, the students agreed that the first sentence involved two books, while the second sentence denoted only one book.

2.3 Heuristics inquiry

Heuristics inquiry is the third stage of the process which focuses on teacher-student interaction. In the inquiry grammar teaching, the teacher is the guide, guiding the way; the students are inquirers, inquiring about new knowledge. Heuristics inquiry is a powerful solution to the relationship between the guide and inquirers. On one hand, the guide cannot let go, offering no help to the inquirers; on the other hand, the guidance should not be overplayed. As for the difference between restrictive relative clauses and non-restrictive relative clauses, the teacher made use of the following sentences to achieve heuristics inquiry.

3) *Her brother who is now a soldier always encourages her to go to college.*

4) *Her brother, who is now a soldier, always encourages her to go to college.*

The formal difference enabled the students to figure out the restrictive relative clause by the third example as well as the non-restrictive relative clause by the fourth example. Then the teacher raised several questions, called question scaffolding. The understanding could be deepened when the questions were answered gradually. The first question was to translate the two sentences into Chinese so that the difference between the two types of relative clauses turned out to be evident. The students took advantage of individual inquiry or cooperation inquiry, coming up with the correct Chinese translations. Meanwhile, the questions continued, inquiring about the implied meanings respectively. Yet the students felt bewildered. It was at that moment that the teacher acted as a mediator and guided them in the right direction to reach the second stage in the ZPD. With the help of the teacher's introduction to the definitions of the two types of relative clauses, the students understood that the third example involved more than one brother and the fourth example mentioned only one brother.

3 Experiment Design

The present research has examined the learning effect of Chinese learners of English grammar at the university level in an inquiry teaching situation. Its objective includes evaluating the effectiveness of inquiry grammar teaching compared with traditional grammar teaching approach and instruction.

3.1 Hypotheses

The formulation of the two hypotheses, null and alternative, was based on the following reasoning:

1) $H_0: U_a = U_b$

More specifically, the null hypothesis (i.e., H_0 in the formula) suggests that there exists no significant difference between inquiry grammar teaching and traditional grammar teaching approach and instruction.

2) $H_1: U_a \neq U_b$

On the other hand, the alternative hypothesis (i.e., H_1 in the formula) implies that the effect of inquiry grammar teaching is significant, namely, inquiry grammar teaching is more effective than traditional grammar teaching approach and instruction.

3.2 Subjects

The whole investigation involved a teaching experiment which compared one class that studied with inquiry grammar teaching versus another class that was taught with the traditional grammar class instruction method. The present research contained a total of 60 subjects who formed two groups, namely, experimental group and control group. The subjects were first-year English majors in Wuhan University of Technology. None of the subjects knew the purpose of this study in advance. The students in both control and experimental groups shared similar English learning background and showed no significant difference in their English grammar proficiency, which has been proved to be true through the pre-test before the teaching experiment.

Proficiency level in the pre-test was regarded as grouping criterion. Guided by the principle of "be homogeneous among groups and heterogeneous within a group", the teacher subdivided the experimental group into six mixed proficiency groups, each of which was composed of two students with an advanced level and an elementary level respectively, and three students with an intermediate level. Due to the teacher's justification of the use of small groups for inquiry, the students agreed upon learner groupings. However, they had no idea of the criterion of learner groupings.

3.3 Procedure

This research was a classroom-based research, which lasted two months. In order to control the elements of the teaching research, the teacher taught both the control and experimental groups. The students in experimental group were taught by means of inquiry grammar teaching with the help of scaffolding theory, which was manifested by *individual inquiry*, *cooperation inquiry*, and *heuristics inquiry*. The above-mentioned experimental lesson on relative clause elucidated how each of these

stages functioned.

With regard to the control group, the situation was widely divergent. The students in the control group learned the same textbook as those in the experimental group. But they were taught in a totally different way. The teacher emphasized on grammar, drill patterns and simple question-and-answer, which was the traditional dominant approach in English grammar teaching. The students listened to the lectures given by the teacher for most of the time. That is, nearly no inquiry between the students happened. Certainly, they were asked to sit for pre-test and post-test that were identical to the two test papers respectively in the experimental group.

4 Data Analysis and Discussion

4.1 Experimental results and interpretation

The results of this study are presented according to different data sources in the teaching research. They are test scores including pre-test and post-test. The data got from the pre-test is analyzed by means of SPSS software. The results can be shown clearly in Table 1 and Table 2.

4.1.1 Result from pre-test

According to the nature of the research, the related theory in statistics and SPSS software, since the samples are relatively small and the groups are independent, the appropriate test is the *t*-test for independent samples. The critical value of *t*-test for the 5 percent level and 58 df (degrees of freedom) in a two-tailed test is 2.000. The calculated value of *t* shown in Table 1 does not exceed the critical value. In this case, the means are not significantly different at the 5 percent level. Thus a conclusion can be drawn here that there is no significant difference between the two groups of learners in grammar proficiency before the teaching research.

Table 1 Comparison of Grammar Achievements Between the Two Groups

	Group		t
	experimental	control	
Mean	14.267	14.000	1.000
SD	1.202	0.983	

Note: maximum score=20 n₁=30 n₂=30 P< .05 df=58

4.1.2 Result from post-test

After the teaching research, the students in the two groups took another grammar test. SPSS software is again applied into the analysis of the data. Since the samples are small and the groups independent, the appropriate test is again the *t*-test for independent samples. The critical value of *t* for 5 percent level and 58 df in a two-tailed test is 2.000. Table 2 shows that the *t*-value for the comparison of grammar achievements between the two groups is 7.393, which exceeds the critical value of 2.000. Furthermore, the mean of the experimental group is higher than that of the control group. Therefore, it comes to the conclusion that grammar achievements of the experimental group are significantly better than those of the control group.

Table 2 Comparison of Grammar Achievements Between the Two Groups

	Group		t
	experimental	control	
Mean	15.833	13.500	7.393
SD	1.234	1.140	

Note: maximum score=20 n₁=30 n₂=30 P< .05 df=58

4.2 Comparison and discussion

In this present study, the teacher applied inquiry grammar teaching in the experimental group and traditional grammar teaching method in the control group. The contrast between the two groups is striking. The success of inquiry grammar teaching is attributed to three effects of scaffoldings: timeliness (i.e. scaffoldings are provided whenever in need and removed when the students are capable of solving the problems), dynamics (i.e. scaffoldings vary with the difficulty of grammatical points), and guidance (i.e. scaffoldings serve as guidance rather than substitution in grammar learning).

5 Conclusions

Grammar teaching is not the transmission but the transaction and the transformation of knowledge. (Zhao Jiaping, 2009) With the help of the scaffolding theory, an innovative method of inquiry grammar teaching, consisting of three major stages *individual inquiry*, *cooperation inquiry*, and *heuristics inquiry*, has been proposed. An empirical research has been conducted to evaluate the effectiveness of inquiry grammar teaching compared with traditional grammar teaching approach and instruction. Based on the results of the current research, the conclusion has been drawn that inquiry grammar teaching is more effective than traditional grammar teaching approach and instruction, for scaffoldings achieve three effects of timeliness, dynamics, and guidance. Needless to say, the present research is far from perfect because of some objective and subjective limitations. Inquiry grammar teaching calls for the further study on the degree of individual inquiry, the validity of cooperation inquiry, and the profundity of heuristics inquiry.

Abstract: Learning evaluation is an effective way to ensure the quality of online education. However, Most of online learning researches have not fully considered the influence between the effectiveness of online learning and the learners' behavior. This paper lists all of the online learners' behaviors factors which may influence the effectiveness of E-learning. These behavior factors are redacted by rough entropy. The behavior factors are identified, which impact the effectiveness of online learning significantly. Meanwhile, Reduction algorithm based on rough entropy is given out. The valid of the algorithm is tested through examples. It is concluded that the algorithm could accurately identify factors which influence the effectiveness of online learning. This will be conducive to the development of online education.

Key Words: Entropy; Online learning; Rough Set; Behavior

1 Introduction

Lifelong learning is the current development trend of social education. Construction of modern network education is the primary means of lifelong learning system. Internet offers an ideal learning environment for distance education. With the launch of online learning, its' quality has aroused extensive concern. Quality of online education is the key to development for online learning, is also the core competence for the long-term development of online education. How to discover the knowledge of the online learners' characteristic behavior at the different level is conducive to enhancing the qualities of online learners.

Nowadays, the concept of online learners' behaviors has not been clearly defined neither in domestic nor abroad. There are many concepts similar to the concept of online learning behavior, such as "Distance learning behavior", "Online self-Learning behavior", etc. These concepts mainly are: Learners make use of network media to learn online course. In this process, learners need control their cognitions, motivations and behaviors. The characteristic is making use of various of information resources, communication tools from network platform. It emphasis on "Self-directed, Self-motivation, Self-Monitoring"^[1]. It also emphasis on "Temporal separation" and "Media Education". However, as a new learning concept, a product of learning mode, network learning behaviors should be given richer content^[2]. It include: E-learning behavior is a form of multi-dimensional and multi-level learning which is carried out by means of the Internet; E-learning behavior is a kind of self-discipline, self-control of learning behavior^[3]; Actors have full autonomy to decide learning objectives, learning progress, learning strategies and learning behavior's occurrence, development and change. Learners can discuss topics and communicate the issues by various communication tools to achieve online distance collaborative learning. Learners can obtain support and help from teachers, partners, experts and learning support system in the learning process.

Currently, some scholars from domestic and abroad have researched the online learners' behaviors. Such as Karin, Anna and Hummel analysis the online learners' behavior by online learning platform and database log^[4]. Du and Jin divide the online learning model into learner model of personality and learners' behavior model, and present learners' behavior model^[5]. LU Rurong analysis the factors affecting the students' online learning behavior^[6].

In summary, the research of learners' behavior is still in the exploratory stage. Quantitative research on online learners' behavior characteristic is lacked.

2 Online Learners' Learning Effect and Learners' Behavior Attributes

Learning effect is divide into better, worse and general. The learning effect is presented by d . The Learners' Behavior contain c_1 : Information retrieval ability c_2 : Information dissemination ability c_3 :

Information exchange ability c_4 : Computer skills, c_5 : Problem-solving ability, c_6 : Information dissemination ability.

3 Online Learners' Behavior Identify Model Based on Rough Entropy

3.1 Rough Set Introduction

Rough set is a data analysis theory, which is presented by Professor Zdzislaw Pawlak. Following probability theory, fuzzy set theory, evidence theory, rough set is a new math tool, which is used to analyze incomplete and uncertain data. It can effectively analyze and deal with imprecise, incomplete, inconsistent, incomplete and other type data. Meanwhile, it could discover the hidden knowledge from this information. Rough set redact the data and obtain minimal expression of knowledge from information provided by data self. Rough set method can identify the data dependencies.

3.2 Data Discretization

Let Decision Information System $DS = \langle U, C \cup D, V, f \rangle$, domain $U = \{x_1, x_2, \dots, x_n\}$, C , D , respectively, as a condition attributes and decision attributes. For each condition attributes and decision attributes $C_i (i = 1, 2, \dots, m)$, $D_i (i = 1, 2, \dots, m)$, its value range is divided into k equal or unequal levels. Respectively $1, 2, \dots, k$ as the indicator value of each level. The value of the property is determined by discrete values falling into the scope.

3.3 Attribute Reduction and Attribute Core

Idea of Attribute reduction is to remove redundant attributes and identify attribute core values *Core*, while maintaining the same premise of knowledge classification ability. The basic idea of attribute reduction is: when a property is removed, if $Pos_C(D) = Pos_{C-a}(D)$, property a relative to the decision attribute D is unnecessary. a can be reduced, otherwise, property a is not reduced. If each of the properties in a are irreducible, C and D is independent. If there are $B \subseteq C$ and $Pos_B(D) = Pos_C(D)$, meanwhile, B and D is independent. It is claimed that B is the reduction with C respect to D . It is claimed $Red_D(C)$, C is all about the intersection of D reduction of core attributes called D . It is claimed $Red(R)$.

3.4 Reduction Algorithm Based on Information Entropy

Attribute reduction is the core research in rough set theory. The traditional rough set reduction algorithm is based mainly on the expansion of discernibility matrix algorithm, which is presented by professor Skowron. However, attribute reduction algorithm based on discernibility matrix have some limitation, when the incompatible rough set is reduced. There are many incompatible data in many online learners' behaviors data, therefore, the method of seeking core properties based on information entropy is presented. Heuristic algorithm for attribute reduction based on mutual information quadratic reduction algorithm is presented to resolve attribute reduction of incompatible decision tables.

3.4.1 Information Entropy of Knowledge, Conditional Entropy and Mutual Information

Definition 3.1 Knowledge of P information entropy is defined as:

$$H(P) = - \sum_{i=1}^n P(x_i) \log_2 P(x_i) \tag{1}$$

$P(x_i)$ is a probability of x_i in the dipartition of P based on U , $U/P = \{x_1, x_2, \dots, x_n\}$, $P(x_i) = \frac{|x_i|}{|U|}, i = 1, 2, \dots, n$.

Definition 3.2 Knowledge Q relative knowledge of P conditional information entropy is defined as:

$$H(Q|P) = - \sum_{i=1}^n P(x_i) \sum_{j=1}^m P(y_j | x_i) \log_2 P(y_j | x_i) \tag{2}$$

Subject to $P(y_j | x_i) = \frac{|y_j \cap x_i|}{|x_i|}, i = 1, 2, \dots, n; j = 1, 2, \dots, m$

Definition 3.3 Knowledge of P and Q mutual information is defined as:

$$I(P, Q) = H(Q) - H(Q|P) \tag{3}$$

3.4.2 Reduction Algorithm Description

Let Decision table is $T = \{U, C \cup D, V, f\}$, U is domain. C is condition attribute set of U , D is decision attribute set. Let $a \in C$, if mutual information $I(C, D) > I(C - \{a\}, D)$, then a is core attribute. Set C_0 is constituted by all of the core attributes. Then C_0 is called core attribute set.

The algorithm is as follows:

Step1: $I(C, D)$ is calculated

Step2: All of the core attributes a are calculated. Core attribute set C_0 is obtained. Then, let $B = C_0$

Step3: $I(B, D)$ is calculated, if $I(B, D) = I(C, D)$ then algorithm is end. Otherwise, step4 is executed.

Step4: Attribute P is selected sequentially from the condition attribute set C , $p \notin B$, $I(B \cup \{p\}, D)$ is calculated. The attribute is selected when $I(B \cup \{p\}, D)$ is maximum. If there are many attributes making the mutual information achieving the maximum at the same time. The attribute is selected., which make combination with B least. Meanwhile, $B = B \cup \{p\}$, at last, go to Step3.

4 Case Study

Now, there are eight online learner. Through data of online learners' behavior and data of the E-learning effect discretization based on table 1, decision table 2 can be obtained.

Table 1 The Level of Discrete Values

Discrete values	1	2	3
C_1 : Information retrieval ability	Worse	General	Better
C_2 : Information dissemination ability	Worse	General	Better
C_3 : Information exchange ability	Worse	General	Better
C_4 : Computer skills	Worse	General	Better
C_5 : Problem-solving ability	Worse	General	Better
C_6 : Information dissemination ability	Worse	General	Better

Table2 Decision Information figure

U	Behavior attributes (C)						Effect attributes (D)
	C_1	C_2	C_3	C_4	C_5	C_6	d
U_1	3	3	2	3	3	3	Better
U_2	3	2	3	3	3	3	Better
U_3	3	3	2	3	2	3	General
U_4	1	1	2	2	2	2	General
U_5	1	1	2	2	2	1	Worse
U_6	2	2	1	1	1	1	Worse
U_7	1	2	2	2	1	2	General
U_8	1	2	2	2	1	2	Worse

Rough set theory shows that:

$$U / C = \{U_1, U_2, U_3, U_4, U_5, U_6, (U_7, U_8)\}$$

$$U/D = \{(U_1, U_2), (U_3, U_4, U_7), (U_5, U_6, U_8)\}$$

$$\text{According to formula (3-1): } H(D) = -\left(\frac{2}{8}\log_2 \frac{2}{8} + \frac{3}{8}\log_2 \frac{3}{8} + \frac{3}{8}\log_2 \frac{3}{8}\right) = 1.565$$

According to formula (3-2)

$$\begin{aligned} H(D|C) &= -\left(\frac{1}{8}(1\log_2 1 + 0 + 0) + \frac{1}{8}(1\log_2 1 + 0 + 0) + \frac{1}{8}(1\log_2 1 + 0 + 0)\right) \\ &+ \frac{1}{8}(1\log_2 1 + 0 + 0) + \frac{1}{8}(1\log_2 1 + 0 + 0) + \frac{1}{8}(1\log_2 1 + 0 + 0) + \frac{2}{8}\left(0 + \frac{1}{2}\log_2 \frac{1}{2} + \frac{1}{2}\log_2 \frac{1}{2}\right) \\ &= 0.25 \end{aligned}$$

According to formula (3-3)

$$I(C, D) = H(D) - H(D|C) = 1.315$$

Similarly

$$I(C - \{c_1\}, D) = 1.315, \quad I(C - \{c_2\}, D) = 1.315, \quad I(C - \{c_3\}, D) = 1.315$$

$$I(C - \{c_4\}, D) = 1.315, \quad I(C - \{c_5\}, D) = 1.065, \quad I(C - \{c_6\}, D) = 1.065$$

As $I(C, D) > I(C - \{c_5\}, D), I(C, D) > I(C - \{c_6\}, D)$, so c_5, c_6 are core attributes.

So $C_0 = \{c_5, c_6\}$, Let $B = C_0$, According to calculating: $I(B, D) = 1.065$.

Just as $I(B, D) \neq I(C, D)$, Consequently, According to Reduction Algorithm in 3.4.2, $I(B \cup \{c_1\}, D)$ need to be calculate. so $I(B \cup \{c_1\}, D) = 1.315$.

As $I(B \cup \{c_1\}, D) = I(C, D)$, Algorithm is end. then, $B \cup \{c_1\}$ is relative reduction of table. So $B = \{c_1, c_5, c_6\}$. the E-learning effect can be determined by c_1, c_5, c_6 . If the learners' problem-solving ability (c_5) is better, then the effect of e-learning is better. If the learners' problem-solving ability (c_5) is general, then the effect of e-learning is general. If the learners' problem-solving ability (c_5) and information dissemination abilities (c_6) is worse, then the effect of e-learning is poor, so the problem-solving ability is most important to the effect of e-learning.

5 Conclusions

Many factors influence the effectiveness of online learning. This paper makes use of rough entropy reducing the behavior attributes which influence the effect of e-learning. It concluded that the learner's problem-solving ability and information dissemination ability and Information retrieval ability influence the effectiveness of e-learning remarkable. Rough entropy can effectively identify the behavioral factors which influence the effectiveness of e-learning.

A Study on Relationships among Art, Nature and Society

Zhang Xiaobao, Xue Li

School of Art and Design, Wuhan University of Technology, Wuhan, P.R.C,430070
(E-mail: xl6824@sohu.com, zql680224@sina.com)

Abstract: Art is closely linked with nature and society. In this paper, from the perspective of art, the spirit of art is defined as a social product of labor, and a kind of important social phenomenon. Besides, this paper assumes social effect just means art criticism to society way is the reason why it exists and art is a projection of our times and cultural metaphor and symbol, which will present the world itself. Finally, this paper puts forward that it is art tell us the age and society and promote the historical development of human society, which has a certain significance.

Key words: Art; Nature; Society; Social effect; Mental labor products

1 Introduction

Art, is a natural person. This is Francis Bacon's words, who is a great painter and was injected with one of the most essential thing that is hidden in everyone heart the most gentle of poetry, and poetic rise to philosophy, so as to communicate with the whole nation to complete, and human love together. His every ounce of joy and pain, are associated with nature and society, in the process of appreciating natural to appreciate art, enjoy life, and in after suffering arrived in noble and beautiful.

Painting is a process of setting not only need to use eyes to see, but also using the soul to feel, listening to natural music, and experiencing the natural sense of humor. Love is natural with sensitive nature. If we strongly feel the splendid nature, we will linger on everything. But not everyone can see, even without name, because it is not the reason you will be able to access and analysis, it can only be understand by love, have no this feeling will not be able to become a painter.

Vast twilight, like the nilkfog, such as cotton thin rain, wrapped in ice river: the distance Snow reflects the rosy sky, and sky bit the black color of the jungle, and extension: the spring twilight thousand form the shape color cloud, leisurely moving with the wind, in the dusk's arms... Levitan, the Russia in the 19th century outstanding landscape painter, he only lived for forty years in the world. All his life, poetry and all feelings, dedicated to the nature. He experienced the natural mind, earth and sky, mountains and rivers, birds, trees and flowers and plants, wind and rain lightning, light and moonlight... He colors blend in so many kinds of joys and sorrows.there, his creation of landscape, surreally quiet and quiet. You desire to went into his prairie, into those sending out the bitter with the sweet spied the haystack. On the far side of a bit thick, there are some small village, people are working peacefully. When the sun has not yet put, moon in green air appeared. Red clouds illuminated the lover's clothing, under the moonlight of birches deep and mysterious.

In the late 19th century Russian art, and it's contemporary literature, music, are assumed with distinctive ethnic features and is famous for its spirit of critical realism. Levitan Isaak Iliich and other contemporary landscape painters showed a Russian culture connotatio from the landscape areas with unique angles of viewpoints. Their poetic lyricism, solemn and stirring and philosophical meaning were full of melancholy mood, and seemed to have something type of Chekhov. Their poetic attitudes have the same understanding of nature and the simple art language. Momentum is not sweep, but it has the artist of his day to pursue national emotion, local and democratic tendency. So he scenery always keep the light and air for a very serious performance, and find out the person's feeling from the image of nature and feeling, from the early famous work "autumn, feeding the eagle", "twilight", "the day of the spring, the sun" can see him on the details of the processing, as well as the charming color. All in their body and mind to love nature and subtle dig deeply in the charming poetry.

Levitan gave life into his drawings, which can reveal the vitality and the beauty of nature; However, his works were not just pure beauty of artistic conception because his own youth suffered greatly from discrimination. So that the painter expressed heavy emotional and dripped wet brush strokes, whose color can actually read through the nature associated with the suffering of the people. His realism and the last in the studio was not the same because he repeated observation, pondered over and over again. He didn't give up the pursuit of a harmonious unification of aesthetic feeling, and presented the most natural picture. Finally have such a wonderful work.

As a man who always loved the nature, Levitan leaved all day in the cry of urban people and tired back to the mysterious beauty of nature. As a result, he could have such advocate natural beauty of the

artist, is really a treasure of human beings and let a person feel the beauty of nature, the earth's beauty, the original habitat for humanity is so beautiful, can think of now environment is sharp, harsh destroyed, those beauty will leave us forever. Wish the world more than a few Levitan that natural landscape painter, with the mind to arouse the people to the natural beauty of empathy and care for the environment of strong consciousness^[1].

2 The Relationship Between Art and Nature

Because art is a social mental labor products, it has traditionally been treated as some kind of social phenomenon.

However, it is condensed into a free entity, rather than obeying the existing social norms and displaying their own social effect, which means that art criticism to society way is its very existence. Art is for the survival conditions of degeneration of a wordless criticism. For example, from Russian painter Ilya Yafimovich Repin's work "Tracker on the Volga River" (1870-1873), it is easy to see: broad on the Volga River, a group of slaves who pull a heavy boat loan, support somberly ahead, they weathered's heat were shabby, looked through the black, but can't see a trace of sorrow and melancholy sorrow in his eyes, still staring at the front, in the crowd of different ages, different personalities, different experiences, then send the red clothes young straight body, hand grasp cordelle action, revealing a kind of unbearable the backlash. Tracker were silently sweating flow, gulping for heavily, and they consistent pace, which seemed to feel out of the ground shaking slightly, a solid pace, and a social system of dark stripes. This group of people were suffering savings invincible power. He reflected heavy emotion and dripping wet brush strokes to depict the suffering of the people, the painter used touching artistic language to tell people to love their land and people, and to shoulder the sacred responsibility of history^[2].

3 The Relationship Between Art and Society

Art can express the nature of society, sometimes revealing the dark of the society at the same time, also have a pure expression of beauty.

As the painting of Mona Lisa, Leonardo Da Vinci, no matter any direction you stand, she always smile to you directly. And you will feel that she had been watching you, the reason is that her face is 3/4 of the observer, is the most critical and her eyes were moving to the same side, and the pupil area no specular highlights. Oneself forget this is not an artist, but Da Vinci in his painting, he slowly exploring, is a genius of innovation to create a shocked the world wonderful results, corners of the mouth slightly become warped up of Mona Lisa, a noble grace fully mysterious smile, the whole painting color transition is very uniform, particularly in the hands of representation. Natural soft together. If it's not long time and make it fade's masterpieces, the hands that you must be can't help to lift your hands into the picture kiss. Three piece of Leonardo Da Vinci's most famous women's portrait is hidden in a kind of desire. This verve "auspicious, Huang De Qi Car" behaved in the most appealing, the protagonist is neither take Mona Lisa heart did Sarah laugh, without cutting has led the tender submission, the young man gently beautiful dark eyes across the us, the curve of the lips sensitive presents without compromise. Deserted ChiBing, the haze of smoke, dark trees, check the reflection in the water around the light with the woman. For artist, she was flesh and blood. Besides, art can show something of society, sometimes revealing the dark of the society at the same time, also have a pure expression of beauty.

Leonardo Da Vinci is the most outstanding representative of the Italian Renaissance, painting for he is only one way he wants to know the world. The Bancroft Virgin is treasures of his paintings. Renaissance artists in the performance of the religious subject matter often god as the humanized handle, make works more vivid and real. Reflected a kind of very simple emotion, from the virgin's face filled with happiness, we can feel the existence of the real. Hand flowers is a kind of guidance and enlightenment for Jesus, haunts a kind of sweet atmosphere between mother and son this is the first time that human painting history describe the soul communication between mother and son's masterpiece. No matter what theme painting, image composition of choose and employ persons, both can show Christ between dust atmosphere of life experience, and idyllic atmosphere of the world can show the ancient pagan gods.

4 The Relationship Between Nature and Society

Today the existence and development of art continues to be brought from the mass culture.

In the field of literature, art as well as painting, like the peak of the world of pop music has its own literary world, enables us to achieve that kind of situation. Such as the three giants of the Renaissance.

Shakespeare in the literary world, the music of Johann Strauss, Leonardo da Vinci painting. Not only that, today's artists are from the ancient times, the art of its traditional heavy pressure. Art is impossible in vacuum, the temple of narcissistic, artistic creation is also difficult to really completely abandon traditional and innovative, let alone a posturing for innovation.

After modern art and modern art are undoubtedly implies heavy contradictions, problems or even dangerous. It is against traditional even against art, there were also some of them grandstanding, vulgar, extreme and through the head, for innovation and innovation. Anyway, art is a projection of our times and cultural metaphor and symbol, and it can show the world forever, because this society is not only art that inhabit it, also because of art not only bear the world needs, more because art is the human, is with the people and society are each other's ontology. Indeed such as John Russell said: "when the art renewal, we must also be updated." We with our age has the feeling of a closely related, there is a sharing and power by the spirit of strengthening, that's what life should be the most satisfying things contribute to age. If this is possible, we said to herself, so everything is possible. In the history of human consciousness, a brand-new of period has started... It tells us time, art is the art tells us social, it is also the art that we know ourselves.

5 Conclusions

At one time, as noted above, the same meaning was given to art that was applied to techniques. The blanket description that each involves the skill to make or do something is no longer true or accepted, however.

Nature is now generally thought of as applied science. The old terminology still has some validity in the role that skill plays and also in the transformation of matter. The skills of the artist, the craftsman, and the technologist all generally involve changes in the natural world. A block of marble is shaped into a statue by a sculptor. Silicon, metal, and plastic are shaped into a microchip by a technician using a machine. Otherwise art and Nature have diverged completely. The goal of artists is to give permanence to the present, to speak to their age by creating works that will endure for all time. The goal of technicians is to press on to the future and to new discoveries.

Nature suggests permanent change and improvement. Once a new technique is discovered and adopted, society does not attempt to revert to the former technique. The automobile displaced the horse and buggy; the electric light replaced kerosene lamps; sound movies replaced silent films; and word processors are rapidly making typewriters obsolete.

This forward march of Nature is called Society. In the fine arts such Society does not exist. The skill of the artist rests upon knowledge and experience, just as the skill of the technician does. But the creative processes involved seem to be different. Today, for example, one can admire the design of a Roman chariot, but few people would ever want to depend on it as a regular means of transportation. By contrast, it is still possible to walk into the Vatican's Sistine Chapel and be astounded by the magnificence of Michelangelo's frescoes. These paintings have an excellence that will never become outmoded.

A work of art, whether it be a painting by Titian or a concerto by Mozart, is not a stepping-stone to something else that will someday be considered better. It is not like the vacuum tube, which served its purpose well enough until the transistor was invented. Each artwork stands on its own--distinctive for all time. Even poor imitations cannot damage the goodness and integrity of the original.

All the paintings and pieces of sculpture that have been done since Michelangelo and Leonardo da Vinci are different from the works of those two masters. But the more recent work can in no sense be viewed as an improvement in the same sense that the steamship is an improvement on the sailing ship. Painting of the 20th century, no matter how good it is, cannot be considered an improvement over the prehistoric cave paintings discovered near Lascaux, France; it can only be considered different.

In the late 20th century art and nature have been united by the computer. It is possible to create musical compositions on a computer. It is also common to design three-dimensional models of commercial products or to sketch out blueprints. Computers are used by sculptors, filmmakers, architects, printmakers, and other workers in the visual arts. It is even possible to create finished works of fine art on a computer screen. But the distinction between Nature and art persists. Computers make the execution of some kinds of art more challenging and interesting; they do not, however, make art better.

Abstract: In recent years, more and more scholars have began to realize that the importance of design strategy on the corporation, and to force in the research of this aspect. However, current research still stays on concept level rather than on the level of design strategy system. This paper, on the basis of previous studies, defines the concept and composition of design strategy, advances four patterns of design strategy, and takes the design strategy of Apple as an example as the basis for empirical research. I hope which facilitates the research on the enterprise strategic.

Key words: Corporation design strategy; Strategic pattern; Application

1 Introduction

With the progress of society and science and technology in the 1990s, the concept of industrial design translated from the category of single, specific product design to an integrated globalised system. Many influential people, such as entrepreneurs, government officials, design educators, and designers began to realize that the success of a product needed the co-coordinated co-operation of several corporate departments. Design was just one link in the whole systems. More recently design has begun to influence the corporation's market positioning, product development and competitive mechanisms. Increasingly, much attention is being paid to those who are winning market share through design. Design strategy arises at an historic moment.

At present, the research on design strategy remains at concept level, and has not penetrated into the strategic design system. Many scholars study the concept of design strategy, but seldom speak about the application of design strategy for specific purposes. This paper on the basis of previous studies, defines the concept of design strategy and composition system according to the characteristic of design activity, then advances four patterns of design strategy. Corporations can choose strategic pattern according to the characteristic of design activity in order to make the operation of design activity more smoothly and effectively.

2 The Implication and Composition of Design Strategy

2.1 The Implication of Design Strategy

Design strategy is a literal translation new word from western in the field of modern design. Different scholars have different views from different angles on the concept of design strategy. Caijun(2002) consider "Confronting with rigorous market challenge and environment, design strategy is the strategic plan for sustainable development aiming at market development, manifested the strategic thought and culture principles of corporation."^[1]Some scholars taking design strategy as strategic resources of design management, which is the method and reflection of it. Liu Guoyu(2003) claim that "design strategy is proposed a series of definite guidelines for design activity, evaluating environment of a particular product for ensuring the success before design activity."^[2]Yu Zhonghua(2007) argue that design strategy is taking design management as a strategic resources, mixing design management and strategic management of corporation together and balancing the corporation interest.^[3]Wang Xijun(2008) state that achieving balance of corporation profit, design strategy is the long-term plan and strategic method for design works on the basis of corporation circumstance, the plan of design stage development, and the principle and method of design.^[4]

Based on the concept of design strategy above scholars mentioned, this paper defined design strategy as followed: design strategy is the overall plan of organizational design activity, finding and confirming the core competitiveness or development direction of corporation, enclosing product with certain method and measures, and confirming the concept and target of product strategy according to conditions and target market positioning of corporation.

2.2 The Composition of Design Strategy

On the composition of design strategy, Caijun(2002) believe that design strategy should be composed of seven aspects, such as market strategy, research and development of the consumer centered

life forms, identification of corporation image and product design, future strategy, integration process of design and exploitation, design strategic orientation and design management.^[5] Famous British experts MarkOakey of managing product design pointed out: “proper design strategy can great use of corporation resources and fully manifested in the market.^[6] He claims that the corporation must go through three steps to form its own design strategy, including market understanding, the potential ability of correct appraisal corporation and form strategy”.

Therefore, refer to the related concept and composition analysis of design strategy by Caijun etc; we consider that “design strategy is consisted of market analysis, strategic concept, strategic orientation and strategic implementation”.

3 Strategic Pattern of Corporation Design

The design strategic pattern should be selected by the corporation based on the design strategic system considering its own characteristics. During the strategy design, the characteristics of design object and the plan as well as the procedure of the operational activities should be determined first. Corporation can engaged in single or multi-design field. Therefore, we can divide design strategy into single and multi-design strategy. Whether corporation select single or multi-design strategy, it all under any one condition of cost leadership or differentiation competition strategy. Therefore, design strategy of corporation can divided into four aspect, including low-cost strategy of single or multi design (LSSD\LSSM), and differentiation strategy of single or multi design (DSSD\DSSM), as shown in Table 1.

Table 1 The Pattern of Corporation Design Strategy

Design Business Field		Single Business Field	Multi-Business Field
Corporation Competition Strategy			
Cost Leadership Strategy	Low-cost Strategy of Single Design LSSD	Low-cost Strategy of Multi-Design (LSMD)	
Differentiation Strategy	Differentiation Strategy of Single Design DSSD)	Differentiation Strategy of Multi-Design DSMD)	

3.1 Low-cost Strategy of Single Design

LSSD refers to that the design activity of corporation focused on a certain field, serving in design strategy of cost leadership. The characteristics of LSSD reflected in two aspects: on the one hand, the design of corporation focused on industrial design or sub-industrial design; on the other hand, design activity of corporation emphasized on low-cost advantage to gain the advantage of market competition and seek survival and development.

The key to implement LSSD is to analyze the value chain of corporation design deeply, understand the value chain of competitor, study mechanism of cost formation for value activity, and establish the pattern of design activity, and then establish low-cost advantage through the practice and accumulated experience unceasingly.

The advantage of the design strategy is that corporation concentrates their power on a certain area to accumulate experience and reduce unforeseeable risk; form their competitive advantage to resist competitor through accumulated experience and the formation of lean management system.

The disadvantage of the design strategy is that due to the oneness of design business, corporate will confronted with huge risk once challenged by powerful competitor; it is easy to lose the insights of market change and the sensitivity of technological change to the disadvantage of sustainable development of corporation.

3.2 Differentiation Strategy of Single Design

DSSD refers to that the corporation’s design is stable, and the product is unique compared with competitor in order to establish unique competitive advantage. Obviously, the characteristics of DSSD reflected in two aspects: on the one hand, the corporation design focused on a certain core field to develop, and also it can through some way of cooperation design to use outside design ability when necessary; on the other hand, the design activity of corporation emphasized on exploiting unique product in order to gain the market competitive advantage.

The key to implement DSSD is to take its product design as leading, accurate positioning customers of target market and its unique characteristics of value need, analyze the impact of design value chain of corporation for customer value need, evaluate and test the existing and potential core

ability of corporation and its origin to continue ascension in order to keep sustainable competitive advantage.

The advantage of the design strategy is that corporation concentrates their power on a leading position of certain field for sustainable development, easy to accumulate specific core competitiveness of design; through the concentration of market research and exploitation forming the unique ability to recognize customer need.

The disadvantage of the design strategy is that exploitation of unique innovative product is difficult, and imitated by competitor easily, once the corporation cannot introduce innovative product continually, then getting into passive easily; due to the design business is too centralized, losing the insight and sensitivity easily about transformation of market life cycle and revolution of new technology to the disadvantage of sustainable development of corporation.

3.3 Low-cost Strategy of Multi-Design

LSMD refers to that the corporation utilizes ability of multi-design to get a low-cost advantage product and form competitive advantage. The characteristics of LSMD reflected in two aspects: on the one hand, the design business of corporation involves in multiple fields; on the other hand, the design activity of corporation emphasized on low-cost to get the market competitive advantage.

The key to implement LSMD is to combine the characteristics of design, excavate customer needs as the center of design business to integrate, develop a cost advantage of product to gain market competitive advantage through the lean management.

Due to the added value and market profit of low-cost product is relatively low, hard to provide a high level of performance resources support in multi-design team of corporation, which is not to the benefit of sustainable development of design system. Therefore, the strategic pattern of corporation should exploit the ability in market insight and product exploitation, transferring to DSSD in order to cultivate core competence and achieving sustainable development ability; or transferring to DSMD in order to achieving high value of product and cultivating the core competence of corporation.

3.4 Differentiation Strategy of Multi-Design

DSMD refers to that the corporation utilizes ability of multi-design to get unique market competitive advantage. The characteristics of DSMD reflected in two aspects: on the one hand, the design business of corporation involves in multiple fields; on the other hand, the design activity of corporation emphasized on exploiting unique product in order to get the market competitive advantage.

The key to implement DSMD is to cultivate core competence of perceptive identification of collaborative innovation and customer need, excavate and create potential customer needs, evaluate and test core ability of corporation and its origin to continue ascension in order to keep sustainable competitive advantage.

The advantage of the design strategy is through differentiation of product design to get market competitive advantage; through high added value of differentiation product to get high returns, which provide the good sustainable development conditions for multi-design team; through research and exploit on market to form the unique recognition ability for customer need.

The disadvantage of the design strategy is that exploitation of unique innovative product is difficult, and imitated by competitor easily, once the corporation cannot introduce innovative product continually, getting into passive easily.

The four strategies have a certain conversion demand relationship between them, as shown in figure 1 below.

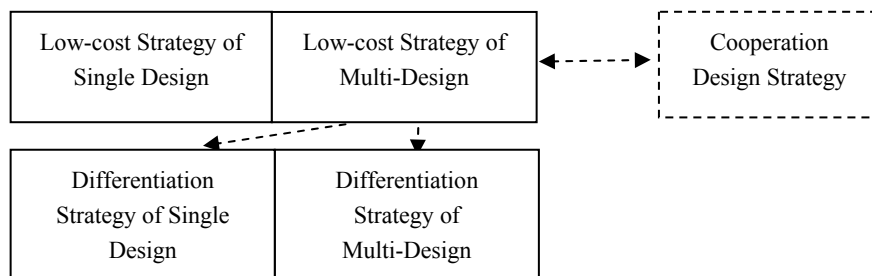

Figure 1 Conversion Relationship Between Design Strategic Patterns

4 Application of the Apple Design Strategic Pattern

The success of Apple lies in its use of DSMD, its design business involves the iMac, iPod, iPhone, Pixar (Pixar animation studios) and so on, its rich product portfolio and unique product winning the market for its competitive advantage, and taking effective measures to prevent the competition in the field of opponents to imitate.

The miracle differentiated combination patterns of Apple reflect in two aspects: iPod + iTunes, iPhone + App Store. Innovation is the foundation of differentiation combination patterns in Apple. The unique combination pattern of Apple is iPod player + iTunes and online store + copyright protection technology. This pattern provides consumers with bundled services (iPod and iTunes forced binding) for e-consumer and music retail simultaneously. Intelligent mobile phone is the development trend of the mobile phone market, and also the chance for Apple. Therefore, Apple launched a combination for iPhone + App Store.^[7]

The unique product of Apple is not the false speculation, but the concern for unique design. The senior vice President Mark Rolston in charge of business innovation once said, "Apple and manufacturers have close relations, they have an amazing interest in selecting material and manufacturing process, they are always asking producers what they can do for them." Meanwhile, Apple keeps hard working on improving product performance and quality, realizing product differentiation, the evolution of the iPhone series is obvious.

The design strategy of Apple develops on the distinctive product and service of user oriented by virtue of its own professional technology. Those products and services form the competitive advantage for the corporation to earn high gross profit, so that it can reinvest again and continue concentrate on more attractive products.

5 Conclusions

In conclusion, the design strategies have the following characteristics at present:

(1) Design strategy is the strategic plan attached to the corporation and the basic guarantee of success in design, reflected the guiding and cultural principle of overall management strategy, and also provides definite direction and goal for various design activities in the corporation.

(2) Design strategy is the core element of design management. Design strategy evaluates and analyzes the environment of a particular product, proposes a series of definite guidelines to design activity for the guarantee of design success.

As the guiding of a series of standards for the behavior of the corporation design, design strategy is an important part of the corporation strategy. The introduction and formulation of design strategy can not only increase the value-added of the product, and also set up a good image of the corporation, above all enhance the core competitiveness of the corporation, thus the corporation always maintains a competitive advantage.

Levels of Faculty Rank: A Higher Education Policy Issue in China*

Wang Lingfeng, Shen Ting

Business School, Guilin University of Electronic Technology, Guilin, P.R.China, 541004

(E-mail: wangsir@guet.edu.cn, 756298428@qq.com)

Abstract: Levels of faculty rank problem has been a hot higher education policy issue in China from 2006. Based on 1990-2010 paper citation data of JCR 2011 representative journals from WOS database with using descriptive statistics method, we think faculty rank level should be set as 6. Age and creativity curve also supports this argument. And academic title rank practice in prominent USA university (for example Harvard university) supports above argument too. A natural corollary is that 13 levels policy implemented from 2006 by The Chinese Government Ministry of Personnel and Ministry of Education is absent in empirical evidence.

Key words: Faculty rank level; Citation analysis; Chinese university Ministry of Personnel and Ministry of Education

1 Introduction

Academic ranks has long been 4 levels in USA and Europe universities, after the Second World War higher education in developed countries come into Higher Education Popularization age, some new fact in university management emerges mainly as following: (1) Dramatic increase in the number of university teachers; (2) The average life expectancy increases, university teachers can work to 70-year-old before retirement; (3) The pressures of budget constraints are increasing for majority of universities, higher education leaders face the challenge of encouraging research vitality of their faculty to perform research.

Different strategies such as adding a new rank into the faculty rank hierarchy, establishing post-tenure review, offering travel funds, have taken to respond above new factor in university management after the Second World War. Among the above different strategies, many scholars and policy makers believe that changes of the faculty rank hierarchy would be an effective way to influence faculty behavior^[1].

One representative of these authors is Tuckman. Because of his worry about the aging effect on reducing the overall research productivity of American faculty, Tuckman has suggested changing the academic reward structure by increasing the numbers of ranks that faculty can attain.

From the review of management practice, in 1989 the Executive Yuan in Taiwan submitted a plan to the legislature to change their present rank system by adding a new rank level. In 1994, the government in Taiwan did add a new rank of assistant professorship to the Taiwanese faculty career ladder (University Act, 1994). A policy of adding a new rank to the faculty career ladder was implemented in Taiwan in 1994^[2].

The opinion of adding a new level to faculty rank was suggested independently by some China mainland scholars. One of these scholars is LIU Yufen. LIU Yufen^[3] suggested that the four academic ranks in Chinese university are not enough, so that each level of four academic ranks is full of different age university teachers, even appears rather strange phenomenon of four generations university teachers crowding in a academic rank. This phenomenon greatly reduces the incentive effect of academic ranks. LIU Yufen suggested more level should be introduced into Chinese university academic rank, but LIU did not specify what on the earth how many levels Chinese university academic ranks should be.

During long time from 1911 to 2005, Chinese university follow academic ranks system of USA university. In 2006, The Chinese Government Ministry of Personnel, Ministry of Education, the Ministry of Finance launched a university personnel policy reform. So from 2006, academic ranks level of Chinese university are 13, this number is double that of USA university academic ranks. In fact, it maybe is the maximum academic ranks in the world academia. Then a question naturally emerge that what is the reason and argument of stipulating academic ranks of Chinese university as 13 levels? Official documents of Personnel Department did not give explanation.

2 Data and Method

This paper uses citation analysis method to analyzing the reasonable levels of the academic title of university teachers' problem. The basic analysis thinking way is as following: Generally the norm for the professoriate should be the tripartite responsibility of teaching, research, and service in university. However, many studies show that faculty research productivity is the most important criterion for promotion in universities due to the objectivity of academic research^[4]. Evaluation on research is relatively easy than teaching for university management. There are many types of research results of academic research such as books, papers, patents and so on, but paper is most representative type for its huge number and cross disciplines property (almost every discipline researcher face the famous pressure of "publish or perish"). In a national survey of department heads at 134 higher education schools, Centra described sixteen criteria which might potentially be used to evaluate research^[5]. "Number of articles in quality journals" was ranked first by the department heads, both in response to what is currently done and what ought to be used.

A basic fact in scientometrics is: Paper citation counts in academic journal obey power law distribution^[6]. Power law distribution demonstrates typical hierarchical characteristics. Generally a higher citation count means better paper quality in same discipline or more correct on same research topic, and vice versa.

Paper citations counts hierarchical level definitely and objectively reflect paper author research ability difference, so a rather reasonable idea emerges naturally, we can adopt hierarchical level number of paper citation counts distribution as the appropriate academic title ranks number, and by so reasonable faculty rank level problem is given an objective reason and argument.

The data used in the study are obtained from the Web of Science (WoS) bibliometric database. Division of academic fields also adopts WOS database frame.

Taking into account the enormous article counts of the various disciplines and the representative degree of paper citation data, the paper citation counts data of the highest impact factor journal in each discipline has been selected as research data set.

Time window for paper citation counts is 20 year (SCI, 1990-2010) and 25 years (SSCI, 1985-2010). The life cycles of citations and the peaks in the citation distribution curves vary from discipline to discipline. 20 years is enough to make a correct judgment with a very high accuracy for majority proportion of paper.

Paper citation counts data set is gathered as following: the highest impact factor journal in each discipline has been selected based on JCR 2011 report. Citation counts of paper published in 1990 of the highest impact factor journal in each discipline until 2010 are collected. SCI journals are 128, SSCI journals are 41.

Division of intervals of citation counts are as following: [0,20), [21,40), [41,80), and so on. The upper value of first division of interval is 20 because paper citation counts gathering time windows is 20 years. A paper can hardly be viewed as having long-time academic value if citation counts of the paper is lower than 20 after its publication.

3 Basic Results

SSCI and SCI citation counts are discussed separately for human and social disciplines are rather different with natural and engineering disciplines. The analysis method of SCI is same to SSCI citation data.

The Detailed analysis is as following: academic Title classification is for most people and most paper, so if a value of academic title rank covers most of papers of most journals, then we can safely set the value as feasible academic title rank levels. An example is as following:

As a famous econometrics journal, *ECONOMETRICA* published 63 papers in 1990. according to paper citation counts of *ECONOMETRICA* in table 1, 100% paper and 100% journal (i.e. all *ECONOMETRICA*) can be covered while the value of academic title rank equal to 8. Further analysis demonstrates that about 95% papers in *ECONOMETRICA* 63 papers in 1990 can be covered while the value of academic title rank equal to 5.

We extend above analysis on all journal in table 1. If a value of academic title rank covers a high proportion such as 95% of papers of all journals, then we can safely set the value as feasible academic title rank levels.

We select top 6 journals in table 1 as discussion target because top 6 are representative of all SSCI journals in table. If a value of academic title rank covers 95% of papers of top 6 journals then this value

covers 95% of papers of all journals.

Table 1 Paper Citations of Top 6 SSCI Journals in Table 1

	1	2	3	4	5	6	7	8
ECONOMETRICA	16	14	10	16	3	2	1	1
JOURNAL OF PERSONALITY AND SOCIAL PSYCHOLOGY	85	70	76	35	21	6	1	1
JOURNAL OF FINANCE	35	21	10	6	5	1	1	
CHILD DEVELOPMENT	36	41	31	19	11	4	1	
AMERICAN ECONOMIC REVIEW	77	27	23	20	11	0	2	
AMERICAN JOURNAL OF PSYCHIATRY	46	35	44	26	13	1	2	

Table 2 Paper Coverage Proportion under Different Rank Level of Journals in Table 2

	4	5	6	7	8
ECONOMETRICA	89%	94%	97%	98%	100%
JOURNAL OF PERSONALITY AND SOCIAL PSYCHOLOGY	90%	97%	99%	100%	100%
JOURNAL OF FINANCE	91%	97%	99%	100%	100%
CHILD DEVELOPMENT	89%	97%	99%	100%	100%
AMERICAN ECONOMIC REVIEW	92%	99%	99%	100%	100%
AMERICAN JOURNAL OF PSYCHIATRY	90%	98%	99%	100%	100%

It is obvious that table 2 means 6 is enough for academic title rank for art human and social disciplines. Set the coverage proportion of every SCI journals is same as SSCI journals, i.e. 95%.under the same analysis process as above SSCI journals, Results of SCI journals are demonstrated in Table 3.

Table 3 Paper Coverage Proportion under Different Rank Level of SCI Journals

Rank level	Paper coverage proportion
6	80%
7	95%
8	99%

Table 3 means that academic title rank level in science and engineering disciplines,7 is enough, higher level is unnecessary totally.

4 Discussions

Figure 1 The Age of Peak Scientific Achievement, 280 Scientists

Satoshi Kanazawa^[7] study a random sample of the biographies of 280 scientists (mathematicians,

physicists, chemists, and biologists. Fig. 1 presents the distribution of the peak age among the 280 scientists in Satoshi Kanazawa sample.

The highly similar rules exist in arts field such as music or paint. Fig. 2 presents the relationship between age and productivity in jazz music^[8].

Figure 2 The Age-Genius Curve among Jazz Musicians. Source. Miller(1999)

A rather new and large sample research in 2011 concerning roughly 3600 French and Italian physicists showed that the age of academics is negatively correlated to both number of publications and impact^[9].

In a word, for majority researcher especially researchers in natural and engineering disciplines their creativity ability and activities keep at a high level during 25-50 and majority people reach their creativity peak during this age range.

Based on basic fact that majority people reach their creativity peak during 25-50, we can make a simple and powerful calculation. For a long time after 1949, academic title promotion cycle time is 4 years in Chinese university. A university faculty can apply for higher title when he has achieved current title for 4 years. So academic title level in Chinese universities is $(50-25)/4 \approx 6$. Of course this rule is for majority, not for researcher with excellent academic performance.

5 Conclusions

Faculty rank level is basic parameters in faculty employment contract and influences motivation effect of faculty employment contract significantly. So reasonable faculty rank level problem is indispensable problem of human resource management in higher education, but the problem had gone unnoticed in literature for a long time.

This paper found that: (1) faculty rank level should be set as 6, based on 1990-2010 paper citation data of JCR 2011 representative journals from WOS database. (2) calculation based on age and creativity curve support basic argument in this paper. (3) Academic title rank system in prominent USA university (for example Harvard University) support basic argument in this paper. (4) 13 levels subdivision of academic title rank which is implemented from 2006 by The Chinese Government Ministry of Personnel and Ministry of Education is absent robust empirical evidence.

What to Be Done for English Education in Private Universities under the Impact of MOOC? —Based on English Education in Guangdong Peizheng University

Cao Fengting

Foreign Languages School, Guangdong Peizheng University, Guangzhou, P.R. China 510830
(E-mail: caoft@whut.edu.cn)

Abstract: It is anticipated that the popularity of MOOCs (Massive Open Online Courses) will have a great impact on all the conventional university education in China. This paper intends to make an analysis on the present situation of English education that the private universities in China are facing by taking Guangdong Peizheng University for example. And then it comes up with some ideas on how English education in private universities should respond to the great changes of information-based education. Finally, it concludes that innovation in English education is the only way out for private universities in China.

Key words: English Education; Massive Open Online Courses; Reflections; Innovation

1 Introduction

“Education is power” is a famous saying put by the great English philosopher, Francis Bacon, which has been a motto in countless schools or universities of China, and which has influenced one generation after another. However, a book entitled “Knowledge Is Not Power” puts: “what’s the point of knowledge if a person knows a lot of facts but does not know how to get along with other people and tackle problems, since it is very easy to gain knowledge in internet era?” (Fang Bolin 2012) The explanation of the author reminds us that we should reflect what the nature of learning and education is.

With Massive Open Online Courses coming into the life of every student, the conventional learning methods will be sure to be challenged. It’s high time that the English teachers in private colleges and universities began to think how to make knowledge become power.

2 The Opportunities and Challenges English Teaching Faces

In recent two years, the application of information such as electronic library and computer-aided teaching has constantly promoted the progress of information-based education. It can be seen that the future higher education will face three major trends. First, on-campus will give way to above-campus, that is to say, learning in classrooms made up of bricks and cement will become mobile learning from online. Second, ownership will move to access, which means that the teachers in the past who were afraid of letting known what they taught in the class will be pleased to make their teaching content accessible online so that they might be noticed by the public. The massive open online courses from many world-known universities both abroad and at home are good examples. The third trend is from “protection” to “share”. It is known that intellectual property rights prevent many things, such as journals, from being developed or shared, but massive open online courses can make ordinary people enjoy the basic right – education. Everyone in the world who is capable and enthusiastic enough can learn what they want, so as to pursue a better life for themselves, their family members and their communities. English education is very necessary to meet these three trends. That is why all the universities in China establish English courses so that they can keep up with the trend of globalization. Guangdong Peizheng University is such a one whose aim is to build the students into high quality talents who are supposed to know how to use English properly in different fields. The emphasis of learning practical English, and the great efforts made for this aim is a wise choice undoubtedly.

But for decades, English teaching in private universities has been influenced by that of public universities. Teaching modals are similar to each other and so are the evaluation modals. The national band 4 and band 6 examinations and the national TEM4 and TEM8 are like magic potions that keep our students unable to be their own. The requirement of graduation paper for our students is even the same as the one for public university students. But is it true that all the students have gained enough knowledge and made it into power?

Most probably, we cannot give a positive answer, because English teaching in private universities has constantly tried to move towards making students know something. They really know how to find a correct answer from the four multiple choices, but when it comes to why the answer is right, they don’t

know how to explain. They understand they can have an easy access to many wonderful English reading and spoken materials by only using a cable, but seldom bother having a try. Some students have been taught to be such learners that, when they are in danger and asked “How are you?” by the rescuers they would only respond mechanically by saying “I am fine, thank you! And you?”

From all these discussed above, there is still a long way to go before English teachers in private and vocational schools as Peizheng University develop the students into innovative talents with global version that satisfy the demand of the society. What is to be done then? The renovation of concepts, and the exploration on applied English teaching are very necessary in order to establish a curriculum system for the students in universities like Peizheng University.

3 Reflections

MOOC that win the most popularity with the young students are the hottest topic in 2012 Educause. In order to promote MOOC, some education providers have supplied a learning platform named Coursera which wants every student to make use of the textbook freely, move the conventional classrooms out of campus and set up evaluation systems between students.

Another online course set up by the co-operation of MIT and Harvard University places great emphasis on independent study and co-operative study based on Wikipedia, including interactive activities in online lab.¹ MOOC have been accepted more and more and even have been used by some universities to replace the regular credits. It can be predicted that more students far from luck or cleverness will be able to make up for the poor teaching of some higher education and learn to be what they want to be.

3.1 Guidance and motivation

The great difference between private universities and public ones is the difference of the students in learning capacities and skills. The students of ours are generally poorer in basic English, and weak in self-control. Moreover, many of them are not confident enough. So, English teachers in private universities have to take more responsibilities.

First of all, English teachers must understand, if they want students to be of benefit to the society when they are out of campus, they should teach them to be true to themselves. Good English teachers should be more patient, tolerant and well-disciplined, so that they can be a good example for the students to follow. Second, an English teacher should be a good guide, that is, to introduce students how to make a reasonable schedule and learn efficiently. Take electronic learning for example. Teachers should push the teaching resources to the students in an easy and fast way through internet and drive them to be interested in mobile learning. To build up a good study atmosphere is a key to improving education level so that the students will be made to know the essence of education — learning. Teachers may give them some suggestions on choosing some English reading materials according to their English levels. They should also play a role as a facilitator in checking how much they have read, and finally hold a meeting to celebrate their great achievement in reading at the end of a semester. In the third place, teachers should frequently reflect their own teaching methods. Some teachers regard mobile phones or computers as sirens which may often distract the attention of the students from classroom teaching. What a teacher should do is to have an effective counseling, and try to seek for chances to use them in a proper way. In the practice of translation from Chinese into English or from English into Chinese, it will be a good idea to ask the students to look for answers from computers. Their answers may be different and not right, but you can ask them to discuss, argue and lead them to the right answer. Don't say “no” to them at the very beginning. Only by frequent two-way interactions, can the students have interests in analyzing, thinking and innovating critically.

3.2 Training modes

Peizheng University, like many other private universities, is a university that focuses on developing practical students. In fact, universities of this kind can also be built into a strong and excellent one with its own characteristics if we draw on the experience of other universities or allow for trials and errors.

First, a private school like Peizheng must know clearly whether it should focus on developing a student's strong points or developing their weak points. Education in China, in fact, often spends much more time helping students to gain what is beyond them. Teachers often ask the students who have difficulty in pronunciation to practice again and again, but as a result, they are depressed at their

¹ http://www.edu.cn/zy_6504/20130129/t20130129_898338.shtml

progress and lose confidence finally. They also try to force the students who are tired of English to learn English. And the students end up in failure. The way advisable is to let students choose to work at what they are capable of or what they are good at. Teachers or educators may set up some courses especially for those who are good at speaking, translation, and reading or some project English courses related to law, economics and business. Those who have trouble in pronunciation should be encouraged to exert their potential in reading to the full and those who can speak fluent English should be encouraged to strengthen their spoken English so that they can find jobs relating to written work and oral work respectively in the future. The non-English majors should be allowed to be in English programs if they have changed their mind after entering the university.

If a student is strong in English but his total scores in the national entrance examination prevent him from being enrolled in a university, a private school might as well accept him to be in a program without diplomas, since Peizheng University, unlike many public schools, has many foreign English teachers, from whom his potential in English can be realized.

As far as English majors are concerned, much more importance should be attached to the courses in the training of fundamental English skills in the first two years, and other courses in the last two years should be offered as both required ones or selected according to several modules. Those who are interested in doing translation can select the courses related to translation, those who are interested in teaching can select courses related to education and those interested in business can select courses concerned with business and communication. Of course, all the courses in each module can be regulated in accordance with the change of social economy. It's not necessary to divide the students into different classes according to the so-called orientations, because their diplomas conferred by the university are "Bachelor's Degree in English Language and Literature." (Peng Ping 2012)

Second, more practical courses should be opened. Studying in Guangzhou, some English majors are lucky enough to have the chance to participate in Guangzhou Trade Fair. However more students don't have as many opportunities as the students in public universities whose English level is higher and enjoy better education resources. So a private school should focus their attention to some small enterprises or businesses around it. To combine their course work with social practice may be a good attempt, which is known as project learning. Peizheng University is close to Shilin, a world known town for the manufacture of leather bags, suitcases and so on. They have much to do with foreign businesses in many parts of the world. So they would use English in their promotion of products, communication with their partners, and doing the imports or exports practices. In this aspect, English majors can have a service-learning without any difficulty. They can learn how to put their English into practice if they have an object, even if they have difficulty at first. Their teachers can give them suggestions, and what's more they can surf on internet, from which much information is available. The course practice can prepare students for becoming a businessman, a secretary, and a trader dealing with foreigners, an English teacher, an English tour guide, and a customs officer etc.

At present, Peizheng university is confronted with a difficulty in finding an English teacher who has much experience in practice, such as office work, business, management of companies etc. To solve this problem, it is supposed to set up relations with enterprises, companies, and businesses, or select some good young teachers to work in those enterprises or businesses so that they can gain some experiences in production, management and trade.

Third, it is necessary to let freshmen get hold of learning strategies, which are of vital importance to them. They must be taught to know very well what they are doing in the university. All the students in China are offered to study in a university depending on their scores achieved in the national entrance examination without any study plan. But in most universities of western countries, scores in high schools are only an element for them to accept the students' application. The most important thing for a university to consider about is to get to know what kind of men the students will become, what career they will pursue, and whether they are doing what they originally planned. Because the students are not sure of their own future, the training of learning strategies is very necessary. This work can be only done by teaching affairs office, academic and career consultants, and courses teachers who work together to interact with the freshmen frequently.

3.3 Teaching evaluation

Huang Daren, the former president of Sun Yat-sen University, has a very vivid description of public universities and private or vocational universities, in which he compares state-key universities to cars and private universities to tractors. "The function of tractors cannot be replaced by cars. Tractors can plough fields that no cars can do. But if we drive tractors on motorways, even the poorest-quality cars can run faster than tractors." (Huang Daren 2012) Since the universities like Peizheng are tractors,

and live at the foot of the mountain, the teaching evaluation should not be the same as the one for universities which are cars, which can run around the mountains. Unfortunately, most of the tests in private universities are centering round “memorization” as the public universities do. That happened to be what many students in private universities are short of. Why technology of computers and mobile phones is popular with young students in both public universities and private universities lies in the fact that part of our memories in the brain can be replaced by them. Then what should we do with this part of memories? Of course, it would be a good idea to use them to do creative thinking such as, analysis, application, comprehension, and estimation. The tests in the future are supposed to be more about task analysis, content analysis, procedure analysis which let the students digest what they have taken as a whole.

Paper writing is another means to evaluate students' English level which decides whether a student can successfully get his bachelor degree or not. The standard for an English paper is the same as the standard in a public university and so is the number of words required. Since Peizheng University has oriented itself as a university aiming at practical training, why not let students choose to do what they are interested in, for example, writing an investigative report, setting up a website, and coming up with a marketing plan, promoting plan, or a business plan etc.

3.4 Teaching Methods

More and more attempts in English teaching, such as presentations by students themselves, group activities, and role plays, have played an important part in stimulating the interests of students' learning. But with more activities organized by the students on their part, they are not happy any longer. They think teachers are lazy, and they can not learn anything in classroom teaching. So it is necessary to teach students according to their aptitude. Teachers should try to arouse the curiosity of students all the time. English teaching practice should be based on the actual situation or facts in everyday life. A good case in point is to let students do or complete a real task. The task-oriented teaching approach is helpful to make students more analytical, creative, innovative as well as cooperative and independent. Students who are used to being spoon-fed can not tolerate this method for sure. Disagreement from the students can be understandable, but innovation or change in teaching must be carried on. English teachers are required to learn from books, internet, and other sources all their lives. Otherwise, they will be unable to face the students who can absorb large amount of knowledge from the internet easily.

4 Conclusion

From what has been discussed above, it can be concluded that private universities do need to have innovations in English education. Both the educators and teachers in private schools should take actions and do something at an era when the massive open online courses in the world-known universities come into the life of average students freely. Only when reality-based learning, problem-based learning and project-based learning are applied more and more, can the education in private universities survive the rat race in this world and make knowledge powerful.

Performance of Socially Responsible Investment

El-Mehdi BARCA

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: madido@live.fr)

Abstract: For ten years, companies have stated their desire to better control the social and environmental consequences that may exercise their activity throughout the economy. Anxious to preserve their image as they try to carry out policies protective of the environment, their employees but also all of their financial and business partners. A general movement, often referred to as "sustainable development", which aims to ensure that the global economy healthy growth over the long term. The application of these principles to investment strategies led to the development of Responsible Investment (SRI) Socially. It defines its investment choices based on socio-environmental criteria to place on the same plane as the financial criteria commonly used.

If SRI is still far from having conquered the whole of the financial sector, development of great interest on the part of practitioners who are more likely to consider these criteria. The purpose of this research is to analyze the performance to date of this type of investment to determine whether it will remain restricted to a class of investors more concerned with their own values in their wallets or if announces a real transformation of investment strategies.

The introduction of SRI has led to many studies and researchers have mainly addressed the issue of performance, which is considered crucial for its future development. There are two clans: on the one hand critics of SRI, based on financial theory to highlight the weaker performance of this type of investment, and other supporters of SRI empirically demonstrate that the good results of this strategy. Studies have mainly focused on the United States and Europe, home of SRI. They are also of great statistical diversity, using measuring instruments and multiple complex performances.

Key words: Socially Responsible Investment; performance

1 A priori Less Efficient Investment

1.1 Less diversification

According to modern portfolio optimization financial theories, the primary goal of any investor is to maximize the return on his investment while enjoying taking minimal risk. Several models are applied to define the optimal strategy, of which the most used is the CAPM. The CAPM (Capital Asset Model Evaluation) was developed in the late 1950s as the CAPM and represents a major breakthrough in understanding the balances involved in the financial markets. The model assumes perfect information to market participants, who all have the same data on securities (profitability, risk, correlation with other securities). These seek to maximize their profitability while minimizing the risk associated with their portfolio. The model thus pushing to minimize the variance of the portfolio that each investor makes the best he can by diversifying its portfolio to the maximum, since the proliferation of securities in which it invests reduce portfolio risk (for example, a portfolio containing two securities with the same volatility has a lower volatility than the sum of the volatilities of the two components).

In doing so, each participant in the market will eventually eliminate the inherent risk of each activity by investing the same proportions in a "market portfolio." This portfolio contains all securities available in proportion to their capitalization: it is characterized by a minimal risk, "market risk."

This shows that the model urges all investors to diversify into possible portfolio. But the principle of selection in SRI excludes a number of companies that do not meet the defined criteria and reduces its investment universe. It contains fewer securities than the market portfolio; the SRI portfolio is less diversified and therefore is exposed to lower returns for a given risk.

Based on this financial theory, many economists demonstrate the necessary poorer performance of SRI. Thus in 1981, A. Rudd¹ says that the introduction of any constraint in the investment universe of a portfolio (size, price-to-book ratio ... or social criteria) reduces performance. Taking the example of the portfolio excluding the shares of companies involved in South Africa, it demonstrates that the actions chosen correspond to smaller companies and are therefore subject to changes much less correlated with the market. Similarly, R. Clow² emphasizes the industrial means confronting an SRI Portfolio rejecting a number of industries; it concentrates risk in a small number of sectors. In both cases, the inherent risk of the portfolio increases and exposes the investor to greater variations.

Less theoretically, it is clear that SRI simply reduces the choice available to the investor. Thus, a

universe of 1,000 shares, if the SRI selection excludes in advance 200, the investor will have more than 800 investment choices to try to outperform the market while a typical investor can choose between all 1000 titles available on the market. In addition, the reduction of the universe can often include particularly performing stocks, as is the case for example for the arms companies.

In addition, the method of selecting securities SRI is still far from being systematic and criteria defined by the rating agencies are not always clear or easy or very applicable. And SRI is it for a certain mode of investment disconnected from relevant financial analysis and therefore reduced to a rather subjective choice of titles. The random nature of this investment therefore inevitably decreases performance.

1.2 At the enterprise level

Finally, critics of SRI are convinced that the inclusion of social and environmental constraints in a business is necessarily accompanied by additional costs. These costs are then passed on to prices and products become less competitive. The company recorded lower profits, which inevitably affects the price of his action ... and reduces the performance of SRI portfolio.

Thus, financial theory seems to condemn SRI to poor performance. An empirical analysis of the situation is needed to confirm or refute these findings. I wear my analysis on two types of indicators SRI equity indices and funds management.

2 Method used to Measure the Performance of SRI

2.1 First performance measures

The simplest of the performance of a financial asset is measured in calculating its profitability. It has the advantage of being easily calculated and provides a first estimate. Monthly performance for a month i are calculated as follows:

$$R_i = \frac{V_{31} - V_1}{V_1}$$

With V_1 the value of the assets on the first day of the month i

V_{31} the value of the assets on the last day of month i

The profitability average is calculated by geometric average:

$$\bar{R} = \prod_1^T (1 + R_i)^{1/T} - 1$$

In addition, analysis of returns can not be made without taking into account the volatility of these returns, which is calculated using the statistical variance of a sample of size n :

$$\sigma^2(R_p) = \frac{\sum_1^n (R_i - \bar{R})^2}{n - 1}$$

With \bar{R} the average of R_i over the period given of time

However, these measures are still too brief to form the basis of a rigorous proof. That's why I put on this study two other performance measures, such as the "Sharpe ratio" and "Jensen alpha."

2.2 Deepening the performance measurement

The Sharpe ratio is based on the idea that a rigorous measure of performance must include both the returns of the assets identified in excess of the risk-free rate and the risk of the asset. It is therefore a measure of the premium variability. For an ex-post measure, it is often stated as:

$$S_p = \frac{\bar{R}_p - R_f}{\sigma(R_p)}$$

With R_f the risk-free rate over the period studied

The Sharpe ratio represents the limits of its assumptions, including that postulate that returns follow a normal distribution and that the risk-free rate is constant over the period studied. However, in this study, such assumptions can be accepted without reducing the significance of the results.

The second performance measure used in this analysis is Jensen's alpha. According to the CAPM model presented above, the cost of a financial asset must satisfy the following equation:

$$E(R_p) = R_f + \beta_p \times (E(R_M) - R_f)$$

$$\text{With } \beta_p = \frac{COV(R_p; R_M)}{\sigma_M^2}$$

Ex post, therefore Jensen's alpha measures the outperformance of the asset over its expected performance, that is to say:

$$\alpha_p = \bar{R}_p - E(R_p)$$

If these two measures have certain biases we have already mentioned, yet they have the advantage of being easy to use, unlike other measures of modern performance. These new measures are also not unanimous in the world of researchers because of their technical expertise. In addition, the historical data characterizing low SRI is still too little suited to this kind of action. That is why I chose to limit myself to the ratios presented above.

3 Compared with a Benchmark

To refine the comparison between two indices, it is often useful to calculate the average of the differences between their returns and the variance of these differences. Finally, since the purpose of this study is to analyze the difference between the performance of SRI indices and those of their benchmarks, it is important to test the validity of this hypothesis. It is therefore to provide a test of hypothesis to accept or reject the hypothesis H_0 against the hypothesis H_a as:

$$H_0 : \mu_d = R_{ISR} - R_{benchmark} = 0$$

$$H_1 : \mu_d = R_{ISR} - R_{benchmark} \neq 0$$

For this, I will use a t-test for a confidence interval of 95%, the formula is as follows:

$$t_d = \frac{\mu_d}{\sigma_d}$$

With μ_d the average of the differences

σ_d the variance of the differences

This value must be compared to the value of t after the Student table with a degree of freedom equal to the sample size - 1. If $t > t$ or $t < -t$, then we can reject the hypothesis H_0

4 Conclusion

Socially responsible investing has formed since the eighteenth century around a conscious reconciling material respect moral enrichment religious ideology. Initially reserved for religious congregations, it has been a decade largely developed through the global financial sphere. The emergence of an entire class of professionals who specialize in this sector, such as rating agencies or socially responsible funds, demonstrates the growing interest in this type of investment. Its development will be assured however that once the debate on the quality of its performance ended. This question has been the subject of numerous studies among researchers. I did my own study based on data on the performance of indices and socially responsible funds.

It is too early to draw any real conclusions about this research: the phenomenon is new and we do not yet have the necessary perspective. However, it seems that

Socially responsible investment has a positive impact on the policies of the companies and helps select those that are the most successful financially. A trend that has not escaped investors, more and more people consider these criteria in their investment choices.

If the specifics of the SRI are now well represented in the strategies of investment, valuation models are still far from the mainstream. That is why in 1998, Statman proposes an extension of the evaluation of the CAPM model, the "behavioral asset pricing model". In this model, the expected asset returns are calculated considering both utilitarian criteria (such as beta, the level of taxation, liquidity, dividend yield) and criteria expressing the values important to investors ("value-expressive features"). We perceive how quickly the design of such a model is complex: how to formalize the social criteria and legal requirements of investors? This is a vast field of action that opens to the research devoted to SRI.

A Research on Effect of Vacuum and Pressure Treating Seeds on Mung Bean Sprout*

Chen Liying^{1,2}, Liao Hong¹

1 School of Science, Wuhan University of Technology, Wuhan, P. R. China, 430070

2 Laboratory of High Pressure Physics, Southwest Jiaotong University, Chengdu, P. R. China, 610031

(E-mail: clychenliying@sohu.com, liaohong@wuhan.edu.cn)

Abstract: In this work, mung bean seeds were pre-treated by vacuum and high pressure for 4 h respectively, and the untreated one as a comparison group. Then the comparison group and two pre-treated groups sprouted under the same condition. Results showed there are no significant differences in germination rate, sprout crown and stem of the three groups of mung bean seeds. but there are great differences in root of the three groups of mung bean. mung bean sprout pre-treated by high pressure was worse in growing, while the group of pre-treated in vacuum became better.

Key words: Vacuum soaking; High pressure soaking; Mung bean

1 Introduction

As is well known that mung bean is rich in nutrition, which not only plays an important role in the treatment of scurvy and removal of fat and cholesterol in the vessel wall deposition, but also has a good curative effect for oral ulcer, constipation, gastrointestinal cancer and for prevention of cardiovascular disease. However, root and tip of mung bean sprout is easy to be rotten in the germination process. Therefore, it has important application value to study how to reduce rotten root and tip of mung bean in the germination process.

It recently has been gotten more and more attention that pressure parameter is regarded as the description of biological growth process and behavior rules of molecular mechanics and dynamics [1]. Many scholars have done lots of research about the influence of pressure on plant growth. Liang Ling etc. have studied the effects of high pressure on seed germination and seeding development of wheat. Wu XueHua etc. have investigated the influence of the growth characteristics of miniature tomato seed treated by high pressure nitrogen [2], and so on. These studies show that the effects of pressure on the growth of the organism can not be ignored. It has been not reported the effects of pressure on mung bean seeds. Therefore, this paper discusses the effects of different pressure on mung bean root by pre-treating mung bean seeds, which aims to find a Physical method that is helpful for growth of mung bean root..

2 Materials and Methods

2.1 Material

New green mung bean seeds, purity 95%, cleanliness 97%.

2.2 Processing method

It was divided into three groups of mung bean seeds, the weight of mung bean seeds for each group was 200g.

The First Group (pre-treated by high pressure): mung bean seeds were treated for 4 hours in the high pressure 12.7MPa and temperature 26.7 °C. processing medium was mixed gas of argon gas and air, the pressure of the air was 0.1 MPa.

A Second Group (pre-treated by vacuum): mung bean seeds were treated by vacuum for 4 hours, which vacuum degree was 0.04 MPa to 0.05 MPa and temperature was 26.7 °C.

The third group (the comparison group): untreated mung bean seeds.

2.3 Seed soaking

Three groups mung bean seeds were put respectively in three separate foam box (size 800 × 500 × 400) in the same conditions, mung bean seeds were soaked in the water for 5 hours. We observed the changes of the mung bean seeds during the soaking.

2.4 Sprouting

After soaking, three groups mung bean seeds were put respectively in three separate foam box in the same conditions (there was disinfection of treated rice straw in the bottom of box), mung bean seeds of each group were watered every day in the same conditions, at the same time we recorded the time,

* This paper is supported by the Fundamental Research Funds for the Central Universities (Grant No. 2011-Ia-003)

temperature and humidity and observed the changes during the seed germination. The duration time was 7 days.

3 Results

3.1 The effects of pressure on germination rate of mung bean seeds

At room temperature, three groups of mung bean seeds were germinated in the same condition. The results show in figure 1. The germination rate of mung bean seeds in pressure treated group is 85% and the Vacuum treated group is 87%, while the Comparison group is 84%. There are no significant differences in germination rate of the three groups of mung bean seeds.

Figure 1 The germination rate of mung bean seeds
a. Pressure treated group b. Vacuum treated group c. Comparison group

3.2 The effects of pressure on mung bean sprouts

After seven days of germination, results showed that there are no significant differences in sprout crown and stem, but there are great differences in root of the three groups of mung bean. For the first group, root of mung bean sprout is dark brown and not developed. There is seriously rotten root and tip of mung bean in the germination process. For the second group, root of mung bean sprout is white and well developed. There is not rotten root and tip of mung bean in the germination process. For the third group, root of mung bean sprout is slightly hazel and well developed. There is partly rotten root and tip of mung bean in the germination process. As shown in figure 2.

4 Discussion

Wu XueHua etc. have investigated the influence of the growth characteristics of miniature tomato seed treated by high pressure nitrogen. They believe that the decline of mortality rate of tomato is affected by oxidative stress of exercise during growth and development to some extent^[2]. Therefore, the mung bean root by treated in vacuum is white and well developed, there is partly rotten root and tip of mung bean in the germination process. It may be related to 5 hours hypoxia by vacuum treatment. In some extent, hypoxia caused oxidative stress of exercise of mung bean, stress to normal conditions the activity recovery speed, corrosion resistance improved obviously, so mung bean sprout pre-treated by in vacuum became better.

Cucumber cotyledon, hypocotyl and tomato peel after the cold exercise and so on were tread with 12 MPa pressure helium and nitrogen by Saltveit etc.. Its results show that chilling injury degree will aggravate^[3]. Chen Liying etc. found that disease-resistant ability of periwinkle plant by high pressure seed treatment had been dropped^[4]. Li Guishuang, Bai Chengke etc. also reported rice growth is restrained obviously by hydrostatic pressure processing. Many experiments showed that high pressure had inhibition or destroy effect on the biological growth, and also damaged the cell membrane^[5]. High pressure maybe increase the thickness of the membrane and lead to a net volume decrease, which affects the membrane fluidity. In this experiment, for the first group(pre-treated by high pressure), root of mung bean sprout is dark brown and not developed. There is seriously rotten root and tip of mung bean in the germination process. It is possible that the high pressure damaged mung bean seed cell membrane structure and the growth of the mung bean sprout is inhibited, which lead to undeveloped roots and weakening of corrosion resistant ability and rotten root and tip.

5 Conclusion

In summary, it has the promoting effect on the growth of mung bean by the vacuum processing of the sprout seeds, while high pressure treatment has the inhibition effect on the the growth of mung bean. mung bean sprout is rich in nutrition, We will test Nutrition contents of mung bean sprout of each groups in the next step.

Abstract: The key value of the experiential teaching in universities is its link with educational Innovation. Not only does it boost the revolution of the traditional teaching styles and behaviors, it also poses considerable influence on the traditional educational concept to a great extent. This paper tries to take the characteristics of experiential teaching of the course “Social Issues in Contemporary China” as the entry point, discuss its epochal characteristics, practical applicability and trend of its modes and values, so as to provide theoretical support and practical thoughts for experiential teaching practice in universities.

Key words: Experiential teaching; Teaching innovation; Game theory; Course of “Social Issues in Contemporary China”; Characteristics and practice.

1 Introduction

If we take a closer look at the fields of innovation in China’s higher education, we will find out that the promotion and development of experiential teaching are always happening along with the educational reforms in universities. As it is the case in the course of “Social Issues in Contemporary China”, in particular, the application of experiential teaching Method not only accelerate the transformation of the ideas of traditional classroom teaching, it also induces the transformation of the teaching behaviors in classrooms in a sense. And it has become an approach in which university students may achieve self-liberation in a classroom, a foundation on which personalized knowledge may integrate, a catalytic agent with which fine personality may be nurtured, and a guarantee under which a healthy mind may be cultivated. This paper will take the course of Social Problems in Contemporary China as a point cut, conducting theoretical analysis and practical investigation of the characteristics, practical issues and developing trend of experiential teaching. And hopefully, the research and discussion conducted in the paper may provide some new thoughts for the educational innovation in China’s universities.

2 Contemporary Characteristics of Experiential Teaching in Universities

Traditional experiential teaching refers to a teaching philosophy and approach in which education is conducted in accordance with the characteristics and pattern of students’ cognition, an actual or similar scenario and opportunity is created and reproduced, so as to make students construct knowledge base, develop ability, formulate emotions and grasp gist in the process of personal experience. While in the field of education in ordinary universities, especially during the teaching process of the course “Social Issues in Contemporary China”, the experiential teaching is more like a characteristic which promote college students’ practical activities expansion, conscious grasp of social laws and principles and transformation of self-perception.

2.1 Promote the Transformation Process of Teaching Practice from Static Teaching to Dynamic Exploration

The general teaching practice is always conducted in a static way of theory and approach teaching, although certain society-related case studies will be done and some social practice work will be organized in the classroom. However, it is, seen as a whole, still a one-way static teaching practice from teachers to students. And it is lack of an atmosphere in which teachers and their students could have considerable interaction, thereby affecting the organization and conduction of the intellectual delivery to the students. While experiential teaching may arouse a healthy and active emotional experience from students during the process of education delivery, so as to motivate students’ initiative of cognition and

* This paper is supported by the project “Innovation of Experiential Teaching in University Classrooms – Taking the course Social Issues in Contemporary China as the example” of Jiangxi Province.

achieve the targeted outcomes through vivid, enthusiastic and creative process of teaching and learning.

In a creative way, the author inserted a cartoon scenario into the teaching practice of the course of “Social Issues in Contemporary China”. By watching the video clip of the fairytale of Cinderella, students will be guided to find out the social issues that are reflected in the story. The process of cartoon watching is also the process that students’ cerebral cortexes are relaxing and their emotions in the childhood are awakened. The experiential function and creative potentials are stimulated through the process of watching the fairytale and analyzing the issues together by the teachers and their students. For instance, the students will have better understanding of the “social fairness”, “political enforcement” reflected in the fairytale in comparison with the actual situation of “a government lack of credit” in the real life. And a better teaching outcome can be achieved. On the one hand, students will be led to experience the psychological changes of different roles based on the cartoon images and will have multi-form and multi-lateral experience, comprehension and creative thoughts in accordance with their own cognition and needs. This has well shown the subjectivity and personality of individual student. On the other hand, students may analyze the social phenomenon in the real life based on the stories in the cartoons. And this will create empathetic conditions and cognitive foundation for teachers to deliver teaching contents with real cases and to arouse students’ in-depth thoughts.

2.2 Promote the Transformation Process of Teaching Practice from Phenomenon Collection to Principles Grasp

University students living in the campuses are always considered as a unique social group. And they do understand some of the social phenomenon or issues to certain extent in their growth. However, due to the restriction of the factors including environmental issues and personal experience, their understanding of those phenomenon or issues is plain and superficial. And their understanding is merely a collection of the simple phenomenon and is far from the in-depth grasp of the social laws. As one of the compulsory courses of Sociology major, the course “Social Issues in Contemporary China” is designed to deliver the basic social knowledge and ethical issues to students from the theoretical and practical angles, help university students analyze the existing social issues and be precautious of the potential social crisis. Therefore, in order to realize the teaching objective of the course “Social Issues in Contemporary China”, teachers shall fully exert the characteristics of “simulated personal experience” of experiential teaching method, thereby transforming students’ learning process from collection of phenomenon to grasp of social laws and principles.

The core part of “simulated personal experience” theory is the integration of the direct and the indirect, which means students are no longer the passive recipients of knowledge during the teaching process. They are encouraged to participate in the teaching process in terms of their behaviors and emotions and accumulate their knowledge base through their direct or indirect experience. The so-called “direct” refers to highlight the intuitive feeling function of the situations through a variety of themed scenarios design. For example, the author adds the fairytale of “Here comes the Dingdong” into the course design, in which the phenomenon of conformity is reflected. This design has fully mobilized students’ visual feelings and has made them cognate, feel, analyze and investigate the essence of the social issues reflected in the fairytale. Therefore, a psychological interactive experience of their own will be formed. In the mean time, phenomenon that students have superficial knowledge about the social issues will be greatly improved. The so-called “indirect” refers to the scientific discussion and analysis of the appearances, causes, trends of a variety of social issues through necessary teacher-student interaction and student-student interaction on the basis of direct experience, so that social laws and principles can be grasped and bad habit like metaphysics and mechanical application can be eliminated.

2.3 Promote the Transformation Process of Teaching Focus from self-spontaneity to self-awareness

From the perspective of sociology, the focus of the course “Social Problems in Contemporary China” is the real issues occurred in the present society, among which some are ones left over by history, and some are new products brought by the social progression, including issues of social norms, social fairness, social organization, public security, population and ecological environment, etc. It is the core part of experiential teaching to help the university students fulfill the transformation from independent awareness of social problems to understanding social disciplines.

In order to realize the transformation of the learning focus, it requires the emphasis the principle of “integration of appearance and essence” in experiential teaching during the process of teaching practice, so as to drive students transform from self-spontaneity to self-awareness. All appearance is the representation of essence, and essence has to be expressed through appearance. The settings in experiential education are all consciously selected and personally optimized by teachers. And the social phenomenon reflected in the optimized settings, especially the carefully selected fairytales, will provide

students a much better experience of the story, vividly affect students' psychological cognition, and even can help students learn how to think, summarize and be abstract. While teachers may step back and seek for education opportunities from students' performance by observing students' psychological changes. In that case, a classroom may then become a place where students take their own initiative and study, and a place where students' self-awareness about social issues may generate.

3 Realistic Problem of Experiential Teaching in Universities

Although experiential teaching enjoys some obvious advantages in the area of creativity in universities, it is still undeniable that we need to be really careful to spread and popularize it because certain issues do exist which are generated by some historical and factual matters.

3.1 The imbalance between the Contents and Forms of Experiential Teaching

During the process of teaching innovation in universities, the style and contents of experiential teaching are closely related, interdependent and indispensable. In the mean time, they are mutually restricted and can affect each other, thereby forming a relation of unity of opposites. The contents of experiential education will lose its carrier without the style, which then make the contents impossible to be expressed. Likewise, the style of an experiential education without proper contents is very much alike a body without a soul, and will be unworthy existing in the world. Taking the course "Social Issues in Contemporary China" as an example, experiential teaching is not only the tool to express its contents, but also a basic prerequisite which makes teaching practice deserve to be called a teaching practice. This requires us, on the one hand, stress the dominant position of the education contents and pay much attention to the influence that education contents have to education style. Also, the function of education style cannot be overlooked. Great efforts shall be invested in transforming the teaching style to promote the optimization of teaching contents, adjusting the sentiments of teaching contents, and adding aesthetic elements to classroom education. Only by doing that can we achieve the goal of "teaching contents are changed after the style and teaching styles are innovated after its contents".

However, in the actual teaching practice, it is commonly seen that imbalances between teaching contents and its styles in experiential teaching are existing. And it is usually the case that the education contents and styles are disunited and sometime only contents or styles are emphasized. This will lead to a distortion of knowledge delivery. On the one hand, some teachers always believe that the more experiential materials and questions, the better. However, with the excessive experiential sources, insufficient experiential time-space will be left over for students. Teachers will then, therefore, find it difficult to inspire students on how to identify and formulate questions, and students will undergo mismatch between emotional cognition and spiritual experience. On the other hand, some teachers partially believe that the more situational expression modes in the experiential teaching the better. So they overuse different kinds of experiential modes in one single teaching period. From a certain perspective, perhaps, diversified experiential modes may make new knowledge fun to learn. However, it can easily lead to a situation in which students will have a way too fast sense and feelings, and way too short time for critical thinking. This is definitely not the objective that experiential teaching would like to achieve.

3.2 The Imbalance of Pre-determinative Teaching and Generative Teaching in Experiential Teaching

From the perspective of the theories of modern education, pre-determinative teaching is a teaching method that abides by certain teaching principle and designs the teaching objective, contents, approach and styles, so as to elevate the teaching efficiency. Generative teaching is the innovation and improvement under the framework of pre-determinative objective and contents. Pre-determinative teaching reflects the scientific nature of teaching practice, while generative teaching reflects its artistic nature. Sparks will be produced when teachers try to use both of the teaching methods in a classroom. Unfortunately, this needful balance of pre-determinative and generative teaching has become the main stream of experiential teaching. And quite a lot of imbalanced cases can be observed. First, too much pre-determinative work has been done in the lesson preparation. Indeed, pre-determinative work before a class is indispensable when conducting experiential teaching. Yet in practice some teachers have done too detailed pre-determinative planning which seriously affect students' autonomous experience. The teaching practice will then become a mere formality, and the teaching outcomes and original teaching design may be widely divergent. Second, given the background that generative teaching has become dominant in educational reforms in universities, some people falsely believe that the basic teaching practice will transform from pre-determinative teaching method to generative teaching. Consequently,

per-determinative teaching method, together with its inherent drawbacks, has become the target of critics. In contrast, generative teaching method becomes the perfect prototype which has countless advantages. This has led to the imbalanced situation between pre-determinative teaching and generative teaching method.

Both of the above-discussed phenomenon stem from the improper handle of the duality of experiential teaching method. On the one hand, generative teaching is advocated in the experiential teaching and the old-fashioned pre-determination-oriented teaching practice has to be abandoned. This fact is totally misinterpreted. On the other hand, the fact that pre-determinative teaching is the foundation of generative teaching method is not properly taken into consideration. Therefore, advocating generative teaching method does not equate with denying per-determinative teaching method. And it is unnecessary to change all the pre-determinative teaching into generative teaching method. The guideline is that the pre-determined key points should be clear teaching objective and systematic teaching ideas, and should also provide macro-level of guidance for creation of discussion atmosphere, perception of issues and ability of critical thinking, etc. And the control of the dialectical relationship between pre-determinative teaching and generative teaching not only turn the classroom into a platform for students to show their abilities, but also a place where teachers may present their intelligence and reflect the core value of “Teaching serves Learning” in experiential teaching.

3.3 The Estrangedness of Teacher-Student Interaction and Student-Student Interaction in Experiential Teaching

The dominant factor in experiential teaching is the mechanism of interactive teaching, among which the most important part is teacher-student interaction and student-student interaction. From the sense of philosophy, they are mutually interdependent, and also complement each other, and it is safe to say that they together determine the development direction of experiential teaching. Teacher-student interaction requires teachers to establish a classroom teaching system which complies with the “Students First” principle. Under this framework, the teaching and learning attempts between teacher and students shall be promoted, knowledge obtaining and practicing shall be carried out in a multi-directive interaction, and the phenomenon of excessive dependence of teachers and learning all by oneself shall be avoided. Student-student interaction is designed to conduct activities including feeling expression, experience summary, problem discovery and countermeasures raising among students, and connect classroom teaching practice and theoretical investigation, so as to make all the students consciously conduct critical thinking about the issues reflected in the teaching contents. In that case, every single student has become the designer and researcher of the teaching settings. And when it comes to the teaching practice of the course “Social Issues in Contemporary China”, experiential teaching is a process of multi-element interactive teaching reforms and innovation of teaching theories. Therefore, the harmony of teacher-student interaction and student-student interaction becomes very important.

Undeniably, it is a common situation that teacher-student interaction and student-student interaction cannot coexist in ordinary classroom teaching. Some teachers have very superficial understanding about the teacher-student interaction and cannot appreciate the internal connection between teacher-student interaction and student-student interaction from different angles. They attach too much importance to the teaching position and teaching function of teacher-student interaction and do not realize the problems in such interaction like little room for idea-exchanging, impossible to have all the students involved in the process of thinking and experiencing, etc. These misconceptions will lead to a serious situation in which students in the classroom are only a bunch of audience who do not care about what’s happening on the stage. It is especially the case for the lesson with complicated contents. Students have no communication with each other, either emotionally or behaviorally. Therefore, a better teaching outcome can never be reached. This demands our teachers to make student-student interaction a supplementary component to the classroom teaching, and encourage students to come up with their personalized viewpoints, so as to elevate their cognitive competence and abstract analysis ability by defending and even arguing for their own point of view. By doing this, not only do we provide a platform for those who are eager to think and learn, we also help achieve the “integration of emotion and context” in the experiential teaching

4 Practical Tendency of Experiential Teaching in Universities

Although plenty of research has been done regarding the experiential teaching, the research of it in terms of ordinary universities are still remaining on the aspects of its characteristics, value and ways of realization. Very limited research regarding its trend of development in future has been conducted. So it is much needed that we have to do rational reflections about teaching styles, teaching objective and

teaching activities from a certain height.

4.1 Coexistence of Situational Teaching and Emotional Teaching

As the educational reforms in ordinary universities goes deeper, the simple situational teaching method can no longer cater the need of the development of experiential teaching in universities. It has become a tendency that situational teaching method and emotional teaching method will have equal importance in classroom teaching. Research on emotional psychology shows that individual emotion has at least three aspects of function on cognitive activities: power, consolidation and adjustment. Hence, emotional teaching needs to create situations to inspire, arouse and satisfy students' emotional need, thus makes the teaching activities even more active. A combination of situational and emotional teaching method is not only helpful for college students to create harmonious and cozy teaching relationship from the appearance of situational teaching, it also can facilitate students' transformation of learning emotion, abandon the past perplexed and superficial learning moods, reposition learning goals and reshape learning behaviors.

As far as the course "Social Issues in Contemporary China" is concerned, the key point of "coexistence of mood and mentality" lies in the fact that the development of mood shall be prompt while that of mentality shall be gradual. Prompt mood development attaches importance to the guidance of the development of university students' learning psychology and requires them to form proper appreciation about the psychological status like happy, angry, love, hate, fear and sorrow aroused by experiential teaching situations during their learning process. Moreover, university students are expected to have self-control over their personal quality or comprehensive ability expressed during the process of situational teaching practice. In contrast, gradual development of mentality emphasizes that university students' learning mentality shall move forward or upward in a more systematic and ordered way, so as to achieve a situation in which the need for learning comes from the deep of their hearts. And their heart and soul become the first classroom where experiential teaching is conducted, and emotions become the major drive of students' learning behaviors.

4.2 Coexistence of Realistic Education and Future Education

Based on the practical experience collected through working in the universities for many years, the author believes that the theory of "reality teaching and future teaching coexist" can focus on the reality and the future of teaching object at the same time. It is not only the key to solving the imbalance between per-determinative teaching and generative teaching, but also the only way in which experiential teaching in ordinary universities can develop. Namely, in the process of experiential teaching, we have to take "facing reality and facing the future" as the logical origin, no matter the per-determination of emotional situation or the generation of teaching objective. In that case, students will realize that the present learning situation and outcomes are not only the need for the completion of a single academic job, but also the foundation of future development. Therefore, the cultivation of students with strong ability of sustainable development becomes the common agreement among teachers and students.

As for the course interface of "Social Issues in Contemporary China", on the one hand, experiential teaching advocates to take "Learning for learning's sake" as the starting point, which requires students to retrieve their knowledge base, take initiative to use the strategy of collection and summarization, reorganize all the existing theories and practical knowledge, and turn them into basic factors that are needed for academic learning. On the other hand, it is also promoted that students shall make their study plan according to the principle of "learning for future career's sake". And all the university students should set their target as mastering the professional qualities required by modern society and industries. So they can develop their ability of abstract analysis and perfect themselves for future development by connecting the experiential materials and social issues.

4.3 Coexistence of Generalized Teaching and Personalized Teaching

During the process of experiential teaching in universities, it is an indisputable fact that generalized teaching has been playing the dominating role. And it is common to see that same kind of experiential teaching setting and teaching resources have been used by many subjects, or sometimes even many majors. Such kind of generalized teaching method is beneficial to the expansion of experiential teaching to a larger scale. However, it comes with a price, which is the sacrifice of personalized teaching practice. We have to admit that personalized teaching method effectively connects teacher-student interaction with student-student interaction in the experiential teaching practice. The personalized teaching method, in a sense, is the internal driving force of the development of experiential teaching in universities.

5 Conclusions

As for the teaching practice of the course "Social Issues in Contemporary China", it requires a

visionary insight and sensitive thoughts to optimize and highlight the teaching mode and contents, so as to construct a brand new context for generalized teaching method. Meanwhile, teachers should also discard the misgivings of experiential teaching which is believed to be too limited, and facilitate students to grasp the principal contradiction in the teaching contents and the major aspects of the contradiction under the actual educational conditions. With the deepening of teacher-student interaction and larger-scale of student-student interaction, the features of the course will be very well demonstrated. Therefore, when remedying the defects and omissions of generalized teaching, the teaching context of “personalized teaching and personalized learning” shall be deemed as the banner of the experiential teaching reforms in universities.

Evaluation on Financial Synergy Effect of Enterprise Group Based on the Unascertained Measure Theory

Zhang Baoqiang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 775778934@qq.com)

Abstracts: Due to the complexity and diversity of organizational form, the financial cooperative governance issues of the enterprise group become the significant problem of modern enterprise group. On the basis of the existing research results and the principle of systematic, the paper constructs three dimensions of financial cooperative system, which includes financial strategy cooperation, financial resource cooperation and financial interest's cooperation. It puts forward the index system of enterprise financial cooperation effect evaluation, by means of questionnaire and financial data the listed companies publish, and uses unascertained measure model to judge the financial strategy cooperative ability, financial resource cooperative ability and financial interests coordinative ability, finally it is the financial cooperative ability evaluation and analysis of the 20 enterprises. Through the research, the financial cooperative ability of enterprise group is weak, mainly due to the insufficiency of the financial resource cooperative ability and the weakness of financial interest's cooperative ability.

Key words: Enterprise group; Synergistic governance; Synergistic effect; Evaluation system; Unascertained Measure Theory

1 Introduction

The enterprise group is the legal entity which is formed by a plurality of enterprises or organizations through the organic economic link, it plays a decisive role in the today's market competition and economic development, and it's the concentrated expression of national competitiveness. Since the reform and opening up, the constant adjustment of national economic development, a great number of enterprise groups with independent intellectual property rights, well-known brands and international competitiveness spring up rapidly, and become the backbone of national economy. Because of the complexity and diversity of organizational form, the financial cooperative governance issues of the enterprise group become the significant problem of modern enterprise group, and also become the main issues that many foreign and domestic scholars concerned with. In recent years, domestic and foreign scholars study a lot about the financial synergy development agent, mechanism and influence. However, the current research has not solved the integration between the traditional financial management theory and systematic, and its perspective on the lack of dynamic state and application oriented, therefore making it difficult to explain the financial synergy deep mechanism. On the basis of the existing research results, the paper combines the economics, management science and system science, and adopts the methods of literature research, questionnaire survey, empirical analysis and theoretical reasoning, it aims at trying to solve two key problems: one is to reveal the financial synergy governance mechanism, model construction and realization way, the other is to construct the evaluation system and method of the financial synergy governance effect.

2 Financial Synergy: Three-Dimensional Evaluation System in Enterprise Group

Financial synergy governance is related to many factors, therefore we need to design the evaluation index from various angles and levels, in order to ensure that the evaluation results reflect the true level. On the basis of existing literature, and according to the factors affecting the financial synergy governance, the basic framework of financial synergy effect evaluation index system can be constructed (Figure 1) It can be divided into four levels: the goal layer refers to the top of the index system, namely the financial strategy synergy, financial resource synergy and financial interests synergy. The index layer refers to the concrete index contains the various subgoals, the specific meaning and code are shown in Table 1: The object layer contains the financial synergy effect evaluation object, namely the 20 listed corporations.

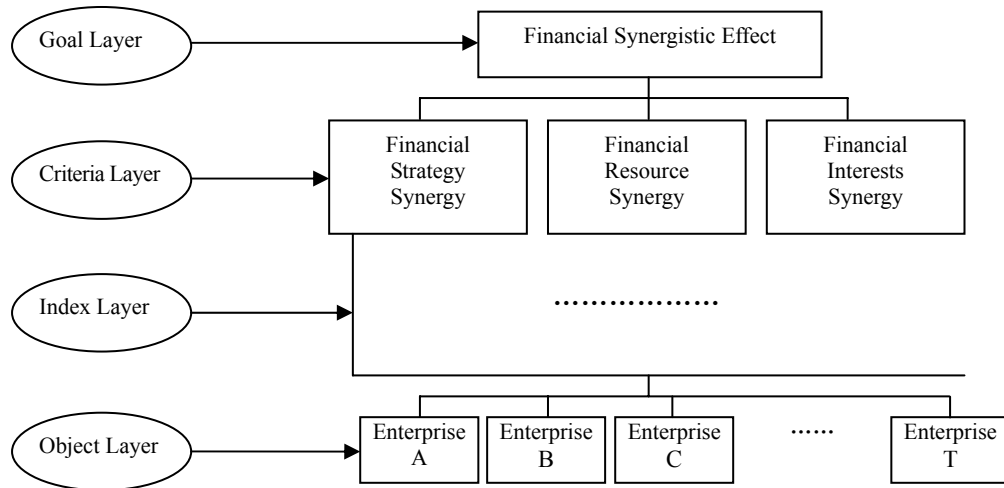

Figure 1 Evaluation Index of Financial Synergistic Effect

Table 1 Evaluation Index of Financial Synergistic Effect

Goal Layer	Criteria Layer	Index Layer	Code
Financial 3D Model of Synergistic Governance (X)	Financial Strategy Synergy Model (X1)	Market Environment Adaption Visibility	X11
		Investment Environment Adaption Visibility	X12
		Precision Visibility of Industry Competition in Profit	X13
	Financial Resource Synergy Model (X2)	Resources Allocation Advantage Visibility	X21
		Property Allocation Advantage Visibility	X22
		Capital Allocation Advantage Visibility	X24
	Financial Interests Synergy Model (X3)	Shareholder Satisfaction	X31
		Employee Satisfaction	X32
		Customer Synergy Visibility	X33
		Supplier Synergy Visibility	X34

3 Based on the Unascertained Measure Model, the Construction of Financial Synergy Effect Evaluation Model

3.1 Single Index Model of Financial Synergy Effect Evaluation

The financial synergy evaluation index contains both quantitative indicators and qualitative indicators, taking the uncertainty and order distribution into consideration, the unascertained measure model is used to evaluate the financial synergy capability.

Set up x_1, x_2, \dots, x_n is to be evaluated n collaborative project financial indicators, the evaluation object space $X = \{x_1, x_2, \dots, x_n\}$. To $x_i \in X$, have m Evaluation indexes I_1, I_2, \dots, I_m . Then the evaluation index space $I = \{I_1, I_2, \dots, I_m\}$. Thus, for $x_i \in X$ Can be expressed as m Dimensional vector $x_i = x_{i1}, x_{i2}, \dots, x_{im}$, Where in x_{ij}

Evaluation of the object representation x_i . An evaluation I_1, I_2, \dots, I_m $i = 1, 2, \dots, n$ For an index $I_i \in I$, have k Secondary evaluation $I_{i1}, I_{i2}, \dots, I_{ik}$. Then the two evaluation space $I_i = \{I_{i1}, I_{i2}, \dots, I_{ik}\}$. Then x_{ij} Can be expressed as k Dimensional vector $x_{ij} = \{x_{ij1}, x_{ij2}, \dots, x_{ijk}\}$. Wherein x_{ijr} Evaluation of the object representation x_i . About an indicator I_j . The following two indicators measured values. For each x_{ijr} . With p Rank

c_1, c_2, \dots, c_p Then the evaluation space $C = \{c_1, c_2, \dots, c_p\}$ And if c_k Indicates the importance of financial indicators, then k Level than $k + 1$ Level and recorded as an important $c_k > c_{k+1}$. If the $\{c_1, c_2, \dots, c_p\}$ Met: $c_1 > c_2 > \dots > c_p$, Called $\{c_1, c_2, \dots, c_p\}$ Is to evaluate the spatial C An ordered partition classes.

$$(\mu_{ijq})_{m \times p} = \begin{bmatrix} \mu_{i11} & \mu_{i12} & \dots & \mu_{i1p} \\ \mu_{i21} & \mu_{i22} & \dots & \mu_{i2p} \\ \dots & \dots & \dots & \dots \\ \mu_{im1} & \mu_{im2} & \dots & \mu_{imp} \end{bmatrix}, \quad i = 1, 2, \dots, n$$

The formula for the object x_i , The single index measure evaluation matrix

3.2 Evaluation of Corporate Financial Synergies Entropy Model

Objects x_i About indicators I_j Observations x_{ij} The object is c_1, c_2, \dots, c_p Each evaluation level unascertained vector is: $\mu_{ij1}, \mu_{ij2}, \dots, \mu_{ijp}$, Denoted $(1 \leq j \leq p)$ Indicates x_{ij} Make x_i At the evaluation level unascertained measure, then $\mu_j^i = (\mu_{ij1}, \mu_{ij2}, \dots, \mu_{ijp})$.

Single index measure μ_{ijk} The value reflects the degree of decentralization and centralization I_j Indicators distinguish x_i .The size of the contribution of the category, that decision I_j Indicators About x_i Sample classification weights w_j^i The size of the μ_{ijk} The degree of decentralization and centralization values available information entropy to quantitatively describe. Defined by the information entropy can be obtained:

$$H_i(j) = -\sum_{k=1}^p \mu_{ijk} \log \mu_{ijk} \quad v_j = 1 + \frac{1}{\log p} \sum_{k=1}^p \mu_{ijk} \log \mu_{ijk} \tag{1}$$

$$w_j^i = \frac{v_j^i}{\sum_{j=1}^m v_j^i} \tag{2}$$

Order

Obviously there $0 \leq w_j^i \leq 1$ and $0 \leq w_j^i \leq 1$

The above formula, w_j^i Is the indicator I_j To x_i Classification weights. Call $W^i = (w_1^i, w_2^i, \dots, w_m^i)$ As an indicator on x_i Classification of the weight vector.

3.3 Financial Synergy Enterprise Multi-indicator Model Evaluation

Known About x_i The single index measure evaluation matrix, on x_i Classification index weights each vector $W^i = (w_{i1}, w_{i2}, \dots, w_{im})$, There are:

$$\mu^i = W^i \cdot (\mu_{ijk})_{m \times p} = (w_1^i, w_2^i, \dots, w_m^i) \begin{bmatrix} \mu_{i11} & \mu_{i12} & \dots & \mu_{i1p} \\ \mu_{i21} & \mu_{i22} & \dots & \mu_{i2p} \\ \dots & \dots & \dots & \dots \\ \mu_{im1} & \mu_{im2} & \dots & \mu_{imp} \end{bmatrix}$$

$$\mu^i = (\mu_{i1}, \mu_{i2}, \dots, \mu_{ip})$$

Then μ^i To x_i Evaluation vectors.

3.4 Enterprise Financial Synergy Evaluation Criteria

As the evaluation rating $C = \{c_1, c_2, \dots, c_p\}$ Is ordered, and satisfies $c_1 > c_2 > \dots > c_p$, So the

use of home linearity criterion.

On confidence $(0 \leq \lambda \leq 1)$, Usually calculated taking $\lambda = 0.7$:

$$K_0 = \min \left\{ \left[\sum_{l=1}^k \mu_{il} \right] \geq \lambda, k = 1, 2, \dots, k \right\} \quad (1 < i < n)$$

Thereby that the evaluation sample x_i Belong c_k Classes.

4 The Financial Synergy Effect Based on the Unascertained Measure Model

On the basis of unascertained measure model, the paper makes an empirical study of the 20 listed enterprises. Firstly, calculating the unascertained measure value of qualitative index, then the quantitative index, the multi-indexes, finally the financial synergy capability of 20 sample enterprises.

4.1 Unascertained Valence of Qualitative Index

For instance, the A1 enterprise, its financial interests synergy evaluation dimension (x3) involves shareholder satisfaction (x31) and employee satisfaction (x32). Shareholder satisfaction of enterprise A1 can be divided into five classes: I, II, III, IV, V, they separately mean worse, relatively worse, medium, good and excellent. Experts' scores of X31 are shown in Table 2. Assuming the participating personnel's comprehensive reliability is $\beta = [0.113, 0.101, 0.095, 0.098, 0.103, 0.096, 0.097, 0.093, 0.107, 0.097]$.

Table 2 Experts' Evaluation of Shareholder Satisfaction

Results Indexes	Experts' Numbers									
	1	2	3	4	5	6	7	8	9	10
X311	4	3	3	2	4	4	3	5	5	3
X312	3	4	4	2	2	3	5	4	4	5
X313	4	3	5	3	4	2	3	4	2	5
X314	3	3	3	4	3	2	2	4	3	4
X315	4	3	4	4	5	3	3	5	4	3
X316	5	3	4	4	5	4	4	5	3	4

Set up $f_{31}(x), f_{32}(x), \dots, f_{36}(x)$ is the comprehensive evaluation value of x_{311}, \dots, x_{316} , $f_{31}(x), f_{32}(x), \dots, f_{36}(x)$ is the blind number, they are shown as follows:

$$\begin{aligned}
 f_{31}(x) &= \begin{cases} 0.098, x = 2 \\ 0.39, x = 3 \\ 0.312, x = 4 \\ 0.2, x = 5 \\ 0, others \end{cases} &
 f_{32}(x) &= \begin{cases} 0.201, x = 2 \\ 0.209, x = 3 \\ 0.396, x = 4 \\ 0.194, x = 5 \\ 0, others \end{cases} \\
 f_{33}(x) &= \begin{cases} 0.203, x = 2 \\ 0.296, x = 3 \\ 0.309, x = 4 \\ 0.192, x = 5 \\ 0, others \end{cases} &
 f_{34}(x) &= \begin{cases} 0.193, x = 2 \\ 0.519, x = 3 \\ 0.288, x = 4 \\ 0, others \end{cases} \\
 f_{35}(x) &= \begin{cases} 0.391, x = 3 \\ 0.413, x = 4 \\ 0.196, x = 5 \\ 0, others \end{cases} &
 f_{36}(x) &= \begin{cases} 0.208, x = 3 \\ 0.483, x = 4 \\ 0.309, x = 5 \\ 0, others \end{cases}
 \end{aligned}$$

According to the blind number, μ_{31} can be used to represent the unascertained measure value evaluation :

$$\mu_{31} = \begin{pmatrix} 0 & 0.098 & 0.39 & 0.312 & 0.2 \\ 0 & 0.201 & 0.209 & 0.396 & 0.194 \\ 0 & 0.203 & 0.296 & 0.309 & 0.192 \\ 0 & 0.193 & 0.519 & 0.288 & 0 \\ 0 & 0 & 0.391 & 0.413 & 0.196 \\ 0 & 0 & 0.208 & 0.483 & 0.309 \end{pmatrix}$$

Enterprise A1, the shareholder satisfaction can be measured as W1:
 $w_{31} = (0.1726 \ 0.1758 \ 0.1776 \ 0.1568 \ 0.1589 \ 0.1583)$

From the formula $\mu_{31}^* = w_{31} \cdot \mu_{31}$, Enterprise A1 shareholder multi-indexes evaluation can be measured as μ_{31}^*

$$\mu_{31}^* = (0.0000 \ 0.1186 \ 0.3331 \ 0.3656 \ 0.1828)$$

Through the above methods, Enterprise A1 personnel multi-indexes evaluation can be measured as μ_{32}^*

$$\mu_{32}^* = (0.0000 \ 0.1065 \ 0.3536 \ 0.3682 \ 0.1718)$$

4.2 Unascertained Valence Quantitative Index

Take the enterprise A1 for example, the financial interests synergy dimension is also designed with two quantitative indicators, including customer synergy visibility (X33) and suppliers synergy visibility (X34). To ensure quantitative indicators and qualitative indicators measure the same, firstly, we need to determine the division of quantitative indicators nature space $F \{a_1, a_2, \dots, a_k\}$. Comprehensive survey results and experts' opinions, these quantitative indicators for each division in each category are shown in Table 3.

Table 3 Single Index Valence Space of Financial Synergy Effect

Indexes Symbols	Index Name	I Worse	II Relatively Worse	III General	IV Good	V Excellent
X11	Market Adaption Visibility	0.2	0.4	0.6	0.8	1
X12	Investment Adaption Visibility \geq	0.1	0.3	0.4	0.5	0.8
X13	Industry Competition Profit Visibility	0.1	0.2	0.3	0.4	0.5
X21	Resources Allocation Advantage Visibility \geq	0.4	0.5	0.6	0.7	0.8
X22	Property Allocation Advantage Visibility \geq	0.2	0.3	0.5	0.6	0.7
X23	Capital Allocation Advantage Visibility \geq	0.1	0.2	0.3	0.4	0.5
X33	Customer Synergy Visibility \geq	0.3	0.4	0.6	0.7	0.8
X33	Supplier Synergy Visibility \geq	0.3	0.5	0.6	0.7	0.8

According to the Table 3, calculating enterprise A1 unascertained measure value of customer synergy visibility(X33) and supplier synergy visibility(X34):

$$\mu_{33}^* = [0.09 \ 0.224 \ 0.365 \ 0.206 \ 0.115]$$

$$\mu_{34}^* = [0.17 \ 0.315 \ 0.07 \ 0.117 \ 0.328]$$

According to the former μ_{31}^* , μ_{32}^* , μ_{33}^* and μ_{34}^* , the unascertained measure vector value μ_3 of enterprise A1 financial interests synergy indexes can be figured out:

$$\mu_3 = \begin{bmatrix} 0 & 0.1186 & 0.3331 & 0.3656 & 0.1828 \\ 0 & 0.1065 & 0.3536 & 0.3682 & 0.1718 \\ 0.09 & 0.224 & 0.365 & 0.206 & 0.115 \\ 0.17 & 0.315 & 0.07 & 0.117 & 0.328 \end{bmatrix}$$

Enterprise A1 indexes weight of financial interests synergy is w_3 :

$$w_3 = (0.2428 \quad 0.2410 \quad 0.2592 \quad 0.2570)$$

From the formula $\bar{\mu}_3 = w_3 \cdot \mu_3$, we can figure out the unascertained measure valence vector $\bar{\mu}_3$ of financial interests synergy indexes:

$$\bar{\mu}_3 = (0.0670 \quad 0.1935 \quad 0.2787 \quad 0.2610 \quad 0.1999)$$

According to the above method, we can figure out the financial strategy synergy measure value $\bar{\mu}_1$, financial resource synergy measure value $\bar{\mu}_2$, financial interests synergy measure value $\bar{\mu}_3$, finally we can get the multi-indexes measure value of financial synergy μ :

$$\mu = \begin{pmatrix} \mu_1 \\ \mu_2 \\ \mu_3 \end{pmatrix} = \begin{pmatrix} 0.1079 & 0.1107 & 0.3627 & 0.2606 & 0.1581 \\ 0.1227 & 0.2540 & 0.3442 & 0.1554 & 0.1236 \\ 0.0670 & 0.1935 & 0.2787 & 0.2610 & 0.1999 \end{pmatrix}$$

Enterprise A1 criteria layer weight of financial synergy is w :

$$w = (0.3312 \quad 0.3340 \quad 0.3348)$$

Through the formula $\bar{\mu} = w \cdot \mu$, we can figure out unascertained measure evaluation vector of each criterial layer index $\bar{\mu}$:

$$\bar{\mu} = (0.0991 \quad 0.1863 \quad 0.3284 \quad 0.2256 \quad 0.1606)$$

$\lambda = 0.7$, we can figure our enterprise A1 financial synergy evaluation grade.

$$k_0 = \min \left| k : \sum_{i=1}^k \bar{\mu}_i \geq \lambda \right| = \min \left| k : \mu_5 + \mu_4 + \mu_3 \geq \lambda \right| = 3$$

Because of the unascertained measure vector $\bar{\mu}$, $k_0 = 3$ can be worked out, therefore it belong to the third class, namely Class III. For the realization of the financial resource synergy evaluation results ranking, we can adopt the scoring criteria to calculate:

$$q = \sum_{k=1}^k a_k \cdot \bar{\mu}$$

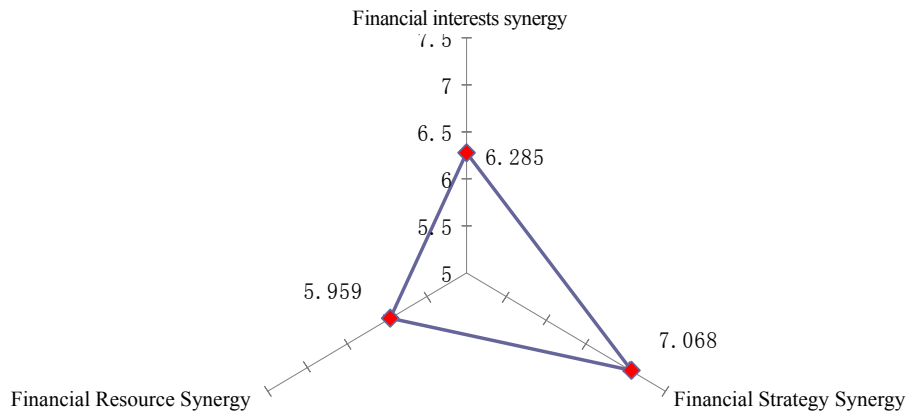

Financial resource synergy shows the property space of F, $a = \{2,4,6,8,10\}$, $q = 6.3246$. According to the values of enterprises'q, the 20 sample enterprises financial synergy comprehensive effect can be ordered, the results are shown in Table 4:

Table 4 Comprehensive Evaluation Results of Financial Synergy Capability

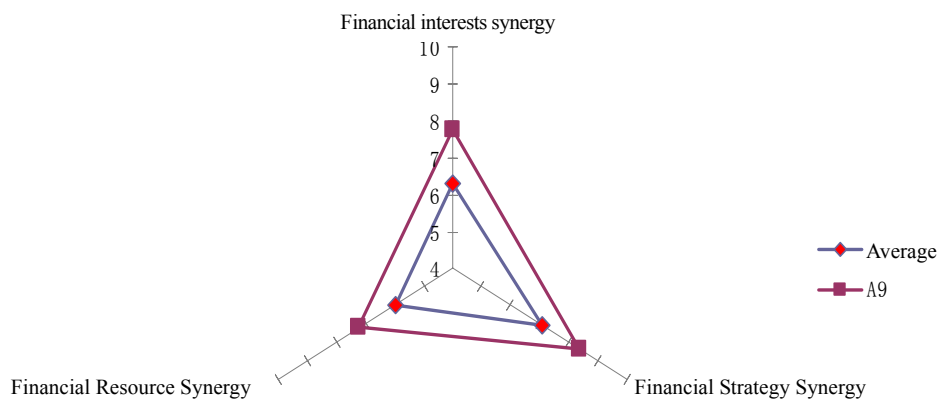

Enterprise Code	Comprehensive Measure Value	$\lambda = 0.7$	Total Scores	Ranking
A9	[0.049 0.063 0.196 0.347 0.345]	IV	7.751	1
A15	[0.082 0.114 0.234 0.284 0.287]	III	7.164	2
A3	[0.106 0.163 0.193 0.298 0.241]	III	6.81	3
A8	[0.094 0.144 0.265 0.265 0.232]	III	6.795	4
A11	[0.100 0.159 0.255 0.282 0.204]	III	6.66	5
A7	[0.114 0.177 0.209 0.274 0.226]	III	6.639	6
A13	[0.111 0.196 0.197 0.288 0.208]	III	6.572	7
A2	[0.137 0.166 0.216 0.256 0.225]	III	6.531	8
A6	[0.134 0.138 0.261 0.269 0.199]	III	6.518	9

A12	[0.095 0.158 0.338 0.232 0.177]	III	6.478	10
A4	[0.135 0.181 0.226 0.265 0.193]	II	6.402	11
A14	[0.146 0.166 0.236 0.270 0.182]	II	6.353	12
A1	[0.099 0.186 0.328 0.226 0.161]	II	6.324	13
A18	[0.148 0.171 0.252 0.271 0.159]	II	6.247	14
A16	[0.118 0.216 0.300 0.220 0.147]	II	6.121	15
A5	[0.119 0.196 0.334 0.214 0.137]	II	6.106	16
A17	[0.169 0.204 0.221 0.234 0.172]	II	6.073	17
A20	[0.185 0.221 0.302 0.153 0.141]	II	5.693	18
A19	[0.215 0.218 0.260 0.192 0.116]	II	5.55	19
A10	[0.195 0.290 0.319 0.126 0.071]	II	5.175	20
Average			6.398	

From Table 4, when the $\lambda = 0.7$, in the 20 sample enterprises, one enterprise stays in the good state, which takes up 5%; nine enterprises stay in the medium level, which takes up 45%; ten enterprises stay in the relatively bad level, which takes up 50%. The financial synergy capability of investigated enterprises stay in the mediocre level.

(a) Three-dimensional Average Distribution of 20 Sample Enterprises Financial Synergy

(b) Three-dimensional Average Distribution of Excellent Sample Enterprise (A9)

(c) Financial Synergy Score Distribution of Secondary Sample Enterprises

(d) Financial Synergy Score Distribution of Poor Sample Enterprises

Fig.2(a) shows a sample of 20 enterprises, in the financial synergy three-dimensional index distribution, we can see that the overall financial strategy synergy effect is the strongest, followed by the financial interests synergy effect, the financial resource synergy effect comes last. The mean value in the three-dimensions stays in the middle class (class III), which shows that the financial synergy effect of sample enterprises stays weak, especially the financial resource synergy effect.

Fig.2(b) shows that financial synergy three-dimensional index of enterprise A9 is greater than the sample mean value, if the overall capability of financial synergy get better, the three kinds of financial synergy capability should be improved.

Fig.2(c) shows that the sample enterprises in the medium level (class III), the financial strategy synergy effect is better than financial interests synergy ability and financial resource synergy effect. The same-level enterprises have more differences in single dimension effect. For instance, enterprise A2 shows much better in financial strategy synergy, but the financial resource synergy effect is significantly worse than other sample enterprises. Enterprise A12 is better than other sample enterprises in financial resource synergy effect, but the financial strategy synergy effect is obviously insufficient. Enterprise A13 is better than other sample enterprises, but the financial strategy synergy and financial resource synergy are insufficient. Through the above analysis, most secondary sample enterprises own effect advantage in some areas also some disadvantages, which result in the insufficient financial synergy effect. The conclusion again proves that the promotion of financial synergy effect relies n the promotion of three kinds of effect.

Fig.2(d) shows that the sample enterprises in lower level (class II), its financial synergy effect is better than the financial interests effect and financial resource synergy effect, and the financial interests

synergy resource synergy effect.

Compared Fig.2(c) with Fig.2(d), we can find that the enterprises in lower level, its three kinds of financial synergy effect are all significantly weaker than the medium-level enterprises. According to the above analysis, the financial synergy effect depends on the promotion of its three kinds of capability, some advantages can't achieve the overall financial synergy effect.

5 Conclusion

The paper studies 20 listed enterprises, through the unascertained measure model, the financial strategy synergy effect, financial resource synergy effect and financial interests synergy effect are evaluated and analyzed one by one. Through the empirical analysis, the current overall level of financial synergy effect is relatively low, in the three kinds of effect, financial strategy synergy effect is relatively better, the financial interests synergy effect is worse, the financial resource synergy is the worst. The findings will provide the theoretical basis for the promotion of financial synergy effect.

Research on Student Management Mode of College System Based on Complete Credit System*

Tan Liman

The Department of Student Affairs, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: tlmisme@163.com)

Abstract: Currently, the complete credit system is an education and teaching management mode being implemented by some universities. How to adapt to this system is a new topic in the current college student management work. Based on the analysis of its characteristics, significance, and the challenge under the system in the university students management work, this paper expounds the basis of student management mode of college system, and elaborates the research on the construction of student management mode of college system under the condition of the complete credit system.

Key words: Complete credit system; College system; Student management

1 Introduction:

Nowadays, in order to meet the development trend of education information, internationalization, popularization, many universities in our country improve the quality and efficiency of higher education, and actively explore the education and teaching management mode under the condition of the complete credit system. The complete credit system is a teaching management mode that is based on course-selecting system, and takes the credits as teach units of measurement, in order to obtain the minimum credits for graduation and get the corresponding degree of teaching management system. It is also a teaching operation mechanism and management mode that centers on students, and teaches students in accordance with their aptitude, individuality and awards the superior, eliminates the inferior.

2 The Characteristics and Implementation Significance of the Complete Credit System

2.1 The characteristics of the complete credit system

2.1.1 Selectable learning content

The complete credit system is based on course-selecting system, and allows students to select relevant professional and curriculum according to their personal career planning, interests and hobbies. At the same time, a large number of selective courses are set up under the complete credit system, which can contribute to the real implementation of course-selecting system, maximize the mobilization of learning initiatives of students, and promote students to play their creation potential.

2.1.2 Flexible learning time

Compared to the learning time, which is clearly formulated by the school year system and the credit system of the school year, the complete credit system has greater flexibility in the learning time. It admits the differences of students in their talent and temperament, interests and hobbies, their learning foundation and diligence. Moreover, it allows students themselves to arrange the learning process, to graduate in advance, to suspend or extend the length of schooling.

2.1.3 Scientific training process

Most students' learning plan and process vary under the complete credit system, and parts of students are confused of setting scientific goals independently. It is also difficult for them to select the best learning plan. So the complete credit system is often accompanied by the tutor system, and implemented the fine guidance and personalized guidance in the training process, which can guide students to arrange their learning plan reasonably.

2.1.4 Flexible ways of assessment

As for the course students select under the complete credit system, if students fail to pass the exam, they must retake the failed courses or choose another test until they pass the exam and obtain equivalent credit. This way allows the educated to adjust themselves to a certain extent according to their own development, which can not only show the importance of credit, but also help students to develop abilities that our society needs.

* This paper is supported by “the Fundamental Research Funds for the Central Universities” and College Student Work Seminar in Hubei Province.

2.2 The implementation significance of the complete credit system

2.2.1 To promote the cultivation of creative talents

The complete credit system respects students' individual differences, gives them the right to select the appropriate major, curriculum and learning progress, instead of the rigid arrangement and hard rules under the school year system, which can get the real implementation of teaching students in accordance with their aptitude. At the same time, lots of selective courses set up under the complete credit system can meet the need to promote students' own development, realize the intercommunication of scientific and technological knowledge and humanistic knowledge, optimize their own knowledge structure, in order to better mobilize the enthusiasm of students, stimulate the potential creative ability of students, promote the cultivation of creative talents.

2.2.2 To promote the improvement of teaching quality

The complete credit system gives students the right to select their teachers, which can truly enhance teachers' sense of competition, improve their teaching level, optimize their teaching content and method, update their knowledge structure, and to maximize the potential of teachers, promote the overall quality of teaching. At the same time, the complete credit system concentrates on the target management; help educational administrators to relieve from the complicated affairs, to make rules with a global vision to do the "macro-control", to turn the direct arrangement into "guide", "service", to promote the level of educational administration and teachers' capacity, so as to promote the improvement of teaching quality.

2.2.3 To promote the development of higher education

The complete credit system does not strictly distinguish the grade, and the length of schooling is more flexible, so students have the main right to choose the class time, which gives more people the chance to get higher education, to promote the popularization of higher education. At the same time, the complete credit system identifies credits according to the learning hours, which makes the quantitative standard of students more clearly, and provides a good foundation to strengthen the intercollegiate cooperation, mutual recognition of credits, organizing the teaching community. This method also promotes the sharing and integration of educational resources, and makes schools focus on the development of the advantageous subjects, so as to promote the development of higher education.

3 The Challenge Faced by the Traditional Student Management Mode

3.1 The traditional student management carrier is challenged

Under the mode of school year system, class is a basic carrier of student management. Students in class have the same curriculum and class time, so they become a closely-linked collective, an effective carrier to bear the ideological and political education factors, to perform the management function of school. However, under the condition of the complete credit system, there are different schedules for students in the same class in the traditional sense because of the course-selecting system. Differences in course selection, mobility in class time and space, disperse the original administrative class, weaken the concept of class and make it fuzzy, which is difficult for a class to carry out the tangible hard management, such as to conduct the ideological and political education, and to carry out the extracurricular activities, the construction of learning style and the social practice, so the difficulty in the student management work increases.

3.2 The traditional student management method is challenged

The management method is essential to improve the management effectiveness. The method that the administrative classes make students to take unified rigid management and dominant education under the mode of the school year system becomes the most common, and one of the most important management methods under the traditional management mode. However, under the complete credit system, because of the inconsistent study progress and flexible learning time, the possibility to carry out centralized hard management is greatly reduced, and the effect of the dominant education is very limited, while to different students, using the method of "influencing students by the environment" and "educating them in the shadow" has more effective and important impact on students' recessive education, such as their thought, conception, value, moral, attitude and emotion, so the traditional student management method is challenged.

3.3 The traditional student management concept is challenged

The student management concept is the rational thinking of the student management work. The college student management in China has long persisted the value of social-oriented, adheres to the concept of "management" instead of "service", and carries out a direct, tangible, and even forceful discipline and norms of behavior to students, emphasizes the consistence and unify, ignores or pays no

attention to the subjectivity of students. The complete credit system emphasizes the student-oriented, pays great attention to the students' guidance and service, and inspires the students' learning initiative and creativity, so the traditional student management is challenged. At the same time, under the complete credit system, the phenomenon may appear that some students select courses blindly and have difficulty in learning, which also requires schools to strengthen the construction of supporting system, and provides better service and guidance for students' learning life.

3.4 The traditional student evaluation system is challenged

The traditional student evaluation system is based on the unified teaching plan, which takes the students' achievement as the main target, the unified organization activities as the main content, and the grades and classes as the evaluation mode of students. The complete credit system has broken traditional boundaries in major and grade, allowing students to select courses regardless of their major, grade, and college, and they can expand or reduce their schooling time, which makes the traditional student evaluation system lose its reasons to exist. At the same time, under the complete credit system, the flexible ways of assessment, retaking the failed courses or choosing another test also make the traditional student evaluation system lose to operate. Thus, the unified student evaluation system under the traditional teaching management system is deconstructed, and the traditional student evaluation system is challenged.

4 The Construction of Student Management Mode of College System

The student management mode of college system is a kind of management mode of community life for students. It is based on inheriting the traditional college system in ancient China, and using the foreign residential college system for reference to develop, whose core is to take the student apartments and dormitories as the management platform and the carrier, and to implement general education, to develop students' comprehensive quality. There is a high degree of consistency in goal setting and high association in the target realization between the student management mode of college system and the education and teaching management mode under the complete credit system. Therefore, the student management mode of college system can meet the requirements of college student management under the complete credit system. For the construction of the student management mode of college system under the complete credit system, this paper is mainly explored from the following aspects.

4.1 To regenerate the class construction mode, optimize students' management carrier

The class is an important carrier of the college student management work. The complete credit system disperses the traditional group of class, and the student management carrier is challenged. Therefore, to innovate the class construction mode, and establish a student management carrier that is adapted to the complete credit system, is the foundation to explore the student management mode of college system under the complete credit system.

Under the student management mode of college system, the student work is focused on the college and students' dormitories. Therefore, based on the students' dormitory, following the "principle of proximity" of student accommodation, a certain quantity of students will be arranged into an administrative class, while students that have the same major and a certain professional background will be arranged into the professional class. According to the stability of administrative class and professional class, it is good to choose the relatively stable administrative class as the basic carrier of student management, and develop student management activities like the corresponding daily ideological and political education and Party organizational learning. What's more, the professional class can be the auxiliary carrier of student management, and develop student management activities, such as the corresponding academic competition and professional education, in order to optimize student management carrier under the complete credit system.

4.2 To improve the student information management system, optimize students' management approach

The difficulty in fully mastering the student information increases under the complete credit system. However, to adapt to the requirements of the complete credit system, the requirements of strengthening communication and exchanges between each unit are becoming increasingly strong. Therefore, to establish and improve the student information management system, and to get the acquisition, processing and handling of education management information on students, to transmit and share information through the internet, are important approaches to improve student management to be informational, standardized and scientific.

- 1) Based on the forms of the campus network information platform, student mobile phone

messaging platform, regular public information platform, special information delivery platform, to establish the information exchange platform, strengthen communication among students and transfer information, are to realize the auxiliary function of information transmission. 2) Based on the choice of students' major, curriculum and teachers, and the registration and classification of students' grades, to establish academic registration platform, is to achieve auxiliary function of students' academic guidance, and establish academic security system. 3) Based on the establishment of public network course like students' psychological quality, appearance and behavior, to establish moral integrity platform, is to realize the records of students' moral integrity and promote its function, and form a self-discipline system of the civilized etiquette.

4.3 To reform the student evaluation system, optimize students' management means

Scientific incentive evaluation mechanism is the important means of guiding students' self-management, self-control, and self-development. The complete credit system has fundamentally brought changes about students' achievement assessment standards and methods, and the deconstruction of the traditional student evaluation system. Therefore, to reform student evaluation system, and establish an evaluation mechanism that is adapted to the complete credit system, are the important parts of optimizing students' management means.

1) Improve rules and regulations, optimize evaluation basis. Evaluation basis like "students' comprehensive quality evaluation methods under the complete credit system" and "the scholarship evaluation means" is to be formulated. In the comprehensive quality evaluation, based on the four examination items, that is moral quality, scientific and cultural quality, health quality, and expanding quality, the establishment of a new evaluation system is to guide students to promote their all-round development. In the scholarship evaluation, based on the comprehensive principle of "quality" and "quantity" on study, to optimize of ranking methods, and give corresponding proportion to the total credits and the grade point of learning for students, and award students according to the standard of combination of these two proportions, can guide students to develop individually.

2) Standardize evaluation procedure, optimize evaluation process. According to the actual evaluation content, combining the methods of self-evaluation and peer evaluation, outstanding students' main role in the procedure, and emphasizing the process management, is to make the evaluation become a process for students to summarize their evaluation themselves, improve their mutual study, and cultivate their ability.

5 Conclusions

The complete credit system is the trend of university education and teaching reform in China currently. Combined with the actual situation of college student management, this paper constructs the basic mode of the optimized student management carrier, management mode and management means. It preliminarily explores the implementation approaches of college student management mode in China's universities, which provides the reference for the reform of the credit system and the college student management mode in China's universities.

Research on the Compensation of the Main Productive Factors in the Income Distribution

Huang Song, Yu Jiali

Wuhan University of Technology, Wuhan, 430070, P.R.China

(E-mail: 178864145@qq.com, 297118468@qq.com)

Abstract: Based on the previous studies, this paper objectively analyzed the status of the wealth gap in China. It establishes the econometrics model, and use EVIEWS, STATA and other software to solve the model. Based on the empirical results, this paper discussed the factors which impact the labor compensation in the market. Finally, we proposed some relevant suggestions. Therefore, the research on the compensation of the main productive factors in the income distribution is of theoretical value and social value.

Key words: Labour compensation; Capital compensation; Income distribution; Productive factors

1 Introduction

At the 18th National Congress of the Communist Party of China, the reform of the income distribution was proposed. The National Bureau of Statistics data shows that, in the past few years, the proportion of the consumption in China's GDP has been declining. Although in recent years, some policies have been launched continually to expand the domestic demand, to stimulate the consumption. Actually, these measures by the authorities have yielded some effects; however, there still have some distance from the ideal level. Actually, some scholars have argued that this phenomenon was attributed to the labour compensation's declining, which may significantly affect the consumption capacity (Chen Zongsheng, etc. 2002; Li Shi, 2002). During the period of 1996 to 2007, China's total labour compensation share of GDP fell from 53.4% to 39.7%. The labour compensation share in the primary distribution is low which means that most people cannot enjoy the outcomes of the rapidly soared economic growth. On the other hand, as the income growth ratio lags far behind the growth ratio of the fiscal revenue, making the residences' income share declining and leading to sluggish domestic demand and economic structure imbalance. In fact, at the 17th National Congress of the Communist Party of China, Hu Jintao has put forward the comments about the current income distribution and more attention should be put on this worsening situation, seeking a valid solution path.

Currently, China is in the golden era of economic growth. However, with the overall level of the residences' income is increasing, the income gap is also expanding. If this gap is out of control, the social stability and the health will certainly be affected. Therefore, the research on the compensation of the main productive factors in the income distribution is of theoretical value and social value.

2 Literature Review

It is well known that the current status of the income gap has become the obstacle of the processing of building a harmonious society. Chen Zongsheng and Li Shi (2002) has explored the income distribution, and proposed the famous "Chen Inverted-U Curve". Chen Liming, etc. (2008) described China's wealth gap in the current state of society and discussed how to narrow the wealth gap and enhance people's sense of fairness. Zhang Jinsong, He Xiaolin (2008), Sun Hui (2009) put forward that we should consider the phenomena of inequitable distribution of wealth, and improve the system environment, and also lower the social impact of the wealth gap.

In contrast, the relevant literatures by the foreign authors seem to be more completed. Khan (1998), Coes (2008), Yong (1999) studied this issue from the macro perspective. They thought that the economic reform in China is one of the most important reasons for the rapid economic growth. However, the income distribution is changing at the same time. As a result, China's income distribution pattern has changed and the income gap has expanded. Bian and Zhang (2002) studied this issue from the micro aspect, exploring the city's income gap of different classes in this society in the process of marketing. The results show that the income gap in the monopoly sector and the competitive sector has expanded during the process of planned economic system to marketing economic system

In short, the issue of narrowing the wealth gap and building a harmonious society has been discussed from the evaluating method, factor prices, the distribution theory and other aspects of national policies perspective. This paper analyzes the issue, thus as the allocation of production factors disparity,

wealth gap associated with the dynamics of social harmony, national policy-making and the forth, using quantitative analysis based on the Chinese provincial panel data.

3 Data Description and Variable Settings

In order to make our analysis more convincing, we selected 2000-2009 data from the Chinese Yearbook. To study the compensation of the main productive factors in the income distribution, this paper sets the following variables.

Table 1 The Data Description

Year	Y	X1	X2	X3	X4	X5
2000	49948.07	1696.3	39274.2	32917.7	9371	3849.081
2001	54934.65	1730.73	42183.6	37213.5	10870	4637.663
2002	60099.14	2084.98	51378.2	43499.9	12422	5480.028
2003	67260.69	2599.35	70483.5	55566.6	14040	6208.265
2004	72352.67	3285.68	95539.1	70477.42	16024	7242.599
2005	81888.02	3978.799	116921.8	88773.61	18364	8418.839
2006	93822.83	4334.315	140971.4	109998.2	20856	9815.309
2007	109532.3	5132.689	166740.2	137323.9	24721	12148.07
2008	134578.9	5311.936	179921.5	172828.4	28898	14500.74
2009	170299.7	4623.734	150648.1	224598.8	32244	15234.5

Y: The ratio of labor compensation to GDP to measure the share of labor income;

X1: foreign direct investment to GDP ratio to measure the degree of competition in the market, from an economic point of view we find that the higher the degree of market competition on the market means that capital mobility is strong, so that the weight of capital replacement cost decreased, resulting in reduced labor share;

X2: total imports and exports to GDP ratio to measure the degree of openness of the economy;

X3: fixed asset investment to GDP ratio, a measure of social investment rate, in accordance with the economic point of view as the labor income share will decline in the growth rate of investment;

X4: average wage to GDP ratio is used to measure the level of labor income;

X5: investment in education expenditure to GDP ratio is used to measure the quality of workers' skills.

4 Empirical Analyses

Firstly, we take the unit root test for the time series selected. The unit root test is the test sequence, the existence of a unit root, because of the presence of unit root is non-stationary time series, which will be easier to make the final regression spurious regression phenomenon.

Table 2 The Unit Root Test For X1

	T-Statistic	Prob
Augmented Dickey-Fuller Test Statistic	-1.672774	0.4069
1% Level	-4.582648	
5% Level	-3.320969	
10% Level	-2.801384	

Notes: Null Hypothesis: X1 has a unit root; Exogenous: constant; Lag Length: 1 (automatic based on SIC, MAXLAG=1)

Table 3 The Unit Root Test For X2

	T-Statistic	Prob
Augmented Dickey-Fuller Test Statistic	-3.178748	0.0604
1% Level	-4.582648	
5% Level	-3.320969	
10% Level	-2.801384	

Notes: Null Hypothesis: X2 has a unit root; Exogenous: constant; Lag Length: 1 (automatic based on SIC, MAXLAG=1)

Table 4 The Unit Root Test For X3

	T-Statistic	Prob
Augmented Dickey-Fuller Test Statistic	1.452396	0.9966
1% Level	-4.420595	
5% Level	-3.259808	
10% Level	-2.771129	

Notes: Null Hypothesis: X3 has a unit root; Exogenous: constant; Lag Length: 1 (automatic based on SIC, MAXLAG=1)

Table 5 The Unit Root Test For X4

	T-Statistic	Prob
Augmented Dickey-Fuller Test Statistic	-2.852821	0.0932
1% Level	-4.582648	
5% Level	-3.320969	
10% Level	-2.801384	

Notes: Null Hypothesis: X4 has a unit root; Exogenous: constant; Lag Length: 1 (automatic based on SIC, MAXLAG=1)

Table 6 The Unit Root Test For X5

	T-Statistic	Prob
Augmented Dickey-Fuller Test Statistic	-5.661017	0.0021
1% Level	-4.420595	
5% Level	-3.259808	
10% Level	-2.771129	

Notes: Null Hypothesis: X5 has a unit root; Exogenous: constant; Lag Length: 1 (automatic based on SIC, MAXLAG=1)

Table 7 The Unit Root Test For Y

	T-Statistic	Prob
Augmented Dickey-Fuller Test Statistic	-1.873127	0.3260
1% Level	-4.582648	
5% Level	-3.320069	
10% Level	-2.801384	

Notes: Null Hypothesis: Y has a unit root; Exogenous: constant; Lag Length: 1 (automatic based on SIC, MAXLAG=1)

From the above tables, we can see that each ADF values of X1, X2, X3, X4, X5, Y were -1.672774, -3.178748, 1.452396, -2.852821, -5.661017, and 1.873127. Their absolute value greater than the critical values, so we can not reject the null hypothesis which means they are not stationary time series. Then we conduct a difference to the original sequence. The results show that the differential sequences are stationary.

Then we establish the following model.

$$Y = \alpha_0 + \alpha_1 X_1 + \alpha_2 X_2 + \alpha_3 X_3 + \alpha_4 X_4 + \alpha_5 X_5 + \mu \tag{1}$$

Where α_0 is a constant and μ is the random disturbance.

We enter the command in STATA software code to do the regression analysis. The results are as the following.

Table 8 The Results of the Regression

Number of obs =	10
F(5, 4)	58.8
Prob > F	0.0008
R-squared	0.9866
Adj R-squared	0.9698
Root MSE	0.00684

Table 9 The Results of the Regression

y	Coef.	Std. Err.	t	P>t	[95% Conf.Interval]
x1	-2.364457	6.29392	-0.38	0.726	(-19.83918,15.11027)
x2	-0.1852058	0.1779696	-1.04	0.357	(-0.6793286,0.308917)
x3	0.1330879	0.0656235	2.03	0.112	(-0.0491121,0.3152878)
x4	6.621642	1.697395	3.9	0.018	(1.908917,11.33437)
x5	-8.253739	3.03635	-2.72	0.053	(-16.684,0.1765186)
_cons	0.2673257	0.074274	3.6	0.023	(0.0611082,0.4735433)

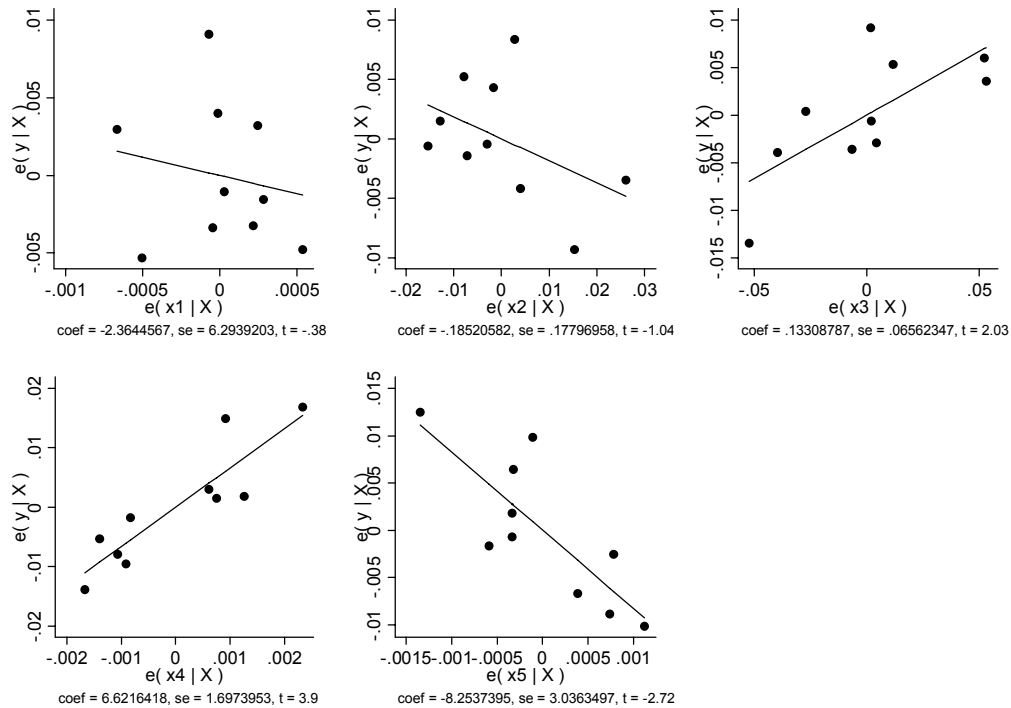

Figure 7 The Results of the Regression

Regression analysis results show that F-value of the model is greater than the critical value and the determine coefficient value is 0.9866 which is significant, indicating that the model fits well. On the other hand, all the variables coefficients passed the t-test, except X1 and X2. The results show that there has a relatively weak correlation between the labour remuneration reducing and the economic development.

5 Conclusions

Through the above empirical analysis, we can draw the following conclusions.

Although Harrison (2002) in the paper of "Has Globalization Eroded Labour's Share? Some Cross-Country Evidence" pointed out that the opening up means that economic liberalization of capital flows, capital replacement costs decline, the capital side more bargaining power, which would lead to labour share decreased. However, according to our empirical results show that degree of market competition and economic development level, these two indicators and China are not significantly related to labour remuneration, indicating that China's market has a certain degree of particularity. At the same time the rate of investment, education funding and other factors can significantly affect the share of labour compensation in China, able to interpret these results in large part to reduce the current status of the domestic labour remuneration.

On Cultivation of Cross-Cultural Awareness in Interpretation Context*

Li Lifang

School of Foreign Languages, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: 411532296@qq.com)

Abstract: Interpretation is not only the transfer between two languages, but also a kind of face to face cross-cultural communication. The cross-cultural awareness of the interpreter is of great importance, for cultural considerations determine the accuracy and quality of interpretation. This paper analyzes the need to overcome the barrier of cultural differences in interpretation and highlights strategies adopted in dealing with cultural phenomena so as to enhance the quality of interpretation and to achieve efficient communication. The paper also puts forward teaching methods in the course of interpretation.

Key words: Interpretation; Cross-cultural awareness; Context; Skill training

1 Introduction

Owing to the accelerated process of economic globalization, and in the turn of the century, China increasingly conducts more frequent exchanges and cooperation with other countries in the fields of economy, culture, education and other fields, which provides a broad space for development of translation and interpretation. As a result of the differences in geographic location, social environment, religious beliefs, ways of thinking and living habits, there exist a variety of different geographical and cultural features in different ethnic groups, which result in complicated cultural conflicts. Therefore, the interpreter inevitably faces cross-cultural communication in the presence of language barriers and cultural conflicts. As a communicative messenger, the interpreter, shuttling between two different languages and cultures, is supposed to have a solid basic language skills, be fluent in language, and be acquainted with the unique cultures and ways of thinking in two languages. The interpreter should be familiar with cultural differences in conversion between English and Chinese. Otherwise, he may be trapped in cultural difficulties, which hinders the process of interpretation.

2 The Features of Interpretation Context

2.1 Definition of Interpretation

Interpretation is a very complex dynamic process. Successful interpretation is closely related to bilingual knowledge, cross-cultural communication awareness, level of understanding of the target culture, cognition, reasoning ability, interpreting skills, adaptability and other relevant strategies. Interpretation is the tool to convey and express the thoughts and feelings of humans. Interpretation and translation are similar. But interpretation has its own characteristics, for the interpreter must promptly and independently conduct one mission, which means he or she has no enough time to reflect or scrutinize his or her interpretation, and is impossible to turn to others during interpretation, or refer to the dictionary. This requires that the interpreter should have a solid language skills both in Chinese and in English, according to the appropriate styles of the speech. He or she also should have a good grasp of knowledge and the ability to focus on taking notes. However, the biggest challenge for the interpreter is cultural difference. The same word in one culture may mean totally different things in another culture and cost more effort to be explained. The interpreter's cross-cultural awareness determines his or her ability to handle the interpretation free from the negative impact of cultural differences.

Interpretation is a special communicative process: to understand, to analyze and to convey the implied meaning. It is a positive, complex and creative activity. Through oral expression, interpretation converts the information perceived in one language into another in the form of cross-cultural communicative acts. The information is conveyed through the integrated forms such as the voice and tone, facial expressions and body language.

2.2 Difference between translation and interpretation

Compared with translation, interpretation is with high degree of flexibility. It is also characterized by speedy, on-site, and independent features. Confronted with the unforeseen topics and the unknown cultural background information, the interpreter has to have a higher degree of improvisation capacity,

* This paper is supported by the Fundamental Research Funds for the Central Universities (WUT : 2012-lb-005)

raise cross-cultural awareness, and grasp the cultural differences, so that the audience effectively understands the information from another culture. The topics of interpretation cover various fields and interpreters work for people from different social classes, different industries and different educational and cultural backgrounds. Some of the speakers articulate clearly and fluently, and think in a logical way, while others speak in a confusing way with great accent. People communicate with different purposes and motives. Some translation needs strong generalization, and some require detailed translation, with semantic translation as well as with a thorough connotation delivery. Occasions of interpretation are not the same: some are lighthearted, such as tourism, while others are tense, serious and formal, such as conferences. Interpretation is dynamic: the Chinese native speakers and native speakers of English communicate with the help of an interpreter. Interpreters are not communicative himself, but must be close to communication to maximize contextual assumptions in the entire translation process to establish a new context to make real inference of the implied meaning.

Interpreting is the reconstruction of the target language, in which the interpreter actively participate in coordination for the balance between the original language context and target language. The ability to grasp the implications of the source language is the key to successful interpretation. To better understand the original speech, the interpreter, based on the original specific context, must infer the original author's true intentions, and then, create a suitable context for the listener to be able to correctly grasp the speaker's intended meaning. Interpreting attaches importance not only to linguistic context, but also pays attention to situational context and cultural context for the dynamic adaptability. Interpretation is expressed through verbal means, which should be accurate, decent and fluent to reveal and explain the intended meaning of the speaker. The Interpreter, in the process of interpretation, has to overcome many obstacles, which is due to cultural differences and language barriers. In cross-language communication, cultural barriers bring communication difficulties to people of different cultural backgrounds for mutual understanding. The interpreter must take full consideration of the cultural individuality, pay special attention to cultural differences between Chinese and Western countries so as to achieve accurate, smooth and timely translation, in order to promote cross-cultural communication conversation between the two sides on the basis of mutual understanding.

To conclude, its features manifest themselves in the following aspects: a) it is a bilingual impromptu activity, which requires the interpreter to be equipped with a superb impromptu resilience and the ability to express fluently; b) it presents on-site serious atmosphere, which imposes greater psychological pressure on the interpreter, affecting his or her normal performance; c) it is conducted individually by the interpreter, which requires high skills of reading, speaking, listening, writing and translating of the interpreter; e) it embodies the wide breadth of information exchange. There are no boundaries of fields of interpreting, in other words, the range of interpretation encompasses all professional fields.

3 The Importance of Cross-Cultural Awareness in Interpretation

In fact, the success of interpretation is a dynamic interaction between the language knowledge systems and strategies, and any lack of knowledge on the one hand or ignorance of contextual information in communicative scene may affect the accurate understanding of the information, thus affecting the communicative effects. This means that a qualified interpreter must be equipped with rich knowledge of the language and non-language knowledge, and the ability to process nonverbal communicative information, to work independently, and the ability to cope with stress. In cross-cultural communication, people from different cultural and social backgrounds are not just involved in language exchange, but more in a cultural exchange. Different ethnic groups vary in terms of values, ways of thinking and body language. With cross-cultural awareness, the interpreter has the capacity of interpreting in terms of vocabulary, pragmatics, discourse, and texts to successfully complete the cross-cultural communication. Culture is diverse, and the language is varied. Due to cultural and linguistic differences, mutual understanding is not an easy task, as a result, the communication between different cultures often encounter difficulties. The difficulty lies in intercultural communication based on lack of awareness in different cultural values and beliefs. People tend to rely on native language rules, communication habits, and way of thinking to understand and express thought in another language, which lead to false expressions and interpretation.

Cross-cultural awareness is to recognize that translation is cross-cultural exchange of information across languages, and cultural differences, like language differences, are likely to become barriers to communication. During the conversion of the two languages, we must also pay attention to overcoming

obstacles caused by cultural differences, in order to ensure the smooth exchange of information. For interpreters, the cross-cultural awareness means in cross-cultural communication, interpreters consciously or unconsciously form a way of thinking or a cognitive standards and adjustment methods, and are sensitive to cultural elements. Presence of cross-cultural awareness and the level of ability are closely related and are crucial for interpreters. To this end, the interpreter must not only be proficient in source and target languages, but also understand the culture conveyed in the languages, and know how to deal with cultural differences and cultural barriers. Due to lack of cultural awareness, the interpreter may concentrate on the literal or superficial meaning of the speech and neglect cultures in the language, which distorts the intended meaning and leads to misinterpretation.

4 Ways to Enhance Cross-Cultural Awareness

4.1 Acceptance of cultural diversity

Cross-cultural awareness is not through natural acquisition, but through conscious learning of culture. The interpreter is supposed to use all their senses, and to be exposed to different cultures, so as to achieve the highest level of cultural awareness. Different cultures demonstrate themselves in customs, religious beliefs, ways of thinking, ethics, and values. A nation's cultural orientation would be strange, and unfamiliar to another nation. In the cross-cultural communication, if people only recognize their own cultural values and beliefs, and ignore other cultures, negative outcome will inevitably affect communication.

A competent interpreter should try every means to improve sensitivity to cultural differences, try to eliminate barriers in interpretation. By religion, geography and national temperament and other factors, each nation has its own language and culture, ways of thinking and aesthetic taste. If misunderstanding a culture, the interpreter will be trapped by Chinese way of thinking, which leads to negative transfer of language, especially in slangs, proverbs which are rich in cultural characteristics.

It is crucial for interpreters to find about the differences between different cultures and accept them, and are willing to adjust their behavior to suit different cultural patterns and styles while preserving their culture. The interpreter should be able to stand from the perspective of the target language audience and interpret cultural connotation of the source language into target language for the audience to understand the intended meaning. If there is no cross-cultural awareness, understanding is impossible and the interpretation will have no guidelines to follow. Therefore, to cultivate students' cross-cultural communicative activities is simply for the purpose of making students understand the cultural diversity, foster their tolerant attitude, and enhance their sensitivity in cultural differences.

4.2 Integration of cross-cultural awareness with skill training

The essence of interpretation course lies in skill training course, which involves listening skills, presentation skills, and memory skills. Training and practice can enable students to understand the characteristics of interpretation, skill requirements, and consciously and continuously improve these skills. Being aware of the cultural differences between source language and target language is the prerequisite and basis, and how to use appropriate methods to convey the intended meaning to the target language audience is the interpreter's challenge. Direct interpretation requires rapid response requirements and generally does not allow amendments. So in this case, the interpreter has not time to make the choice of translation strategies and has to rely on quick response from the summary of basic rules of daily training and experience.

4.2.1 Reform of classroom teaching method

Unlike traditional speaking and listening lesson, interpretation training focuses on pronunciation, intonation, rhythm, syntax, and techniques involved in public speaking. At the same time, the training material used must be true materials, including audio and video recordings. Students are supposed to be exposed to a lot of different English accents, rather than the standard pronunciation, so as to adapt to real difficulties in future interpretation tasks.

Most students lack subject knowledge and background information, and therefore interpretation teaching must be closely integrated with language as well as culture. Teachers should provide students with a large number of materials concerning economic trade, international relations, industry, agriculture, science, education, and tourism. Interpretation skills are to be adopted to guide students in the accumulation of a large number of related words and expressions, the language skills and in the awareness of cross-cultural communication, so as to blurt out authentic English expression. Interpreters commonly encounter various types of discourse, narrative speech, demonstration speech, introduction speech, etiquette speech, etc. Chinese and English languages have different linguistic features. Being

Familiar with the unique form of different types of speech can greatly improve the students' level of interpretation. The specific teaching method is: at the beginning of the training on etiquette, the teacher is to explain the characteristics and structure of such words and expressions, followed by students' impromptu speeches or scenario simulation.

4.2.2 Practical experience of interpretation

It is crucial to establish translation learning website and expand the scope of translation covering literary and non-literary stylistic materials, while providing foreign web site library, databases, practice library, famous translation, etc., and continue to provide a wide range of resources for the follow-up of new information, update teaching materials, so that translators and interpreters can follow the skill straining phase.

The prospective interpreters can simulate international conferences, business meetings, receptions and other effective ways to enhance their cross-cultural communication skills, including interpreting skills. This requires an appropriate learning environment for interpretation, where students improve knowledge skills and communicative competencies required.

The study is extended to extra-curricular classroom training, encouraging students to look for real opportunity to practice interpreting, or attend international conferences, actively and independently involved in solving a variety of problems and barriers concerning culture in interpretation, which offers learners a chance to understand their level of interpretation, and puts forward a clear direction for improvement. This will not only enrich students' interpretation experience, but also develop students' awareness of the market, and with enterprise's feedback, learners can be familiar with practical translation skills to address gaps and improve personnel training programs.

Teachers should connect with relevant institutions and enterprises to establish a practice base for students. Teachers' on-site guidance is to resolve students' problems encountered in practice. This phase mainly exercises students' ability to improve the quality of interpretation, helps accumulate practical experience, and to lay a solid foundation for future professional interpreters. The teaching content and methods of interpretation should be authentic and meet the needs of the society, make the classroom environment close to the requirements of true tasks, and improve the capacity to process information in complex communicative factors.

Cross-cultural awareness should be integrated with skill training in order to promote effective communication for people from different cultural backgrounds. Interpreters sometimes need some special treatment to cultural factors to fully achieve communicative purposes. Only in the practice can allow students to become more conscious to develop their cross-cultural awareness, so that they can make continuous progress, overcome cultural barriers and respond flexibly to difficulties in interpretation.

5 Conclusion

Owing to differences between Chinese and Western cultures, interpreters should develop cross-cultural awareness and help both the speaker and the audience overcome cultural differences. The interpreter is supposed to constantly improve their ability to master the language, and enrich their knowledge in cultural origins, history, tradition, religion, customs as well as a full range of political, economic and cultural knowledge, which is the fundamental guarantee for cross-cultural communication. Interpretation is a skill, and it is also an art, which requires an interpreter to have more sensitive cross-cultural awareness, to overcome language barriers. Through extensive reading and constant practice, the interpreter is supposed to actively expand their knowledge and accumulate their own cultural knowledge to avoid misinterpretation and ultimately, to achieve the purpose of communication.

Philosophic Analysis on the Innovation Nature

Xue Xinguang

Wenzhou Vocational And Technical College, Wenzhou, P.R. China, 325000

(E-mail: 459994501@qq.com)

Abstract: Currently most innovation studies focus on methodological aspect. Through the study on innovation activities from philosophic angle, the innovation principle innovation nature and innovation principle are disclosed and innovation thinking is expanded. Cross-over study and exploratory study are used to study innovation origin, motive power, innovation nature, and innovation principle. Demand and market competition are regarded as the driving forces of innovation. The innovation is divided into two types: 1. The breakdown process of matter from old nature to new nature; 2. The process of finding the new expression form different from current expression form based on the same nature. The innovation principle is further stated. The disclosure of origin and innovation nature is innovative. The innovation direction is pointed out based on driving force of innovation, and the innovation thinking is pointed out based on the innovation nature.

Key words: Innovation; Philosophy; Principle; Method; Nature

In current world, the whole social economy is troubled by the surplus production capacity. And, the increasing demand of consumers cannot be satisfied. The solution to the conflict is product innovation and technology innovation. Innovation is the basic driving force of social progress and economic development. Innovation becomes the most important evaluation standard for the vitality and competitiveness of a country or an enterprise. Jiang Zemin once said, "Innovation is a soul of a national progress and the endless motive power of national development." Then, what is the innovation? What is the innovation nature? As a philosophic issue, the innovation can be analyzed from the following 4 aspects.

1 Innovation Origin and Motive Power

When people solve a problem, they should master the matter origin and look for the fundamental solution based on the problem origin. Innovation is a unique complex activity integrating with the knowledge and practice of human beings. People's strong desire to explore unknown matters is permanent motive power to promote the innovation. People explore the unknown matters by two ways. Firstly, people identify the objective matters and find new matters when identifying certain matter; and, people explore the causal relationship of objective matters. After explain certain matter, people may doubt or refuse the explanation to the other matter, so they explore and make the innovation with material objective.

Demand is the driving force of innovation. With increasing income, people have demand development far beyond products provided by the society. The permanent demand for material life and spiritual life is the motive power of innovation activities. Plato once said, "The real innovator is the demand." If people do not demand certain matter, they will not create the matter positively. When people realize certain demand, they will begin to think about it and realize it.

Human demand for material life is reflected in the market economic activities. Market is the motive power of innovation. In the market activities, people's pursuit for profits, results in the competition. Competition is the direct motive power of innovation. Driven by realistic market demand, innovations are made constantly. In the potential market, profits are obtained through innovation. Future market is won in advanced based on production innovation. Fundamentally, innovation is the requirement of social development and social competition. The highest competition is the competition with no opponents. The innovation desire and driving force is in fact the demand for material benefit that the enterprise obtains great profit with lowest input by avoiding the competitors and competition loss. The practice of market economic activities is the most important motive power of human innovation activities at present. People have endless pursuit for profits in the market activities.

Innovation is critical for sustainable growth of enterprises. Market competition is the motive power of enterprise innovation. Market demand drives the enterprises to make innovations on product, technology, and operation for survival and development, so innovations become necessary. Meanwhile, market competition promotes the enterprises to carry out better and faster effective innovation activities

than competitors. Under the market economy, social material demand is motivated and the effective supply is realized through price and profit mechanism. Market demand becomes the general guide of all vitality in the enterprise. Discovering and satisfying demand becomes the origin of all innovations.

2 Innovation Meaning and Innovation Nature

Then, what is the innovation? What is the innovation nature? The so-called innovation is the process of creating the new matter different from current matter. Namely, innovation is such a practice process and result that the subject fully displays the subjective initiative to positively transform object based on subject's demand in line with the objective rule of matter development. As a complex and exploratory creative activity, innovation is different from common simple labor, and is not the modification on original content. Instead, seem from its appearance form and nature requirement, innovation the breakthrough discovery, historical revolution, comprehensive innovation, and leap development. Joseph Alois Schumpeter suggested, "the innovation is the establishment of new production function. Namely, the entrepreneur makes new combination of production factors. That is to say, the brand-new combination of production factor and production condition is introduced in the production system."

Fundamentally, there are two kinds of innovations. The first is the breakdown process from old nature to new nature. The innovation nature is shown as follows;

Figure 1 Innovation of the Nature

For example, in the innovation on shoe products, people firstly protect the feet and beatify the feet. Then, the develop shoes with antiskid tooth (snowfield antiskid shoes) and shoes with wheel (Heelys). The innovation on practical kangaroo shoe and jump shoe can be expected. The latter innovation will undoubtedly bring revolutionary reform on human life.

Another innovation refers the process of finding the new expression form different from current expression form based on the same nature. In daily life, most of innovations are the second kind.

Figure 2 Innovation of Form

Every point in the external circle of Figure2 is the expression form of the same matter. The whole circle reflects that the matter of the same nature has various expression forms. For example, various beautiful styles of shoes are designed based on traditional form to realize the pursuit for beauty.

The sketch map for the innovation nature tells us:

- (1). Endless development of the matter results in endless development of the first innovation.
- (2). The same nature can be reflected in different expression forms, so the form innovation has endless developments.

3 Innovation Principle

The innovation becomes simple with clear understanding of nature. According to the above innovation nature, the following innovation principle is stated:

- (1). The development degree of the matter is judged based on development rule, so the old matter (old nature) is transferred into new matter (new nature). For example, in the reform of enterprise management system, private enterprises in Wenzhou are developed from manual workshop and family management. However, according to the rule, along with the development of enterprise productivity, the shortage of family management is gradually exposed, blocking the development of private enterprises in

Wenzhou. In the modern enterprise management, professional managers are the development direction. Therefore, many private enterprises abandon old modes and systems to look for a new system and adapt to the productivity level.

(2). It is a differentiation process to look for different expression forms in a matter of the same nature. For example, different realization modes are found based on the same objective. Or, different realization forms are found based on the same function. In urban traffic solution, when the busload cannot be expanded, many cities use motor-driven walking street and bike in central region to release the passenger flow.

As mentioned above, innovation has endless extensibility. Then, is the randomness of innovation can be added wantonly? Can the enterprise innovation be developed in all directions? The answer is no. Every matter has its development rule. The innovation in line with development rule can promote the matter to develop in line with ideal direction. Or else, the innovation may block the development and lead to great resource waste. Therefore, the following rules must be complied with in the innovation process.

(1) Specification of objective, determination of objective nature. During the innovation process, firstly, the clear innovation objective is needed. For example, the promotion channel is innovated to increase product sales. New products are developed to satisfy specific customer group for specific product positioning. Meanwhile, the innovation objective should not be vast and empty. Only specific and clear innovation objective can be achieved. Namely, organizers of the innovation must analyze the nature of the matter. In fact, when the objective is specific and clear, the matter can be solved simply.

(2) Among various expression forms of innovation, the expression forms in line with overall development direction are chosen as the innovation result. Besides certain rule of creative thinking, innovation activities also demand clear understanding of development rule of the matter. Innovation is not the objective, but the way to promote matter development. Therefore, the innovation activity should be thought based on development rule of the matter.

(3) Being the innovation result, the expression form should be subject to the objective condition. Innovation is easy, but whether the innovation can be successful depends on whether the innovation result meets the objective environment. Taking Wenzhou Shuoerbo Enterprise for example, when the enterprise carries out product innovation, it integrates the functions including manual motor, radio, lighting, and warning into a device necessary for emergency rescue. Thus, it becomes the device specified by the General Logistics Department and wins many orders for the enterprise. In addition, it plays a positive role in disaster and earthquake rescue. Therefore, the innovation result must satisfy the requirement of objective conditions to avoid the loss of blind innovation.

4 Innovation Capacity and Innovation Thinking

Innovation capacity, creativity for short, is the aggregation of intelligent factors including intelligence and skill as well as non-intelligent factors including motivation, will, and feeling. Its structure is consisted of 3 factors such as innovation consciousness, innovation thinking, and innovation skill.

As a non-intelligent factor, innovation consciousness is the internal motive power system of innovation activities. Many words are used to describe innovation consciousness such as innovation personality, innovation individuality, innovation consciousness, and innovation spirit. Innovation consciousness is critical for the success of innovation activities. Innovation consciousness means the opinion and consciousness of advocating innovation, pursuing innovation, and regarding innovation as honor, which is reflected in strong innovation motivation, firm innovation will, and healthy innovation feeling. Innovation consciousness shows good innovation initiative of innovation subject. Guided by strong innovation consciousness, people can have strong innovation motivation, establish innovation objective, fully express innovation potential, release innovation passion, and carry out innovation activities. Innovation is not only an intelligent characteristic, but also a personal characteristic.

Innovation personality is the internal power system of innovation activity and the key for the success of innovation activity. Innovation personality reflected in strong innovation motivation, firm innovation feeling, constant innovation will, permanent innovation power, and brave innovation behavior. Namely, innovation personality is the foundation for innovation production and implementation. The personal glamor of innovator is included in the whole process from the generation of innovation to the continue innovation process to the verification of innovation result.

The source of innovation consciousness is the thinking of looking for difference. Seen from the

superficial meaning of innovation, innovation includes the objection against the reality or the objection against the existence. All matters are the integrated body of community and personality. The community is connected and transferred with personality. The innovation nature is the search for difference. Namely, the conflict relationship between community and personality is grasped dynamically and the particularity is discovered and studied guided by community. The innovation is realized through personal development and change and opens a new way for matter development. The core of search of difference: sensitive to doubt, brave to doubt. In addition, new diversified thinking with development, creativity, and breakthrough comes out.

Innovation thinking has vast and broad meaning. Broad innovation thinking refers to thinking activities of all kinds in the innovation process, including new thinking or new solution, and thinking mode indirectly in innovation. Narrow innovation thinking refers to thinking form in innovation form, which is also known as innovation thinking mode.

Innovation thinking is the intelligent organ of innovation activity consisted of re-creative thinking and creative thinking. Re-creative thinking is based on current experience and knowledge. In the beginning of innovation activities, innovation thinking is reflected in that the innovation subject uses the common mode based on experience and knowledge directly. In the end of innovation, the innovation thinking of looking for unique mode for expression and verification of innovation process is also very important.

Innovation thinking is the key component of creativity with characteristics of irregularity and initiative. As a capacity, innovation thinking includes innovation imagination, instinct, insight capacity, forecast capacity, and capacity of grasping the opportunity. Instinct and imagination capacity is the most important.

In the innovation thinking, the innovation subject usually cannot realize the whole process of problem solving. Instead, during the most important process, namely, the basic stage of discovering new channel and finding critical component for problem solving, is realized through unconscious thinking activity. Therefore, innovation thinking is instinct and thinking. Thinking result comes out suddenly. Seen from the angle of innovation technology, innovation is a complex process including

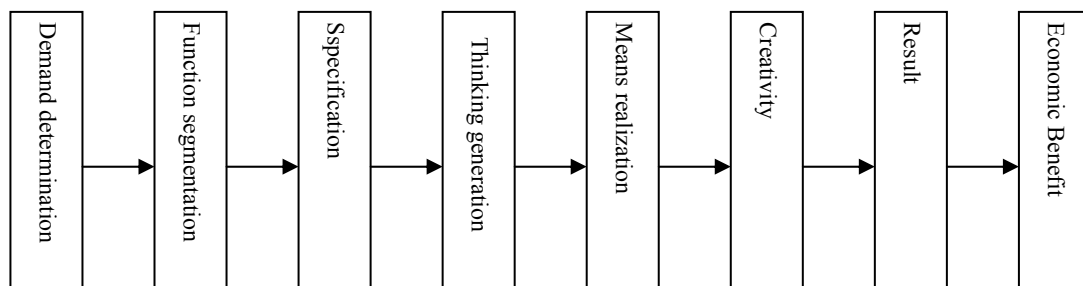

Figure 3 Innovation Process

In the whole innovation process, innovation is just a part. In order to better understand innovation, the innovation model can be determined as:

Figure 4 Innovation Thinking Mode

Innovation capacity refers to innovation thinking capacity and innovation practice capacity. Innovation thinking capacity includes 5 basic characteristics: positive search for difference, acute observation, creative imagination, unique knowledge structure, active inspiration and instinct. Innovation practice capacity includes practical operation capacity, organizational management capacity,

innovation development and transfer capacity, and information collection and processing capacity. Innovation skill is the capacity to reflect behavior and skill of innovation subject, and is the work mechanism of innovation activity controlled and limited by innovation intelligence. The innovation capacity is cultivated based on the knowledge of innovation theory and understanding of innovation field, as well as practice and enthusiasm of innovation field.

5 Conclusion

Innovation theory is a dynamic theory with constant development, and is a theory of a vast scope. It also has the basis characteristic of practical nature and vast nature. If we are brave to carry out systematic and long-term innovation theory exploration and practice and cultivate the innovation habit, we can yield twice the result with half the effort. As a result, we can have enthusiasm and power, and achieve the objective of challenging the limit constantly. During the process of going beyond ourselves, we can realize our value and social value and have free life in transformation.

On the Function Upgrade and the Service Innovation of the University Library

Zhang Hong

Library, Hubei University, Wuhan, P.R.China, 430062

(E-mail: 576799460@qq.com)

Abstract: With the development of modern information technology, the function of the university library under the backgrounds of network, digitization, globalization, technology service and expanding readers is updating. the changes are mainly as follows :from tangible paper books to intangible electronic ones, from the service free of charge to paid services, from single audience to the society reader, from the passive service to the active service, from the "mechanical" service to the comprehensive service, from the timer service to the flexible service. Accordingly, the university library service also needs to innovate to meet the needs of the readers, which mainly reflected in the innovations of management services, technology services and information services.

Key words: University library; Function upgrade; Service innovation

1 Introduction

In the age of modern digital information, the modern library is different from the traditional one with paper books, and its function has updated, hence, the modern library service need innovations to further develop its resources and release its potential abilities, which is convenient for scientific research for college teachers and students and the mass, in order to serve the promotion of economic and social development, the improvement of cultural quality and the construction of powerful cultural country.

2 The Background of the University Library Function Update

2.1 The background of the Internet

The university library is an important auxiliary institution of higher learning institutions, where books can be collected, borrowed and exchanged, it is in the service of college teaching, scientific research, personnel training and social services, acting as an information exchange center. Since the 1950 s, with the rapid development of computer science and information technology, the Internet has also rapidly developed and came into thousands of households, thus, human beings enter the information revolution era and the connective network age.

The university library as a traditional information center is faced with more and more severe challenges. Diversified and multi-channel accesses to information resources are gradually weakening the the importance of the library and changing the nature of the library as the only access to information resources. Some books that are only found in the library in the past can now be obtained from the Internet, even some information resources which can not be found in the library can also be found on the Internet. So, an open network environment makes the library's traditional service functions change deeply. And the library service function needs to be updated to meet the challenge.

2.2 The background of digitization

With information technology services expanding, electronic books and electronic information platform constructed, a lot of information is digitally stored and opened. Library information lies in the background of digitization. under this circumstance, the library's service objects are expanding to the public, so the library service function needs t updating.

2.3 The background of globalization

In modern times, capitalism expanded and colonized worldwide, the global economy has been involved in the world economy of capitalism. it is indescribable pain process for the backward Oriental world, it is capitalism's global expansion that promoted the cultural communication and integration in the world, forming a modern trend that backward countries pursued advanced countries wave after wave. Since the second half of the 20th century, due to the acceleration of world economic integration, the world increasingly becomes a global village. Remote geographic distance has disappeared, the information communication is no longer impossible, on the contrary, it can realize in a wink. The background of globalization also give new challenges to service function of the library..

2.4 The background of technical service

With the development of information technology, providing fast and convenient information inquiry, consultation for readers through information needs constantly refined information technology development in order to meet the needs of different readers, meanwhile, it is necessary to meet the requirements of classification and refinement of different readers necessary in the library service function updates. It is according to this requirement that modern information technology services develop.

2.5 The background of expanding readers

With the development of the university library's socialized service system, the readers expand from sole college students at this school to the college students in the same city, and even to college students in another cities and social readers through network technique. The requirements of different groups of readers are different, therefore, the university library services tend to be diversified.

3 The Function Update of the University Library

3.1 The function of the traditional library

Traditional library mainly functions as a tool of borrowing paper books and querying for data for readers. In general, paper books are more convenient for management by registering borrowing and lending books and standardizing the lending program, it generally can be perfect service. The traditional function can't meet the demand of people for information in modern society where science and technology and the network highly developed. Information needs timeliness and update, only timely and a lot of information can provide advanced information for scientific research and promote the further development of scientific research. The function defects of the traditional library require the modern university library to update the function.

3.2 The function update of the modern library

The function update of the modern library is as follows:

First, change from the tangible paper books to intangible electronic books. With booming information in modern society, the paper books can't meet the demands of readers. A large number of information has been transformed into electronic information under the support of the modern computer technology, and more readers choose to read electronic information. Therefore, the library must work hard at purchasing and producing electronic information. This function update puts forward new requirements for the library to survive and library services.

Second, change from the service free of charge to paid services. To get electronic information, the author need to be paid for his writing and production. Therefore, social readers will have to provide payment for reading e-books and electronic information from the university library, This service must be paid. It is this paid service that can more effectively stimulate the enthusiasm of the creators and make them provide more and better information for the society.

Third, change from a single audience to the social readers. With the development of the university library's socialized service system, the single college students and faculty have morphed into more complex social readers. Because of the diversification of public audience, their demands are also varied, this requires that the library must provide the public differentiated services, the homogeneous services are replaced by the diversified and differentiated services.

Fourth, change from passive service to active service. The service objects of the traditional college library are mainly students and the staff, the relatively fixed single reader groups are disadvantageous to the library construction and development, it is lack of initiative and innovation. The traditional library service is in a state of "waiting" for readers, with the development of modern information technology, the reader often actively goes to the library, in most situations, libraries tend to actively offer more information for the readers.

Fifth, change from "mechanical" service to comprehensive service. "Mechanical" service means that the service function of the library changes from providing books to providing more information for the reader, especially providing more information platforms and changes from actively searching information by the readers to actively providing more information search platform by the library.

Sixth, change from regular service to timing service. With life rhythm speeding up in modern society, the modern library must provide services without time limit and meet the demands of readers for information processing at different times, therefore, the modern library information, especially electronic information must meet the demands of readers for 24 hours.

Table 1 Comparison of the Function Between Traditional Library and Modern Library

Traditional library	Modern library
tangible paper books	intangible electronic books
free service	paid services
a single individual	social readers
passive service	active service
mechanical service	comprehensive service
regular service	timing service

4 The Service Innovation of the University Library

In order to meet the needs of function update, the university library should innovate service, give full play to the advantages of books and information resources to serve the readers better.

4.1 Management service innovation

Owing to the modern university library goes beyond the traditional library in service functions, therefore, the modern library needs innovation to improve the work efficiency in the management and service. Management service innovation mainly displays in:

First, librarians must be familiar with the entire work process of the library besides individual work process, sort out dynamic information of book resources, such as books on the shelves, loaned and returned.

Second, the chain of services, service quality, service attitude of librarians must be showed in public for better quality services.

Third, with the rapid development of Internet, relatively single service model of the library is impacted. For example, the application of network technology makes the library get rid of the traditional management mode of information resources, The literature information collection, processing, organization and services are greatly improved by new network technology, radiant developmental, comprehensive service system are also established. At the same time, the efficient service make it possible for colleges and universities to actively contact the public, the service objects also expand from the staff here to the public for literature information. The multi-level and broadening trend of service object must promote the development of university library construction. Therefore, differential service is an important characteristic of modern library development.

4.2 Technical service innovation

Printed literature borrowing and face-to-face service is the basic service mode of the traditional library, and some high-level services such as document information processing, SDI still need librarians. With the advent of the era of network, the application of digital technology provides modern technical service for the library, the library automation system is growing mature. These automation systems with multiple functions include the purchasing& cataloguing, circulation, and periodicals management, and the public information query system provides the library online retrieval and network consulting services, automated service is becoming the foundation of all library services. And, due to the information resources modernization in library management, the user can use search engines and information retrieval tools to inquire documents and information on the internet, timely understanding all kinds of dynamic information in the library. Digital information resources can be transmitted to other places quickly and conveniently through the network. Readers can not only search for booklists, but also search for documents, make an appointment, renew and make a recommendation on the internet, the library needs a technological innovation of service in order that readers can get the information wanted timely and efficiently. At present, the university libraries make a success of technological innovation generally. It mainly reflects in:

First, the information guidance service. The guidance system is plane layout diagram with explanatory note in the traditional university library. The modern guidance system under the network environment generally USES the touch or voice technology. It is intuitive, stereo, acting as interactive “man-machine dialogue”. As a important channels of information, it can not only reveal library service tenet, service content and layout to the readers and users. but also enable the reader to find information and service they want quickly and conveniently, which save a lot of time for the readers.

Second, the public query service. Lending services, circulating services and document retrieval of the traditional library mainly rely on the manual operation, readers usually need three steps including

“getting into the library–inquiring–asking for books”, which is inefficient. Modern computer technology has a strong capacity of sorting index and high-speed processing, providing a convenient technology for the library for multifarious bibliography indexing and directory management, at the same time, with the aid of unified cataloging of bibliographic data, retrieval system network extends unlimitedly, after three steps like “inquiring–getting into the library–asking for books”, readers can retrieve related literature. Many previous manual operations such as library information inquiry and reader information inquiry are replaced by the efficient automation system.

Third, the literature review technology. to find the appropriate literature as requested by readers is basic service work for the university library. Traditionally, the librarians mainly rely on their experience, professional knowledge and abilities, It is difficult to meet the needs of the readers who require “accurate, comprehensive and fast” service. Because of the widespread application of information resources retrieval technology, information inquiry like SDI is getting easier, some service system of full-text retrievals, the readers can search and read simultaneously without getting into “the library”, Fourth, the technical services of electronic documents. The electronic document is an emerging carrier of modern information communication, which develops into current audio-visual one from previous printed document and greatly enrich document resources. It consists of electronic publications, multimedia documents and so one, it is informative, easy to save and carry, it also can review anytime and anywhere. Under the modern network environment, electronic documents double every year, electronic documents has become an important form of document resources in the library today. In order to play the role of the electronic documents better, many libraries have opened the multimedia electronic reading room and the local area network (LAN) CD-ROM database query service, in some library the multimedia CDs play automatically under the network environment. the technical services of electronic documents become an important feature of service innovation in the university library.

4.3 The information service innovation

Under the modern network environment, readers demand more and more kinds of documents. On the one hand, they need a variety of multimedia documents, including audio-visual materials and various kinds of electronic publications, on the other hand, they need the documents for retrieval, especially the digital document resources. To this end, the types of information services provided by the university library also increase accordingly, such as multimedia electronic reading services, CD-ROM database services, and online retrieval services, document copy and editing and so on. The information services broaden the service field and content of the traditional library. Today, under the network environment, these are very important and are an essential part of the library service.

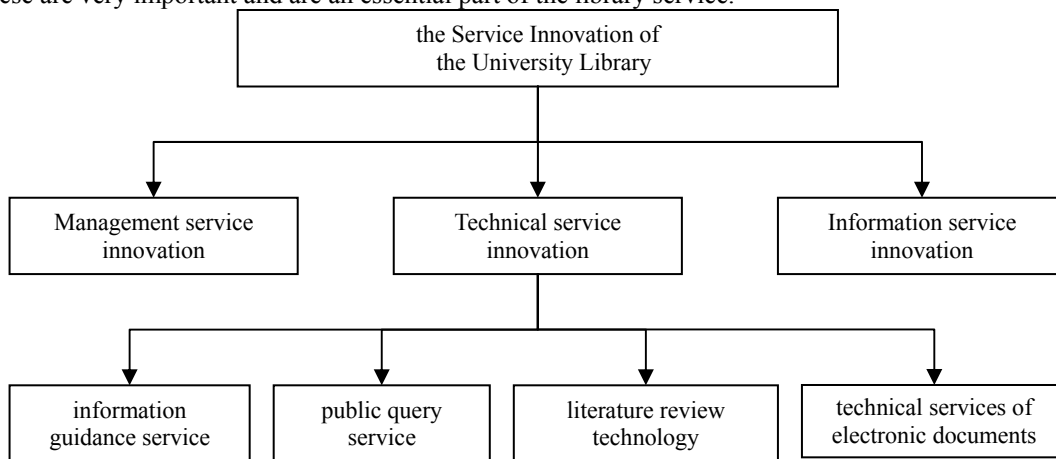

Figure 1 The Service Innovation of the University Library

5 Conclusion

In short, a highly networked modern library doesn't only provide a traditional document service, but provides the service of information resources for users. By tidying up and sorting out a large number of network resources, they can be effectively used by users. All of the information processing and development is part of the new library work under the network environment. Therefore, the university library must make efforts on information service innovation, providing readers convenient. The good

sort of information and smooth guidance services are the important assessment criteria for modern library.

Abstract: Science popularization capability is a comprehensive strength that the scientific wealth such as scientific knowledge, scientific thinking, scientific method and scientific spirit a country or area have had for a long time, is passed to the audience in a certain form and method in order to enhance their scientific literacy. As a wide coverage and influential science popularization work, science popularization at the grass-roots level should be paid more attention to its work capability. This article searches the building model and promoting countermeasures of science popularization at the grass-roots level and establishes the key impact indexes of science popularization capability at the grass- roots level. A new science popularization capability model at the grass-roots level is constructed by the optimization and recombination of the key factors. Practical and concrete countermeasures are put forward according to the new model designed.

Key words: Science popularization at the grass-roots level; Capability building of science popularization; Capability improving model; Capability improving countermeasures

1 Introduction

Based on the deep thinking of the connotation of science popularization activities, the concept of capability building of science popularization is put forward. Science popularization capability is a comprehensive strength that the scientific wealth such as scientific knowledge, scientific thinking, scientific method and scientific spirit human society has possessed for a long time, is passed to the audience through a certain form and method so as to enhance their scientific literacy. The capacity of science popularization work is the embodiment of science popularization capability. It refers to the work capacity shown by the participators including the government, enterprises, schools, mass media, social organizations or individual who is engaged in the science popularization career.

On the basis of above discussion, the capability building of science popularization is defined as a process that science popularization subjects including government, schools, enterprises, mass media, other organizations and individuals, find and identify various factors which will obstacle the progress of science popularization work and solve them so that capability of science popularization can achieve a comprehensive and sustainable development.

Based on the research of building model and promotion countermeasures of science popularization at the grass-root level, a new capability building model is constructed by the optimization of the key factors that influence science popularization capability at the grass-root level. Practical and concrete countermeasures are put forward according to this new model designed.

2 Key Impact Indexes of Science Popularization Capability at the Grass-roots Level

This article is in reference to the paper of Construction of the Indicator System of Regional Science Popularization Capacity written in 2011 by Li Ting, a scholar of Beijing Institute of Technology. The key index system of measuring the capability of science popularization is established based on the actual situation of investigation and interview of Hubei Association for science and technology projects, the characteristics of subjects and objects, the main content and the actual features of science popularization work at the grass- roots level.

Different components of science popularization capability at the grass-roots level play a different role in the building of science popularization at the grass- roots level. The understanding of objects of science popularization at the grass-roots level and the culture of the building of science popularization at the grass-roots level constitute the leading force of science popularization capability at the grass-roots level, deciding the patterns, types and methods of the building of science popularization at the grass-roots level. The penetration of science popularization network at the grass-roots level, the integration of social resources and the synergy of science popularization platform are the core force of

science popularization capability at the grass-roots level and the measures of subjects' science popularization capability. The influence of propaganda channels of science popularization knowledge and the originality of science popularization works become support of science popularization capability at the grass-roots level and determine the breadth and depth of science popularization knowledge spreading. In a word, science popularization capability at the grass-root level means transfer input to output in the support of science popularization support system at the grass-root level.

Therefore, the key index system of science popularization capability at the grass-roots level can be divided into input, output and supporting condition of science popularization at the grass-roots level. The three key indexes can be also divided into science popularization organization and management system at the grass- roots level, the building of science popularization talent team at the grass-roots level, science popularization communication activities at the grass-roots level, science popularization funds at the grass-roots level, science popularization facilities at the grass-roots level and quality and conversion rate of science popularization works at the grass-roots level. Each of the indexes can be further divided. The hierarchical structure is shown in Table 1.

Table 1 Three Hierarchies Index System of Science Popularization Capability at the Grass-Roots Level

The first level index	The second level index	The third level index
input of science popularization at the grass-roots level	science popularization venue facilities at the grass-roots level	comprehensive science and technology activity places
		feature and professional science popularization places
	team building of science popularization at the grass-roots level	science popularization talent team at the grass-roots level
		expert team engaged in science and technology service
		science popularization volunteer team at the grass-roots level
	science popularization funds at the grass-roots level	science popularization special funds at the grass-roots level
diversified social science popularization funds		
output of science popularization at the grass- roots level	science popularization creation at the grass- roots level	laboratory science popularization works at the grass-roots level
		original science popularization works at the grass-roots level
		science popularization products transformation ability at the grass-roots level
	science popularization propaganda activities at the grass-roots level	science popularization propaganda media and channels at the grass-roots level
		science popularization propaganda mode at the grass-roots level
		science popularization organizational structure at the grass- roots level
science popularization propaganda frequency at the grass- roots level	science popularization propaganda frequency at the grass- roots level	
supporting condition of science popularization at the grass-roots level	science popularization organization and management system at the grass- roots level	science popularization work regulation and procedure at the grass- roots level
		supervision mechanism of the building of science popularization at the grass- roots level

3 The Building Model of Science Popularization Capability at the Grass-roots Level

Based on above indexes, a new building model of science popularization capability at the grass-roots level is put forward. This model is on the foundation of science popularization support system at the grass-roots level. Through the building of input and output system of science popularization at the grass-roots level, a benign circle of input to output is achieved which provide a solid foundation for the support system's normal operation. It is shown in detail in Figure 1.

3.1 The Building of science popularization support system at the grass-roots level

As the basis of science popularization capability building model at the grass-roots level, the support

system played an important role in supporting the capability building of science popularization. The building of science popularization organization and management system at the grass-roots level is a prerequisite for the launching of science popularization at the grass-roots level. And the government's macro management provides guidance and support for the launching of science popularization at the grass-roots level. By the integration and optimization of science popularization business and industry at the grass-roots level, science popularization resources integration and optimization work at the grass-roots level encourage the complement and development of them.

The government's macro management to science popularization at the grass roots level embodies in three aspects, including the government's encouragement and guidance, communication and coordination, evaluation and supervision. Encouragement and guidance refers to all kinds of policies and regulations and the corresponding incentive measures made by the government for promoting science popularization work at the grass-roots level to carry out orderly and healthily. Communication and coordination is to coordinate all kinds of works among the subjects of science popularization work at the grass-roots level, promote the exchanges and cooperation, form a joint force, and optimize the effect of science popularization at the grass-roots level. Evaluation and supervision is about to evaluate and supervise science popularization activities at the grass-roots level in order to ensure the effectiveness and scientific-ness of the activities.

3.2 The building of science popularization input system at the grass-roots level

This system includes three subsystems-the building of science popularization facilities at the grass-roots level, the building of science popularization talent team at the grass-roots level, the building of science popularization funds at the grass-roots level. Among them, the building of science popularization funds at the grass-roots level directly decide and affect the strength and effect of the building of the first two systems. The construction funds will be raised through various channels such as special funds and social funds. To optimize the use of science popularization funds, these funds should be managed scientifically.

The building of science popularization team at grass-roots level includes the building of science popularization talent at the grass-roots level, expert team and science popularization volunteer at the grass-roots level. Talent and expert team comprises science and technology workers, science teachers, science popularization creation staff at the grass-roots level, mass media reporters and editors of science and technology, exhibition design and production staff of science popularization venue, management personnel of science popularization activity, scientific theoretical research workers and so on. The facilities include science popularization venues, science popularization bases, urban and rural activity places, science and technology exhibition hall and so on.

3.3 The building of science popularization output system at the grass-roots level

Science popularization output system at the grass-roots level is achieved by the building of science popularization creation and propaganda activity at the grass-roots level. The building of science popularization creation at the grass-roots level is the foundation and support of science popularization propaganda. The building of science popularization propaganda activity at the grass-roots level will directly influence and restrict the propaganda quality and effect of science popularization at the grass-roots level, is the result of science popularization works propaganda at the grass-roots level.

Science popularization works mainly includes the original works and laboratory works. To create works by the core force of science popularization creation at the grass-roots level such as professional science and technology personnel, literary and artistic creator and media creative personnel. The creation works mainly includes teaching products of science popularization works at the grass-roots levels, publications of science popularization works at the grass-roots level, science classes of science popularization at the grass-roots level, science popularization toys at the grass-roots level, science popularization tourist souvenir at the grass-roots level, science popularization network information products at the grass-roots level.

The main part of science popularization propaganda activity construction at the grass-roots level is the building of science popularization propaganda channels. The propaganda channels include mass media, popular science venues, school science classroom, science popularization product sales channels, science popularization organizations and facilities at the grass-roots level and so on. And by the scientific combination of propaganda frequency and mode, the desired communication effect is achieved.

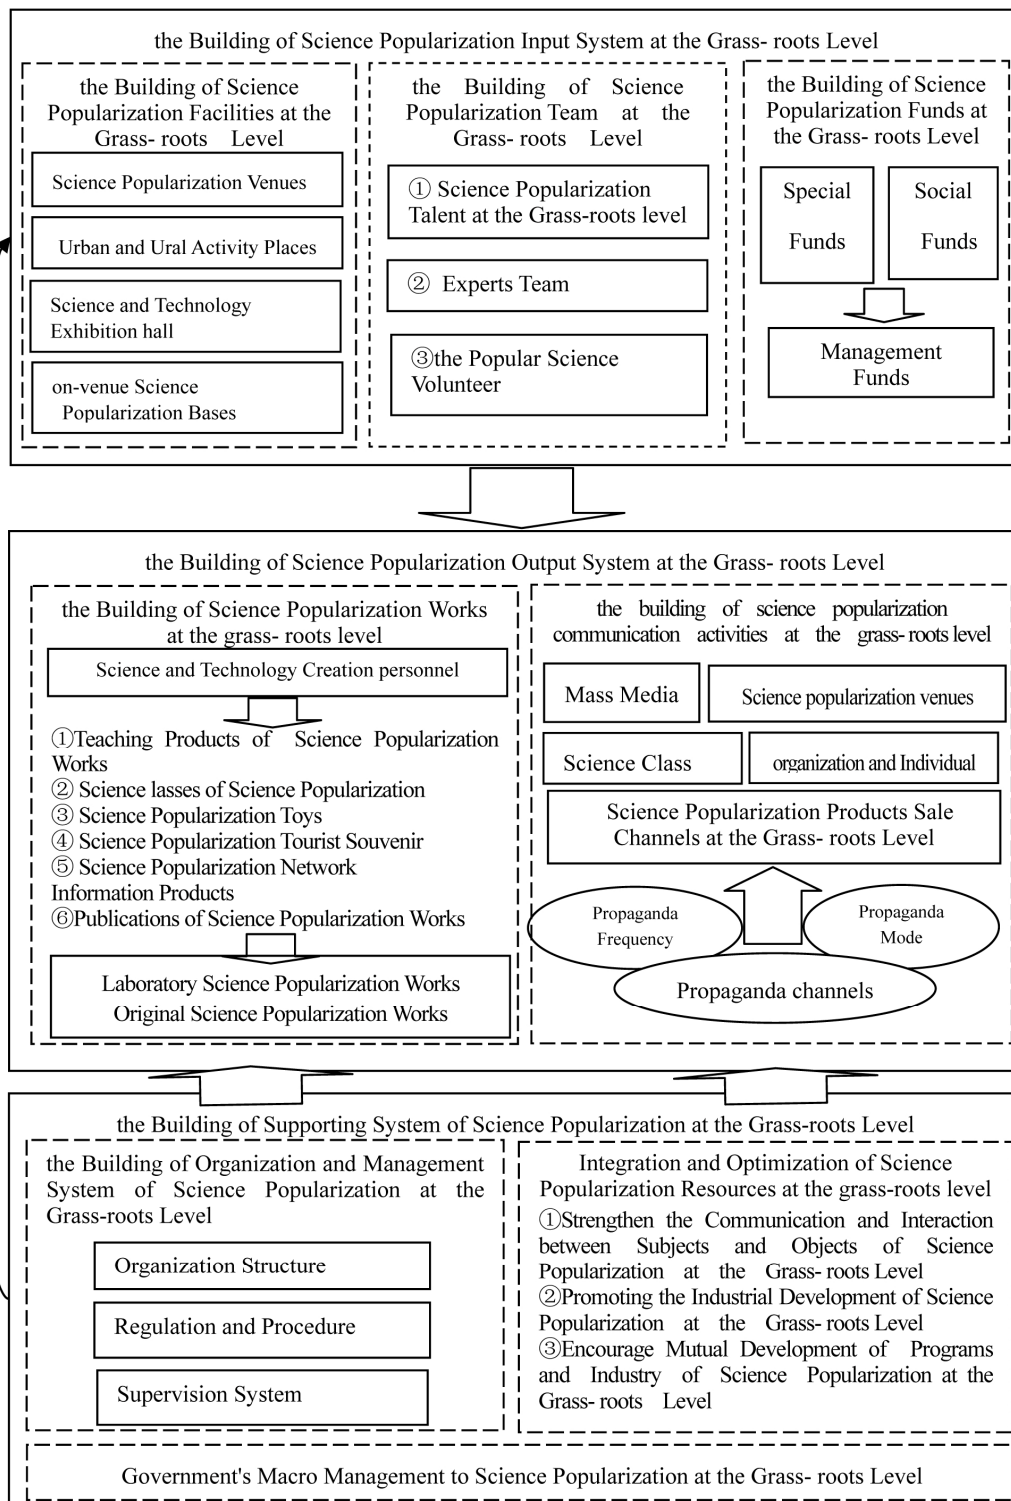

Figure 1 The Building Model of China's Science Popularization Capability at the Grass-Roots Level Based on the Key Effect Factor

4 The Countermeasures Study of Science Popularization Capability Promotion at the Grass-Roots Level in China

4.1 To construct the systematic science popularization organization at the grass-roots level

From transverse view, due to the science popularization at the grass-roots level emerges in all aspects of the society, any organizations and individuals should take an active participate in it. So, transverse functional departments can be divided into government, education institutions, science and technology organization, mass media, businesses, private foundation and other department. Then, according to different science popularization objects, science popularization organization can be divided into juveniles, the rural, urban workers, cadres and civil servants, and special science projects popularization of five key crowds in communities. That is to say, each transverse functional department must give supervision and support to each special science popularization at the grass-roots level. Then every longitudinal science popularization special project should be supervised and supported by each transverse functional part. So systematization between subjects of science popularization and projects is formed. The mutual support of transverse and longitudinal interaction matrix of science popularization organization coordination mechanism have shaped, which is shown in figure2.

Specifically, science popularization actions or plans at the grass-roots level often relate to many departments, need multi-dimensional and multi-level cooperation and coordination among various related departments. Establish the relevant government departments such as science, teaching, culture, hygiene, radio and television, agriculture and so on. Also, Establish the science popularization work reported regular exchange mechanism at the grass-roots level, science popularization major planning activities negotiation cooperation mechanism at the grass-roots level, etc among departments at different levels such as the ministry, the department bureau class, the place class. That is, we should not only emphasize the two-way communications between science popularization subjects in the vertical direction from top to bottom and from bottom to top, but also pay attention to the horizontal communication and contact between science popularization subjects at the grass-roots level.

Organization and coordination mechanism is a process of science popularization systematization including the government, education institutions, science and technology organizations, mass media, and private foundations and other organizations. In recent years, many governments encourage cooperation between science popularization subjects, especially in science institutions and the formal science education institutions. For example, the national science foundation (NSF) encourages science popularization project organizations to employ the primary and secondary school teachers to involve in project work in order to make the relevant science program’s design schemes which are supported by them can be used by primary and middle school students. Besides the enhancement in domestic cooperation between science and technology communication subjects, international exchanges and cooperation between the subjects of science and technology population are also strengthened. With the increasing systematization of science popularization subjects and continuously strengthened cooperation, science communication transforms from the “little science popularization” to “big science popularization”. The so-called “big science popularization” includes traditional science popularization, science education, science and technology news, technology training, technology policy, and scientific communication integration in the sense of science communication.

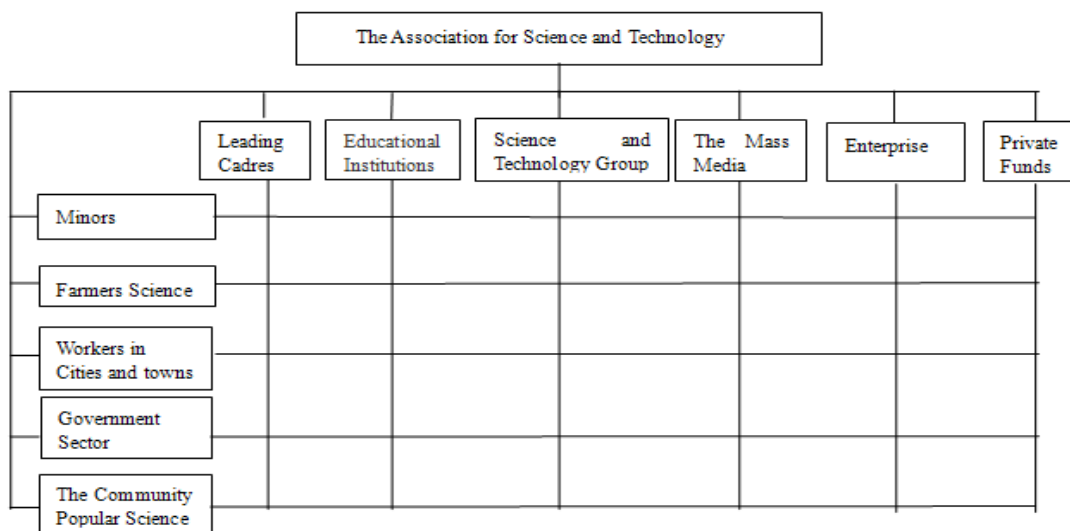

Figure 2 The Matrix Organization Management System of Science Popularization Work at the Grass-Roots Level

4.2 Establish the girding science popularization talent team at the grass-roots level

Due to the wide range of the science popularization objects at the grass-roots level, at present our country has expanded scientific objects to the ascension of civic scientific literacy. As a result, the requirements to science popularization team are also higher. Different objects and regions have different features. And the support and organization assurance team they need is different. If only to generalize, it will be hard to achieve the desired effect. Introduction of grid management thought will be more convenient to provide service for science popularization objects at the grass-roots level, break the isolated situation between functional departments, realize dynamic control and coordination of resources, improve the efficiency of management, and achieve fine management.

Speaking from the content, the building of science popularization team at the grass-roots level mainly includes three aspects which are educational background structure, experience, age structure of science popularization team, the quantity, type, and personnel quality of experts science and technology service team, the stable volunteers and staff number, type, and quality of science popularization at the grass-roots level.

Using the grid theory to analyze and build science popularization team at the grass-roots level, the key premise is to have a clear standard. And the specific points in the process of the implementation of science popularization work at the grass-roots level are the characteristics of area and population. That is to say, "civic scientific literacy action" should be carried out in various regions for different people across the country. To make the team more implemented and effective the objects should be divided by region and science popularization subjects.

Specifically, a grid construction of science popularization team at the grass-roots level is based on the objects of the science popularization at the grass-roots level and geography in our country administrative areas (according to the situation of dividing administrative regions considering the actual needs). Under the guidance of the fine management and the efficiency of science popularization improving, the whole scientific regions will be divided into a small region or a type of science popularization object. The division number of the grid cell is equal to the number of area multiply by the number of science popularization object type. Then, in each grid cell, a specified science team is responsible for it. Divide all of the scientific objects into the various girding cell to realize the precise localization of management object.

Science popularization activities at the grass-roots level often need to spread the different science and technology information in different regions, among different groups, through different ways, using various means which determines the different division of science popularization team including knowledge producers and disseminator. Then, the pattern of the government guide and the whole society participate in is formed by the establishing of a multi-level, wide distribution, complete function, reasonable division organization network.

To ensure good implementation of the girding construction of science popularization team at the grass-roots level must have a strong guarantee system. That is to say, the talent training mechanism must be carried out. For example emphasize diversified input mechanism of the building of science popularization at the grass-roots level, innovate talents training and assessment mechanism of science popularization at the grass-roots level, improve the personnel training mechanism of science popularization at the grass-roots level, establish the supervision and evaluation mechanism of science popularization talent team construction at the grass-roots level.

4.3 Strengthen the building of science popularization places at the grass-roots level

We should increase and improve the function of science popularization in the process of public facilities building of science popularization at a grass-roots level. We should promote science popularization facilities building, and strengthen regulation and guidance to various types of building of science popularization infrastructure. Under the premise of raising money in multiple channels and sufficient research, we should build a batch of science popularization venues which are rational layout, scientific management, operational norms, and meet the requirements. It can form a coordinated development pattern between comprehensive venues and professional venues through integrating science venues and facilities, optimizing usage rate of infrastructure and conversion rate of project research and development, establishing science venues open, flow, collaborative operation mechanism, constructing science popularization resource innovative and sharing platform.

4.4 Encourage diversity science popularization creation

More and more original excellent science popularization works appear constantly because of the encouragement of science popularization creation. To promote the whole society to participate in science popularization creation, we should not only guide all aspects of the social power such as the

literature, art, education, media to devote to science popularization creation, but also encourage scientific researchers to transform their achievements into works, and vigorously develop new types of science popularization exhibition and teaching products. At the same time, the quality of science popularization works should be guaranteed. Encourage and guide the various labs and centers at the provincial level such as scientific research institutions, universities, science and technology enterprises and other social forces to take an active part in science popularization creation. Launch design and development activities of the science popularization exhibits and teaching products. Encourage scientific researchers to transform their achievement into works. Establish an effective incentive mechanism to provide support and reward for good science popularization works.

4.5 Widen the input channel of science popularization funds at the grass-roots level

Widen the input channel of science popularization funds at the grass-roots level. Regard the government funding as leverage. Encourage and attract societies and enterprises to invest and donate in science popularization work, gradually form a marketed pattern of science popularization investment. Increase public investment of infrastructure construction and operation funds for public welfare science popularization, and drive private organizations and companies to make donation to science popularization activities and science popularization organizations. A diversified fund raising mechanism is formed which gives priority to private organizations and corporate donations and regards market-oriented operation mechanism as complementary by combining with market-oriented operation mechanism. Encourage social forces to participate in science popularization infrastructure construction and operation service. Finally, the three source structure financing mechanism-government funding, private institutions and enterprises donation, market-oriented operation is formed.

4.6 Innovate science popularization propagation path

According to the practice of science popularization construction at home and abroad at the grass-roots level, there are two main types of propagation path-the government-oriented top-down science promotion mode and the citizen-oriented bottom-up promotion mode. In the two paths, the status and requirement of government and audience in the building of science popularization at the grass-roots level is different. Although the core role of the government and audience in the two paths is respectively emphasized, the utility of science popularization is inefficient as a result of the one-way propagation of science popularization knowledge. So we should establish a triangle of government - society - audience in science popularization propagation at the grass-roots level to change the audience's participation mode from passive to active, make public science literacy from known science popularization to acquire science popularization, finally to use science. Emphasize the interaction feedback two-way propaganda, pay attention to interact with the public, enable the public to understand the scientific process and the nature of science.

At the same time, improve the mass media's propagation strength by strengthening the building of science popularization propagation system. Make full use of the three nets fusion new situation, comprehensive newspapers, journals, multi-media, and the mass media such as television, radio, internet, to set up a science popularization project, column, page, or channels for science popularization propaganda at the grass-roots level, and improve the quality and level by increase its air time and layout. On the basis of theoretical support, continuously broaden dissemination channels, optimize transmission carrier, perfect science popularization propaganda system at the grass-roots level, form a Interactive and circular propaganda system between the subject and audience, the audience and the audience.

5 Conclusions

Science popularization in grass-roots level aims to comprehensively promote the individual's scientific and cultural quality, to overcome the tendency of emphasizing natural science and belittling social science, to popularize scientific and cultural knowledge in order to make people to understand science knowledge, enrich their social science knowledge, pay attention to human dignity and value, make people focus on their own survival and development requirements and the pursuit of happiness. Guide people to respect nature, respect the objective law, and realize the harmonious development of man and nature. Science popularization work at the grass-roots level is a far-reaching social engineering and significant strategic task for our country. However, science popularization capability at the grass-roots level is a broad and abstract concept containing in the practice of science popularization work at the grass-roots level. This article is to explore the epistemology of the capability building of science popularization at the grass-roots level. In the course of science popularization capability promotion work, it must be supported by the science popularization

organization system, through the building of input of science popularization, to get the effective output and achieve the building and promotion of science popularization capability at the grass-roots level. Science and technology group, the mass media, universities, research institutes, enterprises and private foundations should play a positive role in science popularization with the integration of various social resources and the guidance of the government. Break through the traditional, rigid and old form and content of science popularization works at the grass-roots level to make them lively and interesting. Improve the influence and sociality of science popularization works at the grass-roots level by exploring new propagation path.

Looking forward to the future, science popularization work should be carried out from point to plane gradually, especially need to highlight the interaction of individual and society and to gradually form professional science popularization power and science popularization professional activities at the grass-roots level. Let science popularization career at the grass-roots level socialize. Let science popularization career at the grass-roots level of the people, for the people and by the people. Finally, the sustainable development of science popularization career can be ensured.

Construction of a Clean and Honest Administration Culture from the Perspective of Socialist Cultural Development

Zhu Min

Commission for Discipline Inspection, Wuhan University of Technology,
Wuhan, P.R.China, 430070
(E-mail: 1030845901@qq.com)

Abstract: This article aims at the influence from the cultural development of human's spiritual beliefs, values and so its development as a breakthrough point. On the basis of the status and importance of the honest government culture of University, puts forward personnel training positions, shoulders the advocating and promoting the construction of honest government culture historical responsibility. The development of university culture is an important part of the harmonious and healthy development of the country. University teachers are the main force in the construction of clean and honest, and they are the examples of strengthening their own moral self-cultivation, the theory research with the ideological reality of the students and the psychological demand combined; becoming model and example of their students to promote clean government culture by "to be a model for others and make oneself an example" morality, to cultivate the students to be honest and clean government culture advocates.

Key words: Clean and honest culture; Innovation; campus culture; Anti-corrupt quality

1 Introduction

From the scope of the whole globe, in some countries the situation is good, except for the influence of system, legal system, system. One of the important reasons is they form an honest government culture that the whole community recognized and the people accepted and followed. The successful cultural construction of Singapore is because of advocating the idea "integrity—the foundation of a country "as a very important aspect.

The word "Cultural management", first appeared in the book "enterprise culture—the company life rituals and ceremonies" which wrote by American management scientist Terence Deal and Alan Kennedy in 1982. It pointed out "we want to instill a new corporate life rules to our readers in this way: culture is power."^[1] Effect of culture refers to a nation's spiritual beliefs, values, social systems and its development potential and the appeal of the summary. The eighteenth National Congress of the CPC stressed, "culture is the lifeblood of a nation, is the spiritual home of the people", which "plays the leading role of cultivating people, servicing the society and promoting the development of culture". Culture is the necessary way to revive the national prosperity and keep national sustainable development. History and reality have proved that any developing countries will lose its spiritual force if it has no the leading scientific culture system. The famous philosopher and anthropologist Randman pointed out: the cultural creation has broader and more profound connotation than we ever believed^[2]. The culture is a nation's blood, is the spiritual home of the people. Although invisible, it has a profound impact on everyone all the time, just like air. It is a kind of spiritual power, is the symbol of social civilization and progress of science and technology, is the vitality of the harmonious development of the country. It is and will liberating and developing people's spiritual world, stimulating people's creative ability. The formation and development of the cultural can affect a nation's character and promote a national spirit connotation, develop the potential and innovation of a nation. Throughout the world the strength of competition, in addition to the scientific spirit and economic strength, is the culture and national spirit national contest. The development of culture is the main factor to promote the development of the society, the culture of the Chinese nation and the era program of Chinese socialist modernization.

2 The Status and Role of the Clean and Honest Culture

For in-depth understanding of the current situation of the honesty education of the university students, University Students' Honesty Education issued "investigation questionnaire", a total of 160 questionnaires were issued, and ultimately recovered 159 valid questionnaires, the recovery rate was 99.4%, by analyzing the questionnaires, the survey results with high reliability. In the respondents, 61% undergraduates, postgraduates accounted for 39%; the Communist Party activists accounted for 27.7%, accounted for 18.2%, the Communist Youth League member 48.4% people, accounted for 4.4%; the questionnaire adopts radio and multi form of combination, including college students' honesty education

on knowledge and attitude etc.

Table 1 The Correct Understanding of Honesty Education.

know;	degree of satisfaction	The act of contempt	Not in
91.7%	73.7%	50.4%	94.1%

Table 2 The Degree of Understanding of the Phenomenon of Current College Students Honesty.

Dishonesty	The phenomenon of students cadres canvassing	No attention	Pretending not to see
33.9%	51.1%	58.7%	3.8%

Table 3 Understanding of Developing the Honesty Education of the University

86.9%	7.9%	9%	2.2%

Table 4 Publicity and Education Form.

The ideological and Political Course	Debate competition;	speech contest;	The works of painting and calligraphy
26.5%	21.87%	15.7%	16.7%

2.1 Honest culture is the advanced culture of the times

The Chinese nation has abundant culture resources. Clean and honest spirit is the baseline of the country and the officials with the people should discipline themselves. All these concepts constitute the basic connotation of Chinese traditional thought of clean government culture. As early as the Western Zhou Dynasty, “Clean and honest spirit” has become a kind of moral and thinking to govern the nation. The Western Zhou Dynasty evaluated the officials’ superiority or inferiority on the investigation of clean and honest spirit. Since then, the political thought of the dynasties followed was “morality is the first while clean is most important”, as an important measurement of governing the country. This thought in Chinese traditional culture, has the positive significance to the construction of clean government culture today. Adhering to the honest government culture contains philosophy of life to guide people to develop good quality and admire the clean and honest morality, which is a kind of social influence, anti-corruption education playing basic roles in the way of combating corruption and maintaining the important ruling purity state guarantee.

2.2 Construction of a clean and honest administration culture is an important part of the development of Chinese culture

College is an effective role in spreading the advanced socialist culture, concept, promoting the socialist core value system to lead the socialist concept of honor and disgrace with important position in the heritage of civilization, shaping national character and national spirit. It undertakes the task to enhance the ideological and moral qualities and scientific and cultural qualities, so as to promote the development of science and technology, social progress, cultural innovation mechanism. University brought together a large number of experts who have outstanding commitment to the cultural heritage and cultural innovation. Through their hard working, University Culture plays a leading role in the whole process of social cultural and ideological progress. So, to strengthen the construction of university culture following the “cultural ideas of inheritance innovation, all-round development” so as to mining the law of culture development is the need of promoting socialist cultural development and prosperity. And also, is the need of enhancing the national cultural soft power and the important function of the new higher education.

The University clean and honest administration culture can give full play to the education function of honesty education, strengthen the construction of spiritual civilization and moral civilization construction with new ideas and new spirit to enrich the existing cultural achievements, combine the profound thought and culture of mass education with campus culture to integrate the development of the new and old culture. Let the students inherit and carry forward the " socialist core value of prosperity, democracy, civilization, harmony, freedom, equality, justice, rule by law, patriotism, dedication, integrity, friendly" concept based on the comprehensive development and continuously improve the students’ self-discipline, honesty, integrity, justice, dedicated to the clean and honest concept deeply

rooted in the hearts of the students ,to foster the new talented person “strong willed, political, moral quality” to adapt to the need of development of a new era.

3 The Construction of College credibility Culture and the Spirit of Innovation

Innovation is the soul of a nation’s progress, is an inexhaustible motive force for national prosperity, and is also the source of the eternal vitality of a political party. ^[3] Kang Youwei had a famous saying: Anything is strong, fresh, lively, and fluent when it is young while is weak, rotten, dull, and lagged when old.^[4] The spirit of innovation is the courage to abandon the old things and create the new ideas and new things. Spirit, is the new spiritual foundation the humanity pursues and source of power to new things.

3.1 The theory study team should become the vanguard of incorrupt cultural construction

A University should construct a research team to carry out clean theory research. Based on the theoretical foundation of cultural construction of honest and clean government, to improve the system of cultural theory plays an important role in promoting the construction of a clean government culture era. The information of theory rich in resources, human resources makes the research subjects at home and abroad to carry out academic communication channels, various platforms and other aspects of the advantages to develop the theoretical research in colleges and universities. Colleges and universities should adhere to the theoretical research as an important support and guidance to improve the anti-corruption construction scientific level, encourage the theory study to carry out by the relevant subject teachers.

3.1.1 The comprehensive development of the research project

It is necessary to mining the depth of the cultural connotation and refining the honest government culture theory. Marx historical materialism tells us: “the society change must result social consciousness change, but it is a long and tortuous process”. China is a country with the deep and traditional culture of unremitting self-improvement, social commitment, honesty and self-discipline, true patriotism. These real social virtues have already deeply moistened the deep inner peace of sons and daughters. Colleges and universities should carry out the work and the construction of clean government culture, thinking mode and behavior identity consciousness from the honest government culture of philosophy of science, theory summary and the refinement of incorrupt cultural construction, make the essence of construction of a clean and honest administration and incorrupt government culture influence and spread widely in the whole society, gradually completed from practice to theory of sublimation, the formation of the overall construction of a clean and honest administration with the cultural advantages, coordinated development, guiding role for the whole society with the development of anti-corruption work. Strengthen the summary of the current anti-corruption and clean government culture activities experience, refined theory; pay attention to the study on the culture carrier, with rich forms and incorrupt cultural construction of social culture, the thought and art of combining; mining traditional culture the thought of incorruptible culture, inherit and carry forward the culture; accelerate the absorption and the introduction of foreign excellent culture of honest and clean government thought, accelerate the introduction and absorption to enrich our culture content.

3.1.2 Enrich the research method further

Study on the honest government culture to the latest achievements of subject focused on political science, sociology, ethics, psychology and so on, seriously study the party literature, in-depth analysis of typical cases, special attention should be paid to the problem of data analysis, expand the research object of the honest government culture. To grasp the party’s work style and promote the healthy development of the school as a leader, to explore the new situation, new problems in the construction of anti-corruption from the combination of theory and practice; carry out different levels, academic deliberate activity from multiple perspectives, draw the honest government culture material from the practical experience, on the idea of culture, the culture of clean government the characteristics, construction of a clean and honest administration mode of in-depth study, scientific thought and puts forward the effective countermeasures in accordance with China’s basic national conditions. To pay attention to the use of modern scientific research with Chinese current anti-corruption faces a series of contradictions and problems of analysis and conclusion, to seek truth from facts, providing strong support for the construction of a clean and honest administration.

3.2 Ideological and political course teachers to be incorrupt cultural construction seeder

The culture of honest and clean government and the education should be put into all aspects of professional learning, penetrating into every aspect of teaching, scientific research and social service.

The course has a function of education. The teachers should be clean and honest culture education resources to explore various courses, strengthen the education imparting professional knowledge in the process, to enable students to learn scientific and cultural knowledge in the process, strengthen the cultivation of consciousness, improve self-discipline consciousness.

3.2.1 To improve the quality of College Teachers' integrity

The rise and fall of the country lies in the education, and the rise and fall of education depend on the teachers in the system. The university teachers are the essence of "advanced culture and science and technology civilization pioneer, who shoulders the important mission of sacred duty and foster ideals, morality, culture, discipline socialist successors. A good teacher with deep thinking, life attitude, knowledge breadth and height is the learning behavior model of the student lifelong. As communicators, incorrupt cultural construction practitioners and promoters, teachers should make oneself an example continue to strengthen their own moral self-cultivation, improve their ideological and political quality and professional quality, strive to have both ability and political integrity, rigorous learning dedication, honesty and self-discipline of moral character to promote clean government culture model and example by " be a model for others, make oneself an example " morality, for students' moral development course guidelines, to educate and guide the teachers to set up the correct academic view, teaching view and dedication, rigorous learning, fame and fortune, adhere to academic self-discipline, enhance the academic responsibility, to the image of occupation morality affects students noble clean.

3.2.2 To guide teachers to carry out the initiative clean education

Firstly, it is necessary to pay attention to the combination of the ideological and political education and honesty education. The clean and honest government culture of the campus is an important content of strengthening and improving the ideological and political education work in school, is also the important content of improving college students' Ideological and moral quality. The construction of a clean and honest government culture is a kind of psychological environment construction which influences character by environment permeating in people's ideology, so as to form the healthy psychological mechanism, leading the compliance and corruption of morals norm system attitude. Teachers should make full use of the ideological and political courses, the Party school training, students' organizations, students' Party branch, the development of Party members and other training way to expand the coverage and influence of the education, to educate and guide students to pursue the positive and scientific culture, to help the students realize the long-term nature, complexity, difficulty of anti-corruption struggle. The teachers should make the clean honest cultural and ideological education extend to the construction course of community construction, the model class, the students' dormitory culture, daily life, excellent personal assessment. Also, the teachers should let clean seed take root in the hearts of the students, make everyone to "emulate those better than himself. If not, examine himself". If the students have a good clean and honest quality, they can take the initiative to do the honest cultural practice after their graduation. They can affect the people around them by their own words and deeds, and then drive the forming of unit clean atmosphere, promoting the whole society.

Secondly, it is necessary to pay attention to the ideological and theoretical education combined with the honest character. The purpose of construction of a clean and honest government culture is to make every member of the society act according to the ethics and value norms. Ideological and theoretical education is a part of the culture of clean and honest government. Further strengthening and improving the ideological education of college students is the important content of the development of socialist advanced culture, is the powerful measure to maintain the harmonious development of the country, and is the spiritual impetus to make the student grow health. Thoroughly implementation of the socialist core values and the concept of honor and disgrace always pay attention to students' ideological trend, the thought political lesson in moral, cultural quality, integrity education. It should strengthen the combination patriotism, the theme of the national spirit education, moral standard moral education and the aim of quality education for all-round development. It should open psychological intrinsic behavior of their active thinking, creation, efforts at the same time of the construction style of teaching, studying and class. It should strengthen students' self-respect, self-examination, self-warning, self-encouragement, honest moral virtues, establish probity values of "everyone advocates, praises, lauds the incorruption", enhance students' self-discipline and immunity ability against corruption.

The third is the student's education and legal system education combined. Abide by the law is the basic law of every citizen should abide by the quality, honesty is one of the students have the. College students are an important group in the society, is in the personality of the "period", easy to one-sided pursuit or others from morality behavior. To strengthen the cultural construction of University Campus Law, stimulate students' hearts lofty moral emotion with the socialist core values, legal education for

college students with socialist concept of honor and disgrace, purification college pure soul with a clean government culture advanced, combined with the side and honest and clean government warning education, to understand the law, law-abiding atmosphere, learn to restrain myself discipline, legal rules and regulations to work; actively construct the legal consciousness of modern college students, time will “know for, do not know to stop” in mind, for the construction of Chinese democracy, legal system, equal, harmonious socialism has far-reaching practical significance.

3.3 College students should be honest and clean government cultural construction workers

To make “Honor Incorruption and Shame Corruption” become the spirit and culture of an era, and make it as the ethics standard and conscious action of the whole society, is the mission of incorrupt culture. Mr Cai Yuanpei once said: “To know tomorrow’s society, please look at today’s campus first.” Colleges are important educational positions and also important ideological and cultural fronts.

College’s core mission is to cultivate talents, which is the most direct and fundamental way to inherit humanity outstanding culture. Honest thoughts doesn’t mean honest culture. College students are imaginative, innovative and active, and to carry out incorrupt education on them are of great importance for them to remain diligent, pragmatic, indifferent to fame and fortune, selfless in the complex social environment when they step into the society. It is also very critical for them to cultivate noble thoughts and beliefs, to keep honest, to establish rigorous learning attitude. Colleges should make full use of ideological and political course, school training, student organizations, student party branch, party member development and other training ways to expand anti-corruption education coverage and influence, so that clean seeds can take root in the minds of college students. Colleges should also strive to improve students’ honesty and quality, so they will be the best incorrupt cultural practitioner after graduation and their words and actions will be able to affect the people around them, then the clean atmosphere can be formed in their companies or organizations, which will promote social righteousness. All these will be able to lay a good cultural foundation to push forward the incorrupt culture construction steadily.

3.4 The school discipline inspection commission should become the cultural construction of lubricant

The 15th Party Congress determined the anti-corruption leadership system and working mechanism, that is, “unified leadership by the party, together efforts made by the governments and the party, coordinated by the discipline inspection departments, relying on the people’s support and participation”, which defines the organization and coordination responsibilities of the discipline inspection departments in the anti-corruption work. On July 11, 2005, the Discipline Inspection Standing Committee of the CPC Central Commission discussed and adopted that the regulations “The requirements on the discipline inspection departments to assist the party committees in anti-corruption work requirements (Trial)” shall come into force from July, 26, 2005, which defines the main task of the discipline inspection departments as organization and coordination. Incorrupt cultural construction is an effective carrier and an important platform to create a harmonious campus. It is a system engineering, that’s to say, the discipline inspection department coordinates the whole work, pushing forward the incorrupt culture into the campus, making multi-channel incorrupt culture education using various ways, which will infiltrate the incorrupt culture into the campus, classrooms and dormitories; on the other hand, the discipline inspection departments should try to enhance the attraction, influence and participation of the incorrupt culture education, so that college students can experience it in practice, and percept it in life. College discipline inspection organs should play a lubricant role in enhancing inter-departmental communication and coordination in accordance with the overall deployment and requirements by the party committees and the higher discipline inspection organs. Colleges should include the incorrupt culture construction into their reform and development plans; Colleges should make studies on new situations and solve new problems timely; They should also coordinate different forces to promote the healthy and harmonious development of the college incorrupt culture construction.

4 Results

University is an important base for training talents, heritage of civilization, the construction of advanced culture. It shoulders the important task of training qualified builders and reliable successors of socialism. The implementation of the education of comprehensive university, is an important part of the whole society to the anti-corruption education, is the inevitable requirement for reinforcing the ideological and moral construction of students, the honest culture is to create a complete the guide, inevitable requirement of harmonious society and civilization.

(E-mail: xliac@ust.hk)

Abstract: This paper focuses on China's situation and responses during the 2008-2009 global financial crisis by analyzing statistics covering several aspects. Contents cover the financial crisis's influence on China and why harmed China's economy. Chinese government's responses: pro-active fiscal policy, monetary easing policy, as well as their immediate effects are analyzed respectively. The long-term effects of these policies are also included. In addition, the debate on whether China should be blamed for the crisis is also analyzed, together with suggestions for China's future development.

Key words: China; Financial crisis; Fiscal policy; Monetary policy

1 Introduction

Since the beginning of the 2008-2009 Global Financial Crisis, many researches were conducted on by different scholars around the world. Topics include the U.S. and Europe's performances during the Financial Crisis, their governments' responses, their expected aftermath and so on. In-depth analyses of the formation of the Global Financial Crisis were also a heated research topic. Western scholars including Frederic S. Mishkin, Coenen, Robert Hall, Philip R. Lane et al all came up with remarkable papers, however, only few paid their attention to East Asia countries, especially China. As for Chinese scholars, theoretical analysis researches were conducted far more than quantitative research.

2 The Influence of the Financial Crisis on China

Since the end of 2007, despite the fact that China's total expenditure was still increasing, foreign investment and export started to decrease gradually. China's economy growth of coastal regions started to slow down, marking the beginning of China being influenced by the Global Financial Crisis. Shanghai, Zhejiang Fujian and Hainan province experienced an average decrease of 3.65% in GDP growth¹. At the mean time, price and trading volume of housing market started to decrease national wide for the first time since 2003. During October 2008, due to the influence of the plummet of the Dow Jones Industrial Average, Shanghai Stock Exchange Composite Index was dragged to its trough of 1664.93 points from 6,124 points. The influence of Global Financial Crisis trigger by the bankruptcy of Lehman Brothers started to show more effects on China: large Chinese financial institutions, whose shares were held by Lehman Brothers or were holding Lehman Brothers' bonds, were severely influenced. Chinese investors' confidence was influence and therefore resulted in further contraction in domestic investment.

Before 2007, China maintained a stable GDP annual growth rate of double digits for over a decade. However, the GDP growth rate dropped from 14.2% in 2007 to 9.6% in 2008². After that, China's GDP growth rate maintained a downward sloping tendency for the following 3 years. The GDP growth rates were 9.2%, 10.4% and 9.3% respectively³. During the third quarter of 2012, the GDP growth rate was only 7.4%, lowest of the past 3 years. From the data above, we can see that the effect last much longer than expected.

Figure 1 shows the 4 components of real GDP. We can see that a sharp drop in Net Export started in mid-2008 terminated China's Golden age of trade, which started from 2002 (Weidong Liu, Clifton W. Pannell and Hongguang Liu, 2009) and the decreasing tendency maintained for the following 3 years. China's Export value decrease from 1.43 trillion us dollar to 1.20 trillion U.S. dollar² and trade surplus in 2009 was 111 billion U.S. dollar less than that of 2008³.

Figure 1 Four Components of GDP's Changingtendency from 2003 to 2011

Similar to the U.S China's job market was also influenced (Weidong Liu, Clifton W. Pannell and Hongguang Liu, 2009). Many jobs provided by export-oriented enterprises disappeared due to the bankruptcy of a huge amount of small to medium-size non-public enterprises. In 2008, 67,000 Small and Medium-size non-public enterprise filed bankruptcy¹. As for the textile industry, a representative of labor-intensive industry, over 10,000 enterprises filed bankruptcy and the remaining two-third faced reforming. Until September of 2008, around 1600 Taipei companies and 3000 Hong Kong companies left Dongguan (a city in Guangdong Province), which made up one-fourth of total Taiwan companies and one-third of the total Hong Kong companies within the region². Jobs positions provided by both local companies and companies outside Mainland China decreased, causing the entire industry and investment cash flow to shrink.

China's inflation level was influenced by the financial crisis as well. From 2007 to 2008, there was a sharp rise in inflation rate from 1.46% to 4.75% and then to 5.86%. However, in 2009, the inflation rate become negative, and then in 2010, jumped back to 3.31%. The fluctuation of inflation rate made it difficult for business organizations to predict future incomes and therefore undermined business confidence during the period.

Figure 2 China's CPI Change in Annual %, 2003 to 2011

Although China was affected by the financial crisis through several aspects, comparing with other developed economies, the damage was not too severe. First is because that, due to the reason that some foreign investors believe CNY would continue appreciating against dollar and maintain a relative high level of savings interest rate (Ronald McKinnon, Gunther Schnabl, 2009), China still managed to attract increasing foreign investment during the financial crisis. Foreign investment solved part of the liquidity

¹ Data Source: Small and Medium-size Enterprise Administration Report. State Development and Reform Commission of China, 2008 (In Chinese)

² Data Source: Guangdong Province investigation report. Guangdong Province Information Investigation Center, 2007

problem in Chinese market, especially among companies that had strong reliance on cash flow. Second is that China's diversification of its trade partners⁴ and reduction of the Export/GDP ratio since mid-2000s also helped China from further loss⁴. Third is that, the limited usage and regulations on financial derivative and securitizations helped China minimize its loss in the finance industry.

3 Reason why China was Influenced by the Global Financial Crisis

First of all, China's economic growth pattern has serious structural problems that prevent China from a long-term sustainability growth. For example, the lack of protection for technology innovations and the heavy reliance on natural resource consumption are all visible problems. Among all possible problems, the most severe one is the imbalance GDP growth reliance among export, foreign investment and domestic consumption. This imbalance leads to a double reliance on the global economy and a weak linkage between GDP and domestic consumption (S. Breslin, 2011).

Second, the integrated effect of macro regulations China applied during the mid 2000s was problematic. Policies include the new labor law that increase the labor cost in China dramatically and the rapid appreciation of CNY in a short period of time. Contractionary monetary policy and rapid increase of cost of imported goods influenced China's two economic cycles. The first one is the high savings rate – high investment – high trade surplus together with income distribution and domestic expenditure cycle. The other one is: huge demand of houses triggers the development of real estate industry chain and increases government's income reliance on land rent. Regulations that influenced these 2 cycles led a deceleration of China's economic development, a decrease in fiscal revenue, business profit and expenditure. All those influence made China more vulnerable to the change of global financial environment (Qingyun Li, 2010).

4 China's Policy Response to the Global Financial Crisis

After the influence of global financial crisis started to affect China's economy, Chinese government took immediate actions. Pro-active fiscal policy and so-called moderate easing monetary policy were introduced and applied simultaneously.

The main target for the fiscal policy was to expand the domestic demand. Chinese government switched the macroeconomic regulation tone from 'Inflation Control' to 'Maintain Stable Growth'. Also, the government expressed its willingness to encourage industrial reformation and focus more on people's livelihood while trying to deal with the financial crisis. Chinese government introduced the 'Ten National Policies' and the 4 trillion CNY (598 billion US dollar¹) stimulus package. The stimulus package was equal to 16% of China's 2007 total GDP and expected to be fully invested by the end of 2010 to boost the domestic demand. The 'Ten Policies' mainly focused on the construction of government-subsided housing; rural infrastructures; fundamental facilities including railways, highways, airports; development of medical care system and tax cut. The effect to the stimulus package was very obvious. Five months after the announcement of the stimulus package, domestic fixed asset investment increased by 26.5%. The number of new construction projects increased by 87.5% and the investment in railway transportation construction increase by 210.1% than the previous year³. Also, many regional government started to initiate 'Local Financing Program' to stimulate local economy development. The tax cut on consumers boosted the car market in China in 2009. The sales reached 13.6 million cars, ranked number one in the global car market³. Tax cut on companies released the burden of around 500 billion CNY on small to medium-size enterprises (Qingyun Li, 2010).

Project	Estimated Fund
Government-subsided housing and the low-rent housing project	400 billion
Rural infrastructure construction	370 billion
Fundamental transportation facility construction	1500 billion
Develop the medical care system and education system	150 billion
Ecological environment protection program	210 billion
Innovation and reformation of industrial structure	370 billion
Post-disaster reconstruction of Wenchuan earthquake	1000 billion

Figure 3 Detail of the Stimulus Package

¹ CNY/USD exchange rate applied: 2010 October exchange rate

In order to protect peoples' living condition, Chinese government also introduced some other supporting policies. The most important one was the 'appliance and electronics rebates for consumers in the countryside'. Chinese government would provide 13% of retail price as subsidize (among which 80% come from the central government and 20% come from the regional government) for residents in the countryside if they buy electronics after December of 2008. Until September 2012, a total of 76.5 Billion CNY subsidize was provided by the Chinese government and 275 million pieces of electronics were sold and achieved a total sales of 659.76 billion CNY¹. 200,000 local sales spots were built across country and provided 60,000 new jobs. As for the stimulus in the industry, during 2009-2011 the sale of refrigerator increase by 11.9%, 20% and 2.9% respectively and many companies increased their production capacity (Luolin Wang, 2010).

As for the so-called moderate easing monetary policy, Chinese government set the goal of increasing the M2 by 17% and increasing 5 Trillion of CNY new loans (Qingyun Li, 2010). The first action to achieve this goal was to decrease the interest rate to inject liquidity into the banking system. In November of 2008, the Central Bank of People's Republic of China announced the biggest cut in loan and deposit rates for recent 10 years. The 1-year savings interest rate was cut from 4.14% to 3.87% and the 1-year loan interest rate was cut from 6.21% to 6.12%. After that, the Central Bank decreased the loan and deposit rate for another 4 times. By December of 2008, the 1-year savings interest rate was 2.25% and the 1-year loan savings rate was 4.86%. Besides, the Central Bank decreased the deposit-reserve ratio for 4 times since 2008 September, which was the first time after 1999. Finally the deposit-reserve ratio for large financial institutions was decreased from 17.5% to 15.5% and was decreased from 17.5% to 13.5% for small to medium-size financial institutions. One of the effects of the loan and deposit rate cut was to eliminate the sense of crisis for residents and non-public enterprises; the other effect was to eliminate the potential of deflation caused by the outflow of US dollar.

The second action was to increase the loan scale in order to inject liquidity into enterprises. The Chinese government expected that sharp decrease in export demand and household consumption will dry up the cash of small to medium-size enterprises, which will ultimately lead to a decrease in real economy. In order to avoid this situation, the Chinese government worked as a guarantor. With the back up promised by the government, commercial banks are more willing to increase their loan scales which will lead to an increase in upper stream investment (Commercial banks in China enjoy a government guarantee of deposits, even though there is no official deposit insurance⁷).

The third action was to devalue CNY. This action was applied to cancel out the negative effect of the above two policies. During 2007 to 2009, China was holding as much as 2.3991 trillion dollar U.S. Treasury note. In order to prevent the loss of U.S. dollar devaluation, CNY had to devalue together with U.S. dollar².

Figure 4 Amount of U.S. Bond Hold by China, in 100 Million \$, 2008.01 to 2009.09

5 Side Effects of China's Response to the Financial Crisis

Although Chinese Government tried hard to eliminate the side effects of the above policy and monetary responses, side effects still existed. The so-called moderate loose monetary policy resulted in

¹ Data Source: Ministry of Commerce, Statistical report

² Data Source: Xinhua Net

excessive increase in monetary supply. Starting from 2009, the growth rate for monetary supply was 25.52%, 28.46% and 29.31% respectively. Compared to 16.74% of monetary supply growth rate in 2007, while China was having the highest growth rate of GDP as 13%, those numbers seemed a little bit too high for merely an 8% of GDP growth rate for 2009³.

The change of loan scale caused excessive credit expansion. Starting from 2009, the growth rate increased from 20% in March to 30% in June, which was far higher than the government's policy. Meanwhile, the structure of credit loans also had a problem. The ratio of medium to long-term loan was too high, and it was not helpful for industrial restructuring. Large amount of credit loans flowed to repeated constructions and worsened the over capacity problem².

Figure 5 Loan Growth Rate and Savings Growth Rate in Monthly %, 2008.09 to 2009.12

There was also a sharp increase in real estate price from March of 2009 due to the effect of the stimulus package and until now the tendency is still continuing. The rise of housing price had three features: fast, country wide and speculative. During November of 2009, housing price increased 15.7% on average among 70 Cities in China¹, differed from previous situations of rising only in first-tier cities only. Irrational investment and speculation contributed a lot to the rise of housing price. The housing price increased the uneven distribution of income (Y. Deng, R. Morck, J. Wu et al, 2011). The reason that led to this situation was Central government's direct control over major banks and largest non-financial enterprises (State-owned enterprises). Large amount of supporting funds lend to those institutions formed an increase in investment plans involving lands and real estates and thus caused the rocketing price rise in land and housing market (Ronald McKinnon, Gunther Schnabl, 2009).

6 Should China be Blamed for the Global Financial Crisis?

Figure 6 Price of Real Estate Sales, 2007.11 to 2010. 11

One of the popular views among western scholars is that China should be responsible for the

¹ Data Source: Real estate industry analysis report. China Statistic Database, 2009

Global Financial Crisis. Among those opinions, the undervaluation of CNY was mentioned repeatedly. Those scholars hold the opinion that CNY's undervalue caused China's huge trade surplus to the rest of the world (Martin Wolf, 2008). Therefore, China should be responsible to the formation of U.S.'s huge trade deficit. They believe that China's trade situation stroke U.S.'s industrial market, labor market and caused the economy difficulty in the U.S. and then triggered the Global Financial Crisis. Nobel Laureate, Professor Paul Krugman claimed that China should be responsible to the 1.4 million unemployed and the 1.3 trillion U.S. dollar budget deficit in the U.S. (Paul Krugman, 2010).

However, this is not what the statistics show. First of all, there was no concrete conclusion that whether CNY was undervalued or not. According to the Big Mac¹ index announced by Economist in 2008, the real exchange rate of CNY/USD should be 3.5, it seems that CNY was indeed undervalued. However, according to the World Bank's data in the same year, China's Price Level Index² was 55% of the U.S. and ranked 116 in the world, higher than the ranking of China's GDP per capita, showing that China's price level surplus China's economy development level, therefore CNY was not undervalued. Thus, with different measurement existed, it is hard to conclude that the CNY was indeed undervalued and that directly caused the Financial Crisis (Weiping Huang, Kai Ding, 2010). Also, there is no reason for other economies to pressure China to appreciate CNY with the harm of China's own good to deal with the aftermath of global economy imbalance.

Second, even if we assume that CNY was undervalued, exchange rate's impact on the global trade situation is rather limited. Even if China appreciated CNY due to U.S.'s pressure, there wouldn't be much improvement of the global trade situation. Take the U.S. dollar as an example: from 2005 to 2008, CNY appreciated against U.S. dollar for over 20%, however, U.S.'s trade deficit against China increase 20 billion U.S. on yearly basis³. On the contrary, in the year of 2009, CNY remained relatively stable towards U.S. dollar, but U.S.'s trade deficit against China decreased by 42 billion U.S. dollar¹². In fact, China's high level of trade surplus was due to the combination of China's high savings rate and low domestic investment rate, rather than the exchange rate. This is also the reason why China became creditor country for many other countries. An appreciation of creditor country would result in decrease in oversea investment and causing a further turbulence situation in the global financial environment. What the U.S. and China should do is maintain a stable exchange rate between USD and CNY and decrease the amount hot money inflow to China. At the meantime, if investors lower their expectations on appreciation on CNY, private investment would flow from China to the U.S. market, resulting in a win-win situation (Xiaochuan Zhou, 2009).

Third, China's trade surplus has nothing to do with U.S.'s huge trade deficit, not to mention striking the U.S.'s industrial market and labor market. The U.S. has already maintained a large trade deficit with other major trading district for over 30 years and the tendency is still increasing¹². Meanwhile, China only started to run a trade surplus for the recent few years. Also, comparing to other trade partners of China, U.S. experienced the least influence of all due to the "Chinamerica" relationship (Yongding Yu, 2009). Therefore, there is no evidence can support the idea that China's trade surplus triggered the U.S. trade situation and Global Financial Crisis.

The fact is that the real reason that caused U.S.'s huge trade deficit is due to its huge budget deficit. According to the twin deficit definition that derived based on the national accounting model of the economy (Yongding Yu, 2007):

$$Y = C + I + G + NX \quad (1)$$

$$Y - C - T = S \quad (2)$$

$$S = G - T + NX + I \quad (3)$$

Simplifies and get:

$$(S - I) + (T - G) = NX \quad (4)$$

As for the U.S. situation, $(T - G)$ is negative, which means an existing budget deficit. While Y and S remain fixed, if the deficit increases, it implies that either investment I must fall or NX must fall, causing a trade deficit. So that we can conclude that U.S. maintaining such a huge trade deficit is caused by U.S. its self's huge budget deficit.

In fact, the Financial Crisis that started in the U.S. and spread to Europe was rooted by endogenous factors; exogenous factors are only influencing factor. The nature for the formation of the financial crisis is due to U.S.'s production, consumption and policy problems: huge amount of resources flowed into

virtual economy; the law of economy growth that based on “die proportionale koordinierte Entwicklung” was violated; long term application of low interest rate loose monetary policy since the economy bubble burst in 2001, provided the soil for existence of housing and asset bubble; large budget deficit and excessive government spending (Carmen M. Reinhart, Kenneth S. Rogoff, 2011); expansion credit in financial market and the complex chain that linked banks, insurance company, credit rating institutions (Frederic S. Mishkin, 2011). Thus, we can see that those endogenous factors are the real cause of the U.S. Financial Crisis, and that China is responsible is untenable.

7 Aftermath and Suggestion for China's Duture Development

The impact of the stimulation package is very long lasting, for example, the inflation and excessive cash in the market, and China should be prepared for the aftermath. Although the stimulus package was focused on the infrastructure aspect, it still reduced China's investment efficiency. Also the period of infrastructure investment cycle is long, which means that it will take a long time before China can get the entire fruit of the stimulus package. Also, the local governments' aggressive financing policy might cause unexpected results of China's future development and the central government should pay more attention to this sector. Finally, China has to be careful with the current monetary policy for it is too loose. As a developing country, China still needs to maintain a relatively high interest rate for future development (Yongding Yu, 2009).

Besides taking care of the followed up effects, China also need to discover new ways to restructure its strategy and economic trajectory for future growth. The most important problem in China's model of development is that it is easy to speed up the economy growth but hard to slow down and control (S. Breslin, 2011). What China could do in the future is to reduce the reliance on foreign investment and export. China should depend more on domestic demand, and depend less on oversea funding to achieve a more balanced situation between investment, consumption and trade. Also as the world's second largest developing economy, China should invest more instead of saving more. In addition, China should reduce the mismatch between the economy status and the twin surpluses: current account surplus and budget surplus (Yongding Yu, 2007). The twin surpluses situation indicates that even though China has obtained capitalinflow through foreign investment, the capital failed to be used in technology development and other aspects. In fact, these capitals flowed back to the U.S. government bond market due Chinese government's policy, instead of investing in goods that can raise the productivity and living standard of Chinese people (Dornbusch, Rudiger and F. L. C. H. Helmers, 1988). Furthermore, Chinese government should encourage and support technology innovations to speed up industrial reforming and reduce technology reliance on developed countries. This should be the root and key concept that China bears in mind.

8 Conclusion

The 2008–2009 global financial crisis has influenced China in many aspects. During the period, Chinese government took immediate responses and tried hard to keep the level of harm under controllable level by using fiscal policies and monetary policies. The effect of Chinese's governments responses were remarkable, however, problems of the structure of China's economic development also emerged. The imbalance among domestic consumption, foreign investment and trade and the twin surplus made China vulnerable against global market change. The negative side effect of the global financial crisis on China is still not over yet and there are still many things requiring the Chinese

government to take care of.
