Currently, with the quick development of national economy, people's living standard is continuously improving and the demand for higher education, especially that of postgraduate education is also increasing. Meanwhile, the quality of postgraduate education draws more attention. The management organization and regulation establishment in postgraduate education is the core to guarantee the quality. The cultivation and management of postgraduates, including school organization, system establishment, scientific research, talents development and material construction, is an essential part of university planning. Perfect management organization and regulation establishment is the important means to guarantee postgraduates' quality, push university planning and intensify the quality.

The internal management organization of graduates in present China is the three-level management of the university (graduate school), school and department<sup>[1]</sup>. The graduate education has developed to a new stage rapidly and stably. However, not all the universities and colleges have formed perfect management pattern and operation system. Thus, how to reasonably set up management organization with the principle of capacity, efficiency and optimization as well as how to coordinate and cooperate within two-level or three-level management organization with the principle of the unified position, right and obligation to push the management of postgraduates to perfection and standardization has become an important topic. From the perspectives of management organization and regulation establishment of postgraduate, this paper proposes the related suggestions and counter-measures.

## 2 Present Situation and Problems of Graduate Education

### 2.1 The status quo of management organization and regulation establishment

#### 1)The status quo of graduate management organization

First, establishment of management organization. At present, Chinese high education sets up the management institutions in the levels of the university and the school. Under the level of the university, graduate school is set up, mainly responsible for the recruitment, cultivation, degree and employment of graduates. While, under the level of the school, the related office will be concretely responsible for the teaching and daily management of the graduates. At the same time, some universities and colleges set up the management organization in the level of departments. However, seen from the result, the department level burdens more of the coordination with the school office and does not carry out obvious management.

Second, management organization and operation of graduate education. Currently, the organization and operation of graduate education management mainly are embodied in three aspects: a) establishment of new basic-level organization level, such as the research institute system, relying on the subject and its prominent characteristics and charged by the director. The establishment of the institute system evidently corresponds to the Degree Authorization Center, which promotes the establishment of the Degree Authorization Center fairly well. b) making use of the two-level organization of the university and the school to complete the education management, i.e. to complete the main part of graduate education and management through the school and basic-level and establish a benign interactive mechanism to push the overall development of graduate education. c) the pattern of classified

management in the level of the university, school and Degree Authorization Center. The Degree Authorization Center constructs the discipline quality monitoring mechanism. Through implementation of various regulations, assessment system, performance evaluation and incentive, the quality of the degree can be guaranteed.

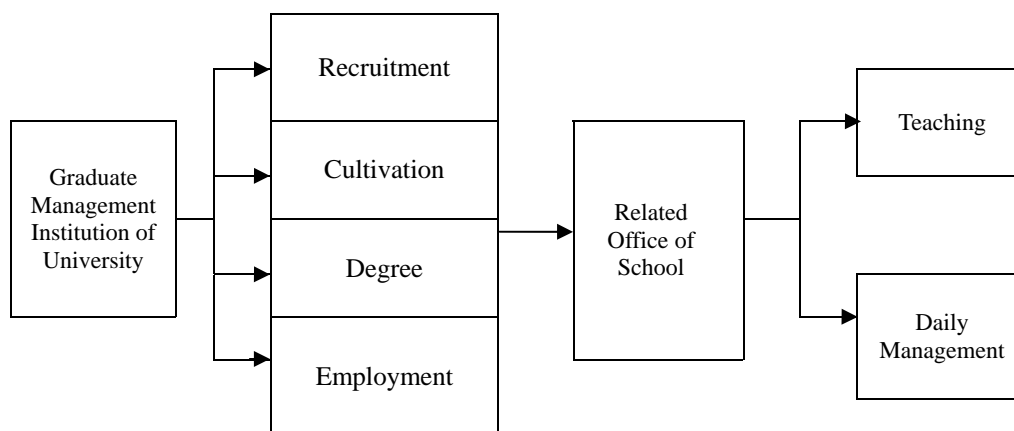

Figure 1

2) the status quo of the graduate education system construction in China

The system construction of Chinese graduate education mainly includes the constructions of the disciplines, courses and the teaching teams.

First, the discipline construction. Currently, the construction and management of the disciplines in most universities adopt the system of “one academic leader in one school”. Meanwhile, many universities also set up the discipline expert committee to guide the discipline construction. The management mode can be summarized as “general arrangement of the university, coordination of the school, responsibility of the person, examination of the concrete item”.

Second, the course construction. At present, course construction of the national graduate education is not so satisfactory. a)The elements of course system have strong trace of the undergraduates. The course contents are largely similar to those of the postgraduates, which is not beneficial to students’ deep research and their interest development. b)The curriculum requirement has the strong tendency of “unification”. c)The course system structure has evident feature of “disciplinization”. d)The course system is not scientific enough.

Third, tutor team construction. Presently, the tutor team needs great improvement. a) The number of the professor is still less whose average age is relatively old and the discipline distribution is uneven, directly affecting the construction of degree authorization center and key disciplines. b) The overall strength of the teacher’s team is not strong. c) The number of degree authorization center is less with unreasonable structure and uneven distribution. d) The condition of degree authorization center and that of the discipline is not perfect.

**2.2 The problems and enlightenment**

As for how to effectively carry out scientific management organization and regulation construction of graduate education, from book<sup>[2]-[5]</sup> in the reference, most scholars hold that:

First, management organization and system construction of graduate education mainly focus on the setting-up of management institutes, establishment of management system as well as the implementation of various related rules and regulations.

Second, management organization and system construction of graduate education is a systematic project and the effects of various policies will be shown after a period of practice, which requires the scientific attitude to direct graduate education in the course of concrete management organization and system construction.

Third, for different colleges and universities, in the course of concrete management organization and system construction of graduate education, there will be some similar problems. However, due to different development level, different school characteristics or different regional environment, no unified patterns of development exist for graduate education. In this sense, different colleges and universities need to make out their respective management system and regulation of graduate education according to their different actual situation.

At present, many scholars in China propose some positive countermeasure toward this issue, but there are still some problems to be solved for certain concrete colleges and universities. (1) Operational organization, system and measures are needed to support the implementation of the measures. (2) It is necessary to borrow the successful experience on the management patterns and regulations of graduate education from other colleges and universities. However, owing to the different history and disciplines of each schools, the borrowing of management patterns must be combined with their real situation to explore a scientific and effective way.

### **3 Countermeasures and Suggestions**

Good operation mechanism is the guarantee of standardized management. Therefore, the operation mechanism in Chinese graduate management organization should concentrate on the sound regulations, rights and standardized procedures<sup>[6]</sup>. The establishment of management regulation is an important guarantee for the smooth realization of management operation and function. Hence, the paper, in view of the above problems, proposes some suggestions as follows:

#### **3.1 Perfection of recruitment and training process of graduate**

In practical terms, the recruitment of graduates, first of all, should be in strict accordance with the national plan of students' proportion and development. Secondly, the different schools should report the scale of graduate development according to the tutor team status and cultivation conditions to the university and it is the university who determines the final number of graduate recruitment with overall balance. Besides, the university should maintain the right of approval and decision in the recruiting process for extra examination of some subjects, abnormal admission, major adjustment and additional admission, etc.

In cultivation issue, first of all, the graduate department of universities and colleges shall be responsible for the plan of training formulation of all the schools and then the schools carry out the concrete cultivation process. Secondly, the independent schools arrange the specialized teaching curriculum, professional foreign language teaching, training and assessment of the teaching ability and practical teaching skills. Again, the university shall keep the approving power of public teaching courses, exempted courses, auditing courses, management of science and research funds and application of science and research fruits, etc.

In addition, as for the registration management of the graduate, first of all, each school should manage the registration, qualification accreditation, all kinds of scholarship of their own graduates and sign them up for school record. Second, the school should keep the approval of the projects like temporary suspension of schooling, resuming of interrupted studies, graduation in advance, delayed graduation, administrative justice, approval to go abroad as well as graduates' marriage, etc.

#### **3.2 Improvement of tutor selection method and the school's daily work**

The selection of tutors should strictly obey the standards of the university and be carried out by the academic degree evaluation committee. Each school is responsible for the training, evaluation and daily management of the tutors.

As for the work of each school, perfect graduate management organization should be set up and full-time and experienced administrative management personnel should be assigned. Besides, the school should allocate certain amount of funds for graduates' management and provide special office space as well as research and test conditions, so as to lay a solid foundation for the efficiency of graduates' management.

#### **3.3 Perfection of development plan and tutor team construction**

First, making a perfect development planning of degree and graduate education is of great significance to guide the graduate education of the university. Meanwhile, it also promotes the discipline establishment and the education development of the university. At present, the Ministry of Education in China has dramatically adjusted the related evaluation index of doctor degree's auditing, who extends the scope of assessment from certain authorized degree center of major to the whole subordinate discipline. This increases the breadth and depth of the assessment. Therefore, the university shall adjust some index in the original planning to make them better in line with the real development trend of the construction.

Second, tutors burden the divine mission and important responsibility in recruitment, cultivation, employment, quality education and training quality of the graduate. The tutor system is beneficial to fulfill the tutors' duties and raise their teaching levels. Therefore, the large-scaled graduate education atmosphere shall be formed by adjusting discipline structure to increase discipline construction, training

and introducing large amount of high-level tutors and related personnel, such as increase of detailed rules of tutor team construction as well as recruiting and training tutor policy, etc.

### **3.4 Further perfecting the management system**

First of all, according to the actual condition of the university, Graduate Study Manual shall be made as the necessary material for teachers and graduates, which includes the codes of conduct in daily management.

Second, for the overall consideration of graduates' management, except for the contents of Graduate Study Materials, the following several aspects can be perfected as regulations to satisfy the future expanding scale of graduates. (1) The making out of work regulations. The management regulations and document management system shall be established according to the national policy. (2) Position obligation shall be set up to guarantee the systematicness and integrity of all the materials about recruitment, cultivation, discipline construction of graduates, etc. which will not be disconnected due to the personnel exchange. (3) Inviting and hiring experts at home and abroad to give academic lectures periodically to realize the institutionalization, standardization and scientification of graduates education management.

Lastly, experience of the leading universities should be actively absorbed and borrowed so as to strengthen the graduate management on the basis of management system construction to promote its faster and better development.

## **4 Conclusion**

By the purpose of graduate education, the management activity is to effectively allocate the personnel and various resources in the system and to determine the relations among them and their forming process. The design of its organization structure should insist the principle of division and coordination of labor, the right corresponding to the obligation and effective communication of information. Besides, the design should also depend on the features of the scale and layers of graduate education. As the expression form of the organization, the set up of graduate management organization needs to obey the related organisational principle. Each subsystem and member in this organization have the common goal, i.e. the standardization of graduate management. To achieve this goal, all the personnels and subsystems in the organization have a clear division of work.

The construction of graduate management does not mean to pursue a new regulation, but put more efforts in strengthening the integrity, connection and completeness of its function so as to establish a set of constraint, standard, incentive and monitoring system as well as to maximize the function. The management system of graduate education mainly covers a series of management documents and regulation of graduate recruitment, identity management, cultivation, degree, tutor management and discipline construction.

# Shared Value Creation: An Innovative Approach on Women's Enterprise Development

Erika Zoeller VÉRAS

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: crosscultural\_business@yahoo.com)

**Abstract.** A growing number of researches are addressing gender and entrepreneurship exploring women business owners. This paper is exploratory and gives a short overview to provide an understanding on the possible relationship between women's enterprise development and shared value creation. There is still a lack of comprehensive research regarding the combination of the two concepts. Within this frame, the article investigates this approach by highlighting the Women's Empowerment Principles and its goals towards women's advancement. The intention is to outline the topic suggesting the need of further studies and analysis, especially concerning the role that gender can play in entrepreneurship and its impact on societal progress.

**Key words:** Gender; Shared value; Entrepreneurship.

## 1 Introduction

This paper aims to present part of the findings of a doctorate research of which the core objective is to identify a pathway that connects gender and shared value creation, focusing on women's enterprise development. It addresses aspects of the *status quo*, the development and economic opportunities, and future directions of women-owned business by trying to explore its linkage to shared value. Women entrepreneurs are advancing and, to some studies, making a revolution in the business world. Female-owned businesses are growing in a fast pace and have great potential to expand even more their businesses. However, enterprising women encounter gender specific obstacles. This way, in order to overcome them, the Women's Empowerment Principles - WEPs - can be an important vehicle to promote female entrepreneurship.

For the present study, the main attention is on women's enterprise development as a key channel to create shared value. The concept of shared value once applied, can increase multinational corporations' competitiveness by addressing social issues and identifying new areas of growth and profitability. Access to healthcare, poverty relief, nutrition, environmental sustainability, education and rural development are challenges the companies are building sustainable solutions for.

The paper is structured as follows: first an overview about women and entrepreneurship scenario followed by an introduction of the WEPs, and then the introduction of the Shared Value concept. Finally, the combination of gender and shared value creation through the lens of the WEPs focusing on Principle number five which, among other, aims to implement enterprise development and supply chain.

Currently, when talking about women in business and entrepreneurship, is possible to verify that they are publicized and promoted in many different ways. The article will point out some trends and challenges in the field. Nevertheless, there is a lack of comprehensive research regarding the combination of the two concepts and much has to be done to gain knowledge and to advance.

It is important to mention that nowadays there are more systematic data available referring to women's entrepreneurship and gender empowerment in terms of business. However, little is available about shared value, but it is clear that along the elaboration of this work, more essays were probably released. At the same time, until the present moment, we couldn't find any academic text with the gender and shared value creation framework. One might say this is not because it does not happen with frequency, but due to the fact that the concept is on its embryonic phase, at least in terms of documented material.

## 2 Gender and Entrepreneurship: Women's Enterprise Development

The concept *Third Billion* was coined by DeAnne Aguirre and Karim Sabbagh in a 2010 report (Booz & Company apud Ernst Young, 2012) and represents women who are entering the mainstream economy for the first time. Yet to the same source, in spite of all advancement, approximately 860 million women worldwide are not prepared and/or not enabled to take part in the world economy. That means they lack sufficient education and support from their families and communities. The report also

mentions United Nations data, according to which women invest a larger proportion of their income than men in children's education, enabling them to make a greater economic impact in the future.

The emerging acceptance of gender equality as an investment concept has been gaining space in the latest years. Experts state that investing in women is one of the most important strategies to promote sustainable development around the globe. Women's empowerment, if understood as investment concept, can bring long-term value creation and better investment performance (Keefe, 2011).

Entrepreneurship, defined as the resource and process whereby individuals utilize opportunities in the market through the creation of new firms (Naude, 2010), is a relatively new concept. Academic studies about female entrepreneurship concentrate on main themes such as characteristics and motivations of women entrepreneurs, start-up patterns, resources and constraints, management style, finance issues, business networks and business performance and growth (Fenwick, n.d.). Researches investigate differences in the psychological and social background, and the labour market. They draw differences between men and women's characteristics varying from the propensity to start its own firm, lack of business training or experience, leadership style, and barriers such as access to land-ownership and credit.

Enterprising women encounter gender specific obstacles in both developing and developed countries, in spite of their great potential to expand their businesses. A pilot - Women's Economic Opportunity Index, - the first of its kind, was conceived by the Economist Intelligence Unit in order to provide a better understanding of the factors that influence women's economic opportunity and how countries have addressed them. A set of laws, practices, regulations, customs and attitudes that allow women to participate in the workforce under conditions roughly equal to those of men composes the women's economic opportunity, regardless of their being wage-earning employees or business owners (Economist Intelligence Unit, 2010). When it comes to setting up business, women face greater barriers than their male counterparts. Women's enterprises are often small, and may not mature to their full potential, being concentrated in the retail or services sectors. The same source also points out that in some countries women are not allowed to obtain loans, unless with the permission of a man, making evident how much access to credit and property ownership rights differ from country to country. Not being allowed to vote, to own property or venture outside the home without a male family member in some developing countries, as well as being perceived as not well qualified as men to run a business in general, are main barriers for the development of women's enterprise. Increased access to business education, finance, management training, credit, opportunity to land-ownership, among others, are necessary for women to overcome the barriers.

According to Kelley et alli (2011), in 2010 business ventures were started and managed by 104 million women in 59 countries, which represents more than 52% of the world's population and 84% of world GDP. In their respective countries, these female entrepreneurs made up between 1.5 percent and 45.4 percent of the adult female populations. Across those regions, other 83 million women ran businesses they had launched at least three and a half years before. The contribution women make to worldwide entrepreneurship and business ownership can be exemplified by these 187 million together. Overall, entrepreneurs have a critical role to play in fostering innovation and women contribute to entrepreneurship in all economies. According to the same source, there are some key findings about women's entrepreneurship around the globe. The conclusions point that:

1) Women are more likely to believe in the existence of entrepreneurial opportunities if they live in societies in which they perceive themselves as capable for entrepreneurship.

2) Although women are equally likely to see entrepreneurship as attractive, if compared to men, they lack positive attitudes about their own personal capacities or inclinations for starting businesses, besides having less personal contact with entrepreneurs.

3) As an overall trend, women are less likely to venture in entrepreneurship than men; in particular economies it is magnified.

4) In less-developed economies, although women entrepreneurs are more likely than men to be motivated by necessity, the gap may be starting to narrow.

5) In times of economic downturns, necessity-based entrepreneurship may partially fill in employment gaps in developed countries.

6) In early development-stage economies, a key challenge for female entrepreneurs is sustaining their businesses beyond the start-up and early phases.

7) Generally speaking, networks of women entrepreneurs are smaller and less diverse than those of men. Women's personal relationships, particularly family, are more relied upon than other sources.

8) In wealthier economies, although women entrepreneurs tend to be older, as equally educated and

as likely to create innovative products as men, their growth expectations are half those of men.

Moreover, Kelley et alii (2011) state that in order to advance female entrepreneurship it is important to promote societal attitudes toward entrepreneurship (especially women's engagement in entrepreneurship), make opportunities and resources available in order to assist women-run business start-ups, and use technical assistance and education to support women's business growth.

Implementation of legislation is often weak and opportunities, limited, even where this legislation is intended to help women (the Economist Intelligence Unit, 2010). However, as economies develop and opportunities for women expand, attitudes change. Women are now perceived as essential to the expanding labour force in countries with stagnant or slow-growing populations.

### **3 Women's Empowerment Principles**

The Women's Empowerment Principles - WEPs (launched in 2010) - were created to guide on how to empower women in the workplace, marketplace and community. Hence, after adaptation from the Calvert Women's Principle launched in 2004, this set of Principles for businesses was created in collaboration between the United Nations Entity for Gender Equality and the Empowerment of Women (UN Women) and the United Nations Global Compact and aimed at the promotion of gender equality and women's empowerment. The Principles emphasize the business case for corporate action and are subtitled Equality Means Business. They not only seek to inform other stakeholders, including governments, in their engagement with business, but also to be a useful guide for business. In short, according to the Global Compact Network Switzerland and UN Women (n.d), the Principles consist of:

- 1) Establishing high-level corporate leadership for gender equality.
- 2) Treating all women and men fairly at work – respecting and supporting human rights and non-discrimination.
- 3) Ensuring health, safety and well-being of all women and men workers.
- 4) Promoting education, training and professional development for women.
- 5) Implementing enterprise development, supply chain and marketing practices to empower women.
- 6) Promoting equality through community initiatives and advocacy.
- 7) Measuring and publicly reporting on progress in order to achieve gender equality.

For the present paper, the Principle number five will be highlighted for its focus on implementing enterprise development, supply chain, and marketing practices that empower women. This Principle comprises the expansion of business relationships with women-owned firms (including small businesses, and women entrepreneurs); the support of gender-sensitive solutions to credit and lending barriers; having business partners and peers respect the company's commitment to advancing equality and inclusion; the respect for the dignity of women in all marketing and other company materials; and the ensuring that company products, services and facilities are not used from human trafficking and/or labour or sexual exploitation (United Nations Global Compact; UNIFEM, 2010). Among the benefits of this Principle is the stimulation of female entrepreneurship. Section number five, about gender and shared value creation, will highlight a figure about the WEPs and the leading companies in terms of putting the Principles into practice.

### **4 Economic Progress and Societal Needs: Shared Value Creation**

An article outlining a new concept for corporate responsibility was published by Michael Porter and Mark Kramer in 2006. In it, the authors state that there would be considerable potential for organizations to contribute to sustainable global growth if they went beyond compliance and philanthropy to actively look for connections between their activities and the growth and progress of society. This concept was called Creating Shared Value (Nestlé, 2012). Shared value consists of policies and operating practices that enhance the competitiveness of a company while advancing the economic and social conditions of the communities in which it operates. It focuses on identifying and expanding the connections between economic and societal progress using value principles (Porter and Kramer, 2011). To the same source, companies can create shared value in three basic ways:

- By redefining value chains - Companies can act as a steward for essential natural resources and drive economic and social development, while improving the quality, quantity, and reliability of inputs and distribution.
- By reconceiving products and services - While better serving existing markets, accessing new ones, or lowering costs through innovation, businesses can meet social needs.

· By strengthening local clusters - Provided that businesses do not operate in isolation, they need reliable local suppliers, a functioning infrastructure of roads and telecommunications, access to talent, and an effective and predictable legal system in order to compete and thrive.

For the moment, it seems that Nestlé Company has been leading the way in terms of creating shared value initiatives and issuing reports since 2007. The key focus areas are related to nutrition, environmental sustainability and rural development. They stress that engaging with the stakeholders underpins shared value creation, enabling the firm to identify emerging issues and respond to them accordingly, driving performance improvements (Nestlé, 2012a). Some other companies have already started to issue annual reports on shared value related to their core business. Avista (2011) and Nestlé (2012a) are two examples of firms that make use of the pyramid shape to represent their understanding on how to meet societal needs while making profits. The pyramid is divided in three parts, where the basis is compliance, laws, licenses, and codes of conduct. In the middle lies sustainability, and creating shared value is on the top of the pyramid. Moreover, Avista (2011) states that shared value is created when social need, business opportunity and the company's set of corporate assets and expertise intersect:

**Figure 1 Building Shared Value (Avista, 2011).**

Another graphic representation about shared value creation was found on Bockstette and Stamp (n.d). For the authors, shared value creation consists of investments in long-term business competitiveness that also address social and environmental objectives. By incorporating social issues into their core business strategies to benefit both society and their own long-term competitiveness, these companies seek to create shared value.

**Figure 2 Shared Value (Bockstette; Stamp, n.d).**

The idea that both business decisions and social policies must follow the principle of shared value is an implication of the mutual dependence between corporations and society. A business will find itself on a dangerous path if it pursues policies that just benefit its own interests at the expense of or the society, and vice-versa. The long-term prosperity for both will be undermined if just a temporary gain to one is sought (Porter and Kramer, 2006).

## 5 Gender and Shared Value Creation

It appears that the intersection between gender and shared value creation happens when one has an understanding on Women's Empowerment Principle number five, which focuses on implementing enterprise development, supply chain and marketing practices that empower women. Through this, one might say that it is possible to achieve shared value creation. Promoting practices and expanding

business relationships with women-owned firms, especially small and medium-sized enterprises - SMEs - and supporting gender-sensitive solution to credit and lending barriers may be a good channel to enhance businesses and create shared value. After the launching of the WEPs in 2010, several companies demonstrated their commitment to the Principles and signed the document expressing their support for advancing equality between women and men. The list of signatories to the CEO Statement of Support for the Women’s Empowerment Principles had 263 companies until February, 2012 (United Nations Global Compact; UN Women, 2012). There are companies already leading the way putting the Principles into practice. According to United Nations Global Compact and UN Women (2011), there are over 90 good practices from companies to empower and advance women. These companies have several programmes in different parts of the world and the programmes vary from companies and region, but they all aim to contribute to the advancement of women’s empowerment around the globe.

The figure below shows how many companies have practices regarding each of the WEPs. The Principle that has the most practices within 93 companies is the number 4 (51 companies or 55% of the total), which promotes education, training and professional development for women. The Principle that has the fewest practices is the number 3 (18 companies or 19% of the total) regarding health, safety and well-being of all women and men workers. The Principle number 5 stays on the 5<sup>th</sup> position. Out of 93 companies, 22 (24%) address the principle having practices to implement enterprise development, supply chain and marketing practices that empower women, whilst 71 don’t. WEPs 1, 2, 6 and 7 are ranked on 3<sup>rd</sup> (40%), 2<sup>nd</sup> (53%), 4<sup>th</sup> (34%), and 6<sup>th</sup> (21, 5%) places respectively. Out of 93 firms, only one has practices with all the WEPs, another has practices with 6 of the WEPs. All the other companies address between one and five of the WEPs.

**Figure 3 Companies Leading the Way and Women’s Empowerment Principles**

One of the barriers towards women-owned firms is their absence in the supply chain of large companies and their lack of financial resources to competitively bid on supply contracts. Some non-profit institutions are working on the matter. For instance, WEConnect International, a corporate led non-profit that connects women business owners globally to facilitate inclusive and sustainable economic growth. In addition, women's business enterprises that are at least 51% owned, managed, and controlled by women are identified, educated, registered and certified by them. WEConnect is connecting women entrepreneurs to its corporate members, which collectively represent billions of dollars in annual purchasing power, therefore expanding opportunities for them. Companies need to be engaged to increasing their relationship with suppliers led by women, driving inclusion throughout their supply chain. These firms leading the way are already promoting gender equality and diversity, equal pay for equal work, providing funding, giving business training, encouraging female entrepreneurship, and strengthening legal awareness, to list some of the initiatives. Likewise, in order to reflect their market and customer base, many multinational corporations have diversified their global supplier base. This not only increases shareholder value, but also enhances their competitive advantage. One can boost local well-being and add to a project’s long term sustainability, building the way to create shared value, by promoting gender equality practices and including local women within the supply chains of international investment projects. Opportunities to create shared value can arise by increasing procurement from firms led by women. By strengthening local clusters and making women-owned firms reliable local suppliers by sharing knowledge, providing financing and specific training, companies can increase quality, avoid certain costs, increase flexibility and foster innovation.

Some studies elsewhere state that the full role of women is untapped and this is the time to unleash

this powerful source of new possibilities. In this context, it is possible to make a parallel with the Blue Ocean Strategy. According to Kim and Mauborgne (2005), red oceans represent the industries in existence today and the blue oceans denote all the industries not in existence today. To the authors, blue oceans are defined by untapped market space, demand creation, and the opportunity for profitable growth. It requires organizations to develop and align the three strategy propositions: value proposition, profit proposition and people proposition. Although the authors do not mention societal needs and demands, one might say that it seems this strategy suits the trends when it comes to gender issues and can go beyond the existing boundaries in a new blue ocean: the gender business ocean. Added to this, lays the possibility of combining the Blue Ocean Strategy and the Shared Value concept, given the fact that the Shared Value concept focuses on the connection between societal and economic progress, and the Blue Ocean Strategy seeks value innovation by focusing in a new and uncontested space.

Figure 4 New Socio-Economic Oceans of Opportunities.

## 6 Conclusions

One might say that there is a gender impact on entrepreneurial activities and this can lead to development and economic growth. Although there is still a gap between the potentiality and what happens in the reality, progress has been made towards gender equality. The impact and growth in the share of women's participation in the economy as entrepreneurs and in corporate life has changed the workplace creating a series of challenges. It is necessary to gain a better knowledge on the impact caused by economic, cultural and social aspects, when it comes to business. Also, to explore the perceptions of entrepreneurs about the difficulties of starting a business, and beliefs about the existent opportunities in the economic scenarios.

If investing in women's empowerment and gender equality is smart business, and if it is becoming a growing consensus, then it seems that a new blue ocean has been created. To Porter and Kramer (2011), opportunities have been there, but have been overlooked. Holding back half of the population through unequal education, job opportunities and wages does not represent sustainable development. At few times throughout the history, the roles were balanced by having both men and women doing equally important economic activity. Recently, a lot has been said on the importance of balancing the female participation in the economy.

Firms can build a path to their actions towards gender equality and women's enterprise development. At companies, the implementation of the Women's Empowerment Principles in different contexts may take some time and different paths to be implemented, depending on the firm's size, industry, location and corporate culture. It is the moment for companies to start to dialogue with non-traditional partners and ask what their difficulties are, in order to offer products / services that meet their needs. Companies may face challenges on their way to create shared value. Nevertheless, those challenges should not prevent them from pursuing this goal.

Although the leading companies in terms of WEPs practices do not link their outcomes to the WEPs and shared value creation, the author sustains the exploratory idea that, firms which are committed to the Women's Empowerment Principles are paving their ways to create shared value through the gender perspective. Moreover, when women-owned business gain economic empowerment, access to knowledge and training, access to market and value chains, land and finance, then they can

transform and be agents of changes in the community they are involved in. Developing and investing in women's enterprises as capable suppliers can transform the environment once they become more robust, with higher profits and able to hire more people and pay better wages, invest in training and education, meeting societal needs. Therefore, shared value can be created. The WEPs, particularly Principle number five, can be a strong tool and guidance in helping realize this purpose.

In terms of research, the gender and shared value framework has not been explored and further studies need to be developed. Achieving gender equality and empowerment, encouraging women's enterprise development and creating shared value could be the gateway for numerous social-economic new possibilities for society's challenging environment.

# Analysis of the Critical Influential Factors on Healthy Development of University Academic: Based on DEMATEL Method

Gao Hui, Zhang Zhongjia

School of Management, Wuhan University of Technology, Wuhan, Hubei, China 430070

(E-mail:portiagaohui@sina.com, zzj@yangteu.edu.cn )

**Abstract:** From macroscopic and microcosmic levels the paper systematically analyzes the factors that influence the healthy development of universities academic and the relationships among them based on social, economic, cultural, institutional, educational, personal respects and universities themselves. By using the DEMATEL method, it is revealed that the comprehensive effect of influential factors differs in degree quantitatively. The result is that academic standardization and honesty education, academic standards and related laws, the performance appraisal and evaluation system, academic ability training system and other factors are the direct causes of healthy development of academic in universities. While ill general mood of society, mechanism of market economy competition, personal morality are the central issues, the education system itself is the main factor, individual factors in academic healthy development are at the core position.

**Key words:** Universities; Healthy development of academics; Critical factors; DEMATEL method

## 1 Introduction

Academic development is the basic motivation of university consistent innovation. The uniqueness of university lies in that its purpose is not to make profits or to manage but to the development of various academics. Originally, universities are based on academic development and teaching, with the core position of academy. Academy is the logical starting of universities as well as their ending. However, as to the various students and their degrees, they are just the inevitable outcome of this kind of college education. Currently, the university academic matters have always been criticized and been the burning questions of news media. Although they are not new and unique in China, it shows that there have been books about making and distinguishing forgeries in our ancient times and thus came the differentiating the false books' learning. In 1990s, problems about academics have come into being in the American science policy schedule. Max Weber points out: the university students and staff go after reputation, cater to the power unconsciously. The professors consider the scholastic work that they should be committed to as performance. They try their best to demonstrate their values by so-called academic achievement without the influence and effect in the academic development. With the repeated exposure of academic scandals, such similar problems have increased.

Recently, researchers began to keep a watchful eye on it. Many worldwide scholars have researched the problems as fabrication, falsification and plagiarism etc. For the reason and which factors influenced academic development, they have not arrived any agreement. Few people worked on the influential factors specially, no one has systematically done analysis and never before has anyone use this method to talk about it. Most of the researchers just judge the act. Foreign scholars did more exploration in institutional construct terms to solve the problems, while Chinese scholars mainly from the perspective of construction of morality. We should clear up the sources and get to the bottom of problems, suit the remedy to the case, and strengthen governance from the root of it. For this reason, this paper tries to analyze the factors that influence healthy academic development of universities and their relationships with the help of DEMATEL method in the hope of providing the decision-making basis for healthy development of university academics.

## 2 Analysis of the Influential Factors on Healthy Development of University Academic

### 2.1 Macroscopic influential factors

#### 2.1.1 Social circumstance

(1)Social Utilitarianism. As the subsystem of society, universities will be influenced by the social circumstance naturally. The reality that our country has been entering an transformation period determines the coexistence of all kinds of moral values, and shows the tendency of value diversification. Under the above influences, the teachers' values and interests have changed much more obviously than traditional intellectuals. Under the background of the whole society which seeks quick success and

instant benefits, they abandon the tradition "thin gentlemen in profits" and think it is unreasonable and dehumanizing to devotion rather than belittle or give up material benefits. They tend to focus more on the unity of devotion, development and the corresponding material treatment. Under the current circumstances that there is a close link between academic achievement and financial benefits, social status as well as professional title and post, people engage in academic development with the outstanding purpose and are driven from the point of Utilitarianism view. Some of scholars put academic research and individual material benefits together closely to go after the maximum of personal profits and disregard academic development and advancement.

(2) Adverse social atmosphere. Under the influence of adverse social atmosphere, such as the lack of responsibility and integrity, currently, the atmosphere in academic circles is still worrying. There are some bad points such as: plagiarizing others academic achievement, improper means to obtain competitive research funding and a variety of academic awards, academic journals for the collection of high fee for publication to ignore the strict academic quality, manuscript, low-level repetition, academic faction, for academic resources to form the exchange of interests group and so on. The lack of sense of responsibility, integrity and lack of consciousness of adverse social impact exist in the current academic circles.

#### 2.1.2 Economic factors

(1) The introduction of Market economy competition mechanism. With the establishment of our socialist market economy system, competitive status and competitive consciousness get rich soil and enormous power. The competition inside or among universities has been very fierce. University ranking and evaluation which led to Matthew effect in the competing for sources, make universities try to increase research quantity and link research up with title, treatment or graduation, which results in distortion of some scholars' individual values

(2) The drive of economic benefits. The economic benefits drive influences academic development mainly in the following point: some people fight for research funding only focusing on immediate results of short-term projects, they take the engagement in scholarly activities as the means of acquisition of personal fame, but not to go after the academic development. Under the drives of real interests, such as evaluation of title and subject, first title for superior and so on, academic research and academic achievement rise constantly in the quantity but in quality on the decline, which leads to the bubble of academic research

#### 2.1.3 Cultural factors

(1) The influence of historical culture. China has the tradition of "the government is closely linked to the schools, and has a monopoly of them". That is to say school is the political appendage, as the government monopoly. In addition, the modern university as an exotic thing, the foundation of university autonomy is not firm, and the freedom of academy is faint. The pragmatism tendency of traditional intellectuals "to secure safe and fortune for the people, to establish peace for all the future generations", "a good scholar will make an official " and traditional idea of "official standard" lead to the imbalance between university administrative power and academic power, which is deeply influencing the academic development.

(2) The influence of mass culture. Under the market economy system, mass culture has become quickly to a new force and expanded to the mainstream one. What it pursues is the popularization and rapidity, and what it discards is the original creativity and individuality. The traditional academic standardization and the current mass culture combined with each other. Thus, some people do not take the academic individuality and innovation as the aim but an increased amount of accumulation which cannot promote the academic quality improvement.

#### 2.1.4 Institutional reasons

(1) The academic standard and related legal system. In academic circles, we lack of an authoritative academic standard text. Although some academic institutions developed their own academic norms, there exists many problems in the academic authority, systematicness and rationality, and there is no corresponding academic activity norms. As for the norms of academic behavior legal construction, there also has the loophole, lacking of strict laws and regulations and weak enforcement, which results in low cost of academic behavior of violation and repeated academic behavior.

(2) The academic supervision and evaluation system. At present the special supervision mechanism of academic conduct is in the blank state in China. There is lacking of academic criticism and public opinion supervision. In the academic evaluation standards, we have not established the agreeable authentic ones, and we pay too much attention to academic carrier level and scientific research but despise teaching. As well as academic review procedure transparency also defects. In the academic

evaluation system, we tend to put much more emphasis on the quantity than quality. Some poor academic behaviors can only be found through reports, and generally solved in the unit itself. In the project approval, awards and other academic evaluation activities, we fail to establish the leading role of professional association of experts in the academic evaluation.

(3)The influence of management system. In China, the relations between universities and the superior competent department is of leader and administrative subordinating member and of supplying and being supplied. The administrative departments, which are in charge of universities, increasingly have a hand in university affairs by controlling all kinds of limited resources. Universities must rely on various kinds of quantitative indicators among college competition, to get the resources. Therefore, the academic and research activities have been influenced by the superior department. Thus, on the one hand, academic power is dominated by administrative power, on the other hand, academic freedom is destroyed, all of which affected the academic development.

## **2.2 Microscopic influential factors**

### **2.2.1 Educational factors**

(1)The marketization and massification of higher education. The marketization of higher education make the competition among colleges fierce, which results in some of the colleges "academic drift" and "academic great leap forward". Therefore, it is full of a large number of low level repetition in the academic achievement. Higher education popularity led to lower quality, such as the level of university education is like it in high school, the education of postgraduate undergraduatize, which affects the healthy development of university academic.

(2)Lacking in the education of academic standardization and academic integrity. Generally speaking, universities neglect of guiding the students in academic norm of behavior, lack of the education of students' moral and honesty, which lead to these students now — potential scholars are indifferent to the intellectual property concept, lack of academic standard understanding, and don't indicated others research results while citing .

(3)The effect of academic ability training system academic ability training system effect of academic ability training system. The academic training for students is relatively deficient, and there is not a complete set of mature academic ability training system. As Sun Zhengyu said," a lot of people engaged in academic research, are still lacking of formal, systematic, rigorous academic training, still do not have indispensable concept system, background knowledge, research methods and academic self consciousness of academic research, as well as have not yet achieved on learning ' and ' knowledge ' identity".

### **2.2.2 Individual factors in academic activities**

(1)Personal academic capability. The absence of personal academic quality is an important factor. Academic research is an steadily accumulative, successive process. Some people can't promote the advancement of learning because of the absence of their own academic quality, such as knowledge structure, research methods and so on.

(2)Personal moral quality. Some people's moral quality is low and their sense of discipline is rather weak, they take part in academic activities unwillingly and they look for quick success, doing things by irregular ways, which distorts academic true motive.

### **2.2.3 The factors lies in universities**

(1)The consciousness of academic management in Universities. University internal management shows the duality of academic one and administrative one. Currently, internal academic management and administrative management is mixed, responsibilities of academic management are not clear, administrative management generalizes, which lead to the academic administrative change and the weak consciousness of academic management.

(2)University research performance management and evaluation system. At present, many universities in our country are explicitly required numbers of published papers and publications on the level when the graduates want to get the degree or a diploma. In students or teachers assessment and in the advance and superiorly commenting, universities give different value calculation according to the numbers and level of publications. University teachers' evaluation of professional titles, they mainly rely on scientific research projects, research results. In university scientific research incentive, there exists the tendency of linking academic together with money, power and reputation. Thus, it doesn't encourage academic development but leads to the alienation of academic. Therefore, the students, who do not have academic literacy to graduate, put all sorts of things together in papers to increase score, and teachers focus on scientific research but despise teaching, and they are busy in project, topics and papers.

### 3 Analysis on the Relationship among the Factors on Healthy Development of University Academic

According to the analysis above, the following Table 2 can summarize and show the influential factors of university academic development. But the factors are not isolated from each other but perplexing. For example: on the one hand, the individual academic quality has been vulnerable to some social evils, and has been influenced by academic monitoring and evaluation, higher education massification and marketization, academic standardization and academic integrity education and academic ability training system. And on the other hand, individual academic quality influences the academic supervision and evaluation as well as social atmosphere. We should combine present situation of academic development, by investigation and fully discussion in order to determine the relationships among various factors. Thus, we formed the relationships among the factors which influence healthy development of university academic. It is shown in the Table 1. If the factor “i” has effects on j(i≠j), in the table 1, line ij column the value is 1, whereas the value is 0. As the academic standard and academic integrity education have the impacts on the supervision and evaluation, in the corresponding position, the value is 1, it has no effect on the management system, the corresponding position, it is 0.

**Table 1 The Direct Influence Matrix of University Academic Healthy Development**

No.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
1	0	1	1	1	1	1	0	0	0	0	0	0	0	1	0	0
2	1	0	1	1	0	1	0	1	0	0	0	0	1	1	0	0
3	1	1	0	1	1	1	0	0	0	1	0	0	0	0	0	1
4	1	1	0	0	0	0	0	0	0	1	0	0	0	1	0	1
5	1	1	1	0	0	1	0	0	1	0	0	0	0	1	1	0
6	0	1	0	0	1	0	0	1	0	1	0	0	0	1	0	0
7	0	1	0	1	0	0	0	1	0	0	1	1	1	0	0	0
8	0	1	0	0	0	0	1	0	0	0	0	0	1	0	0	1
9	0	0	1	0	1	0	0	1	0	0	0	0	0	0	1	1
10	0	0	1	1	1	1	0	0	1	0	0	1	1	0	1	0
11	1	1	0	0	0	0	0	1	0	1	0	1	1	1	0	0
12	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0	0
13	0	1	0	0	0	0	0	1	0	0	0	0	0	0	0	0
14	1	1	1	1	1	1	0	0	0	0	0	0	1	0	0	0
15	0	0	0	0	1	0	0	0	1	1	0	0	0	0	0	1
16	0	0	1	1	0	0	0	1	1	0	0	0	1	1	1	0

According to the analysis above, the various factors of the academic healthy development influence one another, and directly or indirectly have an influence on the healthy development. In the academic development process, it is difficult to determine which factors influence much more than others. Therefore, with the help of DEMATEL, we build an analyzing model of the key points of academic healthy development, in order to analyze the degree of various factors on academic healthy development and the important degree at academic health development process.

**Table 2**

The Factors that Influencing Healthy Development of University Academic

society	1.social utilitarianism	2.adverse social atmosphere	
economy	3.market economy competition mechanism	4.drive of economic benefits	
culture	5.historical culture	6.mass culture	
institution	7.academic standard and related legal system	8.academic supervision and evaluation system	9.management system

education	10.marketization and massification of higher education	11.education of academic standardization and academic integrity	12. academic ability training system
individual	13.personal academic capability	14.personal moral quality	
colleges&universities	15.consciousness of academic management	16.research performance management and evaluation system	

## 4 Analysis on the Model of the Critical Influential Factors on Healthy Development of University Academic

### 4.1 Constructing the comprehensive-influence matrix of the various factors

According to the relationship of the above factors, with the help of DEMATEL, we analyze the comprehensive effect of each index and the effect of each index on academic healthy development, so as to identify the key factors of university academic healthy development. The DEMATEL method, namely Decision-Making and Trial Evaluation Laboratory, is proposed by American scholars by using graph theory and the tool of matrix for systematic analysis. That is to say, we can analyze systematically the logical relation of every factor and direct influence relation matrix. So we can calculate the influence degree and the influence degree of every factor for other factors, so as to calculate each factor's "prominence" and "relation". Based on the method, the steps of constructing the model of academic healthy development are described as follows:

Step 1, for academic healthy development, we adopt the system diagnosis method to determine the affecting factors, then take the "healthy development of university academic" as the overall factors. If it is set to F1, F2, ... in this paper, Fn, n=16.

Step 2, to analyze the relationship among the factors. That is to say, we analyze whether the factors have direct relations with each other or not, to invite experts to discuss the relationships among the influencing factors of the academic healthy development .

Step 3, to establish direct-influence Matrix Y. The matrix represents direct relationship of each index. The 16 assessment factors will generate the direct-influence matrix of 16 x 16 sizes. And if the factor "i" in matrix has a direct influence on factor j, the value of  $Y_{ij}=1(i \neq j)$ , if the factor of "i" had no direct impact on factor "j",  $Y_{ij}=0$ . in addition, when  $i=j$ ,  $Y_{ij}=0$ .

Step 4, normalizing the direct-influence Matrix Y. In order to analyze the indirect influence among factors, we need normalize the direct-influence Matrix Y, i.e. get the Max, that is the maximum value of the sum of each element in matrix Y , we can get the normalized Matrix  $X=Y/Max$ .

Step 5, to establish the total-relation Matrix T. after get the normalized Matrix X, by the formula of  $T=X(E-X)^{-1}$  we can get the total-relation Matrix T, where E is an identity matrix.The fifth step, to establish the influence relationship matrix T. Obtaining the standardized matrix X, by the formula of  $T=X(E-X)^{-1}$  can be drawn from the total influence relationship matrix T, where E is the unit matrix.

Step 6, to analyze influencing factors. Take the element  $T_{ij}$  in T for example, for each element we can calculate the influence degree, the influenced degree, the "prominence" and the "relation". The sum of the elements in every row of matrix T represents the comprehensive-effect that factor i gives to the other factors, which is called the influence degree. The sum of the elements in each column of matrix T represents the influenced degree that factor i is influenced by the other factors. The sum of rows and the sum of columns are separately denoted as vector D and vector R. The horizontal axis vector(D + R), named "Prominence", is made by adding D to R, which represents the importance of the factor. Similarly, the vertical axis(D-R), named "Relation", is formed by subtracting D from R which may divide factors into a causal group and an effect group. Based on the above statements, the factor belongs to the causal group if (D-R) is positive, it means that the factor has a greater effect on the other factors. And the factor belongs to the effect group when (D-R) is negative, that is the factor which is affected more by others .

Through the calculation, according to the influence degree and influenced degree, we can judge the degree of each factor to a university academic development. According to "prominence", we can judge the important degree of every factor in the development of college academic health system. We can also analyze the relationship of every factor in accordance with the "prominence". Therefore, according to the table1 which shows a direct relationship between each factor, we can calculate the comprehensive influence matrix of influencing impact on colleges academic healthy development, then get the influencing degree, "prominence" and "relation" of factors on the academic healthy development as

shown in Table 3.

**Table 3 The Total-Relation Matrix (×100)**

NO.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	Sum(D)	Promin-ence	relation

Sum(R)	303.50	457.91	342.57	330.92	320.96	323.99	50.42	303.34	165.30	210.20	18.80	72.43	311.98	356.80	165.30	225.93	~	~	~

**4.2 Analysis of results**

First of all, according to the “relation” of various factors, we can divide the academic development of health impact factors into two groups. One is the causal factor. As shown in the table, the sequence of causal degree is academic norms and honesty education, academic standards and related laws, the popularization of higher education and marketization, management system, performance assessment and evaluation system in Universities, academic ability training system and so on. These factors are the direct reasons of influencing college academic health development. The other is effect factor. According to the large to small order of the absolute value, the sequence is individual academic quality, social evils, academic monitoring and evaluation , mass culture and economic benefits and so on. These factors are affected by the causal factors, thus they indirectly have an effect on universities' academic healthy development. Thus we can strengthen the individual academic quality cultivation from the source. According to Table 3, with the value number of each row's sum from the largest to the smallest, we can know that mechanism of market economy competition, historical culture, higher education massification and marketization, the individual morality accomplishment, adverse social utilitarianism moral, the education of academic standardization and honesty, college performance appraisal and quantity evaluation system have much more influence on other factors. Under the existing environment, which can not temporarily change, we can strengthen the personal moral quality training, the education of academic standardization and honesty, college performance appraisal and quantity evaluation system to improve and promote the healthy development of university academic.

According to the “prominence” of various factors, from the largest one to the smallest, the sequence is the adverse social atmosphere, mechanism of market economy competition, personal morality, historical culture, utilitarianism social moral and economic benefits, these factors are the keys to the university academic healthy development and indicate that currently academic status is worrying. It is the priority to purify the social atmosphere and improve personal moral qualities to promote academic healthy development.

In the light of the following aspects : society, economy, culture, education, institution, individual, universities, and the factors belong to them, we can get another group of sum of “prominence” and “relation”. We will grasp the various factors on the academic healthy development as a whole. It is shown in Table 4.

**Table 4**

various factors	influence degree	“prominence”	“relation”
Society	595.95	1357.36	-165.46
economy	592.56	1266.05	-80.93
culture	567.56	1212.51	-77.39
institution	610.61	1129.67	91.55
education	714.73	1016.16	413.3
individual	399.83	1068.61	-268.95
Colleges & universities	479.08	870.31	87.85

From Table 4, we know that education plays the largest role in university academic healthy development process, followed by institutional factors. From number of the “prominence”, make a comparison among the microcosmic effects such as education, individuals and universities, it is shown that individual factors is at the core position in academic healthy development. Seen from the “relation”, the value of education, institution and university is positive, which explains that they play active roles on promoting academic healthy development, and they are main driving factors in the academic healthy development. We should promote university academic healthy development from these aspects.

## 5 Conclusion

The healthy development of university academic is influenced by many factors. This paper analyzed the influencing factors as for the healthy development of university academic from seven aspects-- the society, economy, culture, education, institution, individual and university itself. By using the DEMATEL method, it reveals quantitatively comprehensive effect degree among factors and its “relation” and “prominence”. It also reveals the essential problems of the academic healthy development are adverse social atmosphere, mechanism of market economy competition, personal morality, historical culture, the utilitarianism moral and economic interest drive and so on. Through the overall analysis of the above seven aspects, we conclude that the education itself is the key influential factor in academic healthy development, and individuals are in the core status in the academic healthy development. Education, institution and university is the key driving factor in academic healthy development. For the sake of healthy development of academic, we should do further research about improving academic quality and academic morality through education. It is necessary to explore further the perfection of the related system.

# Performance Evaluation of Budget Management System Based on AHP

Zeng Weilin

School of Economic and Business, Nanchang Institute of Technology, Nanchang, China

(E-mail: qylxtu@163.com)

**Abstract:** Performance Evaluation of Budget Management is a key part of the entire process in the budget with a connecting role. This article determines the weight on Performance Evaluation system of Budget Management on the basis of AHP to provide support and assistance for companies. The study found it has considerable desirability and can truly reflect the level of performance.

**Keywords:** AHP; Budget management; Performance evaluation

## 1 Introduction

Budget management is constituted by a series of budget activities. The budget activities are interrelated and influence each other to form an interdependent whole. As a management tool and method, budget management through reasonable distribution business people, financial, material and other strategic resources to help enterprises achieve the established strategic objectives, and with the appropriate performance management with to monitor implementation progress of strategic goals, control Expenses, and forecast demand for funds, profits, and final financial status.

The theory on budget shows the entire process of budget management contains budget preparation, budget implementation, budget control, budget analysis, budget evaluation and so on. Among them, Performance Evaluation of Budget Management is a key part of the entire process in the budget, with a connecting role<sup>[1]</sup>. At present, the mature methods on performance evaluation, including Cluster Analysis, Fuzzy Evaluation, Gray Evaluation, Analytic Hierarchy Process and so on<sup>[2]</sup>. Among them, AHP have been widely used to determine the weights. Analytic Hierarchy Process, a popular decision method software used for making multi-criteria decisions, invented by Professor Saaty in 1970. In this paper, we design performance evaluation of Budget Management System on AHP.

## 2 The selection on Performance Evaluation of Budget Management system

Currently, the performance evaluation index system of state-owned enterprises should reflect the "central management of enterprise performance evaluation of Interim Measures" and the implementation details, because "the central management of enterprise performance evaluation of Interim Measures" and its implementation rules include a detailed performance evaluation system, and corporate management as the basis for the relevant assessment. However, the Enterprise Group for internal management needs, evaluation mechanisms should be constructed to adapt to the characteristics of budget management Group management performance evaluation system to improve the objectivity and impartiality. In the budget management performance appraisal, pay attention to the combination of a variety of evaluation, namely, when considering the quantitative indicators of qualitative indicators, evaluation indicators need to combine absolute and relative indicators, targets can not ignore local concerns the overall objective. According to the indicators of general settings [3]. we believe that the Performance Evaluation of Budget Management should be composed of three parts, namely, the Basic indicators, Auxiliary indicators and Modification indicators. Detailed in Table I.

Performance evaluation indicators in the budget management system, the basic indicators (operating margin, net cash rate of operating profit, return on investment, asset turnover, asset-liability ratio and rate of sales growth) is the business goals and development strategies; auxiliary indicators (rate of product qualification, cost margins, current ratio and rate of cash inflow from operating activities) is the extension of basic indicators in the process of business activities; modification indicators (rate of residual income and rate of market share) is a key element of strategic complement to the basic indicators on the impact of objective factors correction.

## 3 The Basic principles on Analytic Hierarchy Process

Analytic Hierarchy Process is a combination of qualitative and quantitative analysis on multi-objective decision methods. AHP hierarchical complex problems, according to the properties of the problem and the goal, be broken down into different components and in accordance with the

inter-related factors will be combined according to different levels together to form a multi-Level of analysis model.

According to the characteristics and basic principles, the comparative analysis of each layer factors, the introduction of 1 to 9 ratio scaling method to determine the matrix, by solving the largest Eigen value and the eigenvector of the matrix to get the relative weight of each factor, finally, calculating the value of each bottom index relative to the highest level to get the weight order of each program. AHP determines the weight as the following steps: first, the establishment of hierarchical structure model; second, structural matrix; third, the consistency test. Among them, the matrix is the relative importance of each index value. Structure Paired comparison matrix by comparison and 1 to 9 ratio scale system.

The consistency test is on the basis of normalizing the matrix, calculating eigenvectors and the largest Eigen values.

After calculation, if the test passed, then the feature vector is the weight vector; if not passed the inspection, you need re-construct comparison matrix.

## 4 Determine the Weight on Performance Evaluation system of Budget Management based on AHP

### 4.1 Establish hierarchy model

Performance Evaluation system of Budget Management is composed of Target layer, Sub-goal layer and Index layer. Detailed in Table 1.

### 4.2 Structure matrix (paired comparison matrix) and the consistency test

We structure Matrix (paired comparison matrix) through visiting and survey the large enterprise groups which using budget management, and inviting the relevant experts comparing the relative importance of the assignment.

Detailed in Table 2, Table 3, Table 4, Table 5, Table 6.

## 5 Conclusion

From the allocation weights on Performance Evaluation system of Budget Management, Determine Performance Evaluation system of Budget Management based on AHP is in line with the principles of our building, which is based on maximizing profits, taking the basic development strategy of the enterprise into account. AHP can improve enterprise performance evaluation indicators `s reasonable, reducing unreasonable passing phenomenon, reducing communication and coordination costs of the enterprise. In short, the performance evaluation of budget management is not entirely on the responsible units or individuals to evaluate the performance, and its deeper purpose is to effectively promote the responsible unit and individual behavior, and guide enterprises all employees towards the goal of enterprise in the overall budget. Therefore, the design of budget management performance evaluation regime, managers must keep the enterprise's strategic objectives and overall budget management system work closely together, so as to guarantee the realization of business strategy.

## The Influence of External Search Strategies on the Innovative Performance of Brazilian Firms

Carlos Arruda, Anderson Rossi, Gustavo Mendes, Paulo Ferreira  
Fundação Dom Cabral Business School, Belo Horizonte, Brazil  
(E-mail: arruda@fdc.org.br, andersonrossi.associado@fdc.org.br, gustavo.souza@fdc.org.br,  
paulo.ferreira@fdc.org.br)

**Abstract:** In this paper we attempt to analyse the influence of three dimensions of external search strategies on the innovative performance of Brazilian firms. The dimensions analysed were: external search breadth, external search depth which deal with how firms access external knowledge and the types of external innovation partners that emphasize the “with whom” to interact. The underlying findings are mainly derived and based on conclusive descriptive research that utilized a survey as an instrument of data collection. In relation to external search breadth the results suggest that the variety of external actors produces a positive impact on the innovative performance of Brazilian firms. As regards external search depth a curvilinear relationship was observed –taking an inverted U-shape–. The empirical analysis also indicated that there was a difference in the impact of different external actors on the innovative performance of Brazilian firms, only customers and/or users and suppliers presenting significant impact.

**Key words:** External search depth; External search breadth; External innovation partners; Innovative performance

### 1 Introduction

The development of the theory of the firm from the neo-Schumpeterian perspective points to innovation as the fundamental element in explaining development and the generation of sustainable competitive advantage (NELSON, WINTER, 1982; DOSI, 1982; DIERICKX, COOL, 1989; TEECE *et al.*, 1997). In this sense, Chesbrough (2003) proposes the utilization of the term open innovation to refer to the inclusion of innovation as the strategic variable in the business model and whose function is to create and capture value for the firm. In this approach the process of innovation is, above all, fed by the internal and external flow of knowledge and technology and, accordingly, dependent on the interaction of the company with external actors. It should be pointed out that the interaction with external actors throughout the innovation process is a question that has been debated for some time in the academic community (VON HIPPEL, 1988; NELSON, 1993).

In general, Child *et al.* (2005) suggests that there are a great number of motivations for the company to interact with external actors throughout its innovation process, ultimately all these motivations culminating in an increase in competitiveness and profitability. Nevertheless, there exists also a series of barriers that can diminish the effectiveness of an interactive innovation process, such as asymmetrical power relations, asymmetrical learning and cultural aspects, among others (HLADIK, 1988; HAMEL, 1991).

Keeping in view the motivations and barriers to companies interacting with external actors throughout their innovation process, it becomes important to analyse the external search strategy, which Laursen and Salter (2006) define as the use of external actors to achieve and sustain innovation. In analysing the external search strategy, Katila and Ahuja (2002) investigate the relevance of analysing deeply the intensity of the interaction with external actors (External search depth) and the diversity of the actors with which the company interacts (External search breadth). Belderbos *et al.* (2004) and Miotti and Sachwald (2003) on the other hand highlight the importance of the choice of which external actors to interact with. Thus, in this paper we analysed the impact of these three dimensions of external search strategy on the innovative performance of Brazilian firms. Therefore, we sought empirical evidence for the relationship between external search strategies and the innovative performance of Brazilian firms.

In addition to this introduction, the paper is structured into four topics of theoretical review, the first covering innovation process models and the importance of external search strategy, the second external search breadth, the third external search depth and the fourth the external innovation partners. Following this, the descriptive analysis of the variables analysed is presented, as well as the analysis of the impact of the three dimensions analysed on the innovative performance of Brazilian firms. Finally,

in the conclusion, a discussion of the main results is given.

## 2 Conceptual Background

### 2.1 Innovation process and external search strategy

Authors such as Van de Ven *et al.* (1999) and Tidd *et al.* (2008) have maintained that innovation should be understood as a process, that is, as the sequence of events interconnected by causal relationships. The first innovation models proposed, that arose in the 40s, have become known as linear models and treated innovation as a linear sequence of activities, in other words, the development of innovations followed a rigid and sequential trajectory – basic research, applied research, development, production and launch of the product on the market - (GODIN, 2006; TIDD, *et al.*, 2008; SVETINA, PRODAN, 2008).

More recently non-linear or interactive innovation process models have been proposed (TIGRE, 2006; TIDD, *et al.*, 2008), which, in general, try to emphasize, above all, the relationship between the stages, the effects of feedback and the relationship with external actors throughout the process. In this sense, Leonard-Borton (1995), Keil (2002) and Chesbrough (2003) emphasize the use of external knowledge in the success of the innovation process. Kline and Rosenberg (1986) on the other hand state that the interactions of the firm with external actors and the relationships between the stages of the process can follow not only one, but various paths.

Thus, in analysing non-linear or interactive innovation process models it is observed that the strategy of external search for external ideas, knowledge and technologies assumes great importance (KATILA, AHUJA, 2002). The external search strategy can be defined as the set of decisions that the firm takes in relation to the manner of best exploiting external knowledge (LAURSEN, SALTER, 2006). In this sense, Chesbrough (2003) suggests that the adoption of an open innovation model necessarily involves the implementation of an external search strategy.

It is stressed that the external search strategy adopted by the firm is influenced by the characteristics of the external environment, such as, for example, the availability of technology, the degree of complexity and turbulence, the framework of the national innovation system, formal mechanisms of transfer, among others. Moreover, Laursen and Salter (2006) propose that the external search strategy is influenced by the past experiences and future expectations of the managers.

In addition to these factors, the effectiveness of the external search strategy depends on how the company manages the search processes for new combinations of ideas, knowledge and technologies. In this sense four capabilities are singled out that need to be developed by the companies. The first is the ability to work with different external actors (LUNDVALL, 1992; von HIPPEL, 1988). The second refers to the ability to build relationships and absorb and assimilate external knowledge (COHEN, LEVINTHAL, 1990). The third refers to the ability to understand the routines, standards and habits of how different external actors work (BROWN, DUGUID, 2000). And the fourth consists in the ability to build up networks of contacts and social capital (HAGEDOORN, DUYSTERS, 2002; POWELL *et al.*, 1996).

From the foregoing, Levinthal and March (1993) point out that it is difficult for organizations to determine what is the best external search strategy. Moreover, empirical evidence is observed that the best external search strategy varies in accordance with the firm's sector of activity, with the type of knowledge sought and with the type of innovation - incremental or radical - (CRISCUOLO *et al.* 2011; KÖHLER *et al.*, 2009). Nevertheless, companies that succeed in developing an effective external search strategy succeed in differentiating themselves and thus generating sustainable competitive advantages. Hence the importance of going deeper into the study of the variables that affect it.

In this sense Katila and Ahuja (2002) propose two dimensions to be analysed in developing an external search strategy. The first consists of the deepness or intensity of the interaction with the external actors (External search depth). The second dimension is the diversity of actors with which the company interacts (External search breadth). In addition, Miotti and Sachwald (2003) and Belderbos *et al.* (2004) highlight a third dimension, the choice of which external actors to interact with. These three dimensions constitute the focus of this paper, while the impact of the external search strategy on the innovative performance is analysed within the Brazilian context. In the topics that follow, conceptual and empirical aspects of these three dimensions are dealt with.

### 2.2 External search breadth

Laursen and Salter (2006) explore the necessity of the firm to analyse its external search strategy with the intention of making possible the absorption of new ideas, knowledge and technologies and thus

making the innovation process more effective. One of the dimensions of analysis proposed for the external search strategy refers to the diversity of external actors with which the firm interacts (External search breadth). Katila and Ahuja (2002) make a point of this being the dimension of the external search strategy utilized by companies to explore new knowledge or access new solutions.

In a rapid review of the literature on the subject, it was found that there is a positive relation between the diversity of external actors that participate in the innovation process and the innovative performance (KATILA, AHUJA, 2002). As explanatory factors for this relationship the following are singled out: *i.* the enrichment of internal knowledge and the creation of new combinations that make it possible for the firm to deal with the problems identified (MARCH, 1991) and *ii.* the increase in the capacity of the firm to recombine internal knowledge, making possible the appearance of new products (FLEMING, SORENSON, 2001).

Nevertheless, Katila and Ahuja (2002) also argue that the interaction with a great number of external actors may cause a negative impact on the innovation process. This is because there exists a cost in the integration of knowledge that may from certain point on offset the benefit of the discovery of new knowledge. In this sense, Henderson and Clark (1990) stress that the interaction with each external actor demands changes in the form of communicating and also in the contacts network. In addition to this, the difficulty that companies encounter in responding to new information in the correct way and thus assimilating it into their innovation process is also pointed out. From this perspective, the interaction with external actors tends to present a saturation point, after which the entry of more actors produces a negative impact on innovative performance. Chen *et al.* (2008) calculate this saturation point at between 8 and 9 external actors in their analysis of Chinese companies.

Uniting the cases of positive and negative effects, empirical studies (LAURSEN, SALTER, 2006; LEIPONEN, HELFAT, 2010) have concluded that the diversity of external actors with which the firm interacts presents a curvilinear relationship (taking an inverted U-shape) with innovative performance. As, however, in this paper only 5 external actors were analysed, it is expected that the diversity of external actors (External search breadth) is positively related to the innovative performance of Brazilian firms. Accordingly, the hypothesis 1 can be stated as:

**Hypothesis 1.** *External search breadth has a positive effect on innovative performance of Brazilians firms.*

### 2.3 External search depth

The diversity of external actors with which the firm interacts has proved to be an important dimension of external search strategy. However, the external search strategy is not based only on finding the external actors that have knowledge, it is also important to analyse the interaction process with them. In this sense, the analysis of the depth of the interaction with each external actor (*External search depth*) becomes relevant. Katila and Ahuja (2002) suggests that this is the dimension of the external search strategy that makes it possible for the company to exploit the knowledge of the external actors with which it interacts in different ways.

Levinthal and March (1981) expand this analysis and conclude that the utilization of the same elements of knowledge intensively reduces the possibility of errors and facilitates the development of routines, which adds reliability to the process. In this context, the repeated utilization of knowledge gained from the external actors can lead to an understanding of the concepts that it involves, and help the company to adapt or expand its competencies (KATILA, AHUJA, 2002). Further, Eisenhard and Tabrizi (1995) describe that the depth of the interaction with external actors makes possible the decomposition of activities linked to innovation in a logical and well demarcated sequence, facilitating the elimination of dispensable stages, in this way associating dynamism to the process.

Nevertheless, Dosi (1988) suggests that there is a limit to the process of deepening of the interaction with the external actors. In this sense, Katila and Ahuja (2002) highlight two factors. The first refers to the existence of a point after which the innovation process based on the same knowledge becomes expensive, while the solutions to its problems become excessively complex. The second is connected to the fact of the deepening of the interaction with external actors making the innovation process more rigid, and thus the entrance of new knowledge less flexible (ARGYRIS, SCHON, 1978).

In this sense, Katila and Ahuja (2002) and Laursen and Salter (2006) propose that innovative performance will be positively affected in principle, but, after a certain point, greater deepening of the interaction with external actors generates a negative impact in innovative performance. Based on these authors hypothesis 2 has been framed:

**Hypothesis 2.** *External search depth is curvilinear (taking an inverted U-shape) related to innovative performance of Brazilian firms.*

## 2.4 External innovation partners

In this section we have tried to describe the specific contributions of five external actors in the sense of helping companies to attain superior performance in their innovation process. It should be pointed out that the five external actors selected were those analysed by the Industrial Research of Technological Innovation (PINTEC), carried out by the Brazilian Institute of Geography and Statistics (IBGE) relative to the period 2008 (IBGE, 2010). They are: customers and/or users, competitors, firms within the holding, suppliers and universities and research institutes.

In general the customers and/or users constitute an external source of information about technologies, user's needs and market characteristics. In the specific analysis of the innovation process, interaction with the customers and/or users tends to speed up the process and also reduce the risk associated with the introduction of a new product or service in the market (von HIPPEL, 1988). Close contact with this actor can also make him an inventor or co-developer, principally in the initial phase of projects related to radical innovations, helping in the introduction of new concepts for the development of prototypes or of complex products (TETHER, 2002; LETTL *et al.*, 2006). In addition, von Hippel (1986) highlights the necessity of identifying and interacting with the lead users, which can be defined as users whose present needs can become the general need of the market in the future.

As well as the customers and/or users, the suppliers can also contribute to speeding up the innovation process, reduce costs, improve the quality of the product or service and, consequently, generate competitive advantages (CLARK, 1989; DYER, 1996; RAGATZ *et al.*, 1997). It should be mentioned that interaction with suppliers, also called vertical cooperation, was extensively analysed in the context of supply chain management. Concerning the innovation process, Bidault *et al.* (1988) stress the benefits of the involvement of suppliers in the initial stages of the innovation process, more specifically in relation to conceptualization and design. In addition, Handfield *et al.* (1999) highlight the possibility of accessing the technological roadmap of the supplier and the greater facility and flexibility in integrating technological changes by means of longer term interaction with the suppliers. On the other hand, Mikkola and Larsen (2006) highlight a substantial increase in the risk of the competitor having access to the knowledge developed.

Concerning the interaction with universities and research institutes, this is seen to be an important external actor for accessing new scientific and technological knowledge and also, understanding new scientific developments (KLEVRICK *et al.*, 1995; BELDERBOS *et al.*, 2004). Based on this information Belderbos *et al.* (2004) highlights the fact that interaction with universities and research institutes tends to facilitate the process of the development of radical innovations.

In relation to the Brazilian context, Benedetti and Torkomian (2009) suggest that in the interaction between universities and research institutes and companies, although the main objectives of the parties diverge, there is a complementarity of the objectives and capacities with the characteristic of co-development. This is because the result desired by the universities and research institutes serves, with great frequency, as input for the company to reach the results planned. Nevertheless, Segatto-Mendes (2001) suggests that the existence of divergent interests and the information asymmetry between the parties tends to generate an agency cost, while it demands the utilization of monitoring and control mechanisms which itself tends to jeopardize the interaction.

In addition to the customers and/or users, suppliers and universities and research institutes, Chesbrough (2003) argues that ideas, knowledge and technologies can be found in companies of all sizes. In this sense, interaction with firms within the holding is presented as an important external source in obtaining superior performance in the innovation process. Cooperation in R&D is held to be one of the principal mechanisms for the company to succeed in increasing its innovation process by means of the recombination of its own resources with the complementary resources of other actors (TEECE, 1986; MITCHELL, SINGH, 1992).

Prominence is given to the fact that companies can also interact with their competitors to learn more about the technology and mainly to reduce costs and risks in large projects and seek solutions to common technological problems, to the extent that they possess complementary R&D resources (TETHER, 2002; MIOTTI, SACHWALD, 2003). However, it can be seen that interaction with competitors tends to be limited to a few situations, such as those cited above, due to the fact that the inherent risk is significantly high. In the Brazilian context, Leão (2005) highlights the relevance of the Theory of Coopetition in understanding the dynamic of interaction among competitor companies.

Based on the foregoing, it was possible to observe the specific factors inherent to interaction with each of the five external actors throughout the innovation process. Thus, it is proposed in this paper that there is a heterogeneity in the impact of different external actors in innovative performance, as outlined

by Belderbos *et al.* (2004), and a reply was sought to the following question:

**Question:** *Which types of external innovation partners have a positive effect on the innovative performance of Brazilian firms?*

The following presents the method adopted for measuring the impact of the three dimensions of external search strategy on the innovative performance of Brazilian firms. Subsequently the results obtained are presented and discussed.

### 3 Data and Methodology

With the intention of replying to the guiding question of this paper, a work of a conclusive descriptive nature was carried out, which according to Malhotra (2006) proves adequate when one possesses *a priori* knowledge of the problem investigated and seeks to describe the existence of relationships between variables. To this end, the quantitative approach was chosen utilizing a survey as an instrument of data collection.

In the first place, a prior test was performed with 3 specialists of the area and 2 companies to analyse the conformity of the instrument of data collection, some alterations being made with a view to simplifying understanding, and in addition two new questions were included. Subsequently, the survey was undertaken during the period July to September 2011, the questionnaire being applied in person when possible and by e-mail to an available database. At the end of this period 72 valid questionnaires were collected for companies operating in Brazil, filled out by executives from the Research and Development areas and Planning.

The survey prepared possesses three parts. The first covers descriptive information about the companies, such as invoicing and investment in R&D. The second seeks to map the inbound and outbound of knowledge and technology throughout the stages of the innovation process. And the third presents a series of questions focused on the problem of this paper, covering: *i. Types of external innovation partners; ii. External search breadth; iii. External search depth; iv. Innovative performance.* In this part of the survey the Likert scale of seven points was used. In topic 3.1 the operationalization of each of the variables examined in this paper is presented.

The data collected were then analysed using the software: SPSS (Statistical Package for the Social Sciences). Univariate and multivariate statistical techniques were utilized, among them the analysis of central tendency measures and dispersion and multiple regression. It is stressed that linear and curvilinear models were tested with a view to verifying which presents a better fit in the Brazilian context.

As already pointed out the sample utilized in this survey consists of 72 companies that operate in Brazil. Concerning revenue 43% of the companies invoice over R\$ 1 billion, 21% between R\$ 100 million and R\$ 1 billion, 29% below R\$ 100 million and 7% did not provide information on revenue. In relation to shareholding control, it is observed that 53% of the companies are Brazilian owned, 39% have foreign capital, 4% are state-owned Brazilian companies and 4% did not reply.

In relation to the approximate percentage of the 2010 revenue invested in R&D and innovation, for the 56 companies that replied an average rate of investment of 4.57% was obtained, 50% of these companies investing up to 2%. On the other hand concerning the percentage of the revenue arising out of the innovation process carried out over the last 3 years, for the 47 companies that replied, an average of 16.58%, was obtained, the revenue brought about by the innovation process over the last 3 years for 50% of these companies being below 10%.

#### 3.1 Measures

##### *Types of external innovation partners*

The question of the external actors was tackled through questions relative to the interaction of the company with each of the five external actors analysed in its innovation process. The following external actors were analysed separately: customers and/or users, competitors, firms within the holding, suppliers and universities and research institutes, whose importance in the process of innovation was stressed in topic 2.4. For these indicators the Likert scale of 7 points was utilized, 1 being "I disagree totally" and 7 "I agree totally". Cronbach's alpha for these five external sources is 0.615, which indicates internal consistency and adequate reliability of the questionnaire. On the occasion of the regression analysis we chose to use the binary scale, so that values of 1 to 4 were codified as 0 and values of 5 to 7 were codified as 1, as Leiponen and Helfat (2010) propose.

##### *External search breadth*

The Breadth variable represents one of the dimensions of the external search strategy. This

indicator was operationalized in accordance with the works of Laursen and Salter (2006) and Chen *et al.* (2008). Thus, it was chosen to codify the interaction with the 5 external actors using a binary scale, values of 1 to 4 on the Likert scale being codified as 0 and values of 5 to 7 as 1. Following that the results obtained for each of the 5 external actors were summed. The firms present Breadth equal to 0 when they do not possess a consolidated relationship with any of the 5 external actors analysed, and present Breadth equal to 5 when they possess a consolidated relationship with the five external actors. Accordingly, the greater the value for the variable Breadth the greater will be the diversity of partners with which the company interacts during its innovation process.

*External search depth*

The Depth variable also represents one of the dimensions of the external search strategy and refers to the intensity of the interaction with the 5 external actors analysed in aggregate. This variable was operationalized as the average of the interaction with the 5 external actors measured on a Likert scale of 7 points, as Chen *et al.* (2008) proposes. Higher values for this variable indicate that the firm possesses an intense relationship with a larger number of external actors, indicating that it exploits the knowledge of the external actors with which it interacts in greater depth, a question dealt with in section 2.3.

*Innovative performance*

The measurement of innovative performance was theoretically based on the work undertaken by Griffin (1993), Rindfleisch and Moorman (2001) and Knudsen and Mortensen (2011), which utilize development cycle time measures in the place of financial measures, which permits the comparison between different innovation processes, even when the companies analysed are active in different sectors. The following dimensions were analysed: *i.* superior quality of the product or service generated; *ii.* greater speed of the innovation process; *iii.* less cost of the innovation process. It must be pointed out that these three dimensions were compared with the average of the market in which the company is active. For operationalization of these indicators the Likert scale of 7 points was utilized that goes from 1 “I disagree totally” to 7 “I agree totally”. Cronbach’s alpha for these three variables is 0.660, which indicates internal consistency and adequate reliability of the questionnaire. In the regression analysis we chose to use the average of these three variables to represent the innovative performance of Brazilian firms.

**4 Results**

**4.1 Descriptive statistics**

Based on the sample of 72 large Brazilian companies we sought to explore the impact of the Breadth and Depth variables and of each of the 5 external actors on the innovative performance of Brazilian firms. Table 1 presents the descriptive statistics of each of the variables. It should be pointed out that before these analyses were effected, 5 companies of the sample were excluded due to the fact that they had a high percentage of missing values, which could cause some type of bias in the research.

**Table 1 Descriptive Statistics**

	No. of firms	Mean	S.D.	Minimum	Maximum
Breadth	67	2.70	1.21	0	5
Depth	67	4.02	1.10	1.2	6.8
Innovative performance	67	4.38	1.32	1	6.33
Customers and/or users	61	3.92	1.74	1	7
Suppliers	60	4.94	1.68	1	7
Universities and research institutes	64	4.72	2.02	1	7
Firms within the holding	67	4.43	1.74	1	7
Competitors	67	1.98	1.46	1	7

In relation to the Breadth variable it was observed that Brazilian companies on average present a deeper relationship with 2 to 3 external actors to provide support for their innovation process. It was observed that only 5 companies analysed noted that they had a deep relationship with the 5 external actors and 12 companies with 4 external actors. It should be pointed out that Chen *et al.* (2008), in analysing 10 potential external partners of Chinese companies observed that on average these companies present a deep relationship with 7 external actors.

For the Depth variable this has an average of 4.02, a result that demonstrates that in general

Brazilian companies present a moderate and not very intensive relationship when analysing the five external actors in aggregate. It can be seen also that on average the relationship of the Brazilian companies is more intense with suppliers, university and research institutes and with firms within the holding. On the other hand, the lower intensity of the relationship with customers and/or users should be pointed out and the low intensity with competitors, illustrated by the low average of the study. In relation to the innovative performance variable a middling performance of Brazilian companies is observed on average in relation to the speed, to the cost of the innovation process, and to the quality of the product or service provided.

#### 4.2 Results of the regression analysis

In the first place the correlations are presented between the variables that are to make up the regression analysis. As can be seen there is a positive and strong correlation between the variables Breadth, Depth and the innovative performance. Nevertheless, the correlation between the variables Breadth and Depth is very strong, which could cause problems of multicollinearity in the regression analysis. In this sense, we chose to analyse the impact of these variables on innovative performance separately.

**Table 2 Correlations**

	1	2	3
1. Breadth	1		
2. Depth	0.856*	1	
3. Innovative performance	0.510*	0.570*	1

\*Correlation is significant at the 0.01 level (2-tailed)

Table 3 presents the results of the impact of the variables Breadth and Depth and of the 5 external actors on the innovative performance of Brazilian firms. In models 1 and 3 the linear and positive relationship between the variables Breadth and Depth and innovative performance is tested. In models 2 and 4 the curvilinear relationship (taking an inverted U-shape) between these variables is tested, to identify the existence or not of "over-search". In Model 5 we try to identify which external actors have a significant impact on the innovative performance of Brazilian firms.

**Table 3 Determinants of Innovative Performance in Brazilian Firms**

	Model 1	Model 2	Model 3	Model 4	Model 5
Breadth	0.559*** (0.117)	0.857* (0.479)			
Breadth <sup>2</sup>		-0.054 (0.085)			
Depth			0.683*** (0.122)	1.890*** (0.714)	
Depth <sup>2</sup>				-0.143* (0.083)	
Customers and/or users					0.734** (0.296)
Suppliers					0.770** (0.350)
Universities and research institutes					0.455 (0.300)
Firms within the holding					0.487 (0.323)
Competitors					0.301 (0.437)
Number of observations	67	67	67	67	67
R-squared	26%	26.4%	32.5%	35.5%	27.2%
F-test (sig.)	22.793	11.499	31.337	17.605	4.569

Notes: Standard error between brackets

\*\*\* $p < 0.001$ ; \*\*  $p < 0.05$ ; \*  $P < 0.10$

Model 1 shows that the variable Breadth presents a positive and significant impact on the innovative performance of Brazilian firms, confirming hypothesis 1. In this sense, it is observed that an external search strategy that involves a greater variety of external actors tends to result in better performance in the innovation process.

In Model 2 we sought, by means of the inclusion of the square of the Breadth variable, to analyse if there exists an optimum point after which work with a greater variety of external actors starts to cause a negative impact on the innovative performance (taking an inverted U-shape). This resulted in the coefficient of the square of the Breadth variable presenting a negative sign, which would indicate a tendency to fall after the optimum point, nevertheless this coefficient is not significant. Such a result demonstrates that the variety (Breadth) of external actors is a relevant factor in explaining innovative performance and that in analysing 5 sources of knowledge a point of inflection was not observed after which Brazilian companies would present a decrease in their innovative performance in relating to one more external actor.

It should be stressed that this result differs from that obtained by Chen *et al.* (2008) for Chinese companies, as these start to present a negative return in interacting with more than 9 external actors. The work of Laursen and Salter (2006) demonstrated that UK companies present a decreasing return after the point of interaction with 11 external actors. As only 5 external actors were analysed in this paper it was already expected that the existence of “over-search” for the Breadth variable would not be observed.

Model 3 shows that the Depth variable presents a positive and significant effect on innovative performance. Such a result demonstrates that a strategy that seeks to deepen the relationship with external actors tends to increase innovative performance. In complementary fashion, in Model 4 hypothesis 2 is tested, that there is a point beyond which it is not more advantageous for the company to intensify the relationship with its external partners. The coefficient for the square of the Depth variable was negative and significant. Consequently, the curvilinear Model presents better fit in the Brazilian context considering the 5 external actors analysed, which indicates the existence of “over-search” in the Brazilian context when the variable Depth is analysed. This implies that there is a point, in this survey between 5 and 6 (see Figure 1), beyond which the company, in deepening its relationship with more external actors, starts to present a negative return. In practical terms, we have that the strategy that seeks to deepen interaction with the 5 external actors analysed has a saturation point.

**Figure 1 Predicted Relationship Between Innovative Performance and External Search Depth**

In Model 5 we sought to identify which of the 5 external actors analysed presented a positive and significant impact on the innovative performance of Brazilian firms. As a result it was observed that the interaction of Brazilian firms with actors of their value chain, namely: their customers and/or users and suppliers, presented a positive and significant impact on innovative performance. It must be stressed that although Brazilian firms demonstrate a high average for their relationship with universities and research institutes and with firms within the holding, these two external actors were not statistically significant in

explaining innovative performance, as neither were competitors.

## 5 Conclusion

The more recently proposed non-linear or interactive innovation process models emphasize the necessity of firms to interact with external actors in the search for ideas, knowledge and technologies that help to increase the innovation process, either accelerating the process, reducing the cost or improving the quality of the product or service. From this perspective, Katila and Ahuja (2002) highlight the importance of formulating an external search strategy which makes the interaction process with the external actors throughout the innovation process more effective.

It has therefore been our aim in this paper to analyse the influence of three dimensions of external search strategy on the innovative performance of Brazilian firms. The following dimensions were analysed: external search breadth, external search depth which deals with how firms access external knowledge, and the types of external innovation partners that emphasize whom they interact with. In relation to external search breadth and external search depth the results suggest that the variety and depth of the interaction with external actors presents a positive impact on the innovative performance of Brazilian firms, as found by Katila and Ahuja (2002) and Laursen and Salter (2006).

Also examined in this paper was the existence of “over-search”, that is, a point beyond which an increase in the diversity and depth of the interaction with external actors starts to affect the innovative performance negatively as Katila and Ahuja (2002) and Laursen and Salter (2006) suggest. In relation to the external search breadth the presence of “over-search” was not observed. It should be pointed out that this result was expected since only 5 external actors were analysed, they being: customers and/or users, competitors, firms within the holding, suppliers and universities and research institutes. This result indicates that Brazilian companies tend to succeed in improving their innovative performance by the interaction with these 5 actors. Nevertheless the interaction with additional actors, like virtual community and of technologically based start-ups can result in the generation of counterproductive results beyond a certain point, in that it becomes more complicated for the firm to internalize and integrate all the ideas, knowledge and technologies in its innovation process.

In relation to external search depth the hypothesis was corroborated that there is a point beyond which “over-search” is observed. This indicates that Brazilian companies that exploit in depth the interaction with the 5 external actors tend to display inferior results to the companies that exploit in depth the interaction with less external actors. This indicates that the decision to deepen the interaction with a determined external actor should be pondered through an analysis of the associated costs and benefits. In this sense, Almirall and Casadesus-Masanell (2010) highlight that interaction with external actors throughout the innovation process should be analysed in terms of the trade-off between the benefit of the discovery and the cost of the divergence.

The empirical analysis also indicated that there is a difference in the impact of different external actors on the innovative performance of Brazilian firms, corroborating the heterogeneity among the external sources proposed by Belderbos *et al.* (2004). In addition, the results demonstrated that learning in Brazilian companies is more associated with learning by doing and learning by using, than with learning by searching. This is because the external actors that present a significant impact on innovative performance are the suppliers and the customers and/or users, universities and research institutes showing no significant result.

According to Bittencourt (2012), this means that the learning typically utilized by Brazilian companies comes from the accrual of knowledge obtained from firms’ production routines and search processes not associated with codified knowledge. It is pointed out that the learning mechanisms used to a greater degree by Brazilian firms tend to change in accordance with the sector of activity, technology intensive sectors being more attuned to learning by searching.

In general the results obtained demonstrate that open innovation practices, more specifically the interaction with external actors throughout the innovation process, are found within the context of large Brazilian companies. Which according to Chesbrough (2003) indicates greater ability of these in exploring external opportunities and attaining greater innovative performance. In addition to this, it is observed that a large part of the companies can increase the diversity and depth of interaction with the external actors, and should take the presence of “over-search” into consideration when formulating their external search strategy.

As a limitation of the work special mention should be made of the reduced size of the sample, although significant, which reduced the force of the statistical analyses and made it impossible to

undertake sectoral analyses, as well as testing other variables that influenced the formulation of external search strategy.

(E-mail: 873924190@qq.com)

**Abstract:** Campus sports competition is not only a platform to show the students' athletic ability and to spread sport culture, but also an important way to improve the students' enthusiasm to participate in sports activities actively. Management reform and innovation to improve the quality of teaching and promote students' health has become urgent to carry out. By using the literature, interviews and logical analysis, this paper proposes the innovative method for physical education management. The author does the research from three aspects: physical education, sports competition platform building and campus sports talents' training. Based on the three aspects, this paper builds up in and outside classroom teaching and managing model and concludes that the campus physical education could be improved by adopting utilitarian teaching ideas so as to increase students' physical fitness and health standards.

**Key words:** Integrative education ideology; Physical education management; Reform; Innovation

## 1 Introduction

There are more than 80 articles related to the integrative education ideology on CNKI. By reading these articles, these articles can be roughly divided into the following categories: The first category focuses on the theoretical study such as the meaning, the status quo, teaching evaluation, system constitution, teaching mode constitution of the integrative education ideology.

The second category pays more attention to practical research. Through teaching experiments and surveys, they discuss the curriculum setting, the use of venues and equipment, student learning effect assessment, management model constitution and so on. They aim at discovering the problems exist in physical education and dealing with them through practice.

The concept of the integrative education ideology is proposed by the sport club teaching mode of United States. In Russia, the study of school extra-curricular physical activity model began with Soviet Union National Board approved establishing the Children's physical training club in 1990. In 1913, University of Michigan and Ohio University set up a special organization to manage the sports extracurricular activities. In Germany, the study of extracurricular sports activity pattern focused on the sports club inside and outside the school. Japan formed two types of sports club early after the war. One is compulsory sports club and the other is liberal sports club. The ultimate goal is developing the autonomy and creative ability of students with the teacher's help.

To summarize, the research of the integrative education ideology has a long history. Predecessors have also done a lot of scientific research to verify the correctness and rationality of the integrative education ideology of Physical Education. Most of the studies mentioned the concept of the life-long sports and people le-centered concept. But we found that few study is related to classroom teaching management and extracurricular fitness activities. In other words, there is a lack of studies about how to innovate in teaching management and how to establish an incentive mechanism.

## 2 The Theoretical Basis of Management Innovation in Physical Education Activities

### 2.1 Instilling education utility in campus sports and enhancing students' sense of happiness

The utilitarian thought is always accompanied by the development of education. In 19<sup>th</sup> century, the British utilitarianism educators set sense of happiness as the aim of education and treat the individual experience of happiness as the long-lasting intrinsic motivation of education.<sup>[1]</sup> This is worth re-interpretation the content of China's educational value and meaning. Combined with China's series measure of physical education reform in recent years, such as "sunshine sports activity", "club teaching method", we may see that students' initiative, enthusiasm and personalized training have been

emphasized and students' personal sense of happiness has been put in the first place.

But we have to admit that if education utility was emphasized excessively, some negative effects could appear because training fatigue and exercise performance appear simultaneously and are indivisible. Thus educators should combine education utility with practice and emphasize students' sense of accomplishment and utility so as to stimulate students' intrinsic motives of physical exercise.

## **2.2 Theory of achievement motivation**

Psychologists have done researches about learning motivation from various aspects. Zhang Chengfen points out that Target, as a motivation incentive, usually triggered a motivation when people realize its value and draws the conclusion that achievement goal is an important trigger of learning motivation.<sup>[2]</sup> In the current school physical education, in-class teaching is always the most important teaching points while extracurricular activities are always out of touch. In this case, it is difficult for students to combine sports knowledge and skills with extracurricular activities. Thus, students, lacking of achievement motivation, usually set the examination and credit as their goal and appear to be negative in study. From what has been discussed above, we may find that it is high time educators adopt incentive measures in campus education.

Learning to use is the most direct incentive motivation to inspire students to learn knowledge and skills. The combination of learning and practice should be emphasized in physical education and the platform for students to practice their skills should be built. The sports competition is a very good method to stimulate students' learning motivation. Students could show their sports knowledge and skills, fully arouse their inner potential and make clear the goal of their extracurricular sports activities. Only in the integration can learners establish motivation adaptability, face challenging task, so as to improve their ability.<sup>[3]</sup>

## **3 Analysis of Factors in Physical Education Management**

### **3.1 Favorable factors**

The parents and the school leaders pay less attention to students' sports activities, which has negative effect on physical education. To be admitted to university is the common goal of the students, the parents and the high schools. However, physical education is not a part of this examination, thus can hardly be valued.

In universities, though influenced by education utility, physical education is easier to be conducted because students have more spare time and less academic pressure. On the other hand, taking part in sports is man's nature and also one of the ways to relax and rest. For university students, it is also a good method to communicate with others. Thus, we may encourage students to take part in sports activity by emphasizing these advantages.

University students have more spare time compared with primary and middle school students. The relatively relaxed environment and loose school curriculum enable university students to have more time to dominate. Many students take part in sports activities voluntarily after class because sports activities have their own enchantment. Physical educators should carry out innovation in the management of extra-curricular activities to serve students better.

In China many sports facilities are not perfect in middle schools because of budget problems, and it is even worse in rural schools. But in universities, sports facilities are relatively perfect for various kinds of sports because of the support of the country. As long as we manage sports competition reasonably scientifically, we could make full use of college sports resources.

### **3.2 Unfavorable factors**

Because of the defects existing in present physical education in primary and middle school, numerous students hold negative views on physical education. In many students' mind, physical education means unimportance. No wonder they appear negative and careless in university sports course.

University students, who entered universities aged averagely 18 years old, have passed the best period for physical development. Without good physical education in primary and secondary school, they probably feel difficult to adapt themselves to university physical education. Therefore, it is necessary to promote indented sports competition based on hierarchical teaching.

### **3.3 Necessary factors**

Sports course is compulsory course for the freshmen and sophomores but optional course for juniors and seniors in universities. This is a vital period for students to form the awareness of lifelong sports.

College physical education is the last chance to cultivate students' life-long physical education awareness. The conception of integration teaching management model combined with the campus sports system reform and innovation

### 4 The conception of Integration Teaching Management Model Combined with the Campus Sports System Reform and Innovation

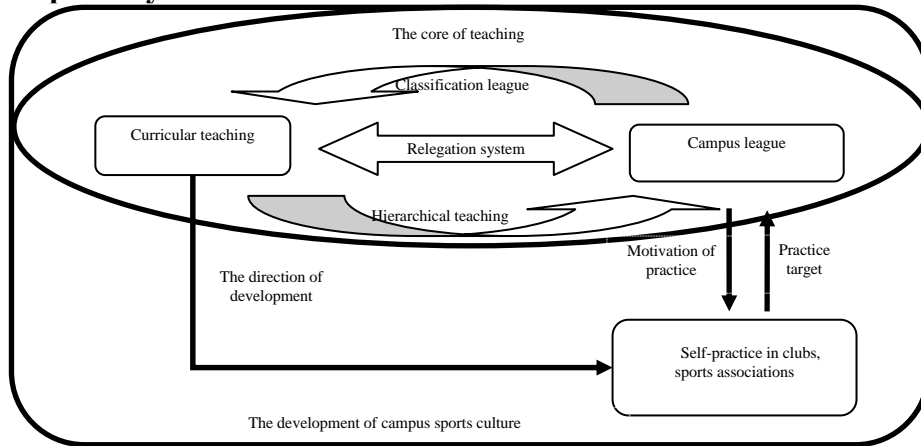

Figure 1 Model of Teaching

In this teaching model, club teaching, three autonomy teaching and stratified teaching are combined, and teaching management is innovated based on the teaching model.

Layered teaching is adopted in the core part of teaching and layered competition is adopted in campus competition, in which promotion and demotion run system in professional league is adopted to encourage students and the coach to take part in the training earnestly. What's more, layered competition can narrow the strength gap between the teams so as to avoid inferiority complex.

In campus sports culture construction, club teaching, sports association teaching, and independent teaching should be encouraged to replace class teaching. At the same time, self-independent exercise and campus competition should be complementary and can not be separated from each other. On the one hand, campus competition is the goal and driving force of extracurricular exercise. On the other, the improvement of students' sports level can promote the development of campus competition.

#### 4.1 In-class learning

Teaching: Skill teaching is the main part; students will be divided according to teaching project into three layers, high, medium and low level, without considering their age.

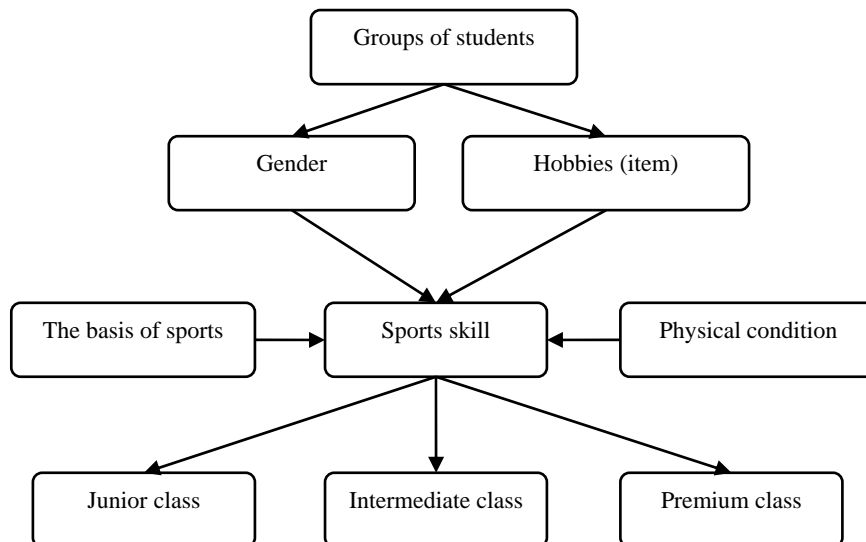

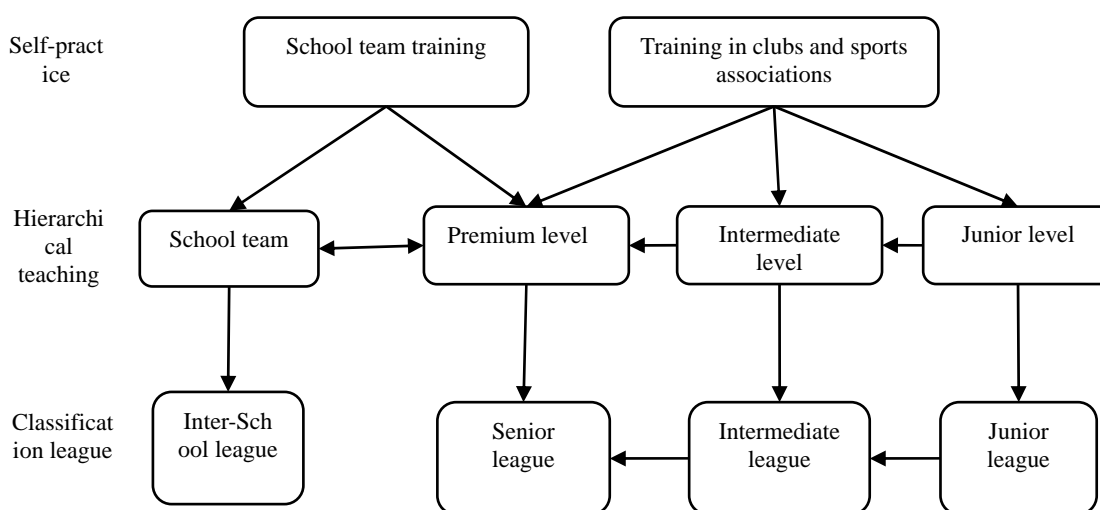

Figure 2 Classification of Students

According to stratified teaching and “three autonomy”, students should be divided into different groups according to their interests and sports skills instead of grade and class. Based on this classification, teachers can draw up specific teaching and training plan for students with different interests and skills. In this case, students can learn and make progress in a more appropriate environment. After the students choose the content of the class according to their interests and gender, the teacher could divide them into different layers according to their physical basis and personal conditions. Take basketball for example, height is one of the core factors. Students, who meet this requirement, can make progress even without physical basis.

**4.2 Extracurricular application**

Campus competition (the platform to show sports skills): There are three layers in teaching, and then campus competition should be divided into high, medium and low levels correspondingly. The purpose of campus competition is to implement a league system, in which clubs, sports associations and classes play as units. Stratified competition has extensive adaptability for students on different levels. In order to guarantee the fairness and competitive nature of the competition, promotion and demotion run system can be implemented.

**Figure 3 Figure of the Relationship Between Competition, Teaching and Exercise**

**4.3 Integration**

Promotion and demotion run system can be freely switched in classes of three levels, primary, medium and high, and this system can also be adopted in various campus competitions.

Self-independent exercise could adopt club training and “three autonomy” instead of class training. Sports clubs should be encouraged to complement campus competition and enrich the campus sports culture.

The ultimate goal is to set up a physical education system in which the sports clubs and campus competition interact complementarily and students form the awareness of long-life physical education.

**5 Conclusion**

The advantages of education utilitarianism should be learned and absorbed and students’ sense of happiness should be put in the first place in physical education reform. Learning to use should be the basic starting point of physical education, and the theory of achievement motivation should be one of the guiding theory in physical education reform.

University physical education has advantages in aspects of environment, policy, students’ spare time and sports facilities. However, students’ awareness of physical education and weak sports foundation need to be improved.

Integration teaching ideas absorb advantages of several teaching mode. Students, who could be divided into groups according to their gender, interests and sports skills, are encouraged to take part in sports clubs, associations and self-independent exercises after class. Stratified competitions could be carried out to stimulate students’ learning motivation, spread campus sports culture, and encourage students to show their skills.

Interest is the best teacher. Integration teaching management mode mainly serves to stimulate the students' participation in sports. This research explores the innovation of basic teaching and physical education mode, and we still need practice in actual management and operation.

## An Empirical Study on Affecting Factors of Independent Innovation in Small and Medium Sci-tech Firms\*

Zhuang Yue, Lu Yuwen

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: zhuangy2008@163.com, yuyu36520@163.com)

**Abstract:** Through a questionnaire survey of some small and medium Sci-tech firms, this paper analyses on the present situation of independent innovation, reveals the relationship between the firm's sci-tech resources input (R&D personnel quantity, R&D input intensity) and firm's performance. It also shows that affecting factors of independent innovation not only are the enterprise internal investment and R&D personnel, but also closely related to the factors from external innovation system. Such as, many firms eager to look for external finance supports, cooperative development and technical information service. The empirical analysis for sci-tech companies in Wuhan of China shows that the intangible assets of an enterprise (patent, copyright, trademark), and the R&D investment support from governments are positively related to firm's output. Finally, this paper puts forward some polices to enhance the firms' independent innovation competence.

**Key words:** Small and medium Sci-tech firms; Independent innovation; Affecting factors; An empirical study

### 1 Introduction

Small and medium firm is an important component of China's high-tech industry, and small and medium sci-tech firm is the most innovative part of small and medium firm groups. In the era of knowledge economy, improving the ability of independent innovation is an important source to obtain competitive advantage for small and medium sci-tech firms. In the international financial crisis period, as international and domestic economic environment has been more complex, knowing well affecting factors of independent innovation in small and medium sci-tech firms has important theoretical and practical significance on promoting the innovational ability and sustainable growth.

As the development of economic globalization, small and medium sci-tech firms face more serious competition environment, the shortage of investment and talent, poor information and technological such as congenital deficiency are prominent increasingly, especially insufficient investment on research and slow new product development lead to the insufficient of firms' independent innovation ability, which are common problems faced by small and medium sci-tech firms. This paper, based on the date of small and medium sci-tech firms in Wuhan, through the establishment of the model, empirically inspects the technological human resource input, the firm's R&D investment and the firm scale for influence on the independent innovation performance, and explains the relationship between variables corresponding to provide a theory and practice support for the relevant problems' research.

### 2 Research Model and Main Framework

#### 2.1 Concept model

In this context, put forward the relation model of affecting factors of independent innovation in small and medium sci-tech firms. Such as the following figure 1:

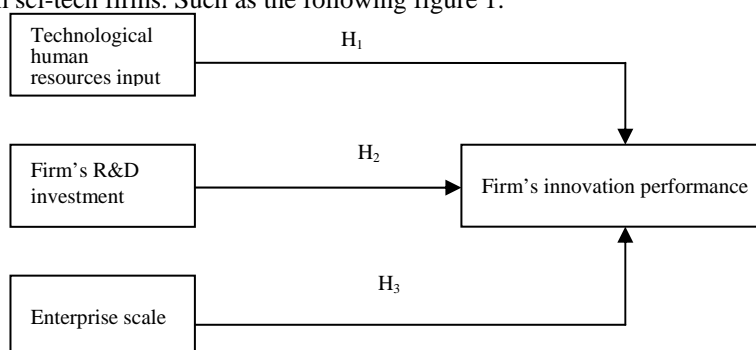

Figure 1 Relation Model of Affecting Factors of Independent Innovation in Small and Medium Sci-Tech Firms

\* Fund project: China Ministry of Education, Humanities and Social Sciences Research Fund (11YJA630226)

## 2.2 Variables analysis and research hypothesis

### (1) The technological human resource input and the firm's innovation performance

The technological human resource is often called scientific and technical personnel, belongs to human resources in a high quality, but it is different from the general human resources. In this paper, it mainly refers to R&D personnel, workers with college degree or above or with senior professional title, etc.

Patrick Ronde and C • Hussler's research (2005) based on the questionnaire survey of 14 industry and 22000 manufacturing firms in French, shows that firm's independent innovation ability has significantly positive correlation with its R&D personnel.<sup>[1]</sup> Domestic scholar, Qiren Zhou thinks that technical personnel is a kind of common resources and essential for the independent innovation of small and medium Sci-tech firms. Zhang Jie's(2007) empirical research shows that many important variables, effected on independent innovation and product upgrades of our country's firms, all refer to the related function of key technological personal.<sup>[2]</sup> Xutao Zheng(2009) chooses the data of 30 provinces in China to make an empirical analysis showing that the R&D input stock and human investment play important roles in promoting the independent innovation ability of firms in China<sup>[3]</sup> According to above review, this paper puts forward the hypothesis 1:

H<sub>1</sub>: The technological human resource input has a positive effect on the firm's innovation performance.

### (2) Firm's R&D investment and the firm's innovation performance

Firm's R&D investment is the necessary condition for its independent innovation. Small and Medium Firm Development and Research Institution of Central South University finds that, in technological innovation, the top 20 small and medium listed companies' average R&D investment is three times than the final 20 ones. Compared with foreign firms, the R&D investment of domestic firms is lower. The R&D investment proportion of foreign firms in most is more than 10%, but domestic firms' is only 1%, even some firms almost have no R&D investment, or own no R&D institutions.<sup>[4]</sup> The extent of the R&D investment not only acts directly on whether an firm can introduce and keep R&D personnel of high quality or not, but also determines whether an firm can buy advanced research equipment and own corresponding conditions for technical tests or not.<sup>[5]</sup> Guanghan Chen and Baojiang Lan (2007)<sup>[6]</sup> based on the provincial panel data in 1998-2004, find that the R&D investment in China has a significant effect on the ability of independent innovation. Yidong Hu and Weijun Zhong(2011)<sup>[7]</sup> think that R&D capital has much higher contributions on the technical innovations than R&D personnel. Firm's R&D behavior (new product development funds, technological R&D costs, technical reform funds) is closed to the ability of independent innovation.<sup>[8]</sup> The R&D investment in small and medium firms is an important mean to improve the ability of independent innovation. Therefore, this paper puts forward the hypothesis 2:

H<sub>2</sub>: The Firm's R&D investment has a positive correlation with the firm's innovation performance.

### (3) Firm scale and the firm's innovation performance

It has been always a hot point on the relationship between independent innovation and firm scale. Some studies reflect a positive correlation, but others reveal a negative correlation, mainly for the complexity of the independent innovation and the difference of variables selected.<sup>[9-11]</sup> For example, the index measuring the technological innovation performance is based on new product output or the patent output; and firm scale is measured by total employees or total assets, and so on, which all could affect on the performance evaluation and get inconsistent conclusions.<sup>[12]</sup> Yang Yong(2007)<sup>[13]</sup> proves firm scale is significantly positive related to firm's technological innovation performance through an empirical analysis. Yidong Hu and Weijun Zhong(2011)<sup>[14]</sup> think that total employees and total assets all have a significantly positive correlation with technological innovation output. According to above review, this paper, choosing total employees as the measuring index, puts forward the hypothesis 3:

H<sub>3</sub>: Firm scale has a positive correlation with the firm's innovation performance.

## 3 Research Process and Empirical Results

### 3.1 Survey situation of sample firms

In order to know well the present situation of independent innovation in small and medium sci-tech firms, in 2011, we took a questionnaire investigation, filled out by main technical management personnel and technological R&D personnel, on 78 small and medium sci-tech firms in Wuhan city. Finally got 41 effective samples and the recovery rate was 52.56%, which meet the demand of the samples for analyses. Firms researched are mostly key sci-tech firms in zone, the industry distribution as

follows table 1:

**Table 1 The Industry Distribution of Firms Researched in Wuhan**

Industry distribution	Electronic information	Biological medicine	Energy and environment	Equipment manufacturing	Others
Numbers	17	6	5	5	8
Rates	41.46%	14.63%	12.19%	12.19%	19.51%

**3.2 Regression analysis conclusion**

(1) Effect of technological human resource input

Statistical analysis shows that independent variables such as R&D personnel quantity, the proportion of workers with college degree or above, the proportion of workers with senior professional title and net assets have significant effects on the sale income in 2009.

Taking the sale income in 2009 as the dependent variable, the net asset as the control variable, R&D personnel quantity, the proportion of workers with college degree or above and the proportion of workers with senior professional title as independent variables, make an linear regression analysis. We first designed research regression model as equation 1.

According to the regression analysis form, we set the proportion of workers with senior professional title as  $x_1$ , the proportion of workers with college degree or above as  $x_2$ , net assets as  $x_3$ , R&D personnel quantity as  $x_4$ , the company sales income as  $y$ . According to the basic model designed, we get the test of statistical analysis.

$$y = \beta_0 + \beta_1x_1 + \beta_2x_2 + \beta_3x_3 + \beta_4x_4 + \varepsilon \tag{Equation 1}$$

**Table 2 Regression Model Summary<sup>b</sup>**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	F	Sig.
1	.772a	.595	.535	17963.506	9.930	.000 <sup>a</sup>

<sup>a</sup>Predictors:(Constant) R&D personnel quantity, the proportion of workers with college degree or above, the proportion of workers with senior professional title and net assets(ten thousand yuan)

<sup>b</sup>Dependent variable: the sale income in 2009

According to statistical analysis showed in table 2, the statistic F in the table 2 is 9.93, the significant level is 0.000, so the linear regression equation is very significant. But the square of fitting coefficient of regression model is 0.595, showing that the model has the strong ability to explain.

In table3, the significant level of the proportion of workers with college degree or above is 0.021and the one of R&D personnel quantity is 0.003, showing that they are both significantly affect on the sale income. The VIF numbers are relatively small by the model linear inspecting, therefore, there are no multicollinearity in the model.

In the model, the net asset, as a control variable, is mainly used to control sales income of firms with different sales. R&D personnel quantity has a positive correlation with sales income, showing that firm's R&D personnel quantity growth will drive sales income increase. This is mainly because researchers bring more innovative technology for firms, strengthening continuously the innovation ability, and pushing the sales income growth. But in practice, firms must improve the ability of independent innovation to improve their sales income, which also are inseparable with R&D personnel. So it is one of measures to improve its ability that improve firm sales income by increasing R&D personnel quantity. The proportion of workers with college degree or above is negatively related to sales income, showing that the R&D level of firms is not sensitive to technical personnel's education required, so also failed to play a positive role.

**Table 3 Outcome of Regression Analysis<sup>b</sup>**

Model	Un-standardized Coefficients		Standardized Coefficients	t	Sig	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
Constant <sup>a</sup>	21357.776	11927.585		1.791	.085		
$x_1$	555.187	616.242	.124	.901	.376	.789	1.268
$x_2$	-359.047	146.255	-.332	-2.455	.021	.819	1.222
$x_3$	.146	.181	.134	.809	.426	.544	1.840
$x_4$	159.078	48.462	.563	3.282	.003	.509	1.964

<sup>a</sup> Predictors:(Constant) R&D personnel quantity, the proportion of workers with college degree or above, the proportion of workers with senior professional title and net assets(ten thousand yuan)

<sup>b</sup> Dependent variable: the sale income in 2009

(2) Effects of firm's R&D investment

The R&D investment under 5 million yuan defined as low input, the R&D investment over 5 million yuan defined as high input, the sales income over 10 million yuan defined as high income and the sales income under 10 million yuan defined as low income, are listed as table 4:

**Table 4 The Crosstabulation of the R&D Investment and the Sales Income**

Count		The sales income		Total
		Low	High	
The R&D investment	High	5	30	35
	Low	4	2	6
Total		9	32	41

Seen from table 5, the significant test value of Pearson Chi-Square is 8.20(sig<0.01), so there are reasons to refuse the assumption that the R&D investment and the sales income are independent, that is the firm's R&D investment is related to the sales income.

**Table 5 Variance check List of the R&D Investment and the Sales Income**

**Chi-Square Tests**

	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	8.203 <sup>b</sup>	1	.004		
Continuity Correction <sup>a</sup>	5.430	1	.020		
Likelihood Ratio	6.809	1	.009		
Fisher's Exact Test				.015	.015
N of Valid Cases	41				

a. Computed only for a 2x2 table

b. 2 cells (50.0%) have expected count less than 5. The minimum expected count is .32.

(3) Effects of number of employees

The number of employees under 100 defined as less, the number of employees over 100 defined as more, the sales income over 10 million yuan defined as high income and the sales income under 10 million yuan defined as low income, are listed as table 6:

**Table 6 The Crosstabulation of the Number Of Employees and the Sales Income**

Count		The sales income		Total
		High	Low	
The number of employees	More	21	2	23
	Less	10	8	18
Total		31	10	41

**Table 7 Variance Check List of the Number of Employees and the Sales Income**

**Chi-Square Tests**

	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	6.998 <sup>b</sup>	1	.008		
Continuity Correction <sup>a</sup>	5.193	1	.023		
Likelihood Ratio	7.233	1	.007		
Fisher's Exact Test				.012	.011
N of Valid Cases	41				

a. Computed only for a 2x2 table

b. 1 cells (25.0%) have expected count less than 5. The minimum expected count is .39.

Seen from table 7, the significant test value of Pearson Chi-Square is 6.99(sig<0.01), so there are reasons to refuse the assumption that the number of employees and the sales income are independent ,that is the number of employees is related to the sales income.

**3.3 Hypothesis testing results**

According to above analysis, three hypotheses all have been proved, as follows table8:

**Table 8 Test of Hypothesis**

Hypothesis	Y	N
H <sub>1</sub>	√	
H <sub>2</sub>	√	
H <sub>3</sub>	√	

#### 4 Conclusion

This article, directly using data of some small and medium Sci-tech firms in Wuhan on the micro level, makes empirical analysis on affecting factors of independent innovation which contain the technological human resource input, the firm's R&D investment and the firm scale. According to existing empirical research, take respectively R&D personnel quantity, the proportion of workers with college degree or above, the proportion of workers with senior professional title, the firm's R&D investment and the number of employees as explanatory variations, and the sales income as explained variables. And descriptive results show that, the technological human resource input, the firm's R&D investment and the firm scale all have a positive correlation with firm's innovation performance. Based on the above analysis, this paper puts forward countermeasures as follows to enhance the firms' independent innovation ability.

Capital demand becomes the most important barrier for firms' independent innovation. No adequate funds, no abundant firm's R&D investment. Among firms investigated answering "what service project is needed to provide by government", 92.6 percent of the ones choose "capital support". Therefore, government should formulate the corresponding policy inspire firms to increase R&D investment and take various measures to increase the proportion of the technological of investment funds accounting for the finance funding. While, at the same time, government also needs to strengthen the supervision of the funds for investment in science and technological field, so that lead firms using the fund rationally and increasing efficiency of the use of the fund.

Firms in technological innovation activities should strengthen the talent strategy and the import of high-level technological innovation talents. When answered the question of "what innovation service type is needed", 51 percent of the firms choose "technical information service" and 48.8 percent of the ones choose "cooperative R&D". So both technical information service and cooperative R&D are the most requirements for small and medium Sci-tech firms.

# An Approach Towards Medical Insurance Business Innovation Based on Japanese Customer Survey Data

Yoko Ishino

Graduate School of Innovation & Technology Management,  
Yamaguchi University, Ube, Japan, 7558611  
(E-mail: ishino.y@yamaguchi-u.ac.jp)

**Abstract:** The insurance industry in Japan has undergone drastic changes, since the new insurance business law became effective in 1996. Understanding customers' needs and values in purchasing insurance products has become more important for insurance institutions than ever before, because of not only environmental changes but also changes in customer behavior. From many areas of insurance that the life and non-life insurers cover, this study concentrates on the private medical insurance field in Japan, excluding national health insurance. The research goal is to elucidate customers' perceived value structure regarding medical insurance products and to obtain knowledge useful for performing business innovation of medical insurance. For the purpose, the data from both the attitude survey toward medical insurance products and the awareness survey on health was analyzed using the theory and method of Bayesian networks.

**Keywords:** Medical insurance business; Service innovation; Bayesian network modeling

## 1 Introduction

Consumers' attitude towards insurance products has greatly changed compared to before. Economic growth has recently slowed as a consequence of the current world economic crisis. And the labor force in Japan is shrinking because of the falling birthrate and the aging population. Accordingly, Japanese consumers came to put a higher value on the existence security that enhances the medical treatment, the pension, and nursing, rather than the expensive life insurance against death.

In addition, Japanese insurance industry has undergone the critical policy shift towards deregulation since the mid-1990s. Efforts to liberalize the industry have resulted in both the removal of many barriers to market entry and the promotion of cross-sectoral entry of life insurers and non-life insurers. It led to stiffer market competition. Under these circumstances, each insurance company must not only work harder at product differentiation but also create service innovation to survive.

Insurance companies will have to make changes to their traditional business models to attract and retain customers that are increasingly price-conscious while seeking better, more customized service. Understanding how happy current customers are with their insurance products and what factors affect their satisfaction/dissatisfaction helps insurers understand what service innovation they should tackle with.

From many areas of insurance that the life and non-life insurers cover, this study concentrates on the private medical insurance field in Japan, excluding national health insurance. It is because the private medical insurance market has historically been complicated but hot topic. The research goal is to elucidate customers' perceived value structure regarding medical insurance products and to obtain knowledge useful for performing business innovation of medical insurance. For the purpose, the actual customer survey data regarding medical insurance was analyzed using the theory and method of Bayesian networks.

This paper is organized as follows. Section 2 introduces the outline of Japanese insurance industry focusing on the medical coverage after 1990s. Section 3 explains the data and method, which were employed to elucidate the customers' perceived value structure regarding medical insurance products. Section 4 discusses the direction of measures for performing business innovation based on results of the analysis and empirical evidence concerning medical insurance. Section 5 provides the conclusions.

## 2 Japanese Insurance Industry Concerning Medical Care after 1990s

Japanese life and non-life insurance industry used to be heavily regulated. However, the situation changed after the mid-1990s. The insurance industry has undergone drastic changes since the new Insurance Business Law became effective in 1996, as aiming to loosen regulations on insurance companies. This law newly established Sector III Medical Insurance, the third field insurance services including medical insurance and nursing insurance [1]. By contrast, two other insurance fields had

already existed: Sector I Life Insurance including the whole life insurance and the ordinary term insurance, and Sector II Property and Casualty Insurance including the automobile insurance and the fire insurance. Before the law was implemented, foreign companies had monopolized the insurance services virtually classified into Sector III. However, the law allowed both life insurers and non-life insurers to enter Sector III, so that a variety of medical insurance products were launched in the market.

The number of contracts of the medical insurance belonging to Sector III has increased continuously since 2001. However, the way of adding a medical special contract to a Sector I Life Insurance product constitutes a still significant share of the medical service coverage in Japan. The market of the medical coverage is very competitive and complicated where it is still unclear how and why consumers choose insurance products.

Focusing on private medical insurance products containing both an insurance product of Sector III Medical Insurance and a medical special contract attaching to Sector I Life Insurance, this study explores the customers' perception and behavior about those commercial products and service.

### 3 Analysis of Survey Data Using Bayesian Network

We employed a probabilistic graphical model having the conditional dependency structure between random variables in order to explain customers' perception and behavior concerning medical insurance products. The theory and method was called a Bayesian network or belief network. A Bayesian network modeling is a machine learning technique for empirically identifying associations in complex and high dimensional data, so-called "structure discovery" [2-6]. In this study a Bayesian network modeling was applied to identify the structure of the customer-perceived value, using the data from both the attitude survey toward medical insurance products and the awareness survey on health.

#### 3.1 Consumer survey data

The following two datasets of Internet survey performed by a private research company in Japan were used to infer the model structure explaining the customers' perception and behavior.

- Survey on Health Awareness (survey period: May 1 to 5, 2010)
- Survey on Medical Insurance Enrollment (survey period: December 1 to 5, 2010)

Of the 2,002 respondents who participated in both the surveys listed above, we analyzed data from 1,631 respondents who clearly indicated their medical insurance enrollment status. These respondents included only those who selected "I have a stand-alone medical insurance (Sector III)," "I have medical-service coverage as part of a special life insurance contract (Sector I)," "I have both stand-alone medical insurance and medical-service coverage as part of a special life insurance contract," or "I do not have medical insurance." The respondents were from throughout Japan without any specific regional variation. The breakdown for gender was 49% for males and 51% for females; and for age, 39% were 39 years and below, 35% were 40 to 49 years, and 26% were 50 years and above.

We extracted from the survey questionnaires the attributes that fell into one of the following seven major categories as being likely to be related to customer values on medical insurance. Accordingly, 67 attributes were selected in total, and then we conducted a Bayesian network analysis using them; the description of each category and the attributes within them is as follows.

##### 1) Demographic characteristics of a respondent (5 attributes)

These are answers to questions relating to gender, age group, marital status, presence of children, and household income levels.

##### 2) Health-conscious behaviors of a respondent (21 attributes)

These are yes or no answers to questions on 21 behavioral attributes about maintaining and improving health, such as "play sports," "walk as much as possible," and "eat breakfast every day."

##### 3) Perceptions on health of a respondent (9 attributes)

These are yes or no answers to questions on a respondent's perception about nine health awareness attributes, such as "want to live longer," and "don't want to be sick."

##### 4) Benefits sought from medical insurance products (15 attributes)

These are yes or no answers to questions on 15 medical insurance attributes to determine whether that benefit would be a decisive factor when a respondent select a product, including "inexpensive monthly premiums," and "lifetime premium payment period."

##### 5) Source of health information (9 attributes)

These are yes or no answers to questions on nine information sources, such as the TV, radios, newspapers, and the Internet, to determine whether a respondent obtained health information from these sources.

#### 6) Medical insurance purchase channels (5 attributes)

These are yes or no answers to questions to determine whether a respondent used one of five channels to enroll in their insurance, including “acquaintance or referral,” “sales visits,” and “direct mail or flyer.”

#### 7) Medical insurance evaluation attributes (3 attributes)

Answers to the following three questions were used as evaluation attributes: “medical insurance enrollment status,” “satisfaction with your current medical insurance,” and “considerations about renewing medical insurance in the future”

### 3.2 Method of analysis

Considering all attributes as stochastic variables constituting the Bayesian networks, we inferred the structure of the Bayesian networks from data. First, we set the three attributes of medical insurance evaluation as dependent variables to be explained and developed in advance some hypotheses about rough relationships among the seven attribute groups. After incorporating constraints according to each hypothesis, we searched for a reasonable graph structure of Bayesian networks. While changing the assumptions and search conditions, we searched for the best graph structure to describe dependencies between attributes. The BayoNet software package was used to infer the Bayesian network structure, where Greedy Search Algorithm was used as the search algorithm and Akaike’s Information Criterion (AIC) and Minimum Description Length (MDL) were used as the information criteria. We then evaluated the resulting multiple graphs using AIC as the indicator and selected the model with the lowest AIC value as the best one. In addition, we verified the resulting graph to ensure that there was no bidirectional relation-ship or circular reference. Once a best Bayesian network structure was obtained, we conducted the probabilistic inference to evaluate each attribute’s effect, where an algorithm of Loopy Belief Propagation functioned.

### 3.3 Results and discussion

#### 3.3.1 Graph Structure

Figure 1 illustrates a best model obtained by the Bayesian network structure search. This model had the lowest AIC value of 107064.9.

Based on this graph structure, we identified the following findings relating to medical insurance evaluation attributes, which are shown in Figure 1 as oval objects in bold line.

- ✓ The attribute directly related to “satisfaction with medical insurance” is “medical insurance enrollment status.” None of the attributes in “benefits sought from medical insurance products” is directly related to “satisfaction with medical insurance.”
- ✓ The attributes directly related to “medical insurance enrollment status” were the two purchase channels, “sales person/agent’s visit” and “acquaintance or referral.”
- ✓ The attributes directly related to “considerations about renewing medical insurance in the future” were the evaluation attribute, “satisfaction with medical insurance” and the information source attribute, “preferred method of using the Internet when selecting medical insurance.”

#### 3.3.2 Findings from probabilistic inference

The results of the probabilistic inference to evaluate each attribute’s effect were as follows. The most effective way to increase the satisfaction indicator was to set the medical insurance enrollment status to “I have a stand-alone medical insurance (Sector III),” which increased the satisfaction indicator from 42.0% to 56.5%. When customers purchase medical coverage as part of a special life insurance contract (Sector I), their satisfaction indicator slightly improves (44%); however, this is a lower satisfaction level than when “stand-alone medical insurance” was used. The second most effective way was to set the purchase channel to “acquaintance or referral,” which raises the satisfaction indicator to 47.8%. “Benefits sought from medical insurance products” did not have a significant impact on the satisfaction indicator; it was only 42.8% even when the most influential benefit attribute of “low monthly premiums” was used. Similarly, the satisfaction indicator remained at almost the same level (42.1%) when the “lifetime premium payment period” attribute was used. Among the attributes within “preferred method of using the Internet when selecting medical insurance,” “use the Internet to gather information only” was found to increase the satisfaction indicator. However, at 43.5% the level was not significantly higher.

**Figure 1 Customer-Perceived Value Model Obtained by Bayesian Network Structure Search**

### 3.3.3 Discussion

From the results mentioned above, we found that the type of insurance policy that the consumer had enrolled in significantly influenced their satisfaction with their medical insurance. Being enrolled in a stand-alone medical insurance (Sector III) was associated with a higher level of satisfaction than having a medical special contract as a part of a life Insurance (Sector I). At the same time, we found that purchase channels also have a profound effect on the customer satisfaction.

And moreover, customers prefer to collect information using information and communication technologies (ICTs), such as the Internet. However, the face-to-face and word-of-mouth communication, such as referrals from acquaintances, has the largest effect on satisfaction levels.

So when considering how to reflect these results in marketing strategies, we propose both product innovation and service innovation. Insurers should make an effort to understand the customer needs in varied situations and incorporate the solutions into the medical insurance product and service, which should belong to the stand-alone medical insurance (Sector III), because Sector III is much satisfying customers. It is vital for insurers to develop attractive content of insurance and also to curtail price increases of the monthly premiums. Insurers have to balance them through the innovation of the product and service.

On the other hand, insurers should notice that the face-to-face personal communication is currently considered more effective in this study than the communication provided over the Internet. However, today's customers are not interacting with insurers solely through an agent or a sales person. Consumers including potential customers are using not only Internet browsers and email software but also Twitter or

other social networking services. To succeed these days, it is not enough for personal-line insurers to excel at merely one of these channels. In short, insurers should connect with their customers across many channels, including face-to-face personal communication, websites in the Internet, Twitter, and Facebook. We call it a multiple channel policy, which is described in detail in the following section.

#### 4 Possible Measures for Insurance Business Innovation

The insurance industry now faces the rapidly proliferating array of consumer choices, just like other industries. So what sort of beneficial features do customers require from the medical insurance product and service? Figure 2 shows the top 10 list of customer requirements derived from the survey data used above. According to Figure 2, price is a major factor for insurance shoppers.

**Figure 2 Attributes Customers Require of the Medical Insurance Products and Service**

However, price is far from the only factor driving an acquisition decision. It is said that a today's typical consumer creates a simple list of potential insurers based on favorable perceptions of not only price, but also the following factors: trust in the brand, availability of coverage, and anticipated customer and claims service. Once a consumer determines that they have achieved an appropriate level of savings for the value he/she is receiving, he/she buys.

Just as automobile shopper may browse online before going into a dealership for a test drive, today's insurance customers appear to prefer to do their research online before making a contract with an agent or a sales person. Online channels provide a cost-effective way to educate and attract the potential consumer. In short, insurers having multiple channels will draw in customers most successfully by demonstrating that they have the capabilities to generate true value for their consumers (both price and service).

Online channels (such as social media and email) are cost-effective ways to maintain contact and build relationships when the right strategies are deployed. The face-to-face communication by an agent or a sales person is also critical to deepening the relationships with the important customers through customized coverage evaluations. An effective and integrated contact strategy makes the best use of all channels to deliver coordinated messages while driving more frequent interaction to build loyalty.

**Figure 3 Intention to Use the Internet, When Buying a Medical Insurance Product (in Total)**

Since there are several segments of target customers in the marketplace, insurers should select the combination of appropriate channels for each segment. Figure 3 shows customers' responses to the following question: how do you want to use the Internet when buying a medical insurance product? Figure 4 shows the breakdown of the same answer by a purchase channel that a respondent experienced when buying a current medical insurance product. The percentage of people who has the intention to make the most of the Internet when buying the medical insurance product is significantly different between the two groups, because of the difference of the purchase channel experienced. In the black part in Figure 3 this difference is especially remarkable. This indicates that the channel selection appropriate for a consumer segment is significantly important. Insurers can meet channel requirements by pinpointing their target customer segments and determining through which channels those customers want to interact.

An integrated, multi-channel model creates the opportunity to take advantage of the unique capabilities of each channel to drive interaction in a cost-effective manner. Of course, creating multiple channels in a company is challenging. However, the pursuit of the appropriate multiple channel system is a goal worth trying for, which leads to service innovation in an insurance company.

**Figure 4 Intention to Use the Internet, When Buying a Medical Insurance Product (Breakdown)**

### 5 Conclusion

In this study, we analyzed the structure of the customer-perceived value related to medical insurance products and demonstrated that a stand-alone medical insurance (Sector III) marked a higher level of satisfaction than a medical special contract as a part of a life Insurance (Sector I). We also indicated that the face-to-face personal communication is currently considered more effective in this study than the communication provided over the Internet. To succeed these days, however, insurers should connect with their customers using multiple channels, including face-to-face personal communication, websites in the Internet, Twitter, and Facebook. We illustrated that the channel selection appropriate for each consumer segment is significantly important to execute service innovation.

In the future, we will study the multiple channel effect by using a simulation so that we may better understand the dynamics of consumers' behavior when they select an insurance product. Specifically, we will carry out a multi-agent simulation by developing a model where various communication channels exist, such as word-of-mouth communication through face-to-face interaction, websites in the Internet, and social networking services when choosing a medical insurance product. The insights obtained will then be able to use to create more detailed strategy of the medical insurance business innovation.

**Abstract:** The business model innovation has become the important content in enterprise innovation in our country recently. This paper take the enterprise core value chain as a foundation, using the different change ways and its own foundation value activity innovation on the entire industrial chain, explained the process of enterprise business model innovation, then had pointed out five kinds of enterprise business model innovation type based on the ductility, partition, conformity, enhancement and mix and so on, namely value chain ductility, value chain partition, value chain enhancement, value chain conformity and value chain mixed type business model innovation.

**Key words:** Enterprise value chain, Industrial value chain, Business model

### 1 Introduction

Market competition become more and more intense, the enterprise wants to guarantee its own survival and the development, and obtain the competitive power which continues, they must innovate the business model. As Peter F. Drucker: "Now the competition between enterprise is not the product competition, but the competition of business model." Obviously, the business model is the enterprise competition highest shape, related to the enterprise life and death and the prosperity and decline, also success and failure. The enterprise's success must start from formulating the successful business model, the emerging new enterprise is this, the traditional old enterprise is so as well. After China's enterprise development has experienced the essential factor actuation and the investment actuation stage, now it has already entered the developed innovation actuation phase, the technological innovation is no doubt important, but it must take the business model innovation as the precondition, otherwise the market value of the technological innovation will be unable to realize<sup>[1]</sup>. But the enterprise business model's innovation practice depends on the study of the connotation, the innovation motive and the form mechanism of the enterprise business model. This paper carry on the analysis to the enterprise business model innovation's process and the type though the value chain theory, in order to impetus our country's native enterprise to carry on suitably, the effective enterprise business model innovation better.

### 2 Enterprise Business Model Innovation Process Based on Value Chain

Many overseas scholars mentions enterprise's value chain more or less when definite the enterprise business model. Rappa(2004) believed that the business model had stipulated the position that the enterprise in the value chain, and instructed it to how to make money. And further pointed out that the business model was clear about what activity the enterprise to carry out to create the value, how to select the upstream and the downstream partners' position in the value chain, and the income institutional arrangements type achieved with the customer. The business model is an enterprise's pattern of enterprises and the partner network to carry on the value creation, the value marketing and the value provide, as well as produce the customer capital which is profitable, and can maintain the income<sup>[2]</sup>. These limits or the elaboration on the enterprise business model is a enlightenment function for us to explain that the enterprise business model innovation.

According to Porter's "value chain analytic method", enterprise's value activity may divide into the basic activity and auxiliary activity. And the five basic activity includes internal rear service, production work, exterior rear service, marketing and sales service, the four auxiliary activity including the enterprise infrastructure, human resources management, the technology development and purchases.

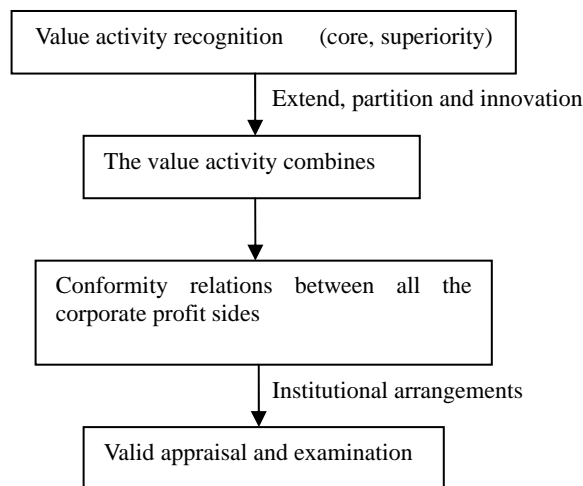

In the above nine kind of enterprise value activity contains many kinds of segmentation value activities and the value element, says generally, the porter's enterprise value chain included all the activity and the factor that has been able to create the value for the enterprise, also includes the enterprise organisational structure, the institutional arrangements, the value idea and the enterprise culture and so on. Porter also pointed out that the supplier value chain, the enterprise value chain, the channel value chain and the buyer value chain constituted the entire value system, the enterprise value chain connected with the

upstream supplier value chain and the downstream channel value chain at the same time, constitutes a complete industrial value chain(Figure 1). The value chain theory used is based on the enterprise core value chain (the classical value chain which porter defines), explained the enterprise how to realize the business model innovation by using different change ways on entire industrial value chain and own foundation value activity innovation.

**Figure 1 Industrial Value Chain**

Under the premise that did not consider the innovation to the value activity, The enterprise business model may constituted with the value activity on the entire strip value chain, or the industrial chain's fragment combination. under ability premise that in explicit exterior supposition condition, internal resources and ability, in some determination industry enterprise's business model is a function of the enterprise value chain, and may regard it as a enterprise gross value activity valid combination based on the value chain innovation, a total effective institutional arrangements realized by optimized conformity with the corporate profit side which involves these value activity. The enterprise may obtain the excess profit through the business model innovation. The enterprise may lengthen own foundation value catenuliform to become the enterprise business model, may also own foundation value chain partition, the function outsourcing reduce the value chain to form the enterprise business model, and also delaying and partition own foundation value chain at the same time to form the enterprise business model. May also carry on the innovation on one or many foundation value activity on the enterprise value chain to form the enterprise business model. What's more, the enterprise may choose one kind in the first three way to combine with the value activity to form the highly effective value module, finally links these value module to the effective value system. Because the industrial value chain has covered all value activity which the enterprise involved, this innovation based on the value chain can have a direct-viewing, clear, carry on the theory explanation comprehensively to the enterprise business model innovation. The enterprise may divided the value activity in the value chain into segmentation, distinguishes the superior and the inferiority in its own value activity, then optimize, reorganize, conformity and innovate among the exterior value activity, finally realizes the effective enterprise business model innovation(Figure 2).

**Figure 2 The Process of the Enterprise Business Model Innovation**

### 3 Enterprise Business Model Innovation Type Based on Value Chain

Known by the preamble analysis, the enterprise business model innovation is essentially a process that including the optimized choice, Improvement innovation to the inside and outside value activity, then arranges, the conformity to form the system again. According to the different formation mechanism

of the enterprise business model, may summarize for the following five kind of enterprise business model innovation.

### **3.1 Value chain delaying business model innovation**

This kind of business model innovation is in the enterprise value chain's foundation, through lengthens its both sides of the value activity, that is, extend to supplier value chain, the channel value chain and the customer value chain in the both sides of the profession value chain, or delays the similar value activity in certain value activity's lateral section to cause the enterprise value to cover the more value activities, for example the merger and acquisition of similar enterprise to realize the similar products' related multiplication, thus obtains the cost to be in the lead and the variation superiority<sup>[3]</sup>. Therefore, it may also divided into the delaying enterprise business model innovation to the longitudinal delaying enterprise business model innovation, crosswise delaying enterprise business model innovation and mix delaying enterprise business model innovation.

Delaying enterprise business model innovation makes the exterior value activity inside, this not only increased enterprise's value activity but also expanded the enterprise and each benefit side's relational network, including network value chain under enterprise's cooperation. The massive transaction cost can be saved through its effective institutional arrangements and the relational conformity (for example information search cost, negotiations cost and so on), to raise enterprise's whole response efficiency, then enhancement enterprise's whole competition strength and profit ability.

### **3.2 Value chain partition business model innovation**

The value chain partition enterprise pattern innovation is the partition, the peeling, the outsourcing on enterprise's foundational value activity, reduce the length of the enterprise value chain (reduce the length of the value activity), enterprise only retains these core value activity (these have the core competitiveness, and is imitated with difficulty value activity) and relative superiority value activity, based on this conformity the value activity's various benefits side particularly the partnerships, forms the effective institutional arrangements. This kind of enterprise business model innovation follows the basic principle that the total cost the enterprise engaged in the total cost which the foundation value activity produces to be higher than the new total cost which the value chain partition, the function outsourcing produces. The enterprise through the function outsourcing, may realize the resources, the essential factor and ability survival of the fittest with its partner enterprise, then reduce the total cost, enhance enterprise's agility and the flexibility, increase the enterprise excess profit. In value chain partition enterprise business model, the most representative is the OEM (Original Equipments Manufacture) pattern, that is the usually called sign production, the enterprise only retains the brand, the design, the finance and these essential value activity, but outsource the produce actives to the comparison superiority (is specially low cost) other enterprises.

### **3.3 Value chain enlargement business model innovation**

This kind of enterprise business model innovation is different from the former two types, it does not lengthen or reduce enterprise value chain, but only aims at the value activity innovation on the foundation value chain, thus forms core competencies that difficult to study or imitate. The value activity innovation is generally coordinates in several kind of value activities, both includes the technical stratification plane innovation, and the organisational structure, the institutional arrangements, the value idea and the enterprise culture stratification plane innovation, it's difficult for other enterprise to imitate. This enterprise business model formed by this kind of value activity innovation may have very strong cooperative effect, not only raises enterprise's operation efficiency, but also reduces enterprise's operation cost, enhance enterprise's core competitiveness<sup>[4]</sup>.

The product core value promotion and the core multiplication through the technological innovation are more common in the value chain enlargement business model innovation, then forms the unique enterprise business model.

### **3.4 Value chain delaying and the partition unify business model innovation**

Value chain delaying and the partition unify business model innovation is actually the synthesis of the first and the second kind of enterprise business model innovation. This kind of enterprise business model innovation is the partition and the outsourcing to the enterprise foundation value activity, also integrates enterprise's outside value activity into the enterprise value system, then optimized conformity the value activity and the benefit side relations, selects the effective organization method and the institutional arrangements. Therefore, it has the model merit both of the former two kinds. On the one hand, delays through the value chain, the enterprise may obtain the cost advantage, the coordination superiority and the scope superiority; on the other hand, it may enhance the enterprise agility and the flexibility, realizes the resources and ability survival of the fittest through the value chain partition, so it

may enhance enterprise's whole competitive advantage to a great extent. This kind of enterprise business model's success operation is very complex in reality, it requests the enterprise first to distinguish in own foundation value chain's superiority value activity and the inferiority value activity very prudently, then carries on the partition to it, meanwhile requests the enterprise to integrate own outside value activity into the enterprise value chain, and carries on the conformity to optimize to realize the whole cooperative effect.

### **3.5 Mixed enterprise business model innovation**

Mixed enterprise business model innovation is formed by introducing the innovative activities into the first, the second, and the fourth kind of enterprise business model. Therefore, it may also subdivide for the delaying innovation, partition innovation and delaying and partition mix innovation. The delaying innovation enterprise business model is formed by carrying on the innovation to its value activity ; the partition innovation enterprise business model is formed by the innovation on the superiority value activity after the partition; delaying and the partition mix innovation enterprise business model is on the foundation that delaying and the partition of the enterprise value chain, formed by optimized conformity the value activity after combining, including the value chain's delaying and the partition, the technological innovation, the institutional innovations, the organization way innovation and the cultural innovation and so on, it is the most complex, most competition vigor moreover to be also most difficult to be imitate in all the business model innovation.

The mix innovation enterprise business model is the most common kind of business model in the reality, because the enterprise must act according to own superiority to carry on the innovation unceasingly if they want to have the long-term maintains certain competitive advantage at the intense market competition. On the one hand, realize the survival of the fittest and the nimble response through value chain's delaying, the partition, obtains the cost to be in the lead with the management coordination; on the other hand, enhance enterprise core competitiveness, sharpens the enterprise variation business capacity through the value activity's innovation, create more values for the enterprise and the customer.

## **4 Conclusions**

The paper believed that the enterprise business model actually is an enterprise to carry on the value creation, the value marketing and the value provide the pattern of enterprises and the partner network forms, as well as produces the customer capital that is profitable, and can maintain the income, and the industrial value chain has covered the gross value activity which the enterprise can involved. Therefore, the enterprise business model innovation is essentially a process that the optimized choice, the improvement innovation and the reorganization conformity on the total value activity on the industrial chain. Based on the above understanding, the paper has analyzed the enterprise business model innovation process, predominant type and mechanism based on the industrial value chain. This research has certainly practical significance regarding to the instruction enterprise business model innovation.

# Research and Analysis of Budget Methods of Marketing Expenditure Based on Flexibility

Dai Shengli, Zhou Ying

College of Public Administration, Central China Normal University, Wuhan, P. R. China, 430079

(E-mail: storymaker@163.com, zhou.ying221@163.com)

**Abstract:** In recent years, the enterprise marketing expenditure budget has been the research hotspot in the fields of academy and industry all over the world. This article puts forward an idea that selecting budget methods of marketing expenditure should use flexible, dynamic idea, and it discusses the application of flexible budget method and rolling budget method in details, and builds a flexible operational mechanism to adjust the marketing expenditure effectively. Finally, it reaches the following conclusions: marketing expenditure budget based on flexibility is inevitable; available resources of enterprises, market conditions and opportunities should be considered in marketing expenditure budget; the combination of flexible budget method and rolling budget method is more effective, etc.

**Key words:** Flexibility; Marketing expenditure; Budget; Literature Research Method; Mathematical Model Method

## 1 Introduction

The enterprise marketing expenditure represents the expenditure which is used by enterprises for marketing management activities and practices in order to realize business objectives. With the trend of economic globalization, marketing expenditure in most enterprises is turning up sharply, which gobbles up a great deal of enterprise profits, and the proportion of marketing expenditure in the enterprise operational cost is increasing gradually. Therefore, more and more attention is being paid to the subject that includes how to form a flexible financial management that contains higher capabilities of external environment adaptability and internal resources integration, and how to utilize the marketing expenditure budget methods based on flexibility.

In foreign countries, the research of marketing expenditure budget mainly focuses on the analysis of marketing budget methods. Gary L. Lilien and John D. C. Little<sup>[1]</sup> analyzed a new method-the ADVISOR Project, which has higher adaptability. Nigel F. Piercy<sup>[2]</sup> proposed an organisational framework of enterprise marketing budget. B. Ramaseshan<sup>[3]</sup> pointed out that the common marketing budget methods resulted in the deviation between the theories and practices, so it's very necessary to propose a more complete, precise budget method. In China, the research mainly focuses on the analysis of marketing budget management. Song Lijun<sup>[4]</sup> proposed that there exist some problems in the budget management of marketing expenditure in China, such as the weak internal controlling of enterprise, imperfect organization of budget management, etc.

All the literatures above provide a sound basis for further study in this field. However, the researches on the quantity and quality of the specific budget methods of marketing expenditure are few. Therefore, this article will analyze the budget methods of marketing expenditure based on flexibility, in order to provide some theoretical supports and practical references for enterprises.

## 2 The Idea of Flexibility

### 2.1 Flexibility

Under the conditions of market economy, implementing a flexible marketing budget to adapt to changes in marketing environment have become inevitable trends. Originally, flexibility was a kind of "People-Oriented" management mode, while now it has changed to a management capacity-"response and adaptation to changes". So, the "flexibility" represents a kind of capacity that a system quickly and economically adapts to changes and uncertainty triggered by environment. In essence, flexibility refers to the capabilities of external environment adaptability and internal resources integration.

### 2.2 Financial flexibility

The financial flexibility means a sustainable, effective ability, enterprises have, to integrate the internal and external resources, and to cope with the environment of uncertainty and ambiguity in financial management system. It requests the enterprise to be able to adapt to changes, use changes, and create changes, which could develop enterprises' dynamic competitiveness, and achieve the financial goal. Specifically, it includes four kinds of abilities: buffer capacity, adaptability, coordination, and

innovation ability.

### 3 Marketing Expenditure Budget

#### 3.1 The definition and content of marketing expenditure budget

Marketing expenditure budget means making a budget for all expenditures used in enterprise marketing practices and activities. According to the marketing expenditure behavior, we can divide it into three types: fixed marketing expenditure budget, semi fixed marketing expenditure budget and variable marketing expenditure budget. Fixed marketing expenditures include the salesmen’s salary, rent of office space, etc. Semi fixed marketing expenditures include after-sales service expenses, advertisements and PR activity expenses. Variable marketing expenditures include expenses aiming at promoting selling the product, salesmen’s commission award. The types of marketing expenditures are given in Table 1, which takes the example of E-Lay Company in 2012. (Unit: ten thousands)

**Table 1 The marketing expenditure budget of E-Lay Company in 2012**

No.	Types		Contents	Unit expenditure	Total unit expenditure	Budget portfolio
1	Fixed expenditure		Salesmen’s salary	0.0296	0.0679	2000
			Rent of office space	0.0300		
			Office expenses	0.0001		
			Other	0.0082		
2	Semi fixed expenditure	Fixed part	Advertisements	0.0450	0.0453	2000
			PR activity expenses	0.0003		
	Alterable part	Logistics expenses	0.0400	0.0630	2000	
		Other	0.0230			
3	Variable expenditure		Promotion expenses	0.0050	0.0706	2000
			Salesmen’s commission	0.0337		
			Other	0.0319		

#### 3.2 The factors should be considered in selecting the methods of marketing expenditure budget

When selecting the methods of marketing expenditure budget, enterprises should consider all kinds of factors, such as available resources of enterprises, market competition conditions, market opportunity conditions, and other uncertain factors. Table.2 shows the factors and their contents or examples.

**Table 2 The factors should be considered in selecting the methods of marketing expenditure budget**

No.	Factors	Contents /Examples
1	Available resources of enterprises	Size of enterprise, reserves for marketing expenditure, enterprise culture, PLC (product life cycle), financial technology, etc.
2	Market competition conditions	Quantity of competitors, marketing strategies of competitors(especially the leading enterprise) ,etc.
3	Market opportunity conditions	Demands which have not been met , such as market opportunities of products, industry, regions ,etc.
4	Other uncertain factors	Consumption psychology of consumers, all kinds of possible crises(such as the problem of product safety, the contradiction between the consumers and salesmen), etc.

### 4 Analyses of Budget Methods of Marketing Expenditure Based on Flexibility

#### 4.1 The model of flexible budget method

##### 4.1.1 The definition of flexible budget method

The flexible budget represents the expenditure formulating mode based on the analysis of expenditure behavior, which is used to reflect the expenditure level and the income level under different professional competence according to the relevant budget amount calculated out by various portfolio levels predicted by plans or budgets. The flexible budget is adjusted in accordance with the portfolio changes, and many kinds of portfolio changes in the plan period are considered in this method. Thereby, it is also called the alteration budget. The basic premise of flexible budget is to classify all the cost into variable expenses, constant expenses and semi variable expenses according to the expenditure characteristic and state (the dependence relationship between the total expenditure changes and the portfolio level).

##### 4.1.2 The model of flexible budget method

Suppose the relation between budgeting enterprise marketing expenditure and the portfolio is the typical linear relation, then the way to budget the marketing expenditure would be like the following.

$$Y = (a + b_1) + (b_2 + c) X \quad (1)$$

In the formula,  $Y$  represents the total marketing expenditure of the budget. The  $a$  represents the constant expenses of the budget,  $b_1$  represents the fixed part of the semi constant marketing expenses of the budget,  $b_2$  represents the amount that the alterable part of the semi constant expenses allocated to the unit's business in the budget. The  $c$  represents the variable expenses of the unit budget, and  $X$  represents the budget portfolio. Table 1 gives an example of marketing expenditures of E-Lay Company in 2012. According to the formula (1), we can get that:

$$\text{Known } a = 0.0679 * 2000 = 135.8,$$

$$b_1 = 0.0453 * 2000 = 90.6,$$

$$b_2 = 0.0630, c = 0.0706, X = 2000,$$

$$\text{Thus } Y = (a + b_1) + (b_2 + c) X = (135.8 + 90.6) + (0.0630 + 0.0706) * 2000 = 493.6.$$

Some discussions about  $a$ ,  $b_1$ ,  $b_2$ ,  $c$  in the formula will be carried out as the following.

As for  $c$ , the variable expenses, the total amount will be changed in proportion with the portfolio. The unit expenditure is not influenced by the output changes, and its amount keeps in a specified level all the time. The budget of the variable expenses is calculated by the ascertained budget value of unit change timing the portfolio anticipated.

From the static aspects, the budget method of  $c$ , the variable expenses of the unit budget in marketing expenditure, can be done by the flow in the chart 1 with synthetic consideration of the following factors, such as market competition conditions, market opportunity conditions, profit conditions of enterprise unit's business and enterprise implementation ability, etc. It would be wrong to only consider some single factor or the enterprise leader's personal favor to decide the budget of unit's variable expenses.

From the dynamic angle, the budget of  $c$ , the variable expenses, is mainly about to add one emergency response mechanism in the process of the marketing expenditure budget. And then according to the specific industrial circumstances of the enterprise, the adjustment of the marketing expenditure budget can be carried out every three months or every half a year on the basis of the practical conditions of the portfolio to decrease the marketing expenditure waste caused by the absence of the adjustment mechanism.

As for the fixed marketing expenses, since its total amount is not influenced by the portfolio changing in the related areas, there are difficulties to budget it by carrying out the flexible budget method directly. The idea of budget this part of expenditure is to consider the integration of the resource conditions of enterprises, the market competition conditions, the enterprise tactics and the market opportunity conditions synthetically, and then decide the total investment amount of the fixed marketing expenses of enterprises.

The model is as the following:

$$I_g = f(x_1, x_2, \dots, x_n) \quad (2)$$

In the formula (2),  $I_g$  represents the investment amount of the fixed marketing expenses. The  $f$  represents the investment function of the fixed marketing expenses. And  $x_1, x_2, \dots, x_n$  represent the decisive factors of the investment amount of the fixed marketing expenses.

As for  $b$ , the semi variable expenses, though its total amount is influenced by the changing of the portfolio level, the alteration range keeps no strict proportion with different portfolio changes. In fact, it is the mixed expenditure mingled with  $b_1$ , the restraining constant expenses, and  $b_2$ , the considering constant expenses. The constant expenses mainly belong to the marketing ability expenditure, which is related with the formation of the whole enterprise marketing ability and its regular upkeep. Once the enterprise marketing ability formed, it is very difficult to make a significant change in a short period. It will exist a long period to anticipate the related expenditure. Thereby, the restraining constant expenses are unavoidable and need to be fully satisfied preferentially. They have certain controllability. But the considering constant expenses are comparatively more flexible and the amount can be ascertained by the income situation of the unit and the operational need. They have a kind of uncontrollability. Thus to ascertain the budget amount of the considering constant expenses reasonably is the most important factor to make full advantages of the budget for controlling the constant expenses.

Hence, as for the budget of the semi variable expenses  $b$ , at first,  $b$  should be disassembled into  $b_1$ , the restraining constant expenses and  $b_2$ , the considering constant expenses. Then budget  $b_1$  by the budget method of fixed marketing expenses, and budget  $b_2$  by the budget method of variable marketing

expenses.

**4.2 The model of rolling budget method**

**4.2.1 The definition of rolling budget method**

Rolling budget method is also called sustained budget. It means according to the principle of paying particular attention to the recent situation in details and a rough attention to the future briefly, on the basis of the budget completion situation of last term, to adjust and concretely formulate the budget of the next term, and roll the period of budget formulating forward regularly and sustainably to keep a certain time range among the budget.

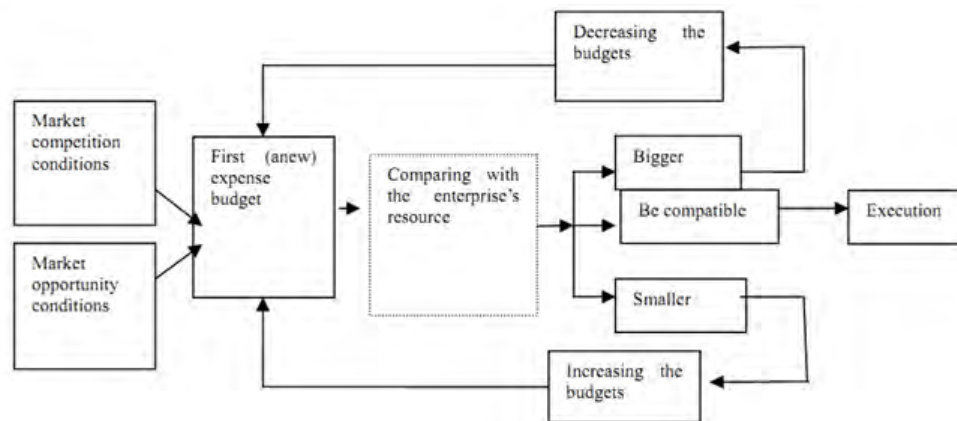

**4.2.2 The model of rolling budget method**

The model of rolling budget method in the marketing expenditure budget may be consulted from the above-mentioned application methods of the flexible budget method in the marketing expenditure. The marketing expenditure can be divided into the fixed marketing expenses, the variable marketing expense and the semi variable marketing expenses, etc. The budget period may be extended longer when the rolling budget method is used for the fixed marketing expenses, such as a year or half a year. But the budget period needs to be shorter when it is used for the variable marketing expenses. The cost of the semi constant expenses budget can be classified into restraining fixed budget and considering fixed expenditure, and then the rolling budgets can be calculated by the periods of the constant expenses and the variable expenses respectively.

To budget the enterprise marketing expenditure with the rolling budget method can have the budget and the actual conditions fit more in each other and produce the best possible results of conducting and controlling. It is also helpful for various levels of the management crew in the enterprise marketing system to keep careful and detailed consideration and the comprehensive plan of the future marketing work to guarantee it carried out methodically.

**4.3 Integration mechanism of flexibility and marketing expenditure budget adjustment**

Making a marketing expenditure budget needs an all-sided consideration that includes company’s recourses and market competition. The basic flow chart, which is based on competition, market opportunities and resources, is illustrated in the Figure.1. The establishment of the integration mechanism between flexibility and budget adjustment of marketing expenditure should be set as the following.

**Figure 1 The Basic Flow Chart of Marketing Expenditure Budget Based on Competition, Marketing Opportunities and Resources**

**4.3.1 A certain amount of marketing expenditure reserves should be kept by decision-makers**

In the process of marketing decision-making, decision-makers should hold a certain amount of reserves for marketing expenditure adjustment in case of emergency. It needs to consider the available resources, market opportunities and other uncertain factors comprehensively, and be based on the principle of “effectively use, moderately loose”.

**4.3.2 Constructing specified organization of market analysis which concentrates on analyzing market opportunities, competitors’ dynamic situation and market emergencies**

For the convenience of decision-makers to adjust the marketing expenditure budget, the green channel through which analysts can suggest decision-makers directly should be established once market opportunities and competitors’ dynamic situation influencing the industry competition are discovered,

and a huge expenditure increase or decrease needed by market emergencies occurs.

#### 4.3.3 Constructing supervision and evaluation mechanism of marketing expenditure usage

Constructing a supervision and evaluation mechanism requires enterprises to make the following efforts: 1)formulating evaluation indices of marketing budget, include salesmen's performance, product market share, consumer satisfaction, added value of marketing profit, etc; 2) constructing salesmen's reward-punishment mechanism in order to control the marketing expenditure budget effectively.<sup>[5]</sup>

## 5 Conclusions

Through the research and analysis in this article, we can draw the following conclusions: 1) with the trend of economic globalization, adjusting the strategies and methods of enterprise financial management timely has stronger realistic significance; 2)decision-makers should consider the available resources, market strategies and opportunities of enterprises comprehensively when making the marketing expenditure budget; 3) selecting budget methods of marketing expenditure should use flexible, dynamic idea which combines resource guide, competition guide and market guide together; 4) the combination of flexible budget method and rolling budget method is more effective.

At the same time, we also should notice that, the research and analysis of budget methods of marketing expenditure based on flexibility in this article is not comprehensive enough, and the effectiveness of these budget methods in enterprises also needs to be carried out in practice test. I hope the analysis and research will provide theoretical supports and practical significances for further study of marketing expenditure budget.

# A Study Discussing Cultural Soft Power of the State and Its Enterprises Is the Fundamental Way to Be a Powerful Trading Country

Wang Haibin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail:wanghaibin@whut.edu.cn)

**Abstract:** In recent years, China's foreign trade surplus, especially U.S. trade surplus, has aroused broad international interest, even leading some countries to react as so-called "counter". At present, the production of a number of products in China are at the forefront of the world, the international balance of payments surplus is very large, but this does not mean that we are a powerful trading country, and does not urge the continued development of the national economy. In my opinion, in order to make the country strong and sustained development, we must foster the concept of powerful trading country, use soft power of the state and its enterprises as the correct and effective measure to be a powerful trading country. Speaking from the phenomenon level, trading is a kind of exchange among different regions, but from the essence level it is a process that makes an optimal allocation of resources among regions or countries. Therefore, the commodity exchange through the trading activities, in essence, is to maximize the regional or national interest through circulation of commodities. A country with large trading quantity is not always a country with strong trade power. A large trading country maybe is just the large volume of trade, rather than the maximization of the various national interests. For China's sustained economic and social development, it is not enough to be a large trading country, we have to build a powerful trading country. Building a powerful trading country, especially in the 21st century, could not depend on natural resources and cheap labor, but the cultural soft power of a state and enterprises. From the perspective of international trade, that is not to depend on the entity trade, but to depend on the trade in services. Therefore, it is the fundamental way solution of developing trade in services, constructing the powerful trading country, achieving sustainable development of China to enhance the soft power of our country and enterprises, to rely on the construction of China's traditional culture, which greatly improved the cultural quality and the level of knowledge of our people.

**Key words:** Trade; Powerful trading country; Soft power

## 1 Introduction

There has been over 30 years since China's starting reforming and opening up, and in the process of transition from planned economy to socialist market economic system with Chinese characteristics, the strength of market opening and international dependence is still increasing. In the last 30 years, we have took full advantage of the comparative advantages of large cheap labor supplies and relatively sufficient natural resources is to actively participate in international economic cooperation and competition, achieve China's rapid economic growth, and the scale of international trade has been top ranked in the world. The year before last, China's GDP has surpassed Japan, has become the world's second largest economic entity; total exports exceeded that of Germany, the domestic trade is also very active; the long-term huge surplus of the international balance of payment has made China become a big country with veritable industry power and trade power. (See Table 1).

**Table 1 A Comparison Table among China, the United States, Japan and the EU in GDP , Steel Production, Coal Production, Oil Production and Automobile Manufacturing Volume in 2009**

Project Country	China	United States	EU	Japan
GDP (Unit: 100 million dollars)	87670	142600	145200	41410
Steel Production (Unit: 10,000 tons)	56780	5810	13910	8750
Coal Production (Unit: million tons)	1552.9	539.9	420.4	0.7
Oil Production (Unit: one hundred million tons)	1.89	3.253	8.548	-
Automobile Manufacturing Volume (Ten thousand)	1379	571	1524	793

Note: GDP data is from the the Huitong network; steel production data is from the statistics of the Brussels World Steel Association, January 22, 2010; coal production and oil production data is from" BP World Energy Statistics

2010"; the data of automobile manufacturing volume is from Association of China Automobile industry "in 2009 the world car production data".

However, the growth of GDP has brought the consumption of large quantities of resources and serious pollution of the environment and other issues. At the same time, the level of domestic consumption and the general national wage haven't been improved in a long term, and the rapid growth of national economy is fulfilled by an extensive management which relies on inputting all types of materials. (See Table 2)

**Table 2 2008 the World's Major Countries (Regions) of Trade in Services and Trade in Goods Accounted Situation**

Unit: one billion U.S. dollars

country/ region	Total foreign trade	Trade in Services		Trade in Goods	
		Sum	Proportion(%)	Sum	Proportion(%)
United States	4353	886	20.4	3467	79.6
Germany	3191	520	16.3	2671	83.7
Japan	1854	310	16.7	1544	83.3
England	1572	482	30.7	1090	69.3
France	1606	290	18.1	1316	81.9
Italy	1351	255	18.9	1096	81.1
China	2866	304	10.6	2562	89.7
Netherlands	1402	194	13.8	1208	86.2
India	559	197	35.2	362	64.8
EU	15435	3254	21.1	12181	78.9
<b>World</b>	<b>39742</b>	<b>7200</b>	<b>18.1</b>	<b>32542</b>	<b>81.9</b>

Therefore, in order to achieve the sustained and healthy development of national economy, to enhance our international competitiveness greatly, it is necessary for our country to range from a large trading country to a powerful trading country. There are some reasons. firstly, the high-end status of global value chain represents the great circulation ability, brand ability and value conversion ability, which belong to the horizontal division of labor in international processing, but China's current trade situation reflects the vertical division of labor, and in the lower end of the value chain; secondly, high production and labor efficiency is to use less inputs to output a relatively high value, while China's current trade situation reinforces the consuming of resource costs, the destruction of environment and ecology environmental and labor welfare and other issues, which do not meet the requirements of high efficiency; thirdly, at present, we take tangible products which are based on all kinds of resources to exchange with other countries intangible products which are based on knowledge service. The United States and other developed countries use knowledge and other intangible products to get our scarce resources. As for making international trading as a means to get international interests from the process of allocation of global resources, China is still very backward. Therefore, considering from a perspective of global strategic thinking, we must recognize the importance of changing from a large trading country to a powerful trading country, and need to see domestic trade and foreign trade as a whole.

April 18, 2010, the Ministry of Commerce in the Canton Fair held the transformation of foreign trade development mode report, and put forward at the meeting to initially achieve the goal of powerful trading country in 2030. There are two steps to achieve the goal. The first step is to consolidate the status as a large trading country before 2020, promote the process of powerful trading country; the second step, in 2030, initially to achieve the goal of powerful trading country. October 31, 2010, the National Institute of Business Economics, Beijing Technology and Business University with many universities professors and experts of circulation of commodities, held the first "powerful trading country" forum in Beijing, fully discussed a series of problems related to powerful trading country and published the "Beijing Declaration". However, although the social parties start to focus on the issue of "powerful trading country", there are still many basic theoretical questions have not been sorted out yet.

Furthermore, we must have a deep understanding of how to implement a powerful trading country.

## **2 The Essence of Trading is to Optimize Social Resources Among Countries**

The process of social reproduction is divided to four parts: distribution, exchange and consumption. Trading belongs to exchange part of which the essence is to achieve the balance and rebalance of social resources (Marxist "political economy critique"). In human society, due to the existence of Social specialization division and labor collaboration, people need to exchange products of labor in their producing and life. However, this is not the general sense of "exchange", under the condition of commodity economy, this exchange is essentially the mutual exchange of people's living labor or labor, and in social economic activities it is shown as Commodity Exchange. Marx said: " the developed form of exchange is trade ", trade is also the developed form of commodity circulation.

### **2.1 Exchange of commodities developing with the development of commodity economy**

Based on two basic premises of social division and labor products to different owners, and with the development of social productive forces, trade, as a specific commodity exchange activities, has experienced three stages, a direct barter between the producers, a concurrently trade between producers directly use the money as a medium and businessmen specialized trade. In the three stages, the contents of trade activities enrich constantly. The goods of exchange include both tangible goods such as production and consumption materials, and other intangible goods such as labor services; trading space is more and more wide, including regional trade activities, national trade activities, and the international trade among countries.

### **2.2 Exchange of commodities is an effective means of the balance and rebalance of various social resources among countries**

The form of commodity exchange and commodity circulation has transformed from direct bartering among producers to exchanging of tangible or intangible goods by merchant intermediation in vast areas of space.; the reason has transformed from the initial production constraints, which makes them not self-sufficient in some respects, to obtain the comparative advantage of using their own resources to conduct the selective production of the goods. On this point, the Western classical economists Adam Smith and Ricardo have a very brilliant complete exposition. Therefore, the substances of commodity circulation activities, the parties who participate in exchange activities meet their own multifaceted needs by exchanging their own goods. During the exchange process, the value of various social and natural resources is achieved behind the commodity exchange. In this sense, we believe that the essence of trade is to adjust the balance and rebalance of various types of social resources among countries.

### **2.3 International trade is the balance and rebalance of worldwide resources under the conditions of economic globalization**

Under the conditions of developed commodity, economic globalization has been deep into the various aspects of social-economic, the geographical scope of the trading activities is increasingly wide, the scope of the rebalance of social resources develop from national internal area to among countries. The domestic trade is the rebalance of the country's internal resources, which promotes the development of economy and culture around the country. At the first, because of the differences of the geographical environments, cultural practices, such as resource endowments, every area can take advantages of local resources, avoid weaknesses to establish a specialty manufacturing industry for fully improving the utilization rate of resources, which is conducive to the improvement of economic efficiency and the blend of inter-regional cultural. Secondly, the State may regulate the distribution of national income and consumer attitudes by the terms of trade and cultural values to guide the consumer demand, balance interests among the regions, industry to achieve coordinated development of the country.

International trade is the balance and rebalance of various types of resources in the worldwide under conditions of economic globalization. Firstly, the development of international trade makes each country complementary division of labor according to the production technology, the ratio of the factors of production, the difference of the production scale of to gain a win-win. Secondly, international trade strengthens the multifaceted contacts among countries. By the commodity circulation among countries, they obtain the respective differences in interests based on their own advantages, which greatly improve the strength of the country in all aspects.

## **3 The Powerful Trading Country is the Strategic Choice to Achieve National Strength and Prosperity**

According to the principle of Marx economics, the commodity circulation itself does not create any

value. However, the commodity circulation is an important way to achieve the value of the product, adjust market supply and demand. Merchandise trade makes the production and reproduction of the national economy, and promotes the development of national social-economic and the improvement of people's living standards. Therefore, the trade, especially the international trade among countries is a strategic choice to achieve national strength and prosperity which enhances the comprehensive strength of a nation.

### **3.1 A powerful trading country is firstly a large economic country**

The level of trading matches with the national economic strength. A country with a relative strong economic strength and suitable international trade dependency, will not strongly influenced by fluctuations of world economy, will not lose the leading role of trading on the economy. Furthermore, international trade will bring a positive impact on domestic industrial upgrading, which provides the implementation of trade policy a strong guarantee. China has become the second largest economic entity, but the per capita GDP does not reach the medium-level developed countries, so China does not belong to the powerful trading country.

### **3.2 The products outputting form powerful trading countries are mainly high value-added products and services products**

Powerful trading countries provide more competitive products, more likely to focus on trading of service products, and have strong influence on world trade. Powerful trading countries mainly import primary products, and export high value-added products. They rely on a highly developed service industry to extend their services to global chains, and control the value chains, to maximize national interests.

### **3.3 Powerful trading countries have many aspects of national competitiveness**

Powerful trading countries make multi-trade zones to resist risks. They have well-known multinational companies to form the country's microeconomic competitiveness which create a trade advantage by direct foreign investment and attracting foreign investment.

### **3.4 Powerful trading countries have the right of speech in international trade**

Powerful trading countries participate in the formulation and revision of the international trade rules, practices and standards. They have a certain discourse initiative in the international trade arena. By playing an important role in the formulation and revision of the rules, practices and standards, powerful trading countries obtain a favorable position to achieve a win-win situation in trade activities.

## **4 Constructing Cultural Soft Power of our country and Enterprises is the fundamental Way to be a Powerful Trading Country**

Soft power is relative to the material aspects of so-called "hard power", which is proposed by American Joseph Nye in the early 1990s, the so-called soft power is a country's cultural power, which includes three kinds of powers, the cultural attractions of the country, the country's political values, foreign policies with legal and moral authority. "Hard power" is manifested by economic, technological, military, while soft power is reflected by cultural, educational, ideological, political values, the National Literacy, which together constitute a country's comprehensive national strength. China can take the following specific approaches to enhance state soft power to achieve the strategic goal about being powerful trading country.

### **4.1 Change consumption ideas positively, stimulate domestic demand, enhance the strength of domestic trading**

Guiding and opening national consumer attitudes in order to stimulate domestic demand, and enhance the country's economic development efforts by the development of domestic trade, which will help to reduce the risk of domestic economy being influenced by international environmental impact. In addition, the appropriate guidance of the concept of people's spending could promote domestic industrial structure upgrading. For example, when the concept of low carbon environmental enjoys is supported popularly, people will reduce the consumption of products which consume a lot of resources, seriously pollute the environment. So the related production will be inhibited, and the resources are transferred to the industries of high-tech alternatives.

### **4.2 Integration of a wide range of educational resources, and constantly improving the quality of people's culture**

Improving the quality of national culture is helpful to shape the national cultural image, enhance the national reputation and establish a good relationship in international trading. Improving the quality of national expertise could help to change the situation that simple processing is in the dominant situation of China's international trade patterns, increase the technological content of export products,

and establish brands advantages, then to form the core culture-based competitiveness. The improvement of independent innovation capability also makes our rising position in the division of labor in the industrial chain, to improve foreign trading benefits of our country .

#### **4.3 Strengthen China's excellent traditional culture inheritance and dissemination**

Making the excellent traditional culture as a carrier is good to spread country's good image, strengthen national influence, to fully tap the intangible value of culture. At present, China's total exports and scale of cultural products are very small, the export channels very limited, the operating mode very simple. Because of China's rich cultural connotations, we can select the dominant species from them, focus on them to strengthen the brand, and encourage the diversification of its export content, or even make the product groups. About export channels, we can make full use of the Information Society advantage through the network platform, the formation of professional overseas distribution company, or rely on international distribution network that other countries establish to expand the scope of the spread of our culture. As an important part of the global trade in services, the prosperity of the export of cultural products is conducive to improve the product structure in China's international trade, improve the proportion of China's service exports, enhance national influence, and narrow the gap with trade powers.

#### **4.4 Strengthen international communication, build a good culture image of our country**

A country's cultural tradition is directly related to the country's foreign policies and the relationship with other countries. Establishing and disseminating the culture which is compatible with the development of national international trade, has positive and beneficial effects on the development of national international trading. In the 2009 Summer Davos Forum, Premier Wen Jiabao pointed out China's soft power is to respect all countries, especially developing countries, least developed countries, and try to help them when making our own development. Interpretation of China's soft power from Premier Wen Jiabao makes people understand the cultural values of China's friendship and respect of other countries, especially weak countries, which is conducive for China to gain more support in international trading activities. One nation alone can not accomplish these things, such as the expansion of trade areas, the establishment and operation of multinational corporations, fighting for right to speak on the development of the international trading system, rules and so on, we all need to find a community of interests and gain certain support from them, and these all need to strengthen the international contacts, establish a good image of the national culture.

## **5 Conclusion**

Trade is essentially a redistribution of resources, trade among countries is not only mutual exchange, is the redistribution of resources among countries. Therefore, trading among countries is the only way to realize the balance of resources and development. Facing the increasingly rising of labor costs and resource costs, price-competitive having to deal with more and more international trade disputes, we must achieve the transition from a large trading country to a powerful trading country, using the soft power of the state and enterprises to be a powerful trading country. First of all, we must change consumption ideas positively, stimulate domestic demand, enhance the strength of domestic trade; Secondly, integrate various education resources, and constantly improve the quality of Chinese culture; Thirdly, strengthen the inheritance and dissemination of China's excellent traditional culture. Finally, we should strengthen international exchanges and establish a good international image. Otherwise, we can't establish a powerful trading country, can't achieve a sustainable development of China's national economy more fastly.

# The Enlightenment of China's Religious Resources to Management Innovation

Zhang Yong

School of History and Culture, Central China Normal University, Wuhan, P.R.China, 430079

School of Art and Law, Wuhan University of Science and Technology, Wuhan, P.R.China, 430070

(E-mail: zhangyong@whut.edu.cn)

**Abstract:** This paper, in use of deduction and induction of philology, puts forward the view that management innovation can draw nutrition from Chinese religions. China's religions mainly include Buddhism, Taoism, Confucianism, Zen, Christianity and Islamism, The Taoist view "doing nothing" and "nature" thought, the Buddhist thought "the law of mutual causation of all actions" does not disappear, but strengthen and change economic management. This paper gives the outlines of the general distribution of China's religious resources, provides a roadmap of beneficial enlightenment of China's religious resources to management innovation, and points out the future development of the management innovation. The question is answered why dedication-orientated religion enjoys more longevity than the profit-aiming company. The paper will have good auxiliary function to the different levels and different stage of management innovation.

**Key words:** Management innovation; Religion; Resources; Righteousness; Nature; Lao-tzu

## 1 Introduction

As an organization form, religion is the most ancient group, which shows a lot of advantages: First, the expansion cost is low and it doesn't cost the headquarters money to build temples and each does their own. Second, it has no brand director, no religion saying it has a brand director, but the brand image is very consistent. Third, there are no very clearly-disciplined oversight mechanisms, and religion is supervising agencies for the afterlife with no cost, no need to raise people but with good results. Finally, the reputation and complaint of board is zero. You ask Avalokitesvara for offspring and finally give birth to a daughter. Do you go to destroy the temples? No, you donate money again and go back home to regenerate. If you analyze religion form, you will find that the organization exists in dispersed molecular state, coordinates with values and bears its own cost. This kind of organization behavior has low cost, effective result, and great economic benefit. From this perspective, the religious organization has a massive boost space to be researched to cultivate the sense of value of enterprise organization.

## 2 Research Status Quo

There are many achievements about Chinese philosophy of three religions in enterprise operation and management, innovation at home and abroad. From magazines or newspapers, you will find numerous papers related to them. Especially at the practical level, you will find more about them. Because there is a deep relation between the three Chinese religions, philosophy and Chinese culture, the three religion-related philosophy schools has special relationship with today's many popular phenomena. In addition, because the use of the noun is different, it shows that the name is different but the sense is the same, such as "Studies of Chinese ancient civilization" and "Oriental wisdom". In fact, they are based on the three religion-related philosophy schools.

There are many examples about Movers and Shakers, Mr. Rongjin Ge in his paper "Chinese philosophy wisdom and modern enterprise management". Many people talk about Confucianism management, such as Taiwan Scholar Mr. Shijiang Zeng in his paper "Blue Ocean Strategy"; Mr. Deyi An (From Wuhan) claims the relationship between Confucianism and business management. In terms of Buddhism, Mr. Dayuan Shi writes "Zen and the modern enterprise management" series of published books; Mr. Guoning Shi and Mr. Juezhen Shi deliver many speeches in public, advocating that the people should use the spirit of "out of the world to go into the society"; Peter M. Senge's book *The Fifth Discipline: The Art & Practice* is the guideline of enterprise management.

In terms of Taoism, Chinese well-known entrepreneur Mr. Ruimin Zhang, Mr. Yongxin Xue, advocate Taoist management thoughts, using Lao Zi's wisdom to get the enormous success of enterprise management. Mr. Ruimin Zhang has a motto to remember: one is the "all things come from the way, and the way comes from nothing, "and the weak overcomes the strong". Similarly, Japan, the United States and other western developed countries to praise highly of Taoist culture make Taoist thoughts

shine more brilliantly. The flexible management model in Japanese enterprise fully absorb the Laozi's water-like management. The Chinese scholar Tang Xiaofang discusses about the Taoist influence and function in the enterprise management in her course "the way of management". In Management innovation, there have been many discussed research programs. In the paper "Enterprise technology innovation and management innovation the coordination effect of research", Mr. Sun Jiang and Mr. Yang Yimei from Wuhan University of Technology, tells us that in the knowledge economy era, the innovation is important factor, which enterprise forms the core competitiveness and keeps the competitive advantage, and is also access of the enterprise survival and development. It also discusses about the connotation and characteristics of the technology innovation and the management innovation, and probes into the synergy of how to accurately grasp the technology innovation and management innovation.

Xue Jie from South China Normal University in "Management innovation concept and its formation mechanism", analyzes the connotation of the concept of management innovation from three perspectives: the content, the novel degree and purpose innovation. According to the enterprise internal evolution's point of view, based on the motivation, inventions, implementation, theoretical and communication, the research constructs the generating mechanism of management innovation of the conceptual framework, highlights the status and the interaction between the internal change subject and external change subject, and analyzed the ten key activities of the management innovation in the process of generating.

In short, there are many academic thesis. This is just the tip of the iceberg.

### **3 The Value and Trouble of the Management Innovation**

There are a group of well-known numbers. Apple Iphone can make \$187 from a mobile phone. and America, Japan. Korea and Taiwan engaged in the production of hardware get \$187, and China's mainland working on the assembly only gets \$6.54. Since 2006, Foxcom, the largest generation of label enterprise and Apple's biggest foundry enterprise has decreased its profit. The distribution profit of Iphone is 20% in Taiwan and 30% in the United States. This comparison proves an intentionally ignored fact that innovation consciousness, conformity ability and manufactory plants are in completely different status in the global industrial chain link.

Innovation is always risky. How is innovation to develop steadily? It is common that there exist monasteries for thousands of years, but it's rare that an enterprise can remain for hundreds years. According to a report, in America, about 62% of the enterprises lasts less than 5 years. The average life expectancy of small- and medium-sized enterprises is less than 7 years, the multinational company 10 to 20 years, and the global 500-strong enterprises 40-42 years, the top 1,000 enterprises 30 years. Only 2% of the enterprises live up to 50 years. But in Japan, the average life of a company is 30 years and only one enterprise has always ranked the top. It shows that company of China can last 7 to 8 years, the average life of small business as 2.9 years, and about 1 million enterprises closed down annually in China.

In order to improve the efficiency of the organization, our revolution is also going on. So how to change? There are two directions. One is religious organization, while the other special efficiency will be very high. Of course, the power and efficiency of this organization belong to the extreme example of religious organization.

## **4 Enlightenment of Chinese Religious resources to the Management Innovation**

### **4.1 The Belief Life of Contemporary Chinese**

According to the research of the implementation of the investigation in the summer of 2005, in the age of 16 years old and above of the Chinese people, with the number of religious belief is 31.4%. So, China has the religious beliefs of the population of about 300 million.

From the survey result, Catholic, Christianity, Islam, Buddhism and Taoism audiences account for 67.4% of the total, up to an absolute majority, a belief in the world of other religions of the 6%. In the survey, Buddhism, Taoism and folk beliefs add up 66.1% of the total, if on the total population, approximately 200 million people. For many years, the fastest growing Christian, In this century, s reach 16 million.

#### 4.2 The confucian philosophy of righteousness to the enlightenment of the management innovation

The representative figure of Confucianism is Confucius and Mencius, and the representative book is “the four books”. The representative speech (core value concept) is “benevolence”, “loyalty”, expansion of a “etiquette”, “wisdom”, and “faith”.

The TV series “family yard of Qiao” is our familiar programs, and with the program broadcast, Shanxi Province businessman returned to the audience view. There is a comment in CCTV documentary: Confucian requirements of “faith” and “loyalty”, traders in the activities were not abate, but get more strengthen, this gives us a warning: people often consider “loyalty” and “benefit” as the conflict, especially the Confucian classic “university” having such a word: “When money is scattered, the people gathered. When wealth gathered, people scattered...the ruler who gather wealth must follow the petty man... That is to say, the country is not for profit, but with righteousness as interest”. It often misleads us for: if you have loyalty, you won’t earn money; If you have good faith, you will lose benefit. Shanxi businessman’s practice of case tells us, loyalty can maintain long-term peace and stability and faithless business activities are very easy to cause the enterprise of loss and direct and indirect loss. Reflected from the Daxue (Rite, one of the Four Books ) tends to “justice” and intent, we will see that leaders should not struggle for profit with subjects and people, whereas for the businessman, business is business, it’s extremely legitimate. If your position and angle is different, you will have different conclusions.

Yoshitaka Kitao, the famous Japanese entrepreneurs, studies ancient Chinese philosophy and applies it to the modern enterprise management, and wins a great success. The main works are “the create value “business”, “create characters”, “from China’s ancient books get incredible power”. In a book the authors said: “I have great respect for the entrepreneurs Mr. Wade Ze, because he had combined moral with economy. The core of the doctrine is: business should be based on love. He gets abacus on the left hand, and “the analects” on the right hand, which has been called a right value in economy world.

He had been established more than 500 enterprises in Japanese capital market development period of high-speed growth age. So many established representative enterprise of Japan are associated with him. On one hand, he dives into the Confucianism, digests the Confucianism thought and theory, and corrects ethical values widely used in economic business expansion. On the other hand, in the scientific management field, he explores double-entry accounting in Japan. So, the true sense of the successful career should be the faith. And, this applies not only to enterprises, but also suitable for the state, the society, or any organization.

“We get the ethical values from” the analects, like three words: “benevolence”, “loyalty” and “faith”. The ‘aith’ is never regretted; the loyalty is doing the right thing; the “benevolence” is to stand in the other side to consider.

The success of Japanese enterprise is just the tip of the iceberg, from which we can know that the economic development background of the four small Asian dragons. They are in Asian Confucian cultural circle. So the Confucian culture plays an important role on the Asian economic development. But the strong condemnation of Confucius in 1971 during China’s “ultural revolution” almost led to breakdown of the national economy.

#### 4.2 The enlightenment of Taoist "Tao Te" to the theory of management innovation

When the chief Editor of "si ku quan shu" by Ji Xiaolan speaks of Taoism: "It's pretty subtle while it contains hundreds of theories". The representatives of Taoism are Laozi, Zhuangzi and Lieh-tzu, and the representative work, which is called in different names. The representative philosophy of Taoism is "Tao". "Tao rules nature", and Tao here refers to nature, the origin and crude in accordance with nature. In that case, obeying the rules of nature stands for virtue, and virtue can be shown in Tao, while Tao can be seen in virtue. However, this concept is different from the later morals in "ethics", which considers people who are nice and does good deeds. Tao can be good, evil; It can also be Yin, or Yang; It exists, and can also be nothing, as we just have to define.

People often associate Tao with words like "the fairy", "be divine", "be alive forever" and so on, which contains very deep ethics, but we are not going to talk about it. What does the Taoist doctrine contribute to the innovation of management? You don't know if you make no research. Let us just take two cases as example.

The Taoist (Lao zi) system contains rich and sophisticated management wisdom, which still has a unique and profound influence on the management of modern enterprise today. Lao Zi didn't elaborate something related to problems of enterprises. Just because of this, we have enough space for thinking, we should combine the Taoist spirit with modern enterprise management, combine the Oriental traditional culture with western modern civilization, take good for the bad, and walk into a distinctive way of modern enterprise management.

Giving an example, Feng Lun said: "I am zero".

As a boss of a famous estate, why is Feng Lun so moderate? "Ancient wise man often said, the water is so low that many things will come to it." Feng Lun began to concentrate on studies of history and philosophy from high school, and he stands in an ancient angle to think in a philosophy way. "Those who think they grow from zero into 1, into 100, are the man who overlooks history and time. If you look at history based on the vast infinite universe, people are actually extremely small. I think I'm actually nothing a '0'. Zero is zero, and zero can be nothing, as well as all."

The "Washington type" withdraw let Feng Lun totally retreat from Wantong Company, thus avoiding the bottleneck brought about by the enterprise founder's limitations of perspective, economic idea and health, and thus breaking down the threshold which most enterprises can never overcome in a 15-year's life cycle. And it gives him "a looking back opportunity" to Wantong Company.

The management philosophy "Not to last" refresh the enterprise. "I am zero, and zero isn't aggressive. So I can simply get along with friends, and usually it can last long." The core value that FengLun gave Beijing Vantone Real Estate Co., Ltd is simply four characters- "keeping and be surprising".

So what does it say in Taoist classic *Lao zi*? "the river carves out the valley by flowing beneath it. Thereby the river is the master of the valley. so the popularity of the sage does not fail, he does not contend, and no one contends against him." "Do not control the people with laws, nor violence nor espionage, but conquer them with inaction."

In addition, why is Li Ka-shing's industrial enterprise named after "the Yangtze River"? it also originates from the same philosophy. The great minds think alike.

#### 4.3 Enlightenments of Buddhist wisdom to management innovation

The creator of Buddhism is of the Indian Buddha, but Buddhism could not pass down in India, while China inherited this and carried it up, letting it combine with the Chinese culture, and thus forming Zen. Buddhist's representative theories are "four noble truths" and "twelve principal and subsidiary causes", with its core of "Cittamatra".

The core of management is the people, while the core of the management innovation is the development of hearts. The enterprise's personnel resources are simply classified into three types: First is the open of hearts, the consciousness of wisdom, which produce creativity; Second is the development of staffs' hearts, which creates enthusiasm; And third is resultant force produced both, namely the cohesive affinity and centripetal force of the enterprise itself. Unity is strength, which produces the soil of innovation.

The most representative theory is "directed at heart" from the Zen: run hearts rather than run products.

## 5 Conclusion

All in all, this paper thinks respectively from Confucianism, Buddhism, and the philosophy of the

Tao, combining with the innovation of enterprise management of the real cases, elaborate the beneficial enlightenments that Chinese religious resources bring about the innovation of management. Furthermore, the demands for the internal upper, middle and lower employees of the enterprise are different. Scholars think that the low-rank leaders should learn from the legislator school, following rules; that the middle-rank leaders should learn from the Confucian, following faithfulness; and that the upper-rank leaders should learn from Daoism, emphasize on changes and consequences. And we should also use different changes in different stages of management innovation. These will be our direction of next research.

## The Construction of University Marine Culture Core Value System: From a Cultural Management Perspective\*

Wang Xiao

Wuhan University of Technology, Wuhan, P.R. China, 430063

(E-mail: ttxs@whut.edu.cn)

**Abstract:** Constructing university marine culture core value system (UMCCVS) which aims to cultivate marine talents plays a significant role in the development of shipping business. However, few scholars at home and abroad have studied on this system. From the angle of cultural management, this article constructs UMCCUVS from 4 aspects, namely: substantial, behavioral, institutional and spiritual levels, and then discusses significance, connotation, characteristics, functions, construction approaches and goal of this system, which not only fills vacancy in this field theoretically but also serves as a reference for contemporary marine education.

**Key words:** Culture management; University marine culture; Core value system; Outstanding marine talents; Human—oriented thought

### 1 Introduction

Organisational culture management originates from the field of corporate management. But in our domestic studies, it has already been successfully applied into school management, and has exerted its educational function. Although university has its unique features, it shares the general features of an organization. Therefore organisational culture management is important theoretically and practically for exerting university culture's educational function.

University education highlights "human". Making human-oriented thought as its kernel, university cultural management can better satisfy peoples' self-realization needs than previous rational systematic management. University marine culture is an important part of university culture, which has common features of university culture, as well as the distinct characteristics of marine industry. However, contemporarily none research has been done on university marine culture, and not yet in university marine culture system theoretically, which leads to a series of problems unsolved in marine education. Therefore, this article, from the cultural management perspective, puts forward UMCCVS and makes a reference for cultivating outstanding marine talents and exerting culture's educational function.

The main achievements related are reviewed as follows:

1. Study on organisational culture in universities reflects western educational management in the mid 1980s focusing on subject values and beliefs, and emphasizing the trend of training cohesive force among organisational members and forming organisational culture (Bush, 1995).

Many authors have defined organisational culture over the last 30-40 years and as a result, the variety of approaches and definitions of organisational culture is considerable. It can be said that organisational culture is a diverse phenomenon that can take on different roles, perform different functions and be expressed in different ways.

Aboard studies of organisational culture in higher education flourishes thanks to overwhelmed highlights on this theme since 1980s. Making a literature review, major studies focuses on: 1) collegiate administrator perception on organisational culture (Felice, 2011); 2) culture categorization and analysis (Berquist & Pawlak, 2008; Kuh & Whitt, 1988; Clark, 1980); 3) institutional culture and subcultures (Kuh & Whitt, 1988; Masland, 1985; Adrianna & Peter, 2002); 4) culture framework or model (Tierney, 1988); 5) cultural assessment practice (Barbara et al., 2010); 5) indicators and approaches of organisational culture in higher education (Masland, 1985); 6) query on culture in higher education (Silver, 2003); 7) the relationship between culture and institutional transformation or change process (Keup, 2001; Adrianna & Peter, 2002)

The book "Cultural Perspectives on Higher Education" examines a range of cultural studies esp. making an overview of the history of cultural approach in higher education (Valimaa & Ylijoki, 2008). Among all these ideas, the voice against the "monolithic entities" view of higher education institutions emerges. Higher education institutions are fragmented into innumerable "small worlds" divided along the lines of disciplinary cultures, institutional traditions and resources, and the national systems of education (Clark 1987). The book "Academic Tribes and Territories" (Becher, 1989) has been

---

\* This paper is supported by "the Fundamental Research Funds for the Central Universities"

forerunner in creating a possibility for understanding the different “small worlds” of academia, namely, disciplinary cultures in future study, laying a basis for one of the popular cultural frames in the analyses of higher education.

2. As a kind of flexible management strategy, organisational culture management theory has completed the expansion from corporate management into school in China (Wu et al., 2006). Among the studies, the idea viewing school culture as a management theory is the product of accepting the western culture management theory. Along with the further enforcement of higher education reform, university culture management gradually becomes a common concern. Some universities emphasizing cultural forces and influences regard cultural construction as the current and future strategic task. Main research involves the following aspects: 1) Concept of university culture and its realization; 2) The trend from systematic management to cultural management in university; 3) The basic characteristics of university culture management; 4) Key elements of university culture management; 5) Connotation, strategies, principles of university; 6) Roles, trends, and strategies of university cultural management.

3. Through the current literature review, it can be found that study on culture management in university has aroused scholars' attention, with numerable fruits obtained on organisational culture in higher education institution, organisational culture managerial performance, etc.. But researches have some limitations: 1) not involving a specific industry with no connection with a certain industry's culture. Contemporarily, study on university marine culture at home and abroad remains blank. Rare study has been done relating outstanding marine talents to university culture and marine culture, let alone forming a system; 2) no considering the educational function and platform of university culture management. Besides university marine culture, the combination of university culture and marine culture, has received rare attention. Study for constructing UMCCVS and educational function of university marine culture lag far behind.

## **2 University Culture Management and Outstanding Talent Cultivation**

### **2.1 Introduction to the theory of organisational culture management**

The theory of organisational culture management dates back to the 1980s, marked by the book “Corporate Cultures: The Rites and Rituals of Corporate Life” coauthored by Terrence Deal and Alien Kennedy. Thereafter, cultural management theory has been widely used in corporate management practice with great success.

However, Organisational culture has been criticized as being conceptually weak, since it has been defined in many ways (Jelinek et al., 1983) and each definition emphasizes a particular focus or level. Among the practitioners, Schein was an especially influential scholar for his conceptual framework for analyzing and intervening organisational culture. Schein (1992) regards it as a multidimensional and multilevel concept by describing three levels of culture. The first level consists of visible organisational structures and actions, such as dress code, facilities and procedures. The second level consists of espoused values manifested in the public images of organizations, such as strategies, goals, and philosophies. The third level consists of basic assumptions, or unconscious beliefs, perceptions, thoughts, and feelings. These determine both behavior norms (the way people should behave) and organisational values (the things that are highly valued). Buono and Bowditch (1989) holds that the visible elements created by an organization on the first level are treated as objective organisational culture, while the elements on the second and the third levels are concerned with subjective organisational culture.

Studies have shown that organisational culture is a unique way of thinking, ethical style, value and norm of behavior widely accepted by members of the organization which are gradually created and formed in the process of social practice in a certain social, political, economic, and cultural background. Broad organisational culture includes not only the spiritual form, but also the physical form. Organisational culture has the following features: 1) It focuses on the values and beliefs of members of organizations; 2) It emphasizes the development of shared norms and meanings; 3) Culture is typically expressed through rituals and ceremonies which are used to support and celebrate beliefs and norms; 4) It assumes the existence of heroes and heroines who embody the values and beliefs of the organization (Bush, 2003). Culture Management theory shows how to affect an organization's culture to achieve the purpose of effective management of the organization, which is a supplement and improvement of the empirical management and systematic management theory (Wang, 2008).

### **2.2 The concept and role of university culture management**

Cultural management theory regards “human” as its fundamental factor and main concern. Therefore, this article holds that university culture management is the highest level of human-oriented

management, with its nature which takes human's overall development as the goal and creates a healthy and harmonious cultural atmosphere by means of substantial, institutional, behavioral, spiritual culture's combined role so that the staff and students would involve themselves into it and change from being management to self-restraint, which maximizes individual and social value thus finally achieves university's mission of shaping people. The roles of university culture management are as follows: 1) The guiding role. Making clear purpose and values of the university; 2) Encouraging function. Meeting the spiritual needs of human self-realization; 3) Cohesive function. To be cohesive to improve the university's self-worth and social value; 4) Shaping role. To create a good environment to improve people's sense of shared responsibility. 5) Radiant role. To establish a good social image of the university.

### **2.3 University cultural management and outstanding talents cultivation.**

The core content of university cultural construction and its main objective is to cultivate outstanding talents. University cultural management should be "human-oriented" to develop functions of guiding people, inspiring people, shaping people, uniting spirit, and establishing image, thus maximizing the social and individual values of university. Among the studies of outstanding talent cultivation, Wuhan University of Technology has established an outstanding talents cultivation system with "outstanding pursuit" and "outstanding capability" as basic features, which refines the standards of outstanding talents cultivation and shows direction for university culture management applying into outstanding talents cultivation.

At the same time, it should be recognized that different disciplines and specialties with characteristics reflects the industry demands. Industry's specific culture also proposes corresponding requirements for outstanding talents cultivation. So the integration of industry culture into university culture and the research of university culture with specific industry feature would provide more help to the talents cultivation in this industry. Therefore, on the basis of university culture and marine (industry) culture, the construction of UMCCVS plays an important role in outstanding marine talents cultivation

## **3 The Construction of University Marine Culture Core Value System**

Distinctive characteristics and its interaction with industry culture are the salient features of the university culture. This is due to the fact that different industries have different personnel demand and cultural heritage which requires unique hardware facilities, institutional culture and spiritual culture in university. These "different" and "unique" consist distinctive featured university culture. University marine culture is an important component.

However, as a navigational strong power possessing numerous seafarers and many marine universities and colleges, China has not established a complete university marine culture system in theory. This is due to the fact that, for a long time, most maritime colleges lack cognition and attention to marine culture reflected by limiting its purpose to developing navigational major courses and specialties, while ignoring integrity of university marine culture as an organic entity. The lack of university marine culture results in a series of realistic problems, for instance, lacking professional identity and interest, seaman's frequent job changing; no correspondence between student education mode and industry demand, etc. Remaining a bottleneck, these problems directly affect China's advanced seafarer supply and quality. Therefore, the construction of UMCCVS has vital theoretical and practical significance

Study on university culture and marine culture can offer some ideas to construct UCMCCVS. Through literature review, different opinions with different expressions can be found. University culture as a particular form of organisational culture can be defined "as the collective, mutually shaping patterns of norms, values, practices, beliefs, and assumptions that guide the behaviour of individuals and groups in an institute of higher education and provide a frame of reference within which to interpret the meaning of events and actions on and off campus" (Kuh & Whitt, 2000). William H. Bergquist & Kenneth Pawlak proposes six different, yet interrelated, cultures found in North American higher education: collegial, managerial, developmental, advocacy, virtual, and tangible culture (Berquist & Pawlak, 2008).

While the term organisational culture is used as if an organization has a monolithic culture, most organizations have more than one set of beliefs influencing the behavior of their members (Morgan, 1986; Sathe, 1985). The same phenomenon occurs on higher education with various collegiate subcultures. Cultural diversity appears to be more obvious in higher education institutions (Kuh & Whitt, 2000). As institutions and systems of higher education expand, academic culture tends to fragment.

Clark (1972) noted that institutions of the higher education may actually move from “integrated academic culture” to the “many cultures of the conglomeration”. Thus, university as an institutional entity clusters a series of subcultures reflected in various functional sections, which avails university marine culture a reasonable and feasible basis.

However, on the understanding of major views, in this article, university culture can be defined as the synthesis of value notion, behavior criterion, language habit, knowledge symbol, institutional system, regulation standard, campus construction and fund support with distinct comprehensive and educating features in the process of teaching and supervising through knowledge inheriting, sorting, exchanging and innovating. Marine culture is still a vague concept. Based on domestic research, marine culture can be defined as a synthesis of value notion, behavior criterion, supervision system, institutional regulation, business operation, knowledge skill, marine system, and fund support in accordance with the industry’s particularity and marines’ standard, professional, comprehensive quality, as well as responsibility and quality awareness gradually formed by marine organizations and individuals during the process of management and operational activities in marine circle.

Merging marine culture into university culture, the article tries to construct UMCCVS shown in Figure 1:

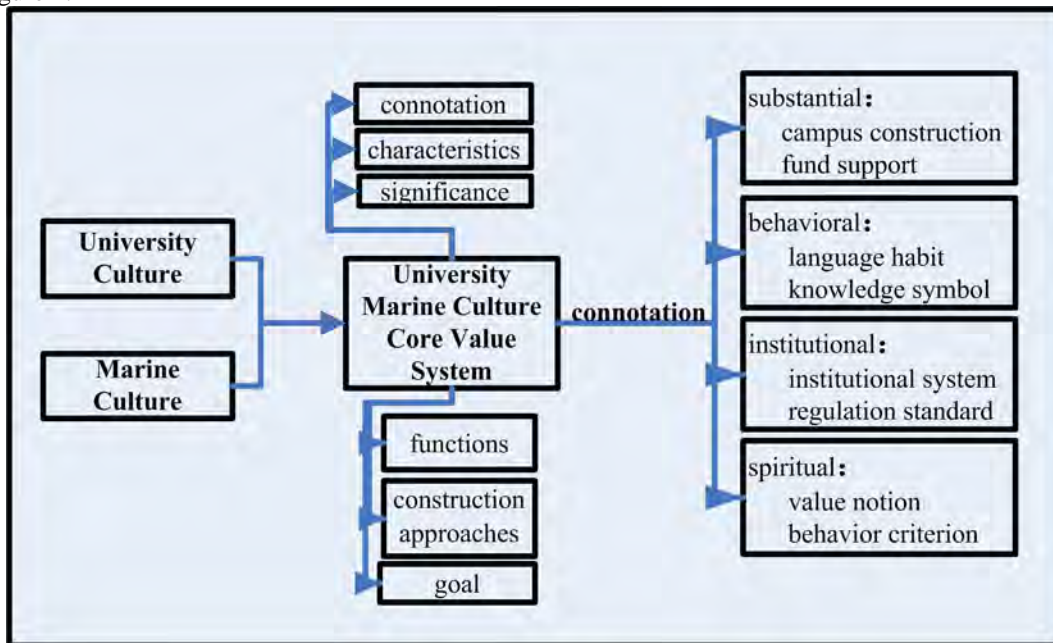

Figure 1 Structure of UMCCVS

**3.1 The significance of university marine culture**

University marine culture is of theoretical value and practical significance. The study on university marine culture may supplement university marine culture system theoretically, and play its roles, for instance, culture’s educating role, which helps solve many troubles caused by the notion of emphasizing professional skill while ignoring culture construction.

**3.2 The connotation of university marine culture**

At present, study on university culture and marine culture focuses on their concepts, roles etc. Based on previous analysis, this article suggests that university marine culture may be defined as integration of university culture and marine culture, in detail, a synthesis of value notion, behavior criterion, institutional system, regulation standard, language habit, knowledge symbol, campus construction, fund support which is a reflection of merging marine culture into 4 aspects of university culture, namely, substantial, behavioral, institutional and spiritual levels. For outstanding marine talents cultivation, university marine culture should satisfy the following 4 requirements: 1) having basic conditions and guarantees for cultivating talents meeting industry’s demand; 2) performing knowledge transfer and communication for improving industry quality and overall quality; 3) possessing a behavior system reflecting combined spirit of university and marine industry; 4) constructing regulation system reflecting marine industry’s particularity and university’s routine management.

**3.3 The characteristics of university marine culture**

University marine culture has common features of university culture and marine culture: 1) Quality foremost. To guarantee marine education's standardization, professionalism, comprehensiveness, a complete quality standard should be established. For example: maritime education and training quality system; 2) Distinct characteristics. According to the industry requirements, featured education and management pattern should be formed. For example, specialty setting highlights international standards.

### **3.4 The functions of university marine culture**

1) Marine culture inheritance. A main approach to cultivate talents is knowledge transfer and culture influence; 2) Marine cultural innovation. University marine culture helps urge exchanges of new ideas, knowledge and skills, thus improving industry's advance; 3) Marine culture pioneering. It mainly reflected by serving a culture pioneer in university, and industry, and broadening external communication.

### **3.5 The construction approaches of university marine culture**

It lies in exploring the realizing methods of outstanding marine talents cultivation from culture's educating angle, in detail, constructing marine culture's educating mechanism from 4 aspects: substantial, behavioral, institutional and spiritual aspects, and constructing marine culture's educating platform from 4 carriers: teaching and training, quality-oriented education, industry practice, and educational management.

### **3.6 The goal of university marine culture**

The goal is to maximize the value and function of university marine culture, thus improving comprehensive development of university, society and marine industry.

## **4 Conclusion**

Constructing UMCCVS is rather important for playing culture's educating role in respect of outstanding marine talents cultivation, as well as serving a reference for marine education. This article puts forward UMCCVS, a theoretical attempt, from the cultural management perspective as a reference for cultivating outstanding marine talents and exerting culture's educating function. But there remain weaknesses: 1) The study is not deep; 2) It lacks of empirical study. Future research should 1) make an in-depth research on UMCCVS by examining it in practice; 2) make a survey of marine industry's personnel demand, and continue exploring university marine culture's educating functions and methods.

## How to Construct “Living” Enterprise Culture?

Jiang Wei

Xinjiang Rita (Group) co., LTD, Wulumuqi, P.R. China, 830004  
(E-mail: jwei9696@126.com)

**Abstract:** This paper try to give an answer about how to construct “living” enterprise culture via criticizing and analyzing the formalistic enterprise culture. Through case study and literature analysis, the author offers four steps about constructing living enterprise culture: firstly, forming people-oriented awareness; secondly, understanding the value of enterprise ethic; thirdly, attaching great importance to traditional culture; fourthly, protruding the character of enterprise culture.

**Key Words:** Enterprise culture; Living; The character of enterprise culture

### 1 Introduction

In modern world, culture, economy and politics intermingle with each other, playing a more and more important role in competition of comprehensive national strength. As to a country, culture can create productivity, improve competitiveness, enhance attraction, and form cohesion (Matsumoto, 2009), which is related about the foundation of our country, our statecraft and way to develop our country. For the same reason, the effect and impact of the enterprise culture to an enterprise is self-evident (Merrill-Sands & Holvino, 2000). It is an important question how to construct a true “living” enterprise culture system. Through case study and literature analysis, this paper explains that how to construct a “living” enterprise culture.

### 2 Forming People-oriented Awareness

Human is the most positive, active, subjective factor of the production factors. The traditional Chinese culture has had the gene of people-oriented awareness. The ancients had realized the importance of human early: Zhen Guan Dignitaries recorded, “Water can not only carry the boat, but also can overturning it”, which refers to the principle for the feeling of the public. Liu Bang, first emperor of Han Dynasty, said “When it comes to the question of devising strategies within a command tent and deciding how to win, I am no match for Zhang Liang; when it comes to the question of governing a country, placating the citizens, raising military fund, dredging the food road, I am no match for Xiao He; directing millions of soldiers, winning every war and getting every city we want, I am no match for Han Xin; they are all extraordinary person, but they all listen to me, that is the reason why I can be the emperor of the country.”(Si Maqian, 1550)

As the development of our society, people-oriented awareness gradually becomes the symbol of civilization progress, and the modern enterprise has changed their way of object-oriented management to people-oriented management. People-oriented management asks the manager to regard the employee as the most important resource, and scientifically arrange one’s work as the employee’s ability, specialty, interest and mentality as well as considering the employee’s growth and values enough, respecting the employee’s personality and independent character. It can be done as the following aspects in detail.

Firstly, respect and care for the employee. Respecting one person is very important for association and management. In this aspect, MOTO, HP are the successful models, and respecting everyone is an important character of these enterprises’ enterprise culture. Human is the most emotional animal and needs others’ respect and trust. The enterprise should respect and trust the employees, regard them as friends who can be relied on, help them establish self-esteem and self-confident, and give them space to grow and develop. For example, if an enterprise bravely promotes the managers above middle-level in several years: two employees being promoted as vice-presidents, five employees being promoted as division managers, four employees being promoted as business supervisor. According to this way, it improves not only the cohesion of the enterprise, but also the competitiveness. Having the foundation of respect and trust, the enterprise should also start from preserving the employee’s interest and care for the employees truly via tangible action. For instance, an enterprise provides not only “Five Insurance and One Fund”, but also health care benefits to the employees, as well as giving them weekends and legal holidays liking the treatment for civil servants, so that the employees can feel that they are valued, respected. Therefore, the employees will see themselves as the host of the enterprise, and consciously connect the fate of the enterprise with their own career and future so that they are willing to devote all their working enthusiasm to the enterprise.

Secondly, found high-efficiency communication mechanism. In modern society, employee's emotional requirement becomes more and more strong, and a favorable communication mechanism is the foundation to fulfill this kind of requirement. Above all, an enterprise should found efficient way for communication, if the enterprise wants to have a high-efficiency communication mechanism (Hui, 1990). Besides, the enterprise should strengthen the communication between employees and the organization. The essence of communication is delivering and understanding, sharing the information resource, not negotiating and introducing. As a senior manager, if one can form a favorable listening habit, usually listen to his/her subordinates' sound, realize their requirements, and try his/her best to solve the employees' problem from both work and life, he/she can tremendously improve his/her subordinates' working enthusiasm.

Thirdly, form a self-managed team. In the era of knowledge economy, the employees regard work as a choice of lifestyle, not just a way to earning their living. They hope to seek self-development and achieve self-worth. Their requirement for work autonomy will replace the traditional state of passively accepting what their superior ordered. The employees want to get more autonomous right in their work from the organization, to participate the decision, to understand more responsibility and challenging work, and to share more information with their superiors. It is an important way to fulfill this requirement to form a self-managed team. Therefore, we have successively founded project team, the pre-researching project team, and sales team, and these teams get a certain right to using people and fund from the enterprise. After making a trial, the team's whole efficiency gets a full play.

Fourthly, satisfy the employee's requirement of continuously learning. The successful enterprise in the future will be a "learning organization", and the employee's requirement of continuously learning will be over the requirement of payment as before so that it will be an important standard for the employees to choosing a job whether the organization can provide them the opportunity to learn continuously. An enterprise should found a learning organization to embody the people-oriented culture, and it is the main function of human resources department to provide the employees a system, long-term, targeted training and offer different training to different employees. It will have a more obvious effect, if the enterprise gives the employees relevant training about their professional knowledge every week.

### **3 Understanding the Value of Enterprise Ethic**

An enterprise's vitality is not only embodied in respecting people, but also reflected more in enterprise ethic which is the enterprise's foundation to survive and the most fundamental construction of enterprise culture. The effect of enterprise ethic is reflected in: firstly, found a friendly, harmonious, coordinately developmental relationship between society, environment and the enterprise, which is the requirement of both the development of modern society and market economy and the development of modern enterprise; secondly, enterprise ethic is indispensable for correctly handling of the internal variety of relationships, resolving the various inner contradictions, and enhancing the internal unity and cohesion; thirdly, enterprise ethic can stimulate the employees' positivity and creativity, change personal action from heteronomy to autonomy, which is in favor of the enterprise to remain invincible in the competitive market.

For this reason, we mainly start from the following aspects:

Firstly, set the ethic goal of the enterprise; stick to the right management idea and moral ideal; unify the economic goal with the social moral goal, the economic benefit with the social benefit; emphasize the responsibility to the society and people's livelihood.

Secondly, formulate the ethic principles embraced by the enterprise, which should be implemented in operation decision and every other important action of the enterprise. Formulating ethic principles is building the enterprise's moral standards so that the enterprise's moral culture can be founded on the base of concrete principles and the staff can have concrete moral standards to comply with. The enterprise should attach great importance to the balance between "Regimes" and "Morality" instead of simply relying on deducting wages, bonus and welfare to restrain the employees' action. An enterprise should respect people's emotion instead of regarding human as "economic animal". The employees should truly realize that an enterprise would lose its common goal and right behavior principles, if it only paid attention to material and money without mentioning any ideal and morality.

Thirdly, enhance ethical education for the employees to change personal action from heteronomy to autonomy. It can improve the employees' mental consciousness and moral level to cultivate the employees' favorable "morality", and on the contrary, it will make people's hearts slack, be short of cohesion, and make the benefit decrease. For example, since an enterprise was created, the employer has

always been sticking to provide “a presented language” per week, which is unconsciously influenced to the employees’ morality and behavior principles. This corporation also takes advantage of every festival in a year to make traditional moral education to the employees, such as “Teachers’ Day”, “Mother’s Day”, “Father’s Day”, and “Double Ninth Festival”, and so on, which receives a more obvious effect.

Fourthly, the leaders and layers of cadres in a enterprise should lead by example, integrating heart to heart with the employees to the emotional extent, and often be close to the staff, listening to their voice, observing their opinions, knowing their feelings, being familiar with what they think, and implement solving ideological problems to solving practical problems. In recent years, the ideological work is often neglected. We should do ideological work, and meanwhile, carry out moral education so that the employees’ sense of morality, responsibility and view of honor and disgrace can be enhanced, which can help the employees consciously accept the norms and constrains of the enterprise culture, manage and control themselves automatically in accordance with the enterprise culture, and abide by the enterprise’s every regime more consciously, changing from passive management to active management.

#### **4 Attaching Great Importance to Traditional Culture**

In the modern enterprise culture management, it is an important goal to correctly handle of the internal variety of relationships, to resolve the various inner contradictions, and to enhance the internal unity and cohesion. To achieve this purpose, every enterprise culture cannot be separated with its local cultural traditions. The famous Swiss psychologist Carl Jung once presented the theory of “collective unconscious” in *Theory Analysis of the Relationship between Psychology and Poetry* published in 1922 (Jung, 1970), thinking that people’s unconsciousness should be divided into two levels: individual and non-individual. The former only need the extent of the baby’s earliest memory, which is composed by impulses, desires, vague perception and experience, while the latter includes all the time before the baby actually exists, including the residues of ancestral life, which can be found in everyone’s heart and is universal so that it is called “collective unconscious”.

According to Jung’s theory, the residues of ancestral life is existing, so any nation’s traditional culture and civilization can exist in our life with a form of residues.

As to our Chinese people and enterprises, China’s traditional culture provides us with many “ancestors” that have ever affected us and the outstanding cultural foundation that still impact us:

For example, as a kind of traditional values, the Confucian thoughts of “Harmony is the essential part of ritual applications”, “Serve the sovereignty and the county” are to maintain social stability and group harmony for the purpose, which emphasize the individual interests should be subordinate to the overall interests and consciously put oneself to the group in order to maintain the overall harmony and stability.

#### **5 Protruding the Character of Enterprise Culture**

The enterprise culture is an enterprise’s unique mode of management in certain cultural background, and the enterprise’s personalized performance. Because different enterprises have different leaders, the enterprises’ business development and composition of ingredients are different. The enterprises have their own strategy to reflect the environment and way to deal with internal conflicts. As a result, different enterprises naturally have different enterprises cultures.

However, some enterprises cannot really understand their own enterprise cultures in the construction process of enterprise culture, blindly copying other enterprises’ ideas, guidelines, visions and forms, ignoring the individuality, characteristics and content of the culture in their own enterprise.

An authority figure of enterprise culture Edgar Shaw thinks: the core of an enterprise is basic assumptions, and then is the level of value, followed by the level of conduct principles and behavior mode. Enterprise culture is a kind of basic assumption to human nature, value and world view formed in the process of entrepreneurship and development of an enterprise, as well as a condensation of business philosophy created by all the entrepreneurs in entrepreneurial process. The enterprise expresses these values and theories via various activities and forms, and after that, an enterprise culture is formed which is fresh, individualistic, vitality and really belongs to its own enterprise.

#### **6 Conclusions**

The 21<sup>st</sup> century is a century of cultural management and cultural victory. Every enterprise operator must learn, close to, grasp, and practice cultural management so that the enterprise can longevous. Only by establishing the above principles for construction of enterprise culture can the enterprise culture be a

living system that really plays a management role.

## A discussion of Management Mechanism Based on Marketing Channel Risk Conduction Mechanism

Zhang Lili

Economics and Management School of Wuhan University, Wuhan, P.R.China,430072

(E-mail: zhangllmail@yahoo.com.cn)

**Abstract:** Marketing channel, as an important part of enterprises marketing activities, has the characteristics of externality and complexity, facing lots of risks in its operation. The marketing channel risk management has always been an important field in the study of marketing channel management. This paper firstly analyses the marketing channel risk conduction mechanism. Then it gives views that marketing channel risk conduction is a process that risk factors carried by risk conduction carrier move along the risk chain to risk conduction receptor directionally, causing a risk event, eventually leading to a deviation between marketing channel performance and anticipating goal. On this basis, this article builds a management mechanism on channel risk conduction with the core of risk conduction block, risk conduction channelizing and risk conduction loss controlling, which aims to provide beneficial reference for the study on marketing channel risk management.

**Key words:** Marketing channel; Risk conduction; Management mechanism; Normative analysis

### 1 Introduction

Marketing channel, the transferring route for products and services, is an important system for enterprises to transfer products and services to customers, gaining competitive advantages and profits. Due to the characteristics of subject diversification and interest decentralization, marketing channel is more vulnerable to the internal and external impacts of environment. Its operation faces more risks, and comparing with other marketing tools, it is more difficult to control. Hence, it has become an important issue of marketing channel management to research on marketing channel risk conduction mechanism, establishing appropriate risk management mechanism and avoid the risk of marketing channel effectively.

Domestic and foreign scholars have done a lot of researches on marketing channel risk. Gallagher(1950)proposed the concept of risk management in his article "Risk Management in the Business Enterprise". Serena Williams and Hans (1965) used probability theory and mathematical statistics to analysis quantitatively and evaluate enterprise risk in their book "Risk Management Insurance". Domestic scholars. Ma Ying and Xie Kefan(2007) analyzed transferring ways and means of marketing channel risk chain, and furthermore used the Markovian model to make a quantitative study on the transfer. Zhang Jianwen (2007),based on the analysis of marketing channel risk types, put forward the Specific methods and steps of channel risk control. Wu Yane (2007) analyzed the types and origins of marketing channel risk, and put forward the marketing channel risk evaluation model based on Fuzzy Synthetic method. Li Zhengquan (2002) analyzed the origins of cost risk and early warning characteristics of every channel's self-supporting cost, and discussed how to establish early warning and prevention system of self-supporting channel cost risk. Rui Xinguo (2002), from the perspective of cost risk control, presented a channel cost review system and a channel cost early warning system to select outsourcing channel. Li Wei(2001) classified the marketing channel security and put forward early warning index of the corresponding marketing channel security. Hou Zhongyi (2004) applied the theory of crisis management to classify the crisis of the marketing channel, and put forward early warning model of marketing crisis , established a crisis early warning model of marketing channel in theory. Lv Shuchun analyzed channel design risk from the channel level and price aspect, and did researches on distributor management risk from the perspective of partners' selection. Wang Ziguang (2005),based on the particularity of the Chinese market, put forward the importance of straightening out the relationship between manufacturers and agents to prevent and dissolve the channel risk. Yao Junwen (2006) ,applying the theory of crisis management and early warning management, constructed the basic structure of early-warning management system of the marketing channel , established alarming index system of marketing channel risk, and put forward the measures of marketing crisis management. Zhang Shuyun(2005)put forward corresponding management mechanism to prevent and control credit-sale risk ,strengthening the management of receivable accounts. In order to adjust to the flexibility of marketing channel and improve the efficiency, Peng Xianqi(2005) established risk priority degree

evaluation model to adjust the sales channel flexibly for the enterprise and enhance the efficiency of sales channel. Chen Jiabing(2002) argued referred that the chosen distribution channel could not perform well or meet the objectives and then caused a series of adverse consequences, which was the distribution channel risk; the distribution channel risk included distributor risk, storing-transportation risk and payment risk; at the same time he studied their causes and control measures .Sun Lili (2008) did research on the marketing channel risk types and causes, and put forward measures to prevent marketing channel risk .The above researches undoubtedly provide beneficial guide and reference for this paper.

## 2 The Analysis of Marketing Channel Risk Conduction Mechanism

Referring to the description for the enterprise marketing risk by dr. Dai shengli <sup>[1]</sup>, we consider that the marketing channel risk conduction is the process that in the business marketing channel system, because of inevitable interference and effects of uncertain factors, some small deviation or uncertainty from one point in the initial moments are attached to all kinds of transmission carrier, being sent and spread in various forms to every point and surface in the enterprise marketing channel , which results in the deviation or failure of the goal of the enterprise marketing channel .

According to the above definition, marketing channel risk conduction mechanism could be depicted as: risk factors from risk source, carried by risk conduction carrier, directionally move along the risk chain to risk conduction receptor, and thus triggering risk events, which eventually lead to the deviation of the performance and expected goal of marketing channel. As is shown in figure 1 below.

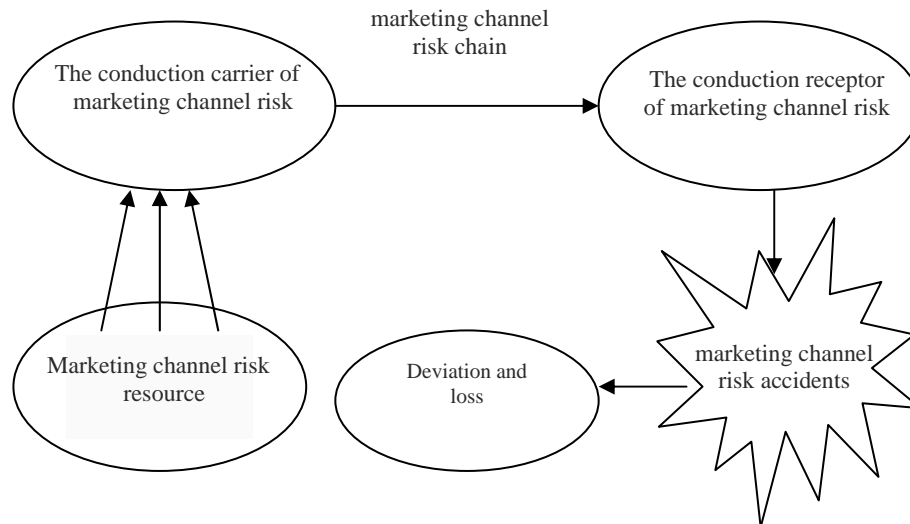

Figure 1 Marketing Channel Risk Conduction Mechanism

### 2.1 Marketing channel risk resource and risk factors

Marketing channel risk source is the collection of the unexpected changes and uncertainty factors in the marketing channel system, and also the origins to the deviation of goals and performance of marketing channel. It is the risk source that changes the equilibrium of internal and external environment in marketing channel, triggering the risk events, which eventually lead to the deviation of goals and performance of marketing channel. Marketing channel risk factors are the uncertainty elements affecting the marketing channel performance. They are the relationship of specific factors and the whole collection. Marketing channel risk source includes various marketing channel risk factors, and all kinds of marketing channel risk factors constitute a marketing channel risk source .

Generally speaking, the marketing channel risk factors can be divided into two categories. One is the uncertain factors which are hidden in the external environment of marketing channel system, including the adjustment of national policy and law, the change of the natural environment, the application of science and technology innovation achievements, the change of consumer demand, marketing strategy adjustment of competitors, etc. The other is derived from unsafe acts factors of behavior subject in marketing channel system, including the self-interest and opportunism behavior orientation of channel members , the anticipated conflicts resulted from the different division of labor among channel members, risk aversion strategy among channel members ,etc .

## 2.2 Marketing channel risk conduction carriers

Marketing channel risk conduction carrier is the bearing or form of the channel risk factors in the marketing channel transmission, including visible matters and intangible effects. In the process of marketing channel risk conduction, channel risk factors attach to conduction carrier, and being transferred or spread to a series of nodes and process in marketing channel system under specified conditions, mainly include product flow, capital flow and information flow, etc. Marketing channel acts as the shift channel of products' value. The risk conduction carrier is hidden in these processes, specifically including the following aspects:

First, product carrier. In the marketing channel system, product is the most common carrier of risk. For example: the discordance of understanding to the products' function between manufacturer and consumers; a mismatch between different stages of manufacturers' product life cycle and the corresponding marketing channel strategy adjustment; the loss of Products in the process of the transfer in the channel system and the different understanding of brand value caused by cross-cultural conflicts.

Second, capital carrier. There are various analytical factors in the process of capital operation of marketing channel. For example: in order to encourage downstream enterprise to purchase more, reducing the fund occupied and financing difficulties, upstream enterprises often adopt credit sales or set up a transaction mode with some credit limit; Under the pressure of downstream enterprises, upstream enterprises adopt the transaction mode of cash on delivery.

Third, information carrier. In the marketing channel system, because of the information asymmetry between the downstream enterprises and upstream enterprises, and the pursuit of benefit maximization for itself, the demand information in the marketing channel transmission is distorted; the channel members' perversion to demand information in the channel system is gradually amplified, forming "the bullwhip effect", and so on. The risk factors brought by information carriers not only make every link of channel invalidly run, but also bring cumulative effect.

## 2.3 The marketing channel risk chain

The marketing channel risk chain is the route through which the risk factors released by channel risk sources deliver to the conduction receptor of marketing channel risk. The marketing channel risk chain goes with all kinds of dynamic processes in the marketing channel system. Suppliers, manufacturers, brokers, secondary providers and consumers are likely to deliver the risk to the next member enterprise of the channel system through the marketing channel risk chain. It mainly includes the following forms<sup>[2]</sup>:

First, organization transmission. Due to the cooperative relations existing among the upstream and downstream channel members, the marketing channel risk can transmit through channel member companies. For example, the financial crisis of brokers will affect manufacturers' reflow of corporate sales income, and in turn, the manufacturers' financial difficulties will influence the suppliers' sales and production.

Second, artificial transmission. Under the guidance of the egoism, channel members may shift the risk to the other members in the channel, consciously and selectively. For example, large chain retailers may take advantage of their huge sales ability to make rules of the game, shift risk to suppliers by using the terms of the contract, even if there is something outside the terms of the contract, they can still force suppliers to accept.

Third, regime transmission. The formation and transmission of marketing channel risk is closely related to the regimes such as price system, sales policies, and marketing support, and so on. That out-zone sale, bad debts, and chaotic distribution area in the channel, are largely incurred by the imperfection of the system.

## 2.4 The conduction receptor of marketing channel risk

The conduction receptor of marketing channel risk is the subject receiving the channel risk, it receives the conduction of the channel risk, and also is the object of conduction. The conduction receptors' ability of acceptance and conduction for the channel risk is affected by many factors, including the perfect degree of the marketing channel functions, the correlation degree among the member companies of marketing channel system, and the reasonable degree of business process among the member of channel enterprises, etc. If the marketing channel has the correspondingly perfect functions, the design of business process among the member of channel enterprises and correlation degree between other channel members become more reasonable, the conduction receptor of the marketing channel risk will then have a stronger capability of resilience and digestion to the channel risk, thus reducing the conduction efforts of marketing channel risk.

## 2.5 The marketing channel risk accidents

The marketing channel risk accidents are the destructive events which caused by the risk factors of marketing channel. It's an actualization of the potential danger in the channel. As a result, there is a deviation between the expected goal and the actual result of marketing channel. What's more, the enterprises in the channel system will suffer loss from this.

### **3 The Management Mechanism Based on The Risk Conduction of Marketing Channel**

Because of the characteristics of the complex conductivity and the progressive bullwhip effect of the marketing channel risk ,once there is a comparatively large risk occurring among members within the channel system ,it will definitely bring relevant influence and loss to other members among channel enterprises. Therefore, it's necessary for channel enterprises to establish the management mechanism on channel risk conduction, aiming at the mechanism on channel risk conduction, to lessen the channel risk to a certain degree that the enterprises can accept, thus minimizing the loss of channel risk, ensuring the channel performance goal of enterprise coming true.

#### **3.1 The block mechanism on marketing channel risk conduction**

The risk factors released from risk source of marketing channel at the initial stage are usually just on one or some function node of the marketing channel .With the business dealings among members in the channel enterprises, the risk factors continuously conduct and spread to the relevant function node enterprises, forming the channel risk event consequently. It is that the block mechanism on marketing channel conduction is to block the risk conduction path through controlling the risk source by controlling the risk resource ,helping enterprises to avoid the uncertain result caused by risks .For example ,abandon channel business containing risks ;block the business contact with channel enterprises with poor credit ;reject credit sale under any conditions ;eliminate the dependence on potentially risky channel members ,etc.

The basic foundation of block mechanism on marketing channel risk conduction includes:

First, rapid channel message transmission network and valid channel risk monitoring system, which are to identify channel risk source and risk factors, analyzing the situation of channel risk conduction, supporting the decision of channel risk block.

Second, business capacity and history credit grading system of channel members, which grants different privileges and lines of credit to the channel members at different levels.

Third, channel accountability system, which is to find channel bottleneck timely, making up the short-board of channel.

Fourth, multichannel candidate system, which is to disperse channel risk effectively, avoiding the market vacuum after some channel quits.

Though the block mechanism on marketing channel risk conduction can help enterprises to avoid potential loss or uncertainties through blocking risk conduction, it simultaneously misses the opportunity to achieve potential benefit from the risk, and also coming to undertake all sorts of cost and responsibility from blocking risk conduction .Therefore, when we deal with channel risk by the way of blocking the marketing channel risk, some aspects as follows have to be taken into account:

First, whether the channel risk is one that is independent to enterprises' will and can't be controlled by the enterprises .The block to this channel risk will only waste enterprise resource.

Second, whether the block is reasonable in the economic sense from the perspective of cost-benefit. The loss may outweigh the gain if we chosen the way of blocking the channel risk conduction blindly, when the actual cost and opportunity loss caused by the channel risk block is higher than the profit achieved by undertaking the channel risk.

Third, whether the block to some channel risk may cause new channel risk. For instance, we adopt check clearance in order to avoid credit risks of authorized collection, but if this causes new risk of an empty promise.

Based on the consideration of the aspects above, the block mechanism on marketing channel risk conduction is appropriate for such situations:

First, risk with high probability of occurrence or which will trigger serious consequences.

Second, the cost to block channel risk conduction surpasses the revenue achieved by undertaking the channel risk.

Third, the probability of new channel risk caused by the block to some channel risk conduction is comparatively low or the new risk is under control.

#### **3.2 The channelizing mechanism on marketing channel risk conduction**

During the conduction process of risk factors released by channel risk source, the channelizing mechanism on marketing channel risk conduction consciously guides the direction of channel risk conduction and decreases the conduction speed, reducing the possible loss and uncertainties which will be encountered by the enterprises. It is an alternative choice to effectively manage the channel risk conduction under the condition that the function of the block mechanism is limited.

The channelizing mechanism on marketing channel risk conduction includes:

First, guiding the direction of channel risk conduction, that is, the enterprise initiatively guides the channel risk factors transferring to other risk-takers, shifting the possible risk and uncertainties to others. The main modes contain insurance transfer and non-insurance transfer. Insurance transfer is that the enterprise signs a channel business insurance contract with an insurance company, paying a premium to exchange for the commitment of compensation for economic loss when there is specified risk event, the purpose is to narrow the range of loss which some channel risk will bring to the enterprise. Non-insurance transfer is that the enterprise transfers the responsibility of channel risk loss to the risk-takers who are non-insurance institutions by exculpatory contract, in order to exempt the risk-taker's responsibility for the loss.

Second, reducing the speed of channel risk conduction, that is, the enterprise delays the speed of channel risk factors conducting and diffusing among channel function-correlated node enterprises to the uttermost, thus postponing the time of channel risk loss realized. From the strategic perspective, the key to reduce speed of channel risk conduction is to establish flexible channel management system to improve the ability of defending risk of channel function-correlated node enterprises. The flexible channel management system emphasizes that enterprise change the single channel mode, keeping the sensitivity to channel environment, distinguishing the potential channel risk factors correctly, utilizing and creating changes by continuously learn innovation, developing flexible decision plan to cope with channel risk and take advantage of the channel risk, thus increasing the resistance of channel risk conduction, alleviating the intensity of driving force of channel risk.

### **3.3 Loss control mechanism on marketing channel risk conduction**

From the perspective of marketing channel conduction receptor, it can help channel risk receptor to lower the probability of channel risk loss and narrow the range of channel risk loss by establishing an effective loss control mechanism on channel risk conduction for those channel risks that are unavoidable or anticipated to acquire risk premium. The essence of this mechanism is to consciously improve the characters of risk conduction factors, being accepted by the channel risk conduction receptor, making the enterprises to achieve opportunities and rewards.

The loss control mechanism on marketing channel risk conduction includes:

First, The loss prevention on marketing risk conduction is the motivation and requirement for acceptors to control the conduction of channel risk factors, which will decrease the probability of loss caused by channel risk events. The loss prevention on channel risk conduction is established on the basis of recognizing the types and conduction characters of risk factors. With a prevention in advance, it can reach the goal of controlling the probability of risk events happening. In practice, it has the function of loss prevention on channel risk conduction on monitoring the channel environment, follow-up surveying the credit line of close correlated members in the channel and setting corresponding credit line, etc.

Second, The loss restrain on channel risk conduction is that the channel risk conduction receptor will prevent the magnification of event influence through the measure of emergency treatment, thus narrowing the range of loss cause by channel risk events when acceptors faced with risk events. In practice, it has the function of loss restrain on channel risk conduction such as establishing the reserving alternative channel, giving warning penalty to channel that caused heavy loss to enterprises, etc.

Something to point out: the focus of loss prevention on channel risk conduction is to reduce the probability of the loss caused by channel risk events, nevertheless the focus of loss restrain on channel risk conduction is to narrow the range of loss caused by channel risk. Yet, during the process of channel risk conduction management, the two are often inter-infiltration, each other is premise, the combination of loss prevention and loss restrain jointly realizes the control to channel risk conduction loss.

## **4 Conclusion**

Under the complex and turbulent economic environment, with more and more uncertainties, the marketing channel faces a series of risk puzzles which limits the increase of enterprises product salesman volume and profit. Hence, establishing effective management mechanism on channel risk is of

prime importance for enterprises to avoid and rein risks and achieve risk premium .This paper mirrors the research achievements on marketing channel risk management from domestic and overseas scholars ,discussing the management mechanism on channel risk from the perspective of channel risk conduction , constructing the management mechanism on channel risk with risk conduction block ,risk conduction channelizing and risk conduction loss control as its core .And it still needs to dig deeper into the study of the dynamic process ,the measurement and the assessment of the channel risk conduction .

(E-mail:rongyan5878@vip.sina.com, 510522042@qq.com,)

**Abstract:** The present article deals with the issue of the quality of academic journals. After we have analyzed the current situation of the problems, we propose some solutions. Academic journals should try to attract the best articles by making an arrangement in advance with the writer or by contributions solicitation. At the same time, the amount of subscription should be enlarged and the academic quality of the editorial team should be improved. It is also important for striving for more financial support. We conclude that the coordination of the different aspects involved is the key to the improvement of the quality of academic journals.

**Key word:** Academic journals; Management; Multiple linear regression model; Impact factor; Circulation

### 1 Introduction

It is commonly acknowledged that one of the problems with the academic world in China is that, in spite of the large quantity of the published articles, the quality is less than desirable. As a result, publication in international journals is taken as an important criterion in evaluating the research of scholars. The relatively higher prestige enjoyed by international journals can be attributed to undesirable quality and prestige of the domestic ones. Such a situation calls for innovation in the management systems in domestic journals, especially where the quality of the journals are concerned. In an article by the National General Administration of Press and Publication on *People's Daily* in Feb. 2<sup>nd</sup> in 2011, it was pointed out that some domestic academic journals should be evaluated and inspected in order to initiate some necessary changes in the academic field. Those journals that ignore the tenet and domain of the publication, show poor quality and management, and make money by the publication fee will receive administrative penalty. Some may even be forced to close down<sup>[1]</sup>. It is clear that to improve the quality is the lifeline and developing direction of the journals. The following are our ideas about the quality management and innovation of academic journals with respect to our practical experience.

### 2 Article Quality Management

#### 2.1 Obtaining articles by first-class writers

The common practice in running a journal is to wait in the office for the submissions to come and to choose from them. This is the usual and conservative way and it may not so effective in getting the best quality articles, which are of vital importance to the improvement of the quality of academic journals. There are three premises leading to high-quality articles. First, the personality of the editor is relevant. If the person who is contacting the writer is not easygoing and show strong officialdom, the expert may easily turn his/her back on the journal. Secondly and most importantly, the prestige of the academic journal counts a lot. Only when you have improved the quality of the academic journal, experts may be willing to contribute their research papers to your journal. This is a process of mutual promotion. Once relationship between the editorial department and the experts has been brought into a benign cycle, the prestige of the journal will soon be established. Finally, the editors are advised to communicate with the experts frequently, and to attach more importance to article resulting from nationally funded projects and major construction projects. And they should be ready to send the feedbacks of the experts' opinions to the editorial department. They should often consider how to organize more good articles in order to better serve the academia.

When the above three conditions are satisfied, the editorial department should make a scale of subject plan in the academic frontiers. They should choose leading issues or make specific plans about what to publish. They should make an arrangement with the authoritative writers or related scholars in advance, and make contributions solicitation with such writers with respect to development tendencies and research trends of the time. With this accurate positioning, they can determine their aim and may be able to communicate better with the writer, and then they can obtain the best articles, which may in turn improve the quality of the journal. In this way, the competitiveness of the journal will improve and it will occupy a more and more important position in the academia.

Furthermore, in the process of getting good quality articles, particular attention should be paid to the advantage of cultural environment which may give support to the journal. For instance, *Higher Education Research*, which is a high-quality journal in the higher-education circle, has been a strong component of the academic strengths of the Institute of Education Sciences of Huazhong University of Science and Technology. Similarly, *Journal of Rock and Mechanism Engineering* is also growing gradually under the academic support of the mechanism institute of CAS Wuhan Branch and finally becomes a high-quality journal.

### 2.2 Flexibility in designating the length of articles

It goes without saying that the number of pages within each issue is the limited resources of a journal. In order to maximize the benefits and publish as many articles as possible, the following methods are suggested for the editor to deal with articles: (1) try to save space to publish as many articles as possible, (2) shorten the article. According to She Shigang, the chief editor of *Journal of Rock and Mechanism Engineering*, the average length of articles is 5.5 pages in 2005, it is 7.8 pages in 2010. This means that both the average length and the quality are on the rise as prestige of journal improves. A typical article will put forward a question, which is usually followed by some analyses and a solution. As a result, it will include the sections of an introduction, a main body, and a conclusion. All these usually amount to 6000-7000 words (4 or 5 pages). Due to the characteristics of liberal arts journals, there is more descriptive language in articles. We should be flexible where the lengths of articles are concerned. Rigid length limit will do harm to the quality of articles.

## 3 Management Efficiency

### 3.1 Impact Factor

Impact factor refers to the total times of citation of articles published 2 years ago divided by the total research number. It is internationally used as an evaluation index of journals. However, the impact factor has its limitations. The quality and features of articles published, the features of journals, the subject differences, and the distribution and amount of the source journals library are the factors that reflect the impact factor. Generally speaking, the greater amount of the published articles, the more likely those articles are cited, and the larger amount of the impact factor<sup>[1]</sup>. It takes a relatively shorter period of time for shorter articles to be published, so the total citation frequency will increase.

Impact factor is influenced by the total number of journals from different subjects, average reference number, and the cited half-like (this refers to the total citation times during the whole year in the statistics of the journal, and how long half of the newer citation number comes to accumulation)<sup>[2]</sup>. Therefore, when we evaluate the quality of a journal, we should not merely consider the impact factor but also associate the citation number with other evaluation indexes. Moreover, some journals that lack academic integrity, because of the influence of the vicious competition, form illegal alliance and take some means to improve the impact factor. The relation between improving the impact factor and journal quality is like that between Chinese exam-oriented education and quality-oriented education. As Elman advocates, the more celebrated goals of running a journal is to develop its social influence. As we go through the official evaluation processes, we should keep in mind that the more worthwhile long-term goal is to improve its prestige by enhancing the quality of journals. The quality is to be evaluated by using examination and the aim of improving quality cannot be achieved when focusing on the exam-oriented education. Quality is the basis and the way to take exam is the auxiliary means to promote the short-term effects. If the editor tangles on the impact factor all the time, the result will be like the exam-oriented education. You may come to a dead end when you pay a lot and get far away from your original aim and cannot get back. Only by improving the article quality, by strictly regulating the editing process, and by increasing the influence of the journal can the quality of journal be substantially improved. If we improve the quality and the prestige of the journal step by step<sup>[3]</sup>, the impact factor will increase and many important writers will be attracted to your journal, as is the case with many prestigious journals.

The two major factors of influence are the quality of contributions and quality of editing. Of course, these two factors are weighted differently. I set the factor of influence at “a”, the high-quality contribution at “ $a_1$ ”, the quality of editing at “ $a_2$ ”, the coefficient of “ $a_1$ ” at “r”. The relationship among “a”, “ $a_1$ ” and “ $a_2$ ” can be represented as:

$$a = r \times a_1 + a_2$$

### 3.2 Circulation promotion

Most academic journals usually pay much attention to current trendy academic topics. They do not

have a clear idea of what they should aim at in the long run, without even paying enough attention to the size of the circulation. This is true with some prestigious journals such as *Historical Research*, *Social Science in China* (both are hosted by CAS), whose circulation is less than 8000 copies, let alone the local social ISS and the journals hosted by some colleges and universities, whose circulation is about 2000-3000 copies at best and 300-500 copies at worse. Some journals send free issues to the readers<sup>[4]</sup>. Academic journals have their unique characteristics; the amount of circulation represents the size of the readership, which in turn reflects its academic influence. Promoting circulation can not only bring about financial benefits but also improve the academic influence and promote journal quality. Except for the post office subscription, the editorial department should spare no effort to popularize their academic journal and expand the range of its audiences by holding some academic activities. They can form a mutually benefiting relationship with the readers to popularize the journal. The academic journals in the same field or of the same organizer can form a group in the market in circulation promotion. They can also manage the academic influence of the journal by setting up network data, in order to promote the circulation, so that a positive cycle can be formed yielding both academic and economic rewards.

**3.3 Striving for financial support**

Academic journals are usually hosted by the government or science institutes and colleges affiliated to some public institutions. The main source of finance is the administrative funding. The public investment is limited (less than RMB 10, 000 yuan a year). According to some insider’s estimate, 30, 000 yuan are needed to ensure the normal operation of an academic journal. That is one of the reasons for the phenomenon of making money by the payout fee. It is a cultural enterprise to found and manage academic journals, and it needs the support of the government. The expenses of running a journal include among other things, paying the invited contributions, participating and hosting academic conferences, and the daily editing activities. The organizer should try different means to obtain more financial support in addition to the current financial resources. This is practically important in that it makes possible all the quality activities of academic journals.

**4 Training Editors**

Editing is an laborious and painstaking job, which demand a comprehensive range of practical skills including that of dealing with the literature and the references, charts and tales, etc. Those skills are essential to the quality of journals. We should encourage communication among colleagues to improve the editing quality within the profession.

The editing profession is a demanding and hard job. Capable editors should pay attention to the academic situation of the related journals. They should have a correct understanding of the theory and sensitive insights to excellent articles. They should be able to conduct editing process of the articles efficiently and accurately. Therefore, the quality of editors should be improved if we want to improve the journal.

**5 Conclusion**

It is a comprehensive process to improve the quality of academic journals. It means coordination and efforts from different parties including financial support from the government, obtaining high quality articles and strict observation of principles and standards in choosing and editing articles on the editors’ parts. This can be formulated as follows:

**Figure 1 Mechanism of Academic Journals**

# The Advantages of Brand Management Innovation in Product Competition

Qi Yi, He Fang

School of Art and Design, Wuhan University of Technology, Wuhan, P.R.China, 430000

(E-mail:164880055@qq.com,hefang6262@sina.com)

**Abstract:** In this paper, the brand management innovation of the research methods, and put forward the internal driving force, the core value, cognitive pattern and integration promotion plan, construct a carefully designed the complete business system, the brand innovation of management of the core—brand and consumer contact-any point, line and plane can effective integration and control all communication level element, make its fully reflect the core value of the brand and strategy. For every may affect consumers to the brand experience, or to the brand of the activities and view the decision-making, must strict management control, it is concluded that the brand management innovation can be in today's fierce competitive products get huge advantage conclusion.

**Key words:** Brand management; Innovation; Superiority

## 1 Introduction

The word "brand" is not strange, many entrepreneurs and managers are often in a variety of business communication about the product brand, "brand" can be regarded as anthropology research results applied in modern social behavior model. "Experience" is through the brand communication, it has become the modern city life a kind of label. If we on this label is put to good use, can compete in the product obtained in the huge advantage.

## 2 Brand Management How to Innovation

### 2.1 What is the brand

Brand can often through the product attributes, packaging, name, price, history, credit, advertising and sales promotion behavior, concrete expression comes out, the definition of brand will often by consumer feel and experience and decide. Therefore, we also said the brand is leading, by consumers by enterprise to create and care, through the products and consumption to express a kind of complex and unique business relationship and symbols.

### 2.2 Brand management how to innovation

Brand management of innovation is the most important is to enhance brand management innovation the driving force. Because the brand is the symbol of the complex relationship between the products, consumers and businesses three. Brand driver elements include—brand management innovation and enterprise core consumer driving force driving force.

First, need to improve consumer driving force—Brand products to consumers decided to brand transformation

“Consumers have a brand” This view has been more and more recognition. The brand is the relationship between consumers and products, each behind the brand that contains at least one product. In the era of market purchase rate decision, the consumer in the end about what to buy? Consumer products and services to the understanding of the known, identity, in the ownership of the association, catalytic effect through cascade, under the progressive, realize the product to brand transformation.

Second, need to improve the enterprise core driving force—The driving force of enterprise core brand ultimate is the core competitiveness of the enterprise.

The product competition, the brand construction is not only required for survival of the enterprise, and promote the enterprise brand itself is high speed, high efficiency, and low risk and sustainable development of the force at the core. Core competence is the enterprise access, allocating resources, form and can stay competitive advantage of ability. Core competence is the foundation of the enterprise survival, but also the development of the enterprise core power.

### 2.3 Brand management innovation core value

Brand management innovation is the core value of the brand owners of core values reflect. Brand management innovation core value is not only the consumers of driving force driving force and enterprise core polymerization overlay, and it is both the generation after polymerization of new kinetic energy. The product brand management core value and brand owners have inseparable relationship of

dependence.

For example, bold and unconstrained, masculine, attractive “Marlboro” cigarettes, its consumer driving force elements have: bold, power, freedom, independence, rebel, and the enterprise core driving force is: enthusiasm, strong, independence, and freedom, and power. Visible, freedom and independence is the “Marlboro” brand core values. It is not only a man exclusive tobacco brand of psychological suggestion, and is “Marlboro” enterprise internal spirit and values reflect. Thus, only the abstract core value of refined into the core concept, we can clear brand personality style, theme design and induction, which is undoubtedly the core of the brand management.

**2.4 The core content of the brand management innovation**——Brand personality let the core value of the brand humanization

The brand is the efforts of a business for unique consumer groups. Brand management innovation of the fundamental essence is in the communication and interaction. Consumers have already used to evaluate a company personality factors or brand. When enterprise for their own brand created a character, the brand is more easily impress consumers. Give the consumer brand personality of the different cognitive feeling and different levels of experience, the core value of the brand specific, personal, and also promoted the development of the brand. Marlboro cigarettes are a product quality and perceptual characteristics link into simple, powerful character brand, at the same time will brand elements together of the typical case.

In order to achieve better communication, Marlboro the brand is personified. “Morris” company through the choice, Marlboro symbol of “cowboy” to achieve this purpose communication. So, Marlboro is setting up its image: freedom, haggard and adventure. This image is like a bridge, it connects the Marlboro cigarettes and Marlboro individual character. One of the most important is the Marlboro individual character. Marlboro cigarette smokers have attracted to such attraction, in the final analysis because of its brand personality.

### **3 The Advantages of Brand Management Innovation in Product Competition**

#### **3.1 Advantage category**

##### **3.1.1 Brand style are more likely to be felt—Multidimensional information dissemination**

The brand is the product and the relationship between consumer and enterprise, and information is dependent on the spread in the relationship. Can say consumers of brand of cognitive is according to what he can sense a comprehensive information and gain. Therefore, the spread of information to cognitive model of brand multidimensional nature of multidimensionality, this makes the brand product competition in more easily be the feel of the consumers.

##### **3.1.2 Brand recognition is easier to be identity—With the core value of the brand and brand positioning as the center**

As for brand recognition, consumers first through the enterprise or product external form to perceive the enterprise or the existence of the product brand, thus gradually to accept and agree with them. And the enterprise must be a strategy for the foundation, on the brand construction, we should pay attention to the core value of the brand and brand positioning as the center, can be the feel of the consumers through all kinds of the brand information, form strong brand recognition identity.

##### **3.1.3 The brand image is better convey—From “eye” to “heart” visual communication process**

Visual communication design to the innovation of the brand construction can make the brand image of better communicated:

First, the visual communication design to create value a. graphic design can reflect the product function b. spread to be able to be reflected message form

Second, Visual generates loyalty. Visual identity is actually emotional identification, emotional make enterprise products and consumers have linked, make consumers of enterprise and brand loyalty products produced.

Third, visual communication design can improve the added value of products. Aesthetic way of a consumer to whom the feelings of identity resides in the product, they increase the product value-added.

Fourth, the visual communication design can dash forward show the product's personality. Special product personality can not only attract the attention of consumer, also can be accepted by consumers. Through the design to let the product a perfect expression of, will be deeply impress the consumer heart, and have an emotional connection with consumers.

Fifth, visual communication design will make brand always lead, design competition not imitate brand have feeling elements.

In the 1930s, the “Marlboro” together with other consumer goods, had because of the economic crisis brings “the depression years”, when it’s name little-known. Embrace be unwilling mood, “Morris” company began to consider remodeling image.

MARLBORO to the core value of the brand and brand positioning as the center, the product quality unchanged, the package was the first of the open the lid technology flat, and the name of the standard word (MARLBORO) sharp edges, which make it more rich men are strong, and the main color of red as a result.

In addition, the company sends someone to please the Leo Burnett advertising agency for advertising planning “Marlboro”, played the fame of “Marlboro” sales. Only 1954-1955, the “Marlboro” sales increased three times, became the nation’s 10th largest cigarette brands, 1968 and its market share rose to second in the nation counterparts. Now, “Marlboro” in the world, “Marlboro” every year in the world with 300 billion cigarettes, 5000 Boeing 707 aircraft can be finished loading. The world every removed 4 cigarette, including one is “Marlboro”.

What is it that makes the little-known “Marlboro” become so a favor? Survey shows that: the real fascinating is not the “Marlboro” and other between the taste of cigarettes small differences, but “Marlboro” advertising, information and packaging to cigarette brought about by the sense of superiority. This set of multi-dimensional information transmission, to the core value of the brand and brand positioning as the center, from “eye” to “heart” visual communication way makes “Marlboro” brand in the competition to make a great advantage.

### **3.2 Advantage penetration**

The innovation of the brand management is how to realize the advantage in the market competition of penetration? We will this advantage through the brands of legend, public relations, advertising, marketing, sales promotion, direct effect Internet marketing all aspects of the permeability reflected.

Brand legend: how to make the brand has focus effect? The public psychology proof: the legendary brand, the more we can cause the public attention. The name of the Marlboro, from their first cigarette factory address in London, its founder Philip Morris thought of company in London factory on a street name “Marlborough”. Another and there another kind Of statement, the brand name from “Man Always Remember Love Because Of Romance Only is the abbreviation Of”, namely “the Man Because Remember romantic Love”, and the corresponding have compiled for the lovers story. The origin of these brands, the founder of the unique experience, and the consumer’s brand evolution personalized consumer experience can inspire more interested in the market, and to the spread of the brand to stoke the.

Advertising: the midst of brand promotion homework, standing in the position of the consumers, from their starting their feeling, or the point of view of products for the consumer to solve the problem of the immediate, with different impression and psychological pleasant advertising impress consumers.

Public relations: affinity, brand orderly appearance, the establishment of affinity between brands and consumers, an orderly relationship.

Straight effect marketing: let the brand and target consumers for deep communication, construction target consumers, human services, maintain contact for a long time.

Promotion: consumers buy action to shareholders, innovative promotion form and content to meet and meet the core value of the brand, positioning and individual character style, etc.

The success of the Marlboro cigarette filter except benefit from mouth, unique, have also benefited from the outer packing in advertising, public relations, marketing policy efforts. In order to make the advertisement effect lifelike, in Marlboro cigarette advertising, the poster people present, is to find the real American cowboy, and nonprofessional model. For freedom, straightforward men and listening to the cowboy to impressive background music with very successful, AD copy Where there is a man, there is a Marlboro (Where there is man, Where to have Marlboro), the more memorable. In the world of advertising marketing strategy implement consistency, and established the Marlboro cigarettes in various countries consumers idea of the unity, integrity, the image of the deep foundation, and Philip Morris companies also, thus creating the largest advertising effects and marketing benefits. The success of the marketing strategy has made Marlboro cigarettes popularized worldwide.

## **4 Conclusion**

Through the analysis of the brand management innovation, we can see that the brand management innovation in product competitive advantage is huge. Consumers usually in particular style of brand perception in understanding the brand information, set up the brand personality, and the enterprise is

based on consumer consumption experience and market dynamics, the initiative to convey the theme with brand information, deepen the impression of consumer brand and good will.

And innovative brand management clear the brand of consumption and enterprise core driving force driving force, this is sketching brand vision, realize the value of the largest commercial brand foundation. At the same time, it effective integration the driving force of the brand, combined with the brand owners and operators of the core values, induces the brand vision. It makes the product has strong ability to adapt to the change of control the core brand, and in the variety of the market always make sure that the competitive advantage of. In addition, it also let the consumer brand cognitive more objective, realistic and plump, make enterprise inside and outside each link resources and power more integration, to ensure that its full compliance with the core value of the brand. I believe in the near future, brand management innovation will become the most competitive products of the advantages of the brand management framework.

# Knowledge Management Based on the Cultural Historical Activity Theory

Du Lunfang

School of Humanities and Law, Wuhan University of Technology, Wuhan, P.R.China, 430223  
(E-mail: dulunf@126.com)

**Abstract:** This paper presents various perceptions on the knowledge management, and analyses the complex interaction between technology and people in the knowledge-making. Moreover, the paper uses the Cultural Historical Activity Theory (CHAT) as the theoretical framework to study the knowledge management and to design the knowledge management systems. In addition, studies on the Chinese universities demonstrate the importance of adopting a holistic approach, including cultural, historical, contextual and dynamic, to knowledge management.

**Key words:** Knowledge management; Knowledge management systems; Organizational knowledge; Cultural historical activity theory

## 1 Introduction

As the information and communication technologies advances, the organizational interest in knowledge as a critical strategic<sup>[1]</sup> resource and organizations are looking to information technologies for solutions to knowledge management (KM) efforts. The computer-based information systems (CBIS) are becoming sophisticated and complex. However, there remains incongruence between their prescriptive requirements and the intangible and volatile nature of knowledge. The need for structure in CBIS, has meant that most computer-based knowledge management systems (KMS) attempt either to measure and codify knowledge, including intangibles such as intellectual capital, intellectual property and intellectual potential, or to enable the sharing of knowledge, which essentially resides in people. Currently, most technologists lack the understanding of the situated work practices of user communities, making the low success rates for KM type systems. Systems designers do not have accepted models for the large invisible and complex nature of work that KMS are expected to support. Whether the KMS are effective, it depends as much on the social context of users, their perceptions of their roles and community expectations, as the design and functionality of the system.

With the advent and rapid development of knowledge economy, great changes have taken place in the environment faced up with by the colleges and universities, which puts forward unprecedented challenges to the colleges and universities. Universities invent and pioneer, networks and knowledge management with, and without, new technologies. Therefore, universities represent an ideal setting for an examination of the complex interaction between technology and people in knowledge making and KM. This paper begins with a presentation and discussion of various perceptions of organizational knowledge and what KMS are, or should be, with the suggestion that the Cultural Historical Activity Theory (CHAT) be used as the theoretical framework for both the study of KM and the design of KMS. It will then describe a study in one Chinese university. The study uses the CHAT approach to improve the university's existing KMS. A significant outcome of the study was recognition of the importance of adopting a holistic approach to KM, which is cultural, historical, contextual and dynamic.

## 2 Connotation of KM

The KM, emerged in the 1990s, has not formed a standard definition up till now.

By synthesizing various opinions of the schools, the connotation of KM would be drawn. KM is a process for members of the organization to develop, manage and use the internal and external knowledge in order to promote the acquisition, communication, sharing, and innovation of the knowledge by using technical means in certain circumstances. It is the management theory and method for the organization to enhance the creative ability and core competitiveness.

KM involves knowledge, people, environment, culture and organizational structure, etc... From the Angle of Business Process and with system, comprehensive view, KM contains not only the tasks concerning KM, such as the classification, coding, innovation, share, application and appraisal of the knowledge, especially, but also the factors effecting KM, such as organization's strategy, KM strategy, organization culture, personnel participating in KM and organization learning.

### 3 Knowledge in Organization

The widely-used concepts of organizational knowledge<sup>[2]</sup>, knowledge work<sup>[3]</sup>, organizational memory<sup>[4]</sup> and the learning organization<sup>[5]</sup> imply that knowledge processes in organizations are complex, distributed, context dependent and dynamic<sup>[6]</sup>. Each of these attributes will now be discussed.

The complexity is evident from the tensions between the old and the new, between the desire for change and the need for stability, between ambiguity and clarity in sense-making<sup>[7]</sup>, between improvisation and ordered decision making, between diversity and consensus, between the different natures of tacit and explicit knowledge<sup>[8]</sup>, and between the push for competitiveness in business and the need to cooperate for knowledge sharing. There are constant conflicts between individual, group and organizational goals between intentional information seeking and scanning for general sense-making<sup>[9]</sup>; between rational computer-based system requirements and the nebulous nature of knowledge in people. Knowledge management could be thought of as the quest for achieving a balance between the extremes on each of these dimensions.

In order to understanding how knowledge is distributed it is useful to draw on the concept of distributing cognition across the human and technological members of a critical team situation<sup>[10]</sup>. A major shift, associated with the advent of information and communication technology (ITC), is a shift from individual notions of expertise and merit to shared information, knowledge and teamwork, i.e. from individualism to collectivism<sup>[5]</sup>. Organizational knowledge creation occurs when people combine and exchange their personal knowledge with others and there is little doubt that organizations that will excel in years to come, will be those that understand how to gain the commitment of employees at all levels and continually expand their capacity to learn, supported by ICT systems<sup>[11]</sup>.

The question of context arises in the debate between the view of knowledge as object, extracted from its context, and knowledge in its context, embedded in individuals. McLure-Wasko and Faraj<sup>[1]</sup> identify a third perspective, that of knowledge embedded in the community, perceived as a public good that is socially generated through actions and interactions, maintained and exchanged within communities of practice<sup>[12]</sup>. The view of knowledge embedded in community activity implies that organizations are best conceptualized as a collection of overlapping communities of practice. Employees do not receive, or even construct, abstract, objective individual knowledge rather they learn to function in a community. Knowledge, in this view, supersedes any one individual and the knowledge capital of the organization can be considerably more than the sum of the individual knowledge of employees. This is the sense of the metaphorical concepts of organizational memory, while the creation of new collective knowledge is reflected in the term the learning organization, where the collective context of knowledge is retained.

**Figure 1 The Knowledge Creation Spiral of Nonaka**

The dynamic process of KM is described in the model of Nonaka<sup>[6]</sup> in which explicit and tacit knowledge in organizations are exchanged and transformed through four modes (Figure 1). Socialization is the process whereby tacit knowledge is transferred from one individual to another. Combination allows the existing explicit knowledge to be integrated into new explicit forms. Externalization is the process of converting tacit knowledge into explicit knowledge in the form of concepts and models. Internalization allows individuals to absorb explicit knowledge and broaden their tacit knowledge so that new knowledge could be developed. This has led to the knowledge creation spiral of Nonaka and Takeuchi<sup>[8]</sup>, shown in Figure 1, which views organizational knowledge creation as a process involving a continual interplay between the explicit and tacit forms of knowledge, through the four transforming modes, and evolving from the individual level, through the group level, to that of the organization as a whole.

## 4 Approaches to KMS

The two most common forms of KMS are based on perceptions of knowledge as object and on knowledge as embedded in people. Typical of the first approach is the notion that KMS are information systems designed specifically to facilitate the sharing and integration of knowledge<sup>[13]</sup>. The second form of KMS is typified by a statement such as "the goal for KMS is to create a connected environment for knowledge exchange, a technical embodiment of corporate memory"<sup>[14]</sup>.

KMS based on the first perspective, of knowledge as object, are referred to as product-centered, content-centered or codification. Here knowledge is an entity separate from its context and from the people who create and use it. This is consistent with the view of Alavi and Leidner<sup>[13]</sup> that KMS are special purpose information systems. In the process- or people-centered KM perspective knowledge is closely tied to the person who developed it and is shared through person-to-person contacts. The main purpose of information technology (IT) in this approach is to help people communicate knowledge, not to store it. Thus, organizational knowledge is the sum of knowledge in the minds of employees and organizational knowledge increases through the learning of individuals or adding new people to the organization. In this view knowledge is difficult to codify and loses its value once coded. A KMS becomes a communication device to link experts with knowledge seekers<sup>[1]</sup>.

While these two divergent approaches each have merit in giving an organization a clear direction to follow, they avoid many of the difficult and critical issues that are picked up in the following three definitions of KM:

(1) KM caters to the critical issues of organizational adaptation, survival, and competence in face of increasingly discontinuous environmental change. Essentially embodies organizational processes that seek synergistic combination of data and information processing capacity of information technologies and the creative and innovative capacity of human beings.

(2) An operational objective of KM is to ensure that the right knowledge is available to the right processor in the right representation at the right time for performing their knowledge activities at the right cost<sup>[15]</sup>.

(3) In addition there is the popular Nonaka<sup>[6]</sup> and Takeuchi<sup>[8]</sup> concept of the knowledge spiral where the creation of knowledge is built on the interchange between tacit and explicit forms of knowledge enacted through the sequential process of socialization, externalization, combination and internalization. These descriptions indicate that KM problems should be tackled from a holistic view that balances the roles of people and technology, the individual and the organization and place KM in a cultural and historical context. McLure-Wasko and Faraj<sup>[1]</sup> identify a third perspective underlying the design of KMS in addition to those of knowledge as object and knowledge embedded in people. This is knowledge embedded in the community, perceived as a public good that is socially generated through actions and interactions, maintained and exchanged within communities of practice. The view of knowledge embedded in community activity implies that organizations are best conceptualized as a collection of overlapping communities of practice. Learners do not receive, or even construct, abstract, objective individual knowledge rather they learn to function in a community. Knowledge supersedes any one individual, is highly context dependent and is embedded within a community KMS in this view are utilized to enable discussion, mutual engagement and exchange between members of the communities of practice. This could include elements from the previous perspectives where CBIS capture and store knowledge objects used by the community together with facilities for communication. However the KMS also need to support a dynamic process of interchange where knowledge is constantly being regenerated and recontextualised, thus maintaining its relevance to the community. Judge et al<sup>[16]</sup> observe that work units behaving as focused communities are more innovative.

Researchers are actively seeking methodologies, frameworks and theories to enable a way forward in this complex area. Schultze and Boland<sup>[17]</sup> use Structuration and Actor Network theories to focus on action and agency in understanding how IT, organizations and practices shape each other. Mentzas et al<sup>[14]</sup> have developed a holistic conceptual framework, a KM methodology and an intranet-based tool with an emphasis on technology, cultural, organizational and managerial issues. The Cultural Historical Activity Theory will now be presented as a more relevant basis of an effective framework both for the study of KM and for the design of KMS.

## 5 Cultural Historical Activity Theory

CHAT represents one of a broad family of theories that view the cultural mediation of behavior to be the central moment in the constitution of the human mind (Engestrom, Mietinen, &

Punamaki<sup>[18]</sup>.1999). It is rooted in the Russian psychological tradition initiated by the developmental psychologist Vygotsky, together with his colleagues Luria and Leontiev (Leontiev<sup>[19]</sup>. 1978; Luria<sup>[20]</sup>. 1971; Vygotsky<sup>[21]</sup>. 1978). CHAT is an interdisciplinary enterprise, as it emphasizes the role of culture and society in organizing the proximal settings in which individual change is studied. It brings together a wide range of scholarship, including the ideas of philosopher and psychologist John Dewey, sociologist and psychologist George Herbert Mead, literary & cultural theorist M.M. Bakhtin, Marxist philosopher E.V. Ilyenkov, philosopher and literary critic Kenneth Burke, and anthropologists including Gregory Bateson and Clifford Geertz. CHAT emphasizes the primacy of social processes in human development, the importance of semiotic mediation in this development, and a view of this development as simultaneously occurring in phylogenetic, ontogenetic, cultural-historical, and micro-genetic time. In this paper we focus on the ontogenetic and micro-genetic time scales

The basic structure of human thought that emerges from sign mediation has typically been represented using a triangle (see Fig.2 where the base signifies the ‘direct’ relation between individual and environment and the path via the vertex stands for the ‘indirect’ route of artifact mediation<sup>[22]</sup>. These relations exist simultaneously, creating a qualitatively distinct structure to human action that Vygotsky<sup>[23]</sup> (1929) referred to as the ‘cultural habit of behavior’. Vygotsky’s colleague, Leontiev, concerned that Vygotsky’s view was too narrowly focused on the individual, despite his emphasis on the social origins of individual psychological functioning, suggested that the historically evolving division of labor brought about the crucial differentiation between individual action and collective activity (Engestrom<sup>[24]</sup>. 1987). Leontiev therefore proposed that in thinking about the mediated nature of human thought we must theorize not only the relations among individuals, their objectives, and the mediational means they employ, but extend this theorizing to include the interconnections among these units and the larger social structures which play a part in organizing the unfolding of the actions being studied. Engestrom<sup>[24]</sup> (1987) subsequently represented this unit of collective activity by expanding the semiotic triangle to include broader mediating social structures (see Fig. 3).

**Figure 2 The Basic Meditational Triangle**

**Figure 3 Cultural Historical Activity Theory Model**

The significant difference that CHAT brings to the study of KM is that it places the focus of study on the activities that are carried out by people in support of their interpretations of their role, the

opportunities available, and the purpose for which the organization exists.

Central to CHAT is the concept of the way all human activities are mediated by the available tools. Figure 4 indicates the kinds of relationships that are recognized in CHAT between human activity and mediating tools. Knowledge and KMS are complex tools that mediate the activities of organizations and are themselves influenced by the particular circumstances of the organization. Activities, and the tools used, must therefore be studied together in the context of the organization where, and at the time when, they occur. This implies a new interpretation of knowledge in organisations which was once conceived as something that only existed within people's heads. Knowledge management systems are tools that now actively mediate aspects of knowing and activity. In particular, KMS potentially provide a new kind of extracranial 'operation' that can be used by people in their activity to extend their capabilities in complex settings.

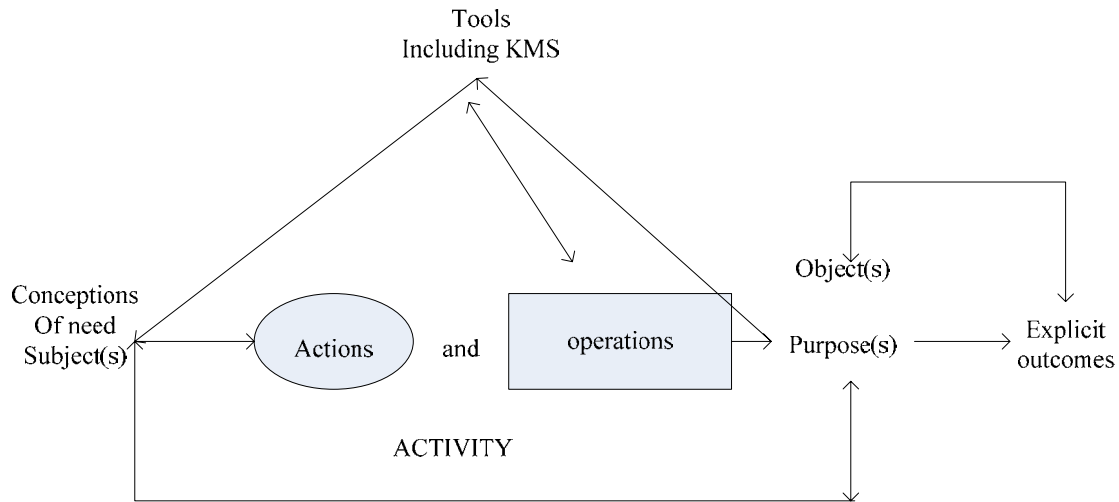

Figure 4 The CHAT View of Activity

Because of the nature of information technology, KMS have initially been tools to automate and standardise the skilled, and often idiosyncratic, processes used by people to classify, store and provide managed access to complex organizational information. The impact on people has often been a sense of deskilling. The early systems have often usurped an operational role in human activity. The more recent convergence of communications and information technology has again changed to possibilities for knowledge management tools. Tools that incorporate strategically designed settings to enable informed communication, cooperative analysis, review and decision making now have the potential to enhance human capabilities for more creative 'actions' and expanded awareness. A CHAT research approach recognizes the dynamic nature of the complex activities carried out by people within an organization. The contradictions between and within activities can be a source of organizational learning and knowledge creation.

There are several researchers ( Choo<sup>[2]</sup>. Blackler<sup>[25]</sup>. Engestrom<sup>[26]</sup>. Kuutti and Virkkunen<sup>[4]</sup>. Hasan<sup>[27]</sup> ) who are using frameworks based on the CHAT for the study of technology, cultural, organizational and managerial issues and their work has had a strong influence on the approach adopted in this paper. The CHAT approach of Engestrom is particularly well known. His work uses cycles of expansive learning shown in Figure 5, and demonstrates positive interventions into activity systems can promote growth and innovation<sup>[28]</sup>. This is not unlike the knowledge spiral of Nonaka and Takeuchi where the contradictions between tacit and explicit knowledge promotes new learning. Whereas most approaches to date categorise or reconcile the anomalies and dichotomies that arise in KMS, CHAT welcomes these as contradictions that stimulate the activities into a more advanced state.

**Figure 5 Engestrin's Cycle of Expansive Learning Shows How Contradictions Within and Between Human Activities Enable Them To Grow**

Another well-known structure giving another dimension to activity is the hierarchy of Leontiev. Leontiev, a student of Vygotsky, was the first to propose that ‘activity’ should be the unit of analysis in the study of sustained human endeavour and placed this at the top of the hierarchy shown in Figure 6, associated with purpose and motive. This is a conceptual level above the level of goal-oriented actions at which most business analysis takes place. Activities are carried out by a collection of actions, undertaken towards specific, and often short-term, goals. Under certain conditions, conscious actions can be driven to a lower level of automation, often in computer systems, as they become standardized.

**Figure 6 The Hierarchical Structure of Activity**

In the design of KMS a unit of analysis is required that will encompass the many diverse and contradictory elements in KM. There are candidates such as knowledge objects, knowledge assets, knowledge-creating activities<sup>[14]</sup> and knowledge management episodes, such as making a decision, solving a problem conducting an experiment and performing a scenario analysis<sup>[15]</sup>. Fowler<sup>[29]</sup> approaches this diversity by noting that it is important to recognize the existence of different ways of conceptualizing and representing knowledge through, for example, anecdote, metaphor or diagram. The same piece of knowledge can be used in different ways, depending on the context and transformation process involved in satisfying goals from information inputs.

The advantage that a CHAT-based framework has for the design of KMS is that it uses activity, purposeful human work, as an explicit unit of analysis. An activity is defined by the relationship between an individual or collective subject (people) and their object of work related to its purpose and motive. This relationship produces both intended and unintended outcomes and is mediated by tools and

the community in which the subjects conduct the activities. Information, knowledge and language would all be seen as tools that mediate activities. The authors propose that these elements of activity, as defined in CHAT, could be used as the basis of a dynamic knowledge repository in a KMS, with 'activity' as the basic unit, not unlike the use of an 'object' in object-oriented systems.

The following section of the paper presents some outcomes of a study where CHAT has been used as the theoretical framework. The study uses the CHAT approach to improve the university's existing KMS. A significant outcome of the study was recognition of the importance of adopting a holistic approach to KM, which is cultural, historical, contextual and dynamic.

## **6 The University Study**

### **6.1 The development situation of KMS in the university**

Originally, the university took two projects:

(1) The DW (a data-warehouse of student course information for line managers)

(2) A campus-wide infrastructure (CWIS) to manage communications and access to computing resources

Practice indicated that the DW and the CWIS were relatively static and the Intranet had been greatly expanded to provide online information from former paper-based documents such as course requirements and timetables, procedure manuals, reports and soon. In addition, most staff and student transactions could now be submitted by forms on the web. The university has won awards for its use of Internet technology for flexible administration and teaching across multiple sites, an indication that this is effective and innovative. However negative consequences of the automation of student enrolment, reported by one academic student advisor, were the lack of personal contact, diminished control over student choices and having no feel for the type and number of students entering his program of study. There was also much tension evident between the market-driven focus of administrative staff and the teaching styles of academics manifest in continued arguments about quantity, versus quality, of students. The new technology enabled the easy processing of more students and allowed diverse forms of course delivery, including remote sites, but this increasing the complexity of the work of teaching staff with a lack of support in critical areas, such as moving subject delivery into the new flexible mode. With more work at the coalface, academic staffs were disillusioned with the lack of understanding, coherence and direction from the top concerning teaching loads and work practices in a climate where they were being asked to also increase their research profiles.

Two recent initiatives in the university were identified as involving KM issues. The first belongs to a business decision to outsource the unit responsible for student recruitment, which has now become an independent company located on campus. This unit developed its own database of course content and delivery information, designed to support the work of front-line customer service personnel taking inquiries from potential students in person, over the phone or online. This independent system of core business knowledge is not available to internal staff, several of whom reported that they would like access to this integrated collection of information both to support their work of advising students and to verify that the information was accurate and current. There is a strong belief by staff that this is not the case, as they identified many students entering the university on courses inappropriate to their needs and abilities. This is clearly a case of bad knowledge management both in the outsourced business arrangement and the maintenance of the CBIS.

The second initiative was the appointment of a Chief Information Officer (CIO) from industry who has been given the task of developing the new strategic plan for the university. The first draft of this, now distributed for comment, appears to lack a vision for KM. It mentions vague goals, such as growth in certain areas and the desire for an international reputation, but no indication of what criteria will be set to evaluate or measure these. While the new CIO is well respected, it is obvious that he has no historical and cultural knowledge, being neither an academic nor a long-serving member of the institution. There is a need for a chief knowledge officer (CKO) who, through experience, has an understanding or appreciation of the institutional culture, along the lines of that suggested by Earl and Scott.

### **6.2 Analysis by CHAT**

In summary, the innovative use of CBIS in the university falls into the following three categories:

(1) Extracting data from transaction databases on business performance for management decision making at various levels.

(2) Document management, procedure manuals, job descriptions, product descriptions, minutes of

meetings, reports now on Intranets with hypertext linked information architectures and search engines.

(3) The use of on-line, end-user forms to automate transactions and capture operational data.

Apart from standard Internet communications there are no knowledge sharing systems which attempt to codify tacit knowledge, identifying intellectual capital or encourage communications between knowledge workers, connecting experts with knowledge consumers. Indeed the new business imperatives push for increased competition and productivity, which actively inhibits the sharing of knowledge even within departments. The drive to be business-like is giving priority to the use of CBIS for basic operations but it is not being leveraged for higher-level knowledge creation, learning, and innovation. The CHAT model is shown in table 1.

**Table 1 CHAT Model**

Component	Definition and Clarification	
object	the purpose and motives that define the activity.	Stimulate the development
Activity		Use the projects
subjects	the person or people who carry out the activity	The teachers and students
tools/instruments	both physical and non-physical instruments that are used in the conduct of the activity	KMS
community	the community in which the subjects carry out that activity	The university and the social context
Outcomes	both intended and unintended results of carrying out the activity	Planned, Intended Outcomes Unintended Outcomes as mentioned above

### 6.3 Discussion

People at work in organizations need to 'know' in order to improve, innovate and survive. KMS have the potential to enable people working in ever more complex settings to take a fresh look at what they actually do, why they do it, in what context and with what tools.

From the study it could be seen that in the rush to become more business-like universities are turning to CBIS for KM in the hope that this will lead to increased productivity and a reputation for being at the forefront of innovation. Online information and transactions mean a faster turn around of data and more immediate information. However the use of CBIS is less personal and contextual and there is more responsibility on the user (often the customer). Universities can make innovative use of technologies, in particular the World Wide Web (WWW). Putting what were previously paper documents onto the web has several advantages, namely, greater flexibility in display and arrangement, the ability to maintain currency, less paper and greater access. However, there is still a need to learn how to use the new medium better and be sure equity of access and usability of the technology. KM efforts in this university were hampered by questionable business decisions, such as the outsourcing of customer resource management and bringing in someone, outside the organizational culture, to set the strategic direction. This shows that senior management lack an understanding of KM and the importance of the knowledge resource.

### 6.4 The results of the university study

(1) Organizational learning is a multifaceted and multi-phased phenomenon, a complex interplay between different elements of a system. It cannot be studied by reducing the scope to one or another element, but a minimum meaningful system as a whole should be taken as the unit of analysis and intervention.

(2) Organizational learning is always local and situational: structures, practices, habit and ways of thinking in an organization are all shaped and produced in the historical development of that particular organization. Transformation from the current situation to a new one cannot be done without a historical perspective.

## 7 Conclusions

The message of this paper is that current technologies may do little more than process data into information In the complex realm of organizational knowledge management, but they can be used judiciously in conjunction with new communication technologies to develop a more holistic, and

forward-looking KM approach.

Through the analysis as discussed above, CHAT may provide the means to do this effectively by focusing on forward-looking activities with their goals, motives, priorities, tensions, contradictions, changes and intentions. Such a framework is appropriate for both the study of knowledge management and for the design of knowledge management systems, which enable organizational learning and adapting. Indeed, in understanding the activities that create KMS, organizations may learn not only how to better manage knowledge, and foster new knowledge making, but also how to better use technology for more effective KMS.

## Comparisons of Chinese & British University Library Homepages

Lv Jingping

Library of Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: z730326@yahoo.com.cn)

**Abstract:** This paper aims to find the distance between the university library homepages of China and of Britain, and point out a future developing direction of Chinese university library homepages. A statistic method and a comparison method are used, the frequency of some certain items in university library homepages in these two countries are compared. There are some differences in column establishment, layout design, color tone selection, media application between two countries' university library homepages, these differences manifest the features of two countries' university library, and reflect the gap of the design conception of library homepages between two countries. From a deeper level it also reflects the distance of service conception of university library between these two countries. From the viewpoint of humane and function, Chinese university library homepages should learn British university library homepages. This paper is a original study in the comparison between the Chinese university library homepages and British ones, and can help Chinese university libraries to improve their homepage design and idea of service.

**Key Words:** University library homepages; China; Britain; Comparison; Statistic

### 1 Introduction

With the universal digitalization and networking of university libraries, almost all colleges and universities have set up their own Websites and homepages respectively. The study of construction of university library homepages has get more achievements, the following aspects are particularly noteworthy:

The first is the design of university library homepages. Yong-Mi Kim raised a principle that the less complex a website's design is the more likely users will use it because of low strain on cognitive efforts.<sup>[1]</sup> Based on Nielsen and Tahir's criteria, Pamela Harpel-Burke compared 80 academic library homepages to business homepages, then he found that library homepage designs were significantly different from businesses for only four variables: the ability to search the website, the use of a search box or a link, the use of animation, and a change of link colors to indicate viewed links.<sup>[2]</sup> Laurel A. Clyde surveyed the home pages of public libraries and school libraries in 13 different countries (but he didn't compare these library homepages in different countries), then he concluded some features of the library home page, and he found that the most effective of the library Web sites or home pages appeared to be those that had a clear sense of purpose and a clear sense of the needs of users.<sup>[3]</sup> Fan Cui-ling summarized some problems of homepages construction in Chinese university libraries, such as web organization, establishments of columns, esthetics, and so on, and put forward some countermeasures.<sup>[4]</sup>

The second is the redesign of university library homepages because of the quick developments of technology of information and computer. Dominique Turnbow et al described the redesign processes of the UCLA Library Website, then a complicity user-centered sample was given.<sup>[5]</sup> Junior Tidal described the process of redesigning Ursula C. Schwerin Library's homepage, and he gave some recommendations to improve the usability of library homepage.<sup>[6]</sup> Fan Ai-hong analyzed the reconstruction of website of Tsinghua University Library, and summarized some successful experiences.<sup>[7]</sup>

The third is the evaluation of university library homepage. Junior Tidal and his team used both a user survey and two usability tests to test visitors' interactions with the library homepage, and the evaluated key points is the most commonly used links – finding books and articles, the library's hours, and reference support – were exclusively featured on the homepage. Sandra Shropshire examined four case studies, and identified the salient issues in library Web site direction.<sup>[8]</sup> Using a complicated statistic, Lisa Finder, Valeda F. Dent, Brian Lym found some pages of Hunter College

Library are not easy to use, while the others are easy to use because of more efficient placement, layout and functionality of certain features in the pages.<sup>[9]</sup>

Although there are some fruits in the study of university library homepages, there is still an inadequacy in these studies, which is the methods of survey-statistic and of international comparison have not been combined yet. So there is still exploring space in clearing realization of the characteristics and deficiencies of university library homepages in China, and thus the countermeasures to improve them is still lack of specificity. Foreign university library homepages design may not be fully better than those of China, but through comparing the gap to further optimize China university library homepages design is still a constructive idea, which is the purpose of this article.

Based on above conceptions, attempting to mainly use quantitative statistical analysis, this paper compares some main Chinese and British university libraries homepages and draws two kinds of service concepts. The writer selects 50 British famous universities and 100 Chinese famous universities as samples simultaneously to investigate the situations of these libraries homepages, and examines their differences by statistical analysis, at the same time, makes a summary and analysis of the disparities in the service concepts which behind differences.

## **2 The Column Establishment of Two Counties' University Libraries Homepages**

Overall, the amount of columns in Chinese university libraries homepages is much more than in British. According to statistics, in the samples, the average of columns in British university libraries homepages is 10, but in Chinese is 13.6. There are 22 sections in British university libraries homepages, the average frequency of 45.5%, but 23 in Chinese, 59.2%, which reflects that in respect of the column sequencing of the same frequency, British university libraries homepage is far ahead of Chinese's. This inevitably leads to enrich content of Chinese university libraries homepages, but meanwhile readers, sometimes, would ignore the most primary information that is submerged in a large number of columns after entering homepages.

The statistics of the sample shows (table 1), the navigation bar appears very frequently in both Chinese and British university library homepages and are close to or at 100%. This explains the importance of the navigation bar, thanks to that people need to enter next stage of windows of library homepages. The other two important items of those two university library homepages are the library catalog and electronic resources and electronic library (Elibrary), ranking into the top three, which connect with both sides recognizing the main task of library homepages: telling readers the service concept, what resources are available.

University library homepages in both countries usually have two columns, the help and the feedback from readers, for improving service quality and attaching importance to readers' views. In Britain, the frequency of occurrence of these two columns is up to 74%, tied for the fifth, and in China, is respectively 88% and 66%, ranked as fifth and thirteenth. This means that they all are aware of the need of improve the quality of service.

But then some differences have arisen in the two sides which first manifested in the understanding of the depth and convenience of information retrieval service. The fourth important item in British university library homepages is the keyword search window which can be used to retrieve sites within the library or can also jump to the school homepage site, providing convenience to readers who search relational news within the school information network. But this ranks only 19th in Chinese university library homepages. Besides, an item of a high frequency in British is the A-Z Index, up to 54%, ranking 10th. Yet this highly effective search entrance that has never been used in China is regretful. As similar as the A-Z Index, the frequency of the item, subject retrieval and characteristic resources, is up to 64% in Britain, ranking 8th; 34% in China, just 18th. Accordingly, the frequency occurrence of the item, subject retrieval, is 12% in Britain, but 1% in China. The subject retrieval and characteristic resources are major construction direction for modern libraries to get out of homogenization, and the former which is developed on the basis of the traditional catalog search is the development direction of information retrieval services. Evidently, there are significant differences in service concept and level of two countries.

**Table 1 Items Distribution of Two Counties University Library Homepages**

	UK			China

There is another window both sides pay attention to, that is library information and news. In samples, the frequency of occurrence of this part in British university library homepages is 72%, while as high as 94% in Chinese, which indicates that this window is very common in both sides. But as far as

the content of news and information concerned, the content which has nothing to do with the information retrieval appears in domestic university library, such as leader inspection, library activities and so like; conversely, the content in British university library homepages is just introduction and publication of information resources, consolidation and relocation of library, academic activities held in the library and other purely academic and resource retrieval activities. This reflects that the basic orientation of British university library is academy-oriented, academic independence and service-oriented.

There are other two items of differences worth noticing: brief introduction of library and borrowing requirements. In Britain, the frequency of brief introduction of library is 28%, ranking No.14; in China, is up to 82%, ranking No.6, which proves that British university library is more low-key, pragmatic and even more confident: some information readers understood doesn't need to be introduced. As for borrowing requirements, the frequency in Britain is 12%, ranking 17th; in China is 59%, ranking 15th, the slightly higher location. This illustrates that the lighter preaching colors of British university library; of course, it maybe is related to more conscious readers, while the heavier didactic colors and more obviously normative of Chinese university library

There are two items that make us a particular deep impression in the British university library homepages. One is a mobility information section, designed for providing the close service to action-impaired readers, which reflects humanity of British university libraries, but the cell deep spirit of individualism in western developed countries. The frequency of occurrence of this window is 14%, while it almost do not seen in domestic university library homepages or public library homepages. In our sample, the frequency of this part is zero. This gap is worthy of our deep introspection. The other one is honors of university or library. Its frequency of occurrence in British homepages is 6%, not that high, but compared with zero in Chinese, the number is quite good. The comparison shows that people would work more confident and feel more a sense of accomplishment in British university libraries. In contrast, it seems difficult to link up a sense of accomplishment with working in Chinese university libraries.

### **3 The Layout of Chinese and British University Library Homepages**

The layout design includes the height, the bar number and the partition number of the homepage, the location of the navigation bar and so on.

How much high is appropriate for the height of a university library homepage? Statistical results (table 2) shows that in 80% of the total number of British sample, the height is no more than twice of the computer screen, and it is a convenient height readers can easily drop down to the end of pages, would not lead to dizziness caused by the rapid drop-down and contains regular item content. 12% of homepages are even just a screen height, compact and simple, no extra information, and no ornate decoration, which reflects the pragmatism tendency of British university library homepage design. In China, 52% of homepages are more than twice height of computer screen, and only 48% of homepages are not higher than twice height of it. That is the result above mentioned that bar number of Chinese homepages is much more than British's. This also means that, in Chinese university library homepages, finding some information needs to scroll down the homepage many times, but in British university library homepages, just once.

Another point should be noted in the layout design is columns and zoning of the layout. The column can effectively shorten the length of the horizontal saccade of eyes, and improves the efficiency of visual response. But too many columns also affect the efficiency. In 50 British university library homepages, only 2 are no column, 5 are divided into two columns, 14 are no less than four columns, and the layout divided into three columns is really dominated (table 3), accounting for 58%. This column, relatively consisted with reading habits, is varied but also does not seem too trivial. On the contrary, in 100 Chinese homepages exist opposite situation. Only 30% of the homepage column is divided into no more than three columns, and 66% more than four columns, which are bound to fragmentary interface, and also increased the difficult level of information search.

In addition to the column, both of them commonly use partitioning approach (table 4), dividing homepages into several horizontal area from the top to the bottom. 10 British university library homepages are divided into two areas, accounting for 20% of the total; 28 three areas, accounting for 56%, which constitutes the main body of layout design partition; and 12 no less than four areas. Chinese has different distribution of partition of homepages. 34% of homepages are divided into two areas, 32% three areas, 24% four areas, more dispersed, unlike the partition of British university library homepage

is mainly concentrated in three areas.

**Table 2 The Height of Chinese and British University Library Homepages**

The height proportion(A) of homepage to computer screen	UK			China		
	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence
A=1	6	12	4	1	1	5
1<A<=1.5	15	30	2	26	26	2
1.5<A<=2	19	38	1	21	21	3
2<A<=2.5	9	18	3	15	15	4
A>2.5	1	2	5	37	37	1

**Table 3 The Layout Column of Chinese and British University Library Homepages**

The largest number of columns	UK			China		
	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence
1(No column)	2	4	4	0	0	4
2	5	10	3	4	4	3
3	29	58	1	30	30	2
4 or more than 4	14	28	2	66	66	1

**Table 4 The Layout Partition of Chinese and British University Library Homepages**

The largest number of areas	UK			China		
	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence	The number of corresponding homepages	(%)The proportion of simples (%)	The order of the frequency of occurrence
1(No area)	0	0	5	0	0	5
2	10	20	2	34	34	1
3	28	56	1	32	32	2
4	9	18	3	24	24	3
5 or more than 5	3	6	4	10	10	4

Besides, the placement of navigation bar in British university library homepage is arranged in a way of respecting the traditional reading habit. The left side of homepage is the preferred location of the navigation area, followed by the upper position. Statistics manifests 82% of total sample are designated navigation area in these two locations in British university libraries. But in China, this proportion is much lower, only 51%, while homepages whose navigation area is not located in these two locations accounts up to 39% of the total, which is a rather high proportion. Apparently, British homepages are more in line with the reading habits of modern people: enter the page from top left. But Chinese homepages are designed less consideration of the habit, and it seems to that its man-machine interface not very friendly.

#### 4 The Color Tone of Chinese and British University Library Homepages

The color design of the library homepage focuses on the processing of tone. Colors of British university library homepages dominate by blue tone, 72% of samples mainly using blue or involved blue. And in Chinese homepages, the proportion is also up to 66%. This shows a common philosophy of these two countries libraries: the library is an academic workplace with calm, and objective of academic activities & criteria of independence should be presented in library homepages. The blue tone is easier for people to get a psychological suggestion to calm down, which is consistent with the mood needed in academic activities. 6 British university library homepages are designed in red and similar red as a main

tone, only 12%. It thought that far higher proportion of red tone would be arranged in Chinese university library homepages, after all, Chinese prefer the red, but the surprising statistics shows that only 9% of homepages use red tone, even lower than the UK. That is to say, in library homepage design, the calm and the rationality are widely accepted.

It is worth noting that less purple tone in the Chinese web design, nevertheless it takes a place in color design in British university library homepage. 4 homepages are purple tone. Although the proportion is not high (8%), it is pretty high compared to zero in Chinese web design. In addition to the above tones, British libraries rarely use other colors. Green -- Another Chinese people's favorite color is rarely showed in color tone design of British university library homepage; while in China, the proportion is 7%. In addition, some homepages have no clear main tone in both sides (mainly white background). This proportion of Chinese library homepages is higher than British's: the former is 10%, the latter 2%. It means that layout of British homepage is more concise but paying more attention on adjusting to visual effect by colors; Chinese homepages are more inclined to complex partition variety.

**Table 5 The Color Tone of Chinese and British University Library Homepages**

Tone type of homepage		UK			China		
		The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence
Blue tone	Blue	23	46	1	44	44	1
	Blue-gray	9	18	2	4	4	7
	Other color related blue	4	8	4	19	19	2
	Total	36	72		67	67	
Red and similar red tone		6	12	3	9	9	4
Purple and similar purple tone		4	8	4	0	0	8
Green and similar green tone		1	2	7	7	7	5
Other color		1	2	7	7	7	5
No obvious color		2	4	6	10	10	3

## 5 The Usage of Visual Media in British and Chinese University library Homepages

Both sides design homepages by use of various visual media, but have different preference. Statistics (table 6) shows that only one homepage (DMU) in British university libraries does not use any visual medium, and 49 use a variety of them, which is an absolute majority. For Chinese homepages, this proportion is as high as 100%.

However, the library, after all, is an academic service organization. Its object is relatively stable. Its primary means to attract readers is the academic content and literature search of literature or resources of their collections accessible and convenient extent, rather than fancy visual form. The usage of visual media just to give readers more comfort in the process of retrieval literature, meanwhile to allow readers to get a hint of emotion: this is a relatively objective and dispassionate academic information exchange intermediary. It clearly is not an art window for the purpose of aesthetic, and thus using visual media, designers of UK do both use and play a variety of visual media, and also avoid a result of overwhelming and even affect the functions of information inquiries because of too much visual media. In this way, it can be say that "modernism" this quality has been fully embodied in the use of visual media in various library homepages. In 50 British university library homepage design, only 2 use video, accounting for only 4% of total samples; only 9 use Flash, 18%, not high, which indicates that British homepages are not characterized by the visual impact. In China, although the sample does not appear video, the proportion of the use of Flash animation is as high as 66%, which tends to pursue the visual impact.

Both sides extensively use images and icons, the former is larger, the reproducibility, the latter is relatively small, abstract and indicative. British university library homepages which use images are 39,

accounting for 78% of total samples, those which use icons are 46, 92%; in china, the proportion respectively are 80% and 71%. Highly use of icons in UK indicates that design of library homepage should be more emphasis on the indicative, rather than the reproducibility. Different with British homepages, Chinese one is more inclined to images instead of icons. Together with the above mentioned about large numbers of Flash animation, they attract readers by the vivid means of media, which has obviously been the impact of websites in society, and what calm and rationality academic institutes need is highlighted not enough.

**Table 6 The Visual Media of Chinese and British University Library Homepages**

The visual media type	UK			China		
	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence	The number of corresponding homepages	The proportion of simples (%)	The order of the frequency of occurrence
Video	2	4	4	0	0	4
Flash	9	18	3	66	66	3
Image	39	78	2	80	80	1
Icon	46	92	1	71	71	2

## 6 Conclusion

Through comparison between Chinese and British university library homepages, it is not difficult to find that there are some conspicuous differences in the understanding of the service concept of library which is a relatively independent complementary unit of academic research, following conclusions can be drawn out:

1) Typical British university library homepages possess the height of homepages limited in less than two times of screen, layout arrangement mainly led by three columns and three areas, navigation bar located in the left and top of the interface, respecting the reading habits of modern man; in color tone design, they commonly use blue-oriented and occasionally red and purple; in application of visual media, they less use means of video and Flash animation, but more use traditional media such as images and icons. Whereas typical Chinese university library homepages possess the height of homepages is mostly more than two times of screen, more than four columns, no obvious difference in cutting area, arbitrary location of navigation bar in the interface, no much consideration of reading habits; in color tone design, they commonly use blue-oriented and occasionally red and green; in application of visual media, they often use Flash animation.

2) British university library homepages is characterized by good function, concise and simple interface, and calm-and-rational-oriented psychological intimation, etc. Chinese university library homepages have not bad functions as well, but too many optional items influent the efficiency of getting information, at the same time, they ignore apparent inclination of differences which between library homepages' and regular social websites'. Besides, they blindly copy the portal site homepages' features, chasing visual impact, complex content and layout, which is no match with academic orientation.

3) Both sides have their failures. For British university library homepages, some of them are far too simple, a small part of them are short of a unified sense of order, and they fully reflect the principle of modernistic function above all and the design concept of neglecting form. For Chinese university library homepages, they are too complicated and trivial: too rich and not well organized content, too active and impulsive interface. Function-only and the shortage of form result in unsuccessful works in British university library homepages; form-only and the shortage of function bring about failures of Chinese university library homepages. Admittedly, it is Chinese university library homepages that have serious problems.

4) The contrast of the advantages and the disadvantages of university library homepages of two countries implies the improving direction of future China university library homepages: more emphasizing the function and appropriately diluting the form, more emphasizing the academic characteristics and appropriately keeping away from common portals, more corresponding to the ergonomics and avoiding the violation of perceived psychology and reading habits. Furthermore, more attention should be paid on in-depth service philosophy, we should consciously learn British university libraries. British university library homepages reflect British university library's respecting readers, more humanity services, efforts to refine service quality, function first and any other concepts which

should be praised and confirmed, and they should be the good example of Chinese university libraries.

## Analyses on Risks of Intellectual Property Rights in Enterprises' International Operations\*

Peng Shaohua

School of Art and Law, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: conbrave@hotmail.com)

**Abstract:** It successfully applies the method of interdisciplinary research, and it conducts a mathematical model to analyze. Risks of intellectual property rights, which enterprises confront during international operations, are comprehensively analyzed from political, legal, economic, market, technology, culture and operations management aspects. And on this base, a financial method about analyzing risks of security investments is proposed, and the mathematical model concerning the risks of intellectual property rights during international operations of enterprises is established, then a quantitative analysis is conducted. It comes to a conclusion that risks of intellectual property rights can be measured. The model is of great importance for enterprises to do with precaution, protection and management of intellectual property rights accurately.

**Key words:** International operations of enterprises; Risks of intellectual property rights; Risk factors; Mathematical model analysis

### 1 Introduction

With China's accession to the WTO, domestic enterprises face more and more fierce international competitions, and internationalization becomes an inevitable development road. However, in the process of international operations, domestic enterprises face a lot of risks, including the risk of intellectual property rights, which is one of most important and frequent risks. The gradually maturing external condition, the intellectual property rights as the asset with independent commercial value to participate in the financing load, essentially can support growing food for cultural enterprise lacked of fixed asset and fund. (Wei Yaping, Yang Jianping, 2006) The financial crisis across the world leads domestic export enterprises especially high technological enterprises to go bankrupt or be on the brink of bankruptcy, and the global economic situation is seriously bad. The research and developing feature of high technological enterprises makes them confront various crises and disasters in intellectual property rights field. (Wei Chen, Guan Jianxin, 2007) Under this background, more and more Chinese enterprises gradually realize the importance of intellectual property rights. There have been many domestic and overseas studies concerning intellectual property rights and the protections and managements. Tang Heng points out that effectively recognizing and controlling risks of intellectual property rights is the guarantee for victory of enterprises' market competence. (Tang Heng, Zhu Yu, Jin Yucheng, Liu Jia, 2007) Tod Mongan thinks technological enterprises should execute routine check of risks of intellectual property rights. (Tod Mongan, 2005) However, few has yet studied these from the view of quantitative analysis. For this, on the basis of comprehensively analyze risk factors that enterprises face during international operations, it innovatively guides into analytical method of security investment risks to establish risk analysis model and makes quantitative analyses, which provides risk-prevention-and-control references of intellectual property rights for enterprises undertaking international operations.

### 2 Analyses on Risk Factors of Intellectual Property Rights during Enterprises' International Operations

Enterprises will face a series of risks during international operations, and in the case of risks of intellectual property rights, it mainly includes seven aspects of risk factors: the political risk factors, the legal risk factors, the economic risk factors, the market risk factors, the technology risk factors, the culture risk factors and the operations management risk factors.

#### 2.1 The political risk factors

Intellectual property rights is an enterprise's strategic resources, and during an enterprise's international operations, its political risk factors mainly include all countries' strategy formulation and implementation of intellectual property rights; the instability of all countries' policy of intellectual

---

\* Fund Project: Independent Innovation Research Fund Project of Wuhan University of Technology (NO.125213002; Approving NO. 2012-ZY-096)

property rights; and regional group development of the world economy.

## **2.2 The legal risk factors**

There are two legal risks: one caused by legal system, and the other caused by legal reality. As intellectual property rights has the character of legal exclusivity and reproducibility, besides, it can bring an enterprise with huge economic benefits, as a result, during the process of management and application, an enterprise' intellectual property rights may have the legal risk of being imitated, faked, leaked out, registered and so on. (Jiang Zhihong, 2010) Management of legal risks has increasingly become an important strategic means for all countries' enterprises to grab domestic and foreign markets. However, Chinese enterprises show weak consciousness, backward system, and insufficient input problems in the management of intellectual property rights, thus they pay a painful price in the increasingly fierce market competitions. The legal risks of intellectual property rights have big effects on international operations of an enterprise, and there are two main factors, including legal risks brought by world convergence of intellectual property laws and different limitations on intellectual property rights.

## **2.3 The economic risk factors**

### **2.3.1 Economic risks brought by the change of economic conditions**

Economic conditions an enterprise face in international operations mainly conclude: natural resources, human resources, the economic basis, and the investment and financing environment, and the change of these conditions will bring the enterprise with economic risks during international operations. (Zhou Yongming, 1994)

### **2.3.2 Economic risks brought by the change of economic policies**

Due to different economic developing levels, different countries will implement different economic policies. However, the economic developing level and economic status of a country are not unchangeable, and its economic policies will change accordingly, and change of some economic policies would bring enterprises, hosted by this country, with different economic risks during international operations. The change of economic policies related to intellectual property rights would also bring enterprises with economic risks during international operations.

## **2.4 The market risk factors**

Under the conditions of market economy, market risk is inevitable for any economic participation body, especially for enterprises undertaking international operations.

During international operations, due to different factors, not all countries have the same requirement and standard for one product, and different markets also have different consumption demands. With the constant expansion of financial innovation fields, securitization of intellectual property rights assets get a rapid development. On the trade process of securitized assets, speculation is not rare, and this accelerates the market price of intellectual property rights to change.

## **2.5 The technology risk factors**

The maturity and reliability of a technology are essential to its successful transformation. Some core technologies of an enterprise's intellectual property rights are likely to face technology risks in the concrete implementation process. That is to say, technological achievements can't or can't successfully transform into real productivity, and it may cause uncountable losses to the enterprise.

## **2.6 The culture risk factors**

Whether international operations of an enterprise will succeed, it is not only due to consideration of factors like products, market and technology, but also to analyses of culture differences. Culture risks of intellectual property rights during enterprises' international operations mainly perform in the following two aspects: interior fusion and exterior cooperation of operation and management of intellectual property rights.

## **2.7 The operations management risk factors**

Under different political, economic and culture backgrounds, an enterprise has different operation and management ways and different operation and management ways of intellectual property rights. Facing the increasingly complex international environments, an enterprise often suffers huge losses during international operations, as a result of improper operation and management.

## **3 Mathematical Model Analyses about the Risks of Intellectual Property Rights during International Operations of Enterprises**

For the mentioned risk factors of intellectual property rights enterprises confront during international operations, the following mathematical model will do quantificational analyses.

### **3.1 Lead-in of the model**

Generally speaking, risk is the probability an investor would suffer losses, and in financial terms,

the accurate meaning of risk is to deviate from the expected earnings, and it is the same with the risk of intellectual property rights an enterprise confronts during international operations. There are so many factors cause the deviation, including the mentioned seven risk factors.

**3.2 Basic assumptions of the model**

The model includes four basic assumptions:

- 1) The market is strongly effective;
- 2) Enterprises are only faced with risks of intellectual property rights during international operations;
- 3) There are only seven risks of intellectual property rights, including the political risk, the legal risk, the economic risk , the market risk, the technology risk, the culture risk and the operations management risk;
- 4) There are only four economic statuses, including bad, so-so, good and very good.

**3.3 Establishment of the model**

3.3.1 The measure of overall risks of intellectual property rights an enterprise confronts during international operations

1) The way to measure overall risks

The measure of risks of intellectual property rights an enterprise confronts during international operations can be realized by calculating the standard deviation or variance of return rate. According to the definition on statistics, the variance of return rate of intellectual property rights can be calculated by the following formula:

$$\sigma^2(R) = \sum P_i * [R_i - E(\tilde{R})]^2 \quad (i=1,2,3,4) \tag{1}$$

Among them:

$P_i$  means the happening probability of return event of intellectual property rights under different economic statuses;

$R_i$  means the return rate under different economic statuses;

$E(\tilde{R})$  means the expected return rate of intellectual property rights.

2) The specific operations to measure overall risks

In most cases, the return rate of intellectual property rights will change along with economic statuses, and it's more obvious under the increasingly complex international environments. In the model, there are only four economic statuses, and it makes some assumptions of the return rates and their happening probabilities under every economic status, as the following table shows:

**Table 1 The Measure of Overall Risks of Intellectual Property Rights**

Economic Status	Probability	Return Rate
Bad	0.14	-0.2
So-so	0.3	0.1
Good	0.4	0.2
Very Good	0.16	0.5

So, the expected return rate of intellectual property rights is:

$$E(\tilde{R}) = 0.3 \times 0.1 + (-0.2) \times 0.14 + 0.5 \times 0.16 + 0.2 \times 0.4 = 0.162$$

Then, apply formula (1), and we can get the variance of the expected return rate of intellectual property rights:

$$\begin{aligned} \sigma^2(R) &= \sum P_i * [R_i - E(\tilde{R})]^2 \\ &= 0.3 \times (0.1 - 0.162)^2 + 0.14 \times (-0.2 - 0.162)^2 + 0.16 \times (0.5 - 0.162)^2 + 0.4 \times (0.2 - 0.162)^2 \\ &= 0.0203 \end{aligned}$$

According to the definition of variance, we get to know that in this assumption, the value-at-risk of intellectual property rights of this enterprise is 0.0203.

3.3.2 The measure of specific risks of intellectual property rights an enterprise confronts during international operations

3) The way to measure specific risks

In the model, it makes an assumption that during an enterprise's international operations, there are

only seven mentioned risks of intellectual property rights, and these seven risks are calculated by losses under certain probabilities, and here is the formula:

$$R_m = P_m * L_m \quad (2)$$

(m=1,2,3,4,5,6,7; and 1 represents political risk of intellectual property rights, 2 represents law risk of intellectual property rights, 3 represents economic risk of intellectual property rights, 4 represents market risk of intellectual property rights, 5 represents technology risk of intellectual property rights, 6 represents culture risk of intellectual property rights, 7 represents operations management risk of intellectual property rights)

Among them:

$R_m$  means the size of the specific risk m;

$L_m$  means the loss caused by the specific risk event m;

$P_m$  means the happening probability of the specific risk loss event m.

4) The specific operations to measure specific risks

According to different industries and different sizes of enterprises, the influences of different risks of intellectual property rights are also different. In the model, we take a group of data for instance, as the following table shows:

**Table 2 The Measure of Specific Risks of Intellectual Property Rights**

Specific Risks	Loss(L)	Probability of Loss(P)	Size of Risks(R)	Weight of Risks(W)
Political Risk (1)	50000	0.002	100	0.216
Law Risk (2)	30000	0.003	90	0.194
Economic Risk (3)	80000	0.0004	32	0.069
Market Risk (4)	60000	0.0005	30	0.065
Technology Risk (5)	70000	0.0001	7	0.015
Culture Risk (6)	20000	0.0002	4	0.009
Operations Management Risk (7)	40000	0.005	200	0.432

From the table, we can obviously find, in this assumption, different specific risks of intellectual property rights have different influences on enterprises' international operations. In practical operations, we can refer to the model, and combine with the characters of different enterprises.

## 4 Conclusion

It comprehensively analyzes seven main risks of intellectual property rights, including political risks, legal risks, economic risks, market risks, technology risks, culture risks and operations management risks, and their influencing factors. On this base, it establishes a mathematical model centered with two formulas to measure overall and specific risks of intellectual property rights during enterprises' international operations respectively. And this is a great innovation. The model and its quantificational analyses may lead enterprises undertaking international operations to locate in international markets specifically, and to make schedules about precaution, protection and management of intellectual property rights accurately. However, it's just a model which rejects some real conditions, and scholars can do deeper researches to consider more market factors to complete this model and help enterprises win in practical international operations.

**Abstract:** Based on the description of the conception, the demanded resources, the objective and the control process of venture capital fund, this paper will analyze the important use of the knowledge in venture capital fund, the mode of operation for venture capital fund and we will elaborate the characteristics and the classical operation mode of venture capital fund management. Then this paper will design one mode through the process of knowledge management. At last, we can get the conclusion that knowledge management is the most important element of venture capital fund management and how we should use knowledge in venture capital fund.

**Key words:** Venture capital fund management; Operation mode; Knowledge management; VaR

## 1 Introduction

Venture capital plays a crucial role in transferring science and technology to practical productivity and in promoting economic growth and social progress. With the growth of the venture capital industry, the venture capital fund has become the core mode of venture capital. As fund managers, the venture capital fund management company is a key part of the venture capital. Its efficiency and effectiveness directly affect the consequences of running the venture capital. Therefore, the investigation on the organization and operation of a venture capital fund management company is extremely important on improving its performance.

In current years, venture capital is one of the focuses of academic research in China. Most researches of venture capital investigated it from “macro” to “micro” levels, and the study that focus on the operation mode was rarely mentioned. Since operation mode is crucial to the effectiveness of venture capital. In the era of knowledge economy, the foundation of venture capital industry, VC companies’ core-competitiveness and development potential are all closely linked to knowledge of management team. In order to add value to an enterprise by using knowledge, effective techniques and tools are necessary for knowledge management. As a new concept and model of modern management, knowledge management has increasingly become the focus of venture capital industry and a key factor to find the competitiveness of a VC fund. The establishment of a knowledge management system is the basis of knowledge management. With the growing awareness of knowledge management, many venture capital companies have begun to apply knowledge management and knowledge management systems. Few companies have introduced the concept, even developed the culture of knowledge management, and developed knowledge management systems. Some VC companies succeed, some companies failed. There are many reasons that some VC companies failed to develop knowledge management systems, one of significant factors is the failure of risk management. Some project managers ignore risk management. The lack of risk-control places risk into disaster, and finally lead to the failure of knowledge management system project. How to improve the success rate of knowledge management systems, and effectively reduce and control the risk has become an important theoretical value and practical significance. This paper is trying to elaborate the importance of it to improve the management of the venture capital fund in our country.

## 2 Essence of Venture Capital Fund Management: Knowledge Management

### 2.1 The main resources of venture capital fund management: knowledge

In Economics, the typical resources are land, labor, capital, and later the entrepreneurs become the forth factor of production. Currently, with the continuous development of technology and productivity, knowledge gradually gets rid of its dependence on other production factors and becomes an independent resource, which plays an increasingly important role in economic development and social progress.

Leading resources is the dominant resources that among those that create wealth. During different economic era, the leading resources are different. In the agricultural economy era, land is the leading resource. In the industrial economy era, capital is the leading resource. In the era of knowledge economy which is on the horizon, knowledge will become the dominant resource.

The venture capital process is the process of combining capital with knowledge. The leading resource for venture capital fund management is knowledge rather than capital, which can be proved by borrowing the concept of organizational capital and social capital. According to Phillips Specter and Wesker's discourse, knowledge is the basic source of organizational capital. As Keli Man said: "capital is the most typical social capital, organizational capital is dedicated and hidden, while social capital is a common and dominant under normal circumstances, the enterprises will be constrained by organizational capital and social capital, the level of knowledge is not the same as it when enterprises are mainly subject to the constraints of social capital (such as a shortage of funds), social capital will play a leading role in the enterprise, when the enterprise was mainly due to organizational capital constraints, the knowledge will play a leading role in the enterprise. " For the venture capital industry, the scarcity is not the money, but the knowledge of operating funds. Therefore, in the venture capital fund management, knowledge is the leading resource. Through the development that direct investments mode transferred into the principal-agent mode, we can see that: for venture capital firms, knowledge as organizational capital is more scarce than the fund as social capital; knowledge is more restrictive than fund in the venture capital fund management. Hence, knowledge will replace the capital to become the leading resource for venture capital fund management.

According to the decision theory, decision should be made by the one who have the related knowledge. In general, in the venture capital industry, while venture capital investors are responsible to the final decision making, venture capital fund management teams own the knowledge for the decision making. In the early stage of development of the venture capital industry, investment was mainly in the direct investment mode. In this mode, the final decision maker and the knowledge owner is one entity (investors used their own capital for risk investment. They not only had capital but also had the knowledge and experience for making investment decisions).With the development of the venture capital industry, the principal-agent model gradually occupied a dominant position. In this new mode, the final decision maker and knowledge owner are separated. Hence, the agency relationship is formed. However, the principal-agent mode produces much cost, since the learning is needed for acquiring knowledge and learning produces need much cost. Moreover, it is difficult for the final decision maker to learn all the effective knowledge. Therefore, in the venture capital industry, the original decision maker transfers the decision-making power to the knowledge owner, which is the professional venture capital fund management team. This is also the reason why commission management system is dominant form of the venture capital organization in developed countries. Such an alienation of decision-making power also illustrates the dominant role of knowledge in the venture capital industry. Therefore, knowledge is the leading resource in venture capital firms.

## **2.2 The organizational characteristic of the venture capital fund management: a knowledge-based organization**

The basis organizational characteristic of the venture capital fund management is knowledge. Venture capital fund management companies can be regarded as a knowledge-based organization. Knowledge-oriented resources are the dominant resources of knowledge-based organization; the creation of knowledge, transfer and use of the capacity are the core competitiveness of the organization to provide knowledge-based product or service. First of all, the provision of knowledge-based products or services for customers is the fundamental means to profits for knowledge-based organization. It is also the fundamental way to display the organization's objectives. Second, organizational knowledge is the leading resource of knowledge-based organization. There are a variety of resources in the organization, and they work together to achieve organizational goals. In knowledge-based organizations, knowledge will become the leading resource; it is in a dominant position in a variety of resources. Again, the knowledge acquisition, use and creation ability of organizations will become the fundamental source of core competitiveness in the knowledge-based organization.

From the above, knowledge is the leading research that achieve the goal of venture capital. The most fundamental products and services that it has provided is knowledge (i.e., value-added services). The source of its core competitiveness is the knowledge and ability that company used to provide value-added services. Therefore, venture capital is a knowledge-based organization, and these features will give an important and far-reaching impact to its organizational design and management of production.

## **2.3 The objectives and forms of venture capital fund management: knowledge**

The rise of the venture capital industry is due to the large inflow of money to the industry. The purpose of the entry of funds is to obtain high profits. In the principal-agent mode of venture capital, company must give sufficient returns as the managers of venture capital venture capital fund

management. This is the only possible way that venture capital can raise the appropriate capital for the next round of investment. Therefore, the pursuit of profit becomes the primary objective of the venture capital in order to obtain considerable returns.

The customers of the venture capital are venture firms or risk projects. Generally speaking, they have two demands: capital and value-added services. Venture capital fund is the combination of capitals and technology. The effectiveness of this combination depends largely on the degree of integration of management and technology, which means that it depends on the value-added services, such as strategy, management and social network resources which are provided by the venture capital fund management company. The process of venture capital is not the one-way selection from venture capital investment fund management companies to risk enterprise (or risk project). While venture capital firm selects the best venture capital, but the most suitable venture capital. To risk enterprises, venture capitals that provided by different venture firms have basically no difference. What attract venture businesses are value-added services, which are provided by venture capital. Moreover, the value-added services of the investment risk are from the knowledge of the company's venture capital fund management team, as well as the company's organizational knowledge. Therefore, knowledge is a fundamental product of the venture capital firm.

High risk is the characteristic of the venture capital industry. Venture capital firms gain profits through the effective management of risk, and get its achieve its organizational objectives. Risks can be understood as an uncertainty of results. There is a negative correlation between uncertainty and available information.

**Figure 1 Relationship of Information and Risk Rate**

As shown in Figure 1, venture capital firms grasp information more fully, the investment risk becomes smaller. Moreover, the ability of acquiring knowledge is stronger, the quality is higher. Figure 2 can infer the relationship that risk and knowledge is negatively correlated. In other words, the more knowledge that the more venture capital firm holds, the higher the quality is. The stronger its investment risk management capabilities, the smaller the risk of their investment, as shown in Figure 3. Therefore, knowledge of the venture capital fund management is not only the fundamental guarantee of the venture capital risk management, but also the essence of venture capital to achieve its objectives.

**Figure 2 Relationship of Information and Knowledge**

Figure 3 Relationship of Risk Rate and Knowledge

### 3 The Use of Knowledge Management in the Venture Capital Fund

#### 3.1 The basic situation of the venture capital fund

In 2009, the number of SMEs in China is over 4000, which accounts for more than 95% of the total number of enterprises in China. However, China's SMEs have been faced with the difficult problem of financing to handle large enterprise groups. In the actual economic life, besides dealing with its solid financial research, development and production of high-tech investment projects, there are limits in the financing of SMEs. Therefore, new channels of financing for SMEs' further development are needed. Under such condition, firstly, venture capital funds were invented by western countries. They specialized in high-risk investment fund. These companies recruited a large number of high level talents to good business venture capital, and they issued a considerable number of venture capital funds. These funds were invested into the SMEs projects that were valuable after careful screening. After the investment in venture capital funds to become successful, the venture capital fund transferred bribery by going to the public. Venture capital funds played a pivotal role in the economic development of countries in the Western, and they have made an invaluable contribution to the development of SMEs in these countries.

#### 3.2 Market risks management method in venture capital funds: knowledge Management

In the investment of venture capital funds, there are a lot of market risk, which refers to the changes in market factors and the decline in value of investment. In general, there are four categories of market risk factors, stock indexes, interest rates, exchange rates and commodity prices. Stock index risk is the risk of stock price fluctuations. Interest rate risk refers to the risks of interest rate changes. Exchange rate risk refers to the risks of changes in foreign exchange trading price. The commodity risk is the risk of changes in commodity prices. These risks may bring the risk of investment failure to the venture capital fund. Therefore, venture capital fund should use knowledge management to manage market risk.

##### 1) Identifying the market risk

The first step in risk management is to identify them. If we cannot correctly identify the risk, we will not be able to find legitimate ways to manage risk through knowledge management. Venture capital funds can observe the changes in interest rates and commodity price changes firstly, then detect the operation of the project to identify potential risks.

##### 2) Accessing market risk.

3) After venture capital funds find that the market risk, they should assess risk factors and potential loss. Knowledgeable staffs in venture capital fund can use historical data and statistical tools to create a unique style of risk assessment models and market risk assessment system. Through this model and evaluation system, the venture capital fund managers can identify and assess risk factors and make appropriate decisions.

##### a) The value of the absolute VaR: $VaR = w - w = -w\sigma$

b) Relative VaR is the loss of average expectations of a project. Absolute VaR is the loss with a project related to the initial value, not with the average expected Relative VaR takes time value into account, so it can reflect the true level of risk better. We can generalize the existing VaR methods into three categories: parameter method (including Risk Meteics and GARCH), non-parametric method (to

include Historical Simulation and Hybrid mode) and semi-parametric method (including extreme value theory Extreme Value Theory CAVIAR and like the maximum likelihood method, such as the GARCH). VaR is widely used in many fields. For example, JPMorgan uses VaR to build Risk Meteics model in order to manage the market risk; banks use VaR to manage market risk.

#### 4) Management of market risk and feedback

After the staff of venture Capital Fund found the potential market risk, venture capital funds should take measures to manage risk and minimize the loss of these measures. These measures include the long-term investment in different types of small and medium-sized enterprises and the Financial Street tools include: Forwards, futures and options to hedge against market risk. At the same time, venture capital funds should refuse to provide more funds for SMEs. When SMEs encounter serious market risk, venture capital fund should establish early warning systems and appropriate management mechanism, and it should change the traditional risk management models. In order to establish an early warning and feedback mechanisms, venture capital funds should firstly create database and risk management models. Then, venture capital funds should take advantage of the validity of the data to test models and the applicability of early warning systems. Finally, venture capital funds should update the data of SMEs and timely adjust the investment strategy to manage market risk and to obtain more return.

Venture capital fund is with implicit knowledge and explicit knowledge. Implicit knowledge is the knowledge of the inner sentiment, such as know how and professional thinking, while explicit knowledge can be expressed by equations and other knowledge and can be used for risk management. Therefore, venture capital funds should firstly formulate the strategy of knowledge management, then using knowledge management to manage market risk.

### 3.3 The process of the knowledge using

#### 3.3.1 Building a knowledge database

Since venture capital funds have more and more information and risk information of small and medium enterprises and investment projects, venture capital funds must establish a database to manage these information. Through the database, the venture capital fund is able to query, analyze and share the project information of small and medium-sized enterprises, and then analyzing and monitoring the information and risks. Therefore, they can propose appropriate strategies to manage these risks

#### 3.3.2 Managing creative knowledge

Because venture capital funds have a lot of experts and knowledgeable staff, venture capital funds should motivate employees to learn more knowledge and creative work. Through the creative work of the knowledgeable staff, the venture capital fund will be able to find the profitability of the project and to manage risks for more returns.

## 4 One Design of the Ventures Business System Concerting on Knowledge Management

According to the organizational characteristics and operational characteristics of the venture capital firms, venture capital firm's business process system can be horizontally divided into strategic management, investment management and knowledge management. The strategic management process subsystem describes the company's strategic planning and business processes. Investment management process subsystem is a venture capital firm's business processes; it is prescribed according to the kind of operation that be used to access risk capital, the management and how to cast the risk of corporate divestment. The venture capital firm's investment management business processes subsystem is actually a process that providing services to create value for customers. It is also a basic value-added process of the venture capital firm. Knowledge management processes subsystem is an assurance process of, venture capital firm. This regulates the company's access to knowledge. By the process of knowledge creation and knowledge application, it provides protection to the company's value-added process.

Pressing business process system of venture capital firms, in the horizontal, can be divided into three business processes subsystem, and the various business processes subsystem pairs, in the vertical, can be down decomposition. Strategic management process subsystem can contain the company's strategic planning process and the company's business process management process. The operation capacity of the business process is an important foundation for companies to obtain competitive ability, so the company cannot fail to give sufficient attention to the base business process system. Since business process design and optimization is not easy, we need to be adjusted accordingly based on base operation and the company's internal and external environment. Therefore, the company should have a standardized business processes to guide the work. The company's investment management process

subsystem including the company's financing, investment, divestment, and the tube of the invested enterprises. The company's knowledge management process subsystem is the process of creation, dissemination, sharing and application process so that organizes knowledge. All we know is the leading resource for venture capital firms. Knowledge management capacity is the key to maintain sustainable competitiveness lies, because knowledge management process is the core of the company's business process system. Knowledge management processes are closely related with the company's investment, financing, and value-added services. In essence, knowledge management processes are the knowledge support for finance, investment, value-added services and the divestment process. On the other hand, the activities of these business processes are the source of knowledge for knowledge management processes. They both tend to integrate as a whole, and it is difficult to clearly distinguish between them. Figure 4 is a business process architecture diagram in the venture capital firm, which can clearly describe the architecture of venture capital firm.

The business process system of venture capital firms can be fatherly divided in the vertical direction, until the activity levels. This will constitute the system, which is a crisis-cross network-based business process, to improve operational efficiency and effectiveness.

**Figure 4 One Business Process Architecture Diagram in the Venture Capital Firm**

## 5 Conclusions

This paper explores the meaning of venture capital funds and knowledge. Then it analyzes the necessity and feasibility of knowledge management in venture capital funds. Eventually, this paper claims the method how to use knowledge management to manage market risks. Through our research, we discovered that we should construct venture capital funds starting from designing strategy for knowledge management, which should be used to manage the market. Specifically, doing venture capital funds should establish database and VaR model at the beginning, then use these to evaluate and calculate the market risks of the invested small and medium-sized enterprises. What's more, the managers should use the diversified investment strategy, as well as financial street derivative to hedge the market risk. By using knowledge management, venture capital fund can provide funds for small and medium-sized enterprises, meanwhile obtaining profits through market risk management.

**Abstract:** This paper empirically analyzes the effects of information technology function on tacit knowledge transfer effectiveness. The functions of information technology are summarized as follows: feedback, symbol variety, parallelism, rehearsability, reprocessability. The effects of information technology function and the moderating effects of common experience of both sides on tacit knowledge transfer effectiveness are analyzed through multiple linear regression model. The results show that, feedback, parallelism, rehearsability, reprocessability functions of information technology have a significant impact on tacit knowledge transfer effectiveness. Meanwhile, the familiar degree of both parties involved in knowledge transfer, and the familiar degree between the exchange theme and both parties have positive moderating effects on tacit knowledge transfer effectiveness based on information technology.

**Key words:** Tacit knowledge; Information technology; Knowledge transfer; Transfer effectiveness; Multiple linear regression model

## 1 Introduction

With the market competition becoming increasingly fiery, knowledge has become the core resource in the enterprise. It is also the important means to obtain competitive advantage of enterprises. Business and academic circles begin to widely pay attention to knowledge management. One of the important goals of knowledge management is: "The right knowledge is transferred to the most appropriate person at the right time". The main strategy of knowledge sharing and exchanging is that the two parties involved in knowledge exchange need to stay in the same place, at the same time to carry out the knowledge exchange activities. However, under the background of economic globalization, the enterprises geographically dispersed degree is increased. Many businesses are operated in other regions and countries. Knowledge exchange is affected by time difference, space difference, and social difference. This problem is alleviated a large extent by information technology (IT). Many experts and scholars have discussed in theory: "How to effectively use information technology?" Roberts & Lowry have studied the effect of knowledge transfer on team with the application of information technology. They suggested that information technology could decrease the negative effect caused by the expansion of the team size<sup>[1]</sup>. Chen HW & Zhu WF suggested that one of the main measures of promoting tacit knowledge communication was the application of information technology. But some scholars put forward the different views<sup>[2]</sup>. Cooper thought the effect was not significant in tacit knowledge transfer with using information technology<sup>[3]</sup>. The inner mechanism of tacit knowledge transfer with using information technology will be further explored in this paper. Information technology has the five functions, which are feedback, symbol variety, parallelism, rehearsability, reprocessability. The relationships of IT functions and tacit knowledge transfer effectiveness are analyzed. The moderating effects of the common experience in tacit knowledge transfer are analyzed, which about the relationships of the familiar degree of two parties, and about the relationships of the familiar degree between both parties and the communication theme.

## 2 Literature Review

### 2.1 Tacit knowledge

Polanyi presented the concept of tacit knowledge in 1958. He thought that knowledge could be coded which was explicit knowledge, knowledge could not be coded which was tacit knowledge<sup>[4]</sup>. Nonaka & Takeuchi thought that tacit knowledge was highly individualistic, difficult to formula, difficult to communication, and rooted in action and specific situation<sup>[5]</sup>. In addition, some other

---

\* This paper is supported by the Science and Technology Planning Projects in Jiangxi province, No.2009ZDG03100, and supported by the Project of College of Humanities and Social Sciences in Jiangxi province, No. GL1108.

scholars on tacit knowledge also put forward own viewpoint. Nelson & Winter thought that tacit knowledge was the skills of people in the action<sup>[6]</sup>. Durcker thought that tacit knowledge was derived from experience. It could not be interpreted with the language. And it could only be demonstrated that was exist<sup>[7]</sup>.

## **2.2 Tacit knowledge transfer mode**

Knowledge transfer refers to knowledge sharing within the organization or organizations across the borders. Teece first put forward the concept of knowledge transfer. He pointed out that the knowledge transfer could help enterprises to accumulate the valuable knowledge and promote the technology diffusion. Thus the technology gap between regions was narrowed<sup>[8]</sup>.

There are many ways of tacit knowledge transfer. Currently the main tacit knowledge transfer mode includes: flow of personnel, training, observation, technology transfer, copy path, patent, scientific publications and lectures, the exchanges of suppliers and customers, alliance and so on.

## **2.3 Influence factors of tacit knowledge transfer**

Knowledge transfer has been certain affected by knowledge sender and acceptor characteristics. On the one hand, the knowledge sender has to have the cooperation and the will of knowledge transmission. The motive of the knowledge sender is the key factor of knowledge transfer success. The higher knowledge sender wishes, the more knowledge and information can be obtained by the knowledge acceptor. On the other hand, the absorption abilities of knowledge acceptor also affect knowledge transfer effectiveness. The more strong absorption abilities is, the more effective holding and using these opportunity to obtain new knowledge.

## **2.4 Influencing factors of tacit knowledge characteristics**

Knowledge characteristics which effected knowledge transfer mainly included: causal ambiguity, knowledge tacit degree, embedability.

Causal ambiguity refers to causal relationship between action and result is uncertainty. The bigger causal ambiguity is, the more difficult to identify the relevant knowledge element is. Simonin systematic studied the effect of knowledge transfer based on knowledge ambiguity. The results showed that knowledge ambiguity had negative moderating effects on knowledge transfer effectiveness<sup>[9]</sup>.

Knowledge tacit degree refers to knowledge was difficult to express with text, charts, and language. The greater knowledge tacit degree is, the more difficult knowledge transfer carries out.

Embedability refers to the knowledge cognitive characteristics. It exists in different levels, such as person, organization, product, tools and technology, organizational task, organizational networks and so on. Cummings & Teng pointed out that knowledge was contained in different carriers, and the difficulty of transfer would be different<sup>[10]</sup>.

## **2.5 Situational influencing factors of tacit knowledge transfer**

Situational features of knowledge transfer includes: trust, previous experience, relationship strength, similarity of knowledge background, organization culture and other aspects.

Soekijad pointed out that good previous experience for the alliance or specific partner had a positive effect on promoting the knowledge transfer, because previous experience could make the enterprise to realize the value of new knowledge, and to absorb it, and to apply it<sup>[11]</sup>.

A bigger difference still exists in the academic circles about the effect of knowledge transfer on knowledge background similarity. On the one hand, many scholars thought knowledge background similarity had a positive effect on knowledge transfer. Nonaka pointed out knowledge overlapping and similar experiences could contribute to knowledge transfer<sup>[5]</sup>. On the other hand, some scholars thought knowledge background similarity had a negative effect on knowledge transfer. Burgelman thought that the knowledge difference was too smaller to lose the power to learn the new knowledge for knowledge receiver<sup>[12]</sup>.

Organizational culture is an important factor of knowledge transfer too. Even though knowledge transfer mechanism is rather mature, it may not be possible to get the expected result, it determinants in organization knowledge sharing culture.

## **2.6 IT influencing factors of tacit knowledge transfer**

Some scholars explained how to realize knowledge transfer through analyzing various functions of new media. Dennis & Valacich put forward the media synchronicity theory. The theory indicated that the exchange process could be divided into two processes: transmission and convergence. The media function of IT is divided into five aspects: feedback, symbol variety, parallelism, rehearsability, reprocessability. The five functions could affect for the efficiency and effectiveness of two exchange process<sup>[13]</sup>.

### 3 Theories and Hypotheses

#### 3.1 The relationships of IT function and tacit knowledge transfer effectiveness

Tacit knowledge is the knowledge based on long-term accumulation of experience that is un-formal, highly personal, and subjective. Tacit knowledge transfer is usually through association learning theory. The first the both sides of transfer study, running-in, forming a common language, then transfer using language. The association learning process need to have enough time. If the feedback function is too strong, and the feedback speed is too fast, then it is not conducive to transfer of tacit knowledge. Therefore, this paper put forward the following hypothesis:

Hypothesis 1: Feedback function of IT is negative correlation to tacit knowledge transfer effectiveness. That means the stronger feedback function of IT, the worse the effect of tacit knowledge transferring.

Hypothesis 2: Symbol variety of IT is positive correlation to tacit knowledge transfer effectiveness. That means the more the express way of IT option has, the better the effect of tacit knowledge transferring.

Hypothesis 3: Parallelism of IT is negative correlation to tacit knowledge transfer effectiveness. That means the more the number of user in exchanging with IT, the worse the effect of tacit knowledge transferring.

Hypothesis 4: Rehearsability of IT is positive correlation to tacit knowledge transfer effectiveness. That means the stronger rehearsability of IT, the better the effect of tacit knowledge transferring.

Hypothesis 5: Reprocessability of IT is positive correlation to tacit knowledge transfer effectiveness. That means the stronger reprocessability of IT, the better the effect of tacit knowledge transferring.

#### 3.2 The moderating effects of common experience

The common experience of both parties involved in tacit knowledge transfer includes: the familiar degree of both parties and the familiar degree of exchange theme. If both sides involved in tacit knowledge transfer are familiar, the expression way of one side is fit the thinking habit of the other side. The tacit knowledge of transferred will be easier to understand by both parties. If both sides of the knowledge transfer are familiar to the exchange themes, the thinking time of knowledge transfer can be reduced. Therefore, this paper put forward the following hypothesis:

Hypothesis 6: The familiar degree of both parties has positive moderating effect on relationship between the function of IT and tacit knowledge transfer. That means in the same conditions, the more familiar the exchange partner, the better the effect of tacit knowledge transfer.

Hypothesis 7: The familiar degree between both parties and exchange theme has positive moderating effect on relationship between the function of IT and tacit knowledge transfer. That means in the same conditions, the more familiar the exchange theme, the better the effect of tacit knowledge transfer.

### 4 Questionnaire Design and Data Acquisition

#### 4.1 Questionnaire design

This paper adopts the method of questionnaire to collection data. The questionnaire uses Likert 7 scale. The object of investigation is the managers of the enterprise. They frequently use the IT tools in their practical work. 150 questionnaires are issued and 112 questionnaires responded. Response rate is 74.67%. There are 97 valid questionnaires. Valid rate is 64.67%.

#### 4.2 Variable measures

Questionnaire design references to the related research results of many scholars.

In the questionnaire reliability aspect, Cronbach's  $\alpha$  coefficient is used to test scale internal consistency. The Cronbach's  $\alpha$  values of all variables are greater than 0.70. Thus the sample reliability passes internal consistency test.

In the questionnaire validity aspects, factor analysis is used to verify. KMO and Bartlett globular test are used to test the correlation between each item. The results show that, the various indicators are passed with the Bartlett globular test ( $P < 0.0001$ ). KMO values can satisfy requirements of factor analysis.

### 5 Empirical Analyses

Multiple linear regression analysis is used with SPSS17.0 software in this research. In order to eliminate multicollinearity problems, the factor values of independent variable, Moderating variables

and dependent variable are centrally processed. The results of regression analysis are on table 1.

**Table 1 The Effect Between the Five Functions of IT and Tacit Knowledge Transfer**

Regulating variables	No Regulating variables	The familiarity of both parties	The familiarity of exchange theme
Variables			
Feedback	-0.132**	0.175**	0.046
Symbol variety	0.03	0.07	0.115*
Parallelism	-0.092*	0.163*	0.082
Rehearsability	0.245**	-0.089	-0.102
Reprocessability	0.253**	0.098	0.104
R square	0.518	0.587	0.563
adjusted R square	0.506	0.562	0.536
changed R square		0.069	0.045
F	38.187**	21.471**	20.462**

\*express  $P < 0.05$  significantly, \*\*express  $P < 0.01$  significantly

### 5.1 The effects of the five functions

Table 1 shows that, in the regression model, the cumulative rate of interpretation is 51.80%. F is 38.187. It is significantly under  $P < 0.01$ . According to the data in Table 1, the results in Table 2 are obtained. Table 2 shows that, hypothesis 1, 3, 4, 5 are supported, and the hypothesis 2 is not supported.

**Table 2 The Effects of The Five Functions of IT**

Hypothesis	Content of Hypothesis	Is supported?
Hypothesis 1	Feedback has negative correlation to tacit knowledge transfer effectiveness.	supported
Hypothesis 2	Symbol variety is positive correlation to tacit knowledge transfer effectiveness.	not supported
Hypothesis 3	Parallelism is negative correlation to tacit knowledge transfer effectiveness.	supported
Hypothesis 4	Rehearsability is positive correlation to tacit knowledge transfer effectiveness.	supported
Hypothesis 5	Reprocessability is positive correlation to tacit knowledge transfer effectiveness.	supported

### 5.2 The moderating effects of the common experience

Table 1 shows that, in the regression model, the cumulative rate of interpretation is 58.70% when the moderating variable is the familiar degree of both parties involved in tacit knowledge transfer. And the cumulative rate of interpretation is 56.30% when the moderating variable is the familiar degree between both parties and exchange theme. F is 21.471 and 20.462 respectively. They are significantly under  $P < 0.01$ . According to the data in Table 1, the results in Table 3 are obtained. Table 3 shows that, hypothesis 6 and hypothesis 7 are supported.

**Table 3 The Moderating Effects of Tacit Knowledge Transfer**

Hypothesis	Content of Hypothesis	Is supported?
Hypothesis 6	The familiar degree of both parties involved in tacit knowledge transfer has positive moderating effect.	supported
Hypothesis 7	The familiar degree between both parties and exchange theme has positive moderating effect.	supported

## 6 Conclusion

The five functions of IT tool are summarized: feedback, symbol variety, parallelism, rehearsability, reprocessability, based on the review of previous related literature of knowledge transfer. The empirical analysis of the effects between the five functions and tacit knowledge transfer has carried out. The empirical analysis of the moderating effects of the common experience of both parties on tacit knowledge transfer effectiveness has carried out too. The results show that, feedback, parallelism, rehearsability, reprocessability functions of IT have a significant impact on tacit knowledge transfer effectiveness. However, symbol variety of IT has not significant impact on tacit knowledge transfer. Meanwhile, the familiar degree of both parties involved in knowledge transfer has positive moderating

effects on tacit knowledge transfer effectiveness based on information technology function. The familiar degree between the communicating subject and both parties has positive moderating effects on tacit knowledge transfer effectiveness based on information technology function too.

In addition, some useful conclusions are obtained in this paper. At the same time, there are some shortages. It is to be improved in the further research. For example, the scope of investigation will be further expanded. The more influence factors will be considered, such as organization culture, trust, and so on.

# External Network, Absorptive Capacity and Performance: the Affecting Mechanism\*

Liu Lu

School of International Trade and Economics, Shandong University of Finance and Economics, Jinan,  
P. R. China, 250014  
(E-mail: panykll@126.com)

**Abstract:** Performance is an important goal for enterprises. With the development of globalization economy and knowledge economy, networks have become an important way to improve enterprise performance. While, however, most of the existing research on the impact of enterprise external network on its performance merely emphasize the role of their network location and neglect the heterogeneity themselves, and thus, leading to contradictory conclusions. In this paper, external network is the independent variable, absorptive capacity is the intermediate variable, enterprise performance is the dependent variable. The paper conducts a further study on the subject, set up the mechanism of enterprise external network affecting its performance.

**Key words:** Enterprise external network; Absorptive capacity; Concept model; Profit performance; Innovation performance

## 1 Introduction

The concept of absorptive capacity arose from the macro level and was first used to analyze technology catching-up of lagging countries. In the book "Economic Backwardness in Historical Perspective", Gerschenkron(1962) given the concept of backward advantage, he pointed that lagging countries can utilize tacit knowledge from the world, therefore, lagging countries have more growth potential than developed countries. Rapid growth potential depends on many factors such as the natural endowments and the country's social competence. Among these factors, technology matching ability are the most important ones (Abramovitz, 1986). Absorptive capacity is an integral part of social competence, which affects a country's ability to absorb and assimilate knowledge from leading countries (Ohkawa & Rosovsky, 1973).

Cohen and Levinthal (1990) first introduced absorptive capacity into the level of the firm, they given that absorptive capacity refers not only the acquisition or assimilation of information by an organization but also the organization's ability to exploit it.

With the intensified of economic globalization and coming of knowledge economy, it is becoming more and more important for enterprises to make full use of its external resources, particularly knowledge resources. Thus, absorptive capacity as an enterprise's capacity to deals with information and knowledge, has received extensive attention from researchers. Through reviewing the related theory on knowledge absorptive capacity, not only have a systemic understanding on existing knowledge absorptive capacity researches, but also propose directions for further research.

## 2 Literature Review on Absorptive Capacity Model

### 2.1 The model of Cohen and Levinthal

The most widely used process model of absorptive capacity was advanced by Cohen and Levinthal (1990) that showed in Figure 1. They argued that absorptive capacity consists of the abilities to recognize the value of new knowledge, to assimilate it and to apply it to commercial. The three processes are dynamic and depend on the knowledge source and prior knowledge, and furthermore, they affect innovation activity and innovative performance of enterprise.

In this model, they not only firstly introduced absorptive capacity into the level of the firm, but also firstly analyzed absorptive capacity from the process perspective. Therefore, as enterprises' capacity to deal with information and knowledge, absorptive capacity make a reasonable explanation on static knowledge affected enterprise innovation process.

Besides all the above contributions, this model also had some limitations. On one hand, it ignored

---

\*This paper is supported by Natural Science Foundation of Shandong Province, "The impact of open innovation embeddness on enterprise technology innovation" (ZR2012GQ007), and Doctoral Fund in Shandong University of Finance and Economics, "Research on the impact of enterprise network on its performance".

the process of knowledge acquisition, which was necessary in the whole process. On the other hand, it ignored enterprise profit performance, which was the most important goal for enterprises.

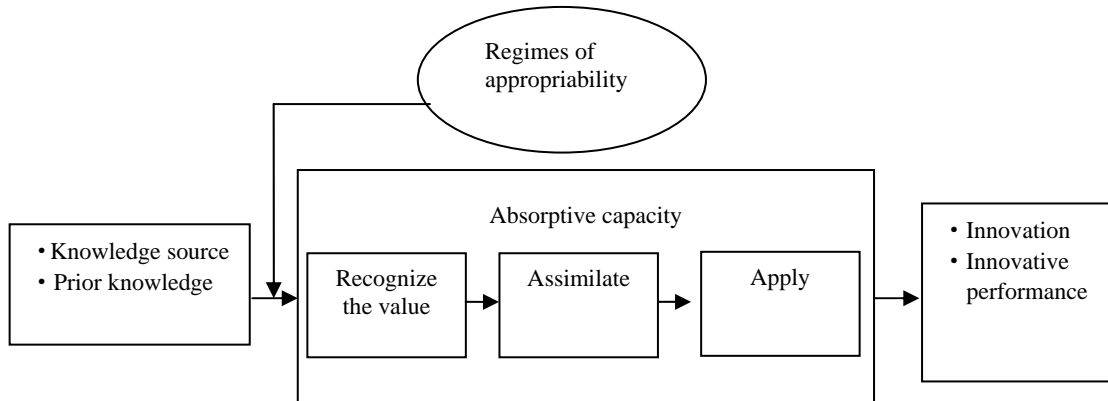

Figure1 Absorptive Capacity Model of Cohen and Levinthal (1990)

**2.2 The model of Zahra and George**

Zahra and George (2002) reconceptualized the concept of absorptive capacity, took absorptive capacity as a dynamic capability and proposed a new model showed in Figure 2. Absorptive capacity is a set of organizational routines and processes to acquire, assimilate, transform and exploit knowledge. Being a kind of capability, absorptive capacity focus on enterprise’s ability of managing its resources especially its knowledge resources, and this ability can improve enterprise performance and competitive advantage.

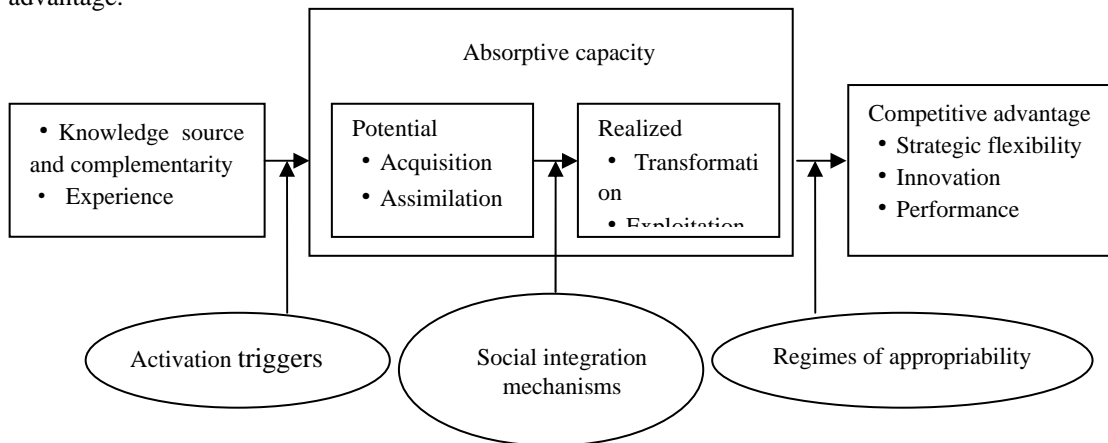

Figure2 Absorptive Capacity Model of Zahra and George (2002)

Different from previous researches, “cognitive” was replaced by “acquire” in their study, and absorptive capacity was divided into potential absorptive capacity (including acquire and assimilate knowledge) and realized absorptive capacity (including transform and exploit knowledge). Meanwhile, new concepts were raised such as activation triggers, social integration mechanisms and regimes of appropriability. Firstly, prior knowledge, knowledge source and complementarity are acquired and assimilated by enterprise under activation triggers. Then, they are transformed and exploited by social integration mechanisms. And under given regimes of appropriability, enterprise competitive advantage form (including flexibility, innovation and performance).

In this model, absorptive capacity was divided into two phases and competitive advantage included both innovation and profit performance. This gave valuable references for further study. However, it didn’t give in-depth analysis on the relations between these four variables.

**2.3 The model of Todorova and Durisin**

Based on empirical research, Todorova and Durisin (2007) reconceptualized the concept of absorptive capacity that has five elements including recognize the value, acquire, assimilate, transform and exploit, showed in Figure 3. They reintroduced the concept of recognizing the value, and argued that transformation represents an alternative process linked to assimilation. Besides social integration

mechanism, they proposed power relationships as the new contingency factor. And meanwhile, new feedback links was added to reflect the dynamic aspect of absorptive capacity.

Figure 3 Absorptive Capacity Model of Todorova and Durisin (2007)

This model gave a reasonable division on absorptive capacity, but still didn't make a clear explanation on different absorptive capacity stage and different competitive advantage content.

### 3 Mechanism of Absorptive Capacity Acting

The above models on absorptive capacity and competitive advantage give enlightenment for related study, however, there are some limitations at the same time. Firstly, all the above models assumed that there was a knowledge source, more specifically, they assumed that there was no difference between different enterprise knowledge source. Thus, none of them made a specific analysis on enterprise different knowledge sources and ignored the role of enterprise external network. Secondly, all the above models didn't make a clear explanation on different absorptive capacity stage and different competitive advantage content. Competitive advantage includes several dimensions, which are decided by different factors. Different dimension of absorptive capacity certainly influence different dimension of competitive advantage. However, this relation is not clearly explained in the above models.

#### 3.1 Theoretical analysis

Enterprise external network is a kind of relation between external free market and internal organizations. Enterprise external network is not only the collection of enterprise relations but also the collection of resources contain in these relations. Theoretically speaking, there are two aspects enterprise external network affected enterprise performance.

On one hand, enterprise external network is a kind of resource allocation system paralleling with enterprise and market. Enterprise external network directly affect its profit and innovation performance by way of network structure and network relation. This means that the specific network position itself is critical, the position determines the knowledge, information, capital and other resources for enterprises and furthermore affects enterprises performance, whether it is who in this place.

On the other hand, enterprise external network is a collection of potential resources filled with knowledge, information, capital and etc. These potential resources can be translated into real resources, and the conversion rate is determined by enterprises abilities of recognize, acquire, understanding and exploit resources. Only the translated real resources can affect enterprise performance, and thus, the enterprise itself is more important than the specific network position.

#### 3.2 Mechanism building

The mechanism building in this paper focus on the second theoretical aspect. That is, though enterprise external network do not affects enterprise performance significantly, it affects absorptive capacity apparently. Resources acquired from enterprise external network can only effective by way of being recognized, being gathered, being understood and being exploited. This process, in essence,

reflects the role of absorption capacity.

From the perspective of social network analysis, network structure and network relation are the two dimensions of it. Indicators of network structure include network size, network density, network centrality and network heterogeneity. The structural dimension concentrated not only resources given by enterprise position in the net but also arising from the ability possessing resources (Burt, 1992; Granovetter, 1973). Network structure impact on the flow of resources (Nonaka, 1994), thereby affecting enterprise absorptive capacity. And absorptive capacity furthermore, determines enterprise performance.

Network relation focus on the bilateral relations between a given ego and a given alter. It means that network relations can increase quantity of knowledge learn from others in the net (Dyer & Singh, 1998; Nahapiet & Ghoshal, 1998), based on these knowledge network relation affects enterprise performance significantly, while, the extent of this impact are decided by absorptive capacity.

Integrated previous literatures on absorptive capacity, this research redefines the concept of absorptive capacity. The essence of the absorptive capacity is a kind of accommodation capacity in the ever-changing business environment. The absorptive capacity is a processing ability including four dimensions, which are recognize the value, acquire resources, assimilate resources and apply resources.

On the basis of the above definition, the paper conducts a model of enterprise external network affecting its performance. The mechanism is shown in Figure 4.

Figure 4 Mechanism on the Impact Enterprise External Network on Its Performance

Specifically, the absorptive capacity plays an intermediary role in the process of enterprise external network affects enterprise performance. Enterprise external network not only has a significant positive impact on enterprise performance, furthermore, the absorptive capacity, as the intermediate variable, decides the extent of this impact.

What's more, the potential absorptive capacity mainly affects enterprise profit performance and the realized absorptive capacity mainly affects enterprise innovation performance. The absorptive capacity can be divided into the potential absorptive capacity and the realized absorptive capacity. The potential absorptive capacity is the ability to recognize and acquire resources such as information, knowledge and technology. It represents the abundance of resources and mainly affects the profit performance. The realized absorptive capacity is the ability to assimilate and apply resources. It mainly decides the ability of innovation, and therefore, it affects both the innovation performance and the profit performance.

#### 4 Conclusion

This is the time of globalization economy and coming of knowledge economy, the competition among enterprises is fierce day by day. All these make it important for enterprises to communicate with

external organizations. The aim of the communication is to make full use of its external resources, particularly knowledge resources, and furthermore, improve enterprise performance. Essentially, the process of this communication is the process absorptive capacity acting. By introducing absorptive capacity, we can not only give a reasonable interpretation on enterprise differential performance in a cluster, but also give a guide for enterprise to keep competitive advantage based on this difference.

**Abstract:** The non-technological types of innovation are neither clearly defined, nor are they differentiated from each other, from other forms of innovation, from innovation in general, and from creativity. Hence we use co-citation analysis based on bibliometrics to produce a quantitative literature review that results in identification of key areas of research within the non-technological innovation literature. It enables us to find out where the knowledge base comes from in each of the areas. By using authors as the units of analysis and incorporating all the citations that are included in the ISI Web of Science, we trace the evolution of the intellectual structure of the non-technological innovation field during the period 1975–2011.

**Key words:** Innovation; Non-technological innovation; Co-citation analysis

### 1 Introduction

In the last couple of years, non-technological innovation is becoming increasingly recognized as a previously often overlooked factor in the innovation literature that may serve as a promising component for enhancing business performance. It has been demonstrated that firms that introduce non-technological in addition to technological innovations outperform those firms that have introduced a new process without any organizational or marketing innovation (Schmidt & Rammer, 2007\_ENREF\_81). Therefore, understanding both non-technological and technological aspects of innovation is necessary to achieve optimal results in terms of innovation.

In practice, many managers are unaware of what constitutes the complex construct of innovation, especially the intangible part of innovation activities. Many confusing typologies and conceptualizations (Damanpour & Aravind, 2012) do little to help. Understanding innovation as a complex and multi-dimensional phenomenon remains a significant agenda for the researchers (Adams, 2003). Since innovation is based on continuous incremental activity, it is necessary to consider the complementary relationships between different types of innovation. By understanding innovation as a dynamic and multifaceted process, a more comprehensive account of organizational innovativeness will be obtained (Walker, 2008).

Some innovation scholars argue that innovation types may be artificial distinctions and are conceptually and operationally alike (Edquist, Hommen, & McKelvey, 2001). The dimensions of innovation, such as type, stage or radicalness of innovation overlap (Damanpour & Aravind, 2012) or are mutually dependent (Walker, 2008). There is no single coherent conceptual framework that would bring together all types and forms of innovation, especially non-technological innovation (Lam, 2004). Fragmentation of the field prevents us from seeing the relations between these facets, which ultimately impedes consolidation of the field (Crossan & Apaydin, 2010). Although several forms of non-technological innovation exist, non-technological innovation and its content are not clearly defined in the innovation literature.

This study aims to provide a clearer distinction between various non-technological innovation types and a more concise idea of what constitutes each type and where the knowledge that serves as a basis from its development comes from. We examine how domains of knowledge on which the field of non-technological innovation drew from have been changing through time and what prospects current domains of knowledge bring to the stream. To this end, we use a bibliometric quantitative technique called co-citation analysis (White, 2003). Such analytical review enables the identification of the most important contributions and contributors. It also facilitates better completeness of the presentation of a particular scientific field and is more objective. Similar co-citations within the literatures denoting different types of innovation would basically mean that the knowledge informing those research streams comes from similar sources. This implies that the differentiation between them or their cores might be seen as

questionable.

By using authors as the units of analysis and incorporating all the citations that are included in the ISI Web of Science, we trace the evolution of the intellectual structure of the non-technological innovation field during the period 1975 – 2011. We chose a starting point in the year 1975. Two important articles for the development of this field were published this year. First is an ASQ piece by Baldrige and Burnham (1975) 'Organizational Innovation: Individual, Organizational, and Environmental Impacts', where the authors derive on previous individual-level work on innovative behavior to shift this view to include organizational and environmental factors that shape innovation. This study, although not explicitly discussing non-technological innovation, adopts the view of innovative individuals that both complement technological breakthroughs as well as are a form of innovation themselves. This view has been later adopted by management innovation scholars (e.g. Birkinshaw, Hamel, & Mol, 2008).

The second article in 1975 that is relevant to the development of the field is a piece in *Omega* by Utterback and Abernathy (1975). The authors delineate between product and process innovation, allowing for a non-technological aspect of process innovations. This article is influenced more by economics literature and thus comes from the field of technological innovation or innovation in general. However, their view is later adopted by many scholars examining organizational innovation (e.g. Daft, 1978; Kimberly & Evanisko, 1981) that view it as a separated part of technical activities. This resulted in many different typologies, and conceptualizations and empirical studies attempting to capture relations among them and their association with beneficial outcomes, such as technological innovation or organizational performance (e.g. Damanpour & Evan, 1984). Yet a thorough investigation and even conceptualization that would include different proposed types of non-technological innovation activities has been lacking.

To provide a systematic examination of the development of the non-technological innovation field, we delineate the whole period (1975-2011) into four time periods: 1975-1990, 1991-1997, 1998-2004, and 2005-2011. Delineating the whole time stamp into shorter periods is common in co-citation research (e.g. Nerur, Rasheed, & Natarajan, 2008; Fernandez-Alles & Ramos-Rodríguez, 2009). Decision on the number of periods is in the researchers' hands and is related to optimal illustration of the field development. In our case, the beginning period is longer (16 years) than other time frames (7 years each), because the field has grown exponentially and was relatively less active at the beginning. Especially the last couple of years witnessed a rapid growth of this field.

By applying co-citation analysis (a technique that uses co-citations of pairs of authors as the variable that indicates their distances from each other, White & Griffith, 1981; Eom, 2008) in the aforementioned periods, we attempt to identify key areas of research within the non-technological innovation literature and explore where the knowledge base comes from in each of the areas. By using authors as the units of analysis and incorporating all the citations included in the ISI Web of Science, we trace the evolution of the intellectual structure of the non-technological innovation field during the period 1975–2011.

Using pathfinder analysis (a graph-theoretic approach for portraying most important units of analysis and their interrelationships, Nerur et al., 2008) with island algorithm (Batagelj & Mrvar, 1998), we (1) delineate the subfields that constitute the intellectual structure of non-technological innovation and contribute to differentiating between various forms of non-technological innovation; (2) determine the relationships between the subfields; (3) identify authors who play a pivotal role in bridging two or more conceptual domains of research; and (4) graphically map the intellectual structure in two-dimensional space in order to visualize spatial distances between intellectual themes. We contribute to overcoming the ambiguity in the field by clarifying where each topic originates. This provides insight into the content and its origins, and serves as a foundation for a better distinction among various types of non-technological innovation.

By using co-citation analysis, we are able to more objectively single out most important authors and their work and see whether the knowledge comes from the same literatures to studies describing particular types of non-technological innovation. Based on a recent qualitative review article of Damanpour & Aravind (2012), one can assume that non-technological innovation has become mature enough to treat the literature generated by the field as a research topic in its own right. Their study does go into describing different forms of non-technological innovation, but does little to differentiate between them. Furthermore, their review is purely qualitative, whereas we attempt to shed light onto the field using a more subjective and quantifiable approach. Thus, bibliometric methods we use can avoid some of the potential subjective biases and perhaps provide validation to qualitative reviews.

I also want to discuss, compare, and contrast my findings with results of two recent knowledge base explorations by Fagerberg, Fosaas, & Sapprasert (2012) and Martin (2012). The authors of the first study examined the whole scientific field of innovation with a different methodology. They focused on

handbooks of that particular field as representative of the most important knowledge and concentrated on works these handbooks cite. Therefore, they only conducted a citation analysis, not a co-citation analysis. Doing so, they drew inferences about the structure of the knowledge base on innovation and analyzed the changing character of the field (Fagerberg et al., 2012). Thus, it provides an interesting basis for comparison of our findings that center on the sub-field of innovation, non-technological innovation, and the whole field. This would enable us to contribute to the field by exploring whether the knowledge base of both fields is any different, has the knowledge come from different theories and research streams, and thus help to further establish differences between non-technological and technological innovation. It also reveals if the field is only growing quantitatively, or is it really contributing content-wise to the field of innovation in general.

Martin (2012), as opposed to Fagerber et al. (2012), did not consult the handbooks to construct the list of most influential authors. He rather applied a snowball technique to identify key authors of the field as well as searched journals for articles using relevant keywords. With the latter, his approach is more similar to mine. However, his findings of the citation analysis may be slightly less representative because his field of interest included both innovation studies and science policy. Nevertheless, as innovation studies do represent most of his field of interest, we also compare our findings with his.

## 2 Types and Forms of Non-Technological Innovation

There are many types of innovation that authors understand within the term non-technological innovation. We first had to do a qualitative literature review to identify these types and forms that would serve as search terms for the co-citation analysis and science mapping. We identified several of them and summarize their authors and definitions in Tables 1 and 2.

**Table 1 A Brief Summary of Definitions of Different Types of Non-Technological Innovation Along with Their Authors (Part 1)**

TERM	AUTHOR	MEANING OR DEFINITION	AUTHORS ADOPTING THIS VIEW
Administrative innovation	Evan (1966)	Technical (new products, processes or services) vs. administrative innovation (new policies)	Daft (1978): administrative innovation = policies of recruitment, allocation of resources, and the structuring of tasks, authority and rewards – <i>organizational level</i> , but content-wise related to administrative practices at lower levels  Kimberly & Evanisko (1981): distinction between technical and administrative innovations is not so much that they serve different functions but that they imply potentially different decision making processes
Organizational innovation	Baldrige & Burnham (1975)	Individual characteristics, such as sex, age, and personal attitudes, administrative positions and roles, structural characteristics of the organization, such as size and complexity, environmental input from the community and other organizations - non-technical process innovations (not non-technical service organizations)	
Organizational innovation	Damanpour & Evan (1984)		Damanpour (1991); Anderson & King (1993); Toterdel et al (2002); Lam (2005); Armbruster et al (2008) - organizational innovation as a change process or as the result of adoption
Administrative innovation	Nutt (1986); Nutt (1989)	The extent to which organizations incorporate and routinely use the following innovations: fresh rules and procedures, changes in roles and structures, and establishment of new relationships	Cooper and Zmud (1990), Kostova (1999) and Klein et al. (2001)  Empirical: Naveh et al (2006) : influence on performance
Organizational, management, and business model innovation	Hamel (1991)	How companies organize, lead, allocate resources, plan, hire, motivate – a holistic view	
Organizational innovation	Nonaka (1994)	A key form of organizational knowledge creation	Damanpour (1996) - innovation as a process of organizational learning and knowledge creation with an emphasis on organizational capacity for change and adaptation; all innovation studies adopting a knowledge-based view
Market innovation	Johne (1998)	As opposed to product and process innovation	
Organizational innovation	Staroboli (1998)	Network as an organizational innovation	Open innovation and supply chain management literature – <i>organizational and economy level</i>
Non-technological process innovation	Papinniemi (1999)	Focused on <i>how</i> (a form of innovation, not a type) – Process innovation = a set of activities to produce output	Krause et al (2007); Li et al (2007); Lambertini & Mantovani (2009)

**Table 2 A brief Summary of Definitions of Different Types of Non-Technological Innovation along With Their Authors (Part 2)**

TERM	AUTHOR	MEANING OR DEFINITION	AUTHORS ADOPTING THIS VIEW
Management innovation	Mol & Birkinshaw (2009)	Organizational structures, management techniques and marketing concepts / strategies - in line with CIS	Vaccaro et al. (2010)
Organizational innovation	Boer & Duing (2001)	organizational vs. process innovation (vs. product innovation) – mixing the innovation form and type typologies	Aunique & Montoro-Sanchez (2010)
Open innovation	Chesbrough (2003, 2006)	The use of purposive inflows and outflows of knowledge to accelerate internal innovation, and expand the markets for external use of innovation, respectively	Open innovation literature (e.g. Chesbrough, 2007, 2010; Vanhaverbeke, Van de Vrande, & Chesbrough, 2008)
Organizational innovation	Sanidas (2004)	Disembodied, not technical	
Strategic innovation	Kodama (2004)	Business process improvement	
Strategic innovation	Filson & Gretz (2004)	Marketing, licensing, adoption / generation	
Business model innovation	Shafer (2005)	Innovation in strategic choices, value network, creating value, and capturing value	
Non-technological innovation	OECD (OSLO Manual, 2005)	Non-technical product and process innovation: organizational (implementation of innovative organizational concepts: structural vs. procedural; intra vs. inter-organizational; business processes or organizational structures) and marketing	Baranano (2003), Wu (2009), Community Innovation Survey (CIS), Mothe & Thi (2010), Schmidt & Kammer (2007)
Technological process innovation	OECD (OSLO Manual, 2005)	Also includes the production organization and/or organizational, financial and commercial activities	Community Innovation Survey (CIS)
Management innovation	Hamel (2006)	What managers are and do	Vaccaro et al. (2012)
Business model innovation	Zott & Amit (2008)	Innovation in the way a company does business, what is its source of competitive advantage, how it transcends traditional firm boundaries	Sosna (2010)
Organizational and managerial innovations	Bodas Freitas (2008)	Quality circles and business process re-engineering	
Business model innovation	Lindgardt et al (2009, BCG)	Innovation in the value proposition (target segments, product or service offerings, revenue model) and the operating model (value chain, cost model, organization)	
Innovation as a process	Barezheh (2009)	Process as a type of innovation (not a procedure or a set of routines – thus a type of innovation, not a form)	
Business model innovation	Teece (2010)	Innovation in five business model elements: capture value, technologies & features, benefit for the customer, target segments, revenue streams)	
Strategic innovation	Afuah (2010)	Strategic management (closely related to business model innovation)	Dozanova (2010)

### 3 Methods

Co-citation analysis is a bibliometric technique that usually uses a matrix of co-citation frequencies between authors as its input (McCain, 1990). This matrix can be the basis for various types of analyses, such as factor analysis, multidimensional scaling, and hierarchical clustering. Instead of conducting all these analyses separately, we follow White's (2003) suggestion and only perform a graph-theoretic approach called Pathfinder analysis in Pajek. This enables us to gain insights into network relationships among authors as well as to identify boundary spanners within each field. Doing so, we can extract key conceptual themes in the non-technological innovation field, show the protagonists of the subfields and the pervasiveness of their influence, as well as finally graphically represent author proximities.

Pathfinder analysis generates a network structure which emphasizes strongest relationships between concepts of interest in the domain (Schvaneveldt, 1990). The nodes in such a network represent the authors, with the co-citation frequency between authors being a measure of their conceptual similarity. The input to Pathfinder analysis is a matrix of raw counts (White, 2003). Such a dataset results in an undirected graph (Nerur et al., 2008). The data were then analyzed with 'island algorithm' in Pajek (Batagelj & Mrvar, 1998), which produced different domains of knowledge for various time segments.

This approach has considerable advantages over traditional author co-citation analysis that uses multiple techniques (e.g. factor analysis, multidimensional scaling, and hierarchical clustering). As Pathfinder networks are generated from matrices of raw counts, such approach removes a computational step associated with traditional co-citation analysis, as well as eliminates the need to use additional

software and apply multiple computer and drawing operations. In Pathfinder networks, nodes represent authors, and particular links represent weighted paths between nodes, with the weights being co-citation counts (White, 2003). The strength of co-citation is defined as the number of times two documents have been cited together. This provides an objective and quantitative way to group or cluster the cited documents (Small & Griffith, 1974). By only including the highest counts for author pairs, only the most salient relationships can be mapped. Dominant authors (e.g. with high degree centrality that are focal to particular disciplines) can be easily identified, as well as those authors that serve as boundary spanners between particular disciplines.

**3.1 Retrieval of co-citation and citation data**

We chose the period 1975-2011 for the examined timeframe. We obtained secondary data through ISI Web of Science, a database used in most bibliometric studies (e.g. White, 2003; Nerur et al., 2008). We searched the database using the search term ‘OR’. The following keywords were used: ‘non-technological innovation’, ‘non-technical innovation’, ‘management innovation’, ‘marketing innovation’, ‘organizational innovation’, ‘strategic innovation’, ‘business model innovation’, ‘administrative innovation’, ‘open innovation’, ‘green innovation’, and ‘ancillary innovation’.

The search was refined by key areas (Web of Science Categories): MANAGEMENT or BUSINESS or PSYCHOLOGY EDUCATIONAL or PSYCHOLOGY EXPERIMENTAL or OPERATIONS RESEARCH MANAGEMENT SCIENCE or PUBLIC ADMINISTRATION or BUSINESS FINANCE or ECONOMICS or PSYCHOLOGY APPLIED or SOCIOLOGY or INDUSTRIAL RELATIONS & LABOR or SOCIAL WORK or PSYCHOLOGY or PSYCHOLOGY SOCIAL or PSYCHOLOGY MULTIDISCIPLINARY or SOCIAL SCIENCES INTERDISCIPLINARY. We searched in all three databases offered by ISI: SCI-EXPANDED (Science Citation Index Expanded), SSCI (Social Sciences Citation Index), and A&HCI (Arts & Humanities Citation Index).

From this search, we got a database containing 538 units of literature. After that, we manually reviewed the abstracts and excluded the articles that weren’t relevant for my topic, even if they passed the first filtering by keywords. Doing so, we reduced the number of articles to 482 units. The sample or primary articles (citations of these primary articles are used in the analyses) thus includes 482 articles from the ISI Web of Knowledge from the 1975-2011 period that fit the keywords relevant for non-technological innovation field. They cited 11,036 papers (average citations per article: 31.90). In turn, they were later cited by others 15,375 times. Figure 1 demonstrates how the primary articles were published in terms of the actual publication dates within the period.

**Figure 1 Distribution of the Primary Articles Within the Years in 1975-2011**

Source: ISI Web of Knowledge.

As attested by Figure 1, a relatively low amount of papers were published in the earlier years of the 1975-2011 period. This is characteristic for many fields, but an exponential growth is even more present on the field of non-technological innovation. Figure 2 reveals when these primary articles were then later cited and times they were cited, indicating their influence in general. Table 3 reveals primary articles that were cited the most. In terms of the co-citation analysis, not primary articles, but target articles are

important (that are referred to in the primary articles). We obtained these through the cited references search.

**Figure 2 Date of Primary Articles' Citations**

Source: ISI Web of Knowledge.

We exported the database of target articles into Bibexcel (Persson, Danell, & Schneider, 2009). Because a large number of references usually have to be handled in the co-citation analysis, there must be a cutoff point, or citation threshold, which is applied to the references that exceed a preset number of citations (Eom, 2008; Fernandez-Alles & Ramos-Rodríguez, 2009). We applied different thresholds in each time stamp to provide as insightful presentation of the field and its origins at each period as possible. We used Bibexcel for counting frequencies and co-occurrences, and generating the raw co-citation matrix.

**Table 3 Highest Cited Primary Articles**

Title	Authors	Source Title	Year	Citations	Citations per Year
A dynamic theory of organizational knowledge creation	Nonaka, I	Organization Science	1994	2190	115.26
Organizational innovation - a meta-analysis of effects of determinants and moderators	Damanpour, F	Academy Of Management Journal	1991	1004	45.64
Assessing the work environment for creativity	Amabile, TM; Conti, R; Coon, H; Lazenby, J; Herron, M	Academy Of Management Journal	1996	548	32.24
Organizational innovation - the influence of individual, organizational, and contextual factors on hospital adoption of technological and administrative innovations	Kimberly, JR; Evanisko, MJ	Academy Of Management Journal	1981	522	16.31
Toward a theory of organizational creativity	Woodman, RW; Sawyer, JE; Griffin, RW	Academy Of Management Review	1993	476	23.80
Bridging epistemologies: The generative dance between organizational knowledge and organizational knowing	Cook, SDN; Brown, JS	Organization Science	1999	403	28.79
Institutional and competitive bandwagons - using mathematical-modeling as a tool to explore innovation diffusion	Abrahamson, E; Rosenkopf, L	Academy Of Management Review	1993	260	13.00

Disrupted routines: Team learning and new technology implementation in hospitals	Edmondson, AC; Bohmer, RM; Pisano, GP	Administrative Science Quarterly	2001	247	20.58
Aging, obsolescence, and organizational innovation	Sorensen, JB; Stuart, TE	Administrative Science Quarterly	2000	242	18.62

Source: ISI Web of Knowledge.

We first present some descriptive statistics characteristic for the whole period 1975-2011. Focusing on citations, Table 4 reveals articles that were cited the most from the target articles (that were in the references of the primary articles). The article by Damanpour (1991) was the most often cited piece, cited 140 times in all 482 articles that constitute the database of primary articles.

**Table 4 Target Articles with Highest Citation Frequencies (1975-2011)**

Citation frequency	First author, year, and publication
140	Damanpour F, 1991, V34, P555, Acad Manage J
105	Kimberly J, 1981, V24, P689, Acad Manage J
67	Daft R, 1978, V21, P193, Acad Manage J

#### 4 Co-citation analysis results

To facilitate visualization of data and improve interpretation of results we segmented the 1975-2011

period into four segments. We created four separate files in Bibexcel that we could transfer to Pajek, where we could visualize the network using social network analysis with Kamada-Kawai algorithm. The data were then analyzed with 'island algorithm' in Pajek (Batagelj & Mrvar, 1998), which produced different domains of knowledge for various time segments using line weights. We then compare results of analyses with other quantitative reviews of the field of innovation in general (e.g. Fagerberg et al., 2012; Martin, 2012).

Following the procedure outlined above, a frequency of co-citations was obtained for each pair of authors. We used objective modeling procedure without subjective weighting of authors or studies. For each period of analysis, only authors who had a threshold of co-citations that was designed for each period separately were retained for analysis. It must be noted that not all target authors appear in all the time periods analyzed.

Island algorithm enables to only look at the tops of the clusters formed by target co-citation articles. This is provided by choosing a number of bottom and top components using line weights. We decided to use an approach that looks at all the tops, even if they had different altitude. There is a content-wise argument for this decision; otherwise there would be too much organizational innovation that actually denotes innovation in organizations - technological included - within the database. This way, we were able to better differentiate between various forms of innovation. We portray and interpret results for each of the smaller periods separately for better illustration and then altogether for the whole period 1975-2011.

#### **4.1 First interval (1975-1990)**

Focusing on citations, we first identified articles that were cited the most from the target articles (that were in the references of the primary articles during 1975-1990). By identifying most frequently cited studies, we would be able to identify key topics of research within the discipline in each period. The book by Rogers and Shoemaker (1971) 'Communication of Innovations; A Cross-Cultural Approach' was the most often cited piece, cited 6 times by the primary articles in 1975-1990). We then focused on articles that were most often cited together (co-occurrences). Articles by Baldrige and Burnham (1975) and Mohr (1969) were most often cited together by the primary articles in 1975-1990 – 5 times. The same is true for a co-occurrence of March and Simon (1958), and Sapolsky (1967) and Rogers and Shoemaker (1971), respectively.

To portray a network of co-citations for the first period, we chose a cutoff point of at least three co-citations in the first stage. This resulted in two graphs. The first one (Figure 3) reveals all islands. This period comprises the fewest authors of all periods. It consists of four clusters. We then removed the first (largest) island so the graph (Figure 4) only portrays the most important authors and the relationships among them. Unit (circle) sizes reflect the number of links they hold. Three islands remain, and are very well connected with each other without any authors serving as particular boundary-spanners. Analysis of the first co-citation network reveals theoretical foundations on which the non-technological innovation discipline has been built. It is obvious that the works of Baldrige and Burnham (1975) and Rogers and Shoemakers (1971) are central to the network. These studies are apparently the most important for the development of the non-technological innovation field in the first examined period. Both studies (that are in separate clusters) are also connected with both two other clusters.

The ASQ piece by Baldrige and Burnham (1975) seems to be the first to argue that research on innovation diffusion should shift from individuals to organizational structure and environmental factors. Examining innovative behavior at the individual level, they found that personal characteristics do not seem to be as important in complex organizations as administrative and structural factors and even environmental input from the community and other organizations.

Besides this study, the first cluster (that is actually a dyad – market with red circles in Figure 2.4) also includes a study by Mohr (1969). As this article also deals with antecedents of innovation, we label this cluster 'determinants of innovation'. What is interesting, however, is that both of these studies derive from individual-level factors for innovation and draw a lot from, especially Baldrige and Burnham (1975), psychology. This indicates that individual-level innovation research has been of great importance for the development of the non-technological innovation field.

The second cluster (green circles) is labeled 'organization studies'. It is in fact a triplet of Rogers and Shoemakers (1971), Sapolsky (1967), and March and Simon (1958). These studies deal with organizational-level factors and the dynamics of problem solving and consequently innovation, but also with diffusion of innovation within the social system of an organization.

The third cluster (a dyad denoted by yellow circles) is labeled 'industrial economics'. It includes two studies: Mansfield (1968), and Galbraith and Nathanson (1978). Their approach is related to the

perspective of evolutionary economics and is more focused at the level of an industry, with organizations being considered as the ‘black box’. This cluster indicates an important discipline that was even more salient for innovation research in general, but has also influenced the field of non-technological innovation. However, this influence was less strong than the influence of organization studies or individual-level innovation research.

Figure 3 Co-citation Network (1975-190) – All Islands, Cutoff = 3 Co-Citations

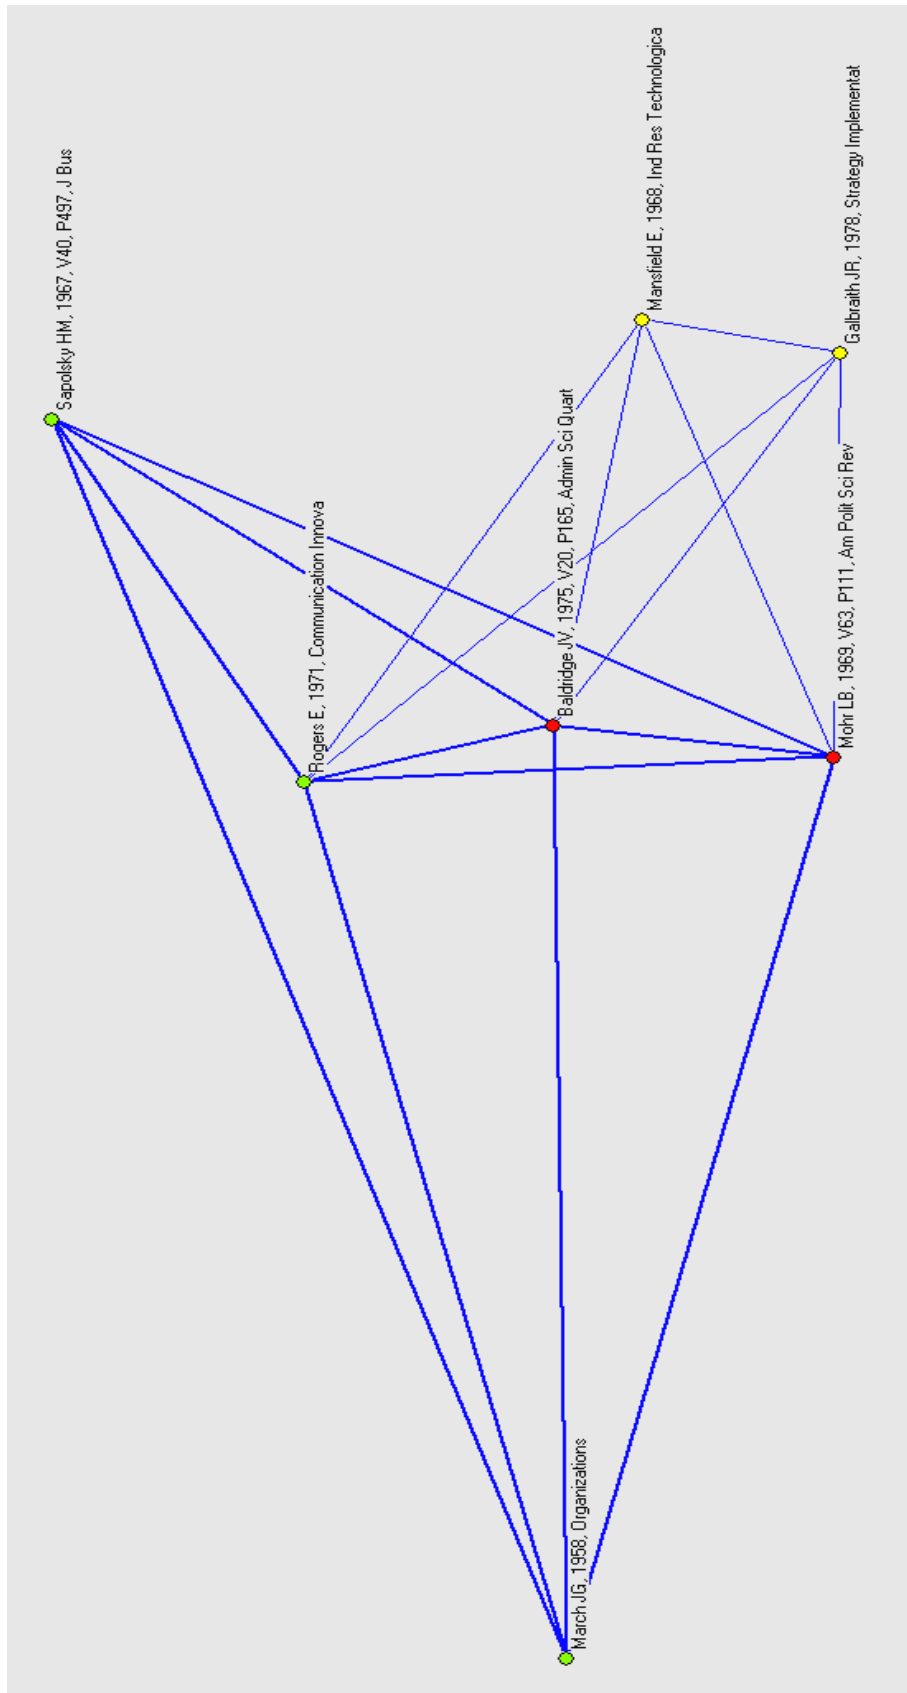

Figure 4 Co-citation Network (1975-1990) – Without the First Island, Cutoff = 3 Co-citations

### 4.2 Second interval (1991-1997)

The book by Rogers (1983) was the most often cited piece in this period, cited 24 times in primary articles during 1991-1997, followed by the article of Kimberly and Evanisko (1981) that was cited 23 times. Article by Kimberly and Evanisko (1981) was the most often cited together with the book by Zaltman et al. (1973) by the primary articles in 1991-1997– 14 times. An overview of size and composition of the research network arising from co-citation relations among the most cited authors in the period 1991-1997 reveals only one large cluster. This indicates that the field of non-technological innovation in this period was very well connected – authors (co-) cited very similar studies.

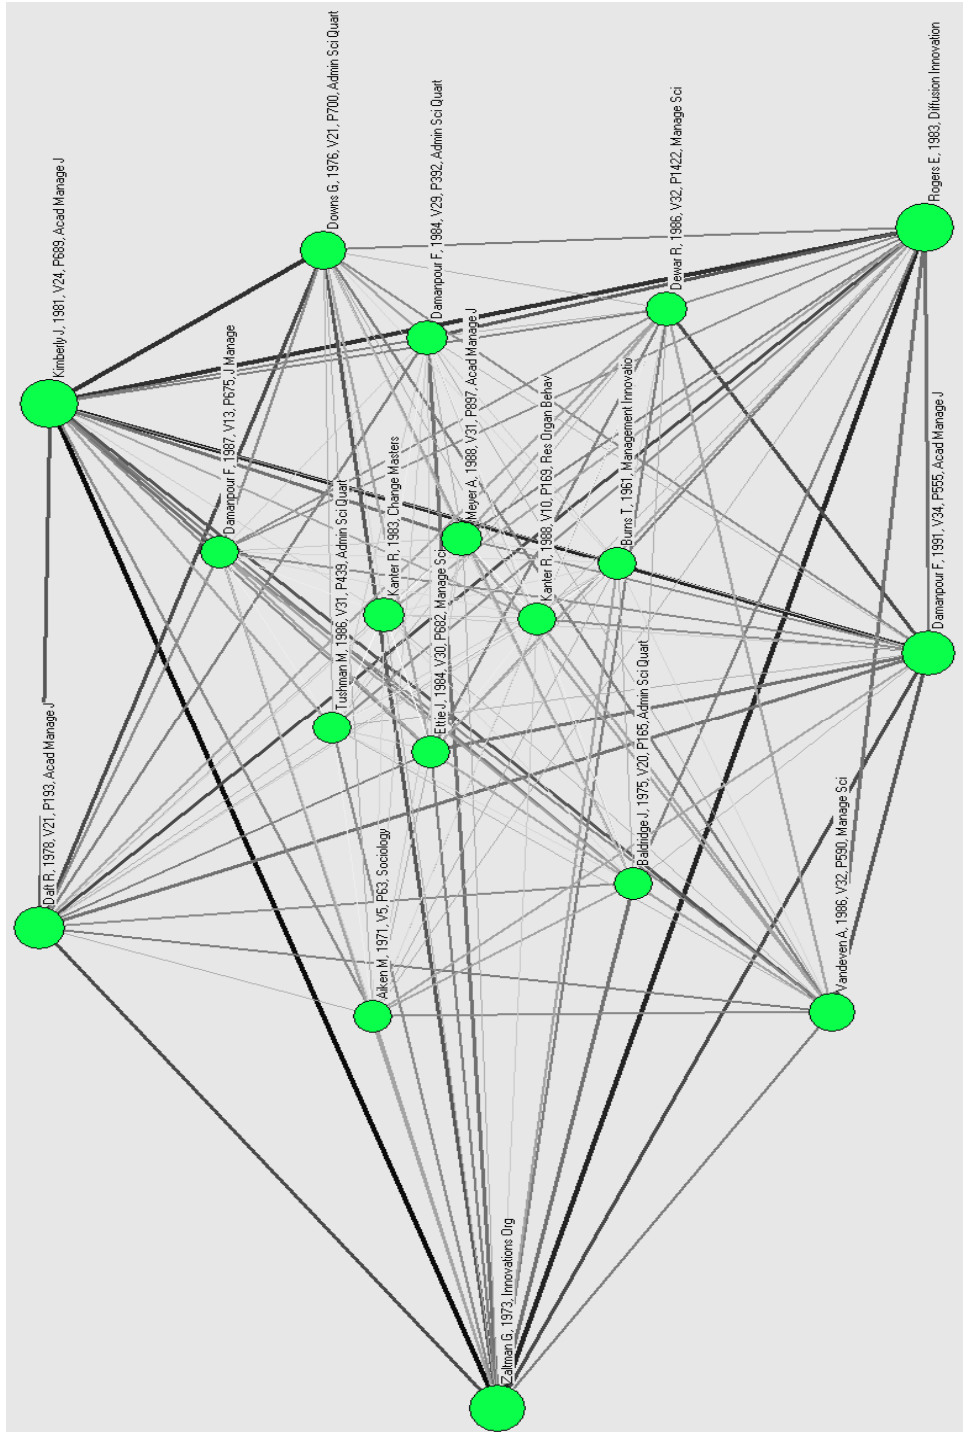

Figure 5 Co-Citation Network (1991-1997), Cutoff = 10 Co-Citations

A very influential work of Baldrige and Burnham (1975) is the only one from the previous era remains in the network with a milder threshold (Figure 5). A network with a stricter citation threshold (Figure 6), however, reveals that none of the influential works in the first period was among the most important ones in the second period. Moreover, we can observe a large influx of works based on organizational studies that emerge in this period and are apparently very influential for the development of the field in the second period. This is the period that organizational innovation effectively became a discipline of its own. The most notable studies in this component from the organization studies of innovation discipline that emerge in the field of non-technological innovation are articles by Damanpour and Evan (1984), and Downs Jr and Mohr (1976) in ASQ, by Kimberly and Evanisko (1981) and Damanpour (1991) in AMJ, and by Dewar and Dutton (1986), and Van de Ven (1986) in Management Science. These studies were crucially affected by Daft's (1978) work on dual-core model of innovation (administrative and technical, which is actually based on Evan, 1966), Zaltman et al.'s (1973) book on innovation in organizations, and Rogers' (1983) new book on diffusion of innovations.

Figure 6 Co-Citation Network (1991-1997), Cutoff = 12 Co-Citations

From this evidence, we can conclude that organizational studies became a predominant research stream driving new research on the field of non-technological innovation during 1991-1997, overtaking individual-based innovation research. It is not arguable that industrial economics did influence the field of organization studies. However, industrial economics did not seem to have a major direct influence on the field of non-technological innovation. Another important lesson learnt from this analysis is related to labeling of non-technological innovation. It is in this period that a clear distinction was made apparent by Daft (1978) between administrative (non-technological) and technical (technological) innovation. However, authors following in his footsteps confusingly use the notion of organizational innovation both to denote innovation in organizations as well as to label only non-technological forms of innovation. Thus, the delineation, even if it was first made very explicit by Daft (1978), did not hold for long as perplexity regarding labeling soon started to ooze into the field.

**4.3 Third interval (1998-2004)**

The article by Damanpour (1991) was by far the most often cited piece, cited 43 times in primary articles during 1998-2004, followed by Kimberly and Evanisko (1981). Damanpour (1991) conducted a meta-analysis of the relationships between organizational innovation and its determinants, including technical knowledge resources. In one of the earliest works to contain the term 'organizational innovation' in its title, Kimberly and Evanisko (1981) analyzed the influence of individual, organizational and contextual factors on hospitals' adoption of technological and administrative innovations. To no surprise, the first two articles that were most often cited together (co-occurrences) in primary articles during 1998-2004 are linkages with Damanpour's (1991) meta-analysis on organizational innovation: an aforementioned piece by Kimberly and Evanisko (1981) and a review on organizational innovation by Wolfe (1994) in JMS.

**Figure 7 Co-Citation Network (1998-2004), Cutoff = 8 Co-Citations**

Co-citation networks (Figures 7 and 8) again only reveal one cluster. The network of the period 1998-2004 is quite similar to the one from the previous period. Like before, organization studies is the main domain of knowledge where organizational innovation studies that are still predominant on the field of non-technological innovation during 1998-2004 draw their knowledge.

Even though the main domain of knowledge remains very dense, connected, and coherent, we can see three interesting influxes to this homogenous cluster. One is the appearance of sociological studies that see DiMaggio and Powell's (1983) article as being one of the most influential in this era (Figure 8). Another is the occurrence of an earlier study on management of innovation (Burns & Stalker, 1961), which indicates a future development of management innovation that is popular now. Connected to these are studies on knowledge and learning (Nonaka, 1991) and absorptive capacity (Cohen & Levinthal, 1990) that together indicate a different approach again more based on people, their knowledge and skills, and the relationships among them.

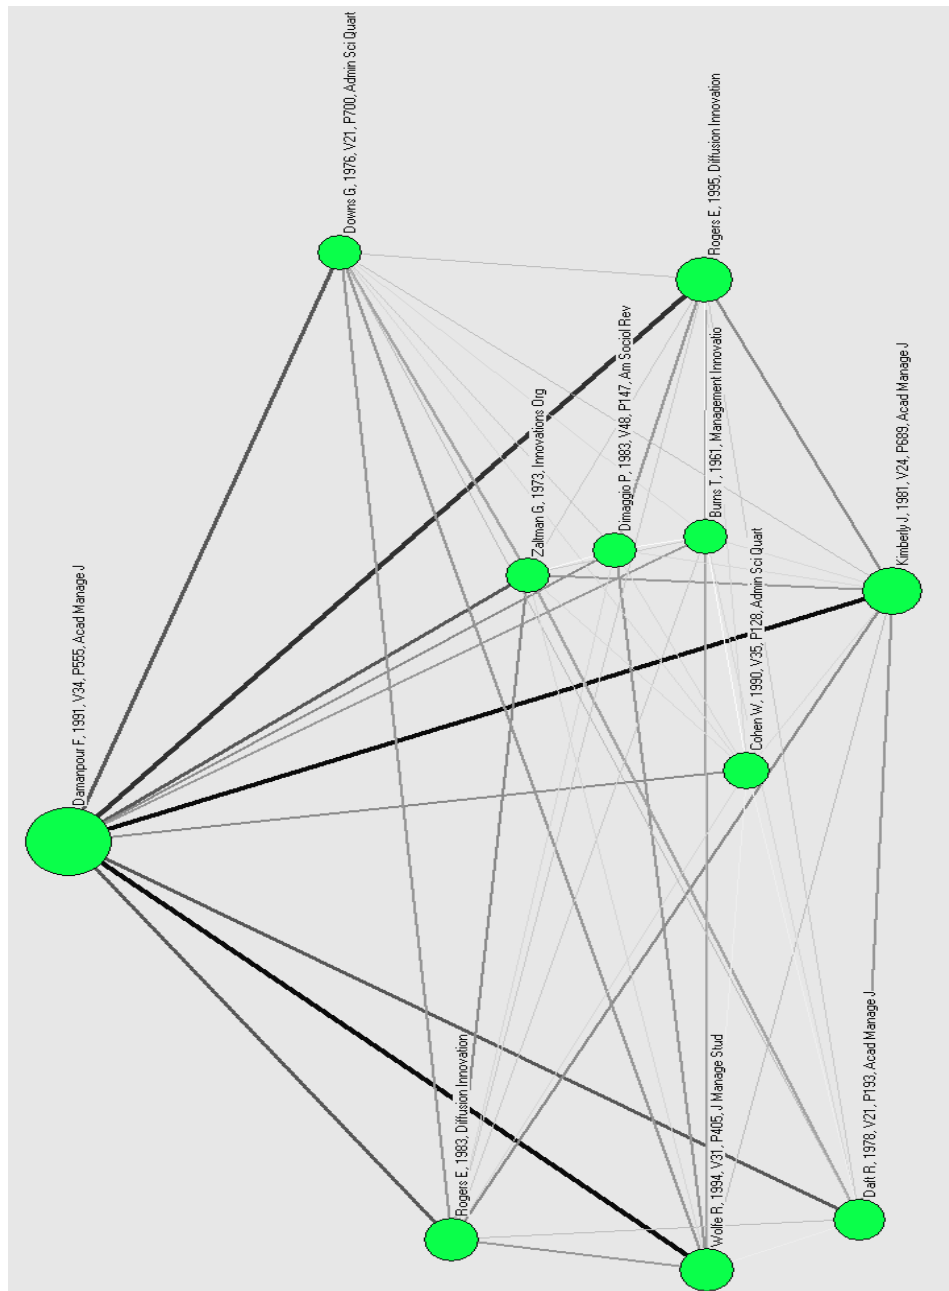

Figure 8 Co-Citation Network (1998-2004), Cutoff = 12 Co-Citations

Therefore, the period 1998-2004 has seen an important decline from using merely organizational studies as the knowledge basis. Studies on non-technological innovation in this era have started to draw from sociology and resource-dependence theory, particularly organizational learning and absorptive capacity. Other than that, as mentioned, organizational studies still dominate this field. It also has to be again pointed out that all these studies were all frequently cited together, which means they do not represent separate clusters, but one well connected network.

#### **4.4 Fourth interval (2005-2011)**

As in the previous period, the article by Damanpour (1991) was by far the most often cited piece in this period, referenced to 80 times in the primary articles during 2005-2011. Again, first two co-occurrences are connections with the highest cited article by Damanpour (1991) – Kimberly and Evanisko (1981) and Daft (1978).

Figures 9 (citation threshold at 20) and 10 (citation threshold at 20, without the first island and with different islands marked) reveal the co-citation networks of the final period. Compared with previous networks, there are more authors and clusters in this era, in line with the general growth of the non-technological innovation research activity. There is also quite a lot of fluctuation, which indicates the research dynamic that was in play during this time period. Figure 10 in particular reveals the main knowledge domains that influenced the research fronts within the field of non-technological innovation during 2005-2011. We also summarize these components in Table 6.

The first component is an extension of the most influential studies in the previous period and is thus labeled 'organizational innovation'. Organizational studies thus had a steady impact on non-technological innovation and still appear to be central to the network. This cluster includes studies such as Daft, 1978; Damanpour, 1991; Kimberly & Evanisko, 1981; and Wolfe, 1994, but also a piece by Cohen and Levinthal (1990) on absorptive capacity, indicating this learning perspective has become embodied within the mainstream of the non-technological innovation field. There is also another interesting study dealing with research on organizational creativity (Amabile, Conti, Coon, Lazenby, & Herron, 1996) that serves as evidence for the importance of creativity research based on psychology for the field of non-technological innovation. It is in this period that the fields of creativity and innovation became more tightly connected.

There are three components (dyads) that appear to be very central to the co-citation network. The second component can be labeled as 'group decision-making and creativity' and includes two studies published in *Applied Psychology* (Tjosvold, 1998; West, 2002). The authors deal with conflict and group decision-making for creativity and goal achievement. These studies draw a lot from psychology, indicating an intertwining between the field of non-technological innovation and individual-level psychology work on creativity, which became apparent in this period.

The third component has a lot in common with the previous one and is termed 'creativity at work'. It includes Woodman et al.'s (1993) AMR conceptualization of organizational creativity and Oldham and Cummings' (1996) AMJ study on personal and contextual factors of creativity at work. The fourth component comprises studies of more methodological orientation, more specifically, it consists of two pieces on case study research (e.g., Eisenhardt, 1989).

There are five more components in the network, all of them more on the edge of the network with weaker linkages with the more homogenous cluster and with no direct linkages among them; one of them is even not connected to other components at all. Component number five consists of two studies and is termed 'innovation and entrepreneurship'. It deals with creating new businesses on the basis of creating something new (e.g. Garud & Karnę, 2003). It is connected both with creativity literature and with organizational innovation research. Component number six consists of a triplet of studies published in the *Journal of Marketing* (e.g. Narver & Slater, 1990) and is labeled 'marketing innovation'. This component is much more loosely linked to other studies in the network; there are some connections through the methodological component, as well as with some of the earlier work on organizational innovation (e.g. Kimberly & Evanisko, 1981). Other components deal with cost and performance management, creativity and innovation in organizations, and human resource management.

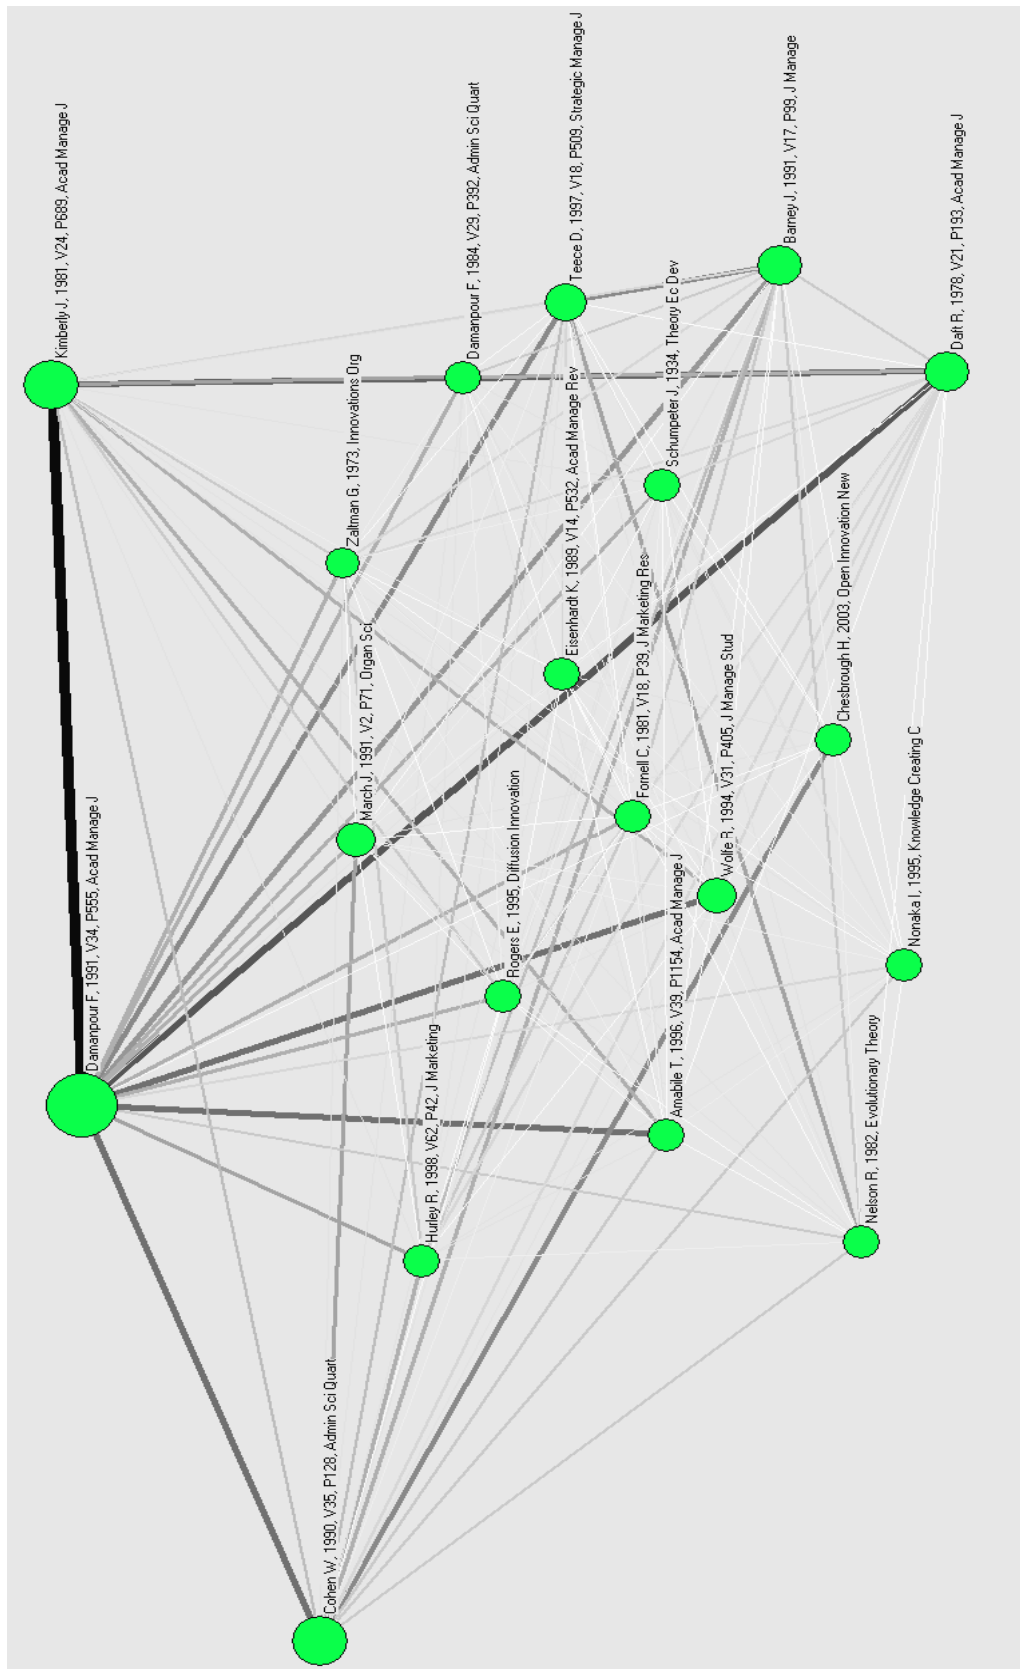

Figure 9 Co-Citation Network (2005-2011), Cutoff = 20 Co-Citations

Figure 10 Co-Citation Network (2005-2011) – Without the First Island, Cutoff = 20 Co-Citations

**Table 6 Components of the Co-Citation Network (2005-2011)**

Component # and label	Color (Figure 10)	Characteristic authors	Content
1) Organizational innovation	Light blue	Daft, 1978; Damanpour, 1991; Kimberly & Evanisko, 1981; and Wolfe, 1994	Organizational studies, absorptive capacity, creativity

The period 2005-2011 presented a more differentiated structure with plenty of new lines of research that influenced the field of non-technological innovation. There are many new authors, with only the most important authors from the previous cluster appeared again (e.g. Daft, 1978; Damanpour, 1991; Kimberly & Evanisko, 1981). Because of this heterogeneity, it comes as no surprise that the components constituting the network are a lot less connected to each other than in the previous time frames. This provides an opportunity to observe brokerage of particular studies.

Figure 10 demonstrated the network diagram for the set of authors that were co-cited in the period 2005-2011. In addition to emphasizing the most critical paths between authors, the figure also helps us to discern authors who play a pivotal role in bridging otherwise separate components. Three pieces in particular, which are all nodes constituting the first component (Daft, 1978; Kimberly & Evanisko, 1981; Damanpour, 1991) are critical to the stability of this network of authors because they are central nodes that connect distinct clusters. These studies are not only central to the network, but also act as brokers (Burt, 2007) and serve as bridges between distinct subgroups or sub-disciplines. Based on this evidence, we can conclude that the most influential investigations in the area of non-technological innovation have been related to organizational innovation, and other subfields are tightly connected to this research.

Figure 11 summarizes the development of the field presented before and illustrates where the knowledge came from (in terms of other disciplines) to the field of non-technological innovation, through which studies and authors, and during which period. What is important is that individual-level innovation studies and organizational creativity studies are relatively unconnected. Even if both provided the field of non-technological innovation with important insights from individual-level psychology studies, it is important to note that these were relatively unconnected. Also, even if it is common belief that creativity is the discipline that was the first to provide innovation studies an individual level based perspective, there are other individual-level based studies that had an impact first. Besides, the importance of these individual-level innovation studies is much more important for the field of non-technological innovation

than it is for the field of innovation in general.

**Figure 11 An Illustrative Simplification of the Knowledge Emergence for the Field of Non-Technological Innovation**

**4.5 Total period (1975-2011)**

Comparisons across the four periods revealed some interesting patterns about how the domains that influenced the intellectual structure of the field have evolved. Now we focus on the whole timeframe and try to make sense of the co-citation networks that denote the field during this period. We pointed out in the previous sections that subsequent periods show greater fragmentation arising from exogenous theoretical influences and endogenous developments. In Figures 12 and 13, these are portrayed altogether to provide an overview of the field.

Figure 12 includes all islands (after the cutoff of 20 citations) that had at least two nodes. We try to interpret the four largest rather heterogeneous components as well, but nonetheless present Figure 13 without those factors that are very complex and as such add little illustrative and simplifying value. The Pathfinder analysis results provide many interesting insights about the network structure of the intellectual community in non-technological innovation. A large number of factors persist (19, in addition to four largest ones).

Four largest factors identify the influence of organizational theory, with a couple of influxes from industrial organization economics (e.g. Porter, 1985) and power/resource dependence school (e.g. Blau, 1964) in the first component; psychological safety and support in the second component (e.g. Edmondson, 1999); knowledge-based view with organizational learning (e.g. Argyris & Schon, 1978), leadership for innovation (e.g. Mumford, Scott, Gaddis, & Strange, 2002), and behavioral theory of the firm (Cyert & March, 1963) in the third component; and marketing of innovation in the fourth (e.g. Gatignon & Robertson, 1989).

Examination of the following six components reveals some other more dominant perspectives that delineate the field. Component five (1<sup>st</sup> in Figure 13, red circles) reveals the influence of behavioral theory and organization studies (e.g. March & Simon, 1958), as well as the importance of resource and knowledge-based view (e.g. Kogut & Zander, 1992; Grant, 1996). We thus label it ‘organization studies and knowledge-based view’. Some highly cited work on non-technological organizational innovation has been carried out by researchers in organizational studies.

Component six (2<sup>nd</sup> in Figure 13, green circles) is strongly dominated by marketing innovation and top management role in technological innovation (e.g. Howell & Higgins, 1990). It is thus termed ‘top management and marketing innovation’. Component seven (3<sup>rd</sup> in Figure 13, orange circles) includes works on ‘behavioral theory’ of the firm (Cyert & March, 1963), and other topics that adopt this

perspective or are informed by it and study diffusion of innovations (Cooper & Zmud, 1990), innovations in strategy, structure, and organizational process (Miles, Snow, Meyer, & Coleman Jr, 1978), or organizational creativity (Woodman et al., 1993). Another homogenous group is component eight (4<sup>th</sup> in Figure 13, light blue circles). This factor is also predominantly informed by ‘organization studies’ (e.g. Hage, 1980). Other components are smaller, but are nevertheless described in Figure 13. They include interesting studies on determinants of innovation, dynamic capabilities and absorptive capacity, technological innovation’ and its exploitation, sociology and management of innovation, competitive advantage, organizational behavior and conditions for innovation, creativity and organizational learning, modeling creativity and innovation, and diffusion of innovation in organizations.

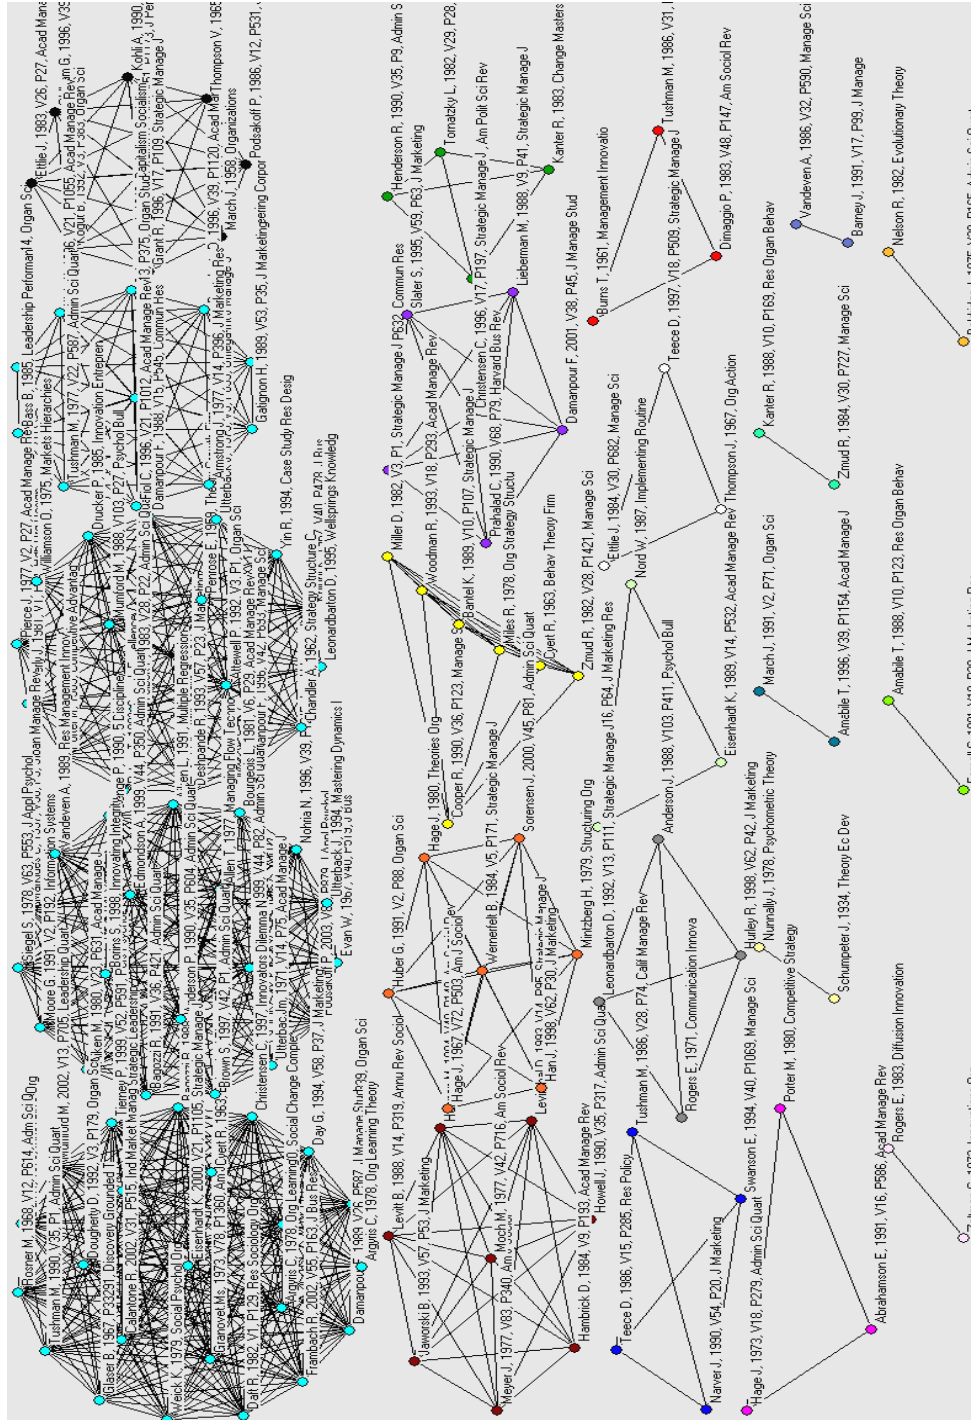

Figure 12 Co-Citation Network (1975-2011) – All Islands (Low = 2), Cutoff = 20 Co-Citations

After interpreting each of the components, we return to four largest clusters that are harder to interpret because of their heterogeneity. A pretty safe assumption is that target studies co-citing the first four clusters that include many perspectives are in fact recent studies on management innovation. This is a perfect example of how a dominant domain overrides other promising domains. Namely, management innovation includes many of the abovementioned perspectives and made them its own. This could deepen even more in the future in the hands of management innovation that has included many of the new influxes to the field. It could particularly be so if the scholars fail to recognize different types and definitions of non-technological innovation and term any kind of non-technical innovation as management innovation. This may not be optimal as this way the field rests on consensus building instead of critical reflection that can cause an evolution of the field.

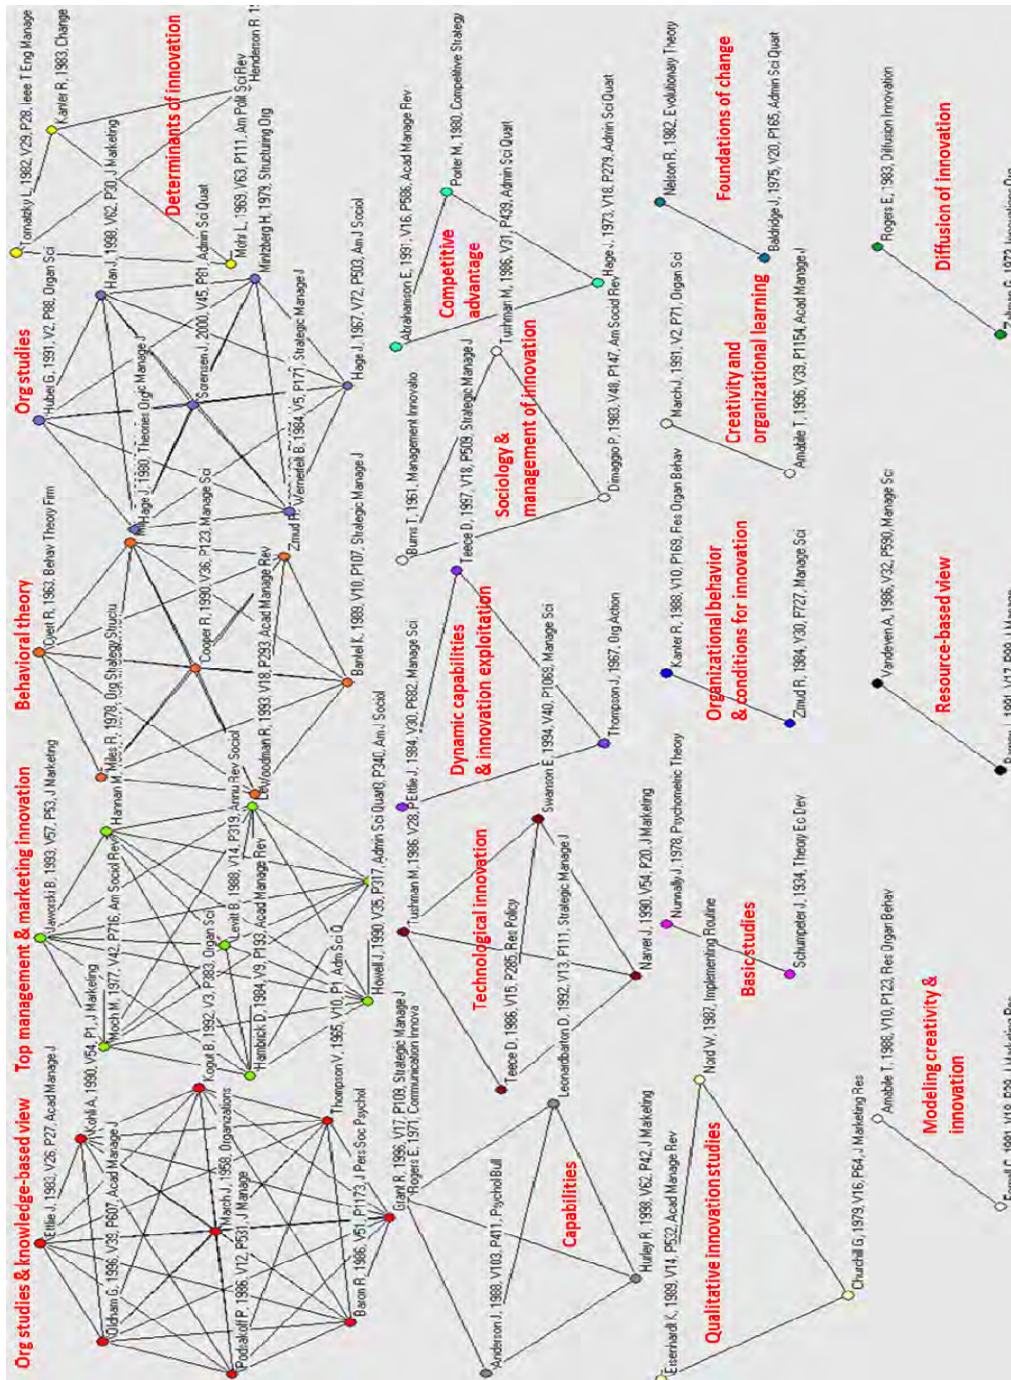

Figure 13 Co-Citation Network (1975-2011) – Without The First Four Islands (Low = 2), Cutoff = 20 Co-Citations

## 5 Comparative Discussion of Co-Citation Analysis Results

As we discussed and interpreted the findings of each period and altogether within the results section, and also focused on the content of each island in terms of differentiating between different forms of non-technological innovation, we use this section to compare our findings to quantitative (e.g. Fagerberg et al., 2012; Martin, 2012) reviews of the field of innovation in general to provide more insight into the similarities and differences of the two fields that are undoubtedly connected to each other.

'An Evolutionary Theory of Economic Change' (Nelson & Winter, 1982) appears to be the most crucial influence in the field of innovation, besides Schumpeter (1934). Nelson there combines Schumpeterian and evolutionary perspectives with theories on organizations and human behavior (Cyert & March, 1963) to produce a theory of how firm-level knowledge and its outcomes are shaped (Fagerberg et al., 2012). In our study, this book is only on the 22<sup>nd</sup> place of most influential pieces in terms of times cited by the primary articles in our analysis. Nevertheless, even though it is written by two economists, it has found a large audience among business and management scholars. Other 17 pieces on the Top 20 contributions list by Fagerberg et al. (2012) cannot be traced among the top 30 contributions in our study. The only two other exceptions to this rule are the book by Rogers (1983) that is recognized as seminal work to the diffusion scholarship within innovation studies and Cohen and Levinthal's (1990) ASQ article 'Absorptive capacity: a new perspective on learning and innovation'.

Contrasting to the list of Fagerberg et al. (2012), where articles and books by economists (e.g. Schumpeter, 1934; Freeman, 1974) and institutional and strategic business scholars (e.g. Porter, 1990; Saxenian, 1996) are mostly present, our top contributions list is dominated by management and organization scholars (Daft, 1978; Kimberly & Evanisko, 1981; Damanpour, 1991). This indicates that organizational studies and a more in-box perspective have always driven research on non-technological innovation, in contrast with innovation studies in general that are much more macro- and economy-oriented.

Another difference between the knowledge base of the two fields is related to the temporal component; studies that form the knowledge base of innovation are, in general, much older than studies that represent the core of the knowledge of non-technological innovation. A pretty straightforward explanation is that the field of non-technological innovation in itself has started to develop much later, which naturally causes this effect. Comparing the evolution of the field, it is apparent that the field of non-technological innovation has grown a lot more in the last couple of years with a pattern that resembles an exponential curve, whereas the field of innovation in general, although also growing, has done so at a much steadier pace. Given that the field of innovation also encompasses non-technological innovation as a subfield, we could make a conclusion that it has grown predominantly based on the increasing popularity of non-technological innovation among the researchers.

These differences in top contributions aside, Fagerberg et al. (2012) were also able to draw a graphical representation of the content-wise clusters in their sample of contributions. Based on the number of pieces in each cluster, two main polar groups arise: economics of R&D that emphasizes the role of technology and innovation in economic in social change; organizing innovation, which focuses on innovation in firms and is popular among scholars in business and management (Fagerberg et al., 2012). The former had a lot less influence in the field of non-technological innovation, whereas the latter is also core to our studied field. A third branch of research can also be distinguished from their drawing and that is innovation systems that in fact keeps the other two parts of the knowledge base connected, which also has importantly influenced the field of non-technological innovation.

It appears that the importance of individual-level innovation studies is much more important for the field of non-technological innovation than it is for the field of innovation in general. As mentioned, the influence of psychology that has penetrated the field of non-technological innovation through the work of Baldrige and Burnham (1975) is crucial for its development. Such occurrence is not apparent in the field of innovation in general. One manifestation of this influence is related to two different definitions of management innovation, for example, which are very tightly related to multi-level issues. On one hand, there is a person-centric definition of Hamel (2006\_ENREF\_100) – what managers are and how they do something differently, whereas a more organization studies-based perspective offers an organizational-level definition: new approaches to devise strategy and structure of tasks and units, modify the organization's management processes and administrative systems, motivate and reward organizational members, and enable organizational adaptation and change (Damanpour & Aravind, 2012).

It is thus not surprising that the review of Damanpour and Aravind (2012), with the organizational studies background of the authors, focuses at the firm level. A definition of management innovation by

Birkinshaw et al. (2008) goes across more levels; these are innovations in organizational form, practices, processes, or techniques, and constitute the rules and routines that describe how work gets done inside organizations (Birkinshaw et al., 2008). Yet even if, 'for parsimony', the authors intend to conceptualize management innovation as an overarching construct for all types of non-technological innovation (Damanpour & Aravind, 2012), they do not include, for example open or marketing innovations, nor do they include any notion of non-technological innovation by the employees (other than the managers).

Creativity is another very interesting topic with important influence within the non-technological innovation literature. Co-citation analyses reveal some crucial insights. First, creativity is not the only psychological and individual-level influence in the field, as individual innovation is in fact the one perspective that sits at the very core of the field development. Second, creativity with its influx in the second part of the examined time frame had a crucial impact on the field of non-technological innovation, which is not true for the field of innovation in general. Third, creativity itself had two major paths within the field: one coming straight from psychology and focusing more at the individual level (Amabile et al., 1996), whereas the second domain derived more from the innovation literature (based on disciplines such as industrial economics, strategy, organizational studies, etc.) and was also more organization level-based (e.g. Woodman et al., 1993). This by itself results in many multi-level issues and even more confusion that is caused by a relative independence of research streams of creativity and innovation. Fourth, creativity is often simply listed as an antecedent of innovation, with little attention paid into how, through which mechanisms, and under which conditions the two processes are related.

We also compare my results with Martin's (2012) citation analysis of the field of innovation studies and science policy. Nelson and Winter (1982) as well as Rogers (1983\_ENREF\_128) were also present here, as in the study by Fagerberg et al. (2012). Contrasting to the latter study, Martin (2012) found another piece that we identified to be of crucial importance for the field of non-technological innovation - Nonaka and Takeuchi's (1995): 'The knowledge-creating company'. Other top contributions reveal similar results as Fagerberg et al. (2012) in terms of the differences from non-technological innovation. Martin (2012) also found that the field is mostly influenced by economic, institutional, and social change scholars, with the exception of a couple of 'outside' influences that are, however, also not on the list of most important contributors in the field of non-technological innovation.

In terms of the sources of influences on the field of innovation studies and science policy, Martin (2012) discovered that during the earlier years of the field (before 1980), many different disciplines influenced it after the work of Schumpeter (1934), such as economics (authors such as Arrow and Sollow) that was probably the most influential, sociology (e.g. Rogers, 1983), management (e.g. Utterback & Abernathy, 1975), and organizational studies (e.g. Cyert & March, 1963).

He also found that these separated parts of the field started to coalesce into a more coherent field centered on the adoption of an evolutionary (or neo-Schumpeterian) economics framework (e.g. Nelson & Winter, 1982; Rosenberg, 1982), an interactive model of the innovation process (encompassing management of technology, e.g. Porter, 1985, but also accounting for organizational innovation, Kimberly & Evanisko, 1981, resource-based view, e.g. Barney, 1991; Hamel, 1991, and organizational learning and knowledge management, e.g. Nonaka & Takeuchi, 1995, as well as inter-organizational collaboration and open innovation, e.g. Chesbrough, 2003), and (a little later) the concept of 'systems of innovation' (Saxenian, 1996). Thus, after 1980 we can see that there is quite an overlap in terms of the key areas of influence for innovation studies and for non-technological innovation studies (with the exception of an evolutionary economics framework which, besides the work of Nelson and Winter, 1982, did not influence the field as much). This further depicts non-technological innovation as an important driver of the scientific growth of innovation studies.

## 6 Conclusion

Our research goes beyond a traditional qualitative review, which has more or less rigorously already been conducted on a large part of this field (cf. Damanpour & Aravind, 2012). Co-citation analysis is useful because it provides an objective and 'aerial' view. It shows how citers, often numbering in the hundreds, jointly perceive the relationships among key writers in the field (White & Griffith, 1981). A map based on co-citation data thus sheds light on the social construction of the non-technological innovation field by its members. A longitudinal comparison of the maps across the era 1975-2011, a significant slice of the history of the field of non-technological innovation, also informs us about the changes occurring in the social construction of the field and the evolving consensus about the domain of the field.

Spatial maps illustrate the network of studies that provide insight into which themes constitute the nucleus of the non-technological innovation field and where the knowledge came from. Using Pathfinder analysis with Island procedure, we were able to represent the networks of relationships among the most-cited studies within the field of non-technological innovation and group them under common themes. Thus, we were able to provide an illustrative description of the knowledge base constituted by accumulated works of research within the non-technological innovation field. This provides important insights into the intellectual structure of the field and where its subtopics are derived from. The identification of structural holes within the intellectual network of the non-technological innovation field suggests both opportunities for closure and brokerage that could contribute to the future development of the field.

We were also able to identify which parts have been the ones where new ideas have emerged. This has important implications for the field, because it provides insight and understanding of the knowledge that the field has produced. It also serves as delineation of the field from the field of innovation in general. The approach we have used and its results represent important means for cementing the status of non-technological innovation as a scientific field of its own, helping it become independent from the field of innovation in general. In addition, we were able to identify the sub-disciplines of the field. As these overlap with several types and forms of non-technological innovation, our study serves as means to provide better distinction between them.

From the co-citation analyses, it is evident that non-technological innovation, so far, lacks a single identity. This fact has to do with conceptual confusion and with ambiguous overlapping definitions. It is intertwined with innovation in general and also (naturally) heavily influenced by innovation studies, which usually adopt an organizational-level or even more macro/strategic perspective. However, it differs from this basic general field of innovation due to the fact that it was heavily influenced from psychology and sociology (behavioral theory) from the beginning. The non-technological innovation field has also received important and influential influxes in the last two examined periods from resource- and knowledge-based perspectives, as well as from creativity literature that is also based on psychology. Nevertheless, it has predominantly progressed organically, mostly dominated by organization (innovation) studies.

# Analysis of CCHP and Distributed System on Energy Consumption in Northeast China

Zhang Yi, Zhou Mingyue, Liu Jinyuan, Wang Huibin

School of Economics and Management, Northeast Dianli University, Changchun, P.R.China 132012

(E-mail: 717278447@qq.com)

**Abstract:** As a feasible way to save energy and reduce carbon emission, combined cooling heating and power (CCHP) gains a lot controversial debate about energy consumption. This paper focuses on the establishment of the CCHP system and points of the system mathematical equations in energy consumption. There is a simple example of a CCHP project feasibility study in Northeast China analysis. The CCHP option, fitting the cooling area technical constraints, is feasible for energy comparison.

**Key words:** Combined cooling heat and power (CCHP); Energy consumption; Distributed system; District cooling;

## 1 Introduction

The CCHP is a kind of based on the concept of energy system based on cooling; heating and power generation process integration of all-round can always system. In recent years, China's cogeneration developed rapidly, but district cooling system is less widely application than district heating system. Because of district cooling system has many advantages it is taken seriously more and more. In 1962 the United States in Harford city, Connecticut built the world's first district cooling system, now the U.S. has more than 60 district cooling system; In Asia ,Japan's district cooling system is growing the fastest; Europe has more power and cooling unit system is in operation. However in our country, district cooling system based on cogeneration has just started, but development is rapid, such as CCHP of JiNan the total capacity of cooling develop from zero to 49.6 MW, with gas turbine as foundation gas cogeneration has emerged.

## 2 Energy Consumption Calculation of Distributed System

The working principle of distributed system as shown in figure 1 below

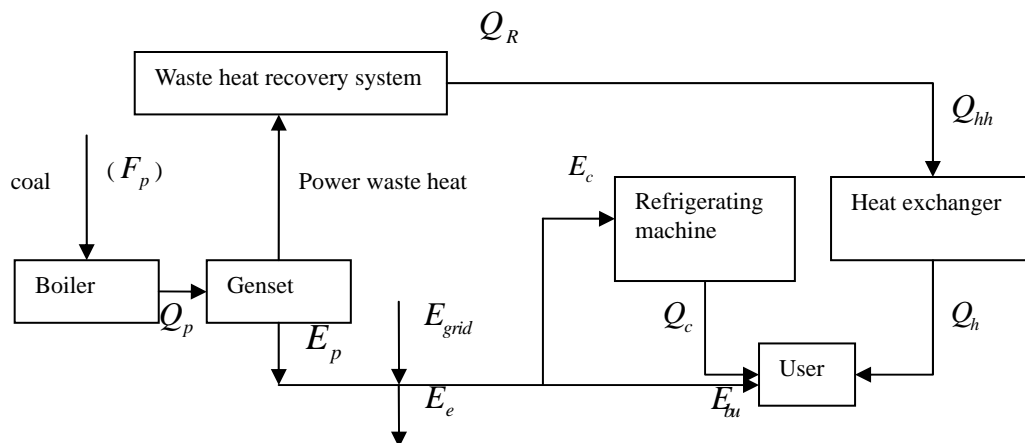

Figure 1 The Working Principle of Distributed System

### 2.1 Establishing energy consumption modelling

The different between distributed system and CCHP is the way to provide cold load. The distributed system is that setting up user self-built cold source set in where needs cold load, so just need to calculate power consumption, but in the comparison need to calculate the power grid transmission efficiency

Estimate in power consumption of user self-built cold source set according to the type 1 and 2:

$$Q_{ec} = \mu_c Q_c \tag{1}$$

$$Q_{ecy} = \mu_c Q_c \tau_c \tag{2}$$

In the formula:  $Q_{ecy}$  —System power consumption, kWh;

$Q_{ec}$  —System design power consumption, kW;

$\mu_c$  —system design power consumption of Unit cold quantity.

### 3 Energy consumption calculation of CCHP

The working principle of CCHP as shown in figure 2 below

Figure 2 The Working Principle of CCHP

#### 3.1 Establishing energy consumption modeling

In CCHP, the user gets cold quantity directly through steam rather than electricity.

CCHP generating efficiency of low parameters steam can be estimated by parameters capacity loss to do work according to type 3

$$e_x = (h - h_0) - T_0(s - s_0) \tag{3}$$

In the formula:  $e_x$  —Steam power capability, kJ/kg;

$h$ 、 $h_0$  —Steam medium and the state of the environment enthalpy, kJ/kg;

$s$ 、 $s_0$  —Steam medium and the environment of state entropy, kJ/(kgK);

$T_0$  —Temperature of environmental state, K.

As known system source load, estimation CCHP power consumption according to type 4 and 5.

$$Q_{ecs} = \mu_s Q_{cs} \tag{4}$$

$$Q_{ccsy} = \mu_s \tau_c Q_{cs} \tag{5}$$

In the formula:  $Q_{ccsy}$  —Power consumption of CCHP, kWh;

$Q_{ecs}$  —Design power consumption of CCHP, kW;

$\mu_s$  —System unit co-production cold quantity system design power consumption.

#### 3.2 The calculation of equivalent efficiency

When output the same cold quantity, we can think that absorption machine use more heat consumption exchange for less power consumption. So this process can be equivalent to a power generation process, and its power generation efficiency can be calculated by type 6.

$$\eta_c = Q_{ecy} - Q_{ccsy} / Q_{ch} \eta_{sp} \tag{6}$$

In the formula:  $\eta_c$  —Equivalent power efficiency, %;

$Q_{ch}$  ——Design recovery quantity of waste heat, kW;

$\eta_{sp}$  ——Grid transmission efficiency, %.

### 3.3 The calculation of coal consumption

Firstly steam content consumption of CCHP should be converted into standard coal consumption quantity, which can be calculated by type 7.

$$G_c = 3600 Q_{ch} / q_c \quad (7)$$

In the formula:  $G_c$  ——Translate heat into coal quantity, kg;

$q_c$  ——Steam and condensate enthalpy difference, kJ/kg.

Secondly CCHP system consumes more waste heat and reduces reduce power consumption, which equivalents to power generation, so equivalent coal quantity can be calculated by type 8.

$$g_c = 1000 G_c / (Q_{ecy} - Q_{ecsy}) \quad (8)$$

In the formula:  $g_c$  ——Equivalent coal consumption, g/kWh.

So annual coal saving capacity can be calculated by type 9.

$$\Delta G_c = 1000 Q_{ch} / (g - g_c) \quad (9)$$

## 4 Case Analyses

There is a simple example of a CCHP project. Installed capacity: there are four boilers which total capacity is 300t/h(4×75t/h),and three turbo generator sets which total capacity is 42MW. Actual heating area is four million square meters, gross building area is one hundred and fifty thousand square meters, and air conditioning area is one hundred square meters.

### 4.1 Energy consumption calculation of distributed system

Setting up user self-built cold source set is just need to calculate power consumption. Every 1000 RT (3517 kW) according to the shaft power estimate as follows: the main engine is 650 kW, cooling tower is 30 kW, cooling water pump is 90 kW, cold water level 1 pump is 55 kW, and they added up to 825 kW / 1000 RT. Total years cold load is  $1.3 \times 10^7$  kWh, which converts into full load time is

$$1.3 \times 10^7 \text{ kWh} \div (6250 \text{ RT} \times 3.517) = 592 \text{ h.}$$

Annual electricity consumption of setting up user self-built cold source set:

$$6.25 \times 825 \times 592 = 3.053 \text{ GWh.}$$

So annual electricity consumption is 3.053GWh.

### 4.2 Energy consumption calculation of CCHP

1) Calculation of power consumption

System design working conditions power consumption:

$$1563 \text{ kW} \times 20156.48 \div (6978 \times 3) = 1504.9 \text{ kW};$$

Converts into full load time is 592h, annual electricity consumption is

$$1504.9 \text{ kW} \times 592 \text{ h} = 0.891 \text{ GWh}$$

2) Calculation of steam consumption

Single 6978 kW installed cooling quantity steam consumption for 8838 kg/h. Total steam consumption :

$$8838 \text{ kg/h} \times 20156.48 \div (6978 \times 3) \times 592 \text{ h} = 5.037 \times 10^6 \text{ kg}$$

3) The calculation of equivalent efficiency

CCHP system consumes the amount of steam 0.8MPa saturated steam  $5.037 \times 10^6$  kg, less consumption of electricity:  $3.053 - 0.891 = 2.162$  GWh; Steam and condensate enthalpy difference is much heat consumption

$$Q_h = \Delta h \times G = (2768 - 84.0) \times 5.037 \times 10^6 \div 3600 = 3.756 \text{ GWh}$$

$$\eta_c = W_0 - W / Q_h \eta_{sp} = 2,161,675 / (3,756,243 \times 0.92) = 62.6\%$$

4) The amount of steam will be converted into standard coal , which equivalents to coal consumption

$$3,755,243 \times 3600 \div 29270 = 461,867,9 \text{ kg}$$

$$461,867.9 \div 2.162 \text{ GWh} \times 1000 = 213,7 \text{ g/kWh.}$$

This value is much lower than the national average coal consumption in recent years. Therefore, CCHP system is more favorable than distributed system on the energy consumption.

## 5 Conclusion

This paper mainly analyzes something on the energy consumption of regional CCHP, and through the actual cases can come to the conclusion that fitting the cooling area technical constraints, the CCHP is superior to distributed system in energy consumption. This study can provide guidance for the application of CCHP.

# Analysis of Coordination Degree of China's Financial Development and Economic Development Based on Systems Engineering\*

Diao Jiewen, Guo Yajuan

1University of Shanghai for Science and Technology, Shang Hai, P.R.China, 200093

(E-mail: diaojiewen@tom.com; gyj\_303@126.com)

**Abstract:** Studying the degree of coordination between economic and social development is of great significance to analyze a region's sustainable development ability quantitatively and promote the healthy development of economic society. The paper employs the coordination degree measure model based on systems engineering, conducting the unit root test, the co-integration test and the Principal Component Analysis, to calculate the static and dynamic coordination degree between financial development and economic development from 1992 to 2010. The conclusions of our research are that the static coordination degree is in a quite good status over 19 years except for two lower values respectively in the year of 1994 and 2009, similarly the dynamic coordination degree is showing an upward trend on the whole except for twice obvious decline respectively from 1993 to 1995 and from 2008 to 2010. It is because that the economy has separately suffered an overheating and a crisis during these two periods. In brief, the conclusions are matched with the actual situation of China.

**Key words:** Coordination degree; Financial development; Economic development; Empirical analysis

## 1 Introduction

The concept of coordination degree has been proposed by the Sustainable Development Strategy Study Group of the Chinese Academy of Sciences in the research about the sustainable development ability. Coordination degree can be defined as the harmonious and consistent degree of various association relations between different systems or among inner elements of the system. It not only forms the representation of the sustainable development ability, but also is the regulator of the sustainable development ability which is constantly optimized. Studying the degree of coordination between economic and social development is of great significance to analyze a region's sustainable development ability quantitatively and promote the healthy development of economic society.

## 2 Related Literature

The literatures about coordination degree of financial development and economic development are less than that of financial development and economic growth throughout the world. However, some of these literatures still have reference values, such as providing research methods and perspectives etc. This section mainly introduces some empirical studies on coordination degree of financial development and economic development made by China's scholars.

Wei Zhong and Huanchen Wang(2004)<sup>[1]</sup> investigate the degree of intra-impact and coordinated development between financial sector and industrial sector based on the data of China's industrial economy as well as financial development from 1980 to 2002, by using the concept and model of the coordinated theory. The results show that the coordination of two kinds of sectors is strengthened gradually, and the financial sector positively supports the stable and healthy growth of industrial economy. Fangmin Qian, Ke Sun and Zhongyao Tang(2008)<sup>[2]</sup> conduct an empirical analysis on 11 municipalities in Zhejiang province, using econometric models, to analyze the relationship between regional financial development and economic development. The conclusions are that the relationship not only possesses the regional characteristics, but also has the periodic characteristics.

Shouwei Li and Jianmin He(2009)<sup>[4]</sup> use the coordination degree measure model structured by Membership Function in fuzzy mathematics, based on the data of China from 1991 to 2007, to analyze the coordination of financial development and economic development. It is concluded that the coordination of financial development and economic development are in coordination level in almost all years except for the year of 1991, revealing the coordination level is high in general, but it has a downside after 2006; meanwhile, the coordination of securities market development and economic

---

\* Sponsored by National Social Science Fund Project "Study on Effectiveness of Monetary Policy Based on Financial Conditions Index " (10CJY075) and Fifth Key Subject of Shanghai Education Committee Project (J50504)

development are also in coordination level in almost all years except for the year from 1991 to 1993, however, it is descending after 2003. The conclusion has a certain practical significance to coordinated development of China's finance and economy.

Zhiqi Den(2011)<sup>[5]</sup> builds an evaluation system of development level of real economic system – financial system based on the western provinces' data from 2000 to 2008. It is found that the development level is between low and lower, and the degree of coordination is between basic level and primary level, while the development degree of coordination is located in moderate uncoordinated stage.

### 3 Model and Index

Currently, the research on coordination degree of financial development and economic development mostly adopts such method, which combines the Principal Component Analysis(PCA) together with the coordination degree measure model in fuzzy mathematics. To be specific, this paper firstly builds the index systems of financial development and economic development respectively, then calculates the comprehensive levels of each other by using PCA. Finally, apply comprehensive levels to establish the regression models, then to compute the adaptive values of financial development to economic development as well as economic development to financial development with the regression models. Subsequently, based on these two kinds of adaptive values, the static coordination degree will be calculated with coordination degree measure model. According, dynamic coordination degree can be calculated by utilizing static coordination degree.

#### 3.1 Principal component analysis

PCA will reorganize the original and correlated indexes into a set of new and unrelated indicators ( $F_i$ ). PCA computes new variables called principal components which are obtained as linear combinations of the original variables. The greater the variance of the principal component is, the more information it contains and more important it is. Therefore, the first principal component ( $F_1$ ) is required to have the largest variance. Then the second principal component ( $F_2$ ) will be selected with the second largest variance if  $F_1$  cannot contain enough information of the original indexes. In order to reflect the original information effectively,  $F_2$  is computed under the constraint of being orthogonal to  $F_1$ , that is  $COV(F_1, F_2)=0$ . The other components are computed likewise.

$$F_i = a_{1i} ZX_1 + a_{2i} ZX_2 + \dots + a_{ni} ZX_n \quad (1)$$

$F_i$  represents the  $i$ th principal component.  $ZX_j$  is the standardized data of the  $j$ th variable. In practice, every variable has different unit and magnitude order. Standardization can eliminate the influence of dimension to treat every variable fairly.  $n$  is the number of original variables.  $a_{ji}$  is the coefficient of  $X_j$  in linear combination of  $F_i$ , which interprets the size of correlation between  $X_j$  and  $F_i$ .

After each principal component is achieved, studying all of them will lose the original intention of dimension reduction. Only some of them with relatively larger variance need to be studied. Commonly, accumulative contribution rate of variance is required to reach 85% or more. When the principal components to be studied are identified, comprehensive level is calculated by using weighed average method, with these principal components as its variables and their variance contribution rates as weights.

In this paper, the comprehensive level of economic development( $E$ ) is gained when  $X$  in the formula(1) is changed into the relevant variables of economic development, so do the comprehensive level of financial development( $F$ ). Then, regression equation is built to get respective adaptive value, that is:

$$E_i = f(F_i) \quad (2)$$

The adaptive value of economic development to financial development, denoted by  $E_F$ , is obtained with  $F$  and the formula(2). Whereas, applying  $E$  and the inverse operation of the formula(2) to get the adaptive value of financial development to economic development, denoted by  $F_E$ .

#### 3.2 Coordination degree measure model

Coordination degree, which is considered to be a fuzzy concept with clear connotation but unclear epitaxy, is usually described by the membership degree concept in fuzzy mathematics. How the membership degree is varying could be reflected by Membership Function. The formulation of the coordination degree function is as follow:

$$u_s = \exp\left(\frac{-(x - x')^2}{s^2}\right) \tag{3}$$

$u_s$  represents the coordination degree.  $x$  is the actual value.  $x'$  is the adaptive value derived from regression equation.  $s^2$  is the mean square error.

Taking two systems(i and j) as an example to compute the coordination degree of i to j( $u_{(i/j)}$ ) and the coordination degree of j to i( $u_{(j/i)}$ ) firstly.

$$u_{(i/j)} = \exp\left(\frac{-(x_i - x'_i)^2}{s_i^2}\right) \tag{4}$$

$$u_{(j/i)} = \exp\left(\frac{-(x_j - x'_j)^2}{s_j^2}\right) \tag{5}$$

The static coordination degree between two systems can be calculated by the formula below:

$$C_{(i,j)} = \frac{\min\{u_{(i/j)}, u_{(j/i)}\}}{\max\{u_{(i/j)}, u_{(j/i)}\}} \tag{6}$$

The dynamic coordination degree can be obtained with the static coordination degree, i.e.:

$$C_{d(i,j)}(t) = \frac{1}{T} \sum_{i=0}^{T-1} C_{(i,j)}(t-i) \tag{7}$$

$C_{d(i,j)}(t)$  signifies the dynamic coordination degree of i and j at t moment, whilst  $C_{(i,j)}(t-i)$  interprets the static coordination degree at every moment. If  $C_d(t_1)$  at time of  $t_1$  is less than  $C_d(t_2)$  at time of  $t_2$ , where  $t_1$  is less than  $t_2$ , i and j are in coordinated development state.

The purpose of this paper is to study the coordination degree of financial development and economic development, so coordination degree is gained when system i and system j are replaced with F and E respectively.

### 3.3 Selection and treatment of index

This paper adopts the annual data of China from 1992 to 2010. On one hand, not only the coordination degree itself is a broader category but also economic development and financial development pursuit coordinated development in the long-term development. So relatively speaking, annual data will be more rational. On the other hand, the research with quarterly data has already been comprehensive and meticulous, together with the securities market of China has rapidly developed since 1991. Hence, the sample interval with the data after 1992 would be the best supplement for existing researches.

**Table 1 Related Indexes of Economic Development**

Index	Reflecting aspect	Sign
Per capita real GDP	Economic growth based on efficiency	PGDP
Gross export and import	Foreign trade situation	TRA
Total investment in fixed assets	Investment situation	IN
Total volume of retail sales of social commodities	Peoples' material and culture levels	RS
Urban per capita disposable income	Residents income	INCP

Growth rate of import and export	Trade growth rate	TRAR
Growth rate of total investment in fixed asset	Investment growth rate	INR
Growth rate of retail sales volume of social commodities	Commodity retail growth rate	RSR

**Table 2 Related indexes of financial development**

Index	Reflecting aspect	Sign
Financial interrelations ratio	Scale of financial relative to the economic aggregate	FIR
Total deposit and loan to GDP	Development scale of the bank	BANK
Circulated market value to GDP	Development scale of the stock market	SAC
Proportion of securities on financial assents	Financial structure	ATR
Loan to deposit	Efficiency of financial intermediary	RLS
Turnover rate	Efficiency of financial market	TURN
Growth rate of broad money M2	Rate of economic monetization	M2

## 4 Empirical Analysis

### 4.1 Data preprocessing

Before analysis, standardizing each variable with SPSS is necessary. The standardized formula is as follow:

$$\hat{x}_i = \frac{x_i - E(x_i)}{std(x_i)} \tag{8}$$

$x_i$  is the original value of each variable.  $E(x_i)$  is the arithmetic mean of  $x_i$ .  $std(x_i)$  is the standard deviation of  $x_i$ .

Correlation between variables is the premise of conducting PCA. Thus, the correlation coefficients between financial development variables as well as between economic development variables should be estimated before analysis. The correlation coefficient matrixes display that there is a strong correlation between financial development variables, so is between economic development variables. Consequently, by extracting principal component to do PCA is feasible.

### 4.2 Calculation of comprehensive level

Three principal components are extracted from the economic development variables, as well as from financial development variables. The cumulative contribution rate of variance of each other reach 91.56% and 94.10% respectively. It can clearly be seen that the information extraction of variables by PCA is satisfactory.

The comprehensive levels of economic development and financial development are calculated respectively, with the extracted three principal components as variables and the contribution rates of variance of each other as weights, see figureure 1.

**Figure 1 Comprehensive Levels of Economic Development and Financial Development over the Years**

Figure 1 displays the comprehensive scores of economic development and financial development since 1992. The results of figureure exhibit that the comprehensive level of economic development is increasing on the whole except for two period of from 1995 to 1998 and 2009. Relatively speaking, the

comprehensive level of financial development shows a more steady rise feature, only a decline under the impact of the global financial crisis in 2008, demonstrating the comprehensive level of financial development has been improved significantly in recent years.

**4.3 Calculation of adaptive value**

Given the results of the unit root test, the comprehensive levels of financial development and economic development are non-stationary, but their first order difference are stationary, implying both are integrated of order one. Before fitting regression equations with the comprehensive levels of financial development and economic development, it is necessary to perform the co-integration test in order to avoiding the spurious regression. Using maximum-trace method discovers that there is a co-integration relationship between comprehensive level of financial development and economic development's, furthermore with intercept in co-integration equation. Therefore, regressions can be made, and the coefficients can be estimated by the least square method. Regression equations are as follows:

$$F_t = 0.9924 \times E_t \tag{9}$$

$$E_t = 0.9149 \times F_t \tag{10}$$

Upon testing, the goodness of fit of two equations both are above 0.9, meanwhile the residuals are stable without autocorrelation and heteroscedasticity. So adaptive values of E and F calculated from these two equations are reliable.

**4.4 Calculation of coordination degree**

Adaptive values of financial development and economic development to each other are computed by utilizing formula(9) and formula(10), as follows:

**Table 3 Original Values and Adaptive Values of Financial Development and Economic Development**

	F	F <sub>E</sub>	E	E <sub>F</sub>
1992	-0.85	-0.85349	-0.86	-0.7777
1993	-0.81	-0.80387	-0.81	-0.7411
1994	-0.74	-0.18856	-0.19	-0.67706
1995	-0.75	-0.35728	-0.36	-0.68621
1996	-0.58	-0.47637	-0.48	-0.53067
1997	-0.53	-0.57561	-0.58	-0.48492
1998	-0.49	-0.60538	-0.61	-0.44832
1999	-0.38	-0.55576	-0.56	-0.34768
2000	-0.19	-0.33743	-0.34	-0.17384
2001	-0.06	-0.30765	-0.31	-0.0549
2002	0	-0.17864	-0.18	0
2003	0.11	-0.00992	-0.01	0.100644
2004	0.16	0.258033	0.26	0.146391
2005	0.28	0.357276	0.36	0.256184
2006	0.46	0.436671	0.44	0.420874
2007	0.86	0.764174	0.77	0.786851
2008	0.85	1.042056	1.05	0.777702
2009	1.24	0.913039	0.92	1.134529
2010	1.42	1.468802	1.48	1.299219

The static coordination degrees(CC) of financial development and economic development are achieved by formula(6), then using formula(7) to get the dynamic coordination degrees(CD), see figure 2:

**Figure 2 Static and Dynamic Coordination Degrees of Financial Development and Economic Development**

## 5 Conclusion

CC reports the degree of coordination between financial development and economic development at some point, and its values are always fluctuating between 0.92 and 1 during the period of 1992 to 2010. The values of CC are larger, so the coordination of financial development and economic development is in a quite good status over 19 years. But it is also can be seen from the picture obviously that coordination in different years are quite different. In particular, there are two lower values respectively in the year of 1994 and 2009. Because economy experienced an overheating in 1994, economy appears serious inflation (inflation rate was more than 20%). Moreover, the stock surged in 1993 but crashed in 1994. Indeed, in the scale, financial development is not coordinated enough with the economic development. The stock market was the bull market in 2009, with the loose monetary policy in early time, so the data of financial development variables is more perfect; Although China's gross domestic product has increased by 8.7% in 2009, the per capital real GDP and total imports and exports has a negative growth. Altogether, economic development does not keep up with the bull market of financial development.

CD mirrors the degree of coordination between financial development and economic development over a longer period of time. From figure 2, the dynamic coordination degree of financial development and economic development is showing an upward trend on the whole, indicating that financial development is more coordinated with the economic development. But still there are twice obvious decline, respectively from 1993 to 1995 and from 2008 to 2010. As mentioned above, the economy has separately suffered an overheating and a crisis during these two periods. Thus we can say that this paper draws a matched conclusion with the actual situation of China.

**Abstract:** Export of high-tech products and its share in export trade can adequately reflect a nation's or region's economic development level and its position in international trade. The export of high-tech products depends on industrial development level, while industrial development level depends on its Scientific and Technological(S&T) innovation capability. Hence, the relationship between regional S&T innovation capability and export of high-tech products is a subject widely researched in recently years. According to statistical data during 2005 to 2010, the paper evaluates S&T innovation capability of China's 30 provinces synthetically by means of factor analysis method. And then analyzes the relationship between S&T innovation capability and export of high-tech products for several consecutive years by means of correlate and regression analysis method. The results reveal that regional S&T innovation capability and export of high-tech products have close correlation and stable relationship. Additionally, regional S&T innovation capability plays a tremendous role in promoting export of high-tech products.

**Keywords:** S&T innovation; Factor analysis; Export; High-tech products; Regression analysis

## 1 Introduction

Under the urgent pressure of resource and environment, China now has to try to transform from a large trading nation to a strong trading one. It should be pointed out that a strong trading nation is firstly embodied in structure of export products. In 2009, China's general export hits 1201.612 billion dollars. Export of industrial manufactured goods hits 1138.483 billion dollars, 94.75% of general export; while export of high-tech products hits 376.931 billion dollars, only 31.37% of export of industrial manufactured goods, with large proportion of processing trade. It is clear that the export expansion of high-tech products depends on national S&T level and S&T innovation capability.

In 40's, people began to research the theory of technology innovation in trade. Posner (1961) put forward the technology gap theory, Vernon (1966) proposed the product cycle theory, Grober(1967) presented R&D factors theory. Subsequently, people furthered to research the effect of technology innovation on export. Christine Greehalgh (1996) empirically analyzed the impact of technology innovation on British export using technology innovation and intellectual property as variables. Gustavsson (1999) established a econometric model to study the effect of technology, resources and economies of scale on the international competitiveness of OECD countries. They think R&D is essential for the development of international competitiveness of high-tech industries.

In recent years, more and more Chinese scholars have begun to study the relationship between technology innovation and export by various methods. For instance, Jian Chen(2006) and Youqun Guo(2007) analyzed the relationship between innovation capability and export of high- tech products separately using co-integration analysis method and panel data model. As S&T innovation is a complicated process, it is difficult to measure its quality and quantity. Thus, S&T innovation capability cannot be sufficiently reflected by several direct indexes like S&T innovation inputs or results. While researches mentioned-above all select direct indexes.

In order to avoid the one-sidedness of selecting S&T variables, the paper establishes a relatively comprehensive index system to measure regional scientific research and technological innovation. In addition, the paper adopts factor analysis method to evaluate S&T innovation capability of China's 30 provinces according to statistical data during 2005 to 2010; and then analyze the relationship between S&T innovation capability and export of high-tech products for several consecutive years by means of correlate and regression method.

## 2 Methodology

## 2.1 Index system specification

On the basis of related research results in recent years, the paper establishes a set of index system in line with the principles of comprehensive, close correlation and data accessibility, which consists of four first-grade indexes including Basic Conditions, Actual Inputs, R&D Results and Technology Trades, and two to five second-grade indexes under each first-grade index.

For convenience, the paper sets thirteen second-grade indexes as variables, marked  $X_i$  ( $i=1,2,3\dots13$ ) (Table 1). As the paper studies S&T innovation capability of 30 provinces, each variable has 30 observed values, marked  $X_{ij}$  ( $i=1,2,3\dots30$ ).

**Table 1 Evaluation Index System of Regional S&T Innovation Capability**

First-grade Index	Second-grade Index	Variable
Basic Conditions	Number of Institutions (unit)	$X_1$
	Number of R&D Institutions in Large and Medium-sized Industrial Enterprises (unit)	$X_2$
	Number of R&D Institutions (unit)	$X_3$
	Population of Junior College and Above (person)	$X_4$
	Number of Total S&T Personnel (person)	$X_5$
Actual inputs	Region Expenditure for Science and Technology (100 million yuan)	$X_6$
	Intramural Expenditure on R&D (100 million yuan)	$X_7$
	Full-time Equivalent of R&D Personnel (man-year)	$X_8$
R&D Results	Domestic Patents Granted (piece)	$X_9$
	Number of Chinese Scientific Papers Taken by Major Foreign Referencing System (piece)	$X_{10}$
	Sales Revenue of New Products as a Percentage of Total Revenue from the Sale of Products (%)	$X_{11}$
Technology Trades	Value of Contract Deals in Domestic Technical Markets (10000 yuan)	$X_{12}$
	Value of Technology Contracts Imported (10000 USD)	$X_{13}$

## 2.2 Data

The study depends on the data from China Statistical Yearbook and China Statistical Yearbook on Science and Technology. Due to the change of statistical indexes, the paper substitutes statistical data of S&T Institutions in large and medium-sized industrial enterprises from 2006 to 2008 for statistical data of R&D institutions in large and medium-sized industrial enterprises, as well, number of total S&T personnel from 2010 to 2011 are replaced by number of R&D personnel.

## 3 Evaluation of Regional S&T Innovation Capability

### 3.1 Analysis method

Factor analysis method is one of the important methods of multivariate statistical analysis. Its basic idea is to distill variables with complicated relationship to several hypothetical variables (i.e. factors) by studying the inner structure of multivariable correlation coefficient matrix. These supposed variables could reflect the major information of original observed variables and explain interdependency relationship among all these observed variables. On owning large amounts of data, factor analysis could be an ideal evaluation tool of comprehensive evaluation study on regional innovation capability. The paper sets variance contribution ratio of various factors as weight, and then uses weighted average method to calculate column vectors of factor score coefficient matrix and finally obtain column vectors of integrate score. According to the integrate score, the paper evaluates the regional S&T innovation capability.

### 3.2 S&T innovation capability

On the basis of statistical data of 2009, the paper calculates the data by factor analysis. Similarly, statistical data of other years are analyzed in the same way. So, they are omitted.

KMO and Bartlett's test of Sphericity

Before analysis, test of factor analysis should be conducted first, or the analysis maybe mindless. The paper uses SPSS 19 to conduct the test. The result shows that, value of measure of sampling adequacy is 0.738, higher than 0.5. The statistic of Bartlett's test is 731.633, high enough to conduct

factor analysis. Its corresponding P-value (i.e. Sig.) is 0.000, lower than 0.05, that it to say, it can refuse the original suppose that partial correlation coefficient equals 0 and correlation coefficient matrix is identical matrix. In brief, the data can be calculated by factor analysis.

**3.3 Model calculation**

The paper conduct the factor loading evaluation of original observed data of 13 variables (13×30) in Table 1 by using SPSS 19 and factor analysis method, to gets eigenvalue of correlation coefficient matrix and variance contribution ratio (Table 2); and then find out the principal factors based on the principle of eigenvalue higher than 1. Thus, thirteen original variables are converted to three integrated variables (i.e. principal factors).

Table 2 reveals that eigenvalues of first three factors are all higher than 1. Of which, eigenvalue of the first factor is 8.671, explaining 66.702% of thirteen original variables total variance; eigenvalue of the second factor is 1.789, explaining 13.762% of thirteen original variables total variance; eigenvalue of the third factor is 1.020, explaining 7.843% of thirteen original variables total variance. Their cumulative variance contribution ratio is 88.306%. Namely, these three factors cumulatively explain 88.306% of information reflected by original data. Therefore, it is scientific and reasonable to draw first three principal factors (F<sub>1</sub>, F<sub>2</sub>, F<sub>3</sub>).

**Table 2 Eigenvalue of Correlation Coefficient Matrix, Variance Contribution Ratio and Cumulative Variance Contribution Ratio**

Component	Before Rotation			After Rotation		
	Total	Variance contribution ratio (%)	Cumulative Variance contribution ratio (%)	Total	Variance contribution ratio (%)	Cumulative Variance contribution ratio (%)
1	8.671	66.702	66.702	5.353	41.176	41.176
2	1.789	13.762	80.463	3.793	29.174	70.350
3	1.020	7.843	88.306	2.334	17.956	88.306

In order to make the principal factors have obvious meaning, factor loading matrix is needed to be rotated orthogonally, which could make each original variable loading on principal factors divide into 0 and 1, make factor structure simple. Further, practical meaning of each principal factor can be explained more obviously. Here, we use varimax method to rotate it three times and get eigenvalue, contribution ratio and loading matrix (omitted) of principal factors (Table 2). Of which, variance rotation contribution ratio can be used as weights in the calculation of principal factors' integrated scores afterwards.

**3.4 Results analysis**

Since values of principal factors cannot be observed directly, authors hope to describe variation characteristics and horizontal differentiation of principal factors through detailed original data. The paper uses the relationship between principal factors and original variables, adopt regression method to evaluate score coefficient matrixes of 3 principal factors (i.e. FC<sub>i</sub>). (Table 3)

**Table 3 Coefficient of Principal Factor Score**

Std. variable	Score Coefficient			Std. variable	Score Coefficient		
	FC <sub>1</sub>	FC <sub>2</sub>	FC <sub>3</sub>		FC <sub>1</sub>	FC <sub>2</sub>	FC <sub>3</sub>
Z <sub>1</sub>	0.289	-0.019	-0.288	Z <sub>8</sub>	0.166	-0.049	0.045
Z <sub>2</sub>	0.260	-0.261	0.107	Z <sub>9</sub>	0.013	0.048	0.174
Z <sub>3</sub>	0.044	0.380	-0.397	Z <sub>10</sub>	-0.077	0.305	-0.051
Z <sub>4</sub>	0.210	0.023	-0.153	Z <sub>11</sub>	-0.105	-0.176	0.529
Z <sub>5</sub>	0.176	-0.051	0.028	Z <sub>12</sub>	-0.191	0.394	-0.020
Z <sub>6</sub>	-0.008	-0.021	0.294	Z <sub>13</sub>	-0.127	0.065	0.365
Z <sub>7</sub>	0.107	0.042	0.031				

In addition, the covariance of scores of three principal factors between arbitrary two factors is 0. In other words, scores of three principal factors are independent each other. Therefore, collinearity problems could be completely ignored when they are used to calculate integrated scores.

Based on Table 3, observed values of standardized variables can be taken into equation (1). Then,

principal factors' scores of various regions ( $FS_1, FS_2, FS_3$ ) can be calculated.

$$FS = FC^T \times Z \quad (1)$$

In which,  $FS = (FS_1, FS_2, FS_3)^T$  is principal factors' score vector of various regions;  $Z = (Z_1 Z_2 Z_3 \dots Z_{13})^L$  is vector of standardized variables,  $FC^T$  is transposed matrix of principal factors' score coefficient matrix.

Based in equation (1), the paper takes variance rotation contribution ratio of principal factors as weights, gets integrated scores (CS) of regional S&T innovation capability. The equation is listed as follows:

$$CS = 0.4663 \times FS_1 + 0.3304 \times FS_2 + 0.2033 \times FS_3 \quad (2)$$

From equation (2), it can be got that score of first principal factor occupies 47% of integrated score weight, while the second occupies 33%, the third occupies 20%. Thus, scores and integrated scores of principal factors of 30 provinces can be calculated. (Table 4)

#### 4 Study on the Relationship Between Regional S&T Innovation Capability and

## Export of High-Tech Products

### 4.1 Integrated score of regional S&T innovation capability and regional GRP

Innovation capability of China's 30 provinces has significant difference; in the same, export regional of high-tech products is imbalance. (Figure 1) But obviously, they exist a certain correlation relationship. Statistical data of export of regional high-tech products is based on China Statistical Yearbook on Science and Technology.

### 4.2 Correlation study on regional S&T innovation capability and export of high-tech products

The paper uses several different models to analyze and test the correlation between quantitative indexes of regional S&T innovation capability (CS) and export values of regional high-tech products in continuous years. (Table 5)

Figure 1 Regional S&T Innovation Capability and Export of High-Tech Products of China's 30 Provinces in 2009

Form Table 5, it can be revealed that correlation coefficients of six models adopted above are all positive, and also relatively higher; additionally, in terms of F statistic and Sig. (i.e. P-value), they all pass the significance test. In other words, it can explain that regional S&T innovation capability and export of high-tech products have significant linear and nonlinear positive correlation relationship and the relationship is stable. Regional S&T innovation capability plays a tremendous role in promoting export of high-tech products (process omitted).

Table 5 Indexes of Regional S&T Innovation Capability (CS) and Correlation Coefficient of Export of High-Tech Products (2005 - 2010)

Model	Linear			Quadratic			Cubic		
	R	F	Sig.	R	F	Sig.	R	F	Sig.
2005	0.617	17.195	0.000	0.617	8.298	0.002	0.783	13.749	0.00
2006	0.68	24.041	0.000	0.695	12.599	0.000	0.746	10.862	0.00
2007	0.504	9.546	0.004	0.571	6.518	0.005	0.82	17.781	0.00

2009	0.855	76.020	0.000	0.855	76.020	0.000	0.855	76.020	0.00
2010	0.811	53.989	0.000	0.811	53.989	0.000	0.811	53.989	0.00

### 4.3 Study on Regional S&T Innovation Capability Contributing to Export of High-Tech Products

The paper selects four models from six models, and takes indexes of regional S&T innovation

capability (CS) as explanatory variables, takes export values of regional high-tech products (EXPORT) as explained variables. Based on the statistical data, authors respectively establish 4 different econometric models. (Table 6 & Table 7) Of which,  $R=0.714$  or  $R=0.855$ , which shows that variables have strong linear or nonlinear positive correlation relationship; while the result of analysis of variance (ANOVA) shows that, F statistic and corresponding Sig. (i.e. P-value) of four models all explain that four models all pass the integral test, in other words, linear or nonlinear relationship among variables in models is significant; its corresponding T statistic and Sig.(i.e. P-value) respectively explain that parameters of explanatory variables CS in various models all pass the test, in other words, explanatory variables CS and explained variables Y actually have significant linear or nonlinear relationship.

**Table 6 Variance Analysis (2009)**

Model	Sort	Sum of squares of deviations	df.	Variance	F	Sig.
Linear	Regression	1.482×1010	1	1.482×1010	29.104	0.000
	Residual	1.425×1010	28	5.090×108		
	Total	2.907×1010	29			
Compound	Regression	152.748	1	152.748	76.020	0.000
	Residual	56.261	28	2.009		
	Total	209.009	29			
Growth	Regression	152.748	1	152.748	76.020	0.000
	Residual	56.261	28	2.009		
	Total	209.009	29			
Exponential	Regression	152.748	1	152.748	76.020	0.000
	Residual	56.261	28	2.009		
	Total	209.009	29			

For the statistics data of other years in 2005-2010, the paper also establishes models, and all the statistical data pass the F-test and T-test of independent variable coefficient of variance analysis. So, similar processes are omitted here.

**Table 7 Evaluate and Test of Coefficient (2009)**

Model		Coefficient	Std. Error	T	Sig.
Linear	CS	37263.121	6907.195	5.395	0.000
	(C)	12564.167	4119.225	3.050	0.005
Compound	CS	43.977	19.084	2.304	0.029
	(C)	857.023	221.798	3.864	0.001
Growth	CS	3.784	0.434	8.719	0.000
	(C)	6.753	0.259	26.095	0.000
Exponential	CS	3.784	0.434	8.719	0.000
	(C)	857.023	221.798	3.864	0.001

The paper takes linear model, the simplest model as example, establishes econometric model. That is to say, Y is export values of regional high-tech products (EXPORT) and CS is indexes of regional S&T innovation capability.

Based on the analysis above, the paper uses SPSS 19 to conduct regression analysis. (Table 6 & Table 7) Suppose that we take statistical data of year 2009 as example, by means of linear model analysis, when the index of regional S&T innovation capability increase 1%, export value of regional

high-tech products will increase 37.263 billion RMB.

## 5 Conclusions

Based on the research before, in order to avoid the one-sidedness of selecting direct indexes as S&T innovation indexes, the paper objectively and comprehensively evaluates S&T innovation capability of China's 30 provinces synthetically by means of factor analysis method according to statistical data during year 2005 to 2010. And then empirically analyze the relationship between S&T innovation capability and export of high-tech products for several consecutive years by means of correlate and regression analysis method. The analysis result shows that S&T innovation capability and export of high-tech products of China's provinces have significant difference while their correlation extent is high and their correlation relationship is stable. In conclusion, the increase of regional S&T innovation capability plays a remarkable on the rapid increase of export of regional high-tech products.

## The Economic Dynamic Efficiency in China based on DEA-Malmquist

Jiang Bo, Li Mengyi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:jiang\_742@163.com)

**Abstract:** The article analyzed total factor productivity growth and returns to scale based on the DEA-Malmquist index decomposition method with the 1994-2009 years of various regions of China's 30 provinces and municipalities directly under the central government panel data by using software to MAXdea over the input-output efficiency. The results found that since 94, China has seen rapid TFP growth and stability of the characteristics of the volatility coexist, 2001 and 2004 are two troughs, 2003 is a wave, TFP between 1994 and 1997 was in the steady growth of 2% TFP, it began to seen a rapid TFP growth slowing from 1997 to 2005, and in 2002 years later appeared negative growth; 2005-2009, TFP had a steady growth, the scale diminishing returns degree moderate, technological progress is more steady, technical efficiency improved. In the district difference analysis percentile in accordance with the method of classification index TFP, found that the traditional and different regions, such as the western Xinxiang province of Shanxi, should belong to the regions TFP higher. Its returns to scale and technical efficiency is relatively high, it is necessary to increase investment in these areas of inputs for better output.

**Key words:** DEA-Malmquist; MAXdea; Economic dynamic efficiency ;District difference analysis

### 1 Introduction

In order to improve the quality of economic growth, the transformation of economic development is an important goal and strategic initiatives of the implement of the scientific concept of development during the "12th Five-Year" period. However, the measurement of the efficiency of economic growth is important in the analysis of quality of economic growth, it's the basement for quality of economic growth from qualitative analysis to quantitative analysis. Now the research most forus on the overall national level, or alone as a research object to certain provinces, to carry out the evaluation and judgment of the efficiency levels of economic growth, regardless of a comprehensive measure of the efficiency of state of China and the region's economic growth. The paper departed from the analytical framework of economic growth efficiency, used Malmquist Index approach to avoid the subjectivity in ascertaining weights based on data envelopment analysis to measure the efficiency of economic growth in China and the regions between 1994-2009, two aspects of efficiency change and technological change timing evolution and differences in the evaluation and inter-regional, evaluated and the efficiency change and technological change of economic growth in provinces and the regions between 1994-2009 and measured the inter-regional timing of evolution and variance analysis.

### 2 Research Methods, Indicator Selection and Data Sources

#### 2.1 Research methods

Data envelopment analysis (for short DEA) method was originally proposed in 1978 by Charnes, and then gradually developed and matured, widely used in the field of social sciences such as mathematics, operations research, mathematical economics and management science. The method defined evaluation unit as a decision making unit (DMU), determined effective production frontier of the decision-making unit through linear programming, and thus the distance of each DMU and the efficient production frontier, to determine the effectiveness of each DMU. For the character of no need to presuppose a specific production function, does not require pre-estimated parameters, avoids subjective factors and simplified algorithm to reduce the error, DEA has been widely used in evaluating the efficiency of each system to evaluate the multi-input multi-output problems. Between DEA classic models, the paper used the most mature and most basic non-Archimedean infinitesimal C2R model.

As follows: suppose there are  $n$  decision making units:  $DMU_j (1 \leq j \leq n)$ , each decision making unit has  $m$  inputs and  $s$  outputs:

$$X_j = (x_{1j}, x_{1j}, \dots, x_{1j})^T \quad j = 1, \dots, n$$

$$Y_j = (y_{1j}, y_{1j}, \dots, y_{1j})^T \quad j = 1, \dots, n$$

Given the weight of each input, output:

$$V = (v_1, v_2, \dots, v_m)^T$$

$$U = (u_1, u_2, \dots, u_m)^T$$

Unit efficiency evaluation phase should be defined as:

$$h_j = u^T y_j / v^T x_j$$

Now we evaluate the efficiency of  $J_0$ . Its input, output vector:  $(x_j, y_j)$ , for short:  $(x_0, y_0)$ , by selecting the appropriate weight:  $u_j, v_j$ , to make the efficiency evaluation maximus on condition of less than 1, So constructed multi-objective programming model as follows:

$$\begin{aligned} \max Z &= u^T y_0 / v^T x_0 \\ \begin{cases} \frac{u^T y_0}{v^T x_0} \leq 1 \\ u \geq 0, v \geq 0 \end{cases} \end{aligned} \tag{1}$$

(1) is a fractional programming, it means the proportion of output and input for  $DMU_0$  reach maximum on condition that other  $DMU$  remain. By using Char-ness-Cooper transformation, BP planning theory and convexity, cone, invalidity and minimal axiom assumes the introduction of the concept of non-Archimedean infinitesimal, the above equation can be transformed into the following model:

$$\begin{aligned} \min Z &= \theta - \varepsilon(e^{\wedge T} s^- + e^T s^+) \\ \begin{cases} \sum_{j=1}^n \lambda_j x_j + s^- = \theta x_0 \\ \sum_j \lambda_j y_j - s^+ = y_0 \\ \lambda, s^+, s^- \geq 0 \\ e^{\wedge T} = (1, \dots, 1)^T \in R^m, e = (1, \dots, 1)^T \in R^s \end{cases} \end{aligned} \tag{2}$$

We define  $\varepsilon$  as Non-Archimedean infinitesimal,  $s^-$  as slack variable vector corresponded with input,  $s^+$  as slack variable vector corresponded with output, then we seeked the optimal solution  $\theta^*, \lambda^*, S^{*-}, S^{*+}$ .

The basic conclusion:

- (1)  $\theta^* = 1$ ,  $DMU_0$  is Weak DEA;
- (2)  $\theta^* = 1$ , and each optimal solution  $S^{*-} = S^{*+} = 0$ , then  $DMU_0$  is DEA efficient;
- (3) For the non-effective  $DMU_0$ , its projection of the industry production frontier surface:

$$\begin{aligned} X'_0 &= \theta^* X_0 - S^{*-}, \\ Y'_0 &= Y_0 + S^{*+} \end{aligned}$$

Above is the basic DEA method C2R model, constant returns to scale model. If the introduction of  $\sum \lambda_j = 1$  constraint, we can get another DEA model BC2 model, the variable returns to scale model.

The efficiency of C2R obtained is technical efficiency, the efficiency obtained by the BC2 is the pure technical efficiency. For Technical efficiency = pure technical efficiency  $\times$  scale efficiency. The paper used C2R model.

## 2.2 Indicator selection

Domestic application of the Malmquist index method, most of them follow the Fare and other people's ideas, there are some inadequacies in terms of index decomposition. So the article briefly reviewed the Malmquist index method, accurate interpreted the index decomposition. On the other side, This article also used the 30 provinces data of total factor productivity (TFP) changes in cross-section data in China, tied to analysed the trends and causes of economic growth in China's regional analysis. Sichuan Province included Chongqing were analyzed for the same diameter.

According to Fare, etc., the Malmquist index of output direction, which technical referred to  $s$  time and  $t$  time is defined as:

$$M_{st} = \left[ \frac{D_0^s(x_t, y_t)}{D_0^s(x_s, y_s)} \times \frac{D_0^t(x_t, y_t)}{D_0^t(x_s, y_s)} \right]^{\frac{1}{2}} = \frac{D_0^t(x_t, y_t)}{D_0^s(x_s, y_s)} \times \left[ \frac{D_0^s(x_t, y_t)}{D_0^t(x_t, y_t)} \times \frac{D_0^s(x_s, y_s)}{D_0^t(x_s, y_s)} \right]^{\frac{1}{2}} = Ech \times Tch$$

$Ech = D_0^t(x_t, y_t) / D_0^s(x_s, y_s)$  means efficiency change from time s to t.

$Tch = \left[ \frac{D_0^s(x_t, y_t)}{D_0^t(x_t, y_t)} \times \frac{D_0^s(x_s, y_s)}{D_0^t(x_s, y_s)} \right]^{\frac{1}{2}}$  means technological change from time s to t.

The Malmquist index can be decomposed into technical efficiency change (Ech) and technical change (Tch) under the assumption that constant returns to scale.

When  $M_{s,t} > 1$ , TFP improved; when  $M_{s,t} < 1$ , TFP regressed; when  $M_{s,t} = 1$ , TFP remained. When Efficiency change or technological change is greater than 1, that it is the source of TFP growth; the contrary, the source of TFP reduced.

**2.3 Data sources**

The basic data used by the DEA model in this article comes mainly from the China Statistical Yearbook "and" China's Regional Economic and Statistical Yearbook (1994-2009). Analysis of the samples used for the input and output data of the 1994-2009. The article defines the input index consists of two parts of the capital and labor, and capital to represent the actual completion of a fixed period of the regions total capital investment; labor to the city in each period by the end of registration of employment the total number of measure. Output indicators to the regional GDP. Indicators with price factors are adjusted to the relevant price index with 1994 as the base period.

**3 Empirical Analysis**

According to the above input-oriented DEA-the Malmquist index approach, we used SPSS, MAXdea software and years 1994-2009 regional economic aggregate data on the regional input-output ratio and TFP measure, analyze the dynamic efficiency of economic growth and regional differences in analysis. Ech on behalf of Efficiency Change; Tch on behalf of Technology Change; Pch on behalf of Pure Technology Change; Sch on behalf of Returns to Scale Change; TFP on behalf of Total Factor Productivity.

**3.1 Dynamic Timing evolution of total factor productivity**

It can be seen from Figure 1 and Table 1 that China's TFP has the Characteristics of volatility and smooth coexistence since 1994 so far. The year of 2001 and 2004 are two trough, and 2003 is a crest. So the time from 1994 to 2009 can be divided into three stages:

1994-1997, TFP had a steady growth with a rapid more than 2%. This period, TFP progress is mainly due to the acceleration of the process of opening up international trade and FDI levels to substantially increase. Even, International trade and FDI is conducive to China to learn advanced technology from the Western countries. This period of technological progress to increase substantially was the main driving force of the TFP growth. However, due to the market economy and modern enterprise system reform to promote the slow economic entities independent initiative is still subject to certain restrictions, technical efficiency can not be effectively enhanced, but a certain downward trend. However, during this period the degree of decreasing returns to scale to reduce TFP growth, a favorable condition to resume.

1997-2005, The growth of TFP continued but slow, and after 2002 a negative growth. In 1997 Southeast Asian financial crisis happened, in order to ensure the economic growth rate the central government, increased investment, Also the local government driven by GDP growth, constantly improved the level of investment, and local protection policy, redundanted construction. The reform of the financial system is also delayed in progress, but also makes our financial efficiency can not effectively be enhanced. Thus making this period of technical efficiency decline.

2005-2009, TFP steady grewed, the degree of decreasing returns to scale became slow and technological progress was relatively stable, technical efficiency improved.

**Table 1 Average Malmquist Index of China's Economy Efficiency**

years	Ech	Tch	Pch	Sch	TFP

### 3.2 Total factor productivity analysis of regional disparities

For the change of China's TFP region mostly according to the China Statistical Yearbook on the northeast, east, central and western division. However, the article discussed that there is a certain irrationality in accordance with such zoning changes in the TFP region.

**Tabel 2 TFP Changes and Decomposition of the Various Provinces of China**

Anhui	0.933	1.063	0.936	0.997	0.992
Jiangxi	0.936	1.050	0.939	0.997	0.982
Henan	0.939	1.058	0.937	1.002	0.993
Hubei	0.982	1.058	0.981	1.000	1.039
Hunan	1.004	1.110	1.003	1.001	1.115
Sichuan	0.917	1.055	0.920	0.997	0.967
Guizhou	0.921	1.076	0.929	0.991	0.991
Yunan	0.942	1.043	0.947	0.995	0.983
Xizang	0.971	1.018	1.000	0.971	0.988
Shanxi	0.963	1.052	0.965	0.998	1.013
Gansu	0.947	1.057	0.955	0.991	1.001
Qinghai	0.964	1.017	0.984	0.980	0.981
Ningxia	0.976	1.012	0.988	0.988	0.988
Xinjiang	0.976	1.053	0.981	0.994	1.027
Average	0.966	1.061	0.971	0.995	1.025

Source: according to China Statistical Yearbook and analysis by MAXdea.

As shown in Table 2, both the TFP efficiency such as Shaanxi, and Xinjiang in the western areas with high rate, middle like in Henan of TFP efficiency is relatively low provinces. Simple zoning in accordance with the location can not be a true reflection of changes in total factor productivity of the region China each region. This article in accordance with the TFP using the quantile method to the country's 30 provinces, divided into three categories. That is, first obtain the mean of the 30 provinces of the country TFP TFP is greater than the mean TFP higher regions; seek the remaining other provinces TFP mean, divided into two classes. Classification and statistical characteristics as shown in the table below:

**Table 3 The TFP Strength of Regional Classification and Statistical Characteristics**

TFP Rate	TFP with high rate	middle rate	low rate
	Beijing, Tianjin, Liaoning, Shanghai, Jiangsu, Zhejiang, Fujian, Shandong, Guangdong, Hainan, Jilin, Hubei, Hunan, Xinjiang	Hebei, Guangxi, Neimenggu, Anhui, Henan, Guizhou, Shanxi, Gansu	Shanxi, Heilongjiang, Jiangxi, Sichuan, Yunnan, Xizang, Qinghai, Ningxia
Average	1.064	1.001	0.981
S.D	0.033	0.012	0.008
Max	1.127	1.025	0.989
Min	1.027	0.991	0.967
Regions	14	8	8

Source: according to China Statistical Yearbook and analysis by MAXdea.

From the mean point of view, the gap of TFP between areas with high rate and medium rate is larger, but smaller between medium region and lower region, standard deviation of higher TFP region is relatively large, indicating that despite the TFP areas with high efficiency to be more advanced, but its internal output into the efficiency difference is more obvious because of technical progress and returns to scale, for example, technological advances such as Beijing's index is 1.117, while Ningxia only 1.012. TFP medium regions and areas of low standard is relatively small, indicating that these two regions are the internal differences in the trend of shrinking.

In addition, the regions' returns to scale with higher TFP are less than 1, indicating that the window of sustained and large investment in increasing returns to scale has closed, additional input should be reduced in these areas in order to avoid input redundancy, regions with lower TFP, the general returns to scale is higher, and indicated invest shortcomings. As shown in Table 4, Yunnan, 1994-2009, the technological progress index is 1.043, increasing returns to scale, investment in fixed asset investment and employment, respectively, as is shown insufficient

**Tabel 4 Yunnan 1994-2009 TFP Evaluation Results**

#### 4 Conclusion

In the efficiency of economic growth, because this category contains a very complex content and belong to a normative value judgments, there are greater difficulties in making quantitative analysis of articles starting from the DEA-Malmquist Index, through the TFP indextiming changes and inter-regional study the dynamic efficiency of economic growth between 1994-2009, around the interval of the difference analysis.

Overall, the articles used panel data to reasonably reflected the timing of changes in economic growth, carved of dynamic efficiency changes in the 1994-1997 and TFP maintained a 2% growth in this period mainly due to the acceleration of the process of opening, increased dramatically, meantime during this period technological progress was the main driving force of the TFP growth. However, due to the market economy and modern enterprise system reformed slowly, independent activity of economic entities are still subject to certain restrictions, technical efficiency can not be effectively enhanced, but a certain downward trend; from 1997 to 2005, the Southeast Asian financial crisis happened and TFP growth began to slow down, even a negative growth after 2002; 2005-2009, TFP, maintained a steady growth and returns to scale decreased stable, technological progress, technical efficiency has improved.

From the regional point of view, the quantile method reasonable partitioned the country according to the TFP index, avoided the tradition geographical zoning but not a true reflection of changes in total factor productivity of the regions in China. The conclusions in the empirical analysis also confirmed that as shown in Table 3, the technical efficiency of Xinjiang in China is 1.053, increasing returns to scale is 0.994 while TFP is 1.027, obviously belongs to the TFP higher regions, while in the traditional classification, Xinjiang in China is often listed into the western region, resulting in the data analysis process standard deviation is too large, even affected the results.

**Abstract:** Green supply chain management is a kind of effective management approach for home appliance industry to pursue the strategy of sustainable development and improve the product international competitiveness. In this paper, a game model is proposed to study the relationship and game status between governments and enterprises in the green supply chain of the home appliance industry. Through the equilibrium analysis of the game model, some countermeasures are put forward, which can be helpful to improve the construction of the green supply chain in the home appliance industry.

## 1 Introduction

Since the beginning of the 21st century, to protect the ecological environment and realize sustainable development has become a topic of common concern around the world. In recent years, many countries in the world formulate more strict environmental protection laws and regulations to strengthen the environmental protection and management.

WEEE directive 2002/96/EC (Waste Electrical and Electronic Equipment, as amended by 2003/108/EC) and RoHS directive 2002/95/EC (Restriction of Hazardous Substances) are two important regulations relating to household electrical and electronic equipment used by consumers. The objective of the WEEE directive is to improve the level of environmental protection within the European Union through the reduction of waste from household electrical and electronic equipments. Equipment producers are responsible for the management of takeback and disposal of waste starting from 13 August 2005. The RoHS directive aims at harmonization of the legislation in the EU Member States on the restriction of the use of hazardous substances in household electrical and electronic equipment. The general rule is that equipment containing a certain level of lead, mercury, cadmium, hexavalent chromium, PBB's and PBDE's may not be placed onto the market after 1 July 2006. As the main country of manufacturing and exporting home appliances, China will be seriously affected by these regulations. Therefore, there is no time to delay for Chinese home appliance industry to establish green supply chain, which could be with great significance to improve our product competitiveness in the international market, protect the environment and implement the strategy of sustainable development.

Green supply chain, like traditional supply chain, is a cooperative system typically needs coordination and management and may be more complex due to its diversifying components and operational objectives. Hence the mutual relationship between the main stakeholders, especially the relationship between governments and enterprises, will influence the effective implementation of green supply chain (Xu et al, 2012)<sup>[1]</sup>.

## 2 Research Status on Game Analysis of Green Supply Chain

In 1996, the National Scientific Funds (NSF) in USA provided \$400,000 financial aid to the Manufacture Research Consortium (MRC) in Michigan State University to conduct a research project named "Environmental Responsible Manufacture" and then the definition of Green Supply Chain was proposed firstly (Handfield, 1996)<sup>[2]</sup>. From then on, more and more scholars began to research the green supply chain from different perspectives. The so-called green supply chain is a kind of modern management mode which takes the environmental impact and resource efficiency into a comprehensive consideration within the entire supply chain. Taking green manufacturing theory and supply chain management technology as the foundation, it involves suppliers, manufacturers, distributors and users, with the purpose to make the environmental impact (negative effect) minimum and resource efficiency

maximum during the whole process from material acquisition, processing, packaging, storage, transportation, usage to scrapping (Dan Bin and Liu Fei, 2000)<sup>[3]</sup>. The basic objective of green supply chain management is to protect environment and make use of resources effectively.

As for game theory, in mathematics, it models strategic situations, or games, in which an individual's success in making choices depends on the choices of others (Myerson, 1991)<sup>[4]</sup>. Game theory has been widely used in many subject areas, including the field of supply chain management. Many researchers have studied supply chain coordination with contracts and proposed many game models.

However, game analysis between the participating subjects in the green supply chain is still very limit. Only a few researchers have conducted some study on the relationships by using game theory. Pantumsinchai (1992)<sup>[5]</sup> pointed out that government's support increased enterprise's economic and environmental performance, and then the enterprise further integrated and make the whole supply chain 'green'. In order to investigate the game between governments and core-enterprises in green supply chains, Zhu and Dou (2007)<sup>[6]</sup> analyzed their respective costs and benefits, and studied the game status by evolutionary game theory. Li and Liu et al (2007)<sup>[7]</sup> from the government supervision's angle, built up dynamic game models of reverse logistics by using the game theory. Xu and Zheng (2008)<sup>[8]</sup> studied the relationship between governments and corporations in green supply chain under the condition of impeaching. Cao and Wen (2011)<sup>[9]</sup> also set up a game model between governments and enterprises in green supply chain and analyzed their behavior and equilibrium strategies. There are also a few scholars having tried to conduct preliminary analysis of the multilateral game relationship between governments, enterprises and consumers in the green supply chain, e.g., Wang (2004)<sup>[10]</sup>. Yu and Liu (2011)<sup>[11]</sup>. Xu et al (2011)<sup>[12]</sup>.

Some researchers analyzed the relationship between the enterprises within green supply chain, e.g., Wang and Yan (2009)<sup>[13]</sup> analyzed the respective costs and benefits of suppliers and core-enterprise in green supply chain, and established an evolutionary game model between governments and enterprises based on evolutionary game theory. Hou and Wang (2010)<sup>[14]</sup> studied the relationship between enterprises of green supply chain and those of traditional one.

Some scholars conducted some analysis of the game relationship in the green supply chain connected with specific industries, e.g., Zhou and Zhang (2007)<sup>[15]</sup> analyzed the relationship between government, coal and electricity, Feng and Wang (2010)<sup>[16]</sup> analyzed the different intention and game action between client and general contactor in the progress of constructing green supply chain in construction industry. The authors of this paper have ever analyzed the relationship between enterprises and consumers in green supply chain of home appliance industry (Xu et al, 2011)<sup>[17]</sup>.

It can be found that the research results about the game analysis between the main stakeholders is so limit and there is no research result found about the game relationship analysis connected with the background of home appliance industry except the authors' previous study. Concerning of the pressure from the more strict environmental rules such as WEEE and RoHS, it will be essential to study the game relationship between the main stakeholders in the green supply chain of home appliance industry, which will be helpful to promote the construction and development of the green supply chain.

### **3 A Game Model between Governments and Home Appliance Enterprises**

#### **3.1 Basic assumptions and definitions**

The construction of the green supply chain of home appliance industry requires involvement of governments, enterprises, consumers and other relevant society members. In order to facilitate the analysis, here we assume that there are only two stakeholders, i.e. governments and home appliance enterprises (simply as "enterprises"). Governments refer to local governments and also include some relevant organizations or committees who focus on the environment protection and are entitled to issue some environmental regulations or rules. Enterprises refer to those who are engaged in home appliances manufacturing or sales. Meanwhile, we assume that governments and enterprises are all rational economic men, who take the benefit maximization as their goal. The players of the game know the strategies and payoffs of others. In short-term equilibrium, the game problem can be regarded as a kind of static games of complete information and to seek Nash equilibrium.

In the current market conditions with green home appliances and traditional home appliances coexist, the enterprises have two strategies: one is to offer green home appliances, e.g., home appliance manufacturers actively develop ecological design and introduce some available technologies to manufacture green home appliances, or retailers actively promote and sell the green home appliances;

the other one is to offer traditional home appliances by using traditional methods to design, manufacture and sell home appliances, and in this circumstance enterprises will be punished by governments and pay for penalty due to not meeting the requirements of environmental protection. As for governments, they can adopt the strategy of supervision, which means they will supervise whether the enterprises has deployed green supply chain management. If they find the enterprises are offering green home appliances, they give them a sum of money as subsidy. Conversely they will punish the enterprises. Governments can choose the strategy of unsupervision too, which means they will do nothing-no subsidy and no penalty.

According to existing literatures, we make some assumptions and definitions about the benefits and costs for governments and enterprises in order to determine the payoff for each player with every possible combination of actions. When enterprises choose to offer traditional home appliances,  $R_B$  and  $C_B$  respectively represent the total revenues and the total costs, and  $F_B$  represents the payable penalty to governments due to not meeting the requirement of implementing green supply chain. When enterprises choose to offer green appliances,  $R_B'$  and  $C_B'$  respectively represent the total revenues and the total costs in this case, and  $S_B$  represents the subsidy that they can obtain from governments. As for governments, except the subsidy  $S_B$ ,  $C_E$  represents the costs of supervision and  $L_E$  shows the loss of the social welfare due to the environmental disruption from the traditional home appliances.

**3.2 Payoff matrix of governments and enterprises**

Based on the above assumptions and definitions, we can construct a game model between governments and enterprises, which is represented by a payoff matrix shown in Table 1. Each player has two strategies, which are specified following the name of players. The payoffs are provided in the interior. The first number is the payoff received by governments; the second is the payoff for the enterprises.

**Table 1 Payoff Matrix of Governments and Enterprises**

		Enterprises	
		Offer Green Home Appliances ( $B_1$ )	Offer Traditional Home Appliances ( $B_2$ )
Governments	Supervision ( $E_1$ )	$-C_E - S_B, R_B' - C_B' + S_B$	$-C_E - L_E + F_B, R_B - C_B - F_B$
	Unsupervision ( $E_2$ )	$0, R_B' - C_B'$	$-L_E, R_B - C_B$

**4 Equilibrium Analysis of the Game Model between Government and Enterprises**

Now we conduct detailed equilibrium analysis of the game model proposed above.

**4.1 Pure strategy nash equilibrium**

4.1.1 If  $R_B' - C_B' + S_B < R_B - C_B - F_B$ ,

then as for enterprises, this means that the payoff of offering green appliances is less than the amount of offering traditional appliances. This condition can also be expressed in another way, i.e.,  $(C_B' - C_B) - (R_B' - R_B) - S_B > F_B$ , which means that the increased cost of offering green appliances will be greater than the penalty  $F_B$  even if have being compensated by the increased revenue and governments subsidies. Next we consider two circumstances:

(1) if  $-C_E - L_E + F_B > -L_E$ , i.e.  $-C_E + F_B > 0$ , which means the penalty governments gained from the enterprises is greater than the supervisory cost when the governments adopt the strategy of supervision, then there will be a unique pure-strategy Nash equilibrium and the stable strategies combination will be (Supervision, Offer Traditional Home Appliances). In this case, the increased cost for green home appliances is maybe too high and the penalty from the government is lesser, therefore, driven by interests, enterprises may prefer to offer traditional appliances.

(2) if  $-C_E - L_E + F_B < -L_E$ , i.e.,  $-C_E + F_B < 0$ , which means the penalty governments gained from the enterprises can not compensate the cost for supervision, hence the governments would prefer to adopt the strategy of unsupervision. Then it will be discussed further as following two circumstances.

If  $R_B - C_B > R_B' - C_B'$ , which indicates that the payoff of offering green appliances is less than the amount of offering traditional appliances and the enterprises do not need to pay for the penalty because the governments do not supervise. Then there will be unique pure-strategy Nash equilibrium and the stable strategies combination will be (Unsupervision, Offer Traditional Home Appliances).

If  $R_B - C_B < R_B' - C_B'$ , which means the payoff of offering green appliances surpasses the amount of offering traditional appliances, then the enterprises would be willing to offer green home appliances and the governments would adopt the strategy of unsupervision, thus the game has a unique pure-strategy

Nash equilibrium. The stable strategies combination is (Unsupervision, Offer Green Home Appliances). This is the ideal case, under which the enterprises are actively adopt the strategy of “Offering Green Home Appliances” and the governments do not need to supervise.

4.1.2 If  $R_B' - C_B' + S_B > R_B - C_B - F_B$ ,

then as for enterprises, this means the payoff of offering green appliances surpasses the amount of offering traditional appliances. This condition can be expressed in another way, i.e.,  $(C_B' - C_B) - (R_B' - R_B) - S_B < F_B$ , which indicates that the increased cost of offering green appliances are compensated by the increased revenue and governments subsidies and the surplus is less than the penalty  $F_B$ . In this circumstance, the enterprises would rather offer green home appliances. While the governments would adopt the strategy of Unsupervision as a rational economic men. It is obviously that the strategies combination (Supervision, Offer Green Home Appliances) will not become the pure Nash equilibrium. It should be discussed further in two cases.

If  $R_B' - C_B' > R_B - C_B$ , then there will be a unique pure-strategy Nash equilibrium and the stable strategies combination will be (Unsupervision, Offer Green Home Appliances).

If  $R_B' - C_B' < R_B - C_B$  and  $-C_E - L_E + F_B < -L_E$ , then there will be a unique pure-strategy Nash equilibrium and the stable strategies combination will be (Unsupervision, Offer Traditional Home Appliances).

If  $R_B' - C_B' < R_B - C_B$  and  $-C_E - L_E + F_B > -L_E$ , then there will be no pure-strategy Nash equilibrium and the players will choose mixed strategies.

#### 4.2 Mixed strategy equilibrium

If no pure-strategy Nash equilibrium exists, the players will choose mixed strategies, where a pure strategy is chosen at random, subject to some fixed probability. Here we assign governments the probability  $p_1$  of playing  $E_1$  (Supervision) and  $(1-p_1)$  of playing  $E_2$  (Unsupervision), assign enterprises the probability  $p_2$  of playing  $B_1$  (Offer Green Home Appliances) and  $(1-p_2)$  of playing  $B_2$  (Offer Traditional Home Appliances), where  $0 \leq p_1 \leq 1$ ,  $0 \leq p_2 \leq 1$ , then the expected revenue for governments and enterprises can be determined by the following equations.

$$E_E(p_1, p_2) = p_1[p_2(-C_E - S_B) + (1-p_2)(-C_E - L_E + F_B)] + (1-p_1)[0p_2 + (1-p_2)(-L_E)] \quad (1)$$

$$E_B(p_1, p_2) = p_2[p_1(R_B' - C_B' + S_B) + (1-p_1)(R_B' - C_B')] + (1-p_2)[p_1(R_B - C_B - F_B) + (1-p_1)(R_B - C_B)] \quad (2)$$

$$\text{Make } \frac{\partial E_E}{\partial p_1} = 0, \text{ then } p_2 = \frac{-C_E + F_B}{S_B + F_B} \quad (3)$$

$$\text{Make } \frac{\partial E_B}{\partial p_2} = 0, \text{ then } p_1 = \frac{(R_B - R_B') - (C_B - C_B')}{S_B + F_B} \quad (4)$$

In order to facilitate the analysis, another presentation of  $p_2$  is proposed as equation (5).

$$p_2 = \frac{-C_E + F_B}{S_B + F_B} = 1 - \frac{C_E + S_B}{S_B + F_B} \quad (5)$$

##### 4.2.1 Influencing factors of $p_2$

From the equation (3) and (5), it can be found that:

1)  $P_2$  is an increasing function of  $F_B$ . When  $F_B$  increases, the governments would be more willing to supervise driven by economic benefits. Meanwhile, the enterprises would be willing to offer green home appliances in order to avoid to be punished.

2)  $P_2$  is a decreasing function of  $S_B$  and  $C_E$ . The more the number of  $C_E$ , the more the unwillingness of the enterprises to offer green home appliances will be. Similarly, when  $S_B$  increases, the governments could provide more subsidy to enterprise, which will affect the governments' enthusiasm to supervise. In this circumstance, the possibility of enterprises to offer green home appliances will decrease, because they would lack of initiative due to the high expenditure for green products, and under the condition of without the governments' supervision as well.

##### 4.2.2 Influencing factors of $p_1$

From the equation (4), it can be found that:

1)  $P_1$  is an increasing function of  $R_B - R_B'$ .  $R_B - R_B'$  means the difference between the revenue of offering green home appliances and offering traditional ones. When  $R_B - R_B'$  increases, which means the

revenue for green products will decrease more ( $R_B' < R_B$ ) or increase less ( $R_B' > R_B$ ), thus the enterprises will lack of initiative to offer green home appliances. The supervision of the governments would be necessary, then  $p_1$  will increase.

2)  $P_1$  is a decreasing function of  $C_B - C_B'$ ,  $S_B$  and  $F_B$ . Normally, the non-equality  $C_B' > C_B$  exists, i.e.,  $C_B - C_B' < 0$ . Therefore when  $C_B - C_B'$  increases, the cost difference between offering green appliances and traditional ones decreases, which means there will be not too much cost increase for offering green appliances. Taking further considering of the governments penalty, enterprises would have more motive power to offer green home appliances. Similarly, when  $S_B$  and  $F_B$  increases, the enterprises would rather offer green home appliances driven by the subsidy from the governments and restricted by the penalty as well. As for governments, the possibility of supervision would be decrease due to the increasing initiative of enterprises to offer green home appliances.

## 5 Conclusions

In general, in the static game of complete information between governments and enterprises in the green supply chain of home appliance industry, there are three pure-strategy Nash equilibriums, i.e., (Unsupervision, Offer Green Home Appliances), (Unsupervision, Offer Traditional Home Appliance) and (Supervision, Offer Traditional Home Appliance). It is obvious that the solution of (Unsupervision, Offer Green Home Appliances) is what we desire. The condition is  $R_B' - C_B' > R_B - C_B$ . However, offering green home appliances requires higher level of technology and operation management. Hence the cost would be greater than offering traditional ones. At the same time, enterprises have to quote a favorable price in order to attract more consumers to accept green home appliances. Therefore, the condition is hard to accomplish in the current reality.

In the mixed strategy, through the analysis on the influencing factors of  $p_1$  and  $p_2$  by combining the governments and enterprises, it can be found that: (1) when the governments have more initiatives to supervise, the enterprise would be under the pressure and choose to offer green home appliances; (2) when the enterprises could actively adopt the strategy of green supply chain, the governments would not need to supervise. Since there are not conditions for enterprises to actively adopt the strategy of green supply chain, so it is necessary to promote the enterprises to implement green supply chain through governments' necessary supervision. In other words, the governments should play a leading role in the green supply chain management of the home appliance industry. The governments can improve the enthusiasm and possibility of enterprises to participate in green supply chain by setting appropriate subsidy  $S_B$  and penalty  $F_B$  for the case not deploying the strategy of green supply chain management.

In the long run, governments will play a very important role in the construction of green supply chain of home appliance industry. The governments should begin with improving laws and regulations about environmental protection, cultivating green price system and green market in order to create favorable external conditions to improve the construction of the green supply chain of home appliance industry. Meanwhile the role of market in the aspect of resource allocation should effectively come into play and lead the enterprises in consciously pursuing scientific management approaches and techniques of green supply chain. Only by doing so, the home appliance industry can realize sustainable development.

# Construction on Internal Control Evaluation System in Perspective of Organization Immunity

Dai Chunlan, Peng Quan, Ding Xiaoshu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: daichl\_whut@126.com)

**Abstract:** The immune theory is introduced into the area of internal control. The connotation of specification study method is used on organization immunity and its relationship with internal control. The consistency of objectives and elements is demonstrated. The evaluation of enterprise's internal control system is design based on the connotation of organization immunity. The fuzzy hierarchy analysis method is used to construct the evaluation model of enterprise's internal control in organization immunity perspective which provides new ideas for the enterprise internal control evaluation.

**Key words:** Organization immunity; Internal control; Evaluation system; Fuzzy analytic hierarchy process

## 1 Introduction

Internal control is an important part of daily operation and management activity in enterprises, and it is also important means for enterprises to implement a comprehensive risk management. From the impact of SOX Act, countries around the world have similar specifications, requirements for internal control evaluation of listed companies. In our country, in April 2010, the Ministry of Finance and other four ministries jointly issued the "basic standard for enterprise internal control" (hereinafter referred to as the "basic standard"), and introduced a special "enterprise internal control assessment guideline", for a time, the evaluation of internal control has become a hot research problem.

At home and abroad there have been a lot of researches on the evaluation of internal control, which can be divided into two broad categories: first, the construction of evaluation system of enterprise internal control based on the five elements. EI Paso (2002) put forward the evaluation index system of internal control which contains five elements, ninety-three indicators. Shi-Ming Huang (2004) gave out 56 index evaluation of enterprise internal control based on COSO report. Chen Hanwen (2010) construct a five-level evaluation indexes of evaluation index system and expressed as an index of enterprise's internal control effectiveness according to the basic specification and its supporting guidelines, used five elements as evaluation objects. Second is target-oriented evaluation of internal control system. Wanghong, Jiang Zhanhua et (2011) prepared "Internal Control Evaluation Index of Listed Companies in China" based on orientation of internal control objectives. Zhang Zhaoguo et (2011) construct evaluation index system of internal control based on quantitative indicators and objective-oriented, and evaluate the effectiveness of a test.

As there is questioning on effectiveness of internal control evaluation based on the five elements recently, many scholars have pointed out that, the internal control evaluation based on the five elements significantly increased the cost of corporate internal control evaluation, and the effectiveness of five elements and efficiency as a whole does not correspond exactly to each other, therefore, this method can not guarantee the effectiveness of assessment. In view of this, scholars have only come up with goal-oriented evaluation system of internal control. Compared to the evaluation of five elements, goal-directed evaluation system of internal control is indeed a step forward, but internal control objectives are hierarchical in nature, is a complex system. This complexity has made many businesses not to use the evaluation system of internal control. Therefore, the theory of organizational immune evaluation on internal control is introduced, and new idea is provided to internal control evaluation for enterprise.

## 2 Connotations of Organization Immunity and its Relationship with Internal Control

### 2.1 Connotation and classification of organization immunity

In order to construct an enterprise internal control and evaluation system based on the theories of organizational immune-related, the related theory of immunity is organized, and it is analyzed that the relationship between immunity and the internal control of the organization.

In medicine, immunization refers to the body's recognition of "their" and "not", and discriminate

against those who hold different views to maintain a defense mechanism of the body's internal stability. Organization immunity refers to the ability when organizations organizing internal and external risk factors and producing memory to maintain normal functioning of the organization. Lv Ping, Wang Yihua (2009) interviewed a large number of enterprises, and divided organization immunity acts into nonspecific immune and specificity of two categories. Specific immunity is an enterprise that there is the general response planned in advance against the risk of internal and external factors. Nonspecific immunity includes the three elements of organizational structure, institutional rules and organizational culture. Organizational structure is arranged on various positions within the company as well as rights and duties of each position in a set of system, which ensures that the various departments in your organization play a role to organization goals. Institutional rule is that employees can follow clear instructions or explanations. Organizational culture is the core of the formation of attitudes and values in the development process.

Specific immunity refers to a specific response produced when nonspecific immunity cannot solve the major risk factors of acquired immunodeficiency syndrome, based on the predetermined organizational structure, institutional rules and organizational culture. Wang Yihua (2006) holds that the defense organization of nonspecific immunity includes the organization monitoring, organization defense and organizational memory into three parts. Organization monitoring refers to the identification for internal and external risk factors, which is the basis of specific immunity. Organization defense refers to the action to avoid risky behavior. Organizational memory is through the storage of past information for decision-making, in order to facilitate decision-making in the future.

To sum up, the classification of organization immunity is shown in Figure.1.

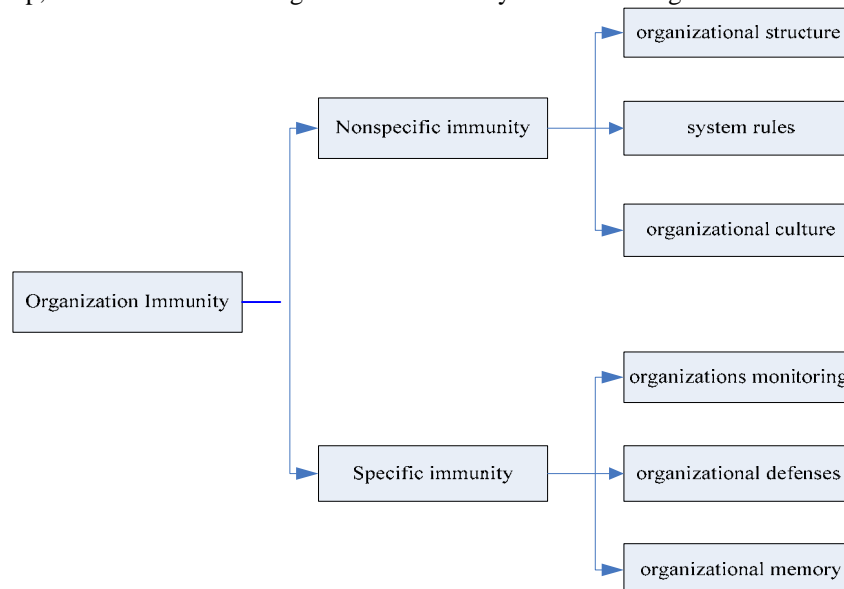

Figure 1 Classification Of Organization Immunity

**2.2 Mechanism of organization immunity**

The action of organization immunity aimed at preventing external risk within the organization so that the organization has always been in a healthy state. Nonspecific immunity is the first line of organization defense in response to internal and external risk factors. In the nonspecific immunity level, organizations need to design organization immunity system according to their own environment and the leader's willingness, including the design of organizational structures, development of system rules and evolving organizational culture, which determines the organization of "innate" immunity. Nonspecific immunity is clearly not protected from all risk factors both inside and outside the enterprise, so that specific immunity is very important. Specific immunity is conducted under the organization's role in internal and external risk factors of immune behavior, through the identification and assessment of risk, and then selecting the strategy of organization, and finally responding to risk and the formation of organizational memory. Therefore, organizations monitor, organization defense and organizational memory is a gradual process, through this process, the enterprise finally reach the ultimate objective to control the risks of the enterprise.

### 2.3 Relationship between organization immune and internal control

Organization immune contact with the internal control closely, which is the foundation of internal control evaluation based on organization immunity perspective. Contacts of organization immunity and the internal control are in the following two aspects:

(1) Consistency on the target. In 2004 COSO published “enterprise risk management-integrated framework” and as stated in it, “risk management is a process, affected by corporate board of directors, management and other staff, including internal control and its application strategy and company as a whole.” From this definition, risk management is a strategic application of internal control procedures and company as a whole, and is the expansion of internal control, which, in turn, can also be said that enterprise internal control is to control the risk at a reasonable level. At the same time, COSO also highlighted the process of risk management. From the above analysis on organization immunity, we can see that the fundamental purpose of immunity is also to risk control, and the process from nonspecific immunity to the specific immune is clearly visible and, therefore, internal control and organization immunity have the same destination.

(2) Consistency on the elements. In 1992, the COSO proposed that internal control includes the control environment, risk assessment, control activities, information and communication, monitoring, five elements, and the eight elements of the later are only the expansion of five elements. In fact, elements of COSO five parts has a high degree of consistency with each part of organization immune. Nonspecific immune belong to the scope of the control environment and the organization monitors is to risk assessment, organizational defenses is similar to control activity, and organizational memory includes reports on risk, also includes continuous monitoring of risk to the organization, which is similar to the information in the five elements of internal control and communication, and monitoring. Therefore, organization immune and internal controls have the same elements.

From this we can conclude that evaluation of internal control based on organization immunity perspective and evaluation goals and five elements of COSO internal control does not contradict, but enterprise internal control evaluation perspective based on organization immunity levels more, better able to reveal the links between elements. Therefore, construction of internal control system based on organization immunity perspective has some relevance.

## 3 Construction of Internal Control Evaluation System based on Organization Immunity Perspective

To build an internal control evaluation system for specific target-oriented and the reality of listed companies in China, there are three issues need to be addressed. First, is to build a complete evaluation index system; second, to select the appropriate evaluation methods; third, to identify specific evaluation process.

### 3.1 Selection of evaluation index

Under the analysis of organization immune and discussion of the relationship between organization immune and internal control, combining the basic specification and evaluation of guidelines, and the comprehensive risk management-integrated framework of the COSO Committee in United States, in this article evaluation of internal control is divided into three levels: the first level is the internal control evaluation ( $X$ ), which is the highest assessment index; the second level is the six indicators for your organization immunity: organizational structure ( $X_1$ ), system rules ( $X_2$ ), organizational culture ( $X_3$ ), the organization monitoring ( $X_4$ ), organization of Defense ( $X_5$ ), organizational memory ( $X_6$ ). The first three indicators belong to the nonspecific immunity, and the other three indicators are specific immunity.

1) Organizational structure ( $X_1$ ). Perfect organizational structure is a strong guarantee of enterprises to establish effective internal control system, the 12<sup>th</sup> to 15<sup>th</sup> of the basic norms in China, respectively, stressed the Board of Directors, the Audit Committee, the internal audit Agency's important role in enterprise internal control, these all belong to the category of the organizational structure. Therefore, it is set up that “establishment and duties of the Board of Directors to perform”, “establishment of the Audit Committee and its powers and responsibilities to fulfill”, “establishment of the internal audit function and the powers and responsibilities to fulfill” are three third-level indicators.

2) System rules ( $X_2$ ). Enterprise system of rule refers to the various rules and regulations. Enterprise must emphasize the importance of internal control in the system rules, and translate abstract internal control into concrete measures. And institutional rule of internal control is closely related to human resources systems, power distribution system and internal control system. First of all, internal controls, there are five major objectives, namely, strategic objectives, operational objectives, property security

goals, reports and compliance objectives, and there is no doubt that good human resources systems is the cornerstone to guaranty the achievement of the strategic objectives; Secondly, the implementation of internal control is an important issue of internal check, which involves the power of enterprise distribution system; and, finally, the enterprise's internal control system is reasonable or not are also important factors which directly affect the effectiveness of internal control.

3) Organizational culture ( $X_3$ ). There is such a presentation in the Basic Norms, "Enterprises should strengthen cultural construction, cultivate positive values and social responsibility, advocate honesty, love and dedication, innovation and team work spirit, modern management concepts, strengthen the consciousness of risk", from this we can see that organizational culture plays an important role in internal control. In conjunction with the presentation of the Basic Norms, it is select that corporate values, corporate social responsibility, and awareness of enterprise risk are three evaluation indicators.

4) Organizations monitoring ( $X_4$ ). Organization monitoring is within the scope of specific immunity, and it is also the key element to find enterprise internal control risk. Enterprise organizations' ability to monitor can be measured from the following aspects: first, the accuracy of enterprise internal control objectives. If enterprises internal control objectives are set up too high, it is likely to cause significant increase in the cost of internal control, this is incompatible with the principle of cost-effectiveness of internal control; when you set the objectives too low, you may not find internal control deficiencies that exist in the enterprise, resulting in failure of internal controls. Therefore, accurate target is particularly important for enterprise internal control. Second, the enterprise risk identification. Accurate identification of business risk is undoubtedly the vital functions of organization monitors, and enterprises should not only concern the financial situation, business processes, such as internal risk factors, should also concern about external risk factors such as economic conditions, laws and regulations. Third, the enterprise risk analysis. After risk factors are identified, enterprises should be able to analyze the severity of these risk factors, determine the focus and reflect the risk control.

5) Organizational defenses ( $X_5$ ). Organization defense is a process to respond to identified risks, it includes both specific risk response, also includes the authorization approval control, separation of incompatible functions control, budget control, control of operations analysis, performance evaluation of general risk control measures such as controlling.

6) Organizational memory ( $X_6$ ). Organizational memory is to store information in the past, for the decision-making process in the future, it also is important to the enterprise's internal control. A good business should be good at timely collection, transmission and processing of information in the past to prevent repeated the mistakes of the past in the future. Enterprises should set up specialized agencies based on past information, which can give special supervision and day-to-day supervision of the internal control in order to improve the effectiveness of internal control. Therefore, organizational memory includes information system control, information quality control, linking control, monitoring organization and monitoring activity for third-level index.

### 3.2 Choice of evaluation methods

The common evaluation methods include Delphi, AHP and fuzzy comprehensive evaluation method and BP neural network method, Data Envelopment Analysis (DEA), and so on. Due to the internal control evaluation indicators are qualitative indicators, BP neural network method and data envelopment analysis method is not applicable, and the subjectivity of the Delphi method is too strong, so we choose fuzzy evaluation methods for evaluation. Taking the target hierarchy into account, we use analytic hierarchy process method for determining indicator weight to reduce the empowering process of subjectivity.

### 3.3 Analysis of evaluation process

#### 3.3.1 Establish the target set

The target set is  $X = (X_1, X_2, X_3, X_4, X_5, X_6)$ , in which "X" is used to evaluate the strengths and weaknesses of the overall goal of internal control, and  $X_i (i=1,2...6)$  represents the sub-objective, their corresponding weight set is  $W = (W_1, W_2, W_3, W_4, W_5, W_6)$ , and  $W_1 + W_2 + W_3 + W_4 + W_5 + W_6 = 1$ .

#### 3.3.2 Set up factor set for evaluation

The factor set shall be the set of the indexes of the third-level factors in the evaluation index system. They are respectively composed of the factor set in all sub-target. Therefore, the factor set in all sub-target is  $X_i = (X_{i1}, X_{i2}, \dots, X_{ip_i})$ , in which  $i = 1, 2, 3, 4, 5, 6$ ,  $j = 1, 2, \dots, p_i$ ,  $p_i$  is the number of index in  $X_i$ . Their corresponding weight set is  $W_i = (W_{i1}, W_{i2}, \dots, W_{ip_i})$ , and  $W_{i1} + W_{i2} + \dots + W_{ip_i} = 1$ .

#### 3.3.3 Use AHP for index weight

Since the vary degrees of each element' influence on the evaluation system of internal control, we can use the experts' estimate method, the analytical hierarchy method and so on to determine the index

and the weight of the project in our practical work. The index weight is determined by the analytical hierarchy method in this article.

Using analytic hierarchy process empowers the main steps are: first, constructing judgment matrix  $W$  according to enterprise organization, management system, operation pattern, and then make the comparison matrix consistency test, level single sort again, finally level the sort to get indicator weights  $W=\{w_1,w_2,w_3,w_4,w_5,w_6\}$ . Simultaneously, the index weight for lower level,  $W_i=\{W_{i1}, W_{i2}, \dots, W_{ipi}\}$ , is determined.

3.3.4 Building reviews set

Enterprise internal control reviews set to  $V$ , which include level of enterprise internal control :  $A([90,100])$ ,  $B([80,90])$ ,  $C([70,80])$ ,  $D([60,70])$ ,  $E([0,60])$ . Business can choose a more complex set of reviews.

3.3.5 Establish the comprehensive evaluation matrix model

The third step of the left are attached to the fourth step of the weight vector matrix, respectively first and second-level fuzzy comprehensive evaluation, ultimate enterprise internal control according to the maximum membership grade principle is good or bad, to completing the fuzzy evaluation of enterprise's internal control.

The fuzzy evaluation matrix established from the target set “ $X$ ” to the reviews set “ $V$ ” is a calculation model which sets up the secondary-level matrix from the bottom to top based on the average scores of review grades corresponding to the secondary-level indexes:

1) Calculate and determine the evaluation value of each factor ( $V_{ij}$ ):

$$v_{ij} = \frac{\sum_{l=1}^n v_{ijl}}{n} \tag{1}$$

(Where  $i = 1,2,3,4,5,6$ ;  $j = 1,2, \dots p_i$ ; “ $p_i$ ” is the number of “ $X_i$ ” under the classification index; “ $n$ ” is the number of experts scoring the evaluation of each third-level index; “ $V_{ijl}$ ” indicates the scores given by experts), get an average score for  $V_{ij}$ , which is the evaluation value of last level.

2) Calculate and determine the evaluation value of each factor ( $V_i$ ):

$$V_i = \begin{bmatrix} w_{i1} & w_{i2} & \dots & w_{ipi} \end{bmatrix} \begin{bmatrix} v_{i1} \\ v_{i2} \\ \dots \\ v_{ipi} \end{bmatrix} \tag{2}$$

Where:  $i = 1,2,3,4,5,6$ ;  $W_{ij}$  (where  $i = 1,2,3,4,5,6$ ;  $j = 1,2, \dots p_i$ ) indicates the weights of each index in  $X_i$ ; “ $v_{ij}$ ” indicates the average scores of the corresponding reviews rating of each index in  $X_i$ .

3) Calculate and determine the comprehensive evaluation value ( $V$ ):

$$V = \begin{bmatrix} w_1 & w_2 & w_3 & w_4 & w_5 & w_6 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ v_5 \\ v_6 \end{bmatrix} \tag{3}$$

Where:  $W_i$  ( $i=1,2,3,4,5,6$ ), indicates the weight of each element in  $X_i$ ; “ $v_i$ ” is the appraisal value that has been calculated for the various elements.

**3.4 Analysis of evaluation results**

Using the model, you can get overall effectiveness of enterprise's internal control, can also be learned in organizational structure, rules, organizational culture, Organization monitoring, organization and organizational memory this defense in six parts, which have done better, what could be improved. Therefore this model can be used as reference for self-evaluation and social evaluation of enterprise's internal control, but the model is just an internal control audit of the supplement, there cannot be a substitute for internal control audit, which is limitation of the model.

## 4 Conclusion

Organization immune theory is introduced into the enterprise's internal control, and it is demonstrated that the consistency of objectives and elements between organizational immunity and internal control. Under the view of organization immunity, we build an enterprise internal control evaluation model with fuzzy hierarchy analysis. Formation mechanism and transfer paths for enterprise risk will be studied by organizational immunity, and we will continue to use the research results to further study on listed company internal control evaluation of specific measures and methods.

**Abstract:** Agricultural sector is seen as an engine that contributes to the growth of the overall economy of Nigeria, despite several government efforts the sector is still characterized with low yields and limited areas under cultivation due to government dependence on mono-agricultural economy based on oil. This study attempts to evaluate the impacts of FDI, trade and its effects on agricultural sector development in Nigeria between the periods of 1980-2009, in analyzing the variables (VAR) model was used employing a three-step procedure. The Unit root test was conducted using the Augmented Dickey Fuller (ADF) and Philips-Parron (PP). Johansen and Juselius multivariate Cointegration test indicate that there is a present of cointegration. Granger causality test result shows that the variables employed have a bidirectional relationship, unidirectional relationship and no casual relationship. It is recommended that in order to boost agricultural output and develop the sector as a whole, more FDI should not only be sourced, there is a need for the government to provide legal and administrative quality framework and encourage more exportation of agricultural output that will enhance foreign exchange earnings and improve the competitiveness of Nigeria agricultural produce in the international market.

**Key words:** Agriculture; FDI; GDP; Economic development and nigeria

### 1 Introduction

The Nigeria economic land scape have developed over the last few years as outcome of rapid phase of industrialization, therefore the economy of the country has improved tremendously due to foreign investment aided by privatization of state owned enterprise.

As a resource-rich country, Nigeria's economic performance has been unfortunately driven by the oil and gas sector to the extent that even the progress recorded towards genuine economic development prior to the discovery of oil in commercial quantity has been virtually eroded. In 2000-2005 the GDP growth of Nigeria was 5.7% and the growth in the non-oil sector, which contributed about 5.9% of the GDP. However, the oil sector provides significant role in revenue sources and foreign exchange to the country.

The decline of the agricultural sector performance was due to the fact that the Federal Government shifted its focus to oil exploration, therefore the sustainable development of the Nigerian economy should be diversified away from oil and gas to non-oil sector and it should be based on the country's abundant resource and comparative advantage. However China-Nigeria relations in recent development has presented Nigeria with both opportunities and challenges. Opportunities that could be derive from the Sino-Nigeria bilateral trade relationship could be described in many forms; prominent among them is the infrastructural development that China offers in returns for mineral resource exploration. Similarly it's expected to gain management and technical know-how, transfer of technology and boosting agricultural production of the country.

The objective of this paper is to assess the agriculture status of the country by looking at the overall development in agriculture relative to the agricultural potential of the nation and the economic cooperation between Nigeria and China in the form of FDI and trade in agricultural sector.

The paper is divided into six sections starting with review of some literatures in section 2; section 3 contains Nigerian Agricultural sector overview and performance while section 4 and 5 where the methodology employed, empirical result and discussion and thereafter it was summed up with conclusion and recommendation in section 6.

### 2 Literature Review

In Nigeria the agricultural sector still remains the most important sector of the economy despite it

neglect, it is however no news before oil, the sector was the pillar of the Nigeria's economy providing employment and source of livelihood for the increasing population and accounting for over half of the GDP of the country. Fasminrin and Braga (2009) ascertained that the main reason for the slow of agricultural development in Nigeria despite the volumes of scientific information to engender improvement is due to poor policy formulation and implementation by the federal government, which implies that there should be a strategy to guide the formulation of policies and the implementation of activities that will lead to a set goal.

However, development economists have focused on how agriculture can best contribute to overall economic growth and modernization. Todaro and Smith (2003) looked at Lewis theory of development, reporting that the underdeveloped economy consists of two sectors. These sectors are the traditional agricultural sector characterized by zero marginal labour productivity and the modern industrial sector. Rostow's (1960) leading sector growth stage approach, identifies five stages in the transition from primitive to a modern economy they are; (a) the traditional society, (b) the preconditions for take off, (c) the take off, (d) the drive to maturity and (e) the age of high mass consumption. Rostow's objective in identifying the five stages of growth and the dynamic theory of production, was primarily concerned with the process by which a society moves from one stage to another and providing policy guidance to the leaders of developing countries. Rostow's system is however the only one which clearly specifies a dynamic role of the agricultural sector in the transition process, stating that in an open economy, primary sector industries may act as leading sector and at a particular time carry the burden of accelerating growth, in addition agriculture must (a) provide food for a rapidly increasing population, (b) provide a mass market for the products of the emerging industrial sectors and (c) generate the capital investment for new leading sector outside of agriculture.

One of the most sought after ways to improve agricultural production especially in developing economies like Nigeria is to source for funds through FDI. Furtan and Holzman (2004) defined it as the most spectacular manifestation of globalization that occurred since 1990. Ogbanje et al (2010) also defined it as a major component of international capital flows, been investment by multinational companies with headquarters in developed countries. This investment ranges from transfer of funds to whole package of physical capital, techniques of production, managerial and marketing expertise, products, advertising and business practices for the maximization of global profits. However, Omankhanlen (2011) in his study of the impact of FDI on Nigeria's economy found no empirical strong evidence to support the notion that FDI has been pivotal to economic growth in Nigeria, which could have justified the effort of successive governments in the country at using FDI as a tool for economic growth even though he recognized its importance. According to Alfaro et al (2009) there is a widespread belief within policy circles that FDI enhances the productivity of host countries and promotes economic development. This implies that FDI may not only provide direct capital financing but also creates positive externality via the adoption of foreign technology and know-how.

### **3 Nigeria's Agriculture Sector Overview and Performance**

Nigeria is one of the largest countries in Africa with a geographical total area of 923,770 square kilometers/ 356,700 square miles and a total land area of 910,770 square kilometers is boarded by the Gulf of Guinea, Benin, Cameroon and Chad, the topography ranges from mangrove swampland along the coast to tropical rain forest and savannah to the north, the country is between the equator and tropic of cancer. The diversity of climate conditions, the richness of soil and water sources has provided it with the potentials for crop, animal and tree production which its major crops includes, beans, cashew nuts, cassava, groundnuts, maize (corn), palm kernels, plantains, palm oil, rubber, sorghum, soybeans, yam, etc.

The country has a highly diversified agro ecological condition, which has made it possible for her to produce agricultural products that falls into food crops produced for home consumption and for commercial (exportation), despite its richness in human and natural resources, it has the potential to become the Africa largest economy and also a major player in the global economy.

The performance of the Nigeria agricultural sector has been impressive recently; there is a trend in the indices of production that generally in the agricultural sector, there is a positive growth rate in staple crops, livestock, forestry, fishery and the sector aggregate production. Table 1 shows the growth in the agricultural sectors contribution to GDP in percentage from 2000 to 2009 increased by 5.02%. Although there was positive growth contribution to the GDP over the years, much more financial effort is needed

to enhance the production of livestock, forestry and fishery sub-sectors, as the bulk of the production of the sector comes from only crop production. From the list of several economic indicators and their measurement indices, such as share of agriculture in the real GDP percentage, annual growth rate of agriculture's real GDP percentage, agriculture share of total value of export percentage, Average per caput calorie intake from cereals and tuber daily and Average per caput protein intake from animal and fish source daily.

**Table 1 Growth in the Agricultural Sectors Contribution to GDP in Percentage (2000-2009)**

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Crop Production	22.00	28.50	29.2	29.06	30.48	29.02	28.50	29.55	27.45	33.20
Livestock Production	2.60	3.30	3.40	2.04	2.14	2.15	2.04	2.10	2.02	2.44
Forestry Production	0.50	0.60	0.60	0.14	0.45	0.42	0.40	0.40	0.40	0.44
Fishery Production	1.20	1.60	1.70	1.09	1.44	1.17	1.06	1.09	1.00	1.20
Total/Agriculture	26.30	34.00	34.90	32.60	34.21	32.76	32.00	33.15	30.87	37.87

Source: CBN statistical Bulletin (2010)

#### 4 Methodology

In other to achieve the stated objective we used annual data for the period 1980 to 2009. The annual variables of Gross Domestic Product, Labour Force and China FDI Inflow to Nigeria data were sourced from UNCTAD, while variables like Agricultural Output, Government Expenditure and Exchange Rate data were sourced from the Central Bank of Nigeria (CBN) Statistical Bulletin and the last variable Total China Trade Volume to Nigeria data was sourced from National Bureau of Statistics China.

##### 4.1 Model specification

This paper uses a Vector Auto Regression (VAR) to identify the relationship between FDI, Trade inflow from China and Agricultural Development in Nigeria. The hypotheses are tested according to seven macroeconomic variables.

$$AG_t = f(GE, LF, GDP, FDI, TV, ER) \quad (1)$$

Where

$AG_t$  is Agricultural output

$GE_t$  is Government Expenditure

$LF_t$  is Labour Force

$GDP_t$  is Gross Domestic Product

$FDI_t$  is China Foreign Direct Investment inflow to Nigeria

$TV_t$  is Total China Trade Volume in Nigeria

$ER_t$  is Exchange Rate

$\mu_t$  is the stochastic random term

In a more explicit and econometric form, equation (1) can be stated as

$$AG_t = \alpha_0 + \alpha_1 GE_t + \alpha_2 LF_t + \alpha_3 GDP_t + \alpha_4 FDI_t + \alpha_5 TV_t + \alpha_6 ER_t + \mu_t \quad (2)$$

##### 4.2 Estimation techniques

The study employs a three-step procedure in order to determine the relationship between Gross domestic Product (GDP), Government Expenditure, Labour Force, Agricultural Output, China FDI inflow into Nigeria, Total China Trade Volume in Nigeria and Exchange rate. These procedures are:

###### 4.2.1 Granger Causality Test

Granger Causality test was conducted to identify causal relationship between the variables Gross domestic Product (GDP), Government Expenditure, Labour Force, Agricultural Output, China FDI inflow into Nigeria, Total China Trade Volume in Nigeria and Exchange rate, and to determine whether the current lagged values of one variable affect another. According to Granger (1969), a variable  $Y$  is caused by another variable  $X$  if  $Y$  can be predicted well from past values of  $Y$  and  $X$  than from past values of  $Y$  alone. Two regressions must be performed to test for causality between them. These regressions provide an F statistic with which the statistical significance of the coefficients of past values of a variable can be tested. The Granger test may be explained with the help of the following equations:

$$X_t = a_0 + \sum_{j=1}^m a_j x_{t-j} + \sum_{j=1}^n b_j y_{t-j} + e_t \tag{3}$$

$$Y_t = c_0 + \sum_{j=1}^m c_j x_{t-j} + \sum_{j=1}^n d_j x_{t-j} + w_t \tag{4}$$

Where  $X$  and  $Y$  are two stationery time series,  $a_0, c_0, a_j, c_j, b_j$  and  $d_j$  are coefficients,  $e_t$  and  $w_t$  are uncorrelated white noise series. The definition of causality given above implies that if  $Y_t$  is to cause  $X_t$ , then some  $b_j$  are non-zero. If both the events occur simultaneously, there is said to be a feedback between  $X_t$  and  $Y_t$ . In other words, the null hypothesis  $Y_t$  does not strictly Granger-cause  $X_t$  is rejected if the coefficients on the lag values of  $Y_t$  in equation (1) are jointly significantly different from zero. Bidirectional causality exists if the null hypothesis, that  $X_t$  does not strictly Granger-cause  $Y_t$ , is also rejected.

#### 4.2.2 Unit root test

We applied the Augmented Dickey-fuller (ADF) test and the Philips-Perron test to check whether each data series is integrated and has a unit root, thereby testing the stationarity of the seven (7) time series. A variable that has a unit root is non-stationary in the level form but becomes stationary after being differenced once such a variable is also called integrated of order one and it is usually denoted by  $I(1)$ . hatemi-j and Hacker (2004) pointed out that it is crucial to test for unit root because in the presence of the unit roots the standard distribution of test statistics are not correct and there is a risk of having spurious regression results. In this study, the ADF tests and PP test were conducted on first and second differenced observations by estimating the following three models of (1) no intercept no trend (2) intercept no trend and (3) intercept and trend model;

$$\Delta y_t = \gamma y_{t-1} + \sum_{i=1}^k \beta_i \Delta y_{t-i} + \varepsilon_t \tag{5}$$

$$\Delta y_t = \infty_0 + \gamma y_{t-1} + \sum_{i=1}^k \beta_i \Delta y_{t-i} + \varepsilon_t \tag{6}$$

$$\Delta y_t = \infty_0 + \infty_{2t} + \gamma y_{t-1} + \sum_{i=1}^k \beta_i \Delta y_{t-i} + \varepsilon_t \tag{7}$$

Where  $\Delta y_t = y_t - y_{t-1}$  is the first difference of the series  $y_t$ ;  $\Delta y_{t-1} = (y_{t-1} - y_{t-2})$  is the first difference of  $y_{t-1}$  etc,  $\infty, \gamma$  and  $\beta_i$  are parameters to be estimated and  $\varepsilon_t$  is a stochastic disturbance term. The three equations differ in the inclusion or exclusion of the deterministic elements  $\infty_0$  and  $\infty_{2t}$ . Having established the non-stationarity of the six variables, the next step is to test for the presence or absence of a long-run equilibrium among the variables.

#### 4.2.3 Cointegration test

We use the Cointegration test, which is an econometric property of time series variables. If two or more time series are themselves non-stationary, but their linear combination is stationary, then the series are said to be co-integrated. In practice, cointegration is a means for correctly testing those hypotheses concerning the relationship between two series with unit roots. The cointegration test is based on the maximum likelihood estimators of a vector autoregressive (VAR) process. The likelihood ratio-test statistic for the hypothesis of the at most  $r$  co-integrated relationship and the at least  $m = n - r$  common trend is given by:

$$\lambda_{trace} = -T \sum_{i=r+1}^n \ln(1 - \hat{\lambda}_i) \tag{8}$$

$$\lambda_{\max} = -T \ln(1 - \hat{\lambda}_{r+1}) \tag{9}$$

Where :

$\lambda_{trace}$  is the trace statistic,

$\lambda_{\max}$  is the eigen-max statistic,

$\hat{\lambda}_i$  denotes the smallest estimated eigen-values,

$T$  is the sample size.

The null hypothesis tested in  $\lambda_{trace}$  is no cointegration. In fact, for bivariate cointegration tests, up to two null hypotheses can be tested. If the null that  $r = 0$  is rejected, at least one cointegrating vector may exist, and the second hypothesis that  $r \leq 1$  is subsequently tested.

## 5 Empirical Analysis

### 5.1 Unit Root test result

First, we test if the relevant variables are stationary and to determine their orders of integration. We use both the Augmented Dickey Fuller (ADF) and Phillips – Perron (PP) tests to find the existence of unit root in each of the time series. The results of both the ADF and PP tests are reported in Table below 2 and 3.

**Table 2 Unit Root Test Stationarity at First difference**

Variables	ADF None	ADF Intercept	ADF Trend & Intercept	PP None	PP Intercept	PP Trend and Intercept
GDP	-2.319 (-1.953)*	-2.134	-3.438 (-3.233)***	-3.664 (-2.650)*	-3.572 (-2.971)**	-4.030 (-3.580)**
GE	-3.814 (-2.650)*	-3.760 (-3.689)*	-4.624 (-4.323)*	-3.791 (-2.650)*	-3.735 (-3.689)*	-4.607 (-4.323)*
LF	-2.483 (-2.650)*	-1.003	-3.323 (-3.243)***	-2.664 (-2.650)*	-3.246 (-2.971)*	-3.087
AG	-5.114 (-2.650)*	0.111	-1.986	-5.114 (-2.650)*	-5.023 (-3.689)*	-5.489 (-4.323)*
FDI	-5.624 (-2.650)*	-5.519 (-3.689)*	-5.691 (-4.323)*	-5.620 (-2.650)*	5.516 (-3.689)*	-5.691 (-4.323)*
TV	4.121	4.007	3.488	-4.195 (-2.650)*	-4.613 (-3.689)*	-5.889 (-4.323)*
ER	-4.130 (-2.650)*	-4.617 (-3.689)*	-4.700 (-4.323)*	-4.162 (-2.650)*	-4.617 (-3.689)*	-4.700 (-4.323)*

Note: \*, \*\*and \*\*\* denote significance at 1%, 5% and 10% level. Figures within parenthesis indicate critical values. Mackinnon (1991) critical value for rejection of hypothesis of unit root applied.

Source: Author’s Estimation using Eviews 5.

The result in table 2 above shows that all the variables were stationary in the First difference. This can be seen by comparing the observed values (in absolute terms) of both the ADF and PP test statistics with the critical values (also in absolute terms) of the test statistics at the 1%, 5% and 10% level of significance. Result from table 2 provides strong evidence of stationarity. Therefore, the null hypothesis is rejected and it is sufficient to conclude that there is a presence of unit root in the variables at the first difference, following from the above result, all the variables were differenced once and both the ADF and PP test were conducted on them, the result as shown in table 3.

The table below reveals that all the variables were stationary at second difference, on the basis of this, the null hypothesis of non-stationary is rejected and it is safe to conclude that the variables are stationary. This implies that the variables are integrated of order one, i.e. 1(1).

**Table 3 Unit Root Test Stationarity at Second difference**

Variables	ADF None	ADF Intercept	ADF Trend & Intercept	PP None	PP Intercept	PP Trend and Intercept
GDP	-6.675 (-2.653)*	-6.479 (-3.699)*	-6.223 (-4.339)*	-6.651 (-2.653)*	-6.442 (-3.699)*	-6.086 (-4.339)*
GE	-6.155 (-2.656)*	-3.413 (-3.020)*	-3.202	-17.463 (-2.653)*	-17.203 (-3.699)*	-16.64 (-4.339)*

**5.2 Cointegration test result**

Having confirmed the stationarity of the variables, we proceed to examine the presence or non-presence of cointegration among the variables. When a cointegration relationship is present, it means that all the seven (7) variables employed, share a common trend and long-run equilibrium as suggested theoretically. We did the cointegration analysis by employing the Johansen and Juselius multivariate cointegration test. Table 4 and 5 below shows the result of the cointegration test. In the table both trace and maximum Eigenvalue statistic indicates that there is a present of cointegration at 5 percent level significance, suggesting that there is cointegration or long-run relations between the variables so tested.

**Table 4 Unrestricted Cointegration Rank Test (Trace)**

Hypothesized No. of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical Value	Prob.**
None*	0.926935	213.9422	125.6154	0.0000

\*\* MacKinnon-Haug-Michelis (1999) p-values

**5.3 Granger causality test result**

**Table 6 Pair-wise Granger Causality Test**

Null Hypothesis:	Obs	F-Statistic	Probability
AG does not Granger Cause GDP	28	20.8773	6.8E-06
GDP does not Granger Cause AG		7.32654	0.00345
AG does not Granger Cause GE		2.45770	0.10781

GE does not Granger Cause AG		5.14443	0.01424
AG does not Granger Cause LF		0.46913	0.63140
LF does not Granger Cause AG		1.76485	0.19362
FDI does not Granger Cause AG		2.04451	0.15232
AG does not Granger Cause FDI		1.97416	0.16172
TV does not Granger Cause AG		6.48120	0.00586
AG does not Granger Cause TV		9.65576	0.00090
ER does not Granger Cause AG		0.49772	0.61431
AG does not Granger Cause ER		3.40974	0.05048

The estimated result obtained from Granger Causality test in the table above shows that variable like Gross Domestic Product (GDP) and Nigeria-China bilateral trade volume (TV) has a bidirectional relationship with Agricultural output (AG) which shows that they are statistically significant in explaining changes in agricultural output in the country.

The result indicate a unidirectional relationship as causality runs from Agricultural output (AG) and Government Expenditure (GE). Government expenditure in the agricultural sector happened to be significant in explaining agricultural development in Nigeria. For instance the current expenditure on agriculture stands at ₦78 billion which is 2.7 percent of the total budget for the year 2012 with the objective to secure food and feed needs of the nation, enhance generation of national and social wealth through greater export and import substitution and enhance capacity for value addition leading to industrialization and employment opportunity. On the other hand agriculture does not contribute to government expenditure due to the fact that revenue realized from the sector is not properly channel back to the sector to generate more revenue rather it is used for importation of fertilizers and some major food crops like rice. For instance the consumption of rice in Nigeria has risen tremendously at about 10 percent annum due to changing consumer preferences, therefore the importation of rice into the country today stands at about 1million metric tons yearly, resulting that Nigeria is spending annually over US\$300 million on rice importation alone and \$4.2 billion on fertilizer making the country the second importer of rice in the world.

However, The result shows that there is no any casual relationship between Labour Force (LF) and agricultural output (AG), which shows that Labour Force is statistically insignificant in explaining changes in agricultural development in Nigeria due to the fact that urbanization holds back production. This indicates that neglect on rural infrastructure affects the profitability of agricultural production and also lack of roads impedes of marketing of agricultural commodities has prevented farmers from selling their produce at reasonable prices and has lead to spoilage, which has resulted to large migration of young able men and women from the rural areas to urban centers in search for white collar jobs instead of embarking on agriculture which has lead to shortage of skilled manpower in the sector.

Furtherance to the result above, it indicates that there is no causal relationship between China foreign direct investment inflow to Nigeria (FDI) and Agricultural output (AG) which has resulted to low level of private investment and low level investment in research and development in the sector, therefore the FDI inflow from China is not focusing on agriculture which can be an excellent source of boosting local economic growth but rather on oil and other sector of the economy which is more profitable. In order to attract FDI and improve the R&D investment in the agricultural sector to boost agricultural production in Nigeria, farmers need access to new technologies. However due to neglect in the sector and the government over dependence on oil, agricultural sector lacks adequate investment influx, recently China has sent about five hundred (500) agricultural experts to assist in teaching the rural farmers, beside that there is also collaboration at state and provincial level among which are the Hubei province, Osun state and Bauchi state government.

Finally the result indicates that Exchange rate (ER) does not Granger cause Agricultural output (AG) and on the other hand agricultural output (AG) Granger cause Exchange rate (ER). Therefore the result shows that there is a unidirectional relationship between the two variables, this means that Agriculture output is statistically significant in explaining changes in Exchange rate of the country. However, it generally indicates that despite the neglect of the sector it still contributes to the country's economy growth. Moreover exchange rate does not Granger cause agricultural output mainly to the fact that there is volatility in exchange rate of the country which has lower the income earnings of farmers

and has subsequently lead to decline in output production and reduction in export production which has resulted to poor performance and lack of competitiveness in the country's agricultural produce in the international market.

## 6 Conclusions

Agricultural sector is the mainstay of Nigerian economy, ensuring food security, rural development, being a major source of raw materials and foreign exchange, employing over 70 percent of the Nigeria labour force and serving as a potential vehicle for diversifying the Nigeria economy. Nevertheless, the sector has the potential to be seen as spring board from which the country's development can take off. Indeed more often than not agricultural activities are usually concentrated in less-developed rural areas where there is urgent need for rural transformation, redistribution, poverty alleviation and socio-economic development. Similarly there is a need to say that evidence from the contribution that the sector has made, it indicate that agricultural sector in Nigeria has been the engine that contributes to the growth of the overall economy.

Despite these laudable efforts by the government, Nigeria's agricultural sector still is characterized by low yields, attributable to low level of technology, low level of inputs and limited areas under cultivation, low productivity, low private sector investment, lack of competitiveness, shortage of skilled manpower, poor development of value chain and low value addition, low investment in research and development, poor policy instability and discontinuity. The research finding reveals that using the Augmented Dickey Fuller (ADF) and Philips-Parron (PP), the result indicate that there is a strong evidence of stationarity between the variables employed. Johansen and Juselius multivariate cointegration test indicate that there is a present of cointegration, suggesting that there is a long-run relationship between the seven (7) variables. Granger causality test result shows that Gross Domestic Product (GDP) and Nigeria-China bilateral trade volume (TV) has a bidirectional relationship with Agricultural Output (AG) while Government expenditure (GE) and Exchange Rate (ER) has a unidirectional relationship with Agricultural output (AG) also the result shows that Labour Force (LF) and China foreign direct investment inflow into Nigeria (FDI) has no causal relationship with agricultural output.

However, based on the empirical findings it is recommended that there is a need for the government to provide legal and administrative quality framework for effective commercialization that will encourage more exportation of agricultural output as this in turn will enhance external foreign exchange earnings and improve the competitiveness of Nigeria agricultural produce in the international market, help in the liberalization of regulated backbone services, which provide opportunities for private investment and management that were hitherto unavailable and strengthen FDI-related institution in Nigeria Such as the NIPC, BPE and NEPZA at administration, policy and promotion level and also provide more funding for agricultural universities in the country to carry out more research on all aspects of agricultural output, such as livestock, crops, fishing and forestry, crop preservation.

# Analysis of Problems of Corporate Intellectual Property Strategy and Countermeasures

Chen Yongzhi, Xiong Yingzi

School of Energy and Power Engineering, Wuhan University of Technology, Wuhan, P.R.China, 430063  
(E-mail: cyz@whut.edu.cn, xyz@whut.edu.cn)

**Abstract:** Scientific and technological activities are a very important part of independent innovation, and technology management is the organization and management of scientific and technological activities. To strengthen intellectual property management is very important for the protection of the new achievements of scientific and technological activities. In this paper, basing on the definition of contents from the different objects of scientific and technological activities, it focuses on the analysis of scientific and technological activities' status quo, emphasizes the important role of patent in technology management, and raises corporate intellectual property management strategy implemented in the management of scientific and technological activities according to corporate role and task in science and technology activities.

**Keywords:** Scientific and technological activities; Technology management; Intellectual property

## 1 Introduction

The recommendations of the CPC Central Committee's eleventh five-year plan on economic and social development puts forward that the improvement of independent innovation capability should be looked as the central link of economic restructuring and transformation of pattern of economic growth. The improvement of capability of independent innovation needs the formation of independent intellectual property rights in strategic areas and key links. The intellectual property system is the key link and important guarantee to promote technological innovation, accelerate the industrialization of high-tech achievements, and improve economic competitiveness. To strengthen the technology-related intellectual property rights management and protection is both an urgent requirement to enhance our scientific and technological ability to continuously innovate and solve the source of the problem of technological innovation, and also is an inevitable choice for China's entry into the WTO, coping with international competition, and turning pressure into motivation. Therefore, the work of intellectual property rights is an important part of the scientific and technological innovation work. To strengthen the management and protection of technology-related intellectual property rights is an important means to promote our level of technological innovation and enhance our technological and economic competitiveness. After joining the WTO, we are faced with the new challenges of a large number of patent applications and technology control from multinational companies in China. We must take effective measures as soon as possible to change the unfavorable situation of intellectual property protection in technological innovation and raise the awareness of the importance of intellectual property work. Based on management system, incentive mechanism and support policies, intellectual property protection should be strengthened in scientific and technological fields so as to increase the total of China's independent intellectual property rights substantially, and to improve the competitiveness of China's science and technology.

## 2 Main Contents of Scientific and Technological Activities

Scientific and technological activities are mainly referred to scientific and technological development, also with technology innovation-related activities, which include scientific and technological research, new product development, production, teaching & research cooperation, academic exchanges, technology transfer and so on. In China, scientific and technological activities appear four levels of government, universities & research institutes, enterprises and individuals. As the purpose of each level, objects, and the results achieved are different, the content of its activities is not the same too. From the perspective of the government's scientific and technological activities are engaged in through the formulation of public policies, whose content is to provide services for enterprises, whose aim is to improve the region's scientific and technological innovation capability and core competitiveness; the scientific and technological activities of universities and research institutes is to improve the technological level of the human through basic research, to advance technological level of the whole society through a high level of technology development, and to

achieve the value of knowledge through technology transfer and result conversion; the scientific and technological activities of enterprise is to enhance the product competitiveness through technological innovation, and to form market share and monopoly, whose purpose is to maximize the benefits. So the scientific and technical activities of enterprise should be inner, active, and are the main body of whole scientific and technological activities; the individual's scientific and technological activities are carried out by individual's creative thinking and research & development. Relatively the purpose is not clear, and therefore a smaller proportion of the entire scientific and technological activities.

Among them, the scientific and technical activities of enterprise are the most active in all scientific and technological activities. As companies involve in all walks of life gradually and become the basis of scientific and technological achievements, the results of scientific and technological activities are ultimately reflected in the production of enterprises. In addition to its own product development, the scientific and technical activities of enterprise include production, teaching & research, participation in the scientific and technical activities of universities and research institutes, as well as undertaking the government's scientific and technological projects. Due to the differences in size and products, the scientific and technological activities have different effects in different enterprises, showing the features of diversity and complexity.

### **3 The Status Analysis of Scientific and Technological Activities of Enterprise**

Since the accession to the WTO, on the one hand enterprises compete with each other on a larger scale, on the other hand manufacturing shifts to China with the large-scale entry of international capital. China's enterprises, especially minor enterprises, are facing with fierce market competition and frequent trade protection of technical barriers in export trade, which force enterprises to enhance the competitiveness of enterprises by science and technology progress and accelerating new product development. The domestic market, after two decades of reform and opening up, has transformed from the supply-side market to a buyer's market, and the production capacity of vast majority of goods excesses. In order to win the market, enterprises must rely on technological innovation to make product better quality, more powerful, use of more humane.

Compared with developed countries, due to the capability of independent innovation lacks, enterprises and industries of our country are facing serious challenges of new technology and intellectual property, and sources of technology for most enterprises rely mainly on the introduction and imitation and secondary innovation is insufficient. The majority of core technology of China's enterprises, brands and distribution channels are still controlled by foreign companies. Enterprises have few technologies and products of independent intellectual property rights, and their technology manpower's overall level and quality are to be improved. Many problems remain in product development, intellectual property and the use and train of scientific and technical personnel. We made a statistical analysis of the provincial high-tech enterprises and enterprise technology centers in Zhenjiang City, Jiangsu Province, and found that companies have the prevalence of following aspects:

Enterprises technology innovation capability is weak. China's enterprises, especially minor enterprises due to long-standing inadequate investment in science and technology, imperfect technological innovation system, and the lack of high-quality science and technology leading talent and other reasons, the research and development capacity is relatively weak. It is reflected in the less commitment to science and technology projects, much less original innovation, and most of the scientific and technical personnel in enterprises is so hard to put out scientific papers of high academic standards. For a long time, technology and process are carried out mainly by imitation. New products and new technologies' research depend mainly on universities and research institutes, and integrated innovation, introduction, digestion and innovation of absorption of scientific and technological achievements are little. In the process of commitment to science and technology projects, the implementation of enterprises' technology development and new product development, they often pay attention to the products of major competitors, but understand the development trend of entire field little by scientific literature and patent search.

**Figure 1 The Status of the Enterprise Patent Application in Zhengjiang City**

The protection awareness of independent intellectual property of enterprises needs to be improved. In Zhenjiang City, Jiangsu Province, for example, 175 of the city's total high-tech enterprises above the provincial level, of which has applied for the patent is only 89, accounting for 50.86%. In 20 years there are 584 total patent applications, including 73 inventions of the representative of the level of scientific and technological innovation, only 12.5%. There are significant gaps between 423 utility model patents and hundreds or even thousands of pieces patents applied by foreign technology companies (as shown in Figure 1). Especially for invention patents reflecting the level of technological innovation, the gap is more pronounced. In 160 award projects applying for Zhenjiang Science and Technology Progress Award received by Zhenjiang City Bureau in 2005, only 36 projects had applied for patents or acquired authorization of inventions or utility model patents, most of which come from colleges and universities. Through investigation, we found that both decision-makers and corporate staffs had relatively weak awareness of patent. Most enterprises even do not know what technology can be applied for a patent and the function of patent in business. Some enterprises are starting to focus on the patent application after suffering from patent claims or punishments. In foreign exhibitions some affairs that items on display were forced to withdraw have occurred due to the lack of intellectual property of testimonial material against complaints.

The building of enterprise technology team is difficult to meet the needs of the scientific and technological innovation. Corporate scientific and technical personnel are the main body in technological innovation, who undertake some scientific and technological activities of new product development and so on. For most enterprises, their core technology and scientific and technological achievements come mainly from technology transfer and result conversion of universities and research institutes. Because of a lack of appropriate platforms and academic technology leaders, these enterprises are difficult to independently develop original scientific and technological innovations of high technology content, and even lack of the abilities of integrated innovation and secondary innovation. Some enterprises' scientific and technical personnel are generally short of basic skills for technological innovation as papers written, literature search, and foreign language reading, and they rarely participate in international and domestic academic exchanges and timely read of the latest scientific literature. Many enterprises allot the jobs of required written materials for declaring scientific and technological

projects to university teachers and science and technology intermediary. Compared with the engineers in the United States and European companies, many of whom have put out articles in the high level of academic journals and acquired patents, there is a big gap. The lack of research capacity of scientific and technical personnel results in insufficiency of businesses' innovation capability and increase of cost of production, teaching & research.

The construction of technological innovation platform lags far behind. The technological innovation platform mainly refers to the public service platform mainly created by government and serving for enterprises, including large-scale equipment's information service platform, scientific and technological achievements' conversion service platform, scientific literature's public service platform and intellectual property rights' public service platform and so on. For most small and medium-sized enterprises, they need to solve the problems that instruments or test equipments is scarce and literature search is difficult in the process of technological innovation, but these problems can not be solved by them on their own. In recent years, many cities in China are committed to building the technological innovation service system, and to enhancing scientific and technological innovation capacity by exploring the construction of the public service platforms above. However the public service platforms that are able to meet enterprises' demands truly are rare.

Scientific and technological innovation system of construction is lagging behind. The system construction is one of the keys to the success of enterprises' technological innovation activities. These systems include enterprise technological innovation motivation system, enterprise technology resource allocation system, technological and innovative funding mechanisms, training system of scientific and technical personnel, scientific and technical management system of personnel and projects and the intellectual property system. Lack of scientific and technological innovation system, the scientific and technological innovation would be difficult to effectively be developed, the enthusiasm of scientific and technical personnel would be difficult to mobilize, the assessment of scientific and technological activities would be difficult to carry out, and the scientific and technical personnel would be difficult to fully play their roles through echelon construction.

## **4 Enterprise Intellectual Property Strategy in Technology Management**

### **4.1 The establishment of enterprise intellectual property system**

For enterprises, it is advisable to recognize that the use of patent protection for technological innovation achievements is enterprises' own needs, and also an effective weapon for enterprises to seize the market. The first thing for corporate intellectual property strategy is the establishment of an effective intellectual property system which prevents intellectual property and innovation achievements from loss in the system aspect. To establish corporate intellectual property strategy based on the characteristics of enterprises, either the system is offensive or defensive, through effective implementation of which to protect new technology activities being developed effectively. These systems include the reward system of intellectual property rights, and the creators of the achievements will be rewarded; the secrecy system of employees intellectual property, which protects intellectual property rights of enterprises in the process flow of scientific and technical personnel, not to appear the results follow where the personnel go; the censorship system of intellectual property rights in scientific and technological cooperation and economic exchanges, which makes technology transfer in scientific and technological cooperation technology transfer of real right holders, avoids intellectual property disputes in the fulfillment of economic contracts.

### **4.2 Enterprise intellectual property strategy in scientific and technological activities**

First, for enterprises' technological innovation it is necessary to avoid infringement, that is, mature products put in a lot of manpower and resources have been covered by patents and turn into the infringing products; Second, take full advantage of existing technology and results to achieve the second innovation, and avoid repetition simply; Third, to strengthen the awareness of IPR protection and give effective protection of innovation through the patents or other intellectual property protection measures. To strengthen intellectual property protection while innovation. Only in this way it is possible to change the advantages of technology into the advantages of resources. Concrete strategies can be taken as following:

The current implementation of patent literature search. To analyze the future patent R&D fields before determining R&D program. Through in-depth search, it is probable to understand the latest technology developments and progress of the field, and to determine whether to continue this project according to the distribution of patent and legal status. The technologies and products covered by a large

number of patents should be treated seriously. For the fields that there are some but not too many patents, it is possible to take the secondary development and bypassing the claims' strategy to start technological research, which can avoid infringement. For those areas not yet applied for a patent it can be assured that the implementation of the project. In addition, the analysis and study of the specification of a patent can take full advantage of the existing results and patent literature, which makes R & D activities begin at a higher level and platform.

Assigning real person responsible for the project management of intellectual property. Formulate projects' intellectual property strategy meantime in the preparation of planned tasks or project proposals. Focus on the protection of key technologies to ensure that innovations arising can be applied for a patent in the implementation of the project timely, and obtain effective protection. At the same time, the tasks of patent applications are decomposed to the task force members and all technologies for patent are to be pre-qualified.

Intellectual property management in project implementation. Because a patent has the timing and regional characteristics and three requirements of novelty, creativity and practicality, the companies may protect either technology innovative ideas and methods or the technological innovation of products and devices through patents. So the applications of patent are carried out in stages in the implementation of the project. In the initial stage it is mainly a technical thinking or methods to be applied for invention patents. In the project process, the application for invention or utility model patent on the initial results can be done based on different situations. In the end of the project acceptance phase, it is necessary to summarize the results of the project and the key technologies. And the project's overall intellectual property strategy is proposed, the core technology patent applications programs and the protective patent applications programs are decided, the patent portfolio program of the project is formed, and the IP strategy is formulated before technologies and products are public, all of which protect scientific and technological innovations fully.

The establishment of enterprise technology, product patent database. Through the establishment of enterprise patent database, it is feasible to analyze dynamically the technologies and products' latest developments and the patent distribution of competitors in this area and to understand the science and technology trends of the industry and competitors' marketing strategy. The corporate R&D plans and sales strategy are timely made.

#### **4.3 The intellectual property strategy in enterprise management**

Through the distribution of the legal status of patent and patent rights as well as a certain stage of a technology patent applications, not only the dynamic R&D conditions in the field can be understood, but also a lot of commercial value can be dig out. Meantime enterprises can also realize a certain area of technology and market monopoly by patent applications. In general, multinational corporations make patent layout first before entering a country's market in order to ensure the access to the monopoly status of technologies and products. So companies can judge the business risks that may arise, and make relevant preparations in advance, such as the timely application of related patents to break the monopoly, the adjustment of product structure, or the changes in business strategy, etc. Equally with upcoming technologies and products of the market a retrieval analysis of the patent situation in the region should be done for the domestic enterprises before the entry into a market, to avoid patent infringement and subjecting to legal sanctions. In the case of confirmation of entry, patent application should be made first so that products obtain reliable assurance in the law when entering the market, and the relative monopoly status.

# The Performance of Socially Responsible Investment Funds in China\*

Xu Lihui, Xia Dan, Xiao Jing

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: xulihui@whut.edu.cn, xiadan2011@sina.com, 704220805@qq.com)

**Abstract:** This paper reviews the development of socially responsible investment(SRI) in China. The study takes AEGON SRI fund as a case and presents an analysis of the performance of China's SRI investment. By using the return rate and the risk-adjusted performance indicators so as to combine risk and profit abilities together, the paper undertakes a comparative analysis of AEGON SRI fund and other matching conventional funds. The study suggests SRI investment in China do not have clear disadvantages concerning their performance compared to conventional investment.

**Key Words:** Socially responsible investment; SRI funds; Performance; Comparison

## 1 Introduction

### 1.1 Background

Over the past decade, Socially Responsible Investment(SRI), also known as sustainable investment or ethical investment, has experienced an explosive growth around the world. SRI can be defined broadly as "an investment process that considers the social and environmental consequences of investments, both positive and negative, within the context of rigorous financial analysis" (Social Investment Forum (SIF), 2001:4).

There are a large variety of SRI investment such as pension funds, life insurances which can be designed with an SRI component, but the major and typical investment products with an SRI component are investment funds, which consider social and environmental aspects within their investment strategy.

Unlike conventional types of investments, SRI funds apply a set of investment screens to select stocks from an investment universe based on social, environmental and ethical criteria. Positive screens are used to select specific stocks out of the investment universe, for example low pollution emissions, equal employment opportunities and good workplace conditions. Usually, negative screen criteria are to delete such stocks like the production of tobacco, alcohol or weapon.

According to the report by Avanzi SRI Research-SIRI Group(2004), by mid-2004 there were 354 SRI funds operating in the European markets, 13% more than in 2003, and showing sustained growth since the products appeared in the early 1980s. By the end of 2005, the total assets managed by SRI investors had grown to well over 1 trillion (Eurosif, 2006). In the US approximately one of every eight dollars under management—12.2 percent of the \$25.2 trillion in total assets under management is in SRI assets (SIF report, 2010). SRI investment has been regarded as "one of the most critical factors driving the future of fiduciary investment". 'the Fundamental Research Funds for the Central Universities

### 1.2 The development of SRI in China

Although the SRI market is quite substantial in most developed countries, it is still new to China. Although China's SRI investment only appeared in recent years and the SRI market still remains almost undeveloped, the SRI has shown the early signs of a growing market in China.

In the mutual fund sector, there are only three SRI funds in China. AEGON-Industrial Fund Management Co. Ltd, an SRI pioneer in China, has offered the first and only socially responsible investment retail fund since May 2008. The AEGON-Industrial Social Responsibility Stock Fund, ( hereinafter referred to as AEGON SRI fund, AEGON) takes the 'top-down' analytical method. After selecting industries which are filled with development potentials according to the industry circle, the level of earnings, and prosperity degree, the AEGON further screens the industries with "AEGON dual screening ways", that is, avoiding companies which perform relatively bad in the implementation of Corporate Social Responsibility (CSR) with negative screening, and pursuing companies which perform better CSR implementation and sustainability records with positive screening, optimizing the allocation of industries dynamically at regular intervals.

The Construction Bank-SSE SRI ETF in 2010 is the first exchange traded fund that follows SSE-SRI index closely. The latest SRI stock fund-China Universal SRI stock fund was offered by China Universal Asset Management Co. Ltd in March 2011.

---

\* This research is supported by the projects of the Fundamental Research Funds for the Central Universities under Grant 2011-ib-051 and Wuhan Soft Science Projects under Grant 201051299446.

The Chinese sustainability theme indices in financial market have also been developed. The first sustainability index in environmental theme, TEDA Environmental Protection Index was launched in January 2008. In 2009, the Shanghai Stock Exchange and China Securities Index launched China's first the Social Responsibility Index SSE-SRI, and then Shenzhen Stock Exchange launched SZSE Corp. Social Responsibility Index (SZSE SRI). CNINFO -Cbn-Aegon-Industrial-CSR Index was released in Nov. 2009, CNINFO Low-Carbon 50 Index was released in Oct. 2010.

## 2 Literature Review

The main focus of recent SRI literature is on the financial performance of SRI investments (Renneboog, 2008), and the major question is whether these funds perform better or worse than conventional investment funds that have no restricted investment universe. SRI funds do not earn statistically significant excess returns and that the performance of such mutual funds is not statistically different from the performance of conventional mutual funds. Qiao Haishu (2009) concludes that the financial performance comparison between SRI funds and conventional funds might be fixed, depending on the funds' location, fund size or fund age.

Michael Schroder (2004) points out that most of the studies agree that SRI funds have a similar performance with conventional funds. The hypothesis that SRI funds must have a worse performance than conventional funds due to the restricted investment universe is rejected. But the SRI funds also exhibit no out-performance.

Some studies on the performance of SRI fund investments apply the matching approach. Considering the management and transaction cost, analysts compare the SRI and conventional investment funds which otherwise have similar characteristics.

The SRI performance analysis has also been made on the SRI indices, whether stock indices that represent socially responsible investments exhibit a different performance compared to conventional benchmark indices. The studies concentrated on SRI indices and not on investment funds may exclude the possible influence from transaction cost, market timing and funds management ability. GARZ (2002) finds the DJSJ Europe index is a slightly significant but small out-performance compared to the DJ STOXX 600-index. Michael Schröder (2006) finds SRI stock indices do not exhibit a different level of risk-adjusted return compared with conventional benchmarks. But many SRI indices have a higher risk relative to the benchmarks.

## 3 Data and Methodology

In the following sections the performance of China's SRI investment funds is analysed. We use the growth rate of net fund asset value indicate the SRI investment profitability. Outstanding profit for the investment doesn't mean it is attractive to investors, because the other dimension – risk, can not be ignored. The risk control capacity can be indicated by Beta coefficient.

To research the investment performance, we cannot simply take the ability of earnings or risk into consideration, but should combine the risk control and profit abilities together. Like most of the studies of investment performance, we use Sharpe ratio, Treynor ratio and Jensen's alpha to measure risk-adjusted performance.

An important selection criterion for the SRI investment funds is the length of time series. Among the existing three SRI funds in China, AEGON SRI fund has more than 30 months' length, and the other two new established funds could not be included in the study. This study choose five other non SRI funds on the matching principle to compare the funds performance.

## 4 The Financial Performance of the AEGON-Industrial SRI Fund

AEGON SRI fund is a stock fund which achieves its goals of economic benefits and social responsibility by the fund manager's initiative allocation. AEGON SRI fund pursues the realization of current profits and long-term capital appreciation. At the same time, it emphasizes listed companies' implementation of sustainable development, legal, and moral responsibility.

Compared with the conventional stock funds which allocate assets according to economic and financial indicators, the study plans to find out whether higher or not lower performance exists in SRI funds in China. The analysis result is an important foundation to promote China's SRI development.

### 4.1 The growth rate of net asset value comparison

Considering the management and transaction cost when comparing the performance, we apply the matching principle. The study compares the performance of SRI and non SRI investment funds which

otherwise have similar characteristics e.g. concerning investment universe, fund age or fund size. AEGON is a stock fund, established on April 30, 2008, and the initial offering size is 1.388 billion. So the non SRI stock funds chosen here were founded between March to June in 2008 and with the initial offering size between 0.8 billion to 2 billion.

The growth rate of net asset value of AEGON and other five comparative funds are shown in table1.

**Table 1 The Growth Rate of Net Asset Value of AEGON and Comparative Funds**

Fund Abbreviation	AEGON	PYAS	JS	SSV	ZS	YFD
Foundation Date	2008-4-30	2008-4-16	2008-5-27	2008-6-18	2008-6-19	2008-6-19
Initial Offering Size (billion)	1.388	1.733	1.81	1.139	0.8609	1.226
Recent 3 Months(%)	3.62	1.36	3.19	5.56	2.01	3.89
Recent 6 Months(%)	-8.27	-8.23	-0.54	-6.07	-12.38	-10.09
Recent One Year(%)	-19.19	-23.46	-13.26	-18.48	-31.87	-23.14
From this Year(%)	3.89	3.61	4.1	5.78	4.1	4.91
Since Foundation(%)	33.27	-25.3	63.68	52.48	18.46	52.08

Data source: www.eastmoney.com.

Note: The full names of the funds in the above table are respectively AEGON SRI stock fund, Pu Ying An Sheng value growth stock fund, Jia Shi selection stock fund, South selection value stock fund, Zhao Shang grail blue chip stock fund, Yi Fang Da small and middle-cap stock fund. The period date ends on March 23, 2012.

From table 1, the cross-fund comparison shows that in recent three months, all funds' growth rate of net asset value are above zero, and AEGON ranks third among those funds. While in recent six months and recent one year, all funds' growth rate of net asset value are below zero, which may related to the weak market. AEGON's growth rate of net asset value ranks middle by and large in recent six months and recent one year, but it's more than zero from this year and since foundation, ranking fifth and fourth. From its longitudinal development, AEGON's growth rate of net asset value in recent one year is -19.19%, while since foundation the growth rate of net asset value is 33.27%, indicating AEGON's growth rate of net asset value in the initial two years after foundation is higher than recent one year.

#### 4.2 Compare in the single-factor indicator of SRI funds' performance

Based on the funds' monthly growth rate of net asset value from foundation date to December 2012, we can calculate all funds' Beta ( $\beta$ ), Sharpe ratio, Treynor ratio and Jensen's alpha ( $\alpha$ ). Market rate of return are composed of Shanghai A-share Index, Shenzhen Component Index, and S&P/CITIC Government Bond Index. The weight of Shanghai A-share Index and Shenzhen Component Index are both 40%, and the weight of S&P/CITIC Government Bond Index is 20%. We regard commercial bank's one-year time deposit interest rate as risk-free rate, and transform it into monthly rate. Commercial bank's interest rate had been adjusted many times during the sample period (from May 2008 to December 2011), which are respectively 4.14%, 3.87%, 3.6%, 2.52%, 2.25%, 2.5%, 2.75%, 3%, 3.25% and 3.5%. We can get the weighted average according to different interest rates' duration. That weighted average rate is 2.83% as the risk-free rate, and we can transform it into monthly rate 0.2359%.

**Table 2 The Single-Factor Indicator of Funds' Performance**

Fund	$\beta$	T statistic of $\beta$	Sharpe Ratio	Treynor Ratio	Jensen's $\alpha$	T statistic of Jensen's $\alpha$
AEGON	0.715100	9.914087	0.039200	0.003610	0.006792	1.231429
PYAS	1.051311	6.566605	0.028046	0.003039	0.009386	0.766622
JS	0.603677	6.571664	0.074780	0.008076	0.007498	1.066103
SSV	0.767585	9.490716	-0.016051	-0.001421	-0.000812	-0.137836
ZS	0.741883	8.870951	-0.010827	-0.000980	-0.000457	-0.074998
YFD	0.842521	8.047707	-0.028995	-0.002718	-0.001983	-0.260096

Note: the indicators above are calculated by monthly data from funds' foundation date to December 2011.

As is shown in table 2 all funds'  $\beta$  are statistically significant. Only PYAS's  $\beta$  is above 1, while the rest five funds'  $\beta$  are between 0.6 to 1, indicating the five funds' smaller fluctuation compared to the market portfolio. Compared to funds that are similar in age limit and size, AEGON ranks fifth according to  $\beta$ , indicating its relatively conservative investment style and lower risk. Sharpe ratio and Treynor ratio of AEGON, PYAS and JS are all above zero, which indicates their mean of monthly rate of return are larger than risk-free rate. AEGON ranks second according to Sharpe ratio as well as Treynor ratio. So AEGON's performance is relatively good based on risk-adjusted indicators of return. However, all funds Jensen's  $\alpha$  are not statistically significant according to their T statistic. So the single-factor Jensen's  $\alpha$  is not suitable for measuring the funds performance here.

## 5 Conclusion

From the comparative analysis of funds' performance above, we know the performance of China's SRI funds do not underperform the conventional funds. The SRI funds rate of return and risk-adjusted performance outperform the market benchmark slightly. SRI investment is not worse than conventional investment.

To summarize, SRI investment in China do not have clear disadvantages concerning their performance compared to conventional investment.

Facing the severe imbalance between economic growth and social/ environmental development, both the Chinese government and the general public could put more emphasis on socially responsible investment.

# A Research on Mutual Influence Mechanism between Psychological Capital and Knowledge Transferring Based on the Mediation Effect\*

Tang Hui, Zhao Fuqiang, Deng Mingran

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: fayhuitang@yahoo.cn, zhaofq@whut.edu.cn, dengmr@whut.edu.cn, )

**Abstract:** As we all know that the knowledge transferring is directly influence by the will, ability and opportunity of both parties in the knowledge transferring. However, the individual psychological capital directly influences the motive, will and ability, and then affects the effectiveness and efficiency of the knowledge transferring. Based on this, the paper firstly put forth the research on the mutual influence mechanism between the psychological capital and the knowledge transferring based on the mediation effects. Secondly, the paper reviewed the relevant literature about the psychological capital and the knowledge transferring and put forth the hypothesis of the relationship between the psychological capital and the knowledge transferring. Thirdly, the paper advanced the hypothesis of the relationship between the psychological capital and the knowledge transferring based on the mediation effect of the knowledge transferring will. Fourthly, the paper put forward the hypothesis of the relationship between the psychological capital and the knowledge transferring based on the mediation effect of the knowledge transferring ability. Fifthly, the paper conceived the comprehensive model and designed the influence path between the psychological capital and the knowledge transferring based on the mediation effect of the knowledge transferring will and ability.

**Keyword:** Psychological capital; Mediation effect; Knowledge transferring; Mutual influence mechanism

## 1 Introduction

It is well known that the knowledge transferring is directly influenced by the knowledge transferring will, ability and opportunity, but the individual psychological status has made effect on the process and result of the knowledge transferring. Therefore, if the enterprises want to make the knowledge transferring effectively and efficiently, they have to make out the organizational support measures to exert the individual psychological capital. However, if you want to make out the effective measures, firstly they have to learn about which kinds of psychological capital will influence the knowledge transferring, what their effects are, and how they influence the knowledge transferring. Based on this, the paper aimed to identify the psychological capital factors, the mediation factors and the result factors of the knowledge transferring, find out the relationships among them, and to provide the organization with the theoretic base and descriptive reference. The content of the paper can be concluded as follows. The paper firstly put forth the research on the mutual influence mechanism between the psychological capital and the knowledge transferring based on the mediation effects. Secondly, the paper reviewed the relevant literature about the psychological capital and the knowledge transferring and put forth the hypothesis of the relationship between the psychological capital and the knowledge transferring. Thirdly, the paper advanced the hypothesis of the relationship between the psychological capital and the knowledge transferring based on the mediation effect of the knowledge transferring will. Fourthly, the paper put forward the hypothesis of the relationship between the psychological capital and the knowledge transferring based on the mediation effect of the knowledge transferring ability. Fifthly, the paper conceived the comprehensive model and designed the influence path between the psychological capital and the knowledge transferring based on the mediation effect of the knowledge transferring will and ability.

## 2 Relevant Literature Reviews of Psychological Capital and Knowledge Transferring

### 2.1 Research on definition and constituent of psychological capital

In 1990s, Luthans put forth the concept of the positive psychological capital and the positive organizational behavior. In 2004, he indicated that the positive psychological capital is a kind of positive psychological status and ability<sup>[1]</sup>. It includes the self efficacy, the optimism, the hope, and the

---

\* supported by “the Fundamental Research Funds for the Central Universities” (2012-Ib-042)

tenacity<sup>[2]</sup>. In 2006, Lason and Luthans put forth that the hopful employees usually have their certain objects and feasible plan and work hard to realize them<sup>[3]</sup>. In 2004, Carr emphasized that the optimism employee can positively explain their work affairs, usually have the positive psychology that is able to enlarge their scopr, receive and produce the new idea, and are creative<sup>[4]</sup>. In 2007, Luthansand Youssef indicated that the tenacity employees are able to cope with the difficulties and the adverse circumstances<sup>[5]</sup>.

**2.2 Research on effects of psychological capital**

The research on the effect of the psychological capital is divided three aspects. Firstly, the individual psychological capital makes effect on his work performance and organizational commitment. In 2007, Luthans found that the psychological capital of the employee have close relationship with their work performance<sup>[5]</sup>. In 2007, Lifeng Zhong put testified that the level of the employees’ psychological capital is positively relevant to their supervisor’s performance appraisal, their work satisfaction, organizational commitment and the Organizational citizen's behavior<sup>[7]</sup>. Secondly, the individual psychological capital is directly relevant to his work attitude and behavior. In 2007, Luthans put forth that the individual psychological capital is positively relevant to his work performance and satisfaction<sup>[8]</sup>. In 2006, Larson and Luthans put forth that the psychological capital is positively relevant to the employee’s satisfaction<sup>[3]</sup>. Finally, the individual psychological capital has made effect on the exit will and absentism behavior of the employee. In 2005, Luthans and Jensen found that the nurses’ psychological capital is positively relevant to their performance from their supervisor’s evaluation<sup>[6]</sup>. In 2009, he found that the higher level the psychological capital is, the lower the employee’s exit will is<sup>[9]</sup>. In 2008, Luthans put forward that the psychological capital is positively relevant to the performance, satisfaction and organizational commitment of the employee<sup>[2]</sup>.

**2.3 Hypothesi of relationship between psychological capital and knowledge transferring**

According to the above research, the employee with the high level of the psychological capital is better to finish his task, cope with the adverse circumstances and be loyal to his responsibility. The knowledge transferring is not only an organizational citizen behavior, but also a behavior way to enhance his performance. At the same time, the process of the knowledge transferring is filled with the failure and uncertainty. So the psychological capital is very important to the knowledge transferring. In 2001, Bloodgood put forth that the knowledge transferring is the transferring or spreading among the different organizations or individuals<sup>[13]</sup>. In 1996, Szulanski indicated that the knowledge transferring is the bilateral knowledge exchange between the providers and the receivers<sup>[14]</sup>. Therefore, the performance of the knowledge transferring results from the knowledge transferring will and ability of both parties. However, the psychological capital directly influences the knowledge transferring will and the exertion of the knowledge transferring ability. In 2000, Nonaka put forth that the knowledge transferring is a process with the socialization, the externalization, the combination and the internalization of the knowledge<sup>[25]</sup>. So the paper put forth hypothesis H1.

H1: the psychological capital is positively relevant to the knowledge transferring.

H1a: the self efficacy is positively relevant to the knowledge transferring.

H1b the optimism is positively relevant to the knowledge transferring.

H1c: the hope is positively relevant to the knowledge transferring.

H1d: and the tenacity is positively relevant to the knowledge transferring.

According to above hypothesizes, the paper conceived the explaining structural model of the influence path between the psychological capital and the knowledge transferring. It is shown in Figure 1.

**Figure 1 The Influence Path Between the Psychological Capital and the Knowledge Transferring**

**3 Influence Mechanism of Psychological Capital Based on Knowledge Transferring Will**

**3.1 Influence of knowledge transferring will**

The knowledge transferring motive of the employees influence their attitude and behavior, and improves or worsens the knowledge transferring<sup>[15]</sup>. Their motive of the knowledge transferring will enhance or reduce the knowledge transferring performance through affecting their interest and intention<sup>[16]</sup>. The bilateral will of the knowledge transferring decide on the quality and effectiveness of the knowledge transferring. In organization, the individual expert knowledge, unique skill or special experience means his right and status in great degree. In 2002, Dixon put forth that the knowledge provider is afraid of losing his competition advantage because of the knowledge transferring, so he will be unwilling to share his knowledge with others<sup>[15]</sup>. The knowledge transferring will not only influence whether the knowledge provider is able to share his valuable knowledge, but also affect the absorption of the knowledge receiver. The motive is the integration of the force to produce, introduce and maintain behavior. However, the psychological capital is able to influence the individual motive to share his knowledge<sup>[18]</sup>. The employee with high level of the psychological capital often own the positive feeling that is able to enlarge his scope, receive the new idea, creativity and practice, and share them with others<sup>[20]</sup>. However, the employee with the lower level of the psychological capital may reduce his diligence or give up<sup>[2]</sup>.

### **3.2 Influences of constituent of psychological capital to knowledge transferring will**

In 1997, Bandura put forth that the self efficacy is a kind of conviction with the good motive, the resource allocation and the necessary measure to finish a special task under the special scenario<sup>[20]</sup>. The individual with the high level of the self efficacy is willing to spend much more time and energy to develop and cultivate the community effect. Then he is able to exert his potential and get much better performance.

The optimism means the positive expectation of the result. The optimistic employee will reduce his anxiety and depression, and enhance his work satisfaction and psychological health. In 2002, Seligman indicated that the optimistic employee will attribute the positive affair to himself and the negative affair to the external environment. The optimistic employee will undertake the responsibility initiatively, transfer the knowledge with the positive way, enjoy accepting the various challenge, and encourage himself to realize the success of the knowledge transferring.

In 2002, Snyder put forth that the hope is a kind of positive motive based on the combination between the successful expectation and the realization path. In the knowledge transferring, the employee with the high level of the hope usually has certain object of the knowledge obtaining, sharing, spreading and creating. What's more, he is able to make out the specific way to realize the object through combining the characteristics of the knowledge. He often pursues to his growth and achievement and creativity, so his motive and will to transfer the knowledge will be stronger, he can bring the better performance to the organization<sup>[23]</sup>.

The tenacity is a kind of ability to positively adapt to the difficulties or dangerous conditions and recover from the challenges. The individual with high tenacity often own self-dignity, self-confidence, optimism, self-control and high level cognitive ability. The tenacity is helpful to conquer the difficulty, adapt to the environment, and enhance the recovery and initiative study. The employee with the high tenacity not only has the idea to transfer the knowledge sustainably, but also makes self-regulation to renew his knowledge, skill and ability. Additionally, he expects to be responsible to transfer the knowledge<sup>[2]</sup>.

### **3.3 Hypotheses of relationship between psychological capital and knowledge transferring based on mediation of knowledge transferring will**

According to above analysis, the paper put forth hypothesis H2.

H2: the psychological capital is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring will.

H2a: the self efficacy is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring will.

H2b the optimism is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring will.

H2c: the hope is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring will.

H2d: and the tenacity is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring will.

According to above hypotheses, the paper conceived the explaining structural model of the influence path between the psychological capital and the knowledge transferring based on the mediation of the knowledge transferring will. It is shown in Figure 2.

**Figure 2 The Explaining Structural Model of the Influence Path Between the Psychological Capital and the Knowledge Transferring Based on the Mediation Effect of the Will**

## 4 Influence Mechanism of Psychological Capital Based on Knowledge Transferring Ability

### 4.1 Influence of Knowledge Transferring Ability

The will and motive decide whether the knowledge transferring take place. However, the ability decides whether the knowledge transferring is frequently. In 1996, Grant indicated that the effective operation of the knowledge transferring depend on the will and ability of both parties in the knowledge transferring<sup>[24]</sup>. In 2000, Nonaka indicated that the individual with the subjective will of the knowledge transferring is not enough, and he must have the ability of the knowledge transferring that includes the spreading ability and the absorption<sup>[25]</sup>.

The stronger the spreading ability of the employee is, the better he express his experience and knowledge, and the more effective he spread his information and knowledge to the appropriate receiver with the appropriate way, channel combination and time. At the same time, he can help others to understand his knowledge. if the absorption ability of the employee is stronger, he will be identify and evaluate the knowledge more accurately. At the same time, he can absorb, store and apply the new knowledge more effectively.

### 4.2 Influences of Constituent of Psychological Capital to Knowledge Transferring Ability

In the knowledge transferring, the individual with high level of the self efficacy is easier to realize his object, and faster to absorb the knowledge and establish the healthy social network. Therefore, the successful experience and the healthy social network can strengthen his psychological capital and enhance the knowledge transferring.

The level of the optimism influences the expectation of the employee to the future new knowledge and affects him to regulate his knowledge transferring behavior continuously under the anxiety in order to cope with the organizational change. The optimistic employee will be initiatively responsible for the knowledge transferring, transfer the knowledge in the positive way, be willing to accept all kinds of challenges, and make a long term success through the self motivating.

The hope includes the will and way to do something. The will of the knowledge transferring mean the motive and the decision that cincentive the individual to realize the knowledge transferring object. The way is the method and tactics to realize the knowledge transferring. The way is the measure and tactic to to realize the knowledge transferring when he is faced with the challenges. The hopeful employee is able to set a specific and challenging objects, consider independently, and found the effective way to success. They have the strong request to the growth and the achievement, are usually creative. As a result, the exertion of the knowledge transferring ability will be stronger.

The tenacity employees own self-respect, self-confidence and ego stipulation, they will be optimism under the adverse circumstances. Their tenacity is helpful to conquer the difficulties, adapt to the environment, enhance the recovery and study initiatively. The tenacity employees not only renew their skill, knowledge and ability, but also are responsible for the knowledge transferring. Additionally, they often take the challenge of the adverse circumstances as the development opportunity, so they can accumulate much more experience, skill and knowledge.

### 4.3 Hypothesizes of Relationship between Psychological Capital and Knowledge Transferring Based on Mediation of Knowledge Transferring Ability

According to above analysis, the paper put forth hypothesis H2.

H3: the psychological capital is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring ability.

H3a: the self efficacy is positively relevant to the knowledge transferring based on the mediation of

the knowledge transferring ability.

H3b the optimism is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring ability.

H3c: the hope is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring ability.

H3d: and the tenacity is positively relevant to the knowledge transferring based on the mediation of the knowledge transferring ability.

According to above hypothesizes, the paper conceived the explaining structural model of the influence path between the psychological capital and the knowledge transferring based on the mediation of the knowledge transferring ability. It is shown in Figure 3.

**Figure 3 the explaining structural model of the influence path between the psychological capital and the knowledge transferring based on the mediation effect of the knowledge transferring ability**

### 5 Comprehensive Influence Model between Psychological Capital and Knowledge Transferring Based on Mediation Effect

According to above hypothesizes, the research can be concluded the follows. Firstly, the psychological capital is very important to the knowledge transferring. Secondly, the psychological capital is positively relevant to the knowledge transferring. Thirdly, the psychological capital is positively relevant to the knowledge transferring based on the knowledge transferring will. Fourthly, the psychological capital is positively relevant to the knowledge transferring based on the knowledge transferring ability. The explaining structural model of the comprehensive influence path of the the psychological capital to the knowledge transferring is shown in Figure 4.

**Figure 4 The Explaining Structural Model of the Comprehensive Influence Path Between the Psychological Capital and The Knowledge Transferring Based on the Mediation Effect Of the Knowledge Transferring Will and Ability.**

# Countermeasures of Developing Higher Vocational College Students' Practical Ability

Wang Bin

Xiamen Ocean Vocational College ,Xiamen, P.R.China, 361012

(E-mail: wbin0743@sina.com)

**Abstract:** In this paper, we put forwards four countermeasures to deal with the problems existed in developing the current higher vocational students' practical ability. The first thing is to construct a distinctive mode of talent training. Secondly is to attach importance to practice teaching, which means investing more in practice teaching. Thirdly is to strengthen the double-qualified faculty team. The last thing is to develop the self-awareness of practical ability training, so as to achieve the goal of higher vocational education more effectively.

**Key words:** Higher vocational colleges; Practical ability; Countermeasure; Logical analysis

## 1 Introduction

Higher vocational education must base on market and serve the society to cultivate students' application competence and professional skill. It aims at training skilled talents for production, construction and service line. The feature of skilled talents is that they have higher occupation skills and practical abilities. In order to achieve this goal, higher vocational colleges need to strengthen the training of students' practical abilities. Meanwhile, with the rapid development of social economy, culture, science and technology, there are more demands for Higher Vocational College Students. For example, the strong innovative ability and entrepreneurship ability, the much stronger practical ability, and the ability to achieve zero distance employment and so on becomes more and more important. In this conditions, how to meet the needs of social development and cultivate the practical ability of vocational college students has become the urgent problems, which is our concern. In recent decades, the developed countries have made a lot of effective attempts and gained rich experiences in this respect.

### 1.1 Six core skills approved by Confederation of British industry, department for education and employment and the qualifications and curriculum Department

In 1998 the British government pointed out in the document *towards the success of the qualification*, "technology is the key to everyone's starting point. Key skills support personal occupation career change and transition. For those who have a solid foundation of key skills and the ability to update these key skills for people, for their work in the leading and surpass others." At present, the Confederation of British industry, department for education and employment and the qualifications and curriculum Department approved six core skills include communications, digital information technology, application, to cooperate with others, improve learning and enhance the performance and the ability to solve problems.

### 1.2 Franz- Josef Kaiser's views

Franz- Josef Kaiser et al divided the key ability into five aspects: the explicit subject ability, the independent ability and the ability to participate, the group or social competence, the system or process capability, the ability to reflect.

### 1.3 Some viewpoints on China

In the *national skills to revitalize the strategy* research report by Chinese human resources and social security department, the occupation core ability is divided into eight parts and called "eight core competencies", which includes: communication with others, digital applications, information processing, problem solving, self learning innovation, innovation and language application.

## 2 The Analysis of Current Chinese Higher Vocational Students' Practical Ability Training Problems

### 2.1 The school talent training mode is lack of characteristics

At present, the feature of Chinese domestic higher vocational college talent cultivation mode is the same as the ordinary higher education training model. Which means that the nation implements the same talent training policy, formulates unified specialty catalogue, teaching plan and teaching material, have same entrance exam and distribution of employment. The difference between them is that one is called college and the other is University. Under this system, this inevitably leads to the assimilation of

higher vocational training targets and that of universities. The direct consequence of this talent training mode is the lack of character and personality. Students having no consciousness and spirit of creativity is difficult to adapt to the market economy and the higher demand. Higher vocational education is to train applied talents, not design and development talents. The Chinese current higher vocational education is still backward and the teaching ideas are still affected by the traditional education thought.

### **2.2 The practice teaching link is seriously out of line**

Because of the influence of traditional education, the higher vocational teaching focus on making the students get the existing theoretical knowledge, not the development of students' practical operation skills and the ability to solve practical problems. It now appears that most of the contents are demonstrative and confirmatory and they are lack of modern new technology, new material, new technology, new equipment and other aspects of the latest results. In addition, the investment of the existing teaching equipment, educational funds, the practice base and experiment teaching condition are backward which makes the experimental level relatively low. So it affects the quality of practice teaching and it can not meet the requirements of experimental teaching. But as a higher vocational college, having no practice base is totally unacceptable. If there is no practice base for a long period, the students will be an armchair strategist. If they take on a new job, they will find themselves are lacking of practical abilities.

### **2.3 double-qualified teachers are in great need**

At present, the teachers in higher vocational colleges are mainly college graduates, most of whom are lack of social experience. Their practical ability in teaching, in practical training and on-the-spot guidance are in a weak position, which hinder the realization of training aim of higher vocational education. As a result, the Ability-Standard principle can not be effectively implemented. I think there are two reasons for the lack of double-qualified teachers. The first thing is that the introduction of higher vocational teachers lays too much stress on education. Blindly pursuit of high academic qualifications and neglect of experience and skills leads directly to the disconnection between teacher and practice teaching. The second thing is that the participation of enterprise in the higher vocational teachers training is too weak. the shortage of communication between schools and enterprises leads to lag in technology, therefore, teachers can not keep ahead of the latest industry developments and make full use of this congenital optimal practice platform.

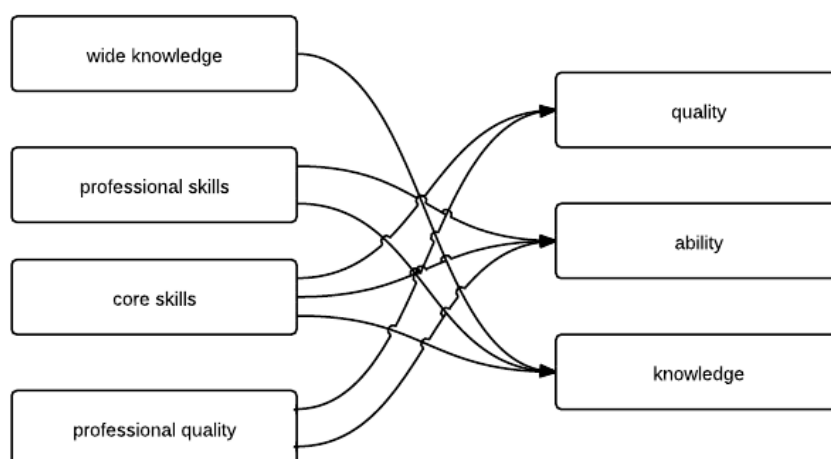

### **2.4 Higher vocational students ' own problems**

As the target of practical activities, Higher vocational students are the embodiment of the practice teaching effect. And their attitudes to the practical activities directly affect the teaching. There are several problems for higher vocational students. First thing is the lack of consciousness of self practice. Most students are dissatisfied with the social practice activities or arrangement of practice by their schools. They complained that the internship platforms offered by their schools hook their professions rarely. In fact, they think that those not only can exercise little but also are a waste of time and the research funding given by the schools is too little. Although these complaints are in some sense connected with the organization by their schools, however, it reflects the current students' low self-consciousness and enthusiasm in practical activities and practical ability. The second problem is the lack of professional skills and practical abilities. The higher vocational students have some common problems such as lacking of professional knowledge and professional skills when they graduate. That's because their cultural bases are not high when they enter the colleges and their subjective learning initiatives are poor. Those directly lead to low appliance ability to analyze and solve problems after their graduation.

## **3 Training Students' Practical Ability Countermeasure**

### **3.1 Constructing characteristic talents training mode**

The purpose of the higher occupation education training should cultivate the students to adapt to the post groups needed for comprehensive practice ability. It not only emphasizes the social role but also make up the absence of individuality.

**Figure 1 Requirements of Characteristic Talents**

### 3.1.1 Curriculum

The curriculum should establish the "wide base, flexible module" teaching pattern, which means to encourage students both to master broad knowledge and critical ability and to strengthen their working ability.

### 3.1.2 Teaching methods

Instead of the one-way indoctrination and centering on subject teaching mode, cultivating the students' practice spirit and practice ability through training should always been implemented. At the same time, in order to highlight the cultivation of students' practical ability, the schools should integrate their subjects, knowledge and abilities and try to carry out the two-way education process and comprehensive education method.

### 3.1.3 Talents training direction.

We should establish the compound talents training mode so that students can really meet the needs of society. In order to achieve the goal, the following specific measures should be adopted. The First thing is to strengthen the teaching and training of foreign language, computer and to prominent English listening, speaking and professional foreign language and computer skills training. The second thing is to pay attention to the students' communicative ability. by offering humanities and social science elective courses, organizing seminars and other activities, the students can learn communication. In this way, they can have the communication abilities of language literal expression, teamwork and social activities. Thirdly, it is important to open the employment and career guidance curriculum, so that the students can really meet the needs of the society.

### 3.2 Attaching the importance to practice teaching and strengthening practice teaching investment

Higher vocational schools should arrange proper practice teaching time and content of courses. To meet to changes of the talent demands for the society, some technical certification examination should be combined with the integrated practice teaching courses, which can make the students both learn a certain skill and obtain the corresponding certifications in the process of practice. Meanwhile, to improve the practice teaching environment and to increase the input of practice teaching are necessary. The schools should place importance on the practical skills training. Cooperating with some of the local industrial and commercial enterprises can establish a practical teaching base that includes research, producing and teaching. The outside school bases are not only carrier of practice and production, but also the link between integration of theory and practice, teaching in combination and production. For example, schools can cooperate with related enterprises in scientific research and production and actively participate in the enterprise production planning, which can make them sides benefit from it. The enterprises are willing to accept the teaching practice and social practice. Those are mutually beneficial to the schools and the enterprises. Therefore, the schools can not only solve the students' problems of the production and practice, but also make the best use of talents and promote new technologies.

### 3.3 Strengthening" double type" teacher team construction

Double-qualified teachers' training is the guarantee of education quality. It's an effective way to achieve the training goal, highlight the characteristics of higher vocational education, improve the

standard of teachers. The school can arrange the teachers for professional practice and study in the enterprises, widely attract and encourage engineers and qualified technician of enterprises, managerial talents and personnel with special skills to come to the colleges as part-time or special hired professors and hiring the distinguished teachers, business and community experts as part-time professors, to improve the teachers' practical abilities. We call this "send out to study, come to teach". Only in this way can we improve the standard of teachers and only the teachers' practical teaching level is improved, the students' ability of practice is improved. Thus the quality of the practice teaching can be ensured.

### **3.4 Strengthening the practice ability of the students in the independent planning consciousness**

The students are the object of practical ability formation and development because any external culture and shaping behavior eventually need the students' efforts to change themselves. Students should have the awareness of self-development and planning and give play to their subjective initiative. In order to achieve that goal, teachers should timely and purposefully teach the students the importance of learning and practice, so that the students can harvest through it and they will have a sense of accomplishment psychologically, which stimulate their higher learning and the practical desire. At the same time, the schools should encourage the students to establish professional associations to enrich their extracurricular activities, understand the professional knowledge and to build their interest in science. In this way, the students can greatly enrich their professional practice skills, organizational skills, and exercise ability of public relations, information search and communication ability. In addition, the school and teachers should organize students to visit factories and enterprises to enable students to understand the gaps between professional knowledge needed in production and in textbook so that they can study hard to improve their practical ability and become truly useful technology applied talents.

## **4 Conclusion**

The fundamental task of the vocational education is to improve the vocational ability, which covers the employment ability and adaption to the change of occupation ability. At present, the contradiction of the shortage of high skill talents needed by the market and the difficulty of the college graduates' employment is that occupation ability training in higher vocational colleges is not implemented and the students occupation ability can not meet the requirements of employers. To change this situation completely, the vocational colleges urgently need to establish employment oriented occupation education systems and to take practical steps to strengthen the occupation ability training so that each student has the ability to enter the market competitively. Higher vocational school should construct the unique talents cultivation mode, attach importance to practice teaching, strengthen practice teaching and the double-qualified faculty team. Higher vocational students' Students should have the awareness of self-development and planning and give play to their subjective initiative. Only in this way can we cultivate skilled talents that can serve the community.

# Research on the Private Financing in China

## --Analysis of the Effectiveness of Financial Reform in Wenzhou of China

Wang Fang

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: privatewf@163.com)

**Abstract:** Since April last year, a large number of bosses in Wenzhou of China have ran away or committed suicide. It is because they had borrowed the loan sharks and couldn't pay back the several hundred million Yuan. As the similar things happened again and again, Private lending crisis in Wenzhou burst out. The government had to take measures to prevent the spread of the crisis, since the crisis do tremendous damage to the financing market and the real economy. On March this year, the government announced to set up financial reform pilot area in Wenzhou to lead private financing to make standard development. Private financing, which was always trading secretly, is now becoming open to the public. In this text, we will discuss the cause of private lending crisis and make a detailed analysis of this financing reform to see the effectiveness and shortages of it and the long prospect of private financing.

**Key words:** Wenzhou; Private financing; Private lending crisis; Financial reform; 12 task of financial reform

### 1 Introduction

The global economic crisis has a bad effect on the small and medium-sized enterprises in China. These enterprises cannot get enough capital from the commercial banks and other formal finance institutions, so they turned to private financing for help. In this case, private lending came into crazy. Finally the private lending crisis broke out. The government has to take measures to resolve the crisis. In the first half of this year, the government set up Wenzhou city experimental area of comprehensive and innovative finance to solve the severer situation.

Private financing isn't a new research direction, many scholars have written many articles to show their opinions about it. As the new round financing reform takes place, there are some new questions and highlights come out. So in the new situation, we need to reconsider this question. In this essay, we will focus on the sunny development of private financing. For the reform in Wenzhou, making an analysis of the policies and searching the real meaning for eliminating crisis. And finally, I will give some advices for the further development of private financing.

### 2 The basics of Private Financing in China

#### 2.1 What is private financing?

Private financing is a financial activity which is between individual creditors and investors, outside of the national financial institution, and with the purpose of getting paid backs a high interest, gaining access to capital and paying the promised interest. Private financing, with its flexibility and convenience, elasticity of interest rate and diversification of financing characteristics; became one of the important means of financing for enterprises, except for formal financial institutions. There are four ways of private financing, namely, private debit and credit, negotiable securities financing, bill financing and internal financing, among which private debit and credit is the most traditional way. Usurious, as one of the main form of private debit and credit, is mainly used for the individual and private enterprises to satisfy the need of turnover in production.

#### 2.2 Why private financing can make a rapid development in China?

As we can see, private financing means the borrower has to pay a much higher interest rate. Even though, there are still a lot of enterprises choosing it. In fact, this is not a strange thing, and we can analyze from four aspects. Firstly, as borrowers, enterprises lack the sense of credit. Subject to the operating conditions and level, they cannot get enough money from commercial banks, and this means they don't have enough money to meet the need of reproduction. In this case, they have to turn to private financing for help. Secondly, the commercial banks are not willing to provide loans to the small enterprises whose operating and financial risk are very high. Thirdly, with the development of our

society, Chinese have more and more idle funds, while there era not enough investment channel. Private financing provide people a way of getting high paybacks. The temptation is hard to resist. And lastly, private financing is very convenient and easy to operate; enterprises can get the loans in a very short period of time. (Zhou Chuang, 2005)These features can meet the need of the enterprises which need short-term financial support. Indeed, private financing has developed rapidly. However, without the legal and standard system, it must involve much hidden danger. Once the hidden danger was exposed, a lending crisis is to break out.

### 3 Private Lending Crisis in China

#### 3.1 Analysis of private lending crisis

Taking a look of the Wenzhou private lending crisis, with the analysis of the current economic situation, we can make a conclusion that small and medium-sized enterprises will become the main demanders of private lending. The report of National Association of Industry and Commerce shows that nowadays it's very difficult for small and medium-sized enterprises to raise money. 90% of those enterprises don't have any credit relationships with any bank. And for micro enterprises this data is up to 95%. Under such great pressure, those enterprises can only take a risk to private lending; however, this measure has no difference with quenching a thirst with poison. The high interest rate is just like a rolling snowball which becomes bigger and bigger. Finally those enterprises got bankrupt, and CEOs of those enterprises all absconded with the money, which shocked the whole country gave the whole society a negative influence. Table 1 and figure 1 show the comparison of Wenzhou private lending and bank borrowing. By the end of the first half of 2011, the whole scale of Wenzhou private lending has reached 1100 hundred billion. During the same period, banks' saving accounts fell sharply and their appeared a recession of bank debit and credit.

In practical operation many people specialize in funds circulation business, which is also known as interest speculating. That is also the reason why the whole private lending chain in Wenzhou become longer through reselling and speculating, and the interests also become higher. As the result of the survey which was made by the People's bank of China Wenzhou central branch shows, there are 89% of individual and 59.67% enterprises that were involved in private lending. (We can see from the diagram about the scale of Wenzhou private lending and groups involved in it.) It is not difficult for us to find out that many of the entity companies didn't use those private lending in their own business when they got them. Those private lending funds and capital even have no access to the entity economy, and most of them were used in the speculation of capital and real estate and so on, which made the economy of the whole society get worse than ever. To see from the perspective of macroeconomics, private lending crisis can be treated as a terrible credit crisis, which is a crowning calamity for the development of local entity economy and finance.

**Table 1 Comparison Between Private Financing and Bank Loans in Wenzhou of China**

Year	The average rate for folk lending	Private lending scale	Benchmark one-year interest rate on loans	Outstanding bank credit loans
1980	34.80	9	12.000	7.16
1983	26.40	10	12.000	8.65
1985	36.00	15	12.000	13.83
1988	45.00	50	17.280	32.03
1990	34.80	85	17.280	42.25
1995	30.00	110	14.930	167.54
1998	26.40	180	7.560	369.36
2001	18.00	240	5.850	708.11
2003	10.60	300	5.310	1312.94
2004	13.04	380	5.580	1534.24
2005	12.16	420	5.580	1711.09
2006	10.92	450	5.850	2205.64
2007	11.70	550	7.730	2783.72
2008	14.37	580	6.525	3306.13
2011	24.40	1100	6.310	6023.00

Figure 1 Comparison Between Private Financing and Bank Loans in Wenzhou of China

## 4 Interpretation of This Financial Reform in Wenzhou of China

### 4.1 The main direction and task of the financial reform

The major problem faced by private lending fundamentally is the problem of standardization. If private lending can be standardized as bank credit, there would not be a private lending crisis which has caused such a great damage. To many of those small and medium-sized enterprises who are eager to capital, the standardization of private lending somehow may decide their destiny.

On March the 3rd, 2012, Premier Wen Jiabao chaired a State Council executive meeting and decided to establish Wenzhou city experimental area of comprehensive and innovative finance. The conference approached the implementation of “Wenzhou city experimental area of comprehensive and innovative finance program of Zhejiang province”, and made requirements and command about the innovation of system in order to build a matched diversified financial system of today’s economic society and makes an improvement in financial service, which can also improve the ability of taking precaution of financial risks and the who financial environment. It will also provide precious experience for the financial reform of the whole nation.

The conference also set 12 main subjects for the comprehensive reform of Wenzhou financial environment. We can make some explanation about these 12 subjects to get a comprehensive understanding of how much development space and guidance are given to the private lending by the government. These 12 subjects can be concluded and divided into 3 points:

Firstly, make a standardization of private lending organization and the direction of investment, including standardize the development of private lending and accelerate the development of new types of financial organizations. The government should encourage and support local private lending organizations to join the reform of local financial institutions; and establish or participate in the equity of village banks, loan companies, rural fund corporations and other new types of financial organizations in accordance of the laws. Small loan companies with certain conditions can be reformed as village banks. And make research on individual overseas investment experimental spot to explore how to establish a standardized and convenient way of direct investment. These subjects show that the nation has changed its attitude and policies of private lending. As its own development, private lending has become one of the important means of social financing, so that we cannot restrain its development or even destroy it. It is too late for the country to take measures of usurious, which is one of the main forms of private debit and credit, And Now we can only standardize the cost of private lending by policies to make it go on a normal track. And only in this way can we take the most advantage of private lending.

Secondly, make special financing platform for small and medium-sized enterprises. The government hopes to provide those enterprises with a larger platform with the use of bunds, new types of financial products and capital markets. For the small and medium-sized enterprises financing problem, which is also one of the difficulties for the development of those enterprises and national economic growth, the government should take full advantage of financial market and new financial tools to give those enterprises a wider and safer resource of financing.

Thirdly, promote the development of both small and medium-sized enterprises and private lending organization by making efforts in controlling the risks through market, government and society. The government will take actions to strengthen the establishment and construction of social security system; also provide reinsurance and improve the function of government supervision. And the government will

control the risks of private lending in the possible maximum degree to make sure that there will be a “win-win” program for both lenders and borrowers.

#### **4.2 Some problems existing in this reform**

It's obviously that this financial reform in Wenzhou plays a very important role in the process of the development of private lending. Apparently the central government has realized private lending has a great impact on the growth of enterprises and the development of our national economy. However, whether the current crisis can be stopped spreading just through this reform, and if the problems of private lending can be solved, these questions urge us to make a more specific analysis on this reform.

By analyzing the twelve tasks of this reform, we find that there are still some problems that can make an impact on the effectiveness of the policy:

(1) As we can see, these tasks cover a wide range. It ranges from standardizing the development of private lending to strengthening the establishment and construction of social security system. However, most of them are just given some guidelines in principle, and lack in specific operating plans, which means these tasks may face the difficulty of feasibility in practice. For example, it refers to making a development of asset management organizations. In fact, this proposal has been proposed several times in many meetings, while it haven't been solved and carried out so far. This means it seems a little difficult to carry out the plans in Wenzhou.

(2) Permission of Personal overseas investment may bring more risks to the national market. As the launch of personal overseas investment in Wenzhou, many capitals in other area in China will be attracted to rush into this area and then be invested overseas. No wonder it will increase the difficulty for capital management and even cause capital flight, impacting our domestic economy. So it's very essential to avoid blind personal overseas investment. This requires the government establish relevant Warning and supervision measures.

(3) Whether the Support for solving the problems in Wenzhou is enough. Thumbing through some of materials of this financial crisis, we can find that the government in Wenzhou used to drafting a document, which was called the overall scheme of establishing a comprehensive experimental area in Wenzhou. The local government has submitted it to the government of Zhejiang province and central government. This document has presented many specific pilot projects of reform, which are quite different from the tasks given by the central government. The local government in Wenzhou submitted eight specific sub schemes, which include establishing the firm of management and service of private capital, making a development of Micro-credit companies and Private Equity Investment Industry, accelerating the shareholding reform of rural financial reform, and establishing local financial regulation. There are many intersection and difference between the two documents. What's more, five specific plans were not approved in the documents of the central government. We can conclude that the financial reform doesn't give enough support to what Wenzhou really needs.

(4) There may be legal risk. The second task of this reform is accelerating development of new financial organizations. The government encourages and supports private capital to participate in the reform of local financial institution and set up according to law or take stakes in new financial organizations such as rural banks, Finance Corporation and rural fund cooperatives. However, we can find no relevant laws which can be the foundation of setting up or taking stakes in rural banks. on the contrary, private capital is banned from setting up banks in the Law of the People's Republic of China on Commercial Banks. This contradiction is bound to cause loopholes. As we can foresee, once there is a flaw, it will be made use by someone, and deepen the disorder of financial market,

We all consider the problem of difficulty of financing in middle and small enterprises as the background and one of the immediate causes of this private lending crisis, so difficulty of financing. Small and medium-sized enterprises must have enough living space and market competitiveness. However, many enterprises have the problems of poor technology and lacking market advantage, and these problems restrict the development of these enterprises radically, while only financing to expand production cannot solve the problems. We can see the favorable terms about financing in the document, but I think the government should do more to guide Small and medium-sized enterprises to turn into technology intensive enterprises. The problem of difficulty of financing in middle and small enterprises can be solved in this way. In turn, the enterprises no longer face the financing problems; since they can operate well, private lending will no longer go wild.

## **5 Prospects of Private Financing and Some Proposals**

### **5.1 Prospects of the development of private financing**

Through the above analysis, it can be concluded that is this financial reform is of important symbolic significance. Private financing which is discouraged in a long-term in china can, it is expected to step into the formal channels of the financial market in china. Since we have analyzed many problems in the reform, the effectiveness of this reform is needed to be proved. Anyway, we can use normalization,legitimation and marketization to describe the future direction of private financing.

### **5.2 Some proposals to promotion of private financing**

In order to accelerate the elimination of lending crisis and maintain the healthy development of the real economy, we can do more from these aspects.

1) Speeding up the marketization of interest rate. Out of worry about short-term finance security, this reform didn't refer to this question. In the short term, private financing is brought into government supervisory and regulation. On one hand, it can reduce the risk of interest rate fluctuations, on the other hand, it reduce the possibility to carry out marketization of interest rate. In the long term, the marketization of interest rate is the core of the steady and efficient operating of financial system. as the biggest problem in formal financial system of China, bank monopoly decrease the efficiency of the whole society. So the marketing operations of interest rate should be the core in further reform. Without operations of market-oriented interest rate, banking monopoly may be more severe after private capital taken in formal channels.

2) The legitimacy of private financing, we should notice that private financing is just enclosed in the public; the government hasn't admitted its legitimacy. This is because private lending has showed more negative than positive impacts, and it still has a lot of problems which we can not solve in a short time. However, on a longer term basis, private financing will be brought into law. Since only regulated and standardized in the law, can private financing develop more healthily.

3) Guiding Small and medium-sized enterprises to turn into technology intensive and capital enterprises. For the enterprises which can adapt to the changing market, the government should support is development; for the enterprises which can not adapt to the changing world, let them be eliminated. The government should improve the mechanism for rewarding independent innovation to guarantee the international competence. Once the profit of these enterprises can be protected, it won't be easy for private financing to gain too much from the real economy.

4) Strengthening the social ensure system. As an essential part of preventing risks, Social security system can decrease the happen of crisis, and reduce the loss. So it's important to perfect social security mechanism; it will support the healthy development of enterprises and minimize both losses and market dislocation. (Liu Zhihao, 2007)

## **6 Conclusion**

This lending crisis in Wenzhou of China exposed the problems of private financing and the vulnerability of our economy. The financial reform will change this situation to some extent. But the effectiveness of the reform has to be in a long term, we hope that there can be more effective measures to be taken, so that private financing can be regulated reasonably, promoting the growth of small and medium-sized enterprises and the development domestic economy.

# Research on Real Estate Bubble in Wuhan City of China

Huang Song<sup>1</sup>, Yu Jiali<sup>2</sup>

1Wuhan University of Technology, 122 Luoshi Road, Wuhan, P.R. China, 430070  
(Email: 178864145@qq.com)

**Abstract:** The real estate industry has been a hot issue of domestic and foreign scholars. In this paper, we studied the theoretical relationship between the real estate and the bubble economy and use the empirical analysis method to explore the real estate market in Wuhan, based on data from 2000 to 2009. After defining and analyzing the Wuhan City real estate bubble, we find that the Wuhan City real estate market may be the existence of the bubble. Finally, this paper proposals some policy recommendations based on the analysis results.

**Keywords:** Real estate; Bubble economy; Recommendations

## 1 Introduction

The real estate industry has always been a hot topic. The real estate operation relates to the healthy development of the national economy. Since 2003, the house prices in China are rising. This overheating caused great social repercussions and great attention by the government. From the government perspective, the government has issued a series of real estate policy to control the overheating house prices. The State Council promulgated in 2003 on the 18th file clearly to promote the real estate market is healthy and sustainable development requirements. In 2005, "state eight" was first proposed to take the appropriate measures to effectively inhibit the fast rising housing prices. In 2006, "state six" made the appropriate regulation, in terms of land, taxation, foreign investment and access to credit, housing structure and the real estate market trading order. Since then, the government unveiled the "state eleven" (2010) and the "new state eight" (2011). We find that over the last decade, the government has been to increase the regulation of real estate policy. But in fact, from the perspective of ordinary people, the effect is not ideal. In the Two Sessions held in 2012, the house price issue is still a hot topic discussed. On the other hand, Premier Wen Jiabao pointed out that the current prices are far below and income to match in the government work report. Wen stated that the current house price has not yet reached a reasonable range, so the regulation of the Government will not relax.

In this context, I believe that a correct understanding of the real estate industry development and systematic analysis of the regional real estate bubble has great significance. The paper selected Wuhan City as a research object. The government work report in 2004 proposed the Rise of Central China. On the other hand, Wuhan will play a very important role in promoting the Rise of central China plans. During this period, the economic development of Wuhan City has made considerable progress, but we can easily find the Wuhan City housing prices is all the way up. So our qualitative and quantitative research on real estate issues in Wuhan has a very important theoretical and practical meaning.

## 2 The Theoretical Relationship between the Real Estate and the Bubble Economy

The bubble economy is caused by the excessive growth of fictitious capital. When the value of assets is far more than the real economy, the lack of economic support of the real economy will lead to the bursting of the speculative market, which led to the bubble burst. After we understand the concept of the bubble economy, the concept of real estate is put into the bubble economy so that we can understand the connotation of the real estate bubble. The real estate bubble is due to excessive speculation, resulting in prices has seriously deviated from its fundamental value. When the current price and its fundamental value deviated from to a certain extent, the whole industry will collapse, it may experience a long-term recession. Obviously, the real estate bubble is more common in a price bubble in the bubble economy, and then the society should be how to detect the real estate bubble? Many scholars have carried out on the measure of the real estate. Dennis (2002) has built a dynamic model analysis of the impact factor of the prices from the short-term and long-term two levels. Kazuo (1995) take Japan's bubble economy as the object, verify that the expected real estate bubble. Lee (2005) studied from the perspective of system dynamics, finding that positive feedback mechanisms of the real estate demand and prices led to a real estate bubble. In the research literature for methods, Noguchi, Yukio (1987) measured the real estate bubble with the income method. Kiyohiko, Nishimura (1990) measured the local real estate industry using the index method. Hing(2001)established the econometric model to measure the bubble. At the same time, more and more scholars using the indicator analysis methods to measure the real estate

bubble. The main indicators include domestic industry profit margins, price earnings ratio, the proportion of the community of all fixed assets investment in real estate investment, real estate class in the proportion of loans in total loans and so on. If an industry's average profit margin is higher than the status quo can be maintained for more than 30 percent of other industries and more than three years, then we can assume the existence of a bubble. In developing countries, the price earnings ratio should be in the 3-6 range. Some scholars believe that if all loans in the developing countries the proportion of real estate loans is over 5%, indicating mild foam. In accordance with the industrial division of labour and the proportion of real estate as a class of tertiary industry in the construction industry to the total investment proportion less than 10% is appropriate. If the ratio exceeds 20%, it indicates that the national economy a serious bubble and the emergence of real estate dependent tendency.

### 3 The Real Estate Bubble in Wuhan

In order to make our analysis more convincing, we selected 2000-2009 data from the Wuhan City Yearbook. We intend that the development of class indicators from the real estate industry, real estate supply and demand indicators, real estate, financial indicators, the indicators of real estate investment class and the Wuhan City standard of living indicators described.

#### 3.1 The real estate industry development in Wuhan

**Table 1 The Development of Real Estate Industry**

year	The real estate value	GDP
2000	30.81	1206.84
2001	37.08	1335.40
2002	53.74	1467.80
2003	64.48	1622.18
2004	77.15	1882.24
2005	86.83	2261.17
2006	105.92	2679.33
2007	134.14	3209.47
2008	236.59	4115.51
2009	283.95	4620.86

From the data in Table 1, we can easily see the economic development of Wuhan City has achieved rapid development in the 2000-2009. But along with this economic growth, we found that the real estate share of GDP has also increased year by year. The proportion rose from 2000 accounting for 2.55% to 6.14% in 2009. From that point on we can speculate, Wuhan City, the real estate industry plays a vital role in the economic development of the region.

#### 3.2 The real estate supply and demand in Wuhan

From the perspective of economics, supply and demand determine the price. So in order to understand the connotation of the current prices, we first need to understand the supply and demand on the market for real estate. In order to more clearly and directly reflect the supply and demand of the real estate industry in Wuhan City, we have selected Wuhan City, real estate sales as indicators reflect the needs of area as the supply indicators reflect completion of the real estate development.

**Table 2 The Real Estate Supply and Demand**

year	Real estate sales	Vacant area	Completion of the area	Sales value
2000	359.52	231.83	425.70	64.09
2001	408.85	288.20	499.60	74.15
2002	450.27	308.36	522.70	86.81
2003	542.79	184.12	600.24	112.46
2004	658.08	121.71	608.91	151.19
2005	914.06	162.14	722.25	279.86
2006	960.88	180.52	776.67	354.53
2007	1135.41	131.88	811.62	529.56
2008	732.07	215.43	768.23	350.01
2009	1086.99	214.14	824.58	579.22

The data show that Wuhan City real estate market supply and demand reached a balance point between 2003 and 2004. But after 2004, it has been a shortage of real estate situation. As a result, the real estate sales increased substantially. On the other hand, we can observe the trend of vacant housing area of Wuhan City real estate market has been fluctuations.

### 3.3 The real estate loans in Wuhan

**Table 3 The Real Estate Loans**

Real estate loans	Total loans
18.53	1196.92
23.36	1380.94
34.09	1698.14
37.96	2138.62
51.39	2481.17
89.78	2719.87
110.15	1162.82
102.79	1363.24
93.01	1620.68
53.26	1904.44

Based on historical experience, in developing countries, if the real estate loans accounted for more than 5%, the bubble may exist. We can calculate the proportion of Wuhan City real estate loans from 2000 to 2009. The calculations show that in 2006 accounted for 9.5% in 2007, accounting for 7.5%, accounting for 5.7% in 2008. We conclude that in the past few years, Wuhan City has a real estate bubble, especially in 2006.

### 3.4 The real estate investment in Wuhan

**Table 4 The Real Estate Investment**

Total fixed asset investment	Real estate investment
461.93	101.31
508.44	115.34
570.43	132.50
645.06	169.55
822.20	233.30
1055.18	297.99
1325.29	366.15
1732.79	459.75
2252.05	560.36
3001.10	778.59

According to the proportion of fixed investment in real estate development and investment can also be good to explain the real estate market bubble. The calculation results based on data from 2000 to 2009, we found that during this 10 years, the proportion of real estate investment is at least 22 % (in 2000). We conclude that there is the current high proportion of real estate investment in Wuhan City. From another point of view also illustrates the Wuhan City, may exist the behavior of the real estate speculation.

### 3.5 The standard of living in Wuhan

**Table 5 The Standard of Living**

year	Per capita disposable income
2000	564.27
2001	609.53
2002	684.02
2003	750.36

2004	846.40
2005	904.14
2006	1030.00
2007	1196.47
2008	1392.70
2009	1532.08

During 2000 to 2009, the per capita disposable income in Wuhan is growing rapidly. In order to analyze whether the current prices putting pressure on the people of Wuhan City, also to test whether the Wuhan real estate market bubble, we choose the price earnings ratio as an analysis indicator. Due to changes in the price earnings dynamic, we choose the mean value. We found that the Wuhan City, price earnings ratio is in the range of (3, 6) during 2000 to 2009. The reason for this result may be the house price data we select are not able to dynamically reflect changes in real estate prices. On the other hand, it may be caused by a substantial increase in living standards.

#### 4 Conclusions

Based on the above analysis, we can easily find the Wuhan City real estate market may be the existence of the bubble. Of the above problems, we propose the following can contribute to the Wuhan City, real estate found in health countermeasures.

1) Government should provide safeguards

To solve the real estate bubble is not a short-term project. The government should introduce policies and laws and regulations, and to provide more "supply" to adapt to its growing "needs". For example, to provide affordable housing, etc.

2) Improve the diversification of investment channels

From the above analysis, we find that the proportion of investment in real estate is very high. The reasons leading to the emergence of this phenomenon is too monotonous social investment channels. As a result, the real estate market has speculation behaviors. The Government should address the investment channels to achieve a wide range of social investment, to avoid the behavior of real estate speculation.

In this stage of the study, we found that the bubble in Wuhan exists. In the next phase of the study, we will work hard on establishing a clearly quantitative measure of the real estate bubble mechanism.

# Research on Financing Risk Control Based on the Technology and Finance Operation Mode\*

Zhang Youtang, Li Sicheng

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: zyt@whut.edu.cn, lisc89@163.com)

**Abstract:** The organic combination of the finance and technology will greatly improve the speed and efficiency of transforming scientific and technological achievements into real productive forces. With the development of economy, science and technology enterprises demand for more and more funds and finance more and more frequently, which will produce some risks. Based on the service operation mode of technology and finance, this paper analyzes the formation factors of the financing risk, forms financing risk index system of the technology enterprises, and constructs financing risk evaluation model of technology and finance using the artificial neural network. Finally this paper puts forward a series of financing risk control measures to technology and finance and provides decision-making reference for the government and enterprises.

**Key words:** Technology and finance; Technology enterprise; Financing risk; Neural network

## 1 Introduction

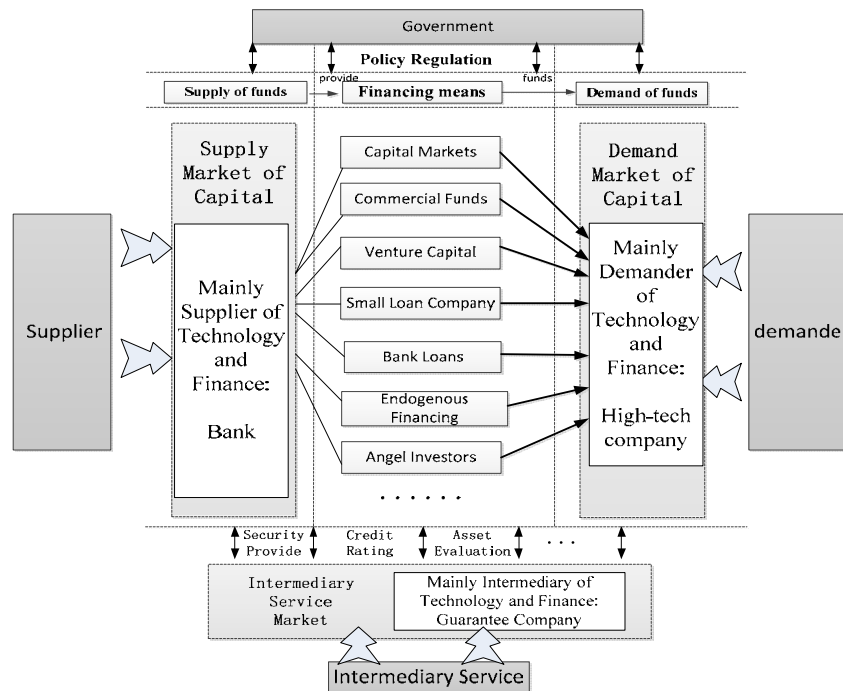

Funds of science and technology enterprise mainly come from financial institutions. However, the current financial market in our country faces too much government control; state-owned financial institutions still dominate the financial market. On this occasion, the correlative operation of technology and finance is difficult to complete spontaneously through the market, so it needs vigorous promotion from the government. Over the years, whether the national science and technology department or the local science and technology committee, they both spend a lot of money to support the development of science and technology enterprises. At the same time, the open economic area and high-tech area also provide financial support for the development of science and technology enterprises in different forms. From the angle of the funds amount, the government's support although could solve the science and technology enterprises' financing problems in some extent, it is still cannot satisfy the enterprises' funds demand. Especially in every stage of the life cycle of technology enterprises, nobody can ensure a steady supply of funds. What's more, government's intervention is a double-edged sword for the development of technology and finance. Although the government's direct and powerful promoting measures achieve the connection between financial and technology in the fastest way, government's intervention may lead the birth defect of the development of technology and finance, and even to bring the huge financial destruction and disaster. In our current technology and finance field, the most important problem which needs to solve is to identify the financing risk factors and take measures to control them from the angle of technology and finance service operation mode.

## 2 Technology and Finance Operation Mode

Zhao Changwen, Chen Chun (2009) hold the view that: technology and finance is a series of systemic and innovative arrangements of financial instruments, financial system, financial policy and financial services to promote science and technology development, achievements conversion and high-tech industrial development. It is a system formed by a variety of subjects—government, business, marketing, social intermediary organizations, which provide financial resources to the scientific and technological innovation activities, together with their behavior in the process of technological innovation financing activities. Based on the above understanding, we think that the technology and finance includes four participants: the first one is the capital demander, such as the science and technology enterprises and the scientific research institutions; the second one is the capital supplier, such as the bank and the risk investment; the third one is the financial intermediary, such as the financial guarantee corporation and credit rating agencies; and the last one is the government acting as the guidance and regulation. The serves of the four major participants will ultimately serve for technological innovation. The operation mode of technology and finance service is shown in figure 1.

---

\* This paper is supported by the Social Science Fund of China (Grant No.11FGL004)

**Figure 1 Operation Mode of Technology and Finance Service**

Enterprises' funding mainly comes from the banks and other financial institutions. However, there are few banks willing to lend money directly to them, because it is hard to predict its future development and assess its solvency when the science and technology enterprise is in the start-up stage. At this time, enterprises can get loan in the way of mortgage and pledge. If the enterprise has a large number of tangible assets to do mortgages, it will be easier to get loans from banks. However, if the enterprise is still in the initial stage, it will be hard to get loans for its mortgage assets are rarely. So it needs to find a new way of financing. The emergence of intermediary institutions just solved this problem. Banks are willing to provide funds for science and technology enterprise for the guarantee companies providing security and the risk of the loans transfer out. But in perspective of the guarantee company things will be different. On the one hand because the high yield the and risks of the high technology industry are so asymmetric, and because it is defined by high concentration of intangible assets and high concentration of the capital, the information of its development is fuzzy, high technology industrial enterprises, especially small and medium-sized enterprise high technology industry are hard to provide effective guarantee responsibility. The Individual has limited capacity to bear risk. On the other hand when enterprise cannot repay the loan, the security companies will be faced with compensatory risk. From two angles, in process of guarantee the company will face great security risk. In this way, science and technology enterprise cannot easily to search guarantee companies acquiring its security. At this time, as one of the main participants, government will play an important role of regulation. On one hand, for guarantee companies, the government's tax support, guarantee subsidies policy will effectively incentive guarantee company providing security for small and medium science and technology enterprise, which makes the enterprise more easy to get money. For capital supplier, the government organization constructs platform sharing information, combines government departments, financial institutions, technology enterprise, guarantee companies together. Sharing information makes the capital suppliers make right decision more conveniently, and evaluate more accurately to avoid the risk. In addition, the government discount of the loan to science and technology can greatly incentive financial institutions to serve technology enterprise.

### 3 Financing Risk Identification Based on the Technology and Finance Operation Mode

#### 3.1 Financing risk factors of technology and finance

To control financing risk of the technology enterprise, we should identify the financing risk factors firstly. The technology and finance operation mode reflects the four main subjects of the economic

relationship. The existence of this interest relation makes a series of financing risk in the technology and finance operation process. Based on the operating mode of the technology and finance, financing risk factors can be summarized as three aspects. That is, financing risk factors from science and technology enterprise, financing risk factors from the supplier funds and financing risk factors from the government. Due to the intermediary service in investment and financing between demander and supplier, its financing risk mainly comes from upstream and downstream subjects, and the government. So we consider that financing risks from the intermediary service subjects can be summed up in the risks factors from the science and technology business enterprise, the supplier and government.

**3.2 Financing risk indicator of technology and finance**

Combined with the actual situation in our country, based on technology and finance operation mode and the financing risk factors above, and in combination with related research achievements, this paper established the financing risk index library from the three subjects: science and technology enterprise, supplier and the government. Technology and finance financing risk index is shown in table 1.

**Table 1 Technology and Finance Financing Risk Indicator**

Subjects	Fist-level Indicator	Code	Second-level Indicator	Code
Capital Demander -- science and technology enterprises (enterprise)	Market Risk	E1	Market maturity of product	E11
			Market competitiveness of products	E12
	Management Risk	E2	Culture degree of management	E21
			Leadership	E22
	Technical Risk	E3	Technology leading level	E31
	Financial Risk	E4	Debt paying ability	E41
			Asset appreciation ability	E42
	Capital Supplier —bank (Bank)	Information Asymmetry Risk	B1	Information asymmetry
Credit Risks		B2	Reimbursement ability risk	B21
			Moral hazard	B22
Operation Risk		B3	Operation personnel quality	B31
			Violate compasses operation risk	B32
Government -- policy guidance control (Government)		Economic Risk	G1	Economy development cycle
	Macro-economic policy			G12
	Technological Policy Risk	G2	Technology tax policy	G21
			Technology guarantee policy	G22
	Financial Regulation Arrangement	G3	Financial business limit	G31

**4 The Control of Financing Risks Based on BP Neural Networks**

**4.1 The design of neural network model for the financing risk assessment**

4.1.1 The data processing of financing risk indicators

For the qualitative indicators in table 1, their scores can be obtained through the Delphi method. And then use the simple weighted average method to calculate the comprehensive scores of the qualitative indicators. The expert evaluation of financing risks can refer to table 2.

**Table 2 Table of the Identification of Financing Risks**

Code	A	B	C	D	E
Types Of Evaluation	Good State	No Warning	Slight Warning	Medium Warning	Severe Warning
Scores	(0.85,1.00]	(0.7,0.85]	(0.50,0.70]	(0.40,0.50]	(0.00,0.40]

4.1.2 The ensure of the network layer of the neural network model

(1) The selection of the input layer

The input layer of BP neural networks, the indicators of technological financing risks, includes 17 risk indicators in three dimensions, indicated by  $X_i$

(2) The design of the hidden layer

The increase of the hidden layer will improve the training complexity and training time of BP neural networks. There is no theoretical guidance for the determination of the hidden layer nodes, which usually using the experience to select formulas to determine them. In this paper, the empirical formula is  $j = \sqrt{n+m} + a$  ( $m$  is output nodes,  $n$  is the input nodes,  $a$  is a constant between 1-10). The number of the hidden layer nodes is 6.

(3) The design of the output layer

Model of the output layer is the measure of the financing risks of science and technology enterprises, so the number of the output layer nodes is 1. In order to position financing risk, we would divide the technology corporate financing risk in accordance with table 2 in this paper: A stands for well-managed and the output of the model is (0.85, 1.00]. B stands for no warning and the output of the model is (0.7, 0.85]. C stands for slight warning and the output of the model is (0.50, 0.70]. D stands for medium warning and the output of the model is (0.40, 0.50]. E stands for severe warning and the output of the model is (0.00, 0.40].

4.1.3 Model simulation and application

The paper collects information of 12 National Torch Plan Key High-tech business operations information in 2011 in Hubei (derived from *Yearbook of the Hubei Science and Technology 2011*, *Hubei Statistical Yearbook 2011*), and invites experts to estimate the risk of various enterprises and picks them as study samples. What's more, the paper selected the design of the neural network toolbox of MATLAB engineering calculation software, trained and detected the BP neural network early warning model. Training sample data input form of the BP neural network model is shown in table 3.

**Table 3 Training Sample Data Input Form of the BP Neural Network Model**

No.	Sample index	C1	C2	C3	C4	C5	C6	C7	C8	C9	C10	C11	C12
1	E11	0.55	0.47	0.45	0.41	0.42	0.46	0.44	0.38	0.41	0.61	0.55	0.45
2	E12	0.56	0.48	0.50	0.50	0.48	0.56	0.53	0.55	0.49	0.60	0.56	0.45
3	E21	0.70	0.68	0.69	0.65	0.71	0.66	0.65	0.64	0.75	0.68	0.62	0.63
4	E22	0.90	0.89	0.95	0.96	0.95	0.90	0.90	0.80	0.95	0.96	0.98	0.94
5	E31	0.86	0.84	0.85	0.87	0.82	0.83	0.86	0.85	0.82	0.89	0.90	0.91
6	E41	0.91	0.92	0.95	0.85	0.80	0.86	0.84	0.83	0.89	0.89	0.90	0.91
7	E42	0.76	0.68	0.69	0.72	0.74	0.71	0.64	0.72	0.75	0.68	0.66	0.61
8	B11	0.60	0.59	0.55	0.70	0.56	0.64	0.71	0.56	0.59	0.62	0.65	0.68
9	B21	0.86	0.75	0.68	0.91	0.85	0.84	0.76	0.94	0.85	0.88	0.91	0.72
10	B22	0.64	0.86	0.87	0.94	0.68	0.67	0.85	0.76	0.78	0.84	0.82	0.79
11	B31	0.86	0.84	0.83	0.89	0.92	0.76	0.92	0.97	0.95	0.93	0.82	0.87
12	B32	0.92	0.87	0.86	0.89	0.91	0.90	0.84	0.82	0.87	0.75	0.90	0.81
13	G11	0.88	0.83	0.92	0.79	0.81	0.80	0.86	0.89	0.91	0.87	0.86	0.85
14	G12	0.92	0.94	0.93	0.90	0.92	0.84	0.75	0.79	0.85	0.88	0.82	0.90
15	G21	0.65	0.63	0.72	0.59	0.61	0.73	0.45	0.68	0.73	0.79	0.64	0.66
16	G22	0.56	0.58	0.67	0.73	0.53	0.45	0.57	0.65	0.54	0.53	0.64	0.73
17	G31	0.61	0.49	0.54	0.57	0.67	0.47	0.55	0.53	0.55	0.64	0.72	0.62

Initialize the BP neural network, call newff() function, construct a prior to the BP neural network, and do the following initialization: activation function of hidden layer using tansig function; activation function of output layer logsig function; to ensure the convergence speed of training function, we choose the trained function; Performance function uses the default function, that is the mse functions; The

computation error is 0.01; the maximum learning number is 5000; the former 10 sample is the training sample, the last 2 sample is the inspection sample. As is shown in figure 2, after 3181 times training, network convergence achieves stability, Performance reach the standards, training is finished. The training output of the BP neural network model is shown in table 4. The risk level judgment refer to table 2.

Figure 2 Network Training Error Drop Curve

Table 4 Training Output of the BP Neural Network Model

No.	C1	C2	C3	C4	C5	C6	C7	C8	C9	C10
Desired Output	0.45	0.68	0.57	0.81	0.75	0.71	0.69	0.78	0.63	0.49
Actual Output	0.66	0.71	0.56	0.74	0.66	0.67	0.70	0.68	0.54	0.64
Risk Level	C	C	D	C	C	C	C	C	D	C

The paper standardized the index of 11, 12 samples and summaries expert practical assessment result of them, respectively as the input data and desired output data of model test. Testing results is shown in table 5.

Table 5 Network Output and The Expected Output

No.	C11	C12
Desired Output	0.63	0.58
actual output	0.7444	0.4969
Expected risk level	C	D
Actual risk level	C	D

The testing results indicate that the financing risk assessment results of the two enterprises are grade C risk and grade D risk, which are the same as the expected risk assessment. Therefore, the example shows that technology enterprise financing risk control model based on the BP neural network is effective. The model after trained and tested can be used into the actual operation, and help the enterprise to take corresponding financing risk control measures.

**4.2 Financing risk control measures of technology and finance**

**4.2.1 Financing risk control measures of technology enterprises**

Enterprises can control its risks mainly from the following aspects. Firstly, enhance the sense of competition, improve its own innovation ability and accelerate the technological transformation and upgrading speed of products. Secondly, establish a good credit concept to obtain the trust and support of the capital market, clear the various financing channels and reduce financing risks. Thirdly, strengthen analysis and judgment ability of the economic form and the national macroeconomic and financial policies. According to the changes of macroeconomic policies, make sufficient use of the advantage of technology enterprise that it's small enough to adjust its business strategy, financing strategy, financing mode and financing scale timely.

**4.2.2 Financing risk control measures of capital suppliers**

Chinese capital suppliers mainly referring to commercial banks should try hard from the following respects to prevent and control of technological enterprise's financing risk. At first, improve the credit

management mode of commercial banks in order to adapt to the technological enterprise financing demand better. Secondly, commercial banks should establish specialized credit department for technological enterprise to provide its financing support. At last, extend the corresponding intermediate business of commercial banks. During the process of reform, commercial banks should actively expand the intermediate business such as trust, commission, insurance agents, guarantee, consulting and custody.

#### 4.2.3 Government's control measures for technology and finance financing risk

Collaboration of technology and finance is inseparable from government's guidance and regulation. In order to control the technological enterprise's financing risks. Government should make effort in the following aspects.

1) Improve tax preference policy. Seen from the technology and finance operation mode, the financial objects are not only technological enterprises, such as the sell and transfer part of the implementation which could have tax incentives in the process of the product sales, but also the guarantee agencies and the supply side. Guarantee agency exists between capital supply and demand sides of the middle, which have danger in upstream and downstream. It's a great inspire that the bonding companies to provide scientific and financial services as the technology guarantees policy, in favour of technology enterprises to raise funds.

2) Build the platform of technology and finance information. In order to put government departments, financial institutions, high-tech enterprise, security companies together, enable information sharing, the government should build science and technology enterprise information platform. On the platform, record individual's credit of enterprises, technicians and entrepreneurs, carry out scientific and technological assessments of credit rating.

3) Formulate supportive policy of science and technology guarantee. Government should establish institution of financial participation, set up guarantee risk compensation fund by the finance, guarantee agencies, banks and many other institutions, and compensate for the risk from the large-scale technology projects guarantee.

## 5 Conclusions

Through the study, there are two major conclusions: one is that because of the economic benefit relations will form the corresponding financing risk, technology and finance capital supplier, demander and intermediary institutions in the operation process of technology and finance will face the possibility of technology and finance market imbalances. As one of the main technology and finance participants, government should play the regulatory role; the other is that using BP neural network to construct financing risk evaluation model of technology and finance has the feasibility and practicability. The financing risk indicators contain qualitative and quantitative indicators, BP neural network can organic combine them. The analysis results can help enterprise to locate financing risk accurately.

# Research on Disclosure of Other Comprehensive Income for A-Shares Market

Huang Jiating

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: huangjiat07@163.com)

**Abstract:** In order to fulfill the internationalization of the accounting standard and provide the enterprises' real income to the users of accounting information, Ministry of Finance promulgated the No. 3 Explanation of Accounting Standards for Enterprises. It meant that other comprehensive income (OCI) was introduced and applied officially. Based on the overseas and domestic research status and the method of descriptive statistics, this paper analyzes the other comprehensive income disclosure of A-share listed companies and reveals the main problems in other comprehensive income disclosure. Finally this paper offers some proposals about the other comprehensive income disclosure system's rebuilding of A-shares listed companies for purpose of enhancing the information quality of listed companies' other comprehensive income disclosure.

**Key words:** A-shares market; Other comprehensive income; Information disclosure; Method of descriptive statistics

## 1 Introduction

Comprehensive income<sup>[2]</sup> first appeared on SFAC No.3. According to the definition of SFAC, comprehensive income is the change in equity of a business enterprise during a period from transactions and other events and circumstances from non-owner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners.

Interiorly, comprehensive income has its evolution course. On February 15th, 2006, Ministry of finance issued new Accounting Standards for Business Enterprise which realized the convergence with IFRS. Firstly, the new standards were carried out by listed companies. Then, they were spread to state-owned enterprises and financial enterprises gradually. Later, IFRS has been carried out a series of revision. In order to keep the same space with IFRS and solve the problem in the implementation process of new standards, Ministry of finance issued a series of supplementary regulations.

The system of new standards brings the concept of Balance sheet, but it doesn't require disclose the comprehensive income in the report form and foot-notes to the financial statements like IFRS. Concept of OCI firstly appeared in the No. 3 Explanation of Accounting Standards for Enterprises, corporations were required add the items of OCI and comprehensive income in the profit statement. In order to make OCI more easily to understand, Ministry of finance issued the document about listed companies and unlisted companies implementing financial accounting standards to prepare annual report of 2009 well. Meanwhile, the format of statement of owners' equity was adjusted and detail regulation about disclosure of OCI in the foot-notes to financial statements was established. With this, comprehensive income has been applied formally.

Based on this situation, the domestic scholars began to pay attention to the prevailing research field which was about disclosure of comprehensive income. Before 2009, most domestic scholars, for instance Ge Jiashu, only touched upon introducing and researching the report which were about how to improve the enterprise performance, which was similar to the situation of foreign theoretical circles. However, after the No. 3 Explanation of Accounting Standards for Enterprises made relevant stipulations on disclosure of OCI, the research fields began involving relevant the disclosure of financial statement. Although they still mainly focused on its specifications and criteria, much research on the current situation of OCI has been done on the basis of the market statistics. But proposals about the OCI disclosure are not given from the whole perspective. This paper covers this shortage and aim to improve the information quality of OCI disclosure.

## 2 Analysis of A-Share Listed Companies in OCI Disclosure

### 2.1 Current situation of OCI disclosure

Overall, the 2009 information disclosure was not ideal, only a few companies disclosed information of OCI in the profit statement. Because it was the first year of OCI disclosure which has been required by Ministry of Finance and CSRC. According to the annual financial report data from

Guo Tai An database, Statistics found that only 15.12% of the A-share listed company disclosed the information of OCI in 2009. But the situation have been greatly improved in 2010, the proportion increased to 43.31%. Looking up the annual reports of listed companies, the fact could be found the vast majority of the companies which have disclosed the OCI have restated this information which was in the previous year. Compared with the situation of 2010, there has been further improved in 2011. The companies which have disclosed the OCI accounted for 91.71% among the 2341 A-share listed companies. It can be seen, as time goes by and with the enhancing of companies' attention, the disclosure of OCI have been improved.

Among the companies which have disclosed OCI in 2009, there were 74 companies which have disclosed OCI of negative, accounting for 28.9% of the total number of disclosure. On the contrary, there were 191 companies which have disclosed OCI of positive, accounting for 72.1% of the total number of disclosure. But this situation has changed dramatically in 2010. The number has become 562 which have disclosed OCI of negative, accounting for 61.42% of the total number of disclosure in this year which has risen comparing to last year. And the number has become 353 which have disclosed OCI of positive, accounting for 38.58% of the total number of disclosure which has fallen. There were two reasons for this change. The depression of China's stock market led to the fair value of available-for-sale financial assets which were held by the listed companies reduced, this resulted in the dropping of OCI. On the other hand, the dollar's devaluation led to losses which were produced by currency translation differences, it could result in OCI of negative and offsetting effect to comprehensive income. Among the companies which have disclosed OCI in 2011, the number was 781 which have disclosed OCI of negative, accounting for 76.72% of the total number of disclosure, and there were 237 companies which have disclosed OCI of positive, accounting for 23.28% of the total number of disclosure. This situation was better than the previous two years.

Below three tables are the descriptive statistic about net profit, OCI and comprehensive income regard to the companies which disclosed their OCI from 2009 to 2011, the data bases on A-share market annual reports which were provided by Guo Tai An database. (Unit: yuan)

**Table 1 Descriptive Statistics of the 2009 Earnings**

Items	Net profit	OCI	Comprehensive income
Mean	587421956	103601926	690749878
Median	66444683	1674987	96666368
Minimum	6737130612	319000000	6494186182
Maximum	1456000000	765700000	2213900000

**Table 2 Descriptive Statistics of the 2010 Earnings**

Items	Net profit	OCI	Comprehensive income
Mean	1692366805	-73053905	1619320029
Median	147974622	-278914	142729428
Minimum	-2740394151	-1621600000	-2903628046
Maximum	16602500000	279600000	16195300000

From table 1 and table 2, we can see that the mean of OCI is 103601926, median is 1674987, both of them are positive value, they have a positive effect to the item that increases the amount of the comprehensive income; In 2010, the mean of OCI equals to -73053905, median is -278914, both of them are negative value, they have a negative effect to the item that decreases the amount of the comprehensive income. As stated above, the reason of this phenomenon appearing is that the macro-economic environment has changed. This change lead to the loss of translation reserves, which was caused by recession in the stock market and devaluation of foreign currency assets in the whole 2010. All of these gains and loss cannot be disclosed in the traditional profit statement. These gains and losses cannot be realized in the report period, but they have a profound effect on the future accounting surplus and liquidity of assets.

**Table 3 Descriptive Statistics of the 2011 Earnings**

Items	Net profit	OCI	Comprehensive income
Mean	1767285785	-116410511	1652415599

Median	0	-1214860	130738944
Minimum	-8838826405	-24214000000	-10883552399
Maximum	208445000000	3142000000	200494000000

Base on the statistics in table 3, the mean of OCI is -116410511, the median is -1214860, both of them are negative value. So they produced the negative effect on comprehensive income amount, which were more than 2010. The reason of this phenomenon is the continually uncertainty in macro-economy. On the one hand, domestic stock market experienced a big adjustment this year, the amount of market financing and stock trading volume declined a lot, market sentiment depressed and needed to be recovered. On the other hand, although the financial crisis has passed for 3 years, the economy in Europe and US are still in the shadow of the recession. it's coupled with the gradual deepening of the European sovereign debt crisis, loose monetary policy in countries and the rapidly rising commodity prices which exacerbating inflation in emerging market countries. All of these produced significant impact on accounting earnings and liquidity of assets for the future business.

After three years' practicing, although enterprises performance was not so satisfactory, but it's undeniable that the No. 3 Explanation of Accounting Standards for Enterprises is more comprehensive in the evaluation of the enterprises' OCI disclosure and more helpful for the information users making reasonable decision.

## 2.2 Existing problems of OCI disclosure

### (1) Articulation error of income statement and owner's equity statement

Articulation<sup>[1]</sup> is the logical relation which can verify each other. In the financial report with the same company and the same period, this logical relation must exist between income statement and owner's equity statement. During disclosing the OCI, articulation error appeared in the financial statements of some firms. The error was embodied in the inconsistent amount of OCI items between the profit statement and owner's equity statement.

### (2) Unauthentic presentation of OCI

It mainly reflects that increasing and decreasing the number of OCI<sup>[3]</sup>. The situations of increasing the number are as following: putting the capital transaction into OCI, putting part of the modification of retained earnings into this item, mistakenly adding the change of equity which comes from the capital transaction of subsidiary into this item, ignoring to put the income tax into the item which is ought to be done. The opposite means that some items which should be added into the comprehensive income subject are left out, it will make the amount of comprehensive income incorrect. There are many factors can lead to such a situation. For example, forgetting to put the translation reserve into comprehensive income, not rolling out the comprehensive income when the firms handle the situation like losing the control right of subsidiaries, etc.

### (3) Lacking of sufficiency and relativity on financial statement presentation

Bringing in the item of comprehensive income makes the financial statements reflect the firms' performance well. But, as a new thing, the implementing time is too short to understand it overall by the employees of the firms, which lead to lack of sufficiency and relativity in the process of preparing the financial statements and disclosing relative information. The outstanding performance shows that some companies present the comprehensive income in the financial statement, however, they only present the remaining balance of some certain accounting period, amount changing cannot be seen in the item, which makes users of financial statements not have a good understanding about the item of OCI, this is contradictory to the original intension about bringing the OCI into the profit statement. What's more, it will lead to opposite effect which will annoy the users of financial statements to understand the real income of the firms and affect their decision.

## 3 Rebuilding of A-shares Market OCI Disclosure System

### 3.1 Accounting standards layer

#### (1) Making the definition and difference between OCI and capital transaction more explicit

Because the new accounting standard system has neither the explicit definition of capital transaction nor the explicit principal of it, this lead to lots of companies regarding capital transaction as OCI and listing it in profit statement. Suggestion here is making utility and instruction of capital transaction more explicit, so that the definition and difference between capital transaction and OCI can be distinguished clearly.

#### (2) Setting the confirmation of OCI item more explicit

Lots of matters which are directly recorded in the owner's equities exist in the accounting standard system. The proposal here is defining the transactions and matters of it, specifying the essence of those matters, and then specifying the principle of confirmation. At the same time, making the regulation of special OCI items is also important, such as shadow accounting invent by insurance companies.

### (3) Adjusting the accounting subject

Accounting subject of OCI should be set separately. Transactions and matters which belong to OCI can be count into OCI accounting subjects. OCI secondary accounting also can be set under capital reserve item to isolate the capital reserve from OCI and the capital reserve from capital transaction. This can avoid the confusion between the two definitions and make statistical data and report filling more convenient.

### 3.2 Layer of operational practice

A part of reasons of unauthentic figures appeared in OCI report is leadership's dressing, but the most important reason is the finance staffs' inaccurate understanding about the accounting standards. And a lot of OCI report problems still appeared in 2009~2010 listed companies' financial statement after the auditing by China CPA (Certified Public Accountant), it indicates that there are still some auditors haven't enough understanding of comprehensive income and OCI.

Encouraging the related persons to understand of OCI overall is the key to solve these problems. Let them eliminate the misjudgments of OCI, clarify the difference between OCI and capital reserve, and then disclosure the correct OCI items in the routine affairs processing and financial statement forming, so that the enterprises' OCI can be reflected authentically. The release of 2010 and 2011 annual reports reflected that the authors of financial statements and related auditors has more explicit understanding of OCI items, lots of confusions have been clarified, and OCI disclosure was becoming more standard and abundant than 2009.

### 3.3 Layer of supervision

The purpose of introducing the OCI is providing the real performance of corporate<sup>[4]</sup> to report users, and letting them make reasonable decision. But there still has opportunities to let leadership dress the reports because there are loopholes existed in the OCI disclosure, it leads to the results that the purpose and request required by the No. 3 Explanation of Accounting Standards for Enterprises cannot be reached, so the supervision becomes the most important things. Although some related supervision organizations have already paid attention to OCI report and disclosure, but they didn't do enough.

In order to let listed companies provide reliable income information, related supervision organization could establish a supervision mechanism regard to OCI report and disclosure. The list of those companies should be published which didn't disclosure their OCI items according to the disclosure principle to let leadership pay enough attention on it. At the same time, the problems should be summarized and analyzed every year and the feasible proposals for these problems also should be raised.

## 4 Conclusions

Though summarizing and analyzing the disclosure of A-share listed companies' OCI from 2009 to 2011, the major problems of OCI's presentation and disclosure could be exposed. In order to solve these problems, suggestion to refactor A-shares market OCI disclosure system should be put forward.

(1) At accounting standards layer, standards setting organizations should optimize the provision to guide the disclosure of OCI. Particularly, they should make a clear definition for OCI and capital transaction, have a distinction between them and make the OCI item more explicit. In addition, the accounting subject should be adapted to the OCI's recording.

(2) At the layer of operational practice, training for relevant employees should be strengthened in order to let them understand and handle the OCI item more comprehensive.

(3) In the supervision level, the supervisory mechanism about OCI's report and disclosure are needed urgently because the time of introducing the OCI items is too short, so it can guide and supervise the listed companies to the disclosure of OCI.

The research of this article aim to enhance the information quality of the OCI disclosure, but whether this disclosure can provide much more information to users of the financial statement, it needs much more in-depth research.

# Measuring Market Liquidity at Shanghai Stock Exchange Based on the Generalized Dynamic Factor Model

Cui Dezhi

Wuhan Vocational College of Software and Engineering, Wuhan, P.R. China, 430000  
(E-mail: 281516417@qq.com )

**Abstract:** Market Liquidity is crucial and unobservable in finance field. We defined the commonness in liquidity across securities, and then apply the Generalized Dynamic Factor Model with block structure to extract market liquidity from three observed liquidity measures: daily excess volatility, daily turnover and daily resilience. Using GDFM without any restrictive assumptions on the data generating process, the extracted market liquidity consider time dependence and commonness. The empirical results show that the three liquidity measures appear to be driven by one-dimensional common shocks, and the composite liquidity calculated based on the commonality as market liquidity is highly related to other market liquidity measures, which therefore qualify as market liquidity shocks.

**Key words:** Market liquidity; Liquidity measures; Shanghai stock market; Generalized dynamic factor model; Block structure

## 1 Introduction

Market liquidity is the embodiment of market operation quality. Rise of empirical finance pushed forward the highlight of the critical role of market liquidity in asset pricing and market efficiency. Current researches on liquidity domestic focus on market liquidity, the factors of liquidity, liquidity premium and liquidity risk measures. In empirical analysis, how to measure the stock market liquidity becomes a key and fundamental issue naturally.

Researches on the whole market liquidity focus on not only the commonality in liquidity and its varying characteristics, but also the relation between the commonness and idiosyncrasy. Therefore, comparative analysis of liquidity can be developed in different stock markets indifferent regions or different types of stock markets. Stock liquidity measures reflect the liquidity from different dimensions separately, and the dimensions conflict mutually. Chordia et al. (2000) found that there is a common component among various liquidity measures, and Amihud(2002) held that market liquidity results in price differences across assets. Brockman and Chung(2002) found that the commonness in individual stock at least partly is determined by market factor, and there is co-movement between the variation of stock liquidity and market or industry liquidity. The co-movement is also found in China, see Song and Tan(2005) and Yu and Gong (2008). Chordia et al.(2001) regarded market liquidity as the weighted average of all stocks liquidity. Given the papers mentioned above, we define the common factor among different liquidity measures as market liquidity.

The generalized dynamic factor model integrates the dynamics of common factors in the exact factor model and the non-orthogonal idiosyncratic terms in static approximate factor model. The GDFM in the presence of block structure applied in the analysis of market liquidity can handle several liquidity measures, jointly or separately. For  $K=2$  blocks, the GDFM decomposes the Hilbert space spanned by all liquidity measures into four mutually orthogonal Hilbert subspaces. And then, projecting individual liquidity measure onto the four subspaces yields strongly common, strongly idiosyncratic, weakly common and weakly idiosyncratic components, respectively. See Hallin and Liška(2008) for details.

## 2 Data

We considered the normal-listed A-share stocks in Shanghai market, that listed before Wednesday January 4th, 2006, and that were still listed normally in the following years. The data was gathered from RESSET finance database, for each stock, including the basic information and transaction data. In order to reduce the abnormal effects, we excluded the stocks with long-time suspension, or without share reform, or with delisting risk or special treatment during the period under study. Then, this leaves us a sample for study with  $n=376$  stocks  $T=1459$  observation dates, and missing values of the sample stocks were interpolated.

Because of the limitation of data acquirement, we selected three observable liquidity measures. The first one is excess volatility adopted from the SEC report, defined as the difference between intraday and interday price range. The second measure is turnover rate multiply 100. The last one is the daily

resilience. The three measures, denoted by  $EXV_n$ ,  $TR_n$  and  $RESIL_n$  respectively, are in ratio form for the purpose of dimensional consistency, and each of them covers a different dimension of liquidity, proxy for tightness, depth and resilience respectively.

**Table 1 Descriptive Statistics of EXV**

EXV	m	IQR	m-v	IQR-v
All	0.0474	0.0059	0.0016	3.50E-04
$[0, Q^{0.25})$	0.0415	0.0036	0.0013	2.06E-04
$[Q^{0.25}, Q^{0.5})$	0.0464	0.0015	0.0016	8.56E-05
$[Q^{0.5}, Q^{0.75})$	0.0491	0.0014	0.0017	7.91E-05
$[Q^{0.75}, +\infty)$	0.0526	0.0019	0.0019	1.20E-04

**Table 2 Descriptive Statistics of TR**

TR	m	IQR	m-v	IQR-v
All	2.9806	1.2470	7.6206	5.9672
$[0, Q^{0.25})$	1.7921	0.6272	2.7578	1.5239
$[Q^{0.25}, Q^{0.5})$	2.6865	0.2921	5.5999	1.5442
$[Q^{0.5}, Q^{0.75})$	3.2546	0.2634	8.3508	1.6940
$[Q^{0.75}, +\infty)$	4.1893	0.6204	13.7741	3.7543

Table 1,2 and 3 shows the descriptive statistics of the means and variances of the three liquidity measures per stock over the sample period, including the cross-sectional means(denoted m and m-v) and interquartile ranges(denoted IQR and IQR-v). It is evident from the table that the larger the mean of the liquidity measure is, the larger the variance is, and that the interquartile range is larger on the tails of the distributions of the liquidity measures. Phillips-Perron unit root tests showed that, at 1% confidence level, all the liquidity measure series are second order stationary. In addition, liquidity time series are strongly autocorrelated and persistent, especially for the averaged turnover rate and daily resilience. Scatter plot of the three liquidity measures showed a cloud with a fuzzy gather and presents undefined principal directions, which means that we should be modeled via GDFM method.

**Table 3 Descriptive Statistics of RESIL**

RESIL	m	IQR	m-v	IQR-v
All	0.0382	0.0045	5.08E-04	1.01E-04
$[0, Q^{0.25})$	0.0334	0.0031	4.08E-04	5.20E-05
$[Q^{0.25}, Q^{0.5})$	0.0375	0.0013	4.83E-04	1.65E-05
$[Q^{0.5}, Q^{0.75})$	0.0396	0.0011	5.33E-04	2.75E-05
$[Q^{0.75}, +\infty)$	0.0423	0.0015	6.09E-04	5.88E-05

### 3 Results

Using the Hallin and Liška (2007) information criterion, we identify the numbers of dynamic factors. That is, the dynamic dimensions of the common spaces of the seven (sub)panels  $EXV_n$ ,  $TR_n$ ,  $RESIL_n$ ,  $EXV_n - TR_n$ ,  $TR_n - RESIL_n$ ,  $EXV_n - RESIL_n$  and  $LIQ_n$ . Identification is based on a visual inspection of figure 1.

The first plot in figure 1 shows that  $q_{EXV}^* = 3$  (for  $c \in [0.153, 0.159]$ ), and likewise  $q_{TR}^* = 6$  (for  $c \in [0.156, 0.162]$ ),  $q_{RESIL}^* = 2$  (for  $c \in [0.149, 0.159]$ ),  $q_{EXV-TR}^* = 6$  (for  $c \in [0.134, 0.135]$ ),  $q_{EXV-RESIL}^* = 2$  (for  $c \in [0.118, 0.120]$ ),  $q_{TR-RESIL}^* = 6$  (for  $c \in [0.127, 0.134]$ ),  $q_{EXV-TR-RESIL}^* = 6$  (for  $c \in [0.121, 0.123]$ ). All plots 3 leads to a selection of one single common factor. This means the three liquidity measures share the same common space, and the shocks driving commonness in relative spread and commonness in volume are the same. In the other hand, this may indicate that market liquidity effects are originated from the market itself, then the one-dimensional factor strongly qualifies as the unobservable market liquidity shock.

Figure 2 presents the decomposition, the percentage of total variation explained for each liquidity measure. Apparently, market liquidity accounts for 23.88% of total variations of excess volatility, for

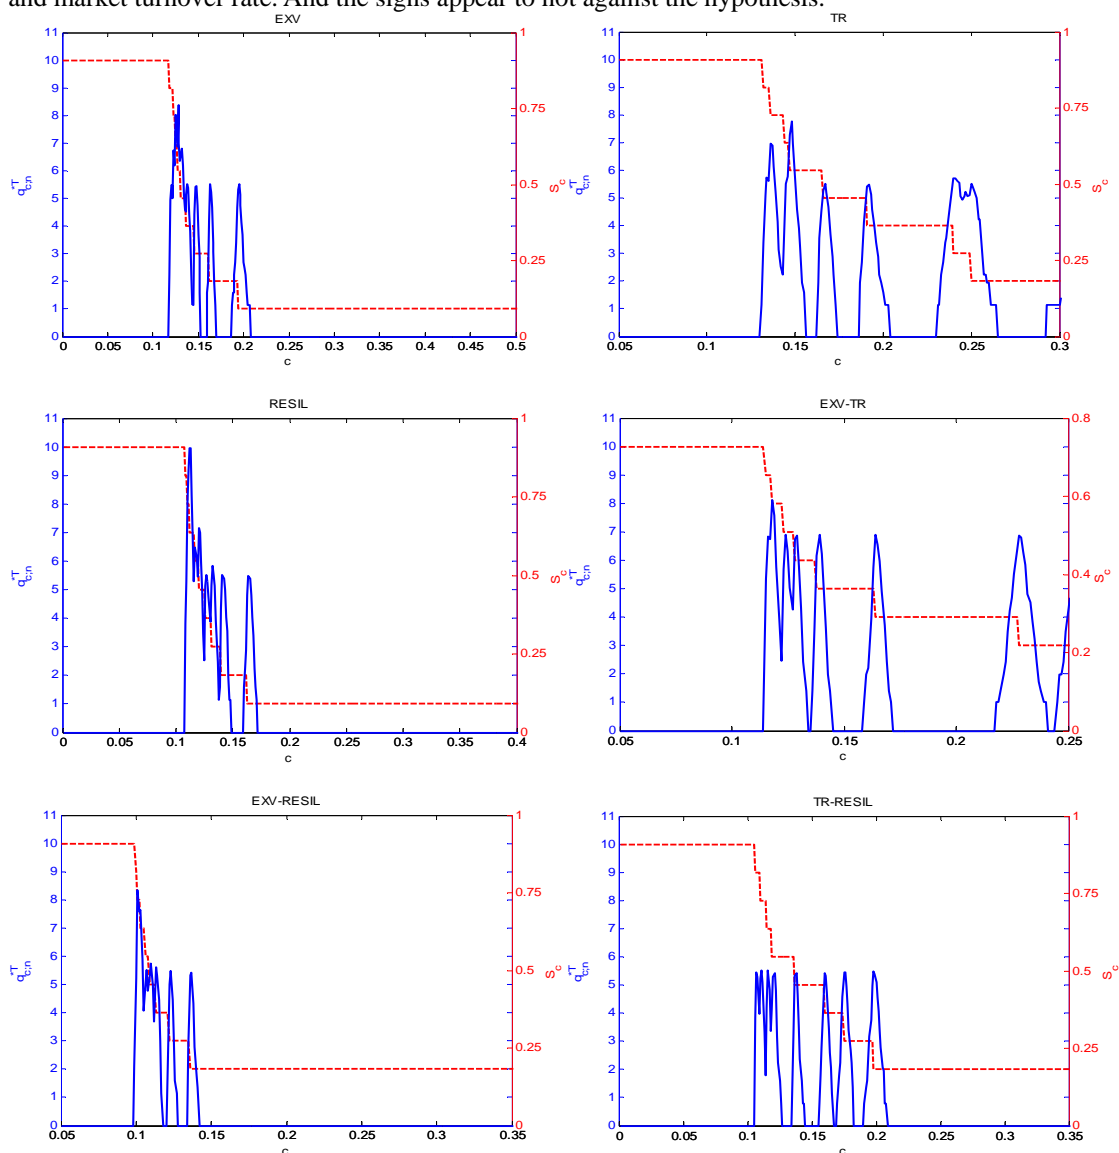

13.96% of total variations of turnover rate and 14.90% of total variations of daily resilience. These proportions are larger than the conclusion abroad. Partly because the model itself allows for cross-correlation among the idiosyncratic components, and partly because in the paper, we took Chinese stock market for study, and the market is not mature compared with developed markets abroad.

**Table 4 Correlations Between the Composite Market Liquidity and Other Measures**

Correlation	Pearson	Kendall's tau_b	Spearman
ILLIQ VS MTR	0.115***	0.134***	0.206***
ILLIQ VS CLIQ	-0.418***	-0.265***	-0.389***
MTR VS CLIQ	0.387***	0.410***	0.576***

\*\*\*. Correlation is significant at the 1% confidence level (2-tailed).

As in Ref.[1], the extracted commonness can be equal-weighted averaged as the composite market liquidity(denoted CLIQ) and then qualifies as market liquidity measure. Furthermore, we computed the correlations between the other measures former scholars proposed. In table 2, ILLIQ denoted the market wide illiquidity, while MTR denoted the market turnover rate. The results shows there are strong relations between the composite market liquidity measure and other measures such as market illiquidity and market turnover rate. And the signs appear to not against the hypothesis.

Figure 1 Identification of Dynamic Factors

#### 4 Conclusion

The GDFM disentangles the assumption of the relation between commonness and idiosyncrasy, and can handle co-movement and time dependencies at the same time to draw a clear distinction between common and idiosyncratic components, and estimate the dimension of the common space to identify the commonness over different liquidity measures. In the paper, we extracted one-dimensional common factor, which strongly qualify as the market liquidity shocks. And for the composite liquidity measure, the correlation test shows the composite liquidity is feasible and significant.

**Abstract:** Innovation is often associated with competitiveness, economic performance and economic growth; it is accepted that Innovation is one of the efficient means to obtain a superior and a stable position in the marketplace. In the last few decades; the literature has shown that the growth in the stock of knowledge has been the most important factor behind the dramatic rise in living standards in countries that show a broad convergence in macroeconomic performance. Countries, also, all around the globe are paying a great attention to Innovation as well as to the whole national innovation system (NIS); While some other countries are still in need to gather their efforts in ways that drive the innovation activities development.

This paper aims at identifying the main characteristics of the NIS of Algeria, it, also, highlights the key innovation problems and obstacles of industrial firms, mainly in North African Countries. Our work is based on the one hand on a theoretical, and comparison study, of the National innovation system, of the Maghreb countries. On the other hand it stands on a field research carried out on a sample of Algerian industrial firms, the interpretation and analysis of the results of our survey through using both, descriptive analysis and logistic regression helped identifying the core characteristic of the Algerian innovative enterprises, in addition to the main obstacles of innovation in Algeria; in Maghreb countries, innovation systems construction takes place in a very specific environment characterized by privatization of public concerns, the rise of a strong Small & Medium enterprises sector but with very little experience in the fields of R&D and innovation, and a relatively weak industrial sector in terms of industrial performances, suffering high obsolescence both in terms of human resources, equipment and linkages between the different actors of the innovation system, which negatively affects the role played by research on development processes. Some recommendations, for a well-functioning national innovation system for Maghreb countries, have been drawn from this study.

**Key words:** Innovation; National Innovation System; R&D; Logistic Regression; Algerian firms; product & process innovation.

### 1 Introduction

Let's try for a moment to think of a world without airplanes, automobiles, telecommunications, televisions, refrigerators, telephones, internet, agriculture ...where would we be without essential stuff for our lives such as alphabet, languages, printing etc? Maybe you would not be able to read this paper, and I, of course, would not be able even to write a word in it. Without Innovation our world would look very, very different, hence Innovation is as old as mankind itself, there seems to be something naturally human to thing about new and better ways of doing things and try them out in practice. In spite of its clear significance, innovation has not always got the scholarly attention it deserves, except in the last few decades; nevertheless, some authors have been interested in innovation processes, from the viewpoints of economic growth, changes and progress (Schumpeter 1939; Schmookler 1966; Freeman 1990; Kline & Rosenberg 1986; Dosi 1982; Amendola & Gaffard 1988, etc.), of social and organizational changes (Rothwell, 1994; Chandler 1990; Callon, 1994, etc.), or from the sociological and managerial viewpoint (Crozier & Friedberg 1977; Mintzberg 1982; Akrich, Callon & Latour 1988; Alter 2000, etc.).

Most authors, economists and theoreticians in the field of innovation have generally accepted that innovation is a key condition for economic success (Hamel, Gary & Gary Getz 2004; Audretsch et al 2000). It has also been argued that the most remarkable examples of growth have been based on 'upsetting innovation's platform. (Christensen et al. 2002). While much has been written on the role of innovation on economic growth, including the influential work of Schumpeter from the 1930's, only lately has there been a compelling folder made to argue that external environmental factors are at least as important as internal factors in motivating innovation. In particular some location based advantages such as the privileged access to information and institutions, the local economic, social, technological

and political factors, and moreover the ability of acceptance in the local market by consumers (Porter, et al. 2001), mainly because there seems to be found a kind of strong effect of consumer desires and needs on the innovativeness of Industries; Schumpeter (1942) declared that Changes, including unexpected results and ongoing processes of creative destruction, create a need for systematic innovation of products, processes and management practices. He also defines Innovation as the process and outcome of creating something new, which is also of value. Michel Porter identifies it as “new way of doing things, which is commercialized. The process of innovation cannot be separated from a firm’s strategic and competitive context...” one of the more cogent definitions of innovation is to be found in Theodore Levitt’s work. According to Levitt, “To be innovative, an idea must be creative and it must be implemented” (Levitt, 2002). Nevertheless; particular emphasis was placed on Hamel’s ‘Design Rules for Innovation’ and Drucker’s comments on industry and market changes, demographic changes, and changes in perception (Hamel, 2000; Sutton, 2001; Drucker, 2002). This emphasis was balanced with consideration for the external environment, including factors such as preferential access to information and information flows (Porter & Stern, 2001). Rogers simply identifies innovation in general as “any idea perceived as new by a person or system” (Rogers, E.M. 1992). Bingham also accepts the definition of innovation as “the first or early use of an idea by one of a set of organizations with similar goals” (Bingham, R.D. 1976). Altshuler and Zegans stress (1990) action by defining innovation as “novelty in action”.

Meanwhile Change is the key point in Moore, Sparrow and Spelman’s definition of innovation, “any reasonably significant change in the way an organization operates, is administered or defines its basic mission,” (Moore, M. H. et al. 1997 ). In Lynn’s definition of innovation “innovation is an original, disruptive and fundamental transformation of an organization’s core tasks”. (Lynn, L. E., Jr. 1997.). Van de Ven et al (1999) suggested that the best strategy which can be taken is to avoid being stuck in the middle, and remain to different solutions/ideas; From this point of view the stress is moved from the introduction of specific new and useful ideas to the general organizational procedures and processes for generating, considering, and acting on such insights leading to important organizational improvements or novelty of products, services, or processes. Through these diversities of perspectives, creativity is in general seen as the source for innovation, and innovation as the successful implementation of original and creative ideas within an organization. Table 1 which follows provides a comparison between four main concepts linked together in so many areas, which are innovation, creativity, invention and science.

**Table 1 – Innovation, creativity, invention and science**

<b>INNOVATION vs INVENTION</b>
<b>Invention</b> is the creation of a new concept. <b>Innovation</b> is reducing that concept to practice, and making it a commercial success.
<b>INNOVATION vs CREATIVITY</b>
<b>Creativity</b> is coming up with ideas. <b>Innovation</b> is bringing ideas to life.
<b>INNOVATION vs SCIENCE</b>
<b>Science</b> is the conversion of money into knowledge. <b>Innovation</b> is the conversion of knowledge into money.
<b>Source: Composed according to Feldman, M., 2004</b>

Arguably, we understand the role played by innovation in economic change, mainly because innovation introduces novelty (variety) into the economic field, for the reason that without innovation the economy will settle down in a “stationary state” with little or no growth (Metcalf 1998), therefore, innovation is essential for long-run economic growth. Furthermore; innovation tends to gather in certain fast-growing sectors, leading to structural changes in so many areas such as production, demand technologies and, ultimately, organizational and institutional changes. The capacity to be the leader in any market or business issue is central for the ability to take advantage from innovation. Innovation also is a powerful explanatory dynamic behind dissimilarities in performance between organizations, regions and countries. Industries that succeed in innovation growth, at the expense of their less able competitors, Innovative countries and regions have higher productivity and income than the less-innovative ones.

Without a doubt, innovation is one of the essential factors of business performance as well as economic growth, the interactions between innovation and success have been and are still being a central topic of a number of studies; Schumpeterian and Neo-Schumpeterian analyses and endogenous growth theories are ones of the most interesting works in this field. Schumpeter for instance builds

almost all of his studies and literature upon technological innovation, which is mainly based on Research and development (R&D); he highlighted the relationship between economic growth and innovation. Schumpeterian and neo-Schumpeterian analyses emphasized also the role played by the public policies to support innovation; mainly through sustain strategies within the country, as exemplified by Schumpeter's "psychological" theory of entrepreneurial behavior (Fagerberg; 2003). Likewise, most work on knowledge focuses on individuals, not organizations. Except Nelson and Winter's work (1982), on "organizational memory" and its links to practice lined the way for much subsequent work in this topic. However, In the late of the 1980s, a new conceptual framework appeared in the economic literature, which is called The National Innovation System, by researchers like Freeman, Lundvall and Nelson, this framework suggests that the research system's main goal is Innovation, and that the system is a component of a larger system composed of government, universities, research labs, and industries and their environment (Godin B. 2007); since then, and because of human resources development, the flow of foreign direct investment (FDI) and the rapid economic growth in some countries such as the US, the EU member countries, Japan, China, developments in the field of science, technology and innovation helped to make those countries and regions in the spotlight of the economic analysis for numerous researches. NIS is getting a growing importance in the literature as well as in policy making for countries all around the world, mainly for understanding and promoting innovation and economic development. (Stephen Feinson, 2002).

## **2 A Brief Overview on the National Innovation System (NIS) Approach**

After its introduction in the late 1980s by researchers such as Freeman (1987, 1988), Lundvall (1988) and Nelson (1988), the concept of National Innovation system has been further elaborated and underpinned in the early 1990s. It can be regarded as a well-known approach within modern innovation research. Above all, the approach focuses on the analysis of national structures of innovative activities, their institutional determinants and economic effects. Freeman defined NIS as the network of institutions in the public and private sectors whose activities and interactions initiate, import, modify and diffuse new technologies. (Freeman, 1987); Lundvall (1992) declared that NIS is the elements and relationships which interact in the production, diffusion and use of new, and economically useful, knowledge ... and are either located within or rooted inside the borders of a nation state. Nelson, also, (1993) affirmed that it is "a set of institutions whose interactions determine the innovative performance ... of national firms; however, The NIS approach stresses that the key to the innovative process are the flows of information and technology between institutions, enterprises and people. Innovation and technology (I&T) improvements are the result of a multipart set of interactions among NIS actors, which contains people, enterprises, universities and research institutes (OECD, 1997). According to the OECD (1997) Innovative performance and general competitiveness can be achieved if the actors of the NIS understand what the best tools, and what the significant roles of the NIS are, and by the way the well understanding of NIS can help identifying leverage faces for enhancing economic performance. Several advanced economies have relied on Policies, which seek to improve networking among the actors and institutions within the system and to enhance the innovative ability of firms and people. And thus several developed economies are supporting education, research, and business in order to foster national and regional competitiveness.

From a neo-Schumpeterian viewpoint, differences across countries' economic performance are explained by the complexity of connections, coordination and interactions among public and private organizations that make their National Innovation Systems advanced. In this context, one can say that the lack of coordination between the major objectives of public and private sectors and those of the other national institutions involved in industrial and technological policies can make vulnerable the national economic performance. And to understand National Innovation Systems, Nelson (1993) says that it is essential to understand how technical advance occurs in the modern world, and the key processes and institutions involved.", while Rosenberg (1993) declared that "Today, R&D facilities, staffed by university trained scientists and engineers attached to business firms, universities or government agencies, are the principal vehicles through which technological advance proceeds in fields such as.....", one can say that the literature has centered the evaluation and assessment of NISs on four types of knowledge or information flows which are as follows;

- 1) Interactions among enterprises,
- 2) Interactions among enterprises, universities and public research institutes;
- 3) Diffusion of knowledge and technology to enterprises, and;

4) Personnel mobility, focusing on the movement of technical personnel within and between the public and private sectors.

Since the first appearance of NIS concept, it has internationally started to change the main directions of innovation policies; this concept highlights the role of the cooperative interaction between individual innovative firms and other innovative organizations. Hence, this concept would be promoted especially when businesses, financial system, and research and academic bodies are included within a general system. Research group headed by Nelson compared the NISs of 15 countries, discovered that the dissimilarities between them reproduced different institutional arrangements, including: systems of university research and training and industrial R&D; financial institutions; management skills; public infrastructure; and national monetary, fiscal and trade policies. By the late 1990s, OECD had initiated broad comparative countrywide study of national innovation systems (OECD 1997, 2002), which produced support to the ideas of Charles Edquist (2001) and Jack Metcalfe (1998), that national innovation system is a comparative concept – there could not be an ideal national innovation system, which fits different nations with their specific socioeconomic, political and cultural background (Urmas Varblane et al, 2007). Nevertheless, a recognized model of a NIS does not exist and it is so hard for a particular NIS to be useful to another country by the same degree of performance. By the way, through case studies, Nelson and Rosenberg have emphasized that "we have been impressed by the diversity of 'national systems' that seem to be compatible with relatively strong, and weak, economic performance in particular contexts...partly is may be because the performance of the innovation system is a larger factor behind economic performance in some contexts than in others."(Nelson and Rosenberg, 1993, p.20); moreover they (Nelson and Rosenberg) have declared that"... since considerable differences exist when even comparing countries with similar economic conditions. The differences are caused by historical and cultural differences including the process of industrialisation, and have a role in shaping the legal systems and policies of a particular country."

As Schumpeter (1939, 59) said « innovation is possible without anything we should identify as invention and invention does not necessarily induce innovation, but produces of itself no economically relevant effect at all », and by the way, entrepreneurs are ones of key creator of innovation within the economy, whatever it is their degree of activities or performance, and even if they don't have such huge capacities or tools to innovate they can do it without anything.

While the US, the EU and Japan are still leading the world in the term of research and development efforts, they are being increasingly challenged by emerging economies, especially China. (UNESCO Science Report, 2010) The Arab World has been trying to improve its NIS over the last few years, although 95 % of the world researchers are found in Asia, Europe, and North America, whereas Africa, Latin America, Oceania, and Caribbean represent only 5% of the world researchers (UIS S&T statistics; 2005) this fact shows a huge gap between the north and south in the matter of research as well as GERD as a percentage of GDP (Algeria is still behind by 0.07 % GERD) (UIS S&T Database, 2008)

As we all probably know, the innovation system approach was employed using experiences of high income countries, with developed infrastructures and institutions, well built knowledge base, and well-functioning /economic systems, The situation of developing countries is rather different than those of developed economies. They have much lower income levels, a smaller amount of the role played by institutions and infrastructures on R&D aspects, and less accumulated knowledge. In addition, the foreign direct investments in the developing countries are playing much more important role than in the rich industrialised countries applying the national innovation system concept, but it's not the case for the less developed countries. Therefore the relationships between globalisation and national/local systems need to be further researched.

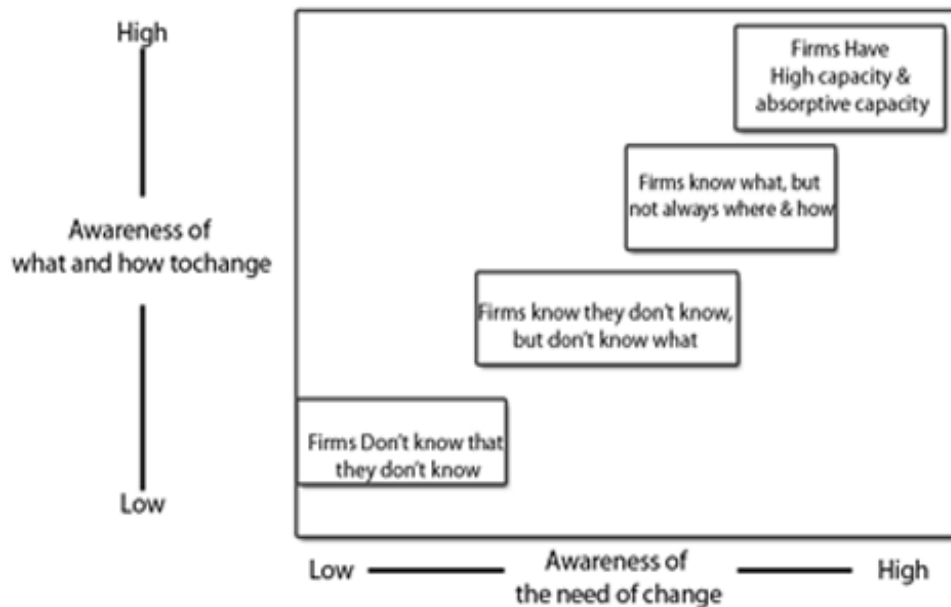

There exists fairly little analysis of organizations acting as obstacles to innovations, which is the case in less developed countries, Therefore instead of copying the adaptation of the innovation system, a different approach is needed in those countries. In order to meet the challenge of adaptation the innovation system for development processes,

After the systemic change in the early 1990s the role of linear innovation model still remained the prevailing innovation model for the policy-makers in transition economies. It has taken the form of the mystification of the role R&D, which reflects the misunderstanding about the mechanistic relationship between increased R&D spending and higher per capita GDP. R&D and innovation are often used as synonyms among the policy- makers in catching-up economies. The higher the expenditures on R&D, the higher is the innovativeness of society expected to be. Unfortunately this fetishism of R&D has been cultivated also in many recommendations given to the transition countries from various consultants and even in the EU recommendations. according to Urmas Verbalane et al (2007). there exist several

problems in the building up of NIS, as the reflection of path-dependency, such as the following ones;

- 1) Underestimation of the role of public sector in the national innovation system
- 2) Dominating role of the linear innovation model and neglecting demand
- 3) Confrontation between high- and low-tech industries
- 4) Overvaluation of the role of foreign direct investments
- 5) Lack of social capital and network
- 6) Weak innovation diffusion system and low motivation to learn

In 2002 the World Bank analysed the technological ability of firms to innovate and their internal willingness to change in Korea. Firms in the following figure are distributed into four groups based on the grade to which they are conscious of the need to change and the degree to which management is aware of what should be changed and how to go about changing it. At the lowest level are firms without any capacity for technological change and which do not feel any need for change; by the way, that is exactly the case of many firms in Algeria.

**Figure 1: Classification of Firms by Their Technological Capability and Motivation to Change**  
 Source: the World Bank, 2002.

The task of the innovation system in this case should be able to move firms up the ladder described in Figure 1. It requires activities in two dimensions. Firstly, to push firms to develop their capacity to absorb technologies from abroad and innovate by providing access to different sources of technologies. Secondly, to improve the internal motivation of firms to change, this requires providing data for firms about their relative position comparing with the best practises in the world.

### 3 What Drives Innovation?

In many ways the discussions made about innovation are not really new, boards are spending more time discussing innovation and what conditions and factors can drive the innovation process and especially that companies all around the world see innovation as a long game in which they can win or lose, thereby, they are continuously trying to tilt the odds in their favour, in order to win that game of innovation. In the recent few years the academic evidence appears to indicate that there exist four factors drive the innovation process of firms, which are:

- 1) The structure of the industry
- 2) The economic structure of the firm
- 3) The organizational structure of the firm
- 4) The historical development of the firm

The firm does not activate in a vacuum but in a very complicated environment full by several factors mainly those that construct and characterize the structure of its industry, which is a main

determinant of whether or not it innovates. Empirical evidences point out that firms in industries where innovation is necessary do innovate, and it is the case of those which are facing a strong competitiveness. However, the evidence also shows that the innovation process is a high risk, but potentially high profit venture, the fundamental uncertainty that cannot be totally taken off from the innovation process, can be limited in industries and environment which help innovative firms; mainly those that include a very sophisticated intra and inter-organizations integration. There are also two main drivers of innovation in the economic structure of the firm, which are the firm's size, and the second is based on the Teece/Itami view of the firm as a producer of information and other intangible outcomes. For the former, the studies that have been done have shown that there are large economies of scale associated with R&D and product development expenditures. While for the latter the stress is made on the firm as developing intangible and non-tradable properties. Firms with a combination of complementary assets can increase these assets over a number of potential products. Innovating firms according to this view invest more than non-innovating ones in both R&D and advertising, several studies have shown also that larger and more horizontally and vertically integrated firms are better innovators than single-product firms; while smaller firms are more flexible and successful at taking advantage of the external effects of R&D accomplished at other organizations, laboratories and universities; this free-ride permit them to recompense for their need of scale in R&D assets. In most innovative countries innovations in small firms do not necessitate so many complementary assets, this reality is right enough to drive the smaller firms being innovative while they can sell or lease their innovations to bigger firms possessing the complementary assets to exploit as best as they can the product's potential. The third factor that drives innovation of a company is the internal structure of the company. Evidences in a great majority of researches that have been done in the domain of innovation have shown that the organizational structure of the firm has a huge impact on the innovativeness of the firm, mainly because innovations need such an internal environment into which information, knowledge and skills are generated and capitalized into profitable products. Much of empirical evidence indicate a very common view that successful innovative firms are less than committed to, they have such an integration of innovation strategies with corporate strategies that allow them to facilitate and insure their working processes and their cross-functional teams' activities. Clark Wheelwright and Hayes provide a remarkable scheme that stresses on the relationship between the management role and its weight on new product development processes.

### **3.1 Measuring innovation**

There exist several ways to measure innovation, but the most used measures are known as the traditional measures of innovation, which are R&D expenditures and patents. Following many studies in this domain since the 1950s, R&D expenditures can be regularly collected, usually on an annual basis, in several countries, while patent data have been collected since an earlier period of the 19<sup>th</sup> century, in the case of Algeria, patent data are available on the INAPI database.

### **3.2 Innovation and patents**

It is widely known that patents provide protection for the invention to the owner of the patent, thereby, the invention cannot be commercially made, used, distributed or sold without the patent owner's permission, this protection is required in today's market and especially with all the emitted products and services that are found in the market, generally this protection is granted for a limited period, which is 20 years in almost all the cases, and sometimes less; in this period, only the patent owner has the rights to give permission to or licence other parties to use the invention on mutual agreed terms, he may also sell the rights to someone else, as he may give them to that new owner; for free. Once a patent expires, the protection ends and then the invention becomes available to commercial exploitation by the others, and the owner no longer holds exclusive rights to the invention. In fact, All patent owners are obliged, in return for patent protection, to publicly disclose information on their invention in order to enrich the total body of technical knowledge in the world. Such an ever-increasing body of public knowledge promotes further creativity and innovation in others. Empirical evidence has shown that there was no relation between a country's score on this index and its economic growth. Increasing IP rights tend to be correlated with R&D spending, but it turns out the causality goes the other way: first a country starts spending more on R&D, and then later they increase IP rights strength. In this way, patents provide not only protection for the owner but valuable information and inspiration for future generations of researchers and inventors. In Algeria a patent may be granted from the INAPI (*Institut National Algérien de la Propriété Industrielle*), which first of all requires the person who asks for the patent to fill up a patent application which contains the name or the title of the invention its self,

the indications of its technical field, the background and the description of the invention as well as the drawings, plans, or the diagrams to better describe the invention.

In 2006 the INAPI received 477 patent demands from national companies, while the whole demand for patents was 514 demands, which is really limited comparing with other countries, and even though for that raise in patents demand, from a year to another in the last decade, patenting is still need to accelerate further; the case was the same for trademarks demand from the INAPI office because it was only 2682 demands in September 2006; with a raise of 244 demands comparing with 2005. the same organization received 2875 trade mark demand to extend into the Algerian market from foreign companies, while the number of these demands was counted by 3665 demands, 31 patents was the number of the accepted patenting demands in 2006 by the INAPI, from the whole 477 demands, sometimes the rejection of these demands was because of the missing files or the uselessness of the invention its self, while some of them was because of the policy of the INAPI, and the wasted time concerning each of the preparation and the patents' demands studies, and so on...through some interviews with local Industries from which have already asked for their patents as well as the local commerce chamber, there was obviously a huge gap in time between the demands and the acceptance/rejection of the files, which is counted as a main problem and obstacle for Industries to get the industrial property rights of their invention. The next Table (Table 2) illustrates the patents' demands, registrations and renewals for national trade marks in the INAPI office in the first three trimesters of 2006 concerning national and foreign companies, this table shows that 554 demands was accepted from the number of 1664 demands of trade marks from national companies, while 546 trade mark was registered from 1018 foreign demands, while only 128 national trade mark have renewed their patents in that period in addition to 487 foreign ones have been renewed in the same period of 2006. In 2007, the WIPO received 84 Patent applications from the Algerian office of patents, while it was 58 applications only in 2006 and in 2008 the number was planned to be extended but data are not available neither at the WIPO's nor at the INAPI's official web sites. It was 59 in 2005 and 58 applications in 2004. (See the WIPO Statistics Database, December 2009)

**Table 2: Deposits, Renewals, and Registration of National Trademarks (Period from 01/01/2006 to 09/30/2006 :**

Country of origin	Deposits	Registration	Renewals
National	1664	554	128
Foreign	1018	546	487
Total	2682	1100	615

**Source: The INAPI web site**

According to the WIPO (WIPO, 2012) a considerable increase has been witnessed in patents granted to both resident and non-resident applicants in Saudi Arabia and Algeria.

Table 3 which is bellow demonstrates some statistics of patents taken from the INAPI data base, it illustrates the number of Patents delivered for national Industries by the INAPI, and the number of patents demanded in the period between 1988 and 2007, we have asked the INAPI offices for recent statistics of this kind, but each time we called they kept saying that it is still confidential and that they cannot offer us such information, because they do not concern the INAPI itself but also the local Industries which have asked about the patents of their products and services, as well as the ministry of the industry, anyway; was 214 in the date of 2007, while it was 590 patents in 2006 and 550 in 2005, with the exception of the drop of the number of patents in 2007, comparing with the previous year, patents number was raising by time in the last decade, while it was not steady in the 1990s; mainly because of the social, political and economic situations in that period. Algeria now is in the right way to strengthen the patents policies within the local market, with so many laws and texts through which companies will be able and sometimes obliged to register their inventions and trademarks.

Comparing with other African countries the Algerian Resident patent filings per \$billion of Gross Domestic Product in the period between 1995 and 2007 seem to be very much low than these of the other countries in the table even the countries which have the same and even a lower income, such as Zambia, Kenya, Madagascar, and even Tunisia, the less than 0.35 billion from the GDP is considered to be low comparing with Egypt which gives more than 1.35 billion for the same year (2007), while Tunisia gave 0.87 \$Billion in 2005 for resident patent filings, that may be because of the reason that in Algeria this kind of expenditures is financed by public sector only, which is the case in Saudi Arabia, and Morocco.

**Table 3: Resident Patent Filings Per \$billion Gross Domestic Product\* (1995-2007)**

Country of Origin	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007

\* Data Based on 2005 Purchasing Power Parities

According to the WIPO statistics database (2012) the number of PCT filings in 2007 is higher than the 2002 level. Algeria, Turkey and Saudi Arabia had the most notable increase (average annual growth) in PCT filings. However, the combined share of all reported emerging countries in total PCT filings was only 2.5% in 2007.

#### 4 Innovation and R&D:

The theoretical background of innovation, and R&D considers R&D as a main driver of innovation performance and is then a determinant of the innovation level of any country, R&D comprise creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society, and the use of this stock of knowledge to devise new applications. R&D is a term covering three activities: basic research, applied research, and experimental development. Basic research is experimental or theoretical work undertaken primarily to acquire new knowledge of the underlying foundation of phenomena and observable facts, without any particular application or use in view. Applied research is also original investigation undertaken in order to acquire new knowledge. It is, however, directed primarily towards a specific practical aim or objective. Experimental development is systematic work, drawing on existing knowledge gained from research and/or practical experience, which is directed to producing new materials, products or devices, to installing new processes, systems and services, or to improving substantially those already produced or installed. The main aggregate used for international comparisons is gross domestic expenditure on R&D (GERD). This consists of the total expenditure (current and capital) on R&D by all resident companies, research institutes, university and government laboratories, etc. It excludes R&D expenditures financed by domestic Industries but performed abroad. Several methods and concepts may be in the use of measuring the R&D activities of an economy, such as the R&D impact on innovation, the NIS GERD, and the number of researchers... (Metaiche, 2010).

#### 5 Measuring Innovation in North African Countries

It is widely accepted that there is a huge gap between the north and south, in all areas and domains including social, economic, organizational, and so on, this gap concerns also the R&D and innovation sector between the north and the south. Many Developing countries, like Maghreb countries (Algeria, Tunisia, Morocco) innovation systems construction takes place in a very specific environment characterized by privatization of public concerns, the rise of a strong SMEs sector but with very little experience in the fields of R&D and innovation, and a relatively weak industrial sector in terms of industrial performances, suffering high obsolescence both in terms of human resources and equipment (Djefflat A., 2008). The performance of research and innovation of Industries and universities from the North bank is very high and dynamic compared to the other bank. In most Maghreb countries, policies are being worked out to establish ITCs in key strategic sectors: textile, garments, mechanical, electrical, food industries etc. ((Djefflat A., 2008); it has been illustrated in the previous part of this work the portion of the Arab countries does not exceed 0.5% from the global scientific publications (all disciplines included), and the GERD does not exceed the average of 1% in almost all the countries, if not pretty much less than that; GERD can show the real picture of these countries in research which is

very limited and does not really contribute in the accumulation of knowledge and enhancement of the productive system. In Algeria, for instance, the GERD has been improving by time in the last decade, but even though that enhancement it (GERD) represented only 0.35% from the GDP in 2004; and research is almost 98% funded from public organizations but there are not any tools or programs to make it concrete and valuable, in Algeria also The creation of innovating Industries is exclusively the mission of large enterprises such as Sonatrach, Sonelgaz, Electricité d'Algérie, SAIDAL.. (Khalfaoui, 2006). While for Tunisia and Morocco, there is a little light concerning GERD and the existence of programs to motivate R&D and innovation, but research is still largely financed by public sectors. Moreover; these three countries possess only few patents in the European offices of patent while the patent applications of these three countries are totally absent in the American Office of patent (OST 2006). Algeria ranks 120 out of 127 (2007) in the BCI subindex "Sophistication of company operations and strategy", while in 2004 it was still 87th; this is surprising, as the countries ranking in "availability of engineers and scientist" (GCI) is excellent (25th, better than Austria, UK, and Netherlands). (Jörg Janischewski, Katja Branzk, 2008). the integration of innovation and R&D activities in the private sector in Maghreb countries seems to be limited mainly for the reason that these activities are not a part of the business proprieties of local Industries in these countries owing to the low rates of technological intensity of these countries, with slight differences between sectors as well as between countries. For instance, the major orientation of scientific and technological innovation policy of the Tunisian governments consists of encouraging enterprises and industrial support institutions to integrate innovation, technology transfer and R&D in their strategies; the following key Characteristics of the algerian NIS may explain a lot about the problems and obstacles facing innovation of the algerian companies;

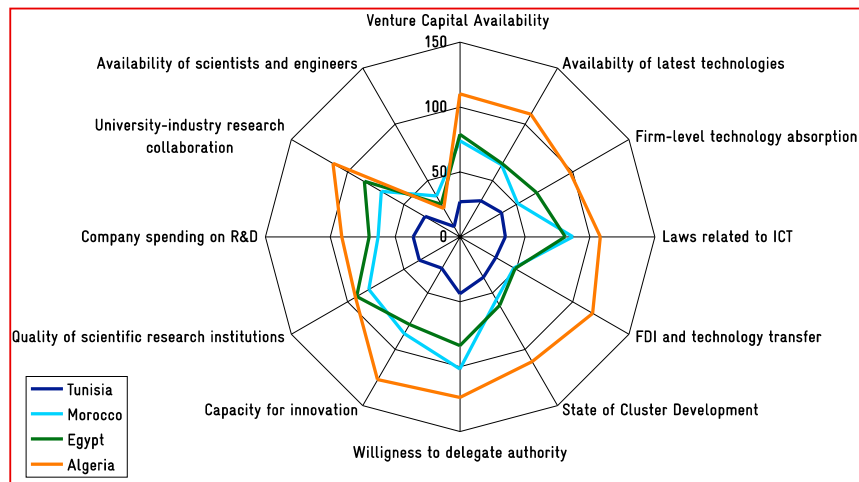

- 1) Centralised system with plans to decentralise operational support for enterprise development
- 2) Emerging awareness of the importance of private equity and an embryonic venture capital industry
- 3) The need for legislative reform to support private equity is currently being addressed.
- 4) However there are essentially no links between industry and academia. A considerable effort will be required to develop appropriate structures.
- 5) The higher education and public research system is weak and needs to be developed in parallel with industry reforms. There is no Research For Technological Development and no Innovation policy and the overall development of intermediaries is weak. (European Trend Chart on Innovation; 2005)

During the last decade, trans-national Industries were considered as the main driver of R&D activities globalization, the R&D activities in these Industries represents almost the half of the global R&D activities and expenditures, and more than 2/3 of Industries R&D activities, R&D expenditures, as well as R&D activities have emerged in the last decade only to reach uncourageous rates in some emerging countries, mainly situated in Asia such as in China, and India, while it is still limited of Arab countries which constitute around 3.5% of world GDP and more than 4% of world population, but Arab countries consume around only 0.4% of the Gross Domestic Expenditure on R&D (GERD) and then The Arab world is not investing enough of its economic resources in technology, and was ranked last – even lower than African countries. By the way, a most recent statistics reveal that 89-97% of R&D expenditure in the Arab world is funded by the public sector. By contrast, more than 50% of R&D expenditure in developed economies is funded by the private sector. (Abdallah Alnajjar, 2002). More than few Industries generally in Arab countries and particularly in North African countries do not have an R&D account in their accounting system. Even if they have already undertaken R&D activities but their R&D expenditures are null. These activities are then funded by another budget. For all Maghreb countries, major efforts have been made to launch innovation, meanwhile; all numbers and facts show that innovation output remains relatively poor in these countries. (Djefflat A., 2008). Meanwhile, almost the totality of the Arab countries has become a destination for some Industries that aim to invest in R&D activities in so many sectors and not only strategic sectors as the case of the last few decades, and by the way, one of the main problems within Maghreb countries which limits R&D activities and then innovative activities for Industries is somehow the high rates of unemployment of well educated and skilled people, and sometimes the time gap between the degree/study accomplishment dates and the dates of being employed, because it works to limit the possibilities to enhance the skills and knowledge gathered and improved at universities and educative centres, and it also bound the knowledge value of those people; which in one way or another will affect the innovative capacity of the Industries; as well as product launching either within or outside the local markets of these countries; Thereby, the value of the R&D activity of the firm is directly related to the core competencies and knowledge of this firm as

well as to its efficient innovative processes. Baldwin & Hamel, (2003) and Duguet, (2000), have proven that the Industries which have higher rates of expenditures on R&D activities have the most competitive advantages in the radical innovation and claim more inventions rights. The poor institutional and incentive regimes of Maghreb countries may be one of the most important causes of the small absorptive capacity of these countries. (Djefflat A., 2008). However, The increasing integration into the world economy raises new challenges for the Algerian productive sector, particularly the industrial sector, which must face increased competition and whose consolidation largely depends on greater business competitiveness. If its transformation is to succeed, the Algerian productive sector must not only be capable of facing competition from imports but also be capable of exporting.

The MENA comparison with regard to selected key indicators describing innovation performance (GCI) sees Tunisia considerably ahead in most aspects, and Algeria far behind (lower ranking reflects better performance). (see figure below)

**Figure 2 The MENA Comparison with Regard to Selected Key Indicators of Innovation :**

**Source: Jörg Janischewski, Katja Branzk, 2008**

According to Jörg Janischewski, Katja Branzk, (2008). Algeria ranks 127 out of 131 countries in “capacity for innovation” (at the company level) according to the GCI, due to relative market isolation and their “planned economy mentality”. Unlike many other countries, financial resources would be available. Nevertheless, Algeria has begun to develop elements of a national innovation policy; including the elaboration of an innovation policy, training of SMEs, financial support schemes, establishment of an Innovation Observatory, incubators and innovation-related organizations as well as reinforcement of the technical centres. (Jörg Janischewski, Katja Branzk, 2008.)

**6 The Field Study**

Our study is based on the innovation survey which we used to measure the innovative activities for the Algerian Industries; a sample of 250 Industries were contacted either electronically via emails or via phone and even personally by the authors. Those Industries have been asked to respond to a questionnaire that includes, besides their principal characteristics (such as the firm’s size, the business field, beginning date for the firm’s activity...), several questions related to R&D and innovation activities, (R&D intensities, skilled employees’ numbers, level of innovation, innovation obstacles, innovation performance, cooperation with universities, labs, other Industries and organizations, we have also taken into consideration the management of innovation, through asking some questions, either related or unrelated to each others but they all fall in the same aim which is to evaluate the innovation management within these companies

**Table 4 Variables Description and Findings**

Name of variables	Type	Value
INNO	dichotomous qualitative	1= the firms has already undertaken process or product innovation 0=otherwise
RD	dichotomous qualitative	1= the firms has R&S activities 0=otherwise

RDI	multinomial quantitative	0 no R&D expenditures 1 very small R&D expenditures 2 average R&D expenditures 3 high R&D expenditures 4 very high R&D expenditures
SIZE	Multinomial Quantitative	1 1-9 employees 2 10-49 employees 3 50-249 employees 4 250 employees, and more
MKGI	multinomial quantitative	0 no marketing expenditures 1 very small marketing expenditures 2 average marketing expenditures 3 high marketing expenditures 4 very high marketing expenditures
COO	multinomial quantitative	0 no cooperation with other organizations 1 very small cooperation levels 2 average cooperation levels 3 high cooperation levels 4 very high cooperation levels
MAR	multinomial quantitative	0 no marketing integration into other departments 1 very small marketing integration 2 average marketing integration 3 high marketing integration 4 very high marketing integration
QI	multinomial quantitative	0 no qualified employees, at all 1 very small intensity of qualified employees to the total number of employees 2 average intensity of qualified employees 3 high intensity of qualified employees 4 very high intensity of qualified employees
OBLEV	multinomial quantitative	0 no innovation obstacles at all 1 very few innovation obstacles 2 average level of obstacles 3 high level of innovation obstacles 4 very high level of innovation obstacles

According to the survey, almost all the contacted companies do not have R&D departments, and then both R&D and innovation activities are included in other activities such as production. And many of them gather R&D spending to the cost of employees' training, product improvements and patents acquisition... in ways that enlarge the numbers of GERD.

In our first model we take the business characteristics as independent variables besides the specific characteristics of the firm as well as the whole sector of activity, for each firm. Our objective from this model is to estimate the impact of each variable on the probability of innovation in the Algerian Industries. The impact of the innovation obstacles is taken in consideration in each of these models, as well as the firm size, the firm's cooperation with other organizations and the skilled employees. We also take RD as a qualitative dichotomous variable which measures whether the firm has already undertaken R&D activities or no, this Model has as objective to see whether the R&D activities in the Algerian Industries have the same importance as in foreign countries or no, but obviously, most of Algerian Industries do not have R&D activities and in case they do some activities which have the same characteristics either for the reason that they do not call them R&D or they include these activities into other departments and functions inside the firm, such as the production activity, Quality, or even Marketing.

This Model takes in evidence the Marketing activity and its integration to other functions and activities within the same firm, we have seen that cooperation and marketing integration have a positive impact on the firm innovativeness as well as the innovation performance of firms, so we aimed to measure the integration levels of marketing functions to other functions within the firm, and the firm's cooperation with other organizations, and institutions including universities, research labs, firms and so on...

We use this model in order to estimate the impact of each variable on the probability of innovation in the Algerian Industries; taking in mind the impacts of Marketing intensity (MKGI) and Marketing

integration (MAR).<sup>1</sup>

In the second model, we try to check out the impact of all the variables taken in “model 1”; with the exception of the existence of marketing activities, and the marketing intensity of the firms taken in this study, while in this time, we link between the marketing activities integration and the firm’s cooperation mainly because there exist empirical evidences that both internal integration, and external cooperation have a positive impact on each others and that they are correlated to each other in so many ways. Because the significance coefficient is 0.11 for the 2-tailed, bivariate correlation between the two variables (COO, and MAR) while the correlation is significant at the 0.05 level. In this Model we take both COO and MAR as correlated variables in the second equation.

We try to check the effect of Marketing efforts on innovative activities of those firms with and without taking “Marketing” variables in mind, while the theoretical background of both innovation and marketing, show the massive impact of these two concepts on each other, we still need to see the results of our study concerning those variables.

**M1:**  $INNO = \beta_0 + \beta_1 SIZE + \beta_2 RDI + \beta_3 MKGI + \beta_4 COO + \beta_5 MAR + \beta_6 QI + \beta_7 OBLEV$

**M2:**  $INNO = \beta_0 + \beta_1 SIZE + \beta_2 RDI + \beta_3 (COO * MAR) + \beta_4 QI + \beta_5 OBLEV$

Through these two models we aim to validate or invalidate the next two hypotheses;

**Table 5: Classification Table (a,b)**

Observed		Predicted			
		whether the firm is innovative or not		Percentage Correct	
		NO	YES		
Step 0	whether the firm is innovative or not	NO	43	0	100,0
		YES	13	0	,0
Overall Percentage					76,8

a Constant is included in the model.

b The cut value is ,500

	B	S.E.	Wald	df	Sig.	Exp(B)	
Step 0	Constant	-1,196	,317	14,285	1	,000	,302

<sup>1</sup> In this Model; We exclude the variable (MDG) that takes in mind the existence of the marketing department within the firm, because it is not necessary for firms to have marketing departments in order to do marketing activities; and as we noted earlier in this work, there have been found so many firms which are so active in the marketing tasks and activities, but they do not have any Marketing departments neither inside their firms, nor in their accounting systems.

Source : Metaiche M.A., 2010.

We have found a positive relationship between the dependent variable and all the independent variables except for QI for the tow Models (1 and 2), and OBLEV for the model 2, while it was insignificant for the model 1, from the study that we have made, we found a positive impact between the firm's size and R&D activities as well as the firm's innovativeness and innovation performance, we must notice here that so many theories as well as empirical studies found that innovative firms which spend more resources on R&D and innovative activities, get bigger and bigger with the time impact, and especially that it benefits from the profits made by the innovation itself, meanwhile, The algerian companies are facing some difficulties in transforming their research efforts into Development efforts. for the Algerian companies taken by this study, most of them are public owned companies, where employees are logically seem to be numerous, and the most innovative firms in Algeria are big public firms with more than 250 employees, at the same time as the private sector plays a little role on the Algerian innovation activities, either counted by R&D intensity or by the innovations done within the national market.

## 7 Conclusion

Innovation is not a choice, it is becoming more and more necessary , day after day, mainly because we are living in an open market which is challenging us, "industries must Innovate or disappear" " (Djeflat, 2008)

In Algeria, both the private and public have invested in R&D centers mainly those situated within the local universities, as a result fort that, we find out that 90% of the local researchers are researchers at the university; and because of the structural weaknesses that face the links between universities and industry (less than 10% of companies in Algeria have links with the university), we can see how much efforts must be done in this field. Both private and public actors have to open their borders to each other, and work together in ways that foster innovation. (Ouchalal et al., 2007) while, one of the key issues facing the construction of a well functioning innovation system in Maghreb countries may be defined as the level of human, financial and institutional ingredients. (Djeflat A., 2008).

While the most important factor of innovation is driven by the R&D activity; Djeflat (2008) argued that creating new institutional university-industry links, and strengthening the existing ones, is a key solution to foster the innovation activities for the Algerian economy. Moreover, several results can be derived from this study, which are of interest to show the innovation level of Algerian Industries. First, the significant estimates in the logistic model recommend that Algerian Industries have to extend their efforts in innovation through raising their R&D activities, and by improving the number and quality of their skilled workers both via adopting short and long-terms training activities as well as by collaborating with other technological organizations. Second, "

Third, both the government and national economic actors must find a solution to enhance the foreign direct investment and exports of Algeria, this might help the economy to become more creative and will certainly improve the Industrial competitiveness of the country, through adopting new partnerships and collaboration agreements with foreign economic actors. And especially that foreign direct investment in Algeria is concentrated mainly either in the petroleum and gas sector, or in the low intensive technologies sectors; but firms' executives have generally a good sight for the future and who are trying their best making their firms more creative and more innovative in the future through adopting certain strategies which allow employees being creative within their organizations, they are aiming to raise the R&D and Marketing intensity of their firms in order to know how to satisfy their customers. The Algerian Industries' innovativeness rates are very low, but we have shown that these firms do innovate, so that we have unaccepted our second Hypothesis, which says that Algerian Industries do not innovate, and even if these firms do not make radical innovations but at least they do some efforts to be

innovative, we have to notice here that both the economic structure and characteristics of the local market are ones of the most problems facing firms in their ways to be innovative, and even if the government is helping firms in so many ways, but there exist so many problems and obstacles that must be faced and resolved by both governmental and non-governmental organizations, the collaboration of the economic actors is so necessary to enhance the firms' innovativeness and innovation performance of the local firms in ways that help them being competitive within and outside the local market. Firms also have to be aware of the barriers to innovation which impede the firms' innovativeness and economic performance, the linkages and cooperation within the firm between Marketing and R&D departments are also so vital for the innovative activities of the firm in order to check out the roles played by marketing to enhance the innovativeness and competitiveness of firms; The requirement of rapid adjustment to dynamic changes reinforces the function of knowledge flow in inter-functional relations. The obligation of integrated knowledge is the most precise in the relations of R&D and marketing, researchers are increasingly aware of its key role in innovation. Innovation barriers in Algeria as well as other Arab countries have been reduced in the last decade but there still so much effort to be done in this aim, mainly through gathering the efforts of both Governmental and non-governmental organizations, and second, there is the role played by the firms themselves, and especially if they act as a one-unit, through creating linkages and networks between them. Nucleus programmes are a good example of these Networks that may help firms succeeding and strengthening their activities either inside or outside Algeria. We notice here that innovation will take place only if the result on the market acknowledges the creative idea, thereby, if the products and services developed with novelty are successfully sold, so that Innovation must rely on marketing activities to succeed, and they need to be linked and integrated either before, during or after the development process of the new product, our study shows that in most cases the integration of marketing and R&D is at much lower level than expected within the Algerian Industries. But it shows also that Algerian Industries are somehow innovative but their innovation rates do not help them being really competitive on the international market, and thereby they have to work collectively as well as individually in order to face the economic challenges and obstacles to improve the economic performance of the whole economy. The potential and capacity of firms for innovation does not only depend on technological and financial resources. Innovation requires expert know-how in a lot of areas such as management, production, the innovation process, intellectual property rights, marketing, and cooperation skills and so on.

# The Inter-correlation Analysis Between Remuneration Satisfaction and the Behaviour of Staff Demission in Original Equipment Manufacturer

Hu Yaqi, Liu Qiang, Shi Changyun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:q.q.7@qq.com, 87114560@qq.com, shichangyun1987@163.com)

**Abstract:** The role that Original Equipment Manufacturer established in China played in the global manufacture industry is of vital importance, but in the process of development, the potential risks derivates with the employee remuneration system. According to the satisfaction of employee remuneration, the satisfactions of Original Equipment Manufacture compensation is categorized into five aspects, which are remuneration system, remuneration structure, fairness of remuneration, incentive motivation and welfare policy based on related literatures. The fairness of remuneration is used as intermediary factor to examine the effect and linkage of remuneration and initiative suspend from the work. The tentative results have verified convinced relationships between those five factors, and find the negative inter-correlations of remuneration satisfaction and initiative demission. Several recommendations were put forwards as corresponding suggestions.

**Keywords:** Equipment Manufacturer; Employee Remuneration Satisfaction; Regression Analysis

## 1 Introduction

With the transferring of global manufacturing center, a growing number of international enterprises put their emphasis on China which leads the tag 'Made in China' an outstanding place in global manufacture industry, and the Original Equipment Manufacturer (OEM) are booming among the wave. OEM refers the concept that one company manufacture products and related accessories based on the specific requirements of the other company, it is also called manufacturing brand-name goods or manufacturing under the trademark-specified production. The OEM enterprise operates on the basis of authorized contract, providing products and services to other enterprises and companies. Along with the financial crisis, OEM enterprises are facing enormous challenges, such as the "labour shortage" in the coastal areas and the suicide accident of FOXCONN in the first half of 2010, those series of incidents disclosure the severity for employee remunerations.

In historical view, most of researchers aimed their eyes at the relationship among the elements of remuneration satisfactions, while theoretical and empirical literature rooted on the risk and inter-correlations between employee remuneration satisfactions is fairly rare. This paper will make clear the inter-correlations between remuneration satisfaction and the behaviour of staff demission, which will be precisely the theory basis for those OEM enterprises to improve their remuneration management and the initial purpose to conduct this research proposal.

## 2 Theoretical Framework

### 2.1 Remuneration satisfaction

The concept of remuneration satisfaction derived from a combination of theory and practice, it is mainly based on the equity theory, Adams (1956) first proposed the concept of remuneration satisfaction in the *Advances in Experimental Social Psychology* in which he considered it due to individual feeling from the pay fairness, and this feeling came from a complex process of perception and comparison. Since then other scholars approach different definitions of the pay satisfaction, Lawler (1971) regarded it as the employees' different perception from expected income and actual income. Singh and Loncar (2010) defined it as the feelings of the comparison from remuneration and non-economic reward with their expectations. In fact, remuneration satisfaction is the link between remuneration and individual behaviour, which is a direct reflection of the attitude for the individual pay fairness.

### 2.2 Factors of Remuneration satisfaction

Remuneration satisfaction affected by various factors, Herbert.G.Heneman and Donald.P.Schwab (1978) first proposed the concept of multidimensional pay satisfaction, they thought that remuneration level, welfare, remuneration promotion and remuneration structure/ management satisfaction were the four dimensions of the remuneration satisfaction. And others as Jason D.Shaw and Michellek.Duff (1999) found that the salary policy with remuneration satisfaction and remuneration level with

remuneration satisfaction was basically having positive inter-correlation. While Chinese scholars Zhao Yong (2006) showed that negative emotions had no influence on remuneration satisfaction, and the positive emotions and remuneration satisfaction are positively correlated, whereas the relationship was destroyed when the pay levels achieve critical mass.

Combing research situation, taking the national conditions of China and the special culture and management of OEM enterprise into account, this paper will separate the pay satisfaction into five aspects—the remuneration system, remuneration structure, remuneration fairness, welfare policy, and intrinsic motivation. The remuneration system reflects the overall satisfaction on pay system, including the reasonableness and fairness of the system, and the satisfaction of the incentive remuneration system; The remuneration structure reflects staffs’ satisfaction on the formulation of the salary structure and itself; Remuneration fairness reflects the satisfaction of internal equity and external competitiveness for the salary; Welfare policy reflects the overall perception of itself while the intrinsic motivation reflects the satisfaction of the intrinsic motivation effects, including a salary perception of their own career development and value.

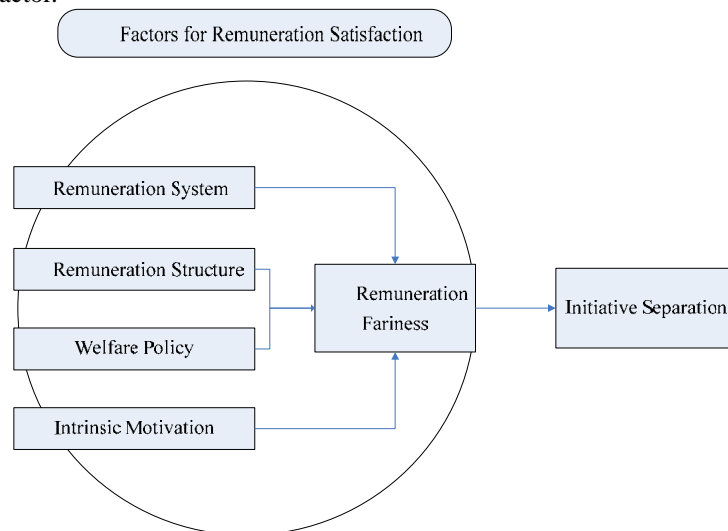

**2.3 Low remuneration satisfaction for employee behaviour**

Low remuneration satisfaction may produce a lot of negative impact on staff, while the most serious behaviour is demission. For this reason, many scholars had focused of their attention on the relationship between the remuneration satisfaction and abdicative behaviour. Study found that the salary unfairness will cause many behaviours such as slack working, being refused to help, leaving intention, the negative attitude to the supervisor, and the violation of discipline and et al. (Colquitt, 2001). A researcher (Randall of S. Sexton, 2005) explained why employees would like to abdicate and how to prevent brain draining, they found the unsatisfied remuneration having a directly impact on employees’ demission. Timothy A. There was a limited positive relation among remuneration level, staff’s working and remuneration satisfaction. While after Empirical research (Judge et al., 2005), while salary and welfare satisfaction had a negative influence on abdicative intention (Xiang Cong, 2006). In general, the higher pay satisfaction, the lower turnover tendency, which will lead to a positively working.

By summarizing the above literature, the authors suggest that remuneration satisfaction would bring with varying degrees of impact to employees, and higher satisfaction allows employees to work more actively, while the lower satisfaction lead negative impact to them. However, the worst negative affection may cause demission, as will make a significant impact on the development of the enterprise.

**2.4 Theoretical assumptions**

Based on the above review, it can be found that the initiative demission is the most significant risk behaviour for staff, so this paper studies the relationship between salary satisfaction and initiative departure. Owing to the fact that the remuneration satisfaction and behavioural risk are closely related, in fact the two item are positive correlated (Jason D.Shaw and Michellek.Duff, 1999), so we pretend that the remuneration fairness play an intermediary role in remuneration satisfaction factors. By studying the relationship of the various elements with remuneration fairness, the further research of the correlations within remuneration satisfaction and initiative separation can made remuneration fairness as an intermediary factor.

**Figure 1 Theoretical Model**

So we establish the following model (see Figure 1) and hypotheses:

- H1: The remuneration system and remuneration fairness have a significant positive correlation.
- H2: The remuneration structure and remuneration equity have a significant positive correlation.
- H3: The welfare policy and remuneration equity have a significant positive correlation.
- H4: The intrinsic motivation and remuneration fairness have a significant positive correlation.
- H5: The remuneration fairness and the initiative demission have a significant negative correlation.

### 3 Study Process

#### 3.1 Samples and scale

The object of this investigation is the foreign OEM enterprise, We totally issued 500 questionnaires, and actually received 432 ones, representing a satisfactory effective response rate of 86.4 percent, excepting for incomplete and significantly biased questionnaire, the final number is 379. The data collecting of the questionnaire includes two parts, the background information of the respondents and the main subject, which is divided into six parts, respectively for the remuneration system, remuneration structure, remuneration fairness, welfare policy, intrinsic motivation and initiative separation, by which the first five part referred to the pay satisfaction questionnaire.

The questionnaire uses the Likert five-point scale, so that the subjects can use 5 levels—strongly agree, agree, not sure disagree, strongly disagree to measuring the feelings, and respectively correspond to endow with a value—5 points, 4 points, 3 points, 2 points, 1 point, the option “1” represents “strongly disagree”, “5” represents “strongly agree” to arrive at each satisfaction factor of the actual experience score.

#### 3.2 Reliability and validity

This research use SPSS17.0 software to carry on data processing and analysis. First of all, by using Corrected Item -Total Correlations (CITC) to examine the construct validity of six parts. CITC is used to examine the inter-correlation of the measure index and its dimension by choosing the CITC value is less than 0.4 index, if each coefficient and total coefficient has been improved when deleted the item, the action should be carried on. After relativity verification we deleted 7 items (B4\C15\C16\H1\H3\H5\H7). We used alpha consistency’s coefficient to test the whole questionnaire and gains an acceptable level of Cronbach’s alpha coefficient which distinguish to 0.921, 0.897, 0.952, 0.904, 0.921, 0.788, so the results are credible.

#### 3.3 Descriptive statistics of the variables

The first glimpse on the descriptive statistics for each variable was achieved by examining the Person correlation matrix (see Table 1). The data showed that five parts of the pay satisfaction scales’ average were between 3.00 to 3.84 which means the overall level of satisfaction is not high and the correlation between each variable in the range of 0.490 to 0.817, all reached a significant level.

**Table 1 Means and Correlations for the Variables**

Variables	Mean	1	2	3	4	5
Remuneration Fairness	3.41	-				
Remuneration System	3	.817**	-			
Remuneration Structure	3.23	.786**	.746**	-		
Welfare Policy	3.66	.725**	.625**	.704**	-	
Intrinsic Motivation	3.84	.685**	.590**	.715**	.646**	-
Initiative Separation	3.39	-.575**	-.490**	-.595**	-.547**	-.719**

Notes: \*\*P<0.01, \*P<0.05

#### 3.4 Remuneration satisfaction to initiative separation

We yielded remuneration system, remuneration structure, welfare policy and intrinsic motivation to be independent variables and make regression analysis with remuneration fairness. The results (see Table 2) suggested that the Durbin-Watson statistic is 1.642, as it means there was no obvious correlation between residuals, and the model could explain 77.3 percent of the variation in remuneration level, telling us the regression model was established with statistic significance.

**Table 2 Model Summary<sup>a</sup>**

Model	R	R2	Adjusted R2	F Change	Sig.F Change	Durbin-Watson
1	.881a	0.775	0.773	322.916	0	1.642

a. Predictors:(Constant),Remuneration system, Remuneration Structure, Welfare Policy, Intrinsic Motivation  
 b. Dependent Variable: Remuneration Fairness

**Table 3 Coefficients<sup>a</sup>**

Model	Coefficients		t	Sig.
	Unstandardized	Standardized		
(Constant)	-.217		-2.027	.043
Remuneration System X <sub>1</sub>	.534	.454	12.054	.000
Remuneration Structure X <sub>2</sub>	.230	.199	4.421	.000
Welfare Policy X <sub>3</sub>	.209	.213	5.802	.000
Intrinsic Motivation X <sub>4</sub>	.135	.138	3.754	.000

a Dependent Variable: Remuneration Fairness  
 b \*P<0.05

We obtained regression equation( $Y_1 = -0.217 + 0.534X_1 + 0.230X_2 + 0.209X_3 + 0.135X_4$ ) according to Table 3, the results suggested that, as expected, the independent variables(i.e. remuneration system, remuneration structure, welfare policy and intrinsic motivation) had a positive impact on remuneration fairness, which provides support for H1,H2,H3 and H4. Such analysis had been enough to answer the relationship between remuneration of diagnostic elements and proved that the remuneration fairness can be a intermediary factor. So we directly do the regression analysis between remuneration fairness and initiative separation instead of diagnostic elements and initiative separation by following the view.

Same as the above steps, Table 4 suggested that the Durbin-Watson statistic is 1.754 and the model could explain 32.9 percent of the variation in remuneration level, as tells us the initiative demission variables can explain the remuneration fairness.

**Table 4 Model Summary<sup>b</sup>**

Model	R	R2	Adjusted R2	F Change	Sig.F Change	Durbin-Watson
2	.575a	0.33	0.329	185.986	0	1.754

a. Predictors:(Constant),Remuneration Fairness  
 b. Dependent Variable: Initiative Demission

**Table 5 Coefficients<sup>b</sup>**

Model	Coefficients		t	Sig.
	Unstandardized	Standardized		
(Constant)	5.108		38.631	.000
Remuneration Fairness X <sub>1</sub>	-.504	-.575	-13.638	.000

a Dependent Variable: Initiative Demission  
 b \*P<0.05

According to the results showed in Table 5, we get the regression equation  $Y_2 = 5.108 - 0.504X_1$ , which suggested the initiative demission had a significant negative impact on remuneration attitude, so the H5 had been proved.

### 4 Conclusions

This study analyzed the impact of the OEM enterprise remuneration satisfaction factors, verified that pay fairness playing a role as an intermediary factor between remuneration satisfaction factors and risk behaviour (i.e. initiative separation), and explored the impact on the different types of remuneration satisfaction factors for employees' demission behaviours.

The results can be shown as follows. According to literature summary and fieldwork, we divided the remuneration satisfaction factors of OEM enterprise into five elements (remuneration system, remuneration structure, welfare policy, intrinsic motivation and remuneration fairness), actually the five

factors has intricate internal relationship. The data shows the first four factors having a significant positive relationship on remuneration fairness, in which the remuneration system has the greatest influence, followed by the remuneration structure, which means the remuneration fairness can be used as a intermediary factor to analysis the influence of pay satisfaction upon initiative separation. And we also find remuneration fairness has significant negative correlation to initiative demission that illuminates the higher of the remuneration satisfaction, the lower probability of a demission initiated. Consequently, during practical working manager can elevate the remuneration satisfaction primarily by modifying remuneration system and improving welfare policies. In view of the fact that most of the OEM enterprises are for high-tech processing, the organizations pay more attention to the skills of the ordinary technical staff, for this reason, by taking the short-term incentive system (i.e. skill wage) enable employees to an objective assessment of salary level for higher pay fairness. Nevertheless, the manager can take incentive stock options for the core staff, in order to making their own interests and business interests to a greater extent consistent, thereby increasing employee loyalty and reducing the demission probability. Furthermore, through scientific and standardized practices survey, the company can develop a remuneration structure for all types of employee needs, which not only play a incentive role, tap the potential of the staff, and improve working, but also effectively avoid pay-risk behaviour occurring.

However, there are still a few limitations in this paper. First of all, our sample is not big enough, future research can increase the sample size, which will reflect more general problem. Second, we only select five factors that affecting pay satisfaction, whether there are other factors that can be included in future research.

# The Research on Company's Investment: An Empirical Study of Marks & Spencer

Li Chaoxin

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 38198802@qq.com)

**Abstract:** Marks & Spencer, as one of the UK's leading retailers, sells high quality, great value clothing and home products as well as outstanding quality food. For a corporate marketing strategy of setting up overseas retail operations in Japan, Japanese whole economic environment should be carefully examined, which may reveal any underlying risks and potential benefits. Based on the case of Marks & Spencer, we analyze the feasibility of company's investment. Finally the calculation has given out the cash flow, income statement, NPV and sensitivity analysis.

**Keywords:** Investment; Risks; Financial; Marks & Spencer

## 1 Introduction

Marks & Spencer as one of the UK's leading retailers, sells high quality, great value clothing and home products as well as outstanding quality food. It expanded all across the UK, Europe, the Middle East and Asia. Being international would largely decrease the risk of bearing the domestic economic cycle and make brand more valuable. Investment has increased its importance within a company's growth. Oversea investing tends to take more time and attention of a corporate on looking and planning before making any commitments. For a corporate marketing strategy of setting up overseas retail operations in Japan, Japanese whole economic environment should be carefully examined, which may reveal any underlying risks and potential benefits.

Japan is a highly developed country, with high standard of living, per capita GDP over \$30,000. Japan was already a mature, developed economy. It is one of the world's richest countries, owning highest living standards and mostly developed economy. Japanese domestic market is lucrative, with great tertiary industry, high-technical improvement trade and world leading manufacturing industry. Japanese are considered as the target population of high purchasing power and the willingness to pay for high standard quality life. Also, being as the leading country with high economy level and large population, Japan translates it into a huge consumer market. Fitting with the principle of M&S selling high-standard goods and organic food, Japanese tends to high-spending and specialty shopping, which offers a good foundation for M&S's development.

Japan describes itself as "plays an important role as a bridge nation connecting Asia and the world, which contributes to Asia's growth." It owns great reputation among western and Asian companies, with 45% surveyed candidates admitting 'very attractive or attractive' for living environment suitable for foreigners, and 39% felt comfortable of its well-developed laws such as intellectual property rights. Japanese government offers series of favorable policy to improve its investment climate and attract more foreign capital. Tokyo, which concentrated large proportion of the population, sets low capitalization rate lower than many other cities, in order to attract more investment.

However, year 2011 has been a tough year for Japan and the global economics. The violent earthquake in northeastern Japan and triggered tsunami caused massive death and homelessness but also gave a strong shock to Japanese economy and even of the whole world. Being as the world leading industrial and export power country, the strong earthquake in Japan has necessarily taken a visible impact in the world economy. However, the government has allocated about 21 trillion yen in stimulus since the earthquake, showing an optimistic view of taking aggressive actions to compensate possible financial panic. According to the new reported by Bloomberg in March 1, the capital spending of Japan excluding software has rose 4.9 percent compared to a year earlier, reaching almost five years peak, when it was just one year the Japanese recovered from the disaster. Government has been doing many stimulus actions in order to boost confidence in the Japan economic outlook. But the nuclear leakage problem has always being a potential hazard among local residents and investors, once nuclear leakage influence were expanded, it would be an irreversible undeniably and destructive disaster.

Look across the whole environment and cultural context in Japan, there exist many differences manifested in many aspects including history, culture, customs and relationships, values and aesthetic standards. It had been reported and discussed in the earlier years that the direct investment in Japan has

been slow down due to many economic cultural barriers. One of the most elusive obstacles seen by foreign investors is the cultural barriers. Although the government has offer many easing policy to attract foreign investment, these measures also become victims of abuse in typical Japanese, due to the bureaucratic interference. Meanwhile, many social phenomenon has also deterred foreign investment, such as high living cost, lack of regulation transparency, strict immigration rules and national lack of English skills. It is considered by foreign investors that the Japanese government tax system and financial regulation is in the red tape, which is also a barrier for making strategic planning of foreign investment.

This paper is organized as follows. Section 2 presents the Potential Foreign Exchange risks and their management. Section 3 gives out the organizational Structure. Section 4 mainly talked about the financial appraisal. Section 5 presents the decisions and in section 6 we draw some conclusions.

## **2 Potential Foreign Exchange Risks and Their Management**

Being as an international company with incomes in more than one country, foreign exchange rate could largely influence the profits.

The simple and direct understanding of foreign exchange risk could be exchange rate and the interest rate risk, which involves the elements fluctuated and really hard to predict. There are various factors may influence the exchange rate, such as international payments, foreign exchange reserves, international capital flows, inflation, political situation. However, the foreign exchange rates not simply included the exchange rate and the interest rate risk, but also performance in transaction risk, translation risk and economic risk. The key factor involved in exchange rate is the domestic currency, foreign currency and the timing. While the accurate proportion of currency depreciation or appreciation is inestimable, timing is the most important factor for investors. The use of financial derivatives to avoid exchange rate risks has become an inevitable choice.

The most common and direct way of hedging the exchange risk is the wise use of future and forwards contracts, offsetting foreign currency holdings or expected revenue. The forward contract can be explained as a transferring of risk to another business by transaction at a pre-agreed rate. Expected currency rate and the expected time value should be carefully examined. This method has advantage on preventing the cost of foreign exchange risk within a certain range; in addition, it is beneficial for cost accounting as it transfer the uncertain exchange rate into calculated element. This method could reach two kinds of currency risk write-off in the provision of time, eliminating time risk and value risk.

There are also various hedging tools of financial derivatives, such as future contract and option. Compared to the forward contract, option method has more function of preservation, as it has to be transacted in the agreed exchange rate in the agreed time when fulfilling the forward contract, which might not protect the future value. Investor may default or execute an option contract according to the market exchange rate, with the worst loss of a premium only.

As our project of investing in Japan for a payback period of about 5 to 6 years, which is relatively a medium long term investment, hedging method suitable for long-term investment should be selected. Thus forward contract, future contract and option should be combined and composed as an optimizing scheme to hedging against the exchange risk.

## **3 Organizational Structure**

Now that the directors of M&S want to extend its operating area and hope to open up new market abroad. Finally, they choose Japan and desire to open about 50 shops in two years. In order to make it be profitable, the company in Japan should have a good organization structure. Thus it can operate successfully.

Usually, there are two kinds of organization structure for a company to choose, that is subsidiary and branch. According to some materials, the author finds that many companies are more likely to operate as branches in abroad countries that have higher taxes and lower regulatory restrictions on industry entry and on foreign branches. On the contrary, subsidiary operations are preferred by companies, which decide to seek to penetrate host markets by establishing large retail operations. In addition, economic and political risks have opposite effects, that suggest legal differences in parent companies' responsibilities associated with branches and subsidiaries are quite significant determinants of multinational companies' organizational form.

Based on the conditions of M&S, it can be concluded that the company is the first time to open up markets in Japan, tries to transplant its business philosophy so that it can maximize its market share and

corporate value. Thus, it can be found that subsidiary should be the most ideal organizational structure. Subsidiary form has many characters, for example, transfer prices, management charges and artificial financing structures are out of local control. More importantly, subsidiaries' operation right is independent from the parent company and cannot take over the parent company. Moreover, combined with Japanese taxation system, M&S will surely enjoy tax policies and effectively avoid the corporate income tax, which can bring a great deal of profit. Due to the fluctuation of currency, high risk can exist. But subsidiary form can help M&S reduce this risk in finance. But in the way, there is need for flexibility of repayment from the parent company and quantity of support, including human resources and technology.

As it is known, M&S has three main parts of business, namely clothing & home, food and stores. Owing to the irrelevant character, three parts may operate separately in every subsidiary. So it is very vital to take the method of business unit. Why this? There are many advantages of business unit:

(1) Business unit can help to develop the human resources' potentials and it is conducive to the culture of the company's reserve team. More importantly, the division system can make the top leaderships to get rid of the daily administrative affairs. Thus the leader team can become stronger and spare more time focusing on strategy and market, which lead to better development of the company.

(2) It can be in favor of performance management. Division as a profit center, business unit can not only facilitate the establishment of the standard measure of employees' working efficiency, but also make it easy to evaluate the contribution of each product on the company's total profit.

(3) It will be beneficial to the specialization and the formation of economies of scale. Each business unit can operate the entire process of production of its own products or services to facilitate the organization of specialized production. By forming economies of scale, using special equipment, and making personal technology, the company can have high labor productivity and economic efficiency. Thus it can help to improve local tax and do a great deal to enhance the revenue of the Financial.

In conclusion, analysis above has given to much evidence to prove it is feasible to build subsidiaries in Japan. Despite of this, it still needs market to detect whether this kind of organizational structure is economic or not. Gradually, M&S will establish more mature structure and become successful in Japan.

#### 4 Financial Appraisal

But any investment is fraught with risks as well as opportunity.

Based on the conditions given in the material, the calculation can be demonstrated as follows:

Step1:

According to the historical numbers and tendency chart, inflation forecasts in UK and Japan can be forecast based on individual risk preferences and awareness. They are donated to calculating exchange rate, for

$$\frac{S_t}{S_{t-1}} = \frac{P_t^* / P_{t-1}^*}{P_t / P_{t-1}}$$

(where t= time period, St=spot rate in foreign/domestic currency, Pt=price level in period t, \*represents foreign values).

Step2:

Usually, the CAPM model is used to get the cost of equity, which is finally equal to 8.56%, and all can be collected with some assumption. Then, it can easily obtained that the cost of debt is 5.57%.

Step3:

It is estimated that each shop will cost approximately 1bn yen to set up, and that they would open 50 shops over the course of two years (spread evenly over that time). What's more, each shop opening cost includes two parts:(1) fixtures and fittings of 300m yen, which is allowable for tax on a straight-line basis of 20% per annum,(2) a 5-year lease of 700m yen. This means that all of the cash is payable up front and no ongoing rental cost is payable for the M&S 5 years. Based on this, the cost of fixtures and fittings and lease can be marked. Because these numbers are taking a different approach, so they can be quite different in cash flow and income statement annually. That's why the cash flow of fixtures and fittings in 2011 is 7500 and lease is 35000. However in income statement the cost of fixtures and fittings in 2011 is 1500 and lease is 3500.

Because market research costing £1m has indicated that in the first year, which demands each shop expects sales of 1.2bn yen. Then based on the information that each shop sales will grow at 25% in the

second year and 10% per annum there after (including the effect of inflation), selling revenue of different year can be gotten, by using  $1200 \times 25 = 30000$  in 2012 and  $1200 \times 50 \times (1 + 25\%)$  and so on.

Gross profit margins are expected to be 35% based on current prices and exchange rates. 50% of goods will be sourced in the Japan, and the remaining 50% will be supplied from the UK via M&S head office. Owing to this information, the cost of goods from Japan and UK can be calculated separately. Because all this cash should be measured in yen, the result of exchange rate should be used to get the results of cost of goods from UK, which is quite complicate.

Local operating costs of 150m yen per annum per shop will be incurred. These costs are expected to move in line with local inflation. In addition, monitoring and management costs of £5m per annum to cover all shops will also be incurred in the UK in relation to this venture. Any excess funds from the Japanese stores will be returned to the UK at the end of the year. All the information given in this part is extremely useful for the calculation of operation cost and WDA. The calculation procedure of this part can be seen in Excel book.

Step4:

After all the revenue and cost is figured out, something about corporate tax rate is important so that the corporate taxation can be gotten.

Step5:

NPV method assumes that each cash inflow received is reinvested at the required rate of return, whereas the IRR method assumes that each cash inflow received is reinvested at the computed IRR. NPV and IRR can be finally calculated with the numbers in cash flow. Then, whether the project will be adopted can be concluded.

Step6:

In order to do sensitivity analysis, key influencing factors should be founded out. It is easy to know that exchange rate and WACC are the two key factors. Exchange rate change has a great effect on the cost of good purchased from UK. So as to the first factor- exchange rate, 10% floats up and down. Thus it can get new NPV. If the NPV value is quite different from the initial, it means that the directors of M&S should pay enough attention to this. The whole profit can be affected with the fluctuation of exchange rate. As regards for WACC, WACC change limits the proportion of equity. 10% is added or subtracted to the initial value. NPV is also calculated in different conditions.

## 5 Decision

Referring to the data from the result of the calculation, on recent condition, the value of NPV is 294.98. It is common sense that in general if the value of NPV in a project is bigger than zero, then most investors will consider to carry out this project, which means the project is good enough and can bring extra profit for the investors, and vice versa. The second indicator is IRR. The value of IRR in this project is 27%. People often use this value to compare with WACC. They have expect for return on the investment. If IRR is larger than WACC, the project will be adopted, and vice versa. NPV has positive value and IRR is much bigger than WACC, so the board of directors needs to vote in favor of this project. They may take action right now for unpredictable changes in markets.

However, everything has to two sides. The hidden and potential risk must be considered. Based on the final outcome of sensitivity analysis, 10% decline in exchange rate leads to huge reflect of NPV. So something about the financial market and Japan politics should be paid much attention to. If there is large fluctuation in exchange rate, the profit can be diluted. What's worse, loss will be brought. How to solve this problem? M&S may set up an information department, whose duty is to collect market information as fast as possible and to build warning system. By this way, the company is rapid to prevent the worst thing happening. Or it can hire an information company locally, which can help them to do the work and hand in report weekly. And public relations department also plays an vital role. The workers in this department may devote them to establishing good relationship with local government and often communicate. What's more, if something serious happens, they should reflect as rapid as possible to leave a good impression on the public and make the company have good image.

Then what about WACC? Too high or too low are both not good to a company. So the CFO in M&S may try to use his/her competence to finance appropriate and take optimal portfolio. Appropriate quantity of asset and debt is hard to decide. This can be reached by referring to the historic number of M&S.

## 6 Conclusions

Above all, M&S can implement this project. While doing this business in Japan, in general, it should focus on the competitive action and employee turnover. Then the management of this company should pay much attention to the exchange rate and make proper financing

## Needs Analysis and Innovation of ESP Teaching

Liu Xiongyou

School of Foreign Languages, Central China Normal University, Wuhan, P.R.China, 430079  
(E-mail: lewis428@sina.com)

**Abstract:** Traditional EGP teaching is being gradually replaced by ESP teaching since the society and employers have a higher expectation of college graduates. By means of theoretical discussion and experimental research, this paper puts forth specific suggestions as to how to innovate ESP teaching in China. Only if ESP course features are paid attention to by both syllabus designer and the teacher of Specialized English reading course, can it be improved. Therefore needs analysis plays an extremely important role in the design of an ESP course, and the innovation of present ESP teaching should be based on needs analysis.

**Key Words:** Needs analysis; ESP; English teaching; Innovation

### 1 Introduction

In China, nearly all universities and colleges provide College English course to their students. College English focuses itself on the basis of language, such as pronunciation, vocabulary, grammar and notional, functional expressions. Students learn English for general purpose and the learning materials for them also cover a wide range based on the basis of the language. So college English is actually what we called EGP (English for General Purpose).

From the early 1960s, English for Specific Purposes has become one of the most prominent areas in EFL teaching. "It is an approach to language teaching in which all decisions as to content and method are based on the learner's reason for learning." (Tom Hutchinson and Alan Waters: 1987). In an ESP course, learners are trained to use language in certain context; teachers are concerned with designing appropriate courses for various groups of learners.

General English is the topic often discussed, but ESP is the one we are not so familiar with. Some people described ESP simply as teaching English for any purpose that could be specified. Others, however, were more precise, describing it as teaching English in academic studies or teaching English for vocational or professional purposes. ESP should be viewed simply as an "approach" to teaching, what Dudley Evans described as an "attitude of mind".

In China, the ESP movement has shown a slow but definite growth over the past two decades. In particular, increased interest has been spurred as a result of social needs after China has become a member of the WTO. This has led to a rapid growth in English courses aimed at specific disciplines, e.g. English for Chemistry, computer, business, engineering, medicine, civil aviation, finance and so on, in place of the more traditional General English courses. According to the new college English syllabus, juniors or seniors should study ESP or subject-based English (SBE) after they have passed CET-4 or CET-6. Universities and colleges should provide different ESP courses to ESP learners according to their majors. Sadly, only some key universities have lived up to this requirement. Worse still, the line between where General English courses stop and ESP courses start is very vague indeed. Few teachers have ever thought of conducting a needs analysis to find out what was necessary for students, to our comfort, some universities and teachers are paying attention to this problem. Undoubtedly, it is time to innovate ESP teaching to meet the needs of English learners and the society.

### 2 Significance of Needs Analysis

A needs assessment enables researchers to justify their assumptions whether or not potential educational needs are sound, to design a program in terms of topics, materials so as to be responsive to the needs of participants. This can maximize the likelihood of students' participation. Finally such focus on satisfying learner needs will help the learners to concentrate on learning and applying what they have learned. Richard believes that the data to be collected from learners, teachers, administrators, and employers in the planning process will help to identify general and specific language needs and contents of a language program. Besides, it will provide data for review and evaluation of the existing program. Then why should we conduct needs analysis?

First, needs analysis tells an ESP course from an EGP course. Generally speaking, needs analysis aims at answering such questions as who will learn the language and why, where, when the language is learned. These questions may fall into two categories: target needs and learning needs. As for target

needs in specific, it explains what the learner needs to do in the target situation. Obviously, target situation for a business man and for a technical worker determines different language contexts they are going to learn. Only if the ESP teacher understands full well what the learner is going to do in a target situation, can he choose proper learning materials and teaching methodology. Whereas for the EGP learner, he does not have any specific purpose in learning a foreign language. On the other hand, English for junior and senior students are specialized. Students' future professions require that they should acquire not only terms but also the ability of how to use them in different situations. Therefore, it is obvious that analysing target needs has not been made full use of in syllabus designing and material choosing at this stage.

Second, needs analysis contributes to the design of a reasonable syllabus and the choice of effective methodology in ESP course. In analysing target needs, necessities, lacks and wants are three important distinctions. Necessities are what the learner has to know in order to function effectively in the target situation. A good understanding of the learner's demands is helpful in deciding on what is going to be taught. Besides, analysing lacks is important in course design, too. It is easier to see that learning time, learning material and teaching methodology would vary for intermediate learners and advanced ones. In fact, it is lacks that determines the variation. Lacks refers to the gap between the target proficiency expected of learners and the existing proficiency. How large the gap is would decide the learning material and the time for learners to gain the target proficiency. Furthermore, if time is fixed, the gap would determine what methodology is going to be applied in the learning process. Only proper methodology will bring about effective learning. When the idea of lacks is applied to Special English reading course, the teaching method is to be questioned. For one thing, time of learning at this stage is fixed. For another, neither is the course a translation one nor is translation method an effective way of teaching in today's classroom. The reason why the translation method is the dominant one is that the teachers care little about the lacks.

Thirdly, needs analysis helps identify and, thus, plays a very important role in arousing the learner's motivation. The learning process of an ESP course not only involves the ESP teachers' workload, but also has much to do with the views of ESP learners to the course. Wants is found in the conflict views towards needs between course designers and sponsors and learners. The greater the conflict is, the more disappointed the learner feels of the course. Then, he lacks the motivation to learn. There are conflict views towards needs between the Syllabus and students in Specialized English reading course, too. The Syllabus regards that students need to read original works in their field while students believe that their future professions need not only reading skill but speaking, listening and writing ones. So, most students are not satisfied with the present course. Therefore, it is not strange that students have little motivation to learn. Furthermore, a better understanding of learning needs contributes to invoking the learner's motivation, too. An analysis of learning needs is trying to answer the question of what the learner needs to do in order to learn. In other words, it is how the learner is going to get from starting point to the destination. Though the ESP learner may just as well have strong motivation in reading long and dull material in target situation, but it is not the case in classroom. So, in the process from starting point to the destination, it is vital to keep the learner being interested in learning. Bearing the learner's motivation in mind, an ESP teacher would probably adjust his teaching techniques constantly. This is a challenge to present ESP teachers' translation method and also a challenge to the traditional way of choosing specialized English reading course teachers. It is said that the inner factor is the key point. So long as the motivation of students is aroused, can they acquire a good command of English. Needs analysis is still critical in accomplishing it.

In order to help students obtain the abilities needed in their work and to improve our teaching efficiency, this research tends to search a better way for ESP teaching, which includes arranging courses, choosing teaching materials, adjusting the teaching methodologies according to the students' needs.

### **3 Experimental Research and Findings**

If we analyse the students' needs and try to live up to their needs, will they make better academic achievements? The writer conducted an experiment on two classes of the same level from September, 2010 to March, 2011. Class A is the treatment group and class B is the controlled group. In the research, the software SPSS is used in comparing the test results of class A and class B. The writer uses SPSS to do relevance analysis of the students' examination scores. See table 1:

**Table 1 Compared Result**

	N	Correlation	Sig
Class A_ Class B	20	1.000	0.417

According to table 1, the correlation of the scores of the students in class A and class B is 1.000. From the statistic point of view, the correlation 1.000 means that the students from the two classes are of the same level. Having proved that the students of class A and class B are of the same level before the experiment, if their examination scores have a great difference after the experiment, we can conclude that it is the result from the different teaching methodologies.

For class B, the teacher took the routine approach: First, translate the terminologies of certain subjects from Chinese to English; Second, explain the contents of the text; Third, assign some translation exercises as after-class practice.

While the students in class A were asked to write down their needs-what they wanted to learn from the course at the beginning of the term. Then the teacher chose the teaching materials and arranged the processes of the lesson according to their needs. Every student felt like a protagonist, so everyone was actively involved in class instead of sitting idly to wait for the teacher’s explanations.

After one term, the mean of class A raises 3.20, improves from 73.35 to 76.55, while the mean of class B only raises 1.1, improves from 73.2 to 74.3.

**Table 2 Paired Samples Test**

	Paired Differences			t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean			
A_NEW-B_NEW	2.6800	10.2740	2.2772	1.164	19	0.248

From table 2, we can see the sig is  $0.248 < 0.5$ , which proves that the difference between the two classes is meaningful. So we can draw the conclusion that the students in class A make greater progress than the students in class B.

In the experiment, the students of class A, who undergo needs analysis, make greater progress than those in class B in ESP course. From the comparison between class A and B before and after the experiment, we can have the following findings:

1) We should innovate the teaching materials and syllabus. Teachers should choose suitable materials according to the students’ needs and appropriate syllabus should be designed based on a needs analysis.

Without appropriate materials, it is hard for teachers to instruct students for their study. Material writing is one of the most characteristic features of ESP in practice. In marked contrast to general English teaching, a large amount of the ESP teacher’s time may well be taken up in writing materials.

Materials for students of class B include a Chinese-English dictionary and some extracts from foreign textbooks. The students say that they only read a few of the extracts because the articles are not related with their major and they are not what they want to learn. Furthermore, some passages are too easy for them since the contents of the passages are something they have already learned in the middle school; while others are extremely difficult both for the English language points and the content. The materials for class A are chosen from some foreign textbooks and scientific journals. All of the articles chosen are about advanced specific knowledge in the students’ major field. Before class, the teachers put notes after each section to help the students to digest better. The notes that include both the difficult language points and some profound specific knowledge, combine the work of both English and professional teachers. For the language points, the teachers would underline the difficult parts and explain the grammatical phenomena of the phrases and usage of the words. These save the students’ time in consulting dictionaries. For the specific knowledge, the teachers will explain the difficult points in Chinese in the notes. Thus, it can first make sure that the students understand the principles in the specific field, and afterwards, they can refer back to the article written in English and learn the corresponding expressions in English. In class, the students are required to discuss what they have read from the material in English. In this way, the students can know more about the specific knowledge in their major fields, at the same time, they can improve their abilities in communicating in English.

Here the writer expects that the authorities concerned would attach importance to the difference between ESP and EGP and design appropriate syllabus based on a needs analysis. In light of the difference between ESP and EGP, we should treat them differently and adopt different materials and

syllabus to meet the needs of the students.

2) We should innovate the teaching methods in ESP teaching. Teachers should take flexible teaching methods in ESP teaching.

It is a misunderstanding that teaching means that the teacher talks and the students listen. Learners may well have a clear idea of the necessities of learning. A need does not exist independently of a person. It is people who build their images of their needs on the basis of data relating to themselves and their environment. Bearing in mind the importance of learner motivation in the learning process, the teacher cannot ignore the learners' perceived wants.

According to the needs analysis, the postgraduate students want to discuss with their classmates and teachers to tackle problems in reading. For class B, the teacher still use grammar-translation approach. Though it can meet the needs for basic language usage training, it is far from enough in cultivating the students' interests and competence in using the language. On the contrary, it just makes the students feel bored and lacks enthusiasm in learning. For class A, the teacher tried to seek a balance between input and output. The students were all given ESP courses based on texts from their subjects, for example, articles introducing medicine for medication majors; articles about latest robot design for students in mechanical engineering. This would motivate the students because of the apparent relevance to their studies. The students learn something new through reading before class, which is the input prepared for the later output-discussion. In class, the students discuss what they knew from the reading material. They can straighten out their thoughts, realize their own faults and solve the problems during the discussion. Input is the prerequisite for the language acquisition and knowledge acquiring, but it cannot be fulfilled without the output checking.

In this information age, no one can survive without exchanging information with the outside world. The students want to improve their abilities in communicating with foreigners as well as gaining the advanced knowledge from books and papers written in English. The "reading and discussion" method serves this need. From the reading part, students can learn how to find out the main idea, how to search the needed information more quickly and also the corresponding expressions in Chinese and English; from the discussion, students can learn to express their thoughts with the terminologies in their field.

3) Knowing the students' needs, teachers can trigger the students' motivation in ESP learning.

In needs analysis, we stress that it is an awareness of the needs that characterizes the ESP situation. But awareness is a matter of perception, and perception may vary according to one's standpoint. When communicating with foreigners, it cannot be avoided to involve in manners from different cultures. The teacher of class A has prepared some text-related cultural background knowledge and discusses it with the students in class, which triggers the students' interests in further study. Besides, the teacher in class A also arrange sometime for each lesson to answer questions, which helps the students to solve their puzzles when they cannot find answers elsewhere. After one term, the students in class A are obviously more familiar with the terminologies in their fields and more fluent in using English to express their thoughts, and what's more important, they begin to like learning English.

#### 4 Conclusion

According to the theoretical discussion and case study and its findings, it can be inferred that needs analysis plays an extremely important role in the design of an ESP course. By analysing the test result of class A and class B with the SPSS, we find that needs analysis is extremely important for ESP teaching and learning. A ESP course would be a successful one if great importance is attached to needs analysis. It is helpful in the innovation of specialized English reading course as it not only affects syllabus design, materials writing, classroom teaching, but also helps ESP teachers bear in mind the learner, a decisive factor in learning. Only if ESP course features are paid attention to by both syllabus designer and the teacher of Specialized English reading course, can it be improved. Doing a needs analysis can make it clear that how language learning and skills learning can be maximized for a given learner group and help us design an effective syllabus.

# Research on the Impact of Pay Fairness on Pay Satisfaction in OEM Companies

Liu Qiang, Hu Yaqi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:87114560@qq.com, q.q.7@qq.com)

**Abstract:** We made the staff in Original Equipment Manufacturer (OEM) as the object of study, and discussed how pay fairness affects pay satisfaction. After dividing pay fairness into the comparative sense of fairness and the institutional sense of fairness and satisfaction into the welfare satisfaction, pay structure satisfaction and pay level satisfaction, by using SEM we find the correlation between each dimension, which may help OEM companies take more effective measures to enhance employees' pay satisfaction and increase their enthusiasm for work.

**Keywords:** OEM companies; Pay fairness; Pay satisfaction; SEM

## 1 Introduction

Pay satisfaction is the attitude of employees to salary, which was firstly raised by the American scholar Adams in 1956 that meant the feeling of personal remuneration fairness. Followed by other scholars also raised the related definitions, Miceli and Lane said it was the sum of positive or negative emotions from individual salary, and Lawler considered it as the differences of staff's expected income and actual income. This perception was based on pay fairness that had a major impact on staff motivation and job performance. Raising pay satisfaction comes to be an important part of human resources management in modern enterprise.

With the transferring of global manufacturing center, a growing number of international enterprises put their emphasis on China which leads the tag "Made in China" an outstanding place in global manufacture industry. As is at the end of the value chain, most of the profits of the product obtained in the course of design and brand management, while the profits left to OEM companies is very limited. In order to survive in the fierce competition, OEM companies have to damage the interests of employees to improve their profits, which resulted rising the unfairness and decreasing the pay satisfaction, which makes many problems prominent. Studying the relationship of pay satisfaction and fairness may help to a better understanding of the salary's formation, as is made to take more effective.

## 2 Pay Satisfaction and Pay Fairness

Equity theory and differences theory are two theoretical basis of pay satisfaction, at the beginning of the pay satisfaction research, equity theory has been applied. A study found that the sense of fairness to general employees' pay satisfaction was much stronger than expectations (Klein, 1973). And staff determines a fair understanding of employees' pay satisfaction (Heneman, 1985), so in order to achieve fair we have to deal with the relations of inputs and outputs. Actually, there was a significant relationship between distributive fairness and pay satisfaction (Oldham, 1986). Followed by Sweeney (1990), Summer and DeNisi (1990), and many other scholars also obtained the same results. Then study found that employees' feelings of fairness on the organization's system management and method would affect their job satisfaction (Lee, 1995). And the program of organization in the pay fairness reflected how the organization allocating resources, and which had relation with the evaluation of pay system (Martin, Belmet, 1996). Only by establishing on an equitable basis can the pay system be the most effective role to motivate staff. In China, researcher found that the pay fairness in organization (i.e. results, programs, interaction and information fairness) is an important factor to various types of pay satisfaction (i.e. pay levels, bonuses, benefits, raises, pay systems and management satisfaction) factor (Wu Xiaoyi, 2006).

After sorting out the literature, we find that most scholars at home and abroad have recognized the sense of fairness had a significant influence on pay satisfaction, and nail down the theoretical value and practical significance of equity theory using in pay satisfaction research. At the same time, there was also a part of foreign scholars studying the affection from the equity theory to various elements of remuneration with cases. However, the research based on the pay fairness and satisfaction in OEM companies is rarely, especially there is almost no empirical research in this area within our native scholars. After combining the researches of other scholars and investigation of the OEM business

practices, we set the pay satisfaction into three dimensions -pay level, pay structure, welfare satisfaction, and divide pay fairness into comparison fairness and system fairness. Finally we test the interaction of these factors.

### 3 Course of the Study

#### 3.1 Indicators design

(1) Pay Satisfaction: Employees' pay satisfaction not only presents the intuitive pay level satisfaction, but also the welfare and the pay structure. Herbert.G. Heneman and Donald.P. Sehwab had divided pay Satisfaction into pay levels, benefits, salary promotion and salary structure / management satisfaction (Herbert.G. Heneman and Donald.P. Sehwab, 1978).Wang Wei made pay satisfaction into pay level satisfaction, pay structure satisfaction, pay system satisfaction and the level of benefits satisfaction (Wang Wei, 2004).Therefore, in this article, we will divide pay satisfaction into three dimensions-the pay level satisfaction, pay structure satisfaction and welfare satisfaction. Remuneration level satisfaction reflects the employees generally pay satisfaction, as well as key staff's pay satisfaction; Salary structure satisfaction reflects the incentive pay satisfaction and satisfaction for the calculation of the salary structure; Welfare satisfaction reflects the satisfaction of the overall level and affection of intrinsic motivation.

(2) Pay Fairness: Employees are very concerned about the fairness of the salary, they not only pay attention to the pay distribution fairness (Folger,and Greenberg, 1985), such as the fairness of the external remuneration and the internal remuneration(Kuang Suxun,2002), but also the fairness of designing and implementing of the pay system(Wang Yue, and Zhou Changqun,2002).Therefore, we divided the pay fairness item into two dimensions-pay comparison fairness and pay system fairness. The pay comparison fairness means the inherent fair feelings of whether the employees individual pay levels reach to their expectations, and the external fair feelings of the comparison with others. While, pay system fairness mainly reflects the fairness of pay system development and implementation.

(3) Questionnaire Design: The questionnaire uses the Likert five-point scale, so that the subjects can use 5 levels—strongly agree, agree, not sure disagree, strongly disagree to measuring the feelings, and respectively correspond to endow with a value—5 points, 4 points, 3 points, 2 points, 1 point, the option “1” represents “strongly disagree”, “5” represents “strongly agree” to arrive at each satisfaction factor of the actual experience score.

#### 3.2 Sample and data collection

The object of this investigation is the foreign OEM enterprise, We totally issued 500 questionnaires, and actually received 432 ones, representing a satisfactory effective response rate of 86.4 percent, excepting for incomplete and significantly biased questionnaire, the final number is 379.In order to avoid each other discussing from affecting the accuracy of the questionnaire, we conducted a separate survey for different staff to ensure employees do not have any communication, which was made to ensure the authenticity of the questionnaire.

### 4 Model Modifying and Result

#### 4.1 Reliability

Reliability refers to the reliability of measurement data, measuring the stability and consistency. In general, if the Cronbach coefficient is about 0.90 that means the reliability of the test or scale is “excellent”, about 0.80 can be considered “very good”, and about 0.70 can be considered “adequate”, about 0.60 is acceptable to a reasonable extent (Peterson, 1994; Slater, 1995).After analyzing with Spss17.0,we find the Cronbach' s value of each scale shows a reliable coefficient ,which indicates the consistency of the scale of measurement results is very good (Pay level satisfaction=0.692; Welfare satisfaction=0.936; Pay comparison fairness=0.952; Pay system fairness=0.921;The whole=0.976).

#### 4.2 The measurement models

We have a total of five measurements models in this study, and confirmatory factor analysis should be made to ensure the indicators reflect various factors before we make the whole model testing. By using Amos17.0 software analysis, we get the following results:

The results show that the CFI, TLI values in the theoretical model of this study are greater than 0.85, while the RMSEA value is less than 0.1, which means the relationship between the factors and indicators pass data validation, indicating that the indicators can be better reflect the factor information and the model can be further tested.

**Table 1 Measurement Models**

Models	$\chi^2$	DF	CFI	TLI	RMSEA
Pay level satisfaction	37.444	8	0.942	0.892	0.099
Pay structure satisfaction	123.820	53	0.961	0.951	0.059
Welfare satisfaction	394.344	103	0.926	0.913	0.087
Pay comparison fairness	177.553	76	0.961	0.973	0.059
Pay system fairness	329.765	103	0.922	0.909	0.076

**4.3 Model Modifying and Hypothesis Testing**

**Figure 1 Completed Model**

Based on the five measurement model, we use Amos17.0 to establish the structural equation model (See Figure 1), the saturated model show:  $\chi^2=98.00$ ,  $DF=28$ ,  $CFI=0.975$ ,  $TLI=0.959$ ,  $RMSEA=0.081$ , the result is not good, and path coefficient between the “Pay comparison fairness” to “Pay structure satisfaction” and “Pay system fairness” to “Pay level satisfaction” are not significant, so we removed the bad path to amend the model (See Figure 2).

**Figure 2 Correction Model**

We continue analysis the new model by using Amos17.0 and the result shows that:  $\chi^2=113.601$ ,  $DF=30$ ,  $CFI=0.970$ ,  $TLI=0.954$ ,  $RMSEA=0.086$ . Description of model is not good. And the result show there is a correction factor of 5.550 between the residuals from “general level of satisfaction” and the “welfare level satisfaction”, which meant a high correlation between the two factors. So we added a two-way path, and further amended results show:  $\chi^2=107.870$ ,  $DF=29$ ,  $CFI=0.971$ ,  $TLI=0.955$ ,  $RMSEA=0.085$  and the model is still bad. So we add two-way path between residual from “system fairness itself” item and residual from “pay external fairness” item. Finally, the result shows:  $\chi^2=95.826$ ,  $DF=28$ ,  $CFI=0.975$ ,  $TLI=0.960$ ,  $RMSEA=0.080$ , indicating the model can reflect the deep-rooted relations from the data.

The SEM shows the path coefficient between pay satisfaction and pay fairness. As shown in Table 2, pay system fairness has a significant influence on pay structure and welfare satisfaction, comparison fairness as well. While, pay comparison fairness has a great relationship with pay level and welfare satisfaction.

**Table 2 Pay Fairness and Pay Satisfaction Path Coefficient**

Variables	Standard Path Coefficient	Path Coefficient	Standard Error	Critical Ratio	Significance
Pay comparison fairness<----Pay system fairness	0.929	0.693	0.027	25.866	***
Welfare satisfaction<----Pay system fairness	0.538	0.249	0.067	3.703	***
Pay structure satisfaction<----Pay system fairness	0.954	0.110	0.011	10.275	***
Pay level satisfaction<----Pay comparison fairness	0.726	0.189	0.012	15.440	***
Welfare satisfaction<----Pay comparison fairness	0.349	0.216	0.089	2.436	0.015

Notes: \*\*\* Means significant at the 0.001 level

## 5 Conclusions

We made empirical research on OEM employees' relationship between comparative fairness, institutional fairness and welfare, structure, pay level satisfaction by using SEM, and finally made the following conclusions.

### 5.1 The pay fairness is an important factor to pay satisfaction

The results show that the two dimensions of pay fairness have positive influence on pay satisfaction. Specially, pay comparison has a direct impact on welfare and pay level satisfaction, which means that when employees compared the wages, they not only cared about the absolute income, but also the welfare and security. At the same time, the pay system fairness also has direct influence on welfare and structure satisfaction. Therefore, the manager can improve the employees' pay satisfaction by modified the salary management system from internal equity and external competitiveness.

### 5.2 The pay system fairness has a great influence on pay structure satisfaction

Comparing the path coefficients between system fairness and each factor of the pay satisfaction, we found the coefficient between the pay structure satisfactions is 0.954 and highly significant, indicating that the system fairness has a great influence on the pay structure satisfaction. This conclusion is easy to understand, the operate salary structure can't formulate without appropriate remuneration system, only the enterprise to ensure that its pay distribution system is reasonable can improve the satisfaction of salary structure formulation to a high level. As a manager, who should first advocate establishing the pay distribution system led to actual job performance, then improve the fairness of the system itself, that would finally make employees feel satisfied with the remuneration distribution structure.

### 5.3 The pay system fairness has a large extent affection to comparison fairness

We can see from the result that the path coefficient between system and comparison fairness is 0.929 and highly significant (critical ratio=25.866), as indicates employees' perception from system comparison may seriously affect the fairness from comparison. Therefore, if the pay distribution system is not reasonable, staff may likely to suspicious whether their returning equity to their own efforts. So the manager should pay a high concern on the fairness of related distribution system, and make communication with them as usual, then the fairness of system will constantly improve.

This paper makes clear how the pay fairness affects the pay satisfaction, which may help OEM companies take more effective measures to enhance employees' pay satisfaction and increase their enthusiasm for work. However, there are still a few of limitations found in the paper. How does the pay level satisfaction influence the pay system fairness? What is the relationship among the welfare, structure, pay level satisfaction? All these matters can be studied in future research.

# 1 Modeling and Analysis of University Library's Books Utilization Ratio

Chen Zhenhua

Library, Wuhan university of Technology, Wuhan, P.R.China, 430070  
(E-mail: chen-zhenhua@whut.edu.cn)

**Abstract:** This paper constructs a model analyzing the university library's books utilization ratio by using the Markov Notion of transition probability matrix. Based on the books utilization data from 2006 to 2011 of the library of Wuhan University of Technology, we gain the utilization ratio of every type of the library's books. Then the author chooses five types of books of high utilization to analyze and to predict the weights of the utilization ratio in 2012, which can provide scientific base for book buyers to meet the readers' needs and promote the quality of service of the university library.

**Keywords:** University library; Transition probability matrix; Model; Utilization ratio

## 1 Introduction

The Library's main task is to provide readers with the book lending service. Therefore, library's books utilization ratio has become an important indicator to evaluate the service. Presently, the analysis of the quality of library service is mostly textual description. Little analysis was conducted from the quantitative point of view by analyzing the past information of library with the mathematical method. In fact, for any library, rational and scientific analysis of quality of service can be developed through the analysis of the books utilization ratio. Especially, a series of corresponding adjustment can be made to optimize the service.

## 2 Modeling of University Library's Books Utilization Ratio

### 2.1 Books utilization ratio

Books utilization ratio is a common term in the library statistic, whose definitions are slightly different in different materials. "Dictionary for Library and Information" defines it as follows: the ratio between the number of species and copies of the books utilized by readers in a certain library and information institutions and the total collection of species and copies<sup>[1]</sup>; The definition in "Foundation of Library Science": the percentage of the number of the books borrowed by readers in the total collection of books.

### 2.2 Establishment of markov model of books utilization ratio

Markov Notion of transition probability matrix makes use of the Markov process and analyzes the books' lending rate to solve the key issues in the library. However, due to the randomness of the Markov chain, it's difficult to investigate directly the transition probability matrix.<sup>[3]</sup> Here, the author establishes a mathematical model to analyze this issue and calculates the transition probability matrix as follows.

**Table 1 Parameters of the Mathematical Model**

Weight of lending rate /Year	First category	Second category	Third category	Total (%)
Year $t_1$	$a_1$	$b_1$	$c_1$	100
$t_2$	$a_2$	$b_2$	$c_2$	100
$t_3$	$a_3$	$b_3$	$c_3$	100
$t_4$	$a_4$	$b_4$	$c_4$	100

For the convenience of discussion, the author makes the vector of all kinds of books composed in the year of  $t_1$  as :  $v_1 = (a_1 \ b_1 \ c_1)$ , similarly, we can get :

$$v_2 = (a_2 \ b_2 \ c_2), v_3 = (a_3 \ b_3 \ c_3) \text{ and } v_4 = (a_4 \ b_4 \ c_4).$$

The matrix which is made of the weight of lending rate of all kinds of books in the year of  $t_1, t_2, t_3$  is

$$A = \begin{pmatrix} v_1 \\ v_2 \\ v_3 \end{pmatrix} = \begin{pmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{pmatrix},$$

similarly, we can get:  $B = \begin{pmatrix} v_2 \\ v_3 \\ v_4 \end{pmatrix} = \begin{pmatrix} a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \\ a_4 & b_4 & c_4 \end{pmatrix}$

The vector which is made of the weight of lending rate of the books in the first category in the year of  $t_1, t_2, t_3$  is  $B_1 = \begin{pmatrix} a_2 \\ a_3 \\ a_4 \end{pmatrix}$ ,

Similarly, we can get:  $B_2 = \begin{pmatrix} b_2 \\ b_3 \\ b_4 \end{pmatrix}, B_3 = \begin{pmatrix} c_2 \\ c_3 \\ c_4 \end{pmatrix}$

Suppose that there exists a non-negative transition probability matrix  $T$ , the above three category change according to this rule, which causes

$$T = \begin{pmatrix} x_{11} & x_{12} & x_{13} \\ x_{21} & x_{22} & x_{23} \\ x_{31} & x_{32} & x_{33} \end{pmatrix} = (T_1 \quad T_2 \quad T_3)$$

Among them,  $T_1, T_2$  and  $T_3$  are three column vectors of  $T$

According to the model: Because the weight of lending rate of the categories in the year  $t_2 -- v_2$  is equal to the vector of original weight of lending rate in the year of  $t_1 -- v_1$  multiplied by  $T$ , that is  $v_2 = v_1 \cdot T$ ,

Similarly, we have:  $v_3 = v_2 \cdot T; v_4 = v_3 \cdot T$ .

Expand them; and we can get a set of simultaneous linear equations

$$\left\{ \begin{array}{l} a_1 x_{11} + b_1 x_{21} + c_1 x_{31} = a_2 \quad (1) \\ a_1 x_{12} + b_1 x_{22} + c_1 x_{32} = b_2 \quad (2) \\ a_1 x_{13} + b_1 x_{23} + c_1 x_{33} = c_2 \quad (3) \\ a_2 x_{11} + b_2 x_{21} + c_2 x_{31} = a_3 \quad (4) \\ a_2 x_{12} + b_2 x_{22} + c_2 x_{32} = b_3 \quad (5) \\ a_2 x_{13} + b_2 x_{23} + c_2 x_{33} = c_3 \quad (6) \\ a_3 x_{11} + b_3 x_{21} + c_3 x_{31} = a_4 \quad (7) \\ a_3 x_{12} + b_3 x_{22} + c_3 x_{32} = b_4 \quad (8) \\ a_3 x_{13} + b_3 x_{23} + c_3 x_{33} = c_4 \quad (9) \\ x_{11} + x_{12} + x_{13} = 1 \quad (10) \\ x_{21} + x_{22} + x_{23} = 1 \quad (11) \\ x_{31} + x_{32} + x_{33} = 1 \quad (12) \end{array} \right.$$

According to the characteristics of the equations, we can consociate (1)、(4)、(7) and we get:

$$\begin{cases} a_1x_{11} + b_1x_{21} + c_1x_{31} = a_2 \\ a_2x_{11} + b_2x_{21} + c_2x_{31} = a_3 \\ a_3x_{11} + b_3x_{21} + c_3x_{31} = a_4 \end{cases}$$

This coefficient matrix of equations is  $A$ , the constant column vector is  $B_1$ , thus it can be written in the

form of matrix:  $AT_1 = B_1$

Similarly, we can get:  $AT_2 = B_2, AT_3 = B_3$

Thus, we get :  $AT = B$ , we know:  $T = A^{-1}B$

That is,

$$T = \begin{pmatrix} v_1 \\ v_2 \\ v_3 \end{pmatrix}^{-1} \cdot \begin{pmatrix} v_2 \\ v_3 \\ v_4 \end{pmatrix}$$

The above formula can be generalized to a wider range of circumstances<sup>[4][5]</sup>.

### 2.3 Empirical analysis of university library’s books utilization ratio

Taking the library of the Wuhan University of Technology for example, according to the numbers of the copies of all the books and lending books in the year 2006-2011, we can get the lending rate. When we get adequate data, we can make a prediction of the utilization rate of every type of books. The prediction results can be used as reference for the procurement staff to determine the variety and the quantity of the books, which can optimize the collection structure and improve the quality of library services.

The library of Wuhan University of Technology has various kinds of books, about 3.5 millions copies, which are divided into Marxism-Leninism, philosophy, general social sciences, politics and law, military affairs, economics, Liberal arts, education and sports, language, literature, literature, history and geography, general natural science, physics and chemistry, astronomy and earth, food science, medicine and health, agricultural science, industrial technology, transportation, aerospace, environment and labor insurance and comprehensive books. Due to the limited data, combined with the characteristics of the model, five kinds of books are selected to be analyzed. We believe that the conclusion from the model would be more accurate with adequate data.

**Table 2 Rate of Utilization of five Kinds of Books in Library of WHUT from 2006 to 2011**

Rate of Utilization/Year	Philosophy	Economics	Literature	Mathematics, physics and chemistry	Industrial technology
Year of 2006	1.837564	1.146315	4.782194	0.966729	1.048346
2007	1.736976	0.972445	3.676339	0.809631	0.879284
2008	1.577993	0.862638	2.828429	0.796822	0.866895
2009	1.213401	0.629463	2.214991	0.595028	0.733167
2010	1.253685	0.590676	2.474701	0.570414	0.674396
2011	1.044239	0.458191	1.802224	0.518558	0.580066

These data were processed according to the model and then we get the weight value of utilization ratio of these five kinds of books.

**Table 3 Weight Value of Five Kinds of Books in Library of WHUT from 2006 to 2011**

Weight Value/Year	Philosophy	Economics	Literature	Mathematics, physics and chemistry	Industrial technology	Total
2006	0.1879	0.1172	0.4889	0.0988	0.1072	1
2007	0.2151	0.1204	0.4553	0.1003	0.1089	1
2008	0.2276	0.1244	0.4080	0.1149	0.1250	1

2009	0.2253	0.1169	0.4112	0.1105	0.1361	1
2010	0.2253	0.1062	0.4448	0.1025	0.1212	1
2011	0.2372	0.1041	0.4093	0.1178	0.1317	1

We make use of the method in the model to estimate the weight value in the year of 2011

**Table 4 Estimation of Weight Value in 2011**

Weight Value/ Year	Philosophy	Economics	Literature	Maths, physics and chemistry	Industrial technology	Total
2006	0.1879	0.1172	0.4889	0.0988	0.1072	1
2007	0.2151	0.1204	0.4553	0.1003	0.1089	1
2008	0.2276	0.1244	0.408	0.1149	0.125	1
2009	0.2253	0.1169	0.4112	0.1105	0.1361	1
2010	0.2253	0.1062	0.4448	0.1025	0.1212	1
2011	$a_1$	$a_2$	$a_3$	$a_4$	$a_5$	1

Here,  $V = (a_1 \ a_2 \ a_3 \ a_4 \ a_5)$  is unknown and it's the weight value to be predicted. According to the formulas in the model, we can get:

$$A = \begin{pmatrix} 0.1879 & 0.1172 & 0.4889 & 0.0988 & 0.1072 \\ 0.2151 & 0.1204 & 0.4553 & 0.1003 & 0.1089 \\ 0.2276 & 0.1244 & 0.4080 & 0.1149 & 0.1250 \\ 0.2253 & 0.1169 & 0.4112 & 0.1105 & 0.1361 \\ 0.2253 & 0.1062 & 0.4448 & 0.1025 & 0.1212 \end{pmatrix}$$

Its inverse matrix:

$$A^{-1} = \begin{pmatrix} -29.0478 & 29.3329 & -5.3785 & -9.8370 & 15.9298 \\ -17.5353 & 79.3542 & -30.8753 & 48.7961 & -78.7427 \\ 6.9005 & -4.2073 & -4.3648 & -4.0070 & 6.6783 \\ 51.4403 & -136.4844 & 131.9363 & -106.2249 & 60.3459 \\ 0.5343 & 6.8067 & -58.5089 & 80.0701 & -27.9081 \end{pmatrix}$$

$$B = \begin{pmatrix} 0.2151 & 0.1204 & 0.4553 & 0.1003 & 0.1089 \\ 0.2276 & 0.1244 & 0.4080 & 0.1149 & 0.1250 \\ 0.2253 & 0.1169 & 0.4112 & 0.1105 & 0.1361 \\ 0.2253 & 0.1062 & 0.4448 & 0.1025 & 0.1212 \\ a_1 & a_2 & a_3 & a_4 & a_5 \end{pmatrix}$$

As to its transition probability matrix, from  $T = A^{-1}B$ , we can get:

$$T = \begin{pmatrix} -3.0001+15.9298a_1 & -1.5218+15.9298a_2 & -7.8448+15.9298a_3 & & \\ 18.3267-78.7427a_1 & 9.3332-78.7427a_2 & 33.4013-78.7427a_3 & & \\ -1.3595+6.6783a_1 & -0.6284+6.6783a_2 & -2.1519+6.6783a_3 & & \\ -14.2063+60.3459a_1 & -6.6430+60.3459a_2 & -25.2615+60.3459a_3 & & \\ 6.5219-27.9081a_1 & 2.5748-27.9081a_2 & 14.5767-27.9081a_3 & & \\ -1.1458+15.9298a_4 & -1.4210+15.9298a_5 & & & \\ 8.9489-78.7427a_4 & 9.7216-78.7427a_5 & & & \\ -0.6843+6.6783a_4 & -0.8541+6.6783a_5 & & & \\ -6.8317+60.3459a_4 & -6.3766+60.3459a_5 & & & \\ 2.5776-27.9081a_4 & 2.6505-27.9081a_5 & & & \end{pmatrix}$$

According to the nature of the model, we can get the elements of matrix  $T \in [0, 1]$

The answers are:

$$\begin{aligned} a_1 &\in (0.2354, 0.2511) \\ a_2 &\in (0.1101, 0.1185) \\ a_3 &\in (0.4115, 0.4242) \\ a_4 &\in (0.1132, 0.1136) \\ a_5 &\in (0.1279, 0.1520) \end{aligned}$$

Through the actual data:  $a_1 = 0.2372, a_2 = 0.1041, a_3 = 0.4093, a_4 = 0.1178, a_5 = 0.1317$ , among which

$a_1$  and  $a_5$  are in the range obtained. The differences between  $a_2, a_3, a_4$  and the actual data are respectively 0.0060, 0.0022 and 0.0042.

Based on the situation of Wuhan University of Technology, Some books of earlier classification have been made some adjustment according to the present classification and this process has been continued. In addition, the library has backtracked and built a database, which brought much more old books. And at the same time, the number of new booking has increased. Thus the total amount of book collections has increased while the number of books that have been read and lent hasn't grown, which means the decline of the utilization rate. This analysis shows that the weight of utilization ratio of the year 2011 which was calculated from the established model is credible, and when sufficient data can be obtained, we can also predict the value of the specific utilization rate of all the categories based on this model.

We use this method to predict the weight values of utilization ratio of these five categories in the year of 2012 as follows:

Suppose that the weights of these five kinds of books, philosophy, economic, literature, mathematics, physics and chemistry, Industrial technology are respectively  $b_1, b_2, b_3, b_4, b_5$  in 2012. And then we can get the matrix of the weights of utilization ratio of these five kinds of books in these years (2006--2011):

$$A_1 = \begin{pmatrix} 0.2151 & 0.1204 & 0.4553 & 0.1003 & 0.1089 \\ 0.2276 & 0.1244 & 0.4080 & 0.1149 & 0.1250 \\ 0.2253 & 0.1169 & 0.4112 & 0.1105 & 0.1361 \\ 0.2253 & 0.1062 & 0.4448 & 0.1025 & 0.1212 \\ 0.2372 & 0.1041 & 0.4093 & 0.1178 & 0.1317 \end{pmatrix}$$

Its inverse matrix is

$$A_1^{-1} = \begin{pmatrix} -175.5965 & 184.3607 & -114.6497 & 228.5385 & -121.6225 \\ -44.3559 & 83.6648 & -14.4763 & 49.6031 & -73.4200 \\ 44.4748 & -49.4384 & 20.8918 & -43.8282 & 28.8921 \\ 226.4220 & -204.0700 & 79.3863 & -316.1596 & 215.3794 \\ 10.5762 & -61.9990 & 81.9981 & -31.8189 & 2.2372 \end{pmatrix}$$

From the above analysis, we can get the weights of utilization ratio of these five kinds of books in these years (2007--2012) :

$$B_1 = \begin{pmatrix} 0.2276 & 0.1244 & 0.4080 & 0.1149 & 0.1250 \\ 0.2253 & 0.1169 & 0.4112 & 0.1105 & 0.1361 \\ 0.2253 & 0.1062 & 0.4448 & 0.1025 & 0.1212 \\ 0.2372 & 0.1041 & 0.4093 & 0.1178 & 0.1317 \\ b_1 & b_2 & b_3 & b_4 & b_5 \end{pmatrix}$$

Therefore,,from the formulas  $T_1 = A_1^{-1}B_1$  , we can get its transition probability matrix:

$$T_1 = \begin{pmatrix} 29.9495 - 121.6225b_1 & 11.3226 - 121.6225b_2 & 46.7104 - 121.6225b_3 \\ 17.2586 - 73.4200b_1 & 7.8888 - 73.4200b_2 & 30.1692 - 73.4200b_3 \\ -6.7051 + 28.8921b_1 & -2.5905 + 28.8921b_2 & -10.8296 + 28.8921b_3 \\ -52.0200 + 215.3794b_1 & -20.1703 + 215.3794b_2 & -85.6265 + 215.3794b_3 \\ -0.7771 + 2.2372b_1 & -0.5362 + 2.2372b_2 & 2.2704 + 2.2372b_3 \\ 15.3661 - 121.6225b_4 & 19.3449 - 121.6225b_5 \\ 8.5079 - 73.4200b_4 & 10.6205 - 73.4200b_5 \\ -3.3743 + 28.8921b_4 & -4.4093 + 28.8921b_5 \\ -25.6404 + 215.3794b_4 & -31.4878 + 215.3794b_5 \\ -0.9791 + 2.2372b_4 & -1.3684 + 2.2372b_5 \end{pmatrix}$$

From the nature of the model, we can get the elements of the matrix  $T \in [0,1]$

The answers are:

$$\begin{aligned} b_1 &\in (0.2321, 0.2462) \\ b_2 &\in (0.0938, 0.1074) \\ b_3 &\in (0.3976, 0.4022) \\ b_4 &\in (0.1190, 0.1237) \\ b_5 &\in (0.1526, 0.1591) \end{aligned}$$

At this point, the author has completed the prediction of the weight of utilization ratio of these five types of the books in the year of 2012.

### 3 Conclusions

This paper makes use of Markov Notion of transition probability matrix to establish a model analyzing the university library's books utilization ratio, calculating the utilization ratio of books of different categories and evaluating the service of the library. By analyzing the weights of utilization ratio of these five categories of books in these years (2006--2011) and in comparison with actual data, the established model has been proven to be scientific. As a result, this model can be used to predict the future utilization ratio of books of all the categories. In particular, the prediction of the weights of utilization ratio provides a reference for the procurement of new books of libraries and predicts the future weights of utilization ratio of all kinds of books for the library, which can guide the book buyers to develop a reasonable procurement programs, maximize the efficiency and improve the utilization ratio of the books.

## An Investigation into the Impact of Investor Relations on the Turnover Rate in the Capital Market

Bian Na

School of Management, Shijiazhuang University of Economics, Shijiazhuang, P.R.China,050031  
(Email:iriscn618@hotmail.com)

**Abstract:** This paper takes the listed companies in China as the samples, describes the relationship between stock price volatility, stock turnover, companies' performance and investor relations by use of correlation analysis and regression analysis. Empirical results show that well investor relations is conducive to reducing the volatility of share prices and stock turnover, which ensures the companies' share stability in the capital market and improves the companies' performance, and IRM has been developed into an important business tool for companies' communication strategies.

**Key words:** Investor Relations; turnover rate; Volatility rate; Corporate Performance; Multiple linear regression model

### 1 Introduction

The companies traditionally rely on loans more than equity capital, but with the continuous development of capital markets, equity capital to growing enterprises, the company's stock performance in the capital market impact of the company have become increasingly prominent. Today, the company is considered the value of the stock market performance to identify and test used to measure the success of the standard indicators and factors. There is evidence that an investor relation is indeed important in obtaining the support of financial entities to play a key role. Investor relations management can help companies and analysts, investors and potential investors with the Company relating to the communication of information between financial entities, financial entities to help understand the market structure, company positioning, at the same time provide some technical support platform, to help investors access to the company's tangible information, facts and data to assess the success or failure of company information. Through information disclosure to reduce the external trading companies to obtain valuable information on fixed costs, investor relations management can also be attractive to investors, the company's size and has a significant impact on performance, and ultimately affect the value of the company

Well investor relations can be more effective in reducing investors' doubt to the companies, and reducing their non-rational behavior. In this way, it could help investors establish the confidence to the companies, so that stocks' stability can be ensured. In the long term, it is helpful for the companies to develop healthily in the capital market and ultimately enhance corporate performance and value.

As early as 1969, Investor Relations Institute (NIRI) defined investor relations management as a strategic management actives, which is responsibility using the disciplines of communication with investors to show them transparently the companies' information and construct companies' good image in the capital market. By 1996, investor relations was added the connotation of marketing in the original basis of definition by NIRI. In 2003, it was defined again, which is investor relations is a corporate activity, combining the disciplines of finance, marketing and communications, which provides present and potential investors with an accurate portrayal of a company's performance and prospects so that they can make properly informed investment decisions. In the new definition, two-way communication is explicitly included. Investor relations have become the link between the financial community and the corporate. It helps the companies to provide information which could reduce information asymmetry, helps the financial community and investors to assess the companies. Today, the majority of large listed companies attach great importance to investor relations.

According to agency theory and asymmetric information theory, investor relations could reduce the agency costs. So it considered as a solution to information asymmetry. If managers deem it necessary to attract and retain investment in the main, the companies will fund the implementation of investor relations. Through investor relations, it could achieve effective communication and coordination between managers and investors. Thereby the information asymmetry is reduced, and more investors are attracted.

Investor relations are a part of comprehensive, integrated information communication. The successful investor relations could impact corporate image through advertising and media-to create a feeling of well-known and loved-so as to enhance the performance and appraisalment in the capital

market (Gregory, 1997). There is no doubt that investor relations will affect the company's performance. Good investor relations will bring lower financing costs, smooth financing channels, more patient investors (Ma Lianfu, Zhao Ying, 2006). A large number of research literatures also show that investor relations may affect the companies' market value and investors' potential evaluation, and the companies with good record of investor relations tend to the good performance (Hall, 1992). Therefore, effective investor relations can reduce costs and risks, and impact stock returns and liquidity (Nash, 2005).

## 2 Investigations Design and Method

### 2.1 Samples Selection and Data

In this paper, our sample companies are listed companies in China in 2007. After excluding the companies lacking of available data, being ST and belonging to financial listed companies, it results in a final sample of 885 companies.

The level of IRM is from the analysis to corporate governance self-examination report released in 2007. Other data is from Wind database.

### 2.2 The Measurement to IRM

In this paper, factor analysis method is taken to evaluate comprehensively the IR level of listed companies in China. According to the IRM index designed by IRM Study Group of The Research Center of Corporate Governance of Nankai University in 2005 and 2006(see table 1), listed companies' self-examination report on corporate governance published in 2007 are arranged. If the item in the index is taken, then it is calculated as 1 on this item, or it is 0. By use of factor analysis, three factors' scores are got and eventually every listed company's IRM level score is got, which three factors mean the level of information disclosure, the level of information feedback and the level of organization indemnification.

**Table 1 IRM Index**

Target layer index	Sub factor layer	Subdivided layer
IRM level	level of information disclosure	Does the company post the archives and annual report to the investors?
		Does the company receive news report and is it cooperative?
		Is there any meeting for analyst, performance and road show?
		Does the company follow and keep contact with the analyst?
		Do the companies compile the weekly report of IR, the weekly report of stork tidings and IR manuals?
	level of information feedback	Is there any management of IR such as telephone-consulting, fax, mail, or exclusive hunt line and regular activities?
		Is there any facilities of network communication (The column of IR management and inquiring, website and its updating, BBS of IR and mailbox for IR)
		Is there one-one communication (Face to Face communication, The communication on the spot, Receiving the visit of investor and the Field visit & study)
		Is there any active contact or visit organized by the company?
	level of organization indemnification	Is there a department in charge of the IR in your company?
		Are there any stipulations for IR in your company?
		Is there any the intercommunication on net
		Does the company have the training for the staff of IR management?

### 2.3 Hypotheses

First of all, the article studies the relationship between IRM and the capital flows in stock market. In the case of information asymmetry, the agent with few information tends to show followers' performance, while the agent with more information tends to take contrarian strategies. Well IRM could establish the open information channels between the investors and the companies, which could maintain the relationship between two agent parties so that the investors could hold more confidence to the companies and hold their stocks long-term. Based on this, the article makes the following assumption.

H1: The level of IRM is negatively correlated with stock turnover rate with other conditions unchanged. The better IRM could lower stock turnover rate, same on the contrary.

Secondly, the article studies the relationship between IRM and the stock price's change. In the

capital market, investors are very sensitive to information and the disclosure and contents of information will influence the investors' decision-making which will affect stock price in the end. Patell (1976) found that if the management holds the information that not affected the price yet, and the price will change immediately as soon as the information disclosures. Nittai K. Bergman and Sugata Roychowdhury (2008) also found that companies' disclosure policy and affect investors mood so that bias investors expect and affect stock price further. Information disclosure level could affect investors' sentiment, resulting in price fluctuation. Well IRM could effectively reduce the information asymmetry between investors and companies, and reduce the impact of noise. All of these could help investors make decisions more rationally which is conducive to stocks' stability in capital market. Based on this, the article made the following assumption.

H2: The level of IRM is negatively correlated with stock price fluctuation rate with other conditions unchanged. The better IRM could lower stock fluctuation rate, same on the contrary.

Finally, the article studies the relationship between IRM and companies' performance. According to agency theory of Coase (1937), Jensen and Meckling (1976) believe that accounting information is aimed at monitoring managers' behavior to reduce agency cost. Admati and Pfleiderer (2000) believe that companies' value is correlated with the companies' disclosure information that is taken by investors. Watts and Zimmerman (1978) also believes that companies should increase voluntary information disclosure in order to avoid the press from government and stakeholders, which may lead to increased agency cost in the future. Fishman and Hagerty (1989) find that IRM could reduce the fixed cost for external traders to get valuable information by information disclosure. Marcus and Wallace (1997) study the disclosure practice of U.S companies, and find IRM have significant impact on companies' size and performance. Well IRM not only can effectively reduce agency cost, but also can increase the value of companies' reputation, reduce the information asymmetry between investors and companies as far as possible. In this way, the effective communication channels could be built and companies' performance is enhanced thereby. Based on this, the article made the following assumption.

H3: The level of IRM is positively correlated with companies' performance with other conditions unchanged. The better IRM could increase companies' performance, same on the contrary.

#### 2.4 Empirical model and variable measurement

Multiple linear regression analysis method is taken to test the hypothesis. The IRM variables used in this study are the level of IRM measured by use of factor analysis, which are independent variables. The dependent variables are stock flowing status, stock price fluctuation status and companies' performance, which are measured by stock turnover rate, stock price fluctuation rate and companies' EPS respectively. Control variables include: 1) the natural logarithm of total assets (*LNSIZE*); 2) leverage (*DTA*); 3) cash flow per share (*CASH*); 4)  $\beta$  value (*RISK*). To find out how the IRM relates to the stock flowing status, stock price fluctuation status and companies' performance separately, we run regressions, using the following model:

$$TUVR = \beta_0 + \beta_1 IRM + \beta_2 LNSIZE + \beta_3 DTA + \beta_4 CASH + \beta_5 RISK + \varepsilon_1 \quad (1)$$

$$VOL = \alpha_0 + \alpha_1 IRM + \alpha_2 LNSIZE + \alpha_3 DTA + \alpha_4 CASH + \alpha_5 RISK + \varepsilon_2 \quad (2)$$

$$EPS = \gamma_0 + \gamma_1 IRM + \gamma_2 LNSIZE + \gamma_3 DTA + \gamma_4 CASH + \gamma_5 RISK + \varepsilon_3 \quad (3)$$

### 3 Empirical Results

#### 3.1 Descriptive statistics

Table 2 shows the descriptive statistics of all variables.

**Table 2 Descriptive statistics**

	N	Minimum	Maximum	Mean	Std. Deviation
<i>TUVR</i>	885	0.69	11.14	4.69	1.57
<i>VOL</i>	885	2.69	15.92	4.02	0.60
<i>EPS</i>	885	-3.15	5.53	0.35	0.52
<i>IRM</i>	885	-1.48	1.53	0.02	0.58
<i>LNSIZE</i>	885	-9.21	27.30	21.65	1.51
<i>DTA</i>	885	0.91	156.72	50.77	17.65
<i>CASH</i>	885	-7.65	9.87	0.40	1.02
<i>RISK</i>	885	-0.24	1.37	0.98	0.18

### 3.2 Regression Analysis

Correlations between IRM and dependent variables are presented in Table3. There is a high negative correlation between IRM level and stock turnover rate, indicating that well IRM could help companies lower investors' speculative behavior which is conducive to stock's stability in capital market. Hypothesis 1 can be confirmed. There is a high negative correlation between IRM level and stock price fluctuation rate, indicating that well IRM could help companies lower stock price's fluctuation which is conducive to stock price's stability in capital market. Hypothesis 2 can be confirmed. There is a high positive correlation between IRM level and EPS, indicating that well IRM could help companies increase companies' performance, and hypothesis 3 can be confirmed.

**Table 3 Correlations**

		<i>TUVR</i>	<i>VOL</i>	<i>EPS</i>
<i>IRM level</i>	Pearson Correlation	-0.084**	-0.068**	0.115***
	Sig. (2-tailed)	0.012	0.044	0.001
	N	885	885	885

Note: \*\*\*,\*\* denote significance at 0.01 and 0.05 level (2-tailed), respectively.

**Table 4 Regressions results**

Variables	Model 1			Model 2			Model 3		
	Coefficient	Std. Dev.	p-value	Coefficient	Std. Dev.	p-value	Coefficient	Std. Dev.	p-value
(Constant)	8.052***	0.709	<0.01	4.225***	0.279	<0.01	-1.259***	0.237	<0.01
<i>IRM</i>	-0.213**	0.084	0.011	-0.071**	0.033	0.031	0.075***	0.028	0.008
<i>LNSIZE</i>	-0.286***	0.034	<0.01	-0.063***	0.013	<0.01	0.084***	0.011	<0.01
<i>DTA</i>	0.012***	0.003	<0.01	0.007***	0.001	<0.01	-0.006***	0.001	<0.01
<i>CASH</i>	-0.231***	0.048	<0.01	-0.051***	0.019	0.007	0.132***	0.016	<0.01
<i>RISK</i>	2.346***	0.284	<0.01	0.840***	0.111	<0.01	0.010	0.095	0.917
R <sup>2</sup>	0.161			0.117			0.163		
Adj- R <sup>2</sup>	0.156			0.112			0.158		
F	33.736			23.245			34.135		
Pr>F	<0.0001			<0.0001			<0.0001		

Note: \*\*\*,\*\* denote significance at 0.01 and 0.05 level (2-tailed), respectively.

Table4 shows the result of regression models. After controlling companies' size, leverage, cash flow per share and risk, there is a high negative correlation between IRM level and stock turnover rate & stock price fluctuation rate respectively (p=0.031,p=0.011), and there is a high positive correlation between IRM level and EPS (p=0.008). According to regression result, well IRM could help the company lower investors' speculative behavior, because effective communication and disclosure could lower information asymmetry. One hand, investors could make the rational judgment by enough information; on the other hand, it could help investors build the confidence to the companies due to investors prefer to hold the stocks long-term. All of these are conducive to the companies' stable and well development, which could reduce the company's agency cost and enhance the company's performance eventually.

### 4 Conclusions

In this paper, we develop models to study the incentives of IRM level to stock flowing, stock price fluctuation and companies' performance. We find that well IRM could help companies lower investors' speculative behavior which is conducive to stock's stability in capital market; well IRM could help companies lower stock price's fluctuation which is conducive to stock price's stability in capital market; well IRM could help companies increase companies' performance.

IRM can help companies to win the support of financial stakeholders, which is conducive to stay and attract shareholders, and IRM has been developed into an important business tool for companies' communication strategies. Well IRM could reduce the volatility in capital market, and guide the

investors from speculators to the direction of genuine investors. At the same time, well IRM could reduce information asymmetry, which could reduce noise interference to investors. Besides, well IRM plays an important role in reducing agent cost, enhancing companies' reputation and ultimately enhancing companies' performance. Therefore, strengthening IRM of listed companies has a positive role not only macroscopically but also microcosmically. With the continuous development of capital market, IRM departments are rising rapidly and occupy an important position in many organizations. At present, China's listed companies' IRM is still in its initial stage, and the overall level is lower with numerous deficiencies. So it is more urgent for all stakeholders to work together to enhance IRM in China.

## Study of the Correlation Between Dominant Indicator of University Presidents and University Ranking

Cai Meng, Xu Hongyi

Higher Education Research Institute, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail:568213437@qq.com)

**Abstract:** This paper is a study about the relationship between the university president and the university ranking, has collected the Chinese 100 "211" university president's basic information and the school ranking change before and after president's tenure. To carry on the empirical analysis with the president's Gender, Nationality, Graduation School, Highest Degree, Major, Took Office Age, Tenure, Over Experience, Academic Title, National Projects and the Number of Papers Published by SPSS software. The result indicated that, only two factors of tenure and graduates school has certain influence to the school, other factors do not have the significance correlation to school. This paper also provides certain model significance for the university president's election.

**Key words:** University president; University ranking; Dominant indicator; Correlation analysis

### 1 Introduction

President has the pivotal status and the function in the higher education development and first-class university president created first-class university. Generally speaking, the famous university's behind all has a series of famous president's name, As a school's highest executive, university president should have an important influence to a school steady movement progress development. To run an excellent university, must have the good school management, good president, good party committee secretary. Many scholars also thought university presidents have the increasingly vital role in the university construction and developing process. To a some extent, the university's competition essence will be the competition of president's quality and the president will become a school soul. Although most scholars agree that university presidents have an important influence to schools, but we found that in many university ranking institutions does not consideration the factor of president. Whether the university president really affect the the school? Which president's aspects have the function? This paper uses the method of correlation analysis to search the influence factor that university president to the university power, hoped provides some suggestions for Chinese university president's selection.

The scholars have done the massive research to university president. American College President is a series of research to American university presidents. In the report of "The American College President: A 1993 Edition", to make comprehensive data analysis for thousands of samples and make comparison for the data of 1990 and 1986, the authors obtained the characteristic which a model US president has (Ross, 1993). On the other report, "The American colleges of president: 2007 edition", To carry on the statistics for the changes which the American president's essential feature, the professional characteristic and some are noteworthy, and carried on the data change from 1986 to 2006 with the graph description, through analysis these data change, thought the university president's structure was changing, and had to undertake the responsibility more and more (King, 2007). For American higher education, it was suggested that university president must have certain political quality and method of carry out (Kauffman, 1974). There is a study on university presidents from the demographic characteristics, educational background, professional background and future plans (Weisman & Vaughn, 2006). In China, what the principal is our universities need? What qualities are a good president should have? Scholars have made a lot of research on these issues. From the president's role, Some scholars pointed out that the first-class university presidents should first of all is an education experts, need to have a certain ability to innovate, but also is scholar, good manager, and outstanding social activist (Niu, 2004). With the development of society, the higher education's function are changing and modern university president's responsibilities are no longer limited to the leadership of academic, management and teaching, also includes how to business and management school, which requires modern university president need to have a certain political quality, academic quality, education quality and management capabilities. In addition, many scholars make study from the background of the university presidents, to investigate the common background characteristics of the presidents on top university. For example, there is a study on university president with demographic characteristics, education background, professional background and academic

background (Meng, Zhang & Zhang, 2012).

It can be seen from the above, the research of university presidents is quite comprehensive, and also indirectly shows that study the relationship between university president and modern university are very meaningful. But now researches mostly focus on one characteristic of the university president, or only through statistical description on the background of the university presidents. There has little research on the problem whether these factors affect the development of the university. Moreover, speculatively research too much, empirical research seems too less. Therefore it is very difficult to comprehensive reflect the relationship between president and university. In future studies, we need to do more in-depth empirical analysis under the actual situation. Based on this, this paper borrows the knowledge of Statistics and SPSS software to analysis the data of 100 Chinese presidents.

## 2 Data and Method

### 2.1 Indicator system

How to choose indicator to weighed president? This paper has also referred some indicator system from other correlation research. For example, a research use the population statistics, the educational background, the work background, the academic background these university president's background characteristics as the indicators (Meng, Zhang&Zhang, 2012). Unifies the actual situation, the factors of personality charm, education idea, education thought intrinsic are very difficult to. Therefore when select president's basic indicators, we choose those dominant indicators as possible. The dominant indicator meant the data may observe and the collection directly and can be quantify. This paper select the indicators include: Gender, Nationality, Graduation School, Highest Degree, Major, Took Office Age, Tenure, Over Experience, Academic Title, National Projects and the Number of Papers Published.

### 2.2 Sample selection

This paper chooses 100 Chinese “211” project university's presidents as sample. The “211” university is China face the 21st century to focus on building about 100 universities and a batch of key disciplines, have certain representation. At present, the “211”universities actually altogether have 112 in China, in which North China Electric Power University, China University of Petroleum, China University of Geosciences, China University of Mining and Technology have two school areas. Moreover also have three military class universities such as The Second Military Medical University, The Fourth Military Medical University and National University of Defense Technology. Because we select the university ranking comes from the “Netbig Chinese University Ranking”, the military university has not contained in the ranking table, therefore we select the number of university sample actually is 109.

In order to carries on the analysis better,there have some requests when we select the presidents. First, selects the president who is appointed in the recent ten years, this is considered the data of presidents collection is easy for near ten year and the information lose few and more accurate, simultaneously has also avoided the environment in different time to influence the ranking of university, In addition the “Netbig Chinese University Ranking” we select is began in 1999. Second, president's tenure have four years at least, this is because the general cycle of president is four years,and the tenure is too short also does not reflected the influence that president to the university. This paper data comes from university's official website, CNKI (China National Knowledge Infrastructure) database and introduce on net.

The ranking standard of university come from the “Net big Chinese University Ranking” in this paper,the ranking change to be reference by selects before and after the president's tenure. (See Table 1) It is the scope situation that complete 109 school ranking rises ,falls and changes , in which ranking rise scope biggest is 200, ranking drop scope biggest is 74.The entire ranking up and down distribution comparison average, is better for carries on the correlation analysis.

**Table 1 University Rankings Change**

	<5	5-10	11-15	16-20	21-25	26-30	>30	Total
Up	21	9	5	2	5	2	11	55
Down	15	6	6	8	2	3	8	48
Constant	6	-	-	-	-	-	-	6

### 2.3 Analytical method

This paper uses statistical methods to classify and organize the president's data, and find the commonalities between them. At the same time, using SPSS 16.0 software does correlation analysis between the data of president and school rankings change.

### 3 Results

It is the correlation coefficient that analysis the president 's each indicator and the school ranking change (See Table 2).

**Table 2 Correlation Coefficient between President and University**

	Ranking rise and drop	Ranking change scope
Gender	-	-
Nationality	0.080	0.149
Graduation School	0.188*	0.135
Highest Degree	0.042	0.035
Major	0.023	0.016
Took Office Age	0.009	0.175
Tenure	0.182	0.256**
Over Experience	0.037	0.090
Academic Title	0.124	0.033
National Projects	0.041	0.162
Number of Papers Published	0.107	0.031
Paper with University or Education	0.057	0.021

\* Said when user specifies the significant level of 0.05, statistics test companions probability value is less than or equal to 0.05. \*\* Said when user specifies the significant level of 0.01, statistics test companions probability value is less than or equal to 0.01

From the table we can see, except president's graduation university and the university ranking fluctuation has the significance correlation when the significant level is 0.05, president's tenure and the school ranking change scope has the significance correlation when the significant level is 0.01, other president's indicators to the school ranking fluctuation and the school ranking change scope does not have the significance correlation.

The specifically explained for indicators as follow.

1) Gender. Complete 109 university's presidents are the male in the sample. The sample does not have the difference, therefore is unable to carry on the relevant judgment.

2) Nationality. In the sample, the ranking up university's 55 presidents have 53 peoples are Han Nationality and accounts for 96.4%, the ranking down university's 48 presidents have 45 peoples are Han Nationality and accounts for 93.8%, all ranking not change university's presidents are the Han Nationality. Discover from the sample that, Han Nationality's presidents are majority and Minority Nationality's presidents are few, but the proportion difference is not big in the university that ranking up and down and does not have the obvious relevance with the school ranking change.

3) Graduation school. Through correlation analyses from Table 2, we can know whether president graduates from now work school and school ranking existence certain relevance. Looking from the entire construction of data that, 109 presidents have 57 peoples are graduate the school which is work now, 55 presidents who the school ranking up have 28 peoples are graduate from now work school and accounts for 50.9%, 48 presidents who the school ranking down have 19 peoples are graduates from now work school and accounts for 39.6%, 6 presidents who the school ranking constant have 5 peoples are graduates from now work school and accounts for 83.3%.In ranking up school the proportion that president graduates from now work school obviously is higher than the proportion that president graduates from now work school.

4) Highest degree. Has 2 president's highest degree in the complete 109 samples to be unclear, the effective sample is 107, in which 85 doctors, 17 masters, 5 bachelors. In ranking up school that 52 presidents have 41 doctors, 11 masters, 1 bachelor. In the ranking down school that 48 presidents have 39 doctors, 5 masters, 4 bachelors. In the ranking Constant school that 6 presidents have 5 doctors, 1 master. From the entire data, the presidents who are doctor is majority, also different highest degree

presidents distribute the average in the ranking up and down school, it is not obvious relevance with the school ranking change

5) Major. The major discrimination based on Chinese 13 discipline class at present, in which has not considered the military universities, therefore does not have the military major in the complete 109 samples, moreover has 1 president's major to be unclear. The distributed situation sees the Figure 1. The presidents who are engineering and science gain advantage, to see the ranking up and down school, except the engineering differ 8, the other major distinguish is not very big. And the correlation coefficient from Table 2 indicates president's major and the school ranking change have not obvious relevance.

Figure 1 Major of University Presidents

6) Took office age. Except 1 president's birth years unclear, the took office age of presidents basically on from 40 years old to 60 years old, in which smallest 37 years old, biggest 71 years old. The distribution situation see the Table 3. Looked from the distribution situation that, the took office age of presidents in ranking up school to concentrate mostly in 40 years old to 50 years old (57.3%), the took office age of presidents in ranking down school to concentrate mostly in 45 years old to 55 years old (58.3%), but the correlation analysis result indicated between president's took office age and the school ranking change does not have the significance related.

Table 3 Took Office Age of President

Age	<40	40-45	46-50	51-55	56-60	>60	miss
Ranking up	2	16	21	9	7	0	0
Percentage	3.6%	29.1%	28.2%	16.4%	12.7%	0%	0%
Ranking down	0	11	15	13	7	1	1
Percentage	0%	22.9%	31.2%	27.1%	14.6%	2.1%	2.1%
Ranking Constant	0	0	2	1	3	0	0
Percentage	0%	0%	33.3%	16.7%	50%	0%	0%

7) Tenure. From Table 3 we found the tenure of president has influence to school. Considered the tenure excessively short cannot reflect the influence that president to school, so the president's tenure we select are few is 4 years, in which the tenure longest is 17 years. Special details as shown in the Figure 2, from the figure can find, the population of presidents in the school ranking down more than the population of presidents in the school ranking up when the tenure below 8 years, but when the tenure above 8 years, except the tenure is 10 years, the situation to the purpose. Therefore said the length of president's tenure has certain influence to the school power.

Figure 2 President's Tenure and University Ranking Change

8) Overseas experience. In the sample (See Table 4), 55 presidents in the ranking up university have 34 peoples once study, visits study or has worked in the overseas, in place drop university's 48 presidents in the ranking down university have 33 once study, visits study or has worked in the overseas. The majority presidents have overseas experience through data analysis. There have no obvious correlation between overseas experience and university ranking.

9) Academic achievement. In this paper, academic achievements include academic title, national projects, Number of Papers Published, Paper with University or Education. Because academic titles have great variety we only choose the academician from Chinese Academy of Sciences and Chinese Academy of Engineering. According to the analysis indicated that, between these factors and the school ranking does not have the very obvious influence.

#### 4 Conclusions

This paper using of the SPSS 16 software do correlation analysis between dominant indicators of university president and university ranking. The conclusions as follows:

In China, university presidents basically are a male. The national major part is the Han Nationality, is created by Chinese nationality's unique feature that main body nationality adds national minority. Above 80% presidents have doctor degree but the major have different, in which presidents who are engineering and science are majority. Partial presidents have academician's title, took office age of presidents generally between 40 years old to 60 years old. But generally speaking, these factors have not obvious influence to university power.

On the analysis result, graduation school and tenure have influence to university. Presidents graduate in work school has certain superiority to the manage school, although said transferred to a new post president from other places to be possible to bring the different management pattern and the development strategy, bring into the fresh blood to manages the university, but is not very stable. Chooses principal from the interior have two advantage, on the one hand, had in certain degree understanding to school actual situation, has advantage to implements own management mentality and the method, on the other hand, understand the management pattern of forward predecessor, can unify the school actual situation, to inherits and carries forward predecessor's school idea, carries on the adjustment to the improper place. President's tenure also has influence to the school. Some research indicated that, university president's tenure stability is advantageous to university president's idea practice and the policy execution. Like Harvard University, in more than 370 years history, only 26 presidents, average each president the tenure was above 10 years, in which Charles William Eliot as president for 40 years, James Bryant Conant for 20 years. Therefore safeguards president's tenure regarding a school development is extremely essential.

Consider the other factors. As a result of the globalization tendency, presidents have the overseas background more and more, the overseas is not the important influence to school ranking. The academic achievement reflect the president's academic level, it has certain help for president to manage school, but cannot merely carry on the appraisal from quantity.

**Abstract:** As graded English teaching mode is a prevalent buzzword nowadays, how to improve the learning efficiency of college School students is an urgent issue to be resolved. This essay takes advantage of the author's rich teaching experience to analysis current English teaching mode in colleges, and put forward a new way of classroom teaching management mode. The author thinks that English teaching in college aims not only to improve the students' language knowledge, but also it should cultivate students' interest in learning because interest is the premise of obtaining the best learning effect. It concludes English teaching in college should make good use of the utilities and equipment and further the reform to improve the students' learning autonomy. In the circumstance of graded teaching mode, English teaching in college must change from the "teacher-centered" class activities to "student-centered". Only when the students develop the autonomous learning ability can the English teaching in college be a success.

**Key words:** Graded English teaching; Management mode; Learning autonomy; Creation

## 1 Introduction

Nowadays, with our country attaches more importance to English teaching, graded English teaching mode is becoming the buzzword for students of different level in colleges. This is a new teaching mode as we teachers change our roles from one man's voice to Automated Instruction assisted by multimedia. More and more people think that we should give the students the freedom of study. Autonomous instruction means making the students the master of educational activities, which represents a more advanced teaching idea. Compared with the traditional teaching method, which focus too much on the passive teacher-to-students mode, it's obviously a great improvement. The new method will reform the traditional classroom teaching mode, trying to make it into more positive, active and colorful, which can widen the students' world view, expand the scope of their study and enrich their knowledge because the new method breaks the limitation of time and space to make the students participate in the teaching process, and at last to make the social perception of the interaction of students, teachers and the study environment become true.

## 2 Changes in Modern English Teaching in Colleges

According to the College English Curriculum Requirements in 2004, in combination with each college's position and their personnel training objective, a unified target is set up to cultivate the students' listening and speaking ability and improve their comprehensive English application ability. And there are three different levels of the requirements for college English learning: the lowest, the normal, and the highest. The teachers have different emphasis on different levels.

### 2.1 The definition of graded English teaching

The graded English teaching mode means organizing the teaching process according to the students' different English levels, which has become the trend of college English teaching reform. The traditional classes are reorganized into different levels, which break through the limit of majors and departments. Adopting the graded English teaching mode scientifically and reasonably is the safe guarantee of college English teaching which contributes most to improving teaching quality, optimizing the teaching staff, and boosting the students' autonomous leaning ability. We are creating a newly interactive classroom environment.

### 2.2 The change of teaching concept

Teachers, students and teaching material compose the basic factors of teaching link. Whether we must teach according to the material or the students, and how to deal with the relationship between these three factors is continuously the topic which we try to explore and examine. As we have more and more frequent contact with foreign countries, the traditional teaching methods are becoming more and more difficult to adapt to the development of the new era.

The teaching process is a process of interaction between the students and teachers. When the

teaching and learning adapt to each other, our higher English teaching can meet a success. In theory, students must adjust their learning strategies to the teachers' different kinds of teaching methods and the teachers must adopt various approaches to adapt to the students' difference in personality. As a matter of fact, there are many factors influencing English teaching in colleges, such as the society, the schools, the teachers, the students, and the syllabus and so on. In order to change the ineffective classroom teaching, we must fundamentally change the traditional teaching mode, change the teacher-centered classroom teaching environment to student-centered to make the students more independent and responsible for their own study.

### 3 The Management Mode in Colleges

The graded English teaching mode breaks the traditional rules of dividing classes. The students in one class may come from different departments and schools. So it's very scarce for the teachers to communicate with the student counselors, which makes it difficult to supervise the class. Even some teachers have no chances to know the names of their students. And from the second term, some students in level A will fall to level B; and so some students in level B advance into level A. The situation will cause some confusion in management. So that improving the academic management mode is vital to the success of graded English teaching.

#### 3.1 The students' management module

Because graded English teaching mode is very dynamic---students move in and out of different levels. We must make a list of all the students in each class and update the list as soon as possible. That is the first step to carry out the teaching mode. By knowing more about the students, teachers can adopt various kinds of materials and methods to help the students make progress.

Of course, some other information of students should also be contained in the list, such as their result in each semester, their main characters and the study status in the study groups, which is a information base of their whole learning process and gives support to their graded teaching mode, in which we must give more aid to the students on how to cultivate their autonomous learning ability and monitor their study process. (See Figure 1)

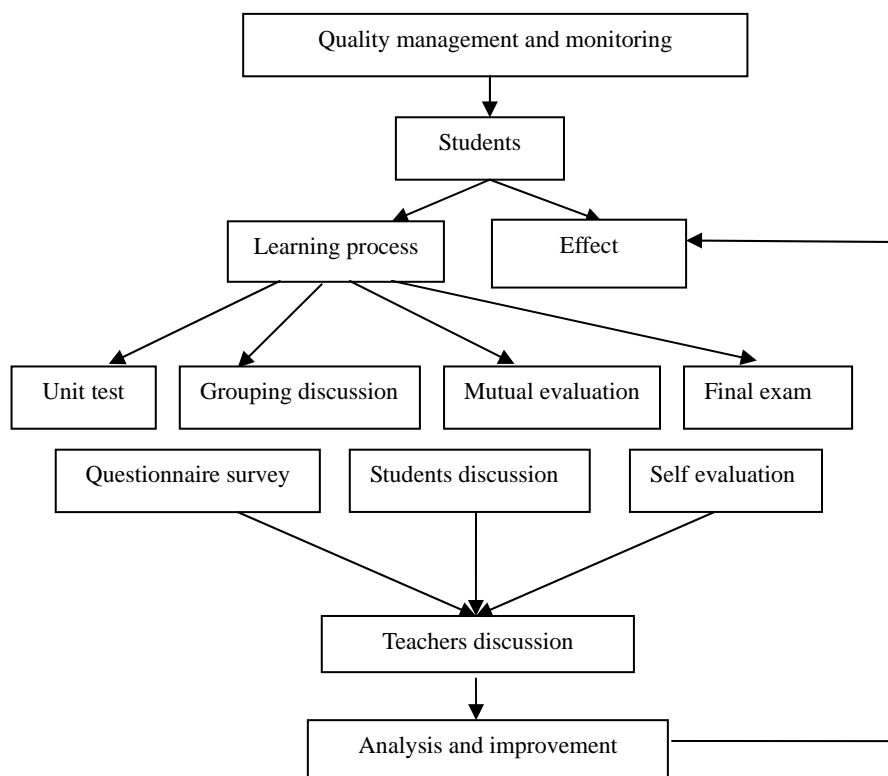

Figure 1 The Quality Management and Monitoring for Students

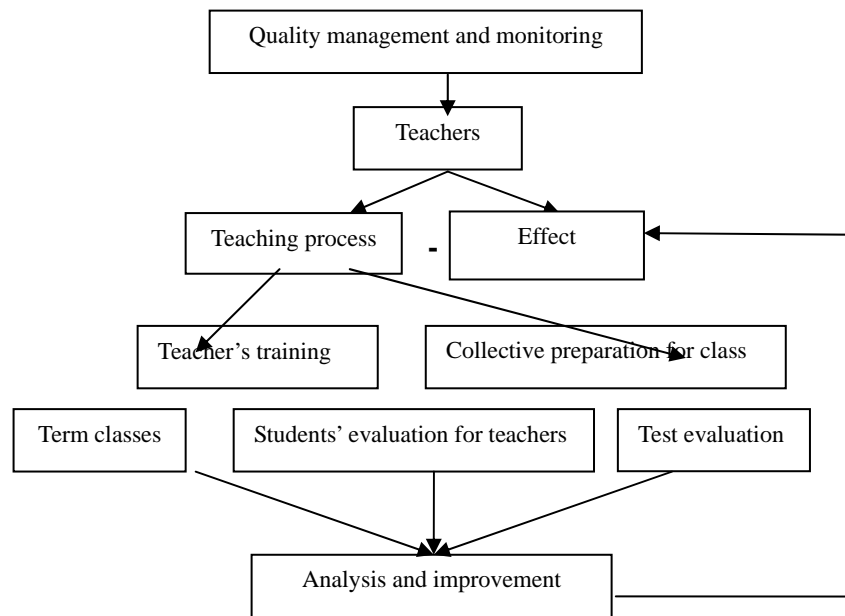

#### 3.2 The education administration management module

The education administration of graded teaching mode has something similar to that of traditional teaching mode and something different as well. The difference lies in graded teaching mode, is that the new education administration management focus on the student-centered environment, in which the modern management program can make it possible for the students to enroll study, seek information, choose curricula and even self test all by themselves. The school opens the electronic network station and provides different kind of information for students to browse or download. In this module, all the tasks are done by the students themselves which is very helpful to put in the idea that students are the master of their study and should be responsible for their own action in the school.

**3.3 The school teaching management module**

Teachers of high quality are essential to teaching performance. In the circumstance of graded English teaching, teaching staff plays a very important role in class activities. Because this mode is still new to some teachers, especially young teachers, the experienced teachers should be the teaching models. They can deal with teaching affairs by communicating with each other. Teachers know more about the teaching mode, the administration mode and their teaching target which will contribute great to the whole learning process.

The purpose of this management module is to guarantee that the target of quality teaching can be achieved smoothly. Firstly, centered on the curricular and individual students of different levels, graded teaching mode proposes the new management method of combining class management and curricular management and allows the students make autonomous learning under the direction of teachers. They can finish the course learning ahead of schedule or postpone the time of graduating; they can choose the same course even in the different grade. As the organization of the teaching, the mode doesn't stickle to the limit of classes and grade in which teachers can organize the class activities freely, so can the students make up their mind on what to study and how to achieve their goals. (See Figure 2)

**Figure 2 The Quality Management and Monitoring for Teachers**

**4 Ways of Classroom Managing to Improve English Teaching in Colleges**

In this circumstance of graded teaching mode, we teachers used various and original method to make the assignment more comfortably accepted by the students. In fact, there are four practical and critical parts in our project to encourage students' learning autonomy. They are grouping, information collecting, presenting and evaluating and commenting.

**4.1 Grouping**

Ho and Crookall (1995) argue that the teachers can help learners to refine their ideas about their responsibility for study and create an environment for them to practice their responsibility. It's believed that well-organized tasks can assist the learner autonomy in much the same way. Some measures were taken in the experiment to stimulate all the students to develop a habit of self-study.

In each class, the students were divided into several groups according to their sex and characters, with one in charge of the group. The purpose of grouping was to make the students share their ideas and communicate. When the students discussed the same topic share the same materials and supervise the learning process, they co-operated, influenced and stimulated each other. There were more interactions between the members. For example, by playing a role in a famous movie, they learned that they might be responsible for their own action. Their program can be a success only when they worked towards the same goal. In this process, the students start to know their roles in learning and switch from teacher-dependence to self-dependence. Their spirit of independence and cooperation is elevated. The less students rely on the teachers, the more their autonomous learning ability will be improved. Experiment showed that students were willing to participate in the grouping activities, through which they could learn from each other and make progress.

One point we must notice that autonomous learning doesn't mean individual learning by the students themselves but being responsible to their learning activities. They can get to know more about themselves through cooperating with others, and try to solve problems. As a result, grouping is an vital aspect of autonomous learning.

#### **4.2 Information collecting**

In this step, students are encouraged to seek information useful for them to present in the class or discuss with the class.

Before each activity, the teacher would make clear their assignments. Then the students must use all kinds of reference books to collect information such as encyclopedias, multimedia software and the internet. The students tried every means to search for the knowledge useful for their program. By information collecting, their motivation was exerted and most of them thought that now the teachers treated them as adults not babies. They started to get to know that learning means much more than just reading the textbooks. They even would make evaluation on the subject and the teaching methods, through which they would get to know that their jobs were respected by others and the teachers could know more about the students' interests and needs.

#### **4.3 Presenting**

In our teaching program, each student should make a presentation of any subject in English---a short story, an English joke or even some English puzzles. At this time they all became the master of the class. They employed pictures, maps, charts, and video shows to make all the class participate in the activity. The others were attracted by their performance and all their performance was graded through which they would be all stimulated to do their outmost to be the best one. In this part of activity, students got to know that self study was very important in learning English.

#### **4.4 Evaluating and commenting.**

In this step, we made the students first evaluate their own performance by comparing their actual work with what they expected. Students were encouraged to make note of their study process by using introspective method and retroactive method. Then their classmates would give them their views on the performance---the strengths and weakness. At last, of course, the teachers would summarize their individual work by giving them a point which would be taken into account in their final examination result.

The feedback from their peers was very valuable for the students to realize their language mistakes, complete with grammar errors and vocabulary misuse. In this step, students got to know more about their own study and start to consider how to make themselves more independent learners. Students were asked to write down their feelings of the study, including success and failure, and the reason analysis. Then after a particular period, the teachers gave them helps and suggestions for them to adjust. Because almost everything was done by the students themselves, which made them know that now they were their own masters, and they should not depend on the teachers that they would learn more about autonomous learning. Experiment indicated that students comprehended more clearly about their learning strategies, and about the significance of a continual evaluation of their study process and the study consequence. Without this recognition, the students would stick to their traditional ways of learning, that they would never be autonomous learners.

Besides, we gave the students different kinds of test to identify the effect of their learning progress in each month. And at the end of each term all the students used a one-level paper to participate in the final exam. And also in each term, we made a note of their result in online learning courses. At last we made comparison of the average scores of these students by using this mode and that of the students without using this mode. In order to support the experiment, findings and surveys are used to get more data. Even though the personalities of the students are different, we try to make the examination

objectively.

#### **4.5 The help of multimedia and internet technology**

College English teaching requires continually reforming its teaching concept and boldly adopting new teaching method. When held in the normal classroom, the class activities can be presented in pair works, group discussion and individual performance. In all these activities, without the question of being primary and secondary, the teachers and the students co-own and build the resources, and cooperate to solve the problems. In the class, teaching doesn't mean simplex knowledge teaching and input. The teachers have become the provider and designer of teaching material, and the monitor of the academic process as well. They are no longer the only authorities of knowledge and the students have their right to raise their own idea and views.

However, the success of graded English teaching mode owe mostly to the usage of multimedia and internet technology. Every one knows that the process of teaching has no standard rules. The academic programs done in multimedia classroom are even versatile and flexible.

The modern multimedia web education combines diagrams, pictures, texts, and videos into one form of teaching method. With the help of campus network, computers can provide internet backing for English teaching, which is very good at integration and powerful in interacting and rich in sources. So that the graded English teaching mode, which is based on multimedia and internet technology, not only can exert the advantage of network, but also make good use of the traditional teaching method, whose vantage is clear to seen. The teachers can make the best of its good features of convenience, flexibility and large carrying capacity to design suitable courseware which aims to repeatedly practice the main point in learning. At the same time, according to the teaching requirement, they can also organize the students to make discussions, presentations, debate and role playing to consolidate what they have learned, which can enormously stimulate the students' autonomous learning ability.

### **5 Conclusion**

The main aim of education is to empower learners' autonomy with the ability of learning how to learn. Students benefited a lot from the graded English teaching mode. They enhance the effect of learning. In becoming actively involved in the process of learning, the students set his or her own objectives and by working independently of the teachers both inside and outside the classroom, they realized a sense of autonomy in the environment of graded teaching mode. The students in this mode, who have become autonomous learners, will surely be a great asset to China because they have not only learned language skills but will also have developed the capacity to think and to take control of their own learning.

Learner autonomy does offer a challenge to both educators and the community. But this process will have been worthwhile in the long run. It's the time for teachers to sow the seeds of autonomy and cultivate a life-long habit of autonomous learning within the students. "Give a man fish, and you feed him for a day; teach him how to fish, and you feed him for a life time." Learning autonomy, and graded teaching mode, can play a vital role in ensuring that academic development goes well in our college teaching environment. And the mode should be sticked to as long as we study English.

# Practice and Development of Construction Engineering Quality Insurance of China

Yang Shuangquan

School of Management, Wuhan University of Technology, 122 Luoshi Road, Wuhan, P.R. China,  
430070

(E-mail: 29914738@qq.com)

**Abstract:** The implementation of construction engineering quality insurance system can effectively take precautions against and reduce risks and protect the interests of related parties. Recently, the pilot work of the construction engineering quality insurance of China has been implemented nearly 5 years but yielded little. Based on the present situation of the pilot work, this paper analysis the problems and reasons of the construction engineering insurance system, puts forward solutions and concrete countermeasures from laws and regulations, insurance system, insurance consciousness, insurance products and other aspects, which promote the successful development of engineering quality insurance in our country.

**Keywords:** Construction engineering quality insurance; Pilot work; Risk management; Countermeasures

## 1 Introduction

Construction engineering quality insurance is a insurance that covers the loss of building owners caused by building structure defects or engineering quality accident in the certain period after the completion acceptance of the construction project, which the owners is the actual beneficiary and developers is the insurer. The implementation of construction engineering quality insurance can not only effectively take precautions against and reduce risks, protect the corpus rights of related parties, purify and perfect the construction market. It is founded by the French, then the UK, Singapore, Italy, Finland, Indonesia, Spain, Sweden, Canada and other countries gradually introduced and developed the operational mechanism. Through nearly two hundred years of development, it has become an internationally recognized construction engineering quality management system. At present, this insurance rate in the residential project in France has reached 100% and Japan, Britain and other developed countries have achieved over 90%<sup>[1]</sup>. In contrast with mature model of foreign countries, the development of construction engineering quality insurance in our country is being placed in the experimental unit stage which few insurance companies and few engineering projects involved this insurance, therefore, with the continuous improvement of the legal system, social supervision, enterprise self-discipline and other various segments, the introduction of quality insurance conditions in construction industry is gradually mature. This paper discuss the present situation of the pilot work of the construction engineering insurance system as a point penetration and fully puts forward solutions and concrete countermeasures, which contribute to the construction industry development and promote the transformation of government function and reach international practice at the same time.

## 2 The Present Situation of Implementation of the Construction Engineering Quality Insurance of China

### 2.1 Laws and regulations basis of the construction engineering quality insurance

For the construction engineering quality insurance, "construction law" promulgated in 1997 did not make explicit regulations, which Article 62 specifies that system of the warranty of quality shall be established for construction projects but now quality assurance system is widely used. 22th April, 2006, the latest revision "construction law" still not establishes the legal position of construction engineering quality insurance. "construction quality management regulations" Article 40 provides the lowest guarantee deadline for the construction project under normal use. In 2005, the Ministry of Construction and CIRC jointly issued "Principle of promoting construction engineering quality insurance", which proposed the basic framework of the system, made clear the types of engineering insurance, insurance project type and insured subject.

### 2.2 The pilot status of the construction engineering quality insurance

19th September, 2006, the pilot work of the construction engineering quality insurance by the Ministry of Construction and CIRC has been officially started, PICC takes the lead to launch new

products in Beijing, Shanghai and other 14 cities. Shanghai, Beijing, Xiamen, Shenzhen, Wuhan and other pilot cities formulate concrete measures in combination with its practices. For instance, Shanghai is exploring the co-applicant and co-insurance mechanism, Beijing implemented the engineering insurance universally in Olympic projects, Xiamen put forward the terms of the local branch offices and make some efforts in the insurance intermediary. 12th May, 2006, Shanghai Construction Administration and Shanghai Construction and Traffic Committee jointly issued "Principle of advancing risk management system pilot work in construction engineering", which make clear explanation of the construction engineering quality guarantee and insurance, Chongqing promulgated the "Principle of accelerating construction quality insurance system pilot work in construction engineering" (Exposure Draft), which propose the developers should joint with contractors to take the pilot work of the warranty of quality in construction stage. 10th October, 2007, Department of Construction of Jiangsu Province, Nanjing branch of PICC and Nanjing Jianye Urban Construction & Development Holdings Co., Ltd jointly held the release of the ceremony of Nanjing Yunhewan Garden District owner" insurance policy of residential quality guarantee ", which the owner of the district has become the first national owner that obtain the insurance policy of residential quality guarantee.

Due to the greater risk of construction engineering quality insurance, its longer time for insurance, less data and no related ripe experience, there appears the situation like "government hot, insurance company cold" after "Principle" issued, although there are individual areas carry some advanced work, so far made no substantial progress.

### **3 Existing Problems of the Construction Engineering Quality Insurance of China**

At present, as a kind of economic means to reduce construction engineering quality risk, the construction engineering quality insurance in its implementation still exists some main problems in the following:

#### **3.1 No source of funding for the construction engineering quality insurance expenses**

In 2003, the Ministry of Construction and the Ministry of Finance jointly issued "the project cost components of the construction and installation", which incorporate the accident and casualty insurance into the budget thereof, but not include the construction engineering quality insurance expenses. In 2008, the revision of the "Specifications of Charging on Bill of Quantities of Construction Projects" make no provisions about the construction engineering quality insurance expenses, therefore, the construction engineering quality insurance expenses lack related laws and documents support.

#### **3.2 Demand shortage of construction market for the construction engineering quality insurance**

At present, China's 14 pilot cities have started to try out construction engineering quality insurance system. Since the reasons such as the lack of investment system, the imperfect market development, the flimsy engineering risk consciousness and claim consciousness of parties and construction engineering quality insurance expenses can't included in the cost of construction enterprise, each parties have not recognized clearly the importance and necessity of the construction engineering quality insurance, which leads to the obviously demand shortage of construction market for the construction engineering quality insurance.

#### **3.3 Unformed market of engineering quality insurer**

As a newly emerging thing, engineering quality insurance business is still in the initial stage, which has many imperfections. It is the high technical type of insurance that if a certain part of the risk management is inadequate, the insurance company may lose money. Due to the general lack of insurance company professional technical force to have effectively risk monitoring and management at present, and the final business risk should assume to his own, many new management problems that are different from the traditional business increase the difficulties to carry out this business, therefore, the market of engineering quality insurer has not formed currently.

### **4 Cause Analysis of the Construction Engineering Quality Insurance of China**

#### **4.1 Inadequate laws and regulations**

At present, construction engineering quality insurance are not explicitly stipulated in "construction law", "construction quality management regulations" and other relevant laws and regulations. "Principle of promoting construction engineering quality insurance" proposed the basic framework of the system but has no legal force. 14 pilot cities also issue relevant official documents. Currently Security Law, Assurance Law, Bidding law and other laws have involved the construction engineering quality insurance, which have become its legal basis, but most of them set the principled request from the point

of view of management that are lack the systematization and integrality. In addition, existing laws and regulations of engineering insurance have not mentioned supporting measures according to the engineering characteristics which leads to the shortage of maneuverability of engineering insurance in practice. The explanation on Security Law issued by the Supreme Court which has 134 articles did not refer to the engineering insurance. The multi-type compulsory insurance is also lack of legal support recently. The administrative departments have not finish its conversion of function, which the inertial thinking of using administrative measure to intervene in markets still play a role.

#### **4.2 Ambiguous position of insurance system**

The frame system of construction engineering quality insurance is not a single insurance but a set of complete system, which mainly includes two aspects: one is the defect insurance of the building itself, the other is each contractor's liability insurance. Only these two types of insurance complement each other can form the complete frame system of construction engineering quality insurance. At present its positioning in some insurance companies in our country is not clear, which confuse the defect insurance with the liability insurance, therefore, its primary proportion of the frame system of construction engineering quality insurance is the quality defects. In addition, the frame system of it emphasizes the usage of the construction process which concentrates more on the construction engineering quality defect insurance than the construction engineering quality liability insurance<sup>[2]</sup>. Take the pilot work of Shanghai in 2006 for instance, the participant parts only can insure contractors all risks insurance, erection all risks insurance, personal accident insurance and the construction quality warranty insurance, therefore, insurance company lose the right of subrogation on all contractors once the claim occurs.

#### **4.3 Flimsy risk awareness of the insured**

At present, construction investment of our country are mainly from government financial investment, private capital investment is relatively less, which leads to the lack of investment system of construction engineering field and the flimsy awareness of engineering risk in companies, therefore it is often the government that assume most of responsibilities once appears serious problems in the end. As the requestors in insurance market, most of the insured regard insurance as an extraordinary expenditure, though the premium is less compared with quality assurance system. Once purchase it, the possibility to take it back is little, which should not cause the companies tend to buy the insurance.

#### **4.4 Slow development of insurance companies and over harsh design of insurance products**

Insurance companies are motivated by their own interests as suppliers, when they enter into a contract, they begin to take care of every step, analyzes the possible cause of the accident and suggest countermeasures to eliminate accidents in the bud as much as possible<sup>[3]</sup>. These all need professional technology and knowledge, and relevant professionals of insurance companies in our country that familiar with engineering risk and understand insurance business presently are very little.

At present, according to the relevant provisions of the Ministry of Construction, China is planning to institute construction engineering quality insurance system for 10 years, the concrete content of it are listed as follows: the contractor is responsible for maintenance and assume related expenses unconditionally in the first year(if the contractor failures, the responsibility of maintenance will transfer to the insurance company that the owner insured); from the second years to the tenth year, the insurance company will compensate firstly when the defects of building structure and function appears, then it will be subjected to related parties' responsibility of subrogation.

Currently the construction engineering quality insurance products that developed in pilot cities are basically belong to Shanghai model, which implement construction engineering risk management system in accordance with the principle of "insure jointly, guarantee jointly, control jointly and mutual restriction" and has the three features in the following: 1) developers take the lead to joint with designers and contractors to purchase the construction insurance; 2) the guarantee community that consists of engineering quality test institution, several insurance companies and its entrusted institution of risk management have security and quality risk management, ensure the engineering quality and safety together and claim in time when accidents happens in accordance with the contract. 3) combining with Contractors All Risks Insurance, Erection all risks Insurance, Personal Accident Insurance and the construction quality warranty insurance to form construction engineering insurance. The starting point of the design is to have risk control and management for the whole course and in all directions, avoid over-insurance in some sections and leaving out some insurance in other sections, therefore reduce insurance transaction cost. But this type of complex product design often becomes the obstacle to promote construction engineering quality insurance at the same time. Under the circumstances of the view that developers consider the construction engineering quality insurance will increase the private cost, over harsh conditions to make it effective become to be the fact that rewards inferiority and

punishes superiority, which the engineering project owned good quality and performance must insure the construction engineering quality insurance but the bad quality and performance of it are exempt from the insurance liability and cost.

#### **4.5 Imperfect market development of engineering insurance**

The smooth implementation of the construction engineering quality insurance system needs a mature market environment, which the matched intermediary service organizations such as quality inspection institution, quality monitoring institution, risk assessment institution are indispensable, they can not only determine to effect insurance or not for insurance company but also provide quality accident assessment service, which such market in our country is immature. From the viewpoint of function, our country's current construction engineering quality assurance system includes the drawing appraisal agency, government supervision department, the supervision organization employed by the developers, and each of them cannot undertake independently all functions of quality inspection institutions; From the viewpoint of independence, the risk management expenses of the construction should be paid by developers and entrusted by the insurance company, but actually the expenses is entrusted and paid by the developers directly that quality inspection institutions (supervision organization) should act in accordance with the intention of the developers, which incurs new asymmetry information. In addition, the asymmetry information also results in other problems such as the qualification of engineering quality; analyzing the quality accident qualitative and quantitatively; defining the insurance liability and scope of each parties and so on.

The insurance rate also needs further discussion to determine. Currently statistical data related to quality insurance in our country is deficient and closed, quality insurance rate is hard to rationally defined, and the pilot project uses the insurance rate of foreign countries for reference, but the proof of the pudding is in the eating, which its rationality directly related to the insurance company's profits and losses. In the initial stage of quality insurance development in France and Australia, excessively low insurance rates results in the general business deficit and insurance company breakdowns, but high rate is difficult to accept for insurers. Therefore, each insurance companies are very cautious and do not take positive attitude though they has realized this new business area and broad prospect.

### **5 Establish and Improve the Thought of Construction Engineering Quality Insurance in Our Country**

Currently under the system of the warranty of quality, contractors should pay the quality deposits to developers of 5%~10% of the contract price and it will be refunded only in the condition of good quality and no complaints three years later, meanwhile developers submit housing quality guarantee to the owners. Since there exists the difficulties of defining quality standards, the scope of quality problems and the responsibility of all parties in practice, the contractor often can't get the quality deposits back on time, by which legitimate interests of small business owners is hard to guaranteed that if quality problems of buildings appears in the reasonable lifespan, developers often shift responsibility for excuses such as bankruptcy or dissolution of contractors<sup>[4]</sup>.

After introducing the construction engineering quality insurance system, developers should pay the quality insurance according to a certain rate to the insurance company with the base of the expected housing sales (deducting the land-transferring fees) and offer insurance certificates for all the owners who have acquired property ownership certificates. If the buildings developed by insurers damaged because of quality accident under normal conditions, the owners can directly claim with the insurance companies for compensation to protect its interests effectively and the insurance companies will take effective measures of having whole process quality control in engineering design and construction to ensure the engineering quality to reduce compensation.

### **6 Establishment and Improvement of Construction Engineering Quality Insurance Measures**

The pilot work of the engineering quality insurance and its nationwide promotion requires common efforts of the government, the enterprises and the social sectors, which the measures to improve can from the following respects:

1) Establishing and improving relevant laws and regulations of construction engineering quality insurance system

Firstly "construction law" and "construction quality management regulations" and other relevant laws and regulations should clearly define the concept of construction engineering quality insurance

system and entrust its mandatory requirements. Secondly we should clarify engineering quality responsibilities of prospecting units, design units and supervisory units, drawing appraisal agency, quality inspection institution and other participants, strengthen their quality consciousness and risk awareness to reduce risks through insurance and maintain the order of construction market.

2) Carrying the pilot work of construction engineering quality insurance actively and reliably

Our 14 pilot cities should make scientific and rational insurance clauses and normative contract terms, set up corresponding supporting institutions and carry each aspects of construction engineering quality insurance work actively and reliably to promote nationwide, in this process we should give priority to the communications among cities, discuss and exchange views in representative and common problems to accumulate experiences and create conditions of the full implementation of the construction engineering quality insurance system in our country.

3) Improving the level of insurance companies

Insurance companies should explore internal management model of new business gradually, set up the new management process and analysis statistical indicator system and explore collaborative approach with the third parties, hence establishing marketing and effective risk management system of the engineering quality and accelerate the training of the compound talents that familiar with engineering risk and understand insurance business.

Insurance products should be simplified to enhance its flexibility and adaptability in order to reduce the barriers of engineering quality insurance system development. Firstly we should separate the engineering quality insurance from engineering insurance and construction personal accident insurance to make them mutual independence insurances, therefore, insurers combine more types of insurances in the light of the actual situation and insurance companies not only ensure the flexibility of insurance products but also saves a great deal of trouble of purchasing and combining more types of insurances for developers who have multiple demands so as to exploit its scale effect and reduce insurance transaction cost<sup>[5]</sup>. Secondly we should dissolve co-applicant and co-insurance, that is, developers select the insurance company that satisfies certain qualifications to purchase engineering quality insurance, contractors all risks insurance and erection all risks insurance as the single insurer, which the problem of insurance premium sharing are negotiated by developers and contractors when signing the construction project contract and the insurance company entrust other institutions such as supervision institution of risk management, engineering quality test institution and reinsurance company to participate the engineering risk management together, hence enhancing the flexibility and adaptability of the engineering quality insurance and promote the development of the insurance market.

4) Establishing scientific and rational mechanism of premium rate of construction engineering quality

Insurance companies should follow the principle of "appropriateness, fairness, rationality, stability, flexibility, encouraging caustic preventing work", attach importance to the lever of rate and promote engineering quality awareness and action of the insured. Differential rate and floating rate should be gradually executed in accordance with the project scale, complexity of technology, performance of contractor, the level of project management and so on to decide insurance rate of each project, meanwhile discounted rate system without compensation can also be established<sup>[6]</sup>. We should try to avoid the phenomenon of the contractor of "bad money drives out good" because of excessively high premium and the phenomenon of high compensation cost because of low premium of insurance company. In addition, we should establish the credit file of companies and personnel professional qualifications to pursue credit evaluation mechanism of the principle of "openness, impartiality, fairness", which the social intermediary organization assess credit rating, establish engineering credit system and regulating the construction market. Meanwhile we should carry out extensive international exchanges and learn the successful experience from foreign countries to establish the construction engineering quality insurance system that is consistent with international practice and Chinese characteristics considering Chinese status.

## 7 Conclusion

The promotion of the construction engineering quality insurance system is a significant reform of construction engineering quality management in our country, which can relieve the pressure of the government, transfer the subject risks of responsibility of each construction parties, reduce business risks of construction enterprises and protect the legal interests of the public. This paper analysis and summarize this insurance system from multiple perspectives: laws and regulations, insurance system

and mechanism, insurance consciousness, insurance products and market, which build a macro guidance in directing the construction engineering quality insurance development, at the same time, it has not deeply analysis the certain part among the perspectives that needs further study in the future to make operable and practical.

## Research on Panic Purchase's Behavior Mechanism\*

Xie Liren, Chen Junmei, Zhang Mingqin  
Xi'an Technology University, Xi'an ,P.R.China, 710032  
(E-mail: 10811xieliren@sohu.com;chenjunmei061@126.com)

**Abstract:** Panic purchase always causes serious influence to social stability; economic order; enterprise management and consumer psychology, and the degree of its frequency and impact are rising. So the research of its behavior mechanism is of very important practical significance. This paper first defined panic purchase and described its characteristics. Secondly, we put forward the evolution mechanism of the panic purchase, including incentive, information dissemination and diffusion, panic purchase happen, reaction of government and the media and subsidy. Finally, the paper analyzed the characteristics of its evolution process.

**Key words:** Panic purchase; Information spreading; Behavior mechanism; Evolution process

### 1 Introduction

Over the past decade, there had been many panic purchases occurred along with many crisis events, the most representative including food and drug panic purchase during the SARS period in 2003, the water panic purchase caused by water pollution at Harbin in 2005, the garlic snapping during the H1N1 influenza virus period in 2009; the salt snapping caused by Japan nuclear radiation in 2011. Those panic purchases' behavior caused serious influence to social stability, economic order, enterprise management and consumer psychology. Panic purchase turned the basic balance of supply and demand to the great contradiction between supply and demand at a short time; promoted product's prices rising deformity; influenced of the economic expectations, decision and future behavior; distorted the market allocation of resources and brought hidden trouble to future market supply and demand balance. Panic purchases cause damage to the market order, make the market failure, and bring the improvement of transaction costs. So the research of panic purchase behavior mechanism can provide theory for governments and enterprises to prevention and control of panic purchases, which has very important practical significance.

### 2 Panic Purchases Definition and Feature Analysis

#### 2.1 Panic purchases definition

Rosenthal defined the emergency event as: it is event that causes serious threats to basic values of social system and behavior framework, must make the critical decision in the timeliness and uncertainty strong conditions. Legislation research project(2002) points out that public emergencies generally refers to events happen all of a sudden that has caused or may have significant threat and damage to national security and legal system, social security and public order, citizens' lives and property safety and caused great casualties and property losses and social influence. Thomas A.Glass (2002) points out that panic purchase is the public's self-presentation behavior when face the terrorism, using the terrorist attacks in the United States as background. Chunlei Fan(2003) believes panic purchases behavior is a kind of automatic reaction in crisis situation from the point of view of psychological behavior. Zhihao Xu defined the panic purchase as a kind of irrational behavior set. Duoyong Sun(2007) thought panic purchase is a flock irrational behavior based on imitation of infection. Honggang Tian(2011) thinks panic purchases is an group insensible market behavior that consumers buy a large number of product more than short-term demand as they perceived expected possible disasters, commodity prices or shortage of such circumstances. Xin Zhou(2011) indicated panic purchases is groups spontaneous irrational buying behavior because of worrying about the price. According to the literature of recent research and analyses and studies on panic purchases events, we defined panic purchases as group's abnormal purchase behavior at an uncertainty, incidental and panic situation caused by natural disasters or social events.

---

\* This paper is supported by the fund project of humanities and social sciences research hosted by the ministry of education: Research on Evolution Mechanism and Coping Strategies of Panic Purchase Behavior. (11YJA630159)

### 2.2 The characteristic analysis of panic purchases

On the basis of summarizes and analyses about panic purchases happened nearly ten years, we can see that panic purchases has significant features includes uncertainty, incidental, panic, and abnormal buy and concentration features. Uncertainty is to point to the happen time, place, scale and influence scope, the cause, development direction and change trend is not clear about panic purchases, which can't cognate clearly in a short time. That is panic purchases' whole process is full of uncertainty from induced reason to the manifestation of the time, and then to the development of the event and the end, it is difficult for people to grasp and control the whole process accurately.

Incidental is point to that there is no obvious signs before panic purchases happen, especially they won't have long transition period, and often can not be expected.

Panic is point to the group who can't hold accurate information effectively often taking part in the panic purchases; they often feel not in the state and worried, feel pressure and worry to the thing. Because the events that caused panic purchases often have threats to the life safety or the property security or even to the social environment, the state must cause psychological pressure to the group, making them fear and rush to buy.

Abnormal buying is refers to a lot of people rush to buy some goods that exceed to their short-term demands, which is a kind of group behavior that not sensible. They buy those goods abundantly in order to placate the panic psychology and increased sense of security.

Concentration is mainly manifested in the time, people and product; it is a large group people at the same time on the purchase of the same goods. Only the number of people at the same time purchase the same goods can form the concept of panic purchase.

### 3 Panic Purchase Evolution Mechanism

Through research and analysis on panic purchase happened in SARS period, water pollution, H1N1 influenza virus period and Japan nuclear radiation, with reference related literature. We sum up panic purchase evolution mechanism mainly divided into the following several steps. (As shown in figure 1)

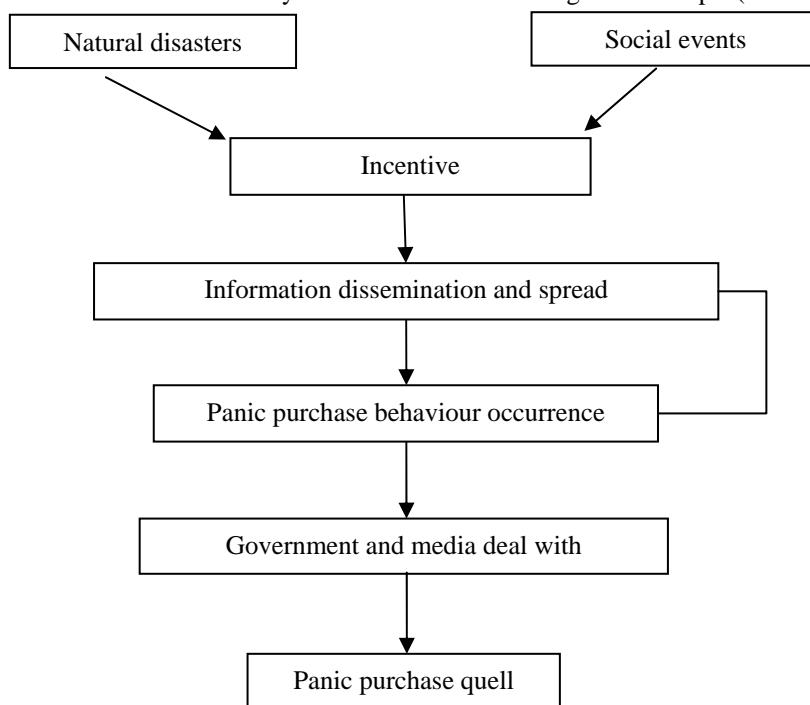

Figure 1 Panic Purchase Evolution Mechanism

(1)Incentive. Panic purchase always happened on the background of particular incident, we call it incentive. The major reason that caused panic purchase concludes natural disasters and social events. SARS, H1N1 influenza virus and and Japan nuclear radiation belong to natural disasters, while water pollution belong to social events. The goods people rush to buy always the daily use goods that have direct relationship with those disasters.

(2)Information dissemination and spread. When natural disasters or social events happened, people

perceived the danger and feel threatened. Information dissemination and spread play an important role at this time. The major methods are interpersonal communication, mass media and network. We can see the information transmission path is interpersonal communication (relatives and friends mouth transmission—phone—short messages—communication software)--mass communication (newspapers-news site—TV).

This propagation path has very high efficiency, and high spread speed. There have social capital and social trust and additional value translate when information translate through interpersonal communication network, which enhanced credibility and effect of information transmission, especially emergence of mobile terminal represented by mobile phone and tiny media represented by blog. This transmission is real-time, and has the ability to translate abundantly, which is a challenge to the modern social management.

(3) Panic purchase behavior occurrence. Due to the change of environment around and the spread of information and spread, people start to have fuzzy understanding of the present situation, and have the pressure and panic in psychological. At this time a small part of people man began to take part in panic purchase. More and more people involved in as information continued to spread, then formed the scale gradually. It caused adverse effect to market and social and made the social status to change. Some events caused by panic purchase happened, media also report trickily, which translate the information indeed.

(4) Government and media deal with. The government began to take certain measures when panic purchase developed to certain period development, and media began to report some news to maintain market and social order. The government began to stage some relevant policy to curb panic purchase phenomenon. At this time the government's main measures are: governments at all levels to take advantage of all media channels to report right information about the crisis, functional department also take some measures to control the market.

(5) Panic purchase quells. When the information about panic purchase appraised fairly by the government and the media, the government takes measures to make group's panic psychology be dissolved. People no longer feel threatened and pressure and have correct understanding on this panic purchase event. so their irrational behaviors reduced and they won't participate in the panic purchase. Market and social order restored to smooth state.

**4 Panic Purchase Evolution Characteristics**

We also can be concluded the development trend and evolution characteristics of panic purchase process as shown in figure 2. we can serve the horizontal axis as time axis and the vertical axis are: the information dissemination; participation of panic purchase; quantity of panic purchase and the spread of panic purchase goods.

**Figure 2 Panic Purchase Development Tendency**

First, it is occurring stage. At this time information began to spread, but the speed is low and the quantity of information is small. Someone began to purchase goods exceed to their daily use at a small scale, but the quantity is small and the kind is single. It is not form great impact. Rarely people participate in the panic purchase at this time.

Second is development. In this period, information is expanding constantly through media and internet and human relations. They are developed either from the information channel or the amount of information transmission. The number of people takes part in panic purchase continuously increased,

and the growing speed is fast. The amount of commodity they purchased also present the quickly increasing, its growth rate is the fastest in the entire process. The kind of goods they snapped spread constantly at this stage and extends to many other goods.

Third is rush hour. In this period, information transmission scope, participation, quantity of panic purchase and the degree of good spread all go to the maximum, which is summit of the whole process. It is the period that causes the social harm. So it is the key period of panic purchase. The scope and extend of panic purchase reach to the highest point of the process.

The last is calm period. As the government and related departments deny the authenticity, group begin to understand the truth and come to their senses gradually. They will no longer participate in panic purchase. This period information transmission still continues, but the information is correct. People still buy product they need. Spread of goods recession sharply.

Thus, we can see, the earlier the government began to interfere, the shorter panic purchase last. That means if government interfere at the left of the curve, the damage to the society will be reduced. The media should play the positive role in the occurring stage and development stage and should guide people purchase rationally. The media should not report blindly. The peak of rush hour is decided by media and the government, the two sides have to work together to control the panic purchase effectively.

## 5 Conclusion

The paper concludes the behavior mechanism and development tendency of panic purchase and analysis their characteristics. The result can be used to control panic purchase. The future research can focus on measures to every stage.

# AHP-Based on Evaluation System of Bilingual Teaching Construct: A Case Study in Yangtze University

Qian Xiuyun, Qian Siyu, Chen Mengjiao  
Yangtze University, Jingzhou, P.R China, 434023

(Email: qianxiuyun@sohu.com, jeu.wegeeks@gmail.com, cmj.wegeeks@gmail.com)

**Abstract:** There are lots of research achievements of bilingual teaching at present. But bilingual teaching is still in an exploration stage whose evaluation system and monitoring system need to be completed. Based on the construction of evaluation system of bilingual teaching in Yangtze University, the study adopts qualitative and quantitative method. It constructs an overall indicator of evaluation system of bilingual teaching using AHP and investigates the current situation of bilingual teaching of liberal arts, science and engineering. By comparing the teaching quality of class which proceeds bilingual teaching with class from the same major who does not conduct it, the study analyzes the advantages and disadvantages of bilingual teaching in Yangtze University and constructs a framework of bilingual teaching evaluation system which is used to evaluate the quality of bilingual teaching effectively and scientifically. It also provides a practical theoretical direction for improving the quality of bilingual teaching in Yangtze University and other colleges.

**Key words:** Bilingual teaching; Evaluation system; AHP

## 1 Introduction

Bilingual education is a major move of educational reform in higher education. In 2001, documents issued by the Ministry of Education require that universities and colleges practice bilingual courses (i.e. using Chinese and English) in various academic disciplines. There are lots of research papers about bilingual teaching since then, and it becomes a hot issue in the academic circle.

In general, the research on bilingual education in China may be roughly classified into five major types: 1) introducing the foreign bilingual education theories and models; 2) making comparison and contrast between bilingual education in China; 3) borrowing useful theoretical and practical experiences from foreign bilingual education to improve Chinese bilingual education; 4) analyzing the problems existing in Chinese bilingual education and providing countermeasures or even new teaching models 5) studies on the bilingual teachers qualities. The difficulties faced in the practice of bilingual teaching in colleges make all the colleges to realize that it is urgent to establish an effective evaluation system of bilingual teaching quality in colleges.

As the quality of teaching has ambiguity, higher education evaluation theory holds that served as a tool, scientific evaluation plays a significant role in the management and monitor of teaching quality in order to judge and balance teaching quality combining with adjustment and control. American operational research experts A. L. Saaty put forward Analytic Hierarchy Process (AHP), a decision-making analysis method combining quantitative and qualitative, in 1970s. The basic idea of AHP is to divide complex problems into several factors and group these factors into well-organized hierarchical structure according to their dominance relations. Through pairing comparison, the relative importance of each factor can be confirmed and then judge and decide the final sequence of the relative importance of the decision.

Constructing evaluation system of bilingual teaching quality of common colleges through AHP is to have an overall scientific evaluation of bilingual teaching quality, so that we can find out the problems, and based on the analyzing the problems, think about measures and then improve the bilingual teaching quality.

## 2 Constructing the Framework of Bilingual Teaching Evaluation System

The framework of college bilingual teaching evaluation system mainly relates to the quality of the various aspects of bilingual teaching and the construction and execution of the teaching rules and regulations in its monitoring system. It includes two aspects: the establishment of the bilingual teaching evaluation system and the establishment of the monitoring system to guarantee the normal operation of the former system. To establish the above systems, the following steps are supposed to be implemented.

### (1) Step One

The first step is “to establish standards”. It is also a process to make plans. The “standard” is a set of metric ruler, which can be regarded as the reference system to assess the effects. The standard can be determined through a variety of ways, but on the whole it is derived from empirical investigation.

### (2) Step Two

The second step is that the management monitors the effectiveness of bilingual teaching, and establishes measuring point of teaching effectiveness to ensure it reaches the standard required. Ways are included personal observation, written or oral report of the teaching staff, the report of the automated information system, testing, test, and sample surveys

(3) Step Three

The third step is to compare the actual teaching effectiveness and preset standards, and to make an analysis of its deviations.

(4) The Final Step

The fourth step is to take corrective measures when necessary (Liu Chun, 2004).

Analytic hierarchy process (AHP) is used to establish a comprehensive index of bilingual teaching quality assessment. By comparing the composite indicators, the priorities to improve bilingual teaching quality in the layer focused on measures can be obtained. Then decisions can be made.

The effectiveness of the monitoring system is based on three premises. The first premise is the effective management of the college evaluation institutions. The second one is the effective supervision of the bilingual teaching. The third one is the establishment of an effective rules and regulations. The following are steps to operate the monitoring system: establishing a centre of bilingual teaching for policy and supervision --- setting monitoring objectives and monitoring standards --- implementing and monitoring bilingual teaching --- collecting information about bilingual teaching --- comparing implementation effects and monitoring standards --- analyzing reasons and taking measures --- conforming to the standards of bilingual teaching.

The quality of teaching is affected by the quality of students, the quality of the teaching process and the quality of teachers. So the internal factors, such as teachers' professionalism, students' quality, teaching conditions and teaching management, are monitored for teaching quality. The monitoring of teaching quality aims to coordinate, evaluate and control these factors and to establish a smooth feedback network, thereby creating and maintaining a pleasant learning environment and ensuring the best teaching results. In other words, by combining the qualitative and quantitative analysis, it is necessary to construct the evaluation system of bilingual teaching, which ensures the steady improvement of teaching quality.

### 3 Practice of the Construction of Bilingual Teaching Evaluation System

It is a case study on bilingual teaching of Yangtze University. The study covers all the majors which implements bilingual teaching in Yangtze University, including liberal arts, science and engineering. Besides, students and teachers are chosen as the subjects of the study.

#### 3.1 Practices in Yangtze University

First of all, a standard of bilingual teaching quality and the first-class indicator of monitoring system are established through questionnaires. Based on the first-class indicator, the second-class indicator is established according to the specific items in questionnaires. Then, a key "observation point" of standard of bilingual teaching quality can be got through a further detailing of the questionnaire. Last, the third-class indicator can be established on the basis of the second-class indicator and the evaluation standard of bilingual teaching quality of Yangtze University is formulated. (See Table 1)

**Table 1 Chart of Evaluation of Bilingual Teaching Quality of Yangtze University**

Items	Evaluation Items
1	Teachers should be the paragon of virtue with earnest and serious working attitudes.
2	Teachers should make enough preparations and are familiar with teaching contents, which are advanced and arranged appropriate.
3	Key points of teaching contents must be emphasized with clear and informative contents.
4	Teaching contents can be taught clearly by both Chinese and English.
5	A good combination of Chinese and English teaching. Teachers need to use English to teach more frequently trying to reach 50% of the whole courses.
6	Multimedia is mainly based on English contents with Chinese notes of some key points. The blackboard writing should be clear and is arranged reasonable. Multimedia and blackboard writing are mutual complementation.
7	Various teaching methods can be adopted to have mutual interaction with students, inspire students to think and improve students' application ability of English.
8	Provide students with English teaching materials and copies of teachers' courseware.
9	Guide students' preview and reading of foreign teaching materials effectively.
10	The class is arranged orderly with a good teaching effect.

The second step of the study is that supervisors need to attend all 80-course lectures, which start bilingual teaching and monitor the effectiveness of bilingual teaching. In addition, supervisors have to evaluate teachers' teaching design, the control of teaching contents, bilingual expression, teaching methods and teachers' ability of teaching media, arrangement of classes, control and regulation of the class and cultivation of students' autonomous learning, etc. Last, supervisors need to give these feedbacks to teachers and teaching management departments and establish the evaluation standard of exam checking of bilingual teaching of Yangtze University (See table 2).

**Table 2 Chart of Evaluation of Bilingual Teaching Quality of Yangtze University**

<b>Evaluation Indicator</b>	<b>Num.</b>	<b>Evaluation Items</b>
<b>Design of paper</b>	1	Exam content fits the outline and has a wide coverage with proper difficulty level.
	2	Structure of exam is reasonable and rich which is no less than 4 types.
	3	Exam combines two types, i.e. A and B, which are not the same.
	4	Both Chinese and English, each of which is almost 50%, design the contents.
	5	The contents, which needed to be answered by students in English, cannot less than 50%.
	6	The standard of grading is scientific, reasonable and normative.
<b>Quality of paper</b>	7	The form of paper is norm without any mistakes.
<b>Marking of paper</b>	8	It is strict during the marking without misjudgment and missing items.
	9	Calculation of score is accurate and the sign of exam marker is standard.
	10	The analysis of test is scientific and reasonable.

The third step of the study is to combine the records of different lessons, and to know the real situation of the bilingual teaching in the Yangtze university through making questionnaire and making comparison of the pretest and post test, and also comparing the teaching quality of the same major by dividing the students into two groups, one is using the way of bilingual teaching, the other is not. The disadvantage and advantage of the bilingual teaching in the Yangtze University is out of the comparison of the real teaching result and the teaching plan, which is made before the class is teaching.

The key point is to study the relation between the bilingual teaching quality and the teaching of the teachers, the bilingual teaching quality and the initiative learning of the student. Thus, there design two set of questionnaires of the bilingual teaching investment of the undergraduate in the Yangtze university, one is for the teachers, the other is for the students, which includes contents of the bilingual teaching quality, the location of the bilingual teaching, the bilingual teaching course and the teaching text, the teaching management and the bilingual teaching quality, the way of making text and teaching quality, courses that are suitable for the bilingual teaching, the expectation from the students on the bilingual teaching, the factors that are influencing the bilingual teaching and learning as well as the reflection about the teaching.

There are 15 teachers and 313 students who are taken the questionnaire. And the result of the investment shows that:

(1)From the perspective of the language ability, the 15 teachers are all postgraduate, in which there are 5 PhD, which is 33% of the total. And there are 50% teachers participates the pre-class language training, they also have overseas learning experience. 60% of them have taught English. 80% of them teach bilingual class. Thus, the level of the teacher is high and they are with well experience of teaching. Although some of the teachers has little problems in pronunciation. However, from the students' point of view, the tone is not quick affecting the teaching result. Thus, it is proper to encourage the teacher to reduce the language anxiety.

(2)The problem of English teaching materials is still serious. Although the foreign original texts are rich in content and comprehensive in the knowledge structure is system, but there is still difference in education system in our country. And because of the differences in disciplines, curriculum, grade and the students' English level, it makes it difficult to choose suitable bilingual textbooks. Therefore, we should strengthen the bilingual textbooks construction and encourage choosing and writing practical teaching materials that have advanced international level and close to the Chinese teaching syllabus and the students.

(3) Now the 80 bilingual courses we offered include both professional courses both optimal courses, and students are from different levels from junior college students to undergraduates. The scope of opening bilingual courses level is too large, so the high-quality resources shall be allocated properly. Bilingual teaching put forward higher request to teachers and students, teachers and students are faced with double tests of both professional level and ability of English, so the offer level should not be too big.

(4) The evaluation and appraisal system are separated. When attended the courses in the assessment of the new curriculum review opening, the teachers presented lively and interesting PPT and well-organized content. But in actual teaching, especially in the case of no class supervision, the teachers use Chinese to teach and that did not reflect the characteristics of the bilingual teaching.

### **3.2 Reasons for measuring standards**

The research in step 4 is to analyze reason to take measures-up to standards.

Compare the practical teaching effect with the prescribed standards to analyze the bilingual teaching advantages and disadvantages in concrete implementation in Yangtze University. The experts should listen to lectures, and so do the teachers who undertake bilingual courses. The evaluation should be steered by students to teachers.

Formed a new evaluation group of academic experts to evaluate the bilingual class qualification of course evaluation system, bilingual teaching quality evaluation standard, implementation of bilingual teaching process monitoring and the experts' attending to lectures system, collection of bilingual teaching effect of classroom teaching feedback system, comparative evaluation standards and implementation effect exam assessment system, and review system of analysis check reason to take measures of teaching qualification. In this way, the overall framework of bilingual teaching quality standards and monitoring system can be completely constructed.

## **4 Conclusion**

It is a significant measure to construct the standard and monitor system of the bilingual teaching quality in common colleges. By adopting qualitative and quantitative research combining with AHP, the overall index of the bilingual teaching quality evaluation can be established and then we can make comparisons in order to know the real situation of the bilingual teaching. Thus, that constructing an evaluation system of bilingual teaching quality provides a practical theoretical instruction for evaluating bilingual teaching quality scientifically and efficiently and improving the quality of bilingual teaching in Yangtze University.

# The Empirical Research on Relationship Between Fixed Assets Investment and Economic Growth

Wang Xigang, Zhang Haiyan

School of Business Administration, University of Science and Technology Liaoning, Anshan 114051, China  
(E-mail: aswxg@sohu.com, haiyan4558@126.com)

**Abstract:** Quantitative analysis is based on econometric model. The model use GDP and kinds of fixed assets investment is constructed and data in 1985-2010 was selected for empirical analysis, Multiple linear regression models in which GDP was dependent variables and other quantifiable factors were independent variables was constructed. And it was carried on the analysis, comparison and optimization. GDP growth change and main factors were analyzed quantitatively with factors analysis. From analysis above, the fixed assets investment can promote economic growth, and there is long-term stable relation and dynamic balance mechanism between fixed assets investment and GDP in our country. Especially the affect of domestic loan and foreign investment to GDP is more significant.

**Key word:** Fixed assets investment; Capital resource; GDP; Econometrics model

## 1 Introduction

Economic growth is incensement of GDP in a country or region. GDP is sum of consumer spending, investment spending, government spending and net export in expenditure approach. Investment has an important role in GDP growth at present of China, while fixed assets investment which has a close relation with economic growth is the major part in investment, which has a great significance in socialist modernization in our country.<sup>[1]</sup>

The economic grows rapidly since reform and opening up. GDP has been up to 4012.02 billion yuan, which adds to 3921.86 billion yuan than 1985. The fixed assets investment has been to 3109.642 billion yuan, which increases rapidly too, and is more than 1985 of 289.44 times. The fixed assets investment has a great significance in growth by analysis above. Through contribution of fixed assets investment to GDP is decrease on long-term in theory, fixed assets investment would be an important role in economic growth in a foreseeable period of time. The economic construction practice of many years shows that there is a close relation between fixed assets investment and economic growth, which is a major part in economic growth.<sup>[2]</sup> The empirical analysis with specific data would be more significant.

The study has shown that fixed asset investment has a positive relation with economic in America. Speed of economic growth could be promoted by capital investment such as machine equipment in developing country, and contribution of equipment investment to economic growth is 0.2175, the contribution of non-equipment investment to economic growth is 25% of the former.<sup>[11]</sup> The study of Younge shows that physical capital, human capital and labor participation are the main reason why East Asia especially the Asia Tigers succeed in economic growth.<sup>[12]</sup>

The domestic study on investment and economic growth is mainly concentrated in correlation analysis and simple regression analysis, study on causal relationship is few. For example, Liu J Q analyzed causal relationship between economic growth and fixed asset investment with data in 1991-2000, which showed that the causal relationship between fixed asset investment and GDP is not significant, but the current relevance between fixed asset investment and GDP is significant.<sup>[3]</sup> Besides, Ran J Y, Yuan G C selected data of fixed asset investment and economic growth in 1978-2003 and described orbit between fixed asset investment and economic growth, then correlation analysis and regression analysis were used for analysis of fixed asset investment and economic growth, which showed that the derive of fixed asset investment to economic growth is significant.<sup>[6]</sup> Ge J L explored relation between fixed asset investment and economic growth with method of Granger causality test, ADF stationarity test, co-integration relationship inspection and ECM model, and the result showed that fixed asset investment is a main factor that derives economic growth, and fixed asset investment was affected by economic growth.<sup>[7]</sup> Meanwhile, co-integration relationship existed between fixed asset investment and economic growth. Wang Y X analyzed fixed asset investment and economic growth empirically with EBA, which showed that the relation between fixed asset investment and economic growth is significant and the economic growth was mainly promoted by incensement of fixed asset investment, and some advices were given.<sup>[8]</sup> The data was selected as fixed asset investment and GDP in 1985-2010. The fixed asset investment is divided into state budget, domestic loan, foreign investment

and self-raised funds and other capital resource to analyze relation between fixed asset investment and economic in this paper. Relation between kinds of investment and economic growth is analyzed with method of econometric model and Eviews6.0.

## 2 Methodology

### 2.1 Variables selection and data collection

Fixed assets investment and economic growth have dialectical relation of mutual promotion and restrict in theory. On one hand, fixed assets investment has a great influence in facilitating economic growth; on the other hand, the fixed assets investment would be influenced by economic growth. But the facilitation of investment to economic growth is limited, namely enough investment capital, enough investment factors and coordination between investment capital and investment factors. The stable operation of national economy would be influenced unless development of investment capital and investment factors. The sources of fixed assets investment capital included state budget, domestic loan, foreign investment and self-raised funds are analyzed in this paper.<sup>[13]</sup> Namely the Multiple linear regression models in which GDP is dependent variables and other quantifiable factors which include state budget, domestic loan, foreign investment and self-raised funds are independent variables is constructed. The data of GDP(Y), state budget ( $x_1$ ), domestic loan ( $x_2$ ), foreign investment ( $x_3$ ) and self-raised funds ( $x_4$ ) in 1985-2010 is collected, as shown in Tab.1

**Table 1 The Data of GDP and Fixed Assets Investment (Billion Yuan)**

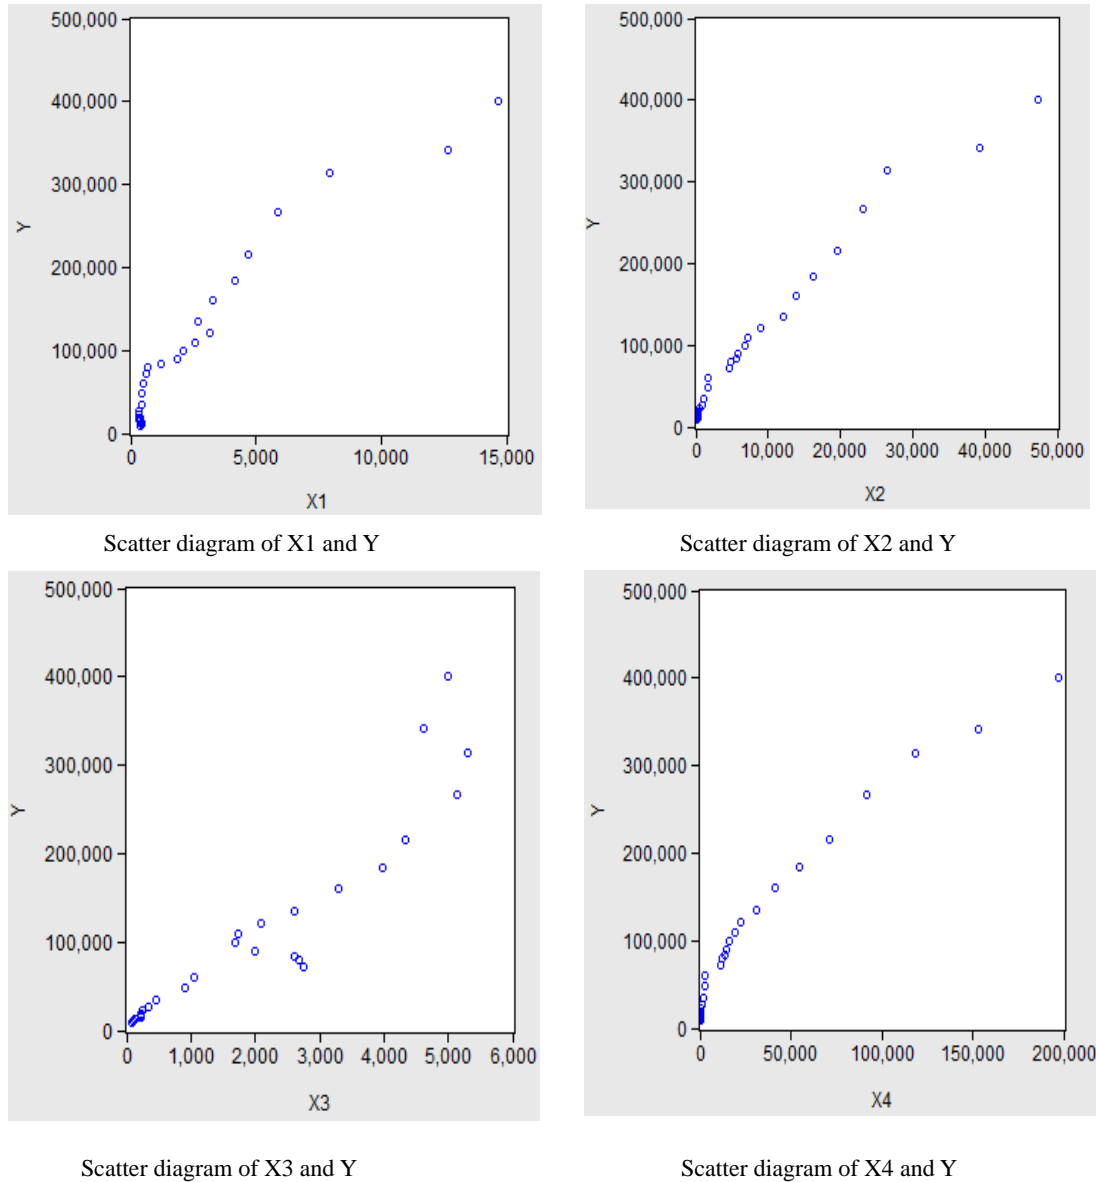

Year	GDP (y)	State budget (x1)	Domestic loan (x2)	Foreign investment (x3)	Self-raised funds (x4)
1985	9016.00	381.18	187.92	73.52	339.99
1986	10275.20	417.39	200.13	109.54	344.65
1987	12058.60	438.52	255.46	139.01	382.78
1988	15042.80	381.66	284.66	218.31	488.75
1989	16992.30	323.33	293.00	221.45	495.03
1990	18667.80	363.59	378.62	224.05	529.92
1991	21781.50	348.45	527.07	239.96	746.73
1992	26923.50	307.87	831.48	334.15	1242.92

2010	401202.00	14677.80	47258.00	4986.80	197099.20

Data resource: Statistical yearbook of China in 1985-2010

### 3 Model Constructing

#### 3.1 Model selection and parameter selection

The scatter diagram of GDP(Y) and state budget ( $x_1$ ), domestic loan ( $x_2$ ), foreign investment ( $x_3$ ) and self-raised funds ( $x_4$ ) is shown in Figure1 according to Tab.1. The x-coordinate is fixed assets investment capital, and y-coordinate is GDP, the result is shown in Figure 1.

**Figure 1 The Scatter Diagram of GDP(Y) and State Budget ( $x_1$ ), Domestic Loan ( $x_2$ ), Foreign Investment ( $x_3$ ) and Self-Raised Funds ( $x_4$ )**

The linear relation between GDP and fixed assets investment is obvious according to Figure1. The Multiple linear regression models is shown as below.

$$y = a_1x_1 + a_2x_2 + a_3x_3 + a_4x_4 + u \tag{1}$$

#### 3.2 Parameter estimation and test

##### 3.2.1 Parameter Estimation

The result was shown in Figure2 with least squares estimate and Eviews6.0.

Dependent Variable: Y  
 Method: Least Squares  
 Date: 06/03/12 Time: 19:46  
 Sample: 1985 2010  
 Included observations: 26

	Coefficient	Std. Error	t-Statistic	Prob.
C	8824.131	4858.479	1.816233	0.0836
X1	13.00474	6.985882	1.861574	0.0767
X2	0.056171	2.770983	0.020271	0.9840
X3	27.01617	4.356770	6.200962	0.0000
X4	0.349360	0.404549	0.863581	0.3976
R-squared	0.991238	Mean dependent var		113362.6
Adjusted R-squared	0.989569	S.D. dependent var		111321.3
S.E. of regression	11369.52	Akaike info criterion		21.68630
Sum squared resid	2.71E+09	Schwarz criterion		21.92824
Log likelihood	-276.9219	Hannan-Quinn criter.		21.75597
F-statistic	593.9225	Durbin-Watson stat		1.267809
Prob(F-statistic)	0.000000			

Figure 2 The Estimate Analysis Results

According to Figure3, the result is shown as below.

$$y = 8824.13 + 13x_1 + 0.06x_2 + 27.02x_3 + 0.35x_4 + u \tag{2}$$

(0.18) (1.86) (0.02) (6.20) (0.86)

$$R^2 = 0.99 \quad \hat{R}^2 = 0.99 \quad DW=1.26 \quad F=593.92$$

- (1) Test of goodness of fit:  $R^2 = 0.991238$ , the goodness-of-fit is obvious high.
- (2) Significant test of formula:  $F \sim Fa(k, n - k - 1)$ , the significant test is well.
- (3) Significant test of variables: When  $\alpha = 0.05$ ,  $n - k - 1 = 21$  according to T distribution table,

$t_{0.025}(21) = 2.08$ . So variable  $x_3$  is significant according to Figure2. But  $R^2 = 0.99$ , and  $\hat{R}^2 = 0.99$ , which means that explanatory of model is reasonable.[4]

The reason would be the following as the data we select is time series data: the joint linear function of each variable to y is significant, but independent linear function of each variable to y is weak as collinearly among variables, so T test is not significant. The model above should be tested and adjusted according to econometric.

### 3.2.2 Test of Econometric

#### (1) Multicollinearity Test

From the analytical result of the model estimation we can see that, the R2 value in the model is higher, but the checkout value of t of x1,x2 and x4.therefore,there is multiple linear in the model. It modifies the model via eliminating variables with gradual regression method, and we obtain this model:

$$y = 12681 + 6.33x_2 + 19.39x_3 \tag{3}$$

(3.27) (16.08) (7.04)

$$R^2 = 0.989 \quad \hat{R}^2 = 0.988 \quad DW=1.45 \quad F=1038$$

Both  $R^2$  and  $\hat{R}^2$  increase when  $x_3$  is added as shown in Figure6. Symbols of estimate is well, coefficient of  $x_3$  is significant at significant level of 5%, and coefficient of  $x_2$  is not influenced.

#### (2) Autocorrelation Test

The result of self-correlation test is shown in Figure 3.

Test Equation:  
 Dependent Variable: RESID  
 Method: Least Squares  
 Date: 06/04/12 Time: 09:35  
 Sample: 1985 2010  
 Included observations: 26  
 Presample missing value lagged residuals set to zero.

	Coefficient	Std. Error	t-Statistic	Prob.
C	-181.4830	3796.449	-0.047803	0.9623
X2	0.059671	0.430208	0.138702	0.8910
X3	-0.144616	2.817377	-0.051330	0.9595
RESID(-1)	0.316888	0.215172	1.472720	0.1557
RESID(-2)	-0.263205	0.240382	-1.094943	0.2859
R-squared	0.123025	Mean dependent var		-1.97E-11
Adjusted R-squared	-0.044017	S.D. dependent var		11650.37
S.E. of regression	11904.02	Akaike info criterion		21.77818
Sum squared resid	2.98E+09	Schwarz criterion		22.02012
Log likelihood	-278.1164	Hannan-Quinn criter.		21.84785
F-statistic	0.736490	Durbin-Watson stat		2.168283
Prob(F-statistic)	0.577477			

Figure 3 Autocorrelation Test

DW=2.168, and n=26, k=4. dL=1.06, dU=1.76 at significant level of 5%. As 1.76=dU<DW<4-dU=2.24, there is no self-correlation in this model.<sup>[5]</sup>

(3) White Test

The result of White test is shown in Figure8.

Heteroskedasticity Test: White

F-statistic	3.418798	Prob. F(5,20)	0.0215
Obs*R-squared	11.98156	Prob. Chi-Square(5)	0.0350
Scaled explained SS	11.99588	Prob. Chi-Square(5)	0.0348

Figure 4 The White Test

The p-value is less than 0.05 as Figure8.shown, so hypothesis that there is no heteroscedastic should be rejected. Namely, heteroscedastic exists in random error of the model. Then the model is adjusted with method of logarithmic as shown in Figure 5.

Dependent Variable: LOG(Y)  
 Method: Least Squares  
 Date: 06/04/12 Time: 10:16  
 Sample: 1985 2010  
 Included observations: 26

	Coefficient	Std. Error	t-Statistic	Prob.
C	6.113884	0.140635	43.47327	0.0000
LOG(X2)	0.612965	0.019200	31.92446	0.0000
X3^3	1.55E-12	7.32E-13	2.113911	0.0456
R-squared	0.990802	Mean dependent var		11.09247
Adjusted R-squared	0.990002	S.D. dependent var		1.158298
S.E. of regression	0.115817	Akaike info criterion		-1.365444
Sum squared resid	0.308512	Schwarz criterion		-1.220279
Log likelihood	20.75078	Hannan-Quinn criter.		-1.323642
F-statistic	1238.777	Durbin-Watson stat		1.291059
Prob(F-statistic)	0.000000			

Figure 5 The Analysis Result of Adjusted Model

$$Ln y = 6.11 + 0.61 Ln x_2 + 1.55 x_3^3 \tag{4}$$

(43.47) (31.92) (2.11)

$$R^2 = 0.99 \quad \hat{R}^2 = 0.99 \quad DW=1.29 \quad F=1238$$

The heteroscedastic is eliminated through test and adjust of model, accuracy of parameters is promoted, and both fixed-squared figures and F-value are promoted too. The analysis that growth of GDP is affected by kinds of fixed assets investment in recent years is shown in model above, while the

influence of domestic loan and foreign investment on GDP is significant as the empirical analysis shows, and the influence of state budget and self-raised funds on GDO is insignificant.

#### 4 Conclusion

The model between GDP and kinds of fixed assets investment is constructed and data in 1985-2010 was selected for empirical analysis, the multiple linear regression models between GDP and kinds of fixed assets investment is got with method of multicollinearity test., self-correlation test and white test. The relation between GDP and kinds of fixed assets investment in 1985-2010 could be interpreted reasonably. From analysis above, there is long-term stable relation and dynamic balance mechanism between fixed assets investment and GDP in our country, especially the affect of domestic loan and foreign investment to GDP is more significant.

The Chinese economic increases rapidly through own advantages, absorbing foreign investment and adding fixed assets investment. The affect of kinds of fixed assets investment to GDP is analyzed in this paper. We can see that from the model, although in recent years, according to the economic background, various types of fixed asset investment have affected GDP growth, the empirical analysis shows that, the domestic loans and the use of foreign investment has obvious effects on GDP. Therefore, China should pay attention to the domestic lending and the use of fixed assets of foreign capital investment, make corresponding policy, and take measures to promote the economic growth in China. The practice of economic construction shows that economic growth is affected by both fixed assets investment and time factor, which gives us a guide to attract more investment as expand fixed assets investment.

# Research on the Construction of College Campus Culture from the Perspective of Harmony Society

Li Ligu<sup>1</sup>, Fang Xiaoqing<sup>2</sup>

1 School of Arts and Law, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 School of Materials science and Engineering, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: whutallen@163.com、fangxq@163.com)

**Abstract:** Campus cultural construction is the important way to strengthen and improve the ideological and political education of college students. From the perspective of harmony theory, this paper analyzes the significance of present harmonious campus cultural construction. Combined with the reality of college students' ideology, it proposes three ways for harmonious campus cultural construction, which includes insisting on adopting and developing, basing on people's overall development, constructing harmonious teaching environment.

**Keywords:** Harmony; Campus Culture; Construction

## 1 Introduction:

“The harmonious culture is the crucial spiritual support of unity and progress to all the people”<sup>[1]</sup>, which has been pointed out in the Report of the 17<sup>th</sup> CCP National Congress. College campus culture is an important part of the construction of socialist harmonious society culture. To strengthen the construction of college, campus culture has a very significant meaning for strengthening and improving college students' ideological and political education, improving their overall quality, developing the advanced socialist culture and building the socialist harmonious society.

## 2 The Connotation of Harmony Theory and Harmonious Campus Culture

Harmony is necessary for the existence and development of a system. According to the dialectical logic of things themselves, revealed in the materialist dialectics, harmony is the integration of the differences of things in essence, and a state in which things exist and develop. Furthermore, it reflects the fact that contradictory unity, in its developing process between the opposites, has shown coordination, consistency, balance, integrity and the regular dialectic category.

Harmonious culture is to advocate and pursue harmony as its value orientation, which combines the idea, way of thinking, behavior and social fashion as a whole, and reflects people's overall view, basic ideas of harmonious society, which is a very important part of socialism with Chinese characteristics. Harmonious culture is not only the harmonious society's important characteristic, but also the cultural origin and spiritual power to realize the social harmony.<sup>[2]</sup>

According to the harmony theory, the harmonious campus, is a balanced theory, coordinating promoted harmonious state, among the various development elements of colleges, the essential one is harmonious culture. And the basic of harmonious campus construction lies in the construction of campus culture. The harmonious college campus culture refers to the culture created by the coordinated efforts of college teachers and students, which reflects its value, the ideal faith, group consciousness, the group mentality, behavior standards, and it is a system consisting of institution and spiritual culture, an existing form of the campus peculiar culture inheritance, whose core content can be summarized as “what sort of man the college students are educated to be” and “what kind of life they are guided to have”. The harmonious campus culture is not only the basic aim and connotation of constructing the harmonious campus, but also the basic way and mode to construct the harmonious campus.<sup>[3]</sup>

## 3 The Significance of the Harmonious Campus Culture Construction

### 3.1 To has a very important meaning for improving the overall quality of college students

College is an important position not only to develop socialist builder and successor, but also to spread socialist spiritual civilization and socialist culture. Campus culture construction is an important way and method of the college ideological and political education, whose ultimate purpose is to develop socialist builder and successor with ideal, morality, culture and discipline in a healthy and comprehensive way.

### 3.2 To be one of the most important parts of socialist advanced culture

College is a creation and transmission position of advanced thought culture, which is a leading culture in social system. It is the best to express the mainstream value culture, such as idea, faith, social fashion, behavior standards, value orientation, group consciousness and group mentality. The construction of harmonious campus can provide a high level of spiritual and intellectual support for national economic development and the whole society's harmony.

### **3.3 To play an important role in promoting social harmony and stability**

Campus culture is to take teachers as the leadership, as well as the students as the main body, and aims to accelerate students' growth and improve their cultural quality and aesthetic sentiment. It is the material and spiritual achievement created by all the teachers and students working together, providing the micro foundation of spiritual support for social harmonious culture construction. Secondly, the construction of the whole society's harmonious culture needs a lot of students of ability out of college's output. The harmonious campus culture construction, which can provide a harmonious environment for the college students' growth, consummating their knowledge structure and improving their quality and ability, has a significant effect on the construction of social harmonious culture.<sup>[4]</sup>

## **3 The Approach to Strengthen Campus Culture Construction**

### **3.1 To insist on adopting and developing, innovating advanced campus culture, promoting the scientific spirit**

Advanced campus culture includes not only the strong academic atmosphere, colorful cultural life, and civilized way of life, good campus environment, and the common value orientation, but also the college's environment, education, scientific research, equipment and so on. To construct harmonious campus culture, it is essential to insist on advanced cultural factors contained in campus culture, such as life belief, morality and aesthetic taste, to guide and shape the teachers and students staff.<sup>[5]</sup>At the same time, it is essential to inherit the excellent traditional culture, absorb the useful excellent international culture, adhere to combine inheritance and innovation, and create advanced campus culture that can not only honor the excellent tradition, embody the era spirits, but also base on domestic and face the world.

### **3.2 To adhere to people-oriented, accelerate people's overall development**

To adhere to the people-oriented, is to reflect the students-centered, to take the cultivation of students as responsibility, to promote the quality education as the main line. Teaching, supervising, and serving students aim to guide and promote the all-round development of students, and their healthy growth. To adhere to the humanistic care, can promote the harmonious interpersonal relationship between educators and the students, Insisting on the outlook of scientific development, is to take quality education as the foundation, take the construction of the academic discipline as the core, pay attention to the students' psychological health, cultivate students' lofty ideological values and good moral quality, guide and help students to set up the correct world outlook, the outlook on life and values, and to improve the students' culture.

### **3.3 To adhere to take campus cultural life as carrier, construct harmonious teaching environment**

Colleges should vigorously develop the colorful campus culture activities to meet the needs of the spiritual and cultural life of teachers and students. It is essential to guide students to advocate science, cultivate their spirit of innovation, improve their cultural quality and campus culture appreciates. To make full use of good students' community organization, expand students' quality, reveal the remarkable characteristics and personality of campus culture. To widespread extracurricular activities, can help college students to establish correct, lofty aesthetic psyche, cultivate rich imagination, keen insight, noble and elegant aesthetic taste. It is necessary to strengthen the network culture construction, to play the network education of guiding function, to enhance the sense of times and pertinence. All in all, the organization of various campus cultural activities that teachers and students extensively participate in, can strengthen the cohesion and solidarity of teachers and students, ensure the harmonious development of colleges.

## **4 Conclusion:**

Harmonious campus construction is a key element of harmonious society construction. It is right to lead harmonious campus culture construction with socialism core value and promote college students to receive and absorb college spirit gradually, and to adopt and develop the college spirit. It is important to pay attention to teachers' culture, to bring teachers' leadership into play, to try hard to build special culture and promote harmonious campus culture appreciates, and to continually promote the ability of students and social harmonious stability.

# Research on Construction and Management of Color Order of Brand Image

He Fang, Cheng Shun

School of Art and Design, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: hefang6262@sina.com, cshunzi@qq.com)

**Abstract:** This paper mainly, through case study, investigates important role played by colors in the process of promoting a brand image. For a company, its brand image is not only an explicit transmission of its products to the potential customers, but also a way to deliver its profile. The innovation of this paper lies in putting forward the idea of color-order development for a brand image. On the basis of the previous study of domestic brand images, the author develops a new color order for brand image. Since most customers' first impression on a brand image is its colors, the promotion and maintenance of a brand image cannot be without the promotion and maintenance of its color order. Therefore, the promotion and maintenance of its color order is essential in developing a brand image.

**Key words:** Brand image; Color order; Color order management; Color order construction; Case study

## 1 Introduction

Famous American marketing theorist Philip once said: "Brand image contains its consumers' faith in it". Therefore, a brand image is not only used to distinguish itself from other brands, but also a symbol of the company. For consumers, the deepest impression a brand image deliver to the customers is its colors. A brand image is passed to the consumer through visual elements, of which the colors are an explicit factor. And color is also an important element to catch consumers' attention.

Nowadays, a large number of scholars and institutions at home and abroad are studying color, including Color and Public Art Research Center of Nankai University, cofounded with Nippon Color and Design Research Institute (NCD). The color system of NCD, on the basis of Mechanics Color Theory, is developed in a more systematic and statistical way to explore the connotation of color. Its researches lay more emphasis on the color psychology and wide range of applications in different designs. Although some aspects of brand image are dealt with, there are only studies in combined usage of color, language, and environment and these studies are not systematic, for example, German researcher Eva Heller studies color from cultures, languages and environments. Up to now, there is no mature system in developing color order, let alone its promotion and management, which are weak points in color study at present.

No matter what industry it is, its leading brands all have their unique color features. Pepsi-Cola's blue, McDonald's yellow, Kentucky's red and Starbucks green all have its own industrial features. To be more specific, Pepsi-Cola chooses blue, which is a symbol of creativity and rebellion, to represent its difference from its main competitor Coca-Cola, which chooses red as its dominant hue. The jet Pepsi hired is painted in blue to deliver Pepsi's new idea to the world and it leaves its customers a deep impression through media. Sometimes, the combination of certain colors and certain forms will generate a very impressive image, such as red and green in traffic lights<sup>[1]</sup>. For many brands, color is the most identifiable element in the consumers' impression. When customers hear, know, or choose goods, they, mainly construct a soul exchange with the brand through its color. Consumers choose a brand because they trust it, and the reason why people trust the brand is that it can give them a sense of emotional communication and a chance to display their personal taste. Therefore, developing a brand image is not only for providing a unique product with certain functions, but also helping to create an enjoyable atmosphere in which its customers can enjoy and relax themselves.

In U.S. marketing industry, there is a "7-Second Law", which means that consumers will decide whether to purchase certain goods within 7 seconds. Consumers' first impression on goods may arouse their interest in better knowing its function, quality and other aspects.

If company neglects the importance of visual design, it does not only lose some attentions on its goods but also its potential customers. In short seven seconds, the color of a commodity will occupy 67% of the customers' attention, so color is a window to presenting brand image, and a proper color order can promote the brand image, which is an immediate cause in the choices of consumers' purchase.

Color is a feeling produced after light stimulation on people's visual organs and it is an important component of visual communication. The principle of color composition is to achieve a balance in color through using and reconciling its hue, brightness and purity. The generation of color order depends on

pursuing the balance between the unity and the change in colors<sup>[2]</sup>.

Color system can be divided into achromatic system and chromatic system. Order-relation can be explained as a kind of gradual change or variation in property. Color order presents the harmonious beauty of colors. The word “harmonic” means “eye-pleasing, concerted, integrated and orderly. Proper development and management of color order can enhance communication between a company and its customers.

Poor color decisions can result in lack of competitive advantage, ineffective or incorrect communications with product or brand characteristics, and untold dollars in wasted inventory comprised of unsold products in undesirable colors<sup>[3]</sup>. The development and management of color will help to guide consumers’ purchasing behavior, and also make a contribution to the global marketing and brand promotion in different cultures, which are extremely important for a company. Same color may present different connotations in different nationalities, regions and countries. In Japan the idiom “White represents winning and black losing” comes from rules in sports sumo, in which white star is the symbol of winning while black star the symbol of losing. Thus, white also becomes a symbol of justice and power. However, China and India, both in Asia, regard white as closely related with calmness and quietness and thus white become also a symbol of death. Same color in different religions also presents different connotations, for example, in Buddhism red is the color of life and creativity and yellow is known as the noblest color symbolizing ultramundane state. The garment of monks and temple often choose yellow as their color; in Christianity, yellow is believed to be the color of clothes of traitor Judah, which is the symbol of ignobility; in Islam, yellow is always associated with desert, drought and regarded as a symbol of death. Golden in Buddhism is a symbol of sacredness, representing the glory of the Buddha dharma and ultramundane state. Orange stands for brightness. In Southeast Asia, we can see that most of decorations of monks’ garments, temples and palaces are painted in orange. We need to investigate and analyze different meanings of different colors in different areas and only by doing so can we avoid taboo and find out their preferences in this area so as to construct adaptable color order for this area.

Through the analysis of color and the development of color order, we find that we need to make different management of color order for different countries and areas, which will help to enhance communication between a brand and its consumers and finally lead to the consumers’ acceptance to the brand.

## 2 Relationship Between Color Order Management and Brand Image

### 2.1 Brand image and its management

At present, homogenization is a very serious problem in market. Different brands and different products rush into market with similar models and colors. How can a brand represent its own unique characteristics? Only by employing suitable colors can a company build its own brand and unique characteristics and cultivate the originality of the brand and can a company make its products identifiable to their consumers (see figure 1).

Figure 1 The Process of the Color Order and Customer Information Exchange

### 2.2 Color order in brand image

With different backgrounds in gender, age, family, ethnicity, culture, cultivation, occupation, income, and habits, different people have their own preference for different colors. Generally speaking, infants prefer red and yellow color (pure color); children like red, blue, green and gold; young people like red, green, blue, black, and mixed color; the middle-aged like purple, brown, blue and green; males prefers colors representing solidity, strongness, warmth, while females love soft, gentle, lyrical tone. In different seasons, different brand promotions also need to take the weather into consideration. Companies need to choose different colors in different seasons, especially for products sold in a certain season of a year. That is to say, products primarily sold in summer should be designed in cool colors, while those mainly sold in winter should be designed in warm colors. Brand image are developed through building a complete set of color order and making minor changes to adapt to the change of many factors, such as different ages, seasons, etc.

**2.3 Management of color order enhances brand image**

President of Coca-Cola Woodruff once said, “even if the whole Coca-Cola were burnt into ashes over one night, he could make a comeback in a very short time with only the brand 'Coca Cola' ". Woodruff’s confidence comes from the brand image of Coca-Cola. Coca-Cola is a reddish-brown liquid instilling energy into its consumers. Red is a positive hint of passion and vigor<sup>[4]</sup>, so the company chose red as the drink’s main hue and kept it for over one hundred years. A set of complete color order of long period will leave consumers’ deeper impression and helps to promote the brand image, for example, red of Coca-Cola, yellow of Hz, blue of IBM.

**3 The Development and Management of Color order**

The development of color order is a systematic project throughout the whole process of brand development. From the setting up of the brand to final products for consumers, every link should be integrated with the brand’s core philosophy in accordance with the characteristics and features of colors to make the development and management of color order more effective. Successful color order should contain the brand’s core philosophy and its consumers’ feeling and experience to work out a suitable system for the brand.

Generally speaking, the development of color order includes three processes: investigation of consumer, identification of enterprise ideal and setting up of color order. (See figure 2). Color-order management is feedback evaluation and management on the basis of the consumers’ feedback. The development and management of color order is a repeated and dynamic process, constantly updated and improved.

**Figure 2 The Development and Management of Color Order**

**3.1 Investigation of consumer**

In order to make the brand image attractive and affective in accordance with its ideal, at company should first employ scientific and rigorous methods to investigate and study the brand-setting-up process and its future expectations. The whole investigation process includes setting up of enterprise brand, expectations of the products, investigation of competitors in the market, investigation of consumers, etc.

The company should investigate its competitors’ potential, advantages in marketing competition, and strategy and achievements in developing color order, and the competitors’ future development

Through the analysis of structure, the company should investigate certain people with particular backgrounds. Also the company should pay attention to its image, popularity and impression in the big market.

**3.2 Identification of enterprise ideal**

Identification of the enterprise ideal is to set a goal for its brand image. Many enterprises have no clear idea for their own brand images and future expectation, so help from designers is necessary, which can help enterprises to better understand the advantages and disadvantages in their daily operation, make clear their target market, and alter the existing brand marketing strategy so as to form a proper enterprise ideal.

### **3.3 Setting up of color order**

Based on the integration of enterprise ideal, consumers' preference and connotations of colors, a proper color order should take a good balance between brand image and consumer. Companies should first have a clear understanding of consumers' psychology, then design products that consumers want, and at last employ proper colors for products, package, environment decoration, and shopping-bag through these processes, a bridge is served between products and consumers to realize a harmonious unity of man, color and product, which is a dynamic process of color order development.

### **3.4 Management of color order**

Companies should send samples to their consumers to revalue whether their products are popular with them and whether they can reach the target: the integration to brand image and consumers' brand expectation. At the same time, companies should test its feasibility in many aspects, such as material, technology, cost, etc. After the color order of a brand is completely developed, the maintenance of color order becomes very important and it needs minor changes to adapt to an ever-changing market and consumers with different backgrounds. Only by doing so can the brand image be more distinctive more popular with consumers.

## **4 Case Study**

We find that Chinese athletes appear in P&G's latest Olympic marketing, and in China the company has adjusted its marketing and changed its logo into red with yellow, which are colors Chinese people are fond of. However, the company chose blue with white as its logo color for the Olympic marketing in other countries. P&G's success in color design lies in deep understanding into the process of "development and management of color order. Although P&G chose blue with white as its logo colors in global marketing, in China, base on the investigations and feedbacks in China, it was found that red and yellow are more popular with Chinese people, for in its long history, yellow is believed to be a color representing royalty and red is a symbol of happiness and luck. P&G's change in logo colors for Chinese market is based on the fact that Chinese people obviously prefer red and yellow to blue and white. Integrating Chinese tradition and the enterprise ideal, P&G achieve a remarkable effect in Chinese market.

## **5 Conclusion**

For companies, establishing a complete dynamic color order will not only make their brand images superior to their competitors in visual effect, but also help to accumulate the brand value and enhance the brand images. Companies should make a proper management of color order so as to attain a desirable effect and thus achieve long-term maintenance and perfection of their brand images. In today's society huge numbers of commodities share more and more similar characteristics and features, so if a company wants to distinguish its brand image from others, the development and management of color order must be an essential part in company's daily operation.

# On Theoretical Logic of Introduction System Engineering to University Moral Education Model Construction

Shen Gewu<sup>1</sup>, Yang Aixia<sup>2</sup>

1 Propaganda Office of Party Committee, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 Wuhan polytechnic, Wuhan, P.R.China, 430074  
(E-mail: Shengewu@whu.edu.cn )

**Abstract:** Begin with the introduction of moral education model, the research makes an analysis on the two aspects of System Engineering: system and engineering. Then the research combines the system engineering theory with the university moral education model construction. Starting from that theoretical logic point and frame, the research integrates the general theoretical logic with the experimentally empirical logic, tries to put forward the principles and the features of university moral education model construction which aiming at offering a theory frame to the university moral education model construction for reference.

**Key words:** System approach; Engineering means; Model construction

## 1 Introduction

The British McQuail, D. and the Swede Windahl, S. took Model from the perspective of Communication as “to purposely perform a simplified description about an event or an entity in the form of images”<sup>[1]</sup>. a model attempting to show that any structure or the main components of the process and the relationship between the parts. Model can be more effective to help people to work and improve quality and efficiency, and that’s where the purpose for the construction of moral education model lies.

The book Moral Education Model written by Richard & Harsh, American experts in moral education, while translated by Fu Weili, a Chinese professor specializing in moral education, has ever mentioned that “moral education model works as a way to speculate and judge the course of action of educational institution, it covers the viewpoint on how to develop moral theory along with certain principles and methods on how to promote the development of morality.” Moral education model embodies such kind of moral education activity form which contains theoretical guidance, the structure and procedures of the activities, implementation principle, operating essentials and etc.

In general, start from the aspect of System Engineering science research; system engineering has two sides, “system” and “engineering”. The former refers to the point of multidisciplinary comprehensive research, while the latter means the point of practice, namely putting the results of research into practice.

The System Engineering Theory took its shape in the middle period of last century, “it is a set of theories and methods which target at large and complicated research objects and then plan, exploit, manage and control with certain purpose, designing to achieve overall optimal effect”<sup>[2]</sup>. It includes two inseparable parts, system engineering concepts and system engineering methodology. Among the two, the former refers to a series of basic ideas on system engineering. It comes down to the integration in thinking methods, the mixture in the usage of resources (technology, knowledge, equipment, material) and the science of management. While the latter generally refers to the seven basic logical programs including environment identification, target establishment, value measure, system integration, system analysis, system selection, decision-making and etc.<sup>[3]</sup>.

The scientific model of university moral education indicates a kind of comprehensive, creative and practical moral education. One of the grounds as well as the sources for its construction is from System Engineering, whose thoughts and methods is followed by it and whose practice and application is displayed in it as well.

## 2 Starting from Logical Point: Construct Principles of University Moral Education Model in System Approach

System approach is widely used in each step and run through in whole process of scientific research. Today it is or will challenge a great deal of traditional approaches. In addition, it also works as an intermediate link between philosophical method and other scientific research methods, it is the embodiment and of realistic application of materialistic dialectics. Moreover, adopting this approach

makes the moral education work go scientifically in university moral education model building; however, it also should abide by certain principles.

### **2.1 Organic combination principle of theory and practice**

Moral education is a subject laying equal emphasis on single analysis and comprehensive research. For the reason that the formation, cultivation and change of ideological morality of young students involve many fields and various subjects, the system and engineering of university moral education accordingly have to touch upon those. Thus only by conducting multi-disciplinary comprehensive research, a research rather than the original individual but the systematic one, rather than the plane but the multi-dimensional one during the process of the construction of university moral education model, can university moral education break away from simplicity, improving the overall effect of ideological education and management work and making the new situation of university moral education even better. In addition, the ideological source and theoretical foundation of moral education come from Marxism, it is necessary to apply its theories to direct the construction of university moral education model to absorb the research results and methods of numerous subjects, then form its special theory system, and at last, become a comprehensive scientific methodology of its own features.

### **2.2 Organic combination principle of systematic thinking and optimization**

“Systematic thinking calls for study and speculation on events and entities from all directions, to pursue the maximum output with minimum input by means of optimization thinking.<sup>[4]</sup>” The optimization principle goes well with whatever we do, so does moral education model, just as the saying in *The Art of War* by Sun Tzu put: “the real winners are those who defeat the opponents without battle rather than those who emerge victorious in every battle.” System actually refers to the organic whole, composed of a quantity of interactional and interdependent parts or essential factors, which are lack of the new quality and function that the whole possesses and makes use of them to conduct interaction with certain environment. System engineering would be applied to make systematic analysis about the managed object and to make research into the internal system along with the organic connection between the system and the external environment, aiming at bringing the integrated function of the system into play and realizing the optimization of moral education model, this is the moral education model system engineering theory.

Process index is the precondition, the step to reach optimization; while the effect index functions as an evaluation data. Yet non-excellent effect index indicates that it is necessary to analyze the parameters and the implementation situation on the basis of the process index to figure out the mistakes that were made in the process of carrying out the moral education model. Building university moral education model desires to cultivate it into a multi-level, multi-formed, multi-channel, multifaceted network with integrating the superior and subordinate authorities and interweaving transdisciplinary subjects to fully develop the comprehensive strength of the whole system and to achieve its maximum efficacy. The basic aim of social optimization principle is: in an attempt to acquire the best qualitative and quantitative measure, ideal sequence, the greatest benefit but minimal risk, the least amount of energy via the most advanced cognitive method and modern operation strategy. While its essence is to use optimization method to put minimal human, material and financial resources, time and space, and information input consumption into use to get maximum social value. Meanwhile, marginal cost effect should be reasonably taken into consideration to see whether based on actual demand and whether of necessity to make further input when increasing input in moral education activities, which is of great significance in scientific decision of current university moral education activities.

### **2.3 Organic combination principle of inner control and outer radiation**

There are certain rules for college students' mental activity and the university moral education activity process; cybernetic thinking plays a key role in the construction of university moral education model. Internal control, as a special nouns and complete concept, was not put forward until the middle of the last century and it was only in recent time that China began to use it for reference in enterprise and company management activities. It can be defined as a business process to provide effective organization and management and to prevent errors and other illegal business from springing up<sup>[5]</sup>. While the one that is applied to university moral education model can be defined as an adjustment, communication and constraint process on moral education activities and its practice performed by the university moral education workers employing balance deviation principle of cybernetic thinking to ensure the moral education process not to deviate from the goal.

Each procedure in the practice activity of moral education represents one of the principles of internal control followed by the construction of university moral education model. It covers the following:

1) Environmental control. It refers to various factors which shall erect an influence on the construction process of university moral education model. Including: ① moral education ideas of university party committee; ② team construction of moral education work; ③ campus cultural atmosphere; ④ social trends; ⑤ mass media; ⑥ legal system environment; ⑦ guidance of public opinion; ⑧ family environment and etc.

The above-mentioned environment can be divided into inner and outer one from the perspective of school; the latter determines work direction and content of school moral education while the former decides its work focus and method. At the same time, school moral education work is able to affect and remold social moral education environment, besides, it has a positive function in the construction and optimization of school moral education environment and also play radiation effect on outer environment of school.

2) Decision control. The supposition and judgment, conforming to developing rules of moral education, made by the moral education workers on unknown things or uncertain situations after previous investigation and study analysis to guide the direction and action of the moral education work and. Moral education decision is essential in the development of moral education work, especially in modern time of high development speed. It includes: ① solve programmatic moral education decision through certain democratic procedure; ② regulate decision-making authority on non-programmatic moral education work; ③ make sure decision-making objectives; ④ to consider the efficiency of decision; ⑤ consider tradeoff of decision; ⑥ evaluate moral education phenomena; ⑦ select decision-making method; ⑧ provide reference for making decision.

3) Program control. The policy and procedure the decision-making team of moral education employed in building university moral education model to ensure the realization of its goal. Including: ① process and implementation of moral education; ② clarity of team collective of university moral education work and division of individual responsibility; ③ system standardization and file construction; ④ investigation research.

4) Restrained thought. The practice to eliminate some negative social influence and inflated selfish desire through the restriction of elementary morality and law to guide personal thought into normal social ideology and life field. Including: ① education on "Three Views" (world view, life view, value view); ② education on "Three Isms" (patriotism, collectivism, socialism); ③ education on "Three Morals" (social morality; career morality; family virtue); ④ education on credit; ⑤ legal binding.

5) Process evaluation. A segment in moral education to make use of certain evaluation norms and methods to inspect and judge the effect of moral education process based on the requirements of the moral education purpose. The establishment of moral evaluation system makes a more systematic education theory and contributes to the facilitation of the operation of moral education. Its steps cover: ① establish standard system of moral education process; ② verify evaluation rating and weighting factor; ③ self-evaluation and peer evaluation; ④ investigate and practical exploration.

#### **2.4 Organic combination principle of benefit motivation and spiritual incentive**

Duty and power, dedication and reward, virtue and happiness are inconsistent in the past due to the inequality of moral evaluation and moral reward. On the other hand, moral education workers still dare not to take moral education work and benefit driving as opposite relation. In fact, morality and benefit are compatible and it's unrealistic to expect everybody to give up individual interest to be a moral model because man has risk-averse instinct. Starting from this point, the best way to establish benefit motivation system is to bring the win-win concept on economics into use to suit individual needs.

The establishment of new effective moral education model should bear market economy and benefit motivation in mind, only by effectively blending benefit driving principle into new moral education model, innovating moral education and infusing university moral education work with benefit driving principle to construct new moral education model suiting market economy of society can the methodology on the implementation of long-term effective moral education be able to be established.

The permeability characteristics should be taken into consideration when setting up incentive system. While ideological and political work tends to be soft and elastic even fuzzy, the effect is not easy to expose and quality are difficult to quantify. As a result, it takes time for moderating penetration and relies on oneself to taste, digest and absorb. Thus this requires the participants of moral education activity to possess persistent and persevering will and perspiration and could fulfill their enthusiasm and creativity while working. On the other hand, it also requires, for the sake of the involved subjects and objects, taking incentive measures and setting up a reward and penalty system, both in material and mind.

System approach is a kind of philosophical epistemology and methodology that can make the moral

education process more scientifically. With the development of system engineering, it's urgent to research on the recognition program of engineering design and construction with the aim of getting the best system and the best decision that can make the moral education process more rigorous. The interaction diagram of system engineering approach (figure 1) can show the point.

Figure 1 The Interaction Diagram of System Engineering Approach

### 3 Starting from Logical Frame: Construct Specific Features of University Moral Education Model with Engineering Means

Different from other activities, engineering activity has strict regulations and procedures as well as complete stereoscopic structure. Special engineering, for example, contains elements like target, method, resource, process and etc. Scientific logic shows that elements form structure while structure determines mechanism, no exception to the construction of moral education model.

#### 3.1 Strengthen normalization of management from perspective of engineering activity elements

Speaking of normalization, according to educational provision, it mainly refers to the rules and regulations on thought and action of related people, and has compulsory and binding property; to put it in another way, it can be identified with the advocacy to integrate education with management. No rules, no orders. In order to fulfill the desired purpose, ideological and political work of whatever enterprise and public institution should be closely related to the regulatory management.

#### 3.2 Stress advisory of education from perspective of engineering technology means

As for advisory, it refers to the action of individual education and topics education (group consulting) focusing on the development of personality which follow the law of personnel training and growth. The aspects of advisory activities it includes are as the following: study, existence, thought, mind, life, career and etc. With the development of reform and opening up policy, social life changes dramatically and life pace speeds up; under this condition, an increase number of factors have sprung up to threaten people's mental health and challenged their mental capacity. Though the obstacle led by this objective situation is various, yet the key one turns out to be people's mental confusion and imbalance. Therefore, it is essential to advisory education and selective orientation, making advisory educational activity as the major method in improving university moral education model.

#### 3.3 Investigate conscientiousness of process from perspective of engineering target

When it comes to conscientiousness, it indicates that moral education is an operational and programmed process; so as to improve the actual effect of moral education work, the methods and skills in developing moral education work should be investigated. As a matter of fact, moral education process is with its special regularity whether in various business work and social activities or relatively independent moral education process. In addition to a means of fulfilling moral education target, it is a dynamic developing process of each single target. However, moral education process theory belongs to the basic theory, occupying the core status in moral education theory system and providing scientific theory reference for the determination of content, policy, principle and method of moral education.

#### 3.4 Evaluate predictability of decision from perspective of scientific engineering decision

Predictability requires constructing a system suitable to the developing need of moral education and making scientific predication and adequate assessment on the law of future moral education and social development. Decision making on moral education is not as easy as that on others because it has to not only predict human's ideological morals and the action itself but also the factors that producing and influencing them. In this case, moral education decision needs to follow strict conditions; otherwise, it reduces to be personal arbitrary acts. In other words, the awareness of moral education decision

makers should be consistent with the development law of ideological morals. “Whoever wants to do successful work or get desired result should abide by objective regularity, if not; the practice would end in failure.” Said comrade Mao Zedong (Selected Works Of Mao Zedong: Volume I . Beijing: People’s Publishing House, 1991:284). Meanwhile, it is necessary to observe and consider issues in a materialist dialectic way in making scientific decision, plus excellent work experience and insight in carrying out moral education activity.

**3.5 Value penetrability of environment from perspective of engineering resource allocation**

According to the requirements economic law lay for talents, the so-called penetrabilityemphasize the cultivation of different social activity abilities. Recently whether culture construction and the regular or irregular activities on memorial, celebration, competition and commendation in factories and enterprises or in schools and community are good examples in showing permeability education. Those university quality-oriented education and campus culture ideology in particular infuse education with entertainment and growth, and with the construction of school spirit and academic atmosphere, activating activity form of moral education; these vivid contents of moral education model made university moral education work receive brilliant education effect and were worth to be widely spread in the practice of moral education model.

On the process of university moral education model construction, especially in the exploration stage, it is important to improve the whole engineering moral education scientific evaluation system and technical approaches, such as combining with the quality and the quantity, the focus and the whole, process and result, short term and propection, self-assessment and evaluation, certainty factors and uncertainty factors. It is necessary to control the process according to the level and make an analysis on the integration control system of university Engineering Moral Education by following the basic principle of system engineering. By reviewing of the above principles and characteristics of moral education model and Combining with system approach and engineering means, the research uses self-organization theory on the moral education goal attainment and tries to construct a simulation model of university moral education. The bellow table (figure 2) shows the interaction diagram of system engineering approach.

**Figure 2 The Hierarchical Control Model of University Moral Education**

**4 Conclusion**

University moral education is an item of systematic and holistic engineering which needs to lead system engineering theory to its organization and management with the aim of getting the best effect. Start from the aspect of system engineering, the construction of university moral education need to protest the usage of engineering technical means and follow the attribute of engineering activities, as well as pay attention to put the holistic thinking and system analysis methods into making decision scientifically. Meanwhile, it is necessary to strengthen the regulation and control of moral activities and do some prospective study on moral education that can promote the task of university moral education roundly. Since the model has some special attributes, such as periodicity and given intention, the

university moral education construction need to base certain theoretical logic and create in practice, that can satisfy the demand of development of university moral education in nowadays.

# Study on The Evaluation Index System of “Three Bases and One Hub” Based on AHP Model: Taking Central Areas in China as an Example

Zhou Hongliang

Wuhan University of Technology, Wuhan P.R. 430070  
(E-mail: zhouhl@hbstd.gov.cn)

**Abstract:** The analytic hierarchy process method is employed to construct the evaluation index system study of “three bases and one hub” in the background of the rise of central China strategy. Considering the positioning and perspective of the State Council, data from statistical annual books and relevant research data, based on AHP Model, constructed the evaluation index system, analyzed the position of “Three Bases and One Hub”, proposed corresponding development advices.

**Key words:** Rise of central China; Three bases and one hub; AHP model; Index system

## 1 Introduction

Promoting the rise of central region was raised in the Government Work Report at the first time by Premier Jiabao Wen on March of 2004 and immediately intensive policy measures came into existence in the policy documents such as Notice of Advancing the Growth of Central China and Advancing the Growth of Central China Strategic Planning. Instead of theory studies, the rise of Central China, after most of the national ministries and six provinces proceed arrangement, was rapidly practiced by the government and all sectors of society. In Advancing the Growth of Central China Strategic Planning, the State Council, on September 2009, indicated that central China will become important national grain production base, energy and raw material base, modern manufacturing and high-tech industry base and comprehensive transportation hub. Central China will achieve all-round, balanced and sustainable development of the economy and society.<sup>[1]</sup>

At present, evaluation of regional development mainly focus on China regional policy overall implementation effect, focus on the evaluation of western big development strategy and the evaluation on the strategy of northeast old industrial base to revitalize implementation, but the study on the evaluation of the Strategy of "The Rise of Central China" is not much.

This paper is aimed to construct evaluation index system by AHP method, collect related data from statistical yearbooks and put them into the assessment index system. Then, concrete and convictive advices for the development of “Three Bases and One Hub” can be proposed and come into practice.

## 2 The Principles to Design Evaluation Index

The design of evaluation index system followed SMART principles as below:

S is short for specific, which means the index is clear and unambiguous, without vagaries and platitudes, which must tell user exactly what the meaning is; M is short for measurable, which stresses the needs for concrete criteria for measuring and data which should be available; A is short for attainable, stressing indexes should be realistic which can be figured out and come true; R is short for realistic, standing for that all indexes should be supported by corresponding data and these data can be observed and obtained; T is short for time-bound, which stresses the importance of indexes within a time frame, giving them a valid date.

## 3 Design of AHP Evaluation Model and Index System

### 3.1 AHP evaluation model

The Analytic Hierarchy Process (AHP) is a structured technique for organizing and analyzing complex decisions. Based on mathematics and psychology, it was developed by Thomas L. Saaty in the 1970s and has been extensively studied and refined since then. The first step in the Analytic Hierarchy Process is to model the problem as a hierarchy. In doing this, participants explore different aspects of the problem from general to details, then express it in the multileveled ways that the AHP requires. Once the hierarchy has been constructed, the participants analyze it through a series of pairwise comparisons that derive numerical scales of measurement for the nodes. The criteria are pairwise compared against the goal for importance. The alternatives are pairwise compared against each of the criteria for preference. The comparisons are processed mathematically, and priorities are derived for each node. As a result, the

performance of “Three Bases and One Hub” will be appraised under the conditions of “Rising of Central China”.

In terms of influence among all the factors, indexes are divided into target layer (index A), criterion layer (index B) and basic index layer (index C), which form the integrated index system.

In order to determine the value of indexes’ weight, a judgment matrix is constructed to compare the influence of individual index by pairing comparison method. Quantified by 1-9 scale, a paired comparison matrix was obtained. Value of weight was calculated on basis of judgment matrix and consistency check was executed. The calculating procedure was listed as below: normalize each column of judgment matrix; calculate the sum of each row respectively; average sums of rows, which is the value of weight; examine the consistency once again, calculate the maximum eigenvalue  $\lambda_{max}$  and the corresponding eigenvector and get the consistency ratio calculation  $CR = \frac{CI}{RI}$ . RI is available in the reference books,  $CI = \frac{\lambda_{max} - n}{n - 1}$ . When CR is smaller than 0.1, judgment matrix was considered to be satisfied with the consistency.

**3.2 Design of evaluation index system**

**3.2.1 Evaluation index system of grain production base**

Under the overall goal to evaluate grain production base, According to the study of experts<sup>[2-3]</sup> the index system employed agriculture development primary capacity, agriculture development input capacity, capacity of farming modernization, agricultural output capacity and food supply capacity as criterion layer (index B), consisting of 23 detailed index.

**3.2.2 Evaluation index system of energy and raw materials base**

Under the overall goal to evaluate energy and raw materials base, the index system employed energy and raw materials development supporting capacity, energy and raw materials development input capacity, energy and raw materials production capacity, energy and raw materials output capacity and energy and raw materials ecological development capacity, as criterion layer (index B), consisting of 17 detailed index.

**3.2.3 Evaluation index system of modern equipment manufacturing and high-tech industry base**

Under the overall goal to evaluate modern equipment manufacturing and high-tech industry, the index system employed modern equipment manufacturing and high-tech industry development supporting capacity, modern equipment manufacturing and high-tech industry production capacity, modern equipment manufacturing and high-tech industry contribution capacity, modern equipment manufacturing and high-tech industry growth capacity and modern equipment manufacturing and high-tech industry primary supporting capacity as criterion layer (index B) consisting of 23 detailed index.

**3.2.4 Evaluation index system of comprehensive transportation hub**

Under the overall goal to evaluate comprehensive transportation hub, According to the research of experts<sup>[4-7]</sup> the index system employed comprehensive transportation industry development supporting capacity, traffic and transportation capacity, traffic and transportation transfer capacity, traffic and transportation bearing capacity, as criterion layer (index B) consisting of 14 detailed index.

**4 Evaluation of “Three Bases and One Hub” Indexes**

**4.1 Evaluation of grain production base**

Results of AHP analysis are presented in Chart 1-1 and conclusions are drawn as follows:

**Table 1 AHP Analysis Results of Grain Production Base**

	2005	2006	2007	2008	2009
Average of Central China	0.3485	0.3544	0.3539	0.3659	0.3701
Average of Eastern China	0.2982	0.3029	0.3024	0.2924	0.306
Average of Northeast China	0.3112	0.3062	0.3261	0.342	0.4212
Average of Western China	0.1703	0.1816	0.1785	0.1882	0.1965

Data Source: 2005-2009 Statistical Yearbook of China, Chinese Yearbook of agricultural statistics

These results suggest that central China is playing more and more important roles as the national granary, with obvious advantages. From 2005 to 2009, the AHP value of central China grain production base rose from 0.3485 to 0.3701. Except slight decreasing in 2007, we witness a steady growth. In terms of relative difference, the gap central China advantaged eastern China increased from 0.0503 in 2005 to

0.0641 in 2009; the gap central China led western China slightly decreased from 0.1785 at 2005 to 0.1736 in 2009. In contrast to western typical region of China, northeast old industrial base and eastern typical region of China, the AHP value of central China grain production base remains ahead all the time except that in 2009 the value is lower than northeast old industrial base of China. Generally, central China has an overwhelming advantage to act as the “national granary”.

**4.2 Evaluation of energy and raw materials base**

Results of AHP analysis are presented in table 2 and conclusions are drawn as follows:

**Table 2 AHP Analysis Results of Energy And Raw Materials Base**

	2005	2006	2007	2008
Average of Central China	0.2353	0.2645	0.2743	0.2926
Average of Eastern China	0.3316	0.353	0.3621	0.3536
Average of Northeast China	0.402	0.3269	0.3325	0.3245
Average of Western China	0.098	0.1174	0.1376	0.1402

Data Source: 2005-2009 Statistical Yearbook of China, 2005-2009Energy Statistics Yearbook of China

The data demonstrates that central China is behind northeast and eastern China, but the gap decreased even further. From 2005 to 2008, the AHP value of central China energy and raw materials base increased from 0.2353 to 0.2926, which embodies the real effect of Rising of Central China policy. But what still worth worried about is that central China was ranked 3rd in the four regions (central China, western typical region, northeast old industrial base and eastern typical region of China). Fortunately, the compared gap from eastern China have narrowed from 0.0963 in 2005 to 0.0576 in 2008; the compared gap from northeast old industrial base have narrowed from 0.1667 at 2005 to 0.0319 in 2008; the advantage over western typical region increased much bigger from 0.1376 at 2005 to 0.1524 in 2008. To some extents, the general function of central China as energy and raw materials base need to be improved.

**4.3 Evaluation of modern equipment manufacturing and high-tech industry base**

Results of AHP analysis are presented in table 3 and conclusions are drawn as follows:

**Table 3 AHP Analysis Results of Modern Equipment Manufacturing And High-Tech Industry Base**

	2005	2006	2007	2008
Average of Central China	0.0952	0.1158	0.1709	0.1642
Average of Eastern China	0.5534	0.6813	0.7605	0.8168
Average of Northeast China	0.1611	0.1788	0.2372	0.2497
Average of Western China	0.046	0.0521	0.0814	0.0695

Data Source: 2005-2009 Statistical Yearbook of China, China Statistics Yearbook on High Technology Industry

The data reveals that the delays of construction of modern equipment manufacturing and high-tech industry base in central China and the behind gap is widening in comparison with northeast and eastern China. From 2005 to 2007, the AHP value of central China modern equipment manufacturing and high-tech industry base raised from 0.0952 to 0.1709. Even though the value fall down to 0.1642 in 2008, the rising tendency is obvious. In relation to the compared difference, value of central China is lower than eastern China as well as 0.4582 in 2004 and this gap spread to 0.6526 in 2008; it is 0.0659 lower than northeast old industrial base in 2005 which widen to 0.0873 in 2008. Overall, central modern equipment manufacturing and high-tech industry base development has been constantly lagging behind northeast old industrial base of China.

**4.4 Evaluation of comprehensive transportation hub**

Results of AHP analysis are presented in table 4 and conclusions are drawn as follows:

**Table 4 AHP Analysis Results of Comprehensive Transportation Hub**

	2005	2006	2007	2008	2009
Average of Central China	0.2166	0.1968	0.2687	0.3476	0.3506
Average of Eastern China	0.3413	0.2998	0.4027	0.434	0.4569
Average of Northeast China	0.1383	0.1365	0.194	0.2362	0.2618
Average of Western China	0.0951	0.0676	0.2723	0.1041	0.1229

Data Source: 2005-2009 Statistical Yearbook of China, 2005-2009China industry economy statistical yearbook

The results illustrate a fact that central China functioned better and better as comprehensive transportation hub in China, but it still fell behind several developed provinces. From 2005 to 2009, the AHP value of central China comprehensive transportation hub went up from 0.2166 to 0.3506. A rising tendency can be easily observed, even though the value is a bit lower in 2006. With reference to relative difference, the gap central behind eastern China decreased from 0.1247 to 0.1063; the advantage over northeast increased from 0.0783 to 0.0888 while the advantage over western China increased sharply from 0.1215 to 0.2277. It is clear that outlook of central comprehensive transportation hub construction continues to be promising when central China quicken its pace to catch up with eastern China as well as leaving northeast behind.

## 5 Conclusions

Analysis results reveal that central China has made gratifying achievements in construction of “Three Bases and One Hub”, especially in the aspect of grain production base development which is not only much better than eastern China but also better than northeast old industrial base and western typical region of China. Central China deserved the title of “National granary”. Meanwhile, its transportation hub construction is the second in the four main regions in China and is emulating the prosperity of eastern China. But, what still worth worrying about is the constructions of ‘energy and raw materials base’ and ‘modern equipment manufacturing and high-tech industry base’. In these two areas, the gap behind eastern China has not been reduced, even in the increasingly widening. It is far to meet the position and requirement of Central Committee of the Communist Party of China and the State Council. Aimed at this point, this paper posted several development advices to solve the problem.

### 5.1 To Build food core producing area and strengthen the rise of central China power

Grain industry is a traditional industry, superior industry and fundamental industry in central China, which is one of the most important industry pillars to support economic development. The achievements they got in grain producing base construction mainly attribute to high productivity and basic development indexes such as crops sown area, cultivated land protection, ‘Gross Output Value of Farming, Forestry, Animal Husbandry and Fishery’. But the lag of agricultural modernization level stands in contrast to the achievement, because of the lack of basic agriculture input. There are many obstacles, for instance, ideas, quality, system, policies, and financing etc. The issues of “Agriculture, Farmer and Rural Area” remain challenging. Weak infrastructure, low technological level and insufficient coordinated reforms all together restrain the development of rural central and furthermore restrain grain producing base construction.

Now is the time for central China to act. In the aspect of development scale, central China should accelerate the pilot project construction, land transfer and cooperative business to expand scale; in the aspect of development level, central China should commit to strengthen scientific support, innovative service system construction, varieties of high quality research and development, try to be the first to establish ecologic agriculture standard; in the aspect of development benefits, central China should adhere to the leading status of industry, work on featured agricultural park construction, industrial hierarchy and brand impact promotion; in the aspect of development safeguard, central China should specially support basic input and projects of agriculture modernization.

### 5.2 Convert the resource-oriented strategy to market-oriented and technology-oriented strategy

Central China is well-known for its rich resources of energy and materials. Nevertheless, there are still many problems to go alongside. At first, productivity mainly relies on the primary industrial products reflecting that central China is staying in a lower energy and materials industrial level. Secondly, energy and materials industry is vulnerable in economic recession owing to contraction of demand, fall of prices and compressed profit opportunities. These are typical signs of contradiction between single industrial structure and over capacity of production. In addition, the realization of resources-priority-strategy in central China relies on resources-transformation model and decision maker neglect the importance of technical-content and market-oriented in featured industry for a long time. So, central China should convert the comparative advantage in resources to the competitive advantage in market on the basis of characteristics of development phrase and industrial structure in the future. Principles of regional division and regional exchange should be followed to maximum comparative advantage and competitive advantage when choosing priority industry carefully. Plus, region management system should be established through legislation on who is responsible to administer, who is managed<sup>[8]</sup>. how to administer and administration evaluation to promote the conversion from to

resource-oriented to market-oriented and technology-oriented development model.

### **5.3 Build modern equipment manufacturing and high-tech industry base**

In comparison with other three main regions in China, level of modern equipment manufacturing and high-tech industry base in central China is behind eastern China and northeast old industrial base, just better than western area. With regard to industrial level, modern equipment manufacturing and high-tech industry base in central China is at the stage of middle and low level, development in various industries is not inharmonious and enterprises lack core competitiveness. Moreover, size of high-tech industry is too small; leading enterprises is too little and regional development is uneven in central China. Besides, high-tech industrial plans are convergent which cause the lack of features in development zones and the homogeneity of production structure. Thus, central China should increase the intensity of support to promote the technical transformation of key enterprises and construct modern equipment manufacturing and high-tech industry base with ability of independent innovation. Relying on key enterprises, central China should focus on clean and efficient power generation equipment and focus on high value-added ships and supporting industry etc. According to national policies, central China should strengthen cooperation with universities, scientific research institute and enterprises to accelerate transformation and commercialization of research achievements, to develop comparative high-tech industry clusters.

## On Strategies and Practical Approaches for College Students' Integrity Education in the View of Game Theory

Wu Hailong

School of Design and Art, Wuhan University of Technology, Wuhan, PRC, 430070

(E-mail: whl@whut.edu.cn)

**Abstract:** This paper uses the game theory to research on the college students' integrity education, it put forward two Strategies for reducing the cost of the college supervision and the benefit of college students choosing to behave in the manner of integrity; enhancing the benefit of the college supervision and the cost of the college students choosing to behave in the manner of integrity in order to carry out effective Strategies on the college students' integrity education. It constructed four effective practical approaches to carry out integrity education of the college students: horizontal collaboration, vertical interaction, implicit recognition, restriction and guidance.

**Key words:** Game theory; Integrity education; Strategies; Practical approach selection

### 1 Introduction

The research performed by the West on integrity in early times mainly focused on the philosophy and religion, of which the codes of ethics and conduct as a concrete type of expression made up most of the ethical codes. In ancient Greece and Rome, integrity converted from a moral standard into a legal form. In the view of the West society, integrity, usually thought of as an instrument, crystallized as a social contract. Mostly it emphasized others' evaluation and correction for the individual integrity, which pointed out the direction for the western research on integrity. The integrity education in the West stressed much on the personal experience of integrity in favorable circumstances or adversities, the decision process of integrity selection, and the consistency among the subjective desire, the language commitment and the action.

The origin of ethical values in China can be traced back at least to ancient time, many famous masters have left lots of masterpieces on integrity. While most of the Chinese traditional ethical values rely much on the people themselves to rethink profoundly their own behavior, whether good or not. Current diverse trends are much likely to lead a group loss in the deadline of integrity. The integrity loss among college students reflects the conflict between the social education and college students' attitude towards integrity. Now the researches on integrity among college students mainly consist of the innovation in the methodologies and perspectives of the research, the present condition and different categories of integrity loss among college students, the integrity speculation among college students and its philosophical foundation. The use of game theory is rarely observed to research on the integrity loss. This project intends to use game theory for reference to analyze the integrity education among college students in order to explore the best strategy for the integrity education among college students and the best approach to further improve its relevance and effectiveness.

### 2 Deductions: Analysis on Costs and Benefits of the Integrity Education Among Chinese College Students in Matrix

In today's market and economic conditions, people are motivated to the maximization of interests. For contemporary college students, also costs and benefits are concerned in the process of the maximization of interests, which is particularly reflected in the dynamic process of value selection that college students should be honest or not. Because each individual tends to low-cost and high-yield, the establishment of mathematical model between the college supervision and the costs and benefits of college students' ethical behavior by the use of game theory is bound to facilitate colleges to effectively implement strategies and select practical approaches.

Due to the fact that either the college or the student individual has to concern benefits and costs during the course of school supervision and credit behavior respectively, this can be seen as a game event under a particular condition. Based on individual choice theory, if individuals choose their own interests as a starting point to take action, all individuals will be betrayed. On the basis of group selection theory, if the individuals put priority to the group interests as a starting point to take action, then all individuals will cooperate. Based on the two theories above, assuming that the school for the

player T, students for the player F, the player T's strategy has the right to choose to supervise or not, and the player F is authorized to behave in the manner of integrity or not. The benefit of the player F to behave in the manner of integrity is C1, the cost is C2; the benefit of the player T to supervise is R1, and the cost of supervision is R2. It is assumed that as long as the player T supervises college students, the player F will choose to behave in the manner of integrity, and for each player, the benefit is higher than the cost. The probability of the player T to supervise is m, and the probability of the player F to behave in the manner of integrity is n. The following chart shows the game states of the both sides:

**Table 1 Benefit and Cost Matrix for Game of the Supervision of Chinese Colleges**

		College student (player F)	
		Integrity probability n	Bad faith probability 1-n
College (player T)	Supervision probability m	(R1-R2 , -C2)	(-R2 , 0)
	Non-supervision probability-m	(-C1 , C1-C2)	(0 , 0)

From the perspective of the player T, if they know college students will behave in the manner of integrity and  $R1-R2-C1$ , then the player T will choose to supervise; if they know college students will not behave in the manner of integrity and  $-R2 < 0$ , then the player T will not choose to supervise. From the perspective of the player F, if they know colleges will supervise and  $-C2 < 0$ , then the player F will certainly not behave in the manner of integrity; if they know colleges will not supervise and conclude that  $C1 - C2 > 0$  on regarding to  $C1 > C2$ , then the player F will certainly choose to behave in the manner of integrity. Therefore in this game model, the ultimate choice between the players is completely dependent on each other's strategies. There is no Pure Strategy Nash Equilibrium within it.

In Mixed Strategy Nash Equilibrium model, if analyzed from the perspective of the player T and the supervision probability of the player T is m, then probability of non-supervision is  $1-m$ . If  $F1$  and  $F0$  are respectively set as the expected revenue of the player F in the choice of integrity and bad faith, then here comes the following equation:

$$F1 = m * (-C2) + (1-m) * (C1-C2) = C1-C2-mC1; F0 = 0.$$

When the cost of integrity is probably the same as the benefit,  $T1 = T0$ ,  $C1-C2-mC1 = 0$ , then  $m = 1 - (C2 / C1)$ . Therefore, we can draw the following conclusions that when the supervision probability of the player T is greater than  $1 - (C2 / C1)$ , the player F will choose to behave in the manner of integrity; when the supervision probability equals to  $1 - (C2 / C1)$ , the player F will have random choice under the circumstances; when the supervision probability is less than  $1 - (C2 / C1)$ , then the player F will certainly choose not to behave in the manner of integrity.

From the perspective of the player F, if the probability of the player F choosing integrity is n, then the bad faith probability of the player F is  $1-n$ . If  $T1$  and  $T2$  are respectively set as the expected revenue of the players T in the choice of supervising or not, here comes the following equation:

$$T1 = (R1-R2) * n + (1-n) * (-R2); T0 = -C1 * n.$$

If colleges are reluctant to supervise, then  $T1 = T0$ , or  $n = R2 / (R1 + C1)$ . Therefore, we can draw the following conclusions that when the probability of the player F choosing integrity is greater than  $R2 / (R1 + C1)$ , the player T will choose to supervise; when that probability of the player F is less than  $R2 / (R1 + C1)$ , the player will choose no supervision; when that probability is equal to  $R2 / (R1 + C1)$ , the player T will have random choices under the circumstances whether to supervise college students.

Derived from the above we can draw the following conclusions, the probability of  $1 - (C2 / C1)$ , with which player T exercises supervision, shows a negative correlation with the cost of the player F choosing to behave in the manner of integrity, a positive correlation with the benefit of the player F to behave in the manner of integrity; the proportion of  $R2 / (R1 + C1)$ , with which the player F will choose to behave in the manner of integrity, shows a positive correlation with the cost of college supervision, and a negative correlation with the benefit of college supervision together with the benefit of the player F choosing to behave in the manner of integrity.

### 3 Conclusions

Based on the cost-benefit analysis and the examine of the integrity education among college students in the view of game theory, we reach the following conclusions: the higher the cost of college supervision, the greater the probability for college students not choosing to behave in the manner of integrity; the greater the benefit of college students not choosing to behave in the manner of integrity,

the greater the probability for college students not choosing to behave in the manner of integrity; the higher the benefit of the college supervision, the probability of colleges choosing to supervise will also increase accordingly. Based on the conclusion of the analysis above, for the implementation of the integrity education among college students, we should focus on the following ways: reducing the cost of the college supervision and the benefit of college students choosing to behave in the manner of integrity, enhancing the benefit of the college supervision and the cost of the college students choosing to behave in the manner of integrity. Specifically, we have to focus on implementing the following aspects: horizontal collaboration – combination of the classroom education and the extracurricular activities; vertical interaction – combination of the phase education and the long-term education; implicit recognition - the combination of self-education and self-management; restriction and guidance – the combination of sound system with multi-level collaboration.

### **3.1 Horizontal collaboration: a combination of the classroom education and the extracurricular activities**

The college is the main front of the advanced culture which is an important part of the culture of the socialism with Chinese characters. Integrity should be the mainstream and the main theme of the advanced culture of the college and the university. We should create a harmonious atmosphere of “everyone in good faith, everything in good faith”, grasp the important principles of combining classroom education with extracurricular education, succeed in combining the recessive education with the dominant education, and the integrity education with the moral education so as to achieve a variety of horizontal collaboration among different education models. Through classroom education we are supposed to instruct students of the basic knowledge of the law and the traditional Chinese virtues to make them clear that the ancient sages as well as the modern great men are all the models of integrity and tell the students they ought to internalize honesty and credit; through various forms of content-rich and extra-curricular activities, such as, integrity education speech contest, integrity education sitcom competition, micro-film of integrity education contest, integrity education graffiti contest, the integrity education has always played a important role in the college education, we make sure the integrity education has always played a important role in the college education, during which college students accept integrity education in a way of entertainment and develop good integrity habits and cultivate a good quality of integrity.

### **3.2 Vertical interaction: a combination of the phase education and the long-term education**

The basic principles of philosophy reveal the basic law of development: there is a law for development. The development path of anything is forward and twisting. The success can not be achieved once. The integrity education among college students is no exception. Integrity Education should include both long-term planning and short-term planning formulated for the integrity education of different college students of different grades. The long-term integrity educational planning focuses on the common integrity standard and the holistic integrity education; the phase integrity educational planning is made for students of different stages. And the integrity education is subdivided into several kinds of curricula. We pay more attention on the professional integrity education for the students who are seeking jobs, the learning integrity education for freshmen, and the economic integrity education for the undergraduates. Through the integrity education with the prominent common characters and personality taken account, colleges combine the phase education with the long-term education, strengthening the relevance and effectiveness of the integrity education.

### **3.3 Implicit recognition: a combination of self-education and self-management**

The ultimate goal of the horizontal collaboration and the vertical interaction is to help each individual college student internalize the integrity education with the help of the combination of the long-term education and the phase education and the combination of classroom education and extracurricular activities. A type of exam with no invigilator is now widely respected among colleges, in which the ex-post monitoring mechanism is used. If two exam papers are almost the same, their scores of the test will be recorded as zero. As a result, it can be a good way to enhance the cost of bad faith of college students. Because when the individual is cheating, he or she will also at the same time think about how to cope with the pressure of public opinion from all the candidates in the classroom. And once this type of exam works well, it will bring students a positive personal experience of integrity, with which none of integrity can be matched. As a conclusion, to combine the self-education and self-management is particularly crucial to the integrity education among college students.

### **3.4 Restriction and guidance: a combination of sound system with multi-level collaboration.**

The explicit system of the integrity education mainly takes responsibility of the combination of system construction and multi-level collaboration. According to the results of the West study on

integrity, a sound system is effective in the constraints of individual behavior and guiding individual integrity. On one hand, because the integrity file is one part of each individual student's file, employers can check it themselves. Once acts of bad faith of each individual student are recorded, the cost of bad faith and the integrity probability will be greater. On the other hand, the integrity education among college students is supposed to be a complete system, which must be implemented both within inside and outside homes and colleges, university and external environment, multi-level collaboration. Governments, institutions, enterprises and other employing units have to recognize integrity files and recommend that integrity files should be associated with bank loans systems and bank credit evaluation systems.

The integrity loss affects the quality of the higher education and the public recognition towards college students. The benefit-cost analysis of integrity in the view of game theory facilitates the revelation of the economic law behind this phenomenon, which can be taken as a reference for the integrity education and selecting practical approaches. By the means of horizontal collaboration, vertical interaction, implicit recognition, and restriction and guidance, the cost of the college supervision and the integrity benefit can be decreased, while the benefit of the college supervision and the cost of integrity benefit can be enhanced so that a harmonious atmosphere of "everyone in good faith, everything in good faith" will be created through the implementation of this integrated, comprehensive integrity education.

## On Family Education Between China and America and Children's Innovation Capacity\*

Deng Hong, Ning Mei, Liu Xiaoyue

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: dh567@126.com, 545210438@qq.com, liuxiaoyue1214@163.com)

**Abstract:** In an era of knowledge-based economy, innovation capacity has become the core competitiveness of one country. And the key element of innovation capacity is innovative talents whose development greatly relies on education, especially family education. This paper, by making a comparative study of Chinese and American family education and analyzing their features, merits and demerits, illustrates the worrying phenomenon that Chinese children lack innovative spirit under the influence of Chinese family education, and offers some suggestions to cultivate Chinese innovative talents by learning from American family education.

**Key words:** Innovation; Innovative talents; Family education; Cross-cultural study; Survey method; Comparison

### 1 Introduction

Innovation is the soul of one nation and an endless motive force for the growth and development of one country. The key element of innovation is talents whose growth depends on education. In 2009, a survey conducted by International Assessment of Educational Progress in 21 countries around the world showed that Chinese children's imagination ranked last and innovation capacity ranked fifth from the bottom. As a systematic education project, the cultivation of innovative talents includes family education, social education, and school education. According to a research, during an individual's growth process in China, family education takes up 70% of the entire education with school education and social education occupying only 20% and 10% respectively; while in America, family education accounts for half of the entire education and school education as well as social education constitutes 20% and 30% respectively. Therefore a good family education is extremely important for the cultivation of innovative talents.

At present, the related researches home and abroad mainly target on innovation and family education respectively, and few involve both aspects. J. P. Guilford, an American psychologist, first proposed the concept of "divergent thinking". He thus associated divergent thinking with creativity, appointing its several characteristics: fluency, flexibility, originality, elaboration. And he also designed a set of specific measurement methods. Based on the theories and methods of J.P. Guilford and considering China's national conditions, we designed the Questionnaire on Cultivation of Children's Creativity in Chinese Family Education. We carried out the survey within the Wuhan City in Hubei Province in China and distributed the questionnaires according to the different levels of the students. The questionnaire is divided into 5 levels: Grades 1-3 of Elementary School, Grades 4-6 of Elementary School, Grades 1-3 of Junior Middle School, Grades 1-3 of Senior Middle School, and Grades 1-4 of University. Each level has 20 questions, covering fluency, flexibility, originality, elaboration and sensitivity elements. A total of 16,000 copies of questionnaire were issued and 14,720 copies were withdrawn, of which 14,056 were valid, accounting for 95.5%.

Figure 2 Individual Education in the U.S

## 2 The Similarities in Chinese and American Family Education

### 2.1 Emphasizing family education

According to the statistics in Figure 1 and Figure 2, we can learn that although the proportions of family education in China and in America are different, family education still enjoys the largest distribution in both countries. In fact, no matter in which country children were brought, families are always considered as their first school and parents are regarded as children's first teachers. Therefore, family education enjoys the most fundamental role in children's education in both China and America

### 2.2 Sharing similar contents

In the first place, Moral value is the motive force of human behavior belonging to the culture of the whole human beings. In fact many countries hold the identical moral views, although they have been taught by different stories and traditions in different cultures. In both Chinese and American family, moral education all along is the key point. Forming under the different cultural backgrounds, Chinese and American morality has different tones and implications. But some qualities have the same core and are the reflections of universal human morality, such as love, kindness, sympathy and so on. In the second place, knowledge is the primarily important force that directly decides national prosperity and personal success. Books are the accumulation of knowledge and experience, which needs us heritage and develop by study. Therefore, the family education of both countries stresses study deeply. In the third place, Hardworking and thrifty are the traditional Chinese virtues. They relate closely with self-cultivation, morality as well as the whole country's future. As an economic super power, America never slackens the thrifty education. The parents develop and temper the children's will power in order to make them adapt themselves to circumstances and enable them to develop competence of independence.

### 2.3 The role of parents in family education

No matter in China or America, parents play different roles in family education. In both countries, mothers are described as the main caregiver and they take care of children's daily life and are responsible for children's emotional education. While fathers are responsible for children's intellectual education and provide material protection for the family, so fathers are usually stricter in the eyes of children. Moreover, although mother and father have different roles in family education, both of them serve as their children's role models and parents' daily words and behaviors are more effective than some instructions in educating children.

## 3 The Differences Between Chinese and American Family Education

### 3.1 The comparison of purpose in family education

Because of the different value orientation in China and America, their specific purposes in family education also have different emphasizes. The purpose in China's family education is extremely utilitarian, which tends to focus on whether their children can achieve something or find a decent job in the future. Based on this purpose, China's family education emphasizes on children's acquisition of knowledge and skills, and the children's ability to live independently, but their ability to adapt to the life in the future are rarely considered. As a result, driven by this purpose, some Chinese parents will ignore children's unique ability, which may contribute to the destruction of children's innovative ability and imagination.

On the contrary, American parents emphasize on their children's acquisition of various abilities to adapt to the society. On the basis of this concept, they attach great importance to their children's exercise from a very young age and believe that children's growth mainly depends on their own strength, so

American parents pay attention to cultivate children's self-awareness and ability to live independently. The exercise mentioned above can be explained in a broad way, including body exercise and the exercise of the will, but the most fundamental meaning is the exercise of ability to adapt to diverse harsh environments and to work. In addition, the purpose in American family education values the process and pursues the development of children's various abilities during the process of study. Therefore, compared with the Chinese children, American children perform better in terms of independent living and the ability to adapt to the society.

### **3.2 The comparison of content in family education**

China's family education tends to emphasize on the knowledge-based educational content which bears an utilitarian nature. Apart from schools, family education in China also plays a vital role in children's knowledge education, which means children have to continue their study at home. And another performance of utilitarian education of cultural knowledge is that if children are weak in learning cultural knowledge, parents will chose a skill for their children to learn, such as playing instruments, dancing and painting. However, most parents do not value the positive influence of art on their children, but only treat art as an advantage to help their children to be admitted to a first-class school. Therefore this is a variant and expression of utilitarian education of cultural knowledge.

By contrast, American family education focuses on the cultivation of social practice and the ability to survive. Thus, in America, it is extremely important to educate children about the awareness of independence. Furthermore, American parents believe that children should learn how to manage and use their money wisely which is favorable to cultivate children's financial awareness and the ability to manage finance, and children's financial ability is related to their career and family happiness. Moreover, in the process of children's growth, American parents will leave children enough self-space and pay attention to children's psychological health. Hence, they put an emphasis on emotional communication with children and care for children's psychological needs.

### **3.3 The comparison of style in family education**

There are generally three styles of family education, which are Authoritarian style, Permissive style, and Democratic style.

Western scholars define traditional Chinese family as "Authoritarian Style" and "Permissive style" while family in Europe and America as "Democratic Style" according to family member relationship. As for Authoritarian Style, influenced by the traditional family concepts, Chinese parents always represent authorities, staying at the core of the whole family. For instance, in the questionnaire, there is a question from the group Grades1-3 of Elementary School, saying "Do you guide instead of reprimanding your child when you find him (her) ransacking boxes and chests to see what is inside?" Only 12% of the parents choose that they would always guide the children; while half the parents choose that they would never or seldom do this. Besides, Chinese family education puts an emphasis on relation between parents and children, and parents always regard their children as part of their possessions; therefore, parents tend to provide their children with immense care and overprotection, this family education is called Permissive style. The following question for university students in the questionnaire will illustrate this point, and the question is that "When resting at home, your parents ask you to bear some housework." The response to this question is that more than half of the interviewees choose the option "seldom" and "sometimes", however, only 6% of interviewees choose the option "always". What's more, a large number of Chinese parents will satisfy every request of their children in terms of money, and the same even goes for some low-income families. Currently, an increasing number of Chinese families have been aware of the drawbacks of Authoritarian and Permissive style of family education and tend to adopt Democratic one which is most conducive to the cultivation of children's innovative spirit.

By comparison, American family pays attention to democracy and equality. The democratic and equal way of education in the American family is mainly manifested as follows: children have the right to choose and the right to express his opinion or idea freely; American parents and their children are like friends and they can communicate equally. However, sometimes too much democracy leads to indulgence in many American families. Especially in recent years, the divorce rate in American family is rising, and children cannot get enough care and education in the single-parent family, and this is an important reason for many American children to misconduct or even commit crimes. Additionally, in America, parents' care and concerns for children is limited in an appropriate range and they will not arrange everything for their children.

The following is 6 typical questions representing three styles of family education in the questionnaire and their results:

**Table 1 Questionnaire**

	Question	Result				
		Never	Seldom	Sometimes	Often	Always
Authoritarian Style	Do you guide instead of reprimanding your child when you find him (her) ransacking boxes and chests to see what is inside?	20%	30%	28%	10%	12%
	Your parents don't interfere with the way you arrange your holiday life; they think reading and hanging out with friends are both a kind of study.	12%	22%	21%	25%	20%
Permissive Style	Do you require your child to do room cleaning or sort clothes regularly?	11%	20%	33%	22%	14%
	When resting at home, your parents ask you to bear some housework.	2%	28%	37%	27%	6%
Democratic Style	Do you let your child make his(her) own study and life plans?	2%	7%	15%	30%	46%
	Do you respect your child's interests and help him(her) choose the university and major he/she likes?	5%	7%	8%	27%	53%

**Figure 3 Results**

## 4 The Implications of American Family Education on Cultivating Children’S Innovative Capacity

### 4.1 Updating the concept of family education and fostering innovative awareness

In America, parents have mutual relationship of equality with their children, and parents always adopt the democratic concept of family education. Democratic style of education is a relaxing and comfortable education, and possesses a good number of advantages: on the one hand, it helps to foster creativity. Relaxing and comfortable conditions are rather important for stimulating children's creativity. Hence, in a happy and peaceful family atmosphere, the creativity of children is most susceptible to stimulation and it is also easier for parents to establish an equal relationship with children. On the other hand, it helps to form a healthy personality of children. If children are given the right to express their idea, to involve and to choose, they can participate in the family affairs with confidence and responsibility and actively voice their opinions. In addition, this relationship can inspire children to share their secrets with their parents. At the same time, the parents can understand their children, thus urging the children to form a good personality.

### 4.2 Emphasizing the comprehensive development of children and promoting innovation capacity

Family education should provide children with rich knowledge, especially the knowledge that does not appear in the textbooks. American parents pay more attention on children’s comprehensive development. On comparison, Chinese parents tend to lose sight of it. Therefore, in order to change this situation, parents are supposed to offer children different educational contents based on different age groups to which their children belong to. First of all, as for the children in the primary stage, the most obvious feature of education is that the systematic study takes the place of the innocent games and

becomes the dominant activity of children. At this stage, the most important thing is to stimulate children's curiosity and thirst for knowledge, and help them develop keen observation and rich imagination. As a result, parents should encourage children to go out and find some interests in their surrounding environment, because interest is a necessity for the development of innovation and without interest, one can hardly gain some inspiration. Secondly, concerning middle and high school children, parents should motivate them to expose themselves to society and gain the knowledge through hands-on experience in order to perfect their own character and prepare for the independent university or college life. Nowadays, however, most parents emphasize too much on knowledge for utilitarian purpose which is a blind action to stifle children's talents. Finally, as to children in the universities or colleges, parents should give free rein to their children and stimulate them to be more aggressive, less inert and encourage them to master the professional knowledge of their majors and to become less timid and hesitant.

#### **4.3 Cultivating children's ability to think independently and creating innovative atmosphere**

American parents attach great importance to cultivate children's ability to think independently and to create innovative atmosphere at home. And as for Chinese parents, it is worth learning from. Therefore, parents should actively provide or create the conditions conducive to the children's development of innovative qualities, so children are able to develop the habits of daring to say, to think and to do in a free, democratic and active psychological atmosphere from an early age. Moreover, parents should also give their children the opportunity, right, environment and time to be alone and the freedom to develop. Parents are supposed to respect their children's individuality, and encourage their originality and diversity.

### **5 Conclusion**

In summary, because of the fierce competition in the international market, building an innovative country seems to be the only choice for us in order to prosper in the world, and the key of constructing such a country lies in the cultivation of innovative talents. In the process of cultivating innovative talents, a correct, complete and scientific family education is very important. Due to the influence of values, history, culture and other factors, China and America formed their own distinctive family education styles, and the results of their education are quite different. Thus, this paper attempts to make a comparison between Chinese and American family education, analyze the characteristics, advantages and disadvantages of these two countries' family education and make several suggestions on Chinese family education by learning from American family education in the hope that Chinese family education will become more scientific and perfect.

**Abstract:** With the popularization and promotion of network, cyber language is born as a new type of language phenomenon. Cyber language follows certain principles of Economics of Language. The paper analyzes the economic and non-economic aspects of cyber language and also its economic features in cost, utility, benefit and value from the perspective of Economics of Language.

**Key words:** Cyber language; Economics of language; Least of effort; Economic features

## 1 Introduction

Economics of Language is an interdisciplinary subject of linguistics, economics, education, informatics, demography, statistics and ekistics. The concept of Economics of Language was first proposed by Jacob Marschak, a pioneer of information economics, in 1965. He argued that as an essential tool in human economic activities, language had the same economic features like other resources, value, utility, cost and benefit.

Researches on Economics of Language can be divided into two aspects: broad sense and narrow sense. Economics of Language in broad sense examines the economic outcome of language, mainly referred to the relationships between language and information, language and human capital, language and economic growth and so on. While in narrow sense, Economics of Language studies language itself.

Some theories have already taken shape in Economics of Language field. The Value of Languages with F.de Saussure as representative; the Maxim of Quality in Grice's Cooperative Principle; Principle of Least Effort by Zipf; Leech's Economy Principle and Principle of Rationality put forward by Lasher are all milestones in the research field of Language Economics. The emergence and development of cyber language are both involved with these theories.

In a long time, scholars in and abroad have been making researches on language from the perspectives of the structure, the use, the social function and the development of language. With the progress of economic globalization and cultural industrialization, language is more and more connected with economy as an essential part of culture. A few linguists begin to study the economic principles of language as well as the utility and value of language. In the latter half of 20<sup>th</sup> century, the cross of economics and linguistics led to the birth of Economics of Language. After human society enters the 21<sup>st</sup> century, a large quantity of cyber language emerges with the rapid development of network. Cyber language is a new language form which differs from traditional language. The formation and development of cyber language reflects the current development of society, politics and culture. The paper is going to analyze the economic features of cyber language from the perspective of Economics of Language.

## 2 Economic Cyber Languages

In computer-mediated communication, time-saving, trouble-saving, brevity and celerity have become the first pragmatic principle. Therefore, lots of cyber words show the principle of least effort in word formation.

### 2.1 Frequent use of acronyms

Acronym is a word formed from the initial letters or parts of a series of words. Generally, the acronyms can be divided into two types: Chinese Pinyin and English abbreviation.

Lots of Chinese acronyms are created by taking the initial letters of the corresponding Pinyin of Chinese character. For example, CJ(纯洁, chun jie), JP(极品, ji pin), LP(老婆, lao po), BT(变态, bian tai), and so on. Apart from initial letters of Chinese character, English abbreviations also prevail in cyber word. Words like ASAP(as soon as possible), BTW(by the way) and DIY(do it yourself) have already been accepted in English language but more frequently used in cyberspace.

### 2.2 Common use of homophones

The popularization of homophones is the result of time-saving. Precisely typing Chinese characters will slow down the speed of communication, so in the specific cyber language environment, based on no violation of the delivering of information, this kind of mistakes are usually accepted, even imitated. The

most typical Chinese homophone might be “斑竹”. As a new word, “版主” was not included in the vocabulary of pinyin input methods, so when someone entered “banzhu”, the first word appeared was an existing word “斑竹”. To pursue the high-speed of word-inputting, “斑竹” was used to replace “版主”. Other words like “河蟹(和谐, harmony)” and “杯具(悲剧, tragedy)” are also very popular in cyberspace. In addition to Chinese characters, homophones of numbers and English letters are equal common. An English letter may stand for the word. For example, U=you, B=be, R=are, C=see. Sometimes a sentence can even be expressed by several letters. ICQ(I seek you) is a typical example. Other than letters, numbers are also used in the formation of cyber words. For instance, 2gether(together), 4ever(forever), L8R(later) in English pronunciation, and 88(拜拜, goodbye), 520(我爱你, I love you), 9494(就是就是, I agree) in Chinese pronunciation.

### 2.3 Wide use of code-mixing

Code-mixing is a special phenomenon which combines different languages or even dialects together. For example, the mix of Chinese and English, “郁闷ing” means the speaking is depressed right now. “-ing” is the suffix of the progressive tense in English and it is borrowed by Chinese netizens to express the current status or action. “很可爱的说” is a mix of Chinese and Japanese. “...的说” is a modal particle in Japanese. Except for the foreign languages, dialects have been mixed in the formation of cyber language, too. For example, in the sentence “昨天我有去 shopping”, “有” is put before the verb, and this is a unique speaking habit in Fujian-Guangdong areas.

### 2.4 Abundant use of emoticons

Emoticons, short for emotional icons, are small pictures generally composed with punctuation marks, English letters, Arabic numerals, mathematic operators and other keyboard characters.

Some emoticons show emotional facial expressions. The following table includes some examples.

Emoticon	Meaning
*^_^*	smiling shyly
(T_T)	crying
:-O	surprised
≧◇≦	moved
( \$ _ \$ )	Greedy for money
(-_-)	Hearing nothing
*^(^_^)*	cheering up
@_@	puzzled
:-(	unhappy

Apart from the symbolic emoticons, many emoticons now appear as pictures in chat rooms and BBS, and netizens can just click the mouse to choose the emoticon they need. The following table is consisted of several typical picture emoticons.

Emoticon	Meaning
	smiling
	Saying goodbye
	Sweating
	Sleepy
	Unhappy
	Surprised
	Shy
	Fighting
	Ok

This kind of cyber words is visualized and humorous, and they can be regarded as a new type of hieroglyph.

All the formation methods of words above are creative simplification, aiming at the optimization of

language configuration.

### 2.5 Economic feature at the level of syntax

In addition to the lexicon, the syntax of cyber language also shows the economic principle. Some economic feature of cyber language reflected greatly in syntax, mainly manifested in the use of abbreviated language. This kind of language obviously embodied the features of the requirements of quick response and the high efficiency of network. The condensation of cyber language can be divided into two types: the omitting of grammar usage and the compression of sentence.

#### ① Omitting of some grammar usage

Cutting certain parts of a complete sentence is the omitting of some grammar usage. The omitted parts can be subjects, objects, attributes and so on. Language of grammar usage omitting has its own feature. To understand the exact meaning of the sentence, one has to combine the given language environment, and add the missing parts according to the relationship of the context and the judgment of own experience. This is mostly the same with our daily oral communication; therefore, this kind of language is common to see in chat rooms and BBS. For example:

Chatter A: 干嘛呢? (你在干什么? What are you doing?)

Chatter A: 午饭 ing (我正在吃午饭。 I am having lunch.)

Chatter B: paper 搞定了? (你的论文写完了吗? Have you finished your paper?)

Chatter A: 木有 (还没有写完。 Not yet.)

Chatter B: 几时交? (什么时候交论文呢? When are you going to hand it in?)

Chatter A: 唔知 (我不知道。 I've no idea.)

This kind of conversation is not uncommon in network, abounding in expressiveness and a high degree of colloquialism. Many constituents are omitted in the dialogue. Others need to be familiar with cyber language and acquire good cultural background knowledge to understand it.

#### ② Compression of sentence

Apart from large quantity of acronyms, compressive sentences are also common to see in cyber language. Compression of sentence is a relatively canonical abbreviated coding form. It follows certain rules, and the compression of sentence can be divided into compression of Pinyin, compression of English and compression of numbers.

The features of compression of Pinyin lie in spelling the pinyin of a sentence or phrase in Chinese, and then combining the initials of each. For example, "PLMM" refers to "漂亮美眉 (beautiful girls)". BRB(马上回来, be right back), IMO(在我看来, in my opinion), JAM(等一会儿, just a moment), BTW(顺便说一下, by the way), MORF(男性还是女性, male or female), CULT(回头见, see you later) are examples of English compression. Features of English compression and Pinyin compression are almost the same, except the way in which the compression of English is more flexible. CULT is not exactly the combination of initials; it adopted the way of using partial tone.

Compression of numbers is using a set of figures to replace a sentence. For instance, "5460" means "I miss you"; "7456" refers to "you piss me off"; "888" means "see you around". To understand the meaning of these figures, one has to decode from the perspectives of the pronunciation of Arabic numerals, musical notation, telegraph code and the like.

## 3 Non-Economic Cyber Languages

As we can see, most cyber language follow the economic principle at the level of lexicon and syntax, however, it is also common that the formation of some cyber words violates the principle of least effort.

### 3.1 Deformations of Chinese characters

Adding components of Chinese characters and spiting components of Chinese characters are the two forms of deformation. For example, "娥媿(我是 I am)"; "迺菘(西瓜 watermelon)"; "弓虽(强 strong)" and "丁页(顶 support)". This is a word game. Sometimes special software is needed to type in these words, which sets handicap in entering. Obviously, this kind of word formation is not economic.

### 3.2 Popularity of ancient Chinese character

Wide use of "囧" and "槩" is a typical example. "囧" was firstly seen in inscriptions on bones or tortoise shells of the Shang Dynasty. The original meaning of the word is light. However, in cyber space, the meaning of the word has been transferred to "I can't stand it; you defeated me". The character is usually used to express an emotion of sadness or gloomy, or the situation that is awkward or frustration. "槩" is the same with "梅" in pronunciation and meaning, referring to plums opened in early spring. But

the word is used to describe a person who is very dull in network. Except the ancient Chinese characters, the original complex form of a simplified Chinese character is also used sometimes. Use of these characters has a tendency of throwing back or returning to the ancients.

### 3.3 Word concept conversions

In the environment of network, many words are separated from their original meanings, and new concept, even totally opposite meanings are given.

The original meaning of “腐败” is a phenomenon in which a behavioral agent abuses his or her power to satisfy his or her own benefits. However, “腐败” has become a pronoun of enjoying life, shortened into “FB”. In cyber space, “腐败” refers to some one asking some strangers who share the same interests to have beer and skittles together through network, blog, BBS, QQ, MSN and so on when he or she is bored or alone. “贤惠” refers to a woman who is kind, obedient, understanding and reasonable, good at managing a household and knows how to photograph husband godchild. The meaning of “贤惠” in network has been changed into “闲在家里什么都会”, which means doing nothing at home and is quite different from its original meaning.

This type of new cyber words usually puzzles netizens who see these words for the first time, and they bring trouble in understanding. Apparently, word concept conversions violate the economic principle.

Violation of economic principle does not only show in the formation of cyber words, but also on the delivery of information. Some “Wulitou” and “zero language valued” sentences are often used. Netizens like quoting the lines in the movie *A Chinese Odyssey*. For example, “曾经有一个暴利的机会放在我面前,我没有珍惜,等我失去的时候我才后悔莫及,人世间最痛苦的事莫过于此。如果上天能够给我一个再来一次的机会,我会对那支股票说三个字:我买你。如果非要在这次交易前加上一个数量,我希望是……十万股!” The information this passage delivered is that the speaker regrets he didn't buy the stock. According to the Maxim of Quality in the famous Cooperative Principle of Grice, the amount of information this passage carried is far less than the amount it is expected to carry.

## 4 Economic Features of Cyber Language

### 4.1 Cost of cyber language

Emergence and popularity of internet infuse new life and energy into people's political, economic, cultural lives. Vice versa, many cyber phrases are created based on the development of politics, economics and culture.

“河蟹”, a very popular cyber word, is created because of certain political element. “河蟹” is the homophone of “和谐”. Because Communist Party of China carries out the policy of “harmonious society”, and often delete the derogatory information or reports by taking it as the reason. So netizens take “” as the behaviors of blocking or covering derogatory information. Meanwhile, the word contains a pun meaning of a crab running amuck.

Rapid development of culture industry, especially film and entertainment industry brings us more and more colorful cyber phrases. One of the top 10 cyber words in 2008, “打酱油”, comes from an interview of a news in entertainment industry. A citizen in Guangzhou was interviewed of his opinions of nude picture scandal, and he answered: “关我鸟事,我出来买酱油的”. Then the phrase “打酱油” began to have a great vogue in cyber space. In internet, “打酱油” refers to the behaviors not talking about sensitive topics, not talking about politics.

Besides, some cyber words come from regional culture features. In the push of bagatelles of Mr. Zhao Benshan, some dialects with vivid northeast features begin to spread in network, in which “忽悠” is a representative word. Meantime, some cyber words are created from the pronunciation of dialects. For example, “灰常” is the pronunciation in Fujian dialect for “非常”, and “淫才” is the pronunciation in Northeast dialect for “人才”.

### 4.2 Utility of cyber language

In the concept of economics, utility refers to the degree of satisfactory of one's needs or desire that achieved through consuming or enjoying leisure time. The satisfactory of desire achieved by language is the utility of language.

Using cyber language in network can satisfy netizens to some extent. First of all, using cyber language can help to cover one's identity, age, gender and codes of language. It is said that the network is a magnificent masquerade. “In the Internet, nobody knows you are a dog.” One can pretend to be

whoever he or she wants to be. There is no threshold of identity, age and gender. As long as the use of cyber language is mastered, a male netizen may pretend to be a female. Sometimes, one can use the dialect of other areas to cover his or her true location. Secondly, using cyber language can highlight one's personality and attract others' attention. The frequent use of "Mars Language" by the generation after 90s is some kind of emotional needs to be unique and go alone especially to a great extent. Many netizens like using reiterative such as "东东", "坏坏" by imitating children's talk to release the pressure as adults. Cyber language gets rid of the restriction of traditional written language, and has become an excellent tool to display ones' own personality. The funny and newfangled cyber language gives people a feeling of being in an entirely new world.

#### 4.3 Benefit of cyber language

In the early 20<sup>th</sup> century, Irving Fisher, a famous American economist, developed the theory of economic benefit. In the book *Capital and Nature of Benefit*, he analyzed the concept of benefit through the forms of benefit, and put forward three different forms of benefit: spiritual benefit, satisfactory acquired spiritually; effective yield, increase of material wealth; pecuniary benefits, the monetary value of the increased property. In the three different forms of benefit, some of them are measurable, while the rest are immeasurable.

Benefit of cyber language is mostly spiritual benefit. Despising tradition and upholding creation is a typical feature of cyber language. The passion, vogue, unique young people make their ways of expression unique. Netizens, young people based, no longer just use cyber language, many netizens create cyber language actively, and this might be one of the reasons why cyber language possesses such a thriving vitality.

Netizens may satisfy themselves by using cyber language. Meanwhile, those who see or hear cyber language can also be satisfied. Humorous sentences like "每个成功的奥特曼背后都有一个默默挨打的小怪兽", "人又不聪明,还学别人秃顶" will make people who see them smile and happy. No matter the creation, the use or the absorption of cyber language, it will bring people full satisfaction.

As a matter of fact, the use of cyber language has gone beyond network. In the Spring Festival Gala in 2010, lots of cyber words and phrases were used in opusculums and crosstalks. For example, "偷菜", "我妈叫我回家吃饭", "不要崇拜哥,哥只是个传说", "唱的不是歌,是寂寞", "雷人", "梦想很丰满,现实很骨感" and so on. These word aroused echo in audiences, especially young audiences. Professor Li Peigen, the president of Huazhong University of Science and Technology, quoted cyber language like "什锦八宝饭", "俯卧撑", "喝开水", "躲猫猫" and the like in his speech to the 2010 graduates, which has evoked people's excitement extensively.

In addition to the spiritual benefit, certain effective yield has also been brought by cyber language. First of all, using cyber language saves time and money more or less. In cyber language, numbers, symbols, pinyin, characters and letters are mined together. It seems that there is no discipline, but in fact, no matter the acronyms, homophones, code-mixing or emoticons, they are easier to use, which helps to save time and even the money spent on Internet surfing. And secondly, cyber language's effective yield is now seen in our real lives. Some merchants print cyber language on their products to attract consumers, especially young consumers. For instance, there are some T-shirts with the cyber word "囧" printed on in the market. Some steamboat restaurants hang a slogan of "哥吃的不是火锅,是寂寞"(It is not the food in the hotpot the brother eats, it is loneliness he has) in front of the shop. As a result of the strong and rapid development of cyber language, more than ten books on cyber language have been published so far. Some writers also use cyber language in their novels. *A Kiss of the Evil* by Guo Ni is full of cyber language. All these can be regarded as effective product of cyber language.

#### 4.4 Value of cyber language

Value can be divided into positive value and negative value.

Through the analysis of the cost, the utility and the benefit of cyber language, it is clear to see the positive value of cyber language. The biggest feature of network is that it is convenient and quick. Therefore, quick and time-saving type in method is the object the netizens pursue. As long as it contains necessary information, the language will be simplified as short as possible. This is an irresistible tendency of the development of the language used in the network. Internet speeds up the development of society, and the rate of cultural diffusion will also be improved. New cyber words and phrases mainly rely on their own vitalities. If these active cyber words and phrases can bare the test of time, they will finally survive and be accepted by most of the netizens.

However, when the positive value of cyber language appears, the negative value appears along with. Not all the cyber words are positive and active. Some gross language also spreads in the network.

Certain cyber language is unreasonable and illogical, and even wrong in the aspect of grammar. The rules of grammar seem to be the greatest enemy to these cyber phrases and sentences. To those who seldom surf the internet, it is easy for them to get confused. In the progress of young people's personality showing off, cyber language has a tendency of vulgarization, which is a great reason why many experts and teachers appeal to make cyber language force-out. Curse language like "TMD (他妈的)", "WBD (王八蛋)" have a bad impact on the healthy development of language.

## 5 Conclusion

As a new type of language phenomenon, cyber language is full of vitality. The emergence of it demonstrates its economic value to people in modern society for it saves people's time and provides people with much spiritual satisfaction as well as working efficiency. Just as everything follows the natural principle of "survival of the fittest", cyber language, as part of our life, will exist and develop despite its shortages.

## On Creative Ability of Chinese Youth and Its Culture\*

Chen Yiran, Liu Xiaoyue, Ning Mei

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: chenyriran0109@163.com, liuxiaoyue1214@163.com, 545210438@qq.com)

**Abstract:** Nowadays, with the development of society and progress of technology, domestic and international competition becomes more and more intense. Creative ability has become an indispensable part of a country's international competitiveness, and the culture of creative talents is one of the key themes of this age of competition. School, family and society are three aspects that are crucially important in the culture of the youth's creativity. However, regarding the culture of the youth's creativity, China still has the problems of emphasizing marks too much, despising creativity and having unscientific methods of family education. This paper puts forward some suggestions from the aspects of school, family and society, hoping to solve those problems, thus helping to cultivate more creative talents required in our age.

**Key words:** Creativity; Youth; Culture; Questionnaire; School; Family; Society

### 1 Introduction

Creativity sustains the progress of a nation, and it is an inexhaustible motive force for the prosperity of a country. The increasingly fierce competition in the international market has forced us to take the route of creativity and the key and foundation of constructing a creative-typed country lie in talents and education. The fundamental task of modern education is developing and cultivating the creative ability of the youth, which requires the support of many aspects, mainly society, school, and family. Since reform and opening up, China's creative ability has been greatly enhanced and a few scientific researches and technological innovations have taken a place in the world. However, there is no doubt that relatively great disparity still exists between China's creative ability and the world's advanced level. According to the relevant analysis data in 2001, China, among 49 major countries, ranked 28<sup>th</sup> in comprehensive ability of scientific and technological creativity, this is slightly below the average level. In 2009, the question "Why cannot our schools cultivate creative talents?" raised by Tsien Hsueshen, a late outstanding Chinese scientist who is hailed as the father of Chinese astronautics and missiles, still remains to be solved, and has triggered a deeper thinking in Chinese education among Chinese people.

### 2 Definition and Evaluation of Creativity of the Youth

At present, a more identical view in China is that creativity is identified as an intelligence quality that, according to certain purposes, utilizes all known information to create some kind of novel and unique product with social or personal values. This definition reflects the common characteristics of creativity, but basing the measurement and evaluation of creativity of the youth merely on such a highly-generalized definition is far from enough. We must be aware of the complexity and diversity of creativity. With the deepening of the research on creative activities and the increasing demand of creative talents, a growing number of people have come to realize the necessity and possibility of measuring creativity. In 1950, J. P. Guilford, an American psychologist, delivered a well-known speech entitled "Creativity" at the annual meeting of the American Psychological Association, and since then the number of researches on creativity rises greatly, and the research methods are becoming more and more diverse. In the process of studying the Structure of Intellect and through factor analytic methods, Guilford discovered "divergent thinking", which he saw as a major component of creativity and associated with four main characteristics: fluency, flexibility, originality, and elaboration. In terms of evaluation of the youth's creativity, especially divergent thinking, there are three main methods: Torrance Test of Creative Thinking, University of Southern California Testing, and Chicago University Test of Creativity.

Based on the theories and methods of J.P. Guilford, learning from the creative tests above, and considering China's national conditions, we designed the Questionnaire on culture of Children's Creativity in Chinese Family Education. We carried out the survey within the Wuhan City in Hubei Province in China and distributed the questionnaires according to the different levels of the students. The questionnaire is divided into 5 levels: Grades 1- 3 of Elementary School, Grades 4-6 of Elementary School, Grades 1-3 of Junior Middle School, Grades 1-3 of Senior Middle School, and Grades 1-4 of

---

\* This paper is supported by Independent Innovation Research Foundation Project of Wuhan University of Technology (NO. 116817001)

University. Each level has 20 questions, covering fluency, flexibility, originality, elaboration and sensitivity elements. A total of 16,000 copies of questionnaire were issued and 14,720 copies were withdrawn, of which 14,056 were valid, accounting for 95.5%.

**Figure 1 Three Main Methods of Evaluating the Youth's Creativity**

### **3 The Influence of School, Family and Society on the Culture of Creativity of the Youth**

Family education, school education, and social education form the vast majority of the whole education. According to a research, during an individual's growth process in China, family education takes up almost 70% of the entire education with school education and social education occupying practically 20% and 10% respectively.

#### **3.1 The influence of school on the culture of creativity of the youth**

Among the factors affecting the development of youth's creativity and exploitation of their potentials, school plays a significant role. In the Ecological Systems Theory developed by Urie Bronfenbrenner, a renowned Russian-born American psychologist, school is one of the innermost microsystems of individual existence. And school environment is an intimate, immediate, and interactive environment the individual lives in. A relaxing, democratic and secure school environment makes it much easier to stimulate creativity. In the circle of international education, whether it helps to develop the students' creativity has become a standard of measuring international quality school environment. In 2003, the World Health Organization suggested in the report "Health-Promoting School: Creating an Environment for Emotional and Social Well-Being", that one of the important qualities of a good school's psychological and social environment is to promote the students' creativity. Primary and secondary school environments are crucially important to students' creativity development. To create a favorable school environment for the development of youth's creativity, we need to use the positive factors more effectively and at the same time, pay more attention to the improvement of some factors harming, or even inhibiting the development of creativity.

#### **3.2 The influence of family on the culture of creativity of the youth**

Generally speaking, family education refers to the education for the youth given by parents or elder members of a family. It is a crucial part of the entire education system. In effect, family education is not only a family activity, but also related to the whole society. Family education is the foundation of school and social education. Thus, it can by no means be replaced by school and social education. Family is the first "school" to educate the youth and also an eternal "school" for the youth's lifelong education, while parents are the first "teachers" of the youth. First of all, for the youth, family education is the beginning and foundation of education. Secondly, the impact of family education is much greater than that of school education. As the first "teachers" of the youth, parents' words and deeds play a pivotal role in the youth's growth. Thirdly, the time that the youth spend in receiving family education is much longer than that spent in two other kinds of education. Everyone's character and way of doing things are closely related to the family education one receives. Family education influences the youth's modes of thinking, which in turn affects a person's behavior. Therefore, family education is vitally important in the process of the youth's good habit formation as well as the physiological and psychological maturity.

#### **3.3 The influence of society on the culture of creativity of the youth**

Modern society attaches great importance to the all-round development of the youth and unprecedented attention has been given to the culture of the youth's creativity. The highly-developed science and technology also provides a favorable external environment for cultivating the youth's creativity. Social educational institutions, though diversified in terms of form and activity, all exert an obviously positive influence on the youth's creativity culture.

## **4 Existing Problems in Chinese Education**

### **4.1 Emphasizing marks and despising creativity**

In 2009, according to a survey conducted by International Assessment of Educational Progress in 21 countries around the world, Chinese children's computing power ranked first in the world, while their

imagination ranked last and creativity ranked the fifth from the bottom. Among Top 20 Major Inventions Affecting Human Life released by several American professional societies, no inventions were invented by Chinese. Every year, there are as many as 2,000 Chinese gaining their doctorates in the United States, which is the largest number of non-American students who get a doctorate and doubles the number of Indian students. American experts comment that though Chinese students' performance is outstanding, their imagination is insufficient. What is worse, Chinese parents even reckon that it does not matter that their children do not have creativity or imagination, and children's performance at school is the only thing that parents care and value. And because of the influence of teachers, parents' strong awareness of educating their children independently is dampened. Family education is based on the theory of school education and modeled on school education patterns in terms of content, methods, languages and way of thinking. Many Chinese parents only cares about their children's scores, performances and whether children can pass the admission exams or not, while discarding the unique function of family education to cultivate students' creative thinking ability and imagination.

#### 4.2 Unscientific parenting styles

There are three typical kinds of unscientific parenting styles in China: Indulgent parenting, Authoritarian parenting, and Neglectful parenting. The first style is Indulgent parenting whose main manifestation is that parents arrange everything for their children and pay no attention to the culture of children's self-care ability and working habit. In addition, indulgent parents are nurturing and accepting, very responsive to children's needs and wishes, and socially "overprotective". The following question for university students that "When resting at home, your parents ask you to bear some housework." in the questionnaire well illustrates this point. The response to this question is that over half of the interviewees choose the option "seldom" and "sometimes", however, only 6% of interviewees choose the option "always". The second style is Authoritarian parenting, which is characterized by the creed "spare the rod and spoil the child" scrupulously abided by parents. Authoritarian parents take severe control over their children and tend to demand obedience without explanation and focus on status. In the question "Your parents ask you to make deliberate plans for family outing or other important activities and organize it. ", 36% of university students choose that they have never made or organized such plans while none of them says that he or she always does it. The answer shows that some parents give little freedom to children. The last style is Neglectful parenting. This style of parenting is mainly manifested by that parents are generally not involved in their children's life, are disengaged, undemanding, and do not set limits. The question "Do you have a wide range of interests and often accompany your child to engage in various cultural and sports activities?" and its answer are a good example of this parenting style. Less than 30% of parents choose "often" and "always", while more than half of the parents choose "sometimes" and "seldom". Besides that, the style is also displayed by the financial indulgence. Quite a number of Chinese parents grant whatever is requested financially by children.

The following table is 3 typical questions representing three kinds of parenting styles in the questionnaire and their results:

**Table 1 Questionnaire**

Style	Questions
Indulgent	1. When resting at home, your parents ask you to bear some housework.
Authoritarian	2. Your parents ask you to make deliberate plans for family outing or other important activities and organize it.
Neglectful	3. Do you have a wide range of interests and often accompany your child to engage in various cultural and sports activities?

**Figure 2 Answers**

## **5 Suggestions**

### **5.1 School**

#### **5.1.1 Humane management**

Schools' administrators should create the conditions for establishing democracy and equality between teachers and students, encouraging respect and love among them, and making teaching benefit the students as well as the teachers. Besides, schools' administrators are also supposed to pave the way for teachers' and students' participation in schools' administration, and building democratic schools. The majority of the college students in the new era, who grow in the period of social transition, are the only children in the family. Students who were brought up in this one-child living environment are sometimes highly dependent, self-centered and afraid of being neglected. Therefore, college logistical personnel should provide a broad platform for college students' living education, carry on living education through service of high quality and enable the students to savor and appreciate the educational elements in it.

### **5.2 Family**

#### **5.2.1 To establish the correct concept of family education**

Family education, school education and social education form a education network for the youth's survival and development, and family education serves as the headquarter in the youth's growth. But now the problem is that family education's independence and special function of cultivating the youth's creative ability is being neglected and quashed. Actually family education has become an extension of school education in terms of educational contents and forms. In order to alter this situation, first of all, parents are required to establish the correct concept of family education. Secondly, parents should let family education get rid of the duplication and extension of school education, and encourage the youth to develop freely, independently and creatively in family education.

#### **5.2.2 To create a suitable family atmosphere and to encourage the youth's sense of creativity**

Sense of creativity is a psychological motivation for stimulating individuals to produce creative behaviors. Without sense of creativity, one can not engage in creative activities, and only creators with strong sense of creativity can dedicate themselves to the creativity, and then accomplish great achievements. More importantly, early childhood is the most important period of the development of the youth's creativity and parents should seize this opportunity for the youth's development.

#### **5.2.3 To enrich the family education content**

Supervising the youth to do their homework and helping them to master the knowledge required in the textbooks are part of the family education content, but not the most important ones. Family education is supposed to provide the youth with richer knowledge than school education, especially the knowledge outside the textbooks, therefore establishing the information foundation for the realization of psychological transcending. When it comes to the form of education, parents should motivate the youth to go out to visit the park, market and streets; to observe the world of nature, plant flowers and trees and raise some pets; to expose themselves to the society and then come to understand it. In this way, the youth can enlarge their exposure to the surrounding environments and broaden their horizons. Furthermore, not only can the youth have an informative understanding of things, but they can gain practical experience and emotional awareness as well.

### **5.3 Society**

#### **5.3.1 Outside class reading materials cultivating the youth's creativity**

Without the mastery of the existing scientific and technological knowledge, the youth are hard to produce creative behaviors for practical use. Even though they come up with creative ideas, they can not put these idea into practice. Accordingly, another method to cultivate the youth's creativity is to guide them to read a large amount of rewarding outside class reading materials, so that they can continue to broaden their horizons, enrich their cognitive structures and lay a solid foundation for creativity in the future.

#### **5.3.2 Social education facilities cultivating the youth's creativity**

In modern society, there are various social education facilities, such as the museum of science and technology, the museum of history and the museum of natural science. These facilities exert a positive impact on expanding the youth's scope of knowledge, cultivating their observation and enriching their perceptual knowledge.

## **6 Conclusion**

To sum up, in the fierce competition of the international market, creative ability has increasingly become an indicator of whether a country possesses international competitiveness. And the key of

constructing a creative country lies in the culture of creative talents. And school, family and society play a vital role in the culture of the youth's creativity. However, concerning the culture of the youth's creativity, China still has the problems of emphasizing marks too much, despising creativity and having unscientific methods of family education. Thus, we propose some suggestions on the culture of the youth's creativity in China from the aspects of school, family and society, hoping they will assist the society to cultivate more creative talents required in our era.

# Research on High-Tech Enterprise Growth Mechanism in the View of Dynamic Capabilities

Ma Lu, Qiao Junguo, Liu Qing

School of Management, Guangxi University of Technology, Liuzhou, P.R.China, 545006

(E-mail: malu6655@163.com, 2004552031@163.com, ginaralphliu@yahoo.com.cn)

**Abstract:** The essay takes “knowledge learning-dynamic capabilities-enterprise growth” as the dominant logic, thinking of the dynamic adaptability of environment-organization-strategy, dynamic capabilities of high-tech enterprises are divided into environmental insight, knowledge innovation and strategic change capacity. Interactions between dynamic capabilities and core competencies go to gain sustainable competitive advantage and to realize the firm growth. Through internal growth, M&A, the network growth and international growth, dynamic capabilities take a role in the enterprise growth and to be further improved.

**Key words:** Dynamic model; High-tech enterprises; Enterprise growth; Organization learning

## 1 Introduction

High-tech enterprises are the effective carrier which is promoting scientific and technological innovation and transformation of the achievements. Since the 1990s, enterprise development environment shows notable variability, complexity and uncertainty, especially in high-tech enterprises. Environment with these characteristics are referred to as the “dynamic environment”. This is not only the major theoretical issue, but also significant practical problem that in dynamic environment, how the high-tech enterprises obtain sustainable competitive advantage.

Dynamic capabilities theory is born out and supplies new ideas and methods for the analysis of the problem. This theory emphasizes the internal and external resources, knowledge, capabilities of integration, as well as the environment changes dynamically adapt to effectively address the core competencies of core rigidity, and thus the high-tech enterprise growth in a dynamic environment has important guiding value.

The essay takes "knowledge learning - dynamic capabilities - enterprise growth" as the dominant logic. First, analyzes the knowledge of high-tech enterprises and their growth characteristics; second, analyzes the meaning dimension of dynamic capabilities of high-tech enterprises, the mechanism of action, the path of ascension; then designs and constructs a theoretical model of the growth mechanism of high-tech enterprises under dynamic capabilities perspective.

### 1.1 The meaning of high-tech enterprise growth

(1) In terms of growth target, the growth of high-tech enterprises refer to the process that enterprises continue developing and then achieving sustainable growth.

(2) As for the growth of nature, any enterprise can be healthy and rapid and sustained growth.

(3) On the part of the growth dimension, the growth of high-tech enterprises always includes boundary growth, structure growth, behavior growth and performance growth (Jiang Ji-hai, 2007), which can be indicated by the following composite function:

$$HG = F(X, Y, Z, W) \quad (1)$$

Among them, HG: high-tech enterprise growth, X: enterprise Boundary, Y: enterprise structure, Z: enterprise behavior, W: enterprise performance.

### 1.2 The basis of high-tech enterprise growth

(1) Knowledge and resources. According to the classified ideas of tangible resources and intangible resources, resources also can be divided into knowledge resources and traditional resources, while under the conditions of the knowledge-based economy, knowledge resources in enterprise growth plays more important role than the traditional one. Also, resources can be divided into material resources and human resources. Human resources, especially high-level human resources, are both corporate knowledge and especially the tacit knowledge of the main carrier, enterprise knowledge innovation and the accumulation of important subjects.

(2) Capabilities and resources. Resources are important for enterprise growth, and static, passive, while capacities are dynamic, active. Dynamic resources are only through their role in order to have an impact on enterprise growth. Accordingly, the enterprise capability theory thinks that the relative terms of the resources, capacity is more important role in enterprise growth. Enterprises growing path is the

ability to act on the resources to achieve enterprise growth. The formation of capabilities depends on the reserved resources, and acquiring resources depends on the capability's cultivation. The enterprises' resources and capabilities interactions are complementary and indispensable.

(3) Capabilities and knowledge. High-tech enterprises belong to knowledge-intensive enterprise, which knowledge is the primary resource for their growth. Capabilities can act on the knowledge to achieve the growth of high-tech enterprises. The enterprise capabilities theory thinks that enterprise knowledge to create profits for the enterprise. Knowledge form capabilities and the capabilities configure knowledge.

In summary, the resources, knowledge, capabilities and enterprise growth have the relationship between a function expressed as:

$$HG = C(R, K) \tag{2}$$

Among them, HG: high-tech enterprise growth, R: resources, K: knowledge, C: capabilities.

**1.3 The relation between knowledge innovation and high-tech enterprise growth**

Nonaka (1991) considered knowledge innovation is the interactive process of tacit knowledge and explicit knowledge, including socialization, externalization, combination and internalization (Figure 1).

Learn from the results of previous studies, and combine with the characteristics of high-tech enterprise, we divide the process of knowledge innovation into knowledge acquisition, knowledge creation, knowledge integration, and knowledge sharing and knowledge application (Figure 2).

Figure 1 Nonaka's SECI Model

Figure 2 The Process of Knowledge Innovation Model

The high-tech enterprises are collection of knowledge, thus their growth are essentially continuous innovation and accumulation of knowledge. Table 1 analyzes the close relationship of the innovative ways of running of knowledge, intellectual property and enterprise-growing path (Table 1).

**Table 1 Innovative Ways, Knowledge Running and Growth Path**

Innovative ways		The connotation	The key link in knowledge running	The owners' mode of intellectual property	Basic approach of enterprise growth
Innovation	Original innovation	Efforts to obtain more scientific discoveries and important technological invention in various production areas.	Knowledge creation	Autonomous Knowledge Property	Internalization of Growth
	Integrated innovation	Related technical results converged to form a market-competitive products and industries.	Knowledge acquisition Knowledge Integration		Networking Growth Or M & A growth

	Secondary Innovation	On the basis of extensively absorb the world's scientific achievements, and actively introduce advanced foreign technology, it is fully digested and absorbed and re-innovation.	Knowledge acquisition Knowledge Integration Knowledge creation		
Cooperation and innovation		Cooperation to achieve innovation and research network, or Union.	Knowledge acquisition Knowledge Integration Knowledge-sharing	Share	Networking Growth
Introduction to imitate		Obtained from external companies lack the knowledge resources through market transactions means.	Knowledge absorption	Transaction	Market of growth

## 2 Analytical Framework of Dynamic Capabilities of High-tech Enterprises

### 2.1 The meaning of dynamic capabilities of high-tech enterprises

Teece&Pisano(1994) believed that, the dynamic capabilities are the capacity of creating, integrating and reconfiguring the internal and external capacity, in order to adapt to rapidly changing external environment. Teece, Pisano&Shuen(1997) first proposed a more systematic analytical framework of dynamic capabilities, they believe that the dynamic capabilities include the three dimensions of the process, location and path.

Learning from past research results, the essay thinks the dynamic capabilities of high-tech enterprise be the capacity of through environmental insight, knowledge innovation and strategic change to maintain the environment - knowledge - strategy to dynamically adapting.

Environmental insight capability = Environment + insight + capability. Environmental insight capability refers to the capability of enterprises to keep perception of changes in the environment. Insight refers to the capability of perceiving things or problems deeply and clearly.

Knowledge innovation capability = knowledge + innovation + capability. Knowledge innovation capability is an important part of dynamic capabilities and manifestations, and the evolutionary system of dynamic capabilities. The high-tech enterprises are high-knowledge accumulation, and rapid innovation in both enterprises and the rapid knowledge innovation capability is the most important source of sustainable competitive advantage of high-tech enterprises. Dynamic capabilities are essentially update capabilities. They have four distinct features: dynamic, learning, openness and innovation, while innovation is the most essential features of dynamic capabilities (Gong Yi-ping, 2010).

Strategic change capability = strategy + transformation + capacity. Mintzberg(1998) had defined the concept of strategic change from the two dimensions of the "change" and "strategy". This essay considers that strategic change is the process of adjustment according to the external environment and organizational status changing strategy content or strategy paradigm, in order to play to our strengths, seize the opportunity and circumvent weaknesses and threats, shows differences of the strategy content or strategy development paradigm in the different stages of development.

### 2.2 The dimension of dynamic capabilities of high-tech enterprises

According to the foregoing interpretation, the dynamic capabilities of high-tech enterprises can be divided into three dimensions: environmental insight, knowledge innovation, and strategic change.

(1) Environmental insight. The purpose of environmental insight aims to discover or predict environment that will be changes and these changes impact on enterprises, and then take effective measures to deal with. Porter believes enterprise strategic environment include four aspects of the PEST: political environment, economic environment, social environment and technical environment. According to the research purpose, the essay divides high-tech enterprise environment into macro-environment, technology and market environment. From this perspective, the capability of environmental insight includes macro-environmental insight, technical environmental insight and market environmental insight. SWOT analysis method takes into accounting the internal and external factors, and through internal environment analysis finds that the strengths and weaknesses and identify opportunities and threats by the external environment. From this perspective, the capability of environmental insight includes the advantage insight, disadvantage insight, opportunities insight and threat insight.

(2) Capability of knowledge innovation. Knowledge of high-tech enterprises mainly includes four types: technical knowledge, market knowledge, management knowledge and system knowledge. Therefore, knowledge innovation capabilities include three types: the capability of technological

innovation, management innovation and system innovation. In addition, from the perspective of knowledge running, knowledge innovation capabilities include the capability of knowledge acquisition, knowledge creation, knowledge integration, knowledge sharing and knowledge application. From the perspective of innovative ways, knowledge innovation capability includes the independent innovation capability and cooperative innovation capability. Among these capabilities, independent innovation capability includes the original innovation, integrated innovation and secondary innovation.

(3) Capability of strategic change. The enterprise strategy includes three levels: corporate strategy, business strategy, and functional strategy. Then strategic change capability can be divided into corporate strategic change, business strategy and change the capabilities and functions of strategic change capacity. According to the way of strategic change, strategic change capability can be divided into strategic adjustment and strategic transformation.

By analyzing the multi-layered and multi-angle meanings and dimensions of the high-tech enterprises above, try to build dynamic capabilities of high-tech enterprise system (Table 2).

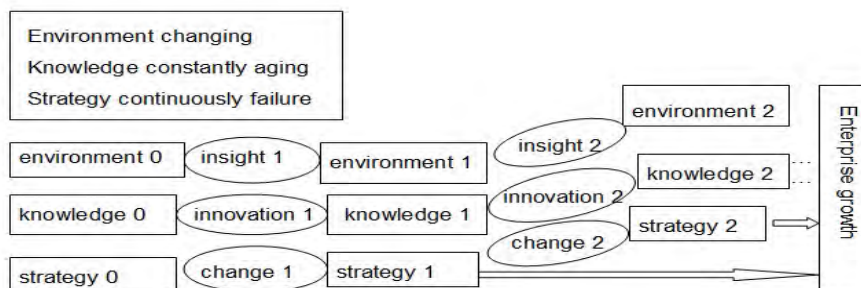

**Table 2 Dynamic Capabilities of High-tech Enterprise System**

Dynamic capabilities of high-tech enterprise	Level indicators	Based on environment / knowledge / strategy	Based on the insight / innovation / change	
	Environmental insight capability	Macro-environmental insight Technical environmental insight Market environmental insight		Advantage insight capability Opportunity insight Disadvantage insight capability Threat insight
Knowledge innovation capability	Technical knowledge innovation capability Management of knowledge innovation capability Institutional knowledge innovation capability		Knowledge acquisition capability Knowledge creation capability Knowledge integration capability Knowledge sharing capability Knowledge application capability	Independent innovation capability Cooperation innovation capability
Strategic change capability	Enterprise strategic change capability Business strategy change capability Functions of strategic change capability		Strategic ability to adjust Strategic transformation capability	

**2.3 Process characteristics of dynamic capabilities of the high-tech enterprises**

The dynamic capabilities have the process characteristics. Dynamic capabilities are nested, which form, enhance and play a role in particular process in order to maintain the dynamic adaptation of the environment - knowledge - strategy, and access to sustainable competitive advantage.

Shown in figure 3, initially the enterprise gets "0" for a balance, which can promote the corporate (Figure 3). Accompanied by the passage of time, the environment changes, knowledge becomes ageing, then existing strategic fails, finally impede enterprise growing. With the dynamic capabilities, the enterprise finds new environment "1", then for knowledge innovation to generate new knowledge to 1, changes strategy to form new strategy "1", in order to not only reach new equilibrium "1" state, but also can promote the role of dynamic capabilities. The dynamic capabilities enable enterprises to the dynamic adaptation of the environment, knowledge and strategic in order to achieve sustained growth.

**Figure 3 Dynamic Capabilities Process Characteristics**

### 3 The Mechanism of Dynamic Capabilities of High-tech Enterprises

#### 3.1 Enterprise growth depends on the sustainable competitive advantage

The concept of sustainable competitive advantage is different from competitive advantage. An enterprise can gain competitive advantage, but whether this competitive advantage can last still remains a problem. In the dynamic environmental conditions, competition among enterprises transforms static competition into dynamic competition, that competitive advantage presents the relative and transient. The dynamic capabilities theory still emphasizes the further sustainable competitive advantage. Only to continue to cultivate new competitive edged to get the old competitive advantage can achieve sustained competitive advantage of enterprises and continue to grow.

The continuity is the deserved meaning of enterprise growth. Enterprise growth is subject to the strength of their competitive advantage and sustainability, and if the enterprises want to have sustainable growing they must make the foundation of creating and continuing of their competitive advantage. In short, the enterprises sustainable growing depends on the sustainable competitive advantage.

#### 3.2 Sustainable competitive advantage is rooted in dynamic capabilities

The core competencies aimed at maintaining the status quo, dynamic capabilities designed to change the strain. Core competencies will enable enterprises to gain competitive advantage which but can not be sustained for long. Dynamic capabilities solve the core competencies of rigidity effectively, thus become source of sustainable competitive advantage.

Enterprise growth is an iterative process in long term which the core competence will be went through a complete growth from formation to destruction, and again, as doing the same back and forth to achieve sustained; while it requires dynamic capabilities to complete not only the formation and destruction of the core competencies in the process, but also can transform one core competency into another. Enterprises gain competitive advantage with core competencies in the short term and by virtue of the dynamic capabilities in the long term, several short-term competitive advantages get together to form long-term competitive advantage in order to achieve sustained competitive advantage.

Introduce the concept of core competencies and dynamic capabilities, and then enterprise growth can be a composite function:

$$HG = DC (CC); CC = CC (K, C) \quad (3)$$

Among them, HG: high-tech enterprise growth, DC: dynamic capabilities, CC: core competencies, K: knowledge, C: the basis of capabilities.

#### 3.3 Dynamic capabilities and enterprise growth

Enterprise growth trend is a direct manifestation of their sustainable competitive advantage, and the research of enterprise sustainable growing equals how to build a sustainable competitive advantage. According to the former paper discusses, the propositions and inferences can be drawn as follows.

Proposition A: dynamic capability is a source of sustainable competitive advantage

Proposition B: sustainable competitive advantage is the basis of business growth

Proposition A and Proposition B inference can be:

Proposition C: dynamic capabilities promote enterprise growth through building sustainable competitive advantage.

Based on the above analysis, the dynamic capabilities perspective enterprise growth mechanism can be described as follows. The survival and development of enterprises are based on resources, knowledge and ability which in a certain extent get the organic combination of the formation of core competencies that will take the competitive advantage for enterprises sometime; while in dynamic environmental conditions, the core competencies of rigidity make this competitive advantage disappear after a certain time. With dynamic capabilities, core competencies have dynamic transformation of the upgraded or updated in order to adapt to dynamic environment, and the new core competencies can bring a certain time for the enterprise competitive advantage; then the enterprises can achieve a dynamic competitive advantage in order to achieve sustained growth.

### 4 Theoretical Model of High-tech Enterprise Growth Mechanism under Dynamic Capabilities Perspective

According to the foregoing interpretation, the high-tech enterprises are typical knowledge-based enterprises, and high-tech enterprise growth is essentially continuous innovation and the rapid accumulation of knowledge. Market knowledge and market environment are closely related, strategic management itself is an important part of enterprise management, and these relate the abilities of the knowledge innovation and environmental insight and strategic change more closely.

There are four main ways in enterprise growth: internal growth, M&A growth, network growth and international growth. Dynamic capabilities promote enterprise growth means and gain their own upgrade through these. Internal growth focuses on knowledge creation and internal accumulation (Figure 4), M&A growth focuses on the external (Figure 5), network growth overall consideration internal and external and internal and external accumulation for integration(Figure 6), the growth of international is the inevitable choice to cope with economic globalization, and make full use of domestic and international two markets and the domestic and international two kinds of resources, in line with the essence of dynamic capabilities (Figure 7). Knowledge creation, knowledge acquisition, knowledge integration, knowledge sharing and knowledge application, are inseparable from the organizational learning participation which is the important factor to enhance the dynamic capability to promote knowledge innovation.

Figure 4 Knowledge Creation, Dynamic Capabilities and Enterprise Growth

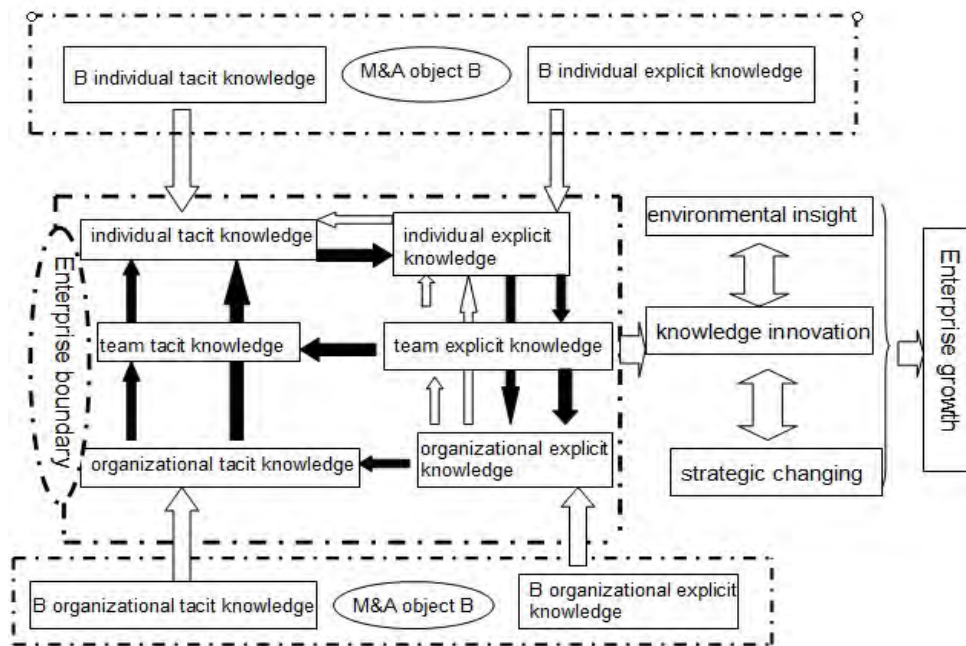

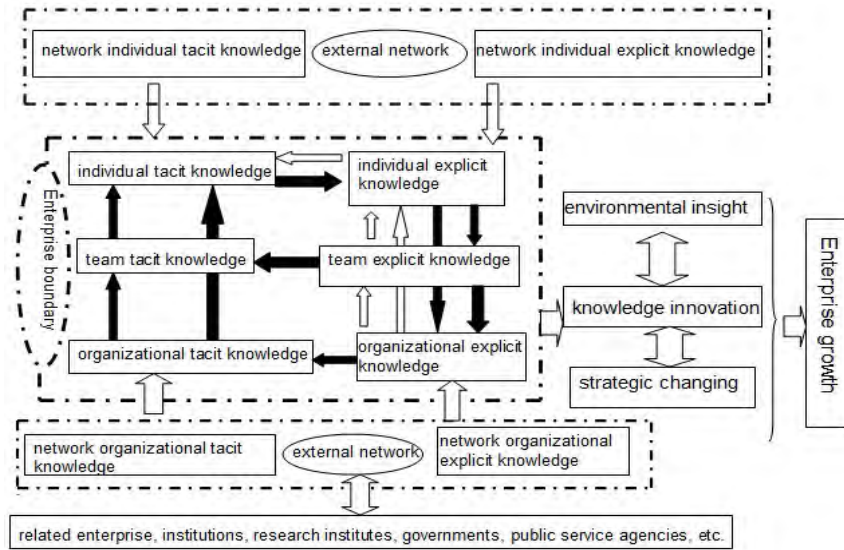

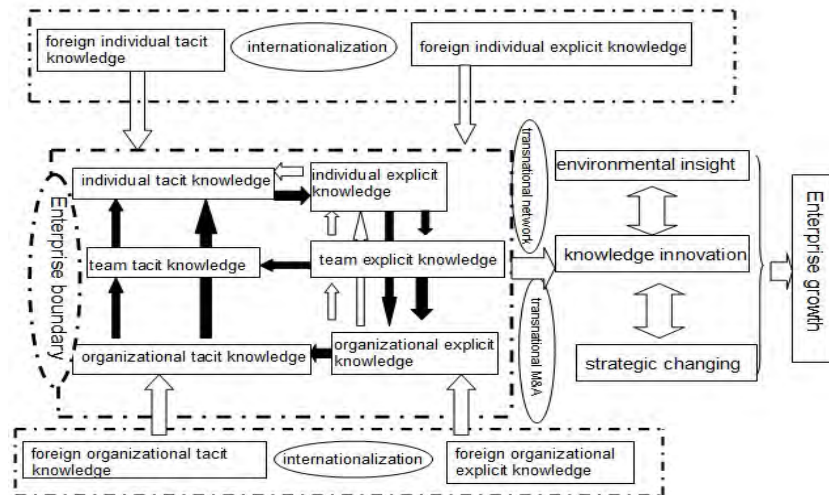

Figure 5 Knowledge of M&A, Dynamic Capabilities and Enterprise Growth

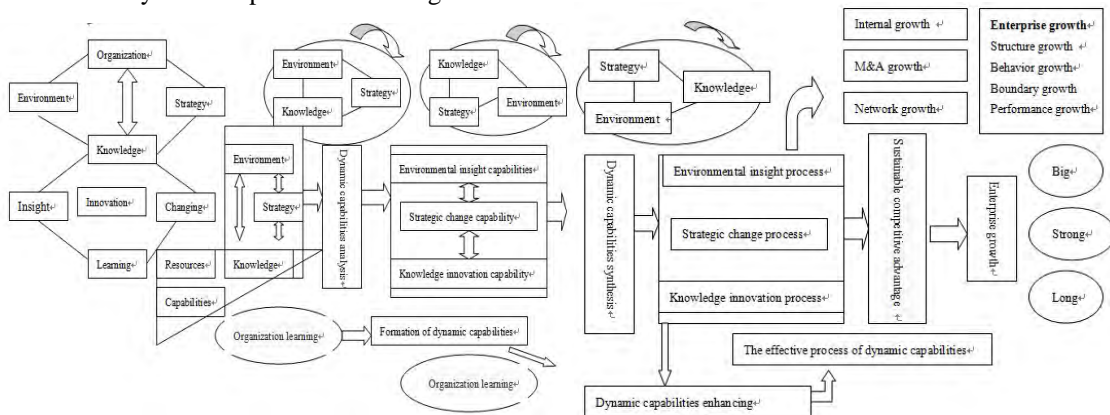

**Figure 6 Knowledge Network, Dynamic Capabilities and Enterprise Growth**

**Figure 7 Transnational Knowledge, Dynamic Capabilities and Enterprise Growth**

Through the above research, the theoretical model of the high-tech enterprise growth mechanism in the view of dynamic capabilities is in Figure 8.

**Figure 8 Theoretical Model of High-tech Enterprise Growth Mechanism in the View of Dynamic Capabilities**

(1) Enterprise growth should be in the adaptation of the dynamic environment, organization, and strategies. When the environment changes, knowledge and strategic must innovate and change to adapt to the changes; when knowledge innovation have a major breakthrough it must have insight into the opportunities and threats and adjust strategy to profit and avoid loss; when the strategy is adjusted or transformed, it must analyze the conditions with knowledge innovation in order to protect itself.

(2) Enterprise growth depends on the base of the foundation and knowledge. Dynamic capabilities theory emphasizes the integration of internal and external resources, knowledge, and capabilities. The high-tech enterprise growth mainly includes internal growth, M&A growth, network growth, and the international growth is a logical extension of M&A growth and network growth which is in the new era of economic globalization. Accordingly, the enterprise can get full range of multi-level growth in the structure, behavior, boundary and performance.

(3) Dynamic capabilities include environmental insight, knowledge innovation and strategic change. Dynamic capabilities acting on the environment performs the insight capability, acting on the knowledge represents the innovation capability, and acting on the strategy performs transformative capability. Insight and change are the nature of innovation. Dynamic capabilities have an effect on enhancing enterprise growth that in the process of the environmental insight, knowledge innovation and strategic change.

## 5 Conclusion

To the research, the high-tech enterprises is a typical of knowledge-based, learning-oriented, innovative enterprises and growing businesses; dynamic capability is a foundation for high-tech enterprises to gain sustainable competitive advantage, thereby achieving a healthy and rapid sustainable growth; the dynamic capabilities of high-tech enterprises is a complex system concluding environment insight, knowledge innovation and strategic change capacity three components; dynamic capabilities through internal growth, merger and acquisition growth, network growth and international growth play a role and get promoted.

## What Is Decision Useful Information: A Perspective of Industrial Capital Cycle and Financial Capital Cycle

Sun Liying

School of Management, Xiamen University, Xiamen, P.R. of China, 361005

(E-mail: lysun@xmu.edu.cn)

**Abstract:** This essay uses qualitative research method to answer the question: what is decision useful financial information. The author believes that financial information is useful only when it suits the decision process of the users. In order to find out what type of financial information fits the users' decision process, the essay analyzes the two capital cycles within firms, namely industrial capital cycle and financial capital cycle. It finds that each capital cycle indicates different risks to the firms. Therefore, for the users, decision useful information should include information that sheds light on the risks underlying the two capital cycle respectively and information that is helpful to compute respectively users' utility on outcomes from industrial capital cycle and financial capital cycle.

**Key words:** Decision useful information; Capital cycle; Objective of financial reporting; Utility function

### 1 Introduction

Since 1970s, the objective of financial reporting is defined as to provide decision useful financial information for existing and potential investors, lenders and other creditors. As this objective is little doubt, accounting standard setters around the world go on to consider what information is decision useful. Their views are summarized in documents named conceptual framework. These views are quite similar and seldom doubt by accounting scholars. Specifically, standard setters believes that, if financial reports meet some qualitative characteristics of financial information, the definitions of elements of financial statements, the criteria of recognition and the requirement of measurement, they successfully provide decision useful information. While agrees the standard setters' opinion on the objective of financial reporting, this essay, however, tries to explain decision useful information from another perspective. The author believes that financial information is useful only when it suits the decision process of the users. In order to find out what type of financial information fits the users' decision process, the essay analyzes the two capital cycles within firms, namely industrial capital cycle and financial capital cycle. It finds that each capital cycle indicates different risks to the firms. Therefore, for the users, decision useful information includes information that sheds light on the risks underlying the two capital cycle respectively and information that is helpful to compute respectively users' utility on outcomes from industrial capital cycle and financial capital cycle.

### 2 Firm's Capital Cycle and Risks

There are two capital cycles within firms. One is industrial capital cycle. The other is financial capital cycle. Firms earn different income from different capital cycle. And they bring different risk sets to firms.

#### 2.1 Industrial capital cycle and the underlying risks

##### 2.1.1 Industrial capital cycle

In nonfinancial firms, the major aim of capital is to earn residual value. The capital that is used by firms to earn residual value is defined in this essay as industrial capital. Residual value is thus named industrial income. Marx (2007) used the following formula to describe how capital was used to earn residual value (industrial income):

$$G—F \begin{matrix} \leftarrow A \\ \leftarrow P_m \end{matrix} \dots p \dots W' —G' \quad (1)$$

G stands for money. G' stands for the increased money. W stands for the volume of commodity. W' stands for the increased volume of commodity. A stands for labor, P<sub>m</sub> stands for production material. P stands for production process. Dotted line stands for the interruption of circulation.

Formula (1) is called industrial capital cycle formula in this essay. It describes the way that firms earn industrial income. There are three phases in the industrial capital cycle: the phase of purchasing production elements (G—W), production phase (...p...) and the phase of selling goods (W'—G'). After the third phase, firms earn industrial income  $x_i$  ( $x_i=G'-G$ ). During the process, capital stays in three

forms respectively, namely monetary capital, production capital and commodity capital. In balance sheet, these three forms of capital are stated as various assets. Specifically speaking, monetary capital is stated as cash on hand and bank deposits. Production capital is stated as raw material, work in process, plant assets and intangible assets. Commodity capital is stated as finished goods.

### 2.1.2 Industrial capital risks

The goal of industrial capital cycle is to increase the wealth of firms by earning industrial income. During the process, firms have to face several risks that may threaten the goal. These risks are called industrial capital risks. They can be divided into three types: commodity price risk, operation risk and industrial strategy risk. Commodity price risk is the risk that the market prices of production elements and finished goods fluctuate as a result external economic factors. It may change the rate of industrial income and thus affect the profitability of firms. Operation risk refers to the risk that commodity capital may not be able to be converted into monetary capital smoothly, as a result of implicit factors such as the incapability of controlling production cost, defects in product quality, and ineffective product promotion. Industrial strategy risk is a risk that overrides the whole industrial capital cycle. It refers to the risk that the industrial strategy adopted may not be able to bring in maximized industrial income. This risk arises from both implicit factors and explicit factors, such as the change of macroeconomic environment and technology innovation.

Industrial capital risks bring uncertainty to the firms while they are trying to maximize their wealth through earning industrial income. If these risks are effectively managed, the firms' goal is most likely assured. On the contrary, profitability of the firms will suffer. Firms may even incur losses as a result. In the extreme situation,  $G'$  in formula (1) may reduce to zero, i.e.,  $G' \geq 0$ . In this case, the maximum loss firms incur will be  $G$  ( $x_i = G' - G = 0 - G = -G$ ).

## 2.2 Financial capital cycle and the underlying risks

### 2.2.1 Financial capital cycle

In modern nonfinancial firms, there exists a second capital cycle. This is called financial capital cycle in the essay. Financial capital comes from two sources: idle monetary capital that regularly arises from industrial capital cycle and receivables. It is defined as the type of capital that firms try to earn financial income by taking advantage of the value change of opportunity capital.

During the industrial capital cycle, some monetary capital remains idle. With the goal to maximize the wealth of firms, firms use the idle capital to earn a type of income other than industrial income, which is called financial income in this essay. For example, firms may deposit the idle money into a bank to earn interest income or use the idle money to buy financial products, such as stocks, bonds and derivatives, to earn investment income. The formula that describes how firms earn financial income through idle capital is as follows:

$$G-F \begin{matrix} < \\ \text{P} \\ \text{O} \dots e \dots \end{matrix} F' - G' \tag{2}$$

$G$  stands for money.  $G'$  stands for the increased money.  $F$  stands for the amount of financial product.  $F'$  stands for a changed amount of financial product.  $P$  stands for principal capital.  $O$  stands for opportunity capital.  $E$  stands for explicit financial factors. Dotted line stands for the interruption of circulation.

Formula (2) is called Financial Capital Cycle Formula I (FCCF I). According to this formula, financial capital cycle consists of three phases. In the first phase, idle monetary capital is converted into financial capital ( $G-F$ ). The financial capital is understood to consist of two parts: principal capital and opportunity capital. In the second phase, financial capital is exposed to external financial factor ( $\dots e \dots$ ). During this phase, the value of financial capital  $F$  is changed randomly. And At the end of this phase,  $F$  becomes  $F'$ . At the end of the third phase, financial capital  $F'$  is converted into monetary capital, and firms realize financial income  $x^F = G' - G$ .

Take time deposit as an example to explain these three phases. In the first phase, idle money  $G$  is converted into time deposit  $F$ . On the date of the transaction,  $G$  is equal to  $F$ . Another fact on this date is that the value of time deposit ( $F$ ) can be divided into two parts: the value of principal ( $P$ ), which is equal to  $G$ , and the value of opportunity ( $O$ ), which is equal to 0. This fact can be expressed as:  $F = P + O = G + 0 = G$ . An important characteristic of financial capital cycle is that, in the first phase of the cycle, firms buy a commodity named opportunity at a initial cost of zero by surrendering the use right of money capital (i.e., principal). Opportunity, as a commodity, is understood as a chance for firms to gain a different amount of money capital  $F'$  after the second phase of the cycle. In the case of time deposit, the chance comes from the time value of money and the changing credit of the bank. The value of the

principal is supposed to be constant at  $G$  during the second phase, because, without buying the opportunity, the idle money will remain at  $G$ . However, during the second phase, the value of the opportunity capital will fluctuate as it's exposed to external financial factors, such as the change of credit risk of the banks and market interest rates. When the firms realize financial income in the third phase, the entire financial income is contributed by opportunity capital.

The second source of financial capital is receivables. Recall the third phase of industrial capital cycle. In that phase, goods are sold and industrial income is earned. However, firms do not always get  $G'$  to end this phase. To increase their competitiveness, firms sometimes get receivables instead of cash to end this phase. Receivables, before they are converted into money capital, are considered as financial capital. They meet the definition of financial capital. When firms accept receivables instead of cash in the sale of goods, they are buying an opportunity from the customers. The value of the opportunity capital depends on the credit of the customers. Thus, we have a second financial capital cycle formula:

$$M' - F < \begin{matrix} P \\ O \end{matrix} \dots e \dots F' - G' \quad (3)$$

Formula (3) will be called Financial Capital Cycle Formula II (FCCF II). The only difference between FCCF I and FCCF II lies in the first phase of the cycle.  $M'$  stands for merchandise capital. In FCCF II, when goods are sold, they are not converted into monetary capital. Instead, they are converted into financial capital, receivables, which can be divided into two parts: principal capital, which represents the sales revenue, and opportunity capital, whose value fluctuates with the credit risk of the customers.

In the balance sheet, financial capital is reported as assets, such as loan and receivables, financial assets held for sale, financial assets available for sale, financial assets held to maturity, and investment property.

### 2.2.2 Financial capital cycle risks

The risks that firms face during the financial capital cycle are called financial capital cycle risks. These risks can be divided into two groups: financial risk and financial strategy risk. Financial risk refers to the unfavorable external financial factors that may threaten the value of opportunity capital. Jorion (2007) further classifies financial risk into five groups: market risk, credit risk, liquidity risk, operational risk and legal risk. Financial strategy risk refers to the risk that the management's strategy on financial capital allocation and financial capital risk management may not be helpful for the firms to earn financial risk. As the value of opportunity capital is mainly affected by external financial factors, financial income can only be earned by luck or by effective financial strategy. Thus, how well financial strategy risk is managed determines how well the firms' goal is achieved.

## 3 The Effect of Firm's Capital Cycle on the Objective of Financial Reporting

The objective of financial reporting is to provide decision useful financial information to the users of financial reports. Observe the decision making process of these users and we will gain some insights on what are useful information. Since equity investor is usually considered as a typical and important user group, our observation will lay on their decision making.

Equity investors' decisions include buying, holding or selling the stocks of firms. According to decision theory, equity investors follow some logical steps to make decisions. First, they will discern all the uncertainties facing them. These uncertainties are called natural states. Let  $S$  represent the state set.  $S = \{s_1, s_2, \dots, s_n\}$ . Since the risks underlying industrial capital cycle and financial capital cycle are different,  $S$  will consist of two subsets  $S^I$  and  $S^F$ .  $S^I$  consists of the natural states from industrial capital cycle and  $S^F$  consists of the natural states from financial capital cycle.  $S = S^I \cup S^F$ ,  $S^I \cap S^F = \emptyset$ . Second, they will compute the expected utility of each action. Let  $A$  represent the action set.  $A = \{a_1, a_2, \dots, a_k\}$ . Each  $a$  ( $a \in A$ ) stands for a specific action. Let  $X$  represents outcome set.  $X = \{x_1, x_2, \dots, x_j\}$ . Each  $x$  stands for an outcome from the combination of some  $s^I$ ,  $s^F$  and  $a$ . Assume that the outcome from industrial capital cycle and financial capital cycle can be separated. Then  $X = X^I + X^F$ . Expressed with function,  $x^I = G(s^I, a)$ ,  $x^F = H(s^F, a)$ . Third, they will apply a subjective probability to each natural state and then choose the action with the maximum utility. Let  $p_i^I$  ( $i=1, \dots, g$ ) represents the subjective probability applied to state  $s^I$ .  $p_j^F$  ( $j=1, \dots, m$ ) represents the subjective probability applied to state  $s^F$ . Function  $F(a)$  represents the utility function of equity investor. If he is someone with economic rationality, his action can be expressed as follows:

$$\max F(a), (a \in A) \quad (4)$$

$$\begin{aligned} F(a) &= \sum_{s^I \in S^I} U(x^I) p(s^I) + \sum_{s^F \in S^F} V(x^F) p(s^F) \\ &= \sum_{s^I \in S^I} U(G(s^I, a)) p(s^I) + \sum_{s^F \in S^F} V(H(s^F, a)) p(s^F) \\ &= E[U|a] + E[V|a] \end{aligned} \quad (5)$$

Formula (5) gives us some insights on what information is supposed to be decision useful information. First, as equity investor knows that the risks underlying industrial capital cycle and financial capital cycle are different, they tend to compute outcome  $x^I$  and  $x^F$  separately. This means that they need information that helps them to evaluate the value of assets attributable to industrial capital cycle and assets attributable to financial capital cycle. Specifically speaking, they need information that enable them to discern  $s^I \in S^I$  or  $s^F \in S^F$ .

Second, though we assume that the form of utility function used by equity investor is fixed, the forms of utility function used to compute the utility from industrial capital cycle and financial capital cycle are different. Function  $V(x^F)$  is usually more risk averse than function  $G(x^I)$ . One reason is that the variance of  $x^F$  is far larger than  $x^I$ . The other reason is that  $x^F$  will not recur typically while  $x^I$  has a higher persistence. Since equity investor has experienced several financial crises in recent years, it is expected that function  $V(x^F)$  is more sensitive to unfavorable outcome than favorable outcome. The difference between the form of  $G(x^I)$  and  $V(x^F)$  means that equity investor's information need in computing outcome from industrial capital cycle and financial capital cycle is not symmetrical. The high risk characteristic of financial capital cycle forces them to require more risk information, so that they can reach a more accurate computation of utility.

#### 4 Conclusions

What is decision useful information? This essay tries to answer the question by analyzing the two capital cycles, namely industrial capital cycle and financial capital cycle, within firms and the risks underlying these two cycles. It concludes that decision useful information should include information that sheds lights on the risks underlying the two capital cycle respectively and information that is helpful to compute users' utility on industrial capital cycle and financial capital cycle respectively. The contribution of this essay is that it combines the understanding of capital cycle and information users' decision making process to discern what information is considered decision useful. This method is different from that taken by standard setters, who consider that decision useful information is information that meets certain qualitative criteria. Since the understanding of decision useful information is so important for the achievement of objective of financial reporting, more methods should be explored to shed light on it.

# Communication Characteristics of the Meanings of Advertising Works in the New Media Age

Li Xiaodan

School of Media and Law, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: lixiaod@whut.edu.cn)

**Abstract:** In light of semiology and communication theories, the paper analyzes the communication characteristics of meanings of advertising works under the new media situation, and attempts to put forward an analysis model for the meanings of advertising works. The meanings of an advertising work tend to be more complicated and polysemous in the creative phase especially when the multimedia display has become more frequently-used currently. In the decoding stage, the meanings of an advertising work tend to be unlimited according to the selectivity principle of understanding, because the communication based on new media has special characteristics such as personality and interaction which highlight the power of the audiences' interpretations of advertisements. It is found that there are only six factors as the focuses of the meaning polymerization in the whole advertising communication process, and the dominant role in the dynamic variation of six factors determines the final effect of communication.

**Key words:** Meanings of an advertising work; Communication characteristics; Complication and polysemia; Meanings communication process; Factor; Communication and semiology theories

## 1 Introduction

Under the environment of new media, advertisement is almost seen everywhere and has drawn a wide attention. It is not only a marketing tool but also a social actor and a cultural artifact along with the more and more pervasive impact of new media on society. Advertising activity is a kind of meaning communication about the ad works, so it is necessary to study on the communication characteristics of the meaning of ad works. It is beneficial to be more objective and accurate for predicting advertising effect and its social influence, and lead the advertisement culture to develop in a sound way.

Researches on the meanings and communication characteristics of advertising works started in 1950s and 1960s. Some famous scholars made pioneering studies, such as Roland Barthes, who made his studies from semiotic perspective; James M. Vicary and Wilson Bryan Key who did from a psychological perspective; and Frankfurt School from the perspective of the social critical theory. In China, lots of related research papers have been published since the 1990s. These researches disclosed the complexity of the meanings of ad works from different angles. However, up to date, there is not an effective meaning analysis model of ad works which has been generally accepted. With the appearance of new media age, the meaning communication of advertisement shows some new characteristics. What are the new characteristics? An effective meaning analytical method is based on a better understanding of the characteristics. So this article attempts to analyze and probe into this question. It mainly focuses on three aspects: signifying characteristics, decoding characteristics, and the dynamic variation characteristic of the meanings of ad works in communication process, to aim at more effective analytical method of advertisement.

## 2 Evolving Tendency of the Meanings of Ad Works in the New Media Age

### 2.1 Advertising creativity makes an ad work complicated and polysemous

The purpose of commercial advertising is to disseminate sales promotional information, but the implications of ad works loading promotional information are complicated. The primary reason is that creative strategies make ad works polysemous. It is a common phenomenon for advertising-minded people to put product information into some new meanings. Like Leo Burnett, the advertising master stated, "Good advertising does not just circulate information. It penetrates the public mind with desires and belief." (Leo Burnett, 1960s). In addition, as far as the creativity aim is concerned, ad works should firstly attract the attention and interest of the audience, and then spread commodity information to arouse their purchasing desire. Under the modern media background, novel advertising creativity is one of the important ways to capture markets in the increasingly fierce competition. The famous AIDMA theory also indicates that advertising should be attractive, interesting and memorable (E.S.Lewis, 1898). Otherwise, the advertising message will just pass unnoticed without leaving anything in the mind of the

audience. In order to attract a variety of audiences, the advertising information should be endowed with rich implication. Therefore, advertising creativity would make an ad work polysemous by a variety of rhetorical means rather than simply show advertising information. For example, “Start ahead” (Rejoice shampoo) uses the homophonic pun and makes intentional ambiguity; “Come to where the flavor is. Marlboro Country” attempts to evoke rich associative meanings.

**2.2 Nonverbal symbols of multimedia make advertising meanings uncertain**

The secondary reason of ad content complexity is that, in new media environment, multimedia has become a familiar means of ad presentation. The expression and transmission of advertising information are realized by symbolized means such as language and image building. Symbols or codes consist of two types: verbal and non-verbal ones. The multimedia advertising works use more nonverbal symbols such as picture, voice, animation, etc. The English scholar Michael Argyle considers that verbal codes are normally used for communicating conscious information, whereas non-verbal codes usually reflect unconscious implication and express attitudes and emotions (Michael Argyle, 1972). Accordingly, meanings of nonverbal symbols are of uncertainty and fuzziness. So the explanation to nonverbal symbols is intuitional and easily influenced by the receiver’s experience, emotion and mood. Though verbal symbols can give specific meanings explicitly, the clarity may be relative in multimedia presentation. In the complex context, it is likely that there are many kinds of different interpretations of the same discourse. And, as Cadamer said, the significations of the text do not sometimes but always transcend the intentions of the speakers (Hans-Georg Gadamer, 1960).

**3 The Highlighted Power of the Audience’s Interpretation of Advertisement**

**3.1 The meaning system of advertising works**

The meanings of an advertising work are all significations of symbols, including the meanings that the advertiser and admen want to communicate and the accepters comprehend, are referred to as advertising information, rhetorical meanings and associative meanings respectively in this paper. (Because the audience’ perception is selective, this paper calls it associative meaning. the following text will discuss this.) Figure 1 shows the meaning system of advertising works.

**Figure 1 The Meanings of an Advertising Work**

**3.2 Interaction and real-time sharing highlight the power of the audience’s interpretation of advertisement**

Nowadays, the audience’s interpretation is more striking. Interaction and real-time sharing represent the main difference between traditional media and advanced ones. The report from CNNIC shows that the number of netizen in China has exceeded 500 million in 2011 and is still increasing. The internet penetration rate stepped up to 38.3% compared with those at the end of last year, increased by 4% (CNNIC, 2012.1). Interactive social network sites have a great impact on people’s lifestyle. With the popularization of blog, qq, microblog, videosharing, etc., people are more convenient to air their opinions openly. The audience can express their opinions and evaluations on advertising immediately. So the power of the audience’s interpretation of advertisement is highlighted. In such case, it becomes more important to research on the law of audience decoding ad works.

Selectivity is a basic characteristic in audience decoding activity according to the communication theory. It includes selective perception, selective exposure and selective retention. The law also discloses psychologic characteristics of audience of ad works. The advertisers and admen always preset a certain theme into an advertising work, but the audience is distractible appreciators. Due to their selective notice, perception, and memory, their explanations are subjective, random and rich in associations. It indicates that the audience can recreate new meanings for an ad work. As to the advertising signal, they can omit it, distort it, or choose what they are fond of by the individual wills. Namely, the comprehension of audience may not be restricted by the presupposition theme. In creative process of an ad work, if admen cannot comprehend their work in view of consumers, they may bring about some troubles. For instance, China banned a Nike TV commercial titled “Chamber of Fear”, because the ad showed the celebrity LeBron James battling a cartoon Kung Fu master and a pair of

dragons, considered as a sacred symbol in traditional Chinese culture. The ad had received an indignant response from Chinese viewers, and Nike Inc. later apologized for the advertisement (China Daily, 2004).

**3.3 The meanings that audiences follow**

What are the meanings that the audiences follow? The polysemy and uncertainty of symbols provide an extensive space for people’s comprehension. “The same text may have different meanings for different persons, and for the same person at different times.”(Jaap van Brakel, 1995). The perception based on the symbols in ad works comprises three kinds of associative meaning. The first is associative meanings aroused by a single sign, for example, “red” may be interpreted as “passion”, “blood” or something else related to individual feeling. The second is co-occurrence associative meanings caused by some combined symbols, the audience can combine the symbols or meanings at random. For example, on a simultaneous celebrity and brand TV show, the audience maybe like the brand because of adoring the celebrity, or hate the celebrity because of disgusted brand experience. The third is the integral associative meanings based on the unity of the ad work.

In addition, comprehension is affected by many factors such as culture, view, status, attitude, emotion, mood, need and even unconsciousness. The meanings assigned to the advertisement may be relate to any aspect such as product, feeling, view, society, culture, form and style, etc. Thus the associative meanings of an advertising work probably consist of an unlimited set of meaning items.

According to the previous analysis, the new media environment is more likely to lead to the meaning set of an ad work unlimited expansion. Linguists have tried to establish componential analysis theory, but there is not an effective meaning analysis model of ad works which has been generally approved of. Though it is difficult to know all meanings, we can try to hold the communication process by studying the characteristics of meaning communication.

**4 The Meaning Communication Process and Dynamic Variation of Advertisement**

**4.1 The meaning communication process of advertising**

R.Jakobson, the famous semiotician, put forward that any communication process is composed of six factors: the addresser and the addressee; the message; the code; the context; the contact ( R.Jakobson, 1960). The model is applicable for advertisement analysis. The meaning communication process of advertisement can be described as follows (Figure 2):

**Figure 2 The Meaning Communication Process of an Advertising Work**

The communication process starts because the advertiser intends to spread the ad information, and the end is addressee (namely, audience, consumers). Information communication needs the contact between addresser and addressee. The contact is realized through different media channels, and it must appeal to codes. Context is the most complicated factor, having powerful impact on meaning communication. An ad work faces double contexts: one inside the work and another outside the work. The former is composed of discourse, story, picture, action, etc. which are designed in the ad work. The latter (context outside the work) includes time, place, occasion of communication, and participants’ occupation, ideology, education, mentality, etc. Context exerts a great influence on interpretations of works.

Because every code system has some uncertain and fuzzy elements, there is always a considerable number of meanings that the audience comprehends by context, code and channel feature. For example, the brand “Kong Fu Jia Jiu liquor” naturally arouses the association of Chinese culture; a lot of people think ads on CCTV credible because they believe the medium.

**4.2 The dynamic variation of advertising meanings in the communication process**

Although interpretations differ in thousands of ways, these meanings are usually oriented toward one of the six factors. So each factor of them is a focus of the meaning polymerization. There is a

function of communication corresponding to each of them. But they are unbalanced in a communication process. One can be predominant, holding the communication process, and leading the audience inclination. When addresser is predominant, the meanings of establishing image for the advertiser and sales promotion are outstanding. The referential meaning is oriented toward the context (e.g. the meaning as “who is the actor of the ad?”). When the communication emphasizes the contact, medium may draw the audience attention. For example, somebody may believe a TV ad because he trusts in TV. When code is the predominant factor, the dominant meanings may like “What is the style of the ad work?” and “Is the picture beautiful?”, and so on. If the communication is oriented toward message, commodity information is the most attractive.

#### 4.3 Ways to seek the dominant meanings

(1) The analysis of core meaning items based on the six factors. The theory of six-factor model provides an effective method that simplifies the analysis process. Even in the environment of new media, the communication process is still composed of the six factors. The meaning analysis model based on six factors pays attention to the meaning polymerizing focuses and semantic orienting directions rather than all meaning items. The core meaning items are the items that represent the semantic orientation and lead the audience inclination. So we can set about analyzing the features of six factors in an ad communication process, and then find the typical and representative meaning items around each factor. Modern interactive networks and social networking sites provide a platform for finding core meaning items. Leech classified meanings into seven kinds: conceptual meaning, connotative meaning, social meaning, affective meaning, reflected meaning, collocative meaning and thematic meaning (Leech, 1974). The reasonable classification also offers reference for a strict analysis. Based on this analysis, maybe we can find some clues that control the communication process.

(2) Investigation. When a single theoretical analysis cannot solve all problems, investigation is essential. What is the most attractive factor to the audiences? A survey released in 2007 (by the School of Journalism & Information Communication at Huazhong University of Science & Technology) showed that about 35 percent of people thought it is picture and music in an ad work, about 30 percent thought it is advertising information, and nearly 15 percent thought it is story or brand. But a correct conclusion is determined by different situation at that time. Constant investigation and research are the scientific method of market prediction. Today sharing and opening networks facilitate consumer investigation greatly.

## 5 Conclusion

To sum up, this paper discusses the meaning communication characteristics of advertisements in signifying and decoding stage under the new media situation, and presents the dynamic variation characteristics of six factors in the communication process. An advertising communication process is composed of six factors: the addresser and the addressee; the message; the code; the context and the contact. In view of the uncertainty and complication of ad meanings and the unlimited probabilities the audience comprehends, this article finally puts forward a core meaning items analysis model based on six-factor model. The model simplifies the meaning analysis process and is more likely to find the dominant factor and meanings that lead the communication process. Of course, besides a scientific theoretical analytical method of advertisements, investigation and research are essential and effective ways of market prediction.

# Core Competencies And The Strategic Management of R&D

Li Wenjing

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail:1239125111@qq.com)

**Abstract:** This paper expounds the theoretical paradigm of the importance of core competitiveness. Points out the advantages of core competence model pointed out that links and strategic management one, mutual trust and salary incentive system, in order to reveal the effects of the research and development. First of all, we know the important of the research and development. we focus on the view of the communist party of China. And then we do detailed research on the core competitiveness of the potential of the most important factors in the description, and give the empirical analysis to support this view. Finally, we can draw the conclusion is that research and development manager and their clients directly within the company between common co-sponsor more and more attention, we can be in continuous research, the case study company.

**Key words:** Core competence paradigm; Strategic management; Research and development; Organizational structure; Multiple linear regression model

## 1 Introduction

Large enterprise strategic management of research and development (R&D) is very important to the core competitiveness of the example (CPC). The communist party of China and emerging between R&D of literature of strategic management a crucial issue has a primary instrument panel similar. The problem isn't as an independent strategic business units (SBUs) of the set, but as a SBU use some common enterprise resources of the concept of diversified company set. Think of the communist party of China, the enterprise can find out the core competitive power, it is the company's unique professional knowledge accumulation, learn from the previous investment. These ability is seen as long-lived assets over specific product market business unit by using these skills. The following mandatory meaning is core competitiveness, becoming the fulcrum of the strategic decision, and excessive dispersed, control SBUS may endanger their sustainable development and value. Nowadays some other methods can also promote the communist party such as mutual trust and salary incentive system, we can use specific data to prove this view.

## 2 The Core Competence Paradigm

Core competence can be thought as consisting of bodies of technological expertise (both product and process) and the organizational capacity to deploy that expertise effectively. Thus they are not simply technological in character, they are also organizational. They are embellished and strengthened through continued using (in other words they are subject to positive returns), and therefore to some extent firm-specific and non-transferable. Indeed, the definition of CCs, given by Prahalad and Hamel insists that not only must they give access to multiple markets, and confer specific advantages to customers, but they also must be difficult to imitate.

CCs are not monolithic. They have an internal structure which is composed of a number of capabilities. The organizational dimension of a core competence appears to lie in part in the ability to combine appropriate capabilities into specific competencies.

Competencies are given a physical and commercial reality in core products, which have a market leading performance in a specific area of the customer's functionality requirements. The often quoted examples here are Canon's laser-printer engines, and Honda's high revving, smoothly performing internal combustion engines. Core products are then deployed in a variety of end-products.

The principle of a variety of technologies (capabilities), being combined in many permutations to create a variety of end-products is not in itself new. The specific feature of the CC paradigm seems to be the emphasis on the intervening concepts of CCs and core products. These are, in essence, particular combinations of capabilities, which are robust over time, confer specific advantages to the supplier and the customer, and therefore create a preferred and firm-specific migration path from technological knowledge to end products for the firm in question. Once this is recognized by a firm, it is then argued that they can use their CCs as an 'orientation device' to shape strategic choices about acquisition of new technologies and development of new end products. Basically, if a technology strengthens your CCs you should acquire it, and if a product exploits your CCs, you should make it. This method seems to create a

need within the company for intelligence and forecasts concerning technical trends and market trends, in order to 'steer' the evolution of the CCs.

Some of the practical implications of this perspective are defined by contrasting the CC paradigm with an outlook based on seeing a corporation as a collection of more or less autonomous SBUs. It is pointed out that a business run as a portfolio of SBUs is in danger of dissipating CCs, or even of inadvertently outsourcing them. CCs can get 'imprisoned' within one SBU and not be made available to other SBUs. The people who are the embodiment of the CCs can be insufficiently mobile with respect to the SBUs. It is clear then, that in the context of large multiproduct firms, the concept of CC is designed to act as a representation of the overlaps and synergies between products. These overlaps and synergies are what make the diversification pattern of the firm rational rather than random, and in addition, they make the firm capable of specific differentiations of its products which confer competitive advantage. Without the use of CCs, a firm's products are less likely to be competitive and less likely to add new cumulative skills to the firms' armory.

### **3 The Link Between Core Competencies and Strategic Management of R&D**

If we now attempting to integrate the two discussed the concept and language, we found some preliminary simple results:

(1) it is one of the duties of R&D acquisitions, produce technical ability, this is the core competitiveness of the important cornerstone.

(2) many of these function is about other business, and research and development manager is often the "default" department manager, technical benefit protection a position of responsibility, appropriation system make it difficult to the operation of the department for cooperation.

(3) in the innovation of the specific application of the project research technical ability, the production of new products and technology, function dependent on complex coordination process, it also involving marketing and operation function. These coordination process, which spans the entire division, and often beyond the other parts of the company's division, is in fact the dimensions of the core competitiveness of the organization is an important part. These coordination process, have a firm specific character lead to the market and technology constraints of the specific experience accumulation.

Therefore, the research and development of the company is the function of the core competitive power web site, but it has two main joint or with the core competitive power point of contact. The first joint investment mode is: in one of the R&D and R&D activities related to the management and development of the technical ability of the combination, in such a way that it directly into the company's core competitiveness of the feed. Therefore, this can't do enough, unless these core competitiveness has been set. The second cohesion is harvest mode, with the orientation of market development of core competitiveness, produce specific cultural relic, or provide for the customer service function and other divisions of functional participation.

The core competitiveness of the potential of the most important factors in is: organization structure, dynamic economies of scale and market knowledge.

The structure of the organization: and this related structure, especially those innovation and product development in the process of connecting various function contributor. These are the level of the SBU between technical personnel, marketing function, operation function of contact. Because the other business related to the core competitive ability, part or all of these functions will allow the skills and knowledge, to the dept of migration between, or division of the organization is Shared between function.

Dynamic economies of scale ability, must continue to shrink, so that they don't exercise. Develop a products in the fields of competitiveness to create new knowledge, expand and deepen ability, make it in other areas of the future of the precious mining. Ability, so be through the perfect and polishing are using, and increase the value of the company.

Market knowledge: a broad definition from all fields for market (which may include suppliers and customers market), this is necessary to make core competitive ability constantly to be translated into core product knowledge.

### **4 The Behavior of Mutual Trust Between the Employees and Managers**

Part of the behavior of mutual trust between the employees and managers can promote the company's core ability, including management activities, signal hint can give employees bring greater incentive mechanism, improve work enthusiasm, jointly promote the company's every level of the development. WILLIMS (2007) had stressed that in both sides of the interaction, trust the grasp of the

party trust mechanism produces social mechanism, and some behavior strategy for his party's reputation can be emotional and cognitive behavioral effects, and the conclusion that, so the mood has established more active. Therefore, if the enthusiasm of management as a trusted party. This is no doubt can get the party's trust effective response. To further discuss research, we might as well do two related hypothesis: suppose a employee behavior and loyal employees are related cognitive trust regulation. Assumption 2: employee behavior and loyal employees are related, in the research process of the emotional trust supervision, we take the way of questionnaire survey, involving the electric power industry, chemical industry, real estate, tourism, etc, altogether collected to the sample of the more than 500 valid questionnaires, SPSS, linear structure, high level statistical software processing, display, employee behavior and management staff credible cognitive trust and emotional trust relationship model fitting is better, RMSEA = 0.061, SRMR = 0.047, fitting index CFI = 0.9, international financial institutions = 0.90, NNFI = 0.89, visible, assuming that get the support of the data.

Model:

Employee trust regulatory role cognition:

$$\begin{aligned} L1: CT_j &= \beta_{0j} + r_{ij}; L2: \gamma_{00} + u_{0j} \\ L1: CT_j &= \beta_{0j} + \beta_{1j}(IT_j) + \beta_{2j}(EC_j) + \beta_{3j}(DS_j) + \beta_{4j}(LY_j) + r_{ij} \\ L2: \beta_{0j} &= \gamma_{00} + \gamma_{01}(FO) + u_{0j}; \beta_{1j} = \gamma_{10} + \gamma_{11}(FO) + u_{1j}; \\ B_{2j} &= \gamma_{20} + \gamma_{21}(FO) + u_{2j}; B_{3j} = \gamma_{30} + \gamma_{31}(FO) + u_{3j}; B_{4j} = \gamma_{40} + \gamma_{41}(FO) + u_{4j} \end{aligned}$$

Staff emotional adjustment role trust:

$$\begin{aligned} L1: AT_j &= \beta_{0j} + r_{ij}; L2: \beta_{0j} = \gamma_{00} + u_{0j} \\ L1: CT_j &= \beta_{0j} + \beta_{1j}(EC_j) + \beta_{2j}(DS_j) + \beta_{3j}(LY_j) + r_{ij} \\ L2: \beta_{0j} &= \gamma_{00} + \gamma_{01}(FO) + u_{0j}; \beta_{1j} = \gamma_{10} + \gamma_{11}(FO) + u_{1j}; \beta_{2j} = \gamma_{20} + \gamma_{21}(FO) + u_{2j}; \beta_{3j} = \gamma_{30} + \gamma_{31}(FO) + u_{3j} \end{aligned}$$

Note: L1 = first layer model; L2 = the second model, CT = cognitive trust; IT = upright; EC = attribute for under; DS = cautious behavior; LY = loyal behavior; FO = system control; CM = organization atmosphere.

## 5 The Salary Incentive System To Promote CCP

In addition, still have a plenty of a strategy of the salary reward mechanism of the core competitive power. Salary incentive system exists in the from all walks of life position. Ordinary employees need to be paid for the incentive, company executives also need high return of pay. This is usually in some monopoly industries, in recent years, particularly outstanding. Employee wages have been going up, this phenomenon results from increase control executives employee welfare brings high wages can make senior management pay more attention to the control. It is, after all, high control, to improve the company's core competitiveness positive effect, we may as well test it again with the empirical analysis.

Hypothesis: executive compensation, executives and control were positively correlated. We choose as test samples and range from 14 home typical industry, including banking, insurance, such as manufacturing, some of the listed company, we get from CSMAR and the company's annual report data. The final agreement with the help of SPSS, the data, it is not difficult to find: with this year's growth, executive pay a significant increase, the staff increased to 1 was significantly lower than the management personnel, including the financial industry, or in the first. And in recent years the core competitiveness of the financial industry increased many indeed. So we can think, higher salary incentive mechanism, and improve the core competitiveness of the enterprise.

## 6 Conclusion

This paper thinks, a research and development manager and their clients directly within the company between common co-sponsor more attention to and have reliable mechanism, and also to the research and development of effective directly rapid innovation and long-term technical strength accumulation. This led to research and development manager seeking analysis tools to help them identify technology has the competitive advantage of multiple division, special meaning, and for long term strategic orientation, but located close to their enterprise the core of strategy. The core competitiveness of the enterprise strategy as a new model of the idea that the review parallel literature, ability can be a useful key equipment, to help create the linkage between the technology of enterprise strategy and non-technical agenda. In order to develop this idea, now need further study on the specific company specific core competitive ability, the ability and the research of the units of the connection between the strategy. Fully do this the detailed analysis of the level is such, long-term case studies, is likely to be the best approach. The work itself is hung in the case study of the technology development

strategy, the actual practice.

## Research on College Students' Spiritual Life under the Network Information Technology\*

Wang Qifeng

Department of Student Affairs, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wangqifeng@whut.edu.cn)

**Abstract:** This paper puts the reality that the influence and innovation of the development situation of science and technology on people's spiritual life as the logical starting points. On the basis of stating the basic implications of the network information technology, the author gives an analysis of college students' spiritual life under the network information technology. The conclusion that the internet is the new space of college students' spiritual life, the network information technology innovates college students' spiritual life style and is likely to dispel the meaning of their spiritual life simultaneously is obtained.

**Key words:** Network information technology; College student; Spiritual life

### 1 Introduction

Since the 1940s and 1950s, with invention and applying of electronic computer, space technology and biology technology as major characteristics, human have launched an information controlling technology revolution which touched information technology, new energy technology, new material technology, biology technology, space technology, marine technology and many other fields. And this is the third giant leap in technology after the steam technology revolution and electrical technology revolution. This revolution of science and technology leads people's social life and its modernization toward a higher development level. It not only promotes the development of human society, economy, politics and culture greatly, but also impacts people's life styles and thinking modes deeply.

"IF we regard plough and millstone as the characteristics in agriculture times and steam engine and motor as the characteristics in industrial age, computer and network must be the characteristics in information era."<sup>[1]</sup> In 1969, the ARPANET was born in the United States Department of Defense. After that, the internet spread its feelers into all fields in people's life. Particularly, since human stepped into 21 century, the internet has influenced people's life in various aspects with its unprecedented spread speed, irradiation space, interactive mode and rich intension. The network information technology is the typical one of science in modern times. The network information technology turns the internet into an organic whole by gathering and integrating its resources, and realizes the goal that its resources can be shared completely and worked together, and let people use its resources transparently and acquire whatever you need. The biggest development tendency of the network information technology is multi dimensional. That is offer a kind of information integration service to the user on one system, including many resources come from politics, economy, culture and other fields. It even also can supply multi-media information simultaneously, such as pictures, audios, videos and so on. With the development tendency of multi-dimensional of the network information technology, information sharing, network chatting, electronic mail, internet trading, video playing and many other new forms of network application emerge constantly, which enlarges and expands people's sense organ, nerve system and brain function. On the basis of the charm of its unique virtual, global, open, interactivity and real-time, network information technology not only promotes the development of economy, political and culture of human society greatly, brings people a completely new world, but also changes our mind and philosophy of life simultaneously.

The development of spiritual life is inseparable from certain social historical conditions. There are many impact factors, social productive forces, the mode of production of material life and the development situation of science and technology, which may restrict and influence the development and characteristic of spiritual life. The rapid development of network information technology is one of major characters. On the issue of the influence of network information technology's rapid development on human society and its development, the current research mainly bases on the material life style's influence. There is not so much research on the field of mental world's influence of network information technology, especially among the college students group which is the largest part of network using

---

\* This paper is supported by Research on independent innovation foundation of Wuhan University of Technology(2011-Ib-041).

people. Thus, on the basis of presenting the content of network information technology briefly, the essay analyses and introduces college students' spiritual life under network technology.

## **2 Network Is the New Space of College Students' Spiritual Life**

### **2.1 General views on college students' spiritual life**

College students' spiritual life is, on certain social historical conditions, college student group implement, facing their inner world, a series of practical activities to answer their spiritual demands. Meanwhile, it is a kind of specific modality through which college students pursue the meaning and value of life initiatively and illustrate the essence of their existence. The college students' spiritual life represents the cognition, action and condition in their value choosing, knowledge obtaining, morality practicing, culture evaluating, emotion experiencing and entertainment appreciating. College students' spiritual life can show their mental outlook, embody students' spiritual value and reflect the essence and meaning of campus life.

### **2.2 College students' spiritual characteristic on network living space**

College students meet their mental needs of obtaining information and gaining knowledge through the network. The present network has been a huge virtual library and a kind profound instrument. College student may obtain lots of information and knowledge by using the internet at home. As a survey showed that 52.3% of information comes from the internet directly or indirectly, if they need material, what the 82.5% of students would first call to mind is the internet, and there are 86% of the student visit some subject websites or material websites which are related to study. In 2009, as the questionnaires of college students' web actions in Xi'an showed that there are 21.6% of the students often log on campus website and look for some useful campus information, 31% of students choose to collect paper material through the digital library, 49% of the interviewees think that the internet benefit them a lot to their study. However, there is only 10% of the student view that the internet benefits them a little. The survey result bespeaks that network has been to be the main platform firmly and prominently for college students to obtain learning information, and has received positive affirming.

College student voice their pursuits of freedom and equality on the internet. As a survey shows that, facing the question of "what is the biggest superiority of the internet do you think", their answers range from freedom (47.2%), free charge (20.3%), equality (18.5%) to efficiency (14%). We can see how strong college students' yearning for the freedom and equality. There is 47% of student participate the voting activities on the internet, they exchange their idea, present comments on the social issues or political issues and express their appeals through the campus BBS, QQ groups or micro blogs. In addition, there is 14% of student often post messages for college's development and self-accomplishment at the virtual forum.

College student show their spiritual features of upholding personalities and pursuing fashion on the internet. Take their "net language" for example, recent years, there are a lot of concise, humorous, vivid and creative net languages appeared. Such as "ou"(a kind lively say to me), "dongdong" (means things), "zaozhuan"(means writing by heart), "7456" (means "I angry very much"), "886" (means bye-bye) and so on. These words and phrases are very popular with its vanguard, fashion in college students, and give a chance to experience a different life style and a different self. "In 2011, as the questionnaire among seven universities' student in Hubei province shows that 90% of student use the net languages during chatting by QQ or post messages at the BBS forum, 63.2% of student is familiar with the popular net languages and have their words at hand."<sup>[2]</sup>

College student may experience the dynamic, fashionable, rich, visual spiritual recreation. Net film and net TV, online game, online chatting are the main net recreation for college students. Novel and exciting online game, fair-sounding net music, dynamic and abundant video, various network novels, all these things have very strong attraction to college students. "In 2009, as the questionnaire among partly college students in Chongqing shows that 77.4% of student choose recreation as their major activities on the internet, and nearly 18% of student choose online game among these recreation, and the rest people choose chatting, listen music and watching movie as their main recreation style."<sup>[3]</sup>

## **3 The Network Information Technology Influence College Students' Spiritual Life**

College student is the largest group among cyber citizens. Therefore, the internet has an abroad and deep impact on college students' spiritual life.

### **3.1 Network information technology innovate the manner of college students' spiritual life**

#### **3.1.1 Innovation of knowledge style**

Study is the major part in college students' spiritual life. Learning from teacher in classroom is the main access to acquire knowledge for student before personal computer is available to them. Different professors receive mixed feedback under this kind of knowledge style for the sake of its single form, limited content and the time lag. Thanks to the rapid development of network information technology, the internet and its abundant resources have been the principle access to knowledge for college students. In the endless knowledge world created by the network, College students may obtain various kinds of information, broaden horizon and improve their knowledge structure by using these resources. Meanwhile, students can keep the same state of the time and space with the knowledge publishers by its improvement of the time lag. In addition, student could learn ideas from different professors on the internet, and voice their own opinion during communicating with the same interest people on the internet. The broadest possible group can publish their views and present questions on this platform. Network is just like the latest classroom in which many professors are the teachers and the utility media are the new study forms. College students' new knowledge style has subverted the convention under this internet environment, and this tendency must be deepened by the developing network information technology.

### 3.1.2 Innovation of speaking manner

Language is a man of the inner spirit external expression. The speaking manner can reflect college students' spiritual life style partly. Compared with traditional expression manner, such as talking face to face, letter and writing, the network technology has profoundly altered the way on which college students express. Making personal website, opening blogs and QQ zones, or using podcasts, all these have been the new speaking manners among college students. They can chat with friend by QQ, MSN, Micro blogs or Fetion. These manners gathered words, videos, audios, photographs and many other forms, college students can present thoughts, exchange academic views and spread friendship through these manners. In addition, the important significance of these manners also bespeak they remove the influence of the status and offer an equally space for college students to express the true individual. Recent years, many college students consult and communicate by the campus BBS, they'd like to offer help and consult through these network speaking manners. Thus, the network information technology creates those new speaking manner, simultaneously promote college students to develop the sense of equality, lenience and open.

### 3.1.3 Innovation of recreation manner

Recreation is a state of spiritual life. It is more like a wind vane for the material well-being modern citizen. Before the internet is available to college, no matter it is college students learned ballroom dancing in 1980s and 1990s or collective outing. No matter it is reading quietly under the point of enriching their spiritual life, or playing Mahjong and pork to kill time. No matter it is thinking during reading, or listening to broadcast and watching TV. College students' recreation manners are the continuation of the traditional way of entertainment in China society. The present network is a complex which gathered words, photographs, audios and videos. It is a diversified recreation platform on which filled with many wonderful articles, colorful pictures, melodious songs and vivid videos. It can see, hear, say, sing, dance simultaneously. The recreation manners on network have a great attraction to fashionable and creative college students. Thanks to the network, students' creation is no longer a single color. Listening music, playing computer games, reading news, chatting or even shopping on the internet, all these are the expression form. College students make full use of the internet to choose spiritual and cultural products which they like. And they achieve the purpose of entertainment by different recreation manners.

## 3.2 Network information technology probably dispel the meaning of college students' spiritual Life

College students are probably dominated by "digitized facility", becoming a simplex "digitized man". The network can simplify the material world into "bite", and the meaning in philosophy of this kind of simplification is human nothingness. When the information technology, characterized by the internet, bring human to step into powerful network world, "Since people dedicate into digitized circumstance and break away from the 'present' social relation too long, they regard themselves as pure 'bite'. .... And step into the process of digitization so that make themselves into one-sided man."<sup>[4]</sup> "The dependent relation between human beings in reality is replaced by the network one, both the word and action are transferred into binary language on the internet, and people's emotions and appearance spread on the screen by the digital way. As a result, human become the digital existence."<sup>[5]</sup> College students are at a passive and controlled position because they dedicate into digital circumstance and dominated by the 'bite'. Thus, they are easily indifferent to everything and their senses of justice and morality are easily numbed by the 'bite'. Finally, they probably lose themselves when live in the so-called free space

which controlled and monitored by bite and number. The communication relied on network makes college students wouldn't like to or even can't talk with others face to face sincerely. Their emotional world may easier be closed and cold when the essence of communication becomes the exchange between students and computers. Recent years, most of the students who have internet addiction often are accompanied by cold emotional world. They are gradually becoming the "hollow man" who has no life goals and value orientation under the controlling of internet. The network information technology excessively expands the thought of scientism among college students.

The network information technology leads college students' thought about "science supremacy" excessively broaden, and causes the instrument rationalism trespass upon value rationalism. The main characteristic on the powerful attraction of the network world and the students' pursuit to technology and fashion probably makes the students over worship the science under the influence of network information technology. Meanwhile, regards the science as the only standard of value to measure social improvement and people's overall development. What's worse is that many Chinese colleges' shortage on the education of science and human thought for a long time increase the number of this one-side thought. In addition, college students' curiosity and immature mind increase their interests in using technology, especially the network technology, to realize their certain psychic gratification. These psychic characters, however, stimulate them prefer the network technology and internet world. When college student think technology may take control of the whole world and run through the universe freely, they actually have become the slave of the technology, and then their value world would disappear in spiritual life.

The network information technology cause college students trend to sense experience and lack of the thinking on things' essence and meaning. The network brings people abundant information and the enjoyment of colorful life and partly replaces people's firsthand experience simultaneously. "The network makes people's inner individuals have a general and superficial touching with the outside world, and far away with the core of personality."<sup>[6]</sup> The back of recreation and entertainment reflects its plane, shallow and vulgar characteristic. The dedicated students trend to the sensory stimulation, which often becomes college students' value target. When the happy or unhappy on sensory becomes the standard to measure realities and values, however, life must lose all its meanings and values. The direct and visual acceptance way on the internet aggravates the tendency which views things emotionally and shallowly among college students. Meanwhile, it affects, to some extent, students' rational thinking, causes students lack of rational analysis to things' essence and meaning, and discard the mode of thinking through which students may think and query the essence. Rudolf Eucken point that "If man can not pursue a lofty goal by relying on a kind of higher power than human himself and realize themselves more fully than sensory experience on the way to advance, life must lose all its meaning and value."<sup>[7]</sup> What's above the network information technology is the college students' excessive pursuit and experience to material and sensory stimulation. Its company, however, is the decline of life.

#### 4 Conclusions

With the development of the internet, the youth, who were born after 1977 and lived in the digitized environment, have been the first generation. Their life style and behavioral pattern embody sharply the characteristic of networked and digitized living logic. Thus, the network information technology has influenced college students' spiritual life deeply and widely. In this special net world, college students' value conception, social psychology, spiritual status, mode of thinking, knowledge structure, moral integrity and aesthetic sentiment have changed greatly reflected by their daily study, association, communication, recreation and entertainment. In a word, the network information technology make the internet become the new space of college students' spiritual life, innovate the mode of college students' spiritual life, but it also cause the side effect that it probably dispel the meaning of college spiritual life simultaneously.

## Discussing Ideological and Political Education's Attention and Guidance on College Students' Personality Development

Liu Ying

School of Art & Design, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: richliuying@163.com)

**Abstract:** College ideological and political education should pay attention to the personality development under the students' intergraded development, and should always show respect on their thought freedom, independent personality, value pursuit and life dignity. While currently some students lack correct recognition of individual character development, colleges and universities still have some dissatisfactory exist in the respect of education and guidance, these affect health development on colleges students personality. College ideological and political education work should "people foremost" and actively guide college students personality development.

**Key words:** College students; Personality development; Ideological and political education

### 1 Introduction

General Secretary Hu Jintao put forward on the celebration of Tsinghua 100th anniversary of assembly on April 24, 2011: Hope that the mass of youthful students combine integrated development with personality development. In developing personal interest and potential advantages and on the basic of correctly managing individual, collectivity and social relationships to keep your character, ecru reveal, strive to be an eminent personage who can be of great use and undertake heavy responsibility. It expressed his eager expectation for contemporary college students, as well as higher requirement for college ideological and political education work.

### 2 Problems Existing in Contemporary College Students' Individual Character Development Education

The main trend in the aspect of contemporary college students' ideology and politics is positive and healthy. They generally support leadership of Chinese Communist Party, they are full of high and hot patriotic feelings, support the fundamental policy of the Nation and the Party and, they are proud of every achievement that their nation have made; They care about current political affairs, positive participate in discussing on all kinds of social phenomena, giving their own thinking, putting forward their own opinions; They keep aggressive actively, follow the pulse of the times closely, and have possessed modern consciousness to adapt to market economy; They are pragmatic and independent, seek individual gifts development and self-worth realization; they are broad interests, character lively, sociable, broad knowledge, pursue healthy, helpful and colorful cultural life, they carries vivid time feature during their growth and development. Recent years, however, with economical, social, cultural and educational environment changing, personality development of college students is suffering an profound impact; they demonstrate a new change and feature in the aspect of their outlook on life, value, moral, and life attitude and so on, this promotes college students' subject consciousness arousal and personality development, yet causes new conflict and problem to appear.

The big environment of market economy conditions intensifies the college students' subject consciousness and personality characteristics, makes their subject consciousness and personality characteristics vivid, makes students attach more importance to free concept, independent consciousness and completive consciousness, value natural abilities training, and dare to appeal and expression, reveal independent personality, makes students not depend on others and dare to hold critical attitude to many things. However, it will easily lead to collective consciousness and organizational principle concept be declined, and solitary attitude in handle interpersonal relationship, the formation of due unity, friendly and mutual trust become difficult, thus lacking the consciousnesses and abilities of mutual cooperation. Meanwhile, they don't possess mature psychological quality and tolerance capacity, and they do not have strong identification ability and mental adaption, once there are problems in their mind, study, life, and emotion, it will be very easy to cause psychological unbalance and result in all kinds of unhealthy psychological problems. While due to some students' lacking of correct personality development attitude in their personality development, it appears aimlessly pursuing personality, ignoring personality improvement, indulging individuality demand and so on problems, which finally

makes students deviate from the individual character development direction and orbit.

In the meanwhile, Traditional college ideological and political education has preference for emphasizing on personal function for the social development, but ignores individual function for aspect in promoting students' personal freedom development. Traditional ideological and political education emphasis more on commonality cultivation but less on personality cultivation; emphasis more on social status but less on personal demand of students; Pay more attention to the obligation undertaking but less attention to the rights defense; Pay more attention to tool value of social service but less attention to terminal value. Therefore, in operation practice level, too much attention is paid to the uniform, but personality development is ignored and little attention is paid to students' individual difference, it cannot make students improve themselves according to their personal characteristics. Because of this kind of guiding ideology, traditional college ideological and political education one-sided highlights the leading role of educators, ignoring the students' subjectivity characteristics. Simply regarding educator as the unique subject in education process and the educated who negatively accept education as object of education, enforcement phenomenon often happens in ideological and political education process, emphasizing one-way cramming on education content, thus making the educated become passive object who has no independence and who lacks creativity. So it cannot take full advantage of the effect of which ideological and political education inspires students' subjective initiative, and seriously frustrate students' enthusiasm for ideological and political education, and the spirit of independence, aggressiveness, bold innovation, and responsibility that students have cannot be given best cultivation. Currently many colleges and universities have misunderstanding and deviation in the comprehension for students' personality development, particularly in the relation between students' comprehensive development and individual development. They often ignore the organic link of the promotion of students' comprehensive moral, intelligence, physics, and beauty development and the promotion of their personality development, and separate comprehensive development from personality development even make them opposite. Respecting for and encouraging students' to develop personality is emphasized, while at the same time the guidance for the comprehensive development is left, even regarding the respect for students' personality development as what should be blamed on to give up the request for students' comprehensive development.

### **3 Positively Guide College Students' Personality Development**

Problems happening on college students' personality development doesn't simply reflect that some students lack correct understanding problem of personality development, it also reflects that colleges and universities is left behind in education and guidance. It is the problem that appears under new situation in college students' personality development as urgently needs significant ideological and political education work attention

Strengthen attention and guidance for college students' personality development cannot be empty talk, it must be taken into effect and stressed to educate and guide in practice. Only if better settle down the guidance problem in practice can it real work. The ideological and political education should grasp the dialectical relationship between comprehensive development and personality development according to the problems existed in current college students' personality development and take effective measures, exploring actively in practice and striving to reinforce the attention and guidance for students' personality development.

#### **3.1 Tempering justice with mercy and keeping relaxation balance to build a environment for college students' healthy personality development**

Ideological and political education on students' individual personality development guidance lies in guiding and controlling the correct way in which their characteristics develop. Therefore, when dealing with students' personality development, it should keep a necessary tension between strict requirement and encouraging development, setting up an education environment which is consistent with the above two. First, ideological and political education should set social and universities' "Generality" as framework of students' personalizing development, and it must be strictly required and constrained to point out the premise and direction for students' character development when it comes to the serious problems on view of life, world view, values and ethics; it should seriously emphasize on strict management and training their collective consciousness when it comes to problems on school orders and organizational disciplines. In the meanwhile, it should built a growth environment which is beneficial to students' personality development, By providing relaxed academic atmosphere, holding rich and colorful education interactive sports, cultural and artistic activities, etc to provide students with environment to develop personality demand and stage to show personal talents, and cultivate spirits of

students' self-confidence, self-independence, self-improvement, self-respect and conscientiousness, promote the students' main body consciousness and the formation of the independent personality, make the students' individual character to obtain the full development.

### **3.2 Cultivating the bold innovation character and courage**

China's socialist modernization construction needs rich individual character and diverse talents, college students to be the carrier inheriting knowledge and specific group developing career, shouldering historical mission of building the state and reviving the nation. Therefore, this group must possess innovation consciousness and spirit. Innovation is the nation progress' endless power, only innovation consciousness training can pour infinite energy into whole social development and change. Contemporary college students have great curiosity, active thoughts and they are free from constraints; possess advantageous environmental condition and knowledge reserves in campus which is the best time to innovate boldly. Students must be cultivated to have the innovation consciousness, it has to be constantly training their own innovative thinking, no matter content or way, thinking or concrete practice, should create own characteristics by using cultivation and development of personality. That neither going for blind to faith authority nor treading as on eggs and dare try to explore issues in distinctive approaches is the most precious individual character that college students have, as well as fundamental element that motive yourself to grow and be useful

### **3.3 Attaching importance to fit into team and social responsibility**

One's personalized development is not isolated from social group, human as an individual must fit in social organization, must participate in group work. Therefore, as a college student of personalized development who wants to be excellent talents must have group consciousness and cooperation spirit, on the contrary he or she is not able to fit in future organization's demand and social development. Personalized development is not developing without target and direction, in which it needs constantly revising and adjusting, it needs people and societies' approval and appreciation, Only the personalized development which fits in group can get the closest and fastest attitude feedback, get people's attention, understand, approval, respect and appreciation, form a sound interaction between individual and group, and realize special self-worth and social value. The development of personality on condition that it adapts to social development and organization demand, in no way does it go against public cooperation spirit, public order, collective interest and the social responsibility, everyone's act must regard respecting others and undertaking social responsibility as premise. Therefore, college and universities can either straightway organize students to take a part in collective activities and social public welfare establishments, or indirectly organize students to participate in all kinds of activities through college students' club activities so as to organically combining personality development and group consciousness with social duty.

### **3.4 Guiding students to improve comprehensive quality and perfect personality development in social practice.**

College students' social practice is a good form to get out of school, into society, touch society, understand society, and devote into society, as well as effective approach to cultivate the development and improvement of their personality. Through various forms of social practice, college students experience social life outside campus themselves, through emotional cognition to let them have a rational thinking on reality and future problems and promote the self-introspection and the self-adjustment for their own acts and character qualities. In the meanwhile, social practice also extends students' view, promotes selective space and gains time for adjustment and preparation, offering the precious practice chance for cultivating and developing their personalities and interests. In addition, the ideological and political education workers should be in the social practice process timely follow-up, listen to the students' awareness and opinions, understand their comments and thoughts fluctuation, answer questions and confusion in their heart, to help them overcome the difficulties and obstacles, promote them to understand the world, understand themselves, will tempering, exercise characters, develop characteristics, enhance autonomy consciousness, develop self-discipline quality, make great efforts to perfect personality, and comprehensively improve overall quality.

## **4 Conclusion**

College students as a certain group, have both the group generality and personality difference. This kind of individual difference decides that college ideological and political education should not simply request students' integrated development but ignore their individual character. College ideological and political education must insist on "people foremost", not only comprehensively improve the overall

quality of students, pursuit integrated development, but also respect subjectivity of right of every student, keep an eye on the external circumstance and internal world of the heart during their development, manage to be close to every student's living, close to individual thought reality, and solve problems existing in the process of college students' development one step at a time.

College ideological and political education must first respect the characteristics of students, and respect their freedom thought, independent personality, pursuit of value pursuit and life dignity from beginning to end. In the process of education, pertinence of education must be improved according to the characteristics of students as to make the education content more profitable, to make the education methods more actual, and to make the progress more reasonable. In individual education, it should vary from person to person, vary from situation to situation, teach students according to their aptitude, analyze case by case and make students' problems existing in their real study and living solution targeted. College ideological and political education should also combine organically students' characteristic development with potential personality expression exploring, bring the self-consciousness and initiative of students and set up their self-confidences to further foster the individual creation and practice abilities, to protect students' initiatives and creativities; Actively guide them to develop their own characteristics and gifts, put an emphasis on improving students' spirit of keeping forging ahead, perseverance of overcoming difficulties, learning ability of actively developing personality and viability.

Human value is organic unity of "Social value" and "self value". On one hand, Society should create conditions as much as possible satisfy the development of individual characteristic and talents; on the other hand, individual also should be responsible to society through hard working, and devote our talents and intelligence as we can. College ideological and political education should respect college students' personalized demand and plural value orientation without one-sided emphasis on social value, ignoring even denying individual value; also it should help college students to actively withstand all kinds of negative thoughts and adverse effects, to make college students understand the dialectical unity of personal value and social value, personal development and social development, making college students stick to positive mental attitude, adhere to pursuit the ideal and faith of truth, kindness and beauty, and cultivate their own lofty goal in life and sense of responsibility through the correct guidance of college ideological and political education.

## Decoding the Misuse of Open-Choice Principle in Chinese-English Translation with the Search Engine—Google\*

Li Hui, Liu Yeqiong

School of Foreign Languages, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: thornbird\_2008@163.com, 174493304@qq.com)

**Abstract:** Translation from Chinese to English for a non-native English speaker has long been a great difficulty and thus leads to various mistranslation problems. Most of them are caused by the misuses of English collocations. This paper takes a Chinese essay and its English-version translations as the object and adopts the search engine—Google to help retrieve the accepted collocations and fixed expressions and thus to identify the mistranslated parts of the essay. As a result, the paper finds that most English learners in China are unconsciously misusing Sinclair’s open-choice principle in translation, because they lack of prefabricated chunks so that they don’t know how to correctly put different collocations together. At last, it concludes the real reason for the mistranslation problems and gives practical suggestions for English learners.

**Key words:** Collocation; Open-choice principle; Chinese-English mistranslation; Google search analysis

### 1 Introduction

The term ‘collocation’ was first introduced by Firth<sup>[1]</sup> as the level of meaning created in language independent of the ideational concepts of the individual words or the contextual level of meaning to be derived (pragmatics). Defining this level of meaning created by word combinations or patterns, where the pattern or ‘co-location’ with other words can actually create the meaning of a given word, he states “You shall know a word by the company it keeps”<sup>[1]</sup>. Another definition of the concept he offers is “collocations of a given word are statements of the habitual or customary places of that word”<sup>[1]</sup>.

In line with the Firthian tradition, further awareness of collocation at an empirical level was brought to the forefront by analyzing language statistically via large computer-based corpora. Sinclair, who defines collocation as “the occurrence of two or more words within a short space of each other in a text”<sup>[2]</sup> led the COBUILD corpus project which led to, among other things, innovations in lexicography and dictionary design informed by corpus evidence in order to take more into account commonly found collocation and lexis behavior.

One of the lasting concepts to have grown out of this research is Sinclair’s distinction between what he terms ‘the idiom principle’ and ‘the open-choice principle’. ‘The idiom principle’ observes that language is largely systematic in that “... a language user has available to him or her a large number of semi-preconstructed phrases that constitute a single choice, even though they might appear to be analyzable into segments”<sup>[2]</sup>. This is what is meant by collocation in the broad sense. ‘The open-choice principle’, in contrast, sees slots in a grammatical framework being filled more arbitrarily, thus a ‘choice’ of words being made at each turn limited only by grammaticality.

Sinclair posits that users of a language use both principles, but rely on the open choice principle only when the idiom principle fails. This insight has serious implications for pedagogy such as a structural approach that presents only ‘the open choice principle’ and focuses on grammar determined by sentence or phrase structure ignoring lexically determined behavior or restrictions.

Using the word ‘grammar’ in a lexically centered sense, Michael Lewis<sup>[3]</sup> observes that “every word has its own grammar ... (and) ... ‘knowing a word’ involves knowing its grammar -the patterns in which it is regularly used.” In this way, the ‘collocationist’ view of language sees “the predictability of the co-occurrence of words in the slots that constitute the underlying structural frame”<sup>[3]</sup>. and with obvious relevance to the language learner, recognizes these combinations and/or ‘chunks’ as an important part of the mental lexicon. Furthermore, collocational competence is said to provide an efficiency of effort, or fluency in terms of both decoding and encoding language in that it allows learners to process and produce these chunks at a faster rate as well as convey more easily complex ideas that are

---

\* This paper is supported by “the Fundamental Research Funds for the Central Universities”

① According to Wikipedia, Google Search is the most-used search engine on the World Wide Web, receiving several hundred million queries each day through its various services.

often expressed lexically<sup>[3]</sup>.

Learners can deploy approximated ‘open-choice principle’ language to communicative ends, but appear stuck in terms of improving fluency because of their not possessing an awareness of, or perhaps an appropriate level of acquisition of collocation as The Oxford Collocations dictionary for students of English defines it, “the way words combine in a language to produce natural-sounding speech and writing”.

Translation is not simply to find equivalent expressions in the source language and the target language. It is a process of transferring cultural information and linguistic features from the source language to the target language instead. Chinese translators have long been influenced by bulk of factors, many of which lead to mistranslation, while, the open-choice principle is one of the good ways to decode the mistranslation problems.

## 2 Empirical Study and Analysis

In this section, the author uses a Chinese essay and its English-version translation as the study object and analyzes the mistranslation parts by the adoption of Google search engine. The essay this paper took came from China Daily BBS. China Daily is one of the most famous English newspapers in China. There was a translation competition on the BBS and many English learners took part in it (<http://bbs.chinadaily.com.cn/viewthread.php?tid=552705>). The author selects some of the sentences as the study objects and uses the open-choice principle together with the Google search engine to analyze the mistranslation problems. All the data obtained from Google has been updated on April 22, 2012. Furthermore, after making an explicit analysis of each example, this paper also gives a correct translation sample for each wrong one.

### 2.1 Correct collocation checked by Google

【Translation】 The earliest brands *can be dated back to* the early days of China and Egypt.

As we know *date back to* is a set phrase interpreted by the idiom principle, so its passive form—*be dated back to* can also be considered as a set phrase. Needless to say, it’s a correct collocation. Actually, we can also use Google to check it if we are not so sure whether it is a set phrase or not. Let’s first turn to Google for the frequencies of the word group *can be dated back to*.

**Table 1** Frequencies for Can Be Dated Back to

No. of Words	Fragment	Google Hits
1	Can	15,530,000,000
2	Can be	14,810,000,000
3	Can be dated	191,000,000
4	Can be dated back	166,000,000
5	Can be dated back to	132,000,000

From the frequencies listed above, we can see that the table demonstrates the relations between words and word groups within this fragment. For instance, there are approximately two bands of frequencies between the five word groups: two in the billions and three in the millions. Therefore, we can clearly find out that the words in the same frequency bands seem to have a closer bond with each other than with other words in the fragment.

According to Chi-Chiang Shei<sup>[4]</sup>:

1) when the number of words increases in a fragment, the frequency of the overall fragment decreases;

2) when a new word is added to a fragment and the frequency line remains stable (i.e. level), that word is closely bound to the word within a fragment which it is attached to, and the overall fragment may be considered formulaic.

3) when a new word is added to a fragment that causes the overall frequency to precipitate, the overall fragment can no longer be considered formulaic.

Based on the above mentioned principles, it can be easily seen that *can be* and *dated back to* are closely bound to each other respectively within the group, because when the number of words increases in a fragment, the frequency of the overall fragment decreases continuously and stably. Therefore, the entire fragment is reasonably formulaic. In other words, it is a good translation from Chinese to English.

However, the following examples are different. From Table 2 to Table 4, this paper examines the misuse of collocation in different translation versions and finds out that these English learners lack of

prefabricated chunks so that they tend to misuse the open-choice principle and put different words together, which easily leads to Chinglish and mistranslation problems. Now, let's come to the examples with wrong collocations in the translated sentence.

### 2.2 Misused collocation No.1

【Translation】 With the globalization of brands and the internalization of global competition, foreign brands are *making unceasing effort in* attacking the China market.

When we translate the above sentence and are not sure about the italicized part, we can try Google to check whether it is done correctly. The author searched on Google and found the following result about the word group *make unceasing effort in...*

**Table 2** Frequencies for Making Unceasing Effort in...

No. of Words	Fragment	Google Hits
1	Make	1,510,000,000
2	Make unceasing	3,880,000
3	Make unceasing effort	2,120,000
4	Make unceasing effort in	4,080,000

By taking the above mentioned theory to analyze Table 2, we can get very clear and informative results; that is, *make* and *unceasing effort in* are not closely bound to each other due to the reason as follows:

When the number of words increases in a fragment, the frequency of the overall fragment first decreases from 1,510,000,000 to 2,120,000; then it begins to increase and finally stops at 4,080,000, which means it cannot keep table. That's to say, the translation is not a good one.

As we know, *unceasing* means "continuing forever"; however, the original sentence indicates that "with the globalization, more and more foreign brands influx into China and thus bring in great threat to local brands". It doesn't mean the foreign brands will come into China forever. Therefore, *unceasing effort* is not a good choice for the translated sentence. The author hereby suggests to change it into "make continuous effort in...", which well matches the meaning of the original sentence.

### 2.3 Misused collocation No.2

【Translation】 Many businesses in our country are wholeheartedly *fighting beachhead for the* share of the international *market* and metropolitan areas...

Some collocations seem correct in a certain discourse. However, they are sometimes misused by English learners, for they don't know the proper context for the phrase. And we can also use Google to check it under such a situation. The following table shows the result that the author searched on Google about the word group *fighting beachhead for the ...market*.

**Table 3** Frequencies for Fighting Beachhead for the ... Market

No. of Words	Fragment	Google Hits
1	Fighting	902,000,000
2	Fighting beachhead	901,000
3	Fighting beachhead for	901,000
4	Fighting beachhead for the	901,000
5	Fighting beachhead for the...market	2,830,000

Based on the principles quoted above, Chi-Chiang Shei<sup>[4]</sup> infers the following results:

1) when the number of words increases in a fragment, the frequency of the overall fragment fluctuates;

2) when a new word is added to a fragment, the frequency cannot keep stable;

3) when a new word is added to a fragment that causes the overall frequency to increase, the overall fragment can be considered formulaic.

From the above table 3, we can say that *fighting beachhead* and *for the ...market* are not closely bound to each other, because when a new word is added to the fragment, the overall frequency fluctuates, which not only decreases from 902,000,000 to 901,000, but also levels at 901,000 for three times and then increases to 2,830,000. In other words, this overall fragment is not formulaic. However, Thus, it is not a good translation.

Actually, *beachhead*, in English, means "an area of shore that has been taken from an enemy by

force, and from which the army can prepare to attack a country”. It is obvious that *beachhead* is not a proper word for the original text. Therefore, we can change the translation into “Many of our enterprises (businesses)are obsessed with the idea of nudging into the international market and metropolitan areas...”.

#### 2.4 Misused collocation No.3

【Translation】 Many powerful foreign brands are trying a thousand ways to *make a fuss about the Chinese rural market*.

The author searched on Google and hereby presented the result about the word group *make a fuss about the ...market* in the following table.

**Table 4** Frequencies for Make a Fuss about the ... Market

No. of Words	Fragment	Google Hits
1	Make	1,510,000,000
2	Make a	8,180,000,000
3	Make a fuss	44,500,000
4	Make a fuss about	56,800,000
5	Make a fuss about the	44,500,000
6	Make a fuss about the...market	52,800,000

Table 4 shows us that the frequency from No.1 to No.6 fluctuates much. Therefore, based on the same reasons the author listed above, we can say that this word group is not a correct collocation, either. In fact, according to Longman Dictionary of Contemporary English, “to make a fuss” means “to complain or become angry about something, especially when this is not necessary”, whereas the collocation is not suitable for the original sentence. We should change the mistranslation to “Some well-established (strong)international brands are constantly racking their brains over China’s rural market”.

### 3 Conclusion

Generally speaking, English learners in China do not have enough prefabricated chunks, that’s to say, they don’t know how to use the idiom principle; so when they translate from Chinese to English, they tend to put different collocations into one word group according to their understanding.

It seems that they are following the open-choice principle; however, in fact, they are misusing it. That’s why many of the English-version translation sound like Chinglish, which only part of the Chinese English learners can understand, but not the native English speakers. Therefore, Chinese English learners should obtain as many idioms and collocations as they can, so that when the idiom principle doesn’t work, they can also correctly use the open-choice principle to make acceptable word groups and sentences. Fortunately, the search engine—Google plays an important role in helping the English learners in China for checking their word choice as well as improving their English proficiency.

# A Diachronic Study on the Construction of Ecological Awareness in Newspaper

Yang Ying, Peng Yuan

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: yangyingwhu@gmail.com; tricia8008@163.com)

**Abstract:** Ecological awareness is the concern hold for ecology and environment. It needs to be cultivated through the criticizing of anthropocentrism and growthism, which have been accepted by people from the ancient time. As a result, the establishing of ecological awareness is very difficult and challenging. This paper, by analyzing 129 reports on the theme of Genetically Modified Foods from The New York Times, attempts to study the way of constructing ecological awareness in news paper and how it is changed diachronically.

**Key words:** Ecological awareness; Newspaper; Genetically modified foods

## 1 Introduction

News paper is an indispensable part of life. It disseminates information, it teaches knowledge, and it also guides public opinions. Hachten once said "all press systems reflect the values of the political and economic systems of the nations within which they operate"<sup>[1]</sup>. By this, Hachten most probably means that the press or the mass media in general, has a value, but not of its own: it is the representative of the political or economic systems of the country under which it exists or of the interest which it represents.

Critical Ecolinguistics emerged in 1990s with Halliday's keynote speech at the 10th AILA as the landmark in Greece in 1990. Critical Ecolinguistics is also addressed as Ecocriticism of Language and presupposes two points: the language system embodies cognitive thoughts of ecological problems; the cognitive thoughts in a language system exert impacts to the ecological awareness of language users.

The theory analyzes language and discourse from an ecological angle with an aim to uncover thoughts unhelpful to ecological environment thus cultivating people's ecological awareness. In so doing, the theory attempts to criticize anthropocentrism and growthism in language system, especially in the lexical system and grammar.

After Halliday, Goafly and Trampe criticized language through an ecological angle. Goafly expressed his objection of the systematic-functional approach because he thought the approach divided a process into 3 parts thus breaking the integrity of the universe. Trampe criticized anthropocentrism and commercialism.

In recent years, people are increasingly concerned with environmental issues and ecological problems, and they are showing more considerations on what their daily conducts might do to the ecological surroundings, which they seldom or never did before. Is people's growing care to ecology resulted from the recent propaganda of media, which adjusts the stereotypical views of people being the center of the universe thus removing the ignorance about ecological environment?

This paper, with the help of Critical Ecolinguistics, attempts to figure out the questions: Is an ecological awareness constructed in news coverage? If so, how it is constructed and how it is changed diachronically?

## 2 Data Collection

In order to figure out the answers to the proposed questions, the thesis chooses The New York Times as a representative of news paper and the resource of research data. The data are collected with the key words "Genetically Modified Foods" thus involve 129 pieces of reports ranging from the year of 1986 when genetic technology initially known to the end of 2011. The following part elaborates what motivates the choice of the New York Times and the sampling of the research data.

### 2.1 The reasons for deciding the medium—The New York Times

The New York Times is an American daily newspaper founded and continuously published in New York City since 1851. The print version of the paper remains both the largest local metropolitan newspaper in the United States, as well the third largest newspaper overall and long regarded within the industry as a national "newspaper of record". In a word, The New York Times is a widely-circulated, easily-accessed and long-existed medium with profound influences among the public. The reports in it are surely loaded with significance to be studied to identify the construction of a particular awareness in

a diachronic way.

**2.2 The reasons for choosing the topic**

Genetically Modified (GM) food is a tentative use of Tran genetic technology in the field of food production. This technology originally is invented to overcome some intrinsic defects of a food so that the food can be “improved”<sup>[2]</sup>. For example, corns cannot resist pests themselves nor resist drought for a long time. However, after being added some genes from other species which possess traits of overcoming the shortcomings of corns, the “new” corns will become pest-resisted and drought-resisted. Apparently, this is a good technology; however, as the added genes can be any genes from all species including either plants or animals, it may have great potential dangers for people’s health if it is used in food production. What’s more, GM food is not reproductive and usually with high yield thus have possible harm to environment and ecology.

Genetically modified Foods are highly related to technology which is rarely known by common people if without the information and knowledge from media. That is to say, all the reports on this topic can best explain how they construct awareness and how they influence people by demonstrating the awareness in the reports.

On the other hand, the debate on the safety of GM foods involves struggles over power between the most powerful state and the almost weakest country in the world. But there has not been any analysis of language and linguistic features of the report on GM food in all relative press. So, people never know how the press works to construct a particular awareness.

What’s more, owing to the intrinsic traits of GM foods like uncertainty of safety and heavy reliance on the inventors, the hot issue is not merely relative to the technology itself, but to the field of economics and politics. The topic is thus far more complex than others. It is just the complexion that will make corpus possesses more significance to answer the questions proposed before.

The last but not least, Fairclough once claimed, “The selection of data should correspondingly reflect areas of variability and instability as well as areas of stability”<sup>[3]</sup>. That is to say, in collecting data, we should determine a stable point and then collect related variable respects. By this means, the variable instabilities have some common senses thus make the collected data relative each other. Here, in this paper, all the data are related each other by the discussion on the same topic.

**3 Data Analysis**

As introduced previously, the research data covers 129 reports in total from 1986 to 2011. They are centering on genetically modified foods, including both the comments on the technology involved, the foods themselves and the foods to health thus being presented in different forms.

The part of analysis, with an aim to identify the way of constructing an ecological awareness, will expound both general features of the 129 reports and concrete features in content, a distribution of the content and language used. What’s more, in order to recognize how awareness construction changes diachronically, all the general and concrete features will be compared and contrasted.

By analyzing general features of the data, we can recognize the influences of social or economic systems on the report and concern of a particular issue, the genetically modified foods in this paper thus identifying the way news paper construct an awareness among people with its reporting.

**3.1 The general features of the data**

**Figure 1 The General Features of the Data**

Generally, in the 35 years from 1986 and 2011, the reports on genetically modified foods in The New York Times varied greatly. Figure 1 demonstrates the variations in a detailed way.

From Figure 1, we can see that after the initial report of genetically modified foods in 1986, another similar report occurred 10 years later in 1995. Within the 10 years, The New York Times never presented any information on either the new technology or the technology-related foods. But after 1995, every year saw one relevant report until the year of 1998. However, a sudden increase of relevant reports happened in the year of 1999 with 22 pieces of reports, contrasting with the previous 1 or 2 pieces. Then, the next year, the year of 2000 experienced the most frequently reported time on genetically modified foods with the highest number of 32. But the increasing trend did not steadily go on. The year of 2001 quickly saw the decrease from 32 to 8. From 2001 on, the low frequency of reporting continued with less than 4 pieces until 2011, within which the year of 2006 was an exception, with 10 pieces.

**3.2 The classification and distribution of the data**

In terms of content, the data can mainly be categorized into 4 sections: News report, Column, Letter and Editorial. This could be illustrated in Table I. News report is the most common form of reporting in news paper when presenting a particular view. Column is a piece of writing from a columnist who has expert knowledge in a specific field thus this section is usually informative and personal. Letter apparently is a kind of communication between readers and editors or a feedback from readers. It is mainly considered as the presentation of public opinions. Editorial, to a great extent, reflects the standpoint of the press itself.

Of all these four sections, news reports constitute the majority with the number of 102; the number of column is 6, of letter to editors is 19 and 2 are editor’s note. The distribution could be illustrated by Table 1.

**Table 1 The Classification and Distribution of the Data**

Total Number	Classification and Distribution			
	News Report	Column	Letter	Editorial
129	102	6	19	2

Table 1 indicates that besides News Report, “Letter” occurred most frequently among the four categories of the data. Especially in the year of 1999 and 2000, “Letter” appeared 13 times, which is far more from the total number of the rest of the period. From Table II, Table III and Table IV, a year should be noted with special attention. That is the year of 2000. This year not only witnessed the occurrence of every category of the four sections, but also saw the greatest number of each section. So without any doubt, reporters made great efforts in constructing an awareness this year.

**Table 2 The Distribution of Letter**

Letter	Distribution in Different Years					
	1992	1999	2000	2003	2010	2011
19	1	5	8	2	1	2

**Table 3 The Distribution of Column**

Column	Distribution in Different Years				
	1997	1999	2000	2001	2002
6	1	1	2	1	1

**Table 4 The Distribution of Editorial**

Editorial	Distribution in Different Years	
	1998	2000
2	1	1

**3.3 The content of the data**

As the data comprise of 129 reports, they are abundant in information. In considering the size of the thesis, the data are mainly analyzed from the content of the headlines.

The initial report in 1986 on genetics was titled “Genetics Concern on the Spot”, which was an overview on the new biotechnology. Then in 1992, the only relevant report was about the risks or danger of trans-genetic foods in the form of Letter. But the headline, “Mutant Foods Create Risks We Can’t Yet Guess; No evidence of Danger”, indicated clearly that the news paper was telling the public that genetically modified foods have no danger.

So this could be considered as the first phase when general information and positive aspects of genetically modified foods were mentioned.

The second phase was about the doubting and questioning of the altered foods. It covered the period from 1995 to 2007.

The report of 1995 emphasized the foods' influence to health with the title "Research Hints of Immunization via Food". The similar concern of health was also presented in 1996 titled "Genetic Engineering of Crops Can Spread Allergies, Study Shows".

Though people were concerned with health problems genetics may bring, most of them had no knowledge or information of the altered foods. So some people requested the knowing of the gene-altered foods with labeling. The headlines in 1997 and 1998 exemplified that condition:

"Biotechnology Company to Join Those Urging Labels on Genetically Altered Products (February 24, 1997)"

"Shoppers Unaware of Gene Changes (July 20, 1998)".

At the same time, the news paper questioned the significance of genetic technology:

"Can Bioengineers Feed the Planet (July 23, 1998)?"

With the questioning in 1998, the sudden increase of reports designated people's growing concern over the technology. In terms of content, the reports in the following years, including 1999 and 2000, discussed the labeling and safety of genetically modified foods and the control of the technology. The examples are in legion. The following ones are just some typical ones.

"U.S. Sidetracks Pact to Control Gene Splicing (February 25, 1999)"

"U.S. Plans Long-Term Studies on Safety of Genetically Altered Foods (July 14, 1999)"

"Now Label Altered Food (August 3, 1999)"

"Talks on Biotech Food Turn on a Safety Principle (January 28, 2000)"

"Tell the Truth About Altered Food; Profits, Not Health (June 8, 2000)"

"Food Companies Urged to End Use of Biotechnology Products (July 20, 2000)"

"Case Illustrates Risks of Altered Food (October 14, 2000)"

The third phase started from the year of 2001 to 2009. during this period, the bans or control on biotech foods won the upper wind with more reports advocating the rules of controlling the technology. The examples are as follows:

"Panel Backs Stronger Rules For Some Food (December 18, 2000)"

"Without U.S. Rules, Biotech Food Lacks Investors (July 30, 2007)"

"European Official Faults Ban on Genetically Altered Feed (November 27, 2007)"

"Europe to Allow Two Bans on Genetically Altered Crops (March 3, 2009)"

The last phase is from 2010 to 2011. This phase saw the generalization of genetically modified foods again but emphasized the negative aspects.

"Genetically Engineered Distortions (May 15, 2010)"

"Questions About Gene-Modified Foods (August 25, 2011)"

## 4 Conclusion

The general features of the data suggest that the effort of constructing a particular awareness is never the same in a long time. It could be exerted in one special time or period or time. In presenting views thus constructing ecological awareness, various forms will be used but the most common form is still news reports written by journalists rather than Letter, Column or Editorial.

From the content of the data, the reports undergo different stages: no mentioning of any ecologically related information, small amount of relevant information in abbreviation or acronyms, some information in altered or changed forms, objective mentioning of relevant information in complete form. With the examples from the reports, the stages could be explained as follows: people are the center of the universe and new technology like genetically modified foods serves people; genetically modified foods have potential harm or danger to people; genetically modified foods should be controlled with rules.

With more information presented, the relevant reports are more comprehensive thus some extreme or stereotypical views in the initial stage are adjusted or even changed completely. Reports become more objective under this circumstance.

To sum up, news coverage construct an ecological awareness. But the ecological awareness has undergone stages from none to weak, from weak to strong. The construction is realized with less emphasis on people's central position. In terms of genetically modified foods, the initial reports did not

construct ecological awareness when they only emphasized the “center” position of people and the “growth” ushered by the new technology—genetic engineering. Then, by pointing out the nature of genetics is making profit in 2000, the report criticized “commercialism” thus constructing a weak ecological awareness. After 2000, more reports questioned and criticized the “growthism” of gene-altered foods, the ecological awareness are strengthened.

# Investigating the Relationship Between Human Resources Management Practices and Organizational Citizenship Behavior: A Case Study

Sumayya Begum, Fatma Waziri, Mohammad Amzad Hossain Sarker  
School of Management, Wuhan University of Technology, P.R. China, 430070  
(E-mail: fsumayya@yahoo.com\*, wazirifatma@yahoo.com and emailtoamzad@yahoo.com)

**Abstract:** This study investigates the impact of human resource management practices on organizational citizenship behavior (OCB). A convenience sample of one hundred and twenty (N= 120) employees was surveyed from twenty five different branches of Mercantile Bank Ltd. Bangladesh. The structured survey questionnaire used to seek to obtain primary information through five point Likert Scale. Linear regressions were used to analyze the data collected. The Pearson correlation results support all hypotheses stating that there is a positive relationship among human resource management practices and organizational citizenship behavior. The findings of the study indicate that the selected practice of HRM of that bank has positive relationship with OCB. Finally, this study suggest that the management should ensure the practice for the banks to develop a sense of belongingness in the mind of all the employees working together to get the desired behavior which can not be measured by monetary terms only.

**Key Words:** Training and development; Fair treatment; Promotion and transfer; Leave and vacation; Reward; Organizational citizenship behavior

## 1 Introduction

Banking industry as a service based industry concentrating to increase their customer satisfaction for achieving the competitive advantage in the long run. Most of the banking organization in Bangladesh realizing that organizational citizenship behavior can dramatically change the organization output through the employees extra role behavior and contribution which should be encouraged throughout the whole organization by ensuring sound and harmonious practice of human resources management. Why does OCB seem to have such compelling effects on the individual and the success of an organization? Organ et al. (2006) has offered the following suggestions. OCB can: (1) enhance productivity (helping new co-workers; helping colleagues meet deadlines), (2) free up resources (autonomous, cooperative employees give managers more time to clear their work; helpful behavior facilitates cohesiveness (as part of group maintenance behavior), (3) attract and retain good employees (through creating and maintaining a friendly, supportive working environment and a sense of belonging), (4) create social capital (better communication and stronger networks facilitate accurate information transfer and improve efficiency).

Mercantile Bank Limited is one of the commercial bank out of near to 50 commercial banks in Bangladesh. The Bank commenced its operation on June 2, 1999. It provides a broad range of financial services to its customers and corporate clients inside and outside of the country. The board of directors of the bank consists of eminent personalities from the realm of commerce and industries of the country. Mercantile Bank Limited has 75 branches throughout the country. The Bank has two subsidiaries namely Mercantile Bank Securities Ltd and Mercantile Exchange House (UK) Limited and a Off-shore Banking Unit to pace up the international trade especially in Export Processing Zone. The bank has a separate human resources division aim to practice successfully recruiting talent people and train them properly to cope up with the changing demand in the market and also retain them long term with job satisfaction, motivation and organizational citizenship behavior. Thus the aim of this paper is to explore the relationship between the HRM practice and organizational citizenship behavior of the employees in the bank

### 1.1 Literature review

A few numbers of researches has already done to determine the relationship between HRM and OCB in developed countries. But in a developing country like Bangladesh no significant research found on the impact of HRM on OCB in banking sector specially. Absar at. el. (2010) conducted a study to exploring the impact of HR practices on job satisfaction in the context of Bangladesh. They found that HR practices have significant association with job satisfaction (JS). In addition, human resource planning (HRP), and training and development (TND) were found to have positive impact on job satisfaction (JS). It was also

found that TND has the greatest impact on JS. Mahmud and Idrish (2011) revealed in their study on six Human Resource (HR) practices (realistic job information, job analysis, work family balance, career development, compensation and supervisor support) and their likely impact on the Employee Intention to Leave (EIL) in the Bangladeshi banks. Their research results indicated job analysis, career development, compensation, realistic job information variables were negatively and significantly correlated with EIL. Interestingly work family balance was not negatively correlated with EIL. These six variables can jointly explain 67% of the variance in EIL. Results of regressing the HR practices on EIL showed that compensation and job analysis are strong predictors of EIL. Jill Wo Graham (1991) advocated a more comprehensive understanding of job performance and organizational citizenship behavior (OCB) than that employed by earlier researchers on those topics. Using the intellectual heritage of the word "citizenship" from political philosophy and related disciplines, OCB is positioned as the organizational equivalent of citizen responsibilities, of which there are three categories: obedience, loyalty, and political participation. Two other key citizenship concepts, relational ties and citizen rights, are described, and a set of ten research propositions is offered relating the citizenship concepts to one another. Suggestions for other areas of investigation are also provided. Finally, the advantages of using OCB as a global measure of individual behavior at work are defended. Work environment, benefits and promotion opportunities has significant influence on organizational citizenship behavior (Begum and Sarker, 2012). They also revealed that only work environment has significant effect on OCB, other two variables benefit and promotional opportunities has no effect on OCB for the particular organization of research. So, Management should redesign these two variables to ensure OCB in their organizations betterment. As pointed out by many service scholars, in service-oriented or service-based organizations, human resources or employees are a crucial variable that links the firms to profits (e.g., Heskett, Jones, Loveman, Sasser Jr., & Schlesinger, 1994; Schneider, 1994, 2004; Morrison, 1996; Bowen & Ford, 2002; Anderson, 2005). Employees of high levels of OCBs are aspired in service organizations because such employees are committed to excel in their jobs and they are also able to face the unforeseen contingencies resulted from the unique nature of services (Morrison, 1996). Sun, Aryee and Law (2007) point out the role of HRM practices as an indicator of organizations' attitudes towards employees. For example, the extent to which the organizations are concerned with the employee well-being is indicated by the design of the HRM practices. These researchers propose in their study that employees' OCBs will be enhanced if they perceive there is an existence of supportive HRM practices (i.e., positive work environment) implemented by the organizations. According to social exchange theory, it is hypothesized in this research exercise that service-oriented HRM practices which are focusing on satisfying both customers and employees (Schneider & Bowen, 1993) will create an environment where employees are motivated to work for the benefits of their organizations. In one of the most widely cited article, Morrison (1996) suggests organizational citizenship behaviour (OCB) as an alternative to other customer-oriented behaviours. OCB is a discretionary behaviour displayed by the concerned employees who are committed to contribute to the positive development of the organizations (Organ, 1988). The fact that OCB can be a significant consequence of service-based HRM and it has been inferred from the studies conducted by Chebat et al. (2002) and Tsaur and Lin (2004).

## 2 Methodology

### 2.1 Objectives

The main objective of this study is to investigate the impact of some selected HRM practices on organizational citizenship behavior. Other objectives are:

- (1) To know the relationships between human resources management practices and OCB.
- (2) To explore the HRM function which most significantly influence OCB.
- (3) To give some recommendations for policy makers for future development.

### 2.2 Conceptual model and hypotheses

Figure 1 Conceptual Framework

The general form of the model was as follows:

$$OCB = \alpha + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + e$$

Where, OCB = Organizational Citizenship Behavior

X<sub>1</sub> = Training & Development

X<sub>2</sub> = Fair Treatment

X<sub>3</sub> = Promotion & Transfer

X<sub>4</sub> = Leave & Vacation

X<sub>5</sub> = Reward

And  $\alpha$  is constant and  $\beta_1, \beta_2, \beta_3, \beta_4$  and  $\beta_5$  are coefficient to estimate, and e is the error term.

**2.3 Hypotheses:**

H<sub>1</sub>: Training & Development are positively related to OCB.

H<sub>2</sub>: Fair Treatment and OCB are positively related to each other.

H<sub>3</sub>: Promotion & Transfer are positively related to OCB

H<sub>4</sub>: Leave & Vacation are positively related to OCB.

H<sub>5</sub>: Reward and OCB are positively related to each other.

**2.4 Sample size and sampling technique**

To fulfill the objectives of this study, total 125 questionnaires were distributed among the employees of 25 different branches of Mercantile Bank Ltd. Out of which 120 questionnaires found correct and complete. So the responses of sample 120 (N= 120) were analyzed to find the result of the study. The convenience sampling technique was used for selecting the respondent.

**2.5 Research instrument**

The main methodology chosen for this study is the questionnaire survey method. The survey was conducted from May 2011 to August 2011. Primary data were obtained through a structured survey questionnaire. Total fifteen questions under the head of five human resource management practices and four questions for organizational citizenship behavior are included in the survey questionnaire.

**2.6 Measurement of dependent and independent variables**

For the purpose of the study, respondents were asked to give tick marks on right side of different statements related to HRM practice and OCB. Dependent and all of the independent variables were measured on five point Likert scale. The response scales for each statement in the survey questionnaire were as: 1= Strongly disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly agree.

**3 Data Analysis**

Data were analyzed by using software SPSS- 17 version. The following statistical techniques were applied to analyze the data:

- Cronbach's alpha (Reliability test Table 1)
- Descriptive statistics and correlation (Table 2)
- Linear regression (Table 3)

**Table 1 Reliability Test**

HRM & OCB *C	Training & Development	Fair treatment	Promotion and transfer	Leave & Vacation	Reward	OCB
CA**	0.843	0.777	0.741	0.775	0.764	0.783

Source: Calculated, \*Human Resource Management and Organizational Citizenship Behavior

\*\*Cronbach's alpha ( $\alpha$ )

**Table 2 Descriptive Statistics and Correlation**

	M	SD	1	2	3	4	5	6
Training & Development	3.9000	1.04841	1					
Fair treatment	3.9333	.77496	.405**	1				
Promotion and transfer	4.0333	.83950	.348**	.675**	1			
Leave & Vacation	3.9000	1.01584	.211*	.333**	.556**	1		
Reward	4.2667	.68272	.178	.479**	.805**	.572**	1	
OCB	4.1333	.80891	.214*	.336**	.389**	.630**	.544**	1

\*. Correlation is significant at the 0.01 level (2-tailed), \*. Correlation is significant at the 0.05 level (2-tailed).

**Table 3 Regression Analysis**

Variable	R	t-value	coefficient	F-value	P-value
1.Training & Development	0.214	2.380	0.214 (0.165)	5.665	0.019
2.Fair treatment	0.336	3.875	0.336 (0.351)	15.019	0.000
3. Promotion and transfer	0.389	4.592	0.389 (.375)	21.089	0.000
4. Leave & Vacation	0.630	8.811	0.630 (0.502)	77.635	0.000
5. Reward	0.544	7.038	0.544 (0.644)	49.528	0.000

**3.1 Cronbach’s alpha**

Internal reliability of the questionnaire was tested by using Cronbach’s alpha. According to Nunnally, J. (1978) Cronbach’s  $\alpha$  with larger  $\alpha$  values (greater than 0.70) indicating higher internal consistency in the measured dimension and hence greater reliability. In our study the entire variables Cronbach’s alpha (showed in Table I) are greater than 0.70. So, it is clear that the questionnaire used in this study had strong internal reliability and it could be used with confidence for the application of next statistical analysis and interpretation.

**3.2 Descriptive statistics and correlation analysis**

Table II represents descriptive statistics and correlation between each variable. If the mean scores of independent variables are observed then it is clear that Reward has higher value 4.26 then the rest of the order is as follows: Promotion and Transfer (4.03), Fair Treatment (3.93), and Training & Development and Leave & Vacation have same value (3.90). The mean score of the OCB is 4.13 means most of the employee are satisfied. Range of correlation among variables is between 0 .178 to 0 .805. Therefore, all the variables are positively related to each other (Table II).

**3.3 Regression analysis**

In order to check the impact of each independent variables on dependent variable and linear regression analysis was applied to test the hypothesis developed. Results of linear regression analysis are shown in Table III.

**3.3.1 Hypothesis 1** postulates that training and development has significant affect on OCB.

**H<sub>1</sub>: Training & Development are positively related OCB.**

21.4% variance in OCB is explained by training and development, which is evident by the value of R = 0.214, F = 5.665 at P = 0.019 explains the model’s goodness of fit. The value of t = 2.380 is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H1 is accepted.

**3.3.2 Hypothesis 2** postulates that fair treatment has significant affect on OCB.

**H<sub>2</sub>: Fair Treatment and OCB are positively related to each other.**

33.6% variance in OCB is explained by fair treatment, which is evident by the value of R = 0.336, F = 15.019 at P = 0.000 explains the model’s goodness of fit. The value of t = 3.875 is the evident of significant relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H2 is accepted.

**3.3.3 Hypothesis 3** postulates that promotion and transfer has significant affect on OCB.

**H<sub>3</sub>: Promotion & Transfer are positively related OCB.**

38.9% variance in OCB is explained by promotion and transfer, which is evident by the value of R = 0.389, F = 21.089 at P = 0.000 explains the model’s goodness of fit. The value of t = 4.592 is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H3 is accepted.

**3.3.4 Hypothesis 4** postulates that leave and vacation has significant affect on OCB.

**H<sub>4</sub>: Leave & Vacation are positively related to OCB.**

63.0% variance in OCB is explained by promotion, which is evident by the value of R = 0.630, F = 77.635 at P = 0.000 explains the model’s goodness of fit. The value of t = 8.811 is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of these results it can be inferred with confidence that H4 is accepted.

**3.3.5 Hypothesis 5** postulates that reward has significant affect on OCB.

**H<sub>5</sub>: Reward and OCB are positively related to each other.**

54.4% variance in OCB is explained by people, which is evident by the value of R = 0.544, F = 49.528 at P = 0.000 explains the model’s goodness of fit. The value of t = 7.038 is the evident of significant positive relationship between independent and dependent variable. Therefore, on the basis of

these results we accept H5.

#### 4 Discussion

After analyzing the descriptive statistics, we found that the mean scores of the human resource management practices are greater than 3.0. It's indicating that all of the independent variables have significant relationships with OCB. The findings also prove that 'Reward' has the most significant relationship with OCB. That is, the reward system prevailing in that organization play significant role to create OCB among employees. 'Promotion and Transfer' is the second most significant practice that helps to create OCB among employees of that organization. Most of the employees are satisfied about the promotion and transfer policies of that organization. The third most influencing variable is 'Fair Treatment' which have significant relationship with OCB. The fourth most influencing variables are 'Training & Development and Leave & Vacation' which play significant role to create OCB among employees. Finally, the mean score of OCB is explained overall satisfaction of the employees toward the HRM practices of that organization.

#### 5 conclusion

Commercial banks in Bangladesh are operating their business in a highly competitive market. Especially the competition is high among the large number of privatized banks serving the society. So banks need to motivate their human resources with their limited benefit opportunities and resources to obtain maximum work effort and output. Thus sound human resource management practice could be the effective way to ensure proper utilization of human capital through intrinsic and extrinsic satisfaction and enhance organizational citizenship behavior of the people to gain sustainable competitive advantage for the survival of the banks in the long run. The bank should improve its promotion and transfer policy and equal fair treatment should be introduced. The bank also develops its training and development program through need basis and modifies the rules and regulations regarding leave and vacation. Though the result of this study clearly indicate that the practice of HRM of the particular bank have positive relationship with OCB. It could be the best way in practice for the banks to develop a sense of belongingness in the mind of all the employees working together to get the desired behavior which can not be measured by monetary terms only.

# Structural Analysis on College Research Team's Psychological Contract

Lu Aixin

Luoyang University of Technology, Luoyang, P.R.China, 471023

(E-mail: najia593@yahoo.com.cn)

**Abstract:** Based on self-designed questionnaire and data collected, the subjective characteristic and structure of college research team's psychological contract are analyzed. Results show that, the college research teams and members have highly similar psychological perception of mutual obligation. Structure of college research team's psychological contract is a 2 levels 6 dimensions' model. Team obligation includes goal achievement, development promotion and humanistic care. Member obligation includes task accomplishment, interpersonal cooperation and team maintenance. A significant 2-way interaction effect is also found in structure relation.

**Key words:** Chinese college; Research team; Psychological contract; Structure of psychological contract

## 1 Introduction

Psychological contract is firstly introduced by organizational behavior researcher Aigyris. Since 1980s, psychological contract is always one of the most popular research topics in organizational behavior and human resource management. Two main fields of psychological contract are most deeply studied. One is psychological contract itself, including its concept, contents, dimensions, dynamical development and violations. There are one-way/two-way relation theories for subject, 2/3/multi-dimensions for structure. And for contents of psychological contract, there are implicit agreement, suggestive commitment, expectation for duty and obligation, subjective psychological commitment, and many other different orientations. The other field is differential study based on different teams or groups, such as enterprise employee, college teachers, construction team, etc.

Based on former researchers' work on psychological contract theory and its application, there are several issues need to be solved. One is the limitation of subject, because most existing research is about enterprise employee. The other is the ignorance of organization subjective characteristic and only focuses on one-way relation. In this study, Chinese college research team is studied under a two-way relation's perception, we hope to find its unique features and figure out how to improve the formation of psychological contract in it.

## 2 Theories and Hypotheses

### 2.1 Feature of college research team's psychological contract

As a special work group, Chinese college research team is a temporary team based on college research institute, with members from different study field, intending to finish a specific research task. A college research team usually has clear goal, leader and rules, with members voluntarily and creatively cooperate with each other, and the achievement is shared by the whole team. College research team, as an unofficial temporary organization, doesn't have many restrictions to its members. In the research process, the team need all the members to do their best, while the members would want to gain certain kind of benefits. In order to maximize each side's profit, the team and its members all have their own obligations. Some of these are explicit and known as rules, others are implicit. The implicit, unspoken rules and expectations are contents of psychological contract.

Focus on two-way relation and interaction between college research team and its members, the definition of Chen and colleagues is used in this study. Chinese college research team's psychological contract is defined as the subjective understanding of team and member obligation, which is different from official rules or contract. Because the high flexibility and autonomic feature of college research team, a well defined psychological contract would help the team to improve communication and trust between its members, promote the organization as a real team and achieve a win-win situation.

### 2.2 Structure of college research team's psychological contract

Structure definition is a necessary part to study psychological contract. Based on existing research about 2 and 3 dimensions structure theory and features of Chinese college research team, this study has following hypotheses.

Firstly, college research team is highly goal orientated, so the foundation of psychological contract is team development and goal achievement. Secondly, cooperation and trust is valued higher in such a loose structure. Because research team is usually a flexible organization, with members from different majors and positions. Besides professional skills and problem-solving ability, cooperation and communication ability is also very important for a research team to function normally. Also, members have a great need for value achievement and self development. A research team is normally built with creative intelligent people, who values self development higher than people from other kind of organizations. In the incentive structure of college research team, the mental incentive factors such as social respect, value admission and achievement are more attractive to team members. Finally, based on college research team's feature(broad autonomy field, high self-esteem sensitivity, low attachment with team, etc), team and its members are equally positioned in real life relationship, the traditional advantage of organization over members is weakened. In obligation fulfillment process, team members would make subjective judgments and then adjust their behavior based on them. For college research team to form a psychological contract, the team and its members have to continuously experience a psychological interactive process of offer, counter offer, new offer and commitment.

We have two hypotheses in this study: college research team focuses on goal achievement, development promotion and interpersonal cooperation; there is a significant two-way interaction effect between team and member's obligation.

### **3 Scale Design and Analysis**

#### **3.1 Scale development**

The twin-subject feature is a key point to truly understand college research team's psychological contract. In the development process, we use deep interview and open-questionnaire to gather data from both the manager and member. Data collected these ways are then categorized, ranked by frequencies, and compared. Based on our own data and former researcher's tool, the original scale is made. After reliability, validity, and factor analysis, the final version is completed.

##### **3.1.1 Structured interview and open-questionnaire**

5 research team managers and 6 professors are invited to join the interview and talk about their understanding of college research team's psychological contract. A 10-item open-questionnaire based on literatures and experts' opinion is used on 30 college teachers to further study factors affecting psychological contract.

Results reveal that college research team's psychological contract can be divided into 2 parts: team obligation and member obligation. Team obligation focuses on goal achievement, development promotion and humanistic care. While member obligation focuses on task accomplishment, interpersonal cooperation and team maintenance.

##### **3.1.2 Item formation**

60 items are created based on interview. After revising and deleting inappropriate ones, 50 items are selected to form the original scale. Items are randomized, each facet has 25 items. Among all 50 items, 4 are reversed and should be marked accordingly. Responses are collected by a 5-point Likert scale ranged from completely unlikely to completely likely.

#### **3.2 Procedure**

36 college research teams from Hunan and Hubei are selected, including participants from literature, science and engineering. 36 Managers and 460 members are randomly selected to participate. 500 questionnaires are sent, with 473 returned and 442 been valid (88.4%). In our sample, 15.2% are professors, 72.8% are associate professors, and 13% are lecturers. About participants' degree, 31% are PhDs, 57.3% are masters.

In order to further understand the structure of the scale, we divide 442 data into 2 halves. One is then used in explorative factor analysis; the other half is for confirmative factor analysis.

### **3.3 Analysis**

#### **3.3.1 Item analysis**

Extreme group method is used to test each item's discriminability. Each participant's total score is ranked (after reversing item9, 20, 32 and 42), then the top 27% is selected as high group while the bottom 27% is low group. A t-test is carried to test the difference between 2 groups on each item. Results are reported in Table 1.

**Table 1 T-Test Between High and Low Group**

Item	<i>t</i>	<i>p</i>	Item	<i>t</i>	<i>p</i>	Item	<i>t</i>	<i>p</i>	Item	<i>t</i>	<i>p</i>	Item	<i>t</i>	<i>p</i>
1	2.385	.012	11	4.369	.000	21	5.752	.000	31	2.987	.004	41	1.657	.142
2	2.172	.032	12	4.587	.000	22	5.382	.000	32	3.467	.000	42	5.899	.000
3	2.513	.015	13	1.479	.129	23	2.379	.017	33	5.559	.000	43	6.618	.000
4	3.978	.000	14	4.172	.000	24	2.799	.005	34	3.803	.000	44	4.990	.000
5	2.976	.004	15	3.013	.003	25	3.650	.000	35	5.757	.000	45	4.507	.000
6	4.134	.000	16	3.316	.002	26	2.156	.034	36	6.221	.000	46	4.602	.000
7	4.457	.000	117	4.601	.000	27	3.389	.001	37	4.702	.000	47	4.465	.000
8	4.019	.000	18	5.814	.000	28	1.701	.101	38	5.504	.000	48	4.033	.000
9	5.775	.000	19	4.745	.000	29	.364	.717	39	6.129	.000	49	5.798	.000
10	5.911	.000	20	5.568	.000	30	1.663	.084	40	3.102	.003	50	3.022	.003

Results indicate that there are significant differences between 2 groups on all the items except 13, 28, 29, 30 and 41. These 5 are deleted; remaining 45 items are tested again.

### 3.3.2 Explorative factor analysis

EFA is used to test scale's structure validity, delete unnecessary items, and improve the total psychometric quality.

Kaiser-Meyer-Olkin measure of sampling (0.824) and Bartlett's test of sphericity(<.000) results show that data is capable for EFA. 6 Factors are extracted based on following 3 principles: eigenvalue over 1, scree plot, and each factor should have at least 3 items. 52.59% total variance could be explained by these 6 factors, see Table 2.

**Table 2 Total Variance Explained**

Factor	Eigenvalues	% of Variance	Cumulative %
1	5.547	18.301	18.263
2	2.702	8.899	28.231
3	1.786	6.021	35.234
4	1.699	5.876	42.175
5	1.435	4.503	47.562
6	1.203	3.944	52.610

After deleting low loading (lower than 0.4) and double loading items, 26 items are left to form the final version. All 26 items and their component matrix are showed in Table 3.

**Table 3 Component Matrix**

		1	2	3	4	5	6
V11	Necessary research conditions	.726					
V45	Reasonable amount of resources	.667					
V37	Advanced and scientific regulations	.647					
V16	In time positive regard	.508					
V27	Clear assignment and obligation	.520					
V42	Chance for further studying		.655				
V39	Focus on member's development		.627				
V41	Assistance in project application		.587				
V32	Just and rational ownership assignment		.562				
V40	Regular academic communication conference		.549				
V14	Respect other members			.636			
V12	Consider member's opinion when making big decision			.612			
V43	Trust other team members			.607			

V23	Caring about teammate's life			.561			
V12	Fair and just environment			.534			
V9	Ever growing skill and ability				.690		
V3	Finish research task successfully and timely				.576		
V6	Possibility to fully perform academic specialty				.518		
V10	Maintain a harmony relationship between members					.405	
V33	Respect academic disagreement					.609	
V29	Teamwork					.656	
V30	Greater good					.601	
V49	Defend team image and interest						.795
V37	Follow team regulation						.748
V22	Willing to give advice for team development						.455
V4	Willing to participate in communication conference						.448

Analysis reveals 2 facets: team obligation and member obligation. Each factor is named according to their items and content. Factor 1 is Goal Achievement, which is mainly about software and hardware condition of the college; Factor 2 is Development Promotion; Factor 3 is Humanistic Care; Factor 4 is Task Accomplishment; Factor 5 is Interpersonal Cooperation; Factor 6 is Team Maintenance.

### 3.3.3 Reliability analysis

Cronbach's Alpha and split-half reliability is used as reliability index. After removing Factor 5, Cronbach's Alpha is 0.716, split-half is 0.911. All six dimensions' reliability ranges from 0.616-0.763( $\alpha$ ) and 0.614-0.735(split-half) respectively, indicate high consistency and psychometric quality.

**Table 4 Reliability Analysis**

Factor	Cronbach's Alpha	Split-half reliability
Factor 1 Goal Achievement	.758	.729
Factor 2 Development Promotion	.702	.721
Factor 3 Humanistic Care	.687	.608
Factor 4 Task Accomplishment	.621	.588
Factor 5 Interpersonal Cooperation	.588	.544
Factor 6 Team Maintenance	.541	.637
Total	.719	.909

### 3.3.4 Confirmative Factor Analysis

CFA is used to test the fitness between model and actual data. As introduced in 2.2, 221 participants' data is used in this analysis using AMOS 7.0. Results are showed in Table 5.

**Table 5 Confirmative Factor Analysis Results**

$\chi^2$	df	$\chi^2/df$	RMSEA	GFI	AGFI	CFI	NFI	IFI	TLI
247.251	81	2.524	0.037	0.8765	0.869	0.868	0.794	0.875	0.862

Fitness index ( $\chi^2/df$ ) is 2.013; GFI, AGFI, CFI, NFI, IFI, TLI are all above 0.80; RMSEA is 0.044; all indexes indicate a very good model fitness. Final version of college research team's psychological contract scale has satisfactory structure validity.

## 4 Conclusions

Subjective characteristic and structure feature of college research team's psychological contract are analyzed and tested. The scale we designed shows great psychometric quality in data analysis, is qualified for research purpose and requirement. College research team's psychological contract is significantly dual-subject; similar patterns exist in team and member's psychological perception of mutual obligation. Structure of college research team's psychological contract is a 2 levels 6 dimensions' model. Team obligation includes goal achievement, development promotion and humanistic care. Member obligation includes task accomplishment, interpersonal cooperation and team maintenance. A significant interaction effect between different levels is also found.

(E-mail: chenjun@whut.edu.cn, pfinance1967@sohu.com)

**Abstract:** Based on the analysis of no-cash reimbursement's influence on university financial process, this paper points out that no-cash reimbursement puts forward new requirements for financial internal control system in university accounting, the requirements including to strengthen the information control of bank card, to strengthen the accounting business audit control and the safety control of system, and to improve the accountant's quality, etc. Finally, the paper gives suggestions on financial internal control innovation of university accounting under no-cash reimbursement, including creating people-oriented internal control environment, comprehensively assessing the financial risks, sounding the internal control system and making the financial process standardization, strengthening the internal and external information exchange, and establishing internal and external coordination supervision mechanism.

**Key words:** No-cash reimbursement; University accounting; Financial internal control system; Institutional innovation

### 1 Introduction

In early 1992, the COSO (The Committee of Sponsoring Organizations of The National Commission of Fraudulent Financial Reporting) had already issued the famous "internal control---integrated framework", the concept of internal control was first put forward and divided into five elements which were internal control environment, risk assessment, accounting process control, exchange of financial information, establishing coordination supervision mechanism.

Generally, no cash reimbursement can be regarded as one of the important aspects of the accounting information system.

Zhou Ping(2007) discussed the relationship between internal control and accounting information quality, considering that there is a close logical relationship between them<sup>[1]</sup>. Sun Pengyun(2009) studied the demand motivation of enterprises' internal control environment<sup>[2]</sup>. Wang Suping(2010) found out the path to implement the internal control of accounting information system through analyzing the features the system under network environment<sup>[3]</sup>. Andreas I. Nicolaou (2000) made an empirical study on accounting information system, and it indicated that the fit between the accounting system design and the contingency factors resulted in a more successful system. The study addresses an important area in accounting systems research that directly relates to the decision facilitation and control objectives of accounting information<sup>[4]</sup>. Jap Efendi, Elizabeth V. Mulig and Murphy Smith's(2006) study shows that Information technology plays a critical role in modern business, especially regarding the accounting function. Thus, one might expect that information technology and accounting systems would be a major component of accounting research. They have examined the proportion of technology and systems articles in seven top-ranked accounting journals<sup>[5]</sup>.

Although there are plenty of researches on the internal control of accounting, there is little about the internal control in university accounting under no-cash reimbursement which now is the new trend of university financial development.

No-cash reimbursement is a new way for accounting processing. When a customer applies for reimbursement business, the payment will be finished by no-cash payment system. In other words, since the financial system of the accounting department is connected with bank's system by network, then the reimbursement expense can be transferred directly to the customer's bank card or savings account instead of by cash payment. Considering the characteristics of university's accounting under no-cash reimbursement, this paper analyzes the deficiencies of traditional internal control system, and puts forward the measures to innovate the internal control system under no-cash reimbursement.

### 2 No-Cash Reimbursement and Its Influence on the University Accounting Process

Along with the trend that the university accounting has gradually adopted the no-cash reimbursement mode, the accounting operation process and financial management have been changed subsequently. And this affects a lot on the financial internal control system of university accounting.

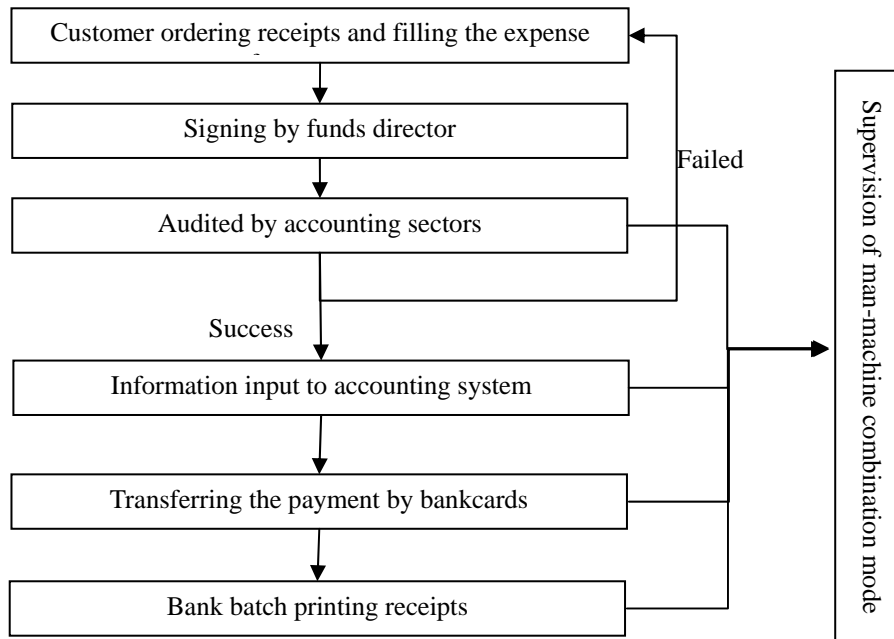

**2.1 Changes in the control over cash flow**

From the view of cash flow control, university accounting control on cash payment gradually becomes weaker, while the control on electronic means of payment is emphasized. On one hand, there is no need for university financial department to make settlement by cash or by check under no-cash reimbursement mode, and then the financial department gradually achieves the “zero cash stock”. Therefore, cash control will be gradually weakened, and the work on cash safekeeping and bill management associated with the currency payment is reduced accordingly. On the other hand, since the university financial department directly transfers the payment by no-cash reimbursement system, the control on electronic payment means should be strengthened. The control includes the developing and maintenance of the electronic payment system, authorizing the accountant to implement payment, and so on.

**2.2 Changes in supervision mode**

From the view of supervision on financial department, the no-cash reimbursement mode makes the supervision more rigid because it transfers the mode from traditional "person to person" to "man-machine combination". As we know, the traditional inspecting subject and object of financial internal control both are persons, and this kind of supervision is flexible in some degree. However, the settlement and payment are finished mainly by the help of computer system, network and other hardware equipment and financial software under no-cash reimbursement. On one hand, the specially designed financial software can play a role in the supervision of accounting operation process. On the other hand, the supervision objects are extended from person to computer system, network, hardware equipments and financial software, which make the inspection more rigid.

The new financial process and supervision mode under no-cash reimbursement can be described by figure1.

**Figure 1 Financial Process and Supervision under No-Cash Reimbursement**

**2.3 Changes in professional requirements for the accountants**

From the accountant’s quality view, they should have high quality associated with the no-cash reimbursement. On one hand, besides the professional ability as the traditional accounting work requires, under no-cash reimbursement, the accountant is needed to master the technique of electronic payment expertly, to communicate promptly with the bank and other sectors of financial department, and to conduct regular reconciliation work, etc. On the other hand, due to the particularity of no-cash reimbursement, if one part of the accounting process is not prudent, it is easy to lead to embezzlement and corruption, which requires the accountant with high occupation morality and legal consciousness.

### **3 The Requirement to Innovate Financial Internal Control System of University Accounting under No-cash Reimbursement**

#### **3.1 Requirement to strengthen the control of primary information on bank card**

As a carrier of electronic payment, bank card plays an important role in no-cash reimbursement. So there is no doubt to strengthen the control of primary information on bank card. The control includes the accuracy and security on the primary information of bank card.

As an important carrier of electronic settlement, bank card's information accuracy directly relates to whether the reimbursement process can be smoothly finished under no-cash reimbursement. The role of bank card is different from the traditional cash payment or cheque clearing mode. Once there is an error in the accounting process will directly impact the efficiency of financial department, and it would also threaten the accountant's key interests. Therefore, it is necessary to carefully collect cardholder's information, and strictly limit to issue the bank card. On one hand, in order to ensure the accuracy of the primary information from the source, the accountants should not only check the cardholder's name and his ID number, but also verify the matching of his name with his ID card number and bank card number. On the other hand, there should be someone specially assigned to maintain the information of bank card in daily work to assure that the information is accuracy when somebody applies for reimbursement. The information maintenance includes renewing cardholder's information, changing the card number, and so on.

As to the control on the security of bank card's primary information, the accountant must strictly keep the customer's information as secret and should not reveal it outward at will. One important work is to prevent some illegal members to exploiting the information for cheating, and to prevent the internal accountant's illegal infringement. This is helpful to reduce the financial risks. Besides, the financial department should strengthen the connection and communication with the bank. The financial department not only need to ensure the interface between bank payment and reconciliation keeping clear in order to smoothly finish daily settlement and reconciliation work, but also need to negotiate with the handling bank in advance and to solve the problems such as withdrawing cash on strange land, charging service fee when transferring bank card, etc. This would be helpful to avoid unnecessary conflict afterward.<sup>[6]</sup>

#### **3.2 Requirement to strengthen the control of accounting audit**

The internal audit is an important part of financial internal control system. The audit to each operating link of the accounting process is especially important under no-cash reimbursement mode. As no matter for the individual business or group business, the settlement and payment are finished by electronic money directly instead of by cash under no-cash reimbursement, without the need for the on-site inventory notes. Therefore, in order to ensure the reimbursement payment accurately entering the designated payee's bank account, it is necessary to strengthen the audit for each business link in the no-cash reimbursement. This would be helpful to make the reimbursement business completed effectively, and to prevent the accountant using his authority for corruption and embezzlement of public funds.

On reimbursement business audit, no-cash reimbursement requests to strengthen accounting audit, review of accounting documents, operation information check before payment, and timely account reconciliation. Firstly, for every reimbursement business, the accounting audit personnel need to audit the legitimacy of all the original accounting documents, the rationality of reimbursement channels and the accuracy of reimbursement amount seriously, and to input the payee's information accurately or to correctly extract the payee's information from the financial system. Secondly, the accounting documents review has been changed from the traditional checking after the event to spot checking under no-cash reimbursement mode, i.e. the accounting documents will be passed directly to the reviewer after the audit's check and attn's confirmation, and then the reviewer makes on-site check and signs or seals on the documents if there is no problem. Thirdly, the cashier must make further check on the payee's name and bank account after the accounting documents has been delivered to him, then executes the payment after verification. Finally, the cashier must print the daily deposit account, timely accomplish reconciliation work with the bank, prepare the bank balance reconciliation statement and find the cause of pending items to ensure each settlement business being finished accurately

#### **3.3 Requirement for the system and its safety control**

Compared with traditional reimbursement mode, no-cash reimbursement is more dependent on computer network, which consists of three systems as bank system, financial system and no-cash reimbursement system. Failure in any part will cause the system unable to run. So this proposes new

requirement for the system and its safety control. The requirement for system performance can be for both hardware and software.

From the hardware point of view, no-cash reimbursement mode requires that the accounts, information storage and file transfer should be stored in the computer in the form of electronic file, and be transmitted through the network. Thus, this raises high requirement for system hardware in bank and university financial department. For example, the information output devices, information receiving devices and computer system must be equipped with the requirement of no-cash reimbursement system. They should be compatible, harmonious and consistent and able to create an overall effect. In addition, the electromagnetic storage of accounting information has raised new requirement to the application personnel and the maintenance personnel, because huge amount of accounting information are stored on magnetic media and can be easily removed or tampered without traces under no-cash reimbursement. Therefore, the application personnel must strictly abide by the rules and regulations to avoid unauthorized and illegal behavior. While the system maintenance personnel must timely make fault detection and have the ability for system recovery if the system is in trouble, and ensure the normal operation of the system.

From the software point of view, since no-cash reimbursement system makes the financial data to flow from closed processing platform into the network, and this makes the reimbursement system operating in the open network, therefore the financial system and accounting information security has been faced hitherto unknown challenge. This puts forward high requirement for software system. In the developing process of financial software, the software developer needs to consider the problem in all its aspects, to prevent the system setting not matching with actual situation, and to avoid system vulnerabilities. Once some malefactors find the loopholes, they may use high-tech means to invade the system, and would bring great losses for the university and bank.

### **3.4 Requirements to improve the accountant's quality**

Since no-cash reimbursement system changes the traditional accounting process, it requires the accountant to complete the settlement and payment work in electronic money online. Therefore, financial personnel must be able to adapt to the new working environment, and has the ability to solve new problems appeared in the accounting process. This puts forward new requirement for improving accounting personnel's quality.

Firstly, the financial personnel must have the ability to do the accounting work on network and is capable of electronic settlement task under no-cash reimbursement. This requires the financial personnel has relevant professional knowledge and computer skills, and is familiar with no-cash reimbursement process. Therefore, the financial department should train the financial personnel to help them to get the knowledge on no-cash reimbursement and financial regulations, and to improve their financial professional skills and operational level.

Secondly, the financial personnel must be capable to resolve new problems encountered under no-cash reimbursement. For example, the financial personnel can timely discover the problems, and promptly notify the maintenance personnel to conduct inspection and troubleshoot system fault in the event of a fault. Another example, in view of the particularity of information storage under no-cash reimbursement, the financial personnel must have the ability to maintain system security, to preserve the existing data, and to prevent the emergence of greater error in case of system failure.

Finally, no-cash reimbursement mode needs the financial personnel has good occupation ethics and moral cultivation to avoid financial crime. Under no-cash reimbursement mode, financial data is stored on magnetic media, and no trace is left when the data is changed. Thence, this may easily leads to indiscriminate use of privileges, embezzlement and financial crime. This requires the financial personnel have good occupation morality, can resist the temptation and legitimately perform the accounting responsibility.

## **4 Suggestion on the Institutional Innovation of Internal Control in University Accounting under No-cash Reimbursement**

From the perspective of the key elements of internal control, the university's financial department can make some innovation from five interrelated aspects such as internal control environment, risk assessment, accounting process control, exchange of financial information, establishing coordination supervision mechanism. The financial department needs to establish long-term control mechanism and standard, to control and manage the process effectively, and to ensure the implementation of the standardization of basic accounting work.<sup>[7]</sup>

#### **4.1 Creating people-oriented internal control environment**

A good internal control environment play a key role in shaping organizational culture, and it influences personnel control's consciousness and lays organizational styles on internal accounting control. A good environment is the foundation and the engine of financial internal control frame. Along with the change of university financial reimbursement mode, it is necessary to create appropriate financial internal control environment under no-cash reimbursement in order to follow this new trend. We will analyze from the following three aspects.

Firstly, it is urgently important to improve the financial personnel's professional ability, so that they can fit the new working environment of no-cash reimbursement. Since no-cash reimbursement mode has changed the traditional accounting operation process, this requires the financial personnel have the ability of electronic money payment. So it is necessary to train the accounting personnel, to help them become familiar with operation procedures and the new environment under no-cash reimbursement as soon as possible, to deepen their understanding on the new accounting process and learn to solve the new problems.

Secondly, it is important to strengthen organization construction, to make appropriate adjustment for organization setting, and to intensify the mutual restraint on the division of sector function. Under no-cash reimbursement, accountant and cashier are more strongly associated with together, in many cases, they work at the same office, but this is not conducive to the independence of the powers and responsibilities of different accounting sectors. In view of this phenomenon, when setting financial sectors, the university financial department should obey the duties incompatible principle, reasonably set accounting sectors including accounting sector, audit sector, cashier sector, and achieve all the sectors separation and keep the independence of accounting and cashier sectors. In accordance with the accounting positions incompatible and duties separation principle, the financial department should set the positions such as cashier, audit, check, account management, system maintenance, file management, bill management, salary management and so on. And each position has clear post duty and responsibility.<sup>[8]</sup>

Thirdly, the financial staff's occupation morality education should be strengthened in order to promote the healthy development of university's financial affairs under no-cash reimbursement. Based on the particularity of electronic clearing operations under no-cash reimbursement, the financial personnel is easier to modify financial information or even operate illegally. Therefore, it is very important to improve financial personnel's occupation morality and to enhance his legal consciousness.

#### **4.2 Comprehensively assessing the financial risk**

Because of the financial activity change from traditional mode to no-cash reimbursement mode, many new risks appear. Compared with the traditional mode, the financial risk highlights in the technical risk and operational risk coming from new operational procedures under no-cash reimbursement system. Therefore, in order to reduce the risk of accounting work, it is necessary to bring these new risk factors into consideration, comprehensively and reasonably to assess the financial risk, and to take the combined measures of self-inspection and error correction.

The technical risk mainly comes from the hardware and software of the system under no-cash reimbursement. On hardware, no-cash reimbursement system consists of three parts of bank port, financial system and no-cash reimbursement process. This puts forward higher requirement for the performance of computers and other equipments. Once one part is not functioning properly will make the entire system cannot to operate. On software, since no-cash reimbursement system is under the open network, the financial system can be often infected by virus or attacked by hacker.

The operational risk is mainly due to financial personnel's lack on technical knowledge and skills or improper operation. For example, if the financial personnel does not install antivirus software, not regularly updated virus database, and add hardware or install application software at discretion, this would causes the system to be infected by virus or attacked by hacker, lead to the password disclosure or being stolen, eventually result to serious losses for the university and the customers.

#### **4.3 Sounding the internal control system and making the financial process standardization**

The university financial department should establish and improve the internal control system after it utilizes no-cash reimbursement, for example, to set up the management regulations such as "Accounting processes and practices under no-cash reimbursement", and "The division of posts, its responsibilities and authority under no-cash reimbursement". By improving the internal control system, strictly controlling the financial activities and strengthening self restraint mechanism, this will be helpful to reduce the financial discipline and to ensure orderly operation of the university's financial business.

After a detailed decomposition to the process of no-cash reimbursement, and according to the

mutual relationship between each link of the processes, the "Accounting processes and practices under no-cash reimbursement" gives detailed operating rules, which makes the financial activity standardization, and helps the financial personnel quickly to get familiar with no-cash reimbursement process and to avoid mistakes by improper operation.

"The division of posts, its responsibilities and authority under no-cash reimbursement" includes division of labor, the authorized examination and approval system, internal control system for cash and bank account, the implementation of special management for the bill, etc. And this provision should pay special attention to authorized examination and approval system, because only when all accounting personnel engage in the accounting business activities within the scope of authorization, can the occurrence of corruption be effectively prevented. It is required to set the appropriate permissions for cashier, audit, review public inquiries and other users in order to limit their right to use the financial system module. The chief accounting officer is responsible for the system operation permission setting. The operation authority is set according to the post's responsibilities and may not be changed at discretion.

Since the accounting process has been changed under no-cash reimbursement, it is necessary to establish strict internal control system to standardize the accounting procedures and to constrain the financial behavior.

#### **4.4 Strengthening the internal and external exchange of financial information**

Since the internal control goes together with the management process, which is a dynamic process of moving in circles with ongoing problem-discovering and problem-solving, therefore, under the new mode of no-cash reimbursement, whether the internal and external information can be captured and be processed in time, and be smoothly transferred among different sectors of the financial department even outside the department on different levels, and can be well understood and be used will determine the realization degree of the organization's goal. And this is also the necessary condition for the organization and its employees to perform their duties.

On internal communication, in view of the features of no-cash reimbursement, university financial department may take training, lectures and other internal communication forms to promote the financial personnel to better understand the operation processes and new accounting business. On external communications, the financial department can get more feedback information through information communication and the exchange among the different departments in the university. And this is helpful to find the problems in the system operation. In view of its particularity, since no-cash reimbursement system consists of three parts of bank port, financial system and cash reimbursement system, therefore, the university financial department should pay special attention to strengthen the information exchange with nominated bank. Timely transfer of internal and external information can help financial personnel to find out the problems and inadequacy of no-cash reimbursement system.

#### **4.5 Establishing internal and external coordination supervision mechanism**

Internal control emphasizes on process management. Under no-cash reimbursement mode, financial activities participants not only include the university financial department, but also include the banks, customers and system developers and so on. And the financial supervision mode changes from the traditional 'people to people' supervision into 'human-machine' supervision, which requires to establish the cooperative supervision system combined with internal supervision and external supervision.

On one hand, the financial department can make real-time control and supervision for the accountant's operation by properly designed financial software. For example, the financial department can set reimbursement amount restriction. Once the financial personnel inputs data and submits reimbursement application more than the limit amount, the system will send out warning. Another example, the financial department can strictly supervise the reimbursement process, to prevent the skip or leakage of necessary operation process by controlling the system process's operation sequence. On the other hand, the external auditing department or administrative department of the university should check the basic accounting work regularly, assess accounting work quality and establish a perfect financial discipline and the incentive system in order to effectively prevent the moral risk under no-cash reimbursement.

## **5 Conclusion**

Computer and internet technology has changed the financial process, whereby no-cash reimbursement mode has appeared subsequently. No-cash reimbursement has changed the traditional

financial process, and it will result in the change of traditional financial internal control system.

Taking university accounting as an example, this paper gives some suggestions for financial internal control system innovation under no-cash reimbursement in current technology conditions, which would provide reference for the financial department in university. However, since computer and internet technology is in continuous development, it will deeply influence the accounting activities, so that no-cash reimbursement mode will also be changed subsequently. Then, the innovation of financial internal control system will be a lasting process. Therefore, in the era of rapid development of computer and internet technology, the study on the innovation of financial internal control system will be an eternal topic.

## Analysis of Influencing Factors on Improving the Effect of College Graduates Village Officials Project

Qu Shuaifeng

Student Career Center, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:qsf1980@163.com)

**Abstract:** As a strategic measure proposed by the Party Central Committee in the new historical situation, college graduates village officials project has an important influence on alleviating the employment pressure of college students and promoting the building of new socialist countryside. Taking the effect of college graduates village officials project as the focus, applying interviews and questionnaire to evaluate and analyze the influential factors of the engineer, we believe that village officials familiarity to rural work and their practical ability are closely related to the effect of college graduates village officials project, and finally, we put forward response measures to the restricting factors which affect the effect of college graduates village officials project.

**Key words:** College graduates village officials; Questionnaire survey ; Effect evaluation; Influential factors

### 1 Introduction

The Communist Party Central Committee's Organization Department has promulgated a series of policies of the college graduates village officials Project since 1995 in order to promote the construction of new socialist countryside. Historically, the strategic value of the college graduates village officials exists in two points—one is to solve the problem of college graduates' employment, another is to transport talents to the construction of new socialist countryside (Wang Tianmin, 2007). Meanwhile, with the implementation of the project, the advanced deeds of the college graduates village officials had been diffused rapidly around the country from part to whole and have drawn more attention of the society. The effect of this project have gained social recognition gradually. In order to analyze the influencing factors of these effects, this paper made expert interviews and questionnaire survey on Henan Province and Shanxi Province of China. Besides, questionnaire on typical nationwide areas where the project of the college graduates village officials implemented and case analysis had been used in this paper. The questionnaires were sent to the college graduates village officials, the leaders of the rural basic-level organizations and the local villagers. Among them, 350 questionnaires were issued to the college graduates village officials, from which 332 questionnaires were returned and 306 were valid. 210 questionnaires were sent to the leaders of the rural basic-level organizations, from which 198 questionnaires were returned and 195 were valid. 500 questionnaires were sent to the local villagers, from which 460 questionnaires were returned and 415 were valid.

### 2 Effect Evaluation on the College Graduates Village Officials Project

The college graduates village officials, who are the educated youth having finished the higher education, can take advantages of their knowledge, technique and networking resources to serve the rural areas well. Not only do they pass the scientific agriculture technique, advanced management measures, effective information of being rich to farmers, they also influence and improve farmers' living habits, ways of thinking, etc., which promotes both the material civilization and the spiritual civilization development in the rural areas.

#### 2.1 College graduates village officials' advantage

As shown in the investigation's findings, there are more than 90.0% of villagers holding the point that the college graduates village officials are full of knowledge and their learning abilities are high. In addition, 87.0% of villagers think that the college graduates' approaches to the information are ample and more than 60.0% of them consider that the college graduates village officials have great passion and vigor. Above all, villagers think highly of the college graduates village officials. A detailed result is shown in Figure 1.

**Figure 1 College Graduates Village Officials' Advantage Map**

**2.2 College graduates village officials' evaluation of its own effect**

As highly educated youth the college graduated village officials take advantage of their knowledge, skills and the network of resources to serve the countryside. They can not only transfer to the farmers agricultural science and technology, advanced methods of management and effective information to become rich, but also objectively influence and improve the farmers habits of life and the way of thinking and thus, accelerate the development of both materials and spiritual civilization in the rural areas. The research has discovered that 79% of the college graduates village officials frankly say that they participate the management of the affairs of the villagers and improve efficiency, 60.3% of them say they have spread new agricultural technology and provide information to become rich. 59.3% think they have animated the farmers cultural life.66.7% are sure that they have transformed the farmers concepts.66.5% of them think that they've improved the natural environment and strengthened securities management. A specific evaluation is shown an in Figure 2.

**Figure 2 College Graduates Village Officials' Evaluation of Its Own Effect**

**2.3 Villagers and basic-level organizations' evaluation of the college graduates village officials**

In order to truly reflect the effect of the status quo of the college graduated village officials from various angles, the report made a separate investigation on local villagers and primary organizations. When asked "What do you think of the role that the college graduated village officials have played in

the construction of new countryside”, farmers and primary organization from 5 provinces all hold positive attitude and their evaluation is shown in Figure 3.

**Figure 3 Villagers and Basic-level Organizations of the Five Provinces' Evaluation of the College Graduates Village Officials**

It can be seen from the data in Figure 3, that local villagers and primary organizations hold a pretty high acceptable level. Analyzing the data, it's not difficult to find that the recognition levels of villagers and organization for the college graduated village officials from the same province are about the same whereas there exist some differences between people from different provinces. Those from Jiangsu Province of China hold the highest level of recognition while Hubei Province of China the lowest with Beijing, Henan and Shanxi following Jiangsu Province of China. Coincidentally Jiangsu of China took the lead in the whole country to advertise job offers to the college graduated village officials throughout the country to serve as primary officials in the countryside in 1995, while Hubei province of China started the project in 2008.

Based on the consideration of the starting time of the project, we made an analysis on the length of time when the college graduated village officials, work in the country and the effect of the project. The beta value of the correlation coefficient is 0.414. The two show a strong positive correlation, indicating that the length of time working in the country effect the efficiency of the project of the college graduated village officials. As a special social group, the transform of their identity must face the process of the socialization of roles. The realization of self-identity recognition and the shortening of psychology distance with the rural masses require a certain period of times, during which the degree that the college graduated village officials realized their value and their working ability will both be promoted. Therefore, with the popularization of the project on a large scale throughout the country and constantly improve, the project will play a greater effect and encourage the construction of socialist new countryside.

### **3 Analysis of Influencing Factors on the Effect of College Graduates Village Officials Project**

With the implement of the college graduates village officials project, a wide range of college graduates village officials have been gradually admitted. However, effect of the college graduates village officials project and the role it plays are affected by many factors.

#### **3.1 Analysis of the subjective factors on the effect of college graduates village officials project**

The survey suggests that 74.1% of the university students as village officials are under the age of 26, 49% of which are graduates. And only 32.5% of the undergraduates have been working in the village before they do their job as village officials. They just graduate, or have one year working experience, or 2-3 years. They are incapable of adapting to the rural environment, neither are they familiar with the work. However, the rural environment and the related work are trivial, complex, which makes it difficult to those village officials who are not familiar with the rural environment, and those who lack the rural working experience of rural work experience. Therefore the graduate fails to realize the potentiality as village officials. In addition, 38.3% of the college graduates village officials believe that many problems

occur in their practical works because of the failure of making fully advantage of their professional knowledge and skills, the lack of social experiences, and the inharmonious relation between their skills and the economic development, resulting in their work not be effectively carried out.

### 3.2 Analysis of the objective factors on the effect of college graduates village officials project

According to survey, 76.5% of village officials think that the most obvious obstacle is the obscurity of their legislative status. Besides, their rights and obligations are not clear. 67.9% of the people think that the village appraisal and promotion mechanism is not perfect, and their future development is uncertain. 46.9% of village officials feel the pressure deriving from the low wages and the lack of security. At present, the recognition of the identity as village officials' identity of the village officials comes from two sources. One is them and the other is the society. The social recognition is related with their social position. Sometimes the psychological problems occur in their minds in terms of the legislative status and recognition, which results in the difficulties in their practical work. At the same time, as a new phenomenon, there are inevitably some defects, such as policy formulation and evaluation of supervision. The fact that welfare and security may not be implemented easily leads to the village officials in the psychological form rooted psychological development of the conflict and the future; they need to be continuously improved and optimized. Therefore, accurate recognition of identity, stable welfare system and complete working system is to make students village officials to be maintained the necessary way, and it needs for continuous improvement and optimization.

Other factors are as follows: 52.9% of the college graduates village officials think that the rural environment is complex and tedious; 34.6% of the college graduates village officials complain about the lack of human, material and financial resources; 33.3% of the college graduates village officials think that the working environment is disappointed and the office instruments are deficient.

Thus, in order to realize their potentialities, not only that their abilities should be developed, but also the working conditions should be improved. As shown in Figure 4.

Figure 4 Factors that Affect College Graduates Village Officials' to Play a Role

## 4 The Improvement Measures of the College Graduates Village Officials Project

In this paper, we can conclude that both village officials familiarity to the rural work and their practical ability affect the project effect through the in-depth analysis of those influential factors. (Just as shown in Table 1 and Table 2, the relationship between both the null hypothesis is  $0.000 < 0.05$ , and the relationship strength respectively is 0.614 and 0.879). Village officials generally just graduated from college and didn't know much about the rural working conditions. Therefore, it is necessary for village officials to receive training in agriculture-related policies, knowledge, psychological and work experience. Specifically, one is to establish a platform for village officials to communicate and learn mutually, and another is to set a "one-to-one" supporting system, namely a cadre having grass-roots work experience helps a village official and teaches them working experience, assists them to analyze and solve the problems faced in the practical work. Accordingly, strengthening the "village official" work skills training, enriching their rural work experience, and improving their working capacity play a vital role in the new rural construction process. At the same time, because the village officials practical ability affect the project effect to a certain extent, so when recruiting village officials, local government

should highlight their practical ability, increase the threshold of students competition, enhance transparency in the selection process, and make the selection process and results known to the public (Lv Hongliang, Lv Shuliang, 2009), which will help to establish an excellent village official team.

**Table 1 Correlation Analysis of College Graduates Village Officials Familiar with the Rural Work and Effect of College Graduates Village Officials Project (N=564)**

Correlation analysis of college graduates village officials familiar with the rural work and effect of college graduates village officials project	Type of measurement	Value
The strength of relationship	Eta	0.614
Significant level of inspection	Variance test	0.000 (P※)

**Table 2 Correlation Analysis of College Graduates Village Officials Ability to Practice and Effect of College Graduates Village Officials Project During the School (N=564)**

Correlation analysis of college graduates village officials ability to practice and effect of college graduates village officials project during the school	Type of measurement	Value
The strength of relationship	Eta	0.879
Significant level of inspection	Variance test	0.000 (P※)

(P※ is the probability for the null hypothesis (i.e., the relation between them is not the establishment of probability) ,similarly hereinafter . In this paper, we put saliency as 0.05, we consider the relationship between the two factor is not established as long as the null hypothesis probability less than 0.05, similarly hereinafter.)

In addition, through the investigation, this paper finds that village officials' level of education and the effect of college graduates village officials project show weak positive correlation, the correlation coefficient ETA is 0.273. However, there is a strong positive correlation between whether village officials apply their major to the rural counterparts or local government whether consider the college students work professional background match their demands and the effect of college graduates village officials project , the correlation coefficients are 0.575 and 0.693.

## 5 Conclusions

To implement the "one college official for one village" work plan and make the full show of effect of college graduates village officials project , on one hand, we must formulate scientific recruit training system, increase the rural working familiarity and practical ability and take the professional counterparts problems into consideration, so that those selected village officials can apply what they have learned to serve the new rural construction and development. On the other hand, the project should follow the "distribution according to the need" principle, that is to say, when university cultivate and transfer talents to rural and the local government select village officials ,the demand for local talents situation need to be considered to make every man do his best according to his lights.

## Reflection on the Roles of Language Teachers in Computer-Assisted Class

Zhang Ping, Liu Jingjin

College of Science, Naval University of Engineering, Wuhan, P.R.China, 430033

(E-mail: danpingping@sohu.com, Liuliza@163.com)

**Abstract:** Different from the traditional ones, the roles language teachers are taking in the context of computer-assisted class deserve much more attention. This paper at first explores the characteristics of computer-assisted class and the new relationship between the teacher and students in the new pattern is also discussed. And then it analyzes from four dimensions the various roles language teachers play, on which occupational and interpersonal roles are put much focus. The paper at last comes to the conclusion that study on the roles of language teachers provides valuable insights into language teaching, making the computer-assisted language teaching more effective and creative as well.

**Key Words:** Computer-assisted classroom; Teachers' roles; Occupational; Interpersonal

### 1 Introduction

In everyday life, computer has now become quite available in many aspects such as financial affair, personal communication, and health service as well. In 1950's computer significantly came into the area of language learning and teaching, which has been developing with the researches on the language acquisition. Since then CALL (Computer-Assisted Language Learning) has experienced its important phases which fall into 3 categories: behavioristic, communicative and integrative CALL.

It was not until 1980's, however, that computer-assisted language instruction begun to draw people's attention in China. And after that this topic gradually became one of the research issues in the field of foreign language learning and teaching. At the end of last century, CALL has widespread so quickly in the country that nearly 10% of the college students learn foreign languages, more or less, on computer either in schools or at home. Besides, more and more language teachers have begun to think more about the implications of computer technology for their language teaching. In the 21<sup>st</sup> century computer-assisted instruction is expected to lead the trend of foreign language learning and teaching, which is characterized by the co-operation on the parts of both teachers and students. And when role relationship between teachers and students becomes a central issue in the researches of language classroom, the new roles of language teachers in the new pattern have been drawn much more attention.

What is discussed in this paper is the roles that language teachers play in the context of computer-assisted class. To begin with the study, the characteristics of computer-assisted class, are analyzed. By comparison, the relationship between teachers and students in the new pattern is also discussed. To explore the transform of teachers' roles from the traditional ones to new ones, the discussion of language teachers' roles at different stage of class and in different classroom teaching is developed from four dimensions, on which occupational and interpersonal roles are placed much emphasis. Lastly conclusion is drawn.

### 2 Literature Review

In the traditional model of language teaching and learning, teacher have always acted as the controller of the class, while the students are the passive receivers. And such case has no exception in Chinese classroom. However, in a desired classroom setting, a qualified teacher and successful students are expected to be prepared to take different roles at different stages of language teaching and learning process.

Many researches on the traditional role of the teacher have been done. (Littlewood, 1981; Harmer, 1983; Meagan, 1990; Feuerstein, 1997; Li, 1998; Zhang, 2000;) in which teachers' roles as the speech-maker or the lecturer should be replaced by the new and multiple ones such as participants of teaching-learning program, while the students are no longer expected to be the passive receptacles but more possible partners and performers of communicative activities. (Wright, 1987; Widdowson, 1990; Nunan, 1991; Wang, 1996; Wright, 2000)

In the field of language teaching and learning, role refers to a special set of conventions in which teachers and students can identify themselves respectively. As the two human factors in the whole program, teachers and students carry out their own parts that in fact complement with each other. In the

classroom co-operation, teachers actions and their interactions with their students are believed to mirror their own beliefs, which make it possible for languages teachers to play an important and special part in promoting effective learning in significant ways. In terms of foreign language teaching in multi-media context, teaching behavior of language teachers has been discussed. And the roles of language teachers with the assistance of computer have become facilitator of effective learning and prompter of the foreign language and its culture, fostering the right climate for learning to take place, for confidence to develop, for people's individuality to be respected and for moving towards learner autonomy".(Williams & Burden, 1997; Zhang, 2010).

### **3 Characteristic of Computer-Assisted Class**

Different from the traditional language class, computer-assisted language class presents its own characteristics, which is the reason for making a focus on teacher and student relationship an issue. The characteristics of compute-assisted language teaching & learning are as follows:

#### **3.1 Differences from the traditional class**

First, compute-assisted language class is characterized by computer assistance. The use of computer provides the students and their teachers with an important information source, which actually puts forward some new requirements on both parts. With a computer serving as a vehicle for delivering instructional materials to the students, it is very convenient for the teachers to prepare their lectures either at office or at home, and it is also effective for them to pre-design the teaching program. At the same time, students may take advantage of computer as another "knowledge bank", if they like, to carry out their learning in a more active and dynamic environment, rather than to follow the teacher passively. In other words, computer assistance entrusts to the students the initiative.

Second, computer-assisted language class brings about some changes in the relationship between the teacher and students, in which the two parts get more co-operational. Traditionally, the teacher part is always seen to take much control of the process, with teaching as intervention.(Wright 2000) On the contrary, in computer-assisted class, the equal teacher-student relationship lies at the very heart of the teaching and learning, which makes teachers cooperator and reliable partner. With much help of computer, teachers can easily assist the student's performance and also help them develop a sense of autonomy. Consequently the students would feel flexible to pick up languages, which does goods to their fluency improvement and embodies the typical idea of focusing more on using language rather than the language forms themselves.

#### **3.2 Link between teachers and students in computer-assisted class**

The reason why the teacher-student relationship is taken as another very important factor when interpreting the teachers' roles is that the teacher-student relationship reflects their underlying value systems and attitudes held by individuals that lead to different classroom activities and behaviors. And in compute-assisted language class, the teacher-student relationship changes a lot, compared with traditional relation to each other. The positive performance of role relationships affects successfully the way the teacher and the students communicate each other, where learning will be facilitated and the students are more likely to achieve desirable learning outcomes. (Zhang, 2010) In other words, the positive relationship between the teacher and the students is meaningful to explain interpersonal aspects of the participants in classroom interactions, while the negative role relationship between the teacher and the students seems to be a potential threat to student self-esteem and therefore represents a source of psychological stress, which actually places obstacle in the learning process.

### **4 Teachers' Roles in computer-assisted language teaching**

When it comes to the field of classroom language teaching with computer, the roles the teachers play is of significance and of complexity as well. Different dimensions can be chosen to illustrate such characters such as time, class category, occupation and interpersonal dimension as in the Figure.

#### **4.1 Time dimension**

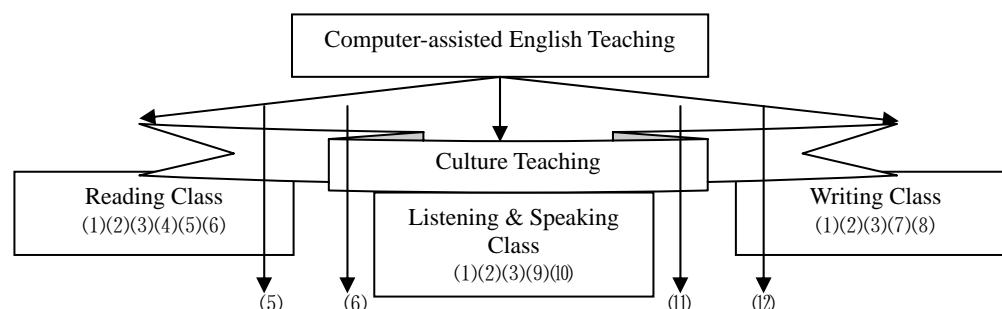

In computer-assisted language class, teachers act as material collector before class, monitor and manager at class, and evaluator or consultant after class.

##### **4.1.1 Material collector before the class**

Generally speaking, before the class, almost all the teachers will do some preparations. The usual preparations of language class mainly covers the introduction to the backgrounds, the grammar points and the vocabulary explanation. Before class teachers often try to collect materials as much as possible which are out of the students' hands. At this stage computer serves as the very "resource bank" which is

quite helpful for the students to understand what they will learn at class.

Besides, language teachers from different college can exchange their materials and experience as with the help of networked computer. For example, teachers download the authentic materials directly from the Internet to get access easily to a number of practice programs designed by other language teachers. Seen in this light, computer is so helpful that it can provide the teachers with some additional materials for them to better their preparations for the classroom teaching. The teacher's role at the phase can be described as material collector, or information selector.

**Figure 1 Teacher's Roles in English Teaching**

- |   |  |
|---|--|
| (1)= organizer of classroom activity                | (2)= participant of classroom communicating          |
| (3)= monitor or a guide of learning                 | (4)= selector of reading materials                   |
| (5)= demonstrator of target language (English)      | (6)= consultant or an adviser of language            |
| (7)= tolerant corrector of errors                   | (8)= evaluator or a consultant of writing            |
| (9)= patient listener                               | (10)= stimulator of students' affective factors      |
| (11)= explainer of foreign language and its culture | (12)= researcher of foreign language and its culture |

#### 4.1.2 Monitor and manager at class

Language teaching in computer-assisted class creates a more authentic environment where target language feels natural instead of created by language teachers. Teacher make use of the instructional software to arouse the students' interest and thereby motivate them to take part in the classroom activities. At computer-aided class teachers become the facilitators or organizers, which may reduce the consumption of their physical power.

Usually students may do their learning on computer respectively. If so, the teacher's task is to give consults and guidance, to organize some communicative activities such as discussions or debates in groups, and to give the examinations. Such learner-centered model makes the teacher monitor the class rather than control it.

#### 4.1.3 Evaluator or consultant after class

Computer can help the teachers to be more scientific and objective in the area of testing and evaluating. A case in point around the world is the TOEFL, which gives a new conception of that "tests can be computerized". In the view of teaching practice computer can help the teachers in the following aspects: (1) to design the testing papers, especially when making decision on the testing range, levels and options (2) to grade the students' examination papers more objectively (3) to analyze the results of the tests scientifically. As a result, the teachers can classify the students into various groups on basis of their scores and become the reliable evaluator or consultant.

### 4.2 Class dimension

As in the figure teachers play different roles at different language class in teaching with assistance of computer. When in different class, teachers act as at least twelve roles to make the classroom teaching more delightful and more effective.

What should be mentioned here is the role language teachers play in teaching culture. On basis of the relation of language and its culture, teaching language should take culture factor into consideration. At surface level, teachers demonstrate the target language and become consultants or advisers of the target language. Only when teachers act as introducer of foreign language and its culture can the classroom teaching be more colorful. And only when language teachers do some research on foreign language and its culture does the communication practice in class become meaningful. From this perspective, language teachers act as a "bridge" with one end to the target language and its culture and the other end to his or her native language and native culture.

### 4.3 Occupational dimension

Banton (1965) puts role in sociological terms as “a set of norms and expectations applied to the incumbents of a particular position”. In other words, once a person is placed in a role, others will expect certain types of his behavior. When it comes to the field of language teaching, the roles of teachers can be occupational, which makes teachers take on more responsibilities and develop more self-satisfaction from the job.

When people do the job of teaching language, he or she is expected to be a model language learner to facilitate effective learning. Sometimes, he or she should do some researches about the target language with the computer. For instance, one can do some semantic analysis in the corpus of any word with the authentic materials. In one experiment after the research on “blue” in the corpus of 5.2 million words, the teacher got 416 blues as occurrences. (Zhang, 2006) Then at class, the students have been cheered up by these interesting sentences that they cannot find in their reference books or dictionaries. By consulting the research documents on the computer, the teachers can specifically update their knowledge and improve professional development and also take part in the international academic exchanges easily at home, which is especially attractive and helpful for those in isolated geographical areas.

As a successful learner and researcher of the target language, language teachers are expected to improve their inner qualities. The more they act professionally, the more they can prove their ability by their successful performances in this new field. And language teachers are regarded as both “insiders” and “outsiders” to the target language and its culture.

### 4.4 Interpersonal dimension

In computer-assisted language instruction, both traditional idea and style of teaching and learning are changed, which makes it possible for the teacher to play a more interpersonal role. Besides as consultants of students, language teachers usually are tolerant corrector of errors made by students, patient listener, and stimulator of students’ affective factors. Seen in this light, the teachers share more equality with students and are on the supportive part, acting as cooperator and partner in inter-relationship of the students. There is a growing body of evidence to show that teaching process is highly influenced by the interpersonal relation between teachers and students.

Although doing computer -assisted language teaching sets higher requirements for the teachers in practice, language teachers still take such a great challenge so as to fulfill interpersonal communication in the computer-assisted instruction, which will have a profound influence on their classroom practice.

In terms of interpersonal communication, the emphasis is shifted from consultation to negotiation in language teaching and learning, in which mutual trust and respect is advocated. The role of teachers is becoming a facilitator and a reflective practitioner to enable the students to explore for themselves.

## 5 Conclusion

In the context of computer-assisted class, language teaching shows differences from traditional patterns, which brings about the variety of the roles language teachers are taking. In terms of different stages of teaching and various class category, the task of teaching enables teachers to become material collector before class, monitor and manager at class, and evaluator after class. From occupational perspective, traditional language teachers are patient listener, equal activity participant, stimulator of students’ affective factors and researcher of the target language and its culture. As far as interpersonal relation to the students is concerned, teachers act as learning supporter or facilitator and reflective practitioner. Therefore the study on the diversity of the roles language teachers play provides valuable insights into language teaching, making the computer- assisted language teaching more effective and creative.

**Abstract:** This paper discusses the gift exchange behavior in international activities from the view of cross-culture. At first, the paper proposes a concept, namely cultural embeddedness of international gift exchange behavior, and then gets some empiric findings based on the investigation of international gift exchange practice from the international offices of 7 universities in Wuhan. Finally, some principles for international gift exchange are presented.

**Key words:** International gift exchange; Cross-culture; Cultural embeddedness

### 1 Introduction

In the era characterized by rapid development of internationalization and globalization, the gift exchange has already become an important part in increasingly frequent international exchanges. While there will be some differences in the process of gift exchanges due to the differences lie in national conditions and cultures.

There are some international scholars who have already done some related researches on the cross-cultural analysis of gift exchanges during international exchanges. For example, Beatty, Kahle and Homer (1991) had done some work which compared gift-giving influences across cultures. In the book *GIVING A RESEARCH ANTHOLOGY*, Cele Otnes and Richard F proposed that Americans and Germans paid more attention in choosing gifts than French people and Danes since gifts mean a lot in America and Germany. Marcel Mauss pointed out in his masterpiece *The Gift* that the behavior of gift exchange is a social fact which includes many factors namely social, religious, emotional, economic and legal ones. (Marcel Mauss,1950)

This paper aims to analyze the recorded data of gift exchanges collected by foreign affairs departments of seven universities in Wuhan in their processes of international exchange and cooperation with French as well as Japanese universities. Through the analysis, the paper probes into the cross-cultural characteristics of gift exchanges in order to provide some principles in international gift exchange.

### 2 Functions and the Cultural Embeddedness of International Gift Exchange

The main functions of international gift exchange are as follows: 1) Ritual function: the gift giver shows his or her respect to recipient through his or her attitudes, behaviors and speech acts; 2) Commemorative function: gifts convey certain kinds of meanings which are unforgettable; 3) Value function: certain kinds of value and function that gifts conveyed by itself; 4) Cultural transfer function: a gift is a lively carrier of the relevant social and cultural value.

The main feature of international gift exchanges is the cultural embeddedness, namely, the cultural embeddedness happens in the process of gift giving and exchange. Besides, the cultural embeddedness is reflected in all the four functions of international gift exchanges presented above. Then, it will be elaborated in the following part (see Figure 1):

#### 2.1 Ritual function

We need to choose different gifts in accordance with different occasions and objects. Besides, cultural embeddedness influences greatly in the specific ways or means to give or to receive a gift. For example, Chinese people value humility, so even though they give a very expensive gift to others they will still say "it is just a little token to show my respect to you". On the contrary, in other countries people prefer exquisite wrapping; even though their gift is not very expensive they will still wrap it well and present it well. As for receiving a gift, Chinese people intend not to light up with pleasure when receiving a gift and they will always refuse to receive ostensibly. However, in other countries people will be glad to receive the gift and unwrap it in front of the giver in order to share the happiness and surprise with them. Meanwhile, there are different taboos in gift giving due to the effects of cultural

differences.

**2.2 Commemorative function**

Gifts as carriers of memory presented to friend also should have certain value of collection. For example, we can give a precious photo album about "a trip to China" to a foreign leader as a gift.

**2.3 Value function**

The gift itself should have certain value. For example, certain work of art as a gift still has its appreciation space.

**2.4 Cultural transfer function**

More or less gifts will have the characteristics of the local culture, for example, the symbol of the country, locality and company.

Figure 1 Cultural Embeddedness of International Gift Exchange

**3 Case Study of International Gift Exchange**

We will analyze the data of gift exchanges collected from seven universities in Wuhan in their processes of international exchanges with French as well as Japanese universities. The data only include gifts between individuals, those between departments or universities are not included.

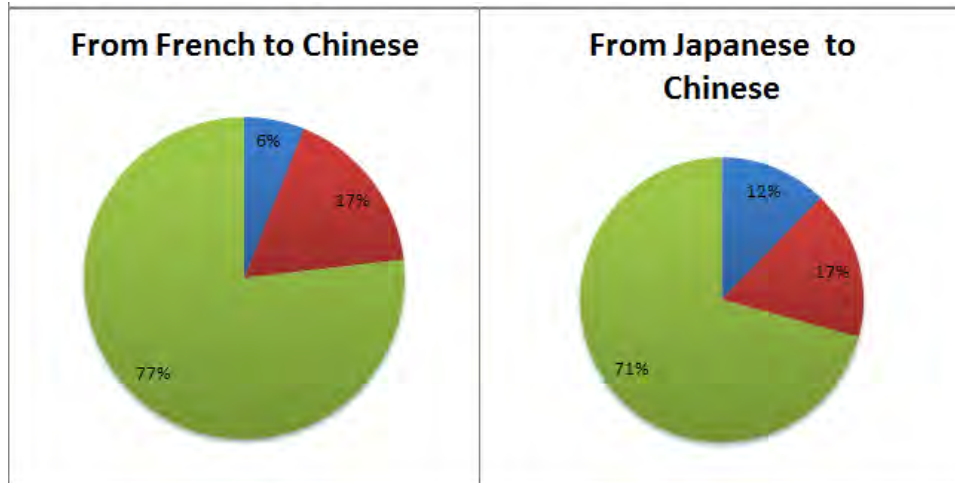

**3.1 Value**

Table 1 shows the statistics regarding to the prices of gifts exchanged among Chinese, French and Japanese sides. In the table, "value" refers to the evaluation of gifts by employees of foreign affairs department according to the quotations on Chinese market. Thereunto, gifts cost more than 500RMB are grouped to be gifts with high value, those cost between 100 and 500 RMB are grouped to be gifts with medium value, and those cost less than 100RMB are grouped to be gifts with low value.

Table 1 The Classification of the Evaluated Value of Gifts Among Chinese, French and Japanese Sides

Number of gifts	High value	Medium value	Low value	Total
From Chinese to French and Japanese	42	85	142	269
From French to Chinese	5	14	63	82
From Japanese to Chinese	16	22	92	130

**Figure 2 The Proportion of Evaluated Value of Gifts Among Chinese, French and Japanese Sides**

**3.2 Wrappings**

Table 2 indicates the wrappings of gifts among Chinese, French and Japanese sides. Wrappings mentioned here refer to those prepared intentionally by gift givers rather than product packaging.

**Table 2 Indicates The Wrappings of Gifts Among Chinese, French and Japanese Sides.**

Number of gifts	Exquisite wrapping	Without wrapping
From Chinese to French and Japanese	102	167
From French to Chinese	43	39
From Japanese to Chinese	117	13

**3.3 Classification**

Table3 shows the classification of the gifts exchanged among Chinese, French and Japanese sides. We classify all the gifts into four types namely: ornamental gifts for collection (such as the handicraft, the painting and so on), disposable gifts ( such as the food, the tea, the wine and so on), repeatedly used gifts (such as the pens, the watch, the USB flash disk and so on ) and other types.

**Table 3 The Classification of the Gifts Exchanged Among Chinese, French and Japanese Sides**

Class of gifts	Ornamental gifts	Disposable gifts	repeatedly used gifts	other
From Chinese to French and Japanese	122	10	111	26
From French to Chinese	23	3	54	2
From Japanese to Chinese	18	42	55	15

It can be clearly found out in table 1 that Chinese pay more attention to the value of a gift while table 2 indicates that Japanese value more the wrapping and ornament of a gift. Contrarily, the practical applicability of a gift is what French people value most. In table 3, it is obviously that nearly more than 60% of the gifts given by French people belong to repeatedly used gifts.

**4 Conclusions**

Gift exchanges play very essential roles in international exchanges. The mutual understanding and emotional bond can be strengthened if we deal with them properly. Generally speaking, we should abide by the following principles in international gift exchanges: first, perspective-taking principle. The gift giver should think from the receiver's point of view and the receiver should behave from the giver's point of view in return. The gift giver should take cultures as well as customs into consideration in order to make the receiver happy and comfortable when receiving gifts.

Second, misunderstanding-avoided principle. There are different customs of gift exchanges in different countries, and some of them are even in conflict with each other. Through understanding the

differences lie in different etiquette cultures and value systems, we should avoid the misunderstandings and conflicts caused by gift exchanges.

Third, appropriate principle. We should choose appropriate gifts according to different customs rather than simply choose the expensive ones.

# Shape the Personalities of the Students in New Period

Hu Guoliang

Central China Normal University, Wuhan, P.R.China, 430079

(E-mail: huguoliang1969@sohu.com.cn)

**Abstract:** The process of shaping the personality of the students is of vital importance in the future of the students. How to develop their healthy personalities is not only the requirement of the society and times, but furthermore the requirement of the country. This essay, which aims to improve the personalities of the students together with all the educators, analyzes the current situation of the personality and proceeds with shaping healthy personality.

**Key words:** Personality; Healthy personality; Personality psychology; Personality shaping;

## 1 Introduction

Personality, which can show the mental attitude of a person, is the comprehensive outlook of ability, quality, character, motivation, interest, ambition, etc. A person can not necessarily be born to have healthy personality but can get it by accumulating little by little. Students at usual times should attach importance to forming correct ideas and keeping good state of mind in order to shape their healthy personalities. In the meantime, they should take measures to update their knowledge structure continuously and improve their cultural deposits, etc.

## 2 Basic Requirements of The Education for Students' All-Round Development

The basic requirements of the quality-oriented education for the students' personalities are independent spirit and subject consciousness. The quality-oriented education regards people as the centre and tries to develop their personalities positively under the condition that every individual are harmonious with the goal of social development. Try to develop ones' personalities to the fullest and make efforts to the society and country. It includes four characters, which are comprehensiveness, participation, subjectivity and difference. Quality-oriented education reflects the essence and requirement of personality-shaping.

Psychology researches show that personality is the behavioral tendency within a person, and it is a lasting self with consistency and continuity, and it is also a characteristic form of minds which form in the socialization. Personality, which comes into existence between different relationship, is not developed itself but under certain circumstances. A good and perfect independent personality can only form in social relations and the personality-shaping emphasis the all-sided quality optimizing. As far as the students are considered, healthy personality, which is the basis of personality-shaping, can lay strong foundation for the students' integrated development. The school is a important place where the quality-oriented education is carried out, and it is also a essential environmental condition where the personality can be shaped. Educators should try hard to shape students' independent and healthy personalities and improve their healthy development standing at the height of the developing times

## 3 The Temporary Situation of Students' Personalities

Nowadays, the international politics is developing into diversification and the economics become global, which sharp change directly influences people's world outlook, view of life, and values and make great impact on the personality development orientation of the students. In general, temporary situation of the students' personality development is positive. They explore life actively, and they are eager to develop their potential so that they can realize their value. However, in terms of the individuals, there is a negative side, that is presenting a series of confusion and conflict, which becomes more apparent in the weaknesses of the personality. And the definite performances are as the followings:

### 3.1 Lack of lofty ideal and faith

With the acceleration of the globalization of the society, the students get to have universal confusion towards those vague "ideal values" and "political values" in the former days, and they doubt them and even hold negative attitudes towards them. Then they change to a kind of utilitarianism personal value system. They do not care much about political situation and social life, and they even pursue hedonism and pragmatism, which in turn weakens their great ideals badly in this situation.

### **3.2 Full of egocentricity**

Nowadays there is only one child in most of the families in China. The way parents bring up their children, the family structure, the relation among family members etc. all unconsciously exert influence on the formation of the teenagers' personalities. Some parents do not take much care of them and even ignore them whereas some parents consider their children as the apples of their eyes and all the families live for them, protect them too much or even spoil their children. This kind of parents' education methods or family atmosphere will surely have negative influence on personality shaping. Under such family circumstances, children turn to have egocentricity.

### **3.3 Being lazy and fickle, lacking the spirit of being practical, persistent and conscientious**

Complicated social life has such a bad influence on students that they form impatient and impetuous attitudes and cannot concentrate their energy on study. In China, the current situation of college students is that they seldom study at ordinary times while they study very hard when the test is approaching. And most of them are satisfied with just passing it. However, many school children in primary school and middle school are forced to take the various kinds of training class courses. According to the surveys about violating-discipline phenomena, cheating on exams ranks the first of all.

### **3.4 Having no firm willpower or not being able to bear failures**

Many students, especially the only child in the family, shrink back when faced with problems. They can do nothing when conflicts arise and are apt to become quite emotional when getting stimulation, etc.

### **3.5 Loss of integrity and extreme consumption value**

Though students have certain ability to choose, judge and evaluate. While in our real life filled with interests and values diversification, the educators should adopt the orientation of that the mainstream value is to put our nation first, pay attention to the team and willing to help others, eventually the students will use double standards choosing definite values.

## **4 Methods of Personality Shaping**

How to help students shape their independent personalities, find their internal egos and realize their self-value, is a new challenge for educators. As a matter of fact, many excellent educators have gained a lot of valuable experience in educational practice. They have explored good ways, which involve in the society part, school part, family part and the students' part, to cope with personality shaping for students. Here I just elaborate on two aspects: the influences of class environment on the personality-shaping and the formation of healthy minds.

### **4.1 Shaping personality through combination of the class and the students**

#### **4.1.1 Formation of self-awareness in class**

The class plays a role in inspiring and guiding students to form self-awareness. In the process of educational management, on one hand, we should strengthen the degree of students' acceptance of the team and try to change their ideas and behaviors by improving students' status and relationship in the team; on the other hand, the team should cooperate with the educators and help students overcome the weakness of one-sidedness and superficiality, through which students can help themselves promote their self-education. The power of team is great, we can hold some theme meetings to discuss their problems or we can go out to get involved in some social practical activities to contact more people and things, and eventually their one-sidedness and superficiality can be overcome to some degree.

#### **4.1.2 Do self-judgment through class**

In order to develop the analogy function of team to students, educators should try hard to achieve the following: first, we should establish the team goal and individual goal with both social awareness and individual value, and set up class behavior discipline and develop healthy public voices. It can help students refer to the above goals, public voices and criteria to judge themselves and others. Second, educators should evaluate the students and guide them in time so that they can get some inspiration soon.

#### **4.1.3 Do self-examination through class**

Self-examination is a kind of positive self-awareness. Class, as a chief educational department of a school, should exert influence on the process of forming self-awareness together with the educators, and use induction mechanism to help students do criticalness self-examination, which can make this process accomplished and perfect. We can take the following measures: first, we can gather the team and demonstrate. When the team meets failures, we should do some collective self-examination activities, which can shock their heart and set an example for them. They will know that failure and mistake are a

kind of precious spiritual wealth and get beneficial lessons from the self-examination. Second, we should often have communications with students and know about their current mind situation. Third, educators should guide students keep writing diary and develop good habit. They can also collect their diaries, read them and correct them, which is a good way to exchange emotion and views and let them talk about themselves and keep improving themselves.

#### **4.2 Shaping healthy personality**

According to educational practice and our surveys, it is found that there is a wide range of a lost of independent personality among our temporary college students. The definite performances are as followings: hatred for school, running away, anxiety, isolation, suicide, psychopathic personality and even transgression of laws, which shows that it is of vital importance for them to shape their independent and healthy personality. There are internal and external mechanisms in shaping personality. The internal mechanism consists of the following sections that students contact the external information and learn to choose them, integrate them, and internalize them at last. The external mechanism consists of personality cognitive, personality culture, personality environment and so on, which has a positive impact on forming a good personality. We can shape a good personality from the following four parts:

##### **4.2.1 They should set up healthy personality reference value**

The students should keep four elements united, which means to unite psychology, social culture, moral discipline and aesthetic standard. The unity, stressed by the healthy personality, does not mean to make all the people present the same character but emphasizes that they unite the four personality factors and fully realize individual characters. In terms of contemporary students, healthy personality should include comprehensive ability, good relationship, normal psychology, stable emotion and good self-awareness. In addition, students should have the ability to know themselves better, find their interests and grasp opportunities. Meanwhile, they should know the difference between real ego and the ideal ego, and try to make efforts to study and learn to create.

##### **4.2.2 They should have appropriate expectation**

The expectation of a person should be higher than his current situation. But we can see that if a person has unpractical expectation of himself, he may risk his personality in order to get something he wants. Thus, establishing appropriate expectation is the precondition to developing the potential of students and shaping their personalities.

##### **4.2.3 Develop their ability to shape personality themselves**

According to some surveys, the reason why the gap gets wider and wider between society development and the quality of the students is that students lack the abilities to shape their personalities. Thus, the school should lay stress on developing students' abilities to shape their personalities, which is essentially a process for the students to internalize healthy-minded educational information.

##### **4.2.4 Strengthening students' subject consciousness**

It is a very important way for the students to get involved actively in order to shape their independent personalities. Educators should develop their abilities to study and live their life actively. We should develop their social ability and organizing ability in order to help them adapt to all the needs from society.

#### **4.3 Educators' shaping their own personalities**

The author set the impact factor of character shaping as  $a$ , exterior factor as  $a_1$ , interior factor as  $a_2$ , coefficient of interior factor as  $r$ . Therefore, the relationship among the three can be expressed as  $a = a_1 + r \times a_2$ .

A good educator should have wholesome personality, apart from profound knowledge and excellent teaching skills. A good teacher with wholesome personality can create a kind of harmonious and cozy atmosphere, which can make the students inspiring and happy. While an educator without wholesome personality will create a kind of nervous and horrific atmosphere, which may make students uncomfortable. The Psychology and Education has proved that an excellent teacher should have 12 characteristics: (1) cooperative and democratic attitude; (2) kind, tolerant and considerate; (3) patient and persistent; (4) versatile and of wide interests; (5) agreeable looks and personality; (6) equal to everyone and everything; (7) humorous; (8) easygoing and insistent; (9) willing to care about students; (10) flexible at work and have the sprite to innovate; (11) good at using praise methods and respect students; (12) have distinguished achievements and be welcome among students; As a educator we should try hard to possess these characters and develop their independent personalities.

## 5 Conclusion

To sum up, it is a key period for students to form independent personality when they are studying at school. We educators should develop their social and independent personality, and associate with them perfectly, as a result, all the students can grow up healthily, which is a sacred duty.

## Residents' Perceptions Towards the Impacts of the 2011 China National Disabled Games on Hangzhou City of China

Bao Yafang, Sun Zhi<sup>1</sup>, Xue Qunhui, Yu JingJing

School of Tourism and Health, Zhejiang Agriculture & Forestry University, Hangzhou, P.R. China, 311300

(E-mail: boyafan@126.com, curelandscaper@126.com, sallyxueqh@126.com)

**Abstract:** The aim of this study is to examine the Hangzhou residents' perceptions towards the impacts of the 2011 China National Disabled Games. Using the data collected prior to the games, an exploratory factor analysis was performed to identify perceived impact dimensions. These identified dimensions were validated with the data collected after the games. A series of t-tests were performed to analyze the differences in perceptions before and after the games. Significant difference was found in the dimension of "congestion and inconvenience". The findings of this study also showed that Hangzhou residents had high perceptions on the benefits and low perceptions on the costs the 2011 China National Disabled Games bring into community. These findings can be used as valuable information for future small scale-sports events organizing/governing bodies.

**Key words:** China national disabled games; Small scale-sports events; Residents' perception, Hangzhou

### 1 Introduction

Sport-based travel has grown dramatically over the past two decades and has become the focus of concentrated academic inquiry. For destinations, sport-based events are being used to increase visitation<sup>[1]</sup>, reduce the seasonality of tourist flow<sup>[2]</sup>, and foster destination development. In the United States, event sport tourism generates an estimated \$27 billion a year<sup>2</sup>, and thousands of people travel significant distances to watch their favorite sports on a regular basis.

A review of literature shows that much of the existing literature on event sport tourism has generally focused on mega or hallmark events, e.g. the Olympic Games, the World Cup. Mega or hallmark events are thought to help position a host city as an international tourist destination. However, some scholars have recognized the downsides associated with these events, such as huge debts for host communities<sup>[3]</sup>, displacement of local residents because of new infrastructural improvements<sup>[4]</sup>, price inflation<sup>[5]</sup>, traffic congestion, increased crime, and culture commercialization<sup>[6]</sup>. Given the challenges associated with hallmark events, Higham (1999) stated that small scale-sports events might result in more positive effects for the host communities as small scale-sports events usually operate within existing infrastructures, require minimal investments of public funds, and are more manageable in terms of crowding and congestion compared to hallmark events<sup>[7]</sup>. He defined small scale-sports events as "regular season sporting competitions (ice hockey, basketball, soccer, rugby leagues), international sporting fixtures, domestic competitions, Masters or disabled sports, and the like". However, few researchers have examined the impacts of small scale-sports events, and the use of disabled sports as a community tourist attraction in China has received scant attention. The purpose of this study were (1) to investigate local residents' perceptions of the impacts of hosting the 2011 China National Disabled Games before and after the games and (2) to compare any perceptual differences between the two time periods.

### 2 Method

#### 2.1 Study population and data collection procedure

The population of interest in this study is all residents who dwell in the host city--Hangzhou. Data were collected twice: prior to the games (August 10 to October 10, 2011) and after the games (November 1 to December 1, 2011). The pre-survey was administered by student volunteers attending the tourism management program at Zhejiang Agriculture & Forestry University in Lin'an, Hangzhou, China. Students were instructed to go to places where many passersby could gather such as bus terminals, restaurants, city halls and asked people to voluntarily participant in the study. After the purposes of the study were explained, respondents completed the questionnaire on the spot. A

<sup>1</sup> Corresponding author. This study was funded by innovation team program for young teachers from Zhejiang Agriculture & Forestry University (2009RC10).

<sup>2</sup> Travel Industry Association of America. Profile of travelers who attend sports events, 1999. www.tia.com

convenience sampling method was employed in the pre-event survey. A total of 480 questionnaires were distributed and 396 were collected, representing a response rate of 82.5%. A number of 90 were discarded due to incomplete information. Thus a number of 306 usable questionnaires were obtained in the pre- games survey.

For the post-event survey, it was conducted by the same student volunteers. They visited the same survey sites and used the same method to distribute questionnaires. A total of 380 questionnaires were distributed and 302 were returned. A number of 50 were discarded due to incomplete information and a number of 252 usable questionnaires were obtained. Therefore, two different samples (one from pre-games and the other from post-games) were collected for this study and Table 1 shows the detailed information on the respondents' demographic profiles, divided into before and after the games.

**Table 1 Respondents' Demographic Profiles**

	Before the games ( n=306)		After the games ( n=252)		Total
	Frequency	%	Frequency	%	
Gender					
Male	138	45.1	106	42.1	244
Female	168	54.9	146	57.9	314
Age					
Younger than 20	30	9.8	24	9.5	54
20-29	183	59.8	153	60.7	336

## 2.2 Scale

Based on a number of sources in tourism literature concerning the impacts of events on communities, a total of 21 items were adopted in this study. Respondents were asked to evaluate all statements on a five-point Likert scale (1= strongly disagree and 5= strongly agree). Questionnaires distributed before the games aimed to measure expected benefits and costs of the 2011 China National Disabled Games whereas questionnaires after the games measures perceived benefits and costs after the

hosting of the 2011 China National Disabled Games.

### 3 Finding

#### 3.1 Identification of underlying characteristics

An exploratory factor analysis was conducted by using data 1 (before the games). As one of the criticisms that factor analysis often receives is a problem of reliability because the results of the analysis may change with new samples, the data 2 (after the games) were used to validate the results of the exploratory factor analysis. The number of factors was determined using eigenvalue greater than 1. Principle axis factoring extraction method with varimax rotation was used. Items with loading of lower than 0.4 or items with loading of higher than 0.4 on more than one factor (cross-loading) were eliminated. Corrected item-to-total correlation was also employed in this study to decide whether to delete an item. Items with corrected item-to-total correlation below 0.5 were eliminated<sup>[8]</sup>.

The result of the exploratory factor analysis showed that a total of five factors had eigenvalues greater than 1 and explained 67.4% of the variance in the data. In addition, seven items were removed from the scale because of cross-loading on more than one factor. The corrected item-to-total correlation of the remaining 14 items was all above 0.5. Therefore, analysis was finalized with five factors totaling 14 items. These five factors are labeled: “social benefits”(4 items,  $\alpha=0.84$ ), “social problems and price increase”(3 items,  $\alpha=0.77$ ), “economic benefits”(3 items,  $\alpha=0.76$ ), “congestion and inconvenience”(2 items,  $\alpha=0.70$ ), “construction costs and destruction of cultural heritages”(2 items,  $\alpha=0.74$ ). These dimensions were somewhat consistent with the factors reported in the previous tourism impact studies. Table 2 presents the results of the exploratory factor analysis and Cronbach’  $\alpha$  values.

As mentioned above, the result of the exploratory factor analysis was validated using data 2 (after the games). Each item belonged to the factor that it was supposed to, satisfying the factor loading criteria which indicated a good stability of the data.

**Table 2 Results of Exploratory Factor Analysis Using Before-the-games Data**

Factors	Loading	% of variance	Cronbach's $\alpha$
<b>Social benefits</b>		20.23	0.84
Provide an incentive for the preservation of the local culture	0.762		
Provide an incentive for the improvement of the local community public services	0.767		
Provide an incentive for promoting the courtesy and politeness in your community	0.840		
Provide an incentive for promoting community pride	0.778		
<b>Social problems and price increase</b>		14.08	0.77
Increase crime rate	0.705		
Lead more public security problems	0.839		
Price increase	0.606		
<b>Economic benefits</b>		13.36	0.76
Attract more investment to your community	0.733		
Create more jobs for your community	0.814		
Provide more business opportunities for the local people	0.699		
<b>Congestion and inconvenience</b>		11.54	0.70
Cause more inconvenience for local people	0.799		
Cause more congestion in your community	0.732		
<b>Construction costs and destruction of cultural heritages</b>		8.22	0.74
Construction of facilities for the disabled wastes taxpayers' money	0.759		
Result in the destruction of the local cultural heritages	0.884		
Total		67.44	0.79

#### 3.2 Residents' perceptions before and after the 2011 China National Disabled Games

After determining the underlying dimensions, t-test was performed in this study and the results were shown in Table 3. As is presented in Table 3, Hangzhou residents had high expectations on the benefits the 2011 China National Disabled Games bring into their community with all the mean values

above 3.5, and the highly expected benefits prior to the games were “social benefits” (3.74), followed by “economic benefits” (3.59). However, there is no significant difference between pre- and post- games on perceived benefits. As in shown in Table 3, all the perceived benefits had higher mean values than expected benefits, which implies that Hangzhou residents had higher perception about the benefits or gains that the 2011 China National Disabled Games bring into their community, and those expectations were met by the games.

**Table 3 Mean and P-Value Scores for Impact Factors Before and after the Games**

Factors	Mean		Difference	p-value
	Before	After		
<b>Positive impacts</b>				
Social benefits	3.74	3.77	-0.03	0.718
Economic benefits	3.59	3.69	-0.10	0.469
<b>Negative impacts</b>				
Social problems and price increase	2.51	2.30	0.21	0.086
Congestion and inconvenience	3.32	2.91	0.41	0.004**
Construction costs and destruction of cultural heritages	2.21	2.13	0.08	0.527

Note: All items were assessed on a 5-point Likert scale (1= strongly disagree, 5=strongly agree). \*\* $p < 0.01$

In terms of the problems, the highly expected problems before the games were “congestion and inconvenience” (3.32) followed by “social problems and price increase” (2.51) and “construction costs and destruction of cultural heritages” (2.21). The rank of perceived problems after the games was unchanged, there were “congestion and inconvenience” (2.91) followed by “social problems and price increase” (2.30) and “construction costs and destruction of cultural heritages” (2.13). As indicated in Table 3, one of the negative impact factors “congestion and inconvenience” was found to be significantly different between pre- and post- games response with its mean value after the games significantly lower than that before the games ( $p=0.004<0.01$ ). This finding suggested that during the Disabled Games period, the problem of “congestion and inconvenience” did not occur as much as the residents expected. With regard to the rest of the two negative impact factors, residents had low impact expectations and perceptions with their mean values close to or below 2.5.

**Table 4 Mean and P-Value Scores for Impact Items Before and After the Games**

Items	Mean		Difference	p-value
	Before	After		
<b>Positive impacts</b>				
Attract more investment to your community	3.64	3.73	-0.09	0.587
Create more jobs for your community	3.13	3.55	-0.42	0.018*
Provide more business opportunities for the local people	4.00	3.79	0.21	0.106
Provide an incentive for the preservation of the local culture	3.54	3.60	-0.06	0.652
Provide an incentive for the improvement of the local community public services	4.00	3.96	0.04	0.793
Provide an incentive for promoting the courtesy and politeness in your community	3.69	3.62	0.07	0.612
Provide an incentive for promoting community pride	3.71	3.92	-0.21	0.144
<b>Negative impacts</b>				
Increase crime rate	2.38	2.23	0.15	0.299
Lead more public security problems	2.56	2.44	0.12	0.424
Cause more inconvenience for local people	3.32	2.81	0.51	0.002**
Cause more congestion in your community	3.32	3.01	0.31	0.073
Construction of facilities for the disabled wastes taxpayers' money	2.13	2.04	0.09	0.545
Price increase	2.58	2.24	0.34	0.012*
Result in the destruction of the local cultural heritages	2.30	2.23	0.07	0.615

Note: All items were assessed on a 5-point Likert scale (1= strongly disagree, 5=strongly agree). \* $p < 0.05$ , \*\* $p < 0.01$

In order to get a better understanding of the variations in impact expectations and perceptions of Hangzhou residents, a series of t-tests was carried out on 14 items. Table 4 presented the means scores for all 14 items pre- and post- games. As presented in Table 4, residents expected the Disabled Games to bring many benefits into the community with the mean values of the most benefits items above 3.5, especially two items of “provide more business opportunities for the local people” and “provide an incentive for the improvement of the local community public services” had the highest mean values, which reached 4.00. Among the 7 benefits items, only one item showed significant difference between pre- and post- games with the perception mean value significantly higher than its expectation one. This finding suggested that Hangzhou residents’ expectations on the benefits the games bring into community were all met while the games created more jobs for the community than their expectation.

Examination of the negative impact expectations suggested that Hangzhou residents did not expect the 2011 China National Disabled Games to bring many negative impacts into community. The mean scores for most of the negative expectation items were found to be below 2.6. Table 4 also indicated that among the 7 negative impact items, two of them showed significant differences between pre- and post-games with residents’ perception mean values significantly lower than their expectation ones. Before the games, Hangzhou residents expected that the Disabled Games would cause more inconvenience ( $m=3.32$ ) for local people. However, after the games they realized that the inconvenience caused by the games was not as bad as they expected ( $m=2.81$ ).

#### 4 Discussion and Conclusions

The findings of this study revealed that Hangzhou residents had high perceptions on the benefits and low perceptions on the costs the 2011 China National Disabled Games bring into the community. Residents’ perceptions of the impact of the games have not drastically changed after the games. This finding suggested that small scale-sports events results more positive impacts for the host community compared to the mega events, which is consistent with the finding of previous study conducted by Higham in 1999.

The 2011 China National Disabled Games appeared to generate more social benefits (i.e. preservation of the local culture, improvement of the local community public services, promoting the courtesy and politeness in the community and promoting community pride) than economic gains for Hangzhou residents. Hangzhou residents took the games as an opportunity to improve the public services in the community and they also regarded the games as an incentive for promoting community pride, which was consistent with the previous study by Garnham (1996) that the major impact of an event for the host community was the increase in community spirit or called psychic income<sup>[9]</sup>.

With regard to the negative impacts, congestion and inconvenience caused by the games appeared to be two biggest problems during the game period although the inconvenience was managed better than residents expected. Congestion in public areas, i.e. restaurants, scenic spots may be unavoidable to a certain degree. However, the city government should come up with some practical ways to cope with the problem. For example, alerting residents in-advance about information pertaining to the tourist flows, creating a program for the announcement of situations in public areas. In order to ease traffic congestion during the games, city government had adopted a series of measure, i.e. license plate numbers restrictions, the adjustment of weekends for schools, universities, government agencies, social organizations, etc. which was expected to bring inconvenience into community, but after the games, the inconvenience caused by the games was not as bad as residents’ expected.

As the majority of tourism impact studies have focused on residents’ perceptions on mega or hallmark events. This study has shown that it is equally important to investigate the residents’ perception on small scale-sports events as it can bring more benefits and less costs into host community compared to the mega or hallmark events. What’s more, this study adopts a longitudinal study to investigate Hangzhou residents’ perceptions before and after the Disabled Games which provides a better picture on the dynamics of residents’ perceptions or attitude toward the tourism development in Hangzhou. Specifically, the investigation of Hangzhou residents’ perceptions prior to the games helps games organizing/governing bodies and authorities to identify concerns and expectations prior to the games so that problems can be promptly and properly addressed. The investigation of changes in perceptions after the games can be utilized as an evaluation tool of how successfully the event has been operated. Therefore, the findings of this study provide valuable information to Hangzhou as well communities that plan to host the small scale-sports events.

# Standardizing and Diversification of Central-branch Library System of Universities: A Case Study of WHUT

Chen Gang

School of Politics and Administration, Wuhan University of Technology, Wuhan, P.R. China, 430070  
(E-mail: 974938624@qq.com)

**Abstract:** The paper is a case study on central-branch library system of universities, which has low productivity in reality for reasons in China. The main goal of the system that offer open and equal service and taking advantage of the collection considerably concern the president of Wuhan University of Technology (WHUT) comparatively. Practices with definite object, special management section in charge of the cooperation, the motivation by matching funds and the evaluation were analyzed in the thesis of management by objective (MBO). But satisfaction of the branch staff has an adverse affect on the system invariably.

**Key words:** WHUT; Central-branch library system; Matching funds; Evaluation; MBO; Satisfaction of staff

## 1 Introduction

The aim of central-branch public library system support by the Chinese government in recent years is the accessible and equal library service for all people. New branches emerged, extending the main library to the community with definite goal. While a great number of reference rooms named branch library now in universities of China utilized only by restricted group like the staff, and the idea “restricted material” survived somewhere. It is a remnant of U.S.S.R library system which was not disposal intentionally, although the system form has changed. It coexisted with university library about 60 years. So the concept of “central-branch library system” was acknowledged widely in universities, the goal, the ideas, the system and the cooperation between the central library and branches have not been established in large scale.

Some semi-formal or unsuccessful designs of central-branch library system involving reference rooms have been undertaken by university libraries. A survey of institute/college of law in Beijing, which was issued in the 14th session of ACSSSIRHEI (All-China Society for Social Sciences Information Research of Higher Education Institutes), shows that there is, fairly, no mature model in the district yet.

The crucial problem is the transforming of the idea and the goal, as its result. The mission of library that open the public resource to public equally has not acknowledged actively in universities. And the mandate, as its result, that the materials of reference rooms turn to accessible to all the people in campus has not given to library management section. While the library system of Wuhan university of Technology (WHUT) implement a scheme about 2005, with the idea of cooperation and sharing resource among main libraries and reference. Originally, the purpose was just taking advantage of the latent recourse. After the united network platform was built and evaluations, however, the service, the collection purchase, the principle, the workplace all changed. The goal leads a discovery of the productivity of the system. At first, the task was limit to standardizing the service and the use of found in branches (reference rooms). In 2009, the goal turns to the special collection building based on purchase professionally and diversely.

And now, the staff activity concerns the librarians of the Management Office of Branch and Reference Rooms (MOBRR). “It is evident that it has been a major concern to create jobs and working conditions that satisfy employees.” “Employee satisfaction assessment” has been an essential perspective in the library organization. Actually, the practice of management by objective met problems in cooperation with top management, middle management, line management, and the workforce.

## 2 Exclusive Service of Branch Libraries

Since reference rooms failed to share their resource with a united platform in a last long time, they are not actually branch libraries. Even in the university which took the system namely, only part of branches open to all readers. Others remained unchanged and self-contained, exclusive to specific read. That’s no more than reference rooms.

In the years of exclusive service, reference rooms had become poor in management. Low opening hours, disappointing service, fund abuse and bad management are common. Collection building was stagnant. In a word, reference rooms in the universities are out of management of library and faculty, out

of reader's concern. And the services are not reliable.

The ideas "open, free and equal" were aroused by people like Wu Xi, the librarian of Shenzhen Library about 2006. This refers to the library organization reforming. And the Chinese *National Eleventh Five-Year Culture Development Plan (2006-2010)* promote the construction of central-branch library system in public domain. Meanwhile transform plans about university library were raised. However the voice of providing open and equal service was seldom heard here, which refers to the so-called reference rooms or branch library.

Obstacles stand in the way to open: rarity of literatures, lack of copies, to serve the faculty first, differential treatment to different reader. But problems can be solved by producing and buying copies or e-version, which is an aspect of collection building. Open is the way to find them scholar value via finding and foster their reader. On the contrary, confine the use will obscure even lose their significance. Interdisciplinary researches need comprehensive utilization of literature, which increased rapidly. To restrict the accessibility of them is to confine the growth of research. Differential treatment violates the spirit of modern library. And university libraries are somewhat quasi-public product. So, "Materials should not be excluded because of the origin, background, or views of those contributing to their creation."

Another critical matter is neglect it or treats it simply. Some universities revoke the reference rooms, e.g. Hubei University. In the 4<sup>th</sup> issue of *Library Development* in 2009, the author of *Research on the management mode of department reference rooms in the university* had surveyed upon 30 plan of universities refer to the reference rooms. Some universities merge them into 3 or 4 branches based on different discipline groups (Peking University, Sun Yat-sen University and Wuhan University). All the resources and staff will be reformed. Library should maneuver great resources, and the distribution of collection will face many troubles. Sun Yat-sen University had all the literature of its reference rooms merge to central library, along with their staffs. Based on these, they build three branch libraries divided by discipline. That's no different from cancelling branch libraries, making central library a library with different disciplinary libraries without branches. I think that decentralize services in that cases means nothing, and the intellectual resource of faculties and vitality of diversified construction are gone alongside. In a word, that's too much centralization and less diversification.

"Change, by its very nature, requires that difficult decisions have to be made. These may impact on technology, systems, management styles, capital, organizational culture, the bottom line and many other aspects of management."

### **3 Why the Agreement is so Hard to Actualize?**

In the reform of organization, idea transforming is a part of it. Material is a kind of material. Economic analysis and economic policy is another part of it.

A common way to absorb faculty reference rooms into central-branch library system is that central libraries and faculties reach agreements on fund and staffs. The agreements are on a voluntary basis. Unfortunately, when implementing agreements, both sides, faculty especially, will take cost-benefit into consideration. Who would afford the cost of retrospection? Who is the most benefit from literature service? And it always turns out that the agreements cannot be properly implemented and must depend on administrative instructions.

## **4 Standardized Service and Management**

### **4.1 Standardized service**

The Wuhan University of Technology library system is a success library system. It started from President Prof. Yan Xinping had visited some U.S. universities. He then came up with a library system construction plan. Management Office of Branch and Reference Rooms (MOBRR) is in charge of the plan.

Since 2005, WHUT had outsourced the work of database retrospection to a business. These expenses are covered by the main library. The cataloguing had taken for a long way. After that, the MOBRR urged the reference rooms to complete the retrospection that remained, and put them into retrospection.

Through faculties and the MOBRR, WHUT provide branch libraries with funds. If the faculties would provide more funds to branch library, WHUT would allocate matching fund as encouragement. WHUT is a construction implementer, and faculties are participants in investment which get benefit from it. The branch libraries get from multiple means and the service should open to more readers. The cost-benefit problem brought by agreement mode could be solved.

The salary that faculty can provide are usually higher than library. So WHUT keep the original staffing and the librarian of branch libraries are still working under branch libraries. In the regrouping of libraries, some of the central librarians entered faculties' libraries, making the quality of the branch libraries staffs better.

The MOBRR had also train the faculty's librarians with technique department and purchase department of central library, making them more professional.

The solving of funds and staffing issues, had accomplish the most significant standard library serving mode.

#### 4.2 Management system motivate the staff

The critical measure of the management of faculty libraries is to establish a set of evaluate system, involving standards of collections, service and management, which reference to the central library. The MOBRR organized an evaluating team led by chief librarian to evaluate 21 reference rooms and faculty libraries biennially (triennially after three times).

The evaluation system includes such items below:

1) Open and equal service. After the retrospection of all books in reference rooms had finished, the unified library retrieval platform put into use, though branch libraries, central library and departments of central library had different permission.

Faculty libraries are open to all staffs and students. All the collection must be open. Readers within WHUT can borrow half the limit of central library in faculty libraries, making the total amount that reader can borrow increase by 50%.

2) Unifying annual collection purchase fund, books per readers and its increment.

3) Standardizing branch libraries' opening hours. Branch libraries must open 70hours per week. In fact, most branch libraries had run beyond that and reach the standard of central library.

4) Faculty libraries undertake the extension service for central library, such as collection recommendation, document delivery and consultation.

All these standardization had made service of branch libraries and reference rooms meet the standards of library.

The standardize service is powered by standardized evaluation system. It includes the duties of branch libraries management office; the fundamental requires of system building; the responsibilities of faculty librarians; subject librarian system; the manage system of branch libraries and archives management.

The core content includes responsibilities of branch librarians; the using of matching fund and fund management (includes unifying purchase discount, registration of fixed assets and acceptance of library purchase department); collecting literature data; unifying checkout rules; checkout within unified system; unifying shelving pattern; eliminates all the dated literature; unifying opening rules (unifying opening hours); consultation.; document delivery; counting rules; planning and summarizing and etc..

Through branch management system, the fund can be guaranteed (unified discount, unified acceptance) the checkout also can be guaranteed (unified collection system, unified checkout system and standard), standardizing collection management; standardizing service (opening hours) and service had been extended to vary fields.

The notable change after building the system, the branch libraries use a little fund to attract large amounts of readers of WHUT, and fully utilize the whole collection. The utilization of fund and resource had increased.

What did the staff obtained?

The standardized right of founds use. They come from both the library and faculty, and were check by the MOBRR.

(1)Make the collection plan and implement it.

(2)Explore the collection and sharing it with the reader.

(3)Reader who came from various colleges of the university and their respects.

**Table 1 The Input of Central Library and Faculties to Faculty Libraries, Acquisitions, the Amount of Borrowing**

	2008	2009	2010
Input of central library (RMB)	692815	687700	773400
Input of faculties (RMB)	1128025	1631200	1524400
Acquisitions	13663	18837	19574
Amount of borrowing	31518	39905	48724

#### **4.3 The interaction between central and branch library**

MOBRR would perform evaluation, consulted with the staff two year each, training, tendering, assets check in. Also, it assist branch libraries to get more fund from central libraries and faculties, ameliorate storage condition, get more service from technique department and reservation department (distribution), ask more discount from book sellers and etc.. And branch libraries serve the central libraries with document delivery, book recommends etc.. Regular business dealings can make branch libraries and central libraries work more smoothly. Healthy competition brought by branch libraries evaluation, cooperation between central and branch libraries can make the central-branch libraries system more energetic.

But, in recent years, the staff activity concerns the librarians of MOBRR. The problem rose from "management by object". The evaluation made people tired. And some voice from staff can not be heard with the MOBRR. "Although MBO demands that the superior and subordinate managers should meet and set up the objectives, in practice the objectives come as executive directives from the top management. The lower (or line) managers who usually bear the brunt of such executive directives have to make ends meet." Fortunately, staff of the branch belongs to faculty, that relief the contradiction.

### **5 Diversified Collection Constructions**

Standardization is to actualize and manage service. However, in terms of collection construction, the heterogeneity, diversity and profession of collection are the primary goals. Standardization of service and management depend on the involvement of central library. Collection construction, on the other hand, depends on profession of faculties and the needs to serve faculty, are implemented by faculty.

#### **5.1 Construction mode of university libraries collection is different from those of public libraries**

The central-branch system of university libraries group is different from that of public libraries. Central-branch libraries of public libraries are built by the same entity in different times. However, central-branch libraries of university libraries are built by different entities (universities and their faculties) are built simultaneously. The construction of public libraries are built from up to bottom, unifying all the purchase, catalog and service. In this case, branch libraries are just the extension of central libraries. By contrast, in universities libraries system, branch libraries have independent collecting plan and purchase plan. They can made unique service plan and mode, and even their collection and service can affect central library, making construction from bottom to top.

University libraries have their own HR resource and advantages. Branch librarians can serve the needs of faculty and stand with researchers. They can easily keep in touch with first line teachers, can easily get recommendation, can easily purchase independently. More professional opinions would make the collections of branch librarians more professional. More professional opinion would make faculty libraries more professional. That's what central libraries should not have. It can compensate the disadvantages of less professional collection, and vital to the level of university library. So the devolution of power to the branch was popular in library circle.

In conclusion, universities' branch libraries are not the same as public branch libraries. So, we don't recommend universities' libraries to purchase like public libraries.

#### **5.2 The right and capability in collection building**

The precondition of independent purchase of university libraries are: there exist a planning of collection (special collection planning), information gathering system and subject librarians. Actually, the relations between them can be called right and capability. They are in accordance with right and execute. The planning and gathering of collection are actually the implementation of democracy of library. However, subject librarians can purchase books according to a certain evaluation system. That's the execution which had been permitted. The executers must be professionals. Meanwhile, an evaluation towards executers must be set up. They should be restricted.

Purchase based on recommendation of teachers or directly purchases by teachers are no advisable. That's because in estimating collection structure, determining copies and evaluating literature, there must be participating of subject librarians. And the most efficient and best way for readers to implementing their rights is to provide collecting plans and theme recommendation.

Teachers are the guardians of knowledge, so are subject librarians. In order to restrict librarians, they must be evaluated by readers, just like teachers must be evaluated by teachers. Readers should have the right to score the collection and the right to hire librarians. The evaluation system of the branches had changed in 2012, the ratios of readers assessment increased. Probably it would become the crucial evaluation criteria in future.

Nevertheless the subject librarians system is immature in university libraries in China. There are not criteria for subject librarians, there are not certificate for it, there is no such major in any universities or colleges and there are no training mode for it.

## 6 Conclusions

The transforming that an old system change to a new system needs to import new idea and take the interests of each side in the course of it. When the idea has been established, system reform would be the next item on the agenda. Good management, evaluation, and good networking will increase the productivity of it, and reinforce the system. The process can move forward by various motivations in different stages. The branch library should improve its service in the relationships with the readers by evaluations and subject service. The conception of “open” reveals that the “objects” of the organization which could transform it may come from any side in the relationships.

## On the Path Selection of the Non-Administration Reform in Chinese Universities

Wu Lanping

Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: wulp@whut.edu.cn)

**Abstract:** This paper proposes that administration of university is the alienation of the historical problems. Now, the non-administration reform in Chinese universities is facing some obstructions from the human, system and culture factors. In order to really realize the non-administration reform target of the universities, the university spirit must be renewed, the academic standard must be returned, modern university system should be established, academic atmosphere should be strengthened, democratic management and professor dominance must be implemented, the social atmosphere of respecting teachers and promoting education must be strengthened, monitoring and guarantee also need to be strengthened.

**Key words:** Non-administration reform of universities; University spirits; Modern university system; Democratic management system; University supervision

### 1 Introduction

Since it was proposed in the *National Program for Medium- and Long-Term Educational Reform and Development* that the administrative levels and administrative management modes must be cancelled gradually in the university, the non-administration of university became a hot social topic. Most of the researchers discussed the non-administration of university from different angles such as establishing modern university system, improving the school-running autonomy, removing the principal administrative levels, constructing the faculty governance mode. I find there are few researchers to study the history background about the administration of university. Based on above-mentioned, this paper seeks the fundamental reasons for the administration of university, deeply analyzes the obstructions of the non-administration of university, and tries to find out the reasonable reform ways.

### 2 Administration of University: The Alienation of the Historical Problems

After the establishment of the People's Republic of China, the status and the function of the higher education have not been paid enough attention in China. In order to pay more attention to the education, give the presidents of university the equal dialogue platform as the senior officials, China imitated the university management mode of the Soviet Union, established the administrative management system of university. In the universities, all the implementations of the funds, the solicit students system, graduation allotment and major setting etc must accord to the national executive orders. As the administrative management system of university was carried out, the resource allocation monopolization and the academic activities utilitarianism appeared, the education ethics lost. Dialectically speaking, the administration has made contributions to the higher education development and the talents cultivation. But now it becomes an important constraint of the higher education development. Under this system, major and scholars right are marginalized, the academicians are seen as salary-men, the principal has the final say to all.

Administration leads to the distortion of the academic value orientation. In order to display their own merits, the university leaders undertake a lot of projects and make the university be deep in debt. The leaders pay little attention on the growth and the future of the students. The desire and pursuit of administrative power lead to the overexpansion of the power functions, the academia has to give place to the power tactics in the universities. University is no longer the holy place of serving to liberate and develop the human personality, cultivate independent spirits of people. Instead, here is filled with deception, the impetuous people and extreme loss of humanistic education. The superincumbent administrative appointment mechanism makes most people pursue money and power, the professor dominance, the democratic oversight of the teaching staff, and learning rights of students can not be really realized.

In order to clean up the detriments of the administration of university, and give the university a democratic and harmonious space, we need to think carefully about the non-administrative of university.

The government, society, universities, scholars and university students must devote themselves to the non-administration reform of university.

### **3 Analysis on the Obstructions of the Non-Administrative Reform of University**

Face to the detriments of the administration of university, many scholars and experts are thinking the reform methods. Most of them present different ways and suggestions from the different angles. However, the administration tendency of university has not changed. Why not? the critical factor is that the non-administrative reform of university is facing some insurmountable obstructions.

Firstly, from the human factor analysis, there still exists some resistance to the non-administrative reform of university<sup>[1]</sup>. Person is not only the reform subjects, but also the reform objects. The main subjects of the non-administration reform of university are university leaders, administrators and academicians besides the related education administration department. Because the administration reform of university inevitably touched or influenced the benefits of the group such as the principals, the secretaries, the division and basic level cadres, even the leaders of the superior departments. This group will do with the administration reform of university with negative attitude, they even opposed the reform<sup>[2]</sup>. Due to the impact of traditional consciousness of official rank standard, the university leaders see the rights and administrative levels as the personal glory capital. In addition, the objective social reality in China is to measure the social status by administrative levels. So the university leaders don't want to fully implement the administration reform.

Secondly, from the system and culture factor analysis, the existing system and policy is hard to support the non-administration reform of university. We need to establish some corresponding measures to support the reform. Higher education is closely related with the social politics, the economy and the culture, the non-administration reform of university inevitable requires the synchronal reform of the social idea concept and policy. If not, it is doomed to failure.<sup>[4]</sup>

### **4 The Path Selection of the Non-Administration Reform of University'**

According to the western modern university management mode, the non-administration of university mainly reflects in university autonomy, academic freedom and professor dominance. Huang DaRen who is the president of Zhongshan University thought, 'Non-administration is not equal to that higher education doesn't need the administration departments to manage it, Non-administration is not to crowd the outstanding scholars who are engaged in the administrative management out of the academic activities<sup>[3]</sup>. Non-administration of university should set up the concept of academic freedom, follow the internal law of university development, realize the university autonomy and professor dominance. Just as GuoWenJing said, "the score of the non-administration of university is not whether to set up the administrative levels but is to liberate university from the government management and to realize the university autonomy."

#### **4.1 The university spirit must be renewed and the academic standard must be returned**

University is the academic hall, the place where the scholars explore the truth and cultivate the high-level talents. In 1711, N.Gundling professor indicated, "The mission of a university is to guide the people to wisdom, that is the ability to distinguish between truth and falsehood. If the university research is limited, the task will be impossible."<sup>[5]</sup> The non-administration reform of university must renew the university spirit and return the academic standard. From the most essential sense, cancelling the administration management and returning the academic standard are to really realize the thought that university is the place for exploring advanced knowledge. The university what as the place of studying academic, enlightening the people wisdom, cultivating the high-level talents and serving the community can better play the role of boosting economic and social development if the administration management has been cancelled and the academic standard has been returned.

Of course, the return of academic standard and the pursuit of academic freedom are needed to pay attention to their limits. The goal of Chinese scholars' concurrent pursuit of academic freedom from politics is that academic activities must be in favor of the prosperity and development of the academic undertakings, be in favor of the development of the country and human society. Scholar lecturing and research cannot be decided entirely by his own subjective values. Lecturing need to help the students grasp the objective fact but introducing the scholar individual claim.

Because the advanced knowledge is out of the public sight, the public are difficult to judge whether the scholars treat their benefit sincerely and fairly when the scholars deal with the academic problems. Based on the case that the scholars are the orderlies of advanced knowledge, people logically conclude

that the scholars are the guardian of their ethical and moral norms. Academic freedom displays not only in the scholars research rights but also in the academic duties. Scholars should abide by the academic standards, the ethical and moral norms. They should take the responsible for their research results and application methods.

#### **4.2 Modern university system should be established and academic atmosphere should be Strengthened**

Academic freedom was originated from the ideal of university autonomy. Higher education will lose its soul without the autonomy. Exploring advanced knowledge is a complex even mysterious inquiry activity, only the scholars could master the complexity of the advanced knowledge. So we should give the scholars the right to independently solve the problems in the research fields. In order to avoid the outside intervention, scholars should have extensive right to deal with academic activities. Establishing modern university system and strengthening academic atmosphere are important guarantees to the non-administration reform of university. Administrator's original function which provide the good service for the teachers and students should be restored. Just as Zhu Qingshi professor thought, the treatment of the university administrators may be high, but they have not the status and the right of the officials. University should win the respect of the society by the achievements in the teaching and research field.

University should take cultivating high-level talents as the basic task. It acquires social prestige by improving the academic level and striving for academic achievements. Just as Chu Zhaohui professor said, the factor that university obtain social recognition is not the administrative levels but its own education level. The facts suggest that university could not get a real ascension relying on its administrative level.

#### **4.3 Democratic management and professor dominance must be implemented**

Administration of university includes two forms: administration of the government department management and administration of the university own management. Administration of the government department management is a state that there are too much government involvement in the university affairs, the autonomy of university is restricted. Administration of the university own management is a state that the university administrators suppress the academic power by administrative power, the university value orientation is distorted, everybody doesn't concentrate on teaching and scientific research but wants to be an officer. Non-administration reform of university must change old management method, implement democratic management.

As far as the administration of the government department be concerned, the government should not only give the university guidance, leadership and management through the proper way, but also give the university autonomy as far as possible. The ultimate goal of the government department management is to enhance the quality of university and maximize the return of cash investment. Just as Gu Yeli professor said, in order to be pulled away from administrative management, the government ought to reduce the items of administrative examination and approval, reduce the functional check and evaluation. What the university need is the support of government.

As far as the administration of the university own management be concerned, the key is to differentiate clearly the professor (or teachers) power and administrator power. University should set up the lawfully, democratic and scientific decision making system to ensure that the professor (or teachers) power and administrator power play good roles. University should change the internal resources allocation method, transform the administrative management type into the service-oriented management type. Under the democratic management mode, the senior administrative leadership of university is elected democratically, the main funds is assigned to departments directly with the respective budget for the teaching and research, compress and simplify administrative institutions, it is the University Board Organizations which is consisted of professors and relevant professional staff that take charge of making relevant academic policy documents.

University should implement professor dominance. In an exclusive interview, Premier Wen Jiabao proposed it must be educators to run university in February 27, 2010. Mr Wen added, "the educators what I said may not be certain professional experts, but they are enthusiastic about education, understand education and are the front-line staff."

#### **4.4 The social atmosphere of respecting teachers and promoting education must be strengthened**

In order to achieve the desired effect in the non-administration reform of university, the ideological baggage that you can get nowhere without administrative levels or administrative power must be put down. The social atmosphere of respecting teachers and promoting education must be strengthened, the status of university staff should get fully respect and guarantee. Rao Zihe professor said, the most

important of non-administration of university is to form the social atmosphere of respecting knowledge, respecting talented person, respecting teachers and respecting students.

We ought to form good environment and establish good soil for educator growth. Zhou Hongyu professor considered the administrative management of university inevitably are docking with the national cadre management system, the university is inevitable leaving no stone unturned to catch up with the existing cadres management system. The key of non-administration reform of university is to find the corresponding cadre management system to avoid the university staff to pursue official rank standard. Cancelling the university administrative levels, adjusting current cadre management system, undertaking institutional innovation and establishing some new organizations are all necessary to the non-administration of university, four afore-mentioned aspects are indispensable.

#### **4.5 Monitoring and guarantee need to be strengthened**

non-administration of university is more than decentralizing to the university, it is also more than keeping balance between the academic authority and administrative power. Non-administration of university needs supervision to eliminate the arbitrary and artificial factors in the operation process of the university, abolish all kinds of disorder and dishonesty, reconstruct an effective university operation pattern. Formulate national laws and university charters to define clearly the boundary of government intervening university, the boundary between the academic authority and administrative power. That is to say, the university implements legal system management to monitor and guarantee the non-administration reform of university to be success.

### **5 Conclusion**

In conclusion, non-administration is the substantial requirement of higher education. It is very important to reflect the background and the obstructions of the non-administration reform in Chinese universities. The non-administration reform in Chinese universities is facing some insurmountable obstructions. In order to really realize the non-administration reform target of the universities, we must make our efforts in remaking the university spirit, establishing the modern university system, implementing a democratic management system, creating good social atmosphere and strengthening the university supervision, etc.

## Research on Module Teaching for English Major in Independent Colleges

Xiao Fenghua

Foreign Language Department, Wuhan University of Technology Huaxia College,

Wuhan, P.R.China,430223

(E-mail:hxws@1957.cn)

**Abstract:** The comparison method is used to define the difference between the traditional teaching and module teaching for English major in Independent Colleges. After several years of implementing the module teaching, it is believed that Chinese traditional teaching for English major focuses on the improvement of basic English skills like listening, speaking, reading and writing, the graduates from this model are not able to meet the market needs. Module teaching for English major, which is focusing on training “practical-oriented” talents is conducive to the quality improvement of employment and market requirements. After several years observation, it is proved that Module teaching increases the graduates employment rate, and obtains the better feedback from the employers.

**Key words:** Independent college; English major; Module teaching; Practical-oriented talents training

### 1 Introduction

As an emerging mode of higher education in China, the independent college, co-developed by social forces and well-known colleges and universities, introduces, integrates social resources and educational ones of the organizing body. It has made a contribution to the increase of higher education popularity in China. Additionally, needs for practical-oriented talents dramatically rise with China's rapid economic development, which happens to correspond to the orientation of independent college. People have been always exploring issues about how to choose a major according to market needs and how to make professional training plans.

For China's prosperous economy and progressively increasing international communication with its entry into WTO, English, as an international language, has been popular in Chinese market, which demands more English major graduates as main economic participation body; therefore, many colleges and universities have set up English major. In the beginning of the establishment of independent college, it often copies the existing templates of training plan and course design in the parent college or university. However, in fact, compared with students in first- or second- ranking universities, those in third-ranking ones relatively lag behind in learning basis and habits. Additionally, with out-dated education thoughts, unspecific contents and dull education methods, the traditional course design and education methods in colleges and universities cannot adapt to modern society development, but lead to low education efficiency and go against the training of practical-oriented talents. According to statistics, there are hundreds of thousands of foreign language major graduates every year in China, but among them, not so many are competent to do work related to foreign languages and there are even very few graduates can do interpreting and translation. (Zhou Chenghu & Luo Jiming, 2010) This has challenged the training plan, course design and teaching method of the traditional English major.

We have been researching the subject that how can the independent college, as a third-ranking college, help its graduates be competent to do English-related work by developing a new way of training “practical-oriented” English major talents. The English major in Foreign Language Department, Wuhan University of Technology Huaxia College is just a reform in this environment. It aims to develop module teaching in its training plan and course design.

### 2 General Education in the First and Second Year of the College

Derived from liberal and general education put forward by Aristotle, general education is a part of higher education. It basically aims to complement specialized courses learning through general knowledge, society and natural science education, to correct the deformed development caused by excessive specialized training, and to help students not only know how to do, but also know how to be. From the course design for English major, the general education includes required courses about general knowledge, society and science like basic principles of Marxism, outline of Chinese modern history, ideological and moral culture, basic laws, mental health education, computer application and practical writing, etc ( Zhang Zhengjun, 2009). The academic basic courses include pronunciation practice, oral

English, listening, English writing, English grammar, extensive reading and so on

### 3 Module Teaching From the Third Year of the College

In the third year of the college, students choose their module based on their interests and employment orientation in the future. There are three modules for them to choose from: business English module, interpreting and translation English module and language and literature module.

#### 3.1 Business English module

There are research-teaching type, research type, teaching type and skill and practical one in the pyramid level system formed among Chinese colleges and universities. As a skill- and practical-oriented college, Huaxia College mainly aims to train senior professionals and to help students equip themselves with professional knowledge and strong practical ability. Therefore, it comforts to the thought of “focusing on specialty and practice” when designing courses and adopts the mode of “specialized courses + practical activity”: with employment as its orientation, the design of the former should emphasize the practicability of its contents and students’ adaptability to its degree of difficulty; the latter emphasizes the basic skill training level including listening, speaking, reading, writing and translating of English and the practical training level including class simulation, social practice activity, professional practice, graduation field work and graduation project, etc.

Due to enrollment expansion, the traditional elite education in colleges and universities has become mass education, the system of which has developed graduates with defects in many aspects of ability, especially the ability to adapt to the society and that to do practical work. In other words, there is a gap between higher education and practical ability in the society. (Zhang Meiyun, 2010). In order to fill this gap, training plan of colleges and universities should be reformed: the college should increase the proportion of practical contents; cooperate with enterprises, develop order-type training and invite responsible people of the enterprises as guest professors to give lectures to students; and prolong professional practice and graduation field work, so as to help students be competent to do the work as soon as they graduate.

Foreign Language Department Wuhan University of Technology Huaxia College has established fifteen Practice Bases around China, involved with many different institutes such as foreign trading companies, translation companies, English training institutes, secondary schools, World 500 enterprises, etc. Through combining the course and graduation practice, our students could find out what they lack. What’s more, it also pays attention to adjust education schedule in according to the problems its students encounter with and the advices and requirement of the practice units, so that the students of it can meet the demand of employers and enable its students to find satisfied job with an easy access.

Business English module is characterized in integrating business and English, compared with general English major. For this reason, it is more suitable for the trend of China’s entry into WTO and the students will thus have a more bright employment perspective. It engages in fostering students who are comprehensively competent in business, English and practical operation. A student like this is the kind of employee that the society needs most badly and will sign him or her up as soon as graduation. And this is the students’ competence the business English module strives to enhance.

The main courses of Foreign Language Department at the early period of its establishment include International Trade Law and Negotiation, Cambridge Business English, International Trade Practice, Business English writing, etc (table 1). The certificates towards which the department provides related training include BEC Certificate and National Foreign Trade Merchandiser Certificate.

**Table 1 Basic Language Courses and Business Module Courses**

Basic Language Courses	Business Module Courses
Essential English	Introduction to Enterprise Management
Oral English as Foreign Teacher	International Business English Writing
Listening Practice	Cambridge Business English
Extensive Reading	International Trade Practice
English Grammar	International Business Negotiation
English Writing	business Etiquette, Practice For International Business Documents(optional)

#### 3.1.1 Methods of business English module teaching

##### (1) Business Professional Teachers

Teachers from Economic and Management Department are hired to giving lessons to our students, which make up the deficiency the teachers of English major have. As a result, the students could make reference from each of the English course and the business course.

(2) English Teachers' Training

We sent our teachers to some time-honored colleges and universities related to economy and commerce to really merge themselves with regular business education atmosphere by giving trial lessons on their own and watch the education course, hence the close experience. It helps popularize advanced education philosophy and improve the education content of business English into a high standard.

(3) Textbook Chosen

For oral competence which is one of the language ability to train, business English module related book is chose as its textbook to let the students adapt to the business English terminology and adeptly apply it into practical operation.

**3.2 Translation and interpreting module**

Huaxia College, located in the hinterland of Optics Valley, processes translation deals worth hundreds million Yuan. However, the fact is that the graduates from traditional English majors can hardly be qualified translators or interpreters, which is the purpose we start the translation and interpreting module.

3.2.1 Input more in teaching facility

(1) Simultaneous Interpreting Booth

A Booth for Simultaneous Interpreting has been established, available for both international academic meetings and education of interpreting. The international meetings to be held here will, in one hand, enable the students with more opportunity watching English lecture on spot, and, in the other hand, improve the influence of Huaxia College, which makes it more possible for holding more interpreting activities.

(2) A CAT Room

Computer-aided Translation Room has been arranged and the students and teachers have formed a translation group, which bought particular translation software and established translation database. The translation orders it has taken bring the students opportunity of practice and make profit.

(3) A English Discussion Room

A English Discussion Room has been established for the communication between the students and faculty when the translation group encounters with some translation problems.

3.2.2 To Make our faculty qualified both in theory and practice

Foreign Language Department encourages more young teachers to get further education in top colleges and universities at home and abroad. Every term, a young teacher must undertake interpreting job 2 or 3 times and complete translation work of more than ten of thousand of words or Chinese characters, meanwhile, he or she should fulfill the education quest.

3.2.3 Arrangement of interpreting lessons (figure1)

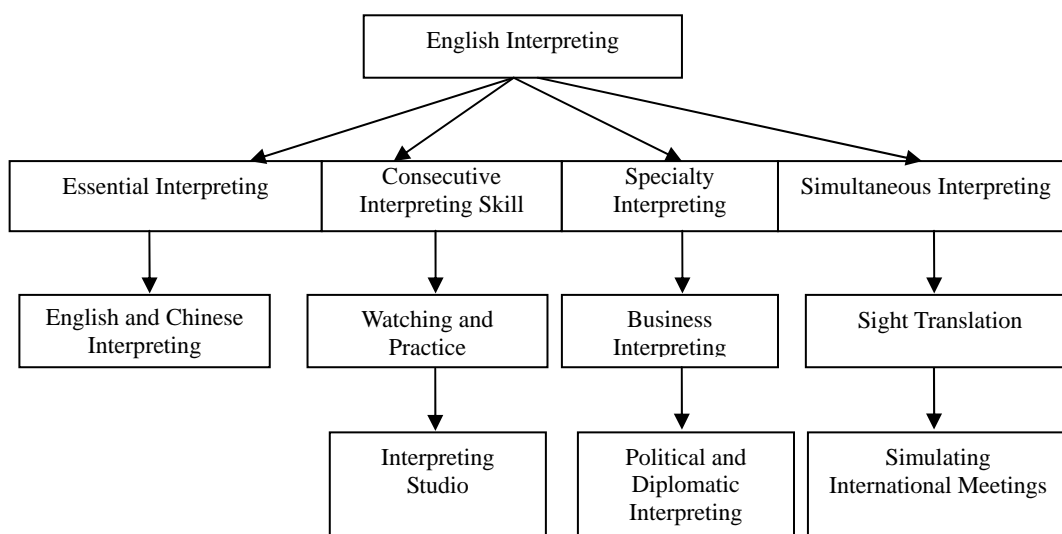

Figure 1 System of English Interpreting Courses

### 3.2.4 Interpreting Skills (techniques) Training

#### (1) Short-term Memory

It includes repeating practice using single language, delayed repeating practice using single language and source language repeating practice, etc.

#### (2) Note-taking and Note-reading

We establish self-created notes and teach students to understand that, so as to make up for the short-term memory.

#### (3) Shadowing Exercise

To train students' ability of listening and speaking simultaneously and distribution of their attention

#### (4) Reconstruction (Liu Heping, 2005)

Since time is limited, the interpreters are requested to reorganize the information into target language.

#### (5) Interpreting Figures

Figures interpreting is the most difficult part for students, we can differentiate and interpret the figure in Chinese and English ways like dot 3 and dash 4 for some big figures.

#### (6) Cultivating Split Attention

Training students' ability that listening or shadowing and backwards counting at the same time.

### 3.3 Language and literature module

The students planning further education such as taking part in postgraduate entrance exam could attend the lecture of language and literature module. ( table 2)

**Table 2 Basic Language Courses and Language and Literature Module Courses**

Basic Language Course	Language and Literature Module
Essential English	British and American Literature, Society and Culture of Britain and America
Advanced English	Instruction to Linguistics
English Writing	Education Approach of English
Oral English Practice	College Chinese

## 4 Conclusion

After several years of implementing of module teaching for English major by of Foreign Language Department, Huaxia College, it is believed that module teaching, which focuses on training "practical-oriented" and develops its training plan and course design based on market needs and students' employment orientation, is superior to Chinese traditional English teaching, which concentrates on basic English skills teaching like listening, speaking, reading and writing only. Besides, by implementing of module teaching, the English Major students have had stronger interest in learning English and it has become very popular to prepare for certificates. The business module concerns about BEC Certificate of vantage level, National Foreign Trade Merchandiser Certificate, etc; the interpretation and translation module includes Certificate in Advanced Professional Translation & Interpreting and Certificate in Intermediate Professional Translation & Interpreting; language and literature module provides tutorship about Teacher Certification, etc. Our students hence will get more employment opportunity and are more likely to have well-paid jobs corresponding to their majors. In conclusion, the module teaching has helped input great amount of "practical-oriented" English talents to the society.

**Abstract:** Higher education is an important force in implementing the strategies for “renovating a country through science and education and empowering a country through talents” as it serves the two tasks of technological progress and talent cultivation. The construction of innovative culture on campus is key to the development of higher education which is essential for sustainable development of modern universities and their cultural heritage. The paper proposes that much emphasis is needed to carry out the construction of innovative culture to fully upgrade the innovative capability in higher education. When the university achieves leaping success, quality of university graduates is enhanced at the same time.

**Keywords:** University; Innovative culture; Construction; Talent cultivation

## 1 Introduction

In 1912, J.A. Schumpeter first used the term “innovation” in his book *Theory of Economic Development*. Till now, innovation is widely highly regarded by the international community.<sup>[1]</sup> Innovation is the result of creation and represents the advanced production force and advanced culture which benefited social progress. Innovative culture refers to all activities in innovation and synthesis of its methods and fields, a combination of culture as the subject and environment as the object. A innovative culture in higher education refers to creating a positive ecological environment for scientific research that encourages progress, courage, creativity, cooperation and tolerance to failure. It is the essence of university culture in the 21<sup>st</sup> century.<sup>[2]</sup>

Compared with top universities in the world, universities in China lag behind in cultural innovation. Much progress has been made in recent years with the support of “211 Project” and “985 Project”, especially in the key universities, but the gap between Chinese universities and the world top universities still exists.

## 2 The Background of Innovation Culture’s Development in Universities

Universities are the main channel of training innovation talents, and the important base for talent cultivation. The university culture is the soul of university, the key to differ universities from the other social organizations, and the core of the existence and development of universities. Meanwhile, innovation culture is the essence of university culture. Jiang zemin pointed out in the Third National Education Conference: “Education is the main base for the innovation, dissemination and application of knowledge and it is also the cradle of innovative spirit and talents.”<sup>[3]</sup>

The university innovation is not only the determinant of the rise and fall of the university, but also the foundation and guarantee in the process of social knowledge innovation. As long as we strive to foster and build innovation culture can we improve comprehensively the quality of higher education, cultivate more outstanding innovation talents, enrich constantly the advanced culture and promote the sustainable developments of the national economy and the progress of the whole society. Universities are not just the reflection of change in society, but leaders of the social culture and thoughts. Therefore, the university innovation culture plays a more important role in the development of human society.

Firstly, the university innovation culture can help to create more innovation talents. A rich innovative culture atmosphere in university can better stimulate students to explore their interest in science. The systematic teaching activities and careful guidance of teachers can also arouse students’ interest so as to enhance the level of knowledge and innovation capacity, and cultivate more outstanding innovation talents with reasonable knowledge structure and comprehensive capacities.

Second, the university innovation culture can help to cultivate innovation and transform their achievements. The university innovation cultivation provides a good environment for knowledge innovation, technology innovation, system innovation, culture innovation and etc. Under this favorable

situation, by bring the innovation talents of various disciplines, universities make them innovative through academic exchanges and conferences, and facilitate their finding of innovation resources and partners for exploring markets and realizing the transformation of innovation achievements.

From the historic perspective of higher education, universities are inherently related to the social development at that time and at the later time. The revolution and innovation of university are closely linked with those of the society. The enduring and effective innovation activities of modern universities must be on the basis of the university culture. As the essence of the university culture, innovation culture provides enduring vitality and innovative driving power to universities. The university innovation culture should consist of the science spirit of pursuing truth, the management system of academic autonomy, and the strong material support.

### **3 The Current Factors Restricting the Development of Innovation Culture**

#### **3.1 Chinese traditional culture and operational institutions hinder the construction of innovation culture**

The traditional Chinese culture prefers to the theory that man is an integral part of nature and humans should revere the power of nature. In the study of nature and the heritage of culture, the Chinese people always emphasize on inheritance, experience and laws of ancestors. Besides, Confucian tradition, especially the imperial examination system which lasted for thousands of years, has led to the scholars' obsession of authority so that people developed habits of sticking to conventions and hierarchical order. The above mentioned worship to authority and overemphasis on heritage are the biggest obstacles to science development and technology innovation. Since the Renaissance, the western society has begun to oppose religious authority by humanity, advocate science and obey the natural order. They dared to suspect and criticize the authority, and gradually formed a new set of value system which resulted in the rapid development of science and the rapid progress of economy and society. <sup>[4]</sup>

Having been constrained by the system and mechanism for a long time, many students and faculties in universities lack of innovation spirit and awareness; what's more, the university mechanisms are rigid, which leads to the oversupply of labor and greatly weakens the enthusiasm of the teachers. Therefore, we believe all the progress of cognition and innovation developments derive from the criticism and transcendence of the pre-existing cognition. Whether a nation or a kind of culture can establish a true sense of critical spirit depends on their encouragement on innovation, progress and development. There is a lack of open and critical academic communication in the current Chinese academia. Consequently, our attitudes toward academic criticism will directly influence the establishment of our expected scientific culture. Profound, candid and insightful criticism is much better than the "harmony". <sup>[5]</sup>

#### **3.2 Utilitarianism prevails in academia, and there is a lack of life-long dedication to scientific truth**

Many scholars lack of the spirit of exploring of truth and dedicating to truth. They engage in scientific researches with a state of mind full of utilitarianism and lack of the scientific spirit of "for the truth of truth", and they also lack the spirit to pursue the first-class academic and achieve first-class innovation research achievements. Some researchers engage in researches in order to get promotion; and the students study for the purpose of getting good jobs, passing examinations and graduation. <sup>[6]</sup> The faculties in the universities lack of first-class aspirations and ambitions, and the enthusiasm of dedicating to science. They lack of initiative in the innovation of scientific research and haven't formed the innovation-oriented value system.

#### **3.3 The official standard thought is too strong, and the administrative authority over intervenes in the development of universities**

Universities in China, especially those modern universities, from the start are established through the promotion of the government, and are under the direct management of the government. The administration modes applied in universities are divided according to different administrative levels, which give rises to the over-interference of administrative competent department in the operation of university. Therefore, colleges and universities lack of authority; the internal resource allocation of universities is over administration-oriented; the implementation of professors' academic rights is inadequate; things are dealt with through administrative sequence rather than the academic democracy of professors. At the aspect of university management, the deficiency of incentive system, allocation system, as well as the revolution of personnel system all result in the poor mobility of personnel and hinder the innovative pioneer talents from taking important research and teaching positions.

#### **3.4 The cultivation of innovation talents is inadequate**

Compared with the foreign high-level universities, the universities in China are weak in mobilizing

students' learning enthusiasm and initiative, as well as cultivating students' innovative and practical abilities. Colleges and universities in China tend to value scores, cramming and tradition rather than quality, ability cultivation and innovation. <sup>[3]</sup>

On the aspect of construction, software construction can not keep up with hardware construction; the blind increase in enrollment leads to the decline in quality of teaching; the area of universities is expanded without corresponding school-running characteristics and development concepts; on the aspect of talent introduction, the cultivation and introduction of master's-level talents are ignored. In addition, the changeless model of teaching and evaluation system can not help to create an environment for personality development, which hinders the cultivation of students' innovation potential.

### **3.5 Social context and college students' internal factors**

Nowadays, China's socialist market economic system is gradually established, which has enhanced people's sense of competition and promoted the social development. However, the confusion of transitional period inevitably influences the values of some university students and impacts their sense of dedication and collective concept, which makes it difficult to achieve the goals of university cultural development. On the other hand, the whole society's pattern of interests is changing. With the continuous deepening in Chinese reform and opening and the adjustment of interest pattern, the social competition becomes more and more fierce. The students find it is harder and harder to get the satisfying social status, occupations and income; therefore, they are forced to consider the immediate interests and their future development, contributing to the sense of utilitarian and hindering the construction of campus innovation culture. Lastly, it is because the diversified roles of international society. With the reform and opening and the development of market economy, international changes become more frequent. On the one side, we introduce the advanced technology and management of the capitalist; on the other side, we also absorb a lot of junk. Some students can not withstand the sugar-coated bullets and gradually lose their ideals and beliefs, going against the integration of campus innovation culture. <sup>[7]</sup>

## **4 Pursue the Ways To Strengthen and Improve the University Innovation Culture**

### **4.1 To derive innovative spirit from traditional culture**

Universities are particularly in need of spiritual support, with innovative spirit, the core spirit of modern universities. The traditional Chinese culture has a long history and a clear evolution path. With a long-term historical accumulation, as well as development and changes in different period, the traditional Chinese culture has been promoted and developed in thousands of years' vicissitudes. Based on the full exploration of their own cultural tradition, the Chinese universities need to keep pace with the times and concentrate on study the traditional culture. Only do they fully understand the traditional culture can they distinguish the good from the bad, and innovate on the basis of inheritance, incorporation, and absorption so as to gradually form their specific concepts school supervision and styles of schooling.

### **4.2 Based on characteristic schooling to establish a university innovation culture value system with independent academic characteristics**

On the basis of its characteristic disciplines, resource, and geographical and cultural background, each university should formulate its schooling objectives and concepts; on the other hand, they need make an effort to create a unique academic atmosphere for breeding innovation culture, reforming schooling concepts and forming specific school characteristics so as to establish a campus culture of the pursuit of excellence, academic freedom, and self-discipline of scholars. In the pursuit of excellence, it covers the pursuit of academy excellence, management excellence, and all the other works. Meanwhile, the university culture favorable to innovation should never be the one largely administration-oriented. Although academic freedom should be restrained by policies and objectives, we must attach great importance to scientific research and real contributions to the country rather than one's own interests. In addition, academic self-discipline is the premise of academic freedom and the important feature of university innovation culture. Self-discipline of scholar means the scholars themselves need to be self-disciplined. Scholars should abide by academic ethics and gain respectability from society; otherwise, there isn't academic freedom at all. Only when the universities establish a culture of pursuing excellence, academic freedom and self-disciplined scholars, can they lead the culture of the whole society and make the culture of Chinese society purer and purer. <sup>[8]</sup> Therefore, the tolerance of the university decides its scope of academic innovation. Modern universities should correctly deal with research risks, promote rational skeptical and critical spirit, and gradually form independent academic innovation culture value system.

### **4.3 Carrying forward the colleges to lead the culture and promote the development of advanced culture**

With the function of foundation and support, cultural construction is the core of development and decides its direction. Innovation culture is a kind of advanced culture and a kind of developing culture. As the culture leader, the university innovation culture is an important part in the whole society's innovation culture. Since the day they are founded, universities have gathered a large number of scientific and cultural talents. Through the diffusion and creation of knowledge, as well as the interaction with society, universities promote the social culture largely. Universities' guidance on the development of innovation culture mainly reflects on their inheritance and promotion of excellent traditional culture, incorporation and diffusion of advanced foreign culture, creation and cultivation of the leading new culture, and etc. Without the inheritance of traditional culture and incorporation of foreign culture, it is difficult to create a new culture leading the development of the new era. If the inheritance and promotion of excellent traditional culture is the universal function of education, the specific functions of universities, especially high-level research universities' are to strengthen the communication with the international advanced culture and advanced academic thoughts, as well as the criticism and incorporation of foreign culture, and widely spread their advanced culture in our society. Meanwhile, universities play a positive role in creating, cultivating, reconstructing, and developing new culture. As the culture leader, universities cultivate talents, and create knowledge culture and more and more direct social service. They are closely related, cooperate and support each other. In the construction of the social innovation culture, universities, which adopt, cultivate and promote new culture, influence profoundly on the development of the whole society.<sup>[9]</sup>

### **4.4 University system is the important foundation of university innovation culture development**

Bath system construction and innovation culture construction are important to the university construction. As the rigid regulation, the former guarantees, stimulates and restrains the development of university innovation culture. Since the former is the foundation of the latter, therefore, in order to construct a unique university innovation culture full of vitality, we must, above all, construct a set of sophisticated university system corresponding to universities' law of development, form the rules abided by teachers and students through the motivation of system, and make them the innovation culture on the spiritual level.<sup>[10]</sup> University system construction needs concretely cultivate and improve the following system culture: firstly, the construction of talent cultivation mechanism and incentive mechanism. As the places for education, colleges and universities are responsible for cultivating a group of young scholars of deep humanities, innovation and rationality, and providing economic and institutional security for their development. Incentives should also be introduced to encourage the scholars' dedication to constructing an innovation-oriented country. Secondly, the construction of scientific teaching content and a sophisticated course system. In order to meet the needs of rapid development in the era of knowledge economy and cultivate innovation spirits, abilities and talents, the latest research contents and achievements should be brought into teaching contents through curriculum reform, optimization of teaching processes and constant renewal of teaching content. Thirdly, universities should establish an academic management system and emphasizes on academic freedom. The protection of scholars to engage freely in all aspects of academic research can not only promote the academic innovation, but also enhance students' innovative consciousness and innovation abilities. Fourthly, the reform of the personnel system should be accelerated to construct and improve the scientific selection and cultivation of talents; the strong scientific research incentive mechanism should be carried out to create an open, fair, and impartial personnel selection and provide a system guarantee for the staff and students to develop their abilities and launch businesses; leverage of systems should be made good use to better attract school resources into innovation activities, and improve the quality and efficiency of innovation activities.<sup>[11]</sup>

### **4.5 A harmonious campus environment as a prerequisite for the development of innovation culture**

The construction of the university innovation culture must be based on an environment conducive to innovation. Only when the harmonious environment which is compatible to the development of innovation culture is established can innovation cultural activities achieve sustainable development.

The harmonious campus environment consists of a harmonious physical campus environment, harmonious interpersonal relations, a humane management mechanism, and an inclusive academic atmosphere. A harmonious physical campus environment is the basic condition of constructing a harmonious campus. In order to construct a harmonious physical campus environment, first of all, the campus building as a whole should be harmonious, which requires a scientific and appropriate design

and planning of the entire campus before it is constructed. Second, the campus beautification and human landscape construction should be improved to highlight the characteristics of the physical campus environment. A pleasant environment should be constructed through a variety of cultural activities in campus for the study, life and work of the staff and students. Harmonious interpersonal relations are the ultimate goal of the construction of a harmonious campus. The education of collectivist concept of honor should be enhanced to make the staff and students firmly establish the common values of loving the university, prospering the university and making the university one's own home, and make them united and seek common ground while reserving differences, and contribute to the common development and progress of the university. What's more, a humane development mechanism is the systematic guarantee of construction a harmonious campus. The school management and system should be people-oriented to reflect humanism; the management mechanism and concepts should be centered on the benefits of the staff and students to fully stimulate their enthusiasm and unit them together. Therefore, they would consciously and voluntarily abide by the relevant rules and regulations of the school, which determines the success of school management.<sup>[12]</sup> Besides, an inclusive academic atmosphere reflects the freedom of thoughts and the democracy of academy. As academic organizations, universities should not only tolerate the criticism of traditions and old concepts, but also accept the challenge of new ideas and concepts. For the sake of cultivating a free and inclusive academic environment, universities should treat academy first, the pursuit of truth, rational criticism and academic freedom as their eternal values and spirits. Therefore, they should strive to get the experts with independent views from different disciplines together to conduct scientific researches and make breakthrough in the universities' development.<sup>[13][14]</sup>

## 5 Conclusion

Cultural construction should be based on the practice of reform and opening up and modernization, focus on the forefront of the world's culture development, promote the excellent traditions of national cultural, learn from the strengths of the nations in the world, and gradually strengthen the appeal and charisma of Chinese socialist culture. As the center for the construction of ideology and culture, universities play an irreplaceable role in promoting and developing advanced culture, and promoting the cultural prosperity and social progress. Universities, especially high-level research universities, are the sources of cultivation talents and the important channels to improve the quality of talents and personnel. Therefore, universities should stand in the front of the era and discipline to cultivate innovation culture, gradually promote cultural innovation, and create a cultural advantage. For their further construction and development, universities should absorb new ideas, theories, and science, create new technologies, knowledge, ideas and concepts, and make them better adapt to the complex changing social environment in the process of reform and development.

# The Research on Constitution of University Physical Cultural Administrative System Based on Life-Span Purpose

Tang Xiaojun

PC Dept. of Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: 8776735@qq.com)

**Abstract:** The paper studies on the content, studying methods, digital technical platform assistance of life-span physical cultural study based on the concept of life-span physical culture teaching and constitution for university students' physical culture teaching platform. It aims at approaching the university physical cultural administrative system for life-span purpose. Furthermore, consolidating the teaching foundation and renewal of university students' life-span physical cultural structure, this paper supplies a scientific guidance for physical culture teaching in China.

**Key words:** Life-span physical culture, Studying ability, Administrative system

## 1 Introduction

As an important element university physical cultural education means to realize “physical health, psychological health, and social adaptation.” called 3-D target for university physical cultural education. University physical culture gradually turn from amount-pattern to a concept of comprehensive essence model oriented life-span physical culture. Life-span physical culture is made up of 2 respects. One is from beginning of life to its ending people participate physical cultural exercises with a life-span explicit purpose and make physical culture in fact a vital part, The other is a practice course under the guidance of life-span physical culture targeting systemization and integrity, offering chances for activities of physical culture in different periods and different living fields.

Based on the life-span physical culture and through the analysis of university physical culture, structure and learning regulation from students towards physical culture, the paper erects a module overall fitting life-span physical cultural performance for students. The also puts forward the physical cultural lessons module for students' self-teaching ability and a campus digital module of physical culture can be constructed with modern campus network. Thus it sets up a solid foundation for their life-span physical culture.

## 2 The Fundamental Content for Life-Span Physical Culture in University Education

Evidenced by life-span physical cultural purpose and through the knowledgeable structural analysis of university physical culture, the paper inducts the university physical cultural system in 4 abilities for knowledge, rousing, scientific coaching and appreciating in physical culture. This is to realize the purpose for fostering life-span physical cultural performance of students. Please see Table 1 for details.

**Table 1 The Module of Basic Concept for Life-Span Physical Cultural Performance in University Physical Cultural Education**

Performance	Knowledge Oriented	Knowledge Content
Study Ability	Physical Cultural & Sports technology Study.	physical culture and traditional culture, mass physical culture and robusting gymnastic and health
Robusting Ability	Body performance Body morphology Sports biochemistry	Essence comment on ability to metabolize aerobic and anaerobic metabolism ability; Anatomical structure and physiological morphological structure analysis and each observation of the physical index determination, etc. The body's blood lactic acid, blood sugar, blood in urine testing and evaluation, the body composition, enzyme function analysis.
Scientific Coaching	Technical posture Analysis Sports Medical Care	3-D digital and testing strength analysis etc. Injurer treatment and aiding, Sports health care and scientific exercise prescription. Scientific preparing Sports nutrition and implementing measures.
Appreciating Ability	Sports aesthetics. Arena sports appreciation	Health and fitness, sports aesthetic features, competitive aesthetic form. Arena sports appreciation of high level sports teams. Participation of Campus sports competition and gym robusting.

Concretely speaking, those four abilities accommodate physical cultural theory, sports technology, body performance, body morphology, sports biochemistry, sports posture analysis, sports medical care, athletic aesthetics, arena sports appreciation and so on. Therefore based on life-span physical cultural purpose to establish university physical cultural system, is overall and fundamental adapting both comprehensive development of physical cultural foundation and self-teaching both.

### 3 Establishing Teaching Module of University Physical Culture for Life-Span Purpose

The structure of physical cultural lessons normally refers some parts forming one period and each part of teaching materials and organizational work for order, plus time distribution and so forth. The university physical cultural lessons based on life-span purpose are subject to the changing regulation and self-teaching ability for students. It is stressed on the performing ability training. The program mainly includes target, content, teaching organization, teaching time distribution. The teaching activities are usually divided into preparing, basic and ending parts as 3 sections. And at different time sections against taught objectives design various activities, sports loadings etc. concrete structural module can be seen in Table 2 below.

The model is meant for performance education and aims at expanding students' self-teaching space and time, increasing exercising density, enhancing multi-swapping and enlarging teachers' participation etc. Further more arousing subjective initiative, creativeness and activity to increase

the interests of students in classroom and improve the understanding for technology. All with a purpose to beat the target as students' self-teaching and interactivity. The practice plan is shown below.

#### 1) Organizing Planning

Before study of physical culture teachers against demands prepare fully teaching materials, teaching plan, ppt etc. And design the groups needed according to the premises and implements.

Or let students form freely and getting explicit divisions.

**Table 2 Teaching Structural Module of University Physical Culture for Life-Span Purpose**

periods	Biological Performance change	body's ability characteristics	Teaching target	Content and teaching attributes	time
Preparing section	Rising stage	Mainly get ready physiological and psychologically, raising the excitability of cerebral cortex and body in Work.	(1) Students understanding explicit tasks and having one period in order. (2) training in correct posture promoting overall body development. (3) preparing for basic study.	(1) mainly the basic teaching requirements for subject standards; (2) Pre-heating activities divided Into general and special preparation (3) Getting ready For fundamental study.	Occupying Percentage in total: 15%-20%, Approx. 7-9 Minutes.
Basic Section	stabilizing section	Body in best performance and cerebral cortex in most proper status.	(1) students learning and mastering basic knowledge, skill and the methods to exercise. (2) develop students' physical essence enhancing body Quality. (3) fostering good essences for ideology and Moral.	(1) teaching content is arranged according to subject standards and combine school Practice. (1) organizing characters: 1).Study succession is arranged rationally for major content. 2).Arranging auxiliary, inducting Exercise and teaching steps. 3). Confirming training times for each materials and rationally setting the density and sports load. 4). Breaking down in training groups.	Approx. occupying 65% accounting 29-32min.
Ending Section	Falling Section	Fatigue appears and cerebral cortex excitability Falls.	Orderly ending The lesson recovering body To comparative Quiet status and Conclusion is given.	Relaxing kind of exercise with simple Dance and smooth gaming. A summary for the lesson and assigning after class training.	Occupying about 10% For 5 min. of total period

2) Teaching Gist

Arousing interests of students in accordance with the physical culture lessons so as to let them know the contents, overwhelm laziness smelting into learning environment and grasping training for sports skills. In addition, guiding students to make personal study plan, and to select personal training methods. This is to be done by divided groups. An then the stressed points can be analyzed, commented and resolved. As to teaching practicing regulations specific explanations on each technical movement let students master skills in posture, ignoring the accuracy.

3) Learning and Teaching Interactive

On the basis of self-teaching organizing a facial lecture to indicate the stressed and difficult points and let them train sports skills against special purposes. Then interactivity, team work, individual coaching are introduced. By nice co-op and competition students forged their quality. More over the ability of co-ordination is raised in the course of co-op and fan is fostered. The personality is developed and confidence is enhanced.

4) Self-Commenting and Team Commenting

After the unit study is over each team checks their study and performs. And teacher should regulate the teaching stresses as well find faults. Additionally, under the guidance against the individual situations confirm the adaptable target and making personal studying plan for the content, methods and resource. To effectively fulfill the study tasks. Having a self-assessment and regulation and questioning and practicing. Actively take part in while modifying and perfecting oneself to cultivate PC learning ability.

**4 Construction of Campus Digital PC Educating Platform for Life-Span PC Purpose**

Construction of an inter-active source system by Campus Digital PC Educating Platform for Life-Span PC Purpose, utilizing sufficient combination of modern multi-media inter-active and sports practice can guide students in PC practice and deploy self-monitoring. The self-explore for knowledge, Life-Span PC Purpose may be laid a solid foundation. The campus internet adopting Microsoft SQL Sever 2000 data base can design backstage, subject to data conformity, integrity, co-sharing, reliability, safety, expandability, flexibility and reduce the storage redundancy. Detailed as students user message statistics chart, gym knowledge transmitting data table, PC knowledge information table, healthy data table, PC skills diagramme and words table, teaching and coaching materials in audio and video forms and connecting tables and Permissions configuration chart etc. Shown as follows.

**Figure 1 Diagramme for Structural Module in Systematic Function**

1) user management, includes sub-module for user management, IP visit control module, data transmitting management module. Each module respectively realizes

Users' message, data resource management, updating and renewing functions and Limiting function for users' application range.

2) Retrieval and Interactivity sub-system includes knowledge learning ability,

Health ability, Life-span PC ability and PC appreciating ability. Users through digital platform realize PC knowledge demands and interactivity by assortments of data base, which cover PC theory study, body performance, body morphology, sports biochemistry, sports technological postures, sports

medical care, PC aesthetics, arena PC appreciation etc. in various forms and contents. This is to become an essential way for students to explore PC knowledge.

3) Personalization health monitoring system mainly to establish body performance interactivity and monitoring platform. Its functions are stage testing, height and weight of body, grasping strength, lung's capacity, anteflexion proneness, standing long jump,

as the ability to metabolize aerobic and anaerobic metabolism ability, strength, flexibility as essences commenting. The system anatomical structure and physiological morphology and structure observation and each index testing or so, The body's blood lactic acid, blood sugar, blood in urine testing and evaluation, the human body composition, enzyme function analysis, three-dimensional digital analysis for sports technological postures and force measurement analysis etc. sports injury treatment and aiding, sports care and scientific gym robusting prescription study, the scientific preparation and measures of sports nutrition.

## 5 Conclusion

University Physical Cultural management system established for Life-Span access varieties of selections for University Physical Cultural forms. On the basis of life-span PC universities adopt its PC educating foundations, which is an important behavior in our university PC education reforming and also a trend for PC development. This sufficiently shows the developing notion that university education of PC emphasizes on human foremost. After practice university PC turns from tedious classroom-type to multi-elements and overall knowledge acquisitive module, which expands the way for students to obtain PC knowledge and arouses interests and creative thinking, as well fostering students self-co-op and exploring spirits. The study aims at improving and perfecting university PC management system and has analyzed and commonly assessed on the study of PC technical skills, classroom studying behavior and studying interest in Physical culture by means of university physical cultural content structure for life-span purpose, teaching structural pattern and campus digital PC interactivity.

# **The Process of Internationalization of JAC Motors in Brazil From the Standpoint of Sustainable Organizational Behavior**

Arnoldo Jose de Hoyos Guevara – Renata Martins Corrêa – Suzana Bandeira -

Claudio Bezerra da Silva- Flavia Frate

School of Economics and Business Administration, Pontifical Catholic University of São Paulo, Brazil  
([arnoldodehoyos@yahoo.com.br](mailto:arnoldodehoyos@yahoo.com.br), [renatamartinscorrea@hotmail.com](mailto:renatamartinscorrea@hotmail.com), [suzana@bg-corporativa-cultural.com.br](mailto:suzana@bg-corporativa-cultural.com.br),

## **Abstract**

The present study has the target of understanding the process of internationalization of the Chinese automaker JAC Motors in Brazil, as well as identifying if the Brazilian group SHC that brought it to the country and controls its operations in the Brazilian market holds a sustainable organizational behavior. The theoretical basis used to understand the internationalization process was the economic theories described by Dunning and behavioral theories from Uppsala University. In addition, we looked at documents and data from the Chinese government in order to understand the policy towards sustainability and innovation processes in the country. Also a vast bibliographic research has been performed regarding the term sustainable organizational behavior in order to support the research made over the SHC group in which we approached the questions related to the interest the group had on JAC Motors, which drove JAC Motors to get into the Brazilian market, questions regarding sustainable management, resources allocation as well as aspects related to innovation and technology.

**Keywords:** Internationalization, China, Sustainable Organizational Behavior

## **Internationalization**

Internationalization is a concept remounting ever since the beginning of man's history and civilizations. Man has somehow developed several different ways of doing business over the borders. "The entry into international markets involves uncertainties, risks and complexity. Uncertainty results into the need of operating in very distinguished markets than the domestic market, that is, in environments in which the political, social and economic systems along with legal standards may be completely different" (TANURE, 2006, p.07).

Aiming at the enhancing of a strategy for international expansion, companies are searching foreign markets for several reasons, such as, economy of scales studies, need of growth, search of efficient processes and natural resources, manpower availability, access to capital at a lower cost, use of already developed existing technology, specialized knowledge via acquisitions, favorable government measures for tax incentives as well as risk reduction as the geographical variation reduces company dependency on a single market (PORTER, 1986; DUNNING, 2001; YIP, 1989, 1996).

From Porter's perspective (1986, p.260), "one industry becomes global basically because there are economic advantages for a company to compete in a coordinated manner inside several national markets".

Several theories present distinct approaches for the entrance of foreign companies into the domestic market, however this study intends to approach two main currents, one understood as

Economic Theory which main representative is Dunning (1980, 2001) and the other current is the School of Uppsala directing to Behavioral Theory.

According to Dunning (1980), the theory of internationalization with the approach of economic environment explains the decision of manufacturing or not in an external foreign market by means of economic drive where structure and cyclic variables are conditioned, such as, the country's and the industry's characteristics with operation variables and company's specific strategies.

As Dunning (1980) understands companies should prepare to compete with other companies already positioned in foreign markets. They should achieve advantages to make up the costs of operating in new environments. Thus, the author directs three elements: *ownership*, *location* and *internalization* (OLI).

For Dunning (1980) the first element (*ownership*) is about the advantages related to location. These are intangible assets that involve resources developed by the organization which are not available for competitors, and allow a better position in the international market. Among these we can highlight knowledge and technical abilities, the opportunity of investment depending on size of the local market, product diversity and higher productivity.

The second element, (*location*); this is related to the host market receiving the investments. Likely this includes intangible assets resulting from implied knowledge, the existence of location advantages are also favorable to local production rather than exportation and licensing. A company locates their activities to gain access to manpower, capital, material and other cheap raw materials, or to have sales closer to their customers and avoid transportation costs and tariffs. These are attractive alternatives in countries and regions that offer advantages and structures to create resources and capabilities.

At last the author provides evidence of *internalization* where a company analyzes the economic advantages between exportation and local production, if the costs of incorporation and productive organization are lower than the transaction costs associated with the transfer of such capabilities to a local manufacturer, the company will transfer the assets for manufacturing in this market. "When the company internalizes it, this company decides to manufacture to obtain either economy of scale or reduction of the costs of transactions and coordination resulting from uncertainty, and the existence of externalities" (DUNNING, 1980, apud BELMIRO et. al 2008, 2012).

The second current classified as Uppsala University translates actions oriented by behaviors from the business environment of the company also known as Behavior Theory. (JOHANSON; WIEDERSHEIM, 1975; JOHANSON; VAHLNE, 1977, 1990; BILKEY, 1978).

Johanson e Vahlne (1977) yet observed that the choice of target countries follows a certain logic of proximity in aspects such as geography, culture, economy, known as psychic distance, that is, the bigger the difference between the country of origin and the foreign country in terms of development, educational level and content, language, culture, political system, among others the higher the level of uncertainty.

For Carlson (1951), the process of internationalization according to Uppsala University, by analogy it is similar to walk with caution over an unknown site. Unknown conditions of local businesses, customer profiles and their respective acceptance, bureaucratic proceedings, the government changes, distance from the headquarters, all these generate uncertainties for the whole allocation of all kinds of resources.

Therefore, according to this school, companies should have caution in their development within other markets, applying gradual penetration aiming at knowledge and experience within the

local environment. Thus, companies increase the trust for the investment of resources in the country and slowly build the process of internationalization as the learning over the local market grows and provides the foundations for the company's strategic decisions in the foreign market. So on a first moment the company decides to start their activities through exportation what should be at a relatively lower cost of operations and lower risk exposure. (JOHANSON;VAHLNE,1977).

Concurrently, Cavusgil (2011) states that as the company reduces uncertainty over experience and knowledge acquired in the activity they can allocate more resources and progress with internationalization.

In the same line of thinking, authors such as Johanson and Mattsson (1990) finalized the thoughts of the Uppsala University as they informed that as the company increases their knowledge over economic, social and cultural aspects about the competitors among other factors, the organization starts to set and establish their own subsidiary.

Other forms of internationalization are the application of speculative capital in stock market and foreign direct investment which capital is focused on manufacturing and long term results. Internationalization may yet be characterized by the transfer of know-how in exchange of financial advantages, and market policies and strategies.

According to Salvatore (1999 p.25), "international economy deals with economic interdependency between nations. It analyzes the flow of assets, services and payments between one nation and the rest of the world, the policies directed to the regulation of such flow and its effects over the welfare of a nation".

In general, when a company decides for its process of internationalization, the objective is expansion of its products and services into different markets and regions of the globe. According to Cavusgil (2011, p.78) "Companies also pro-actively search internationalization due to several internal forces such as search for growth and customers or yet to minimize the dependency on the domestic market by means of geographical diversification".

We will approach then some policies to support internationalization directed by the Chinese government in order to understand the way the process is operated.

## **About China**

From the beginning of the Reform made by Deng Xiaoping in 1978, China has taken advantage of certain conditions, such as, available manpower, cheap and eager to improve their lives and work conditions; they also take advantage of how attractive their growing domestic market is for international companies and thus they make their economy as flexible as possible generating exchanges and learning. Kissinger (2011) states that in a time of economic crisis, China has played an unprecedented role: "in the past the Western world usually applied to China several foreign restrictions forecasted in their economic policies, now the country is more and more an independent proponent of its own solutions and a source of emergency help for other economies facing the crisis." ( KISSINGER, 2011 p.461).

China has already been the center of world for innovation. Weapons, compass, paper, gun powder and printing were invented over a thousand years ago. Scientist and historian Joseph Needham – whose work Science and Civilization in China has set ever since 1950 this subject in details (WINCHESTER, 2008). According to a document from the U.S.Chamber of Commerce, written by McGregor (2009), it is believed that China lost "their hand" over innovation due to a "bureaucratic feudalism". The Western world took advantage of these innovations, improved them and used them as

a base for centuries of technological domination<sup>1</sup>. Having a model under construction, China produces almost everything under several modalities and association arrangements. It became in 2010 the largest world exporter as well as the second largest world importer only behind the US. A significant part of its importation corresponds to products and components of high added value besides raw materials and commodities. In the last 10 years the country leaders have pointed out innovation as a means of repositioning China in the world and sustaining its development keeping in sight the price this growth has charged the nation: inequality, pollution, poverty in rural areas and environmental degradation<sup>2</sup>.

### **Recovering the role of science and technology and the native innovation.**

When Deng Xiaoping launched the Reform and Opening of the country in 1978, he immediately put his efforts to science and technology as keys to modernize China. Along the 80's and early 90's, science, the reforms of the system of technology and new programs rapidly progressed. This progress of science and technology was *top of mind* raked by President Hu Jintao and prime minister Wen Jiabao when they started their ruling in March 2003. In October 2005, the Central Committee of PCC raised native innovation to a strategic level as that of the policy of "reform and opening of the country" from Deng Xiaoping. Hu Jintao said that China would follow a new path of innovation: "innovation with Chinese characteristics ". Native innovation campaign achieved the level of national strategy that would place science and the technology development in the center of the re-balance for China in terms of industrial structure and development standard (McGREGOR, 2009). Along with this guideline we are able to notice the existing industrial policies directed to production expansion and sustainability of payment balance. These two elements control the pace and the direction of the Chinese IDE and set the degree of intervention from the State (ACIOLY e LEÃO 2011)

### **From volume leader to leader in innovation and sustainability.**

With a strategy focused on development of new technologies, the Chinese automotive industry intends to join quality, safety and mainly environmental issues thus paying less attention to manufacturing records<sup>3</sup>. According to data from International Organization of Motor Vehicle Manufacturers (OICA) in 2011 China manufactured 18,4 million vehicles and holds the position as the largest world manufacturer. In April 2011, the Forum of OICA held in Shanghai in partnership with the Chinese Association of Automobile Manufacturer (CAAM), discussed topics about energy economy, environmental protection, low carbon emission among other important challenges to be faced by the automobile industry. Chinese authorities present at the event informed that the next five years will be a landmark for the transition of the development of electric vehicle industry. Mr Su Bo, vice-minister for Industry and Information Technology Department highlighted:

The 12th five-year plan for the automotive industry forecasts a strong development both technical and scientific over the need of opening of the

Chinese automotive industry promoting independent development and innovation. The development of independent brands needs to be accelerated. The whole system, from product to organization structure should be focused on saving energy, new energy and sustainable development setting up a consolidated base for the automotive segment in the Chinese industry.<sup>4</sup>

## **The Internationalization of China in the World**

Since the end of 90's the Chinese government has adopted an internationalization strategy for their companies as a basic tool for economic development and for the country's geopolitical insertion. "To do so, in the XVI Congress of the Communist Party in 1999 the program Going Global was prepared aiming at the following four major objectives:..." i) increase Chinese investments abroad by means of decentralization and relaxing the authorization concessions allowing Chinese industries to leave; ii) improve of the level and quality of projects; iii) reduce capital control and create new channels of financing for the domestic market; and iv) integrate the internationalization policy for Chinese companies with other existing policies for the foreign segment searching to promote brand recognition of such companies (ACIOLY and LEÃO 2011; HOLLAND and BARBI, 2010).

In accordance with the study made by the Applied Economy Institute (IPEA) in 2011, the flows of Chinese direct investment in the world have multiplied by 60 times between 1990 and 2008, according to *United Nations Conference of Trade and Development* (Unctad). When China started its opening process, these investments moved from a figure close to zero to reach US\$ 830 million in 1990 and later US\$ 52,1 billion in 2008. The acceleration of this growth was higher from 2004 when a series of changes in the policy of incentives to internationalization was implemented. From this point on, Chinese investments were made to supersede the investments made abroad from other Asian countries, such as, Korea and Singapore, and then in 2008 China became the second largest investor among developing countries just after Hong Kong.

The internationalization process of Chinese companies by means of foreign direct investment (IDE) is sponsored and managed by the Government (GUGLER and FETSCHERIN, 2010). Made through loans and administrative proceedings among other incentives (ACIOLY and LEÃO, 2011).

The Government encouraged companies by means of financial devices and ease of administrative processes to perform IDE. For Holland and Barbi (2010), this expansion of the Chinese IDE is a result of the governmental strategy that articulates on one side the control over energy and food vendors, and on the other side, the expansion on sectors where the Chinese industrial companies have been developing (automobile, computer systems and telecommunications etc.), even when there is a vast domestic market to be exploited. The Government's capital is represented by a province or city. These are companies with more managerial independence having part of their ownership structure negotiated in the stock market. Among these we can mention as examples, JAC Motors, Chery, Xuzhou Construction Machinery Group and Chongqing Grain Group.<sup>5</sup>

## **The Internationalization of China in Brazil**

---

<sup>4</sup> Constructing the Global High-end Exchange Platform and Leading the Sustainable Development for Global Automotive Industry "2011 OICA China Forum" in Shanghai.

<sup>5</sup> Study published by the Brazil-China Entrepreneurship Council in March 2011

The most usual entrance manner used to announce and bring Chinese foreign direct investments in Brazil has been through partly made Mergers and Acquisitions.<sup>6</sup> The study from the Brazil-China Entrepreneurship Council (CEBC) explains that one of the reasons for such preference is based on the difficulties regarding cultural differences. According to the data from the Applied Research Institute (IPEA) in April 2011, the main sector destination of Chinese FDI in Brazil in 2008 were: retailer business of pesticides, fertilizers and soil correction (37%); manufacturing of semi-finished steel (14,1%); and manufacturing of malt, beer and draft beer (13,7%).

In 2009 it was observed a change in the sector participation of the Chinese Foreign Direct Investment as those that represented the largest participation were the following: multiple banks with commercial customers (73,2%); retail businesses of pesticides, fertilizers and soil correction (4%); and combined services for office and administrative support (4%). Considering that Chinese state industries also sent resources from their base to foreign countries, the flow data for Chinese FDI are distorted and underestimated.<sup>7</sup> In the segment of automakers we highlight the entrance of the following Chinese companies: Chery, JAC Motors, Dongfeng and Sinotruck. These are products manufactured from European designs and international system technician analyst as well as a strong dealer's network and after-sales.<sup>8</sup>

**Figure 1- Chinese Investments in Brazil by entrance means**  
 Source: News press - CEBC / March 2011 ( adapted )

In accordance with the study made by the CEBC, these automakers compete with challenging characteristics, such as, advanced technological resources, proper luxury models, competitive prices regarding the Brazilian industry in equivalent category. Chery and JAC are Chinese Government companies that invest in the Brazilian market. The first one already has 73 authorized dealers and a project announced to install a plant in the country. The latter one which is also targeted at our study,

<sup>6</sup> Study published by the Brazil-China Entrepreneurship Council in March 2011

<sup>7</sup> IPEA studies # 85 April 2011

<sup>8</sup> Special report on China – Magazine ABCD INOVA year 2, # 8 April 2011

JAC Motors has a large dealers' network with 50 units. They adopted the strategy of early internationalization as they have the freedom to sell their cars in other markets. Chery and JAC have existed over 10 years with products found in over 100 countries.

Understanding the Chinese policy regarding global strategies addressing internationalization processes, innovation and sustainability in the world and in Brazil is key, the following will describe the main concepts of sustainable organization behavior by means of theoretical references in order to help us understand how it actually took place in Brazil with the Chinese company JAC Motors.

## **Sustainable Organization Behavior**

According to Derek Pugh (1971 apud Caravantes 2009, p. 27), organizational behavior is “the study of the structure, functioning and performance of the organizations as well as the behavior of groups and individuals part of such organizations”.

Organizational Behavior according to Caravantes (2009), is to be concerned with the performance of workers in the organization environment; the effect of formal and informal groups; feelings and actions of workers; the effect of workers over the organization regarding efficiency, efficacy and effectiveness. Yet according to Hobbins (2010, p. 07).

Organizational Behavior is a field of studies that investigates the impact individuals, groups and the structure have over the behavior of people within the organizations with the intent of using this knowledge to improve organizational effectiveness.

Currently, the need of changes in the organizational strategies is inherent to its survival in the globalized market.

For an organization effectively follow these changes and remain solid, one of the strategies to be concerned about is the understanding of this external scenario and implement a system to learn the concepts of sustainable organizational behavior.

It is notorious that the concept of sustainability is today a significant part of the ideas of most communities around the world, how to preserve biodiversity and natural ecosystems, respect the environment and demand from companies social environmental quality in products and services to be offered to consumers. It is within this perspective that Kofi Annan awarded Nobel Prize for Peace stated “Sustainable development is essential for everlasting peace. Above all it is the reason to be for the United Nations”.

So in 1987 the United Nations' World Commission for Environment and Development prepared a report called “Our Common Future” also known as “Brundtland Report” which defined sustainable development as “the one capable of supplying the needs of the present generation without compromising the supplying of needs and survival of future generations” (BRUNDTLAND, 1987, p.27).

Trying to make this concept more tangible, John Elkington (1994) created the concept called *Triple Bottom Line*, or tripod of sustainability where he states that sustainability from a business point of view should be based on three dimensions in balanced and interdependent manner as follows: economy, social/human and environment what is demonstrated in Figure 2.

**Figure 2: Tripod of Sustainability**  
Source: adapted DNV (2010)

From the same perspective, the Guide for Communication and Sustainability prepared by the Brazilian Business Council for Sustainable Development (CEBDS) in 2008, lists the actions related to the tripod of organizational sustainability as detailed below:

In the economic dimension it is understood that the offer of goods and services at accessible prices at an increasing number of consumers; development of infrastructure for the construction of new inclusive markets and actions to influence and spread good practices for several segments; the incentive to activities for income generation, micro-credit and fight against poverty in the value chain; the expression in sustainability strategies adding value to the relationship with investors (CEBDS 2008).

In the social dimension the development of tools designed to follow up quality and safety of products and services as well as the satisfaction and right to data disclosure for consumers; the development and adherence to laws, regulatory standards and volunteer codes concerning marketing, institutional communication, promotion and sponsorship; the utilization of tools for communication to encourage consumers in a sustainable manner (reduce, reuse and recycle); respect to international labor conventions and human rights, slave work and infant work; respect labor legislation and the right to free association of workers; respect to social, cultural and religious differences and value of ethnic and gender diversity within the company and in their relationship with stakeholders, that is the public that relates to the company; the development of programs for salary leveling between

man and woman, policies, procedures and training of employees and associates in fighting corruption, strategies and programs to improve health conditions for workers and community; creation of strategies and programs to improve the education of workers and the development of qualified manpower, among others (CEBDS 2008).

In the environmental dimension the development of tools for the manufacturing of goods and services allied to a capacity to preserve ecosystems and environmental services.: air, forests, soils, water, energy and food; ecoefficiency in manufacturing processes: produce more generating less environmental impact and consuming less natural and financial resources; optimize the use of raw material, sources of energy and water from re-use and recycling; reduction of waste of raw materials, water and energy; the correct disposal of effluents from manufacturing processes; the capacity to know and reduce the level of gas emission which cause the greenhouse effect in manufacturing processes; the reduction of the impact from the transportation of goods, products and materials used in manufacturing processes and in the transfer of employees; the development of programs for preservation and reduction of the impact over biodiversity; investment in innovation and clean technology for the development of goods and services of quality and high performance; the development of spare logistic processes for the disposal and recycling of products at the end of its cycle of use (CEBDS 2008).

Therefore, we can understand that a company when it starts working with sustainability has as premise of a harmonic relationship between economic agents, community and nature. This implies in a political, social, cultural and ethical revolution, Briefly we can define it as a model that allows economic growth without social exclusion and respects the environment. Its spread will depend on all the actors from the community, the Government, citizens and entrepreneurs to understand that sustainable management is a matter of survival for companies and forthcoming generations.

Ashley (2003) reminds that for some social responsibility represents legal obligation; for others it means a responsible behavior in terms of ethics; for others yet, the message transmitted is to be responsible, and many believe it is charity; and some others take it by the sense of social awareness. Corporate social responsibility is the set of social actions taken by the company aiming at promoting welfare either internally or externally which is seen from broader view as organizational sustainability.

Ethos Institute of Social Responsibility highlights the importance of a way of leading business in which the company becomes a partner and co-responsible for social development. A socially responsible company is the one that has the capability of listening to interests from different parties, such as, shareholders, employees, vendors, suppliers, consumers, community, government, environment, and yet try to incorporate all of them in the planning of its activities, searching to address demands from all of them and not only from shareholders or owners.

Corporate social responsibility may be interpreted and practiced as an ethical compromise from the organization in its actions and relationships with the several publics with which it relates. Thus, the concept goes beyond the legal posture from the company, philanthropy or support to the community, social corporate responsibility is an attitude from an organizational management with the proper value to everyone.

Thus, organizations need to reinvent their businesses and remain profitable, however financially healthy, but also they have to be managed through values and fully in accordance with the system in which it is inserted. "In a world that the natural capital, social capital and human capital are subject to restrictions, considering just a return over financial capital holds back companies into the shadows of a distant past." (SENGE, 2009 p.345). The same author states that today modern companies conceived and managed as "money making machines" are not in harmony anymore.

For Senge (2009) some traditional businesses considered sales to be more important than actually adding value to customers. Side effects of this approach are dissatisfied customers and overflowing landfills, this happens because of the disconnection between organizations and their customers.

In the same line of thinking, author Barrett (2009) informs that we are getting to the era of compassionate capitalism. When selling their products and services, companies need to have basis on values and rules that support common welfare. Ethics and social responsibility are fundamental for the way companies conduct and communicate their businesses. Values that define how companies stand in the community are more and more important on the consumer's decision making and on retaining talents at a company.

“We may carry on spending more time satisfying our selfish needs and greedy egos or maybe we can choose to create a future where we will feel good within, raising our souls and at the same time make it more sustainable for all of us, for the businesses and for the community” (BARRET, 2009, p.24).

For Barrett (2009) companies are yet waking up for this new paradigm. There is still the “cannibalism” being encouraged through numerous limiting values by some companies. Fierce competition, a badge is used as a symbol of power, people are stressed out and afraid of the work environment because they are not able to meet their targets, other people working twelve or fourteen hours per day without any free time to address the needs of other sides of their own lives.

Author Barrett (2009) supports that companies which still feed this kind of culture are short term focused with outdated management and leadership practices. It is necessary to balance this polarity to become an everlasting company with associates who are fully satisfied with their jobs. The change of paradigm is about balance, that is, balance of the organizational and human needs.

Senge (2009) alleges that organizations are recognizing the need of change, either because they need to survive or because they are searching benefits in order to operate in a more sustainable manner, for instance, cost reduction or a better company image. They see the connection between their own survival, advantages of opportunities of advance and preservation of the environment. Companies that are in this stage are going over the line between merely reacting to risks on one side and recognizing the opportunities from active creation of a world in which they will be able to be prosperous indefinitely, on the other side.

It is known that organizations need control to keep the order, however, the argument of the authors is that organization cannot focus business strategy exclusively on this view, but on corporate governance that is open and flexible.

Barrett (2009) describes this level of organizational awareness as adaptability, sharing power of the employee and ongoing learning. The author understands that to encourage innovation so that new products and services are developed, it is necessary that the enterprise goes through changes and incorporates values of flexibility and takes risks during management. In addition we have organizational culture migrating from control to trust, from punishment to incentive, from exploitation to property, and from fear to truth. And thus, mechanisms are set up to promote innovation and learning. The focus simply on financial result starts to disappear as the organizations start to measure its success in comparison to a wide range of indicators. Vision, mission and values are recognized as means to develop a strong organizational identity.

The company is considered a “citizen” when sustainability is fully integrated to the strategy, in general it happens when companies discover

that they have a much wider range of business opportunities, but only if they pro-actively incorporate the factors of sustainability in all dimensions of their business strategy and in the core of their processes of investment and decision making, in all organizational levels. (SENGE 2009, p.115).

Senge (2007) indicates that more and more businesses are incorporating sustainability issues among their objectives for the future. For Senge true innovation demands a distinguished mentality.

Concurrently with Senge, Barrett (2009) says that the primary focus of organizations in this level of awareness is the service to humanity and to the planet. There is recognition of the inter-relationship of life as a whole and the need of individuals and organizations to take up the responsibility for the entire welfare. Internally, the focus of the organization is to create an ethical environment including justice, humility and compassion. Externally, the focus is to understand the impact of present actions in the forthcoming generations, that is, to create a sustainable future for the company and the community.

According to Kuazaqui (2010) companies have been noticing that they can differentiate from their competitors using practices overlooking optimization of non-renewable resources. During many years there has been a concern of contributing financially with programs related to the environment. Currently the practice is to spread the utilization of new technologies and the offer of products and services that are politically correct. Then companies get positive exposure before different groups of interest and at the same time reducing costs, expenses and processes.

Thus, the International Organization for Standardization (ISO), holds together over a hundred countries and regulates by means of ISO 14000, standards that aim at reducing the load of pollution generated by companies in the manufacturing system as well as the wastes of raw materials. In Brazil, the whole process of certification is managed by the Brazilian Association of Technical Standards (ABNT). Companies that meet the standards receive a certification that is worldwide valid. Therefore, in addition to competitive differential, companies may obtain gains by means of economy of scale and productivity reached in the processes of manufacturing.

Brazilian industries have searched cleaner technological alternative and less toxic raw materials in order to reduce the environmental impact and degradation. The community's awareness and the environmental legislation have led companies to a more sustainable relationship with the environment. Companies have been forced to invest in process modifications, manpower improvement, raw material replacement, reduction of residue generation and rationalization of the consumption of natural resources.

In this context for Sachs (2004) the sustainable dimension of development drives us to “[...] search solutions that are triple winners eliminating the wild growth obtained at the cost of highly negative externalities both social and environmental” (SACHS, 2004, p.15).

Sen (2011) completes the theory mentioned by the authors when he observes that in spite of many human activities that follow the process of development may have destructive consequences, yet it is also at reach of human power to enrich or even improve the human environment.

Therefore, the civilian community, companies and the government and all those in charge of the maintenance of the planet we live in.

The following example is of sustainable manufacturing process in an automaker that has been present in the country for the past 87 years.

### **An example in Brazil**

GM Brazil is an American company that manufactures cars focusing on processes that are sustainably managed, besides investing over R\$ 5 billion in the country, and holding almost 600 points of sales and services and the largest line of dual fuel vehicles (gasoline and ethanol) in the market, GM demonstrates that is necessary to manufacture cars focusing on sustainability.

According to Franco (2010) the company has one of the most modern buildings for their technological center constructed in accordance with the concept of “Green Building”, that focus on reducing the utilization of electrical energy and natural resources and the areas of stamping and painting where sustainable practices are also placed at a first level. They value suppliers as business partners and an important part of the compromise of corporate responsibility. The company presents a “zero tolerance” policy against infant work, improper treatment to employees or the practice of corrupted business for the supply of goods and services. In addition to that, they present the guidelines ruling a responsible business conduct including treatment of workers and the role of the company enhancing local communities in which they work.

One of the environmental principles of GM is to reduce the generation of waste. All their units practice composting in which organic residues are transformed into fertilizer for trees and green areas. The company has already designed approximately 1.400 tons of residues to composting. Other sustainable actions are the recycling by means of process of selective collecting of cardboard, paper, plastic, wood, batteries, lamps, metals among others where they recycle 97.7% of what is utilized. In addition, they treat effluents what consists of treating water used in their manufacturing processes and return it to nature. The company is pioneer in the automotive segment as they implemented this type of station in 1951 at their plant in the city of São Caetano do Sul. Other essential issue is the re-use of water which not only creates alternatives to reduce the consumption of potable water. The company re-uses rain water for what it has adopted an automated re-utilization system that collects water by means of pipes and drains and directs it to a reservoir where the water is treated with chloride for later use in lavatories and flush toilet. The company is also aware of an optimized use of water in their manufacturing processes. This is applied in painting, for instance, one of the areas with the largest use of this natural resource. In the stages of pre-treatment, the body of the car passes through several baths in which it is made ready for painting. The area has worked on the re-use of water in more than one stage of washing in order to reduce consumption. Other initiative present in the painting of cars is the use of paints with higher solid content, and thus, the paint has better yield, less smear and a more concentrated paint takes less solvent in its formula resulting into less emissions of volatile organic compounds in the drying hoods.

All GM do Brasil units have an incineration system in charge of reducing 99% of its emission. GM also adopts the practice of turning off all machines during non-productive time as well as eliminating every type of leakage. The outcome of such measures: from 2004 to 2008, GM do Brasil reduced in 35% the consumption of water and electrical energy in their business units. From 2003 to 2009 there was a drop of 51% over electrical energy consumption per vehicle manufactured, and 62% over water. Nanotechnology causes a reduction of 90% on the generation of phosphate burr and saves the consumption of 26.000.000 liters of water /year. In the technological center in the city of São Caetano do Sul, a more efficient air conditioning reduces 13% the consumption of energy. With the use of glass cups, 1.320.000 plastic cups/year were eliminated. With the elimination of plastic bags to wrap silverware, 624.000 plastic bags /year were eliminated. GM do Brasil also invests in social projects as part of the company’s strategy supporting educational programs and qualification of manpower; their priority are the cities where their business units are located. Their associates are offered incentive programs along with a private sports club where they are allowed to take their families as well as several other benefits.

Today GM Brasil is the second largest operation of General Motors outside the US and consolidated as one of the five global development centers of vehicles in the company. This is because they are able to perform all stages of creating a vehicle, from design to validation and to trading in a sustainable manner on all their processes, and yet they export technology to GM around the world.

Below we are going to approach the methodology used in the present study.

## **Methodological Procedures**

First a vast bibliographical study was performed with the objective of reviewing the data referring to the concepts that approach internationalization of companies, the policy of the Chinese government and the sustainable organizational behavior. We searched several sources of evidence such as: secondary data research, document analyses and interviews performed by means of a semi-structured questionnaire.

The Chinese company JAC Motors was chosen as the business unit object of this research due to the process of internationalization in Brazil in a non-conventional manner as the initiative came from a Brazilian group that holds approximately 90% of shares in Brazil.

Thus, the methodology used to collect such information was the case study by means of open interviews for more details with a public relation worker from group SHC that represents JAC Motors in Brazil. The interview performed in July 2012 was preceded by the development of a protocol of case study (YIN, 2005). In order to understand the company's organizational structure and the internationalization process were approached issues related to the interest of SHC group by the company JAC Motors as well as what drove the Chinese company JAC to get into the Brazilian market and the impacts of the organization and yet understand if the group intended to work with sustainable management in all of their processes and issues related to the allocation of resources, innovation and technology.

## **The entrance of the company JAC Motors in Brazil**

Jianghuai Automobile Co., Ltd. – later denominated JAC Motors – was founded in 1969 and is present in more than a hundred countries. In the beginning the manufacturing was exclusively for trucks, but overtime, the factory grew and modernized. Today, they have a diversified line of vehicles that meet the needs of several segments in the automobile market.

The process of internationalization of JAC Motors in Brazil started in 2010 where the SHC group, led by Sergio Habib, announced a partnership with the company to represent the Chinese brand in Brazil.

The process of internationalization was not conventional because it was an initiative from the Brazilian group SHC, the initiative was to bring to the country this Chinese automobile brand. We are talking of a project that was over BRL\$ 1 billion. As any other project, there are challenges. The SHC group the controller of the Chinese brand has acted over twenty years in the importation and distribution of the brand Citroen. After re-organizing the structure of the brand, Sérgio Habib decided to prospect in different parts of the world for new brands of automobile.

Thus, the SHC group analyzed four factors that determine the choice for JAC Motors as a partner to act together in the Brazilian market. The first was to notice that the company is in constant growth investing in new manufacturing processes focusing on the constant improvement of quality. Secondly, as they had a center of design in partnership with the studio Pininfarina in Turim, Italy; and a center of development of interior design in Tokio, Japan. And third, because JAC vehicles have both external and internal design that match the taste of Brazilian consumers, and most importantly, they have an excellent portfolio of vehicles development. And finally, the fact that JAC, according to the surveys made is one of the Chinese brands with excellent rates of quality.

JAC Motors brought to Brazil cars that have high performance engine and European technology. The engines are more resistant and offer more acceleration and a significant saving on fuel.

The process of internationalization of JAC Motors in Brazil takes place in two stages. In the first stage, the SHC group invested BRL\$ 350 million for the importation and distribution of vehicles. This process triggered the immediate opening of fifty authorized dealers, in addition to a modern center of part distribution which demanded investments of BRL\$ 200 million. For the launching of the brand and the start of operations we allocated BRL\$ 120 million.

The second stage will be the implementation of a plant in the city of Camaçari in the state of Bahia, forecasted for 2014. This project will demand investments of BRL\$ 900 million out of which BRL\$ 780 million are from the SHC group and BRL\$ 120 million from the headquarters of the group JAC Motors out of which 87% of domestic capital from the SHC group therefore having Brazilian control and management which will result into more jobs and income for the local community besides helping the economy. We should highlight that part of the financial drive of the SHC group will be made by investment agents, such as, the Brazilian Bank of Economic and Social Development (BNDES).

The choice of the city of Camaçari is because of three structural items: a) suppliers already installed and the culture of manpower spread in the region; b) logistics advantages: roads and harbors with the perspective of growth; c) proximity to points of consumers, for instance, the Brazilian Northeast region that has been showing a strong potential of economic growth.

The plant in Brazil will rely on a center of development for new technologies; center of style and design; control labs for pollutants emission; test track and center of professional development.

Currently, the SHC group has 89 authorized dealers in Brazil out of which 50 are from JAC, this figures should grow to 200 in 2014 with the implementation of the plant and the other brands.

Therefore we understand that the creation of a factory in the state of Bahia will consolidate the process of internationalization of the brand JAC Motors in Brazil.

### **The Institute SHC, a group the company in Brazil**

JAC Motors in Brazil invests in social responsibility by means of the SHC Group which is the company that brought JAC to Brazil, so the social initiative described below are not part of the business strategy of the company at an international level, but only for the group in Brazil.

The SHC Institute which was idealized and established in 2008 by entrepreneur Sérgio Habib has a long history of support to communities in the south of the state of Bahia. Located in Trancoso, the Institute is involved with a series of social projects.

The Institute works the education of the population in Trancoso in the state of Bahia. In total, 1,8 thousand children and teenagers are full time assisted in four school units. Besides that, there is a project to nourish kids which helps in complementing the food served at the schools; the project for improvement that contributes with infrastructure works and improvements at the schools, police posts, medical posts etc; the project clean beaches that helps in the maintenance of trash bins that are ecological friendly at the beaches besides helping with garbage collecting. In addition to the educational centers kept by the institute in partnership with local city halls where children have several activities such as, science lab, art room, room with projector, libraries, theater, dance studio, gymnasium, courts for sports, musical starter, choir, string orchestra, support for rural area schools, medical and dental service for the population. The main mission is to form and educate new citizens in Trancoso teaching citizenship and respect to others.

### **Perception of JAC Motors in the interview**

Some perceptions were highlighted in the dialog between the representative of JAC Motors in Brazil and an employee from SHC group.

The people interviewed inform that the executives from JAC and the SHC group understand that the Brazilian consumer likes innovation however they are very conservative yet regarding some preferences in terms of car and accessories. They stated that “a Chinese company has always been perceived as bad quality by Brazilians so how would this be in terms of cars”?

An important internal procedure from Chinese brand JAC Motors to get the new Brazilian market is the company’s strong concerning with design, technology and quality as well as “the value of service and reception of the customer”, according to the people interviewed. So it is necessary to create organizational conditions to meet this requirement.

What drove JAC to get into the Brazilian market besides the potential of a developing country, it was the character and leadership of Sergio Habib to lead the SHC group and successfully bring the brand Citroën into the Brazilian. The SHC group chose JAC due to the leadership in the manufacturing of light vehicles and the first exportations to China. In addition to JAC being present in over a hundred countries and having a research and development center. The people interviewed also stated that the employees felt proud of working for the company.

Another point in the interview was regarding the aspects related to the organizational behavior in the SHC group, after all those are the ones responsible for the management of the company JAC in Brazil. The people interviewed stated that the company invests a lot in incentive campaigns with awards focusing on driving associates to reach their targets. There is a strong sales strategy focusing on profits; yearly 25% of employees are replaced in case they do not meet the minimum profile set for efficiency.

The hiring of personnel was then made by the president who personally selected according to his own profile that was bold and able to have fantastic sales, so it is possible to believe that he used his emotional intelligence to select them. Later when the volume of activities increased, this task was delegated to employees. We noticed that what matters is the capacity of learning that the applicants have, therefore, prior experience has a proper but not fundamental value. The rationale converges to the high investments in training and *workshops* that the company offers their employees so “they commit more”, states the those interviewed. Sergio has his desk strategically located at a place in the company close to the employees focusing on the dialog between them.

The company does not have a stated mission, vision and values that according to the people interviewed it is part of the strategy of the company. There is not SHC group own site, but a JAC Motors site; this is also for strategic reasons.

The people interviewed said that the company has social-environmental practices through the SHC Institute, however there are plans for sustainable management on all their processes.

Regarding the structure, we can highlight the value of its own processes not accepting outsources. They believe that when the process is owned there is more cultural loyalty.

## **Final Consideration**

After analysis over the concept of internationalization applied to the Chinese automaker JAC Motors in Brazil as well as the understanding of the organizational behavior at the SHC group which brought and has controlled the operations in Brazil since 2010, we can infer the following considerations.

Among the theories of internationalization, it seems to us that the theory conceived by Uppsala University is the one that best reflects the process performed by JAC Motors keeping in sight for the Chinese company: i) the process may take place gradually and slowly focusing on knowledge and experience with the local environment; ii) the process may increase the trust for investment in resources in the country and slowly achieve the process of internationalization as learning over local evolves providing decisions to be made in the country with strategic foundation; iii) choice of starting their activities via exportation as well as the cession of the brand and technology transference and this process is made by JAC in Brazil.

What is highlighted in this process of internationalization is the significant financial allocation provisioned by the SHC group. Approximately 90% of the capital invested is from the Brazilian group that is the major manager of the operations in Brazil. This process may be analyzed in two distinct stages: first, with investment of approximately three hundred million Brazilian reais that were designed to the business stage and the settling of the brand in the Brazilian market, and the second forecasts the implementation of the automaker in the city of Camaçari, in the state of Bahia, and the investment is forecasted to be nine hundred million of Brazilian reais and that will in fact consolidate the process of internationalization of the brand in Brazil.

This process of JAC Motors in Brazil addresses the strategic ambitions both from the Brazilian side and from the Chinese side. On one hand, the SHC group broadens the range of products and expertise in the automotive industry, what provides more consolidation for the Brazilian group which is now more competitive in a highly competitive segment. On the other hand, the Chinese group meets the expectations for the governmental program “GoingGlobal”, which proposes to increase Chinese investments abroad. We should highlight that we have here a process that is difficult to manage as it is a product from China and it faces a certain rejection in the Brazilian market. Besides that, we highlight issues with contingent which are beyond the decision capability of SHC group executives, such as US dollar exchange rate, increase of taxes over industrialized goods.

From the point of view of sustainable organizational behavior we have observed a strong company’s concerning of encouraging employees to achieve the manufacturing targets, a favorable

environment to work, close and charismatic presence of the leader Sérgio Habib, open dialog and solid appearance in the market. And also the allocation of resources for social practices through the SHC Institute located in Trancoso in the state of Bahia. However, it is not evident in the research that a sustainable management is crossing all processes and business strategy of the company as exemplified below.

The company does not expose and therefore does not share in a visible manner their mission, vision and values. This is necessary for the process of the company's transparency before their target public. According to the authors mentioned in this study, this sharing is reflected in the strong organizational identity allowing the employees to have access over the positioning and future of the company they are part of. The management seems to us a little centralized on the leader what makes difficult the decision making and succession plan in the company. We also had the impression that by 2015 vehicle J5 will be launched in the world market as a hybrid, that is, a car that can be either electric or fuel driven.

Therefore we recommend the company to act strongly on sustainable processes for the manufacturing of automobiles as demonstrated in this article by GM do Brasil that has a technological center built in accordance with the concept of "Green Building", that focus to reduce the utilization of electric energy and natural resources in areas like stamping and painting. One of the main environmental principles adopted by GM is to reduce the generation of residues where all business units have composting practices, water recycling and reuse. Another initiative present in the painting of cars is the utilization of paints with higher solid content in order to increase yield and less solvent which results into less emission of organic compounds. GM also values the suppliers as business partners and hires them in accordance with their commitment with corporate responsibility. Upon these and other actions, the company diminished their costs resulting into more gains for the organization. However, one of the measures of sustainable management is the maintenance of jobs, and GM was called in by the Secretary of Treasury of the Ministry of Finance to provide explanations over their lay off plan at their plant in the city of São José dos Campos. The Brazilian federal government has a policy for tax reduction over industrialized products (called IPI in Brazil) for vehicles but on the other hand the government charges the companies the maintenance of jobs in the industry. "We give incentives both financial and taxes, and we want return on that" highlighted President of Brazil, Dilma Rousseff.

With these perceptions we can conclude that it is legitimate and significant for the country the entrance of foreign automakers, in the Brazilian territory, as for instance JAC Motors, main object of our study. Bringing to Brazil their projects for technological innovation focusing on the manufacturing of vehicles that are environmentally sustainable and at the same time on the integration of SHC group in the management of personnel that is compatible with the premises of sustainability, these are the major challenges to be faced and if addressed will be of higher significance for Brazil.

## Abstract

The text addresses the solidarity economy as an alternative to the capitalist economy through the presentation of endeavors incubated by the Technological Incubator of Popular Cooperatives from Universidade Federal de Itajubá. The survey was conducted through a literature review, which the authors selected authors strengthen the issue that reducing the social and economic inequalities can be achieved through this new economy, based on self-management and collaboration, reinforced by several solidarity networks.

**Keywords** solidarity economy, solidarity endeavors, popular incubators.

## 1. Introduction

The capitalist economy is going through the 21<sup>st</sup> century contributing negatively to the increase in environmental, social, economic and cultural impacts, massifying people, disrespecting the diversity of each region, without considering local climates, cultures and knowledge.

The encouragement to exaggerate, unconscious consumption by some media instruments has contributed to the obsolescence programmed by companies, turning the individual hostage to products, services, unnecessary values for a good, healthy life.

Nations have the GDP – gross domestic product as their development indicator; however, there are several signs that the o GNH –gross national happiness index should be the most adequate indicator on the development of a nation, as it occurs in Bhutan.

Several experts have demonstrated that mankind is facing an un motivating scenario, considering the dilemmas of global warming, extinction of original forests, reduction in sea life diversity, loss of agricultural soil, and depletion of critical natural resources.

We have one billion people starving, from which 180 million are children, from which 10 to 11 million die of malnourishment or lack of access to something as common as clean water. This means 30,000 children, or ten Twin Towers, die every day in the silence of poverty; they do not represent such a spectacle for the media. 25 million people have died of AIDS while we debate the value of patents. 2 billion tons of grains, or 800 grams per person per day are produced in the world, not to mention other foods. If we distribute the 63 trillion dollars of the worldwide GDP among the Earth's 7 billion people, the result will be 5,400 reais per month per family of four. Everyone could live in peace and dignity with what is produced. There are 737 global corporate groups, 75% of them for financial intermediation, controlling 80% of the world's corporate system, which explains the existence of billionaires. They aim at

maximizing profits, even if the planet goes into a generalized financial and production crisis. The challenge is simple – and we are destroying the planet to benefit a minority (DOWBOR, 2012).

Social movements are intensified, denouncing several of mankind's problems, but they fight through their own mechanisms and articulations to be heard, because the space given by the private initiative and the public power not always allows their manifestations.

The use of pesticides is increasing in a reckless manner, generating serious problems to the population that ignores their health damages.

Family farming in rural areas has tried to survive, but faces huge challenges concerning tax incentives and the difficulties of access to technologies that could support such endeavors. Thus, it is more difficult to participate in an extremely competitive market with resources in their own dynamics, through private initiative from major companies.

College education tends to adjust to market pressures and as time passes it adjusts its curricula, aligning them to the market needs, which tend to be increasingly technical, that is, searching for professionals who work in their areas of expertise to generate products and services that offer more and more gains and profitability to businessmen.

With so many problems faced by mankind in this century, this paper highlights the solidarity economy, via basic concepts, principles and some of their success practices with the respective challenges, in the sense of showing that a new world is possible with changes in attitudes, values and paradigms. For this purpose, a collaborative existence with a lot more responsibility and commitment with the planet's life is required.

## **2. Solidarity Economy**

Democracy is a relevant value defended in several levels in the social life, although its practice has been frail, especially when speaking on the economy (Tygel, 2011).

It can be seen models still with little participation from the population remain in force in several contexts and, thus live with inequalities and, thus, a wide economic and social gap among people.

The capitalist system exists in several countries, such as Brazil, but coexists with another economy based on its own principles in the sense of reducing social and economic inequalities. In this context, Tygel (2011) provides that in Brazil, set up a Solidarity Economy in three different dimensions:

- Economically, it is a way of executing the economic activity of production, offer of services, commercialization, finances or consumption based on democracy and cooperation, which we call self-management: in other words, in Solidarity Economy, there are no bosses or employees, because all members of the endeavor (association, cooperative or group) are workers and owners at the same time.
- Culturally, it is also a way to be in the world and consume (at home, in events or at work) local, healthy products from Solidarity Economy that do not affect the environment, have no genetically modified organisms nor benefit large corporations. In this sense, also symbolic and related to values, we are talking about changing the paradigm from competition to cooperation and collective, free, shared intelligence.
- Politically, it is a social movement that fights for change in the society, for a different way of developing, based not on major corporations or large estates, with their owners and shareholders, but on

development for people and built by the population upon values of solidarity, democracy, cooperation, environment preservation and human rights.

The fight for a fair world in the Solidarity Economy occurs through collective production, commercialization and consumption initiatives, where self-management, collaboration and participative management happen in the everyday survival of its members.

The way how this economy is conducted and aims at support is via production, commercialization and consumption chains and networks between solidarity economy endeavors and these consumers (Tygel, 2011). Thus, concentrated economic resources from the capitalist system are targeted to a networked system that does not concentrate capital and power.

In the Solidarity Economy, workers operate as an organized unit, valuing cooperation, from self-managed production units or small producers who get together to buy and sell as a group, to different methods of family farming, fair trade networks, company incubators, exchange and microcredit clubs, among many other experiences that have a fairer, more solidary and sustainable way of generating work and income in common (Santos et al, 2012).

Next, the authors Singer and Souza (2000, p.13) present a systematization to differentiate the principles of social economy in relation to the traditional economic model:

- a) collective ownership of production ways by people that use them to produce;
- b) democratic company management by direct participation or proxy, depending on the number of cooperative members;
- c) net revenue sharing among cooperative members, according to decision made in assembly;
- d) forwarding of annual excess (leftovers), according to criteria agreed upon by everyone;
- e) the basic capital share from every cooperative member is not paid;
- f) additional sums loaned to the cooperative offer the smaller interest rate in the market.

In the capitalist model, the overly valued competition increases inequality and contributes for the elite to be increasingly successful and distant from the large mass of poor people. Collaboration and the search for common good coexist with competition in this scenario; however, the existing problem is related to the level of intensity in the competition, which generates the exclusion of the ones who failed or are little prone to market impositions. Singer (2010) states that, with the challenges the solidarity economy faces, the solidary exchange and generation of complementary production chains have proven to be promising alternatives to the strengthening and viability of this new solidarity economy. Several authors feature on their research and practices that, in order to become stronger, solidarity endeavors need to be networked so that social-economic changes occur widely. Thus, such solidarity networks need the integration of several players in order to create a sustainable development process, with such players being governments, NGOs, society, schools and universities, incubators and research centers (SINGER, 2010).

For the Solidarity Economy to change from a remedy to capitalism evils to its competitor, it will have to achieve efficiency levels in the production and distribution of goods that are comparable to the ones in the capitalist economy and other production methods (SINGER, 2002).

Another interesting aspect considered in solidarity endeavors is that they escape from the utilitarian character so commonly found in work relations in the capitalist universe, being closer, in many cases, to actual families, with bonds built, companionship generated and sustained in proximity relationships that go beyond the production nature. Gains in the solidarity economy go beyond the economic ones – they bring autonomy, empowering, higher self-esteem, valuation of the social condition people live in, integrating individuals to the society.

Facing this fact, it is worth highlighting that, in order to measure the results from solidarity endeavors, we need to consider and include all these factors in the creation of indicators, because the return periods will be naturally different from the ones considered in traditional models from the capitalist economy. It is also worth highlighting that it is common to retrieve highly interesting social-cultural wealth from member communities and endeavors, because respect to local, regional and family knowledge is also among the solidarity economy principles.

Santos (2002) recalls the need for us to find new links in the production models. He believes that the relations in conventional capitalist model are impoverished in the face of competitive relationships required by the current market, because individualism prevails. Santos (2002, p. 64) highlights the main points in support the logic of a new production system and sociability:

- a) the importance of ties beyond the economic one;
- b) the success of production alternatives depends on the insertion in collaboration, mutual support networks (unions, NGOs, etc.)
- c) fights for alternative production shall be boosted in and out of the State;
- d) the production alternatives shall not be fixed solely in local scale, but be articulated in a wider scale, pulling away from isolation;
- e) the radicalization of participative democracy and of economic democracy are two sides of the same coin;
- f) there is a strong connection between the fights for alternative production and the ones against the patriarchal society. It is not a fight only in the economic plan, but also of gender, race and emancipation;
- g) alternative methods of knowledge are alternative sources of production; we learn from different ones;
- h) the criteria to analyze the success or failure of economic alternatives shall be gradual and inclusive and go well beyond economic reductionism;
- i) the production alternatives shall be in synergy with alternatives from other economy and society spheres, such as fair trade, Tobin tax, democratization of the World Bank and the IMF, universal minimum income proposals, compliance with ethical rules by foreign investors in southern countries, open immigration.

He also defends that, in order to make concrete a fair, sustainable global development, first it will be necessary to act and think locally, without giving up to possible global articulations. The work in collaborative network, by conjugating different local experiences, may produce one or several global alternatives, and new methods of production and social coexistence, less authoritarian and definitive, may arise in multi-experimentalism and get closer to the political sphere, aiming at a change in the structural foundations the entire dominating social-economic system is based on.

Global, sustainable and fair development can occur if local development occurs first, respecting local and regional knowledge, differences and diversities, in a constant, collective construction of coexistence and of solidarity economy.

In this prism, it emphasizes the role of technology incubators for popular cooperatives, initiatives that have happened within the solidarity economy.

### **3. Technological Incubators of Popular Cooperatives: INTECOOP/UNIFEI.**

Another component of the solidarity economy in Brazil is comprised of cooperatives and associated production groups, incubated by university entities, which name themselves Technological Incubators of Popular Cooperatives (ITCPS). [...] Since 1999, ITCPS have established a network that gathers periodically to exchange experiences, enhance the incubation methodology, and stand in the national movement of solidarity economy (SINGER, 2002, p.123).

The Technological Incubator of Popular Cooperatives from Universidade Federal de Itajubá (INTECOOP/UNIFEI) started its operations in January 2007, as a college extension program related to the Pro-Rectorry of Culture and College Extension (PRCEU). The incubator was implemented with resources from the National Program of Incubators of Popular Cooperatives (PRONINC). After 2003, PRONINC was financed by Fundação Banco do Brasil, by Financeira de Estudos e Projetos (FINEP), in partnership with the National Department of Solidarity Economy (SENAES), from the Ministry of Labor and Employment.

Thus, for Coutinho et al. (2011), the mission of Intecoop / Unifei, which is: “mobilize popular groups through collective work, encouragement to self-management and technology transfer, as a way to promote citizenship according to the principles of Solidarity Economy. As with the groups, one can say that the incubator is still maturing, because so far no group has been removed from the incubator.”

It is noticed that all the work of incubation of enterprises conducted by popular Intecoop / UNIFEI, follows the action research, which according to Pereira (2007) means involving researchers and participants representative of the situation in a cooperative and participatory.

The incubation methodology varies from group to group respecting the contexts presented. Coutinho et al. (2011) state that “likewise, a single group can be in several incubation phases at the same time, because the variables that indicate the conclusion of incubation phases not always are excluding.” For the processes of incubation in Intecoop / Unifei, we found the following stages in the development of the projects:

1. Articulation and mobilization of the society;
2. Identification of the group's profile;
3. Pre-incubation: basic notions of cooperative principles until the formalization;
4. Incubation: follow-up and assessment of the group's self-management;
5. De-incubation: emancipation of the group, for being considered able to work in an independent, formal and sustainable manner.

Currently, INTECOOP/UNIFEI assists four popular groups, each one with its peculiarities and in a different phase of the incubation process: Associação dos Catadores Itajubenses de Materiais Recicláveis (ACIMAR), Associação Artes da Terra (AAT), Associação Nutra|Saúde, and Associação de Pequenos Produtores Rurais de Itajubá e Região (APRIR). These groups include people directly benefited by work and income generation, not to mention their families, who in many cases depend economically on these members/associates. Resources to support the incubator, as well as the groups incubated, are complemented by public letters, such as PROEXT (MEC), CAPES (MEC) and FUNASA (MS).

Below, present a table and a brief summary on the groups currently incubated by INTECOOP/UNIFEI (2012).

Name	Purpose	Number of members	Period of incubation	Phase of incubation	Note
Acimar	Collection of recyclable materials	20	05/2007 - present	Incubation	Weekly meetings. Partnership with PMI (Itajubá City Government)
Nutra Saúde	Nutritional education and healthy eating	9	03/2008 – present	Incubation	Partnership with PMI
APRIR	Family farming	28	11/2010 – present	Incubation	First sale for school meals in the city of Itajubá already made. Partnerships with PMI, CEASA and EMATER
Associação Artes da Terra	Artisan crafts	14	04/2011 - present	Pre-incubation	Bimonthly meetings. Partnership with PMI

**Table 1: Description of groups currently assisted by INTECOOP/UNIFEI.**  
**Fonte: INTECOOP/UNIFEI (2012).**

### 3.1. Association Of Recyclable Materials Collectors Itajubenses (Acimar)

ACIMAR is comprised of a group of recyclable material collectors who worked in the former landfill in Itajubá. Today, through the association, the collectors are able to generate jobs and income and ensure – although still poorly – the support to their families. ACIMAR is an important player in the promotion of responsible management of recyclable residues and urban sustainability. Currently, the collectors have a shed for triage and separation of materials, a truck, as well as a few mandatory equipment items, such as hydraulic press, scale and flexible bags; this area and equipment are granted by PMI or by the service concessionaire. In addition to offering accounting and administrative support, INTECOOP/UNIFEI periodically conducts workshops on “social-citizen” education.

Actions that improve the selective collection route in the city, as well as the expansion of the area served by the association, are also expected.

### **3.2 Nurse Association | Health**

Nurse Association | Health is focused on promoting the population's health through Nutritional Education and Sustainable Eating. The group develops actions that may improve the quality of life for people in social-economic vulnerability position. NutraSaúde works in qualification and generation of work and income, with topics related to eating and nutrition. In advanced incubation phase, INTECOOP/UNIFEI works with the group in order to allow its sustainability.

### **3.3 Association of Small Farmers and Itajubá Region (APRIR)**

From the legal statement that declared, in 2009, that at least 30% of the school meals should come from family farming, PMI, through the Department of Agriculture, looked for support from INTECOOP/UNIFEI, to help establish a group of family farmers. The goal is to strengthen the work from these rural family producers. In addition to offering administrative support, the incubator shall work in the group's formation and integration, identification of new economic potentials, elaboration of business and marketing plans, as well as education in management and legal aspects.

### **3.4 Arts Association of the Earth**

Despite the fact that the association is already formally constituted, its approximation with INTECOOP/UNIFEI is justified by the lack of financial sustainability in the group. The intention is to emphasize the qualifications in financial and accounting advising to the group, as well as support to the expansion of the association's consumer market and the social-environmental commitment of the products sold. The association's meetings – which were held only during crisis and irregularly before the pre-incubation process – became periodical, in order to allow the group to strengthen its planning capacity and pursuit of effective solutions to its needs.

As positive points of the current structure, it is worth mentioning: i) the availability of physical space for the INTECOOP/UNIFEI facilities in the Itajubá campus; ii) the participation from university workers in the INTECOOP/UNIFEI team, which tends to allow built-up institutional knowledge and continuity in the incubation process; iii) interdisciplinary team, competent and committed with the development of the region, in its broader sense; and iv) permanent team qualification in the elaboration of academic projects and products, which has allowed relative success in the execution of such activities. A few of the negative factors were: i) low level of knowledge – and, therefore, of valuation by the academic community of the work developed by the incubator; ii) little participation and involvement from the academic community, a factor that, allied with the low resonance of the work developed, seems to be explained by the institution's predominantly technological nature; iii) lack of institutionalization of the incubator in the institution's organizational chart – as well as for extension in general, which results in budget difficulties; iv) lack of continuity in group advising activities, since most of the resources raised has no multiannual application; and iv) as it happens in several popular groups, the turnover of team members is very high, a factor identified as harmful for the work progress, because it makes difficult to retain institutional knowledge and memories, as well as ones concerning the activities developed with the groups.

Since its foundation, in 2007, except for the current team, nine technicians and 38 students, among scholars, interns and volunteers, have gone through the incubator. Additionally, the excessive bureaucracy, which sometimes deviate the focus from the incubator's intended activities, must be mentioned.

A major challenge to any extension activity is how to measure the results from your work, due to its subjectivity. After all, it is difficult to find numerical indicators capable of reflecting the greatness of recovering the self-esteem and citizenship of a garbage collector, for example. On the other hand, in numbers, INTECOOP/UNIFEI has conducted a few projects awarded through public edicts, its main source of financing. In 2010, INTECOOP/UNIFEI executed four projects that had been approved the previous year by the Edict ProExt/MEC 2009. In 2011, a little over R\$ 495,000.00 will be invested, to be applied in direct benefit of the incubated groups and also of public schools in the city and region. Such resources come from the Edict ProExt/MEC 2010, DEB/CAPES and FUNASA/MS).

The examples presented were taken from materials provided by of INTECOOPS/UNIFEI, especially the article presented on the 5th Brazilian College Extension Congress, in Porto Alegre, November 2011, by members of the incubator, as well as from the institution's website: <http://www.unifei.edu.br/intecoop/a-intecoop>.

Thus, one sees the major challenges faced by the incubator as well as advances of its incubated enterprises. Thus, it was found that INTECOOP / UNIFEI mobilizes people, institutions and partnerships, as well as brings opportunities to everyone involved, from incubated groups that find improvements in job opportunities and generation of income, to experienced, qualified professors, young college students and experts who work together, connected by ideology, principles and by the development of a new economy, where values and principles can be taken to their personal lives. This incubator from UNIFEI is maturing, prioritizes harmonic relationships that allow improvement in the quality of life of people (Coutinho et al, 2011).

Despite the challenges to be faced, we understand that universities cannot hide from major economic, social, political, cultural and environmental dilemmas so evident in our times.

## **Final Remarks**

This paper presented the challenges in the contemporary work concerning un-sustainability issues. It highlighted the solidarity economy as an alternative to reduce exclusions and introduced solidary endeavors from the technological incubator of popular cooperatives from Universidade Federal de Itajubá (UNIFEI-MG).

Despite the constant challenges the solidarity economy faces, it has conquered adept, developed in a more organized manner, and expanded its presence in universities, via technological incubators of popular cooperatives (ITCPs), via research and scientific publications.

It was noted the benefits that this new economy has already generated groups previously thought to be excluded and marginalized. For the purpose of this study was to disseminate INTECCOP / UNIFEI to strengthen the role of social economy as an alternative to the capitalist economy, the actions, principles and management model seeks to reduce economic and social differences, favoring the generation of income and thus reduced social exclusion and marginalization of large groups.

Thus, solidarity economy has presented itself as a more sustainable economy than the capitalist, and could be better explored in research environments, better disseminated by the media, and receive support from different segments of the society.

# Territorial Development – Managing for Sustainability in Brazil

Arnoldo José de Hoyos Guevara, Diego de Melo Conti, Osvaldo Martins  
School of Economics and Business Administration, Pontifical Catholic University of  
São Paulo, Brazil

(E.mail: arnoldodehoyos@yahoo.com.br, diegoconti@uol.com.br, osvaldo-martins@live.com)

**Abstract:** In this study, emphasis will be given to the challenge of the organizational management process within a development model that considers the territorial possibilities and necessities as a basis for the process of sustainable, endogenous development. The territorial unit considered in the study is the municipality, highlighting the existing possibility in Brazil of implanting a model of participatory management on taking into account the large number of small municipalities existing in the Country. The problematic of large cities is also analyzed, recognizing, however, the greater difficulty of articulation among the representative players of society, based on the exogenous forces engaging within these regions. In order to study the management process, the contexts that support the concept of sustainable development and the form of organizing the economic activities will be defined. In the discussion of management properly stated, emphasis will be given to administrative decentralization and to articulation, to planning process and to dissemination of information.

**Key words:** territorial management; articulation; planning; sustainability.

## 1. Territorial development

The study on the possibility of territorial development being considered, as an alternative to the centralized model of public management for countries like Brazil, seems pertinent based on the contrasts encountered within this territory such as, rich industrial development centers neighboring shanty towns, a powerful agro-industry neighboring or occupying deforested areas, a large area of forests with great wealth in terms of biodiversity to be scientifically explored and physically preserved, which demonstrates the diversified scenario of potentialities and needs to be identified and managed.

Brazil embodies an area of approximately 8.5 million km<sup>2</sup>, which can be divided into six different biomes, according to IBGE (Brazilian Institute of Geography and Statistics) publication:

Brazilian Continental Biomes	Approximate Area (Km <sup>2</sup> )	Area/ Total Brazil
AMAZÔNIA Biome	4,196,943	49.29%
CERRADO Biome	2,036,448	23.92%
MATA ATLANTICA Biome	1,110,182	13.04%
CAATINGA Biome	844,453	9.92%
PAMPA Biome	176,496	2.07%
PANTANAL Biome	150,355	1.76%
Total Area - BRAZIL	8,514,877

This space is occupied by a population of more than 190 million habitants, with an urban concentration in the order of 85% of the population. This territory is divided into 5,565

municipalities, of which 4,957 municipalities have less than 50,000 habitants (IBGE, Census 2010).

The high rate of Brazilian urbanization highlighted in the last four decades of the past century, generated a full order of imbalance in these cities, given that they were not prepared for a migratory movement of that order. The urban population in the 1960 Census was in the order of 45% of the total population. In a certain form, the same phenomenon that would occur in Europe during the 19th century, as a result of the industrialization process, has occurred in Brazil, and is aggravated with the installation of the agro-industry and the use of land as a reserve account.

Within this context of deep, rapid changes and of diverse situations, considering the possibility of analyzing the proposals inserted within the discussions on territorial development and the respective management process becomes particularly interesting, as a form of harmonizing the national needs of (economic, social and environmental) development with local particularities.

## **2. Methodological Approach**

From a methodological point of view this study can be classified as follows:

\*As to the approach, it is qualitative, for being concerned with aspects of reality that cannot be quantified, as well as centered on understanding and explaining the dynamics of social relationships.

\*As to the nature, it addresses applied research, for aiming to generate knowledge for practical application, driven at the solution of specific problems.

\*As to the objectives, it addresses exploratory research, for having the objective of affording greater familiarity with the problem, aimed at making the problem more explicit or building hypotheses (GERHARDT, 2009).

## **3. The contexts of sustainable development**

Usually a definition of sustainable development contemplates three contexts: economic, social and environmental.

Another two aspects are equally important and, when inserted into this definition, expand the likelihood of success within the management process for sustainability: territorial and political (SACHS, 2008).

The territorial factor lays out the space where the diagnosis of the situation must be conducted, making the understanding of the possibilities and the needs more practical.

The political factor contributes with the necessary institutional apparatus that allows the local players – Government, business and civil society – to be able to engage in an organized manner, thus maintaining each player's independence and freedom of speech, while generating a favorable environment for the articulation process.

Another aspect that must be considered in a complex environment, as previously pointed out, is the cultural factor. In a country like Brazil, cultural differences must be contemplated upon studying territorial possibilities. Amazon communities present great cultural and environmental differences when compared with communities in the south of the country, both in terms of the biome and the colonizing history, which influence local culture and must be considered and respected in a management process.

Therefore, these six contexts must be present within a process seeking the articulation of the local forces, aimed at organizing public, business and civil actions aimed at the well-being of the community as a whole.

## **4. The organization of economic activities**

Understanding how the economy is organized is important to improve the process of territorial management. Traditionally, economic activities are divided into primary sectors, represented by agriculture, secondary sectors, embodying industry, and tertiary sectors or services. Dowbor, in *A Reprodução Social vol 2*, offers us a broader vision of this division by proposing that the following form of organization be considered for any study that is made of economic processes:

- \*Productive activities – agriculture and husbandry, logging, fishing, mining, construction and transformation industry;

- \*Economic infra-structures – transports, telecommunications, energy, water and sanitation;

- \*Commercial and financial intermediation;

- \*Social services – health, education, culture, information, entertainment, urbanism, housing, social protection networks, tourism, sports, justice and security (DOWBOR, 2001b, p. 9).

This division, on emphasizing infra-structure and social services, becomes more interesting for the study and the definition of the territorial potentialities, as well as for the discussion of action priorities in the management process that will be discussed further on.

## **5. Territorial governance or management**

On considering the Brazilian territorial division of 5565 municipalities, where 89% of these municipalities have less than 50,000 habitants, 85% of the population is concentrated in urban areas and there are diverse potentialities and needs based on the actual territorial extension, these studies are focused on municipal units.

The territory as a place where people live and exercise their rights and duties is, in the definition of geographers, the contiguous space where life, production and culture are organized. This space, in the organization of modern civilization is identified in the *city* (SANTOS, 2008).

Problems such as the eradication of poverty and the preservation of the natural environment, despite being the focus of international discussions, as occurred in the United Nations Conference on Sustainable Development, RIO+20, could see relative advances in being addressed, if they are analyzed on a distributed basis, in compliance with local realities and needs.

This argument takes into consideration that any territory does not exist on an isolated basis and should be attent to global movements, whether they be economic, social or environmental. Thinking globally, acting locally means analyzing territorial particularities aimed at development through their internal or endogenous forces.

## **6. Administrative decentralization and the articulation process**

Within a democratic system, a process of administrative decentralization must hold the basic principles of changing the model of representative democracy to participatory democracy, decentralizing and debureaucratizing the distribution of public funds, and reducing the number of instances until they reach the local administrative units (DOWBOR, 2008).

A central Government is expected to provide the availability of basic infra-structures such as energy, roads, railroads, telecommunications, facilitated public financing, mainly for micro, small and medium-size companies, monetary, oversight and taxation policy to afford an adequate distribution of corresponding responsibilities and financial resources (DOWBOR, 2001b, 2008).

Local public authority is expected to provide the allocation of resources based on an action plan, which has been widely discussed with all the other players of society – businesses and organized civil societies.

This process depends on the understanding that participation enables the alignment of expectations, the recognition of local capacities and needs, a definition of the priorities and control in executing the developed plans. The articulation of these agents is the great challenge of local development and at times its greatest weakness (VAZQUEZ BARQUERO, 2001).

From an institutional point of view, the Federal Constitution of 1988 guarantees the formation of City Councils to allow the participation of citizens in discussions on public policies for social areas. This may be a starting point for popular engagement in defining the priorities of municipal investments, nevertheless, the articulation process must be expanded and the participation of non-governmental organizations, by being structured, can have fundamental significance in thoroughly debating this discussion. Civil society organizations (CSO or NGO) have held an important role in reducing the social problems instilled by strong, disordered urbanization engaged in areas where the public sector and private business have shown to be inefficient and uninterested respectively. The proximity with local reality, the awareness of society's most urgent demands and the fact of being relatively well structured in functioning as networks of information and of the dissemination of knowledge, make these organizations important agents that assist in the formulation of public policies and actions within the territory.

Businessmen must also be stimulated to participate, since the teaching structure contributes in preparing the workforce. The existence of financing, with appropriate rates, is of fundamental importance for modernizing and expanding production, in addition to other factors of interest, such as infra-structure, health and other social services, which contribute towards the territory's business competitiveness.

Equally important is the political forthcomingness of local governing officials, which is fundamental in this process. They are in charge of orchestrating this entire movement, in order to give coherence and realism to these actions, given the existing budgetary limitations (DOWBOR, 2001c).

Dowbor further emphasizes that:

“Reinforcing the local capacity of government is necessary, but not enough, for minimally coherent public management. The required change involves a profound alteration in the administrative political culture. The difference, in our vision, is that a participatory society organized around its own interests – and local interest is a powerful organizer of citizenship – becomes a strong stabilizer of the central government itself and of the processes of international regulation, which we need” (DOWBOR, 2001c, p.30).

Reinforcing the thought that a participatory democracy does not substitute the responsibilities of the elected governing officials, Paul Singer points out that:

“A participatory democracy does not oppose formal representative democracy and does not even intend to substitute it. Participatory democracy incorporates representative democracy, complementing it with direct democracy – consulting, plenary assemblies – whenever possible and multiplying specific representative instances, in which a full diversity of interests and ideologies may be presented, debated and negotiated or, eventually, pre-negotiated, since final decisions must be made in more generally elected instances” (SINGER, 1998, p.125).

## **7. The challenge of planning**

The transition from a central model of decision-making to a participatory model, in search of sustainable development, contemplates the need of knowing how to manage crises, since a simple alteration of the model, opting for the mobilization of those resources within the territory, through the modernization of the productive processes and the rendering of services, may generate imbalances in the allocation of human resources, causing an effect opposite of that desired, which is an expansion of the job opportunities and the generation of income (SACHS, 2008).

This transition process requires the application of a model of progressive change, which must make good use of the technological context existing within the territory, working on organizational improvements through business training and structural changes in the productive process, introducing innovations to the measure that employment is expanded. This model of endogenous development attends the objective of productive efficiency, required to increase competitiveness, giving emphasis to social dimension (VAZQUEZ BARQUERO, 2001).

This process is denominated by Sachs as the use of “*adequate technologies*”, which harmonizes the best use of installed capacity in the local production sector with maintenance and, whenever possible, an extension of the work and income offered. Particular attention must be given to those products denominated “*unmarketable*”, which are products within the territory that do not depend on imported resources, in addition to not suffering strong pressure from outside competition. Examples of perishable products are home building, local infrastructure and services that allocate more of the workforce (SACHS, 2008).

Stimulus for family agriculture must also be considered, with the creation of green belts within municipalities, providing the local populations with produce at lower prices, given a cost reduction in transport and storage, and if adequately orientated, offer products of superior quality. Orientation must be directed at eliminating the use of agrochemicals on planting products and economical forms of irrigation, thus contributing in the generation of work and income, safe nourishment and helping to preserve the natural environment (DOWBOR, 2008). The Social Technology Network offers a series of low cost models that allow for this type of production. Another example is the Bank of Brazil Foundation, which also presents experiences of social technologies already viably operationalized and offers textbooks orientating their implantation.

Dowbor restates the urban-rural relationship in the following way:

“Cities, on the other hand, have to be put back into the rural space where they belong. As such, it would be more accurate to speak of local space than of urban space. In the excitement of recent urbanization, a human being forgets to what point he is bound to the fields surrounding cities, and one essential element of urban development will be the reconstruction of urban-rural relations, no longer based on the fields, as in the classic vision of agrarian reform, but based on the city itself” (DOWBOR, 2001a , p.23).

Local business, particularly micro, small and medium companies (companies with as many as 49 employees were responsible for 39% of people employed in Brazil in 2009 – IBGE, General Business Registry), can be strengthened by several initiatives. Organizational restructuring requires an increase of administrative capacity, the productivity of innovation and the competitiveness of building a network where companies work on a complimentary basis and when they are competitive, by participating in collective purchasing and promoting their products in an organized manner, constantly seeking economies of scale (SACHS, 2008, ALBUQUERQUE LLORENS, 2001).

In Barquero’s vision, there is a “set of initiatives that incentivize the rise and expansion of immaterial factors and qualitative aspects in local development. Then those

measures will be included, which fall upon the qualification of human resources, technological and innovative know-how, technological disclosure, entrepreneurial capacity, information about organizations and companies and the culture of development that is embedded in the population” (VAZQUEZ BARQUERO, 2001, p. 202).

Along this line, it is worth underscoring the contribution that can be given by SEBRAE (Brazilian Small Business Support Service) in forming Local Productive Arrangements. The creation of a Local Development Agency, aimed at organizing needs and monitoring action plans, can also contribute towards the evolution of those immaterial and qualitative factors mentioned above.

The need of financing for local productive activities is not at all immaterial and is, without a doubt, a great challenge in the management process.

Recalling the Brazilian territorial division, 5565 municipalities, presents the challenge of knowing how to get financial resources to reach all these locations, with adequate costs, to foment the previously discussed productive activities. Private banks, when present, operate in a manner that is disconnected from local needs. Local savings are not reused within the actual territory. Interest rates disenable the process of modernizing local companies leaving them hardly competitive. The initiatives of small entrepreneurs become unfeasible and the business mortality rate can increase. There are a few positive experiences in forming municipal banks, credit unions and even the issue of a local currency and these may be a pathway to solving such a complex problem (DOWBOR, 2001b, 2008).

The existence of Development Agencies can also contribute towards the organization of these demands, by supporting local initiatives in the search of financing existing within governmental areas or even at BNDES (Brazilian Development Bank).

If duly organized productive activities sustainably contribute towards territorial development, social services can be used as leverage in the process of generating work and income on two fronts.

On first hand, areas such as education, health, transport, security, leisure, housing, infra-structure, sports and culture hold a strong allocation of the workforce as an essential characteristic. On the other hand, in order for quality services to exist, this contingent of the workforce requires specialized training, which leads to higher wage compensation.

Second of all, the perennality and the competitiveness of productive activities directly depend on the quality of social services offered to the population. Examples can be stated such as education, in training the workforce, health, in reducing absences at work, originating from sickness, transport, facilitating access to companies, security, sport, leisure and culture generating the increased satisfaction of the population and greater productivity at work. As a result, a virtual circle of development is created, with social inclusion and a consequent increase in feelings of belonging (DOWBOR, 2001c, 2008).

Articulating the whole of society in the diagnosis and enabling ways they can improve their quality of life can be a great facilitator in the discussion on environmental issues inherent to the productive processes, as well as in the creation of management processes for existing natural resources. Despite the need for this discussion to occur on a global basis, in UNO sponsored forums, the problems are originated locally. If the principals of environmental education, corporate social responsibility and natural environment preservation have been discussed in each municipality, the possibilities of global targets being met become more promising.

Vasquez Barquero underscores that the structuring of territorial development policies reinforces the ecological dimension, for these give more emphasis to qualitative than to quantitative aspects of development, and complements:

“the preservation of the natural environment is a source of opportunities in creating companies and jobs. The proposals of the last generation (of

policies) stimulate ecological agriculture – producing products that are increasingly demanded more at higher income levels -, feed urban and rural tourism – which attract travelers and tourists and help to conserve historical and cultural treasures and the natural environment -, generating research activities and the production of renewable energy and create activities for services and technical assistance, centered on the preservation of the natural environment” (VASQUEZ BARQUERO, 2001, p.243).

## **8. Organization of information – transparency within the process**

A participatory management process requires transparent organization and the availability of information on a level playing field. This information will be posted at two moments of the processes: firstly as form of obtaining a map of the municipality’s situation in all of its activities, orientating the definition of priorities and the planning of actions and secondly for accompanying the defined plans and the main indicators of results.

The set of information made available by central authorities, quite often, appears to be structured on an aggregated basis and is not transformed as useful information for action in local processes. Furthermore, results if an exclusive economic order do not attend the needs of information as a strategic tool for local planning (ALBUQUERQUE LLORENS, 2001).

The availability of information, with the revolution in information and communication technologies (ICT), has become much simpler and cheaper. The possibility of a municipality setting up its own telecommunications system at a relatively low cost will assist digital inclusion, placing an ordinary citizen in touch with the world, will contribute with local companies towards internet access at reduced prices, and will provide a modernization of the administrative machine. Setting up a database for the actual municipality does not require sophisticated tools and such disclosure complies with the democratization of information, essential in the process of articulation and of stimulating participation (DOWBOR, 2001c, 2008).

In Brazil, IBGE detains a great deal of information already organized by municipality, and other information that can be obtained from the Ministries. Furthermore, initiatives such as the ODM Portal – Municipal Accompaniment of Millennium Development Goals – are made available important indicators on all Brazilian municipalities.

In 2005/2006, the *Instituto Cidadania* developed a National Policy Project for Supporting Local Development introducing eight axis areas in formulating policies, divided as follows: financing and marketing; technology; institutional development; information; communication; education and training; work, employment and income; and environmental sustainability. This project presents a diagnosis on the situation of each axis area and offers proposals in forwarding solutions for problems encountered.

Interesting experiences may also be consulted such as those at *Rede Nossa São Paulo (Sao Paulo Network )* and at *Câmara do Grande ABC ( ABC Chamber )* which are structured on the axis areas and offer a series of development indicators. The *Instituto Pólis*, which gives great emphasis to local development, at its electronic address, offers a manual of Tips for City Actions, where very successful experiences, on several topics of interest to the local players and to the articulation process, may be located.

In light of the scenario exemplified above, it might be said that from an informational point of view, the Brazilian situation shows to be highly promising for the process of identifying needs. However, the importance of structuralization, the availability of information on action plans and their respective indicators must be emphasized.

## **9. Development of Large cities**

Large cities and, mainly, the metropolises present particularities that make their development process sustainably more challenging. The influence of metropolises has altered according to the diverse moments of Brazilian history from, at first, being responsible for commanding the territories and their surroundings, structuring social, political and economic organization according to the determinations of the central Government to, in changing with the process of globalization, primordially serve the hegemonic interests of large national and international organizations, which have come to command these territories with the support of the Government (SANTOS, 2008).

This phenomenon occurs throughout the world, transforming metropolises into the mega-knots of a giant global network, converging points for capital, specialized workforces, processes of innovation and power (CASTELLS, 1999). The power of these transnational organizations is presented in a study from the Swiss Federal Institute of Technology, which is analyzed by Dowbor in an article regarding the network of worldwide corporative power.:

“The Swiss Federal Technology Institute (ETH) of Zurich published the first map of the network of global corporate control, a contribution of first-rate importance. This basically shows that 737 groups control 80% of the universe of large transnational corporations, of which 40% is controlled by a hard core of 147 corporations that are almost all financial corporations” (DOWBOR, 2012).

These forces, studied by Milton Santos, are foreign to local reality and its needs, thus creating great disparities in terms of the distribution of benefits. Municipal investments are centered on services in their own interests, marginalizing everything that does not give them direct returns, causing dramatic situations in these large centers where local power has enormous difficulties in articulating and establishing policies that promote ample rearrangement and development, creating wealthy areas and shanty towns within the same physical environment. According to Milton Santos, “this is the great damnation of the contemporary metropolis” (SANTOS, 2008, p.73).

Data from the 2010 Census show the following reality in terms of large urban agglomerates:

\*Metropolitan Regions and Regions of Integrated Economic Development (RIDES) concentrate a population of around 90 million habitants.

\*When municipalities are classified by population size, 38 municipalities with more than 500,000 habitants are encountered, amounting to a total population of about 56 million habitants.

The vision of this population concentration serves to provide the dimension of those challenges inherent to managing these spaces. The logic of processes seeking sustainable development can be considered the same, however, the organization articulation and planning processes will require greater effort and creativity.

## **10. Final considerations**

Territorial development has been presented as one of the most promising alternative forms to the traditional model of public management in municipalities.

As observed, a process of local management is initiated by administrative decentralization, which leads this discussion to consider that all the other levels of – state and federal – government must provide a flow of resources to municipalities in proportion to the responsibly. Even without considering that this first phase amply, very successful, the next step is put emphasis on the articulation of the local players, Government, business and civil society, aimed at migrating from a representative democracy to a participatory model.

In this system of participatory management, the organization of demands within a planning process, discussing the existing capacities, the potential of developing new activities,

the natural resources, the situation of the natural environment, the business structure, in organizational and technological terms, the agricultural structure, the scenario of local infrastructures as well the situation of public services and the budgetary reality of that municipality, must generate action plans that will form a set of initiatives, understood to be priorities by local society as a whole, in search of local sustainable development.

As Dowbor points out, despite the need of participation from all agents, the orchestration of the process by local governments is of fundamental importance in order for all these interests to be harmonized with the real potentialities, capacities and interests within each municipality and for the process of effectively managing action plans to exist with the facilitated availability of information, thus stimulating the continuity and expansion of the participatory process. Vazquez Barquero warns that, in the process of participatory management, articulation becomes the main challenge and, at times, the greatest weakness, but also recalls that, upon attaining conditions that allow the process to progressively advance, territorial development, by privileging local resources and capacities, carries in itself a unique social dimension.

Finally, it's important to consider that there is a significant volume of information in Brazil, both in terms of structural data as well as accumulated experiences, available for local agents for the purpose of territorial sustainable development management.
